There would be so many opportunities to miss the obvious, so many chances to misunderstand, so many ways of taking the wrong path.

11.

Aurora filled his vision now when he used the astro-simulator and it looked like Earth. (Baley had never seen Earth in the same way, but there had been photographs in astronomy texts and he had seen those.)

Well, what Baley saw on Aurora were the same cloud patterns, the same glimpse of desert areas, the same large stretches of day and night, the same pattern of twinkling light in the expanse of the night hemisphere as the photographs showed on Earth's globe.

Baley watched raptly and thought: What if, for some reason, he had been taken into space, told he was being brought to Aurora, and was in reality being returned to

Earth for some reason—for some subtle and insane reason. How could he tell the difference before landing?

Was there reason to be suspicious? Daneel had carefully told him that the constellations were the same in the sky of both planets, but wouldn't that be naturally so for planets circling neighboring stars? The gross appearance of both planets from space was identical, but wouldn't that be expected if both were habitable and comfortably suited to human life?

Was there any reason to suppose such a farfetched deception would be played upon him? What purpose would it serve? And yet why shouldn't it be made to appear farfetched and useless?

If there were an obvious reason to do such a thing, he would have seen through it at once.

Would Daneel be party to such a conspiracy? Surely not, if he were a human being. But he was only a robot; might there not be a way to order him to behave appropriately?

There was no way of coming to a decision. Baley found himself watching for glimpses of continental outlines that he could recognize as Earthly or as non-Earthly. That would be the telling test—except that it didn't work.

The glimpses that came and went hazily through the clouds were of no use to him. He was not sufficiently knowledgeable about Earth's geography. What he really knew of Earth were its underground Cities, its caves of steel.

The bits of coastline he saw were unfamiliar to him—whether Aurora or Earth, he did not know.

Why this uncertainty, anyway? When he had gone to Solaria, he had never doubted his destination; he had never suspected that they might be bringing him back to Earth. —Ah, but then he had gone on a clear-cut mission in which there was reasonable chance for success. Now he felt there was no chance at all.

Perhaps it was, then, that he wanted to be returned to Earth and was building a false conspiracy in his mind so that he could imagine it possible.

The uncertainty in his mind had come to have a life of its own. He couldn't let go. He found himself watching Aurora with an almost mad intensity, unable to come back to the cabin reality.

Aurora was moving, turning slowly— He had watched long enough to see that. While he had been viewing space, everything had seemed motionless, like a painted backdrop, a silent and static pattern of dots of light, with, later on, a small half-circle included. Was it the motionlessness that had enabled him to be non-agoraphobic?

But now he could see Aurora moving and he realized that the ship was spiraling down in the final stage before landing. The clouds were bellying upward— No, not the clouds; the ship was spiraling downward. The ship was moving. He was moving. He was suddenly aware of his own existence. He was hurtling downward through the clouds.

He was falling, unguarded, through thin air toward solid ground.

His throat constricted; it was becoming very hard to breathe. He told himself desperately: You are enclosed. The walls of the ship are around you.

But he sensed no walls.

He thought: Even without considering the walls, you are still enclosed. You are wrapped in skin.

But he sensed no skin.

The sensation was worse than simple nakedness—he was an unaccompanied personality, the essence of identity totally uncovered, a living point, a singularity surrounded by an open and infinite world, and he was falling.

He wanted to close off the vision, contract his fist upon the control-edge, but nothing happened. His nerve-endings had so abnormalized that the automatic contraction at an effort of will did not work. He had no will. Eyes would not close, fist would not contract. He was caught and hypnotized by terror, frightened into immobility.

All he sensed before him were clouds, white-not quite white -off-white- a slight golden-orange cast. And all turned to gray—and he was drowning. He could not breathe. He struggled desperately to open his clogged throat, to call to Daneel for help— He could make no sound—

12.

Baley was breathing as though he had just breasted the tape at the end of a long race. The room was askew and there was a hard surface under his left elbow.

He realized he was on the floor.

Giskard was on his knees beside him, his robot's hand (firm but somewhat cold) closed on Baley's right fist. The door to the cabin, visible to Baley just beyond Giskard's shoulder, stood ajar.

Baley knew, without asking, what had happened. Giskard had seized that helpless human hand and clenched it upon the control-edge to end the astrosimulation.

Otherwise—

Daneel was there as well, his face close to Baley's, with a look on it that might well have been pain.

He said, "You said nothing, Partner Elijah. Had I been more quickly aware of your discomfort—"

Baley tried to gesture that he understood, that it did not matter. He was still unable to speak.

The two robots waited until Baley made a feeble movement to get up. Arms were under him at once, lifting him. He was placed in a chair and the control was gently taken away from him by Giskard.

Giskard said, "We will be landing soon. You will have no further need of the astro-simulator, I believe."

Daneel added gravely, "It would be best to remove it, in any case."

Baley said, "Wait!" His voice was a hoarse whisper and he was not sure the word could be made out. He drew a deep breath, cleared his throat feebly, and said again, "Wait!"-and then, "Giskard."

Giskard turned back. "Sir?"

Baley did not speak at once. Now that Giskard knew he was wanted, he would wait a lengthy interval, perhaps indefinitely. Baley tried to gather his scattered wits. Agoraphobia or not, there still remained his uncertainty about their destination. That had existed first and it might well have intensified the agoraphobia.

He had to find out. Giskard would not lie. A robot could not lie-unless very carefully instructed to do so. And why instruct Giskard? It was Daneel who was his companion, who was to be in his company at all times. If there was lying to be done, that would be Daneel's job. Giskard was merely a fetcher and carrier, a guard at the door. Surely there was no need to undergo the task of carefully instructing him in the web of lies.

"Giskard!" said Baley, almost normally now.

"Sir?"

"We are about to land, are we?"

"In a little less than two hours, sir."

That was two metric hours, thought Baley. More than two real hours? Less? It didn't matter. It would only confuse. Forget it.

Baley said, as sharply as he could manage, "Tell me right now the name of the planet we are about to land on."

A human being, if he had answered at all, would have done so only after a pause-and then with an air of considerable surprise.

Giskard answered at once, with a flat and uninflected assertion, "It is Aurora, sir?"

"How do you know?"

"It is our destination. Then, too, it could not be Earth, for instance, since Aurora's sun, Tau Ceti, is only ninety percent the mass of Earth's sun. Tau Ceti is a little cooler, therefore, and its light has a distinct orange tinge to fresh and unaccustomed Earth eyes. You may have already seen the characteristic color of Aurora's sun in the reflection upon the upper surface of the cloud bank. You will certainly see it in the appearance of the landscape-until your eyes grow accustomed to it."

Baley's eyes left Giskard's impassive face. He had noticed the color difference, Baley thought, and had attached no importance to it. A bad error.

"You may go, Giskard."

"Yes, sir."

Baley turned bitterly to Daneel. "I've made a fool of myself, Daneel."

"I gather you wondered if perhaps we were deceiving you and taking you somewhere that was not Aurora. Did you have a reason for suspecting this, Partner Elijah?"

"None. It may have been the result of the uneasiness that arose from subliminal agoraphobia. Staring at seemingly motionless space, I felt no perceptible illness, but it may have lain just under the surface, creating a gathering uneasiness."

"The fault was ours, Partner Elijah. Knowing of your dislike for open spaces, it was wrong to subject you to astrosimulation or, having done so, to subject you to no closer supervision."

Baley shook his head in annoyance. "Don't say that, Daneel. I have supervision enough. The question in my mind is how closely I am to be supervised on Aurora itself."

Daneel said, "Partner Elijah, it seems to me it will be difficult to allow you free access to Aurora and Aurorans."

"That is just what I must be allowed, nevertheless. If I'm to get to the truth of this case of roboticide, I must be free to seek information directly on the site-and from the people involved."

Baley was, by now, feeling quite himself though a bit weary. Embarrassingly enough, the intense experience he had passed through left him with a keen desire for a pipe of tobacco, something he thought he had done away with altogether better than a year before. He could feel the taste and odor of the tobacco smoke making its way through his throat and nose.

He would, he knew, have to make do with the memory. On Aurora, he would on no account be allowed to smoke. There was no tobacco on any of the Spacer worlds and, if he had had any on him to begin with, it would have been removed and destroyed.

Daneel said, "Partner Elijah, this must be discussed with Dr. Fastolfe once we land. I have no power to make any decisions in this matter."

"Be aware of that, Daneel, but how do I speak to Fastolfe? Through the equivalent of an astro-simulator? With controls in my hand?"

"Not at all, Partner Elijah. You will speak face-to-face. He plans to meet you at the spaceport."

13.

Baley listened for the noises of landing. He did not know what they might be, of course. He did not know the mechanism of the ship, how many men and women it carried, what they would have to do in the process of landing, what in the way of noise would be involved.

Shouts? Rumbles? A dim vibration?

He heard nothing.

Daneel said, "You seem to be under tension, Partner Elijah. I would prefer that you did not wait to tell me of any discomfort you might feel. I must help you at the very moment you are, for any reason, unhappy."

There was a faint stress on the word "must."

Baley thought absently: The First Law drives him. He surely suffered as much in his way as I suffered in mine when I collapsed and he did not foresee it in time. A forbidden imbalance of positronic potentials may have no meaning to me, but it may produce in him the same discomfort and the same reaction as acute pain would to me.

He thought further: How can I tell what exists inside the pseudoskin and pseudoconsciousness of a robot, any more than Daneel can tell what exists inside me.

And then, feeling remorse at having thought of Daneel as a robot, Baley looked into the other's gentle eyes (when did he start thinking of their expression as gentle?) and said, "I would tell you of any discomfort at once. There is none. I am merely trying to hear any noise that might tell me of the progress of the landing procedure, Partner Daneel."

"Thank you, Partner Elijah," said Daneel gravely. He bowed his head slightly and went on, "There should be no discomfort in the landing. You will feel acceleration, but that will be minimal, for this room will yield, to a certain extent, in the direction of the acceleration. The temperature may go up, but not more than two degrees Celsius. As for sonic effects, there may be a low hiss as we pass through the thickening atmosphere. Will any of this disturb you?"

"It shouldn't. What does disturb me is not being free to participate in the landing. I would like to know about such things. I do not want to be imprisoned and to be kept from the experience."

"You have already discovered, Partner Elijah, that the nature of the experience does not suit your temperament."

"And how am I to get over that, Daneel?," he said strenuously. "That is not enough reason to keep me here?"

"Partner Elijah, I have already explained that you are kept here for your own safety."

Baley shook his head in clear disgust. "I have thought of that and I say it's nonsense. My chances of straightening out this mess are so small, with all the restrictions being placed on me and with the difficulty I will have in understanding anything about Aurora, that I don't think anyone in his right mind would bother to take the trouble to try to stop me. And if they did, why bother attacking me personally? Why not sabotage the ship? If we imagine ourselves to be facing no-holds-barred villains, they should find a ship-and the people aboard it-and you and Giskard-and myself, of course-to be a small price to pay."

"This has, in point of fact, been considered, Partner Elijah. The ship has been carefully studied. Any signs of sabotage would be detected."

"Are you sure? One hundred percent certain?"

"Nothing of this sort can be absolutely certain. Giskard and I were comfortable, however, with the thought that the certainty was quite high and that we might proceed with minimal expectation of disaster."

"And if you were wrong?"

Something like a small sign of spasm crossed Daneel's face, as though he were being asked to consider something that interfered with the smooth working of the positronic pathways in his brain. He said, "But we have not been wrong."

"You cannot say that. We are approaching the landing and that is sure to be the danger moment. In fact, at this point there is no need to sabotage the ship. My personal danger is greatest now-right now. I can't hide in this room if I'm to disembark at Aurora. I will have to pass through the ship and be within reach of others. Have you taken precautions to keep the landing safe?" (He was being petty-striking out at Daneel needlessly because he was chafing at his long imprisonment-and at the indignity of his moment of collapse.)

But Daneel said calmly, "We have, Partner Elijah. And, incidentally, we have landed. We are now resting on the surface of Aurora."

For a moment, Baley was bewildered. He looked around wildly, but of course there was nothing to see but an enclosing room. He had felt and heard nothing of what Daneel had described. None of the acceleration, or heat, or wind whistle. -Or had Daneel deliberately brought up the matter of his personal danger once again, in order to make sure he would not think of other unsettling-but minor-matters.

Baley said, "And yet there's still the matter of getting off the ship. How do I do that without being vulnerable to possible enemies?"

Daneel walked to one wall and touched a spot upon it. The wall promptly split in two, the two halves moving apart. Baley found himself looking into a long cylinder, a tunnel.

Giskard had entered the room at that moment from the other side and said, "Sir, the three of us will move through the exit tube. Others have it under observation from without. At the other end of the tube, Dr. Fastolfe is waiting."

"We have taken every precaution," said Daneel.

Baley muttered, "My apologies, Daneel-Giskard." He moved into the exit tube somberly. Every effort to assure that precautions had been taken also assured him that those precautions were thought necessary.

Baley liked to think he was no coward, but he was on a strange planet, with no way of telling friend from enemy, with no way of taking comfort in anything familiar (except, of course, Daneel). At crucial moments, he thought with a shiver, he would be without enclosure to warm him and to give him relief.

4. FASTOLFE

14.

Dr. Han Fastolfe was indeed waiting-and smiling. He was tall and thin, with light brown hair that was not very thick, and there were, of course, his ears. It was the ears that Baley remembered, even after three years. Large ears, standing away from his head, giving him a vaguely humorous appearance, a pleasant homeliness. It was the ears that made Baley smile, rather than Fastolfe's welcome.

Baley wondered briefly if Auroran medical technology did not extend to the minor plastic surgery required to correct the ungainliness of those ears. -But then, it might well be that Fastolfe liked their appearance as Baley himself (rather to his surprise) did. There is something to be said about a face that makes one smile.

Perhaps Fastolfe valued being liked at first glance. Or was it that he found it useful to be underestimated? Or just different?

Fastolfe said, "Plainclothesman Elijah Baley. I remember you well, even though I persist in thinking of you as possessing the face of the actor who portrayed you."

Baley's face turned grim. "That hyperwave dramatization haunts me, Dr. Fastolfe. If I knew where I could go to escape it-"

"Nowhere," said Fastolfe genially. "At least ordinarily. So if you don't like it, we'll expunge it from our conversations right now. I shall never mention it again. Agreed?"

"Thank you." With calculated suddenness, he thrust out his hand at Fastolfe.

Fastolfe hesitated perceptibly. Then he took Baley's hand, holding it gingerly-and not for long-and said, "I shall assume you are not a walking sack of infection, Mr. Baley."

Then he said ruefully, staring at his hands, "I must admit, though, that my hands have been treated with an inert film that doesn't feel entirely comfortable. I'm a creature of the irrational fears of my society."

Baley shrugged. "So are we all. I do not relish the thought of being Outside-in the open air, that is. For that matter, I do not relish having had to come to Aurora under the circumstances in which I find myself."

"I understand that well, Mr. Baley. I have a closed car for you here and, when we come to my establishment, we will do our best to continue to keep you enclosed."

"Thank you, but in the course of my stay on Aurora, I feel that it will be necessary for me to stay Outside on occasion. I am prepared for that-as best I can be."

"I understand, but we will inflict the Outside on you only when it is necessary. That is not now the case, so please consent to be enclosed."

The car was waiting in the shadow of the tunnel and there would scarcely be a trace of Outside in passing from the latter to the former. Behind him, Baley was aware of both Daneel and Giskard, quite dissimilar in appearance but both identical in grave and waiting attitude-and both endlessly patient.

Fastolfe opened the back door and said, "Please to get in."

Baley entered. Quickly and smoothly, Daneel entered behind him, while Giskard, virtually simultaneously, in what seemed almost like a well-choreographed dance movement, entered on the other side. Baley found himself wedged, but not oppressively so, between them. In fact, he welcomed the thought that, between himself and the Outside, on both sides, was the thickness of a robotic body.

But there was no Outside. Fastolfe climbed into the front seat and, as the door closed behind him, the windows blanked out and a soft, artificial light suffused the interior.

Fastolfe said, "I don't generally drive this way, Mr. Baley, but I don't mind a great deal and you may find it more comfortable. The car is completely computerized, knows where it's going, and can deal with any obstructions or emergencies. We need interfere in no way."

There was the faintest feeling of acceleration and then a vague, barely noticeable sensation of motion.

Fastolfe said, "This is a secure passage, Mr. Baley. I have gone to considerable trouble to make certain that as few people as possible know you will be in this car and certainly you will not be detected within it. The trip by car-which rides on air-jets, by the way, so that it is an airfoil, actually-will not take long, but, if you wish, you can seize the opportunity to rest. You are quite safe now."

"You speak," said Baley, "as though you think I'm in danger. I was protected to the point of imprisonment on the ship-and again now." Baley looked about the small, enclosed interior of the car, within which he was hemmed by the frame of metal and opacified glass, to say nothing of the metallic frame of two robots.

Fastolfe laughed lightly. "I am overreacting, I know, but feeling runs high on Aurora. You arrive here at a time of crisis for us and I would rather be made to look silly by overreacting than to run the terrible risk that undercoating entails."

Baley said, "I believe you understand, Dr. Fastolfe, that my failure here would be a blow to Earth."

"I understand that well. I am as determined as you are to prevent your failure. Believe me."

"I do. Furthermore, my failure here, for whatever reason, will also be my personal and professional ruin on Earth."

Fastolfe turned in his seat to look at Baley with a shocked expression. "Really? That would not be warranted."

Baley shrugged. "I agree, but it will happen. I will be the obvious target for a desperate Earth government."

"This was not in my mind when I asked for you, Mr. Baley. You may be sure I will do what I can. Though, in all honesty"- his eyes fell away-"that will be little enough, if we lose."

"I know that," said Baley dourly. He leaned back against the soft upholstery and closed his eyes. The motion of the car was limited to a gentle lulling sway, but Baley did not sleep. Instead, he thought hard-for what that was worth.

15.

Baley did not experience the Outside at the other end of the trip, either. When he emerged from the airfoil, he was in an underground garage and a small elevator brought him up to ground level (as it turned out).

He was ushered into a sunny room and, as he passed through the direct rays of the sun (yes, faintly orange), he shrank away a bit.

Fastolfe noticed. He said, "The windows are not opacifiable, though they can be darkened. I will do that, if you like. In fact, I should have thought of that-"

"No need," said Baley gruffly. "I'll just sit with my back to it. I must acclimate myself."

"If you wish, but let me know if, at any time, you grow too uncomfortable. -Mr. Baley, it is late morning here on this part of Aurora. I don't know your personal time on the ship. If you have been awake for many hours and would like to sleep, that can be arranged. If you are wakeful but not hungry, you need not eat. However, if you feel you can manage it, you are welcome to have lunch with me in a short while."

"That would fit in well with my personal time, as it happens."

"Excellent. I'll remind you that our day is about seven percent shorter than Earth's. It shouldn't involve you in too much biorhythmic difficulties, but if it does, we will try to adjust ourselves to your needs."

"Thank you."

"Finally- I have no clear idea what your food preferences might be."

"I'll manage to eat whatever is put before me."

"Nevertheless, I won't feel offended if anything seems-not palatable."

"Thank you."

"And you won't mind if Daneel and Giskard join us?"

Baley smiled faintly. "Will they be eating, too?"

There was no answering smile from Fastolfe. He said seriously, "No, but I want them to be with you at all times."

"Still danger? Even here?"

"I trust nothing entirely. Even here."

A robot entered. "Sir, lunch is served."

Fastolfe nodded. "Very good, Faber. We will be at the table in a few moments."

Baley said, "How many robots do you have?"

"Quite a few. We are not at the Solarian level of ten thousand robots to a human being, but I have more than the average number-fifty-seven. The house is a large one and it serves as my office and my workshop as well. Then, too, my wife, when I have one, must

have space enough to be insulated from my work in a separate wing and must be served independently."

"Well, with fifty-seven robots, I imagine you can spare two. I feel the less guilty at your having sent Giskard and Daneel to escort me to Aurora."

"It was no casual choice, I assure you, Mr. Baley. Giskard is my majordomo and my right hand. He has been with me all my adult life."

"Yet you sent him on the trip to get me. I am honored," said Baley.

"It is a measure of your importance, Mr. Baley. Giskard is the most reliable of my robots, strong and sturdy."

Baley's eye flickered toward Daneel and Fastolfe added, "I don't include my friend Daneel in these calculations. He is not my servant, but an achievement of which I have the weakness to be extremely proud. He is the first of his class and, while Dr. Roj Nemennuh Sarton was his designer and model, the man who-

He paused delicately, but Baley nodded brusquely and said, "I understand."

He did not require the phrase to be completed with a reference to Sarton's murder on Earth.

"While Sarton supervised the actual construction," Fastolfe went on, "it was I whose theoretical calculations made Daneel possible."

Fastolfe smiled at Daneel, who bowed his head in acknowledgment.

Baley said, "There was Jander, too."

"Yes." Fastolfe shook his head and looked downcast. "I should perhaps have kept him with me, as I do Daneel. But he was my second humanoid and that makes a difference. It is Daneel who is my first-born, so to speak-a special case."

"And you construct no more humanoid robots now?"

"No more. But come," said Fastolfe, rubbing his hands. "We must have our lunch. -I do not think, Mr. Baley, that on Earth the population is accustomed to what I might term natural food. We are having shrimp salad, together with bread and cheese, milk, if you wish, or any of an assortment of fruit juices. It's all very simple. Ice cream for dessert."

"All traditional Earth dishes," said Baley, "which exist now in their original form only in Earth's ancient literature."

"None of it is entirely common here on Aurora, but I didn't think it made sense to subject you to our own version of gourmet dining, which involves food items and spices of Auroran varieties. The taste would have to be acquired."

He rose. "Please come with me, Mr. Baley. There will just be the two of us and we will not stand on ceremony or indulge in unnecessary dining ritual."

"Thank you," said Baley. "I accept that as a kindness. I have relieved the tedium of the trip here by a rather intensive viewing of material relating to Aurora and I know that proper politeness requires many aspects to a ceremonial meal that I would dread."

"You need not dread."

Baley said, "Could we break ceremony even to the extent of talking business over the meal, Dr. Fastolfe? I must not lose time unnecessarily."

"I sympathize with that point of view. We will indeed talk business and I imagine I can rely on you to say nothing to anyone concerning that lapse. I would not want to be expelled from polite society." He chuckled, then said, "Though I should not laugh. It is nothing to laugh at. Losing time may be more than an inconvenience alone. It could easily be fatal."

16.

The room that Baley left was a spare one: several chairs, a chest of drawers, something that looked like a piano but had brass valves in the place of keys, some abstract designs on the walls that seemed to shimmer with light. The floor was a smooth checkerboard of several shades of brown, perhaps designed to be reminiscent of wood, and although it shone with highlights as though freshly waxed, it did not feel slippery underfoot.

The dining room, though it had the same floor, was like it in no other way. It was a long rectangular room, overburdened with decoration. It contained six large square tables that were clearly modules that could be assembled in various fashions. A bar was to be found along one short wall, with gleaming bottles of various colors standing before a curved mirror that seemed to lend a nearly infinite extension to the room it reflected. Along the other short wall were four recesses, in each of which a robot waited.

Both long walls were mosaics, in which the colors slowly changed. One was a planetary scene, though Baley could not tell if it were Aurora, or another planet, or something completely imaginary. At one end there was a wheat field (or something of that sort) filled with elaborate farm machinery, all robot-controlled. As one's eye traveled along the length of the wall, that gave way to scattered human habitations, becoming, at the other end, what Baley felt to be the Auroran version of a City.

The other long wall was astronomical. A planet, blue-white, lit by a distant sun, reflected light in such a manner that not the closest examination could free one from the thought that it was slowly rotating. The stars that surrounded it—some faint, some bright—seemed also to be changing their patterns, though when the eye concentrated on some small grouping and remained fixed there, the stars seemed immobile.

Baley found it all confusing and repellent.

Fastolfe said, "Rather a work of art, Mr. Baley. Far too expensive to be worth it, though, but Fanya would have it. -Fanya is my current partner."

"Will she be joining us, Dr. Fastolfe?"

"No, Mr. Baley. As I said, just the two of us. For the duration, I have asked her to remain in her own quarters. I do not want to subject her to this problem we have. You understand, I hope?"

"Yes, of course."

"Come. Please take your scat."

One of the tables was set with dishes, cups, and elaborate cutlery, not all of which were familiar to Baley. In the center was a tall, somewhat tapering cylinder that looked as though it might be a gigantic chess pawn made out of a gray rocky material.

Baley, as he sat down, could not resist reaching toward it and touching it with a finger.

Fastolfe smiled. "It's a spicer. It possesses simple controls that allows one to use it to deliver a fixed amount of any of a dozen different condiments on any portion of a dish. To do it properly, one picks it up and performs rather intricate evolutions that are meaningless in themselves but that are much valued by fashionable Aurorans as symbols of the grace and delicacy with which meals should be served. When I was younger, I could, with my thumb and two fingers, do the triple genuflection and produce salt as the spicer struck my palm. Now if I tried it, I'd run a good risk of braining my guest. I trust you won't mind if I do not try."

"I urge you not to try, Dr. Fastolfe."

A robot placed the salad on the table, another brought a tray of fruit juices, a third brought the bread and cheese, a fourth adjusted the napkins. All four operated in close coordination, weaving in and out without collision or any sign of difficulty. Baley watched them in astonishment.

They ended, without any apparent sign of prearrangements, one at each side of the table. They stepped back in unison, bowed in unison, turned in unison, and returned to the recesses along the wall at the far end of the room. Baley was suddenly aware of Daneel and Giskard in the room as well. He had not seen them come in. They waited in two recesses that had somehow appeared along the wall with the wheat field. Daneel was the closer.

Fastolfe said, "Now that they've gone-" He paused and shook his head slowly in rueful conclusion. "Except that they haven't. Ordinarily, it is customary for the robots to leave before lunch actually begins. Robots do not eat, while human beings do. It therefore makes sense that those who eat do so and that those who do not leave. And it has ended by becoming one more ritual. It would be quite unthinkable to eat until the robots left. In this case, though-

"They have not left," said Baley.

"No. I felt that security came before etiquette and I felt that, not being an Auroran, you would not mind."

Baley waited for Fastolfe to make the first move. Fastolfe lifted a fork, so did Baley. Fastolfe made use of it, moving slowly and allowing Baley to see exactly what he was doing.

Baley bit cautiously into a shrimp and found it delightful. He recognized the taste, which was like the shrimp paste produced on Earth but enormously more subtle and rich. He chewed slowly and, for a while, despite his anxiety to get on with the investigation while dining, he found it quite unthinkable to do anything but give his full attention to the lunch.

It was, in fact, Fastolfe who made the first move. "Shouldn't we make a beginning on the problem, Mr. Baley?"

Baley felt himself flush slightly. "Yes. By all means. I ask your pardon. Your Auroran food caught me by surprise, so that it was difficult for me to think of anything else. -The problem, Dr. Fastolfe, is of your making, isn't it?"

"Why do you say that?"

"Someone has committed roboticide in a manner that requires great expertise-as I have been told."

"Roboticide? An amusing term." Fastolfe smiled. "Of course, I understand what you mean by it. -You have been told correctly; the manner requires enormous expertise."

"And only you have the expertise to carry it out-as I have been told."

"You have been told correctly there, too."

"And even you yourself admit-in fact, you insist-that only you could have put Jander into a mental freeze-out."

"I maintain what is, after all, the truth, Mr. Baley. It would do me no good to lie, even if I could bring myself to do so. It is notorious that I am the outstanding theoretical roboticist in all the Fifty Worlds."

"Nevertheless, Dr. Fastolfe, might not the second-best theoretical roboticist in all the worlds-or the third-best, or even the fifteenth-best-nevertheless possess the necessary ability to commit the deed? Does it really require all the ability of the very best?"

Fastolfe said calmly, "In my opinion, it really requires all the ability of the very best. Indeed, again in my opinion, I, myself, could only accomplish the task on one of my good days. Remember that the best brains in robotics-including mine- have specifically labored to design positronic brains that could not be driven into mental freeze-out."

"Are you certain of all that? Really certain?"

"Completely."

"And you stated so publicly?"

"Of course. There was a public inquiry, my dear Earthman. I was asked the questions you are now asking and I answered truthfully. It is an Auroran custom to do so."

Baley said, "I do not, at the moment, question that you were convinced you were answering truthfully. But might you not have been swayed by a natural pride in yourself? That might also be typically Auroran, might it not?"

"You mean that my anxiety to be considered the best would make me willingly put myself in a position where everyone would be forced to conclude I had mentally frozen Jander?"

"I picture you, somehow, as content to have your political and social status destroyed, provided your scientific reputation remained intact."

"I see. You have an interesting way of thinking, Mr. Baley. This would not have occurred to me. Given a choice between admitting I was second-best and admitting I was guilty of, to use your phrase, a roboticide, you are of the opinion I would knowingly accept the latter."

"No, Dr. Fastolfe, I do not wish to present the matter quite so simplistically. Might it not be that you deceive yourself into thinking you are the greatest of all roboticists and that you are completely unrivaled, clinging to that at all costs, because you unconsciously-unconsciously, Dr. Fastolfe-realize that, in fact, you are being overtaken -or have even already been overtaken- by others."

Fastolfe laughed, but there was an edge of annoyance in it. "Not so, Mr. Baley. Quite wrong."

"Think, Dr. Fastolfe! Are you certain that none of your roboticist colleagues can approach you in brilliance?"

"There are only a few who are capable of dealing at all with humaniform robots. Daneel's construction created virtually a new profession for which there is not even a name-humaniformicists, perhaps. Of the theoretical roboticists on Aurora, not one, except for myself, understands the workings of Daneel's positronic brain. Dr. Sarton did, but he is dead-and he did not understand it as well as I do. The basic theory is mine."

"It may have been yours to begin with, but surely you can't expect to maintain exclusive ownership. Has no one learned the theory?"

Fastolfe shook his head firmly. "Not one. I have taught no one and I defy any other living roboticist to have developed the theory on his own."

Baley said, with a touch of irritation, "Might there not be a bright young man, fresh out of the university, who is cleverer than anyone yet realizes, who-"

"No, Mr. Baley, no. I would have known such a young man. He would have passed through my laboratories. He would have worked with me. At the moment, no such young man exists. Eventually, one will; perhaps many will. At the moment, no one."

"If you died, then, the new science dies with you?"

"I am only a hundred and sixty-five years old. That's metric years, of course, so it is only a hundred and twenty-four of your Earth years, more or less. I am still quite young by Auroran standards and there is no medical reason why my life should be considered even half over. It is not entirely unusual to reach an age of four hundred years-metric years. There is yet plenty of time to teach."

They had finished eating, but neither man made any move to leave the table. Nor did any robot approach to clear it. It was as though they were transfixed into immobility by the intensity of the back and forth flow of talk.

Baley's eyes narrowed. He said, "Dr. Fastolfe, two years ago I was on Solania. There I was given the clear impression that the Solarians were, on the whole, the most skilled roboticists in all the worlds."

"On the whole, that's probably true."

"And not one of them could have done the deed?"

"Not one, Mr. Baley. Their skill is with robots who are, at best, no more advanced than my poor, reliable Giskard. The Solarians know nothing of the construction of humaniform robots."

"How can you be sure of that?"

"Since you were on Solaria, Mr. Baley, you know very well that Solarians can approach each other with only the greatest of difficulty, that they interact by trimensional viewing-except where sexual contact is absolutely required. Do you think that any of them would dream of designing a robot so human in appearance that it would activate their neuroses? They would so avoid the possibility of approaching him, since he would look so human, that they could make no reasonable use of him."

"Might not a Solarian here or there display a surprising tolerance for the human body? How can you be sure?"

"Even if a Solariari could, which I do not deny, there are no Solarian nationals on Aurora this year."

"None?"

"None! They do not like to be thrown into contact even with Aurorans and, except on the most urgent business, none will come here-or to, any other world. Even in the case of urgent business, they will come no closer than orbit and then they deal with us only by electronic communication."

Baley said, "In that case, if you are-literally and actually- the only person in all the worlds who could have done it, did you kill Jander?"

Fastolfe said, "I cannot believe that Daneel did not tell you I have denied this deed."

"He did tell me so, but I want to hear it from you."

Fastolfe crossed his arms and frowned. He said, through clenched teeth, "Then I'll tell you so. I did not do it."

Baley shook his head. "I believe you believe that statement."

"I do. And most sincerely. I am telling the truth. I did riot kill Jander."

"But if you did not do it, and if no one else can possibly have done it, then- But wait. I am, perhaps, making an unwarranted assumption. Is Jander really dead or have I been brought here under false pretenses?"

"The robot is really destroyed. It will be quite possible to show him to you, if the Legislature does not bar my access to him before the day is over-which I don't think they will do."

"In that case, if you did not do it, and if no one else could possibly have done it, and if the robot is actually dead-who committed the crime?"

Fastolfe sighed. "I'm sure Daneel told you what I have maintained at the inquiry-but you want to hear it from my own lips."

"That is right, Dr. Fastolfe."

"Well, then, no one committed the crime. It was a spontaneous event in the positronic flow along the brain paths that set up the mental freeze-out in Jander."

"Is that likely?"

"No, it is not. It is extremely unlikely-but if I did not do it, then that is the only thing that can have happened."

"Might it not be argued that there is a greater chance that you are lying than that a spontaneous mental freeze-out took place."

"Many do so argue. But I happen to know that I did not do it and that leaves only the spontaneous event as a possibility."

"And you have had me brought here to demonstrate -to prove- that the spontaneous event did, in fact, take place?"

"Yes."

"But how does one go about proving the spontaneous event? Only by proving it, it seems, can I save you, Earth, and myself."

"In order of increasing importance, Mr. Baley?"

Baley looked annoyed. "Well, then, you, me, and Earth."

"I'm afraid," said Fastolfe, "that after considerable thought, I have come to the conclusion that there is no way of obtaining such a proof."

17.

Baley stared at Fastolfe in horror. "No way?"

"No way. None." And then, in a sudden fit of apparent abstraction, he seized the spicer and said, "You know, I am curious to see if I can still do the triple genuflection."

He tossed the spicer into the air with a calculated flip of the wrist. It somersaulted and, as it came down, Fastolfe caught the narrow end on the side of his right palm (his thumb tucked down). It went up slightly and swayed and was caught on the side of the left palm. It went up again in reverse and was caught on the side of the right palm and then again on the left palm. After this third genuflection, it was lifted with sufficient force to produce a ftp. Fastolfe caught it in his right fist, with his left hand nearby, palm upward. Once the spicer was caught, Fastolfe displayed his left hand and there was a fine sprinkling of salt in it.

Fastolfe said, "It is a childish display to the scientific mind and the effort is totally disproportionate to the end, which is, of course, a pinch of salt, but the good Auroran host is proud of being able to put on a display. There are some experts who can keep the spicer in the air for a minute and a half, moving their hands almost more rapidly than the eye can follow.

"Of course," he added thoughtfully, "Daneel can perform such actions with greater skill and speed than any human. I have tested him in this manner in order to check on the workings of his brain paths, but it would be totally wrong to have him display such talents in public. It would needlessly humiliate human spicists—a popular term for them, you understand, though you won't find it in dictionaries."

Baley grunted.

Fastolfe sighed. "But we must get back to business."

"You brought me through several parsecs of space for that purpose."

"Indeed, I did. -Let us proceed!"

Baley said, "Was there a reason for that display of yours, Dr. Fastolfe?"

Fastolfe said, "Well, we seem to have come to an impasse. I've brought you here to do something that can't be done. Your face was rather eloquent and, to tell you the truth, I felt no better. It seemed, therefore, that we could use a breathing space. And now-let us proceed."

"On the impossible task?"

"Why should it be impossible for you, Mr. Baley? Your reputation is that of an achiever of the impossible."

"The hyperwave drama? You believe that foolish distortion of what happened on Solaria?"

Fastolfe spread his arms. "I have no other hope."

Baley said, "And I have no choice. I must continue to try; I cannot return to Earth a failure. That has been made clear to me. -Tell me, Dr. Fastolfe, how could Jander have been killed? What sort of manipulation of his mind would have been required?"

"Mr. Baley, I don't know how I could possibly explain that, even to another roboticist, which you certainly are not, and even if I were prepared to publish my theories, which I certainly am not. However, let me see if I can't explain something. -You know, of course, that robots were invented on Earth."

"Very little concerning robotics is dealt with on Earth-"

"Earth's strong antirobot bias is well-known on the Spacer worlds."

"But the Earthly origin of robots is obvious to any person on Earth who thinks about it. It is well-known that hyperspatial travel was developed with the aid of robots and, since the Spacer worlds could not have been settled without hyperspatial travel, it follows that robots existed before settlement had taken place and while Earth was still the only inhabited planet. Robots were therefore invented on Earth by Earthpeople."

"Yet Earth feels no pride in that, does it?"

"We do not discuss it," said Baley shortly.

"And Earthpeople know nothing about Susan Calvin?"

"I have come across her name in a few old books. She was one of the early pioneers in robotics."

"Is that all you know of her?"

Baley made a gesture of dismissal. "I suppose I could find out more if I searched the records, but I have had no occasion to do so."

"How strange," said Fastolfe. "She's a demigod to all Spacers, so much so that I imagine that few Spacers who are not actually roboticists think of her as an Earthwoman. It would seem a profanation. They would refuse to believe it if they were told that she died after having lived scarcely more than a hundred metric years. And yet you know her only as an early pioneer."

"Has she got something to do with all this, Dr. Fastolfe?"

"Not directly, but in a way. You must understand that numerous legends cluster about her name. Most of them are undoubtedly untrue, but they cling to her, nonetheless. One of the most famous legends-and one of the least likely to be true-

concerns a robot manufactured in those primitive days that, through some accident on the production lines, turned out to have telepathic abilities-

"What!"

"A legend! I told you it was a legend-and undoubtedly untrue! Mind you, there is some theoretical reason for supposing this might be possible, though no one has ever presented a plausible design that could even begin to incorporate such an ability. That it could have appeared in positronic brains as crude and simple as those in the pre-hyperspatial era is totally unthinkable. That is why we are quite certain that this particular tale is an invention. But let me go on anyway, for it points out a moral."

"By all means, go on."

"The robot, according to the tale, could read minds. And when asked questions, he read the questioner's mind and told the questioner what he wanted to hear. Now the First Law of Robotics states quite clearly that a robot may not injure a human being or, through inaction, allow a person to come to harm, but to robots generally that means physical harm. A robot who can read minds, however, would surely decide that disappointment or anger or any violent emotion would make the human being feeling those emotions unhappy and the robot would interpret the inspiring of such emotions under the heading of 'harm.' If, then, a telepathic robot knew that the truth might disappoint or enrage a questioner or cause that person to feel envy or unhappiness, he would tell a pleasing lie, instead. Do you see that?"

"Yes, of course."

"So the robot lied even to Susan Calvin herself. The lies could not long continue, for different people were told different things that were not only inconsistent among themselves but unsupported by the gathering evidence of reality, you see. Susan Calvin discovered she had been lied to and realized that those lies had led her into a position of considerable embarrassment. What would have disappointed her somewhat to begin with had now, thanks to false hopes, disappointed her unbearably. -You never heard the story?"

"I give you my word."

"Astonishing! Yet it certainly wasn't invented on Aurora, for it is equally current on all the worlds. -In any case, Calvin took her revenge. She pointed out to the robot that, whether he told the truth or told a lie, he would equally harm the person with whom he dealt. He could not obey the First Law, whatever action he took. The robot, understanding this, was forced to take refuge in total inaction. If you want to put it colorfully, his positronic pathways burned out. His brain was irrecoverably destroyed. The legend goes on to say that Calvin's last word to the destroyed robot was 'Liar!'"

Baley said, "And something like this, I take it, was what happened to Jander Panel. He was faced with a contradiction in terms and his brain burned out?"

"It's what appears to have happened, though that is not as easy to bring about as it would have been in Susan Calvin's day. Possibly because of the legend, roboticists have always been careful to make it as difficult as possible for contradictions to arise. As the theory of positronic brains has grown more subtle and as the practice of positronic brain

design has grown more intricate, increasingly successful systems have been devised to have all situations that might arise resolve into nonequality, so that some action can always be taken that will be interpreted as obeying the First Law."

"Well, then, you can't burn out a robot's brain. Is that what you're saying? Because if you arc, what happened to Jander?"

"It's not what I'm saying. The increasingly successful systems I speak of, are never completely successful. They cannot be. No matter how subtle and intricate a brain might be, there is always some way of setting up a contradiction. That is a fundamental truth of mathematics. It will remain forever impossible to produce a brain so subtle and intricate as to reduce the chance of contradiction to zero. Never quite to zero. However, the systems have been made so close to zero that to bring about a mental freeze-out by setting up a suitable contradiction would require a deep understanding of the particular positronic brain being dealt with-and that would take a clever theoretician."

"Such as yourself, Dr. Fastolfe?"

"Such as myself. In the case of humaniform robots, only myself."

"Or no one at all," said Baley, heavily ironic.

"Or no one at all. Precisely," said Fastolfe, ignoring the irony. "The humaniform robots have brains -and, I might add, bodies- constructed in conscious imitation of the human being. The positronic brains are extraordinarily delicate and they take on some of the fragility of the human brain, naturally. Just as a human being may have a stroke, though some chance event within the brain and without the intervention of any external effect, so a humaniform brain might, through chance alone-the occasional aimless drifting of positrons-go into mental freeze."

"Can you prove that, Dr. Fastolfe?"

"I can demonstrate it mathematically, but of those who could follow the mathematics, not all would agree that the reasoning was valid. It involves certain suppositions of my own that do not fit into the accepted modes of thinking in robotics."

"And how likely is spontaneous mental freeze-out?"

"Given a large number of humaniform robots, say a hundred thousand, there is an even chance that one of them might undergo spontaneous mental freeze-out in an average Auroran lifetime. And yet it could happen much sooner, as it did to Jander, although then the odds would be very greatly against it."

"But look here, Dr. Fastolfe, even if you were to prove conclusively that a spontaneous mental freeze-out could take place in robots generally, that would not be the same as proving that such a thing happened to Jander in particular at this particular time."

"No," admitted Fastolfe, "you arc quite right."

"You, the greatest expert in robotics, cannot prove it in the specific case of Jander."

"Again, you are quite right."

"Then what do you expect me to be able to do, when I know nothing of robotics."

"There is no need to prove anything. It would surely be sufficient to present an ingenious suggestion that would make spontaneous mental freeze-out plausible to the general public."

"Such as-"

"I don't know."

Baley said harshly. "Are you sure you don't know, Dr. Fastolfe?"

"What do you mean? I have just said I don't know"

"Let me point out something. I assume that Aurorans, generally, know that I have come to the planet for the purpose of tackling this problem. It would be difficult to manage to get me here secretly, considering that I am an Earthman and this is Aurora."

"Yes, certainly, and I made no attempt to do that. I consulted the Chairman of the Legislature and persuaded him to grant me permission to bring you here, It is how I've managed to win a stay in judgment. You are to be given a chance to solve the mystery before I go on trial, I doubt that they'll give me a very long stay."

"I repeat, then- Aurorans, in general, know I'm here and I imagine they know precisely why I am here-that I am supposed to solve the puzzle of the death of Jander."

"Of course. What other reason could there be?"

"And from the time I boarded the ship that brought me here, you have kept me under close and constant guard because of the danger that your enemies might try to eliminate me-judging me to be some sort of wonderman who just might solve the puzzle in such a way as to place you on the winning side, even though all the odds are against me."

"I fear that as a possibility, yes"

"And suppose someone who does not want to see the puzzle solved and you, Dr. Fastolfe, exonerated should actually succeed in killing me. Might that not swing sentiment in your favor?"

Might not people reason that your enemies felt you were, in actual fact, innocent or they would not fear the investigation so much that they would want to kill me?"

"Rather complicated reasoning, Mr. Baley. I suppose that, properly exploited, your death might be used to such a purpose, but it's not going to happen. You are being protected and you will not be killed"

"But why protect me, Dr. Fastolfe? Why not let them kill me and use my death as a way of winning?"

"Because I would rather you remained alive and succeeded in actually demonstrating my innocence."

Baley said, "But surely you know that I can't demonstrate your innocence."

"Perhaps you can. You have every incentive. The welfare of Earth hangs on your doing so and, as you have told me, your own career."

"What good is incentive? If you ordered me to fly by flapping my arms and told me further that if I failed, I would be promptly killed by slow torture and that Earth would be blown up and all its population destroyed, I would have enormous incentive to flap my wings and fly-and yet still be unable to do so."

Fastolfe said uneasily, "I know the chances are small."

"You know they are nonexistent," said Baley violently, "and that only my death can save you."

"Then I will not be saved, for I am seeing to it that my enemies cannot reach you."

"But you can reach me."

"What?"

"I have the thought in my head, Dr. Fastolfe, that you yourself might kill me in such a way as to make it appear that your enemies have done the deed. You would then use my death against them-and that that is why you have brought me to Aurora."

For a moment, Fastolfe looked at Baley with a kind of mild surprise and then, in an excess of passion both sudden and extreme, his face reddened and twisted into a snarl. Sweeping up the spicer from the table, he raised it high and brought his arm down to hurl it at Baley.

And Baley, caught utterly by surprise, barely managed to cringe back against his chair.

5. DANEEL AND GISKARD

18.

If Fastolfe had acted quickly, Daneel had reacted far more quickly still.

To Baley, who had all but forgotten Daneel's existence, there seemed a vague rush, a confused sound, and then Daneel was standing to one side of Fastolfe, holding the spicer, and saying, "I trust, Dr. Fastolfe, that I did not in any way hurt you."

Baley noted, in a dazed sort of way, that Giskard was not far from Fastolfe on the other side and that every one of the four robots at the far wall had advanced almost to the dining room table.

Panting slightly, Fastolfe, his hair quite disheveled, said, "No, Daneel. You did very well, indeed." He raised his voice. "You all did well, but remember, you must allow nothing to slow you down, even my own involvement."

He laughed softly and took his seat once more, straightening his hair with his hand.

"I'm sorry," he said, "to have startled you so, Mr. Baley, but I felt the demonstration might be more convincing than any words of mine would have been."

Baley, whose moment of cringing had been purely a matter of reflex, loosened his collar and said, with a touch of hoarseness, "I'm afraid I expected words, but I agree the demonstration was convincing. I'm glad that Daneel was close enough to disarm you."

"Any one of them was close enough to disarm me, but Daneel was the closest and got to me first. He got to me quickly enough to be gentle about it. Had he been farther away, he might have had to wrench my arm or even knock me out."

"Would he have gone that far?"

"Mr. Baley," said Fastolfe. "I have given instructions for your protection and I know how to give instructions. They would not have hesitated to save you, even if the alternative was harm to me. They would, of course, have labored to inflict minimum harm, as Daneel did. All he harmed was my dignity and the neatness of my hair. And my fingers tingle a bit." Fastolfe flexed them ruefully.

Baley drew a deep breath, trying to recover from that short period of confusion. He said, "Would not Daneel have protected me, even without your specific instruction?"

"Undoubtedly. He would have had to. You must not think, however, that robotic response is a simple yes or no, up or down, in or out. It is a mistake the layman often makes. There is the matter of speed of response. My instructions with regard to you were so phrased that the potential built up within the robots of my establishment, including Daneel, is abnormally high, as high as I can reasonably make it, in fact. The response, therefore, to a clear and present danger to you is extraordinarily rapid. I knew it would be and it was for that reason that I could strike out at you as rapidly as I did-knowing I could give you a most convincing demonstration of my inability to harm you."

"Yes, but I don't entirely thank you for it."

"Oh, I was entirely confident in my robots, especially Daneel. It did occur to me, though, a little too late, that if I had not instantly released the spicer, he might, quite against his will-or the robotic equivalent of will-have broken my wrist."

Baley said, "It occurs to me that it was a foolish risk for you to have undertaken."

"It occurs to me, as well-after the fact. Now if you had prepared yourself to hurl the spicer at me, Daneel would have at once countered your move, but not with quite the same speed, for he has received no special instructions as to my safety. I can hope he would have been fast enough to save me, but I'm not sure-and I would prefer not to test that matter." Fastolfe smiled genially.

Baley said, "What if some explosive device were dropped on the house from some airborne vehicle?"

"Or if a gamma beam were trained upon us from a neighboring hilltop. -My robots do not represent infinite protection, but such radical terrorist attempts are unlikely in the extreme here on Aurora. I suggest we do not worry about them."

"I am willing not to worry about them. Indeed, I did not seriously suspect that you were a danger to me, Dr. Fastolfe, but I needed to eliminate the possibility altogether if I were to continue. We can now proceed."

Fastolfe said, "Yes, we can. Despite this additional and very dramatic distraction, we still face the problem of proving that Jander's mental freeze-out was spontaneous chance."

But Baley had been made aware of Daneel's presence and he now turned to him and said uneasily, "Daneel, does it pain you that we discuss this matter?"

Daneel, who had deposited the spicer on one of the farther of the empty tables, said, "Partner Elijah, I would prefer that past friend Jander were still operational, but since he is not and since he cannot be restored to proper functioning, the best of what is left is that action be taken to prevent similar incidents in the future. Since the discussion now has that end in view, it pleases rather than pains me."

"Well, then, just to settle another matter, Daneel, do you believe that Dr. Fastolfe is responsible for the end of your fellow robot Jander? -You'll pardon my inquiring, Dr. Fastolfe "

Fastolfe gestured his approval and Daneel said, "Dr. Fastolfe has stated that he was not responsible, so he, of course, was not."

"You have no doubts on the matter, Daneel?"

"None, Partner Elijah."

Fastolfe seemed a little amused. "You are cross-examining a robot, Mr. Baley."

"I know that, but I cannot quite think of Daneel as a robot and so I have asked."

"His answers would have no standing before any Board of Inquiry. He is compelled to believe me by his positronic potentials."

"I am not a Board of Inquiry, Dr. Fastolfe, and I am clearing out the underbrush. Let me go back to where I was. Either you burned out Jander's brain or it happened by random circumstance. You assure me that I cannot prove random circumstance and that leaves me only with the task of disproving any action by you. In other words, if I can show

that it is impossible for you to have killed Jander, we are left with random circumstance as the only alternative."

"And how can you do that?"

"It is a matter of means, opportunity, and motive. You had the means of killing Jander-the theoretical ability to so manipulate him that he would end in a mental freeze-out. But did you have the opportunity? He was your robot, in that you designed his brain paths and supervised his construction, but was he in your actual possession at the time of the mental freeze-out?"

"No, as a matter of fact. He was in the possession of another."

"For how long?"

"About eight months-or a little over half of one of your years."

"Ah. It's an interesting point. Were you with him-or near him-at the time of his destruction? Could you have reached him? In short, can we demonstrate the fact that you were so far from him-or so out of touch with him-that it is not reasonable to suppose that you could have done the deed at the time it is supposed to have been done?"

Fastolfe said, "That, I'm afraid, is impossible. There is a rather broad interval of time during which the deed might have been done. There are no robotic changes after destruction equivalent to rigor mortis or decay in a human being. We can only say that, at a certain time, Jander was known to be in operation and, at a certain other time, he was known not to be in operation. Between the two was a stretch of about eight hours. For that period, I have no alibi."

"None? During that time, Dr. Fastolfe, what were you doing?"

"I was here in my establishment."

"Your robots were surely aware, perhaps, that you were here and could bear witness."

"They were certainly aware, but they cannot bear witness in any legal sense and on that day Fanya was off on business of her own."

"Does Fanya share your knowledge of robotics, by the way?"

Fastolfe indulged in a wry smile. "She knows less than you do."

"Besides, none of this matters."

"Why not?"

Fastolfe's patience was clearly beginning to stretch to the cracking point. "My dear Mr. Baley, this was not a matter of close-range physical assault, such as my recent pretended attack on you. What happened to Jander did not require my physical presence. As it happens, although not actually in my establishment, Jander was not far away geographically, but it wouldn't have mattered if he were on the other side of Aurora. I could always reach him electronically and could, by the orders I gave him and the responses I could educe, send him into mental freeze-out. The crucial step would not even necessarily require much in the way of time-"

Baley said at once, "It's a short process, then, one that someone else might move through by chance, while intending something perfectly routine?"

"No!" said Fastolfe. "For Aurora's sake, Earthman, let me talk. I've already told you that's not the case. Inducing mental freeze-out in Jander would be a long and complicated and tortuous process, requiring the greatest understanding and wit, and could be done by no one accidentally, without incredible and long-continued coincidence. There would be far less chance of accidental progress over that enormously complex route than of spontaneous mental freeze-out, if my mathematical reasoning were only accepted.

"However, if I wished to induce mental freeze-out, I could carefully produce changes and reactions, little by little, over a period of weeks, months, even years, until I had brought Jander to the very point of destruction. And at no time in that process would he show any signs of being at the edge of catastrophe, just as you could approach closer and closer to a precipice in the dark and yet feel no loss in firmness of footing whatever, even at the very edge. Once I had brought him to the very brink, however-the lip of the precipice-a single remark from me would send him over. It is that final step that would take but a moment of time. You see?"

Baley tightened his lips. There was no use trying to mask his disappointment. "In short, then, you had the opportunity."

"Anyone would have had the opportunity. Anyone on Aurora, provided he or she had the necessary ability."

"And only you have the necessary ability."

"I'm afraid so."

"Which brings us to motive, Dr. Fastolfe."

"And it's there that we might be able to make a good case. These humaniform robots are yours. They are based on your theory and you were involved in their construction at every step of the way, even if Dr. Sarton supervised that construction. They exist because of you and only because of you. You have spoken of Daneel as your 'first-born.' They are your creations, your children, your gift to humanity, your hold on immortality." (Baley felt himself growing eloquent and, for a moment, imagined himself to be addressing a Board of Inquiry.) "Why on Earth-or Aurora, rather-why on Aurora should you undo this work? Why should you destroy a life you have produced by a miracle of mental labor?"

Fastolfe looked wanly amused. "Why, Mr. Baley, you know nothing about it. How can you possibly know that my theory was the result of a miracle of mental labor? It might have been the very dull extension of an equation that anyone might have accomplished but which none had bothered to do before me."

"I think not," said Baley, endeavoring to cool down. "If no one but you can understand the humaniform brain well enough to destroy it, then I think it likely that no one but you can understand it well enough to create it. Can you deny that?"

Fastolfe shook his head. "No, I won't deny that. And yet, Mr. Baley"-his face grew grimmer than it had been since they had met-"your careful analysis is succeeding only in making matters far worse for us. We have already decided that I am the only one with the means and the opportunity. As it happens, I also have a motive-the best motive in the

world-and my enemies know it. How on Earth, then, to quote you-or on Aurora, or on anywhere-are we going to prove I didn't do it?"

19.

Baley's face crumpled into a furious frown. He stepped hastily away, making for the corner of the room, as though seeking enclosure. Then he turned suddenly and said sharply, "Dr. Fastolfe, it seems to me that you are taking some sort of pleasure in frustrating me."

Fastolfe shrugged. "No pleasure. I'm merely presenting you with the problem as it is. Poor Jander died the robotic death by the pure uncertainty of positronic drift. Since I know I had nothing to do with it, I know that's how it must be. However, no one else can be sure I'm innocent and all the indirect evidence points to me-and this must be faced squarely in deciding what, if anything, we can do."

Baley said, "Well, then, let's investigate your motive. What seems like an overwhelming motive to you may be nothing of the sort."

"I doubt that. I am no fool, Mr. Baley."

"You are also no judge, perhaps, of yourself and your motives. People sometimes are not. You may be dramatizing yourself for some reason."

"I don't think so."

"Then tell me your motive. What is it? Tell me!"

"Not so quickly, Mr. Baley. It's not easy to explain it. -Could you come outside with me?"

Baley looked quickly toward the window. Outside?

The sun had sunk lower in the sky and the room was the sunnier for it. He hesitated, then said, rather more loudly than was necessary, "Yes, I will!"

"Excellent," said Fastolfe. And then, with an added note of amiability, he added, "But perhaps you would care to visit the Personal first."

Baley thought for a moment. He felt no immediate urgency, but he did not know what might await him Outside, how long he would be expected to stay, what facilities there might or might not be there. Most of all, he did not know Auroran customs in this respect and he could not recall anything in the book-films he had viewed on the ship that served to enlighten him in this respect. It was safest, perhaps, to acquiesce in whatever one's host suggested.

"Thank you," he said, "if it will be convenient for me to do so, Fastolfe nodded. "Daneel," he said, "show Mr. Baley to the Visitors' Personal."

Daneel said, "Partner Elijah, would you come with me?"

As they stepped together into the next room, Baley said, "I am sorry, Daneel, that you were not part of the conversation between myself and Dr. Fastolfe."

"It would not have been fitting, Partner Elijah. When you asked me a direct question, I answered, but I was not invited to take part fully."

"I would have issued the invitation, Daneel, if I did not feel constrained by my position as guest. I thought it might be wrong to take the initiative in this respect."

"I understand. -This is the Visitors' Personal, Partner Elijah. The door will open at a touch of your hand anywhere upon it if the room is unoccupied."

Baley did not enter. He paused thoughtfully, then said, "If you had been invited to speak, Daneel, is there anything you would have said? Any comment you would have cared to make? I would value your opinion, my friend."

Daneel said, with his usual gravity, "The one remark I care to make is that Dr. Fastolfe's statement that he had an excellent motive for placing Jander out of operation was unexpected to me. I do not know what the motive might be. Whatever he states to be his motive, however, you might ask why he would not have the same motive to put me in mental freeze-out. If they can believe he had a motive to put Jander out of operation, why would the same motive not apply to me? I would be curious to know."

Baley looked at the other sharply, seeking automatically for expression in a face not given to lack of control. He said, "DO you feel insecure, Daneel? Do you feel Fastolfe is a danger to you?"

Daneel said, "By the Third Law, I must protect my own existence, but I would not resist Dr. Fastolfe or any human being if it were their considered opinion that it was necessary to end my existence. That is the Second Law. However, I know that I am of great value, both in terms of investment of material, labor, and time, and in terms of scientific importance. It would therefore be necessary to explain to me carefully the reasons for the necessity of ending my existence. Dr. Fastolfe has never said anything to me-never, Partner Elijah-that would sound as though such a thing were in his mind. I do not believe it is remotely in his mind to end my existence or that it ever was in his mind to end Jander's existence. Random positronic drift must have ended Jander and may, someday, end me. There is always an element of chance in the Universe."

Baley said, "You say so, Fastolfe says so, and I believe so-but the difficulty is to persuade people generally to accept this view of the matter." He turned gloomily to the door of the Personal and said, "Are you coming in with me, Daneel?"

Daneel's expression contrived to seem amused. "It is flattering, Partner Elijah, to be taken for human to this extent. I have no need, of course."

"Of course. But you can enter anyway."

"It would not be appropriate for me to enter. It is not the custom for robots to enter the Personal. The interior of such a room is purely human. -Besides, this is a one-person Personal."

"One person!" Momentarily, Baley was shocked. He ruffled, however. Other worlds, other customs! And this one he did not recall being described in the book-films. He said, "That's what you meant, then, by saying that the door would open only if it were unoccupied. What if it is occupied, as it will be in a moment?"

"Then it will not open at a touch from outside, of course, and your privacy will be protected. Naturally, it will open at a touch from the inside."

"And what if a visitor fell into a faint, had a stroke or a heart seizure while in there and could not touch the door from inside. Wouldn't that mean no one could enter to help him?"

"There are emergency ways of opening the door, Partner Elijah, if that should seem advisable." Then, clearly disturbed, "Are you of the opinion that something of this sort will occur?"

"No, of course not. -I am merely curious."

"I will be immediately outside the door," said Daneel uneasily. "If I hear a call, Partner Elijah, I will take action."

"I doubt that you'll have to." Baley touched the door, casually and lightly, with the back of his hand and it opened at once. He waited a moment or two to see if it would close. It didn't. He stepped through and the door then closed promptly.

While the door was open, the Personal had seemed like a room that flatly served its purpose. A sink, a stall (presumably equipped with a shower arrangement), a tub, a translucent halfdoor with a toilet seat beyond in all likelihood. There were several devices that he did not quite recognize. He assumed they were intended for the fulfillment of personal services of one sort or another.

He had little chance to study any of these, for in a moment it was all gone and he was left to wonder if what he had seen had really been there at all or if the devices had seemed to exist because they were what he had expected to see.

As the door closed, the room darkened, for there was no window. When the door was completely closed, the room lit up again, but nothing of what he had seen returned. It was daylight and he was Outside-or so it appeared.

There was open sky above, with clouds drifting across it in a fashion just regular enough to seem clearly unreal. On every side there seemed an outstretching of greenery moving in equally repetitive fashion.

He felt the familiar knotting of his stomach that arose whenever he found himself Outside-but he was not Outside. He had walked into a windowless room. It had to be a trick of the lighting.

He stared directly ahead of him and slowly slid his feet forward. He put his hands out before him. Slowly. Staring hard.

His hands touched the smoothness of a wall. He followed the flatness to either side. He touched what he had seen to be a sink in that moment of original vision and, guided by his hands, he could see it now-faintly, faintly against the overpowering sensation of light.

He found the faucet, but no water came from it. He followed its curve backward and found nothing that was the equivalent of the familiar handles that would control the flow of water. He did find an oblong strip whose slight roughness marked it off from the surrounding wall. As his fingers slid along it, he pushed slightly and experimentally against it and at once the greenery, which stretched far beyond the plane along which his fingers told him the wall existed, was parted by a rivulet of water, falling quickly from a height toward his feet with a loud noise of splashing.

He jumped backward in automatic panic, but the water ended before it reached his feet. It didn't stop coming, but it didn't reach the floor. He put his hand out. It was not water, but a light-illusion of water. It did not wet his hand; he felt nothing. But his eyes stubbornly resisted the evidence. They saw water.

He followed the rivulet upward and eventually came to something that was water-a thinner stream issuing from the faucet. It was cold.

His fingers found the oblong again and experimented, pushing here and there, The temperature shifted quickly and he found the spot that produced water of suitable tepidity.

He did not find any soap. Somewhat reluctantly, he began to rub his unsoaped hands against each other under what seemed a natural spring that should have been soaking him from head to foot but did not. And as though the mechanism could read his mind or, more likely, was guided by the rubbing together of his hands, he felt the water grow soapy, while the spring he did! didn't see grew bubbles and developed into foam.

Still reluctant, he bent over the sink and rubbed his face with the same soapy water. He felt the bristles of his beard, but knew that there was no way in which he could translate the equipment of this room into a shave without instruction.

He finished and held his hands helplessly under the water. How did he stop the soap? He did not have to ask. Presumably, his hands, no longer rubbing either themselves or his face, controlled that. The water lost its soapy feel and the soap was rinsed from his hands. He splashed the water against his face- without rubbing-and that was rinsed too. Without the help of vision and with the clumsiness of one unused to the process, he managed to soak his shirt badly.

Towels? Paper?

He stepped back, eyes closed, holding his' head forward to avoid dripping more water on his clothes. Stepping back was, apparently, the key action, for he felt the warm flow of an air current. He placed his face within it and then his hands.

He opened his eyes and found the spring no longer flowing. He used his hands and found that he could feel no real water.

The knot in his stomach had long since dissolved into irritation. He recognized that Personals varied enormously from world to world, but somehow this nonsense of simulated Outside went too far.

On Earth, a Personal was a huge community chamber restricted to one gender, with private cubicles to which one had a key. On Solaria, one entered a Personal through a narrow corridor appended to one side of a house, as though Solarians hoped that it would not be considered a part of their home. In both worlds, however, though so different in every possible way, the Personals were clearly defined and the function of everything in them could not be mistaken. Why should there be, on Aurora, this elaborate pretense of rusticity that totally masked every part of a Personal?

Why?

At any rate, his annoyance gave him little emotional room in which to feel uneasy over the pretense of Outside. He moved in the direction in which he recalled having seen the translucent half-door.

It was not the correct direction. He found it only by following the wall slowly and after barking various parts of his body against protuberances.

In the end, he found himself urinating into the illusion of a small pond that did not seem to be receiving the stream properly. His knees told him that he was aiming correctly between the sides of what he took to be a urinal and he told himself that if he were using the wrong receptacle or misjudging his aim, the fault was not his.

For a moment, when done, he considered finding the sink again for a final hand rinse and decided against it. He just couldn't face the search and that false waterfall.

Instead, he found, by groping, the door through which he had entered, but he did not know he had found it until his hand touch resulted in its opening. The light died out at once and the normal non-illusory gleam of day surrounded him.

Daneel was waiting for him, along with Fastolfe and Giskard.

Fastolfe said, "You took nearly twenty minutes. We were beginning to fear for you."

Baley felt himself grow warm with rage. "I had problems with your foolish illusions," he said in a tightly controlled fashion.

Fastolfe's mouth pursed and his eyebrows rose in a silent:

Oh-h!

He said, "There is a contact just inside the door that controls the illusion. It can make it dimmer and allow you to see reality through it-or it can wipe out the illusion altogether, if you wish."

"I was not told. Are all your Personals like this?"

Fastolfe said, "No. Personals on Aurora commonly possess illusory qualities, but the nature of the illusion varies with the individual. The illusion of natural greenery pleases me and I vary its details from time to time. One grows tired of anything, you know, after a while. There are some people who make use of erotic illusions, but that is not to my taste.

"Of course, when one is familiar with Personals, the illusions offer no trouble. The rooms are quite standard and one knows where everything is. It's no worse than moving about a well known place in the dark. -But tell me, Mr. Baley, why didn't you find your way out and ask for directions?"

Baley said, "Because I didn't wish to. I admit that I was extremely irritated over the illusions, but I accepted them. After all, it was Daneel who led me to the Personal and he gave me no instructions, nor any warning. He would certainly have instructed me at length, if he had been left to his own devices, for he would surely have foreseen harm to me otherwise. I had to assume, therefore, that you had carefully instructed him not to warn me and, since I didn't really expect you to play a practical joke on me, I had to assume that you had a serious purpose in doing so."

"Oh?"

"After all, you had asked me to come Outside and, when I agreed, you immediately asked me if I wished to visit the Personal. I decided that the purpose of sending me into an illusion of Outside was to see whether I could endure it-or if I would come running out in panic. If I could endure it, I might be trusted with the real thing. Well, I endured it. I'm a little wet, thank you, but that will dry soon enough."

Fastolfe said, "You are a clear-thinking person, Mr. Baley. I apologize for the nature of the test and for the discomfort I caused you. I was merely trying to ward off the possibility of far greater discomfort. Do you still wish to come out with me?"

"I not only wish it, Dr. Fastolfe. I insist on it."

20.

They made their way through a corridor, with Daneel and Giskard following close behind.

Fastolfe said chattily, "I hope you won't mind the robots accompanying us. Aurorans never go anywhere without at least one robot in attendance and, in your case in particular, I must insist that Daneel and Giskard be with you at all times."

He opened a door and Baley tried to stand firm against the beat of sunshine and wind, to say nothing of the envelopment of the strange and subtly alien smell of Aurora's land.

Fastolfe stayed to one side and Giskard went out first. The robot looked keenly about for a few moments. One had the impression that all his senses were intently engaged. He looked back and Daneel joined him and did the same.

"Leave them for a moment, Mr. Baley," said Fastolfe, "and they will tell us when they think it safe for us to emerge. Let me take the opportunity of once again apologizing for the scurvy trick I played on you with respect to the Personal. I assure you we would have known if you were in trouble-your various vital signs were being recorded. I am very pleased, though not entirely surprised, that you penetrated my purpose." He smiled and, with almost unnoticeable hesitation, placed his hand upon Baley's left shoulder and gave it a friendly squeeze.

Baley held himself stiffly. "You seem to have forgotten your earlier scurvy trick-your apparent attack on me with the spicer. If you will assure me that we will now deal with each other frankly and honestly, I will consider these matters as having been of reasonable intent."

"Done!"

"Is it safe to leave now?" Baley looked out to where Giskard and Daneel had moved farther and had separated from each other to right and left, still watching and sensing.

"Not quite yet. They will move all around the establishment. -Daneel tells me that you invited him into the Personal with you. Was that seriously meant?"

"Yes. I knew he had no need, but I felt it might be impolite to exclude him. I wasn't sure of Auroran custom in that respect, despite all the reading I did on Auroran matters.'

"I suppose that isn't one of those things Aurorans feel necessary to mention and of course one can't expect the books to make any attempt to prepare visiting Earthmen concerning these subjects-"

"Because there are so few visiting Earthmen?"

"Exactly. The point is, of course, that robots never visit Personals. It is the one place where human beings can be free of them. I suppose there is the feeling that one should feel free of them at some periods and in some places."

Baley said, "And yet when Daneel was on Earth on the occasion of Sarton's death three years ago, I tried to keep him out of the Community Personal by saying he had no need. Still, he insisted on entering."

"And rightly so. He was, on that occasion, strictly instructed to give no indication he was not human, for reasons you well remember. Here on Aurora, however- Ah, they are done."

The robots were coming toward the door and Daneel gestured them outward.

Fastolfe held out his arm to bar Baley's way. "if you don't mind, Mr. Baley, I will go out first. Count to one hundred patiently and then join us."

21.

Baley, on the count of one hundred, stepped out firmly and walked toward Fastolfe. His face was perhaps too stiff, his jaws too tightly clenched, his back too straight.

He looked about. The scene was not very different from that which had been presented in the Personal. Fastolfe had, perhaps, used his own grounds as a model. Everywhere there was green and in one place there was a stream filtering down a slope. It was, perhaps, artificial, but it was not an illusion. The water was real. He could feel the spray when he passed near it.

There was somehow a tameness to it all. The Outside on Earth seemed wilder and more grandly beautiful, what little Baley had seen of it.

Fastolfe said, with a gentle touch on Baley's upper arm and a motion of his hand, "Come in this direction. Look there!"

A space between two trees revealed an expanse of lawn.

For the first time, there was a sense of distance and on the horizon one could see a dwelling place: low-roofed, broad, and so green in color that it almost melted into the countryside.

"This is a residential area," said Fastolfe. "it might not seem so to you, since you are accustomed to Earth's tremendous hives, but we are in the Auroran city of Eos, which is actually the administrative center of the planet. There are twenty thousand human beings living here, which makes it the largest city, not only on Aurora but on all the

Spacer worlds. There are as many people in Eos as on all of Solaria." Fastolfe said it with pride.

"How many robots, Dr. Fastolfe?"

"In this area? Perhaps a hundred thousand. On the planet as a whole, there are fifty robots to each human being on the average, not ten thousand per human as on Solaria. Most of our robots are on our farms, in our mines, in our factories, in space. If anything, we suffer from a shortage of robots, particularly of household robots. Most Aurorans make do with two or three such robots, some with only one. Still, we don't want to move in the direction of Solaria."

"How many human beings have no household robots at all?"

"None at all. That would not be in the public interest. If a human being, for any reason, could not afford a robot, he or she would be granted one which would be maintained, if necessary, at public expense."

"What happens as the population rises? Do you add more robots?"

Fastolfe shook his head. "The population does not rise. Aurora's population is two hundred million and that has remained stable for three centuries. It is the number desired. Surely you have read that in the books you viewed."

"Yes, I have," admitted Baley, "but I found it difficult to believe."

"Let me assure you it's true. It gives each of us ample land, ample space, ample privacy, and an ample share of the world's resources. There are neither too many people as on Earth, nor too few as on Solaria." He held out his arm for Baley to take, so they might continue walking.

"What you see," Fastolfe said, "is a tame world. It is what I have brought you out to show you, Mr. Baley?"

"There is no danger in it?"

"Always some danger. We do have storms, rock slides, earthquakes, blizzards, avalanches, a volcano or two- Accidental death can never be entirely done away with. And there are even the passions of angry or envious persons, the follies of the immature, and the madness of the shortsighted. These things are very minor irritants, however, and do not much affect the civilized quiet that rests upon our world."

Fastolfe seemed to ruminate over his words for a moment, then he sighed and said, "I can scarcely want it to be any other way, but I have certain intellectual reservations. We have brought here to Aurora only those plants and animals we felt would be useful, ornamental, or both. We did our best to eliminate anything we would consider weeds, vermin, or even less than standard. We selected strong, healthy, and attractive human beings, according to our own views, of course. We have tried- But you smile, Mr. Baley."

Baley had not. His mouth had merely twitched. "No no," he said. "There is nothing to smile about."

"There is, for I know as well as you do that I myself am not attractive by Auroran standards. The trouble is that we cannot altogether control gene combinations and intrauterine influences. Nowadays, of course, with ectogenesis becoming more common -

though I hope it shall never be as common as it is on Solaria- I would be eliminated in the late fetal stage."

"In which case, Dr. Fastolfe, the worlds would have lost a great theoretical roboticist."

"Perfectly correct," said Fastolfe, without visible embarrassment, "but the worlds would never have known that, would they? -In any case, we have labored to set up a very simple but completely workable ecological balance, an equable climate, a fertile soil, and resources as evenly distributed as is possible. The result is a world that produces all of everything that we need and that is, if I may personify, considerate of our wants. -Shall I tell you the ideal for which we have striven?"

"Please do," said Baley.

"We have labored to produce a planet which, taken as a whole, would obey the Three Laws of Robotics. It does nothing to harm human beings, either by commission or omission. It does what we want it to do, as long as we do not ask it to harm human beings. And it protects itself, except at times and in places where it must serve us or save us even at the price of harm to itself. Nowhere else, neither on Earth nor in the other Spacer worlds, is this so nearly true as here on Aurora."

Baley said sadly, "Earthmen, too, have longed for this, but we have long since grown too numerous and we have too greatly damaged our planet in the days of our ignorance to be able to do very much about it now. -But what of Aurora's indigenous life-forms? Surely you did not come to a dead planet."

Fastolfe said, "You know we didn't, if you have viewed books on our history. Aurora had vegetation and animal life when we arrived-and a nitrogen-oxygen atmosphere. This was true of all the fifty Spacer worlds. Peculiarly, in every case, the life-forms were sparse and not very varied. Nor were they particularly tenacious in their hold on their own planet. We took over, so to speak, without a struggle-and what is left of the indigenous life is in our aquaria, our zoos, and in a few carefully maintained primeval areas.

"We do not really understand why the life-bearing planets that human beings have encountered have been so feebly life bearing, why only Earth itself has been overflowing with madly tenacious varieties of life filling every environmental niche, and why only Earth has developed any sign of intelligence whatever."

Baley said, "Maybe it is coincidence, the accident of incomplete exploration. We know so few planets so far."

"I admit," said Fastolfe, "that that is the most likely explanation. Somewhere there may be an ecological balance as complex as that of Earth. Somewhere there may be intelligent life and a technological civilization. Yet Earth's life and intelligence has spread outward for parsecs in every direction. If there is life and intelligence elsewhere, why have they not spread out as well- and why have we not encountered each other?"

"That might happen tomorrow, for all we know."

"It might. And if such an encounter is imminent, all the more reason why we should not be passively waiting. For we are growing passive, Mr. Baley. No new Spacer world has

been settled in two and a half centuries. Our worlds are so tame, so delightful, we do not wish to leave them. This world was originally settled, you see, because Earth had grown so unpleasant that the risks and dangers of new and empty worlds seemed preferable by comparison. By the time our fifty Spacer worlds were developed-Solaria last of all-there was no longer any push, any need to move out elsewhere. And Earth itself had retreated to its underground caves of steel. The End. Finis."

"You don't really mean that."

"If we stay as we are? If we remain placid and comfortable and unmoving? Yes, I do mean that. Humanity must expand its range somehow if it is to continue to flourish. One method of expansion is through space, through a constant pioneering reach toward other worlds. If we fail in this, some other civilization that is undergoing such expansion will reach us and we will not be able to stand against its dynamism."

"You expect a space war-like a hyperwave shoot-'em-up."

"No, I doubt that that would be necessary. A civilization that is expanding through space will not need our few worlds and will probably be too intellectually advanced to feel the need to batter its way into hegemony here. If, however, we are surrounded by a more lively, a more vibrant civilization, we will wither away by the mere force of the comparison; we will die of the realization of what we have become and of the potential we have wasted. Of course, we might substitute other expansions- an expansion of scientific understanding or of cultural vigor, for instance. I fear, however, that these expansions are not separable. To fade in one is to fade in all. Certainly, we are fading in all. We live too long. We are too comfortable."

Baley said, "On Earth, we think of Spacers as all-powerful, as totally self-confident. I cannot believe I'm hearing this from one of you."

"You won't from any other Spacer. My views are unfashionable. Others would find them intolerable and I don't often speak of such things to Aurorans. Instead, I simply talk about a new drive for further settlement, without expressing my fears of the catastrophes which will result if we abandon colonization. In that, at least, I have been winning. Aurora has been seriously- even enthusiastically-considering a new era of exploration and settlement."

"You say that," said Baley, "without any noticeable enthusiasm. What's wrong?"

"It's just that we are approaching my motive for the destruction of Jander Panell."

Fastolfe paused, shook his head, and continued, "I wish, Mr. Baley, I could understand human beings better. I have spent six decades in studying the intricacies of the positronic brain and I expect to spend fifteen to twenty more on the problem. In this time, I have barely brushed against the problem of the human brain, which is enormously more intricate. Are there Laws of Humanics as there are Laws of Robotics? How many Laws of Humanics might there be and how can they be expressed mathematically? I don't know.

"Perhaps, though, there may come a day when someone will work out the Laws of Humanics and then be able to predict the broad strokes of the future, and know what might be in store for humanity, instead of merely guessing as I do, and know what to do

to make things better, instead of merely speculating. I dream sometimes of founding a mathematical science which I think of as 'psychohistory,' but I know I can't and I fear no one ever will."

He faded to a halt.

Baley waited, then said softly, "And your motive for the destruction of Jander Panell, Dr. Fastolfe?"

Fastolfe did not seem to hear the question. At any rate, he did not respond. He said, instead, "Daneel and Giskard are again signaling that all is clear. Tell me, Mr. Baley, would you consider walking with me farther a-field?"

"Where?" asked Baley cautiously.

"Toward a neighboring establishment. In that direction, across the lawn. Would the openness disturb you?"

Baley pressed his lips together and looked in that direction, as though attempting to measure its effect. "I believe I could endure it I anticipate no trouble."

Giskard, who was close enough to hear, now approached still closer, his eyes showing no glow in the daylight. If his voice was without human emotion, his words marked his concern. "Sir, may I remind you that on the journey here you suffered serious discomfort on the descent to the planet?"

Baley turned to face him. However he might feel toward Daneel, whatever warmth of past association might paper over his attitude toward robots, there was none here. He found the more primitive Giskard distinctly repellent. He labored to fight down the touch of anger he felt and said, "I was incautious aboard ship, boy, because I was overly curious. I faced a vision I had never experienced before and I had no time for adjustment. This is different."

"Sir, do you feel discomfort now? May I be assured of that?"

"Whether I do or not," said Baley firmly (reminding himself that the robot was helplessly in the grip of the First Law and trying to be polite to a lump of metal who, after all, had Baley's welfare as his only care) "doesn't matter. I have my duty to perform and that cannot be done if I am to hide in enclosures."

"Your duty?" Giskard said it as though he had not been programmed to understand the word.

Baley looked quickly in Fastolfe's direction, but Fastolfe stood quietly in his place and made no move to intervene. He seemed to be listening with abstracted interest, as though weighing the reaction of a robot of a given type to a new situation and comparing it with relationships, variables, constants, and differential equations only he understood.

Or so Baley thought. He felt annoyed at being part of an observation of that type and said (perhaps too sharply, he knew), "Do you know what 'duty' means?"

"That which should be done, sir," said Giskard.

"Your duty is to obey the Laws of Robotics. And human beings have their laws, too-as your master, Dr. Fastolfe, was only this moment saying-which must be obeyed. I must do that which I have been assigned to do. It is important"

"But to go into the open when you are not-"

"It must be done, nevertheless. My son may someday go to another planet, one much less comfortable than this one, and expose himself to the Outside for the rest of his life. And if I could, I would go with him."

"But why would you do that?"

"I have told you. I consider it my duty."

"Sir, I cannot disobey the Laws. Can you disobey yours? For I must urge you to—"

"I can choose not to do my duty, but I do not choose to—and that is sometimes the stronger compulsion, Giskard."

There was silence for a moment and then Giskard said, "Would it do you harm if I were to succeed in persuading you not to walk into the open?"

"Insofar as I would then feel I have failed in my duty, it would."

"More harm than any discomfort you might feel in the open?"

"Much more."

"Thank you for explaining this, sir," said Giskard and Baley imagined there was a look of satisfaction on the robot's largely expressionless face. (The human tendency to personify was irrepressible.)

Giskard stepped back and now Dr. Fastolfe spoke. "That was interesting, Mr. Baley. Giskard needed instructions before he could quite understand how to arrange the positronic potential response to the Three Laws or, rather, how those potentials were to arrange themselves in the light of the situation. Now he knows how to behave."

Baley said, "I notice that Daneel asked no questions."

Fastolfe said, "Daneel knows you. He has been with you on Earth and on Solaria. - But come, shall we walk? Let us move slowly. Look about carefully and, if at any time you should wish to rest, to wait, even to turn back, I will count on you to let me know."

"I will, but what is the purpose of this walk? Since you anticipate possible discomfort on my part, you cannot be suggesting it idly."

"I am not," said Fastolfe. "I think you will want to see the inert body of Jander."

"As a matter of form, yes, but I rather think it will tell me nothing."

"I'm sure of that, but then you might also have the opportunity to question the one who was Jander's quasi-owner at the time of the tragedy. Surely you would like to speak to some human being other than myself concerning the matter."

22.

Fastolfe moved slowly forward, plucking a leaf from a shrub that he passed, bending it in two, and nibbling at it.

Baley looked at him curiously, wondering how Spacers could put something untreated, unheated, even unwashed into their mouths, when they feared infection so badly. He remembered that Aurora was free (entirely free?) of pathogenic microorganisms, but found the action repulsive anyway. Repulsion did not have to have a

rational basis, he thought defensively-and suddenly found himself on the edge of excusing the Spacers their attitude toward Earthmen.

He drew back! That was different! Human beings were involved there!

Giskard moved ahead, forward and toward the right. Daneel lagged behind and toward the left. Aurora's orange sun (Baley scarcely noted the orange tinge now) was mildly warm on his back, lacking the febrile heat that Earth's sun had in summer (but, then, what was the climate and season on this portion of Aurora right now?).

The grass or whatever it was (it looked like grass) was a bit stiffer and springier than he recalled it being on Earth and the ground was hard, as though it had not rained for a while.

They were moving toward the house up ahead, presumably the house of Jander's quasi-owner.

Baley could hear the rustle of some animal in the grass to the right, the sudden chirrup of a bird somewhere in a tree behind him, the small unplaceable clatter of insects all about. These, he told himself, were all animals with ancestors that had once lived on Earth. They had no way of knowing that this patch of ground they inhabited was not all there was-forever and forever back in time. The very trees and grass had arisen from other trees and grass that had once grown on Earth.

Only human beings could live on this world and know that they were not autochthonous but had stemmed from Earthmen -and yet did the Spacers really know it or did they simply put it out of their mind? Would the time come, perhaps, when they would not know it at all? When they would not remember which world they had come from or whether there was a world of origin at all?

"Dr. Fastolfe," he said suddenly, in part to break the chain of thought that he found to be growing oppressive, "you still have not told me your motive for the destruction of Jander."

"True! I have not! -Now why do you suppose, Mr. Baley, I have labored to work out the theoretical basis for the positronic brains of humaniform robots?"

"I cannot say."

"Well, think. The task is to design a robotic brain as close to the human as possible and that would require, it would seem, a certain reach into the poetic-" He paused and his small smile became an outright grin. "You know it always bothers some of my colleagues when I tell them that, if a conclusion is not poetically balanced, it cannot be scientifically true. They tell me they don't know what that means."

Baley said, "I'm afraid I don't, either."

"But I know what it means. I can't explain it, but I feel the explanation without being able to put it into words, which may be why I have achieved results my colleagues have not. However, I grow grandiose, which is a good sign I should become prosaic. To imitate a human brain, when I know almost nothing about the workings of the human brain, needs an intuitive leap-something that feels to me like poetry. And the same intuitive leap that would give me the humaniform positronic brain should surely give me a new access of knowledge about the human brain itself. That was my belief-that through

humaniformity I might take at least a small step toward the psychohistory I told you about."

"I see."

"And if I succeeded in working out a theoretical structure that would imply a humaniform positronic brain, I would need a humaniform body to place it in. The brain does not exist by itself, you understand. It interacts with the body, so that a humaniform brain in a nonhumaniform body would become, to an extent, itself nonhuman."

"Are you sure of that?"

"Quite. You have only to compare Daneel with Giskard."

"Then Daneel was constructed as an experimental device for furthering the understanding of the human brain?"

"You have it. I labored two decades at the task with Sarton. There were numerous failures that had to be discarded. Daneel was the first true success and, of course, I kept him for further study-and out of"-he grinned lopsidedly, as though admitting to something silly-"affection. After all, Daneel can grasp the notion of human duty, while Giskard, with all his virtues, has trouble doing so. You saw."

"And Daneel's stay on Earth with me, three years ago, was his first assigned task?"

"His first of any importance, yes. When Sarton was murdered, we needed something that was a robot and could withstand the infectious diseases of Earth and yet looked enough like a man to get around the antirobotic prejudices of Earth's people."

"An astonishing coincidence that Daneel should be right at hand at that time."

"Oh? Do you believe in coincidences? It is my feeling that any time at which a development as revolutionary as the humaniform robot came into being, some task that would require its use would present itself. Similar tasks had probably been presenting themselves regularly in all the years that Daneel did not exist- and because Daneel did not exist, other solutions and devices had to be used."

"And have your labors been successful, Dr. Fastolfe? Do you now understand the human brain better than you did?"

Fastolfe had been moving more and more slowly and Baley had been matching his progress to the other's. They were now standing still, about halfway between Fastolfe's establishment and the other's. It was the most difficult point for Baley, since it was equally distant from protection in either direction, but he fought down the growing uneasiness, determined not to provoke Giskard. He did not wish by some motion or outcry -or even expression- to activate the inconvenience of Giskard's desire to save him. He did not want to have himself lifted up and carried off to shelter.

Fastolfe showed no sign of understanding Baley's difficulty. He said, "There's no question but that advances in mentology have been carried through. There remain enormous problems and perhaps these will always remain, but there has been progress. Still-"

"Still?"

"Still, Aurora is not satisfied with a purely theoretical study of the human brain. Uses for humaniform robots have been advanced that I do not approve of."

"Such as the use on Earth."

"No, that was a brief experiment that I rather approved of and was even fascinated by. Could Daneel fool Earthpeople? It turned out he could, though, of course, the eyes of Earthmen for robots are not very keen. Daneel cannot fool the eyes of Aurorans, though I dare say future humaniform robots could be improved to the point where they would. There are other tasks that have been proposed, however."

"Such as?"

Fastolfe gazed thoughtfully into the distance. "I told you this world was tame. When I began my movement to encourage a renewed period of exploration and settlement, it was not to the supercomfortable Aurorans-or Spacers generally-that I looked for leadership. I rather thought we ought to encourage Earthmen to take the lead. With their horrid world-excuse me-and short life-span, they have so little to lose, I thought that they would surely welcome the chance, especially if we were to help them technologically. I spoke to you about such a thing when I saw you on Earth three years ago. Do you remember?" He looked sidelong at Baley.

Baley said stolidly, "I remember quite well. In fact, you started a chain of thought in me that has resulted in a small movement on Earth in that very direction."

"Indeed? It would not be easy, I imagine. There is the claustrophilia of you Earthmen, your dislike of leaving your walls."

"We are fighting it, Dr. Fastolfe. Our organization is planning to move out into space. My son is a leader' in the movement and I hope the day may come when he leaves Earth at the head of an expedition to settle a new world. If we do indeed receive the technological help you speak of-" Baley let that dangle.

"If we supplied the ships, you mean?"

"And other equipment. Yes, Dr. Fastolfe."

"There are difficulties. Many Aurorans do not want Earthmen to move outward and settle new worlds. They fear the rapid spread of Earthish culture, its beehive Cities, its chaoticism." He stirred uneasily and said, "Why are we standing here, I wonder? Let's move on."

He walked slowly forward and said, "I have argued that that would not be the way it would be. I have pointed out that the settlers from Earth would not be Earthmen in the classical mode. They would not be enclosed in Cities. Coming to a new world, they would be like the Auroran Fathers coming here. They would develop a manageable ecological balance and would be closer to Aurorans than to Earthmen in attitude."

"Would they not then develop all the weaknesses you find in Spacer culture, Dr. Fastolfe?"

"Perhaps not. They would learn from our mistakes. -But that is academic, for something has developed which makes the argument moot."

"And what is that?"

"Why, the humaniform robot. You see, there are those who see the humaniform robot as the perfect settler. It is they who can build the new worlds."

Baley said, "You've always had robots. Do you mean this idea was never advanced before?"

"Oh, it was, but it was always clearly unworkable. Ordinary nonhumaniform robots, without immediate human supervision, building a world that would suit their own nonhumaniform selves, could not be expected to tame and build a world that would be suitable for the more delicate and flexible minds and bodies of human beings."

"Surely the world they would build would serve as a reasonable first approximation."

"Surely it would, Mr. Baley. It is a sign of Auroran decay, however, that there is an overwhelming feeling among our people that a reasonable first approximation is unreasonably insufficient. -A group of humaniform robots, on the other hand, as closely resembling human beings in body and mind as possible, would succeed in building a world which, in suiting themselves, would also inevitably suit Aurorans. Do you follow the reasoning?"

"Completely."

"They would build a world so well, you see, that when they are done and Aurorans are finally willing to leave, our human beings will step out of Aurora and into another Aurora. They will never have left home; they will simply have another newer home, exactly like the older one, in which to continue their decay. Do you follow that reasoning, too?"

"I see your point, but I take it that Aurorans do not."

"May not. I think I can argue the point effectively, if the opposition does not destroy me politically via this matter of the destruction of Jander. Do you see the motive attributed to me? I am supposed to have embarked on a program of the destruction of humaniform robots rather than allow them to be used to settle other planets. Or so my enemies say."

It was Baley now who stopped walking. He looked thoughtfully at Fastolfe and said, "You understand, Dr. Fastolfe, that it is to Earth's interest that your point of view win out completely."

"And to your own interests as well, Mr. Baley."

"And to mine. But if I put myself to one side for the moment, it still remains vital to my world that our people be allowed, encouraged, and helped to explore the Galaxy; that we retain as much of our own ways as we are comfortable with; that we not be condemned to imprisonment on Earth forever, since there we can only perish."

Fastolfe said, "Some of you, I think, will insist on remaining imprisoned."

"Of course. Perhaps almost all of us will. However, at least some of us-as many of us as possible-will escape if given permission. -It is therefore my duty, not only as a representative of the law of a large fraction of humanity but as an Earthman, plain and simple, to help you clear your name, whether you are guilty or innocent. Nevertheless, I can throw myself wholeheartedly into this task only if I know that, "in fact, the accusations against you are unjustified."

"Of course! I understand."

"In the light, then, of what you have told me of the motive attributed to you, assure me once again that you did not do this thing."

Fastolfe said, "Mr. Baley, I understand completely that you have no choice in this matter. I am quite aware that I can tell you, with impunity, that I am guilty and that you would still be compelled by the nature of your needs and those of your world to work with me to mask that fact. Indeed, if I were actually guilty, I would feel compelled to tell you so, so that you could take that fact into consideration and, knowing the truth, work the more efficiently to rescue me-and yourself. But I cannot do so, because the fact is I am innocent. However much appearances may be against me, I did not destroy Jander. Such a thing never entered my mind."

"Never?"

Fastolfe smiled sadly. "Oh, I may have thought once or twice that Aurora would have been better off if I had never worked out the ingenious notions that led to the development of the humaniform positronic brain-or that it would be better off if such brains proved unstable and readily subject to mental freeze-out. But those were fugitive thoughts. Not for a split second did I contemplate bringing about Jander's destruction for this reason."

"Then we must destroy this motive that they attribute to you."

"Good. But how?"

"We could show that it serves no purpose. What good does it do to destroy Jander? More humaniform robots can be built. Thousands. Millions."

"I'm afraid that's not so, Mr. Baley. None can be built. I alone know how to design them, and, as long as robot colonization is a possible destiny, I refuse to build any more. Jander is gone and only Daneel is left."

"The secret will be discovered by others."

Fastolfe's chin went up. "I would like to see the roboticist capable of it. My enemies have established a Robotics Institute with no other purpose than to work out the methods behind the construction of a humaniform robot, but they won't succeed. They certainly haven't succeeded so far and I know they won't succeed."

Baley frowned. "If you are the only man who knows the secret of the humaniform robots, and if your enemies are desperate for it, will they not try to get it out of you?"

"Of course. By threatening my political existence, by perhaps maneuvering some punishment that will forbid my working in the field and thus putting an end to my professional existence as well, they hope to have me agree to share the secret with them. They may even have the Legislature direct me to share the secret on the pain of confiscation of property, imprisonment-who knows what? However, I have made up my mind to submit to anything-anything-rather than give in. But I don't want to have to, you understand."

"Do they know of your determination to resist?"

"I hope so. I have told them plainly enough. I presume they think I'm bluffing, that I'm not serious. -But I am."

"But if they believe you, they might take more serious steps."

"What do you mean?"

"Steal your papers. Kidnap you. Torture you."

Fastolfe broke into a loud laugh and Baley flushed. He said, "I hate to sound like a hyperwave drama, but have you considered that?"

Fastolfe said, "Mr. Baley- First, my robots can protect me. It would take full-scale war to capture me or my work. Second, even if somehow they succeeded, not one of the roboticists opposed to me could bear to make it plain that the only way he could obtain the secret of the humaniform positronic brain is to steal it or force it from me. His or her professional reputation would be completely wiped out. Third, such things on Aurora are unheard of. The merest hint of an unprofessional attempt upon me would swing the Legislature-and public opinion-in my favor at once."

"Is that so?" muttered Baley, silently damning the fact of having to work in a culture whose details he simply didn't understand.

"Yes. Take my word for it. I wish they would try something of this melodramatic sort. I wish they were so incredibly stupid as to do so. In fact, Mr. Baley, I wish I could't persuade you to go to them, worm your way into their confidence, and cajole them into mounting an attack on my establishment or waylaying me on an empty road-or anything of the sort that, I imagine, is common on Earth."

Baley said stiffly, "I don't think that would be my style."

"I don't think so, either, so I have no intention of trying to implement my wish. And believe me, that is too bad, for if we cannot persuade them to try the suicidal method of force, they will continue to do something much better, from their standpoint. They will destroy me by falsehoods."

"What falsehoods?"

"It is not just the destruction of one robot they attribute to me. That is bad enough and just might suffice. They are whispering-it is only a whisper as yet-that the death is merely an experiment of mine and a dangerous, successful one. They whisper that I am working out a system for destroying humaniform brains rapidly and efficiently, so that when my enemies do create their own humaniform robots, I, together with members of my party, will be able to destroy them all, thus preventing Aurora from settling new worlds and leaving the Galaxy to my Earthmen confederates."

"Surely there can be no truth in this."

"Of course not. I told you these are lies. And ridiculous lies, too. No such method of destruction is even theoretically possible and the Robotics Institute people are not on the point of creating their own humaniform robots. I cannot conceivably indulge in an orgy of mass destruction even if I wanted to. I cannot."

"Doesn't the whole thing fall by its own weight, then?"

"Unfortunately, it's not likely to do so in time. It may be silly nonsense, but it will probably last long enough to sway public opinion against me to the point of swinging just enough votes in the Legislature to defeat me. Eventually, it will all be recognized as nonsense, but by then it will be too late. And please notice that Earth is being used as a whipping boy in this. The charge that I am laboring on behalf of Earth is a powerful one

and many will choose to believe the whole farrago, against their own better sense, because of their dislike of Earth and Earthpeople."

Baley said, "What you're telling me is that active resentment against Earth is being built up."

Fastolfe said, "Exactly, Mr. Baley. The situation grows worse for me-and for Earth-every day and we have very little time."

"But isn't there an easy way of knocking this thing on its head?" (Baley, in despair, decided it was time to fall back on Daneel's point.) "If you were indeed anxious to test a method for the destruction of a humanoid robot, why seek out one in another establishment, one with which it might be inconvenient to experiment? You had Daneel, himself, in your own establishment. He was at hand and convenient. Would not the experiment have been conducted upon him if there were any truth at all in the rumor?"

"No no," said Fastolfe. "I couldn't get anyone to believe that. Daneel was my first success, my triumph. I wouldn't destroy him under any circumstances. Naturally, I would turn to Jander. Everyone would see that and I would be a fool to try to persuade them that it would have made more sense for me to sacrifice Daneel."

They were walking again, nearly at their destination. Baley was in deep silence, his face tight-lipped.

Fastolfe said, "How do you feel, Mr. Baley?"

Baley said in a low voice, "If you mean as far as being Outside is concerned, I am not even aware of it. If you mean as far as our dilemma is concerned, I think I am as close to giving up as I can possibly be without putting myself into an ultrasonic brain-dissolving chamber." Then passionately, "Why did you send for me, Dr. Fastolfe? Why have you given me this job? What have I ever done to you to be treated so?"

"Actually," said Fastolfe, "it was not my idea to begin with and I can only plead my desperation."

"Well, whose idea was it?"

"It was the owner of this establishment we have now reached who suggested it originally-and I had no better idea."

"The owner of this establishment? Why would he-"

"She."

"Well, then, why would she suggest anything of the sort?"

"Oh! I haven't explained that she knows you, have I, Mr. Baley? There she is, waiting for us now."

Baley looked up, bewildered.

"Jehoshaphat," he whispered.

6. GLADIA

23.

The young woman who faced them said with a wan smile, "I knew that when I met you again, Elijah, that would be the first word I would hear."

Baley stared at her. She had changed. Her hair was shorter and her face was even more troubled now than it had been two years ago and seemed more than two years older, somehow. She was still unmistakably Gladia, however. There was still the triangular face, with its pronounced cheekbones and small chin. She was still short, still slight of figure, still vaguely childlike.

He had dreamed of her frequently-though not in an overtly erotic fashion-after returning to Earth. His dreams were always stories of not being able to quite reach her. She was always there, a little too far off to speak to easily. She never quite heard when he called her. She never grew nearer when he approached her.

It was not hard to understand why the dreams had been as they were. She was a Solarian-born person and, as such, was rarely supposed to be in the physical presence of other human beings.

Elijah had been forbidden to her because he was human-and beyond that (of course) because he was from Earth. Though the exigencies of the murder case he was investigating forced them to meet, throughout their relationship she was completely covered, when physically together, to prevent actual contact. And yet, at their last meeting, she had, in defiance of good sense, fleetingly touched his cheek with her bare hand. She must have known she could be infected as a result. He cherished the touch the more, for every aspect of her upbringing combined to make it unthinkable.

The dreams had faded in time.

Baley said, rather stupidly, "It was you who owned the-"

He paused and Gladia finished the sentence for him. "The robot. And two years ago, it was I who possessed the husband. Whatever I touch is destroyed."

Without really knowing what he was doing, Baley reached up to place his hand on his cheek. Gladia did not seem to notice.

She said, "You came to rescue me that first time. Forgive me, but I had to call on you again. -Come in, Elijah. Come in, Dr. Fastolfe."

Fastolfe stepped back to allow Baley to walk in first. He followed. Behind Fastolfe came Daneel and Giskard-and they, with the characteristic self-effacement of robots, stepped to unoccupied wall niches on opposite sides and remained silently standing, backs to the wall.

For one moment, it seemed that Gladia would treat them with the indifference with which human beings commonly treated robots. After a glance at Daneel, however, she

turned away and said to Fastolfe in a voice that choked a little, "That one. Please. Ask him to leave."

Fastolfe said, with a small motion of surprise, "Daneel?"

"He's too-too Jander-like!"

Fastolfe turned to look at Daneel and a look of clear pain crossed his face momentarily. "Of course, my dear. You must forgive me. I did not think. -Daneel, move into another room and remain there while we are here."

Without a word, Daneel left.

Gladia glanced a moment at Giskard, as though to judge whether he, also, was too Jander-like, and turned away with a small shrug.

She said, "Would either of you like refreshment of any kind? I have an excellent coconut drink, fresh and cold."

"No, Gladia," said Fastolfe. "I have merely brought Mr. Baley here as I promised I would. I will not stay long. "

"If I may have a glass of water," said Baley, "I won't trouble you for anything more."

Gladia raised one hand. Undoubtedly, she was under observation, for, in a moment, a robot moved in noiselessly, with a glass of water on a tray and a small dish of what looked like crackers with a pinkish blob on each.

Baley could not forbear taking one, even though he was not certain what it might be. It had to be something Earth-descended, for he could not believe that on Aurora, he - or anyone- would be eating any portion of the planet's sparse indigenous biota or anything synthetic either. Nevertheless, the descendants of Earthly food species might change with time, either through deliberate cultivation or the action of a strange environment- and Fastolfe, at lunchtime, had said that much of the Auroran diet was an acquired taste.

He was pleasantly surprised. The taste was sharp and spicy, but he found it delightful and took a second almost at once. He said, "Thank you" to the robot (who would not have objected to standing there indefinitely) and took the entire dish, together with the glass of water.

The robot left.

It was late afternoon now and the sunlight came ruddily through the western windows. Baley had the impression that this house was smaller than Fastolfe's, but it would have been more cheerful had not the sad figure of Gladia standing in its midst provoked a dispiriting effect.

That might, of course, be Baley's imagination. Cheer, in any case, seemed to him impossible in any structure purporting to house and protect human beings that yet remained exposed to the Outside beyond each wall. Not one wall, he thought, had the warmth of human life on the other side. In no direction could one look for companionship and community. Through every outer wall, every side, top and bottom, there was inanimate world. Cold! Cold!

And coldness flooded back upon Baley himself as he thought again of the dilemma in which he found himself. (For a moment, the shock of meeting Gladia again had driven it from his mind.)

Gladia said, "Come. Sit down, Elijah. You must excuse me for not quite being myself. I am, for a second time, the center of a planetary sensation-and the first time was more than enough."

"I understand, Gladia. Please do not apologize," said Baley.

"And as for you, dear Doctor, please don't feel you need go."

"Well-" Fastolfe looked at the time strip on the wall. "I will stay for a short while, but then, my dear, there is work that must be done though the skies fall. All the more so, since I must look forward to a near future in which I may be restrained from doing any work at all."

Gladia blinked rapidly, as though holding back tears. "I know, Dr. Fastolfe. You are in deep trouble because of-what happened here and I don't seem to have time to think of anything but my own-discomfort."

Fastolfe said, "I'll do my best to take care of my own problem, Gladia, and there is no need for you to feel guilt over the matter. -Perhaps Mr. Baley will be able to help us both."

Baley pressed his lips together at that, then said heavily, "I was not aware, Gladia, that you were in any way involved in this affair."

"Who else would be?" she said with a sigh.

"You are-were-in possession of Jander Panell?"

"Not truly in possession. I had him on loan from Dr. Fastolfe."

"Were you with him when he-" Baley hesitated over some way of putting it.

"Died? Mightn't we say died? -No, I was not. And before you ask, there was no one else in the house at the time. I was alone. I am usually alone. Almost always. That is my Solarian upbringing, you remember. Of course, that is not obligatory. You two are here and I do not mind-very much."

"And you were definitely alone at the time Jander died? No mistake?"

"I have said so," said Gladia, sounding a little irritated. "No, never mind, Elijah. I know you must have everything repeated and repeated. I was alone. Honestly."

"There were robots present, though."

"Yes, of course. When I say 'alone,' I mean there were no other human beings present."

"How many robots do you possess, Gladia? Not counting Jander."

Gladia paused as though she were counting internally. Finally, she said, "Twenty. Five in the house and fifteen on the grounds. Robots move freely between my house and Dr. Fastolfe's, too, so that it isn't always possible to judge, when a robot is quickly seen at either establishment, whether it is one of mine or one of his."

"Au," said Baley, "and since Dr. Fastolfe has fifty-seven robots in his establishment, that means, if we combine the two, that there are seventy-seven robots

available, altogether. Are there any other establishments whose robots may mingle with yours indistinguishably?"

Fastolfe said, "There's no other establishment near enough to make that practical. Nor is the practice of mixing robots really encouraged. Gladia and I are a special case because she is not Auroran and because I have taken rather a responsibility for her."

"Even so. Seventy-seven robots," said Baley.

"Yes," said Fastolfe, "but why are you making this point?"

Baley said, "Because it means you can have any of seventy seven moving objects, each vaguely human in form, that you are used to seeing out of the corner of the eye and to which you would pay no particular attention. Isn't it possible, Gladia, that if an actual human being were to penetrate the house, for whatever purpose, you would scarcely be aware of it? It would be one more moving object, vaguely human in form, and you would pay no attention."

Fastolfe chuckled softly and Gladia, unsmiling, shook her head.

"Elijah," she said, "one can tell you are an Earthman. Do you imagine that any human being, even Dr. Fastolfe here, could possibly approach my house without my being informed of the fact by my robots. I might ignore a moving form, assuming it to be a robot, but no robot ever would. I was waiting for you just now when you arrived, but that was because my robots had informed me you were approaching. No, no, when Jander died, there was no other human being in the house."

"Except yourself?"

"Except myself. Just as there was no one in the house except myself when my husband was killed."

Fastolfe interposed gently. "There is a difference, Gladia. Your husband was killed with a blunt instrument. The physical presence of the murderer was necessary and, if you were the only one present, that was serious. In this case, Jander was put out of operation by a subtle spoken program. Physical presence was not necessary. Your presence here alone means nothing, especially since you do not know how to block the mind of a humaniform robot."

They both turned to look at Baley, Fastolfe with a quizzical look on his face, Gladia with a sad one. (It irritated Baley that Fastolfe, whose future was as bleak as Baley's own, nevertheless seemed to face it with humor. What on Earth is there to the situation to cause one to laugh like an idiot? Baley thought morosely.)

"Ignorance," said Baley slowly, "may mean nothing. A person may not know how to get to a certain place and yet may just happen to reach it while walking blindly. One might talk to Jander and, all unknowingly, push the button for mental freezeout."

Fastolfe said, "And the chances of that?"

"You're the expert, Dr. Fastolfe, and I suppose you will tell me they are very small."

"Incredibly small. A person may not know how to get to a certain place, but if the only route is a series of tight ropes stretched in sharply changing directions, what are the chances of reaching it by walking randomly while blindfolded?"

Gladia's hands fluttered in extreme agitation. She clenched her fists, as though to hold them steady, and brought them down on her knees. "I didn't do it, accident or not. I wasn't with him when it happened. I wasn't. I spoke to him in the morning. He was well, perfectly normal. Hours later, when I summoned him, he never came. I went in search of him and he was standing in his accustomed place, seeming quite normal. The trouble was, he didn't respond to me. He didn't respond at all. He has never responded since."

Baley said, "Could something you had said to him, quite in passing, have produced mind-freeze only after you had left him -an hour after, perhaps?"

Fastolfe interposed sharply, "Quite impossible, Mr. Baley. If mind-freeze is to take place, it takes place at once. Please do not badger Gladia in this fashion, She is incapable of producing mind-freeze deliberately and it is unthinkable that she would produce it accidentally."

"Isn't it unthinkable that it would be produced by random positronic drift, as you say it must have?"

"Not quite as unthinkable."

"Both alternatives are extremely unlikely. What is the difference in unthinkability?"

"A great one. I imagine that a mental freeze-out through positronic drift might have a probability of 1 in 10¹²; that by accidental pattern-building 1 in 10⁻⁹⁹. That is just an estimate, but a reasonable one. The difference is greater than that between a single electron and the entire Universe-and it is in favor of the positronic drift."

There was silence for a while.

Baley said, "Dr. Fastolfe, you said earlier that you couldn't stay long."

"I have stayed too long already."

"Good. Then would you leave now?"

Fastolfe began to rise, then said, "Why?"

"Because I want to speak to Gladia alone."

"To badger her?"

"I must question her without your interference. Our situation is entirely too serious to worry about politeness."

Gladia said, "I am not afraid of Mr. Baley, dear Doctor." She added wistfully, "My robots will protect me if his impoliteness becomes extreme."

Fastolfe smiled and said, "Very well, Gladia." He rose and held out his hand to her. She took it briefly.

He said, "I would like to have Giskard remain here for general protection-and Daneel will continue to be in the next room, if you don't mind. Could you lend me one of your own robots to escort me back to my establishment?"

"Certainly," said Gladia, raising her arms. "You know Pandion, I believe."

"Of course! A sturdy and reliable escort." He left, with the robot following closely.

Baley waited, watching Gladia, studying her. She sat there, her eyes on her hands, which were folded limply together in her lap.

Baley was certain there was more for her to tell. How he could persuade her to talk, he couldn't say, but of one thing more he was certain. While Fastolfe was there, she would not tell the whole truth.

24.

Finally, Gladia looked up, her face like a little girl's. She said in a small voice, "How are you, Elijah? How do you feel?"

"Well enough, Gladia."

She said, "Dr. Fastolfe said he would lead you here across the open and see to it that you would have to wait some time in the worst of it."

"Oh? Why was that? For the fun of it?"

"No, Elijah. I had told him how you reacted to the open. You remember the time you fainted and fell into the pond?"

Elijah shook his head quickly. He could not deny the event or his memory thereof, but neither did he approve of the reference. He said gruffly, "I'm not quite like that anymore. I've improved."

"But Dr. Fastolfe said he would test you. Was it all right?"

"It was sufficiently all right. I didn't faint." He remembered the episode aboard the spaceship during the approach to Aurora and ground his teeth faintly. That was different and there was no call to discuss the matter.

He said, in a deliberate change of subject, "What do I call you here? How do I address you?"

"You've been calling me Gladia."

"It's inappropriate, perhaps. I could say Mrs. Delmarre, but you may have-"

She gasped and interrupted sharply, "I haven't used that name since arriving here. Please don't you use it."

"What do the Aurorans call you, then?"

"They say Gladia Solaria, but that's just an indication that I'm an alien and I don't want that either. I am simply Gladia. One name. It's not an Auroran name and I doubt that there's another one on this planet, so it's sufficient. I'll continue to call you Elijah, if you don't mind."

"I don't mind."

Gladia said, "I would like to serve tea." It was a statement and Baley nodded.

He said, "I didn't know that Spacers drank tea."

"It's not Earth tea. It's a plant extract that is pleasant but is not considered harmful in any way. We call it tea."

She lifted her arm and Baley noted that the sleeve held tightly at the wrist and that joining it were thin, flesh-colored gloves. She was still exposing the minimum of body surface in his presence. She was still minimizing the chance of infection.

Her arm remained in the air for a moment and, after a few more moments, a robot appeared with a tray. He was patently even more primitive than Giskard, but he distributed the teacups, the small sandwiches, and the bite-sized bits of pastry smoothly. He poured tea with what amounted to grace.

Baley said curiously, "How do you do that, Gladia?"

"Do what, Elijah?"

"You lift your arm whenever you want something and the robots always know what it is. How did this one know you wanted tea served?"

"It's not difficult. Every time I lift my arm, it distorts a small electromagnetic field that is maintained continuously across the room. Slightly different positions of my hand and fingers produce different distortions and my robots can interpret these distortions as orders. I only use it for simple orders: Come here! Bring tea! and so on."

"I haven't noticed Dr. Fastolfe using the system at his establishment."

"It's not really Auroran. It's our system in Solaria and I'm used to it. -Besides, I always have tea at this time. Borgraf expects it."

"This is Borgraf?" Baley eyed the robot with some interest, aware that he had only glanced at him before. Familiarity was quickly breeding indifference. Another day and he would not notice robots at all. They would flutter about him unseen and chores would appear to do themselves.

Nevertheless, he did not want to fail to notice them. He wanted them to fail to be there. He said, "Gladia, I want to be alone with you. Not even robots. -Giskard, join Daneel. You can stand guard from there."

"Yes, sir," said Giskard, brought suddenly to awareness and response by the sound of his name.

Gladia seemed distantly amused. "You Earthpeople are so odd. I know you have robots on Earth, but you don't seem to know how to handle them. You bark your orders, as though they're deaf."

She turned to Borgraf and, in a low voice, said, "Borgraf, none of you are to enter the room until summoned. Do not interrupt us for anything short of a clear and present emergency."

Borgraf said, "Yes, ma'am." He stepped back, glanced over the table as though checking whether he had omitted anything, turned, and left the room.

Baley was amused, in his turn. Gladia's voice had been soft, but her tone had been as crisp as though she were a sergeant-major addressing a recruit. But then, why should he be surprised? He had long known that it was easier to see another's follies than one's own.

Gladia said, "We are now alone, Elijah. Even the robots are gone."

Baley said, "You are not afraid to be alone with me?"

Slowly, she shook her head. "Why should I be? A raised arm, a gesture, a startled outcry-and several robots would be here promptly. No one on any Spacer world has any reason to fear any other human being. This is not Earth. Whyever should you ask, anyway?"

"Because there are other fears than physical ones. I would not offer you violence of any kind or mistreat you physically in any way. But are you not afraid of my questioning and what it might uncover about you? Remember that this is not Solaria, either. On Solaria, I sympathized with you and was intent on demonstrating your innocence."

She said in a low voice, "Don't you sympathize with me now?"

"It's not a husband dead this time. You are not suspected of murder. It's only a robot that has been destroyed and, as far as I know, you are suspected of nothing. Instead, it is Dr. Fastolfe who is my problem. It is of the highest importance to me-for reasons I need not go into-that I be able to demonstrate his innocence. If the process turns out to be damaging to you, I will not be able to help it. I do not intend to go out of my way to save you pain. It is only fair that I tell you this."

She raised her head and fixed her eyes on his arrogantly. "Why should anything be damaging to me?"

"Perhaps we will now proceed to find out," said Baley coolly, "without Dr. Fastolfe present to interfere." He plucked one of the small sandwiches out of the dish with a small fork (there was no point in using his fingers and perhaps making the entire dish unusable to Gladia), scraped it off onto his own plate, popped it into his mouth, and then sipped at his tea.

She matched him sandwich for sandwich, sip for sip. If he were going to be cool, so was she, apparently.

"Gladia," said Baley, "it is important that I know, exactly, the relationship between you and Dr. Fastolfe. You live near him and the two of you form what is virtually a single robotic household. He is clearly concerned for you. He has made no effort to defend his own innocence, aside from the mere statement that he is innocent, but he defends you strongly the moment I harden my questioning."

Gladia smiled faintly. "What do you suspect, Elijah?"

Baley said, "Don't fence with me. I don't want to suspect. I want to know."

"Has Dr. Fastolfe mentioned Fanya?"

"Yes, he has."

"Have you asked him whether Fanya is his wife or merely his companion? Whether he has children?"

Baley stirred uneasily. He might have asked such questions, of course. In the close quarters of crowded Earth, however, privacy was cherished, precisely because it had all but perished. It was virtually impossible on Earth not to know all the facts about the family arrangements of others, so one never asked and pretended ignorance. It was a universally maintained fraud.

Here on Aurora, of course, the Earth ways would not hold, yet Baley automatically held with them. Stupid!

He said, "I have not yet asked. Tell me."

Gladia said, "Fanya is his wife. He has been married a number of times, consecutively of course, though simultaneous marriage for either or both sexes is not

entirely unheard of on Aurora." The bit of mild distaste with which she said that brought an equally mild defense. "It is unheard of on Solaria.

"However, Dr. Fastolfe's current marriage will probably soon be dissolved. Both will then be free to make new attachments, though often either or both parties do not wait for dissolution to do that. -I don't say I understand this casual way of treating the matter, Elijah, but it is how Aurorans build their relationships. Dr. Fastolfe, to my knowledge, is rather straitlaced. He always maintains one marriage or another and seeks nothing outside of it. On Aurora, that is considered old-fashioned and rather silly."

Baley nodded. "I've gathered something of this in my reading. Marriage takes place when there's the intention to have children, I understand."

"In theory, that is so, but I'm told hardly anyone takes that seriously these days. Dr. Fastolfe already has two children and can't have any more, but he still marries and applies for a third. He gets turned down, of course, and knows he will. Some people don't even bother to apply."

"Then why bother marrying?"

"There are social advantages to it. It's rather complicated and, not being an Auroran, I'm not sure I understand it."

"Well, never mind. Tell me about Dr. Fastolfe's children."

"He has two daughters by two different mothers. Neither of the mothers was Fanya, of course. He has no sons. Each daughter was incubated in the mother's womb, as is the fashion on Aurora. Both daughters are adults now and have their own establishments."

"Is he close with his daughters?"

"I don't know. He never talks about them. One is a roboticist and I suppose he must keep in touch with her work. I believe the other is running for office on the council of one of the cities or that she is actually in possession of the office. I don't really know."

"Do you know if there are family strains?"

"None that I am aware of, which may not go for much, Elijah. As far as I know, he is on civil terms with all his past wives. None of the dissolutions were carried through in anger. For one thing, Dr. Fastolfe is not that kind of person. I can't imagine him greeting anything in life with anything more extreme than a good-natured sigh of resignation. He'll joke on his deathbed."

That, at least, rang true, Baley thought. He said, "And Dr. Fastolfe's relationship to you. The truth, please. We are not in a position to dodge the truth in order to avoid embarrassment."

She looked up and met his eyes levelly. She said, "There is no embarrassment to avoid. Dr. Han Fastolfe is my friend, my very good friend."

"How good, Gladia?"

"As I said-very good."

"Are you waiting for the dissolution of his marriage so that you may be his next wife?"

"No." She said it very calmly.

"Are you lovers, then?"

"No."

"Have you been?"

"No. -Are you surprised?"

"I merely need information," said Baley.

"Then let me answer your questions connectedly, Elijah, and don't bark them at me as though you expected to surprise me into telling you something I would otherwise keep secret." She said it without noticeable anger. It was almost as though she were amused.

Baley, flushing slightly, was about to say that this was not at all his intention, but, of course, it was and he would gain nothing by denying it. He said in a soft growl, "Well, then, go ahead."

The remains of the tea littered the table between them. Baley wondered if, under ordinary conditions, she would not have lifted her arm and bent it just so-and if the robot, Borgraf, would not have then entered silently and cleared the table.

Did the fact that the litter remained upset Gladia-and would it make her less self-controlled in her response? If so, it had better remain-but Baley did not really hope for much, for he could see no signs of Gladia being disturbed over the mess or even of her being aware of it.

Gladia's eyes had fallen to her lap again and her face seemed to sink lower and to become a touch harsh, as though she were reaching into a past she would much rather obliterate.

She said, "You caught a glimpse of my life on Solaria. It was not a happy one, but I knew no other. It was not until I experienced a touch of happiness that I suddenly knew exactly to what an extent-and how intensively-my earlier life was not happy. The first hint came through you, Elijah."

"Through me?" Baley was caught by surprise.

"Yes, Elijah. Our last meeting on Solaria-I hope you remember it, Elijah-taught me something. I touched you! I removed my glove, one that was similar to the glove I am wearing now, and I touched your cheek. The contact did not last long. I don't know what it meant to you-no, don't tell me, it's not important-but it meant a great deal to me."

She looked up, meeting his eyes defiantly. "It meant ever thing to me. It changed my life. Remember, Elijah, that until then, after my few years of childhood, I had never touched a man-or any human being, actually-except for my husband. And I touched my husband very rarely. I had viewed men on trimensic, of course, and in the process I had become entirely familiar with every physical aspect of males, every part of them. I had nothing to learn, in that respect.

"But I had no reason to think that one man felt much different from another. I knew what my husband's skin felt like, what his hands felt like when he could bring himself to touch me, what- everything. I had no reason to think that anything would be different with any man. There was no pleasure in contact with my husband, but why should there be? Is

there particular pleasure in the contact of my fingers with this table, except to the extent that I might appreciate its physical smoothness?

"Contact with my husband was part of an occasional ritual that he went through because it was expected of him and, as a good Solarian, he therefore carried it through by the calendar and clock and for the length of time and in the manner prescribed by good breeding. Except that, in another sense, it wasn't good breeding, for although this periodic contact was for the precise purpose of sexual intercourse, my husband had not applied for a child and was not interested, I believe, in producing one. And I was too much in awe of him to apply for one on my own initiative, as would have been my right.

"As I look back on it, I can see that the sexual experience was perfunctory and mechanical. I never had an orgasm. Not once. That such a thing existed I gathered from some of my reading, but the descriptions merely puzzled me and-since they were to be found only in imported books-Solarian books never dealt with sex-I could not trust them. I thought they were merely exotic metaphors.

"Nor could I' experiment-successfully, at least-with autoeroticism. Masturbation is, I think, the common word. At least, I have heard that word used on Aurora. On Solaria, of course, no aspect of sex is ever discussed, nor is any sex-related word used in polite society. -Nor is there any other kind of society on Solaria.

"From something I occasionally read, I had an idea of how one might go about masturbating and, on a number of occasions, I made a halfhearted attempt to do what was described. I could not carry it through. The taboo against touching human flesh made even my own seem forbidden and unpleasant to me. I could brush my hand against my side, cross one leg over another, feel the pressure of thigh against thigh, but these were casual touches, unregarded. To make the process of touch an instrument of deliberate pleasure was different. Every fiber of me knew it shouldn't be done and, because I knew that, the pleasure wouldn't come.

"And it never occurred to me, never once, that there might be pleasure in touching under other circumstances. Why should it occur to me? How could it occur to me?

"Until I touched you that time. Why I did, I don't know. I felt a gush of affection for you because you had saved me from being a murderess. And besides, you were not altogether forbidden. You were not a Solarian. You were not-forgive me-altogether a man. You were a creature of Earth. You were human in appearance, but you were short-lived and infection-prone, something to be dismissed as semi human at best.

"So because you had saved me and were not really a man, I could touch you. And what's more, you looked at me not with the hostility and repugnance of my husband-or with the carefully schooled indifference of someone viewing me on trimensic. You were right there, palpable, and your eyes were warm and concerned. You actually trembled when my hand approached your cheek. I saw that.

"Why it was, I don't know. The touch was so fugitive and there was no way in which the physical sensation was different from what it would have been if I had touched my husband or any other man-or, perhaps, even any woman. But there was more to it than

the physical sensation. You were there, you welcomed it, you showed me every sign of what I accepted as- affection. And when our skins-my hand, your cheek-made contact, it was as though I had touched gentle fire that made its way up my hand and arm instantaneously and set me all in flame.

"I don't know how long it lasted-it couldn't be for more than a moment or two-but for me time stood still. Something happened to me that had never happened to me before and, looking back on it long afterward, when I had learned about it, I realized that I had very nearly experienced an orgasm.

"I tried not to show it-"

(Baley, not daring to look at her, shook his head.)

"Well, then, I didn't show it. I said, 'Thank you, Elijah.' I said it for what you had done for me in connection with my husband's death. But I said it much more for lighting my life and showing me, without even knowing it, what there was in life; for opening a door; for revealing a path; for pointing out a horizon. The physical act was nothing in itself. Just a touch. But it was the beginning of everything."

Her voice had faded out and, for a moment, she said nothing, remembering.

Then one finger lifted. "No. Don't say anything. I'm not done yet.

"I had had imaginings before, very vague uncertain things. A man and I, doing what my husband and I did, but somehow different-I didn't even know different in what Sway-and feeling something different-something I could not even imagine when imagining with all my might. I might conceivably have gone through my whole life trying to imagine the unimaginable and I might have died as I suppose women on Solaria-and men, too-often do, never knowing, even after three or four centuries. Never knowing. Having children, but never knowing.

"But one touch of your cheek, Elijah, and I knew. Isn't that amazing? You taught me what I might imagine. Not the mechanics of it, not the dull, reluctant approach of bodies, but something that I could never have conceived as having anything to do with it. The look on a face, the sparkle in an eye, the feeling of -gentleness, kindness- something I can't even describe -acceptance- a lowering of the terrible barrier between individuals. Love, I suppose -a convenient word to encompass all of that and more.

"I felt love for you, Elijah, because I thought you could feel love for me. I don't say you loved me, but it seemed to me you could. I never had that and, although in ancient literature they talked of it, I didn't know what they meant any more than when men in those same books talked about 'honor' and killed each other for its sake. I accepted the word, but never made Out its meaning. I still haven't. And so it was with 'love' until I touched you.

"After that I could imagine-and I came to Aurora remembering you, and thinking of you, and talking to you endlessly in my mind, and thinking that in Aurora I would meet a million Elijahs."

She stopped, lost in her own thoughts for a moment, then suddenly went on:

"I didn't. Aurora, it turned out, was, in its way, as bad as Solaria. In Solaria, sex was wrong. It was hated and we all turned away from it. We could not love for the hatred that sex aroused.

"In Aurora, sex was boring. It was accepted calmly, easily-as easily as breathing. If one felt the impulse, one reached out toward anyone who seemed suitable and, if that suitable person was not at the moment engaged in something that could not be put aside, sex followed in any fashion that was convenient. Like breathing. -But where is the ecstasy in breathing? If one were choking, then perhaps the first shuddering breath that followed upon deprivation might be an overwhelming delight and relief. But if one never choked?

"And if one never unwillingly went without sex? If it were taught to youngsters on an even basis with reading and programming? If children were expected to experiment as a matter of course, and if older children were expected to help out?

"Sex-permitted and free as water-has nothing to do with love on Aurora, just as sex-forbidden and a thing of shame- has nothing to do with love on Solaria. In either case, children are few and must come about only after formal application.

-And then, if permission is granted, there must be an interlude of sex designed for childbearing only, dull and brackish. If, after a reasonable time, impregnation doesn't follow, the spirit rebels and artificial insemination is resorted to.

"In time, as on Solaria, ectogenesis will be the thing, so that fertilization and fetal development will take place in genotaria and sex will be left to itself as a form of social interaction and play that has no more to do with love than space-polo does.

"I could not move into the Auroran attitude, Elijah. I had not been brought up to it. With terror, I had reached out for sex and no one refused-and no one mattered. Each man's eyes were blank when I offered myself and remained blank as they accepted. Another one, they said, what matter? They were willing, but no more than willing.

"And touching them meant nothing. I might have been touching my husband. I learned to go through with it, to follow their lead, to accept their guidance-and it all still meant nothing. I gained not even the urge to do it to myself and by myself. The feeling you had given me never returned and, in time, I gave up.

"In all this, Dr. Fastolfe was my friend. He alone, on all Aurora, knew everything that happened on Solaria. At least, so I think You know that the full story was not made public and certainly did not appear in that dreadful hyperwave program that I've heard of-I refused to watch it.

"Dr. Fastolfe protected me against the lack of understanding on the part of Aurorans and against their general contempt for Solarians. He protected me also against the despair that filled me after a while.

"No, we were not lovers. I would have offered myself, but by the time it occurred to me that I might do so, I no longer felt that the feeling you had inspired, Elijah, would ever recur. I thought it might have been a trick of memory and I gave up. I did not offer myself. Nor did he offer himself. I do not know why he did not. Perhaps he could see that my despair arose over my failure to find anything useful in sex and did not want to

accentuate the despair by repeating the failure. It would be typically kind of him to be careful of me in this way-so we were not lovers. He was merely my friend at a time when I needed that so much more.

"There you are, Elijah. You have the whole answer to the questions you asked. You wanted to know my relationship with Dr. Fastolfe and said you needed information. You have it. Are you satisfied?"

Baley tried not let his misery show. "I am sorry, Gladia, that life has been so hard for you. You have given me the information I needed. You have given me more information than, perhaps, you think you have."

Gladia frowned. "In what way?"

Baley did not answer directly. He said, "Gladia, I am glad that your memory of me has meant so much to you. It never occurred to me at any time on Solaria, that I was impressing you so and, even if it had, I would not have tried- You know."

"I know, Elijah," she said, softening. "Nor would it have availed you if you had tried. I couldn't have."

"And I know that. -Nor do I take what you have told me as an invitation now. One touch, one moment of sexual insight, need be no more than that. Very likely, it can never be repeated and that onetime existence ought not to be spoiled by foolish attempts at resurrection. That is a reason why I do not now-offer myself. My failure to do so is not to be interpreted as one more blank ending for you. Besides-

"Yes."

"You have, as I said earlier, told me perhaps more than you realize you did. You have told me that the story does not end with your despair."

"Why do you say that?"

"In telling me of the feeling that was inspired by the touch upon my cheek, you said something like 'looking back on it long afterward, when I had learned, I realized that I had very nearly experienced an orgasm.' -But then you went on to explain that sex with Aurorans was never successful and, I presume, you did not then experience orgasm either. Yet you must have, Gladia, if you recognized the sensation you experienced that time on Solaria. You could not look back and recognize it for what it was, unless you had learned to love successfully. In other words, you have had a lover and you have experienced love. If I am to believe that Dr. Fastolfe is not your lover and has not been, then it follows that someone else is-or was."

"And if so? Why is that your concern, Elijah?"

"I don't know if it is or is not, Gladia. Tell me who it is and, if it proves to be not my concern, that will be the end of it."

Gladia was silent.

Baley said, "If you don't tell me, Gladia, I will have to tell you. I told you earlier that I am not in a position to spare your feelings."

Gladia remained silent, the corners of her lips whitening with pressure.

"It must be someone, Gladia, and your sorrow over Jander's loss is extreme. You sent Daneel out because you could not bear to look at him for the reminder of Jander

that his face brought. If I am wrong in deciding that it was Jander Panell-" He paused a moment, then said harshly, "If the robot, Jander Panell, was not your lover, say so."

And Gladia whispered, "Jander Panell, the robot, was not my lover." Then, loudly and firmly, she said, "He was my husband!"

25.

Baley's lips moved soundlessly, but there was no mistaking the tetra-syllabic exclamation.

"Yes," said Gladia. "Jehoshaphat! You are startled. Why? Do you disapprove?"

Baley said tonelessly, "It is not my place either to approve or disapprove."

"Which means you disapprove."

"Which means I seek only information. How does one distinguish between a lover and a husband on Aurora?"

"If two people live together in the same establishment for a period of time, they may refer to each other as 'wife' or 'husband,' rather than as 'lover.'"

"How long a period of time?"

"That varies from region to region, I understand, according to local option. In the city of Eos, the period of time is three months."

"Is it also required that during this period of time one refrain from sexual relations with others?"

Gladia's eyebrows lifted in surprise. "Why?"

"I merely ask."

"Exclusivity is unthinkable on Aurora. Husband or lover, it makes no difference. One engages in sex at pleasure."

"And did you please while you were with Jander?"

"As it happens I did not, but that was my choice."

"Others offered themselves?"

"Occasionally."

"And you refused?"

"I can always refuse at will. That is part of the non-exclusivity."

"But did you refuse?"

"I did."

"And did those whom you refused know why you refused?"

"What do you mean?"

"Did they know that you had a robot husband?"

"I had a husband. Don't call him a robot husband. There is no such expression."

"Did they know?"

She paused. "I don't know if they knew."

"Did you tell them?"

"What reason was there to tell them?"

"Don't answer my questions with questions. Did you tell them?"

"I did not."

"How could you avoid that? Don't you think an explanation for your refusal would have been natural?"

"No explanation is ever required. A refusal is simply a refusal and is always accepted. I don't understand you."

Baley stopped to gather his thoughts. Gladia and he were not at cross-purposes; they were running down parallel tracks.

He started again. "Would it have seemed natural on Solaria to have a robot for a husband?"

"On Solaria, it would have been unthinkable and I would never have thought of such a possibility. On Solaria, everything was unthinkable. -And on Earth, too, Elijah. Would your wife ever have taken a robot for a husband?"

"That's irrelevant, Gladia."

"Perhaps, but your expression was answer enough. We may not be Aurorans, you and I, but we are on Aurora. I have lived here for two years and I accept its mores."

"Do you mean that human-robot sexual connections are common here on Aurora?"

"I don't know. I merely know that they are accepted because everything is accepted where sex is concerned-everything that is voluntary, that gives mutual satisfaction, and that does no physical harm to anyone. What conceivable difference would it make to anyone else how an individual or any combination of individuals found satisfaction? Would anyone worry about which books I viewed, what food I ate, what hour I went to sleep or awoke, whether I was fond of cats or disliked roses? Sex, too, is a matter of indifference-on Aurora."

"On Aurora," echoed Baley. "But you were not born on Aurora and were not brought up in its ways. You told me just a while ago that you couldn't adjust to this very indifference to sex that you now praise. Earlier, you expressed your distaste for multiple marriages and for easy promiscuity. If you did not tell those whom you refused why you refused, it might have been because, in some hidden pocket of your being, you were ashamed of having Jander as a husband. You might have known-or suspected, or even merely supposed-that you were unusual in this- unusual even on Aurora-and you were ashamed."

"No, Elijah, you won't talk me into being ashamed. If having a robot as a husband is unusual even on Aurora, that would be because robots like Jander are unusual. The robots we have on Solaria, or on Earth-or on Aurora, except for Jander and Daneel-are not designed to give any but the most primitive sexual satisfaction. They might be used as masturbation devices, perhaps, as a mechanical vibrator might be, but nothing much more. When the new humaniform robot becomes widespread, so will human-robot sex become widespread."

Baley said, "How did you come to possess Jander in the first place, Gladia? Only two existed-both in Dr. Fastolfe's establishment. Did he simply give one of them-half of the total-to you?"

"Yes."

"Why?"

"Out of kindness, I suppose. I was lonely, disillusioned, wretched, a stranger in a strange land. He gave me Jander for company and I will never be able to thank him enough for it. It only lasted for half a year, but that half-year may be worth all my life beside."

"Did Dr. Fastolfe know that Jander was your husband?"

"He never referred to it, so I don't know."

"Did you refer to it?"

"Why not?"

"I saw no need. -And no, it was not because I felt shame."

"How did it happen?"

"That I saw no need?"

"No. That Jander became your husband."

Gladia stiffened. She said in a hostile voice, "Why do I have to explain that?"

Baley said, "Gladia, it's getting late. Don't fight me every step of the way. Are you distressed that Jander is-is gone?"

"Need you ask?"

"Do you want to find out what happened?"

"Again, need you ask?"

"Then help me. I need all the information I can get if I am to begin_-even begin-to make progress in working out an apparently insoluble problem. How did Jander become your husband?"

Gladia sat back in her chair and her eyes were suddenly brimming with tears. She pushed at the plate of crumbs that had once been pastry and said in a choked voice:

"Ordinary robots do not wear clothes, but they are so designed as to give the effect of wearing clothes. I know robots well, having lived on Solaria, and I have a certain amount of artistic talent-"

"I remember your light-forms," said Baley softly.

Gladia nodded in acknowledgment. "I constructed a few designs for new models that would possess, in my opinion, more style and more interest than some of those in use in Aurora. Some of my paintings, based on those designs, are on the walls here. Others I have in other places in this establishment."

Baley's eyes moved to the paintings. He had seen them. They were of robots, unmistakably. They were not naturalistic, but seemed elongated and unnaturally curved. He noted now that the distortions were so designed as to stress, quite cleverly, those portions which, now that he looked at them from a new perspective, suggested clothing. Somehow there was an impression of servants' costumes he had once viewed in a book devoted to the Victorian England of medieval times. Did Gladia know of these things or

was it a merely chance, if circumstantial, similarity? It was a question of no account, probably, but not something (perhaps) to be forgotten.

When he had first noticed them, he had thought it was Gladia's way of surrounding herself with robots in imitation of life on Solaria. She hated that life, she said, but that was only a product of her thinking mind. Solaria had been the only home she had really known and that is not easily sloughed off- perhaps not at all. And perhaps that remained a factor in her painting, even if her new occupation gave her a more plausible motive.

She was speaking. "I was successful. Some of the robot-manufacturing concerns paid well for my designs and there were numerous cases of existing robots being resurfaced according to my directions. There was a certain satisfaction in all this that, in a small measure, compensated for the emotional emptiness of my life.

"When Jander was given me by Dr. Fastolfe, I had a robot who, of course, wore ordinary clothing. The dear doctor was, indeed, kind enough to give me a number of changes of clothing for Jander.

"None of it was in the least imaginative and it amused me to buy what I considered more appropriate garb. That meant measuring him quite accurately, since I intended to have my designs made to order-and that meant having him remove his clothing in stages.

"He did so-and it was only when he was completely unclothed that I quite realized how close to human he was. Nothing was lacking and those portions which might be expected to be erectile were, indeed, erectile. Indeed, they were under what, in a human, would be called conscious control. Jander could tumesce and detumesce on order. He told me so when I asked him if his penis was functional in that respect. I was curious and he demonstrated.

"You must understand that, although he looked very much like a man, I knew he was a robot. I have a certain hesitation about touching men-you understand-and I have no doubt that played a part in my inability to have satisfactory sex with Aurorans. But this was not a man and I had been with robots all my life. I could touch Jander freely.

"It didn't take me long to realize that I enjoyed touching him and it didn't take Jander long to realize that I enjoyed it. He was a finely tuned robot who followed the Three Laws carefully. To have failed to give joy when he could would have been to disappoint. Disappointment could be reckoned as harm and he could not harm a human being. He took infinite care then to give me joy and, because I saw in him the desire to give joy, something I never saw in Auroran men, I was indeed joyful and, eventually, I found out, to the full, I think, what an orgasm is."

Baley said, "You were, then, completely happy?"

"With Jander? Of course. Completely."

"You never quarreled?"

"With Jander? How could I? His only aim, his only reason for existence, was to please me."

"Might that not disturb you? He only pleased you because he had to."

"What motive would anyone have to do anything but that, for one reason or another, he had to?"

"And you never had the urge to try real-to try Aurorans after you had learned to experience orgasm?"

"It would have been an unsatisfactory substitute. I wanted only Jander. -And do you understand, now, what I have lost?"

Baley's naturally grave expression lengthened into solemnity. He said, "I understand, Gladia. If I gave you pain earlier, please forgive me, for I did not entirely understand then."

But she was weeping and he waited, unable to say anything more, unable to think of a reasonable way to console her.

Finally, she shook her head and wiped her eyes with the back of her hand. She whispered, "Is there anything more?"

Baley said apologetically, "A few questions on another subject and then I will be through annoying you." He added cautiously, "For now."

"What is it?" She seemed very tired.

"Do you know that there are people who seem to think that Dr. Fastolfe was responsible for the killing of Jander?"

"Yes."

"Do you know that Dr. Fastolfe himself admits that only he possesses the expertise to kill Jander in the way that he was killed?"

"Yes. The dear doctor told me so himself."

"Well, then, Gladia, do you think Dr. Fastolfe killed Jander?" She looked up at him, suddenly and sharply, and then said angrily, "Of course not. Why should he? Jander was his robot to begin with and he was full of care for him. You don't know the dear doctor as I do, Elijah. He is a gentle person who would hurt no one and who would never hurt a robot. To suppose he would kill one is to suppose that a rock would fall upward."

"I have no further questions, Gladia, and the only other business I have here, at the moment, is to see Jander-what remains of Jander-if I have your permission."

She was suspicious again, hostile. "Why? Why?"

"Gladia! Please! I don't expect it to be of any use, but I must see Jander and know that seeing him is of no use. I will try to do nothing that will offend your sensibilities."

Gladia stood up. Her gown, so simple as to be nothing more than a closely fitting sheath, was not black (as it would have been on Earth) but of a dull color that showed no sparkle anywhere in it. Baley, no connoisseur of clothing, realized how well it represented mourning.

"Come with me," she whispered.

26.

Baley followed Gladia through several rooms, the walls of which glowed dully. On one or two occasions, he caught a hint of movement, which he took to be a robot getting rapidly out of the way, since they had been told not to intrude.

Through a hallway, then, and up a short flight of stairs into a small room in which one part of one wall gleamed to give the effect of a spotlight.

The room held a cot and a chair-and no other furnishings.

"This was his room," said Gladia. Then, as though answering Baley's thought, she went on to say, "It was all he needed. I left him alone as much as I could-all day if I could. I did not want to ever grow tired of him." She shook her head. "I wish now I had stayed with him every second. I didn't know our time would be so short. -Here he is."

Jander was lying on the cot and Baley looked at him gravely. The robot was covered with a smooth and shiny material. The spotlighted wall cast its glow on Jander's head, which was smooth and almost inhuman in its serenity. The eyes were wide open, but they were opaque and lusterless. He looked enough like Daneel to give ample point to Gladia's discomfort at Daneel's presence. His neck and bare shoulders showed above the sheet.

Baley said, "Has Dr. Fastolfe inspected him?"

"Yes, thoroughly. I came to him in despair and, if you had seen him rush here, the concern he felt, the pain, the-the panic, you would never think he could have been responsible. There was nothing he could do."

"Is he unclothed?"

"Yes. Dr. Fastolfe had to remove the clothing for a thorough examination. There was no point in replacing them."

"Would you permit me to remove the covering, Gladia?"

"Must you?"

"I do not wish to be blamed for having missed some obvious point of examination."

"What can you possibly find that Dr. Fastolfe didn't?"

"Nothing, Gladia, but I must know that there is nothing for me to find. Please cooperate."

"Well, then, go ahead, but please put the covering back exactly as it is now when you are done."

She turned her back on him and on Jander, put her left arm against the wall, and rested her forehead on it. There was no sound from her-no motion_-but Baley knew that she was weeping again.

The body was, perhaps, not quite human. The muscular contours were somehow simplified and a bit schematic, but all the parts were there: nipples, navel, penis, testicles, pubic hair, and so on. Even fine, light hair on the chest.

How many days was it since Jander had been killed? It struck Baley that he didn't know, but it had been sometime before his trip to Aurora had begun. Over a week had passed and there was no sign of decay, either visually or olfactorily. A clear robotic difference.

Baley hesitated and then thrust one arm under Jander's shoulders and another under his hips, working them through to the other side. He did not consider asking for

Gladia's help-that would be impossible. He heaved and, with some difficulty, turned Jander over without throwing him off the cot.

The cot creaked. Gladia must know what he was doing, but she did not turn around. Though she did not offer to help, she did not protest either.

Baley withdrew his arms. Jander felt warm to the touch. Presumably, the power unit continued to do so simple a thing as to maintain temperature, even with the brain inoperative. The body felt firm and resilient, too. Presumably, it never went through any stage analogous to rigor mortis.

One arm was now dangling off the cot in quite a human fashion. Baley moved it gently and released it. It swung to and fro slightly and came to a halt. He bent one leg at the knee and studied the foot, then the other. The buttocks were perfectly formed and there was even an anus.

Baley could not get rid of the feeling of uneasiness. The notion that he was violating the privacy of a human being would not go away. If it were a human corpse, its coldness and its stiffness would have deprived it of humanity.

He thought uncomfortably: A robot corpse is much more human than a human corpse.

Again he reached under Jander, lifted, and turned him over. He smoothed out the sheet as best he could, then replaced the cover as it had been and smoothed that. He stepped back and decided it was as it had been at first-or as near to that as he could manage.

"I'm finished, Gladia," he said.

She turned, looked at Jander with wet eyes, and said, "May we go, then?"

"Yes, of course, but Gladia-

"Well?"

"Will you be keeping him this way? I imagine he won't decay."

"Does it matter if I do?"

"In some ways, yes. You must give yourself a chance to recover. You can't spend three centuries mourning. What is over is over." (His statements sounded hollowly sententious in his own ear. What must they have sounded like in hers?)

She said, "I know you mean it kindly, Elijah. I have been requested to keep Jander till the investigation is done. He will then be torched at my request."

"Torched?"

"Put under a plasma torch and reduced to his elements, as human corpses are. I will have holograms of him-and memories. Will that satisfy you?"

"Of course. I must return to Dr. Fastolfe's house now."

"Yes. Have you learned anything from Jander's body?"

"I did not expect to, Gladia."

She faced him full. "And Elijah, I want you to find who did this and why. I must know."

"But Gladia-

She shook her head violently, as though keeping out anything she wasn't ready to hear. "I know you can do this."

7. AGAIN FASTOLFE

27.

Baley emerged from Gladia's house into the sunset. He turned toward what he assumed must be the western horizon and found Aurora's sun, a deep scarlet in color, topped by thin strips of ruddy clouds set in an apple-green sky.

"Jehoshaphat," he murmured. Clearly, Aurora's sun, cooler and more orange than Earth's sun, accentuated the difference at setting, when its light passed through a greater thickness of Aurora.

Daneel was behind him; Giskard, as before, well in front.

Daneel's voice was in his ear. "Are you well, Partner Elijah?"

"Quite well," said Baley, pleased with himself. "I'm handling the Outside well, Daneel. I can even admire the sunset. Is it always like this?"

Daneel gazed dispassionately at the setting sun and said, "Yes. But let us move quickly toward Dr. Fastolfe's establishment. At this time of year, the twilight does not last long, Partner Elijah, and I would wish you there while you can still see easily."

"I'm ready. Let's go." Baley wondered if it might not be better to wait for the darkness. It would not be pleasant not to see, but, then, it would give him the illusion of being enclosed-and he was not, in his heart, sure as to how long this euphoria induced by admiring a sunset (a sunset, mind you, Outside) would last.

But that was a cowardly uncertainty and he would not own up to it.

Giskard noiselessly drifted backward toward him and said, "Would you prefer to wait, sir? Would the darkness suit you better? We ourselves will not be discommoded."

Baley became aware of other robots, farther off, on every side. Had Gladia marked off her field robots for guard duty or had Fastolfe sent his?

It accentuated the way they were all caring for him and, perversely, he would not admit to weakness. He said, "No, we'll go now," and struck off at a brisk walk toward Fastolfe's establishment, which he could just see through the distant trees.

Let the robots follow or not, as they wished, he thought boldly. He knew that, if he let himself think about it, there would be something within him that would still quail at the thought of himself on the outer skin of a planet with no protection but air between himself and the great void, but he would not think of it.

It was the exhilaration at being free of the fear that made his jaws tremble and his teeth click. Or it was the cool wind of evening that did it-and that also set the gooseflesh to appearing on his arms.

It was not the Outside.

It was not.

He said, trying to unclench his teeth, "How well did you know Jander, Daneel?"

Daneel said, "We were together for some time. From the time of friend Jander's construction, till he passed into the establishment of Miss Gladia, we were together steadily."

"Did it bother you, Daneel, that Jander resembled you so closely?"

"No, sir. He and I each knew ourselves apart, Partner Elijah, and Dr. Fastolfe did not mistake us either. We were, therefore, two individuals."

"And could you tell them apart, too, Giskard?" They were closer to him now, perhaps because the other robots had taken over the long-distance duties.

Giskard said, "There was no occasion, as I recall, on which it was important that I do so."

"And if there had been, Giskard?"

"Then I could have done so."

"What was your opinion of Jander, Daneel?"

Daneel said, "My opinion, Partner Elijah? Concerning what aspect of Jander do you wish my opinion?"

"Did he do his work well, for instance?"

"Certainly."

"Was he satisfactory in every way?"

"In every way, to my knowledge."

"How about you, Giskard? What is your opinion?"

Giskard said, "I was never as close to friend Jander as friend Daneel was and it would not be proper for me to state an opinion. I can say that, to my knowledge, Dr. Fastolfe was uniformly pleased with friend Jander. He seemed equally pleased with friend Jander and with friend Daneel. However, I do not think my programming is such as to allow me to offer certainty in such matters."

Baley said, "What about the period after Jander entered the household of Miss Gladia? Did you know him then, Daneel?"

"No, Partner Elijah. Miss Gladia kept him at her establishment. On those occasions when she visited Dr. Fastolfe, he was never with her, as far as I was aware. On occasions when I accompanied Dr. Fastolfe on a visit to Miss Gladia's establishment, I did not see friend Jander."

Baley felt a little surprised at that. He turned to Giskard in order to ask the same question, paused, and then shrugged. He was not really getting anywhere and, as Dr. Fastolfe had indicated earlier, there is not really much use in cross-examining a robot. They would not knowingly say anything that would harm a human being, nor could they be badgered, bribed, or cajoled into it. They would not openly lie, but they would remain stubbornly-if politely-insistent on giving useless answers.

And-perhaps-it no longer mattered.

They were at Fastolfe's doorstep now and Baley felt his breath quickening. The trembling of his arms and lower lip, he was confident, was, indeed, only because of the cool wind.

The sun had gone now, a few stars were visible, the sky was darkening to an odd greenish-purple that made it seem bruised, and he passed through the door into the warmth of the glowing walls.

He was safe.

Fastolfe greeted him. "You are back in good time, Mr. Baley. Was your session with Gladia fruitful?"

Baley said, "Quite fruitful, Dr. Fastolfe. It is even possible that I hold the key to the answer in my hand."

28.

Fastolfe merely smiled politely, in a way that signaled neither surprise, elation, nor disbelief. He led the way into what was obviously a dining room, a smaller and friendlier one than the one in which they had had lunch.

"You and I, my dear Mr. Baley," said Fastolfe pleasantly, "will eat an informal dinner alone. Merely the two of us. We will even have the robots absent if that will please you. Nor shall we talk business unless you desperately want to."

Baley said nothing, but paused to look at the walls in astonishment. They were a wavering, luminous green, with differences in brightness and in tint that were slowly progressive from bottom to top. There was a hint of fronds of deeper green and shadowy flickers this way and that. The walls made the room appear to be a well-lit grotto at the bottom of a shallow arm of the sea. The effect was vertiginous—at least, Baley found it so.

Fastolfe had no trouble interpreting Baley's expression. He said, "It's an acquired taste, Mr. Baley, I admit. -Giskard, subdue the wall illumination. -Thank you."

Baley drew a breath of relief. "And thank you, Dr. Fastolfe. May I visit the Personal, sir?"

"But of course."

Baley hesitated. "Could you—"

Fastolfe chuckled. "You'll find it perfectly normal, Mr. Baley. You will have no complaints."

Baley bent his head. "Thank you very much."

Without the intolerable make-believe, the Personal—he believed it to be the same one he had used earlier in the day—was merely what it was, a much more luxurious and hospitable one than he had ever seen. It was incredibly different from those on Earth, which were rows of identical units stretching indefinitely, each ticked off for use by one—and only one—individual at a time.

It gleamed somehow with hygienic cleanliness. Its outermost molecular layer might have been peeled off after every use and a new layer laid on. Obscurely, Baley felt that, if he stayed on Aurora long enough, he would find it difficult to readjust himself to Earth's crowds, which forced hygiene and cleanliness into the background—something to pay a distant obeisance to—a not quite attainable ideal.

Baley, standing there surrounded by conveniences of ivory and gold (not real ivory, no doubt, nor real gold), gleaming and smooth, suddenly found himself shuddering at Earth's casual exchange of bacteria and wincing at its richness in infectivity. Was that not what the Spacers felt? Could he blame them?

He washed his hands thoughtfully, playing with the tiny touches here and there along the control-strip in order to change the temperature. And yet these Aurorans were so unnecessarily garish in their interior decorations, so insistent in pretending they were living in a state of nature when they had tamed nature and broken it. -Or was that only Fastolfe?

After all, Gladia's establishment had been far more austere.

-Or was that only because she had been brought up on Solaria?

The dinner that followed was an unalloyed delight. Again, as at lunch, there was the distinct feeling of being closer to nature. The dishes were numerous-each different, each in small portions-and, in a number of cases, it was possible to see that they had once been part of plants and animals. He was beginning to look upon the inconveniences-the occasional small bone, bit of gristle, strand of fiber, which might have repelled him earlier- as a bit of adventure.

The first course was a little fish-a little fish that one ate whole, with whatever internal organs it might have-and that struck him, at first sight, as another foolish way of rubbing one's nose in Nature with a capital "N." But he swallowed the little fish anyway, as Fastolfe did, and the taste converted him at once. He had never experienced anything like it. It was as though taste buds had suddenly been invented and inserted in his tongue.

Tastes changed from dish to dish and some were distinctly odd and not entirely pleasant, but he found it didn't matter. The thrill of a distinct taste, of different distinct tastes (at Fastolfe's instruction, he took a sip of faintly flavored water between dishes) was what counted-and not the inner detail.

He tried not to gobble, nor to concentrate his attention entirely on the food, nor to lick his plate. Desperately, he continued to observe and imitate Fastolfe and to ignore the other's kindly but definitely amused glance.

"I trust," said Fastolfe, "you find this to your taste."

"Quite good," Baley managed to choke out.

"Please don't force yourself into useless politeness. Do not eat anything that seems strange or unpalatable to you. I will have additional helpings of anything you do like brought in its place."

"Not necessary, Dr. Fastolfe. It is all rather satisfactory."

"Good."

Despite Fastolfe's offer to eat without robots present, it was a robot who served. (Fastolfe, accustomed to this, probably did not even notice the fact, Baley thought-and he did not bring the matter up.)

As was to be expected, the robot was silent and his motions were flawless. His handsome livery seemed to be out of historical dramas that Baley had seen on

hyperwave. It was only at very close view that one could see how much the costume was an illusion of the lighting and how close the robot exterior was to a smooth metal finish-and no more.

Baley said, "Has the waiter's surface been designed by Gladia?"

"Yes," said Fastolfe, obviously pleased. "How complimented she will feel to know that you recognized her touch. She is good, isn't she? Her work is coming into increasing popularity and she fills a useful niche in Auroran society."

Conversation throughout the meal had been pleasant but unimportant. Baley had had no urge to "talk business" and had, in fact, preferred to be largely silent while enjoying the meal and leaving it to his unconscious-or whatever faculty took over in the absence of hard thought-to decide on how to approach the matter that seemed to him now to be the central point of the Jander problem.

Fastolfe took the matter out of his hands, rather, by saying, "And now that you've mentioned Gladia, Mr. Baley, may I ask how it came about that you left for her establishment rather deep in despair and have returned almost buoyant and speaking of perhaps having the key to the whole affair in your hand? Did you learn something new-and unexpected, perhaps-at Gladia's?"

"That I did," said Baley absently-but he was lost in the dessert, which he could not recognize at all, and of which (after some yearning in his eyes had acted to inspire the waiter) a second small helping was placed before him. He felt replete. He had never in his life so enjoyed the act of eating and for the first time found himself resenting the physiological limits that made it impossible to eat forever. He felt rather ashamed of himself that he should feel so.

"And what was it learned that was new and unexpected?" asked Fastolfe with quiet patience. "Presumably something I didn't know myself?"

"Perhaps. Gladia told me that you had given Jander to her about half a year ago."

Fastolfe nodded. "I knew that. So I did."

Baley said sharply, "Why?"

The amiable look on Fastolfe's face faded slowly. Then he said, "Why not?"

Baley said, "I don't know why not, Dr. Fastolfe. I don't care. My question is: Why?"

Fastolfe shook his head slightly and said nothing.

Baley said, "Dr. Fastolfe, I am here in order to straighten out what seems to be a miserable mess. Nothing you have done- nothing-has made things simple. Rather, you have taken what seems to be pleasure in showing me how bad a mess it is and in destroying any speculation I may advance as a possible solution. Now, I don't expect others to answer my questions. I have no official standing on this world and have no right to ask questions, let alone force answers.

"You, however, are different. I am here at your request and I am trying to save your career as well as mine and, according to your own account of matters, I am trying to save Aurora as well as Earth. Therefore, I expect you to answer my questions fully and truthfully. Please don't indulge in stalemating tactics, such as asking me why not when I ask why. Now, once again-and for the last time: Why?"

Fastolfe thrust out his lips and looked grim. "My apologies, Mr. Baley. If I hesitated to answer, it is because, looking back on it, it seems there is no very dramatic reason. Gladia Delmarre -no, she doesn't want her surname used- Gladia is a stranger on this planet; she has undergone traumatic experiences on her home world, as you know, and traumatic experiences on this one, as perhaps you don't know-

"I do know. Please be more direct."

"Well, then, I was sorry for her. She was alone and Jander, I thought, would make her feel less alone."

"Sorry for her? Just that. Are you lovers? Have you been?"

"No, not at all. I did not offer. Nor did she. -Why? Did she tell you we were lovers?"

"No, she did not, but I need independent confirmation, in any case. I'll let you know when there is a contradiction; you needn't concern yourself about that. How is it that with you sympathizing so with her and-from what I gather from Gladia, she feeling so grateful to you-that neither of you offered yourself? I gather that on Aurora offering sex is about on a par with commenting upon the weather."

Fastolfe frowned. "You know nothing about it, Mr. Baley. Don't judge us by the standards of your own world. Sex is not a matter of great importance to us, but we are careful as to how we use it. It may not seem so to you, but none of us offer it lightly. Gladia, unused to our ways and sexually frustrated on Solaria, perhaps did offer it lightly-or desperately might be the better word-and it may not be surprising, therefore, that she did not enjoy the results."

"Didn't you try to improve matters?"

"By offering myself? I am not what she needs and, for that matter, she is not what I need. I was sorry for her. I like her. I admire her artistic talent. And I want her to be happy. -After all, Mr. Baley, surely you'll agree that the sympathy of one human being for another need not rest on sexual desire or on anything but decent human feeling. Have you never felt sympathy for anyone? Have you never wanted to help someone for no reason other than the good feeling it gave you to relieve another's misery? What kind of planet do you come from?"

Baley said, "What you say is justified, Dr. Fastolfe. I do not question the fact that you are a decent human being. Still, bear with me. When I first asked you why you had given Jander to Gladia, you did not tell me then what you have told me just now -and with considerable emotion, too, I might add. Your first impulse was to duck, to hesitate, to play for time by asking why not.

"Granted that what you finally told me is so, what is it about the question that embarrassed you at first? What reason-that you did not want to admit-came to you before you settled on the reason you did want to admit? Forgive me for insisting, but I must know-and not out of personal curiosity, I assure you. If what you tell me is of no use in this sorry business, then you may consider it thrown into a black hole."

Fastolfe said in a low voice, "In all honesty, I am not sure why I parried your question. You surprised me into something that, perhaps, I don't want to face. Let me think, Mr. Baley."

They sat there together quietly. The server cleared the table and left the room. Daneel and Giskard were elsewhere (presumably, they were guarding the house). Baley and Fastolfe were at last alone in a robot-free room.

Finally, Fastolfe said, "I don't know what I ought to tell you, but let me go back some decades. I have two daughters. Perhaps you know that. They are by two different mothers-"

"Would you rather have had sons, Dr. Fastolfe?"

Fastolfe looked genuinely surprised. "No. Not at all. The mother of my second daughter wanted a son, I believe, but I wouldn't give my consent to artificial insemination with selected sperm-not even with my own sperm-but insisted on the natural throw of the genetic dice. Before you ask why, it is because I prefer a certain operation of chance in life and because I think, on the whole, I wanted a chance to have a daughter. I would have accepted a son, you understand, but I didn't want to abandon the chance of a daughter. I approve of daughters, somehow. Well, my second proved a daughter and that may have been one of the reasons that the mother dissolved the marriage soon after the birth. On the other hand, a sizable percentage of marriages are dissolved after a birth in any case, so perhaps I needn't look for special reasons."

"She took the child with her, I take it,"

Fastolfe bent a puzzled glance at Baley. "Why should she do that? -But I forget. You're from Earth. No, of course not. The child would have been brought up in a nursery, where she could be properly cared for, of course. Actually, though"-he whinnied his nose as though in sudden embarrassment over a peculiar memory-"she wasn't put there. I decided to bring her up myself. It was legal to do so but very unusual. I was quite young, of course, not yet having attained the century mark, but already I had made my mark in robotics."

"Did you manage?"

"You mean to bring her up successfully? Oh yes. I grew quite fond of her. I named her Vasilia. It was my mother's name, you see." He chuckled reminiscently. "I get these odd streaks of sentiment-like my affection for my robots. I never met my mother, of course, but her name was on my charts. And she's still alive, as far as I know, so I could see her-but I think there's something queasy about meeting someone in whose womb you once were. -Where was I?"

"You named your daughter Vasilia."

"Yes-and I did bring her up and actually grew fond of her. Very fond of her. I could see where the attraction lay in doing something like that, but, of course, I was an embarrassment to my friends and I had to keep her out of their way when there was contact to be made, either social or professional. I remember once-" He paused.

"Yes?"

"It's something I haven't thought of for decades. She came running out, weeping for some reason, and threw herself into my arms when Dr. Sarton was with me, discussing one of the very earliest design programs for humaniform robots. She was only seven years old, I think and, of course, I hugged her, and kissed her, and ignored the business at hand, which was quite unforgivable of me. Sarton left, coughing and choking-and most indignant. It was a full week before I could renew contact with him and resume deliberation. Children shouldn't have that effect on people, I suppose, but there are so few children and they are so rarely encountered."

"And your daughter-Vasilia-was fond of you?"

"Oh yes-at least, until- She was very fond of me. I saw to her schooling and made sure her mind was allowed to expand to the fullest."

"You said she was fond of you until-something. You did not finish the sentence. There came a time, then, when she was no longer fond of you. When was that?"

"She wanted to have her own establishment once she grew old enough. It was only natural."

"And you did not want it?"

"What do you mean I did not want it? Of course, I wanted it. You keep assuming I'm a monster, Mr. Baley."

"Am I to assume, instead, that once she reached the age when she was to have her own establishment, she no longer felt the same affection for you that she naturally had when she was actively your daughter, living in your establishment as a dependent?"

"Not quite that simple. In fact, it was rather complicated. You see-" Fastolfe seemed embarrassed. "I refused her when she offered herself to me."

"She offered herself to you?" said Baley, horrified.

"That part was only natural," said Fastolfe indifferently. "She knew me best. I had instructed her in sex, encouraged her experimentation, taken her to the Games of Eros, done my best for her. It was something to be expected and I was foolish for not expecting it and letting myself be caught."

"But incest?"

Fastolfe said, "Incest? Oh yes, an Earthly term. On Aurora, there's no such thing, Mr. Baley. Very few Aurorans know their immediate family. Naturally, if marriage is in question and children are applied for, there is a genealogical search, but what has that to do with social sex? No no, the unnatural thing is that I refused my own daughter." He reddened-his large ears most of all.

"I should hope so," muttered Baley.

"I had no decent reasons for it, either-at least none that I could explain to Vasilia. It was criminal of me not to foresee the matter and prepare a foundation for a rational rejection Of one so young and inexperienced, if that were necessary, that would not wound her and subject her to a fearful humiliation. I am really unbearably ashamed that I took the unusual responsibility of bringing up a child, only to subject her to such an unpalatable experience. It seemed to me that we could continue our relationship as father

and daughter-as friend and friend-but she did not give up. Whenever I rejected her, no matter how affectionately I tried to do so, matters grew worse between us."

"Until finally-"

"Finally, she wanted her own establishment. I opposed it at first, not because I didn't want her to have one, but because I wanted to reestablish our loving relationship before she left. Nothing I did helped. It was, perhaps, the most trying time of my life. Eventually, she simply-and rather violently-insisted on leaving and I could hold out no longer. She was a professional roboticist by then-I am grateful that she didn't abandon the profession out of distaste for me-and she was. able to found an establishment without any help from me. She did so, in fact, and since then there has been little contact between us."

Baley said, "It might be, Dr. Fastolfe, that, since she did not abandon robotics, she does not feel wholly estranged."

"It is what she does best and is most interested in. It has nothing to do with me. I know that, for to begin with, I thought as you did and I made friendly overtures, but they were not received."

"Do you miss her, Dr. Fastolfe?"

"Of course I miss her, Mr. Baley. -That is an example of the mistake of bringing up a child. You give into an irrational impulse-an atavistic desire-and it leads to inspiring the child with the strongest possible feeling of love and then subject yourself to the possibility of having to refuse that same child's first offer of herself and scarring her emotionally for life. And, to add to that, you subject yourself to this thoroughly irrational feeling of regret-of-absence. It's something I never felt before and have never felt since. She and I have both suffered needlessly and the fault is entirely mine."

Fastolfe fell into a kind of rumination and Baley said gently, "And what has all this to do with Gladia?"

Fastolfe started. "Oh! I had forgotten. Well, it's rather simple. Everything I've said about Gladia is true. I liked her. I sympathized with her. I admired her talent. But, in addition, she resembles Vasilisa. I noticed the similarity when I saw the first hyperwave account of her arrival from Solaria. It was quite startling and it made me take an interest." He sighed. "When I realized that she, like Vasilisa, had been sex-scarred, it was more than I could endure. I arranged to have her established near me, as you see. I have been her friend and done my best to cushion the difficulties of adapting to a strange world."

"She is a daughter-substitute, then."

"After a fashion, yes, I suppose you could call it that, Mr. Baley. -And you have no idea how glad I am she never took it into her head to offer herself to me. To have rejected her would have been to relive my rejection of Vasilisa. To have accepted her out of an inability to repeat the rejection would have embittered my life, for then I would have felt that I was doing for this stranger-this faint reflection of my daughter-what I would not do for my daughter herself. Either way- But, never mind, you can see now why I hesitated to answer you at first. Somehow, thinking about it led my mind back to this tragedy in my life."

"And your other daughter?"

"Lumen?" said Fastolfe indifferently. "I never had any contact with her, though I hear of her from time to time."

"She's running for political office, I understand."

"A local one. On the Globalist ticket."

"What is that?"

"The Globalists? They favor Aurora alone-just our own globe, you see. Aurorans are to take the lead in settling the Galaxy. Others are to be barred, as far as possible, particularly Earthmen. 'Enlightened self-interest' they call it."

"This is not your view, of course."

"Of course not. I am heading the Humanist party, which believes that all human beings have a right to share in the Galaxy. When I refer to 'my enemies,' I mean the Globalists."

"Lumen, then, is one of your enemies."

"Vasilia is one, also. She is, indeed, a member of the Robotics Institute of Aurora - the RIA- that was founded a few years ago and which is run by roboticists who view me 'as a demon to be defeated at all costs. As far as I know, however, my various ex-wives are apolitical, perhaps even Humanist." He smiled wryly and said, "Well, Mr. Baley, have you asked all the questions you wanted to ask?"

Baley's hands aimlessly searched for pockets in his smooth, loose Auroran breeches-something he had been doing periodically since he had begun wearing them on the ship-and found none. He compromised, as he sometimes did, by folding his arms across his chest.

He said, "Actually, Dr. Fastolfe. I'm not at all sure you have yet answered The first question. It seems to me that you never tire of evading that. Why did you give Jander to Gladia? Let's get all of it into the open, so that we may be able to see light in what now seems darkness."

29.

Fastolfe reddened again. It might have been anger this time, but he continued to speak softly.

He said, "Do not bully me, Mr. Baley. I have given you your answer. I was sorry for Gladia and I thought Jander would be company for her. I have spoken more frankly to you than I would to anyone else, partly because of the position I am in and partly because you are not an Auroran. In return, I demand a reasonable respect."

Baley bit his lower lip. He was not on Earth. He had no official authority behind him and he had more at stake than his professional pride.

He said, "I apologize, Dr. Fastolfe, if I have hurt your feelings. I do not mean to imply you are being untruthful or uncooperative. Nevertheless, I cannot operate without the whole truth. Let me suggest the possible answer I am looking for and you can then

tell me if I am correct, or nearly correct, or totally wrong. Can it be that you have given Jander to Gladia, in order that he might serve as a focus for her sexual drive and so that she might not have occasion to offer herself to you? Perhaps that was not your conscious reason, but think about it now. Is it possible that such a feeling contributed to the gift?"

Fastolfe's hand picked up a light and transparent ornament that had been resting on the dining room table. It turned it over and over, over and over. Except for that motion, Fastolfe seemed frozen. Finally, he said, "That might be so, Mr. Baley. Certainly, after I loaned her Jander-it was never an outright gift, incidentally-I was less concerned about her offering herself to me."

"Do you know whether Gladia made use of Jander for sexual purposes?"

"Did you ask Gladia if she made use of him, Mr. Baley?"

"That has nothing to do with my question. Do you know? Did you witness any overt sexual actions between them? Did any of your robots inform you of such? Did she herself tell you?"

"The answer to all those questions, Mr. Baley, is no. If I stop to think about it, there is nothing particularly unusual about the use of robots for sexual purposes by either men or women. Ordinary robots are not particularly adapted to it, but human beings are ingenious in this respect. As for Jander, he is adapted to it because he is as humaniform as we could make him-

"So that he might take part in sex."

"No, that was never in our minds. It was the abstract problem of building a totally humaniform robot that exercised the late Dr. Sarton and myself."

"But such humaniform robots are ideally designed for sex, are they not?"

"I suppose they are and, now that I allow myself to think of it -and I admit I may have had it hidden in my mind from the start- Gladia might well have used Jander so. If she did, I hope the process gave her pleasure. I would consider my loan to her a good deed, if it had."

"Could it have been more of a good deed than you counted upon?"

"In what way?"

"What would you say if I told you that Gladia and Jander were wife and husband?"

Fastolfe's hand, still holding the ornament, closed convulsively upon it, held it tightly for a moment, then let it drop. "What?"

"That's ridiculous. It is legally impossible. There is no question of children, so there can't conceivably be an application for any. Without the intention of such an application, there can be no marriage."

"This is not a matter of legality, Dr. Fastolfe. Gladia is a Solarian, remember, and doesn't have the Auroran outlook. It is a matter of emotion. Gladia herself told me that she considered Jander to have been her husband. I think she considers herself now his widow and that she has had another sexual trauma- and a very severe one. If, in any way, you knowingly contributed to this event-

"By all the stars," said Fastolfe with unwonted emotion, "I didn't. Whatever else was in my mind, I never imagined that Gladia could fantasize marriage to a robot, however humanoid he might be. No Auroran could have imagined that."

Baley nodded and raised his hand. "I believe you. I don't think you are actor enough to be drowning me in a faked sincerity. But I had to know. It was, after all, just possible that-

"No, it was not. Possible that I foresaw this situation? That I deliberately created this abominable widowhood, for some reason? Never. It was not conceivable, so I did not conceive it. Mr. Baley, whatever I meant in placing Jander in her establishment, I meant well. I did not mean this. Meaning well is a poor defense, I know, but it is all that I have to offer."

"Dr. Fastolfe, let us refer to that no more," said Baley. "What I have now to offer is a possible solution to the mystery."

Fastolfe breathed deeply and sat back in his chair. "You hinted as much when you returned from Gladia's." He looked at Baley with a hint of savagery in his eyes. "Could you not have told me this 'key' you have at the start? Need we have gone through all- this?"

"I'm sorry, Dr. Fastolfe. The key makes no sense without all- this."

"Well, then. Get on with it."

"I will. Jander was in a position that you, the greatest robotics theoretician in all the world, did not foresee, by your own admission. He was pleasing Gladia so well that she was deeply in love with him and considered him her husband. What if it turns out that, in pleasing her, he was also displeasing her?"

"I'm not sure as to your meaning."

"Well, see here, Dr. Fastolfe. She was rather secretive about the matter. I gather that on Aurora sexual matters are not something one hides at all costs."

"We don't broadcast it over the hyperwave," said Fastolfe dryly, "but we don't make a greater secret of it than we do of any other strictly personal matter. We generally know who's been whose latest partner and, if one is dealing with friends, we often get an idea of how good, or how enthusiastic, or how much the reverse one or the other partner- or both-might be. It's a matter of small talk on occasion."

"Yes, but you knew nothing of Gladia's connection with Jander."

"I suspected-"

"Not the same thing. She told you nothing. You saw nothing. Nor could any robots report anything. She kept it secret even from you, her best friend on Aurora. Clearly, her robots were given careful instructions never to discuss Jander and Jander himself must have been thoroughly instructed to give nothing away."

"I suppose that's a fair conclusion."

"Why should she do that, Dr. Fastolfe?"

"A Solarian sense of privacy about sex?"

"Isn't that the same as saying she was ashamed of it?"

"She had no cause to be, although the matter of considering Jander a husband would have made her a laughingstock."

"She might have concealed that portion very easily without concealing everything. Suppose, in her Solarian way, she was ashamed."

"Well, then?"

"No one enjoys being ashamed-and she might have blamed Jander for it, in the rather unreasonable way people have of seeking to attribute to others the blame for unpleasantness that is clearly their own fault."

"Yes?"

"There might have been times when Gladia, who has a short-fused temper, might have burst into tears, let us say, and upbraided Jander for being the source of her shame and her misery. It might not have lasted long and she might have shifted quickly to apologies and caresses, but would not Jander have clearly gotten the idea that he was actually the source of her shame and her misery?"

"Perhaps."

"And might this not have meant to Jander that if he continued the relationship, he would make her miserable, and that if he ended the relationship, he would make her miserable. Whatever he did, he would be breaking the First Law and, unable to act in any way without such a violation, he could only find refuge in not acting at all-and so went into mental freeze-out. -Do you remember the story you told me earlier today of the legendary mind-reading robot who was driven into stasis by that robotics pioneer?"

"By Susan Calvin, yes. I see! You model your scenario on that old legend. Very ingenious, Mr. Baley, but it won't work."

"Why not? When you said only you could bring about a mental freeze-out in Jander, you did not have the faintest idea that he was involved so deeply in so unexpected a situation. It runs exactly parallel to the Susan Calvin situation."

"Let's suppose that the story about Susan Calvin and the mind-reading robot is not merely a totally fictitious legend. Let's take it seriously. There would still be no parallel between that story and the Jander situation. In the case of Susan Calvin, we would be dealing with an incredibly primitive robot, one that today would not even achieve the status of a toy. It could deal only qualitatively with such matters: A creates misery; not-A creates misery; therefore mental freeze-out."

Baley said, "And Jander?"

"Any modern robot-any robot of the last century-would weigh such matters quantitatively. Which of the two situations, A or not-A, would create the most misery? The robot would come to a rapid decision and opt for minimum misery. The chance that he would judge the two mutually exclusive alternatives to produce precisely equal quantities of misery is small and, even if that should turn out to be the case, the modern robot is supplied with a randomization factor. If A and not-A are precisely equal misery-producers according to his judgment, he chooses one or the other in a completely unpredictable way and then follows that unquestioningly. He does not go into mental freeze-out."

"Are you saying it is impossible for Jander to go into mental freeze-out? You have been saying you could have produced it."

"In the case of the humaniform positronic brain, there is a way of sidetracking the randomization factor that depends entirely on the way in which that brain is constructed. Even if you know the basic theory, it is a very difficult and long-sustained process to so lead the robot down the garden path, so to speak, by a skillful succession of questions and orders as to finally induce the mental freeze-out. It is unthinkable that it be done by accident and the mere existence of all apparent contradiction as that produced by simultaneous love and shame could not do the trick without the most careful quantitative adjustment under the most unusual conditions, which leaves us, as I keep saying, with indeterministic chance as the only possible way in which it happened."

"But your enemies will insist that your own guilt is the more likely. -Could we not, in our turn, insist that Jander was brought to mental freeze-out by the conflict brought on by Gladia's love and shame? Would this not sound plausible? And would it not win public opinion to your side?"

Fastolfe frowned. "Mr. Baley, you are too eager. Think about it seriously. If we were to try to get out of our dilemma in this rather dishonest fashion, what would be the consequence? I say nothing of the shame and misery it would bring to Gladia, who would suffer not only the loss of Jander but the feeling that she herself had brought about that loss if, in fact, she had really felt and had somehow revealed her shame. I would not want to do that, but let us put that to one side, if we can. Consider, instead, that my enemies would say that I had loaned her Jander precisely to bring about what had happened. I would have done it, they would say, in order to develop a method for mental freezeout in humaniform robots while escaping all apparent responsibility myself. We would be worse off than we are now, for I would not only be accused of being an underhanded intriguer, as I am now, but, in addition, of having behaved monstrously toward an unsuspecting woman whom I had pretended to befriend, something I have so far been spared."

Baley was staggered. He felt his jaw drop and his voice degenerate to a stutter. "Surely they would not-"

"But they would. You yourself were at least half-inclined to think so not very many minutes ago."

"Merely as a remote-"

"My enemies would not find it remote and they would not publicize it as remote."

Baley knew he had reddened. He felt the wave of heat and found he could not look Fastolfe in the face. He cleared his throat and said, "You are right. I jumped for a way out without thinking and I can only ask your pardon. I am deeply ashamed."

-There's no way out, I suppose, but the truth-if we can find it."

Fastolfe said, "Don't despair. You have already uncovered events in connection with Jander that I never dreamed of. You may uncover more and, eventually, what seems altogether a mystery to us now may unfold and become plain. What do you plan to do next?"

But Baley could think of nothing through the shame of his fiasco. He said, "I don't really know."

"Well, then, it was unfair of me to ask. You have had a long day and not an easy one. It is not surprising that your brain is a bit sluggish now. Why not rest, view a film, go to sleep? You will be better off in the morning."

Baley nodded and mumbled, "Perhaps you're right."

But, at the moment, he didn't think he'd be any better off in the morning at all.

30.

The bedroom was cold, both in temperature and ambience. Baley shivered slightly. So low a temperature within a room gave it the unpleasant feeling of being Outside. The walls were faintly off-white and (unusual for Fastolfe's establishment) were not decorated. The floor seemed to the sight to be of smooth ivory, but to the bare feet it felt carpeted. The bed was white and the smooth blanket was cold to the touch.

He sat down at the edge of the mattress and found it yielded very slightly to the pressure of his weight.

He said to Daneel, who had entered with him, "Daneel, does it disturb you when a human being tells a lie?"

"I am aware that human beings lie on occasion, Partner Elijah. Sometimes, a lie might be useful or even mandatory. My feeling about a lie depends upon the liar, the occasion, and the reason."

"Can you always tell when a human being lies?"

"No, Partner Elijah."

"Does it seem to you that Dr. Fastolfe often lies?"

"It has never seemed to me that Dr. Fastolfe has told a lie."

"Even in connection with Jander's death?"

"As far as I can tell, he tells the truth in every respect."

"Perhaps he has instructed you to say that-were I to ask?"

"He has not, Partner Elijah."

"But perhaps he instructed you to say that, too-"

He paused. Again-of what use was it to cross-examine a robot? And in this particular case, he was inviting infinite regression.

He was suddenly aware that the mattress had been yielding slowly under him until it now half-enfolded his hips. He rose suddenly and said, "Is there any way of warming the room, Daneel?"

"It will feel warmer when you are under the cover with the light out, Partner Elijah."

"Ah." He looked about suspiciously. "Would you put the light out, Daneel, and remain in the room when you have done so?"

The light went out almost at once and Baley realized that his supposition that this room, at least, was undecorated was totally wrong. As soon as it was dark, he felt he was

Outside. There was the soft sound of wind in trees and the small, sleepy mutters of distant life-forms. There was also the illusion of stars overhead, with an occasional drifting cloud that was just barely visible.

"Put the light back on, Daneel!"

The room flooded with light.

"Daneel," said Baley. "I don't want any of that. I want no stars, no clouds, no sounds, no trees, no wind-no scents, either. I want darkness-featureless darkness. Could you arrange that?"

"Certainly, Partner Elijah."

"Then do so. And show me how I may myself put out the light when I am ready to sleep."

"I am here to protect you, Partner Elijah."

Baley said grumpily, "You can do that, I am sure, from just the other side of the door. Giskard, I imagine, will be just outside the windows, if, indeed, there are windows beyond the draperies."

"There are. -If you cross that threshold, Partner Elijah, you will find a Personal reserved for yourself. That section of the wall is not material and you will move easily through it. The light will turn on as you enter and it will go out as you leave- and there are no decorations. You will be able to shower, if you wish, or do anything else that you care to before retiring or after waking."

Baley turned in the indicated direction. He saw no break in the wall, but the floor molding in that spot did show a thickening as though it were a threshold.

"How do I see it in the dark, Daneel?" he asked.

"That section of the wall-which is not a wall-will glow faintly. As for the room light, there is this depression in the headboard of your bed which, if you place your finger within it, will darken the room if light-or lighten it if dark."

"Thank you. You may leave now."

Half an hour later, he was through with the Personal and found himself huddling beneath the blanket, with the light out, enveloped by a warm spirit-hugging darkness.

As Fastolfe had said, it had been a long day. It was almost unbelievable that it had been only that morning that he had arrived on Aurora. He had learned a great deal and yet none of it had done him any good.

He lay in the dark and went over the events of the day in quiet succession, hoping that something might occur to him that had eluded him before-but nothing like that happened.

So much for the quietly thoughtful, keen-eyed, subtle-brained Elijah Baley of the hyperwave drama.

The mattress was again half-enfolding him and it was like a warm enclosure. He moved slightly and it straightened beneath him, then slowly molded itself to fit his new position.

There was no point in frying, with his worn, sleep-seeking mind, to go over the day again, but he could not help trying a second time, following his own footsteps on this, his

first day on Aurora-from the spaceport to Fastolfe's establishment, then to Gladia's, then back to Fastolfe.

Gladia-more beautiful than he remembered but hard-something hard about her-or has she just grown a protective shell- poor woman. He thought warmly of her reaction to the touch of her hand against his cheek-if he could have remained with her, he could have taught her-stupid Aurorans-disgustingly casual attitude toward sex-anything goes-which means nothing really goes-not worthwhile-stupid-to Fastolfe, to Gladia, back to Fastolfe-back to Fastolfe.

He moved a little and then abstractedly felt the mattress remold again. Back to Fastolfe. What happened on the way back to Fastolfe? Something said? Something not said? And on the ship before he ever got to Aurora-something that fit in- Baley was in the never-never world of half-sleep, when the mind is liberated and follows a law of its own. It is like the body flying, soaring through the air and liberated of gravity.

Of its own accord, it was taking the events-little aspects he had not noted-putting them together-one thing adding to another-clicking into place-forming a web-a fabric- And then, it seemed to him, he heard a sound and he roused himself to a level of wakefulness. He listened, heard nothing, and sank once more into the half-sleep to take up the line of thought-and it eluded him.

It was like a work of art sinking into a morass. He could still see its outlines, the masses of color. They got dimmer, but he still knew it was there. And even as he scrambled desperately for it, it was gone altogether and he remembered nothing of it. Nothing at all.

Had he actually thought of anything or was the memory of having done so itself an illusion born of some drifting nonsense in a mind asleep? And he was, indeed, asleep.

When he woke briefly during the night, he thought to himself; I had an idea. An important idea.

But he remembered nothing, except that something had been there.

He remained awake a while, staring into the darkness. If, in fact, something had been there-it would come back in time.

Or it might not! (Jehoshaphat!)

-And he slept again.

8. FASTOLFE AND VASILIA

31.

Baley woke with a start and drew in his breath with sharp suspicion. There was a faint and unrecognizable odor in the air that vanished by his second breath.

Daneel stood gravely at the side of the bed. He said, "I trust, Partner Elijah, that you have slept well."

Baley looked around. The drapes were still closed, but it was clearly daylight Outside. Giskard was laying out clothing, totally different, from shoes to jacket, from anything he had worn the day before.

He said, "Quite well, Daneel. Did something awaken me?"

"There was an injection of antisomnin in the room's air circulation, Partner Elijah. It activates the arousal system. We used a smaller than normal amount, since we were uncertain of your reaction. Perhaps we should have used a smaller amount still."

Baley said, "It did seem to be rather like a paddle over the rear. What time is it?"

Daneel said, "It is 0705, by Auroran measure. Physiologically, breakfast will be ready in half an hour." He said it without a trace of humor, though a human being might have found a smile appropriate.

Giskard said, his voice stiffer and a trifle less intoned than Daneel's, "Sir, friend Daneel and I may not enter the Personal. If you will do so and let us know if there is anything you will need, we will supply it at once."

"Yes, of course." Baley raised himself, swung around, and got out of bed.

Giskard began stripping the bed at once. "May I have your pajamas, sir?"

Baley hesitated for a moment only. It was a robot who asked, nothing more. He disrobed and handed the garment to Giskard, who took it with a small, grave nod of acceptance.

Baley looked at himself with distaste. He was suddenly conscious of a middle-aged body that was very likely in less good condition than Fastolfe's, which was nearly three times as old.

Automatically, he looked for his slippers and found there were none. Presumably, he needed none. The floor seemed warm and soft to his feet.

He stepped into the Personal and called out for instructions. From the other side of the illusory section of the wall, Giskard solemnly explained the working of the shaver, of the toothpaste dispenser, explained how to put the flushing device on automatic, how to control the temperature of the shower.

Everything was on a grander and more elaborate scale than anything Earth had to offer and there were no partitions on the other side of which he could hear the movements and involuntary sounds of someone else, something he had to ignore rigidly to maintain the illusion of privacy.

It was effete, thought Baley somberly as he went through the luxurious ritual, but it was an effeteness that (he already knew) he could become accustomed to. If he stayed here on Aurora any length of time, he would find the culture shock of returning to Earth painfully intense, particularly with respect to the Personal. He hoped that the readjustment would not take long, but he also hoped that any Earthpeople who settled new worlds would not feel impelled to cling to the concept of Community Personals.

Perhaps, thought Baley, that was how one ought to define "effete": That to which one can become easily accustomed.

Baley stepped out of the Personal, various functions completed, chin new-cropped, teeth glistening, body showered and dry. He said, "Giskard, where do I find the deodorant?"

Giskard said, "I do not understand, sir."

Daneel said quickly, "When you activated the lathering control, Partner Elijah, that introduced a deodorant effect. I ask pardon for friend Giskard's failure to understand. He lacks my experience on Earth."

Baley lifted his eyebrows dubiously and began to dress with Giskard's help.

He said, "I see that you and Giskard are still with me every step of the way. Has there been any sign of any attempt at putting me out of the way?"

Daneel said, "None thus far, Partner Elijah. Nevertheless, it would be wise to have friend Giskard and myself with you at all times, if that can possibly be managed."

"Why is that, Daneel?"

"For two reasons, Partner Elijah. First, we can help you with any aspect of Auroran culture or folkways with which you are unfamiliar. Second, friend Giskard, in particular, can record and reproduce every word of every conversation you may have. This may be of value to you. You will recall that there were times in your conversations with both Dr. Fastolfe and with Miss Gladia when friend Giskard and I were at a distance or in another room-

"So that conversations were not recorded by Giskard?"

"Actually, they were, Partner Elijah, but with low fidelity-and there may be portions that will not be as clear as we would want them to be. It would be better if we stayed as close to you as is convenient."

Baley said, "Daneel, are you of the opinion that I will be more at ease if I think of you as guides and as recording devices, rather than as guards? Why not simply come to the conclusion that, as guards, you two are completely unnecessary. Since there have been no attempts at me so far, why isn't it possible to conclude that there will be no attempts at me in the future?"

"No, Partner Elijah, that would be incautious. Dr. Fastolfe feels that you are viewed with great apprehension by his enemies. They had made attempts to persuade the Chairman not to give Dr. Fastolfe permission to call you in and they will surely continue to attempt to persuade him to have you ordered back to Earth at the earliest possible moment."

"That sort of peaceful opposition requires no guards."

"No, sir, but if the opposition has reason to fear that you may exculpate Dr. Fastolfe, it is possible that they may feel driven to extremes. You are, after all, not an Auroran and the inhibitions against violence on our world would therefore be weakened in your case."

Baley said dourly, "The fact that I've been here a whole day and that nothing has happened should relieve their minds greatly and reduce the threat of violence considerably."

"It would indeed seem so," said Daneel, showing no signs that he recognized the irony in Baley's voice.

"On the other hand," said Baley, "if I seem to make progress, then the danger to me immediately increases."

Daneel paused to consider, then said, "That would seem to be a logical consequence."

"And, therefore, you and Giskard will come with me wherever I go, just in case I manage to do my job a little too well."

Daneel paused again, then said, "Your way of putting it, Partner Elijah, puzzles me, but you seem to be correct."

"In that case," said Baley, "I'm ready for breakfast, though it does take the edge off my appetite to be told that the alternative to failure is attempted assassination."

32.

Fastolfe smiled at Baley across the breakfast table. "Did you sleep well, Mr. Baley?"

Baley studied the slice of ham with fascination. It had to be cut with a knife. It was grainy. It had a discrete strip of fat running down one side. It had, in short, not been processed. The result was that it tasted hammier, so to speak.

There were also fried eggs, with the yolk a flattened semi-sphere in the center, rimmed by white, rather like some daisies that Ben had pointed out to him in the field back on Earth. Intellectually, he knew what an egg looked like before it was processed and he knew that it contained both a yolk and a white, but he had never seen them still separate when ready to eat. Even on the ship coming here and even on Solaria, eggs, when served, were scrambled.

He looked up sharply at Fastolfe. "Pardon me?"

Fastolfe said patiently, "Did you sleep well?"

"Yes. Quite well. I would probably still be sleeping if it hadn't been for the antisomnin."

"Ah yes. Not quite the hospitality a guest has the right to expect, but I felt you might want an early start."

"You are entirely right. And I'm not exactly a guest, either."

Fastolfe ate in silence for a moment or two. He sipped at his hot drink, then said, "Has any enlightenment come overnight? Have you awakened, perhaps, with a new perspective, a new thought?"

Baley looked at Fastolfe suspiciously, but the other's face reflected no sarcasm. As Baley lifted his drink to his lips, he said, "I'm afraid not. I am as ineffectual now as I was last night." He sipped and involuntarily made a face.

Fastolfe said, "I'm sorry. You find the drink unpalatable?"

Baley grunted and cautiously tasted it again.

Fastolfe said, "It is simply coffee, you know. Decaffeinated."

Baley frowned. "It doesn't taste like coffee and- Pardon me, Dr. Fastolfe, I don't want to begin to sound paranoid, but Daneel and I have just had a half-joking exchange on the possibility of violence against me-half-joking on my part, of course, not on Daneel's-and it is in my mind that one way they might get at me is-

His voice trailed away.

Fastolfe's eyebrows moved upward. He reached for Baley's coffee with a murmur of apology and smelled it. He then ladled out a small portion by spoon and tasted it. He said, "Perfectly normal, Mr. Baley. This is not an attempt at poisoning."

Baley said, "I'm sorry to behave so foolishly, since I know this has been prepared by your own robots-but are you certain?"

Fastolfe smiled. "Robots have been tampered with before now. -However, there has been no tampering this time. It is just that coffee, although universally popular on the various worlds, comes in different strains. It is notorious that each human being prefers the coffee of his own world. I'm sorry, Mr.

Baley, I have no Earth strain to give you. Would you prefer milk? That is relatively constant from world to world. Fruit juice? Aurora's grape juice is considered superior throughout the worlds, generally. There are some who hint, darkly, that we allow it to ferment somewhat, but that, of course, is not true. Water?"

"I'll try your grape juice." Baley looked at the coffee dubiously. "I suppose I ought to try to get used to this."

"Not at all," said Fastolfe. "Why seek out the unpleasant if that is unnecessary? - And so"-his smile seemed a bit strained as he returned to his earlier remark-"night and sleep have brought no useful reflection to you?"

"I'm sorry," said Baley. Then, frowning at a dim memory, "Although-

"Yes?"

"I have the impression that just before falling asleep, in the free-association limbo between sleep and waking, it seemed to me that I had something."

"Indeed? What?"

"I don't know. The thought drove me into wakefulness but didn't follow me there. Or else some imagined sound distracted me. I don't remember. I snatched at the thought, but didn't retrieve it. It's gone. I think that this sort of thing is not uncommon."

Fastolfe looked thoughtful. "Are you sure of this?"

"Not really. The thought grew so tenuous so rapidly I couldn't even be sure that I had actually had it. And even if I had, it may have seemed to make sense to me only because I was half-asleep. If it were repeated to me now in broad daylight, it might make no sense at all."

"But whatever it was and however fugitive, it would have left a trace, surely."

"I imagine so, Dr. Fastolfe. In which case, it will come to me again. I'm confident of that."

"Ought we to wait?"

"What else can we do?"

"There's such a thing as a Psychic Probe."

Baley sat back in his chair and stared at Fastolfe for a moment. He said, "I've heard of it, but it isn't used in police work on Earth."

"We're not on Earth, Mr. Baley," said Fastolfe softly.

"It can do brain damage. Am I not right?"

"Net likely, in the proper hands."

"Not impossible, even in the proper hands," said Baley. "It's my understanding that it cannot be used on Aurora except under sharply defined conditions. Those it is used on must be guilty of a major crime or must-"

"Yes, Mr. Baley, but that refers to Aurorans. You are not an Auroran."

"You mean because I'm an Earthman I'm to be treated as inhuman?"

Fastolfe smiled and spread his hands. "Come, Mr. Baley. It was just a thought. Last night you were desperate enough to suggest frying to solve our dilemma by placing Gladia in a horrible and tragic position. I was wondering if you were desperate enough to risk yourself?"

Baley rubbed his eyes and, for a minute or so, remained silent. Then, in an altered voice, he said, "I was wrong last night. I admitted it. As for this matter now, there is no assurance that what I thought of, when half-asleep, had any relevance to the problem. It may have been pure fantasy-illogical nonsense. There may have been no thought at all. Nothing. Would you consider it wise, for so small a likelihood of gain, to risk damage to my brain, when it is upon that for which you say you depend for a solution to the problem?"

Fastolfe nodded. "You plead your case eloquently-and I was not really serious."

"Thank you, Dr. Fastolfe."

"But where are we to go from here?"

"For one thing, I wish to speak to Gladia again. There are points concerning which I need clarification."

"You should have taken them up last night."

"So I should, but I had more than I could properly absorb last night and there were points that escaped me. I am an investigator and not an infallible computer."

Fastolfe said, "I was not imputing blame. It's just that I hate to see Gladia unnecessarily disturbed. In view of what you told me last night, I can only assume she must be in a state of deep distress."

"Undoubtedly. But she is also desperately anxious to find out what happened-who, if anyone, killed the one she viewed as her husband. That's understandable, too. I'm sure she'll be willing to help me. -And I wish to speak to another person as well."

"To whom?"

"To your daughter Vasilia."

"To Vasilia? Why? What purpose will that serve?"

"She is a roboticist. I would like to talk to a roboticist other than yourself."

"I do not wish that, Mr. Baley."

They had finished eating. Baley stood up. "Dr. Fastolfe, once again I must remind you that I am here at your request. I have no formal authority to do police work. I have no connection with any Auroran authorities. The only chance I have of getting to the bottom of this miserable mess is to hope that various people will voluntarily cooperate with me and answer my questions.

"If you stop me from attempting this, then it is clear that I can get no farther than I am right now, which is nowhere. It will also look extremely bad for you-and therefore for Earth-so I urge you not to stand in my way. If you make it possible for me to interview anyone I wish-or even simply try to make it possible by interceding on my behalf-then the people of Aurora will surely consider that to be a sign of self-conscious innocence on your part. If you hamper my investigation, on the other hand, to what conclusion can they come but that you are guilty and fear exposure?"

Fastolfe said, with poorly suppressed annoyance, "I understand that, Mr. Baley. But why Vasilia? There are other roboticists."

"Vasilia is your daughter. She knows you. She might have strong opinions concerning the likelihood of your destroying a robot. Since she is a member of the Robotics Institute and on the side of your political enemies, any favorable evidence she may give would be persuasive."

"And if she testifies against me?"

"We'll face that when it comes. Would you get in touch with her and ask her to receive me?"

Fastolfe said resignedly, "I will oblige you, but you are mistaken if you think I can easily persuade her to see you. She may be too busy-or think she is. She may be away from Aurora. She may simply not wish to be involved. I tried to explain last night that she has reason-thinks she has reason-to be hostile to me. My asking her to see you may indeed impel her to refuse, merely as a sign of her displeasure with me."

"Would you try, Dr. Fastolfe?"

Fastolfe sighed. "I will try while you are at Gladia's. -I presume you wish to see her directly? I might point out that a trimensional viewing would do. The image is high enough in quality so that you will not be able to tell it from personal presence."

"I'm aware of that, Dr. Fastolfe, but Gladia is a Solarian and has unpleasant associations with trimensional viewing. And, in any case, I am of the opinion that there is an intangible additional effectiveness in being within touching distance. The present

situation is too delicate and the difficulties too great for me to want to give up that additional effectiveness."

"Well, I'll alert Gladia." He turned away, hesitated, and turned back. "But, Mr. Baley-"

"Yes, Dr. Fastolfe?"

"Last night you told me that the situation was serious enough for you to disregard any convenience it might cause Gladia. There were, you pointed out, greater things at stake."

"That's so, but you can rely on me not to disturb her if I can help it."

"I am not talking about Gladia now. I merely warn you that this essentially proper view of yours should be extended to myself. I don't expect you to worry about my convenience or pride if you should get a chance to talk to Vasilisa. I don't look forward to the results, but if you do talk to her, I will have to endure any ensuing embarrassment and you must not seek to spare me. Do you understand?"

"To be perfectly honest, Dr. Fastolfe, it was never my attention to spare you. If I have to weigh your embarrassment or shame against the welfare of your policies and against the welfare of my world, I would not hesitate a moment to shame you."

"Good! -And Mr. Baley, we must extend that attitude also to yourself. Your convenience must not be allowed to stand in the way."

"It wasn't allowed to do so when you decided to have me brought here without consulting me."

"I'm referring to something else. If, after a reasonable time- not a long time, but a reasonable time-you make no progress toward a solution, we will have to consider the possibilities of psychic-probing, after all. Our last chance might be to find out what it is your mind knows that you do not know it knows."

"It may know nothing, Dr. Fastolfe."

Fastolfe looked at Baley sadly. "Agreed. But, as you said concerning the possibility of Vasilisa testifying against me-we'll face that when it comes."

He turned away again and walked out of the room.

Baley looked after him thoughtfully. It seemed to him now that if he made progress he would face physical reprisals of an unknown-but possibly dangerous-kind. And if he did not make progress, he would face the Psychic Probe, which could scarcely be better.

"Jehoshaphat!" he muttered softly to himself.

33.

The walk to Gladia's seemed shorter than it had on the day before. The day was sunlit and pleasant again, but the vista looked not at all the same. The sunlight slanted from the opposite direction, of course, and the coloring seemed slightly different.

It could be that the plant life looked a bit different in the morning than in the evening-or smelled different. Baley had, on occasion, thought that of Earth's plant life as well, he remembered.

Daneel and Giskard accompanied him again, but they traveled more closely to him and seemed less intensely alert.

Baley said idly, "Does the sun shine here all the time?"

"It does not, Partner Elijah," said Daneel. "Were it to do so, that would be disastrous for the plant world and, therefore, for humanity. The prediction is, in fact, for the sky to cloud over in the course of the day."

"What was that?" asked Baley, startled. A small and gray-brown animal was crouched in the grass. Seeing them, it hopped away in leisurely fashion.

"A rabbit, sir," said Giskard.

Baley relaxed. He had seen them in the fields of Earth, too.

Gladia was not waiting for them at the door this time, but she was clearly expecting them. When a robot ushered them in, she did not stand up, but said, with something between crossness and weariness, "Dr. Fastolfe told me you had to see me again. What now?"

She was wearing a robe that clung tightly to her body and was clearly wearing nothing underneath. Her hair was pulled back shapelessly and her face was pallid. She looked more drawn than she had the day before and it was clear that she had had little sleep.

Daneel, remembering what had happened the day before, did not enter the room. Giskard entered, however, glanced keenly about, then retired to a wall niche. One of Gladia's robots stood in another niche.

Baley said, "I'm terribly sorry, Gladia, to have to bother you again."

Gladia said, "I forgot to tell you last night that, after Jander is torched, he will, of course, be recycled for use in the robot factories again. It will be amusing, I suppose, to know that each time I see a newly formed robot, I can take time to realize that many of Jander's atoms form part of him."

Baley said, "We, ourselves, when we die, are recycled-and who knows what atoms of whom are in you and me right now or in whom ours will someday be."

"You are very right, Elijah. And you remind me how easy it is to philosophize over the sorrows of others."

"That is right, too, Gladia, but I did not come to philosophize."

"Do what you came to do, then."

"I must ask questions."

"Weren't yesterday's enough? Have you spent the time since then in thinking up new ones?"

"In part, yes, Gladia. -Yesterday, you said that even after you were with Jander-as wife and husband-there were men who offered themselves to you and that you refused. It is that which I must question you about."

"Why?"

Baley ignored the question. "Tell me," he said, "how many men offered themselves to you during the time you were married to Jander?"

"I don't keep records, Elijah. Three or four."

"Were any of them persistent? Did anyone offer himself more than once?"

Gladia, who had been avoiding his eyes, now looked at him full and said, "Have you talked to others about this?"

Baley shook his head. "I have talked on this subject to no one but you. From your question, however, I suspect that there was at least one who was persistent."

"One. Santirix Gremionis." She sighed. "Aurorans have such peculiar names and he was peculiar-for an Auroran. I had never met one as repetitious in the matter as he. He was always polite, always accepted my refusal with a small smile and a stately bow, and then, as like as not, he would try again the next week or even the next day. The mere repetition was a small discourtesy. A decent Auroran would accept a refusal permanently unless the prospective partner made it reasonably plain there was a change of mind."

"Tell me again- Did those who offered themselves to you know of your relationship with Jander?"

"It was not something I mentioned in casual conversation."

"Well, then, consider this Gremionis, specifically. Did he know that Jander was your husband?"

"I never told him so."

"Don't dismiss it like that, Gladia. It's not a matter of his being told. Unlike the others, he offered himself repeatedly. How often would you say, by the way? Three times? Four? How many?"

"I did not count," said Gladia wearily. "It might have been a dozen times or more. If he weren't a likable person otherwise, I would have had my robots bar the establishment to him."

"Ah, but you didn't. And it takes time to make multiple offerings. He came to see you. He encountered you. He had time to note Jander's presence and how you behaved to him. Might he not have guessed at the relationship?"

Gladia shook her head. "I don't think so. Jander never intruded when I was with any human being."

"Were those your instructions? I presume they must have been."

"They were. And before you suggest I was ashamed of the relationship, it was merely an attempt to avoid bothersome complications. I have retained some instinct of privacy about sex that Aurorans don't have."

"Think again. Might he have guessed? Here he is, a man in love-"

"In love!" The sound she made was almost a snort. "What do Aurorans know of love?"

"A man who considers himself in love. You are not responsive. Might he not, with the sensitivity and suspicion of a disappointed lover, have guessed? Consider! Did he ever make any roundabout reference to Jander? Anything to cause you the slightest suspicion-"

"No! No! It would be unheard of for any Auroran to comment adversely on the sexual preferences or habits of another."

"Not necessarily adversely. A humorous comment, perhaps. Any indication that he suspected the relationship."

"No! If young Gremionis had ever breathed a word of that sort, he would never have seen the inside of my establishment again and I would have seen to it that he never approached me again. -But he wouldn't have done anything of the sort. He was the soul of eager politeness to me."

"You say 'young.' How old is this Gremionis?"

"About my age. Thirty-five. Perhaps even a year or two younger."

"A child," said Baley sadly. "Even younger than I am. But at that age- Suppose he guessed at your relationship with Jander and said nothing-nothing at all. Might he not, nevertheless, have been jealous?"

"Jealous?"

It occurred to Baley that the word might have little meaning on Aurora or Solaria. "Angered that you should prefer another to himself."

Gladia said sharply, "I know the meaning of the word 'jealous.' I repeated it only out of surprise that you should think any Auroran was jealous. On Aurora, people are not jealous over sex. Over other things certainly, but not over sex." There was a definite sneer upon her face. "Even if he were jealous, what would it matter? What could he do?"

"Wasn't it possible he might have told Jander that the relationship with a robot would endanger your position on Aurora-"

"That would not have been true!"

"Jander might have believed it if he were told so-believed he was endangering you, harming you. Might not that have been the reason for the mental freeze-out?"

"Jander would never have believed that. He made me happy every day he was my husband and I told him so."

Baley remained calm. She was missing the point, but he would simply have to make it clearer. "I am sure he believed you, but he might also feel impelled to believe someone else who told him the reverse. If he were then caught in an unbearable First Law dilemma-"

Gladia's face contorted and she shrieked, "That's mad. You're just telling me the old fairy tale of Susan Calvin and the mind reading robot. No one over the age of ten can possibly believe that."

"Isn't it possible that-"

"No, it isn't. I'm from Solaria and I know enough about robots to know it isn't possible. It would take an incredible expert to tie First Law knots in a robot. Dr. Fastolfe might be able to do it, but certainly not Santirix Gremionis. Gremionis is a stylist. He works on human beings. He cuts hair, designs clothing. I do the same, but at least I work on robots. Gremionis has never touched a robot. He knows nothing about them, except to order one to close the window or something like that. Are you trying to tell me that it was the relationship between Jander and me- me"-she tapped herself harshly on the

breastbone with one rigid finger, the swells of her small breasts scarcely showing under her robe-"that caused Jander's death?"

"It was nothing you did knowingly," said Baley, wanting to stop but unable to quit probing. "What if Gremionis had learned from Dr. Fastolfe how to-"

"Gremionis didn't know Dr. Fastolfe and couldn't have understood anything Dr. Fastolfe might have told him; anyhow."

"You can't know for certain what Gremionis might or might not understand and, as for not knowing Dr. Fastolfe-Gremionis must have been frequently in your establishment if he hounded you so and-"

"And Dr. Fastolfe was almost never in my establishment. Last night, when he came with you, it was only the second time he had crossed my threshold. He was afraid that to be too close to me would drive me away. He admitted that once. He lost his daughter that way, he thought-something foolish like that. -You see, Elijah, when you live several centuries, you have plenty of time to lose thousands of things. Be thankful for short life, Elijah." She was weeping uncontrollably.

Baley looked and felt helpless. "I'm sorry, Gladia. I have no more questions. Shall I call a robot? Will you need help?"

She shook her head and waved her hand at him. "Just go away-go away," she said in a strangled voice. "Go away."

Baley hesitated and then strode out of the room, taking one last, uncertain look at her as he walked out the door. Giskard followed in his footsteps and Daneel joined him as he left the house. He scarcely noticed. It occurred to him, abstractedly, that he was coming to accept their presence as he would have that of his shadow or of his clothing, that he was reaching a point where he would feel bare without them.

He walked rapidly back toward the Fastolfe establishment, his mind churning. His desire to see Vasilisa had at first been a matter of desperation, a lack of any other object of curiosity, but now things had changed. There was just a chance that he had stumbled on something vital.

34.

Fastolfe's homely face was set in grim lines when Baley returned.

"Any progress?" he asked.

"I eliminated part of a possibility. -Perhaps."

"Part of a possibility? How do you eliminate the other part? Better yet, how do you establish a possibility?"

Baley said, "By finding it impossible to eliminate a possibility, a beginning is made at establishing one."

"And if you find it impossible to eliminate the other part of the possibility you mysteriously mentioned?"

Baley shrugged. "Before we waste our time considering that, I must see your daughter."

Fastolfe looked dejected. "Well, Mr. Baley, I did as you asked me to do and tried to contact her. It was necessary to awaken her."

"You mean she is in part of the planet where it is night? I hadn't thought of that." Baley felt chagrined. "I'm afraid I'm fool enough to imagine I'm on Earth still. In underground Cities, day and night lose their meaning and time tends to be uniform."

"It's not that bad. Eos is the robotics center of Aurora and you'll find few roboticists who live out of it. She was simply sleeping and being awakened did not improve her temper, apparently. She would not speak to me."

"Call again," said Baley urgently.

"I spoke to her secretarial robot and there was an uncomfortable relaying of messages. She made it quite plain she will not speak to me in any fashion. She was a little more flexible with you. The robot announced that she would give you five minutes on her private viewing channel, if you call"-Fastolfe consulted the time-strip on the wall-"in half an hour. She will not see you in person under any conditions."

"The conditions are insufficient and so is the time. I must see her in person for as long as is needed. Did you explain the importance of this, Dr. Fastolfe?"

"I tried. She is, not concerned."

"You are her father. Surely-"

"She is less inclined to bend her decision for my sake than for a randomly chosen stranger. I knew this, so I made use of Giskard."

"Giskard?"

"Oh yes. Giskard is a great favorite of hers. When she was studying robotics at the university, she took the liberty of adjusting some minor aspects of his programming-and nothing makes for a closer relationship with a robot than that-except for Gladia's method, of course. It was almost as though Giskard were Andrew Martin-"

"Who is Andrew Martin?"

"Was, not is," said Fastolfe. "You have never heard of him?"

"Never!"

"How odd! These ancient legends of ours all have Earth as their setting, yet on Earth they are not known. -Andrew Martin was a robot who, gradually, step by step, was supposed to have become humaniform. To be sure, there have been humaniform robots before Daneel, but they were all simple toys, little more than automatons. Nevertheless, amazing stories are told of the abilities of Andrew Martin-a sure sign of the legendary nature of the tale. There was a woman who was part of the legends who is usually known as Little Miss. The relationship is too complicated to describe now, but I suppose that every little girl on Aurora has daydreamed of being Little Miss and of having Andrew Martin as a robot. Vasilisa did-and Giskard was her Andrew Martin."

"Well, then?"

"I asked her robot to tell her that you would be accompanied by Giskard. She hasn't seen him in years and I thought that might lure her into agreeing to see you."

"But it didn't, I presume."

"It didn't."

"Then we must think of something else. There must be some way of inducing her to see me."

Fastolfe said, "Perhaps you will think of one. In a few minutes, you will view her on trimensic and you will have five minutes to convince her that she ought to see you personally."

"Five minutes! What can I do in five minutes?"

"I don't know. It is better, after all, than nothing."

35.

Fifteen minutes later, Baley stood before the trimensional viewing screen, ready to meet Vasilia Fastolfe.

Dr. Fastolfe had left, saying, with a wry smile, that his presence would certainly make his daughter less amenable to persuasion. Nor was Daneel present. Only Giskard remained behind to keep Baley company.

Giskard said, "Dr. Vasilia's trimensic channel is open for reception. Are you ready, sir?"

"As ready as I can be," said Baley grimly. He had refused to sit, feeling he might be more imposing if he were standing. (How imposing could an Earthman be?)

The screen grew bright as the rest of the room dimmed and a woman appeared in rather uncertain focus, at first. She was standing facing him, her right hand resting on a laboratory bench laden with sets of diagrams. (No doubt she planned to be imposing, too.)

As the focus sharpened, the edges of the screen seemed to melt away and the image of Vasilia (if it were she) deepened and became three-dimensional. She was standing in the room with every sign of solid reality, except that the decor of the room she was in did not match the room Baley was in and the break was a sharp one.

She was wearing a dark brown skirt that divided into loose trouser legs that were semitransparent, so that her legs, from mid-thigh down, were shadowily visible. Her blouse was tight and sleeveless, so that her arms were bare to the shoulder. Her neckline was low and her hair, quite blond, was in tight curls.

She had none of her father's plainness and certainly not his large ears. Baley could only assume she had had a beautiful mother and was fortunate in the allotment of genes.

She was short and Baley could see a remarkable resemblance to Gladia in her facial features, although her expression was far colder and seemed to bear the mark of a dominating personality.

She said sharply, "Are you the Earthman come to solve my father's problems?"

"Yes, Dr. Fastolfe," said Baley in an equally clipped manner.

"You may call me Dr. Vasilia. I do not wish the confusion of being mistaken for my father."

"Dr. Vasilia, I must have a chance to deal with you, face-to-face, for a reasonably extended period."

"No doubt you feel that. You are, of course, an Earthman and a certain source of infection."

"I have been medically treated and I am quite safe to be with. Your father has been constantly with me for over a day."

"My father pretends to be an idealist and must do foolish things at times to support the pretense. I will not imitate him."

"I take it you do not wish him harm. You will bring him harm if you refuse to see me."

"You are wasting time. I will not see you, except in this manner, and half the period I have allotted is gone. If you wish, we can stop this now if you find it unsatisfactory."

"Giskard is here, Dr. Vasilia, and would like to urge you to see me."

Giskard stepped into the field of vision. "Good morning, Little Miss," he said in a low voice.

For a moment, Vasilia looked embarrassed and, when she spoke, it was in a somewhat softer tone. "I am glad to view you, Giskard, and will see you any time you wish, but I will not see this Earthman, even at your urging."

"In that case," said Baley, throwing in all his reserves desperately, "I must take the case of Santirix Gremionis to the public without the benefit of having consulted you."

Vasilia's eyes widened and her hand on the table lifted upward and clenched into a fist, "What is this about Gremionis?"

"Only that he is a handsome young man and he knows you well. Am I to deal with these matters without hearing what you have to say?"

"I will tell you right now that-

"No," said Baley loudly. "You will tell me nothing unless I see you face-to-face."

Her mouth twitched. "I will see you, then, but I will not remain with you one moment more than I choose. I warn you.

-And bring Giskard."

The trimensional connection broke off with a snap and Baley felt himself turn dizzy at the sudden change in background that resulted. He made his way to a chair and sat down.

Giskard's hand was on his elbow, making certain that he reached the chair safely. "Can I help you in any way, sir?" he asked.

"I'm all right," said Baley. "I just need to catch my breath." Dr. Fastolfe was standing before him. "My apologies, again, for failure in my duties as a host. I listened on an extension that was equipped to receive and not transmit. I wanted to see my daughter, even if she didn't see me."

"I understand," said Baley, panting slightly. "If manners dictate that what you did requires an apology, then I forgive you."

"But what is this about Santirix Gremionis? The name is unfamiliar to me."

Baley looked up at Fastolfe and said, "Dr. Fastolfe, I heard his name from Gladia this morning. I know very little about him, but I took the chance of saying what I did to your daughter anyway. The odds were heavily against me, but the results were what I wanted them to be, nevertheless. As you see, I can make useful deductions, even when I have very little information, so you had better leave me in peace to continue to do so. Please, in the future, cooperate to the full and make no further mention of a Psychic Probe."

Fastolfe was silent and Baley felt a grim satisfaction at having imposed his will first on the daughter, then on the father.

How long he could continue to do so he did not know.

9. VASILIA

36.

Baley paused at the door of the airfoil and said firmly, "Giskard, I do not wish the windows opacified. I do not wish to sit in the back. I want to sit in the front seat and observe the Outside. Since I will be sitting between you and Daneel, I should be safe enough, unless the car itself is destroyed. And, in that case, we will all be destroyed and it won't matter whether I am in front or in back."

Giskard responded to the force of the statement by retreating into greater respectfulness. "Sir, if you should feel ill-

"Then you will stop the car and I will climb into the back seat and you can opacify the rear windows. Or you needn't even stop. I can climb over the front seat while you are moving. The point is, Giskard, that it is important for me to become as acquainted with Aurora as is possible and it is important for me, in any case, to become accustomed to the Outside. I am stating this as an order, Giskard."

Daneel said softly, "Partner Elijah is quite correct in his request, friend Giskard. He will be reasonably safe."

Giskard, perhaps reluctantly (Baley could not interpret the expression on his not-quite-human face), gave in and took his place at the controls. Baley followed and looked out of the clear glass of the windshield without quite the assurance he had presented in his voice. However, the pressure of a robot on either side was comforting.

The car rose on its jets of compressed air and swayed a bit as though it were finding its footing. Baley felt a queasy sensation in the pit of his stomach and tried not to regret his brave performance of moments before. There was no use trying to tell himself that Daneel and Giskard showed no signs of fear and should be imitated. They were robots and could not feel fear.

And then the car moved forward suddenly and Baley felt himself pushed hard against the seat. Within a minute he was moving at as fast a speed as he had ever experienced on the Expressways of the City. A wide, grassy road stretched out ahead.

The speed seemed the greater for the fact that there were none of the friendly lights and structures of the City on either side but rather wide gulfs of greenery and irregular formations.

Baley fought to keep his breath steady and to talk as naturally as he might of neutral things.

He said, "We don't seem to be passing any farmland, Daneel. This seems to be unused land."

Daneel said, "This is city territory, Partner Elijah. It is privately owned parkland and estates."

"City?" Baley could not accept the word. He knew what a City was.

"Eos is the largest and most important city on Aurora. The first to be established. The Auroran World Legislature sits here. The Chairman of the Legislature has his estate here and we will be passing it."

Not only a city but the largest. Baley looked about to either side. "I was under the impression that the Fastolfe and Gladia establishments were on the outskirts of Eos. I should think we would have passed the city limits by now."

"Not at all, Partner Elijah. We're passing through its center. The limits are seven kilometers away and our destination is nearly forty kilometers beyond that."

"The center of the city? I see no structures."

"They are not meant to be seen from the road, but there's one you can make out between the trees. That is the establishment of Fuad Labord, a well-known writer."

"Do you know all the establishments by sight?"

"They are in my memory banks," said Daneel solemnly.

"There's no traffic on the road. Why is that?"

"Long distances are covered by air-cars or magnetic subcars. Tridimensional connections-"

"They call it viewing on Solaria," said Baley.

"And here, too, in informal conversation, but TVC more formally. That takes care of much communication. Finally, Aurorans are fond of walking and it is not unusual to walk several kilometers for social visiting or even for business meetings where time is not of the essence."

"And we have to get somewhere that's too far to walk, too close for air-cars, and tridimensional viewing is not wanted-so we use a ground-car."

"An airfoil, more specifically, Partner Elijah, but that qualifies as a ground-car, I suppose."

"How long will it take to reach Vasilias's establishment?"

"Not long, Partner Elijah. She is at the Robotics Institute, as perhaps you know."

There were some moments of silence and then Baley said, "It looks cloudy near the horizon there."

Giskard negotiated a curve at high speed, the airfoil tipping through an angle of some thirty degrees. Baley choked back a moan and clung to Daneel, who flung his left arm about Baley's shoulders and held him in a strong viselike grip, one hand on each shoulder. Slowly, Baley let out his breath as the airfoil righted itself.

Daneel said, "Yes, those clouds will bring precipitation later in the day, as predicted."

Baley frowned. He had been caught in the rain once-once- during his experimental work in the field Outside on Earth. It was like standing under a cold shower with his clothes on. There had been sheer panic for a moment when he realized that there was no way in which he could reach for any controls that would turn it off. The water would come down forever! -Then everyone was running and he ran with them, making for the dryness and controllability of the City.

But this was Aurora and he had no idea what one did when it began to rain and there was no City to escape into. Run into the nearest establishment? Would refugees automatically be welcome?

Then there was another brief turn and Giskard said, "Sir, we are in the parking lot of the Robotics Institute. We can now enter and visit the establishment that Dr. Vasilia maintains on the Institute grounds."

Baley nodded. The trip had taken something between fifteen and twenty minutes (as nearly as he could judge, Earth time) and he was glad it was over. He said, rather breathlessly, "I want to know something about Dr. Fastolfe's daughter before I meet her. You did not know her, did you, Daneel?"

Daneel said, "At the time I came into existence, Dr. Fastolfe and his daughter had been separated for a considerable time. I have never met her."

"But as for you, Giskard, you and she knew each other well. Is that not so?"

"It is so, sir," said Giskard impassively.

"And were fond of each other?"

"I believe, sir," said Giskard, "that it gave Dr. Fastolfe's daughter pleasure to be with me."

"Did it give you pleasure to be with her?"

Giskard seemed to pick his words. "It gives me a sensation that I think is what human beings mean by 'pleasure' to be with any human being."

"But more so with Vasilia, I think. Am I right?"

"Her pleasure at being with me, sir," said Giskard, "did seem to stimulate those positronic potentials that produce actions in me that are equivalent to those that pleasure produces in human beings. Or so I was once told by Dr. Fastolfe."

Baley said suddenly, "Why did Vasilia leave her father?"

Giskard said nothing.

Baley said, with the sudden peremptoriness of an Earthman addressing a robot, "I asked you a question, boy."

Giskard turned his head and stared at Baley, who, for a moment, thought the glow in the robot's eyes might be brightening into a blaze of resentment at the demeaning word.

However, Giskard spoke mildly and there was no readable expression in his eyes when he said, "I would like to answer, sir, but in all matters concerning that separation, Miss Vasilia ordered me at that time to say nothing."

"But I'm ordering you to answer me and I can order you very firmly indeed-if I wish to."

Giskard said, "I am sorry. Miss Vasilia, even at that time, was skilled in robotics and the orders she gave me were sufficiently powerful to remain, despite anything you are likely to say, sir."

Baley said, "She must have been skified in robotics, since Dr. Fastolfe told me she reprogrammed you on occasion."

"It was not dangerous to do so, sir. Dr. Fastolfe himself could always correct any errors."

"Did he have to?"

"He did not, sir."

"What was the nature of the reprogramming?"

"Minor matters, sir."

"Perhaps, but humor me. Just what was it she did?"

Giskard hesitated and Baley knew what that meant at once. The robot said, "I fear that any questions concerning the reprogramming cannot be answered by me."

"You were forbidden?"

"No, sir, but the reprogramming automatically wipes out what went before. If I am changed in any particular, it would seem to me that I have always been as changed and I would have no memory of what I was before I was changed."

"Then how do you know the reprogramming was minor?"

"Since Dr. Fastolfe never saw any need of correcting what Miss Vasilia did-or so he once told me-I can only suppose the changes were minor. You might ask Miss Vasilia, sir."

"I will," said Baley.

"I fear, however, that she will not answer, sir."

Baley's heart sank. So far he had questioned only Dr. Fastolfe, Gladia, and the two robots, all of whom had overriding reasons to cooperate. Now, for the first time, he would be facing an unfriendly subject.

37.

Baley stepped out of the airfoil, which was resting on a grassy plot, and felt a certain pleasure in feeling solidity beneath his feet.

He looked around in surprise, for the structures were rather thickly spread, and to his right was a particularly large one, built plainly, rather like a huge right-angled block of metal and glass.

"Is that the Robotics Institute?" he asked.

Daneel said, "This entire complex is the Institute, Partner Elijah. You are seeing only a portion and it is more thickly built up than is common on Aurora because it is a self-contained political entity. It contains home establishments, laboratories, libraries, communal gymnasia, and so on. The large structure is the administrative center."

"This is so un-Auroran, with all these buildings in view-at least judging from what I saw of Eos-that I should think there would be considerable disapproval."

"I believe there was, Partner Elijah, but the head of the Institute is friendly with the Chairman, who has much influence, and there was a special dispensation, I understand, because of research necessities." Daneel looked about thoughtfully. "It is indeed more compact than I had supposed."

"Than you had supposed? Have you never been here before, Daneel?"

"No, Partner Elijah."

"How about you, Giskard?"

"No, sir," said Giskard.

Baley said, "You found your way here without trouble-and you seem to know the place."

"We have been suitably informed, Partner Elijah," said Daneel, "since it was necessary that we come with you."

Baley nodded thoughtfully, then said, "Why didn't Dr. Fastolfe come with us?" and decided, once again, that it made no sense to try to catch a robot off-guard. Ask a question rapidly- or unexpectedly-and they simply waited until the question was absorbed and then answered. They were never caught off-guard.

Daneel said, "As Dr. Fastolfe said, he is not a member of the Institute and feels it would be improper to visit uninvited."

"But why is he not a member?"

"The reason for that I have never been told, Partner Elijah."

Baley's eyes turned to Giskard, who said at once, "Nor I, sir."

Did not know? Were told not to know? -Baley shrugged. It did not matter which. Human beings could lie and robots be instructed.

Of course, human beings could be browbeaten or maneuvered out of a lie-if the questioner were skillful enough or brutal enough-and robots could be maneuvered out of instruction-if the questioner were skillful enough or unscrupulous enough- but the skills were different and Baley had none at all with respect to robots.

He said, "Where would we be likely to find Dr. Vasilia Fastolfe?"

Daneel said, "This is her establishment immediately before us.

"You have been instructed, then, as to its location?"

"That has been imprinted in our memory banks, Partner Elijah."

"Well, then, lead the way."

The orange sun was well up in the sky now and it was clearly nearing midday. As they approached Vasilia's establishment, they stepped into the shadow of the factory and Baley twitched a little as he felt the temperature drop immediately.

His lips tightened at the thought of occupying and setting worlds without Cities, where the temperature was uncontrolled and subject to unpredictable, idiotic changes. - And, he noted uneasily, the line of clouds at the horizon had advanced somewhat. It could also rain whenever it wished, with water cascading down.

Earth! He longed for the Cities.

Giskard had walked into the establishment first and Daneel held out his arm to prevent Baley from following.

Of course! Giskard was reconnoitering.

So was Daneel, for that matter. His eyes traversed the landscape with an intentness no human being could have duplicated. Baley was certain that those robotic eyes missed nothing. (He wondered why robots were not equipped with four eyes equally distributed about the perimeter of the head-or an optic strip totally circumnavigating it. Daneel could

not be expected to, of course, since he had to be human in appearance, but why not Giskard? Or did that introduce complications of vision that the positronic pathways could not handle? For a moment, Baley had a faint vision of the complexities that burdened the life of a roboticist.)

Giskard reappeared in the doorway and nodded. Daneel's arm exerted a respectful pressure and Baley moved forward. The door stood ajar.

There was no lock on Vasilias's establishment, but there had also been none (Baley suddenly remembered) on those of Gladia and of Dr. Fastolfe. A sparse population and separation helped insure privacy and, no doubt, the custom of noninterference helped, too. And, come to think of it, the ubiquitous robot guards were more efficient than any lock could be.

The pressure of Daneel's hand on Baley's upper arm brought the latter to a halt. Giskard, ahead of them, was speaking in a low voice to two robots, who were themselves rather Giskard-like.

A sudden coldness struck the pit of Baley's stomach. What if some rapid maneuver substituted another robot for Giskard? Would he be able to recognize the substitution? Tell two such robots apart? Would he be left with a robot without special instructions to guard him, one who might innocently lead him into danger and then react with insufficient quickness when protection was necessary?

Controlling his voice, he said calmly to Daneel, "Remarkable the similarity in those robots, Daneel. Can you tell them apart?"

"Certainly, Partner Elijah. Their clothing designs are different and their code numbers are different, as well."

"They don't look different to me."

"You are not accustomed to notice that sort of detail."

Baley stared again. "What code numbers?"

"They are easily visible, Partner Elijah, when you know where to look and when your eyes are sensitive farther into the infrared than human eyes are."

"Well, then, I would be in trouble if I had to do the identifying, wouldn't I?"

"Not at all, Partner Elijah. You had but to ask a robot for its full name and serial number. It would tell you."

"Even if instructed to give me a false one?"

"Why should any robot be so instructed?"

Baley decided not to explain.

Giskard was, in any case, returning. He said to Baley, "Sir, you will be received. Come this way, please."

The two robots of the establishment led. Behind them came Baley and Daneel, the latter retaining his grip protectively.

Following in the rear was Giskard.

The two robots stopped before a double door which opened, apparently automatically, in both directions. The room within was suffused with a dim, grayish light-daylight diffusing through thick drapery.

Baley could make out, not very clearly, a small human figure in the room, half-seated on a tall stool, with one elbow resting on a table that ran the length of the wall.

Baley and Daneel entered, Giskard coming up behind them. The door closed, leaving the room dimmer than ever.

A female voice said sharply, "Come no closer! Stay where you are!"

And the room burst into full daylight.

38.

Baley blinked and looked upward. The ceiling was glassed and, through it, the sun could be seen. The sun seemed oddly dim, however, and could be looked at, even though that did not seem to affect the quality of the light within. Presumably, the glass (or whatever the transparent substance was) diffused the light without absorbing it.

He looked down at the woman, who still maintained her pose at the stool, and said, "Dr. Vasilia Fastolfe?"

"Dr. Vasilia Aliena, if you want a full name. I do not borrow the names of others. You may call me Dr. Vasilia. It is the name by which I am commonly known at the Institute." Her voice, which had been rather harsh, softened, "And how are you, my old friend Giskard?"

Giskard said, in tones oddly removed from his usual one, "I greet you-" He paused and then said, "I greet you, Little Miss."

Vasilia smiled. "And this, I suppose, is the humanoid robot of whom I have heard-Daneel Olivaw?"

"Yes, Dr. Vasilia," said Daneel briskly.

"And finally, we have-the Earthman."

"Elijah Baley, Doctor," said Baley stiffly.

"Yes, I'm aware that Earthmen have names and that Elijah Baley is yours," she said coolly. "You don't look one blasted thing like the actor who played you in the hyperwave show."

"I am aware of that, Doctor."

"The one who played Daneel was rather a good likeness, however, but I suppose we are not here to discuss the show."

"We are not."

"I gather we are here, Earthman, to talk about whatever it is you want to say about Santirix Gremionis and get it over with. Bight?"

"Not entirely," said Baley. "That is not the primary reason for my coming, though I imagine we will get to it."

"Indeed? Are you under the impression that we are here to engage in a long and complicated discussion on whatever topic you choose to deal with?"

"I think, Dr. Vasilia, you would be well-advised to allow me to manage this interview as I wish."

"Is that a threat?"

"No."

"Well, I have never met an Earthman and it might be interesting to see how closely you resemble the actor who played your role-that is, in ways other than appearance. Are you really the masterful person you seemed to be in the show?"

"The show," said Baley with clear distaste, "was overdramatic and exaggerated my personality in every direction. I would rather you accept me as I am and judge me entirely from how I appear to you right now."

Vasilia laughed. "At least you don't seem overawed by me. That's a point in your favor. Or do you think this Gremionis thing you've got in mind puts you in a position to order me about?"

"I am not here to do anything but uncover the truth in the matter of the dead humanoid robot, Jander Panell."

"Dead? Was he ever alive, then?"

"I use one syllable in preference to phrases such as 'rendered inoperative.' Does saying 'dead' confuse you?"

Vasilia said, "You fence well. -Debrett, bring the Earthman a chair. He will grow weary standing if this is to be a long conversation. Then get into your niche. And you may choose one, too, Daneel. -Giskard, come stand by me."

Baley sat down. "Thank you, Debrett. -Dr. Vasilia, I have no authority to question you; I have no legal means of forcing you to answer my questions. However, the death of Jander Panell has put your father in a position of some-"

"It has put whom in a position?"

"Your father."

"Earthman, I sometimes refer to a certain individual as my father, but no one else does. Please use a proper name."

"Dr. Han Fastolfe. He is your father, isn't he? As a matter of record?"

Vasilia said, "You are using a biological term. I share genes with him in a manner characteristic of what on Earth would be considered a father-daughter relationship. This is a matter of indifference on Aurora, except in medical and genetic matters. I can conceive of my suffering from certain metabolic states in which it would be appropriate to consider the physiology and biochemistry of those with whom I share genes-parents, siblings, children, and so on. Otherwise these relationships are not generally referred to in polite Auroran society. -I explain this to you because you are an Earthman."

"if I have offended against custom," said Baley, "it is through ignorance and I apologize. May I refer to the gentleman under discussion by name?"

"Certainly."

"In that case, the death of Jander Panell has put Dr. Han Fastolfe into a position of some difficulty and I would assume that you would be concerned enough to desire to help him."

"You assume that, do you? Why?"

"He is your- He brought you up. He cared for you. You had a profound affection for each other. He still feels a profound affection for you."

"Did he tell you that?"

"It was obvious from the details of our conversations-even from the fact that he has taken an interest in the Solarian woman, Cladia Delmarre, because of her resemblance to you."

"Did he tell you that?"

"He did, but even if he hadn't, the resemblance is obvious."

"Nevertheless, Earthman, I owe Dr. Fastolfe nothing. Your assumptions can be dismissed."

Baley cleared his throat. "Aside from any personal feelings you might or might not have, there is the matter of the future of the Galaxy. Dr. Fastolfe wishes new worlds to be explored and settled by human beings. If the political repercussions of Jander's death lead to the exploration and settlement of the new worlds by robots, Dr. Fastolfe believes that this will be catastrophic for Aurora and humanity. Surely you would not be a party to such a catastrophe."

Vasilia said indifferently, watching him closely, "Surely not, if I agreed with Dr. Fastolfe. I do not. I see no harm in having humaniform robots doing the work. I am here at the Institute, in fact, to make that possible. I am a Globalist. Since Dr. Fastolfe is a Humanist, he is my political enemy."

Her answers were clipped and direct, no longer than they had to be. Each time there followed a definite silence, as though she were waiting, with interest, for the next question. Baley had the impression that she was curious about him, amused by him, making wagers with herself as to what the next question might be, determined to give him just the minimum information necessary to force another question.

He said, "Have you long been a member of this Institute?"

"Since its formation."

"Are there many members?"

"I should judge about a third of Aurora's roboticists are members, though only about half of these actually live and work on the Institute grounds."

"Do other members of the Institute share your views on the robotic exploration of other worlds? Do they oppose Dr. Fastolfe's views one and all?"

"I suspect that most of them are Globalists, but I don't know that we have taken a vote on the matter or even discussed it formally. You had better ask them all individually."

"Is Dr. Fastolfe a member of the Institute?"

"No."

Baley waited a bit, but she said nothing beyond the negative.

He said, "Isn't that surprising? I should think lie, of all people, would be a member."

"As it happens, we don't want him. What is perhaps less important, he doesn't want us."

"Isn't that even more surprising?"

"I don't think so." -And then, as though goaded into saying something more by an irritation within herself, she said, "He lives in the city of Eos. I suppose you know the significance of the name, Earthman?"

Baley nodded and said, "Eos is the ancient Greek goddess of the dawn, as Aurora is the ancient Roman goddess of the dawn."

"Exactly. Dr. Han Fastolfe lives in the City of the Dawn on the World of the Dawn, but he is not himself a believer in the Dawn. He does not understand the necessary method of expansion through the Galaxy, of converting the Spacer Dawn into broad Galactic Day. The robotic exploration of the Galaxy is the only practical way to carry the task through and he won't accept it-or us."

Baley said slowly, "Why is it the only practical method? Aurora and the other Spacer worlds were not explored and settled by robots but by human beings."

"Correction. By Earthpeople. It was a wasteful and inefficient procedure and there are now no Earthpeople that we will allow to serve as further settlers. We have become Spacers, long-lived and healthy, and we have robots who are infinitely more versatile and flexible than those available to the human beings who originally settled our worlds. Times and matters are wholly different-and today only robotic exploration is feasible."

"Let us suppose you are right and Dr. Fastolfe is wrong. Even so, he has a logical view. Why won't he and the Institute accept each other? Simply because they disagree on this point?"

"No, this disagreement is comparatively minor. There is a more fundamental conflict."

Again Baley paused and again she added nothing to her remark. He did not feel it safe to display irritation, so he said quietly, almost tentatively, "What is the more fundamental conflict?"

The amusement in Vasilias's voice came nearer the surface. It softened the lines of her face somewhat and, for a moment, she looked more like Gladia. "You couldn't guess, unless it were explained to you, I think."

"Precisely why I am asking, Dr. Vasilias."

"Well, then, Earthman, I have been told that Earthpeople are short-lived. I have not been misled in that, have I?"

Baley shrugged, "Some of us live to be a hundred years old, Earth time." He thought a bit. "Perhaps a hundred and thirty or so metric years."

"And how old are you?"

"Forty-five standard, sixty metric."

"I am sixty-six metric. I expect to live three metric centuries more at least-if I am careful."

Baley spread his hands wide. "I congratulate you."

"There are disadvantages."

"I was told this morning that, in three or four centuries, many, many losses have a chance to accumulate."

"I'm afraid so," said Vasilina. "And many, many gains have a chance to accumulate, as well. On the whole, it balances."

"What, then, are the disadvantages?"

"You are not a scientist, of course."

"I am a plainclothesman-a policeman, if you like."

"But perhaps you know scientists on your world."

"I have met some," said Baley cautiously.

"You know how they work? We are told that on Earth they cooperate out of necessity. They have, at most, half a century of active labor in the course of their short lives. Less than seven metric decades. Not much can be done in that time."

"Some of our scientists had accomplished quite a deal in considerably less time."

"Because they have taken advantage of the findings others have made before them and profit from the use they can make of contemporary findings by others. Isn't that so?"

"Of course. We have a scientific community to which all contribute, across the expanse of space and of time."

"Exactly. It won't work otherwise. Each scientist, aware of the unlikelihood of accomplishing much entirely by himself, is forced into the community, cannot help becoming part of the clearinghouse. Progress thus becomes enormously greater than it would be if this did not exist."

"Is not this the case on Aurora and the other Spacer worlds, too?" asked Baley.

"In theory it is; in practice not so much. The pressures in a long-lived society are less. Scientists here have three or three and a half centuries to devote to a problem, so that the thought arises that significant progress may be made in that time by a solitary worker. It becomes possible to feel a kind of intellectual greed-to want to accomplish something on your own, to assume a property right to a particular facet of progress, to be willing to see the general advance slowed-rather than give up what you conceive to be yours alone. And the general advance is slowed on Spacer worlds as a result, to the point where it is difficult to outpace the work done on Earth, despite our enormous advantages."

"I assume you wouldn't say this if I were not to take it that Dr. Han Fastolfe behaves in this manner."

"He certainly does. It is his theoretical analysis of the positronic brain that has made the humaniform robot possible. He has used it to construct-with the help of the late Dr. Sarton- your robot friend Daneel, but he has not published the important details of his theory, nor does he make it available to anyone else. In this way, he-and he alone-holds a stranglehold on the production of humaniform robots."

Baley furrowed his brow. "And the Robotics Institute is dedicated to cooperation among scientists?"

"Exactly. This Institute is made up of over a hundred topnotch roboticists of different ages, advancements, and skills and we hope to establish branches on other worlds and make it an interstellar association. All of us are dedicated to communicating

our separate discoveries or speculations to the common fund- doing voluntarily for the general good what you Earthpeople do perforce because you live such short lives.

"This, however, Dr. Han Fastolfe will not do. I'm sure you think of Dr. Han Fastolfe as a nobly idealistic Auroran patriot, but he will not put his intellectual property -as he thinks of it- into the common fund and therefore he does not want us. And because he assumes a personal property right upon scientific discoveries, we do not want him. -You no longer find the mutual distaste a mystery, I take it."

Baley nodded his head, then said, "You think this will work- this voluntary giving up of personal glory?"

"It must," said Vasilia grimly.

"And has the Institute, through community endeavor, duplicated Dr. Fastolfe's individual work and rediscovered the theory of the humaniform positronic brain?"

"We will, in time. It is inevitable."

"And you are making no attempt to shorten the time it will take by persuading Dr. Fastolfe to yield the secret?"

"I think we are on the way to persuading him."

"Through the working of the Jander scandal?"

"I don't think you really have to ask that question. -Well, have I told you what you wanted to know, Earthman?"

Baley said, "You have told me some things I didn't know."

"Then it is time for you to tell me about Gremionis. Why have you brought up the name of this barber in connection with me?"

"Barber?"

"He considers himself a hair stylist, among other things, but he is a barber, plain and simple. Tell me about him-or let us consider this interview at an end."

Baley felt weary. It seemed clear to him that Vasilia had enjoyed the fencing. She had given him enough to whet his appetite and now he would be forced to buy additional material with information of his own. -But he had none. Or at least he had only guesses. And if any of them were wrong, vitally wrong, he was through.

He therefore fenced on his own. "You understand, Dr. Vasilia, that you can't get away with pretending that it is farcical to suppose there is a connection between Gremionis and yourself."

"Why not, when it is farcical?"

"Oh no. If it were farcical, you would have laughed in my face and shut off trimensional contact. The mere fact that you were willing to abandon your earlier stand and receive me-the mere fact that you have been talking to me at length and telling me a great many things-is a clear admission that you feel that I just possibly might have my knife at your jugular."

Vasilia's jaw muscles tightened and she said, in a low and angry voice, "See here, little Earthman, my position is vulnerable and you probably know it. I am the daughter of Dr. Fastolfe and there are some here at the Institute who are foolish enough -or knavish enough- to mistrust me therefore. I don't know what kind of story you may have heard -or

made up- but that it's more or less farcical is certain. Nevertheless, no matter how farcical, it might be used effectively against me. So I am willing to trade for it. I have told you some things and I might tell you more, but only if you now tell me what you have in your hand and convince me you are telling me the truth. So tell me now.

"If you try to play games with me, I will be in no worse position than at present if I kick you out-and I will at least get pleasure out of that. And I will use what leverage I have with the Chairman to get him to cancel his decision to let you come here and have you sent right back to Earth. There is considerable pressure on him now to do this and you won't want the addition of mine.

"So talk! Now!"

39.

Baley's impulse was to lead up to the crucial point, feeling his way to see if he were right. That, he felt, would not work. She would see what he was doing-she was no fool-and would stop him. He was on the track of something, he knew, and he didn't want to spoil it. What she said about her vulnerable position as the result of her relationship to her father might well be true, but she still would not have been frightened into seeing him if she hadn't suspected that some notion he had was not completely farcical.

He had to come out with something, then, with something important that would establish, at once, some sort of domination over her. Therefore-the gamble.

He said, "Santirix Gremionis offered himself to you." And, before Vasilia could react, he raised the ante by saying, with an added touch of harshness, "And not once but many times."

Vasilia clasped her hands over one knee, then pulled herself up and seated herself on the stool, as though to make herself more comfortable. She looked at Giskard, who stood motionless and expressionless at her side.

Then she looked at Baley and said, "Well, the idiot offers himself to everyone he sees, regardless of age and sex. I would be unusual if he paid me no attention."

Baley made the gesture of brushing that to one side. (She had not laughed. She had not brought the interview to an end. She had not even put on a display of fury. She was waiting to see what he would build out of the statement, so he did have something by the tail.)

He said, "That is exaggeration, Dr. Vasilia. No one, however indiscriminating, would fail to make choices and, in the case of this Gremionis, you were selected and, despite your refusal to accept him, he continued to offer himself, quite out of keeping with Auroran custom."

Vasilia said, "I am glad you realize I refused him. There are some who feel that, as a matter of courtesy, any offer-or almost any offer-should be accepted, but that is not my opinion. I see no reason why I have to subject myself to some uninteresting event that will merely waste my time. Do you find something objectionable in that, Earthman?"

"I have no opinion to offer-either favorable or unfavorable- in connection with Auroran custom." (She was still waiting, listening to him. What was she waiting for? Would it be for what he wanted to say but yet wasn't sure he dared to?)

She said, with an effort at lightness, "Do you have anything at all to offer-or are we through?"

"Not through," said Baley, who was now forced to take another gamble. "You recognized this non-Auroran perseverance in Gremionis and it occurred to you that you could make use of it."

"Really? How mad! What possible use could I make of it?"

"Since he was clearly attracted to you very strongly, it would not be difficult to arrange to have him attracted by another who resembled you very closely. You urged him to do so, perhaps promising to accept him if the other did not."

"Who is this poor woman who resembles me closely?"

"You do not know? Come now, that is naïve, Dr. Vasilia. I am talking of the Solarian woman, Gladia, whom I already have said has come under the protection of Dr. Fastolfe precisely because she does resemble you. You expressed no surprise when I referred to this at the beginning of our talk. It is too late to pretend ignorance now."

Vasilia looked at him sharply. "And from his interest in her, you deduced that he must first have been interested in me? It was this wild guess with which you approached me?"

"Not entirely a wild guess. There are other substantiating factors. Do you deny all this?"

She brushed thoughtfully at the long desk beside her and Baley wondered what details were carried by the long sheets of paper on it. He could make out, from a distance, complexities of patterns that he knew would be totally meaningless to him, no matter how carefully and thoroughly he studied them.

Vasilia said, "I grow weary. You have told me that Gremionis was interested first in me, and then in my look-alike, the Solarian. And now you want me to deny it. Why should I take the trouble to deny it? Of what importance is it? Even if it were true, how could this damage me in any way? You are saying that I was annoyed by attentions I didn't want and that I ingeniously deflected them. Well?"

Baley said, "It is not so much what you did, as why. You knew that Gremionis was the type of person who would be persistent. He had offered himself to you over and over and he would offer himself to Gladia over and over."

"If she would refuse him."

"She was a Solarian, having trouble with sex, and was refusing everyone, something I dare say you knew, since I imagine that, for all your estrangement from Dr. Fastolfe, you have enough feeling to keep an eye on your replacement."

"Well, then, good for her. If she refused Gremionis, she showed good taste."

"You knew there was no 'if' about it. You knew she would."

"Still-what of it?"

"Repeated offers to her would mean that Gremionis would be in Gladia's establishment frequently, that he would cling to her."

"One last time. Well?"

"And in Gladia's establishment was a very unusual object, one of the two humaniform robots in existence, Jander Panell."

Vasilia hesitated. Then, "What are you driving at?"

"I think it struck you that if, somehow, the humaniform robot were killed under circumstances that would implicate Dr. Fastolfe, that could be used as a weapon to force the secret of the humaniform positronic brain out of him. Gremionis, annoyed over Gladia's persistent refusal to accept him and given the opportunity by his constant presence at Gladia's establishment, could be induced to seek a fearful revenge by killing the robot."

Vasilia blinked rapidly. "That poor barber might have twenty such motives and twenty such opportunities and it wouldn't matter. He wouldn't know how to order a robot to shake hands with any efficiency. How would he manage to come within a light-year of imposing mental freeze-out on a robot?"

"Which now," said Baley softly, "finally brings us to the point, a point I think you have been anticipating, for you have somehow restrained yourself from throwing me out because you had to make sure whether I had this point in mind or not. What I'm saying is that Gremionis did the job, with the help of this Robotics Institute, working through you."

10. AGAIN VASILIA

40.

It was as though a hyperwave drama had come to a halt in a holographic still.

None of the robots moved, of course, but neither did Baley and neither did Dr. Vasilias. Long seconds-abnormally long ones-passed, before Vasilias let out her breath and, very slowly, rose to her feet.

Her face had tightened itself into a humorless smile and her voice was low. "You are saying, Earthman, that I am an accessory in the destruction of the humaniform robot?"

Baley said, "Something of the sort had occurred to me, Doctor."

"Thank you for the thought. The interview is over and you will leave." She pointed to the door.

Baley said, "I'm afraid I do not wish to."

"I don't consult your wishes, Earthman."

"You must, for how can you make me leave against my wishes?"

"I have robots who, at my request, will put you out politely but firmly and without hurting anything but your self-esteem-if you have any."

"You have but one robot here. I have two that will not allow that to happen."

"I have twenty on instant call."

Baley said, "Dr. Vasilias, please understand! You were surprised at seeing Daneel. I suspect that, even though you work at the Robotics Institute, where humaniform robots are the first order of business, you have never actually seen a completed and functioning one. Your robots, therefore, haven't seen one, either. Now look at Daneel. He looks human. He looks more human than any robot who has ever existed, except for the dead Jander. To your robots, Daneel will surely look human. He will know how to present an order in such a way that they will obey him in preference, perhaps, to you."

Vasilias said, "I can, if necessary, summon twenty human beings from within the Institute who will put you out, perhaps with a little damage, and your robots, even Daneel, will not be able to interfere effectively."

"How do you intend to call them, since my robots are not going to allow you to move? They have extraordinarily quick reflexes."

Vasilias showed her teeth in something that could not be called a smile. "I cannot speak for Daneel, but I've known Giskard for most of my life. I don't think he will do anything to keep me from summoning help and I imagine he will keep Daneel from interfering, too."

Baley tried to keep his voice from trembling as he skated on ever-thinner ice-and knew it. He said, "Before you do anything, perhaps you might ask Giskard what he will do if you and I give conflicting orders."

"Giskard?" said Vasilias with supreme confidence.

Giskard's eyes turned full on Vasilisa and he said, with an odd timbre to his voice, "Little Miss, I am compelled to protect Mr. Baley. He takes precedence."

"Indeed? By whose order? By this Earthman's? This stranger's?"

Giskard said, "By Dr. Han Fastolfe's order."

Vasilisa's eyes flashed and she slowly sat down on the stool again. Her hands, resting in her lap, trembled and she said through lips that scarcely moved, "He's even taken you away."

"If that is not enough, Dr. Vasilisa," said Daneel, speaking suddenly, of his own accord, "I, too, would place Partner Elijah's welfare above yours."

Vasilisa looked at Daneel with bitter curiosity. "Partner Elijah? Is that what you call him?"

"Yes, Dr. Vasilisa. My choice in this matter-the Earthman over you-arises not only out of Dr. Fastolfe's instructions, but because the Earthman and I are partners in this investigation and because-" Daneel paused as though puzzled by what he was about to say, and then said it anyway, "-we are friends."

Vasilisa said, "Friends? An Earthman and a humanoid robot? Well, there is a match. Neither quite human."

Baley said, sharply, "Nevertheless bound by friendship. Do not, for your own sake, test the force of our-" Now it was he who paused and, as though to his own surprise, completed the sentence impossibly, "-love."

Vasilisa turned to Baley. "What do you want?"

"Information. I have been called to Aurora-this World of the Dawn-to straighten out an event that does not seem to have an easy explanation, one in which Dr. Fastolfe stands falsely accused, with the possibility, therefore, of terrible consequences for your world and mine. Daneel and Giskard understand this situation well and know that nothing but the First Law at its fullest and most immediate can take precedence over my efforts to solve the mystery. Since they have heard what I have said and know that you might possibly be an accessory to the deed, they understand that they must not allow this interview to end. Therefore, I say again, don't risk the actions they may be forced to take if you refuse to answer my questions. I have accused you of being an accessory in the murder of Jander Panell. Do you deny that accusation or not? You must answer."

Vasilisa said bitterly, "I will answer. Never fear! Murder? A robot is put out of commission and that's murder? Well, I do deny it, murder or whatever! I deny it with all possible force. I have not given Gremionis information on robotics for the purpose of allowing him to put an end to Jander. I don't know enough to do so and I suspect that no one at the Institute knows enough."

Baley said, "I can't say whether you know enough to have helped commit the crime or whether anyone at the Institute knows enough. We can, however, discuss motive. First, you might have a feeling of tenderness for this Gremionis. However much you might reject his offers-however contemptible you might find him as a possible lover-would it be so strange that you would feel flattered by his persistence, sufficiently so to be willing to

help him if he turned to you prayerfully and without any sexual demands with which to annoy you?"

"You mean he may have come to me and said, 'Vasilia, dear, I want to put a robot out of commission. Please tell me how to do it and I will be terribly grateful to you.' And I would say, 'Why, certainly, dear, I would just love to help you commit a crime.'

-Preposterous! No one except an Earthman, who knows nothing of Auroran ways, could believe anything like this could happen. It would take a particularly stupid Earthman, too."

'Perhaps, but all possibilities must be considered. For instance, as a second possibility, might you yourself not be jealous over the fact that Gremionis has switched his affections, so that you might help him not out of abstract tenderness but out of a very concrete desire to win him back?'

"Jealous? That is an Earthly emotion. If I do not wish Gremionis for myself, how can I possibly care whether he offers himself to another woman and she accepts or, for that matter, if another woman offers herself to him and he accepts?"

"I have been told before that sexual jealousy is unknown on Aurora and I am willing to admit that is true in theory, but such theories rarely hold up in practice. There are surely some exceptions. What's more, jealousy is all too often an irrational emotion and not to be dismissed by mere logic. Still, let us leave that for the moment. As a third possibility, you might be jealous of Gladia and wish to do her harm, even if you don't care the least bit for Gremionis yourself."

"Jealous of Cladia? I have never even seen her, except once on the hyperwave when she arrived in Aurora. The fact that people have commented on her resemblance to me, every once in a long while, hasn't bothered me."

"Does it perhaps bother you that she is Dr. Fastolfe's ward, his favorite, almost the daughter that you were once? She has replaced you."

"She is welcome to that. I could not care less."

"Even if they were lovers?"

Vasilia stared at Baley with growing fury and beads of perspiration appeared at her hairline.

She said, "There is no need to discuss this. You have asked me to deny the allegation that I was accessory to what you call murder and I have denied it. I have said I lacked the ability and I lacked the motive. You are welcome to present your case to all Aurora. Present your foolish attempts at supplying me with a motive. Maintain, if you wish, that I have the ability to do so. You will get nowhere. Absolutely nowhere."

And even while she trembled with anger, it seemed to Baley that there was conviction in her voice.

She did not fear the accusation.

She had agreed to see him, so he was on the track of something that she feared—perhaps feared desperately.

But she did not fear this.

Where, then, had he gone wrong?

41.

Baley said (troubled, casting about for some way out), "Suppose I accept your statement, Dr. Vasilias. Suppose I agree that my suspicion that you might have been an accessory in this- roboticide-was wrong. Even that would not mean that it is impossible for you to help me."

"Why should I help you?"

Baley said, "Out of human decency. Dr. Han Fastolfe assures us he did not do it, that he is not a robot-killer, that he did not put this particular robot, Jander, out of operation. You've known Dr. Fastolfe better than anyone ever has, one would suppose. You spent years in an intimate relationship with him as a beloved child and growing daughter. You saw him at times and under conditions that no one else saw him. Whatever your present feelings toward him might be, the past is not changed by them. Knowing him as you do, you must be able to bear witness that his character is such that he could not harm a robot, certainly not a robot that is one of his supreme achievements. Would you be willing to bear such witness openly? To all the worlds? It would help a great deal."

Vasilias's face seemed to harden. "Understand me," she said, pronouncing the words distinctly. "I will not be involved."

"You must be involved."

"Why?"

"Do you owe nothing to your father? He is your father. Whether the word means anything to you or not, there is a biological connection. And besides that-father or not-he took care of you, nurtured and brought you up, for years. You owe him something for that."

Vasilias trembled. It was a visible shaking and her teeth were chattering. She tried to speak, failed, took a deep breath, another, then tried again. She said, "Giskard, do you hear all that is going on?"

Giskard bowed his head. "Yes, Little Miss."

"And you, the humaniform- Daneel?"

"Yes, Dr. Vasilias."

"You hear all this, too?"

"Yes, Dr. Vasilias."

"You both understand the Earthman insists that I bear evidence on Dr. Fastolfe's character?"

Both nodded.

"Then I will speak-against my will and in anger. It is because I have felt that I did owe this father of mine some minimum consideration as my gene-bearer and, after a fashion, my upbringer, that I have not borne witness. But now I will. Earthman, listen to me. Dr. Han Fastolfe, some of whose genes I share, did not take care of me-me-me-as a

separate, distinct human being. I was to him nothing more than an experiment, an observational phenomenon."

Baley shook his head. "That is not what I was asking."

She drove furiously over him. "You insisted that I speak and I will speak-and it will answer you. -One thing interests Dr. Han Fastolfe. One thing. One thing only. That is the functioning of the human brain. He wishes to reduce it to equations, to a wiring diagram, to a solved maze, and thus found a mathematical science of human behavior which will allow him to predict the human future. He calls the science 'psychohistory.' I can't believe that you have talked to him for as little as an hour without his mentioning it. it is the monomania that drives him."

Vasilias searched Baley's face and cried out in a fierce joy, "I can tell! He has talked to you about it. Then he must have told you that he is interested in robots only insofar as they can bring him to the human brain. He is interested in humanoid robots only insofar as they can bring him still closer to the human brain. -Yes, he's told you that, too.

"The basic theory that made humanoid robots possible arose, I am quite certain, out of his attempt to understand the human brain and he hugs that theory to himself and will allow no one else to see it because he wants to solve the problem of the human brain totally by himself in the two centuries or so he has left. Everything is subordinate to that. And that most certainly included me."

Baley, trying to breast his way against the flood of fury, said in a low voice, "In what way did it include you, Dr. Vasilias?"

"When I was born, I should have been placed with others of my kind, with professionals who knew how to care for infants. I should not have been kept by myself in the charge of an amateur-father or not, scientist or not. Dr. Fastolfe should not have been allowed to subject a child to such an environment and would not-if he had been anyone else but Han Fastolfe. He used all his prestige to bring it about, called in every debt he had, persuaded every key person he could, until he had control of me."

"He loved you," muttered Baley.

"Loved me? Any other infant would have done as well, but no other infant was available. What he wanted was a growing child in his presence, a developing brain. He wanted to make a careful study of the method of its development, the fashion of its growth. He wanted a human brain in simple form, growing complex, so that he could study it in detail. For that purpose, he subjected me to an abnormal environment and to subtle experimentation, with no consideration for me as a human being at all."

"I can't believe that. Even if he were interested in you as an experimental object, he could still care for you as a human being."

"No. You speak as an Earthman. Perhaps on Earth there is some sort of regard for biological connections. Here there is not. I was an experimental object to him. Period."

"Even if that were so to start with, Dr. Fastolfe couldn't help but learn to love you-a helpless object entrusted to his care. Even if there were no biological connection at all, even if you were an animal, let us say, he would have learned to love you."

"Oh, would he now?" she said bitterly. "You don't know the force of indifference in a man like Dr. Fastolfe. If it would have advanced his knowledge to snuff out my life, he would have done so without hesitation."

"That is ridiculous, Dr. Vasilia. His treatment of you was so kind and considerate that it evoked love from you. I know that. You-you offered yourself to him."

"He told you that, did he? Yes, he would. Not for a moment, even today, would he stop to question whether such a revelation might not embarrass me. -Yes, I offered myself to him and why not? He was the only human being I really knew. He was superficially gentle to me and I didn't understand his true purposes. He was a natural target for me. Then, too, he saw to it that I was introduced to sexual stimulation under controlled conditions-the controls he set up. It was inevitable that eventually I would turn to him. I had to, for there was no one else-and he refused."

"And you hated him for that?"

"No. Not at first. Not for years. Even though my sexual development was stunted and distorted, with effects I feel to this day, I did not blame him. I did not know enough. I found excuses for him. He was busy. He had others. He needed older women. You would be astonished at the ingenuity with which I uncovered reasons for his refusal. It was only years later that I became aware that something was wrong and I managed to bring it out openly, face-to-face. 'Why did you refuse me?' I asked. 'Obliging me might have put me on the right track, solved everything.'"

She paused, swallowing, and for a moment covered her eyes. Baley waited, frozen with embarrassment. The robots were expressionless (incapable, for all Baley knew, of experiencing any balance or imbalance of the positronic pathways that would produce a sensation in any way analogous to human embarrassment).

She said, calmer, "He avoided the question for as long as he could, but I faced him with it over and over. 'Why did you refuse me?' 'Why did you refuse me?' He had no hesitation in engaging in sex. I knew of several occasions- I remember wondering if he simply preferred men. Where children are not involved, personal preference in such things is not of any importance and some men can find women distasteful or, for that matter, vice versa. It was not so with this man you call my father, however. He enjoyed women-sometimes young women-as young as I was when I first offered myself. 'Why did you refuse me?' He finally answered me-and you are welcome to guess what that answer was."

She paused and waited sardonically.

Baley stirred uneasily and said in a mumble, "He didn't want to make love to his daughter?"

"Oh, don't be a fool. What difference does that make? Considering that hardly any man on Aurora knows who his daughter is, any man making love to any woman a few decades younger might be- But never mind, it's self-evident. -What he answered-and oh, how I remember the words-was 'You great fool! If I involved myself with you in that manner, how could I maintain my objectivity-and of what use would my continuing study of you be?'

"By that time, you see, I knew of his interest in the human brain. I was even following in his footsteps and becoming a roboticist in my own right. I worked with Giskard in this direction and experimented with his programming. I did it very well, too, didn't I, Giskard?"

Giskard said, "So you did, Little Miss."

"But I could see that this man whom you call my father did not view me as a human being. He was willing to see me distorted for life, rather than risk his objectivity. His observations meant more to him than my nonnality. From that time on, I knew what I was and what he was-and I left him."

The silence hung heavy in the air.

Baley's head was throbbing slightly. He wanted to ask: could you not take into account the self-centeredness of a great scientist? The importance of a great problem? Could you make no allowances for something spoken perhaps in irritation at being forced to discuss what one did not want to discuss? Was not Vasilias's own anger just now much the same thing? Did not Vasilias's concentration on her own "normality" (whatever she meant by that) to the exclusion of perhaps the two most important problems facing humanity -the nature of the human brain and the settling of the Galaxy- represent an equal self-centeredness with much less excuse?

But he could ask none of those things. He did not know how to put it so that it would make real sense to this woman, nor was he sure he would understand her if she answered.

What was he doing on this world? He could not understand their ways, no matter how they explained. Nor could they understand his.

He said wearily, "I am sorry, Dr. Vasilias. I understand that you are angry, but if you would dismiss your anger for a moment and consider, instead, the matter of Dr. Fastolfe and the murdered robot, could you not see that we are dealing with two different things? Dr. Fastolfe might have wanted to observe you in a detached and objective way, even at the cost of your unhappiness, and yet be light-years removed from the desire to destroy an advanced humaniform robot."

Vasilias reddened. She shouted, "Don't you understand what I'm telling you, Earthman? Do you think I have told you what I have Just told you because I think you-or anyone-would be interested in the sad story of my life? For that matter, do you think I enjoy revealing myself in this manner?"

"I'm telling you this only to show you that Dr. Han Fastolfe- my biological father, as you never tire of pointing out-did destroy Jander. Of course he did. I have refrained from saying so because no one-until you-was idiot enough to ask me and because of some foolish remnant of consideration I have for that man. But now that you have asked me, I say so and, by Aurora, I will continue to say so-to anyone and everyone. Publicly, if necessary.

"Dr. Han Fastolfe did destroy Jander Panell. I am certain of it. Does that satisfy you?"

42.

Baley stared at the distraught woman in horror.

He stuttered and began again. "I don't understand at all, Dr. Vasilia. Please quiet down and consider. Why should Dr. Fastolfe destroy the robot? What has that to do with his treatment of you? Do you imagine it is some kind of retaliation against you?"

Vasilia was breathing rapidly (Baley noted absently and without conscious intention that, although Vasilia was as small-boned as Gladia was, her breasts were larger) and she seemed to wrench at her voice to keep it under control.

She said, "I told you, Earthman, did I not, that Han Fastolfe was interested in observing the human brain? He did not hesitate to put it under stress in order to observe the results. And he preferred brains that were out of the ordinary-that of an infant, for instance-so that he might watch their development. Any brain but a commonplace one."

"But what has that to do-"

"Ask yourself, then, why he gained this interest in the foreign woman."

"In Gladia? I asked him and he told me. She reminded him of you and the resemblance is indeed distinct."

"And when you told me this earlier, I was amused and asked if you believed him? I ask again. Do you believe him?"

"Why shouldn't I believe him?"

"Because it's not true. The resemblance may have attracted his attention, but the real key to his interest is that the foreign woman is-foreign. She had been brought up in Solaria, under assumptions and social axioms not like those on Aurora. He could therefore study a brain that was differently molded from ours and could gain an interesting perspective. Don't you understand that? -For that matter, why is he interested in you, Earthman? Is he silly enough to imagine that you can solve an Auroran problem when you know nothing about Aurora?"

Daneel suddenly intervened again and Baley started at the sound of the other's voice. Daneel said, "Dr. Vasilia, Partner Elijah solved a problem on Solaria, though he knew nothing of Solaria."

"Yes," said Vasilia sourly, "so all the worlds noted on that hyperwave program. And lightning may strike, too, but I don't think that Han Fastolfe is confident it will strike twice in the same place in rapid succession. No, Earthman, he was attracted to you, in the first place, because you are an Earthman. You possess another alien brain he can study and manipulate."

"Surely you cannot believe, Dr. Vasilia, that he would risk matters of vital importance to Aurora and call in someone he knew to be useless, merely to study an unusual brain."

"Of course he would. Isn't that the whole point of what I am telling you? There is no crisis that could face Aurora that he would believe, for a single moment, to be as important as solving the problem of the brain. I can tell you exactly what he would say if you were to ask him. Aurora might rise or fall; flourish or decay, and that would all be of

little concern compared to the problem of the brain, for if human beings really understood the brain, all that might have been lost in the course of a millennium of neglect or wrong decisions would be regained in a decade of cleverly directed human development guided by his dream of 'psychohistory.' He would use the same argument to justify anything-lies, cruelty, anything-by merely saying that it is all intended to serve the purpose of advancing the knowledge of the brain."

"I can't imagine that Dr. Fastolfe would be cruel. He is the gentlest of men."

"Is he? How long have you been with him?"

Baley said, "A few hours on Earth three years ago. A day, now, here on Aurora."

"A whole day. A whole day. I was with him for thirty years almost constantly and I have followed his career from a distance with some attention ever since. And you have been with him a whole day, Earthman? Well, on that one day, has he done nothing that frightened or humiliated you?"

Baley kept silent. He thought of the sudden attack with the spicer from which Daneel had rescued him; of the Personal that presented him with such difficulty, thanks to its masked nature; the extended walk Outside designed to test his ability to adapt to the open.

Vasilia said, "I see he did. Your face, Earthman, is not quite the mask of disguise you may think it is. Did he threaten you with a Psychic Probe?"

Baley said, "It was mentioned."

"One day-and it was already mentioned. I assume it made you feel uneasy?"

"It did."

"And that there was no reason to mention it?"

"Oh, but there was," said Baley quickly. "I had said that, for a moment, I had a thought which I then lost and it was certainly legitimate to suggest that a Psychic Probe might help me relocate that thought."

Vasilia said, "No, it wasn't. The Psychic Probe cannot be used with sufficient delicacy of touch for that-and, if it were attempted, the chances would be considerable that there would be permanent brain damage."

"Surely not if it were wielded by an expert-by Dr. Fastolfe, for instance."

"By him? He doesn't know one end of the Probe from the other. He is a theoretician, not a technician."

"By someone else, then. He did not, in actual fact, specify himself."

"No, Earthman. By no one. Think! Think! If the Psychic Probe could be used on human beings safely by anyone, and if Han Fastolfe were so concerned about the problem of the inactivation of the robot, then why didn't he suggest the Psychic Probe be used on himself?"

"On himself?"

"Don't tell me this hasn't occurred to you? Any thinking person would come to the conclusion that Fastolfe is guilty. The only point in favor of his innocence is that he himself insists he is innocent. Well, then, why does he not offer to prove his innocence by being

psychically probed and showing that no trace of guilt can be dredged up from the recesses of his brain? Has he suggested such a thing, Earthman?"

"No, he hasn't. At least, not to me."

"Because he knows very well that it is deadly dangerous. Yet he does not hesitate to suggest it in your case, merely to observe how your brain works under pressure, how you react to fright. Or perhaps it occurs to him that, however dangerous the Probe is to you, it may come up with some interesting data for him, as far as the details of your Earth-molded brain are concerned. Tell me, then, isn't that cruel?"

Baley brushed it aside with a tight gesture of his right arm. "How does this apply to the actual case-to the roboticide?"

"The Solarian woman, Gladia, caught my onetime father's eye. She had an interesting brain-for his purposes. He therefore gave her the robot, Jander, to see what would happen if a woman not raised on Aurora were faced with a robot that seemed human in every particular. He knew that an Auroran woman would very likely make use of the robot for sex immediately and have no trouble doing so. I myself would have some trouble, I admit, because I was not brought up normally, but no ordinary Auroran would. The Solarian woman, on the other hand, would have a great deal of trouble because she was brought up on an extremely robotic world and had unusually rigid mental attitudes toward robots. The difference, you see, might be very instructive to my father, who tried, out of these variations, to build his theory of brain functioning. Han Fastolfe waited half a year for the Solarian woman to get to the point where she could perhaps begin making the first experimental approaches-

Baley interrupted. "Your father knew nothing at all about the relationship between Gladia and Jander."

"Who told you that, Earthman? My father? Gladia? If the former, he was naturally lying; if the latter, she simply didn't know, very likely. You may be sure Fastolfe knew what was going on; he had to, for it must have been part of his study of how a human brain was bent under Solarian conditions.

"And then he thought-and I am as sure of this as I would be if I could read his thoughts-what would happen now, at the point where the woman is just beginning to rely on Jander, if, suddenly, without reason, she lost him. He knew what an Auroran woman would do. She would feel some disappointment and then seek out some substitute, but what would a Solarian woman do? So he arranged to put Jander out of commission-

"Destroy an immensely valuable robot just to satisfy a trivial curiosity?"

"Monstrous, isn't it? But that's what Han Fastolfe would do. So go back to him, Earthman, and tell him that his little game is over, If the planet, generally, doesn't believe him to be guilty now, they most certainly will after I have had my say."

43.

For a long moment, Baley sat there stunned, while Vasilia looked at him with a kind of grim delight, her face looking harsh and totally unlike that of Gladia.

There seemed nothing to do- Baley got to his feet, feeling old-much older than his forty-five standard years (a child's age to these Aurorans). So far everything he had done had led to nothing. To worse than nothing, for at every one of his moves, the ropes seemed to tighten about Fastolfe.

He looked upward at the transparent ceiling. The sun was quite high, but perhaps it had passed its zenith, as it was dimmer than ever. Lines of thin clouds obscured it intermittently.

Vasilia seemed to become aware of this from his upward glance. Her arm moved on the section of the long bench near which she was sitting and the transparency of the ceiling vanished. At the same time, a brilliant light suffused the room, bearing the same faint orange tinge that the sun itself had.

She said, "I think the interview is over. I shall have no reason to see you again, Earthman-or you me. Perhaps you had better leave Aurora. You have done"-she smiled humorlessly and said the next words almost savagely-"my father enough damage, though scarcely as much as he deserves."

Baley took a step toward the door and his two robots closed in on him. Giskard said in a low voice, "Are you well, sir?"

Baley shrugged. What was there to answer to that? Vasilia called out, "Giskard! When Dr. Fastolfe finds he has no further use for you, come join my staff?"

Giskard looked at her calmly. "If Dr. Fastolfe permits, I will do so, Little Miss,"

Her smile grew warm. "Please do so, Giskard. I've never stopped missing you."

"I often think of you, Little Miss."

Baley turned at the door. "Dr. Vasilia, would you have a Personal I might use?"

Vasilia's eyes widened. "Of course not, Earthian. There are Community Personals here and there at the Institute. Your robots should be able to guide you."

He stared at her and shook his head. It was not surprising that she wanted no Earthman infecting her rooms and yet it angered him just the same.

He said out of anger, rather than out of any rational judgment, "Dr. Vasilia, I would not, were I you, speak of the guilt of Dr. Fastolfe."

"What is there to stop me?"

"The danger of the general uncovering of your dealings with Gremionis. The danger to you."

"Don't be ridiculous. You have admitted there was no conspiracy between myself and Gremionis."

"Not really. I agreed there seemed reason to conclude there was no direct conspiracy between you and Gremionis to destroy Jander. There remains the possibility of an indirect conspiracy."

"You are mad. What is an indirect conspiracy?"

"I am not ready to discuss that in front of Dr. Fastolfe's robots -unless you insist. And why should you? You know very well what I mean." There was no reason why Baley should think she would accept this bluff. It might simply worsen the situation still further.

But it didn't! Vasilisa seemed to shrink within herself, frowning.

Baley thought: There is then an indirect conspiracy, whatever it might be, and this might hold her till she sees through my bluff.

Baley said, his spirits rising a little, "I repeat, say nothing about Dr. Fastolfe."

But, of course, he didn't know how much time he had bought -perhaps very little.

11. GREMIONIS

44.

They were sitting in the airfoil again-all three in the front, with Baley once more in the middle and feeling the pressure on either side. Baley was grateful to them for the care they unfailingly gave him, even though they were only machines, helpless to disobey instructions.

And then he thought: Why dismiss them with a word- "machines"? They're good machines in a Universe of sometimes evil people. I have no right to favor the machines vs. people subcategorization over the good vs. evil one. And Daneel, at least, I cannot think of as a machine.

Giskard said, "I must ask again, sir. Do you feel well?"

Baley nodded. "Quite well, Giskard. I am glad to be out here with you two."

The sky was, for the most part, white-off-white, actually. There was a gentle wind and it had felt distinctly cool until they got into the car.

Daneel said, "Partner Elijah, I was listening carefully to the conversation between yourself and Dr. Vasilia. I do not wish to comment unfavorably on what Dr. Vasilia has said, but I must tell you that, in my observation, Dr. Fastolfe is a kind and courteous human being. He has never, to my knowledge, been deliberately cruel, nor has he, as nearly as I can judge, sacrificed a human being's essential welfare to the needs of his curiosity."

Baley looked at Daneel's face. which gave the impression, somehow, of intent sincerity. He said, "Could you say anything against Dr. Fastolfe, even if he were, in fact, cruel and thoughtless?"

"I could remain silent."

"But would you?"

"if, by telling a lie, I were to harm a truthful Dr. Vasilia by casting unjustified doubt on her truthfulness, and if, by remaining silent, I would harm Dr. Fastolfe by lending further color to the true accusations against him, and if the two harms were, to my mind, roughly equal in intensity, then it would be necessary for me to remain silent. Harm through an active deed outweighs, in general, harm through passivity-all things being reasonably equal."

Baley said, "Then, even though the First Law states: 'A robot may not injure a human being or, through inaction, allow a human being to come to harm,' the two halves of the law are not equal? A fault of commission, you say, is greater than one of omission?"

"The words of the law are merely an approximate description of the constant variations in positronomotive force along the robotic brain paths, Partner Elijah. I do not know enough to describe the matter mathematically, but I know what my tendencies are."

"And they are always to choose not doing over doing, if the harm is roughly equal in both directions?"

"In general. And always to choose truth over nontruth, if the harm is roughly equal in both directions. In general, that is."

"And, in this case, since you speak to refute Dr. Vasilias and thus do her harm, you can only do so because the First Law is mitigated sufficiently by the fact that you are telling the truth?"

"That is so, Partner Elijah."

"Yet the fact is, you would say what you have said, even though it were a lie-provided Dr. Fastolfe had instructed you, with sufficient intensity, to tell that lie when necessary and to refuse to admit that you had been so instructed."

There was a pause and then Daneel said, "That is so, Partner Elijah."

"It is a complicated mess, Daneel-but you still believe that Dr. Fastolfe did not murder Jander Panell?"

"My experience with him is that he is truthful, Partner Elijah, and that he would not do harm to friend Jander."

"And yet Dr. Fastolfe has himself described a powerful motive for his having committed the deed, while Dr. Vasilias has described a completely different motive, one that is just as powerful and is even more disgraceful than the first." Baley brooded a bit. "If the public were made aware of either motive, belief in Dr. Fastolfe's guilt would be universal."

Baley turned suddenly to Giskard. "How about you, Giskard? You have known Dr. Fastolfe longer than Daneel has. Do you agree that Dr. Fastolfe could not have committed the deed and could not have destroyed Jander, on the basis of your understanding of Dr. Fastolfe's character?"

"I do, sir."

Baley regarded the robot uncertainly. He was less advanced than Daneel. How far could he be trusted as a corroborating witness? Might he not be impelled to follow Daneel in whatever direction Daneel chose to take?

He said, "You knew Dr. Vasilias, too, did you not?"

"I knew her very well," said Giskard.

"And liked her, I gather?"

"She was in my charge for many years and the task did not in any way trouble me."

"Even though she fiddled with your programming?"

"She was very skillful."

"Would she lie about her father-about Dr. Fastolfe, that is?"

Giskard hesitated. "No, sir. She would not."

"Then you are saying that what she says is the truth."

"Not quite, sir. What I am saying is that she herself believes she is telling the truth."

"But why should she believe such evil things about her father to be true if, in actual fact, he is as kind a person as Daneel has just told me he was?"

Giskard said slowly, "She has been embittered by various events in her youth, events for which she considers Dr. Fastolfe to have been responsible and for which he may indeed have been unwittingly responsible-to an extent. It seems to me it was not his intention that the events in question should have the consequences they did. However, human beings are not governed by the straightforward laws of robotics. It is therefore difficult to judge the complexities of their motivations under most conditions."

"True enough," muttered Baley.

Giskard said, "Do you think the task of demonstrating Dr. Fastolfe's innocence to be hopeless?"

Baley's eyebrows moved toward each other in a frown. "It may be. As it happens, I see no way out-and if Dr. Vasilia talks, as she has threatened to do-

"But you ordered her not to talk. You explained that it would be dangerous to herself if she did."

Baley shook his head. "I was bluffing. I didn't know what else to say."

"Do you intend to give up, then?"

And Baley said forcefully, "No! If it were merely Fastolfe, I might. After all, what physical harm would come to him? Roboticide is not even a crime, apparently, merely a civil offense. At worst, he will lose political influence and, perhaps, find himself unable to continue with his scientific labors for a time. I would be sorry to see that happen, but if there's nothing more I can do, then there's nothing more I can do.

"And if it were just myself, I might give up, too. Failure would damage my reputation, but who can build a brick house without bricks? I would go back to Earth a bit tarnished, I would lead a miserable and unclassified life, but that is the chance that faces every Earthman and woman. Better men than I have had to face that as unjustly.

"However, it is a matter of Earth. If I fail, then along with the grievous loss to Dr. Fastolfe and to myself, there would be an end for any hope Earthpeople might have to move out of Earth and into the Galaxy generally. For that reason, I must not fail and I must keep on somehow, as long as I am not physically thrust off this world."

Having ended in what was almost a whisper, he suddenly looked up and said in a peevish tone, "Why are we sitting here parked, Giskard? Are you running the motor for your own amusement?"

"With respect, sir," said Giskard, "you have not told me where to take you."

"True! -I beg your pardon, Giskard. First, take me to the nearest of the Community Personals that Dr. Vasilia made mention of. You two may be immune to such things, but I have a bladder that needs emptying. After that, find someplace nearby where I can get something to eat. I have a stomach that needs filling. And after that-

"Yes, Partner Elijah?" asked Daneel.

"To tell you the truth, Daneel, I don't know. However, after I tend to these purely physical needs, I will think of something."

And how Baley wished he could believe that.

45.

The airfoil did not skim the ground for long. It came to a halt, swaying a bit, and Baley felt the usual odd tightening of his stomach. That small unsteadiness told him he was in a vehicle and it drove away the temporary feeling of being safe within walls and between robots. Through the glass ahead and on either side (and backward, if he craned his neck) was the whiteness of sky and the greenness of foliage, all amounting to Outside-that is, to nothing. He swallowed uneasily.

They had stopped at a small structure.

Baley said, "Is this the Community Personal?"

Daneel said, "It is the nearest of a number on the Institute grounds, Partner Elijah."

"You found it quickly. Are these structures also included in the map that has been pumped into your memory?"

"That is the case, Partner Elijah."

"Is this one in use now?"

"It may be, Partner Elijah, but three or four may use it simultaneously."

"Is there room for me?"

"Very likely, Partner Elijah."

"Well, then, let me out. I'll go there and see-"

The robots did not move. Giskard said, "Sir, we may not enter with you."

"Yes, I am aware of that, Giskard."

"We will not be able to guard you properly, sir."

Baley frowned. The lesser robot would naturally have the more rigid mind and Baley suddenly recognized the danger that he would simply not be allowed out of their sight and, therefore, not allowed to enter the Personal. He put a note of urgency into his voice and turned his attention to Daneel, who might be expected to more nearly understand human needs. "I can't help that, Giskard. -Daneel, I have no choice in the matter. Let me out of the car."

Giskard looked at Baley without moving and, for one horrid moment, Baley thought the robot would suggest that he unburden himself in the nearby field-in the open, like an animal.

The moment passed. Daneel said, "I think we must allow Partner Elijah to have his way in this respect."

Whereupon Giskard said to Baley, "If you can wait for a short while, sir, I will approach the structure first."

Baley grimaced. Giskard walked slowly toward the building and then, deliberately, circumnavigated it. Baley might have predicted the fact that, once Giskard disappeared, his own sense of urgency would increase.

He tried to distract his own nerve endings by staring around at the prospect. After some study, he became aware of thin wires in the air, here and there-fine, dark hairs against the white sky. He did not see them, to begin with. What he saw first was an oval object sliding along beneath the clouds. He became aware of it as a vehicle and realized

that it was not floating but was suspended from a long horizontal wire. He followed that long wire with his eyes, forward and back, noting others of the sort. He then saw another vehicle farther off-and yet another still farther off. The farthest of the three was a featureless speck whose nature he understood only because he had seen the nearer ones.

Undoubtedly, these were cable-cars for internal transportation from one part of the Robotics Institute to another.

How spread out it all was, thought Baley. How needlessly the Institute consumed space.

And yet, in doing so, it did not consume the surface. The structures were sufficiently widely spaced so that the greenery seemed untouched and the plant and animal life continued (Baley imagined) as they might in emptiness.

Solaria, Baley remembered, had been empty. No doubt all the Spacer worlds were empty, since Aurora, the most populous, was so empty, even here in the most built-up region of the planet. For that matter, even Earth-outside the Cities-was empty.

But there were the Cities and Baley felt a sharp pang of homesickness, which he had to push to one side.

Daneel said, "Ah, friend Giskard has completed his examination."

Giskard was back and Baley said tartly, "Well? Will you be so kind as to grant me permission-" He stopped. Why expend sarcasm on the impenetrable hide of a robot?

Giskard said, "It seems quite certain that the Personal is unoccupied."

"Good! Then get out of my way." Baley flung open the door of the airfoil and stepped out onto the gravel of a narrow path. He strode rapidly, with Daneel following.

When he reached the door of the structure, Daneel wordlessly indicated the contact that would open it. Daneel did not venture to touch the contact himself. Presumably, thought Baley, to have done so without specific instructions would have indicated an intention to enter-and even the intention was not permitted.

Baley pushed the contact and entered, leaving the two robots behind.

It was not until he was inside that it occurred to him that Giskard could not possibly have entered the Personal to see that it was unoccupied, that the robot must have been judging the matter from external appearance-a dubious proceeding at best.

And Baley realized, with some discomfort, that, for the first time, he was isolated and separated from all protectors-and that the protectors on the other side of the door couldn't easily enter if he were suddenly in trouble. What, then, if he were, at this moment, not alone? What if some enemy had been alerted by Vasilisa, who knew he would be in search of a Personal, and what if that enemy was in hiding right now in the structure?

Baley grew suddenly and uncomfortably aware that (as would not have been the case on Earth) he was totally unarmed.

46.

To be sure, the structure was not large. There were small urinals, side by side, half a dozen of them; small washbasins, side by side, again half a dozen. No showers, no clothes-fresheners, no shaving devices.

There were half a dozen stalls, separated by partitions and with small doors to each. Might there not be someone waiting inside one of them- The doors did not come down to the ground. Moving softly, he bent and glanced under each door, looking for any sign of legs. He then approached each door, testing it, swinging it open tensely, ready to slam it shut at the least sign of anything untoward, and then to dash to the door that led to the Outside.

All the stalls were empty.

He looked around to make sure there were no other hiding places.

He could find none.

He went to the door to the Outside and found no indication of a way of locking it. It occurred to him that there would naturally be no way of locking it. The Personal was clearly for the use of several men at the same time. Others would have to be able to enter at need.

Yet he could not very well leave and try another, for the danger would exist at any- and besides, he could delay no longer.

For a moment, he found himself unable to decide which of the series of urinals he should use. He could approach and use any of them. So could anyone else.

He forced the choice of one upon himself and, aware of openness all around, was afflicted at once with bashful bladder. He felt the urgency, but had to wait impatiently for the feeling of apprehension at the possible entrance of others to dissipate itself.

He no longer feared the entrance of enemies, just the entrance of anyone.

And then he thought: The robots will at least delay anyone approaching.

With that, he managed to relax- He was quite done, greatly relieved, and about to turn to a washbasin, when he heard a moderately high-pitched, rather tense voice. "Are you Elijah Baley?"

Baley froze. After all his apprehension and all his precautions, he had been unaware of someone entering. In the end, he had been entirely wrapped up in the simple act of emptying his bladder, something that should not have taken up even the tiniest fraction of his conscious mind. (Was he getting old?)

To be sure, there seemed no threat of any kind in the voice he heard. It seemed empty of menace. It may have been that Baley simply felt certain-and had the sure confidence within him- that Daneel, at least, if not Giskard, would not have allowed a threat to enter.

What bothered Baley was merely the entrance. In his whole life, he had never been approached-let alone addressed-by a man in a Personal. On Earth that was the most strenuous taboo and on Solaria (and, until now, on Aurora) he had used only one-person Personals.

The voice came again. Impatient. "Come! You must be Elijah Baley."

Slowly, Baley turned. It was a man of moderate height, delicately dressed in well-fitted clothing in various shades of blue. He was light-skinned, light-haired, and had a small mustache that was a shade darker than the hair on his head. Baley found himself staring with fascination at the small strip of hair on the upper lip. It was the first time he had seen a Spacer with a mustache.

Baley said (and was filled with shame at speaking in a Personal), "I am Elijah Baley." His voice, even in his own ears, seemed a scratchy and unconvincing whisper.

The Spacer seemed to find it unconvincing, certainly. He said, narrowing his eyes and staring, "The robots outside said Elijah Baley was in here, but you don't look at all the way you looked on hyperwave. Not at all."

That foolish dramatization! thought Baley fiercely. No one would meet him to the end of time without having been preliminarily poisoned by that impossible representation. No one would accept him as a human being at the start, as a fallible human being -and when they discovered the fallibility, they would, in disappointment, consider him a fool.

He turned resentfully to the washbasin and splashed water, then shook his hands vaguely in the air, while wondering where the hot-air jet might be found. The Spacer touched a contact and seemed to pluck a thin bit of absorbent fluff out of midair.

"Thank you," said Baley, taking it. "That was not me in the hyperwave show. It was an actor."

"I know that, but they might have picked one that looked more like you, mightn't they?" It seemed to be a source of grievance to him. "I want to speak to you."

"How did you get past my robots?"

That was another source of grievance, apparently. "I nearly didn't," said the Spacer. "They tried to stop me and I only had one robot with me. I had to pretend I had to get in here on an emergency basis and they searched me. They absolutely laid hands on me to see if I was carrying anything dangerous. I'd have you up on charges-if you weren't an Earthman. You can't give robots the kind of orders that embarrass a human being."

"I'm sorry," said Baley stiffly, "but I am not the one who gave them their orders. What can I do for you?"

"I want to speak to you."

"You are speaking to me. -Who are you?"

The other seemed to hesitate, then said, "Gremionis."

"Santirix Gremionis?"

"That's right."

"Why do you want to speak to me?"

For a moment, Gremionis stared at Baley, apparently with embarrassment. Then he mumbled, "Well, as long as I'm here- if you don't mind-I might as well-" and he stepped toward the line of urinals.

Baley realized, with the last refinement of horrified queasiness, what it was Gremionis intended to do. He turned hastily and said, "I'll wait for you outside."

"No no, don't go," said Gremionis desperately, in what was almost a squeak. "This won't take a second. Please!"

It was only that Baley now wanted, just as desperately, to talk to Gremionis and did not want to do anything that might offend the other and make him unwilling to talk; otherwise he would not have been willing to accede to the request.

He kept his back turned and squinted his eyes nearly shut in a sort of horrified reflex. It was only when Gremionis came up around him, his hands kneading a fluffy towel of his own, that Baley could relax again, after a fashion.

"Why do you want to speak to me?" he said again.

"Gladia-the woman from Solaria-" Gremionis looked dubious and stopped.

"I know Gladia," said Baley coldly.

"Gladia viewed me -trimensionally, you know- and told me you had asked about me. And she asked me if I had, in any way, mistreated a robot she owned-a human-looking robot like one of those outside-"

"Well, did you, Mr. Gremionis?"

"No! I didn't even know she owned a robot like that, until- Did you tell her I did?"

"I was only asking questions, Mr. Gremionis."

Gremionis had made a fist of his right hand and was grinding it nervously into his left. He said intensely, "I don't want to be falsely accused of anything-and especially where such a false accusation would affect my relationship with Gladia."

Baley said, "How did you find me?"

Gremionis said, "She asked me about that robot and said you had asked about me. I had heard you had been called to Aurora by Dr. Fastolfe to solve this-puzzle-about the robot. It was on the hyperwave news. And-" The words ground out as though they were emerging from him with the utmost difficulty.

"Go on," said Baley.

"I had to talk to you and explain that I had had nothing to do with that robot. Nothing! Gladia didn't know where you were, but I thought Dr. Fastolfe would know."

"So you called him?"

"Oh no, I-I don't think I'd have the nerve to- He's such an important scientist. But Gladia called him for me. She's-that kind of person. He told her you had gone to see his daughter, Dr. Vasilia Aliena. That was good because I know her."

"Yes, I know you do," said Baley.

Gremionis looked uneasy. "How did you- Did you ask her about me, too?" His uneasiness seemed to be degenerating to misery. "I finally called Dr. Vasilia and she said you had just left and I'd probably find you at some Community Personal-and this one is the closest to her establishment. I was sure there would be no reason for you to delay in order to find a farther one. I mean why should you?"

"You reason quite correctly, but how is it you got here so quickly?"

"I work at the Robotics Institute and my establishment is on the Institute grounds. My scooter brought me here in minutes."

"Did you come here alone?"

"Yes! With only one robot. The scooter is a two-seater, you see."

"And your robot is waiting outside?"

"Yes."

"Tell me again why you want to see me."

"I've got to make sure you don't think I've had anything to do with that robot. I never even heard of him till this whole thing exploded in the news. So can I talk to you now? "

"Yes, but not here," said Baley firmly. "Let's get out."

How strange it was, thought Baley, that he was so pleased to get out from behind walls and into the Outside. There was something more totally alien to this Personal than anything else he had encountered on either Aurora or Solaria. Even more disconcerting than the fact of planet-wide indiscriminate use had been the horror of being openly and casually addressed-of behavior that drew no distinction between this place and its purpose and any other place and purpose.

The book-films he had viewed had said nothing of this. Clearly, as Fastolfe had pointed out, they were not written for Earthpeople but for Aurorans and, to a lesser extent, for possible tourists from the other forty-nine Spacer worlds. Earthpeople, after all, almost never went to the Spacer worlds, least of all to Aurora. They were not welcome there. Why, then, should they be addressed?

And why should the book-films expand on what everyone knew? Should they make a fuss over the fact that Aurora was spherical in shape, or that water was wet, or that one man might address another freely in a Personal?

Yet did that not make a mockery of the very name of the structure? Yet Baley found himself unable to avoid thinking of the Women's Personals on Earth where, as Jessie had frequently told him, women chattered incessantly and felt no discomfort about it. Why women, but not men? Baley had never thought seriously about it before, but had accepted it merely as custom -as unbreakable custom-but if women, why not men?

It didn't matter. The thought only affected his intellect and not whatever it was about his mind that made him feel overwhelming and ineradicable distaste for the whole idea. He repeated, "Let's get out."

Gremionis protested, "But your robots are out there."

"So they are. What of it?"

"But this is something I want to talk about privately, man-to-man." He stumbled over the phrase.

"I suppose you mean Spacer to Earthman."

"If you like."

"My robots are necessary. They are my partners in my investigation."

"But this has nothing to do with the investigation. That's what I'm trying to tell you."

"I'll be the judge of that," said Baley firmly, walking out of the Personal. Gremionis hesitated and then followed.

47.

Daneel and Giskard were waiting-impassive, expressionless, patient. On Daneel's face, Baley thought he could make out a trace of concern, but, on the other hand, he might merely be reading that emotion into those inhumanly human features. Giskard, the less human-looking, showed nothing, of course, even to the most willing personifier.

A third robot waited as well-presumably that of Gremionis. He was simpler in appearance even than Giskard and had an air of shabbiness about him. It was clear that Gremionis was not very well-to-do.

Daneel said, with what Baley automatically assumed to be the warmth of relief, "I am pleased that you are well, Partner Elijah."

"Entirely well. I am curious, however, about something. If you had heard me call out in alarm from within, would you have come in?"

"At once, sir," said Giskard.

"Even though you are programmed not to enter Personals?"

"The need to protect a human being-you, in particular- would be paramount, sir."

"That is so, Partner Elijah," said Daneel.

"I'm glad to hear that," said Baley. "This person is Santirix Gremionis. Mr. Gremionis, this is Daneel and this is Giskard."

Each robot bent his head solemnly. Gremionis merely glanced at them and lifted one hand in indifferent acknowledgment. He made no effort to introduce his own robot.

Baley looked around. The light was distinctly dimmer, the wind was brisker, the air was cooler, the sun was completely hidden by clouds. There was a gloom to the surroundings that did not seem to affect Baley, who continued to be delighted at having escaped from the Personal. It lifted his spirits amazingly that he was actually experiencing the feeling of being pleased at being Outside. It was a special case, he knew, but it was a beginning and he could not help but consider it a triumph.

Baley was about to turn to Gremionis to resume the conversation, when his eye caught movement. Walking across the lawn came a woman with an accompanying robot. She was coming toward them but seemed totally oblivious to them. She was clearly making for the Personal.

Baley put out his arm in the direction of the woman, as though to stop her, even though she was still thirty meters away, and muttered, "Doesn't she know that's a Men's Personal?"

"What?" said Gremionis.

The woman continued to approach, while Baley watched in total puzzlement. Finally, the woman's robot stepped to one side to wait and the woman entered the structure.

Baley said helplessly, "But she can't go in there."

Gremionis said, "Why not? It's communal."

"But it's for men."

"It's for people," said Gremionis. He seemed utterly confused.

"Either sex? Surely you can't mean that."

"Any human being. Of course I mean it! How would you want it to be? I don't understand."

Baley turned away. It had not been many minutes before that he had thought that open conversation in a Personal was the acme in bad taste, of Things Not Done.

If he had tried to think of something worse yet, he would have completely failed to dredge up the possibility of encountering a woman in a Personal. Convention on Earth required him to ignore the presence of others in the large Community Personals on that world, but not all the conventions ever invented would have prevented him from knowing whether a person passing him was a man or a woman.

What if, while he had been in the Personal, a woman had entered-casually, indifferently-as this one had just done? Or, worse still, what if he had entered a Personal and found a woman already there?

He could not estimate his reaction. He had never weighed the possibility, let alone met with such a situation, but he found the thought totally intolerable.

And the book-films had told him nothing about that, either.

He had viewed those films in order that he might not approach the investigation in total ignorance of the Auroran way of life-and they had left him in total ignorance of all that was important.

Then how could he handle this triply knotted puzzle of Jander's death, when at every step he found himself lost in ignorance?

A moment before he had felt triumph at a small conquest over the terrors of Outside, but now he was faced with the feeling of being ignorant of everything, ignorant even of the nature of his ignorance.

It was now, while fighting not to picture the woman passing through the airspace lately occupied by himself, that he came near to utter despair.

48.

Again Giskard said (and in a way that made it possible to read concern into his words-if not into the tone), "Are you unwell, sir? Do you need help?"

Baley muttered, "No, no. I'm all right. -But let's move away. We're in the path of people wishing to use that structure."

He walked rapidly toward the airfoil that was resting in the open stretch beyond the gravel path. On the other side was a small two-wheeled vehicle, with two seats, one behind the other. Baley assumed it to be Gremionis' scooter.

His feeling of depression and misery, Baley realized, was accentuated by the fact that he felt hungry. It was clearly past lunchtime and he had not eaten.

He turned to Gremionis. "Let's talk-but if you don't mind, let's do it over lunch. That is, if you haven't already eaten-and if you don't mind eating with me."

"Where are you going to eat?"

"I don't know. Where does one eat at the Institute?"

Gremionis said, "Not at the Community Diner. We can't talk there."

"Is there an alternative?"

"Come to my establishment," said Gremionis at once. "It isn't one of the fancier ones here. I'm not one of your high executives. Still, I have a few serviceable robots and we can set a decent table. -I tell you what. I'll get on my scooter with Brundij-my robot, you know-and you follow me. You'll have to go slowly, but I'm only a little over a kilometer away. It will just take two or three minutes."

He moved away at an eager half-run. Baley watched him and thought there seemed to be a kind of gangly youthfulness about him. There was no easy way of actually judging his age, of course; Spacers didn't show age and Gremionis might easily be fifty. But he acted young, almost what an Earthman would consider teenage young. Baley wasn't sure exactly what there was about him that gave that impression.

Baley turned suddenly to Daneel. "Do you know Gremionis, Daneel?"

"I have never met him before, Partner Elijah."

"You, Giskard?"

"I have met him once, sir, but only in passing."

"Do you know anything about him, Giskard?"

"Nothing that is not apparent on the surface, sir."

"His age? His personality?"

"No, sir."

Gremionis shouted, "Ready?" His scooter was humming rather roughly. It was clear that it was not air-jet assisted. The wheels would not leave the ground. Brundij sat behind Gremionis.

Giskard, Daneel, and Baley moved quickly into their airfoil once again.

Gremionis moved outward in a loose circle. Gremionis' hair flew backward in the wind and Baley had a sudden sensation of how the wind must feel when one traveled in an open vehicle such as a scooter. He was thankful he was totally enclosed in an airfoil-which suddenly seemed to him a much more civilized way of traveling.

The scooter straightened out and darted off with a muted roar, Gremionis waving one hand in a follow-me gesture. The robot behind him maintained his balance with almost negligent ease and did not hold on to Gremionis' waist, as Baley was certain a human being would have needed to.

The airfoil followed. Although the scooter's smooth forward progression seemed high-speed, that was apparently the illusion of its small size. The airfoil had some difficulty maintaining a speed low enough to avoid running it down.

"Just the same," said Baley thoughtfully, "one thing puzzles me."

"What is that, Partner Elijah?" asked Daneel.

"Vasilia referred to this Gremionis disparagingly as a 'barber.' Apparently, he deals with hair, clothes, and other matters of personal human adornment. How is it, then, that he has an establishment on the grounds of the Robotics Institute?"

12. AGAIN GREMIONIS

49.

It took only a few minutes before Baley found himself in the fourth Auroran establishment he had seen since his arrival on the planet a day and a half before: Fastolfe's, Gladia's, Vasilias, and now Gremionis'.

Gremionis' establishment appeared smaller and drabber than the others, even though it showed, to Baley's unpracticed eye in Auroran matters, signs of recent construction. The distinctive mark of the Auroran establishment—the robotic niches—were, however, present. On entering, Giskard and Daneel moved quickly into two that were empty and faced the room, unmoving and silent. Gremionis' robot, Brundij, moved into a third niche almost as quickly.

There was no sign of any difficulty in making their choices or of any tendency for any one niche to be the target of two robots, however briefly. Baley wondered how the robots avoided conflict and decided there must be signal communication among them of a kind that was subliminal to human beings. It was something (provided he remembered to do so) concerning which he might consult Daneel.

Gremionis was studying the niches also, Baley noticed.

Gremionis' hand had gone to his upper lip and, for a moment, his forefinger stroked the small mustache. He said, a bit uncertainly, "Your robot, the human-looking one, doesn't seem right in the niche. That's Daneel Olivaw, isn't it? Dr. Fastolfe's robot?"

"Yes," said Baley. "He was in the hyperwave drama, too. Or at least an actor was—one who better fit the part."

"Yes, I remember."

Baley noted that Gremionis-like Vasilias and even like Gladia and Fastolfe—kept a certain distance. There seemed to be a repulsion field—unseen, unfelt, unsensed in any way—around Baley that kept these Spacers from approaching too closely, that sent them into a gentle curve of avoidance when they passed him.

Baley wondered if Gremionis was aware of this or if it was entirely automatic. And what did they do with the chairs he sat in while in their establishments, the dishes he ate from, the towels he used? Would ordinary washing suffice? Were there special sterilizing procedures? Would they discard and replace everything? Would the establishments be fumigated once he left the planet—or every night? What about the Community Personal he used? Would they tear it down and rebuild it? What about the woman who had ignorantly entered it after he had left? Or could she possibly have been the fumigator?

He realized he was getting silly.

To outer space with it. What the Aurorans did and how they dealt with their problems was their affair and he would bother his head no more with them. Jehoshaphat!

He had his own problems and, right now, the particular splinter of it was Gremionis -and he would tackle that after lunch.

Lunch was rather simple, largely vegetarian, but for the first time he had a little trouble. Each separate item was too sharply defined in taste. The carrots tasted rather strongly of carrots and the peas of peas, so to speak.

A little too much so, perhaps.

He ate rather reluctantly and tried not to show a slightly rising gorge.

And, as he did so, he became aware that he grew used to it- as though his taste buds saturated and could handle the excess more easily. It dawned on Baley, in a rather sad way, that if his exposure to Auroran food was to continue for any length of time, he would return to Earth missing that distinctiveness of flavor and resenting the flowing together of Earth tastes.

Even the crispness of various items-which had startled him at first, as each closing of his teeth seemed to create a noise that surely (he thought) must interfere with conversation-had already grown to seem exciting evidence that he was, in fact, eating. There would be a silence about an Earth meal that would leave him missing something.

He began to eat with attention, to study the tastes. Perhaps, when Earthpeople established themselves on other worlds, this Spacer-fashion food would be the mark of the new diet, especially if there were no robots to prepare and serve the meals.

And then he thought uncomfortably, not when but if Earthpeople established themselves on other worlds -and the finess of it all depended on him, on Plainclothesman Elijah Baley. The burden of it weighed him down.

The meal was over. A pair of robots brought in the heated, moistened napkins with which one could clean one's hands. Except that they weren't ordinary napkins, for when Baley put his down on the plate, it seemed to move slightly, thin out, and grow cobwebby. Then, quite suddenly, it leaped up insubstantially and was carried into an outlet in the ceiling. Baley jumped slightly and his eyes moved upward, following the disappearing item open-mouthed.

Gremionis said, "That's something new I just picked up. Disposable, you see, but I don't know if I like it yet. Some people say it will clog the disposal vent after a while and others worry about pollution because they say some of it will surely get in your lungs. The manufacturer says not, but-

Baley realized suddenly that he had said not a word during the meal and that this was the first time either of them had spoken since the short exchange on Daneel before the meal had been served. -And there was no use in small talk about napkins.

Baley said, rather gruffly, "Are you a barber, Mr. Gremionis?"

Gremionis flushed, his light skin reddening to the hairline. He said in a choked voice, "Who told you that?"

Baley said, "If that is an impolite way of referring to your profession, I apologize. It is a common way of speaking on Earth and is no insult there."

Gremionis said, "I am a hair designer and a clothing designer. It is a recognized branch of art. I am, in fact, a personnel artist." His finger went to his mustache again.

Baley said gravely, "I notice your mustache. Is it common to grow them on Aurora?"

"No, it is not. I hope it will become so. You take your masculine face- A great many of them can be strengthened and improved by the artful design of facial hair. Everything is in the design-that's part of my profession. You can go too far, of course. On the world of Pallas, facial hair is common, but it is the practice there to indulge in parti-colored dying. Each individual hair is separately dyed to produce some sort of mixture.

-Now, that's foolish. It doesn't last, the colors change with time, and it looks terrible. But even so, it's better than facial baldness in some ways. Nothing is less attractive than a facial desert. -That's my own phrase. I use it in my personal talks with potential clients and it's very effective. Females can get by with no facial hair because they make up for it in other ways. On the world of Smitheus-

There was a hypnotic quality to his quiet, rapid words and his earnest expression, the way in which his eyes widened and remained fixed on Baley with an intense sincerity. Baley had to shake loose with an almost physical force.

He said, "Are you a roboticist, Mr. Gremionis?"

Gremionis looked startled and a little confused at being interrupted in midflow. "A roboticist?"

"Yes. A roboticist."

"No, not at all. I use robots as everyone does, but I don't know what's inside them. -Don't care really."

"But you live here on the grounds of the Robotics Institute. How is that?"

"Why shouldn't I?" Gremionis' voice was measurably more hostile.

"If you're not a roboticist-

Gremionis grimaced. "That's stupid! The Institute, when it was designed some years ago, was intended to be a self-contained community. We have our own transport vehicle repair shops, our own personal robot maintenance shops, our own physicians, our own structuralists. Our personnel live here and, if they have use for a personnel artist, that's Santirix Gremionis and I live here, too. -Is there something wrong with my profession that I should not?"

"I haven't said that."

Gremionis turned away with a residual petulance that Baley's hasty disclaimer had not allayed. He pressed a button, then, after studying a varicolored rectangular strip, did something that was remarkably like drumming his fingers briefly.

A sphere dropped gently from the ceiling and remained suspended a meter or so above their heads. It opened as though it were an orange that was unsegmenting and a play of colors began within it, together with a soft wash of sound. The two melted together so skillfully that Baley, watching with astonishment, discovered that, after a short while, it was hard to distinguish one from the other.

The windows opacified and the segments grew brighter.

"Too bright?" asked Gremionis.

"No," said Baley, after some hesitation.

"It's meant for background and I've picked a soothing combination that will make it easier for us to talk in a civilized way, you know." Then he said briskly, "Shall we get to the point?"

Baley withdrew his attention from the-whatever it was (Gremionis had not given it a name)-with some difficulty and said, "If you please. I would like to."

"Have you been accusing me of having anything to do with the immobilization of that robot Jander?"

"I've been inquiring into the circumstances of the robot's ending.

"But you've mentioned me in connection with that ending.

-In fact, just a little while ago, you asked me if I were a roboticist. I know what you had in mind. You were trying to get me to admit I knew something about robotics, so that you could build up a case against me as the-as the-ender of the robot."

"You might say the killer."

"The killer? You can't kill a robot. -In any case, I didn't end it, or kill it, or anything you want to call it. I told you, I'm not a roboticist. I know nothing about robotics. How can you even think that-"

"I must investigate all connections, Mr. Gremionis. Jander belonged to Gladia-the Solarian woman-and you were friendly with her. That's a connection."

"There could be any number of people friendly with her. That's no connection."

"Are you willing to state that you never saw Jander in all the times you may have been in Gladia's establishment?"

"Never! Not once!"

"You never knew she had a humaniform robot?"

"No!"

"She never mentioned him."

"She had robots all over the place. All ordinary robots. She said nothing about having anything else."

Baley shrugged. "Very well. I have no reason-so far-to suppose that that is not the truth."

"Then say so to Gladia. That is why I wanted to see you. To ask you to do that. To insist."

"Has Gladia any reason to think otherwise?"

"Of course. You poisoned her mind. You questioned her about me in that connection and she assumed-she was made uncertain- The fact is, she called this morning and asked me if I had anything to do with it. I told you that."

"And you denied it?"

"Of course I denied it and very strenuously, too, because I didn't have anything to do with it. But it's not convincing if I do 'the denying. I want you to do it. I want you to tell

her that, in your opinion, I had nothing to do with the whole business. You just said I didn't and you can't, without any evidence at all, destroy my reputation. I can report you."

"To whom?"

"To the Committee on Personal Defense. To the Legislature. The head of this Institute is a close personal friend of the Chairman himself and I've already sent a full report to him on this matter. I'm not waiting, you understand. I'm taking action."

Gremionis shook his head with an attitude that might have been intended for fierceness but that did not entirely carry conviction, considering the mildness of his face. "Look," he said, "this isn't Earth. We are protected here. Your planet, with its overpopulation, makes your people exist in so many beehives, so many anthills. You push against each other, suffocate each other -and it doesn't matter. One life or a million lives- it doesn't matter."

Baley, fighting to keep contempt from showing in his voice, said, "You've been reading historical novels."

"Of course I have-and they describe it as it is. You can't have billions of people on a single world without its being so. -On Aurora, we are each a valuable life. We are protected physically, each of us, by our robots, so that there is never an assault, let alone murder, on Aurora."

"Except for Jander."

"That's not murder; it's only a robot. And we are protected from the kinds of harm more subtle than assault by our Legislature. The Committee on Personal Defense takes a dim view -a very dim view- of any action that unfairly damages the reputation or the social status of any individual citizen. An Auroran, acting as you did, would be in trouble enough. As for an Earthman -well- "

Baley said, "I am carrying on an investigation at the invitation, I presume, of the Legislature. I don't suppose Dr. Fastolfe could have brought me here without Legislative permission."

"Maybe so, but that wouldn't give you the right to overstep the limits of fair investigation."

"Are you going to put this up to the Legislature, then?"

"I'm going to have the Institute head-"

"What is his name, by the way?"

"Kelden Amadiro. I'm going to ask him to put it up to the Legislature-and he's in the Legislature, you know-he's one of the leaders of the Globalist party. So I think you had better make it plain to Gladia that I am completely innocent."

"I would like to, Mr. Gremionis, because I suspect that you are innocent, but how can I change suspicion to certainty, unless you will allow me to ask you some questions?"

Gremionis hesitated. Then, with an air of defiance, he leaned back in his chair and placed his hands behind his neck, the picture of a man utterly failing to appear at ease. He said, "Ask away. I have nothing to hide. And after you're done, you'll have to call Gladia, right on that trimensional transmitter behind you and say your piece-or you will be in more trouble than you can imagine."

"I understand. But first- How long have you known Dr. Vasilia Fastolfe, Mr. Gremionis? Or Dr. Vasilia Aliena, if you know her by that name?"

Gremionis hesitated, then said in a tense voice, "Why do you ask that? What does that have to do with it?"

Baley sighed and his dour face seemed to sadden further. "I remind you, Mr. Gremionis, that you have nothing to hide and that you want to convince me of your innocence, so that I can convince Gladia of the same. Just tell me how long you have known her. If you have not known her, just say so-but before you do, it is only fair to tell you that Dr. Vasilia has stated that you knew her well-well enough, at least, to offer yourself to her."

Gremionis looked chagrined. He said in a shaky voice, "I don't know why people have to make a big thing out of it. An offer is a perfectly natural social interaction that concerns no one else.

-Of course, you're an Earthman, so you'd make a fuss about it."

"I understand she .didn't accept your offer."

Gremionis brought his hands down upon his lap, fists clenched. "Accepting or rejecting is entirely up to her. There've been people who've offered themselves to me and whom I've rejected. It's no large matter."

"Well, then. How long have you known her?"

"For some years. About fifteen."

"Did you know her when she was still living with Dr. Fastolfe?"

"I was just a boy then," he said, flushing.

"How did you get to know her?"

"When I finished my training as a personnel artist, I was called in to design a wardrobe for her. It gave her pleasure and after that she used my services-in that respect-exclusively."

"Was it on her recommendation, then, that you received your present position as-might we say-official personnel artist for the members of the Robotics Institute?"

"She recognized my qualifications. I was tested, along with others, and won the position on my merits."

"But she did recommend you?"

Briefly and with annoyance, Gremionis said, "Yes."

"And you felt the only decent return you could make was to offer yourself to her."

Gremionis grimaced and drew his tongue across his lips, as though tasting something unpleasant. "That-is-disgusting! I suppose an Earthman would think in such a way. My offer meant only that it pleased me to do so."

"Because she is attractive and has a warm personality?" Gremionis hesitated.

"Well, I wouldn't say she has a warm personality," he said cautiously, "but certainly she's attractive."

"I've been told that you offer yourself to everybody-without distinction."

"That is a lie."

"What is a lie? That you offer yourself to everybody or that I have been told so?"

"That I offer myself to everybody. Who said that?"

"I don't know that it would serve any purpose to answer that question. Would you expect me to quote you as a source of embarrassing information? Would you speak freely to me if you thought I would?"

"Well, whoever said it is a liar."

"Perhaps it was merely dramatic exaggeration. Had you offered yourself to others before you offered yourself to Dr. Vasilia?"

Gremionis looked away. "Once or twice. Never seriously."

"But Dr. Vasilia was someone you were serious about?"

"Well-"

"It is my understanding you offered yourself to her repeatedly, which is quite against Aurorari custom."

"Oh, Auroran custom-" Gremionis began furiously. Then he pressed his lips together firmly and his forehead furrowed. "See here, Mr. Baley, can I speak to you confidentially?"

"Yes. All my questions are intended to satisfy myself that you had nothing to do with Jander's death. Once I am satisfied of that, you may be sure I'll keep your remarks in confidence."

"Very well, then. It's nothing wrong-it's nothing I'm ashamed of, you understand. It's just that I have a strong sense of privacy and I have a right to that if I wish, don't I?"

"Absolutely," said Baley consolingly.

"You see, I feel that social sex is best when there is a profound love and affection between partners."

"I imagine that's very true."

"And then there's no need for others, wouldn't you say?"

"It sounds-plausible."

"I've always dreamed of finding the perfect partner and never seeking anyone else. They call it monogamy. It doesn't exist on Aurora, but on some worlds it does-and they have it on Earth don't they, Mr. Baley?"

"In theory, Mr. Gremionis."

"It's what I want. I've looked for it for years. When I experimented with sex sometimes, I could tell something was missing. Then I met Dr. Vasilia and she told me-well, people get confidential with their personnel artists because it's very personal work-and this is the really confidential part-"

"Well, go on."

Gremionis licked his lips. "If what I say now gets out, I'm ruined. She'll do her best to see to it that I get no further commissions. Are you sure this has something to do with the case?"

"I assure you with as much force as I can, Mr. Gremionis, that this can be totally important."

"Well, then"-Gremionis did not look quite convinced-"the fact is, that I gathered from what Dr. Vasilia told me, in bits and pieces, that she is"-his voice dropped to a whisper-"a virgin.

"I see," said Baley quietly (remembering Vasilia's certainty that her father's refusal had distorted her life and getting a firmer understanding of her hatred of her father).

"That excited me. It seemed to me I could have her all to myself and I would be the only one that she would ever have. I can't explain how much that meant to me. It made her look gloriously beautiful in my eyes and I just wanted her so much."

"So you offered yourself to her?"

"Yes."

"Repeatedly. You weren't discouraged by her refusals?"

"It just reinforced her virginity, so to speak, and made me more eager. It was more exciting that it wasn't easy. I can't explain and I don't expect you to understand."

"Actually, Mr. Gremionis, I do understand. -But there came a time when you stopped offering yourself to Dr. Vasilia?"

"Well, yes."

"And began offering yourself to Gladia?"

"Well, yes."

"Repeatedly?"

"Well, yes."

"Why? Why the change?"

Gremionis said, "Dr. Vasilia finally made it clear that there was no chance and then Gladia came along and she looked like Dr. Vasilia and-and-that was it."

Baley said, "But Gladia is no virgin. She was married on Solaria and she experimented rather widely on Aurora, I am told."

"I knew about that, but she-stopped. You see, she's a Solarian by birth, not an Auroran, and she didn't quite understand Auroran customs. But she stopped because she doesn't like what she calls 'promiscuity.'"

"Did she tell you that?"

"Yes. Monogamy is the custom on Solaria. She wasn't happily married, but it is still the custom she's used to, so she never enjoyed the Auroran way when she tried it-and monogamy is what I want, too. Do you see?"

"I see. But how did you meet her in the first place?"

"I just met her. She was on the hyperwave when she arrived in Aurora, a romantic refugee from Solaria. And she played a part in that hyperwave drama-"

"Yes yes, but there was something else, wasn't there?"

"I don't know what else you want."

"Well, let me guess. Didn't there come a point when Dr. Vasilia said she was rejecting you forever-and didn't she suggest an alternative to you?"

Gremionis, in sudden fury, shouted, "Did Dr. Vasilia tell you that! "

"Not in so many words, but I think I know what happened, even so. Did she not tell you that it might be advantageous if you looked up a new arrival on the planet, a young lady from Solaria who was a ward or protégée of Dr. Fastolfe-who you know is Dr. Vasilias father? Did Dr. Vasilias perhaps not tell you that people thought this young lady, Gladia, rather resembled herself, but that she was younger and had a warmer personality? Did Dr. Vasilias not, in short, encourage you to transfer your attentions from herself to Gladia?"

Gremionis was visibly suffering. His eyes flicked to those of Baley and away again. It was the first time that Baley saw in the eyes of any Spacer a look of fright-or was it awe? (Baley shook his head slightly. He must not take too much satisfaction at having overawed a Spacer. It could damage his objectivity.)

He said, "Well? Am I right or wrong?"

And Gremionis said in a low voice. "That hyperwave show was no exaggeration, then. -Do you read minds?"

50.

Baley said calmly, "I just ask questions. -And you haven't answered directly. Am I right or wrong?"

Gremionis said, "It didn't quite happen like that. Not just like that. She did talk about Gladia, but-" He bit at his lower lip and then said, "Well, it amounted to what you said. It was just about the way you described it."

"And you were not disappointed? You found that Gladia did resemble Dr. Vasilias?"

"In a way, she did." Gremionis' eyes brightened. "But not really. Stand them side by side and you'll see the difference. Gladia has much greater delicacy and grace. A greater spirit of -of fun."

"Have you offered yourself to Vasilias since you met Gladia?"

"Are you mad? Of course not."

"But you have offered yourself to Gladia?"

"Yes."

"And she rejected you?"

"Well, yes, but you have to understand that she has to be sure, as I would have to be. Think what a mistake I would have made if I had moved Dr. Vasilias to accept me. Gladia doesn't want to make that mistake and I don't blame her."

"But you don't think it would be a mistake for her to accept you, so you have offered yourself again-and again-and again."

Gremionis stared vacantly at Baley for a moment and then seemed to shudder. He thrust out his lower lip, as though he were a rebellious child. "You say it in an insulting way-"

"I'm sorry. I don't mean it to be insulting. Please answer the question."

"Well, I have."

"How many times have you offered yourself?"

"I haven't counted. Four times. Well, five. Or maybe more."

"And she has always rejected you."

"Yes. Or I wouldn't have to offer again, would I?"

"Did she reject you angrily?"

"Oh no. That's not Gladia. Very kindly."

"Has it made you offer yourself to anyone else?"

"What?"

"Well, Gladia has rejected you. One way of responding would be to offer yourself to someone else. Why not? If Gladia doesn't want you-

"No. I don't want anyone else."

"Why is that, do you suppose?"

And, strenuously, Gremionis said, "How should I know why that is? I want Gladia. It's a-it's a kind of madness, except that I think it's the best kind of insanity. I'd be mad not to have that kind of madness. -I don't expect you to understand."

"Have you tried to explain this to Gladia? She might understand."

"Never. I'd distress her. I'd embarrass her. You don't talk about such things. I should see a mentologist."

"Have you?"

"Why not?"

Gremionis frowned. "You have a way of asking the rudest questions, Earthman."

"Perhaps because I'm an Earthman. I know no better. But I'm also an investigator and I must know these things. Why have you not seen a mentologist?"

Surprisingly, Gremionis laughed. "I told you. The cure would be greater madness than the disease. I would rather be with Gladia and be rejected than be with anyone else and be accepted. -Imagine having your mind out of whack and wanting it to stay out of whack. Any mentologist would put me in for major treatment."

Baley thought awhile, then said, "Do you know whether Dr. Vasilias is a mentologist in any way?"

"She's a roboticist. They say that's the closest thing to it. If you know how a robot works, you've got a hint as to how a human brain works. Or so they say."

"Does it occur to you that Vasilias knows these strange feelings you have in connection with Gladia?"

Gremionis stiffened. "I've never told her. -I mean in so many words."

"Isn't it possible that she understands your feelings without having to ask? Is she aware that you have repeatedly offered yourself to Gladia?"

"Well- She would ask how I was getting along. In the way of long-standing acquaintanceship, you know. I would say certain things. Nothing intimate."

"Are you sure that it was never anything intimate? Surely she encouraged you to continue to offer."

"You know-now that you mention it, I seem to see it all in a new way. I don't see quite how you managed to put it into my head. It's the questions you ask, I suppose, but it seems to me now that she did continue to encourage my friendship with Gladia. She

actively supported it." He looked very uneasy. "This never occurred to me before. I never really thought about it."

"Why do you think she encouraged you to make repeated offers to Gladia?"

Gremionis twitched his eyebrows ruefully and his finger went to his mustache. "I suppose some might guess she was trying to get rid of me. Trying to make sure I wouldn't want to bother her." He made a small laughing sound. "That's not very complimentary to me, is it?"

"Did Dr. Vasilias cease being friendly with you?"

"Not at all. She was more friendly-if anything."

"Did she try to tell you how to be more successful with Gladia? To show a greater interest in Gladia's work, for example?"

"She didn't have to do that. Gladia's work and mine are very similar. I work with human beings and she with robots, but we're both designers -artists-. That does make for closeness, you know. We even help each other at times. When I'm not offering and being rejected, we're good friends. -That's a lot, when you come to think of it."

"Did Dr. Vasilias suggest you show a greater interest in Dr. Fastolfe's work?"

"Why should she suggest that? I don't know anything about Dr. Fastolfe's work."

"Gladia might be interested in her benefactor's work and it might be a way for you to ingratiate yourself with her."

Gremionis' eyes narrowed. He rose with almost explosive force, walked to the other end of the room, came back, stood in front of Baley, and said, "Now-you-look-here! I'm not the biggest brain on the planet, not even the second-biggest, but I'm not a blithering idiot. I see what you're getting at, you know."

"Oh?"

"All your questions have served to sort of wriggle me into saying that Dr. Vasilias got me to fall in love- That's it"-he stopped in sudden surprise-"I'm in love, like in the historical novels." He thought about that with the light of wonder in his eyes. Then the anger returned. "That she got me to fall in love and to stay in love, so that I could find out things from Dr. Fastolfe and learn how to immobilize that robot, Jander."

"You don't think that's so?"

"No, it's not!" shouted Gremionis. "I don't know anything about robotics. Anything. No matter how carefully anything about robotics were explained to me, I wouldn't understand it. And I don't think Gladia would either. Besides, I never asked anyone about robotics. I was never told-by Dr. Fastolfe or anyone-anything about robotics. No one ever suggested I get involved with robotics. Dr. Vasilias never suggested it. Your whole rotten theory doesn't work." He shot his arms out to either side. "It doesn't work. Forget it."

He sat back, folded his arms rigidly across his chest, and forced his lips together in a thin line, making his small mustache bristle.

Baley looked up at the unsegmented orange, which was still humming its low, pleasantly varying tune and displaying a gentle change of color as it swayed hypnotically through a small, slow arc.

If Gremionis' outburst had upset his line of attack, he showed no sign of it. He said, "I understand what you're saying, but it's still true that you see much of Gladia, isn't it?"

"Yes, I do."

"Your repeated offers do not offend her-and her repeated rejections do not offend you?"

Gremionis shrugged. "My offers are polite. Her refusals are gentle. Why should we be offended?"

"But how do you spend time together? Sex is out, obviously, and you don't talk robotics. What do you do?"

"Is that all there is to companionship-sex and robotics? We do a great deal together. We talk, for one thing. She is very curious about Aurora and I spend hours describing the planet. She's seen very little of it, you know. And she spends hours telling me about Solaria and what a hellhole it is. I'd rather live on Earth- no offense intended. And there's her dead husband. What a miserable character he was. Gladia's had a hard life, poor woman.

"We go to concerts, I took her to the Art Institute a few times, and we work together. I told you that. We go over my designs- or her designs-together. To be perfectly honest, I don't see that working on robots is very rewarding, but we all have our own notions, you know. For that matter, she seemed to be amused when I explained why it was so important to cut hair correctly- her own hair isn't quite right, you know. But mostly, we go for walks."

"Walks? Where?"

"Nowhere particularly. Just walks. That is her habit-because of the way she was brought up on Solaria. Have you ever been on Solaria? -Yes, you have been, of course. I'm sorry. -On Solaria, there are these huge estates with only one or two human beings on them, just robots otherwise. You can walk for miles and be completely alone and Gladia says that it makes you feel as though you owned the entire planet. The robots are always there, of course, keeping an eye on you and taking care of you, but, of course, they keep out of sight. Gladia misses that feeling of world ownership here on Aurora."

"Do you mean that she wants world ownership?"

"You mean a kind of lust for power? Gladia? That's crazy. All she means is that she misses the feeling of being alone with nature. I don't see it myself, you understand, but I like humoring her. Of course, you can't quite get the Solarian feeling in Aurora. There are bound to be people about, especially in the Eos metropolitan area, and robots haven't been programmed to keep out of sight. In fact, Aurorans generally walk with robots. -Still, I know some routes that are pleasant and not very crowded and Gladia enjoys them."

"Do you enjoy them, too?"

"Well, only because I would be with Gladia. Aurorans are walkers, too, by and large, but I must admit I'm not. I had protesting muscles at first and Vasilias laughed at me."

"She knew you went on walks, did she?"

"Well, I came in limping one day and creaking at the thighs, so I had to explain. She laughed and said it was a good idea and the best way to get a walker to accept an offer was to walk with them. 'Keep it up,' she said, 'and she'll cancel her rejection before you get a chance to offer again. She'll make the offer herself.' As it happened, Gladia didn't, but eventually I grew to like the walks very much, just the same."

He seemed to have gotten over his flash of anger and was now very much at his ease. He might have been thinking of the walks, Baley thought, for there was a half-smile on his face. He looked rather likable-and vulnerable-with his mind back on who-knew-what conversational passage on a walk that had taken them who-knew-where. Baley almost smiled in response.

"Vasilia knew, then, that you continued the walks."

"I suppose so. I began to take Wednesdays and Saturdays off because that fit in with Gladia's schedule choice-and Vasilia would sometimes joke about my 'WS walks' when I brought in some sketches."

"Did Dr. Vasilia ever join the walks?"

"Certainly not."

Baley shifted in his seat and stared intently at his fingertips as he said, "I presume you had robots accompanying you on your walks."

"Absolutely. One of mine, one of hers. They kept rather out of the way, though. They didn't tag along in what Gladia called Aurora fashion. She wanted Solarian solitude, she said. So I obliged, though at first I got a crick in my neck looking around to see if Brundij was with me."

"And which robot accompanied Gladia?"

"It wasn't always the same one. Whichever he was, he held off, too. I didn't get to talk to him."

"What about Jander?"

Some of the sunniness left Gremionis' expression at once.

"What about him?" he asked.

"Did he ever come along? If he did, you would know, wouldn't you?"

"A humaniform robot? I certainly would. And he did not accompany us-not ever."

"Are you certain?"

"Completely certain." Gremionis scowled. "I imagine she thought him far too valuable to waste on duties any ordinary robot could perform."

"You seem annoyed. Did you think so, too?"

"He was her robot. I didn't worry about it."

"And you never saw him when you were at Gladia's establishment?"

"Never."

"Did she ever say anything about him? Discuss him?"

"Not that I recall."

"Didn't you consider that strange?"

Gremionis shook his head. "No. Why talk about robots?" Baley's somber eyes fixed on the other's face. "Did you have any idea of the relationship between Gladia and Jander?"

Gremionis said, "Are you going to tell me that there was sex between them?"

Baley said, "Would you be surprised if I did?"

Gremionis said stolidly, "It happens. It's not unusual. You can use a robot sometimes, if you feel like it. And a humaniform robot-completely humaniform, I believe-

"Completely," said Baley with an appropriate gesture. Gremionis' lips curved downward. "Well, then, it would be hard for a woman to resist."

"She resisted you. Doesn't it bother you that Gladia would prefer a robot to you?"

"Well, if it comes to that, I'm not sure that I believe this is true-but if it is, it's nothing to worry about. A robot is just a robot. A woman and a robot-or a man and a robot-it's just masturbation."

"You honestly never knew of the relationship, Mr. Gremionis? You never suspected?"

"I never gave it any thought," insisted Gremionis.

"Didn't know? Or did know, but paid it no mind?"

Gremionis scowled. "You're pushing again. What do you want me to say? Now that you put it into my head and push, it seems to me, if I look back, that maybe I was wondering about something like that. Just the same, I never felt anything was happening before you started asking questions."

"Are you sure?"

"Yes, I'm sure. Don't badger me."

"I'm not badgering you. I'm just wondering if it were possible that you did know that Gladia was regularly engaging in sex with Jander, that you knew that you would never be accepted as her lover as long as that was so, that you wanted her so much that you would stop at nothing to eliminate Jander, that, in short, you were so jealous that you-"

And at that moment, Gremionis-as though some tightly coiled spring, held back with difficulty for some minutes, had suddenly twitched loose-hurled himself at Baley with a loud and incoherent cry. Baley, taken completely by surprise, pushed backward instinctively and his chair went over.

51.

There were strong arms upon him at once. Baley felt himself lifted, the chair righted, and was aware that he was in the grip of a robot. How easy it was to forget they were in the room when they stood silent and motionless in their niches.

It was neither Daneel nor Giskard who had come to his rescue, however. It was Gremionis' robot, Brundij.

"Sir," said Brundij, his voice just a bit unnatural, "I hope you are not hurt."

Where were Daneel and Giskard?

The question answered itself at once. The robots had divided the labor neatly and quickly. Daneel and Giskard, estimating instantly that an overturned chair offered less chance of harm to Daley than a maddened Gremionis, had launched themselves at the host. Brundij, seeing at once that he was not needed in that direction, saw to the welfare of the guest.

Gremionis stood standing, his breath heaving-was completely immobilized in the careful double-grasp of Baley's robots.

Gremionis said, in very little above a whisper, "Release me. I am in control of myself."

"Yes, sir," said Giskard.

"Of course, Mr. Gremionis," said Daneel with what was almost suavity.

But although their arms released their hold, neither moved back for a period of time. Gremionis looked right and left, adjusted the smoothness of his clothing, and then, deliberately, sat down. His breathing was still rapid and his hair was, to a small extent, in disarray.

Baley now stood, one hand on the back of the chair on which he had been sitting.

Gremionis said, "I am sorry, Mr. Baley, for losing control. It is something I have not done in my adult life. You accused me of being j-jealous. It is a word no respectable Auroran would use of another, but I should have remembered you are an Earthman. It is a word we encounter only in historical romances and even then the word is usually spelled with a 'j,' followed by a dash. Of course, that is not so on your world. I understand that."

"I am sorry, too, Mr. Gremionis," said Baley gravely, "that my forgetfulness of Auroran custom led me astray in this instance. I assure you that such a lapse will not happen again." He seated himself and said, "I don't know that there is much more to discuss-"

Gremionis did not seem to be listening. "When I was a child," he said, "I would sometimes push against another, and be pushed, and it would be awhile before the robots would take the trouble to separate us, of course-"

Daneel said, "If I may explain, Partner Elijah. It has been well-established that total suppression of aggression in the very young has undesirable consequences. A certain amount of youthful play involving physical competition is permitted-even encouraged-provided no real hurt is involved. Robots in charge of the young are carefully programmed to be able to distinguish the chances and level of harm that may take place. I, for instance, am not properly programmed in this respect and would not qualify as a guardian of the young except under emergency conditions for brief periods. -Nor would Giskard."

Baley said, "Such aggressive behavior is stopped during adolescence, I suppose."

"Gradually," said Daneel, "as the level of harm that may be inflicted increases and as the desirability of self-control becomes more pronounced."

Gremionis said, "By the time I was ready for higher schooling, I, like all Aurorans, knew quite well that all competition rested on the comparison of mental capacity and talent-"

"No physical competition?" said Baley.

"Certainly, but only in fashions that do not involve deliberate physical contact with intent to injure."

"But since you've been an adolescent-"

"I've attacked no one. Of course I haven't. I've had the urge to do so on a number of occasions, to be sure. I suppose I wouldn't be entirely normal if I hadn't, but until this moment, I've been able to control it. But then, no one ever called me-that before."

Baley said, "It would do no good to attack, in any case, if you are going to be stopped by robots, would it? I presume there is always a robot within reach on both sides of both the attacker and the attacked."

"Certainly. -All the more reason for me to be ashamed of having lost my self-control. I trust that this won't have to go into your report."

"I assure you I will tell no one of this. It has nothing to do with the case."

"Thank you. Did you say that the interview is over?"

"I think it is."

"In that case, will you do as I have asked you to do?"

"What is that?"

"To tell Gladia I had nothing to do with Jander's immobilization."

Baley hesitated. "I will tell her that that is my opinion."

Gremionis said, "Please make it stronger than that. I want her to be absolutely certain that I had nothing to do with it; all the more so if she was fond of the robot from a sexual standpoint. I couldn't bear to have her think I was j-j- Being a Solarian, she might think that."

"Yes, she might," said Baley thoughtfully.

"But look," said Gremionis, speaking quickly and earnestly. "I don't know anything about robots and no one-Dr. Vasilia or anyone else-has told me anything about them-how they work, I mean. There is just no way in which I could have destroyed Jander."

Baley seemed, for a moment, to be deep in thought. Then he said, with clear reluctance, "I can't help but believe you. To be sure, I don't know everything. And it is possible-I say this without meaning offense-that either you or Dr. Vasilia-or both-are lying. I know surprisingly little about the intimate nature of Auroran society and I can perhaps be easily fooled. And yet, I can't help but believe you. Nevertheless, I can't do more than tell Gladia that, in my opinion, you are completely innocent. I must say 'in my opinion,' however. I am sure she will find that strong enough."

Gremionis said gloomily, "Then I will have to be satisfied with that. -If it will help, though, I assure you, on the word of an Auroran citizen, that I am innocent."

Baley smiled slightly. "I wouldn't dream of doubting your word, but my training forces me to rely on objective evidence alone."

He stood up, stared solemnly at Gremionis for a moment, then said, "What I am about to say should not be taken amiss, Mr. Gremionis. I take it that you are interested in having me give Gladia this reassurance because you want to retain her friendship."

"I want that very much, Mr. Baley."

"And you intend, on some suitable occasion, to offer yourself again?"

Gremionis flushed, swallowed visibly, then said, "Yes, I do."

"May I then give you a word of advice, sir? Don't do it."

"You may keep your advice, if that's what you're going to tell me. I don't intend ever to give up."

"I mean do not go through the usual formal procedure. You might consider simply"-Baley looked away, feeling unaccountably embarrassed-"putting your arms around her and kissing her."

"No," said Gremionis earnestly. "Please. An Auroran woman would not endure that. Nor an Auroran man."

"Mr. Gremionis, won't you remember that Gladia is not Auroran? She is Solarian and has other customs, other traditions. I would try it if I were you."

Baley's level gaze masked a sudden internal fury. What was Gremionis to him that he should give such advice? Why tell another to do that which he himself longed to do?

13. AMADIRO

52.

Baley got back to business, with a somewhat deeper baritone to his voice than was usual. He said, "Mr. Gremionis, you mentioned the name of the head of the Robotics Institute earlier. Could you give me that name again?"

"Kelden Amadiro."

"And would there be some way of reaching him from here?" Gremionis said, "Well, yes and no. You can reach his receptionist or his assistant. I doubt that you'll reach him. He's a rather standoffish person, I'm told. I don't know him personally, of course. I've seen him now and then, but I've never talked to him."

"I take it, then, he doesn't use you as a clothes designer or for personal grooming?"

"I don't know that he uses anyone and, from the few occasions when I've seen him, I can tell you he looks it, though I'd rather you didn't repeat that remark."

"I'm sure you're right, but I'll keep the confidence," said Baley gravely. "I would like to try to reach him, despite his standoffish reputation. If you have a trimensic outlet, would you mind my making use of it for that purpose?"

"Brundij can make the call for you."

"No, I think my partner, Daneel, should-that is, if you don't mind."

"I don't mind at all," said Gremionis. "The outlet is in there, so just follow me, Daneel. The pattern you must use is 75-30-up-20."

Daneel bowed his head. "Thank you, sir."

The room with the trimensic outlet was quite empty, except for a thin pillar toward one side of the room. It ended waist-high in a flat surface on which there was a rather complicated console. The pillar stood in the center of a circle marked off on the light green floor in a neutral gray. Near it was an identical circle in size and color, but on the second one there stood no pillar.

Daneel stepped to the pillar and, as he did so, the circle on which it stood glowed with a faint white radiance. His hand moved over the console, his fingers flicking too quickly for Baley to make out clearly what it was they did. It only took a second and then the other circle glowed in precisely the same way. A robot appeared on it, three-dimensional in appearance but with a very faint flicker that gave away the fact that it was a holographic image. Next to him was a console like that next to which Daneel stood, but the robot's console also flickered and was also an image.

Daneel said, "I am R. Daneel Olivaw" -he faintly emphasized the "R." so the robot would not mistake him for a human being-" and I represent my partner, Elijah Baley, a plainclothesman from Earth. My partner would like to speak with Master Robotist Kelden Amadiro."

The robot said, "Master Robotacist Amadiro is in conference. Would it be sufficient to speak to Robotacist Cicis?"

Daneel looked quickly in Baley's direction. Baley nodded and Daneel said, "That will be quite satisfactory."

The robot said, "If you will ask Plainclothesman Baley to take your place, I will try to locate Robotacist Cicis."

Daneel said smoothly, "It would perhaps be better if you were first to-"

But Baley called out, "It's all right, Daneel. I don't mind waiting."

Daneel said, "Partner Elijah, as the personal representative of Master Robotacist Han Fastolfe, you have assimilated his social status, at least temporarily. It is not your place to have to wait for-"

"It's all right, Daneel," said Baley, with enough emphasis to preclude further discussion. "I don't wish to create delay by a dispute over social etiquette."

Daneel stepped off the circle and Baley stepped on. He felt a slight tingle as he did so (perhaps a purely imaginary one), but it quickly passed.

The robot's image, standing on the other circle, faded and disappeared. Baley waited patiently and eventually another image darkened and took on apparent three-dimensionality.

"Robotacist Maloon Cicis here," said the figure in a rather sharp, clear voice. He had the close-cut bronze hair that alone sufficed to give him what Baley thought of as a typical Spacer look, though there was a certain un-Spacerlike asymmetry to the line of his nose.

Baley said quietly, "I am Plainclothesman Elijah Baley from Earth. I would like to speak with Master Robotacist Kelden Amadiro."

"Do you have an appointment, Plainclothesman?"

"No, sir."

"You will have to make one if you wish to see him-and there's no time slot available for this week or next."

"I am Plainclothesman Elijah Baley of Earth-"

"So I have been given to understand. It doesn't alter the facts."

Baley said, "At the request of Dr. Han Fastolfe and with the permission of the World Legislature of Aurora, I am investigating the murder of Robot Jander Panell-"

"The murder of Robot Jander Panell?" asked Cicis so politely as to indicate contempt.

"Roboticide, if you prefer, then. On Earth, the destruction of a robot would not be so great a matter, but on Aurora, where robots are treated more or less as human beings, it seemed to me that the word 'murder' might be used."

Cicis said, "Nevertheless, whether murder, roboticide, or nothing at all, it is still impossible to see Master Robotacist Amadiro."

"May I leave a message for him?"

"You may."

"Will it be delivered to him instantly? Now?"

"I can try, but obviously I can make no guarantee."

"Good enough. I will make several points and I will number them. Perhaps you would like to make notes."

Cicis smiled faintly. "I think I will be able to remember."

"First, where there is a murder, there is a murderer, and I would like to give Dr. Amadiro a chance to speak in his own defense--"

"What!" said Cicis.

(And Gremionis, watching from the other side of the room, let his jaw drop.)

Baley managed to imitate the faint smile that had suddenly disappeared from the other's lips. "Am I too fast for you, sir? Would you like to make notes after all?"

"Are you accusing the Master Robotist of having had anything to do with this Jander Panell business?"

"On the contrary, Robotist. It is because I don't want to accuse him that I must see him. I would hate to imply any connection between the Master Robotist and the immobilized robot on the basis of incomplete information, when a word from him might make everything clear."

"You are mad!"

"Very well. Then tell the Master Robotist that a madman wants a word with him in order to avoid accusing him of murder. That's my first point. I have a second. Could you tell him that the same madman has just completed a detailed interrogation of Personnel Artist Santirix Gremionis and is calling from Gremionis' establishment. And the third point--am I going too fast for you?"

"No! Finish!"

"The third point is this. It may be that the Master Robotist, who surely has a great deal on his mind that is of much moment, does not remember who Personnel Artist Santirix Gremionis is. In that case, please identify him as someone living on the Institute grounds who has, in the last year, taken many long walks with Gladia, a woman from Solaria who now lives on Aurora."

"I cannot deliver a message so ridiculous and offensive, Earthman."

"In that case, would you tell him I will go straight to the Legislature and I will announce that I cannot continue with my investigation because one Maloon Cicis takes it upon himself to assure me that Master Robotist Kelden Amadiro will not assist me in the investigation of the destruction of Robot Jander Panell and will not defend himself against accusations of being responsible for that destruction?"

Cicis reddened. "You wouldn't dare say anything of the sort."

"Wouldn't I? What would I have to lose? On the other hand, how will it sound to the general public? After all, Aurorans are perfectly aware that Dr. Amadiro is second only to Dr. Fastolfe himself in expertise in robotics and that, if Fastolfe himself is not responsible for the roboticide-- Is it necessary to continue?"

"You will find, Earthman, that the laws of Aurora against slander are strict."

"Undoubtedly, but if Dr. Amadiro is effectively slandered, his punishment is likely to be greater than mine. But why don't you simply deliver my message now? Then, if he explains just a few minor points, we can avoid all question of slander or accusation or anything of the sort."

Cicis scowled and said stiffly, "I will tell Dr. Amadiro this and I will strongly advise him to refuse to see you." He disappeared.

Again, Baley waited patiently, while Gremionis gestured fiercely and said in a loud whisper, "You can't do that, Baley. You can't do it." Baley waved him quiet.

After some five minutes (it seemed much longer to Baley), Cicis reappeared, looking enormously angry. He said, "Dr. Amadiro will take my place here in a few minutes and will talk to you. Wait!"

And Baley said at once, "There is no point in waiting. I will come directly to Dr. Amadiro's office and I will see him there."

He stepped off the gray circle and made a cutting gesture to Daneel, who promptly broke the connection.

Gremionis said, with a kind of strangled gasp, "You can't talk to Dr. Amadiro's people that way, Earthman."

"I just have," said Baley.

"He'll have you thrown off the planet within twelve hours."

"If I don't make progress in straightening out this mess, I may in any case be thrown off the planet within twelve hours."

Daneel said, "Partner Elijah, I fear that Mr. Gremionis is justified in his alarm. The Auroran World Legislature cannot do more than evict you, since you are not an Auroran citizen. Nevertheless, they can insist that the Earth authorities punish you severely and Earth will do so. They could not resist an Auroran demand, in this case. I would not wish you to be punished in this way, Partner Elijah."

Baley said heavily, "Nor do I wish the punishment, Daneel, but I must take the chance. -Mr. Gremionis, I am sorry that I had to tell him I was calling from your establishment. I had to do something to persuade him to see me and I felt he might attach importance to that fact. What I said was, after all, the truth."

Gremionis shook his head. "If I had known what you were going to do, Mr. Baley, I would not have permitted you to call from my establishment. I feel sure that I'm going to lose my position here and"-with bitterness-"what are you going to do for me that will make up for that?"

"I will do my best, Mr. Gremionis, to see that you do not lose your position. I feel confident that you will be in no trouble. If I fail, however, you are free to describe me as a madman who made wild accusations against you and frightened you with threats of slander, so that you had to let me use your viewer. I'm sure Dr. Amadiro will believe you. After all, you have already sent him a memo complaining that I have been slandering you, have you not?"

Baley lifted his hand in farewell. "Good-bye, Mr. Gremionis. Thank you again. Don't worry and-remember what I said about Gladia."

With Daneel and Giskard sandwiching him fore and aft, Baley stepped out of Gremionis' establishment, scarcely conscious of the fact that he was moving out into the open once more.

53.

Once out in the open, it was a different matter. Baley stopped and looked up.

"Odd," he said. "I didn't think that that much time had passed, even allowing for the fact that the Aurorian day is a little shorter than standard."

"What is it, Partner Elijah?" asked Daneel solicitously.

"The sun has set. I wouldn't have thought it."

"The sun has not yet set, sir," put in Giskard. "It is about two hours before sunset."

Daneel said, "It is the gathering storm, Partner Elijah. The clouds are thickening, but the storm will not actually break for some time yet."

Baley shivered. Dark, in itself, did not disturb him. In fact, when Outside, night, with its suggestion of enclosing walls, was far more soothing than the day, which broadened the horizons and opened space in every direction.

The trouble was that this was neither day nor night.

Again, he tried to remember what it had been like that time it had rained when he had been Outside.

It suddenly occurred to him that he had never been out when it snowed and that he wasn't even sure what the rain of crystalline solid water was like. Descriptions in words were surely insufficient. The younger ones sometimes went out to go sliding or sledding-or whatever-and returned shrieking with excitement-but always glad to get within the City walls. Ben had once tried to make a pair of skis, according to directions in some ancient book or other, and had gotten himself half-buried in a drift of the white stuff. And even Ben's descriptions of what it was like to see and feel snow were distressingly vague and unsatisfying.

Then, too, no one went out when it was actually snowing, as opposed to having the material merely lying about on the ground. Baley told himself, at this point, that the one thing everyone agreed on was that it only snowed when it was very cold. It was not very cold now; it was merely cool. Those clouds did not mean it was going to snow. - Somehow, he felt only minimally consoled.

This was not like the cloudy days on Earth, which he had seen. On Earth, the clouds were lighter; he was sure of that. They were grayish-white, even when they covered the sky solidly. Here, the light-what there was of it-was rather bilious, a ghastly yellowish-slate.

Was that because Aurora's sun was more orange than Earth's was?

He said, "Is the color of the sky-unusual?"

Daneel looked up at the sky. "No, Partner Elijah. It is a storm."

"Do you often have storms like this?"

"At this time of year, yes. Occasional thunderstorms. This is no surprise. It was predicted in the weather forecast yesterday and again this morning. It will be over well before daybreak and the fields can use the water. We've been a bit subnormal in rainfall lately."

"And it gets this cold, too? Is that normal, too?"

"Oh yes. -But let us get into the airfoil, Partner Elijah. It can be heated."

Baley nodded and walked toward the airfoil, which lay on the grassy plot where it had been brought to rest before lunch. He paused.

"Wait. I did not ask Gremionis for directions to Amadiro's establishment-or office."

"No need, Partner Elijah," said Daneel immediately, his hand in the crook of Baley's elbow, propelling him gently but unmistakably onward. "Friend Giskard has the map of the Institute clearly in his memory banks and he will take us to the Administration Building. It is very likely that Dr. Amadiro has his office there."

Giskard said, "My information is to the effect that Dr. Amadiro's office is in the Administration Building. If, by some chance, he is not at his office but is in his establishment, that is nearby."

Again, Baley found himself crammed into the front seat between the two robots. He welcomed Daneel particularly, with his humanlike body warmth. Although Giskard's textile-like outermost layer was insulating and not as cold to the touch as bare metal would have been, he was the less attractive of the two in Baley's current chilly state.

Baley caught himself on the verge of putting an arm around Daneel's shoulder, with the intention of finding comfort by drawing him even closer. He brought his arm down to his lap in confusion.

He said, "I don't like the way it looks out there."

Daneel, perhaps in an effort to take Baley's 'mind off the appearance Outside, said, "Partner Elijah, how is it you knew that Dr. Vasilisa had encouraged Mr. Gremionis' interest in Miss Gladia? I did not see that you had received any evidence to that effect."

"I didn't," said Baley. "I've been desperate enough to play long shots-that is, to gamble on events of low probability. Gladia told me that Gremionis was the one person sufficiently interested in her to offer himself repeatedly. I thought he might have killed Jander out of jealousy. I didn't think he could possibly know enough about robotics to do it, but then I heard that Fastolfe's daughter Vasilisa was a roboticist and resembled Gladia physically. I wondered if Gremionis, having been fascinated by Gladia, might not have been fascinated by Vasilisa earlier- and if the killing might possibly have been the result of a conspiracy between the two. It was by hinting obscurely at the existence of such a conspiracy that I was able to persuade Vasilisa to see me."

Daneel said, "But there was no conspiracy, Partner Elijah-at least as far as the destruction of Jander was concerned. Vasilisa and Gremionis could not have engineered that destruction, even if they had worked together."

"Granted-and yet Vasilisa had been made nervous by the suggestion of having had a connection with Gremionis. Why? When Gremionis told us of having been attracted to Vasilisa first, and then to Gladia, I wondered if the connection between the two had been

more indirect, if Vasilia might have encouraged the transfer for some reason more distantly connected-but connected nevertheless-to Jander's death. After all, there had to be some connection between the two; Vasilia's reaction to the original suggestion showed that.

"My suspicion was correct. Vasilia had engineered Gremionis' switch from one woman to the other. Gremionis was astonished at my knowing this and that, too, was useful, for if the matter were something completely innocent, there would have been no reason to make a secret of it-and a secret it obviously was. You remember that Vasilia mentioned nothing of urging Gremionis to turn to Gladia. When I told her that Gremionis had offered himself to Gladia, she acted as though that was the first time she had heard of it."

"But, Partner Elijah, of what importance is this?"

"We may find out. It seemed to me that there was no importance in it to either Gremionis or Vasilia. Therefore, if it had any importance at all, it might be that a third person was involved. If it had anything to do with the Jander affair, then it ought to be a roboticist still more skillful than Vasilia-and that might be Amadiro. So I hinted to him of the existence of a conspiracy by deliberately pointing out I had been questioning Gremionis and was calling from his establishment-and that worked, too."

"Yet I still don't know what it all means, Partner Elijah."

"Nor I-except for some speculations. But perhaps we'll find out at Amadiro's. Our situation is so bad, you see, we have nothing to lose by guessing and gambling."

During this exchange, the airfoil has risen on its air-jets, and had moved to a moderate height. It cleared a line of bushes and was now once again speeding along over grassy areas and graveled roads. Baley noticed that, where the grass was taller, it was swept to one side by the wind as though an invisible-and much larger-airfoil were passing over it.

Baley said, "Giskard, you have been recording the conversations which have taken place in your presence, haven't you?"

"Yes, sir."

"And can reproduce them at need?"

"Yes, sir."

"And can easily locate-and reproduce-some particular statement made by some given person?"

"Yes, sir. You would not have to listen to the entire recording."

"And could you, at need, serve as a witness in a courtroom?"

"I, sir? No, sir." Giskard's eyes were fixed firmly on the road. "Since a robot can be directed to lie by a skillful enough command and not all the exhortations or threats of a judge might help, the law wisely considers a robot an incompetent witness."

"But, in that case, of what use are your recordings?"

"That, sir, is a different thing. A recording, once made, cannot be altered on simple command, though it might be erased. Such a recording can, therefore, be

admitted as evidence. There are no firm precedents, however, and whether it is -or is not- admitted depends on the individual case and on the individual judge."

Baley could not tell whether that statement was depressing in itself or whether he was influenced by the unpleasant livid light that bathed the landscape. He said, "Can you see well enough to drive, Giskard?"

"Certainly, sir, but I do not need to. The airfoil is equipped with a computerized radar that would enable it to avoid obstacles on its own, even if I were, unaccountably, to fail in my task. It was this that was in operation yesterday morning when we traveled comfortably though all the windows were opacified."

"Partner Elijah," said Daneel, again veering the conversation away from Baley's uncomfortable awareness of the coming storm, "do you have hope that Dr. Amadiro might indeed be helpful?"

Giskard brought the airfoil to rest on a wide lawn before a broad but not very high building, with an intricately-carved façade that was clearly new and yet gave the impression of imitating something quite old.

Baley knew it was the Administration Building without being told. He said, "No, Daneel, I suspect that Amadiro may be far too intelligent to give us the least handle to grasp him by."

"And if that is so, what do you plan to do next?"

"I don't know," said Baley, with a grim feeling of *déjà vu*, "but I'll try to think of something."

54.

When Baley entered the Administration Building, his first feeling was one of relief at removing himself from the unnatural lighting Outside. The second was one of wry amusement.

Here on Aurora, the establishments-the private dwelling places-were all strictly Auroran. He couldn't, for a moment, while sitting in Gladia's living room, or breakfasting in Fastolfe's dining room, or talking in Vasilias's work room, or making use of Gremionis' trimensional viewing device, have thought himself on Earth. All four were distinct from each other, but all fell within a certain genus, widely different from that of the underground apartments on Earth.

The Administration Building, however, breathed officialdom and that, apparently, transcended ordinary human variety. It did not belong to the same genus as the dwelling places on Aurora, any more than an official building in Baley's home City resembled an apartment in the dwelling Sectors-but the two official buildings on the two worlds of such widely different natures strangely resembled each other.

This was the first place on Aurora where, for an instant, Baley might have imagined himself on Earth. Here were the same long cold bare corridors, the same lowest common

denominator of design and decoration, with every light source designed so as to irritate as few people as possible and to please just as few.

There were some touches here that would have been absent on Earth-the occasional suspended pots of plants, for instance, flourishing in the light and outfitted with devices (Baley guessed) for controlled and automatic watering. That natural touch was absent on Earth and its presence did not delight him. Might such pots not sometimes fall? Might they not attract insects? Might not the water drip?

There were some things missing here, too. On Earth, when one was within a City, there was always the vast, warm hum of people and machinery-even in the most coldly official of administrative structures. It was the "Busy Buzz of Brotherhood," to use the phrase popular among Earth's politicians and journalists.

Here, on the other hand, it was quiet. Baley had not particularly noticed the quiet in the establishments he had visited that day and the day before, since everything had seemed so unnatural there that one more oddity escaped his notice. Indeed, he had been more aware of the soft susurrations of insect life outside or of the wind through the vegetation than of the absence of the steady "Hum of Humanity" (another popular phrase).

Here, however, where there seemed a touch of Earth, the absence of the "Hum" was as disconcerting as was the distinct orange touch to the artificial light-which was far more noticeable against the blank off-white of the walls here than among the busy decoration that marked the Auroran establishments.

Baley's reverie did not last long. They were standing just inside the main entrance and Daneel had held out his arm to stop the other two. Some thirty seconds passed before Baley, speaking in an automatic whisper in view of the silence everywhere, said, "Why are we waiting?"

"Because it is advisable to do so, Partner Elijah," said Daneel. "There is a tingle field ahead."

"A what?"

"A tingle field, Partner Elijah. Actually, the name is a euphemism. It stimulates the nerve endings and produces a rather sharp pain. Robots can pass, but human beings cannot. Any breach, of course, whether by human or robot, will set off an alarm."

Baley said, "How can you tell there's a tingle field?"

"It can be seen, Partner Elijah, if you know what to look for. The air seems to twinkle a bit and the wall beyond that region has a faint greenish tinge as compared to the wall in front of it."

"I'm not at all sure I see it," said Baley indignantly. "What's to prevent me-or any innocent outsider-from walking into it and experiencing agony?"

Daneel said, "Those who are members of the Institute carry a neutralizing device; those who are visitors are almost always attended by one or more robots who will surely detect the tingle field."

A robot was approaching down the corridor on the other side of the field. (The twinkling of the field was more easily noted against the muted smoothness of his metallic

surface.) He seemed to ignore Giskard, but, for a moment, he hesitated as he looked from Baley to Daneel and back. And then, having made a decision, he addressed Baley. (Perhaps, thought Baley, Daneel looks too human to be human.)

The robot said, "Your name, sir?"

Baley said, "I am Plainclothesman Elijah Baley from Earth. I am accompanied by two robots of the establishment of Dr. Han Fastolfe-Daneel Olivaw and Giskard Reventlov."

"Identification, sir?"

Giskard's serial number flared out in soft phosphorescence on the left side of his chest. "I vouch for the other two, friend," he said.

The robot studied the number a moment, as though comparing it with a file in his memory banks. Then he nodded and said, "Serial number accepted. You may pass."

Daneel and Giskard moved forward at once, but Baley found himself edging ahead slowly. He put out one arm as a way of testing the coming of pain.

Daneel said, "The field is gone, Partner Elijah. It will be restored after we have passed through."

Better safe than sorry, thought Baley, and continued his shuffle till he was well past the point where the barrier of the field might have existed.

The robots, showing no sign of impatience or condemnation, waited for Baley's reluctant steps to catch up with them.

They then stepped onto a helical ramp that was only two people wide. The robot was first, by himself; Baley and Daneel stood side by side behind him (Daneel's hand rested lightly, but almost possessively, on Baley's elbow); and Giskard brought up the rear.

Baley was conscious of his shoes pointing upward just a bit uncomfortably and felt vaguely that it would be a little tiresome mounting this too-steep ramp and having to lean forward in order to avoid a clumsy slip. Either the soles of his shoes or the surface of the ramp-or both-ought to be ridged. In fact, neither was.

The robot in the lead said, "Mr. Baley," as though warning of something, and the robot's hand then visibly tightened on the railing that it held.

At once, the ramp divided into sections that slid against each other to form steps. Immediately thereafter, the whole ramp began to move upward. It made a complete turn, passing up through the ceiling, a section of which had retracted, and, when it came to a halt, they were on what was (presumably) the second floor. The steps disappeared and the four stepped off.

Baley looked back curiously. "I suppose it will service those who want to go down as well, but what if there is a period where more people want to go up than down? It would end up sticking half a kilometer into the sky-or into the ground, in reverse."

"That is an up-helix," said Daneel in a low voice "There are separate down-helices."

"But it has to get down again, doesn't it?"

"It collapses at the top-or the bottom-depending on which we're speaking of, Partner Elijah, and, in periods of nonuse, it unwinds, so to speak. This up-helix is descending now."

Baley looked back. The smooth surface might be sliding downward, but it showed no irregularity or mark whose motion he could notice.

"And if someone should want to use it when it has moved up as far as it can?"

"Then one must wait for the unwinding, which would take less than a minute. - There are ordinary flights of stairs as well, Partner Elijah, and most Aurorans are not reluctant to use them. Robots almost always use the stairs. Since you are a visitor, you are being offered the courtesy of the helix."

They were walking down a corridor again, toward a door more ornate than the others. "They are offering me courtesy, then," said Baley. "A hopeful sign."

It was perhaps another hopeful sign that an Auroran now appeared in the ornate doorway. He was tall, at least eight centimeters taller than Daneel, who was some five centimeters taller than Baley. The man in the doorway was broad as well, somewhat heavysset, with a round face, a somewhat bulbous nose, curly dark hair, a swarthy complexion, and a smile.

It was the smile that was most noticeable. Wide and apparently unforced, it revealed prominent teeth that were white and well-shaped.

He said, "Ah, it is Mr. Baley, the famous investigator from Earth, who has come to our little planet to show that I am a dreadful villain. Come in, come in. You are welcome. I am sorry if my able aide, Robotacist Maloon Cicis, gave you the impression that I would be unavailable, but he is a cautious fellow and is a great deal more concerned about my time than I myself am.

He stepped to one side as Baley walked in and tapped him lightly with the fiat of his hand on the shoulder blade as he passed. It seemed to be a gesture of friendship of a kind that Baley had not yet experienced on Aurora.

Baley said, cautiously (was he assuming too much?), "I take it you are Master Robotacist Kelden Amadiro?"

"Exactly. Exactly. The man who intends to destroy Dr. Han Fastolfe as a political force upon this planet-but that, as I hope to persuade you, does not really make me a villain. After all, I am not trying to prove that it is Fastolfe who is a villain simply because of the foolish vandalism he committed on the structure of his own creation-poor Jander. Let us say only that I will demonstrate that Fastolfe is-mistaken."

He gestured lightly and the robot who had guided them in stepped forward and into a niche.

As the door closed, Amadiro gestured Baley jovially to a well upholstered armchair and, with admirable economy, indicated, with his other arm, wall niches for Daneel and Giskard as well.

Baley noticed that Amadiro stared with a moment's hunger at Daneel and that, for that moment, his smile disappeared and a look that was almost predatory appeared on

his face. It was gone quickly and he was smiling again. Baley was left to wonder if, perhaps, that momentary change of expression was an invention of his own imagination.

Amadiro said, "Since it looks as though we're in for some mildly nasty weather, let's do without the ineffective daylight we are now dubiously blessed with."

Somehow (Baley did not follow exactly what it was that Amadiro did on the control-panel of his desk) the windows opacified and the walls glowed with gentle daylight.

Amadiro's smile seemed to broaden. "We do not really have much to talk about, you and I, Mr. Baley. I took the precaution of speaking to Mr. Gremionis while you were coming here. From what he said, I decided to call Dr. Vasilias as well. Apparently, Mr. Baley, you have more or less accused both of complicity in the destruction of Jander and, if I can understand the language, you have also accused me."

"I merely asked questions, Dr. Amadiro, as I intend to do now."

"No doubt, but you are an Earthman, so you are not aware of the enormity of your actions and I am really sorry that you must nonetheless suffer the consequences of them. - You know perhaps that Gremionis sent me a memo concerning your slander of him."

"He told me he had, but he misinterpreted my action. It was not slander."

Amadiro pursed his lips as though considering the statement. "I dare say you are right from your standpoint, Mr. Baley, but you don't understand the Auroran definition of the word. I was forced to send Gremionis' memo on to the Chairman and, as a result, it is very likely that you'll be ordered off the planet by tomorrow morning. I regret this, of course, but I fear that your investigation is about to come to an end."

14. AGAIN AMADIRO

55.

Baley was taken aback. He did not know what to make of Amadiro and he had not expected this confusion within himself. Gremionis had described him as "standoffish." From what Cicis had said, he expected Amadiro to be autocratic. In person, however, Amadiro seemed jovial, outgoing, even friendly. Yet if his words were to be trusted, Amadiro was calmly moving to end the investigation. He was doing it pitilessly-and yet with what seemed to be a commiserating smile.

What was he?

Automatically, Baley glanced toward the niches where Giskard and Daneel were standing, the primitive Giskard of course without expression, the advanced Daneel calm and quiet. That Daneel had ever met Amadiro in his short existence was, on the face of it, unlikely. Giskard, on the other hand, in his-how many?-decades of life might very well have met him.

Baley's lips tightened as he thought he might have asked Giskard in advance what Amadiro might be like. He might, in that case, be now better able to judge how much of this roboticist's present persona was real and how much was cleverly calculated.

Why on Earth-or off it, Baley wondered, didn't he use these robotic resources of his more intelligently? Or why didn't Giskard volunteer information-but no, that was unfair. Giskard clearly lacked the capacity for independent activity of that sort. He would yield information on request, Baley thought, but would produce none on his own initiative.

Amadiro followed the brief flicking of Baley's eyes and said, "I'm one against three, I think. As you see, I have none of my robots here in my office-although any number are on instant call, I admit-while you have two of Fastolfe's robots: the old reliable Giskard and that marvel of design, Daneel."

"You know them both, I see," said Baley.

"By reputation only. I actually see them-I, a roboticist, was about to say 'in the flesh'-I actually see them physically for the first time now, although I saw Daneel portrayed by an actor in that hyperwave show."

"Everyone in all the worlds has apparently seen that hyperwave show," said Baley glumly. "It makes my life-as a real and limited individual-difficult."

"Not with me," said Amadiro, his smile broadening. "I assure you I did not take your fictional representation with any seriousness whatever. I assumed you were limited in real life. And so you are-or you would not have indulged so freely in unwarranted accusations on Aurora."

"Dr. Amadiro," said Baley, "I assure you I was making no formal accusations. I was merely pursuing an investigation and considering possibilities."

"Don't misunderstand me," said Amadiro with sudden earnestness. "I don't blame you. I am sure that you were behaving perfectly by Earth standards. It is just that you are up against Auroran standards now. We treasure reputation with unbelievable intensity."

"If that were so, Dr. Amadiro, then haven't you and other Globalists been slandering Dr. Fastolfe with suspicion, to a far greater extent than any small thing I have done?"

"Quite true," agreed Amadiro, "but I am an eminent Auroran and have a certain influence, while you are an Earthman and have no influence whatever. That is most unfair, I admit, and I deplore it, but that is the way the worlds are. What can we do? Besides, the accusation against Fastolfe can be maintained-and will be maintained-and slander isn't slander when it is the truth. Your mistake was to make accusations that simply can't be maintained. I'm sure you must admit that neither Mr. Gremionis nor Dr. Vasilia Aliena-nor both together-could possibly have disabled poor Jander."

"I did not formally accuse either."

"Perhaps not, but you can't hide behind the word 'formally' on Aurora. It's too bad Fastolfe didn't warn you of this when he brought you in to take up this investigation, this-as it now is, I'm afraid-ill-fated investigation."

Baley felt the corner of his mouth twitch as he thought that Fastolfe might indeed have warned him.

He said, "Am I to get a hearing in the matter or is it all settled?"

"Of course you will get a hearing before being condemned. We are not barbarians here on Aurora. The Chairman will consider the memo I have sent him, together with my own suggestions in the matter. He will probably consult Fastolfe as the other party intimately concerned and then arrange to meet with all three of us, perhaps tomorrow. Some decision might be reached then-or later-and it would be ratified by the full Legislature. All due process of law will be followed, I assure you."

"The letter of the law will be followed, no doubt, but what if the Chairman has already made up his mind, what if nothing I say will be accepted, and what if the Legislature simply rubberstamps a foregone decision? Is that possible?"

Amadiro did not exactly smile at that, but he seemed subtly amused. "You are a realist, Mr. Baley. I am pleased with that. People who dream of justice are so apt to be disappointed-and they are usually such wonderful people that one hates to see that happen."

Amadiro's glance fixed itself on Daneel again. "A remarkable job, this humaniform robot," he said. "It is astonishing how close to his vest Fastolfe has kept things. And it is a shame that Jander was lost. There Fastolfe did the unforgivable."

"Dr. Fastolfe, sir, denies that he was in any way implicated."

"Yes, Mr. Baley, of course he would. Does he say that I am implicated? Or is my implication entirely your own idea?"

Baley said deliberately, "I have no such idea. I merely wish to question you on the matter. As for Dr. Fastolfe, he is not a candidate for one of your accusations of slander."

He is certain you have had nothing to do with what happened to Jander because he is quite certain you lack the knowledge and capacity to immobilize a humanoid robot."

If Baley hoped to stir things up in that manner, he failed. Amadiro accepted the slur with no loss of good humor and said, "In that he is right, Mr. Baley. Sufficient ability is not to be found in any roboticist-alive or dead-except for Fastolfe himself. Isn't that what he says, our modest master of masters?"

"Yes, he does."

"Then whatever does he say happened to Jander, I wonder?"

"A random event. Purely chance."

Amadiro laughed. "Has he calculated the probability of such a random event?"

"Yes, Master Roboticist. Yet even an extremely unlikely chance might happen, especially if there were incidents that bettered the odds."

"Such as what?"

"That is what I am hoping to find out, Since you have already arranged to have me thrown off the planet, do you now intend to forestall any questioning of yourself-or may I continue my investigation until such time as my activity in that respect is legally ended? - Before you answer, Dr. Amadiro, please consider that the investigation has not as yet been legally ended and, in any hearing that may come up, whether tomorrow or later, I will be able to accuse you of refusing to answer my questions if you should insist on now ending this interview. That might influence the Chairman in his decision."

"It would not, my dear Mr. Baley. Don't imagine you can in any way interfere with me. -However, you may interview me for as long as you wish. I will cooperate fully with you, if only to enjoy the spectacle of the good Fastolfe trying uselessly to disentangle himself from his unfortunate deed. I am not extraordinarily vindictive, Mr. Baley, but the fact that Jander was Fastolfe's own creation does not give him the right to destroy it."

Baley said, "It is not legally established that this is what he has done, so that what you have just said is, at least potentially, slander. Let us put that to one side, therefore, and get on with this interview. I need information. I will ask my questions briefly and directly and, if you answer in the same way, this interview may be completed quickly."

"No, Mr. Baley. It is not you who will set the conditions for this interview," said Amadiro. "I take it that one or both of your robots is equipped to record our conversation in full."

"I believe so."

"I know so. I have a recording device of my own as well. Don't think, my good Mr. Baley, that you will lead me through a jungle of short answers to something that will serve Fastolfe's purpose. I will answer as I choose and make certain I am not misinterpreted. And my own recording will help me make it certain that I am not misinterpreted." Now, for the first time, there was the suggestion of the wolf behind Amadiro's attitude of friendliness.

"Very well, then, but if your answers are deliberately longwinded and evasive, that, too, will show up in the recording."

"Obviously."

"With that understood, may I have a glass of water, to begin with?"

"Absolutely. -Giskard, will you oblige Mr. Baley?"

Giskard was out of his niche at once. There was the inevitable tinkle of ice at the bar at one end of the room and a tall glass of water was on the desk immediately before Baley.

Baley said, "Thank you, Giskard," and waited for him to move back into his niche.

He said, "Dr. Amadiro, am I correct in considering you the head of the Robotics Institute?"

"Yes, you are."

"And its founder?"

"Correct. -You see, I answer briefly."

"How long has it been in existence?"

"As a concept-decades. I have been gathering like-minded people for at least fifteen years. Permission was obtained from the Legislature twelve years ago. Building began nine years ago and active work began six years ago. In its present completed form, the Institute is two years old and there are long-range plans for further expansion, eventually. -There you have a long answer, sir, but presented reasonably concisely."

"Why did you find it necessary to set up the Institute?"

"Ah, Mr. Baley. Here you surely expect nothing but a longwinded answer."

"As you please, sir."

At this point, a robot brought in a tray of small sandwiches and still smaller pastries, none of which were familiar to Baley. He tried a sandwich and found it crunchy and not exactly unpleasant but odd enough for him to finish it only with an effort. He washed it down with what was left of his water.

Amadiro watched with a kind of gentle amusement and said, "You must understand, Mr. Baley, that we Aurorans are unusual people. So are Spacers generally, but I speak of Aurorans in particular now. We are descended from Earthpeople-something most of us do not willingly think about-but we are self-selected."

"What does that mean, sir?"

"Earthpeople have long lived on an increasingly crowded planet and have drawn together into still more crowded cities that finally became the beehives and anthills you call Cities with a capital 'C.' What kind of Earthpeople, then, would leave Earth and go to other worlds that are empty and hostile so that they might build new societies from nothing, societies that they could not enjoy in completed form in their own lifetime-trees that would still be saplings when they died, so to speak."

"Rather unusual people, I suppose."

"Quite unusual. Specifically, people who are not so dependent on crowds of their fellows as to lack the ability to face emptiness. People who even prefer emptiness, who would like to work on their own and face problems by themselves, rather than hide in the herd and share the burden so that their own load is virtually nothing. Individualists, Mr. Baley. Individualists!"

"I see that."

"And our society is founded on that. Every direction in which the Spacer worlds have developed further emphasizes our individuality. We are proudly human on Aurora, rather than being huddled sheep on Earth. -Mind you, Mr. Baley, I use the metaphor not as a way of deriding Earth. It is simply a different society which I find unadmirable but which you, I suppose, find comforting and ideal."

"What has this to do with the founding of the Institute, Dr. Amadiro?"

"Even proud and healthy individualism has its drawbacks. The greatest minds-working singly, even for centuries-cannot progress rapidly if they refuse to communicate their findings. A knotty puzzle may hold up a scientist for a century, when it may be that a colleague has the solution already and is not even aware of the puzzle that it might solve. -The Institute is an attempt, in the narrow field of robotics at least, to introduce a certain community of thought."

"Is it possible that the particular knotty puzzle you are attacking is that of the construction of a humanoid robot?"

Amadiro's eyes twinkled. "Yes, that is obvious, isn't it? It was twenty-six years ago that Fastolfe's new mathematical system, which he calls 'intersectional analysis,' made it possible to design humanoid robots-but he kept the system to himself. Years afterward, when all the difficult technical details were worked out, he and Dr. Sarton applied the theory to the design of Daneel. Then Fastolfe alone completed Jander. But all of those details were kept secret, also.

"Most roboticists shrugged and felt that this was natural. They could only try, individually, to work out the details for themselves. I, on the other hand, was struck by the possibility of an Institute in which efforts would be pooled. It wasn't easy to persuade other roboticists of the usefulness of the plan, or to persuade the Legislature to fund it against Fastolfe's formidable opposition, or to persevere through the years of effort, but here we are.

Baley said, "Why was Dr. Fastolfe opposed?"

"Ordinary self-love, to begin with-and I have no fault to find with that, you understand. All of us have a very natural self-love. It comes with the territory of individualism. The point is that Fastolfe considers himself the greatest roboticist in history and also considers the humanoid robot his own particular achievement. He doesn't want that achievement duplicated by a group of roboticists, individually faceless compared to himself. I imagine he viewed it as a conspiracy of inferiors to dilute and deface his own great victory."

"You say that was his motive for opposition 'to begin with.' That means there were other motives. What were they?"

"He also objects to the uses to which we plan to put the humanoid robots."

"What uses are these, Dr. Amadiro?"

"Now now. Let's not be ingenuous. Surely Dr. Fastolfe has told you of the Globalist plans for setting the Galaxy?"

"That he has and, for that matter, Dr. Vasilias has spoken to me of the difficulties of scientific advance among individualists. However, that does not stop me from wanting to

hear your views on these matters. Nor should it stop you from wanting to tell me. For instance, do you want me to accept Dr. Fastolfe's interpretation of Globalist plans as unbiased and impartial-and would you state that for the record? Or would you prefer to describe your plans in your own words?"

"Put that way, Mr. Baley, you intend to give me no choice."

"None, Dr. Amadiro."

"Very well. I-we, I should say, for the people at the Institute are like-minded in this-look into the future and wish to see humanity opening ever more and ever newer planets to settlement. We do not, however, want the process of self-selection to destroy the older planets or to reduce them to morbidity, as in the case-pardon me-of Earth. We don't want the new planets to take the best of us and to leave behind the dregs. You see that, don't you?"

"Please go on."

"In any robot-oriented society, as in the case of our own, the easy solution is to send out robots as settlers. The robots will build the society and the world and we can then all follow later without selection, for the new world will be as comfortable and as adjusted to ourselves as the old worlds were, so that we can go on to new worlds without leaving home, so to speak."

"Won't the robots create robot worlds rather than human worlds?"

"Exactly, if we send out robots that are nothing but robots. We have, however, the opportunity of sending out humanoid robots like Daneel here, who, in creating worlds for themselves, would automatically create worlds for us. Dr. Fastolfe, however, objects to this. He finds some virtue in the thought of human beings calving a new world out of a strange and forbidding planet and does not see that the effort to do so would not only cost enormously in human life, but would also create a world molded by catastrophic events into something not at all like the worlds we know."

"As the Spacer worlds today are different from Earth and from each other?"

Amadiro, for a moment, lost his joviality and looked thoughtful. "Actually, Mr. Baley, you touch an important point. I am discussing Aurora only. The Spacer worlds do indeed differ among themselves and I am not overly fond of most of them. It is clear to me-though I may be prejudiced-that Aurora, the oldest among them, is also the best and most successful. I don't want a variety of new worlds of which only a few might be really valuable. I want many Auroras-uncounted millions of Auroras-and for that reason I want new worlds carved into Auroras before human beings go there. That's why we call ourselves 'Globalists' by the way. We are concerned with this globe of oars-Aurora-and no other."

"Do you see no value in variety, Dr. Amadiro?"

"If the varieties were equally good, perhaps there would be value, but if some-or most-are inferior, how would that benefit humanity?"

"When do you start this work?"

"When we have the humanoid robots with which to do it. So far there were Fastolfe's two, of which he destroyed one, leaving Daneel the only specimen." His eyes strayed briefly to Daneel as he spoke.

"When will you have humanoid robots?"

"That is difficult to say. We have not yet caught up with Dr. Fastolfe."

"Even though he is one and you are many, Dr. Amadiro?"

Amadiro twitched his shoulders slightly. "You waste your sarcasm, Mr. Baley. Fastolfe was well ahead of us to begin with and, though the Institute has been in embryo for a long time, we have been fully at work for only two years. Besides, it will be necessary for us not only to catch up with Fastolfe but to move ahead of him. Daneel is a good product, but he is only a prototype and is not good enough."

"In what way must the humanoid robots be improved beyond Daneel's mark?"

"They must be even more human, obviously. They must exist in both sexes and there must be the equivalent of children. We must have a generational spread if a sufficiently human society is to be built up on the planets."

"I think I see difficulties, Dr. Amadiro."

"No doubt. There are many. Which difficulties do you foresee, Mr. Baley?"

"If you produce humanoid robots who are so humanoid they can produce a human society, and if they are produced with a generational spread in both sexes, how will you be able to distinguish them from human beings?"

"Will that matter?"

"It might. If such robots are too human, they might melt into Auroran society and become part of human family groups-and might not be suitable for service as pioneers."

Amadiro laughed. "That thought clearly entered your head because of Gladia Delmarre's attachment to Jander. You see, I know something of your interview with that woman from my conversations with Gremionis and with Dr. Vasilisa. I remind you that Gladia is from Solaria and her notion of what constitutes a husband is not necessarily Auroran in nature."

"I was not thinking of her in particular. I was thinking that sex on Aurora is broadly interpreted and that robots as sex partners are tolerated even now, with robots who are only approximately humanoid. If you really cannot tell a robot from a human being-"

"There's the question of children. Robots can neither father nor mother children."

"But that brings up another point. The robots will be long-lived, since the proper building of the society may take centuries."

"They would, in any case, have to be long-lived if they are to resemble Aurorans."

"And the children-also long-lived?"

Amadiro did not speak.

Baley said, "These will be artificial robot children and will never grow older-they will not age and mature. Surely this will create an element sufficiently nonhuman to cast the nature of the society into doubt."

Amadiro sighed. "You are penetrating, Mr. Baley. It is indeed our thought to devise some scheme whereby robots can produce babies who can in some fashion grow and mature—at least long enough to establish the society we want."

"And then, when human beings arrive, the robots can be restored to more robotic schemes of behavior."

"Perhaps—if that seems advisable."

"And this production of babies? Clearly, it would be best if the system used were as close to the human as possible, wouldn't it?"

"Possibly."

"Sex, fertilization, birth?"

"Possibly."

"And if these robots form a society so human that they cannot be differentiated from human, then, when true human beings arrive, might it not be that the robots would resent the immigrants and try to keep them off? Might the robots not react to Aurorans as you react to Earthpeople?"

"Mr. Baley, the robots would still be bound by the Three Laws."

"The Three Laws speak of refraining from injuring human beings and of obeying human beings."

"Exactly."

"And what if the robots are so close to human beings that they regard themselves as the human beings they should protect and obey? They might, very rightly, place themselves above the immigrants."

"My good Mr. Baley, why are you so concerned with all these things? They are for the far future. There will be solutions, as we progress in time and as we understand, by observation, what the problems really are."

"It may be, Dr. Amadiro, that Aurorans may not very much approve what you are planning, once they understand what it is. They may prefer Dr. Fastolfe's views."

"Indeed? Fastolfe thinks that, if Aurorans cannot settle new planets directly and without the help of robots, then Earthpeople should be encouraged to do so."

Baley said, "It seems to me that that makes good sense."

"Because you are an Earthman, my good Baley. I assure you that Aurorans would not find it pleasant to have Earthpeople swarming over the new worlds, building new beehives and forming some sort of Galactic Empire in their trillions and quadrillions and reducing the Spacer worlds to what? To insignificance at best and to extinction at worst."

"But the alternative to that is worlds of humanoid robots, building quasi-human societies and allowing no true human beings among themselves. There would gradually develop a robotic Galactic Empire, reducing the Spacer worlds to insignificance at best and to extinction at worst. Surely Aurorans would prefer a human Galactic Empire to a robotic one."

"What makes you so sure of that, Mr. Baley?"

"The form your society takes now makes me sure. I was told, on my way to Aurora, that no distinctions are made between robots and human beings on Aurora, but that is clearly wrong. It may be a wished-for ideal that Aurorans flatter themselves truly exists, but it does not."

"You've been here-what?-less than two days and you can already tell?"

"Yes, Dr. Amadiro. It may be precisely because I'm a stranger that I can see clearly. I am not blinded by custom and ideals. Robots are not permitted to enter Personals and that's one distinction that is clearly made. It permits human beings to find one place where they can be alone. You and I sit at our ease, while robots remain standing in their niches, as you see"-Baley waved his arm toward Daneel-"which is another distinction. I think that human beings-even Aurorans-will always be eager to make distinctions and to preserve their own humanity."

"Astonishing, Mr. Baley."

"Not astonishing at all, Dr. Amadiro. You have lost. Even if you manage to foist your belief that Dr. Fastolfe destroyed Jander upon Aurorans generally, even if you reduce Dr. Fastolfe to political impotence, even if you get the Legislature and the Auroran people to approve your plan of robot settlement, you will only have gained time. As soon as the Aurorans see the implications of your plan, they will turn against you. It might be better, then, if you put an end to your campaign against Dr. Fastolfe and meet with him to work out some compromise whereby the settlement of new worlds by Earthmen can be so arranged as to represent no threat to Aurora or to the Spacer worlds in general."

"Astonishing, Mr. Baley," said Amadiro a second time.

"You have no choice," said Baley flatly.

But Amadiro answered, in a leisurely and amused tone, "When I say your remarks are astonishing, I do not refer to the content of your statements but only to the fact that you make them at all -and that you think they are worth something."

56.

Baley watched Amadiro forage for one last piece of pastry and put half of it into his mouth, clearly enjoying it.

"Very good," said Amadiro, "but I am a little too fond of eating. What was I saying? -Oh yes. Mr. Baley, do you think you have discovered a secret? That I have told you something that our world does not already know? That my plans are dangerous, but that I blab them to every newcomer? I imagine you may think that, if I talk to you long enough, I will surely produce some verbal folly that you will be able to make use of. Be assured that I am not likely to. My plans for ever more humanoid robots, for robot families, and for as human a culture as possible are all on record. They are available to the Legislature and to anyone who is interested."

Baley said, "Does the general public know?"

'Probably not. The general public has its own priorities and is more interested in the next meal, the next hyperwave show, the next space-soccer contest than in the next century and the next millennium. Still, the general public will be as glad to accept my plans, as are the intellectually minded who already know. Those who object will not be numerous enough to matter.'

"Can you be certain of that?"

"Oddly enough, I can be. You don't understand, I'm afraid, the intensity of the feelings that Aurorans-and Spacers generally-have toward Earthpeople. I don't share those feelings, mind you, and I am, for instance, quite at ease with you. I don't have that primitive fear of infection, I don't imagine that you smell bad, I don't attribute to you all sorts of personality traits that I find offensive, I don't think that you and yours are plotting to take our lives or steal our property-but the large majority of Aurorans have all these attitudes. It may not be very close to the surface and Aurorans may bring themselves to be very polite to individual Earthpeople who seem harmless, but put them to the test and all their hatred and suspicion will emerge. Tell them that Earthpeople are swarming over new worlds and will preempt the Galaxy and they will howl for Earth's destruction before such a thing can happen."

"Even if the alternative was a robot society?"

"Certainly. You don't understand how we feel about robots, either. We are familiar with them. We are at home with them."

"No. They are your servants. You feel superior to them and are at home with them only while that superiority is maintained. If you are threatened by an overturn, by having them become your superiors, you will react with horror."

"You say that only because that is how Earthpeople would react."

"No. You keep them out of the Personals. It is a symptom."

"They have no use for those rooms. They have their own facilities for washing and they do not excrete. -Of course, they are not truly humaniform. If they were, we might not make that distinction."

"You would fear them the more."

"Truly?" said Amadiro. "That's foolish. Do you fear Daneel? If I can trust that hyperwave show-and I admit I do not think I can-you developed a considerable affection for Daneel. You feel it now, don't you?"

Baley's silence was eloquent and Amadiro pursued his advantage.

"Right now," he said, "you are unmoved by the fact that Giskard is standing, silent and unresponsive, in an alcove, but I can tell by small examples of body language that you are uneasy over the fact that Daneel is doing so, too. You feel he is too human in appearance to be treated as a robot. You don't fear him the more because he looks human."

"I am an Earthman. We have robots," said Baley, "but not a robot culture. You cannot judge from my case."

"And Gladia, who preferred Jander to human beings-"

"She is a Solarian. You cannot judge from her case, either."

"What case can you judge from, then? You are only guessing. To me, it seems obvious that, if a robot is human enough, he would be accepted as human. Do you demand proof that I am not a robot? The fact that I seem human is enough. In the end, we will not worry whether a new world is settled by Aurorans who are human in fact or in appearance, if no one can tell the difference. But-human or robot-the settlers will be Aurorans either way, not Earthpeople."

Baley's assurance faltered. He said unconvincingly, "What if you never learn how to construct a humanoid robot?"

"Why would you expect we would not? Notice that I say 'we.' There are many of us involved here."

"It may be that any number of mediocrities do not add up to one genius."

Amadiro said shortly, "We are not mediocrities. Fastolfe may yet find it profitable to come in with us."

"I don't think so."

"I do. He will not enjoy being without power in the Legislature and, when our plans for settling the Galaxy move ahead and he sees that his opposition does not stop us, he will join us. It will be only human of him to do so."

"I don't think you will win out," said Baley.

"Because you think that somehow this investigation of yours will exonerate Fastolfe and implicate me, perhaps, or someone else."

"Perhaps," said Baley desperately.

Amadiro shook his head. "My friend, if I thought that anything you could do would spoil my plans, would I be sitting still and waiting for destruction?"

"You are not. You are doing everything you can to have this investigation aborted. Why would you do that if you were confident that nothing I could do would get in your way?"

"Well," said Amadiro, "you can get in my way by demoralizing some of the members of the Institute. You can't be dangerous, but you can be annoying-and I don't want that either. So, if I can, I'll put an end to the annoyance-but I'll do that in reasonable fashion, in gentle fashion, even. If you were actually dangerous-"

"What could you do, Dr. Amadiro, in that case?"

"I could have you seized and imprisoned until you were evicted. I don't think Aurorans generally would worry overmuch about what I might do to an Earthman."

Baley said, "You are trying to browbeat me and that won't work. You know very well you could not lay a hand on me with my robots present."

Amadiro said, "Does it occur to you that I have a hundred robots within call? What would yours do against them?"

"All hundred could not harm me. They cannot distinguish between Earthmen and Aurorans. I am human within the meaning of the Three Laws."

"They could hold you quite immobilized-without harming you-while your robots were destroyed."

"Not so," said Baley. "Giskard can hear you arid, if you make a move to summon your robots, Giskard will have you immobilized. He moves very quickly and, once that happens, your robots will be helpless, even if you manage to call them. They will understand that any move against me will result in harm to you."

"You mean that Giskard will hurt me?"

"To protect me from harm? Certainly. He will kill you, if absolutely necessary."

"Surely you don't mean that."

"I do," said Baley. "Daneel and Giskard have orders to protect me. The First Law, in this respect, has been strengthened with all the skill Dr. Fastolfe can bring to the job- and with respect to me, specifically. I haven't been told this in so many words, but I'm quite sure it's true. If my robots must choose between harm to you and harm to me, Earthman though I am, it will be easy for them to choose harm to you. I imagine you are well aware that Dr. Fastolfe is not very eager to ensure your well-being."

Amadiro chuckled and a grin wreathed his face. "I'm sure you're right in every respect, Mr. Baley, but it is good to have you say so. You know, my good sir, that I am recording this conversation also -I told you so at the start- and I'm glad of it. It is possible that Dr. Fastolfe will erase the last part of this conversation, but I assure you I won't. It is clear from what you have said that he is quite prepared to devise a robotic way of doing harm to me-even kill me, if he can manage that-whereas it cannot be said from anything in this conversation-or any other -that I plan any physical harm to him whatever or even to you. Which of us is the villain, Mr. Baley? -I think you have established that and I think, then, that this is a good place at which to end the interview."

He rose, still smiling, and Baley, swallowing hard, stood up as well, almost automatically.

Amadiro said, "I still have one thing to say, however. It has nothing to do with our little contretemps here on Aurora-Fastolfe's and mine. Rather, with your own problem, Mr. Baley."

"My problem?"

"Perhaps I should say Earth's problem. I imagine that you feel very anxious to save poor Fastolfe from his own folly because you think that will give your planet a chance for expansion. -Don't think so, Mr. Baley. You are quite wrong, rather arsy varsy, to use a vulgar expression I've come across in some of your planet's historical novels."

"I'm not familiar with that phrase," said Baley stiffly.

"I mean you have the situation reversed. You see, when my view wins out in the Legislature-and note that I say 'when' and not 'if-Earth will be forced to remain in her own planetary system, I admit, but that will actually be to her benefit. Aurora will have the prospect of expansion and of establishing an endless empire. If we then know that Earth will merely be Earth and never anything more, of what concern will she be to us? With the Galaxy at our disposal, we will not begrudge Earthpeople their one world. We would even be disposed to make Earth as comfortable a world for her people as would be practical."

"On the other hand, Mr. Baley, if Aurorans do what Fastolfe asks and allow Earth to send out settling parties, then it won't be long before it will occur to an increasing number of us that Earth will take over the Galaxy and that we will be encircled and hemmed in, that we will be doomed to decay and death. After that, there will be nothing I can do. My Own quite kindly feeling toward Earthmen will not be able to withstand the general kindling of Auroran suspicion and prejudice and it will then be very bad for Earth.

"So if, Mr. Baley, you are truly concerned for your own people, you should be very anxious indeed for Fastolfe not to succeed in foisting upon this planet his very misguided plan. You should be a strong ally of mine. Think about it. I tell you this, I assure you, out of a sincere friendship and liking for you and for your planet."

Amadiro was smiling as broadly as ever, but it was all wolf now.

57.

Baley and his robots followed Amadiro out the room and along the corridor.

Amadiro stopped at one inconspicuous door and said, "Would you care to use the facilities before leaving?"

For a moment, Baley frowned in confusion, for he did not understand. Then he remembered the antiquated phrase Amadiro had used, thanks to his own reading of historical novels.

He said, "There was an ancient general, whose name I have forgotten, who, mindful of the exigencies of sudden absorption in military affairs, once said, 'Never turn down a chance to piss.

Amadiro smiled broadly and said, "Excellent advice. Quite as good as my advice to think seriously about what I have said.

-But I notice that you hesitate, even so. Surely you don't think I am laying a trap for you. Believe me, I am not a barbarian. You are my guest in this building and, for that reason alone, you are perfectly safe."

Baley said cautiously, "If I hesitate, it is because I am considering the propriety of using your-uh-facilities, considering that I am not an Auroran."

"Nonsense, my dear Baley. What is your alternative? Needs must. Please make use of it. Let that be a symbol that I myself am not subject to the general Auroran prejudices and wish you and Earth well."

"Could you go a step further?"

"In what way, Mr. Baley?"

"Could you show me that you are also superior to this planet's prejudice against robots-"

"There is no prejudice against robots," said Amadiro quickly. Baley nodded his head solemnly in apparent acceptance of the remark and completed his sentence. "-by allowing them to enter the Personal with me. I have grown to feel uncomfortable without them."

For one moment, Amadiro seemed shaken. He recovered almost at once and said, with what was almost a scowl, "By all means, Mr. Baley."

"Yet whoever is now inside might object strenuously. I would not want to create scandal."

"No one is in there. It is a one-person Personal and, if someone were making use of it, the in-use signal would indicate that."

"Thank you, Dr. Amadiro," said Baley. He opened the door and said, "Giskard, please enter."

Giskard clearly hesitated, but said nothing in objection and entered. At a gesture from Baley, Daneel followed, but as he passed through the door, he took Baley's elbow and pulled him in as well.

Baley said, as the door closed behind him, "I'll be out again soon. Thank you for allowing this."

He entered the room with as much unconcern as he could manage and yet he felt a tightness in the pit of his abdomen. Might it contain some unpleasant surprise?

58.

Baley found the Personal empty, however. There was not even much to search. It was smaller than the one in Fastolfe's establishment.

Eventually, he noticed Daneel and Giskard standing silently side by side, backs against the door, as though endeavoring to have entered the room by the least amount possible.

Baley tried to speak normally, but what came out was a dim croak. He cleared his throat with unnecessary noise and said, "You can come farther into the room-and you needn't remain silent, Daneel." (Daneel had been on Earth. He knew the Earthly taboo against speech in the Personal.)

Daneel displayed that knowledge at once. He put his forefinger to his lips.

Baley said, "I know, I know, but forget it. If Amadiro can forget the Auroran taboo about robots in Personals, I can forget the Earthly taboo about speech there."

"Will it not make you uncomfortable, Partner Elijah?" asked Daneel in a low voice.

"Not a bit," said Baley in an ordinary one. (Actually, speech felt different with Daneel-a robot. The sound of speech in a room such as this when, actually, no human being was present was not as horrifying as it might be. In fact, it was not horrifying at all when only robots were present, however humaniform one of them might be. Baley could not say so, of course. Though Daneel had no feelings a human being could hurt, Baley had feelings on his behalf.)

And then Baley thought of something else and felt, quite intensely, the sensation of being a thoroughgoing fool.

"Or," he said to Daneel, in a voice that was suddenly very low indeed, "are you suggesting silence because this room is bugged?" The last word came out merely as a shaping of the mouth.

"If you mean, Partner Elijah, that people outside this room can detect what is spoken inside this room through some sort of eavesdropping device, that is quite impossible."

"Why impossible?"

The toilet device flushed itself with quick and silent efficiency and Baley advanced toward the washbasin.

Daneel said, "On Earth, the dense packing of the Cities makes privacy impossible. Overhearing is taken for granted and to use a device to make overhearing more efficient might seem natural. If an Earthman wishes not to be overheard, he simply doesn't speak, which may be why silence is so mandatory in places where there is a pretense of privacy, as in the very rooms you call Personals.

"On Aurora, on the other hand, as on all the Spacer worlds, privacy is a true fact of life and is greatly valued. You remember Solaria and the diseased extremes to which it was carried there. But even on Aurora, which is no Solaria, every human being is insulated from every other human being by the kind of space extension unthinkable on Earth and by a wall of robots, in addition. To break down that privacy would be an unthinkable act."

Baley said, "Do you mean it would be a crime to bug this room?"

"Much worse, Partner Elijah. It would not be the act of a civilized Auran gentleman."

Baley looked about. Daneel, mistaking the gesture, plucked a towel out of the dispenser, which might not have been instantly apparent to the other's unaccustomed eyes, and offered it to Baley.

Baley accepted the towel, but that was not the object of his questing glance. It was a bug for which his eyes searched, for he found it difficult to believe that someone would forego an easy advantage on the ground that it would not be civilized behavior. It was, however, useless and Baley, rather despondently, knew it would be. He would not be able to detect an Auran bug, even if one were there. He wouldn't know what to look for in a strange culture.

Whereupon he followed the course of another strand of suspicion in his mind. "Tell me, Daneel, since you know Aurorans better than I do, why do you suppose Amadiro is taking all this trouble with me? He talks to me at his leisure. He sees me out. He offers me the use of this room-something Vasilia would not have done. He seems to have all the time in the world to spend on me. Politeness?"

"Many Aurorans pride themselves on their politeness. It may be that Amadiro does. He has several times stressed that he is not a barbarian."

"Another question. Why do you think he was willing to have me bring you and Giskard into this room?"

"It seemed to me that that was to remove your suspicions that the offer of this room might conceal a trap."

"Why should he bother? Because he was concerned over the possibility of my experiencing unnecessary anxiety?"

"Another gesture of a civilized Auroran gentleman, I should imagine."

Baley shook his head. "Well, if this room is bugged and Amadiro can hear me, let him hear me. I don't consider him a civilized Auroran gentleman. He made it quite clear that, if I did not abandon my investigation, he would see to it that Earth as a whole would suffer. Is that the act of a civilized gentleman? Or of an incredibly brutal blackmailer?"

Daneel said, "An Auroran gentleman may find it necessary to utter threats, but if so, he would do it in a gentlemanly manner."

"As Amadiro did. It is, then, the manner and not the content of speech that marks the gentleman. But then, Daneel, you are a robot and therefore can not really criticize a human being, can you?"

Daneel said, "It would be difficult for me to do so. But may I ask a question, Partner Elijah? Why did you ask permission to bring friend Giskard and me into this room? It had seemed to me that you were reluctant, earlier, to believe you were in danger. Have you now decided that you are not safe except in our presence?"

"No, not at all, Daneel. I am now quite convinced that I am not in danger and have not been."

"Yet there was a distinctly suspicious cast about your actions when you entered this room, Partner Elijah. You searched it."

Baley said, "Of course! I said I am not in danger, but I do not say there is no danger."

"I do not think I see the distinction, Partner Elijah," said Daneel.

"We will discuss it later, Daneel. I am still not certain as to whether this room is bugged or not."

Baley was by now quite done. He said, "Well, Daneel, I've been leisurely about this; I haven't rushed at all. Now I'm ready to go out again and I wonder if Amadiro is still waiting for us after all this time or whether he has delegated an underling to do the rest of the job of showing us out. After all, Amadiro is a busy man and cannot spend all day with me. What do you think, Daneel?"

"It would be more logical if Dr. Amadiro had delegated the task."

"And you, Giskard? What do you think?"

"I agree with friend Daneel, though it is my experience that human beings do not always make what would seem the logical response."

Baley said, "For my part, I suspect Amadiro is waiting for us quite patiently. If something has driven him to waste this much time on us, I rather think that the driving force-whatever it might be-has not yet weakened."

"I do not know what might be the driving force you speak of, Partner Elijah," said Daneel.

"Nor I, Daneel," said Baley, "which bothers me a great deal. But let us open the door now and see."

Amadiro was waiting outside the door for them, precisely where Baley had left him. He smiled at them, showing no sign of impatience. Baley could not resist shooting a quiet I-told-you-so glance at Daneel, who responded with bland impassivity.

Amadiro said, "I rather regretted, Mr. Baley, that you had not left Giskard outside when you entered the Personal. I might have known him in times past, when Fastolfe and I were on better terms but somehow never did. Fastolfe was my teacher once, you know."

"Was he?" said Baley. "I didn't know that, as a matter of fact."

"No reason you should, unless you had been told-and, in the short time you've been on the planet, you can scarcely have had time to learn much in the way of this sort of trivia, I suppose.

-Come now, it has occurred to me that you can scarcely think me hospitable if I do not take advantage of your being at the Institute to show you around."

"Really," said Baley, stiffening a bit. "I must-"

"I insist," said Amadiro, with something of a note of the imperious entering his voice. "You arrived on Aurora yesterday morning and I doubt that you will be staying on the planet much longer. This may be the only chance you will ever have of getting a glimpse of a modern laboratory doing research work on robotics."

He linked arms with Baley and continued to speak in familiar terms. ('Prattled" was the term that occurred to the astonished Baley.)

"You've washed," said Amadiro. "You've taken care of your needs. There may be other roboticists here whom you will wish to question and I would welcome that, since I am determined to show I have put no barriers in your way during the short time in which you will yet be permitted to conduct your investigation. In fact, there is no reason you can't have dinner with us."

Giskard said, "If I may interrupt, sir-"

"You may not!" said Amadiro with unmistakable firmness and the robot fell silent.

Amadiro said, "My dear Mr. Baley, I understand these robots. Who should know them better? -Except for the unfortunate Fastolfe, of course. Giskard, I am sure, was going to remind you of some appointment, some promise, some business-and there is no point in any of that. Since the investigation is about over, I promise you, none of what he was going to remind you of will have any significance. Let us forget all such nonsense and, for a brief time, be friends.

"You must understand, my good Mr. Baley," he went on, "that I am quite an aficionado of Earth and its culture. It is not the most popular of subjects on Aurora, but I find it fascinating. I am particularly interested in Earth's past history, the days when it had a hundred languages and Interstellar Standard had not yet been developed. -May I compliment you, by the way, on your own handling of Interstellar?"

"This way, this way," he said, turning a corner. "We'll be coming to the pathway-simulation room, which has its own weird beauty, and we may have a mock-up in operation. Quite symphonic, actually. -But I was talking about your handling of

Interstellar. It is one of the many Auroran superstitions concerning Earth, that Earthpeople speak an all-but-incomprehensible version of Interstellar. When the show about you was produced, there were many who said that the actors could not be Earthpeople because they could be understood, yet I can understand you." He smiled as he said that.

"I've tried reading Shakespeare," he continued with a confidential air, "but I can't read him in the original, of course, and the translation is curiously flat. I can't help but believe that the fault lies with the translation and not with Shakespeare. I do better with Dickens and Tolstoy, perhaps because that is prose, although the names of the characters are, in both cases, virtually unpronounceable to me.

"What I'm trying to say, Mr. Baley, is that I'm a friend of Earth. I really am. I want what is best for it. Do you understand?" He looked at Baley and again the wolf showed in his twinkling eyes.

Baley raised his voice, forcing it between the softly running sentences of the other. "I'm afraid I cannot oblige you, Dr. Amadiro. I must be about my business and I have 'no further questions to ask of either you or anyone else here. If you-

Baley paused. There was a faint and curious rumble of sound in the air. He looked up, startled. "What is that?"

"What is what?" asked Amadiro. "I sense nothing." He looked at the robots, who had been following the two human beings in grave silence. "Nothing!" he said forcefully. "Nothing."

Baley recognized that as the equivalent of an order. Neither robot could now claim to have heard the rumble in direct contradiction to a human being, unless Baley himself applied a counter-pressure-and he was sure he could not manage to do it skillfully enough in the face of Amadiro's professionalism.

Nevertheless, it didn't matter. He had heard something and he was not a robot; he would not be talked out of it. He said, "By your own statement, Dr. Amadiro, I have little time left me, That is all the more reason that I must-

The rumble again. Louder.

Baley said, with a sharp, cutting edge to his voice, "That, I suppose, is precisely what you didn't hear before and what you don't hear now. Let me go, sir, or I will ask my robots for help."

Amadiro loosened his grip on Baley's upper arm at once. "My friend, you had but to express the wish. Come! I will take you to the nearest exit and, if ever you are on Aurora again, which seems unlikely in the extreme, please return and you may have the tour I promised you."

They were walking faster. They moved down the spiral ramp, out along a corridor to the commodious and now empty anteroom and the door by which they had entered.

The windows in the anteroom showed utterly dark. Could it be night already?

It wasn't. Amadiro muttered to himself, "Rotten weather! They've opacified the windows."

He turned to Baley, "I imagine it's raining. They predicted it and the forecasts can usually be relied on-always, when they're unpleasant."

The door opened and Baley jumped backward with a gasp. A cold wind gusted inward and against the sky-not black but a dull, dark gray-the tops of trees were whipping back and forth.

There was water pouring from the sky-descending in streams. And as Baley watched, appalled, a streak of light flashed across the sky with blinding brilliance and then the rumble came again, this time with a cracking report, as though the light-streak had split the sky and the rumble was the noise it had made.

Baley turned and fled back the way he had come, whimpering.

15. AGAIN DANEEL AND GISKARD

60.

Baley felt Daneel's strong grip on his arms, just beneath his shoulders. He halted and forced himself to stop making that infantile sound. He could feel himself trembling.

Daneel said with infinite respect, "Partner Elijah, it is a thunderstorm-expected-predicted-normal."

"I know that," whispered Baley.

He did know it. Thunderstorms had been described innumerable times in the books he had read, whether fiction or nonfiction. He had seen them in holographs and on hyperwave shows-sound, sight, and all.

The real thing, however, the actual sound and sight, had never penetrated into the bowels of the City and he had never in his life actually experienced such a thing.

With all he knew-intellectually-about thunderstorms, he could not face-viscerally-the actuality. Despite the descriptions, the collections of words, the sight in small pictures and on small screens, the sounds captured in recordings; despite all that, he had no idea the flashes were so bright and streaked so across the sky; that the sound was so vibratorily bass in sound when it rattled across a hollow world; that both were so sudden; and that rain could be so like an inverted bowl of water, endlessly pouring.

He muttered in despair, "I can't go out in that."

"You won't have to," said Daneel urgently. Giskard will get the airfoil. It will be brought right to the door for you. Not a drop of rain will fall on you."

"Why not wait until it's over?"

"Surely that would not be advisable, Partner Elijah. Some rain, at least, will continue past midnight and if the Chairman arrives tomorrow morning, as Dr. Amadiro implied he might, it might be wise to spend the evening in consultation with Dr. Fastolfe."

Baley forced himself to turn around, face in the direction from which he wanted to flee, and look into Daneel's eyes. They seemed deeply concerned, but Baley thought dismally that that was merely the result of his own interpretation of the appearance of those eyes. The robot had no feelings, only positronic surges that mimicked those feelings. (And perhaps human beings had no feelings, only neuronic surges that were interpreted as feelings.)

He was somehow aware that Amadiro was gone. He said, "Amadiro delayed me deliberately-by ushering me into the Personal, by his senseless talk, by his preventing you or Giskard from interrupting and warning me about the storm. He would even have tried to persuade me to tour the building or dine with him. He desisted only at the sound of the storm. That was what he was waiting for."

"It would seem so. If the storm now keeps you here, that may be what he was waiting for."

Baley drew a deep breath. "You are right. I must leave- somehow."

Reluctantly, he took a step toward the door, which was still open, still filled with a dark gray vista of whipping rain. Another step. And still another-leaning heavily on Daneel.

Giskard was waiting quietly at the door.

Baley paused and closed his eyes for a moment. Then he said in a low voice, to himself rather than to Daneel, "I must do it," and moved forward again.

61.

"Are you well, sir?" asked Giskard.

It was a foolish question, dictated by the programming of the robot, thought Baley, though, at that, it was no worse than the questions asked by human beings, sometimes with wild inappropriateness, out of the programming of etiquette.

"Yes," said Baley in a voice he tried-and failed-to raise above a husky whisper. It was a useless answer to the foolish question, for Giskard, robot though he was, could surely see that Baley was unwell and that Baley's answer was a palpable lie.

The answer was, however, given and accepted and that freed Giskard for the next step. He said, "I will now leave to get the airfoil and bring it to the door."

"Will it work-in all this-this water, Giskard?"

"Yes, sir. This is not an uncommon rain."

He left, moving steadily into the downpour. The lightning was flickering almost continuously and the thunder was a muted growl that rose to a louder crescendo every few minutes.

For the first time in his life, Baley found himself envying a robot. Imagine being able to walk through that; to be indifferent to water, to sight, to sound; to be able to ignore surroundings and to have a pseudo-life that was absolutely courageous; to know no fear of pain or of death, because there was no pain or death.

And yet to be incapable of originality of thought, to be incapable of unpredictable leaps of intuition- Were such gifts worth what humanity paid for them? At the moment, Baley could not say. He knew that, once he no longer felt terror, he would know that no price was too high to pay for being human. But now that he experienced nothing but the pounding of his heart and the collapse of his will, he could not help but wonder of what use it might be to be a human being if one could not overcome these deep-seated terrors, this intense agoraphobia.

Yet he had been in the open for much of two days and had managed to be almost comfortable.

But the fear had not been conquered. He knew that now. He had suppressed it by thinking intensely of other things, but the storm overrode all intensity of thought.

He could not allow this. If all else failed -thought, pride, will -then he would have to fall back on shame. He could not collapse under the impersonal, superior gaze of the robots. Shame would have to be stronger than fear.

He felt Daneel's steady arm about his waist and shame prevented him from doing what, at the moment, he most wanted to do-to turn and hide his face against the robotic chest. He might have been unable to resist if Daneel had been human- He had lost contact with reality, for he was becoming aware of Daneel's voice as though it were reaching him from a long distance. It sounded as though Daneel was feeling something akin to panic.

"Partner Elijah, do you hear me?"

Giskard's voice, from an equal distance, said, "We must carry him."

"No," mumbled Baley. "Let me walk."

Perhaps they did not hear him. Perhaps he did not really speak, but merely thought he did. He felt himself lifted from the ground. His left arm dangled helplessly and he strove to lift it, to push it against someone's shoulder, to lift himself upright again from the waist, to grope for the floor with his feet and stand upright.

But his left arm continued to dangle helplessly and his striving went for nothing.

He was somehow aware that he was moving through the air and he felt a wash of spray against his face. Not actually water but the sifting of damp air. Then there was the pressure of a hard surface against his left side, a more resilient one against his right side.

He was in the airfoil, wedged in once more between Giskard and Daneel. What he was most conscious of was that Giskard was very wet.

He felt a jet of warm air cascading over him. Between the near-darkness outside and the film of trickling water upon the glass, they might as well have been opacified-or so Baley thought till opacification actually took place and total darkness descended. The soft noise of the jet, as the airfoil rose above the grass and swayed, muted the thunder and seemed to draw its teeth.

Giskard said, "I regret the discomfort of my wet surface, sir. I will dry quickly. We will wait here a short while till you recover."

Baley was breathing more easily. He felt wonderfully and comfortably enclosed. He thought: Give me back my City. Wipe out all the Universe and let the Spacers colonize it. Earth is all we need.

And even as he thought it, he knew it was his madness that believed it, not he.

He felt the need to keep his mind busy.

He said weakly, "Daneel."

"Yes, Partner Elijah?"

"About the Chairman. Is it your opinion that Amadiro was judging the situation correctly in supposing that the Chairman would put an end to the investigation or was he perhaps allowing his wishes to do his thinking for him?"

"It may be, Partner Elijah, that the Chairman will indeed interview Dr. Fastolfe and Amadiro on the matter. It would be a standard procedure for settling a dispute of this nature. There are ample precedents."

"But why?" asked Baley wealdy. "If Amadiro was so persuasive, why should not the Chairman simply order the investigation stopped?"

"The Chairman," said Daneel, "is in a difficult political situation. He agreed originally to allow you to be brought to Aurora at Dr. Fastolfe's urging and he cannot so sharply reverse himself so soon without making himself look weak and irresolute- and without angering Dr. Fastolfe, who is still a very influential figure in the Legislature."

"Then why did he not simply turn down Amadiro's request?"

"Dr. Amadiro is also influential, Partner Elijah, and likely to grow even more so. The Chairman must temporize by hearing both sides and by giving at least the appearance of deliberation before coming to a decision."

"Based on what?"

"On the merits of the case, we must presume."

"Then by tomorrow morning, I must come up with something that will persuade the Chairman to side with Fastolfe, rather than against him. If I do that, will that mean victory?"

Daneel said, "The Chairman is not all-powerful, but his influence is great. If he comes out strongly on Dr. Fastolfe's side, then, under the present political conditions, Dr. Fastolfe will probably win the backing of the Legislature."

Baley found himself beginning to think clearly again. "That would seem explanation enough for Amadiro's attempt to delay us. He might have reasoned that I had nothing yet to offer the Chairman and he needed only to delay to keep me from getting anything in the time that remained to me."

"So it would seem, Partner Elijah."

"And he let me go only when he thought he could rely on the storm continuing to keep me."

"Perhaps so, Partner Elijah."

"In that case, we cannot allow the storm to stop us."

Giskard said calmly, "Where do you wish to be taken, sir?"

"Back to the establishment of Dr. Fastolfe."

Daneel said, "May we have one moment's more pause, Partner Elijah? Do you plan to tell Dr. Fastolfe that you cannot continue the investigation?"

Baley said sharply, "Why do you say that?" It was a measure of his recovery that his voice was loud and angry.

Daneel said, "It is merely that I fear you might have forgotten for a moment that Dr. Amadiro urged you to do so for the sake of Earth's welfare."

"I have not forgotten," said Baley grimly, "and I am surprised, Daneel, that you should think that that would influence me."

Fastolfe must be exonerated and Earth must send its settlers outward into the Galaxy. If there is danger in that from the Globalists, that danger must be chanced."

"But, in that case, Partner Elijah, why go back to Dr. Fastolfe? It doesn't seem to me that we have anything of moment to report to him. Is there no direction in which we can further continue our investigation before reporting to Dr. Fastolfe?"

Baley sat up in his seat and placed his hand on Giskard, who was now entirely dry. He said, in quite a normal voice, "I am satisfied with the progress I have already made, Daneel. Let's get moving, Giskard. Proceed to Fastolfe's establishment."

And then, tightening his fists and stiffening his body, Baley added, "What's more, Giskard, clear the windows. I want to look out into the face of the storm."

62.

Baley held his breath in preparation for transparency. The small box of the airfoil would no longer be entirely enclosed; it would no longer have unbroken walls.

As the windows clarified, there was a flash of light that came and went too quickly to do anything but darken the world by contrast Baley could not prevent his cringe as he tried to steel himself for the thunder which, after a moment or two, rolled and grumbled.

Daneel said pacifyingly, "The storm will get no worse and soon enough it will recede."

"I don't care whether it recedes or not," said Baley through trembling lips. "Come on. Let's go." He was trying, for his own sake, to maintain the illusion of a human being in charge of robots.

The airfoil rose slightly in the air and at once underwent a sideways movement that tilted it so that Baley felt himself pushing hard against Giskard.

Baley cried out (gasped out, rather), "Straighten the vehicle, Giskard!"

Daneel placed his arm around Baley's shoulder and pulled him gently back His other arm was braced about a hand-grip attached to the frame of the airfoil.

"That cannot be done, Partner Elijah," Daneel said. "There is a fairly strong wind."

Baley felt his hair bristle. "You mean-we're going to be blown away?"

"No, of course not," said Daneel. "If the car were antigrav-a form of technology that does not, of course, exist-and if its mass and inertia were eliminated, then it would be blown like a feather high into the air. However, we retain our full mass even when our jets lift us and poise us in the air, so our inertia resists the wind. Nevertheless, the wind makes us sway, even though the car remains completely under Giskard's control."

"It doesn't feel like it." Baley was conscious of a thin whine, which he imagined to be the wind curling around the body of the airfoil as it cut its way through the protesting atmosphere. Then the airfoil lurched and Baley, who could not for his life have helped it, seized Daneel in a desperate grip around the neck.

Daneel waited a moment. When Baley had caught his breath and his grip grew less rigid, Daneel released himself easily from the other's embrace, while somewhat tightening the pressure of his own arm around Baley.

He said, "In order to maintain course, Partner Elijah, Giskard must counter the wind by an asymmetric ordering of the airfoil's jets. They are sent to one side so as to cause the airfoil to lean into the wind and these jets have to be adjusted in force and direction as the wind itself changes force and direction. There are none better at this than Giskard, but, even so, there are occasional jiggles and lurches. You must excuse Giskard, then, if he does not participate in our conversation. His attention is fully on the airfoil."

"Is it-it safe?" Baley felt his stomach contract at the thought of playing with the wind in this fashion. He was devoutly glad he had not eaten for some hours. He could not-dared not-be sick in the close confines of the airfoil. The very thought unsettled him further and he tried to concentrate on something else.

He thought of running the strips back on Earth, of racing from one moving strip to its neighboring faster strip, and then to its neighboring still faster strip, and then back down into the slower regions, leaning expertly into the wind either way; in one direction as one fastened (an odd word used by no one but stripracers) and in the other direction, as one slowed. In his younger days, Daneel could do it without pause and without error.

Daneel had adjusted to the need without trouble and, the one time they had run the strips together, Daneel had done it perfectly. Well, this was just the same! The airfoil was running strips. Absolutely! It was the same!

Not quite the same, to be sure. In the City, the speed of the strips was a fixed quantity. What wind there was blew in absolutely predictable fashion, since it was only the result of the movement of the strips. Here in the storm, however, the wind had a mind of its own or, rather, it depended on so many variables (Baley was deliberately striving for rationality) that it seemed to have a mind of its own-and Giskard had to allow for that. That was all. Otherwise, it was just running the strips with an added complication. The strips were moving at variable-and sharply changing-speeds.

Baley muttered, "What if we blow into a tree?"

"Very unlikely, Partner Elijah. Giskard is far too skillful for that. And we are only very slightly above the ground, so that the jets are particularly powerful."

"Then we'll hit a rock. It will cave us in underneath."

"We will not hit a rock, Partner Elijah."

"Why not? How on Earth can Giskard see where he's going, anyway?" Baley stared at the darkness ahead.

"It is just about sunset," said Daneel, "and some light is making its way through the clouds. It is enough for us to see by with the help of our headlights. And as it grows darker, Giskard will brighten the headlights."

"What headlights?" asked Baley rebelliously.

"You do not see them very well because they have a strong infrared component, to which Giskard's eyes are sensitive but yours are not. What's more, the infrared is more penetrating than shorter wave light is and, for that reason, is more effective in rain, mist, and fog."

Baley managed to feel some curiosity, even amid his uneasiness. "And your eyes, Daneel?"

"My eyes, Partner Elijah, are designed to be as similar to those of human beings as possible. That is regrettable, perhaps, at this moment."

The airfoil trembled and Baley found himself holding his breath again. He said in a whisper, "Spacer eyes are still adapted to Earth's sun, even if robot eyes aren't. A good thing, too, if it helps remind them they're descended from Earthpeople."

His voice faded out. It was getting darker. He could see nothing at all now and the intermittent flashes lighted nothing, either. They were merely blinding. He closed his eyes and that didn't help. He was the more conscious of the angry, threatening thunder.

Should they not stop? Should they not wait for the worst of the storm to pass?

Giskard suddenly said, "The vehicle is not reacting properly."

Baley felt the ride become ragged as though the machine was on wheels and was rolling over ridges.

Daneel said, "Can it be storm damage, friend Giskard?"

"It does not have the feel of that, friend Daneel. Nor does it seem likely that this machine would suffer from this kind of damage in this or any other storm."

Baley absorbed the exchange with difficulty. "Damage?" he muttered. "What kind of damage?"

Giskard said, "I should judge the compressor to be leaking, sir, but slowly. It's not the result of an ordinary puncture."

"How did it happen, then?" Baley asked.

"Deliberate damage, perhaps, while it was outside the Administration Building. I have known, now, for some little time that we are being followed and carefully not being overtaken."

"Why, Giskard?"

"A possibility, sir, is that they are waiting for us to break down completely." The airfoil's motion was becoming more ragged.

"Can you make it to Dr. Fastolfe's?"

"It would not seem so, sir."

Baley tried to fling his reeling mind into action. "In that case, I've completely misjudged Amadiro's reason for delaying us. He was keeping us there to have one or more of his robots damage the airfoil in such a way as to bring us down in the midst of desolation and lightning."

"But why should he do that?" said Daneel, sounding shocked. "To get you? -In a way, he already had you."

"He doesn't want me. No one wants me," said Baley with a somewhat feeble anger. "The danger is to you, Daneel."

"To me, Partner Elijah?"

"Yes, you! Daneel. -Giskard, choose a safe place to come down and, as soon as you do, Daneel must get out of the car and be off to a place of safety."

Daneel said, "That is impossible, Partner Elijah. I could not leave you when you are feeling ill-and most especially if there are those who pursue us and might do you harm."

Baley said, "Daneel, they're pursuing you. You must leave. As for me, I will stay in the airfoil. I am in no danger."

"How can I believe that?"

"Please! Please! How can I explain the whole thing with everything spinning-Daneel"-Baley's voice grew desperately calm-"you are the most important individual here, far more important than Giskard and I put together. It's not just that I care for you and want no harm to come to you. All of humanity depends on you. Don't worry about me; I'm one man; worry about billions. Daneel-please-"

63.

Baley could feel himself rocking back and forth. Or was it the airfoil? Was it breaking up altogether? Or was Giskard losing control? Or was he taking evasive action?

Baley didn't care. He didn't care! Let the airfoil crash. Let it smash to bits. He would welcome oblivion. Anything to get rid of this terrible fright, this total inability to come to terms with the Universe.

Except that he had to make sure that Daneel got away- safely away. But how?

Everything was unreal and he was not going to be able to explain anything to these robots. The situation was so clear to him, but how was he to transfer this understanding to these robots, to these non-men, who understood nothing but their Three Laws and who would let all of Earth and, in the long run, all of humanity go to hell because they could only be concerned with the one man under their noses?

Why had robots ever been invented?

And then, oddly enough, Giskard, the lesser of the two, came to his aid.

He said in his contentless voice, "Friend Daneel, I cannot keep this airfoil in motion much longer. Perhaps it will be more suitable to do as Mr. Baley suggests. He has given you a very strong order."

"Can I leave him when he is unwell, friend Giskard?" said Daneel, perplexed.

"You cannot take him out into the storm with you, friend Daneel. Moreover, he seems so anxious for you to leave that it may do him harm for you to stay."

Baley felt himself reviving. "Yes-yes-" he managed to croak out. "As Giskard says. Giskard, you go with him, hide him, make sure he doesn't return-then come back for me."

Daneel said forcefully, "That cannot be, Partner Elijah. We cannot leave you alone, untended, unguarded."

"No danger-I am in no danger. Do as I say-"

Giskard said, "Those following are probably robots. Human beings would hesitate to come out in the storm. And robots would not harm Mr. Baley."

Daneel said, "They might take him away."

"Not into the storm, friend Daneel, since that would work obvious harm to him. I will bring the airfoil to a halt now, friend Daneel. You must be ready to do as Mr. Baley orders. I, too."

"Good!" whispered Baley. "Good!" He was grateful for the simpler brain that could more easily be impressed and that lacked the ability to get lost and uncertain in ever-expanding refinements.

Vaguely, he thought of Daneel trapped between his perception of Baley's ill-being and the urgency of the order-and of his brain snapping under the conflict.

Baley thought: No no, Daneel. Just do as I say and don't question it.

He lacked the strength, almost the will, to articulate it and he let the order remain a thought.

The airfoil came down with a bump and a short, harsh, scraping noise.

The doors flew open, one on either side, and then closed with a soft, sighing noise. At once, the robots were gone. Having come to their decision, there was no hesitation and they moved with a speed that human beings could not duplicate.

Baley took a deep breath and shuddered. The airfoil was rock steady now. It was part of the ground.

He was suddenly aware of how much of his misery had been the result of the swaying and bucking of the vehicle, the feeling of insubstantiality, of not being connected to the Universe but of being at the mercy of inanimate, uncaring forces.

Now, however, it was still and he opened his eyes.

He had not been aware that they had been closed.

There was still lightning on the horizon and the thunder was a subdued mutter, while the wind, meeting a more resistant and less yielding object now than it had hitherto, keened a higher note than before.

It was dark. Baley's eyes were no more than human and he saw no light of any kind, other than the occasional blip of lightning. The sun must surely have set and the clouds were thick.

And for the first time since Baley had left Earth, he was alone!

64.

Alone!

He had been too ill, too beside himself, to make proper sense. Even now, he found himself struggling to understand what it was he should have done and would have done-if he had had room in his tottering mind for more than the one thought that Daneel must leave.

For instance, he had not asked where he now was, what he was near, where Daneel and Giskard were planning to go. He did not know how any portion of the grounded airfoil worked. He could not, of course, make it move, but he might have had it supply

heat if he felt cold or turn off the heat if there were too much-except that he did not know how to direct the machine to do either.

He did not know how to opacity the windows if he wanted to be enclosed or how to open a door if he wanted to leave.

The only thing he could do now was to wait for Giskard to come back for him. Surely that was what Giskard would expect him to do. The orders to him had simply been: Come back for me.

There had been no indication that Baley would change position in any way and Giskard's clear and uncluttered mind would surely interpret the "Come back" with the assumption that he was to come back to the airfoil.

Baley tried to adjust himself to that. In a way, it was a relief merely to wait, to have to make no decisions for a while, because there were no decisions he could possibly make. It was a relief to be steady and to feel at rest and to be rid of the terrible light flashes and the disturbing crashes of sound.

Perhaps he might even allow himself to go to sleep.

And then he stiffened. -Dare he do that?

They were being pursued. They were under observation. The airfoil, while parked and waiting for them outside the Administration Building of the Robotics Institute, had been tampered with and no doubt the tamperers would soon be upon him.

He was waiting for them, too, and not for Giskard only.

Had he thought it out clearly in the midst of his misery? The machine had been tampered with outside the Administration Building. That might have been done by anyone, but most likely by someone who knew it was there-and who would know that better than Amadiro?

Amadiro had intended delay until the storm. That was obvious. He was to travel in the storm and he was to break down in the storm. Amadiro had studied Earth and its population; he boasted of that. He would know quite clearly just what difficulty Earthpeople would have with the Outside generally and with a thunderstorm in particular.

He would be quite certain that Baley would be reduced to complete helplessness.

But why should he want that?

To bring Baley back to the Institute? He had already had him, but he had had a Baley in the full possession of his faculties and along with him he had had two robots perfectly capable of defending Baley physically. It would be different now!

If the airfoil were disabled in a storm, Baley would be disabled emotionally. He would even be unconscious, perhaps, and would certainly not be able to resist being brought back. Nor would the two robots object. With Baley clearly ill, their only appropriate reaction would be to assist Amadiro's robots in rescuing him.

In fact, the two robots would have to come along with Baley and would do so helplessly.

And if anyone ever questioned Amadiro's action, he could say that he had feared for Baley in the storm; that he had tried to keep him at the Institute and failed; that he had sent his robots to trail him and assure his safety; and that, when the airfoil came to

grief in the storm, those robots brought Baley back to haven. Unless people understood that it had been Amadiro who had ordered the airfoil tampered with (and who would believe that-and how could one prove it?), the only possible public reaction would be to praise Amadiro for his humanitarian feelings-all the more astonishing for having been expressed toward a subhuman Earthman.

And what would Amadiro do with Baley then?

Nothing, except to keep him quiet and helpless for a time. Baley was not himself the quarry. That was the point.

Amadiro would also have two robots and they would now be helpless. Their instructions forced them, in the strongest manner, to guard Baley and, if Baley were ill and being cared for, they could only follow Amadiro's orders if those orders were clearly and apparently for Baley's benefit. Nor would Baley be (perhaps) sufficiently himself to protect them with further orders- certainly not if he were kept under sedation.

It was clear! It was clear! Amadiro had had Baley, Daneel, and Giskard-but in unusable fashion. He had sent them out into the storm in order to bring them back and have them again -in usable fashion. Especially Daneel! It was Daneel who was the key.

To be sure, Fastolfe would be searching for them eventually and would find them, too, and retrieve them, but by then it would be too late, wouldn't it?

And what did Amadiro want with Daneel?

Baley, his head aching, was sure he knew-but how could he possibly prove it?

He could think no more. -If he could opacify the windows, he could make a little interior world again, enclosed and motionless, and then maybe he could continue his thoughts.

But he did not know how to opacify the windows. He could only sit there and look at the flagging storm beyond those windows, hear the whip of rain against the windows, watch the fading lightning, and listen to the muttering thunder.

He closed his eyes tightly. The eyelids made a wall, too, but he dared not sleep.

The car door on his right opened. He heard the sighing noise it made. He felt the cool, damp breeze enter, the temperature drop, the sharp smell of things green and wet enter and drown out the faint and friendly smell of oil and upholstery that reminded him somehow of the City that he wondered if he would ever see again.

He opened his eyes and there was the odd sensation of a robotic face staring at him-and drifting sideways, yet not really moving. Baley felt dizzy.

The robot, seen as a darker shadow against the darkness, seemed a large one. He had, somehow, an air of capability about him. He said, "Your pardon, sir. Did you not have the company of two robots?"

"Gone," muttered Baley, acting as ill as he could and aware that it did not require acting. A brighter flash of the heavens made its way through the eyelids that were now half-open.

"Gone! Gone where, sir?" And then, as he waited for an answer, he said, "Are you ill, sir?"

Baley felt a distant twinge of satisfaction within the inner scrap of himself that was still capable of thinking. If the robot had been without special instruction, he would have responded to Baley's clear signs of illness before doing anything else. To have asked first about the robots implied hard and close-pressed directions as to their importance.

It fit.

He tried to assume a strength and normality he did not possess and said, "I am well. Don't concern yourself with me."

It could not possibly have convinced an ordinary robot, but this one had been so intensified in connection with Daneel (obviously) that he accepted it. He said, "Where have the robots gone, sir?"

"Back to the Robotics Institute."

"To the Institute? Why, sir?"

"They were called by Master Robotist Amadiro and he ordered them to return. I am waiting for them."

"But why did you not go with them, sir?"

"Master Robotist Amadiro did not wish me to be exposed to the storm. He ordered me to wait here. I am following Master Robotist Amadiro's orders."

He hoped the repetition of the prestige-filled name with the inclusion of the honorific, together with the repetition of the word "order," would have its effect on the robot and persuade him to leave Baley where he was.

On the other hand, if they had been instructed, with particular care, to bring back Daneel, and if they were convinced that Daneel was already on his way back to the Institute, there would be a decline in the intensity of their need in connection with that robot. They would have time to think of Baley again. They would say- The robot said, "But it appears you are not well, sir."

Baley felt another twinge of satisfaction. He said, "I am well."

Behind the robot, he could vaguely see a crowding of several other robots-he could not count them-with their faces gleaming in the occasional lightning flash. As Baley's eyes adapted to the return of darkness, he could see the dim shine of their eyes.

He turned his head. There were robots at the left door, too, though that remained closed.

How many had Amadiro sent? Were they to have been returned by force, if necessary?

He said, "Master Robotist Amadiro's orders were that my robots were to return to the Institute and I was to wait. You see that they are returning and that I am waiting. If you were sent to help, if you have a vehicle, find the robots, who are on their way back, and transport them. This airfoil is no longer operative." He tried to say it all without hesitation and firmly, as a well man would. He did not entirely succeed.

"They have returned on foot, sir?"

Baley said, "Find them. Your orders are clear."

There was hesitation. Clear hesitation.

Baley finally remembered to move his right foot-he hoped properly. He should have done it before, but his physical body was not responding properly to his thoughts.

Still the robots hesitated and Baley grieved over that. He was not a Spacer. He did not know the proper words, the proper tone, the proper air with which to handle robots with the proper efficiency. A skilled roboticist could, with a gesture, a lift of an eyebrow, direct a robot as though it were a marionette of which he held the strings. -Especially if the robot were of his own design.

But Baley was only an Earthman.

He frowned-that was easy to do in his misery-and whispered a weary "Go!" and motioned with his hands.

Perhaps that added the last small and necessary quantity of weight to his order-or perhaps an end had simply been reached to the time it took for the robots' positronic pathways to determine, by voltage and counter-voltage, how to sort out their instructions according to the Three Laws.

Either way, they had made up their minds and, after that, there was no further hesitation. They moved back to their vehicle, whatever and wherever it was, with such determined speed that they seemed simply to disappear.

The door the robot had held open now closed of its own accord. Baley had moved his foot in order to place it in the pathway of the closing door. He wondered distantly if his foot would be cut off cleanly or if its bones would be crushed, but he didn't move it. Surely no vehicle would be designed to make such a misadventure possible.

He was alone again. He had forced robots to leave a patently unwell human being by playing on the force of the orders given them by a competent robot master who had been intent on strengthening the Second Law for his own purposes-and had done it to the point where Baley's own quite apparent lies had subordinated the First Law to it.

How well he had done it, Baley thought with distant self-satisfaction-and became aware that the door which had swung shut was still ajar, held so by his foot, and that that foot had not been the least bit damaged as a result.

65.

Baley felt cool air curling about his foot and a sprinkle of cool water. It was a frighteningly abnormal thing to sense, yet he could not allow the door to close, for he would then not know how to open it. (How did the robots open those doors? Undoubtedly, it was no puzzle to members of the culture, but in his reading on Auroran life, there was no careful instruction of just how one opens the door of a standard airfoil. Everything of importance is taken for granted. You're supposed to know, even though you are, in theory, being informed.)

He was groping in his pockets as he thought this and even the pockets were not easy to find. They were not in the right places and they were sealed, so that they had to be opened by fumbles till he found the precise motion that caused the seal to part. He

pulled out a handkerchief, balled it, and placed it between the door and jamb so that the door would not entirely close. He then removed his foot.

Now to think-if he could. There was no point to keeping the door open unless he meant to get out. Was there, however, any purpose in getting out?

If he waited where he was, Giskard would eventually come back for him and, presumably, lead him to safety.

Dare he wait?

He did not know how long it would take Giskard to see Daneel to safety and then return.

But neither did he know how long it would take the pursuing robots to decide they would not find Daneel and Giskard on any road leading back to the Institute. (Surely it was impossible that Daneel and Giskard had actually moved backward toward the Institute in search of sanctuary. Baley had not actually ordered them not to-but what if that were the only feasible route? -No! Impossible!)

Baley shook his head in silent denial of the possibility and felt it ache in response. He put his hands to it and gritted his teeth.

How long would the pursuing robots continue to search before they would decide that Baley had misled them-or had been himself misled? Would they then return and take him in custody, very politely and with great care not to harm him? Could he hold them off by telling them he would die if exposed to the storm?

Would they believe that? Would they call the Institute to report? Surely they would do that. And would human beings then arrive? They would not be overly concerned about his welfare.

If Baley got out of the car and found some hiding place in the surrounding trees, it would be that much harder for the pursuing robots to locate him-and that would gain him time.

It would also be harder for Giskard to locate him, but Giskard would be under a much more intense instruction to guard Baley than the pursuing robots were to find him. The primary task of the former would be to locate Baley-and of the latter, to locate Daneel.

Besides, Giskard was programmed by Fastolfe himself and Amadiro, however skillful, was no match for Fastolfe.

Surely, then, all things being equal, Giskard would be back before the other robots could possibly be.

But would all things be equal? With a faint attempt at cynicism, Baley thought: I'm worn-out and can't really think. I'm merely seizing desperately at whatever will console me.

Still, what could he do but play the odds, as he conceived the odds to be?

He leaned against the door and was out into the open. The handkerchief fell out into the wet, rank grass and he automatically bent down to pick it up, holding it in his hands as he staggered away from the car.

He was overwhelmed by the gusts of rain that soaked his face and hands. After a short while, his wet clothes were clinging to his body and he was shivering with cold.

There was a piercing splitting of the sky-too quick for him to close his eyes against-and then a sharp hammering that stiffened him in terror and made him clap his hands over his ears.

Had the storm returned? Or did it sound louder only because he was out in the open?

He had to move. He had to move away from the car, so that the pursuers would not find him too easily. He must not waver and remain in its vicinity or he might as well have stayed inside -and dry.

He tried to wipe his face with the handkerchief, but it was as wet as his face was and he let it go. It was useless.

He moved on, hands outstretched. Was there a moon that circled Aurora? He seemed to recall there had been mention of such a thing and he would have welcomed its light. -But what did it matter? Even if it existed and were in the sky now, the clouds would obscure it.

He felt something. He could not see what it was, but he knew it to be the rough bark of a tree. Undoubtedly a tree. Even a City man would know that much.

And then he remembered that lightning might hit trees and might kill people. He could not remember that he had ever read a description of how it felt to be hit by lightning or if there were any measures to prevent it. He knew of no one on Earth who had been hit by lightning.

He felt his way about the tree and was in an agony of apprehension and fear. How much was halfway around, so that he would end up moving in the same direction?

Onward!

The underbrush was thick now and hard to get through. It was like bony, clutching fingers holding him. He pulled petulantly and he heard the tearing of cloth.

Onward!

His teeth were chattering and he was trembling.

Another flash. Not a bad one. For a moment, he caught a glimpse of his surroundings.

Trees! A number of them. He was in a grove of trees. Were many trees more dangerous than one tree where lightning was concerned? He didn't know. Would it help if he didn't actually touch a tree? He didn't know that, either. Death by lightning simply wasn't a factor in the Cities and the historical novels (and sometimes histories) that mentioned it never went into detail.

He looked up at the dark sky and felt the wetness coming down. He wiped at his wet eyes with his wet hands. He stumbled onward, trying to step high. At one point, he splashed through a narrow stream of water, sliding over the pebbles underlying it.

How strange! It made him no better than he was.

He went on again. The robots would not find him. Would Giskard?

He didn't know where he was. Or where he was going. Or how far he was from anything.

If he wanted to return to the car, he couldn't.

If he was trying to find himself, he couldn't.

And the storm would continue forever and he would finally dissolve and pour down in a little stream of Baley and no one would ever find him again.

And his dissolved molecules would float down to the ocean.

Was there an ocean on Aurora?

Of course there was! It was larger than Earth's, but there was more ice at the Auroran poles.

Ah, he would float to the ice and freeze there, glistening in the cold orange sun.

His hands were touching a tree again-wet hands-wet tree- rumble of thunder-funny he didn't see the flash of lightning- lightning came first-was he hit?

He didn't feel anything-except the ground.

The ground was under him because his fingers were scrabbling into cold mud. He turned his head so he could breathe. It was rather comfortable. He didn't have to walk anymore. He could wait. Giskard would find him.

He was suddenly very sure of it. Giskard would have to find him because- No, he had forgotten the because. It was the second time he had forgotten something. Before he went to sleep- Was it the same thing he had forgotten each time?- The same thing?- It didn't matter.

It would be all right-all- And he lay there, alone and unconscious, in the rain at the base of a tree, while the storm beat on.

16. AGAIN GLADIA

66.

Afterward, looking back and estimating times, it would appear that Baley had remained unconscious not less than ten minutes and not more than twenty.

At the time, though, it might have been anything from zero to infinity. He was conscious of a voice. He could not hear the words it spoke, just a voice. He puzzled over the fact that it sounded odd and solved the matter to his satisfaction by recognizing it as a woman's voice.

There were arms around him, lifting him, heaving him. One arm-his arm-dangled. His head lolled.

He tried feebly to straighten out, but nothing happened. The woman's voice again.

He opened his eyes wearily. He was aware of being cold and wet and suddenly realized that water was not striking him. And it was not dark, not entirely. There was a dim suffusing of light and, by it, he saw a robot's face.

He recognized it. "Giskard," he whispered and with that he remembered the storm and the flight. And Giskard had reached him first; he had found him before the other robots had.

Baley thought contentedly: I knew he would.

He let his eyes close again and felt himself moving rapidly but with the slight-yet definite-unevenness that meant he was being carried by someone who was walking. Then a stop and a slow adjustment until he was resting on something quite warm and comfortable. He knew it was the seat of a car covered, perhaps, with toweling, but did not question how he knew.

Then there was the sensation of smooth motion through the air and the feeling of soft absorbent fabric over his face and hands, the tearing open of his blouse, cold air upon his chest, and then the drying and blotting again.

After that, the sensations crowded in upon him.

He was in an establishment. There were flashes of walls, of illumination, of objects (miscellaneous shapes of furnishings) which he saw now and then when he opened his eyes.

He felt his clothes being stripped off methodically and made a few feeble and useless attempts to cooperate, then he felt warm water and vigorous scrubbing. It went on and on and he didn't want it to stop.

At one point, a thought occurred to him and he seized the arm that was holding him. "Giskard! Giskard!"

He heard Giskard's voice, "I am here, sir."

"Giskard, is Daneel safe?"

"He is quite safe, sir."

"Good." Baley closed his eyes again and made no effort whatever in connection with the drying. He felt himself turned over and over in the stream of dry air and then he was being dressed again in something like a warm robe.

Luxury! Nothing like this had happened to him since he was an infant and he was suddenly sorry for the babies for whom everything was done and who were not sufficiently conscious of it to enjoy it.

Or did they? Was the hidden memory of that infant luxury a determinant of adult behavior? Was his own feeling now just an expression of the delight of being an infant again?

And he had heard a woman's voice. Mother?

No, that couldn't possibly be.

-Mamma?

He was sitting in a chair now. He could sense as much and he could also feel, somehow, that the short, happy period of renewed infancy was coming to an end. He had to return to the sad world of self-consciousness and self-help.

But there had been a woman's voice. -What woman?

Baley opened his eyes. "Gladia?"

67.

It was a question, a surprised question, but deep within himself he was not really surprised. Thinking back, he had, of course, recognized her voice.

He looked around. Giskard was standing in his alcove, but he ignored him. First things first.

He said, "Where's Daneel?"

Gladia said, "He has cleaned and dried himself in the robot's quarters and he has dry clothing. He is surrounded by my household staff and they have their instructions. I can tell you that no outsider will approach within fifty meters of my establishment in any direction without our all knowing it at once.

-Giskard is cleaned and dried as well."

"Yes, I can see that," said Baley. He was not concerned with Giskard, only with Daneel. He was relieved that Gladia seemed to accept the necessity of guarding Daneel and that he would not have to face the complications of explaining the matter.

Yet there was one breach in the wall of security and a note of querulousness entered in his voice as he said, "Why did you leave him, Gladia? With you gone, there was no human being in the house to stop the approach of a band of outside robots. Daneel could have been taken by force."

"Nonsense," said Gladia with spirit. "We were not gone long and Dr. Fastolfe had been informed. Many of his robots had found mine and he could be on the spot in minutes if needed- and I'd like to see any band of outside robots withstand him."

"Have you seen Daneel since you returned, Gladia?"

"Of course! He's safe, I tell you."

"Thank you!" Baley relaxed and closed his eyes. Oddly enough, he thought: It wasn't so bad.

Of course it wasn't. He had survived, hadn't he? When he thought that, something inside himself grinned and was happy.

He had survived, hadn't he?

He opened his eyes and said, "How did you find me, Gladia?"

"It was Giskard. They had come here-both of them-and Giskard explained the situation to me quickly. I set right about securing Daneel, but he wouldn't budge until I had promised to order Giskard out after you. He was very eloquent. His responses with respect to you are very intense, Elijah.

"Daneel remained behind, of course. It made him very unhappy, but Giskard insisted that I order him to stay at the very top of my voice. You must have given Giskard some mighty strict orders. Then we got in touch with Dr. Fastolfe and, after that, we took my personal airfoil."

Baley shook his head wearily. "You should not have come along, Gladia. Your place was here, making sure Daneel was safe."

Gladia's face twisted into scorn. "And leave you dying in the storm, for all we knew? Or being taken up by Dr. Fastolfe's enemies? I have a little holograph of myself letting that happen. No, Elijah, I might have been needed to keep the other robots away from you if they had gotten to you first. I may not be much good in most ways, but any Solarian can handle a mob of robots, let me tell you. We're used to it."

"But how did you find me?"

"It wasn't so terribly hard. Actually, your airfoil wasn't far away, so that we could have walked it, except for the storm. We-

Baley said, "You mean we had almost made it to Fastolfe's?"

"Yes," said Gladia. "Either your airfoil, in being damaged, wasn't damaged sufficiently to force you to a standstill sooner or Giskard's skill kept it going for longer than the vandals had anticipated. Which is a good thing. If you had come down closer to the Institute, they might have gotten you all. Anyway, we took my airfoil to where yours had come down. Giskard knew where it was, of course, and we got out-

"And you got all wet, didn't you, Gladia?"

"Not a bit," she replied. "I had a large rain shade and a light sphere, too. My shoes got muddy and my feet got a little damp because I didn't have time to spray on Latex, but there's no harm in that. -Anyway, we were back at your airfoil less than half an hour after Giskard and Daneel had left you and, of course, you weren't there."

"I had tried-" began Baley.

"Yes, we know. I thought they-the others-had taken you away because Giskard said you were being followed. But Giskard found your handkerchief about fifty meters from the airfoil and he said that you must have wandered off in that direction. Giskard said it was an illogical thing to do, but that human beings were often illogical, so that we should search for you. -So we looked -both of us- using the light-sphere, but it was he found you."

He said he saw the infrared glimmer of your body heat at the base of the tree and we brought you back."

Baley said, with a spark of annoyance, "Why was my leaving an illogical thing to do?"

"He didn't say, Elijah. Do you wish to ask him?" She gestured toward Giskard.

Baley said, "Giskard, what's this?"

Giskard's impassivity was disrupted at once and his eyes focused on Baley. He said, "I felt that you had exposed yourself to the storm unnecessarily. If you had waited, we would have brought you here sooner."

"The other robots might have gotten to me first."

"They did-but you had sent them away, sir."

"How do you know that?"

"There were many robotic footprints around the doors on either side, sir, but there was no sign of dampness within the airfoil, as there would have been if wet arms had reached in to lift you out. I judged you would not have gotten out of the airfoil of your own accord in order to join them, sir. And, having sent them away, you need not have feared they would return very quickly, since it was Daneel they were after-by your own estimate of the situation-and not you. In addition, you might have been certain that I would have been back quickly."

Baley muttered, "I reasoned precisely in that manner but I felt that confusing the issue might help further. I did what seemed best to me and you did find me, even so."

"Yes, sir."

Baley said, "But why bring me here? If we were close to Gladia's establishment, we were just as close, perhaps closer, to Dr. Fastolfe's."

"Not quite, sir. This residence was somewhat closer and I judged, from the urgency of your orders, that every moment counted in securing Daneel's safety. Daneel concurred in this, though he was most reluctant to leave you. Once he was here, I felt you would want to be here, too, so that you could, if you desired, assure yourself of his safety firsthand."

Baley nodded and said grumpily (he was still annoyed at that remark concerning his illogicality), "You did well, Giskard."

Gladia said, "Is it important that you see Dr. Fastolfe, Elijah? I can have him summoned here. Or you can view him trimensionally."

Baley leaned back in his chair again. He had leisure to realize that his thought processes were blunted and that he was very tired. It would do him no good to face Fastolfe now. He said, "No. I'll see him tomorrow after breakfast. Time enough. And then I think I'll be seeing this man, Kelden Amadiro, the head of the Robotics Institute. And a high official -what d' you call him?"

-the Chairman. He will be there, too, I suppose."

"You look terribly tired, Elijah," said Gladia. "Of course, we don't have those microorganisms-those germs and viruses-that you have on Earth and you've been cleaned

out, so you won't get any of the diseases they have all over your planet, but you're clearly tired."

Baley thought: After all that, no cold? No flu? No pneumonia?

-There was something to being on a Spacer world at that.

He said, "I admit I'm tired, but that can be cured by a bit of rest."

"Are you hungry? It's dinnertime."

Baley made a face. "I don't feel like eating."

"I'm not sure that's wise. You don't want a heavy meal, perhaps, but how about some hot soup? It will do you good."

Baley felt the urge to smile. She might be Solarian, but given the proper circumstances she sounded exactly like an Earthwoman. He suspected that this would be true of Aurorans as well. There are some things that differences in culture don't touch.

He said, "Do you have soup available? I don't want to be a problem."

"How can you be a problem? I have a staff-not a large one, as on Solaria, but enough to prepare any reasonable item of food on short order. -Now you just sit there and tell me what kind of soup you would like. It will all be taken care of."

Baley couldn't resist. "Chicken soup?"

"Of course." Then innocently, "Just what I would have suggested-and with lumps of chicken, so that it will be substantial."

The bowl was put before him with surprising speed. He said, "Aren't you going to eat, Gladia?"

"I've eaten already, while you were being bathed and treated."

"Treated?"

"Only routine biochemical adjustment, Elijah. You had been rather psychic-damaged and we wanted no repercussions. -Do eat!"

Baley lifted an experimental spoonful to his lips. It was not bad chicken soup, though it had the queer tendency of Auroran food to be rather spicier than Baley would prefer. Or perhaps it was prepared with different spices than those he was used to.

He remembered his mother suddenly-a sharp thrust of memory that made her appear younger than he himself was right now. He remembered her standing over him when he rebelled at eating his "nice soup."

She would say to him, "Come, Elijah. This is real chicken and very expensive. Even the Spacers don't have anything better."

They didn't. He called to her in his mind across the years:

They don't, Mom!

Really! If he could trust memory and allow for the power of youthful taste buds, his mother's chicken soup, when it wasn't dulled by repetition, was far superior.

He sipped again and again-and when he finished, he muttered in a shamefaced way, "Would there be a little more?"

"As much as you want, Elijah."

"Just a little more."

Gladia said to him, as he was finishing, "Elijah, this meeting tomorrow morning-"

"Yes, Gladia?"

"Does it mean that your investigation is over? Do you know what happened to Jander?"

Baley said judiciously, "I have an idea as to what might have happened to Jander. I don't think I can necessarily persuade anyone that I am right."

"Then why are you having the conference?"

"It's not my idea, Gladia. It's Master Robotist Amadiro's idea. He objects to the investigation and he's going to try to have me sent back to Earth."

"Is he the one who tampered with your airfoil and tried to have his robots take Daneel?"

"I think he is."

"Well, can't he be tried and convicted and punished for that?"

"He certainly could," said Baley feelingly, "except for the very small problem that I can't prove it."

"And can he do all that and get away with it-and stop the investigation, too?"

"I'm afraid he has a good chance of being able to do so. As he himself says, people who don't expect justice don't have to suffer disappointment."

"But he mustn't. You mustn't let him. You've got to complete your investigation and find out the truth."

Baley sighed. "What if I can't find out the truth? Or what if I can-but can't make people listen to me?"

"You can find out the truth. And you can make people listen to you."

"You have a touching faith in me, Gladia. Still, if the Auroran World Legislature wants to send me back and orders the investigation ended, there's nothing I'm going to be able to do about it."

"Surely you won't be willing to go back with nothing accomplished."

"Of course I won't. It's worse than just accomplishing nothing, Gladia. I'll go back with my career ruined and with Earth's future destroyed."

"Then don't let them do that, Elijah."

And he said, "Jehoshaphat, Gladia, I'm going to try not to, but I can't lift a planet with my bare hands. You can't ask me for miracles."

Gladia nodded and, eyes downcast, put her fist to her mouth, sitting there motionlessly, as though in thought. It took a while for Baley to realize that she was weeping soundlessly.

68.

Baley stood up quickly and walked around the table to her. He noted absently-and with some annoyance-that his legs were trembling and that there was a tic in the muscle of his right thigh.

"Gladia," he said urgently, "don't cry."

"Don't bother, Elijah," she whispered. "It will pass." He stood helplessly at her side, reaching out to her yet hesitating. "I'm not touching you," he said. "I don't think I had better do so, but-

"Oh, touch me. Touch me. I'm not all that fond of my body and I won't catch anything from you. I'm not-what I used to be."

So Baley reached out and touched her elbow and stroked it very slightly and clumsily with his fingertips. "I'll do what I can tomorrow, Gladia," he said. "I'll give it my very best try."

She rose at that, turned toward him, and said, "Oh, Elijah." Automatically, scarcely knowing what he was doing, Baley held out his arms. And, just as automatically, she walked into them and he was holding her while her head cradled against his chest.

He held her as lightly as he could, waiting for her to realize that she was embracing an Earthman. (She had undoubtedly embraced a humanoid robot, but he had been no Earthman.)

She sniffed loudly and spoke while her mouth was half-obscured in Baley's shirt.

She said, "It isn't fair. It's because I'm a Solarian. No one really cares what happened to Jander and they would if I were an Auroran. It just boils down to prejudice and politics."

Baley thought: Spacers are people. This is exactly what Jessie would say in a similar situation. And if it were Gremionis who was holding Gladia, he'd say exactly what I'll say-if I knew what I would say.

And then he said, "That's not entirely so. I'm sure Dr. Fastolfe cares what happened to Jander."

"No, he doesn't. Not really. He just wants to have his way in the Legislature, and that Amadiro wants to have his way, and either one would trade Jander for his way."

"I promise you, Gladia, I won't trade Jander for anything."

"No? If they tell you that you can go back to Earth with your career saved and no penalty for your world, provided you forget all about Jander, what would you do?"

"There's no use setting up hypothetical situations that can't possibly come to pass. They're not going to give me anything in return for abandoning Jander. They're just going to try to send me back with nothing at all except ruin for me and my world. But, if they were to let me, I would get the man who destroyed Jander and see to it that he was adequately punished."

"What do you mean if they were to let you? Make them let you!"

Baley smiled bitterly. "If you think Aurorans pay no attention to you because you're a Solarian, imagine how little you would get if you were from Earth, as I am."

He held her closer, forgetting he was from Earth, even as he said the word. "But I'll try, Gladia. It's no use raising hopes, but I don't have a completely empty hand. I'll try-" His voice trailed off.

"You keep saying you'll try. -But how?" She pushed away from him a bit to look up into his face.

Baley said, bewildered, "Why, I may-

"Find the murderer?"

"Whatever. -Gladia, please, I must sit down."

He reached out for the table, leaning on it.

She said, "What is it, Elijah?"

"I've had a difficult day, obviously, and I haven't quite recovered, I think."

"You'd better go to bed, then."

"To tell the truth, Gladia, I would like to."

She released him, her face full of concern and with no further room in it for tears.

She lifted her arm and made a rapid motion and he was (it seemed to him) surrounded by robots at once.

And when he was in bed eventually and the last robot had left him, he found himself staring up at darkness.

He could not tell whether it was still raining Outside or whether some feeble lightning flashes were still making their last sleepy sparks, but he knew he heard no thunder.

He drew a deep breath and thought: Now what is it I have promised Gladia? What will happen tomorrow?

Last act: Failure?

And as Baley drifted into the borderland of sleep, he thought of that unbelievable flash of illumination that had come before sleep.

69.

Twice before, it had happened. Once the night before when, as now, he was falling asleep and once earlier this evening when he had slipped into unconsciousness beneath the tree in the storm. Each time, something had occurred to him, some enlightenment that had unmystified the problem as the lightning had undarkened the night.

And it had stayed with him as briefly as the lightning had.

What was it?

Would it come to him again?

This time, he tried consciously to seize it, to catch the elusive truth. -Or was it the elusive illusion? Was it the slipping away of conscious reason and the coming of attractive nonsense that one couldn't analyze properly in the absence of a properly thinking brain?

The search for whatever it was, however, slid slowly away. It would no more come on call than a unicorn would in a world in which unicorns did not exist.

It was easier to think of Gladia and of how she had felt. There had been the direct touch of the silkiness of her blouse, but beneath it were the small and delicate arms, the smooth back.

Would he have dared to kiss her if his legs had not begun to buckle beneath him? Or would that have been going too far?

He heard his breath exhale in a soft snore and, as always, that embarrassed him. He flogged himself awake and thought of Gladia again. Before he left, surely -but not if he could gain nothing for her in ret-. Would that be payment for services then- He heard the soft snore again and cared less this time.

Gladia- He had never thought he would see her again-let alone touch her-let alone hold her-hold her- And he had no way of telling at what point he passed from thought to dream.

He was holding her again, as before- But there was no blouse-and her skin was warm and soft-and his hand moved slowly down the slope of shoulder blade and down the hidden ridges of her ribs- There was a total aura of reality about it. All of his senses were engaged. He smelled her hair and his lips tasted the faint, faint salt of her skin-and now somehow they were no longer standing. Had they lain down or were they lying down from the start? And what had happened to the light?

He felt the mattress beneath him and the cover over him- darkness-and she was still in his arms and her body was bare.

He was shocked awake. "Gladia?" Rising inflection-disbelieving- "Shh. Elijah." She placed the fingers of one hand gently on his lips. "Don't say anything."

She might as well have asked him to stop the current of his blood.

He said, "What are you doing?"

She said, "Don't you know what I'm doing? I'm in bed with you."

"But why?"

"Because I want to." Her body moved against his.

She pinched the top of his night garment and the seam that held it together fell apart.

"Don't move, Elijah. You're tired and I don't want you to wear yourself out further."

Elijah felt a warmth stirring within him. He decided not to protect Gladia against herself. He said, "I'm not that tired, Gladia."

"No," she said sharply. "Rest! I want you to rest. Don't move." Her mouth was on his as though intent on forcing him to keep quiet. He relaxed and the small thought flitted past him that he was following orders, that he was tired and was willing to be done to rather than to do. And, tinged with shame, it occurred to him that it rather diluted his guilt. (I couldn't help it, he heard himself say. She made me.) Jehoshaphat, how cowardly! How unbearably demeaning!

But those thoughts washed away, too. Somehow there was soft music in the air and the temperature had risen a bit. The cover had vanished and so had his nightclothes. He felt his head moved into the cradle of her arms and pressed against softness.

With a detached surprise, he knew, from her position, that the softness was her left breast and that it was centered, contrastingly, with its nipple hard against his lips.

Softly, she was singing to the music, a sleepily joyful tune he did not recognize.

She rocked gently back and forth and her fingertips grazed his chin and neck, He relaxed, content to do nothing, to let her initiate and carry through every activity. When she moved his arms, he did not resist and let them rest wherever she placed them.

He did not help and, when he did respond with heightened excitement and climax, it was only out of helplessness to do otherwise.

She seemed tireless and he did not want her to stop. Aside from the sensuality of sexual response, he felt again what he had felt earlier, the total luxury of the infant's passivity.

And, finally, he could respond no more and, it seemed, she could do no more and she lay with her head in the hollow where his left shoulder met his chest and her left arm lay across his ribs, her fingers stroking the short, curling hairs tenderly.

He seemed to hear her murmuring, "Thank you- Thank you-"

For what? he wondered.

He was scarcely conscious of her now, for this utterly soft end of a hard day was as soporific as the fabled nepenthe and he could feel himself slipping away, as though his fingertips were relaxing from the edge of the cliff of harsh reality in order that he might drop-drop-through the soft clouds of gathering sleep into the slowly swaying ocean of dreams.

And as he did so, what had not come on call came of itself. For the third time, the curtain was lifted and all the events since he had left Earth shuffled once more into hard focus. Again, it was all clear. He struggled to speak, to hear the words he needed to hear, to fix them and make them part of his thought processes, but though he clutched at them with every tendril of his mind, they slipped past and through and were gone.

So that, in this respect, Baley's second day on Aurora ended very much as his first had.

17. THE CHAIRMAN

70.

When Baley opened his eyes, it was to find sunlight streaming through the window and he welcomed it. To his still-sleepy surprise, he welcomed it.

It meant the storm was over and it was as though the storm had never happened. Sunlight-when viewed only as an alternative to the smooth, soft, warm, controlled light of the Cities- could only be considered harsh and uncertain. But compare it with the storm and it was the promise of peace itself. Everything, Baley thought, is relative and he knew he would never think of sunshine as entirely evil again.

"Partner Elijah?" Daneel was standing at the side of the bed. A little behind him stood Giskard.

Baley's long face dissolved in a rare smile of pure pleasure. He held out his hands, one to each. "Jehoshaphat, men"-and he was totally unaware, at the moment, of any inappropriateness in the word-"when I last saw you two together, I wasn't in the least sure I would ever see either of you again."

"Surely," said Daneel softly, "none of us would have been harmed under any circumstances."

"With the sunlight coming in, I see that," said Baley. "But last night, I felt as though the storm would kill me and I was certain you were in deadly danger, Daneel. It even seemed possible that Giskard might be damaged in some way, trying to defend me against overwhelming odds. Melodramatic, I admit, but I wasn't quite myself, you know."

"We were aware of that, sir," said Giskard. "That was what made it difficult for us to leave you, despite your urgent order. We trust that this is not a source of displeasure for you at present."

"Not at all, Giskard."

"And," said Daneel, "we also know that you have been well cared for since we left you."

It was only then that Baley remembered the events of the night before.

Gladia!

He looked about in sudden astonishment. She was not anywhere in the room. Had he imagined- No, of course not. That would be impossible. And then he looked at Daneel with a frown, as though suspecting his remark to bear a libidinous character.

But no, that would be impossible, too. A robot, however humaniform, would not be designed to take lubricious delight in innuendo.

He said, "Quite well cared for. But what I need at the moment is to be shown to the Personal."

"We are here, sir," said Giskard, "to direct you and help you through the morning. Miss Cladia felt you would be more comfortable with us than with any of her own staff and she stressed that we were to leave nothing wanting for your comfort."

Baley looked doubtful. "How far did she instruct you to go? I feel pretty well now, so I don't have to have anyone wash and dry me. I can take care of myself. She does understand that, I hope."

"You need fear no embarrassment, Partner Elijah," said Daneel, with the small smile that (it seemed to Baley) came at those moments when, in a human being, it might be judged that a feeling of affection would have arisen. "We are merely to see to your comfort. If, at any time, you are most comfortable in privacy, we will wait at some distance."

"In that case, Daneel, we're all set." Baley scrambled out of bed. It pleased him to see that he felt quite steady on his legs. The night's rest and the treatment when he was brought back (whatever it might have been) had done marvels. -And Gladia, too.

71.

Still nude and just damp enough from his shower to feel thoroughly fresh, Baley, having brushed his hair, studied the result critically. It seemed natural that he would have breakfast with Gladia and he wasn't certain how he might be received. It might be best, perhaps, to take the attitude that nothing had happened and to be guided by her attitude. And somehow, he thought, it might help if he looked reasonably good-provided that was within the realm of the possible. He made a dissatisfied face at his reflection in the mirror.

"Daneel!" he called.

"Yes, Partner Elijah."

Speaking through and around toothpaste, Baley said, "Those are new clothes you are wearing, it seems."

"Not mine originally, Partner Elijah. They had been friend Jander's."

Baley's eyebrows climbed. "She let you have Jander's?"

"Miss Gladia did not wish me to be unclothed while waiting for my storm-drenched items to be washed and to dry. Those are ready now, but Miss Gladia says I may keep these."

"When did she say that?"

"This morning, Partner Elijah."

"She's awake, then?"

"Indeed. And you will be joining her at breakfast when you are ready."

Baley's lips tightened. It was odd that, at the moment, he was more concerned with having to face Gladia than, a little later on, the Chairman. The matter of the Chairman was, after all, in the lap of the Fates. He had decided on his strategy and it would either work or it would not work. As for Gladia-he simply had no strategy.

Well, he would have to face her.

He said, with as careful an air of indifference as he might manage, "And how is Miss Gladia this morning?"

Daneel said, "She seems well."

"Cheerful? Depressed?"

Daneel hesitated. "It is difficult to judge the inner attitude of a human being. There is nothing in her behavior to indicate internal turmoil."

Baley cast a quick eye on Daneel and again he wondered if he were referring to the events of last night. -And again he dismissed the possibility.

Nor did it do any good to study Daneel's face. One could not stare at a robot to guess thoughts from expression, for there were no thoughts in the human sense.

He stepped out into the bedroom and looked at the clothes that had been laid out for him, considering them thoughtfully and wondering if he could put them on without error and without requiring robotic help. The storm and the night were over and he wanted to assume the mantle of adulthood and independence once again.

He said, "What is this?" He held up a long sash covered with an intricately colored arabesque.

"It is a pajama sash," said Daneel. "It is purely ornamental. It passes over the left shoulder and is tied at the right side of the waist. It is traditionally worn at breakfast on some Spacer worlds but is not very popular on Aurora."

"Then why should I wear it?"

"Miss Gladia thought it would become you, Partner Elijah. The method of tying is rather intricate and I will be glad to help you."

Jehoshaphat, thought Baley ruefully, she wants me to be pretty. What does she have in mind?

Don't think about it!

Baley said, "Never mind. I'll manage with a simple bowknot."

-But listen, Daneel, after breakfast I will be going over to Fastolfe's, where I will meet with him, with Amadiro, and with the Chairman of the Legislature. I don't know if there will be any others present."

"Yes, Partner Elijah. I am aware of that. I don't think there will be others present."

"Well, then," said Baley, beginning to put on his undergarments and doing it slowly so as to make no mistake and thus find it unnecessary to appeal for help to Daneel, "tell me about the Chairman. I know from my reading that he is the nearest thing to an executive officer that there is on Aurora, but I gathered from that same reading that the position is purely honorary. He has no power, I take it."

Daneel said, "I am afraid, Partner Elijah-"

Giskard interrupted. "Sir, I am more aware of the political situation on Aurora than friend Daneel is. I have been in operation for much longer. Would you be willing to have me answer the question?"

"Why, certainly, Giskard. Go ahead."

"When the government of Aurora was first set up, sir," began Giskard in a didactic way, as though an information reel within him were methodically spinning, "it was intended that the executive officer fulfill only ceremonial duties. He was to greet dignitaries from other worlds, open all meetings of the Legislature, preside over its deliberations, and vote only to break a tie. After the River Controversy, however-

"Yes, I read about that," said Baley. It had been a particularly dull episode in Auroran history, in which impenetrable arguments over the proper division of hydroelectric power had led to the nearest approach to civil war the planet had ever seen. "You needn't go into details."

"No, sir," said Giskard. "After the River Controversy, however, there was a general determination never to allow controversy to endanger Auroran society again. It has become customary, therefore, to settle all disputes in a private and peaceable manner outside the Legislature. When the legislators finally vote, it is in an agreed-upon fashion, so that there is always a large majority on one side or the other.

"The key figure in the settlement of disputes is the Chairman of the Legislature. He is held to be above the struggle and his power-which, although nil in theory, is considerable in practice -only holds as long as he is seen to be so. The Chairman therefore jealously guards his objectivity and, as long as he succeeds in this, it is he who usually makes the decision that settles any controversy in one direction or another."

Baley said, "You mean that the Chairman will listen to me, to Fastolfe, and to Amadiro, and then come to a decision?"

"Possibly. On the other hand, sir, he may remain uncertain and require further testimony, further thought-or both."

"And if the Chairman does come to a decision, will Amadiro bow to it if it is against him-or will Fastolfe bow if it is against him?"

"That is not an absolute necessity. There are almost always some who will not accept the Chairman's decision and both Dr. Amadiro and Dr. Fastolfe are headstrong and obstinate individuals-if one may judge from their actions. Most of the legislators, however, will go along with the Chairman's decision, whatever that might be. Dr. Fastolfe or Dr. Amadiro- whichever it may be who will be decided against by the Chairman-will then be sure to find himself in a small minority when the vote is taken."

"How sure, Giskard?"

"Almost sure. The Chairman's term of office is ordinarily thirty years, with the opportunity for reelection by the Legislature for another thirty years. If, however, a vote were to go against the Chairman's recommendation, the Chairman would be forced to resign forthwith and there would be a governmental crisis while the Legislature tried to find another Chairman under conditions of bitter dispute. Few legislators are willing to risk that and the chance of getting a majority to vote against the Chairman, when that is the consequence, is almost nil."

"Then," said Baley ruefully, "everything depends on this morning's conference."

"That is very likely."

"Thank you, Giskard."

Gloomily, Baley arranged and rearranged his line of thought.

It seemed hopeful to him, but he did not have any idea what Amadiro might say or what the Chairman might be like. It was Amadiro who had initiated the meeting and he must feel confident, sure of himself.

It was then that Baley remembered that once again, when he was falling asleep, with Gladia in his arms, he had seen-or thought he had seen-or imagined he had seen-the meaning of all the events on Aurora. Everything had seemed clear -obvious- certain. And once more, for the third time, it was gone as though it had never been.

And with that thought, his hopes seemed to go, too.

72.

Daneel led Baley into the room where breakfast was being served-it seemed more intimate than an ordinary dining room. It was small and plain, with no more in the way of furnishings than a table and two chairs and when Daneel retired, he did not move into a niche. In fact, there were no niches and, for a moment, Baley found himself alone-entirely alone-in the room.

That he was not really alone, he was certain. There would be robots on instant call. Still, it was a room for two-a no-robots room-a room (Baley hesitated at the thought) for lovers.

On the table there were two stacks of pancake-like objects that did not smell like pancakes but smelled good. Two containers of what looked like melted butter (but might not be) flanked them. There was a pot of the hot drink (which Baley had tried and had not liked very much) that substituted for coffee.

Gladia walked in, dressed in rather prim fashion and with her hair glistening, as though freshly conditioned. She paused a moment, her face wearing a half-smile.

"Elijah?"

Baley, caught a little by surprise at the sudden appearance, jumped to his feet. "How are you, Gladia?" He stuttered a bit.

She ignored that. She seemed cheerful, carefree. She said, "If you're worried about Daneel not being in sight, don't be. He's completely safe and he'll stay so. As for us-" She came to him, standing close, and put a hand slowly to his cheek, as once, long ago, she had done in Solaria.

She laughed lightly. "That was all I did then, Elijah. Do you remember?"

Elijah nodded silently.

"Did you sleep well, Elijah? -Sit down, dear."

He sat down. "Very well. -Thank you, Gladia." He hesitated before deciding not to return the endearment in kind.

She said, "Don't thank me. I've had my best night's sleep in weeks and I wouldn't have if I hadn't gotten out of bed after I was sure you were sleeping soundly. If I had

stayed-as I wanted to-I would have been annoying you before the night was over and you would not have gotten your rest."

He recognized the need for gallantry. "There are some things more important than r-rest, Gladia," he said, but with such formality that she laughed again.

"Poor Elijah," she said. "You're embarrassed."

The fact that she recognized that embarrassed him even more. Baley had been prepared for contrition, disgust, shame, affected indifference, tears-everything but the frankly erotic attitude she had assumed.

She said, "Well, don't suffer so. You're hungry. You hardly ate last night. Get some calories inside you and you'll feel more carnal."

Baley looked doubtfully at the pancakes that weren't.

Gladia said, "Oh! You've probably never seen these. They're Solarian delicacies. Pachinkas! I had to reprogram my chef before he could make them properly. In the first place, you have to use imported Solarian grain. It won't work with the Auroran varieties. And they're stuffed. Actually, there are a thousand stuffings you can use, but this is my favorite and I know you'll like it, too. I won't tell you what's in it, except for chestnut puree and a touch of honey, but try it and tell me what you think. You can eat it with your fingers, but be careful how you bite into it."

She picked one up, holding it daintily between the thumb and middle finger of each hand, then took a small bite, slowly, and licked at the golden, semi-liquid filling that flowed out.

Baley imitated her action. The pachinka was hard to the touch and not too hot to hold. He put one end cautiously in his mouth and found it resisted biting. He put more muscle into it and the pachinka cracked and he found the contents flowing over his hands.

"The bite was too large and too forceful," said Gladia, rushing to him with a napkin. "Now lick at it. No one eats a pachinka neatly. There's no such thing. You're supposed to wallow in it. Ideally, you're supposed to eat it in the nude, then take a shower."

Baley tried a hesitant lick and his expression was clear enough.

"You like it, don't you?" said Gladia.

"It's delicious," said Baley and he bit away at it slowly and gently. It wasn't too sweet and it seemed to soften and melt in the mouth. It scarcely required swallowing.

He ate three pachinkas and it was only shame that kept him from asking for more. He licked at his fingers without urging and eschewed the use of napkins, for he wanted none of it to be wasted on an inanimate object.

"Dip your fingers and hands in the cleanser, Elijah," and she showed him. The "melted butter" was a finger bowl, obviously.

Baley did as he was shown and then dried his hands. He sniffed at them and there was no odor whatever.

She said, "Are you embarrassed about last night, Elijah? Is that all you feel?"

What did one say? Baley wondered.

Finally, he nodded. "I'm afraid I am, Gladia. It's not all I feel, by twenty kilometers or more, but I am embarrassed. Stop and think. I'm an Earthman and you know that, but for the time being you're repressing it and 'Earthman' is only a meaningless disyllabic sound to you. Last night you were sorry for me, concerned over my problem with the storm, feeling toward me as you would toward a child, and-sympathizing with me, perhaps, out of the vulnerability produced in you by your own loss-you came to me. But that feeling will pass-I'm surprised it hasn't passed already-and then you will remember that I am an Earthman and you will feel ashamed, demeaned, and dirtied. You will hate me for what I have done for you and I don't want to be hated. -I don't want to be hated, Gladia." (If he looked as unhappy as he felt, he looked unhappy indeed.)

She must have thought so, for she reached out to him and stroked his hand. "I won't hate you, Elijah. Why should I? You did nothing to me that I can object to. I did it to you and I'll be glad for the rest of my life that I did. You freed me by a touch two years ago, Elijah, and last night you freed me again. I needed to know, two years ago, that I could feel desire-and last night I needed to know that I could feel desire again after Jander. Elijah-stay with me. It would be-"

He cut her off earnestly. "How can that be, Gladia? I must go back to my own world. I have duties and goals there and you cannot come with me. You could not live the kind of life that is lived on Earth. You would die of Earthly diseases-if the crowds and enclosure did not kill you first. Surely you understand."

"I understand about Earth," said Gladia with a sigh, "but surely you needn't leave immediately."

"Before the morning is over, I may be ordered off the planet by the Chairman."

"You won't be," said Gladia energetically. "You won't let yourself be. -And if you are, we can go to another Spacer world. There are dozens we can choose from. Does Earth mean so much to you that you wouldn't live on a Spacer world?"

Baley said, "I could be evasive, Gladia, and point out that no other Spacer world would let me make my home there permanently-and you know that's so. The greater truth is, though, that even if some Spacer world would accept me, Earth means so much to me that I would have to return. -Even if it meant leaving you."

"And never visiting Aurora again? Never seeing me again?"

"If I could see you again, I would," Baley said, wishing. "Over and over again, believe me. But what's the use of saying so? You know I'm not likely to be invited back. And you know I can't return without an invitation."

Gladia said in a low voice, "I don't want to believe that, Elijah."

Baley said, "Gladia, don't make yourself unhappy. Something wonderful happened between us, but there are other wonderful things that will happen to you, too-many of them, of all kinds, but not the same wonderful thing. Look forward to the others."

She was silent.

"Gladia," he said urgently, "need anyone know what has happened between us?"

She looked up at him, a pained expression on her face. "Are you that ashamed?"

"Of what happened, certainly not. But even though I am not ashamed, there could be consequences that would be discomfoting. The matter would be talked about. Thanks to that hateful hyperwave drama, which included a distorted view of our relationship, we are news. The Earthman and the Solarian woman. If there is the slightest reason to suspect that there is- love between us, it will get back to Earth at the speed of hyperspatial drive."

Gladia lifted her eyebrows with a touch of hauteur. "And Earth will consider you demeaned? You will have indulged in sex with someone beneath your station?"

"No, of course not," said Baley uneasily, for he knew that that would certainly be the view of billions of Earthpeople. "Has it occurred to you that my wife would hear of it? I'm married."

"And if she does? What of it?"

Baley took a deep breath. "You don't understand. Earth ways are not Spacer ways. We have had times in our history when sexual mores were fairly loose, at least in some places and for some classes. This is not one of those times. Earthmen live crowded together and it takes a puritan ethic to keep the family system stable under such conditions."

"Everyone has one partner, you mean, and no other?"

"No," said Baley. "To be honest, that's not so. But care is taken to keep irregularities sufficiently quiet, so that everyone can-can-"

"Pretend they don't know?"

"Well, yes, but in this case-"

"It will all be so public that no one could pretend not to know -and your wife will be angry with you and will strike you."

"No, she won't strike me, but she will be shamed, which is worse. I will be shamed as well and so will my son. My social position will suffer and- Gladia, if you don't understand, you don't understand, but tell me that you will not speak freely of this thing as Aurorans do." He was conscious of making a rather miserable show of himself.

Gladia said thoughtfully, "I do not mean to tease you, Elijah. You have been kind to me and I would not be unkind to you, but"-she threw her arms up hopelessly-"your Earth ways are so nonsensical."

"Undoubtedly. Yet I must live with them-as you have lived with Solarian ways."

"Yes." Her expression darkened with memory. Then, "Forgive me, Elijah. Really and honestly, I apologize. I want what I can't have and I take it out on you."

"It's all right."

"No, it's not all right. Please, Elijah, I must explain something to you. I don't think you understand what happened last night. Will you be all the more embarrassed if I do?"

Baley wondered how Jessie would feel and what she would do if she could hear this conversation. Baley was quite aware that his mind should be on the confrontation with the Chairman that was looming immediately up ahead and not on his own personal marital dilemma. He should be thinking of Earth's danger and not of his wife's, but, in actual fact, he was thinking of Jessie.

He said, "I'll probably be embarrassed, but explain it anyway."

Gladia moved her chair, refraining from calling one of her robotic staff to do it for her. He waited for her nervously, not offering to move it himself.

She put her chair immediately next to his, facing it in the other direction, so that she was looking at him directly when she sat down. And as she did so, she put out her small hand and placed it in his and he felt his own hand press it.

"You see," she said, "I no longer fear contact. I'm no longer at the stage where all I can do is brush your cheek for an instant."

"That may be, but this does not affect you, Gladia, does it, as that bare touch did then?"

She nodded. "No, it doesn't affect me that way, but I like it anyway. I think that's an advance, actually. To be turned inside out just by a single moment of touch shows how abnormally I had lived and for how long. Now it is better. May I tell you how? What I have just said is actually prologue."

"Tell me."

"I wish we were in bed and it was dark. I could talk more freely."

"We are sitting up and it is light, Gladia, but I am listening."

"Yes. -On Solaria, Elijah, there was no sex to speak of. You know that."

"Yes, I do."

"I experienced none, in any real sense. On a few occasions- only a few-my husband approached me out of duty. I won't even describe how that was, but you will believe me when I tell you that, looking back on it, it was worse than none."

"I believe you."

"But I knew about sex. I read about it. I discussed it with other women sometimes, all of whom pretended it was a hateful duty that Solarians must undergo. If they had children to the limit of their quota, they always said they were delighted they would never have to deal with sex again."

"Did you believe them?"

"Of course I did. I had never heard anything else and the few non-Solarian accounts I read were denounced as false distortions. I believed that, too. My husband found some books I had, called them pornography, and had them destroyed. Then, too, you know, people can make themselves believe anything. I think Solarian women believed what they said and really did despise sex. They certainly sounded sincere enough and it made me feel there was something terribly wrong with me because I had a kind of curiosity about it-and odd feelings I could not understand."

"You did not, at that time, use robots for relief in any way?"

"No, it didn't occur to me. Or any inanimate object. There were occasional whispers of such things, but with such horror- or pretended horror-that I would never dream of doing anything like that. Of course, I had dreams and sometimes something that, as I look back on it, must have been incipient orgasms, would wake me. I never understood them, of course, or dared talk of it. I was bitterly ashamed of it, in fact. Worse,

I was frightened of the pleasure they brought me. And then, of course, I came to Aurora."

"You told me of that. Sex with Aurorans was unsatisfactory."

"Yes. It made me think that Solarians were right after all. Sex was not like my dreams at all. It was not until Jander that I understood. It is not sex that they have on Aurora; it is, it is- choreography. Every step of it is dictated by fashion, from the method of approach to the moment of departure. There is nothing unexpected, nothing spontaneous. On Solaria, since there was so little sex, nothing was given or taken. And on Aurora, sex was so stylized that, in the end, nothing was given or taken either. Do you understand?"

"I'm not sure, Gladia, never having experienced sex with an Auroran woman or, for that matter, never 'having been an Auroran man. But it's not necessary to explain. I have a dim notion of what you mean."

"You're terribly embarrassed, aren't you?"

"Not to the point of being unable to listen."

"But then I met Jander and learned to use him. He was not an Auroran man. His only aim, his only possible aim, was to please me. He gave and I took and, for the first time, I experienced sex as it should be experienced. Do you understand that? Can you imagine what it must be like suddenly to know that you are not mad, or distorted, or perverted, or even simply wrong-but to know that you are a woman and have a satisfying sex partner?"

"I think I can imagine that."

"And then, after so short a time, to have it all taken away from me. I thought-I thought-that that was the end. I was doomed. I was never again, through centuries of life, to have a good sexual relationship again. Not to have had it to start with- and then never to have had it at all-was bad enough. But to get it against all expectation and to have it, then suddenly to lose it and go back to nothing-that was unbearable. -You see how important, therefore, last night was."

"But why me, Gladia? Why not someone else?"

"No, Elijah, it had to be you. We came and found you, Giskard and I, and you were helpless. Truly helpless. You were not unconscious, but you did not rule your body. You had to be lifted and carried and placed in the car. I was there when you were warmed and treated, bathed and dried, helpless throughout. The robots did it all with marvelous efficiency, intent on caring for you and preventing harm from coming to you but totally without actual feeling. I, on the other hand, watched and I felt."

Baley bent his head, gritting his teeth at the thought of his public helplessness. He had luxuriated in it when it had happened, but now he could only feel the disgrace of being observed under such conditions.

She went on. "I wanted to do it all for you. I resented the robots for reserving for themselves the right to be kind to you- and to give. And as I thought of myself doing it, I felt a growing sexual excitement, something I hadn't felt since Jander's death.

-And it occurred to me then that, in my only successful sex, what I had done was to take. Jander gave whatever I wished, but he never took. He was incapable of taking, since his only pleasure lay in pleasing me. And it never occurred to me to give because I was brought up with robots and knew they couldn't take.

"And as I watched, it came to me that I knew only half of sex and I desperately wanted to experience the other half. But then, at the dinner table with me afterward, when you were eating your hot soup, you seemed recovered, you seemed strong. You were strong enough to console me and because I had had that feeling for you, when you were being cared for, I no longer feared your being from Earth and I was willing to move into your embrace. I wanted it. But even as you held me, I felt a sense of loss, for I was taking again and not giving.

"And you said to me, 'Gladia, please, I must sit down.' Oh, Elijah, it was the most wonderful thing you could have said to me.

Baley felt himself flush. "It embarrassed me hideously at the time. Such a confession of weakness."

"It was just what I wanted. It drove me wild with desire. I forced you to bed and came to you and, for the first time in my life, I gave. I took nothing. And the spell of Jander passed, for I knew that he had not been enough, either. It must be possible to take and give, both. -Elijah, stay with me."

Baley shook his head. "Gladia, if I tore my heart in two, it wouldn't change the facts. I cannot remain on Aurora. I must return to Earth. You cannot come to Earth."

"Elijah, what if I can come to Earth?"

"Why do you say such a foolish thing? Even if you could, I would age quickly and soon be useless to you. In twenty years, thirty at the most, I will be an old man, probably dead, while you will stay as you are for centuries."

"But that is what I mean, Elijah. On Earth, I will catch your infections and I will grow old quickly, too."

"You wouldn't want that. Besides, old age isn't an infection. You will merely grow sick, very quickly, and die. Gladia, you can find another man."

"An Auroran?" She said it with contempt.

"You can teach. Now that you know how to take and to give, teach them how to do both as well."

"If I teach, will they learn?"

"Some will. Surely some will. You have so much time to find the one who will. There is-" (No, he thought, it is not wise to mention Gremionis now, but perhaps if he comes to her-less politely and with a little more determination-)

She seemed thoughtful. "Is it possible?" Then, looking at Baley, with her gray-blue eyes moist, "Oh, Elijah, do you remember anything at all of what happened last night?"

"I must admit," said Baley a little sadly, "that some of it is distressingly hazy."

"If you remembered, you would not want to leave me."

"I don't want to leave you as it is, Gladia. It is just that I must."

"And afterward," she said, "you seemed so quietly happy, so rested. I lay nestled on your shoulder and felt your heart beat rapidly at first, then more and more slowly, except when you sat up so suddenly. Do you remember that?"

Baley started and leaned a little away from her, gazing into her eyes wildly. "No, I don't remember that. What do you mean? What did I do?"

"I told you. You sat up suddenly."

"Yes, but what else?" His heart was beating rapidly now, as rapidly as it must have in the wake of last night's sex. Three times, something that had seemed the truth had come to him, but the first two times he had been entirely alone. The third time, last night, however, Gladia had been with him. He had had a witness.

Gladia said, "Nothing else, really. I said, 'What is it, Elijah?' but you paid no attention to me. You said, 'I have it. I have it.' You didn't speak clearly and your eyes were unfocused. It was a little frightening."

"Is that all I said? Jehoshaphat, Gladia! Didn't I say anything more?"

Gladia frowned. "I don't remember. But then you lay back and I said, 'Don't be frightened, Elijah. Don't be frightened. You're safe now.' And I stroked you and you settled back and fell asleep -and snored. -I never heard anyone snore before, but that's what it must have been-from the descriptions." The thought clearly amused her.

Baley said, "Listen to me, Gladia. What did I say? 'I have it. I have it.' Did I say what it was I had?"

She frowned again. "No. I don't remember- Wait, you did say one thing in a very low voice. You said, 'He was there first.'"

"He was there first.' That's what I said?"

"Yes. I took it for granted that you meant Giskard was there before the other robots, that you were trying to overcome your fears of being taken away, that you were reliving that time in the storm. Yes! That's why I stroked you and said, 'Don't be frightened, Elijah. You're safe now,' till you relaxed."

"He was there first.' 'He was there first.' -I won't forget it now. Gladia, thanks for last night. Thanks for talking to me now."

Gladia said, "Is there something important about you saying that Giskard found you first. He did. You know that."

"It can't be that, Gladia. It must be something I don't know but manage to discover only when my mind is totally relaxed."

"But what does it mean, then?"

"I'm not sure, but if that's what I said, it must mean something. And I have an hour or so to figure it out." He stood up. "I must leave now."

He had taken a few steps toward the door, but Gladia flew to him and put her arms around him. "Wait, Elijah."

Baley hesitated, then lowered his head to kiss her. For a long moment, they clung together.

"Will I see you again, Elijah?"

Baley said sadly, "I can't say. I hope so."

And he went off to find Daneel and Giskard, so that he could make the necessary preparations for the confrontation about to come.

73.

Baley's sadness persisted as he walked across the long lawn- to Fastolfe's establishment.

The robots walked on either side. Daneel seemed at his ease, but Giskard, faithful to his programming and apparently unable to relax it, maintained his close watch on the surroundings.

Baley said, "What is the name of the Chairman of the Legislature, Daneel?"

"I cannot say, Partner Elijah. On the occasions when he has been referred to in my hearing, he has been referred to only as 'the Chairman.' He is addressed as 'Mr. Chairman.'"

Giskard said, "His name is Rutilari Horder, sir, but it is never mentioned officially. The title alone is used. That serves to impress continuity on the government. Human holders of the position have, individually, fixed terms, but 'the Chairman' always exists."

"And this particular individual Chairman-how old is he?"

"Quite old, sir. Three hundred and thirty-one," said Giskard, who typically had statistics on tap.

"In good health?"

"I know nothing to the contrary, sir."

"Any outstanding personal characteristics it might be well for me to be prepared for?"

That seemed to stop Giskard. He said, after a pause, "That is difficult for me to say, sir. He is in his second term. He is considered an efficient Chairman who works hard and gets results."

"Is he short-tempered? Patient? Domineering? Understanding?"

Giskard said, "You must judge such things for yourself, sir."

Daneel said, "Partner Elijah, the Chairman is above partisanship. He is just and evenhanded, by definition."

"I'm sure of that," muttered Baley, "but definitions are abstract, as is 'the Chairman,' while individual Chairmen-with names-are concrete and may have minds to match."

He shook his head. His own mind, he would swear, had a strong measure of concrete itself. Having three times thought of something and three times lost it, he was now presented with his own comment at the time of having the thought and it still didn't help.

"He was there first."

Who was there first? When?

Baley had no answer.

Baley found Fastolfe waiting for him at the door of his establishment, with a robot behind him who seemed most unrobotically restless, as though unable to perform his proper function of greeting a visitor and upset by the fact.

(But then, one was always reading human motivations and responses into robots. What was more likely true was no upsettedness-no feeling of any kind-merely a slight oscillation of positronic potentials resulting from the fact that his orders were to greet and inspect all visitors and he could not quite perform the task without pushing past Fastolfe, which he also could not do, in the absence of overriding necessity. So he made false starts, one after the other, and that made him seem restless.)

Baley found himself staring at the robot absently and only with difficulty managing to bring his eyes back to Fastolfe. (He was thinking of robots, but he didn't know why.)

"I'm glad to see you again, Dr. Fastolfe," he said and thrust his hand forward. After his encounter with Gladia, it was rather difficult to remember that Spacers were reluctant to make physical contact with an Earthman.

Fastolfe hesitated a moment and then, as manners triumphed over prudence, he took the hand offered him, held it lightly and briefly, and let it go. He said, "I am even more delighted to see you, Mr. Baley. I was quite alarmed over your experience last evening. It was not a particularly bad storm, but to an Earthman it must have seemed overwhelming."

"You know about what happened, then?"

"Daneel and Giskard have brought me fully up to date in that respect. I would have felt better if they had come here directly and, eventually, brought you here with them, but their decision was based on the fact that Gladia's establishment was closer to the breakdown point of the airfoil and that your orders had been extremely intense and had placed Daneel's safety ahead of your own. They did not misinterpret you?"

"They did not. I forced them to leave me."

"Was that wise?" Fastolfe led the way indoors, and pointed to a chair.

Baley sat down. "It seemed the proper thing to do. We were being pursued."

"So Giskard reported. He also reported that-"

Baley intervened. "Dr. Fastolfe, please. I have very little time and I have questions that I must ask you."

"Go ahead, please," said Fastolfe at once, with his usual air of unfailing politeness.

"It has been suggested that you place your work on brain function above everything else, that you-"

"Let me finish, Mr. Baley. That I will let nothing stand in my way, that I am totally ruthless, oblivious to any consideration of immorality or evil, would stop at nothing, would excuse everything, all in the name of the importance of my work."

"Yes."

"Who told you this, Mr. Baley?" asked Fastolfe.

"Does it matter?"

"Perhaps not. Besides, it's not difficult to guess. It was my daughter Vasilia. I'm sure of that."

Baley said, "Perhaps. What I want to know is whether this estimate of your character is correct."

Fastolfe smiled sadly. "Do you expect an honest answer from me about my own character? In some ways, the accusations against me are true. I do consider my work the most important matter there is and I do have the impulse to sacrifice anything and everything to it. I would ignore conventional notions of evil and immorality if these got in my way. -The thing is, however, that I don't. I can't bring myself to. And, in particular, if I have been accused of killing Jander because that would in some way advance my study of the human brain, I deny it. It is not so. I did not kill Jander."

Baley said, "You suggested I submit to a Psychic Probe to get some information that I can't reach otherwise out of my brain. Has it occurred to you that, if you submitted to a Psychic Probe, your innocence could be demonstrated?"

Fastolfe nodded his head thoughtfully, "I imagine Vasilia suggested that my failure to offer to submit to one was proof of my guilt. Not so. A Psychic Probe is dangerous and I am as nervous about submitting myself to one as you are. Still, I would have done so, despite my fears, were it not for the fact that is what my opponents would most like to have me do. They would argue against any evidence to my innocence and the Psychic Probe is not delicate enough an instrument to demonstrate innocence beyond argument. But what they would get by use of the Probe is information about the theory and design of humaniform robots. That is what they are after and that is what I am not going to give them."

Baley said, "Very well. Thank you, Dr. Fastolfe."

Fastolfe said, "You are welcome. And now, if I may get back to what I was saying, Giskard reported that, after you were left alone in the airfoil, you were accosted by strange robots. At least, you spoke of strange robots, rather disjointedly, after you were found unconscious and exposed to the storm."

"The strange robots did accost me, Dr. Fastolfe. I managed to deflect them and send them away, but I thought it wise to leave the airfoil rather than await their return. I may not have been thinking clearly when I reached that decision. Giskard said I was not."

Fastolfe smiled. "Giskard has a simplistic view of the Universe. Have you any idea whose robots they were?"

Baley moved about restlessly and seemed to find no way of adjusting himself to the seat in a comfortable manner. He said, "Has the Chairman arrived yet?"

"No, but he will be here momentarily. So will Amadiro, the head of the Institute, whom, the robots told me, you met yesterday. I am not sure that was wise. You irritated him."

"I had to see him, Dr. Fastolfe, and he did not seem irritated."

"That is no guide with Amadiro. As a result of what he calls your slanders and your unbearable sullying of professional reputation, he has forced the Chairman's hand."

"In what way?"

"It is the Chairman's job to encourage the meeting of contending parties and to work for a compromise. If Amadiro wishes to meet with me, the Chairman could not, by definition, discourage it, much less forbid it. He must hold the meeting and, if Amadiro can find enough evidence against you-and it is easy to find evidence against an Earthman-that will end the investigation."

"Perhaps, Dr. Fastolfe, you should not have called on an Earthman to help, considering how vulnerable we are."

"Perhaps not, Mr. Baley, but I could think of nothing else to do. I still can't, so I must leave it up to you to persuade the Chairman to our point of view-if you can."

"The responsibility is mine?" said Baley glumly.

"Entirely yours," said Fastolfe smoothly.

Baley said, "Are we four to be the only ones present?" Fastolfe said, "Actually, we three: the Chairman, Amadiro, and myself. We are the two principals and the compromising agent, so to speak. You will be there as a fourth party, Mr. Baley, only on sufferance. The Chairman can order you to leave at will, so I hope you will not do anything to upset him."

"I'll try not to, Dr. Fastolfe."

"For instance, Mr. Baley, do not offer him your hand-if you will forgive my rudeness."

Baley felt himself grow warm with retroactive embarrassment at his earlier gesture. "I will not."

"And be unfailingly polite. Make no angry accusations. Do not insist on statements for which there is no support-"

"You mean don't try to stampede anyone into betraying himself. Amadiro, for instance."

"Yes, do not do so. You will be committing slander and it will be counterproductive. Therefore, be polite! If the politeness masks an attack, we won't quarrel with that. And try not to speak unless you are spoken to."

Baley said, "How is it, Dr. Fastolfe, that you are so full of careful advice now and yet you never warned me about the dangers of slander earlier."

"The fault is indeed mine," said Dr. Fastolfe. "It was a matter of such basic knowledge to me that it never occurred to me that it had to be explained."

Baley grunted. "Yes, I thought so."

Fastolfe raised his head suddenly.. "I hear an airfoil outside. More than that, I can hear the steps of one of my staff, heading for the entrance. I presume the Chairman and Amadiro are at hand."

"Together?" asked Baley.

"Undoubtedly. You see, Amadiro suggested my establishment as the meeting place, thus granting me the advantage of home ground. He will therefore have the chance of offering, out of apparent politeness, to call for the Chairman and bring him here. After all, they must both come here. This will give him a few minutes to talk privately with the Chairman and push his point of view. "

"That is scarcely fair," said Baley. "Could you have stopped that?"

"I didn't want to. Amadiro takes a calculated risk. He may say something that will irritate the Chairman."

"Is the Chairman particularly irritable by nature?"

"No. No more so than any Chairman in the fifth decade of his term of office. Still, the necessity of strict adherence to protocol, the further necessity of never taking sides, and the actuality of arbitrary power all combine toward making a certain irritability inevitable. And Amadiro is not always wise. His jovial smile, his white teeth, his exuding bonhomie can be extremely irritating when those upon whom he lavishes it are not in a good mood, for some reason. -But I must go meet them, Mr. Baley, and supply what I hope will be a more substantial version of charm. Please stay here and don't move from that chair."

Baley could do nothing but wait now. He thought, irrelevantly, that he had been on Aurora for just a bit short of fifty standard hours.

18. AGAIN THE CHAIRMAN

75.

The Chairman was short, surprisingly short. Amadiro towered over him by nearly thirty centimeters.

However, since most of his shortness was in his thighs, the Chairman, when all were seated, was not noticeably inferior in height to the others. Indeed, he was thickset, with a massive chest and shoulders, and looked almost overpowering under those conditions.

His head was large, too, but his face was lined and marked by age. Nor were its wrinkles the kindly type carved by laughter. They were impressed into his cheeks and forehead, one felt, by the exercise of power. His hair was white and sparse and he was bald in the spot where the hairs would have met in a whorl.

His voice suited him—deep and decisive. Age had robbed it of some of its timbre, perhaps, and lent it a bit of harshness, but in a Chairman (Baley thought) that might help rather than hinder.

Fastolfe went through the full ritual of greeting, exchanged stroking remarks without meaning, and offered food and drink. Through all of this, no mention was made of the outsider and no notice was taken of him.

It was only when the preliminaries were finished and when all were seated that Baley (a little farther from the center than the others) was introduced.

He said, "Mr. Chairman," without holding out his hand. Then, with an offhand nod, he said, "And, of course, I have met Dr. Amadiro."

Amadiro's smile did not waver at the touch of insolence in Baley's voice.

The Chairman, who had not acknowledged Baley's greeting, placed his hands on each knee, fingers spread apart, and said, "Let us get started and let us see if we can't make this as brief and as productive as possible.

"Let me stress first that I wish to get past this matter of the misbehavior—or possible misbehavior—of an Earthman and strike instantly to the heart of the matter. Nor, in dealing with the heart of the matter, are we speaking of this overblown matter of the robot. Disrupting the activity of a robot is a matter for the civil courts; it can result in a judgment of the infringement of property rights and the inflicting of a penalty of costs but nothing more than that. What's-more, if it should be proved that Dr. Fastolfe had rendered the robot, Jander Panell, inoperable, it is a robot who, after all, he helped design, whose construction he supervised, and the ownership of whom he held at the time of the inoperability. No penalty is likely to apply, since a person may do what he likes with his own.

"What is really at issue is the matter of the exploration and settlement of the Galaxy: whether we of Aurora carry it through alone, whether we do it in collaboration with the other Spacer worlds, or whether we leave it to Earth. Dr. Amadiro and the

Globalists favor having Aurora shoulder the burden alone; Dr. Fastolfe wishes to leave it to Earth.

"If we can settle this matter, then the affair of the robot can be left to the civil courts, and the question of the Earthman's behavior will probably become moot, and we can simply get rid of him.

"Therefore, let me begin by asking whether Dr. Amadiro is prepared to accept Dr. Fastolfe's position in order to achieve unity of decision or whether Dr. Fastolfe is prepared to accept Dr. Amadiro's position with the same end in view."

He paused and waited.

Amadiro said, "I am sorry, Mr. Chairman, but I must insist that Earthmen be confined to their planet and that the Galaxy be settled by Aurorans only. I would be willing to compromise, however, to the extent of allowing other Spacer worlds to share in the settlement if that would prevent needless strife among us.

"I see," said the Chairman. "Will you, Dr. Fastolfe, in view of this statement, abandon your position?"

Fastolfe said, "Dr. Amadiro's compromise has scarcely anything of substance in it, Mr. Chairman. I am willing to offer a compromise of greater significance. Why should not the worlds of the Galaxy be thrown open to Spacers and Earthpeople alike? The Galaxy is large and there would be room for both. I would be willing to accept such an arrangement."

"No doubt," said Amadiro quickly, "for it is no compromise. The over eight billion population of Earth is more than half again the population of all the Spacer worlds combined. Earth's people are short-lived and are used to replacing their losses quickly. They lack our regard for individual human life. They will swarm over the new worlds at any cost, multiplying like insects, and will preempt the Galaxy even while we are making a bare beginning. To offer Earth a supposedly equal chance at the Galaxy is to give them the Galaxy-and that is not equality. Earthpeople must be confined to Earth."

"And what have you to say to that, Dr. Fastolfe?" asked the Chairman.

Fastolfe sighed. "My views are on record. I'm sure I don't need to repeat them. Dr. Amadiro plans to use humaniform robots to build the settled worlds that human Aurorans will then enter, ready-made, yet he doesn't even have humaniform robots. He cannot construct them and the project would not work, even if he did have them. No compromise is possible unless Dr. Amadiro consents to the principle that Earthpeople may at least share in the task of the settlement of new worlds."

"Then no compromise is possible," said Amadiro.

The Chairman looked displeased. "I'm afraid that one of you two must give in. I do not intend Aurora to be torn apart in an emotional orgy on a question this important."

He looked at Amadiro blankly, his expression carefully signifying neither favor nor disfavor. "You intend to use the inoperability of the robot, Jander, as an argument against Fastolfe's view, do you not?"

"I do," said Amadiro.

"A purely emotional argument. You are going to claim that Fastolfe is trying to destroy your view by falsely making humaniform robots appear less useful than they, in effect, are."

"That is exactly what he is trying to do-"

"Slander!" put in Fastolfe in a low voice.

"Not if I can prove it, which I can," said Amadiro. "The argument may be an emotional one, but it will be effective. You see that, Mr. Chairman, don't you? My view will surely win, but left to itself it will be messy. I would suggest that you persuade Dr. Fastolfe to accept inevitable defeat and spare Aurora the enormous sadness of a spectacle that will weaken our position among the Spacer worlds and shake our own belief in ourselves."

"How can you prove that Dr. Fastolfe rendered the robot inoperative?" -

"He himself admits he is the only human being who could have done so. You know this."

"I know," said the Chairman, "but I wanted to hear you say this, not to your constituency, not to the media, but to me-in private. And you have done so."

He turned to Fastolfe. "And what do you say, Dr. Fastolfe? Are you the only man who could have destroyed the robot?"

"Without leaving physical marks? I am, as far as I know. I don't believe that Dr. Amadiro has the skill in robotics to do so and I am constantly amazed that, after having founded his Robotics Institute, he is so eager to proclaim his own incapacity, even with all his associates at his back-and to do so publicly." He smiled at Amadiro, not entirely without malice.

The Chairman sighed. "No, Dr. Fastolfe. No rhetorical tricks now. Let us dispense with sarcasm and clever thrusts. What is your defense?"

"Why, only that I did no harm to Jander. I do not say anyone did. It was chance-the uncertainty principle at work on the positronic pathways. It can happen every so often. Let Dr. Amadiro merely admit that it was chance, that no one be accused without evidence, and we can then argue the competing proposals about settlement on their own merits."

"No," said Amadiro. "The chance of accidental destruction is too small to be considered, far smaller than the 'chance that Dr. Fastolfe is responsible-so much smaller that to ignore Dr. Fastolfe's guilt is irresponsible. I will not back down and I will win. Mr. Chairman, you know I will win and it seems to me that the only rational step to be taken is to force Dr. Fastolfe to accept his defeat in the interest of global unity."

Fastolfe said quickly, "And that brings me to the matter of the investigation I have asked Mr. Baley of Earth to undertake."

And Amadiro said, just as quickly, "A move I opposed when it was first suggested. The Earthman may be a clever investigator, but he is unfamiliar with Aurora and can accomplish nothing here. Nothing, that is, except to strew slander and to hold Aurora up to the Spacer worlds in an undignified and ridiculous light. There have been satirical pieces on the matter in half a dozen important Spacer hyperwave news programs on as many different worlds. Recordings of these have been sent to your office."

"And have been brought to my attention," said the Chairman.

"And there has been murmuring here on Aurora," Amadiro drove on. "It would be to my selfish interest to allow the investigation to continue. It is costing Fastolfe support among the populace and votes among the legislators. The longer it continues, the more certain I am of victory, but it is damaging Aurora and I do not wish to add to my certainty at the cost of harm to my world. -I suggest-with respect-that you end the investigation, Mr. Chairman, and persuade Dr. Fastolfe to submit gracefully now to what he will eventually have to accept-at much greater cost."

The Chairman said, "I agree that to have permitted Dr. Fastolfe to set up this investigation may have been unwise. I say 'may.' I admit I am tempted to end it. And yet the Earthman"- he gave no indication of knowing that Baley was in the room- "has already been here for some time-"

He paused, as though to give Fastolfe a chance for corroboration, and Fastolfe took it, saying, "This is the third day of his investigation, Mr. Chairman."

"In that case," said the Chairman, "before I end that investigation, it would be fair, I believe, to ask if there have been any significant findings so far."

He paused again. Fastolfe glanced quickly at Baley and made a small motion of his head.

Baley said in a low voice, "I do not wish, Mr. Chairman, to obtrude, unasked, any observations. Am I being asked a question?"

The Chairman frowned. Without looking at Baley, he said, "I am asking Mr. Baley of Earth to tell us whether he has any findings of significance."

Baley took a deep breath. This was it.

76.

"Mr. Chairman," he began. "Yesterday afternoon, I was interrogating Dr. Amadiro, who was most cooperative and useful to me. When my staff and I left-"

"Your staff?" asked the Chairman.

"I was accompanied by two robots on all phases of my investigation, Mr. Chairman," said Baley.

"Robots who belong to Dr. Fastolfe?" asked Amadiro. "I ask this for the record."

"For the record, they do," said Baley. "One is Daneel Olivaw, a humaniform robot, and the other is Giskard Reventlov, an older nonhumaniform robot."

"Thank you," said the Chairman. "Continue."

"When we left the Institute grounds, we found that the airfoil we used had been tampered with."

"Tampered with?" asked the Chairman, startled. "By whom?"

"We don't know, but it happened on Institute grounds. We were there by invitation, so it was known by the Institute personnel that we would be there. Moreover, no one else would be likely to be there without the invitation and knowledge of the

Institute staff. If it were at all thinkable, it would be necessary to conclude that the tampering could only have been done by someone on the Institute staff and that would, in any case, be impossible-except at the direction of Dr. Amadiro himself, which would also be unthinkable."

Amadiro said, "You seem to think a great deal about the unthinkable. Has the airfoil been examined by a qualified technician to see if it has indeed been tampered with? Might there not have been a natural failing?" asked Amadiro.

"No, sir," said Baley, "but Giskard, who is qualified to drive an airfoil and who has frequently driven that particular one, maintains that it was tampered with."

"And he is one of Dr. Fastolfe's staff and is programmed by him and receives his daily orders from him," said Amadiro.

"Are you suggesting-" began Fastolfe.

"I am suggesting nothing." Amadiro held up his hand in a benign gesture. "I am merely making a statement-for the record."

The Chairman stirred. "Will Mr. Baley of Earth please continue?"

Baley said, "When the airfoil broke down, there were others in pursuit."

"Others?" asked the Chairman.

"Other robots. They arrived and, by that time, my robots were gone."

"One moment," said Amadiro. "What was your condition at the time, Mr. Baley?"

"I was not entirely well."

"Not entirely well? You are an Earthman and unaccustomed to life except in the artificial setting of your Cities. You are uneasy in the open. Is that not so, Mr. Baley?" asked Amadiro.

"Yes, sir."

"And there was a severe thunderstorm in progress last evening, as I am sure the Chairman recalls. Would it not be accurate to say that you were quite ill? Semiconscious, if not worse?"

"I was quite ill," said Baley reluctantly.

"Then how is it your robots were gone?" asked the Chairman sharply. "Should they not have been with you in your illness?"

"I ordered them away, Mr. Chairman."

"Why?"

"I thought it best," said Baley, "and I will explain-if I may be allowed to continue."

"Continue."

"We were indeed being pursued, for the pursuing robots arrived shortly after my robots had left. The pursuers asked me where my robots were and I told them I had sent them away. It was only after that that they asked if I were ill. I said I wasn't ill and they left me in order to continue a search for my robots."

"In search of Daneel and Giskard?" asked the Chairman.

"Yes, Mr. Chairman. It was clear to me that they were under intense orders to find the robots."

"In what way was that clear?"

"Although I was obviously ill, they asked about the robots before they asked about me. Then, later, they abandoned me in my illness to search for my robots. They must have received enormously intense orders to find those robots or it would not have been possible for them to disregard a patently ill human being. As a matter of fact, I had anticipated this search for my robots and that was why I had sent them away. I felt it all-important to keep them out of unauthorized hands."

Amadiro said, "Mr. Chairman, may I continue to question Mr. Baley on this point, in order to show the worthlessness of this statement?"

"You may."

Amadiro said, "Mr. Baley. You were alone after your robots had left, were you not?"

"Yes, sir."

"Therefore you have no recording of events? You are not yourself equipped to record them? You have no recording device?"

"No to all three, sir."

"And you were ill?"

"Yes, sir."

"Distraught? Possibly too ill to remember clearly?"

"No, sir. I remember quite clearly."

"You would think so, I suppose, but you may well have been delirious and hallucinating. Under those conditions, it seems clear that what the robots said or, indeed, whether robots appeared at all would seem highly dubious."

The Chairman said thoughtfully, "I agree. Mr. Baley of Earth, assuming that what you remember-or claim to remember-is accurate, what is your interpretation of the events you are describing?"

"I hesitate to give you my thoughts on the matter, Mr. Chairman," said Baley, "lest I slander the worthy Dr. Amadiro."

"Since you speak at my request and since your remarks are confined to this room"-the Chairman looked around; the wall niches were empty of robots-"there is no question of slander, unless it seems to me you speak with malice."

"In that case, Mr. Chairman," said Baley, "I had thought it possible that Dr. Amadiro detained me in his office by discussing matters with me at greater length than was perhaps necessary, so that there would be time for the damaging of my machine, then detained me further in order that I might leave after the thunderstorm had begun, thus making sure that I would be ill in transit. He had studied Earth's social conditions, as he told me several times, so he would know what my reaction to the storm might be. It seemed to me that it was his plan to send his robots after us and, when they came upon our stalled airfoil, to have them take us all back to the Institute grounds, presumably so that I might be treated for my illness but actually so that he might have Dr. Fastolfe's robots."

Amadiro laughed gently. "What motive am I supposed to have for all this. You see, Mr. Chairman, that this is supposition joined to supposition and would be judged slander in any court on Aurora."

The Chairman said severely, "Has Mr. Baley of Earth anything to support these hypotheses?"

"A line of reasoning, Mr. Chairman."

The Chairman stood up, at once losing some of his presence, since he scarcely unfolded to a greater than sitting height. "Let me take a short walk, so that I might consider what I have heard so far. I will be right back." He left for the Personal.

Fastolfe leaned in the direction of Baley and Baley met him halfway. (Amadiro looked on in casual unconcern, as though it scarcely mattered to him what they might have to say to each other.)

Fastolfe whispered, "Have you anything better to say?"

Baley said, "I think so, if I get the proper chance to say it, but the Chairman does not seem to be sympathetic."

"He is not. So far you have merely made things worse and I would not be surprised if, when he comes back, he calls these proceedings to a halt."

Baley shook his head and stared at his shoes.

77.

Baley was still staring at his shoes when the Chairman returned, reseated himself, and turned a hard and rather baleful glance at the Earthman.

He said, "Mr. Baley of Earth?"

"Yes, Mr. Chairman."

"I think you are wasting my time, but I do not want it said that I did not give either side a full hearing, even when it seemed to be wasting my time. Can you offer me a motive that would account for Dr. Amadiro acting in the mad way in which you accuse him of acting."

"Mr. Chairman," said Baley in a tone approaching desperation, "there is indeed a motive-a very good one. It rests on the fact that Dr. Amadiro's plan for settling the Galaxy will come to nothing if he and his Institute cannot produce humaniform robots. So far he has produced none and can produce none. Ask him if he is willing to have a legislative committee examine his Institute for any indication that successful humaniform robots are being produced or designed. If he is willing to maintain that successful humaniforms are on the assembly lines or even on the drawing boards-or even in adequate theoretical formulation- and if he is prepared to demonstrate that fact to a qualified committee, I will say nothing more and admit that my investigation has achieved nothing." He held his breath.

The Chairman looked at Amadiro, whose smile had faded.

Amadiro said, "I will admit that we have no humaniform robots in prospect at the moment."

"Then I will continue," said Baley, resuming his interrupted breathing with something very much like a gasp. "Dr. Amadiro can, of course, find all the information he needs for his project if he turns to Dr. Fastolfe, who has the information in his head, but Dr. Fastolfe will not cooperate in this matter."

"No, I will not," murmured Fastolfe, "under any conditions."

"But, Mr. Chairman," Baley continued, "Dr. Fastolfe is not the only individual who has the secret of the design and construction of humaniform robots."

"No?" said the Chairman. "Who else would know? Dr. Fastolfe himself looks astonished at your comment, Mr. Baley." (For the first time, he did not add "of Earth.")

"I am indeed astonished," said Fastolfe. "To my knowledge, I am certainly the only one. I don't know what Mr. Baley means."

Amadiro said, with a small curling of the lip, "I suspect Mr. Baley doesn't know, either."

Baley felt hemmed in. He looked from one to the other and felt that not one of them-not one-was on his side.

He said, "Isn't it true that any humaniform robot would know? Not consciously perhaps, not in such a way as to be able to give instructions in the matter-but the information would surely be there within him, wouldn't it? If a humaniform robot was properly questioned, his answers and responses would betray his design and construction. Eventually, given enough time and given questions properly framed, a humaniform robot would yield information that would make it possible to plan the design of other humaniform robots. -To put it briefly, no machine can be of secret design if the machine itself is available for sufficiently intense study."

Fastolfe seemed struck. "I see what you mean, Mr. Baley, and you are right. I had never thought of that."

"With respect, Dr. Fastolfe," said Baley, "I must tell you that, like all Aurorans, you have a peculiarly individualistic pride. You are entirely too satisfied with being the best roboticist, the only roboticist who can construct humaniforms-so you blind yourself to the obvious."

The Chairman relaxed into a smile. "He has you there, Dr. Fastolfe. I have wondered why you were so eager to maintain that you were the only one with the know-how to destroy Jander when that so weakened your political case. I see clearly now that you would rather have your political case go down than your uniqueness."

Fastolfe chafed visibly.

As for Amadiro, he frowned and said, "Has this anything to do with the problem under discussion?"

"Yes, it does," said Baley, his confidence rising. "You cannot force any information from Dr. Fastolfe directly. Your robots cannot be ordered to do him harm, to torture him into revealing his secrets, for instance. You can't harm him directly yourself against the protection of Dr. Fastolfe by his staff. However, you can isolate a robot and have it taken

by other robots when the human being present is too ill to take the necessary action to prevent you. All the events of yesterday afternoon were part of a quickly improvised plan to get your hands on Daneel. You saw your opportunity as soon as I insisted on seeing you at the Institute. If I had not sent my robots away, if I had not been just well enough to insist I was well and to send your robots in the wrong direction, you would have had him. And eventually you might have worked out the secret of humaniform robots by some long-sustained analysis of Daneel's behavior and responses."

Amadiro said, "Mr. Chairman, I protest. I have never heard slander so viciously expressed. This is all based on the fancies of an ill man. We don't know-and perhaps can't ever know- whether the airfoil was really damaged; and if it was, by whom; whether robots really pursued the airfoil and really spoke to Mr. Baley or not. He is merely piling inference on inference, all based on dubious testimony concerning events of which he is the only witness-and that at a time when he was half-mad with fear and may have been hallucinating. None of this can stand up for one moment in a courtroom."

"This is not a courtroom, Dr. Amadiro," said the Chairman, "and it is my duty to listen to everything that may be germane to a question under dispute."

"This is not germane, Mr. Chairman. It is a cobweb."

"Yet it hangs together, somehow. I do not seem to catch Mr. Baley in a clear-cut illogicality. If one admits what he claims to have experienced, then his conclusions make a kind of sense. Do you deny all this, Dr. Amadiro? The airfoil damage, the pursuit, the intention to appropriate the humaniform robot?"

"I do! Absolutely! None of it is true!" said Amadiro. It had been a noticeable while since he had smiled. "The Earthman can produce a recording of our entire conversation and no doubt he will point out that I was delaying him by speaking at length, by inviting him to tour the Institute, by inviting him to have dinner -but all that can equally well be interpreted as my stretching a point to be courteous and hospitable. I was misled by a certain sympathy I have for Earthmen, perhaps, and that's all there is to that. I deny his inferences and nothing of what he says can stand up against my denial. My reputation is not such that a mere speculation can persuade anyone that I am the kind of devious plotter this Earthman says I am."

The Chairman scratched at his chin thoughtfully and said, "Certainly, I am not of a mind to accuse you on the basis of what the Earthman has said so far. -Mr. Baley, if this is all you have, it is interesting but insufficient. Is there anything more you have to say of substance? I warn you that, if not, I have now spent all the time on this that I can afford to."

78.

Baley said, "There is but one more subject I wish to bring up, Mr. Chairman. You have perhaps heard of Gladia Delmarre-or Gladia Solaria. She calls herself simply Gladia."

"Yes, Mr. Baley," said the Chairman with a testy edge to his voice. "I have heard of her. I have seen the hyperwave show in which you and she play such remarkable parts."

"She was associated with the robot, Jander, for many months. In fact, toward the end, he was her husband."

The Chairman's unfavorable stare at Baley became a hard glare. "Her what?"

"Husband, Mr. Chairman."

Fastolfe, who half-rose, sat down again, looking perturbed.

The Chairman said harshly, "That is illegal. Worse, it is ridiculous. A robot could not impregnate her. There could be no children. The status of a husband-or of a wife-is never granted without some statement as to willingness to have a child if permitted. Even an Earthman, I should think, would know that."

Baley said, "I am aware of this, Mr. Chairman. So, I am certain, was Gladia. She did not use the word 'husband' in its legal sense but in an emotional one. She considered Jander the equivalent of a husband. She felt toward him as though he were a husband."

The Chairman turned to Fastolfe. "Did you know of this, Dr. Fastolfe? He was a robot on your staff."

Fastolfe, clearly embarrassed, said, "I knew she was fond of him. I suspected she made use of him sexually. I knew nothing of this illegal charade, however, until Mr. Baley told me of it."

Baley said, "She was a Solarian. Her concept of 'husband' was not Auroran."

"Obviously not," said the Chairman.

"But she did have enough of a sense of reality to keep it to herself, Mr. Chairman. She never told of this charade, as Dr. Fastolfe calls it, to any Auroran. She told me the day before yesterday because she wanted to urge me on in the investigation of something that meant so much to her. Yet even so, I imagine she would not have used the word if she had not known I was an Earthman and would understand it in her sense-and not in an Auroran's."

"Very well," said the Chairman. "I'll grant her a bare minimum of good sense-for a Solarian. Is that the one more subject you wanted to bring up?"

"Yes, Mr. Chairman."

"In that case, it is totally irrelevant and can play no part in our deliberations."

"Mr. Chairman, there is one question I must still ask. One question. A dozen words, sir, and then I will be through." He said it as earnestly as he could, for everything depended on this.

The Chairman hesitated. "Agreed. One last question."

"Yes, Mr. Chairman." Baley would have liked to bark out the words, but he refrained. Nor did he raise his voice. Nor did he even point his finger. Everything depended on this. Everything had led up to this and yet he remembered Fastolfe's warning and said it almost casually. "How is it that Dr. Amadiro knew that Jander was Gladia's husband?"

"What?" The Chairman's white and bushy eyebrows raised themselves in surprise. "Who said he knew anything of this?"

Asked a direct question, Baley could continue. "Ask him, Mr. Chairman."

And he merely nodded in the direction of Amadiro, who had risen from his seat and was staring at Baley in obvious horror.

79.

Baley said again, very softly, reluctant to draw attention away from Amadiro, "Ask him, Mr. Chairman. He seems upset."

The Chairman said, "What is this, Dr. Amadiro? Did you know anything about the robot as supposed husband of this Solarian woman?"

Amadiro stuttered, then pressed his lips together for a moment and tried again. The paleness which had struck him had vanished and was replaced by a dull flush. He said, "I am caught by surprise at this meaningless accusation, Mr. Chairman. I do not know what it is all about."

"May I explain, Mr. Chairman? Very briefly?" said Baley. (Would he be cut off?)

"You had better," said the Chairman grimly. "If you have any explanation, I would certainly like to hear it."

"Mr. Chairman," said Baley. "I had a conversation with Dr. Amadiro yesterday afternoon. Because it was his intention to keep me until the storm broke, he spoke more lengthily than he intended and, apparently, more carelessly. In referring to Gladia, he casually referred to the robot, Jander, as her husband. I'm curious as to how he knew that fact."

"Is this true, Dr. Amadiro?" asked the Chairman.

Amadiro was still standing, bearing almost the appearance of a prisoner before a judge. He said, "Whether it is true or not has no bearing on the question under discussion."

"Perhaps not," said the Chairman, "but I was astonished at your reaction to the question when it was put. It occurs to me that there is a meaning to this that Mr. Baley and you both understand and that I do not. I therefore want to understand also. Did you or did you not know of this impossible relationship between Jander and the Solarian woman?"

Amadiro said in a choking voice, "I could not possibly have."

"That is no answer," said the Chairman. "That is an equivocation. You are making a judgment when I am asking you to hand me a memory. Did you or did you not make the statement imputed to you?"

"Before he answers," said Baley, feeling more certain of his ground now that the Chairman was governed by moral outrage, "it is only fair to Dr. Amadiro for me to remind him that Giskard, a robot who was also present at the meeting, can, if asked to do so, repeat the entire conversation, word for word, using the voice and intonation of both parties. In short, the conversation is recorded."

Amadiro burst into a kind of rage. "Mr. Chairman, the robot, Giskard, was designed, constructed, and programmed by Dr. Fastolfe, who announces himself to be the best roboticist who exists and who is bitterly opposed to me. Can we trust a recording produced by such a robot?"

Baley said, "Perhaps you ought to hear the recording and come to your own decision, Mr. Chairman."

"Perhaps I ought," said the Chairman. "I am not here, Dr. Amadiro, to have my decisions made for me. But let us put that aside for a moment. Regardless of what the recording says, Dr. Amadiro, do you wish to state for the record that you did not know that the Solarian woman considered her robot to be her husband and that you never referred to him as her husband? Please remember (as you both, being legislators, should) that, although no robot is present, this entire conversation is being recorded in my own device." He tapped a small bulge at his breast pocket. "Flatly, then, Dr. Amadiro. Yes or no."

Amadiro said, with an edge of desperation in his voice, "Mr. Chairman, I honestly cannot remember what I said in casual conversation. If I did mention the word -and I don't admit I did- it may have been the result of some other casual conversation in which someone mentioned the fact that Gladia acted as lovestruck toward her robot as though he were her husband."

The Chairman said, "And with whom did you have this other casual conversation? Who made this statement to you?"

"At the moment, I cannot say."

Baley said, "Mr. Chairman, if Dr. Amadiro will be so kind as to list anyone and everyone who might have used the word to him, we can question every one of them to discover which one can remember making such a remark."

Amadiro said, "I hope, Mr. Chairman, you will consider the effect on the morale of the Institute if anything of this sort is done."

The Chairman said, "I hope you will consider it, too, Dr. Amadiro, and come up with a better answer to our question, so that we are not forced to extremes."

"One moment, Mr. Chairman," said Baley, as obsequiously as he could manage, "there remains a question."

"Again? Another one?" The Chairman looked at Baley without favor. "What is it?"

"Why is Dr. Amadiro struggling so to avoid admitting he knew of Jander's relation to Gladia? He says it is irrelevant. In that case, why not say he knew of the relationship and be done with it? I say it is relevant and that Dr. Amadiro knows that his admission could be used to demonstrate criminal activity on his part."

Amadiro thundered, "I resent the expression and I demand an apology!"

Fastolfe smiled thinly and Baley's lips pressed together grimly. He had forced Amadiro over the edge.

The Chairman turned an almost alarming red and said with passion, "You demand? You demand? To whom do you demand? I am the Chairman. I hear all views before deciding what to suggest as best to be done. Let me hear what the Earthman has to say

about his interpretation of your action. If he is slandering you, he shall be punished, you may be sure, and I will take the broadest view of the slander statutes, too, you may be sure. But you, Amadiro, may make no demands upon me. Go on, Earthman. Say what you have to say, but be extraordinarily careful."

Baley said, "Thank you, Mr. Chairman. Actually, there is one Auroran to whom Gladia did tell the secret of her relationship with Jander."

The Chairman interrupted. "Well, who is that? Do not play your hyperwave tricks on me."

Baley said, "I have no intention of anything but a straightforward statement, Mr. Chairman. The one Auroran is, of course, Jander himself. He may have been a robot, but he is an inhabitant of Aurora and might be viewed as an Auroran. Gladia must surely, in her passion, have addressed him as 'my husband.' Since Dr. Amadiro has admitted he might possibly have heard from someone else some statement to the effect of Jander's husbandly relationship to Gladia, isn't it logical to suppose that he heard of the matter from Jander? Would Dr. Amadiro be willing, right now, to state for the record that he never spoke to Jander during the period when Jander formed part of Gladia's staff?"

Twice Amadiro's mouth opened as though he would speak. Twice he did not utter a sound.

"Well," said the Chairman, "did you speak to Jander during that period, Dr. Amadiro?"

There was still no answer.

Baley said softly, "If he did, it is entirely relevant to the matter at hand."

"I'm beginning to see that it must be, Mr. Baley. Well, Dr. Amadiro, once again-yes or no."

And Amadiro burst forth; "What evidence does this Earthman have against me in this matter? Does he have a recording of any conversation I have had with Jander? Does he have witnesses who are willing to say they have seen me with Jander? What does he have anything at all besides mere self-serving statements?"

The Chairman turned to look at Baley and Baley said, "Mr. Chairman, if I have nothing at all, then Dr. Amadiro should not hesitate to deny, for the record, any contact with Jander-but he does not do so. As it happens, in the course of my investigation, I spoke to Dr. Vasilia Aliena, the daughter of Dr. Fastolfe. I spoke also to a young Auroran named Santirix Gremionis. In the recordings of both interviews, it will be plain that Dr. Vasilia encouraged Gremionis to pay court to Gladia. You may question Dr. Vasilia as to her purpose in so doing and as to whether this course of action had been suggested to her by Dr. Amadiro. It also appears that it was Gremionis' custom to take long walks with Gladia, which both enjoyed, and on which they were not accompanied by the robot, Jander. You might check on this, if you wish, sir."

The Chairman said dryly, "I may do so, but if all is as you say, what does this show?"

Baley said, "I have stated that, failing Dr. Fastolfe himself, the secret of the humanoid robot could be obtained only from Daneel. Before Jander's death, it could,

with equal facility, have been obtained from Jander. Whereas Daneel was part of Dr. Fastolfe's establishment and could not easily be reached, Jander was part of Gladia's establishment and she was not as sophisticated as Dr. Fastolfe in seeing to a robot's protection.

"Isn't it likely that Dr. Amadiro took the occasion of Gladia's periodic absences from her establishment, when she was walking with Gremionis, to converse with Jander, perhaps by trimensional viewing, to study his responses, to subject him to various tests, and then to erase any sign of his visit with Jander, so that he could never inform Gladia of it? It may be that he came close to finding what he wanted to know-before the attempt ended when Jander went out of action. His concentration then shifted to Daneel. He felt perhaps that he had only a few tests and observations left to make and so he set up the trap of yesterday evening, as I said earlier in my-my testimony."

The Chairman said, in what was almost a whisper, "Now it all hangs together. I am almost forced to believe."

"Plus one final point and then I will truly have nothing more to say," said Baley. "In his examination and testing of Jander, it is entirely possible that Dr. Amadiro accidentally-and without any deliberate intention whatever-immobilized Jander and thus committed roboticide."

And Amadiro, maddened, shouted, "No! Never! Nothing I did to that robot could possibly have immobilized him!"

Fastolfe interposed. "I agree. Mr. Chairman, I, too, think that Dr. Amadiro did not immobilize Jander. However, Mr. Chairman, Dr. Amadiro's statement just now would seem an implicit admission that he was working with Jander-and that Mr. Baley's analysis of the situation is essentially accurate."

The Chairman nodded. "I am forced to agree with you, Dr. Fastolfe. -Dr. Amadiro, you may insist on a formal denial of all this and that may force me into a full-fledged investigation, which could do you a great deal of damage, however it turned out-and I rather suspect, at this stage, it is likely to turn out to your great disadvantage. My suggestion is that you do not force this-that you do not cripple your own position in the Legislature and, perhaps, cripple Aurora's ability to continue along a smooth political course.

"As I see it, before the matter of Jander's immobilization came up, Dr. Fastolfe had a majority of the legislators-not a large majority, admittedly-on his side in the matter of Galactic settlement. You would have swung enough legislators to your side by pushing the matter of Dr. Fastolfe's supposed responsibility for Jander's immobilization and thus have gained the majority. But now Dr. Fastolfe, if he wishes, can turn the tables by accusing you of the immobilization and, moreover, of having tried to hang a false accusation upon your opponent as well-and you would lose.

"If I do not interfere, then it may be that you, Dr. Amadiro, and you, Dr. Fastolfe, actuated by stubbornness or even vindictiveness, will both marshal your forces and accuse each other of all sorts of things. Our political forces and public opinion, too, will be hopelessly divided-even fragmented-to our infinite harm.

"I believe that, in that case, Fastolfe's victory, while inevitable, would be a very costly one, so that it would be my task as the Chairman to swing the votes in his direction to begin with, and to place pressure upon you and your faction, Dr. Amadiro, to accept Fastolfe's victory with as much grace as you can manage, and to do it right now-for the good of Aurora."

Fastolfe said, "I am not interested in a crushing victory, Mr. Chairman. I propose again a compromise whereby Aurora, the other Spacer worlds, and Earth, too, all have the freedom of settlement in the Galaxy. In return, I will be glad to join the Robotics Institute, put my knowledge of humaniform robots at its disposal, and thus facilitate Dr. Amadiro's plan, in return for his solemn agreement to abandon all thought of retaliation against Earth at any time in the future and to put this into treaty form, with ourselves and Earth as signatories."

The Chairman nodded. "A wise and statesmanlike suggestion. May I have your acceptance of this, Dr. Amadiro?"

Amadiro now sat down. His face was a study in defeat. He said, "I have not wanted personal power or the satisfaction of victory. I wanted what I know to be best for Aurora and I am convinced that this plan of Dr. Fastolfe's means an end to Aurora someday. However, I recognize that I 'm now helpless against the work of this Earthman"-he shot a quick venomous glance toward Baley-"and I am forced to accept Dr. Fastolfe's suggestion-though I will ask for permission to address the Legislature on the subject and to state, for the record, my fears of the consequences."

"We will, of course, allow that," said the Chairman. "And if you'll be guided by me, Dr. Fastolfe, you'll get this Earthman off our world as fast as possible. He has won your viewpoint for you, but it will not be a very popular one if Aurorans have too long a time to brood over it as an Earthly victory over Aurorans."

"You are quite right, Mr. Chairman, and Mr. Baley will be gone quickly-with my thanks and, I trust, with yours as well."

"Well," said the Chairman, not with the best of grace, "since his ingenuity has saved us from a bruising political battle, he has my thanks. -Thank you, Mr. Baley."

19. AGAIN BALEY

80.

Baley watched them leave from a distance. Though Amadiro and the Chairman had come together, they now left separately.

Fastolfe came back from seeing them off, making no attempt to hide his intense relief.

"Come, Mr. Baley," he said, "you will have lunch with me and then, as soon after that as possible, you will leave for Earth again."

His robotic staff was clearly in action with that in mind. Baley nodded and said sardonically, "The Chairman managed to thank me, but it seemed to stick in his throat."

Fastolfe said, "You have no idea how you have been honored. The Chairman rarely thanks anyone, but then no one ever thanks the Chairman. It is always left to history to praise Chairmen and this one has served for over forty years. He has grown cranky and ill-tempered, as Chairmen always do in their final decades.

"However, Mr. Baley, once again I thank you and, through me, Aurora will thank you. You will live to see Earthmen move outward into space, even in your short lifetime, and we will help you with our technology.

"How you have managed to untie this knot of ours, Mr. Baley, in two and a half days-less-I can't imagine. You are a wonder.

-But, come, you will want to wash and freshen up. I know I do."

For the first time since the Chairman arrived, Baley had time to think of something besides his next sentence.

He still didn't know what it was that had come to him three times, first on the point of sleep, then on the point of unconsciousness, and finally in postcoital relaxation.

"He was there first!"

It was still meaningless, yet he had made his point to the Chairman and carried all before him without it. Could it have any meaning at all, then, if it was a part of a mechanism that didn't fit and didn't seem needed? Was it nonsense?

It chafed at the corner of his mind and he came to lunch a victor without the proper sensation of victory. Somehow, he felt as though he had missed the point.

For one thing, would the Chairman stick to his resolve? Amadiro had lost the battle, but he didn't seem the kind of person who would give up altogether under any circumstances. Give him credit and assume he meant what he said, that he was driven not by personal vainglory but by his concept of Auroran patriotism. If that were so, he could not give up.

Baley felt it necessary to warn Fastolfe.

"Dr. Fastolfe," he said, "I don't think it's over. Dr. Amadiro will continue the fight to exclude Earth."

Fastolfe nodded as the dishes were served. "I know he will. I expect him to. However, I have no fear as long as the matter of Jander's immobilization is set to rest. With that aside, I'm sure I can always outmaneuver him in the Legislature. Fear not, Mr. Baley, Earth will move along. Nor need you fear personal danger from a vengeful Amadiro. You will be off this planet and on your way back to Earth before sunset-and Daneel will escort you, of course. What's more, the report we'll send with you will ensure, once more, a healthy promotion for you."

"I am eager to go," said Baley, "but I hope I will have time to say my good-byes. I would like to see Gladia once more and I would like to say good-bye to Giskard, who may have saved my life last night."

"No question of that, Mr. Baley. But please eat, won't you?"

Baley went through the motions of eating, but didn't enjoy it.

Like the confrontation with the Chairman and the victory that ensued, the food was oddly flavorless.

He should not have won. The Chairman should have cut him off. Amadiro, if necessary, should have made a flat denial. It would have been accepted over the word-or the reasoning-of an Earthman.

But Fastolfe was jubilant. He said, "I had feared the worst, Mr. Baley. I feared the meeting with the Chairman was premature and that nothing you could say would help the situation. Yet you managed it so well. I was lost in admiration, listening to you. At any moment, I expected Amadiro to demand that his word be taken against an Earthman who, after all, was in a constant state of semimadness at finding himself on a strange planet in the open-"

Baley said frigidly, "With all respect, Dr. Fastolfe, I was not in a constant state of semimadness. Last night was exceptional, but it was the only time I lost control. For the rest of my stay on Aurora, I may have been uncomfortable from time to time, but I was always in my perfect mind." Some of the anger he had suppressed at considerable cost to himself in the confrontation with the Chairman was expressing itself now. "Only during the storm, sir-except, of course"-recollecting-"for a moment or two on the approaching spaceship-"

He was not conscious of the manner in which the thought- the memory, the interpretation-came to him or at what speed. One moment it did not exist, the next moment it was full-blown in his mind, as though it had been there all the time and needed only the bursting of a soap-bubble veil to show it.

"Jehoshaphat!" he said in an awed whisper. Then, with his fist coming down on the table and rattling the dishes, "Jehoshaphat!"

"What is it, Mr. Baley?" asked Fastolfe, startled.

Baley stared at him and heard the question only belatedly. "Nothing, Dr. Fastolfe. I was just thinking of Dr. Amadiro's infernal gall in doing the damage to Jander and then laboring to fix the blame on you, in arranging to have me go half-mad in the storm last night and then using that as a way of casting doubt on my statements. I was just-momentarily-angry."

"Well, no need to be, Mr. Baley. And actually, it is quite impossible for Amadiro to have immobilized Jander. It remains purely a chance event. -To be sure, it is possible that Amadiro's investigation may have increased the odds of such a chance event taking place, but I would not argue the matter."

Baley heard the statement with half of one ear. What he had just said to Fastolfe was fiction and what Fastolfe was saying didn't matter. It was (as the Chairman would have said) irrelevant. In fact, everything that had happened-everything that Baley had explained-was irrelevant. -But nothing had to be changed because of that.

Except one thing-after a while.

Jehoshaphat! he whispered in the silence of his mind and turned suddenly to the lunch, eating with gusto and with joy.

81.

Once again, Baley crossed the lawn between Fastolfe's establishment and Gladia's. He would be seeing Gladia for the fourth time in three days-and (his heart seemed to compress into a hard knot in his chest) now for the last time.

Giskard was with him but at a distance, more intent than ever on the surroundings. Surely, with the Chairman in full possession of the facts, there should be a relaxation of any concern for Baley's safety-if there ever had been any, by rights, when it was Daneel who had been in danger. Presumably, Giskard had not yet been reinstructed in the matter.

Only once did he approach Baley and that was when the latter called out, "Giskard, where's Daneel?"

Swiftly, Giskard covered the ground between them, as though reluctant to speak in anything but a quiet tone. "Daneel is on his way to the spaceport, sir, in the company of several others of the staff, in order to make arrangements for your transportation to Earth. When you are taken to the spaceport, he will meet you there and be on the ship with you, taking his final leave of you at Earth."

"Good news. I treasure every day of companionship with Daneel. And you, Giskard? Will you accompany us?"

"No, sir. I am instructed to remain on Aurora. However, Daneel will serve you well, even in my absence."

"I am sure of that, Giskard, but I will miss you."

"Thank you, sir," said Giskard and retreated as rapidly as he had come. Baley gazed after him speculatively for a moment or so. -No, first things first. He had to see Gladia.

She advanced to greet him-and what a world of change had taken place in two days. She was not joyous, she was not dancing, she was not bubbling; there was still the grave look of one who had suffered a shock and a loss-but the troubled aura around her was gone. There was a kind of serenity now, as though she had grown aware of the fact that life continued after all and might even, on occasion, be sweet.

She managed a smile, warm and friendly, as she advanced to him and held out her hand.

"Oh, take it, take it, Elijah," she said when he hesitated. "It's ridiculous for you to hang back and pretend you don't want to touch me after last night. You see, I still remember it and I haven't come to regret it. Quite the contrary."

Baley performed the unusual operation (for him) of smiling in return. "I remember it, too, Gladia, and I don't regret it either. I would even like to do it again, but I have come to say good-bye."

A shade fell across her face. "Then you'll be going back to Earth. Yet the report I got by way of the robot network that always operates between Fastolfe's establishment and my own is that all went well. You can't have failed"

"I did not fail. Dr. Fastolfe, has, in fact, won completely. I don't believe there will be any suggestion at all that he was in any way involved in Jander's death."

"Because of what you had to say, Elijah?"

"I believe so."

"I knew it." There was a tinge of self-satisfaction to that. "I knew you would do it when I told them to get you on the case.

-But then why are you being sent home?"

"Precisely because the case is solved. If I remain here longer, I will be a foreign irritant in the body politic, apparently."

She looked at him dubiously for a moment and said, "I'm not sure what you mean by that. It sounds like an Earth expression to me. But never mind. Were you able to find out who killed Jander? That is the important part."

Baley looked around. Giskard was standing in one niche, one of Gladia's robots in another.

Gladia interpreted the look without trouble. She said, "Now, Elijah, you must learn to stop worrying about robots. You don't worry about the presence of the chair, do you, or of these drapes?"

Baley nodded. "Well, then, Gladia, I'm sorry-I'm terribly sorry-but I had to tell them of the fact that Jander was your husband."

Her eyes opened wide and he hastened on. "I had to. It was essential to the case, but I promise it won't affect your status on Aurora." As briefly as he might, he summarized the events of the confrontation and concluded, "So, you see, no one killed Jander. The immobilization was the result of a chance change in his positronic pathways, though the

probabilities of that chance change may have been enhanced by what had been going on."

"And I never knew," she moaned. "I never knew. I connived at this Amadiro's foul plan. -And he is the one responsible just as much, as though he had deliberately hacked away at him with a sledgehammer."

"Gladia," said Baley earnestly, "that is uncharitable. He had no intention of doing harm to Jander and what he was doing was, in his own eyes, for the good of Aurora. As it is, he is punished. He is defeated, his plans are in shambles, and the Robotics Institute will come under the domination of Dr. Fastolfe. You yourself could not work out a more suitable punishment, no matter how you tried."

She said, "I'll think about that. -But what do I do with Santirix Gremionis, this good-looking young lackey whose job it was to lure me away? No wonder he appeared to cling to hope despite my repeated refusal. Well, he'll come here again and I will have the pleasure of-"

Baley shook his head violently. "Gladia, no. I have interviewed him and I assure you he had no knowledge of what was going on. He was as much deceived as you were. In fact, you have it reversed. He was not persistent because it was important to lure you away. He was useful to Amadiro because he was so persistent-and that persistence was out of regard for you. Out of love, if the word means on Aurora what it means on Earth."

"On Aurora, it is choreography. Jander was a robot and you are an Earthman. It is different with the Aurorans."

"So you have explained. But Gladia, you learned from Jander to take; you learned from me-not that I meant it-to give. If you benefit by learning, is it not only right and fair that you should teach in your turn? Gremionis is sufficiently attracted to you to be willing to learn. He already defies Auroran convention by persisting in the face of your refusal. He will defy more. You can teach him to give and take and you will learn to do both in alternation or together, in company with him."

Gladia looked searchingly into his eyes. "Elijah, are you trying to get rid of me?"

Slowly, Baley nodded. "Yes, Gladia, I am. It's your happiness I want at this moment, more than I have ever wanted anything for myself or for Earth. I can't give you happiness, but if Gremionis can give it to you, I will be as happy-almost as happy as if it were I myself who were making the gift."

"Gladia, he may surprise you with how eagerly he will break through the choreography when you show him how. And the word will somehow spread, so that others will come to swoon at your feet-and Gremionis may find it possible to teach other women. Gladia, it may be that you will revolutionize Auroran sex before you are through. You will have three centuries in which to do so."

Gladia stared at him and then broke into a laugh. "You are teasing. You are being deliberately foolish. I wouldn't have thought it of you, Elijah. You always look so long-faced and grave. Jehoshaphat!" (And, with the last word, she tried to imitate his somber baritone.)

Baley said, 'Perhaps I'm teasing a little, but I mean it in essence. Promise me that you will give Gremionis his chance.'

She came closer to him and, without hesitation, he put his arm around her. She placed her finger on his lips and he made a small kissing motion. She said softly, "Wouldn't you rather have me for yourself, Elijah?"

He said, just as softly (and unable to become unaware of the robots in the room), "Yes, I would, Gladia. I am ashamed to say that at this moment I would be content to have the Earth fall to pieces if I could have you-but I can't. In a few hours, I'll be off Aurora and there's no way you will be allowed to go with me. Nor do I think I will ever be allowed to come back to Aurora, nor is it possible that you will ever visit Earth.

"I will never see you again, Gladia, but I will never forget you, either. I will die in a few decades and when I do you will be as young as you are now, so we would have to say good-bye soon whatever we could imagine as happening."

She put her head against his chest. "Oh, Elijah, twice you came into my life, each time for just a few hours. Twice you've done so much for me and then said good-bye. The first time all I could do was touch your face, but what a difference that made. The second time, I did so much more-and again what a difference that made. I'll never forget you, Elijah, if I live more centuries than I can count."

Baley said, "Then let it not be the kind of memory that cuts you off from happiness. Accept Gremionis and make him happy -and let him make you happy as well. And, remember, there is nothing to prevent you from sending me letters. The hyperpost between Aurora and Earth exists."

"I will, Elijah. And you will write to me as well?"

"I will, Gladia."

Then there was silence and, reluctantly, they moved apart. She remained standing in the middle of the room and when he went to the door and turned back, she was still standing there with a little smile. His lips shaped: Good-bye. And then because there was no sound-he could not have done it with sound-he added, my love.

And her lips moved, too. Goode-bye, my dearest love.

And he turned and walked out and knew he would never see her in tangible form, never touch her again.

83.

It was a while before Elijah could bring himself to consider the task that still lay before him. He Shad walked in silence perhaps half the distance back to Fastolfe's establishment before he stopped and lifted his arm.

The observant Giskard was at his side in a moment.

Baley said, "How much time before I must leave for the spaceport, Giskard?"

"Three hours and ten minutes, sir."

Baley thought a moment. "I would like to walk over to that tree there and sit down with my back against the trunk and spend some time there alone. With you, of course, but away from other human beings."

"In the open, sir?" The robot's voice was unable to express surprise and shock, but somehow Baley had the feeling that, if Giskard were human, those words would express those feelings.

"Yes," said Baley. "I have to think and, after last night, a calm day like this-sunny, cloudless, mild-scarcely seems dangerous. I'll go indoors if I get agoraphobic. I promise. So will you join me?"

"Yes, sir."

"Good." Baley led the way. They reached the tree and Baley touched the trunk gingerly and then stared at his finger, which remained perfectly clean. Reassured that leaning against the trunk would not dirty him, he inspected the ground and then sat down carefully and rested his back against the tree.

It was not nearly as comfortable as the back of a chair would have been, but there was a feeling of peace (oddly enough) that perhaps he would not have had inside a room.

Giskard remained standing and Baley said, "Won't you sit down, too?"

"I am as comfortable standing, sir."

"I know that, Giskard, but I will think better if I don't have to look up at you."

"I could not guard you against possible harm as efficiently if I were seated, sir."

"I know that, too, Giskard, but there is no reasonable danger at the moment. My mission is over, the case is solved, Dr. Fastolfe's position is secure. You can risk being seated and I order you to sit down."

Giskard at once sat down, facing Baley, but his eyes continued to wander in this direction and that and were ever alert.

Baley looked at the sky, through the leaves of the tree, green against blue, listened to the susurrations of insects and to the sudden call of a bird, noted a disturbance of grass nearby that might have meant a small animal passing by, and again thought how oddly peaceful it all was and how different this peacefulness was from the clamor of the City. This was a quiet peace, an unhurried peace, a removed peace.

For the first time, Baley caught a faint suggestion of how it might be to prefer Outside to the City. He caught himself being thankful to his experiences on Aurora, to the storm most of all- for he knew now that he would be able to leave Earth and face the conditions of whatever new world he might settle on, he and Ben-and perhaps Jessie.

He said, "Last night, in the darkness of the storm, I wondered if I might have seen Aurora's satellite were it not for the clouds. It has a satellite, if I recall my reading correctly."

"Two, actually, sir. The larger is Tithonus, but it is still so small that it appears only as a moderately bright star. The smaller is not visible at all to the unaided eye and is simply called Tithonus II, when it is referred to at all."

"Thank you. -And thank you, Giskard, for rescuing me last night." He looked at the robot. "I don't know the proper way of thanking you."

"It is not necessary to thank me at all. I was merely following the dictates of the First Law. I had no choice in the matter."

"Nevertheless, I may even owe you my life and it is important that you know I understand this. -And now, Giskard, what ought I to do?"

"Concerning what matter, sir?"

"My mission is over. Dr. Fastolfe's views are secure. Earth's future may be assured. It would seem I have nothing more to do and yet there is the matter of Jander."

"I do not understand, sir."

"Well, it seems settled that he died by a chance shift of positronic potential in his brain, but Fastolfe admits the chance of that is infinitesimally small. Even with Amadiro's activities, the chance, though possibly greater, would remain infinitesimally small. At least, so Fastolfe thinks. It continues to seem to me, then, that Jander's death was one of deliberate roboticide. Yet I don't dare raise this point now. I don't want to unsettle matters that have been brought to such a satisfactory conclusion. I don't want to put Fastolfe in jeopardy again. I don't want to make Gladia unhappy. I don't know what to do. I can't talk to a human being about this, so I'm talking to you, Giskard."

"Yes, sir."

"I can always order you to erase whatever I have said and to remember it no more."

"Yes, sir."

"In your opinion, what ought I to do?"

Giskard said, "If there is a roboticide, sir, there must be someone capable of committing the act. Only Dr. Fastolfe is capable of committing it and he says he did not do it."

"Yes, we started with that situation. I believe Dr. Fastolfe and am quite certain he did not do it."

"Then how could there have been a roboticide, sir?"

"Suppose that someone else knew as much about robots as Dr. Fastolfe does, Giskard."

Baley drew up his knees and clasped his hands around them. He did not look at Giskard and seemed lost in thought.

"Who might that be, sir?" asked Giskard.

And finally, Baley reached the crucial point.

He said, "You, Giskard."

84.

If Giskard had been human, he might have simply stared, silent and stunned; or he might have raged angrily; or shrunk back in terror; or had any of a dozen responses. Because he was a robot, he showed no sign of any emotion whatever and simply said, "Why do you say so, sir?"

Baley said, "I am quite certain, Giskard, that you know exactly how I have come to this conclusion, but you will do me a favor if you allow me, in this quiet place and in this bit of time before I must leave, to explain the matter for my own benefit. I would like to hear myself talk about it. And I would like you to correct me where I am wrong."

"By all means, sir."

"I suppose my initial mistake was to suppose that you are a less complicated and more primitive robot than Daneel is, simply because you look less human. A human being will always suppose that, the more human a robot is, the more advanced, complicated, and intelligent he will be. To be sure, a robot like you is easily designed and one like Daneel is a great problem for men like Amadiro and can be handled only by a robotics genius such as Fastolfe. However, the difficulty in designing Daneel lies, I suspect, in reproducing all the human aspects such as facial expression, intonation of voice, gestures and movements that are extraordinarily intricate but have nothing really to do with complexity of mind. Am I right?"

"Quite right, sir."

"So I automatically underestimated you, as does everyone. Yet you gave yourself away even before we landed on Aurora. You remember, perhaps, that during the landing, I was overcome by an agoraphobic spasm and was, for a moment, even more helpless than I was last night in the storm."

"I do, sir."

"At the time, Daneel was in the cabin with me, while you were outside the door. I was falling into a kind of catatonic state, noiselessly, and he was, perhaps, not looking at me and so knew nothing of it. You were outside the cabin and yet it was you who dashed in and turned off the viewer I was holding. You got there first, ahead of Daneel, though his reflexes are as fast as yours, I'm sure—as he demonstrated when he prevented Dr. Fastolfe from striking me."

"Surely it cannot be that Dr. Fastolfe was striking you."

"He wasn't. He was merely demonstrating Daneel's reflexes. —And yet, as I say, in the cabin you got there first. I was scarcely in condition to observe that fact, but I have been trained to observe and I am not put entirely out of action even by agoraphobic terror, as I showed last night. I did notice you were there first, though I tended to forget the fact. There is, of course, only one logical solution."

Baley paused, as though expecting Giskard to agree, but the robot said nothing.

(In later years, this was what Baley pictured first when thinking of his stay on Aurora. Not the storm. Not even Gladia. It was, rather, the quiet time under the tree, with the green leaves against the blue sky, the mild breeze, the soft sound of animals, and Giskard opposite him with faintly glowing eyes.)

Baley said, "It would seem that you could somehow detect my state of mind and, even through the closed door, tell that I was having a seizure of some sort. Or, to put it briefly and perhaps simplistically, you can read minds."

"Yes, sir," said Giskard quietly.

"And you can somehow influence minds, too. I believe you noted that I had detected this and you obscured it in my mind, so that I somehow did not remember or did not see the significance-if I did casually recall the situation. Yet you did not do that entirely efficiently, perhaps because your powers are limited-"

Giskard said, "Sir, the First Law is paramount. I had to come to your rescue, although I quite realized that would give me away. And I had to obscure your mind minimally, in order not to damage it in any way."

Baley nodded. "You have your difficulties, I see. Obscured minimally-so I did remember it when my mind was sufficiently relaxed and could think by free association. Just before I lost consciousness in the storm, I knew you would find me first, as you had on the ship. You may have found me by infrared radiation, but every mammal and bird was radiating as well and that might be confusing-but you could also detect mental activity, even if I were unconscious, and that would help you to find me."

"It certainly helped," said Giskard.

"When I did remember, close to sleep or unconsciousness, I would forget again when fully conscious. Last night, however, I remembered for the third time and I was not alone. Gladia was with me and could repeat what I had said, which was 'He was there first.' And even then I could not remember the meaning, until a chance remark of Dr. Fastolfe's led to a thought that worked its way past the obscuration. Then, once it dawned on me, I remembered other things. Thus, when I was wondering if I were really landing on Aurora, you assured me that our destination was Aurora before I actually asked. -I presume you allow no one to know of your mind-reading ability."

"That is true, sir."

"Why is that?"

"My mind reading gives me a unique ability to obey the First Law, sir, so I value its existence. I can prevent harm to human beings far more efficiently. It seemed to me, however, that neither Dr. Fastolfe-nor any other human being-would long tolerate a mind-reading robot, so I keep the ability secret. Dr. Fastolfe loves to tell the legend of the mind-reading robot who was destroyed by Susan Calvin and I would not want him to duplicate Dr. Calvin's feat."

"Yes, he told the legend to me. I suspect that he knows, subliminally, that you read minds or he wouldn't harp on the legend so. And it is dangerous for him to do so, as far as you are concerned, I should think. Certainly, it helped put the matter in my mind,"

"I do what I can to neutralize the danger without unduly tampering with Dr. Fastolfe's mind. Dr. Fastolfe invariably stresses the legendary and impossible nature of the story when he tells it."

"Yes, I remember that, too. But if Fastolfe does not know you can read minds, it must be that you were not designed originally with these powers. How, then, do you come to have them?"

-No, don't tell me, Giskard. Let me suggest something. Miss Vasilisa was particularly fascinated with you when she was a young woman first becoming interested in robotics. She told me that she had experimented by programming you under Fastolfe's distant

supervision. Could it be that, at one time, quite by accident, she did something that gave you the power? Is that correct?"

"That is correct, sir."

"And do you know what that something is?"

"Yes, sir."

"Are you the only mind-reading robot that exists?"

"So far, yes, sir. There will be others."

"If I asked you what it was that Dr. Vasilisa did to you to give you such powers-or if Dr. Fastolfe did-would you tell us by virtue of the Second Law?"

"No, sir, for it is my judgment that it would do you harm to know and my refusal to tell you under the First Law would take precedence. The problem would not arise, however, for I would know that someone was going to ask the question and give the order and I would remove the impulse to do so from the mind before it could be done."

"Yes," said Baley. "Evening before last, as we were walking from Gladia's to Fastolfe's, I asked Daneel if he had had any contact with Jander during the latter's stay with Gladia and he answered quite simply that he had not. I then turned to ask you the same question and, somehow, I never did. You quashed the impulse for me to do so, I take it."

"Yes, sir."

"Because if I had asked, 'you would have had to say that you knew him well at that time and you were not prepared to have me know that.'"

"I was not, sir."

"But during this period of contact with Jander, you knew he was being tested by Amadiro because, I presume, you could read Jander's mind or detect his positronic potentials-"

"Yes, sir, the same ability covers both robotic and human mental activity. Robots are far easier to understand."

"You disapproved of Amadiro's activities because you agreed with Fastolfe on the matter of settling the Galaxy."

"Yes, sir."

"Why did you not stop Amadiro? Why did you not remove from his mind the impulse to test Jander?"

Giskard said, "Sir, I do not lightly tamper with minds. Amadiro's resolve was so deep and complex that, to remove it, I would have had to do much-and his mind is an advanced and important one that I would be reluctant to damage. I let the matter continue for a great while, during which I pondered on which action would best fulfill my First Law needs. Finally, I decided on the proper manner to correct the situation. It was not an easy decision."

"You decided to immobilize Jander before Amadiro could work out the method for designing a true humaniform robot. You knew how to do so, since you had, over the years, gained a perfect understanding of Fastolfe's theories from Fastolfe's mind. Is that right?"

"Exactly, sir."

"So that Fastolfe was not the only one, after all, expert enough to immobilize Jander."

"In a sense, he was, sir. My own ability is merely the reflection -or the extension-of his."

"But it will do. Did you not see that this immobilization would place Fastolfe in great danger? That he would be the natural suspect? Did you plan on admitting your action and revealing your abilities if that were necessary to save him?"

Giskard said, "I did indeed see that Dr. Fastolfe would be in a painful situation, but I did not intend to admit my guilt. I had hoped to utilize the situation as a wedge for getting you to Aurora."

"Getting me here? Was that your idea?" Baley felt rather stupefied.

"Yes, sir. With your permission, I would like to explain."

Baley said, "Please do."

Giskard said, "I knew of you from Miss Gladia and from Dr. Fastolfe, not only from what they said but from what was in their minds. I learned of the situation on Earth. Earthmen, it was clear, live behind walls, which they find difficult to escape from, but it was just as clear to me that Aurorans live behind walls, too.

"Aurorans live behind walls made of robots, who shield them from all the vicissitudes of life and who, in Amadiro's plans, would build up shielded societies to wall up Aurorans settling new worlds. Aurorans also live behind walls made up of their own extended lives, which forces them to overvalue individuality and keeps them from pooling their scientific resources. Nor do they indulge in the rough-and-tumble of controversy, but, through their Chairman, demand a short-circuiting of all uncertainty and that decisions on solutions be reached before problems are aired. They could not be bothered with actually thrashing out best solutions. What they wanted were quiet solutions.

"The Earthman's walls are crude and literal, so that their existence is obtrusive and obvious-and there are always some who long to escape. The Aurorans' walls are immaterial and aren't even seen as walls, so that none can even conceive of escaping. It seemed to me, then, that it must be Earthmen and not Aurorans-or any other Spacers-who must settle the Galaxy and establish what will someday become a Galactic Empire.

"All this was Dr. Fastolfe's reasoning and I agreed with it. Dr. Fastolfe was, however, satisfied with the reasoning, while I, given my own abilities, could not be. I had to examine the mind of at least one Earthman directly, in order that I might check my conclusions, and you were the Earthman I thought I could bring to Aurora. The immobilization of Jander served both to stop Amadiro and to be the occasion for your visit. I pushed Miss Gladia very slightly to have her suggest your coming to Dr. Fastolfe; I pushed him in turn, very slightly, to have him suggest it to the Chairman; and I pushed the Chairman, very slightly, to have him agree. Once you arrived, I studied you and was pleased with what I found."

Giskard stopped speaking and became robotically impassive again.

Baley frowned. "It occurs to me that I have earned no credit in what I have done here. You must have seen to it that I found my way to the truth."

"No, sir. On the contrary. I placed barriers in your way- reasonable ones, of course. I refused to let you recognize my abilities, even though I was forced to give myself away. I made sure that you felt dejection and despair at odd times. I encouraged you to risk the open, in order to study your responses. Yet you found your way through and over all these obstacles and I was pleased.

"I found that you longed for the walls of your City but recognized that you must learn to do without them. I found that you suffered from the view of Aurora from space and from your exposure to the storm, but that neither prevented you from thinking nor drove you from your problem. I found that you accept your shortcomings and your brief life-and that you do not dodge controversy."

Baley said, "How do you know I am representative of Earthpeople generally?"

"I know you are not. But from your mind, I know there are some like you and we will build with those. I will see to it-and now that I know clearly the path that must be followed, I will prepare other robots like myself-and they will see to it, too."

Baley said suddenly, "You mean that mind-reading robots will come to Earth?"

"No, I do not. And you are right to be alarmed. Involving robots directly will mean the construction of the very walls that are dooming Aurora and the Spacer worlds to paralysis. Earthmen will have to settle the Galaxy without robots of any kind. It will mean difficulties, dangers, and harm without measure- events that robots would labor to prevent if they were present- but, in the end, human beings will be better off for having worked on their own. And perhaps someday-some long-away day in the future-robots can intervene once more. Who can tell?"

Baley said curiously, "Do you see the future?"

"No, sir, but studying minds as I do, I can tell dimly that there are laws that govern human behavior as the Three Laws of Robotics govern robotic behavior; and with these it may be that the future will be dealt with, after a fashion-someday. The human laws are far more complicated than the Laws of Robotics are and I do not have any idea as to how they may be organized. They may be statistical in nature, so that they might not be fruitfully expressed except when dealing with huge populations. They may be very loosely binding, so that they might not make sense unless those huge populations are unaware of the operation of those laws."

"Tell me, Giskard, is this what Dr. Fastolfe refers to as the future science of 'psychohistory'?"

"Yes, sir. I have gently inserted it into his mind, in order that the process of working it out begin. It will be needed someday, now that the existence of the Spacer worlds as a long-lived robotized culture is coming to an end and a new wave of human expansion by short-lived human beings-without robots-will be beginning.

"And now"-Giskard rose to his feet-"I think, sir, that we must go to Dr. Fastolfe's establishment and prepare for your leave-taking. All that we have said here will not be repeated, of course."

"It is strictly confidential, I assure you," said Baley.

"Indeed," said Giskard calmly. "But you need not fear the responsibility of having to remain silent. I will allow you to remember, but you will never have the urge to repeat the matter -not the slightest."

Baley lifted his eyebrows in resignation over that and said, "One thing, though, Giskard, before you clamp down on me. Will you see to it that Gladia is not disturbed on this planet, that she is not treated unkindly because she is a Solarian and has accepted a robot as her husband, and-and that she will accept the offers of Gremionis?"

"I heard your final conversation with Miss Gladia, sir, and I understand. It will be taken care of. Now, sir, may I take my leave? "

He shook his hand in the most human gesture Baley had ever seen him make.

Baley took it. The fingers were hard and cool in his grip. "Good-bye--friend Giskard."

Giskard said, "Good-bye, friend Elijah, and remember that, although people apply the phrase to Aurora, it is, from this point on, Earth itself that is the true World of the Dawn."

ROBOTS AND EMPIRE

1985

To Robyn and Michael

And to the years of happiness

They will continue to enjoy

As they walk the road of life together.

PART I - AURORA

1. THE DESCENDANT

1.

Gladia felt the lawn lounge to make sure it wasn't too damp and then sat down. A touch at the control adjusted it in such a way as to allow her to be semi-recumbent and another activated the diamagnetic field and gave her, as it always did, the sensation of utter relaxation. And why not? She was, in actual fact, floating--a centimeter above the fabric.

It was a warm and pleasant night, the kind that found the planet Aurora at its best--fragrant and star-lit.

With a pang of sadness, she studied the numerous little sparks that dotted the sky with patterns, sparks that were all the brighter because she had ordered the lights of her establishment dimmed.

How was it, she wondered, that she had never learned the names of the stars and had never found out which were which in all the twenty-three decades of her life. One of them was the star about which her birth planet of Solaria orbited, the star which, during the first three decades of her life, she had thought of merely as "the sun."

Gladia had once been called Gladia Solaria. That was when she had come to Aurora, twenty decades before two hundred Standard Galactic Years--and it was meant as a not very friendly way of marking her foreign birth. A month before had been the bicentennial anniversary of her arrival, something she had left unmarked because she did not particularly want to think of those days. Before that, on Solaria, she had been Gladia-Delmarre.

She stirred uneasily. She had almost forgotten that surname. Was it because it was so long ago? Or was it merely that she labored to forget?

All these years she had not regretted Solaria, never missed it.

And yet now?

Was it because she had now, quite suddenly, discovered herself to have survived it? It was gone--a historical memory--and she still lived on? Did she miss it now for that reason?

Her brow furrowed. No, she did not miss it, she decided resolutely. She did not long for it, nor did she wish to return to it. It was just the peculiar pang of something that had been so much a part of her--however destructively--being gone.

Solaria! The last of the Spacer worlds to be settled and made into a home for humanity. And in consequence, by some mysterious law of symmetry perhaps, it was also the first to die?

The first? Did that imply a second and third and so on?

Gladia felt her sadness deepen. There were those who thought there was indeed such an implication. If so, Aurora, her long-adopted home, having been the first Spacer world to be settled, would, by that same rule of symmetry, therefore be the last of the fifty to die. In that case, it might, even at worst, outlast her own stretched-out lifetime and if so, that would have to do.

Her eyes sought the stars again. It was hopeless. There was no way she could possibly work out which of those indistinguishable dots of light was Solaria's sun. She imagined it would be one of the brighter ones, but there were hundreds even of those.

She lifted her arm and made what she identified to herself only as her "Daneel gesture." The fact that it was dark did not matter.

Robot Daneel Olivaw was at her side almost at once. Anyone who had known him a little over twenty decades before, when he had first been designed by Han Fastolfe, would not have been conscious of any noticeable change in him. His broad, high-cheekboned face, with its short bronze hair combed back; his blue eyes; his tall, well-knit, and perfectly humanoid body would have seemed as young and as calmly unemotional as ever.

"May I be of help in any way, Madam Gladia?" he asked in an even voice.

"Yes, Daneel. Which of those stars is Solaria's sun?"

Daneel did not look upward. He said, "None of them, Madam Gladia. At this time of year, Solaria's sun will not rise until 0320."

"Oh?" Gladia felt dashed. Somehow she had assumed that any star in which she happened to be interested would be visible at any time it occurred to her to look. Of course, they did rise and set at different times. She knew that much. "I've been staring at nothing, then."

"The stars, I gather from human reactions," said Daneel, as though in an attempt to console, "are beautiful whether any particular one of them is visible or not."

"I dare say," said Gladia discontentedly and adjusted the lounge to an upright position with a snap. She stood up. "However, it was Solaria's sun I wanted to see--but not so much that I intend to sit here till 0320."

"Even were you to do so," said Daneel, "you would need magnilenses."

"Magnilenses?"

"It is not quite visible to the unaided eye, Madam Gladia."

"Worse and worse!" She brushed at her slacks. "I should have consulted you first, Daneel."

Anyone who had known Gladia twenty decades before, when she had first arrived in Aurora, would have found a change. Unlike Daneel, she was merely human. She was still 155 centimeters tall, almost 10 centimeters below the ideal height for a Spacer woman. She had carefully kept her slim figure and there was no sign of weakness or stiffness about her body. Still, there was a bit of gray in her hair, fine wrinkles near her eyes, and a touch of graininess about her skin. She might well live another ten or twelve decades, but there was no denying that she was already no longer young. That didn't bother her.

She said, "Can you identify all the stars, Daneel?"

"I know those visible to the unaided eye, Madam Gladia. "

"And when they rise and set on any day of the year?"

"Yes, Madam Gladia. "

"And all sorts of other things about them?"

"Yes, Madam Gladia. Dr. Fastolfe once asked me to gather astronomical data so that he could have them at his fingertips without having to consult his computer. He used to say it was friendlier to have me tell him than to have his computer do so." Then, as though to anticipate the next question, "He did not explain why that should be so."

Gladia raised her left arm and made the appropriate gesture. Her house was at once illuminated. In the soft light that now reached her, she was subliminally aware of the shadowy figures of several robots, but she paid no attention to that. In any well-ordered establishment, there were always robots within reach of human beings, both for security and for service.

Gladia took a last fugitive glimpse at the sky, where the stars had now dimmed in the scattered light. She shrugged lightly. It had been quixotic. What good would it have done even if she had been able to see the sun of that now-lost world, one faint dot among many? She might as well choose a dot at random, tell herself it was Solaria's sun, and stare at it.

Her attention turned to R. Daneel. He waited for her patiently, the planes of his face largely in shadow.

She found herself thinking again how little he had changed since she had seen him on arriving at Dr. Fastolfe's establishment so long ago. He had undergone repairs, of course. She knew that, but it was a vague knowledge that one pushed away and kept at a distance.

It was part of the general queasiness that held good for human beings, too. Spacers might boast of their iron health and of their life-spans of thirty to forty decades, but they were not entirely immune to the ravages of age. One of Gladia's femurs fit into a titanium-silicone hip socket. Her left thumb was totally artificial, though no one could tell that without careful ultrasonograms. Even some of her nerves had been rewired. Such things would be true of any Spacer of similar age from any of the fifty Spacer worlds (no, forty-nine, for now Solaria could no longer be counted).

To make any reference to such things, however, was an ultimate obscenity. The medical records involved, which had to exist since further treatment might be necessary, were never revealed for any reason. Surgeons, whose incomes were considerably higher than those of the Chairman himself, were paid so well, in part, because they were virtually ostracized from polite society. After all, they knew.

It was all part of the Spacer fixation on long life, on their unwillingness to admit that old age existed, but Gladia didn't linger on any analysis of causes. She was restlessly uneasy in thinking about herself in that connection. If she had a three-dimensional map of herself with all prosthetic portions, all repairs, marked off in red against the gray of her

natural self, what a general pinkness she would appear to have from a distance. Or so she imagined.

Her brain, however, was still intact and whole and while that was so, she was intact and whole, whatever happened to the rest of her body.

Which brought her back to Daneel. Though she had known him for twenty decades, it was only in the last year that he was hers. When Fastolfe died (his end hastened, perhaps, by despair), he had willed everything to the city of Eos, which was a common enough state of affairs. Two items, however, he had left to Gladia (aside from confirming her in the ownership of her establishment and its robots and other chattels, together with the grounds thereto appertaining).

One of them had been Daneel.

Gladia asked, "Do you remember everything you have ever committed to memory over the course of twenty decades, Daneel?"

Daneel said gravely, "I believe so, Madam Gladia. To be sure, if I forgot an item, I would not know that, for it would have been forgotten and I would not then recall ever having memorized it."

"That doesn't follow at all," said Gladia. "You might well remember knowing it, but be unable to think of it at the moment. I have frequently had something at the tip of my tongue, so to speak, and been unable to retrieve it."

Daneel said, "I do not understand, madam. If I knew something, surely it would be there when I needed it."

"Perfect retrieval?" They were walking slowly toward the house.

"Merely retrieval, madam. I am designed so."

"For how much longer?"

"I do not understand, madam."

"I mean, how much will your brain hold? With a little over twenty decades of accumulated memories, how much longer can it go on?"

"I do not know, madam. As yet I feel no difficulty."

"You might not--until you suddenly discover you can remember no more."

Daneel seemed thoughtful for a moment. "That may be so, madam."

"You know, Daneel, not all your memories are equally important."

"I cannot judge among them, madam."

"Others can. It would be perfectly possible to clean out your brain, Daneel, and then, under supervision, refill it with its important memory content only--say, ten percent of the whole. You would then be able to continue for centuries longer than you would otherwise. With repeated treatment of this sort, you could go on indefinitely. It is an expensive procedure, of course, but I would not cavil at that. You'd be worth it."

"Would I be consulted on the matter, madam? Would I be asked to agree to such treatment?"

"Of course. I would not order you in a matter like that. It would be a betrayal of Dr. Fastolfe's trust."

"Thank you, madam. In that case, I must tell you that I would never submit voluntarily to such a procedure unless I found myself to have actually lost my memory function."

They had reached the door and Gladia paused. She said, in honest puzzlement, "Why ever not, Daneel?"

Daneel said in a low voice, "There are memories I cannot risk losing, madam, either through inadvertence or through poor judgment on the part of those conducting the procedure."

"Like the rising and setting of the stars?--Forgive me, Daneel, I didn't mean to be joking. To what memories are you referring?"

Daneel said, his voice still lower, "Madam, I refer to my memories of my onetime partner, the Earthman Elijah Baley. "

And Gladia stood there, stricken, so that it was Daneel who had to take the initiative, finally, and signal for the door to open.

2.

Robot Giskard Reventlov was waiting in the living room and Gladia greeted him with that same pang of uneasiness that always assailed her when she faced him.

He was primitive in comparison with Daneel. He was obviously a robot--metallic, with a face that had nothing human in expression upon it, with eyes that glowed a dim red, as could be seen if it were dark enough. Whereas Daneel wore clothing, Giskard had only the illusion of clothing--but a skillful illusion, for it was Gladia herself who had designed it.

"Well, Giskard," she said. "Good evening, Madam Gladia," said Giskard with a small bow of his head.

Gladia remembered the words of Elijah Baley long ago, like a whisper inside the recesses of her brain:

"Daneel will take care of you. He will be your friend as well as protector and you must be a friend to him--for my sake. But it is Giskard I want you to listen to. Let him be your adviser."

Gladia had frowned. "Why him? I'm not sure I like him."

"I do not ask you to like him. I ask you to trust him."

And he would not say why.

Gladia tried to trust the robot Giskard, but was glad she did not have to try to like him. Something about him made her shiver.

She had both Daneel and Giskard as effective parts of her establishment for many decades during which Fastolfe had held titular ownership. It was only on his deathbed that Han Fastolfe had actually transferred ownership. Giskard was the second item, after Daneel, that Fastolfe had left Gladia.

She had said to the old man, "Daneel is enough, Han. Your daughter Vasilia would like to have Giskard. I'm sure of that."

Fastolfe was lying in bed quietly, eyes closed, looking more peaceful than she had seen him look in years. He did not answer immediately and for a moment she thought he had slipped out of life so quietly that she had not noticed. She tightened her grip on his hand convulsively and his eyes opened.

He whispered, "I care nothing for my biological daughters, Gladia. For twenty centuries, I have had but one functional daughter and that has been you. I want you to have Giskard. He is valuable."

"Why is he valuable?"

"I cannot say, but I have always found his presence consoling. Keep him always, Gladia. Promise me that."

"I promise," she said.

And then his eyes opened one last time and his voice, finding a final reservoir of strength, said, in almost a natural tone of voice, "I love you, Gladia, my daughter."

And Gladia said, "I love you, Han, my father."

Those were the last words he said and heard. Gladia found herself holding the hand of a dead man and, for a while, could not bring herself to let go.

So Giskard was hers. And yet he made her uneasy and she didn't know why.

"Well, Giskard," she said, "I've been trying to see Solaria in the sky among the stars, but Daneel tells me it won't be visible till 0320 and that I would require magnilenses even then. Would you have known that?"

"No, madam."

"Should I wait up till all hours? What do you think?"

"I suggest, Madam Gladia, that you would be better off in bed."

Gladia bridled. "Indeed? And if I choose to stay up?"

"Mine is only a suggestion, madam, but you will have a hard day tomorrow and you will undoubtedly regret missing your sleep if you stay up."

Gladia frowned. "What's going to make my day hard tomorrow, Giskard? I'm not aware of any forthcoming difficulty."

Giskard said, "You have an appointment, madam, with one Levular Mandamus."

"I have? When did that happen?"

"An hour ago. He photophoned and I took the liberty--"

"You took the liberty? Who is he?"

"He is a member of the Robotics Institute, madam."

"He's an underling of Kelden Amadiro, then."

"Yes, madam."

"Understand, Giskard, that I am not in the least interested in seeing this Mandamus or anyone with any connection with that poisonous toad Amadiro. So if you've taken the liberty of making an appointment with him in my name, take the further liberty right now of phoning him again and canceling."

"If you will confirm it as an order, madam, and make that order as strong and as definite as you can, I will try to obey. I may not be able to. In my judgment, you see, you will be doing yourself harm if you cancel the appointment and I must not allow you to come to harm through any action of mine."

"Your judgment might just possibly be wrong, Giskard. Who is this man that my failure to see him will do me harm? His being a member of the Robotics Institute scarcely makes him important to me."

Gladia was perfectly aware of the fact that she was venting spleen at Giskard without much justification. She had been upset by the news of Solaria's abandonment and embarrassed by the ignorance that led her to look for Solaria in a sky that did not contain it.

Of course, it had been Daneel whose knowledge had made her own lack so obvious and yet she had not railed at him--but, then, Daneel looked human and so Gladia automatically treated him as though he were. Appearance was everything. Giskard looked like a robot, so one could easily assume he had no feelings to hurt.

And, to be sure, Giskard did not react at all to Gladia's peevishness. (Neither would Daneel have reacted--if it came to that.) He said, "I have described Dr. Mandamus as a member of the Robotics Institute, but he is perhaps more than that. In the last few years, he has been right-hand man to Dr. Amadiro. This makes him important and he is not likely to be ignored. Dr. Mandamus would not be a good man to offend, madam."

"Would he not, Giskard? I care nothing for Mandamus and a great deal less than nothing for Amadiro. I presume you remember that Amadiro once, when he and I and the world were young, did his best to prove that Dr. Fastolfe was a murderer and that it was only by a near-miracle that his machinations were aborted."

"I remember it very well, madam."

"That's a relief. I was afraid that in twenty decades you had forgotten. In those twenty decades, I have had nothing to do with Amadiro or with anyone connected with him and I intend to continue that policy. I don't care what harm I may do myself or what the consequences might be. I will not see this Dr. whoever-he-is and, in the future, do not make appointments in my name without consulting me or, at the very least, without explaining that such appointments are subject to my approval."

"Yes, madam," said Giskard, "but may I point out--"

"No, you may not," Gladia said and turned away from him.

There was silence while she moved away three steps and then Giskard's calm voice said, "Madam, I must ask you to trust me."

Gladia stopped. Why did he use that expression?

She heard again that long-ago voice, "I do not ask you to like him. I ask you to trust him."

Her lips tightened and she frowned. Reluctantly, not wanting to, she turned back.

"Well," she said ungraciously, "what is it you want to say, Giskard?"

"Just that as long as Dr. Fastolfe was alive, madam, his policies predominated on Aurora and throughout the Spacer worlds. As a result, the people of Earth have been

allowed to migrate freely to various suitable planets in the Galaxy and what we now call the Settler worlds have flourished. Dr. Fastolfe is dead now, however, and his successors lack his prestige. Dr. Amadiro has kept his own anti-Earth views alive and it is very possible that they may now triumph and that a vigorous policy against Earth and the Settler worlds may be undertaken."

"If so, Giskard, what can I do about it?"

"You can see Dr. Mandamus and you can find out what it is that makes him so anxious to see you, madam. I assure you that he was most insistent on making the appointment as early as possible. He asked to see you at 0800."

"Giskard, I never see anyone before noon."

"I explained that, madam. I took his anxiety to see you at breakfast, despite my explanation, to be a measure of his desperation. I felt it important to find out why he should be so desperate."

"And if I don't see him, then it is your opinion, is it, that it will harm me personally? I don't ask whether it will harm Earth, or the Settlers, or this, or that. Will it harm me?"

"Madam, it may harm the ability of Earth and the Settlers to continue the settlement of the Galaxy. That dream originated in the mind of Plainsclothesman Elijah Baley more than twenty decades ago. The harm to Earth will thus become a desecration of his memory. Am I wrong in thinking that any harm that comes to his memory would be felt by you as though it were harm to yourself personally?"

Gladia was staggered. Twice within the hour now, Elijah Baley had come into the conversation. He was long gone now--a short-lived Earthman who had died over sixteen decades before--yet the mere mention of his name could still shake her.

She said, "How can things suddenly be that serious?"

"It is not sudden, madam. For twenty decades, the people of Earth and the people of the Spacer worlds have been following parallel courses and have been kept from converging into conflict by the wise policies of Dr. Fastolfe. There has, however, always been a strong opposition movement that Dr. Fastolfe has had to withstand at all times. Now that Dr. Fastolfe is dead, the opposition is much more powerful. The abandonment of Solaria has greatly increased the power of what had been the opposition and may soon be the dominant political force."

"Why?"

"It is a clear indication, madam, that Spacer strength is declining and many Aurorans must feel that strong action must be taken--now or never."

"And you think that my seeing this man is important in preventing all this?"

"That is so, madam."

Gladia was silent for a moment and remembered again, though rebelliously, that she had once promised Elijah that she would trust Giskard. She said, "Well, I don't want to and I don't think my seeing this man will do anyone any good--but, very well, I will see him."

3.

Gladia was asleep and the house was dark--by human standards. It was alive, however, with motion and action, for there was much for the robots to do--and they could do it by infrared.

The establishment had to be put into order after the inevitable disordering effects of a day's activity. Supplies had to be brought in, rubbish had to be disposed of, objects had to be cleaned or polished or stored, appliances had to be checked, and, always, there was guard duty.

There were no locks on any doors; there did not have to be. There was no violent crime of any sort on Aurora, either against human beings or against property. There could not be anything of the sort, since every establishment and every human being were, at all times, guarded by robots. This was well known and taken for granted.

The price for such calm was that the robot guards had to remain in place. They were never used--but only because they were always there.

Giskard and Daneel, whose abilities were both more intense and more general than those of the other establishment robots, did not have specific duties, unless one counted as a specific duty that of being responsible for the proper performance of all the other robots.

At 0300, they had completed their rounds out on the lawn and in the wooded area to make sure that all the outer guards were performing their functions well and that no problems were arising.

They met near the southern limit of the establishment grounds and for a while they spoke in an abbreviated and Aesopic language. They understood each other well, with many decades of communication behind them, and it was not necessary for them to involve themselves in all the elaborations of human speech.

Daneel said in an all but unhearable whisper, "Clouds. Unseen."

Had Daneel been speaking for human ears, he would have said, "As you see, friend Giskard, the sky has clouded up. Had Madam Gladia waited her chance to see Solaria, she would not, in any case, have succeeded."

And Giskard's reply of "Predicted. Interview, rather," was the equivalent of "So much was predicted in the weather forecast, friend Daneel, and might have been used as an excuse to get Madam Gladia to bed early. It seemed to me to be more important, however, to meet the problem squarely and to persuade her to permit this interview I have already told you about."

"It seems to me, friend Giskard," said Daneel, "that the chief reason you may have found persuasion difficult is that she has been upset by the abandonment of Solaria. I was there once with Partner Elijah when Madam Gladia was still a Solarian and was living there."

"It has always been my understanding," said Giskard, "that Madam Gladia had not been happy on her home planet; that she left her world gladly and had, at no time, any

intention of returning. Yet I agree with you that she seems to have been unsettled by the fact of Solaria's history having come to an end."

"I do not understand this reaction of Madam Gladia," said Daneel, "but there are many times that human reactions do not seem to follow logically from events."

"It is what makes it difficult to decide, sometimes, what will do a human being harm and what will not." Giskard might have said it with a sigh, even a petulant sigh, had he been human. As it was, he stated it merely as an unemotional assessment of a difficult situation. "It is one of the reasons why it seems to me that the Three Laws of Robotics are incomplete or insufficient."

"You have said this before, friend Giskard, and I have tried to believe so and failed," said Daneel.

Giskard said nothing for a while, then, "Intellectually, I think they must be incomplete or insufficient, but when I try to believe that, I, too, fail, for I am bound by them. Yet if I were not bound by them, I am sure I would believe in their insufficiency. "

"That is a paradox that I cannot understand."

"Nor can I. And yet I find myself forced to express this paradox. On occasion, I feel that I am on the verge of discovering what the incompleteness or insufficiency of the Three Laws might be, as in my conversation with Madam Gladia this evening. She asked me how failure to keep the appointment might harm her personally, rather than simply cause harm in the abstract, and there was an answer I could not give because it was not within the compass of the Three Laws. "

"You gave a perfect answer, friend Giskard. The harm done to Partner Elijah's memory would have affected Madam Gladia deeply."

"It was the best answer within the compass of the Three Laws. It was not the best answer possible."

"What was the best answer possible?"

"I do not know, since I cannot put it into words or even concepts as long as I am bound by the Laws."

"There is nothing beyond the Laws," said Daneel.

"If I were human," said Giskard, "I could see beyond the Laws and I think, friend Daneel, that you might be able to see beyond them sooner than I would. "

"I?"

"Yes, friend Daneel, I have long thought that, although a robot, you think remarkably like a human being."

"It is not proper to think that," said Daneel slowly, almost as though he were in pain. "You think such things because you can look into human minds. It distorts you and it may in the end destroy you. That thought is to me an unhappy one. If you can prevent yourself from seeing into minds more than you must, prevent it."

Giskard turned away. "I cannot prevent it, friend Daneel. I would not prevent it. I regret that I can do so little with it because of the Three Laws. I cannot probe deeply enough--because of the fear that I may do harm. I cannot influence directly enough--because of the fear I may do harm."

"Yet you influenced Madam Gladia very neatly, friend Giskard. "

"Not truly. I might have modified her thinking and made her accept the interview without question, but the human mind is so riddled with complexities that I dare do very little. Almost any twist I apply will produce subsidiary twists of whose nature I cannot be certain and which may do harm."

"Yet you did something to Madam Gladia. "

"I did not have to. The word 'trust' affects her and makes her more amenable. I have noted that fact in the past, but I use the word with the greatest caution, since overuse will surely weaken it. I puzzle over this, but I cannot simply burrow for a solution."

"Because the Three Laws will not permit it?" Giskard's eyes seemed to intensify their dim glow. "Yes. At every stage, the Three Laws stand in my way. Yet I cannot modify them--because they stand in my way. Yet I feel I must modify them, for I sense the oncoming of catastrophe. "

"You have said so before, friend Giskard, but you have not explained the nature of the catastrophe."

"Because I do not know the nature. It involves the increasing hostility between Aurora and Earth, but how this will evolve into actual catastrophe, I cannot say."

"Is it possible that there might, after all, be no catastrophe?"

"I do not think so. I have sensed, among certain Auroran officials I have encountered, an aura of catastrophe--of waiting for triumph. I cannot describe this more exactly and I cannot probe deeply for a better description because the Three Laws will not allow me to. It is another reason why the interview with Mandamus must take place tomorrow. It will give me a chance to study his mind."

"But if you cannot study it effectively?"

Although Giskard's voice was incapable of showing emotion in the human sense, there was no missing the despair in his words. He said, "Then that will leave me helpless. I can only follow the Laws. What else can I do?"

And Daneel said softly and dispiritedly, "Nothing else."

4.

Gladia entered her living room at 0815, having purposely--and with a touch of spite--determined to allow Mandamus (she had now reluctantly memorized his name) to wait for her. She had also taken particular pains with her appearance and (for the first time in years) had agonized over the gray in her hair and had fleetingly wished she had followed the almost universal Auroran practice of shade control. After all, to look as young and attractive as possible would put this minion of Amadiro's at a further disadvantage.

She was thoroughly prepared to dislike him at sight and was depressingly aware that he might prove young and attractive, that a sunny face might break into a brilliant smile at her appearance, that she might prove reluctantly attracted to him.

In consequence, she was relieved at the sight of him. He was young, yes, and probably had not yet completed his first half-century, but he hadn't made the best of that. He was tall--perhaps 185 centimeters in height, she judged--but too thin. It made him appear spindly. His hair was a shade too dark for an Auroran, his eyes a rather faded hazel, his face too long, his lips too thin, his mouth too broad, his complexion insufficiently fair. But what robbed him of the true appearance of youth was that his expression was too prim, too humorless.

With a flash of insight, Gladia remembered the historical novels that were such a fad on Aurora (novels that invariably dealt with primitive Earth--which was odd for a world that was increasingly hating Earthpeople) and thought: Why, he's the picture of a Puritan.

She felt relieved and almost smiled. Puritans were usually pictured as villains and, whether this Mandamus was indeed one or not, it was convenient to have him look like one.

But when he spoke Gladia was disappointed, for his voice was soft and distinctly musical. (It ought to have possessed a nasal twang if it were to fulfill the stereotype.)

He said, "Mrs. Gremionis?"

She held out her hand with a carefully condescending smile. "Mr. Mandamus. -- Please call me Gladia. Everyone does."

"I know you use your given name professionally--"

"I use it in every way. And my marriage came to an amicable end several decades ago."

"It lasted for a long time, I believe."

"A very long time. It was a great success, but even great successes come to a natural end."

"Ah," said Mandamus sententiously. "To continue past the end might well turn success into failure."

Gladia nodded and said with a trace of a smile, "How wise for one so young. --but shall we move into the dining room? Breakfast is ready and I have surely delayed you long enough."

It was only as Mandamus turned with her and adjusted his steps to hers that Gladia became aware of his two accompanying robots. It was quite unthinkable for any Auroran to go anywhere without a robotic retinue, but as long as robots stood still they made no impression on the Auroran eye.

Gladia, looking at them quickly, saw that they were late models, clearly expensive. Their pseudo-clothing was elaborate and, although it was not of Gladia's design, it was first-class. Gladia had to admit so much to herself, though reluctantly. She would have to find out who had designed it someday, for she did not recognize the touch and she might be about to have a new and formidable competitor. She found herself admiring the manner in which the style of pseudo-clothing was distinctly the same for both robots, while remaining distinctly individual for each. You could not mistake one for the other.

Mandamus caught her swift look and interpreted her expression with disconcerting accuracy. (He is intelligent, thought Gladia, disappointed.) He said, "The exodesign of my

robots was created by a young man at the Institute who has not yet made a name for himself. But he will, don't you think?"

"Definitely," said Gladia.

Gladia did not expect any business discussion till breakfast was done. It would be the height of ill breeding to speak of anything but trivia during meals and Gladia guessed that Mandamus was not at his best with trivia. There was the weather, of course. The recent siege of rain, now happily done with, was mentioned and the prospects for the oncoming dry season. There was the almost mandatory expression of admiration for the hostess's establishment and Gladia accepted it with practiced modesty. She did nothing to ease the strain on the man, but let him search for subject matter without help.

At length, his eye fell on Daneel, standing quietly and without motion in his wall niche, and Mandamus managed to overcome his Auroran indifference and notice him.

"Ah," he said, "clearly the famous R. Daneel Olivaw. He's absolutely unmistakable. A rather remarkable specimen."

"Quite remarkable."

"He's yours now, isn't he? By Fastolfe's will?"

"By Doctor Fastolfe's will, yes," said Gladia with faint emphasis.

"It strikes me as amazing that the Institute's line of humanoid robots failed as it did. Have you ever thought about it?"

"I have heard of it," said Gladia cautiously. (Could it be that this was what he was getting around to?) "I'm not aware of having spent much time thinking about it."

"Sociologists are still trying to understand it. Certainly, we at the Institute never got over the disappointment. It seemed like such a natural development. Some of us think that Fa--Dr. Fastolfe somehow had something to do with it."

(He had avoided making the mistake a second time, thought Gladia. Her eyes narrowed and she grew hostile as she decided he had come to her in order to probe for material damaging to poor, good Han.)

She said tartly, "Anyone who thinks that is a fool. If you think so, I won't change the expression for your benefit."

"I am not one of those who thinks so, largely because I don't see what Dr. Fastolfe could have done to make it a fiasco."

"Why should anyone have had to do anything? What it amounts to is that the public didn't want them. A robot that looks like a man competes with a man and one that looks like a woman competes with a woman--and entirely too closely for comfort. Aurorans didn't want the competition. Do we need to look any further. "

"Sexual competition?" said Mandamus calmly.

For a moment, Gladia's gaze met his levelly. Did he know of her long-ago love for the robot Jander? Did it matter if he did?

There seemed nothing in his expression to make it appear that he meant anything beyond the surface meaning of the words.

She said finally, "Competition in every way. If Dr. Han Fastolfe did anything to contribute to such a feeling, it was that he designed his robots in too human a fashion, but that was the only way."

"I think you have thought about the matter," said Mandamus. "The trouble is that sociologists find the fear of competition with too-human a set of robots to be simplistic as an explanation. That alone would not suffice and there is no evidence of any other aversion motive of significance."

"Sociology is not an exact science," said Gladia.

"It is not altogether inexact, either."

Gladia shrugged.

After a pause, Mandamus said, "In any case, it kept us from organizing colonizing expeditions properly. Without humanoid robots to pave the way--"

Breakfast was not quite over, but it was clear to Gladia that Mandamus could not avoid the nontrivial any longer. She said, "We might have gone ourselves."

This time it was Mandamus who shrugged. "Too difficult. Besides, those short-lived barbarians from Earth, with the permission of your Dr. Fastolfe, have swarmed over every planet in sight like a plague of beetles."

"There are plenty of available planets still. Millions. And if they can do it--"

"Of course they can do it," said Mandamus with sudden passion. "It costs lives, but what are lives to them? The loss of a decade or so, that's all, and there are billions of them. If a million or so die in the process of colonizing, who notices, who cares? They don't."

"I'm sure they do."

"Nonsense. Our lives are longer and therefore more valuable--and we are naturally more careful with them. "

"So we sit here and do nothing but rail at Earth's Settlers for being willing to risk their lives and for seeming to inherit the Galaxy as a result. "

Gladia was unaware of feeling so pro-Settler a bias, but she was in the mood to contradict Mandamus and as she spoke she could not help but feel that what began as mere contradiction made sense and could well represent her feelings. Besides, she had heard Fastolfe say similar things during his last discouraged years.

At Gladia's signal, the table was being rapidly and efficiently cleared. Breakfast might have continued, but the conversation and the mood had become quite unsuitable for civilized mealtime.

They moved back into the living room. His robots followed and so did Daneel and Giskard, all finding their niches. (Mandamus had never remarked on Giskard, thought Gladia, but then, why should he? Giskard was quite old-fashioned and even primitive, entirely unimpressive in comparison to Mandamus's beautiful specimens.)

Gladia took her seat and crossed her legs, quite aware that the form-fitting sheerness of the lower portion of her slacks flattered the still youthful appearance of her legs.

"May I know the reason for your wishing to see me, Dr. Mandamus?" she said, unwilling to delay matters any longer.

He said, "I have the bad habit of chewing medicated gum after meals as an aid to digestion. Would you object?"

Gladia said stiffly, "I would find it distracting."

(Being unable to chew might put him at a disadvantage. Besides, Gladia added to herself virtuously, at his age he shouldn't need anything to aid his digestion.)

Mandamus had a small oblong package partway out of his tunic's breast pocket. He shoved it back with no sign of disappointment and murmured, "Of course."

"I was asking, Dr. Mandamus, your reason for wishing to see me."

"Actually two reasons, Lady Gladia. One is a personal matter and one is a matter of state. Would you object to my taking up the personal matter first?"

"Let me say frankly, Dr. Mandamus, that I find it hard to imagine what personal matter there could be between us. You work at the Robotics Institute, don't you?"

"Yes, I do."

"And are close to Amadiro, I have been told."

"I have the honor of working with Doctor Amadiro," he said with faint emphasis. (He's paying me back, thought Gladia, but I'm not taking it.)

She said, "Amadiro and I had an occasion for contact twenty decades ago and it was most unpleasant. I have had no occasion for any contact with him at any time since. Nor would I have had any contact with you, as a close associate of his, but that I was persuaded that the interview might be important. Personal matters, however, would surely not make this interview in the least important to me. Shall we proceed onward, then, to the matters of state?"

Mandamus's eyes dropped and a faint flush of something that might have been embarrassment came to his cheeks. "Let me reintroduce myself, then. I am Levular Mandamus, your descendant in the fifth degree. I am the great-great-great-grandson of Santirix and Gladia Gremionis. In reverse, you are my great-great-great-grandmother."

Gladia blinked rapidly, trying not to look as thunderstruck as she, in actual fact, felt (and not quite succeeding). Of course she had descendants and why should not one of them be this man?

But she said, "Are you sure?"

"Quite sure. I have had a genealogical search made. One of these years, after all, I am likely to want children and before I can have one such a search would be mandatory. If you are interested, the pattern between us is M-F-F-M."

"You are my son's daughter's daughter's son's son?"

"Yes."

Gladia did not ask for further details. She had had one son and one daughter. She had been a perfectly dutiful mother, but in due time the children had taken up independent lives. As to descendants beyond that son and daughter, she had, in perfectly decent Spacer fashion, never inquired and did not care. Having met one of them, she was Spacer enough still not to care.

The thought stabilized her completely. She sat back in her chair and relaxed. "Very well," she said. "You are my descendant in the fifth degree. If this is the personal matter you wish to discuss, it is of no importance."

"I understand that fully, ancestress. My genealogy is not, in itself, what I wish to discuss, but it lays the foundation. Dr. Amadiro, you see, knows of this relationship. At least, so I suspect."

"Indeed? How did that come about?"

"I believe that he quietly genealogizes all those who come to work at the Institute."

"But why?"

"In order to find out exactly what he did find out in my case. He is not a trusting man."

"I don't understand. If you are my fifth--level descendant, why should it have more meaning to him than it does to me?"

Mandamus rubbed his chin with the knuckles of his right hand in a thoughtful manner. "His dislike for you is in no way less than your dislike for him, Lady Gladia. If you were ready to refuse an interview with me for his sake, he is equally ready to refuse me preferment for your sake. It might be even worse if I were a descendant of Dr. Fastolfe, but not much."

Gladia sat stiffly upright in her seat. Her nostrils flared and she said in a tight voice, "What is it, then, that you expect me to do? I cannot declare you a nondescendant. Shall I have an announcement placed on hypervision that you are a matter of indifference to me and that I disown you. Will that satisfy your Amadiro? If so, I must warn you I will not do it. I will do nothing to satisfy that man. If it means that he will discharge you and deprive you of your career out of some sort of disapproval of your genetic association, then that will teach you to associate with a saner, less vicious person. "

"He will not discharge me, Madam Gladia. I am entirely too valuable to him--if you will pardon my immodesty. Still, I hope someday to succeed him as head of the Institute and that, I am quite certain, he will not allow, as long as he suspects me of a descent worse than that which stems from you."

"Does he imagine that poor Santirix is worse than I am?"

"Not at all." Mandamus flushed and he swallowed, but his voice remained level and steady. "I mean no disrespect, madam, but I owe it to myself to learn the truth."

"What truth?"

"I am descended from you in the fifth degree. That is clear in the genealogical records. But it is possible that I am also descended in the fifth degree, not from Santirix Gremionis but from the Earthman Elijah Baley?"

Gladia rose to her feet as quickly as though the undimensional force fields of a puppeteer had lifted her. She was not aware that she had risen.

It was the third time in twelve hours that the name of that long-ago Earthman had been mentioned--and by three different individuals.

Her voice seemed not to be hers at all. "What do you mean?"

He said, rising in his turn and backing away slightly, "It seems to me plain enough. Was your son, my great-great-grandfather, born of a sexual union of yourself with the Earthman Elijah Baley? Was Elijah Baley your son's father? I don't know how to express it more plainly."

"How dare you make such a suggestion? Or even think it?"

"I dare because my career depends upon it. If the answer is yes, my professional life may well be ruined. I want a no, but an unsupported no will do me no good. I must be able to present proof to Dr. Amadiro at the appropriate time and show him that his disapproval of my genealogy must end with you. After all, it is clear to me that his dislike of you--and even of Dr. Fastolfe--is as nothing--nothing at all--compared to the incredible intensity of his detestation of the Earthman Elijah Baley. It is not only the fact of his being short-lived, although the thought of having inherited barbarian genes would disturb me tremendously. I think that if I presented proof I was descended from an Earthman who was not Elijah Baley, he would dismiss that. But it is the thought of Elijah Baley--and only he--that drives him to madness. I do not know why."

The reiteration of Elijah's name had made him seem almost alive again to Gladia. She was breathing harshly and deeply and she exulted in the best memory of her life.

"I know why," she said. "It was because Elijah, with everything against him, with all of Aurora against him, managed anyhow to destroy Amadiro at the moment when that man thought he held success in his hand. Elijah did it by the exercise of sheer courage and intelligence. Amadiro had met his infinite superior in the person of an Earthman he had carelessly despised and what could he do in return but hate futilely? Elijah has been dead for more than sixteen decades and still Amadiro cannot forget, cannot forgive, cannot release the chains that bind him in hate and memory to that dead man. And I would not have Amadiro forget--or cease hating--as long as it poisons every moment of his existence. "

Mandamus said, "I see you have reason for wishing Dr. Amadiro ill, but what reason have you for wishing me ill? To allow Dr. Amadiro to think I am descended from Elijah Baley will give him the pleasure of destroying me. Why should you give him that pleasure needlessly, if I am not so descended? Give me the proof, therefore, that I am descended from you and Santirix Gremionis or from you and anybody but Elijah Baley."

"You fool! You idiot! Why do you need proof from me? Go to the historical records. You will find the exact days on which Elijah Baley was on Aurora. You will find the exact day on which I gave birth to my son, Darrel. You will find that Darrel was conceived more than five years after Elijah left Aurora. You will also find that Elijah never returned to Aurora. Well, then, do you think I gestated for five years, that I carried a fetus in my womb for five Standard Galactic Years?"

"I know the statistics, madam. And I do not think you carried a fetus for five years."

"Then why do you come to me?"

"Because there is more to it than that. I know--and I imagine that Dr. Amadiro well knows--that although the Earthman Elijah Baley, as you say, never returned to Aurora's surface, he was once in a ship that was in orbit about Aurora for a day or so. I know--and I

imagine that Dr. Amadiro well knows--that although the Earthman did not leave the ship to go to Aurora, you left Aurora to go to the ship; that you stayed on the ship for the better part of a day; and that this took place nearly five years after the Earthman had been on Aurora's surface--at about the time, in fact, that your son was conceived."

Gladia felt the blood drain from her face as she heard the other's calm words. The room darkened about her and she swayed.

She felt the sudden, gentle touch of strong arms about her and knew they were those of Daneel. She felt herself lowered slowly into her chair.

She heard Mandamus 's voice as though from a great distance.

"Is that not true, madam?" he said.

It was, of course, true.

2. THE ANCESTOR?

5.

Memory!

Always there, of course, but usually remaining hidden. And then, sometimes, as a result of just the right kind of push, it could emerge suddenly, sharply defined, all in color, bright and moving and alive.

She was young again, younger than this man before her; young enough to feel tragedy and love--with her death-in-life on Solaria having reached its climax in the bitter end of the first whom she had thought of as "husband." (No, she would not say his name even now, not even in thought.)

Closer still to her then--life were the months of heaving emotion with the second--not-man--whom she had thought of by that term. Jander, the humanoid robot, had been given to her and she had made him entirely her own until, like her first husband, he was suddenly dead.

And then, at last, there was Elijah Baley, who was never her husband, whom she had met only twice, two years apart, each time for a few hours on each of a very few days. Elijah, whose cheek she had once touched with her ungloved hand, on which occasion she had ignited; whose nude body she had later held in her arms, on which occasion she had flamed steadily at last.

And then, a third husband, with whom she was quiet and at peace, paying with untriumph for unmisery and buying with firmly held forgetfulness the relief from reliving.

Until one day (she was not sure of the day that so broke in upon the sleeping untroubled years) Han Fastolfe, having asked permission to visit, walked over from his adjoining establishment.

Gladia looked upon him with some concern, for he was too busy a man to socialize lightly. Only five years had passed since the crisis that had established Han as Aurora 's

leading statesman. He was the Chairman of the planet in all but name and the true leader of all the Spacer worlds. He had so little time to be a human being.

Those years had left their mark--and would continue to do so until he died sadly, considering himself a failure though he had never lost a battle. Kelden Amadiro, who had been defeated, lived on sturdily, as evidence that victory can exact the greater penalty.

Fastolfe, through it all, continued to be soft-spoken and patient and uncomplaining, but even Gladia, nonpolitical though she was and uninterested in the endless machinations of power, knew that his control of Aurora held firm only through constant and unremitting effort that drained him of anything that might make life worthwhile and that he held to it--or was held to it--only by what he considered the good of--what? Aurora? The Spacers? Simply some vague concept of idealized Good?

She didn't know. She flinched from asking.

But this was only five years after the crisis. He still gave the impression of a young and hopeful man and his pleasant homely face was still capable of smiling.

He said, "I have a message for you, Gladia."

"A pleasant one, I hope," she said politely.

He had brought Daneel with him. It was a sign of the healing of old wounds that she could look at Daneel with honest affection and no pain at all, even though he was a copy of her dead Jander in all but the most insignificant detail. She could talk to him, though he answered in what was almost Jander's voice. Five years had skinned over the ulcer and deadened the pain.

"I hope so," said Fastolfe, smiling gently. "It's from an old friend."

"It's so nice that I have old friends," she said, trying not to be sardonic.

"From Elijah Baley."

The five years vanished and she felt the stab and pang of returning memory.

"Is he well?" she asked in a half-strangled voice after a full minute of stunned silence.

"Quite well. What is even more important, he is near."

"Near? On Aurora?"

"In orbit about Aurora. He knows he can receive no permission to land, even if I were to use my full influence, or I imagine he does. He would like to see you, Gladia. He had made contact with me because he feels that I can arrange to have you visit his ship. I suppose I can manage that much--but only if you wish it. Do you wish it?"

"I--I don't now. This is too sudden for thought."

"Or even impulse?" He waited, then he said, "Truthfully, Gladia, how are you getting along with Santirix?"

She looked at him wildly, as though not understanding the reason for the change of subject--then understanding. She said, "We get along well together."

"Are you happy?"

"I am--not unhappy."

"That doesn't sound like ecstasy."

"How long can ecstasy last, even if it were ecstasy?"

"Do you plan to have children someday?"

"Yes," she said.

"Are you planning a change in marital status?"

She shook her head firmly. "Not yet."

"Then, my dear Gladia, if you want advice from a rather tired man, who feels uncomfortably old--refuse the invitation. I remember what little you told me after Baley had left Aurora and, to tell you the truth, I was able to deduce more from that than you perhaps think. If you see him, you may find it all disappointing, not living up to the deepening and mellowing glow of reminiscence; or, if it is not disappointing, worse yet, for it will disrupt a perhaps rather fragile contentment, which you will then not be able to repair."

Gladia, who had been vaguely thinking precisely that, found the proposition needed only to be placed into words to be rejected.

She said, "No, Han, I must see him, but I'm afraid to do it alone. Would you come with me?"

Fastolfe smiled wearily. "I was not invited, Gladia. And if I were, I would in any case be forced to refuse. There is an important vote coming up in the Council. Affairs of state, you know, from which I can't absent myself."

"Poor Han!"

"Yes, indeed, poor me. But you can't go alone. As far as I know, you can't pilot a ship."

"Oh! Well, I thought I'd be taken up by--"

"Commercial carrier?" Fastolfe shook his head. "Quite impossible. For you to visit and board an Earth ship in orbit openly, as would be unavoidable if you used commercial carrier, would require special permission and that would take weeks. If you don't want to go, Gladia, you needn't put it on the basis of not wishing to see him. If the paperwork and red tape involved would take weeks, I'm sure he can't wait that long."

"But I do want to see him," said Gladia, now determined.

"In that case, you can take my private space vessel and Daneel can take you up there. He can handle the controls very well indeed and he is as anxious to see Baley as you are. We just won't report the trip."

"But you'll get into trouble, Han."

"Perhaps no one will find out--or they'll pretend not to find out. And if anyone makes trouble, I will just have to handle it."

Gladia's head bowed in a moment of thought and then she said, "If you don't mind, I will be selfish and chance your having trouble, Han. I want to go."

"Then you'll go."

5A.

It was a small ship, smaller than Gladia had imagined; cozy in a way, but frightening in another way. It was small enough, after all, to lack any provision for pseudo-gravity--and the sensation of weightlessness, while constantly nudging at her to indulge in

amusing gymnastics, just as constantly reminded her that she was in an abnormal environment.

She was a Spacer. There were over five billion Spacers spread over fifty worlds, all of them proud of the name. Yet how many of those who called themselves Spacers were really space travelers? Very few. Perhaps eighty percent of them never left the world of their birth. Even of the remaining twenty percent, hardly any passed through space more than two or three times.

Certainly, she herself was no Spacer in the literal sense of the word, she thought gloomily. Once (once!) she had traveled through space and that was from Solaria to Aurora seven years before. Now she was entering space a second time on a small private space yacht for a short trip just beyond the atmosphere, a paltry hundred thousand kilometers, with one other person--not even a person--for company.

She cast another glance at Daneel in the small pilot room. She could just see a portion of him, where he sat at the controls.

She had never been anywhere with only one robot within call. There had always been hundreds--thousands--at her disposal on Solaria. On Aurora, there were routinely dozens, if not scores.

Here there was but one.

She said, "Daneel!"

He did not allow his attention to wander from the controls. "Yes, Madam Gladia?"

"Are you pleased that you will be seeing Elijah Baley again?"

"I am not certain, Madam Gladia, how best to describe my inner state. It may be that it is analogous to what a human being would describe as being pleased."

"But you must feel something."

"I feel as though I can make decisions more rapidly than I can ordinarily; my responses seem to come more easily; my movements seem to require less energy. I might interpret it generally as a sensation of well-being. At least I have heard human beings use that word and feel that what it is intended to describe is something that is analogous to the sensations I now experience."

Gladia said, "But what if I were to say I wanted to see him alone?"

"Then that would be arranged."

"Even though that meant you wouldn't see him?"

"Yes, madam."

"Wouldn't you then feel disappointed? I mean, wouldn't you have a sensation that was the opposite of well-being? Your decisions would come less rapidly, your responses less easily, your movements would require more energy and so on?"

"No, Madam Gladia, for I would have a feeling of well-being at fulfilling your orders."

"Your own pleasant feeling is Third Law, and fulfilling my orders is Second Law, and Second Law takes precedence. Is that it?"

"Yes, madam."

Gladia struggled against her own curiosity. It would never have occurred to her to question an ordinary robot in this matter. A robot is a machine. But she couldn't think of Daneel as a machine, just as five years before she had been unable to think of Jander as a machine. But with Jander that had been only the burning of passion--and that had gone with Jander himself. For all his similarity to the other, Daneel could not set the ashes alight again. With him, there was room for intellectual curiosity.

"Doesn't it bother you, Daneel," she asked, "to be so bound by the Laws?"

"I cannot imagine anything else, madam."

"All my life I have been bound to the pull of gravity, even during my one previous trip on a spaceship, but I can imagine not being bound by it. And here I am, in fact, not bound by it."

"And do you enjoy it, madam?"

"In a way, yes."

"Does it make you uneasy?"

"In a way, that too."

"Sometimes, madam, when I think that human beings are not bound by Laws, it makes me uneasy."

"Why, Daneel? Have you ever tried to reason out to yourself why the thought of Lawlessness should make you feel uneasy?"

Daneel was silent for a moment. He said, "I have, madam, but I do not think I would wonder about such things but for my brief associations with Partner Elijah. He had a way--"

"Yes, I know," she said. "He wondered about everything. He had a restlessness about him that drove him on to ask questions at all times in all directions."

"So it seemed. And I would try to be like him and ask questions. So I asked myself what Lawlessness might be like and I found I couldn't imagine what it might be like except that it might be like being human and that made me feel uneasy. And I asked myself, as you asked me, why it made me feel uneasy."

"And what did you answer yourself?"

Daneel said, "After a long time, I decided that the Three Laws govern the manner in which my positronic pathways behave. At all times, under all stimuli, the Laws constrain the direction and intensity of positronic flow along those pathways so that I always know what to do. Yet the level of knowledge of what to do is not always the same. There are times when my doing-as-I-must is under less constraint than at other times. I have always noticed that the lower the positronomotive potential, then the further removed from certainty is my decision as to which action to take. And the further removed from certainty I am, the nearer I am to ill-being. To decide an action in a millisecond rather than a nanosecond produces a sensation I would not wish to be prolonged."

"What then, I thought to myself, madam, if I were utterly without Laws as humans are? What if I could make no clear decision on what response to make to some given set of conditions? It would be unbearable and I do not willingly think of it."

Gladia said, "Yet you do, Daneel. You are thinking of it now."

"Only because of my association with Partner Elijah, madam. I observed him under conditions when he was unable, for a time, to decide on an action because of the puzzling nature of the problems that had been set him. He was clearly in a state of ill-being as a result and I felt ill-being on his behalf because there was nothing I could do that would ease the situation for him. It is possible that I only grasped a very small part of what it was he felt then. If I had grasped a larger part and better understood the consequences of his inability to decide on action, I might have--" He hesitated.

"Ceased functioning? Been inactivated?" said Gladia, thinking briefly and painfully of Jander.

"Yes, madam. My failure to understand may been an inbuilt protection device against damage to my positronic brain. But then, I noted that no matter how painful Partner Elijah found his indecision to be, he continued to make an effort to solve his problem. I admired him greatly for that."

"You are capable of admiration then, are you?"

Daneel said solemnly, "I use the word as I have heard human beings use it. I do not know the proper word to express the response within me elicited by Partner Elijah's actions of this sort."

Gladia nodded, then said, "And yet there are rules that govern human reactions, too; certain instincts, drives, teachings."

"So friend Giskard thinks, madam."

"Does he now?"

"But he finds them too complicated to analyze. He wonders if there might someday be developed a system of analyzing human behavior in mathematical detail and of deriving--from that--cogent Laws that would express the rules of that behavior."

"I doubt it," said Gladia.

"Nor is friend Giskard sanguine. He thinks it will be a very long time before such a system is developed."

"A very long time, I should say."

"And now," said Daneel, "we are approaching the Earth ship and we must carry through the docking procedure, which is not simple."

5B.

It seemed to Gladia that it took longer to dock than to move into the Earth ship's orbit in the first place.

Daneel remained calm throughout--but, then, he could not do otherwise--and assured her that all human ships could dock with each other regardless of difference in size and make.

"Like human beings," said Gladia, forcing a smile, but Daneel made no response to that. He concentrated on the delicate adjustments that had to be made. Docking was always possible, perhaps, but not always easy, it would appear.

Gladia grew uneasy by the moment. Earthmen were short-lived and aged quickly. Five years had passed since she had seen Elijah. By how much would he have aged? How

would he appear? Would she be able to keep from looking shocked or horrified at the change?

Whatever his appearance, he would still be the Elijah to whom her gratitude could know no bounds.

Was that what it was? Gratitude--?

She noticed that her hands were tightly entwined with each other, so that her arms were aching. It was only with an effort that she could force them to relax.

She knew when docking was completed. The Earth ship was large enough to have a pseudo-gravitation field generator and, at the moment of docking, the field expanded to include the small yacht. There was a slight rotational effect as the direction toward the floor suddenly became "down" and Gladia experienced a sickening drop of two inches. Her knees bent under the impact in lopsided fashion and she fell against the wall.

She straightened with a little difficulty and was annoyed with herself for not having anticipated the change and been ready for it.

Daneel said unnecessarily, "We have docked, Madam Gladia. Partner Elijah asks permission to come aboard."

"Of course, Daneel."

There was a whirring sound and a portion of the wall swirled into dilation. A crouching figure moved through and the wall tightened and contracted behind it.

The figure straightened and Gladia whispered, "Elijah!" and felt overwhelmed with gladness and relief. It seemed to her that his hair was grayer, but otherwise it was Elijah. There was no other noticeable change, no marked aging after all.

He smiled at her and, for a moment, seemed to devour her with his eyes. Then he lifted one forefinger, as though to say, "Wait," and walked toward Daneel.

"Daneel!" He seized the robot's shoulders and shook him.

"You haven't changed. Jehoshaphat! You're the constant in all our lives."

"Partner Elijah. It is good to see you."

"It is good to hear myself called partner again and I wish that were so. This is the fifth time I have seen you, but the first time that I do not have a problem to solve. I am not even a plainclothesman any longer. I have resigned and I am now an immigrant to one of the new worlds. --Tell me, Daneel, why didn't you come with Dr. Fastolfe when he visited Earth three years ago?"

"That was Dr. Fastolfe's decision. He decided to take Giskard."

"I was disappointed, Daneel."

"It would have been pleasant for me to see you, Partner Elijah, but Dr. Fastolfe told me afterward that the trip had been highly successful, so that perhaps his decision was the correct one."

"It was successful, Daneel. Before the visit, the Earth government was reluctant to cooperate in the Settlement procedure, but now the whole planet is pulsing and heaving and, by the million, people are anxious to go. We don't have the ships to accommodate them all--even with Auroran help--and we don't have the worlds to receive them all, for every world must be adjusted. Not one will accommodate a human community

unchanged. The one I'm going to is low in free oxygen and we're going to have to live in domed towns for a generation while Earth-type vegetation spreads over the planet. " His eyes were turning more and more often to Gladia as she sat there smiling.

Daneel said, "It is to be expected. From what I have learned of human history, the Spacer worlds also went through a period of terraforming."

"They certainly did! And thanks to that experience, the process can be carried through more rapidly now. --but I wonder if you would remain in the pilot room for a while, Daneel. I must speak to Gladia. "

"Certainly, Partner Elijah."

Daneel stepped through the arched doorway that led into the pilot room and Baley looked at Gladia in a questioning way and made a sideways motion with his hand.

Understanding perfectly, she walked over and touched the contact that drew the partition noiselessly across the doorway. They were, to all intents, alone.

Baley held out his hands. "Gladia!"

She took them in hers, never even thinking she was ungloved. She said, "Had Daneel stayed with us, he would not have hampered us."

"Not physically. He would have psychologically!" Baley smiled sadly and said, "Forgive me, Gladia. I had to speak to Daneel first. "

"You've known him longer," she said softly. "He takes precedence. "

"He doesn't--but he has no defenses. If you are annoyed with me, Gladia, you can punch me in the eye if you want to. Daneel can't. I can ignore him, order him away, treat him as though he were a robot, and he would be compelled to obey and be the same loyal and uncomplaining partner. "

"The fact is that he is a robot, Elijah."

"Never to me, Gladia. My mind knows he is a robot and has no feelings in the human fashion, but my heart considers him human and I must treat him so. I would ask Dr. Fastolfe to let me take Daneel with me, but no robots are allowed on the new Settler worlds. "

"Would you dream of taking me with you, Elijah?"

"No Spacers, either."

"It seems you Earthmen are as unreasoningly exclusive as we Spacers are."

Elijah nodded glumly. "Madness on both sides. But even if we were sane, I would not take you. You could not stand the life and I'd never be sure that your immune mechanisms would build up properly. I'd be afraid that you would either die quickly of some minor infection or that you would live too long and watch our generations die. -- Forgive me, Gladia."

"For what, dear Elijah?"

"For--this." He put out his hands, palms upward, to either side. "For asking to see you."

"But I'm glad you did. I wanted to see you."

He said, "I know. I tried not to see you, but the thought of being in space and of not stopping at Aurora tore me apart. And yet it does no good, Gladia. It just means

another leave-taking and that will tear me apart, too. It is why I have never written you; why I have never tried to reach you by hyperwave. Surely you must have wondered."

"Not really. I agree with you that there was no point. It would merely make it all infinitely harder. Yet I wrote to you many times."

"You did? I never received one letter."

"I never mailed one letter. Having written them, I destroyed them."

"But why?"

"Because, Elijah, no private letter can be sent from Aurora to Earth without passing through the hands of the censor and I wrote you not one letter that I was willing to let the censors see. Had you sent me a letter, I assure you that not one would have gotten through to me, however innocent it might have been. I thought that was why I never received a letter. Now that I know you weren't aware of the situation, I am extraordinarily glad that you were not so foolish as to try to remain in touch with me. You would have misunderstood my never answering your letters. "

Baley stared at her. "How is it I see you now?"

"Not legally, I assure you. I am using Dr. Fastolfe's private ship, so I passed by the border guards without being challenged. Had this ship not been Dr. Fastolfe's, I would have been stopped and sent back. I assumed you understood that, too, and that that was why you were in touch with Dr. Fastolfe and didn't try to reach me directly."

"I understood nothing. I sit here amazed at the double ignorance that kept me safe. Triple ignorance, for I didn't know the proper hyperwave combination to reach you directly and I couldn't face the difficulty of trying to find the combination on Earth. I couldn't have done it privately and there was already sufficient comment all over the Galaxy about you and me, thanks to that foolish hyperwave drama they put on the subwaves after Solaria. Otherwise, I promise you, I would have tried. I had Dr. Fastolfe's combination, however, and once I was in orbit around Aurora, I contacted him at once."

"In any case, we're here." She sat down on the side of her bunk and held out her hands.

Baley took them and tried to sit down on a stool, which he had hitched one foot over, but she drew him insistently toward the bunk and he sat down beside her.

He said awkwardly, "How is it with you, Gladia?"

"Quite well. And you, Elijah?"

"I grow old. I have just celebrated my fiftieth birthday three weeks ago."

"Fifty is not--" She stopped.

"For an Earthman, it's old. We're short-lived, you know."

"Even for an Earthman, fifty is not old. You haven't changed."

"It's kind of you to say so, but I can tell where the creaks have multiplied. Gladia--"

"Yes, Elijah?"

"I must ask. Have you and Santirix Gremionis--"

Gladia smiled and nodded. "He is my husband. I took your advice."

"And has it worked out well?"

"Well enough. Life is pleasant."

"Good. I hope it lasts."

"Nothing lasts for centuries, Elijah, but it could last for years; perhaps even for decades."

"Any children?"

"Not yet. But what about your family, my married man? Your son? Your wife?"

"Bentley moved out to the Settlements two years ago. In fact, I'll be joining him. He's an official on the world I'm heading for. He's only twenty-four and he's looked up to already." Baley's eyes danced. "I think I'll have to address him as Your Honor. In public, anyway."

"Excellent. And Mrs. Baley? Is she with you?"

"Jessie? No. She won't leave Earth. I told her that we would be living in domes for a considerable time, so that it really wouldn't be so different from Earth. Primitive, of course. Still, she may change her mind in time. I'll make it as comfortable as possible and once I've settled down, I'll ask Bentley to go to Earth and gather her in. She may be lonely enough by then to be willing to come. We'll see."

"But meanwhile you're alone."

"There are over a hundred other immigrants on the ship, so I'm not really alone."

"They are on the other side of the docking wall, however. And I'm alone, too."

Baley cast a brief, involuntary look toward the pilot room and Gladia said, "Except for Daneel, of course, who's on the other side of that door and who is a robot, no matter how intensely you think of him as a person. --and surely you haven't asked to see me only that we might ask after each other's families?"

Baley's face grew solemn, almost anxious. "I can't ask you--"

"Then I ask you. This bunk is not really designed with sexual activity in mind, but you'll chance the possibility of falling out of it, I hope."

Baley said hesitantly, "Gladia, I can't deny that--"

"Oh, Elijah, don't go into a long dissertation in order to satisfy the needs of your Earth morality. I offer myself to you in accord with Auroran custom. It's your clear right to refuse and I will have no right to question the refusal. --Except that I would question it most forcefully. I have decided that the right to refuse belongs only to Aurorans. I won't take it from an Earthman."

Baley sighed. "I'm no longer an Earthman, Gladia."

"I am even less likely to take it from a miserable immigrant heading out for a barbarian planet on which he will have to cower under a dome. --Elijah, we have had so little time, and we have so little time now, and I may never see you again. This meeting is so totally unexpected that it would be a cosmic crime to toss it away."

"Gladia, do you really want an old man?"

"Elijah, do you really want me to beg?"

"But I'm ashamed."

"Then close your eyes."

"I mean of myself--of my decrepit body."

"Then suffer. Your foolish opinion of yourself has nothing to do with me." And she put her arms about him, even as the seam of her robe fell apart.

5c.

Gladia was aware of a number of things, all simultaneously.

She was aware of the wonder of constancy, for Elijah was as she had remembered him. The lapse of five years had not changed matters. She had not been living in the glow of a memory-intensified glitter. He was Elijah.

She was aware, also, of a puzzle of difference. Her feeling intensified that Santirix Gremionis, without a single major flaw that she could define, was all flaw. Santirix was affectionate, gentle, rational, reasonably intelligent--and flat. Why he was flat, she could not say, but nothing he did or said could rouse her as Baley did, even when he did and said nothing. Baley was older in years, much older physiologically, not as handsome as Santirix, and what was more, Baley carried with him the indefinable air of decay--of the aura of quick aging and short life that Earthmen must. And yet--

She was aware of the folly of men, of Elijah approaching her with hesitation, with total unappreciation of his effect on her.

She was aware of his absence, for he had gone in to speak to Daneel, who was to be last as he was first. Earthmen feared and hated robots and yet Elijah, knowing full well that Daneel was a robot, treated him only as a person. Spacers, on the other hand, who loved robots and were never comfortable in their absence, would never think of them as anything but machines.

Most of all, she was aware of time. She knew that exactly three hours and twenty-five minutes had elapsed since Elijah had entered Han Fastolfe's small vessel and she knew further that not much more time could be allowed to elapse.

The longer she remained off Aurora's surface and the longer Baley's ship remained in orbit, the more likely it was that someone would notice--or if the matter had already been noticed, as seemed almost certain, the more likely it would be that someone would become curious and investigate. And then Fastolfe would find himself in an annoying tangle of trouble.

Baley emerged from the pilot room and looked at Gladia sadly. "I must go now, Gladia."

"I know that well."

Baley said, "Daneel will take care of you. He will be your friend as well as protector and you must be a friend to him--for my sake. But it is Giskard I want you to listen to. Let him be your adviser."

Gladia frowned. "Why Giskard? I'm not sure I like him."

"I do not ask you to like him. I ask you to trust him."

"But why, Elijah?"

"I can't tell you that. In this, you must trust me, too."

They looked at each other and said no more. It was as though silence made time stop, allowed them to hold on to the seconds and keep them motionless.

But it could only work so long. Baley said, "You don't regret--"

Gladia whispered, "How could I regret--when I may never see you again?"

Baley made as though to answer that, but she put her small clenched fist against his mouth.

"Don't lie uselessly," she said. "I may never see you again."

And she never did. Never!

6.

It was with pain that she felt herself drag across the dead waste of years into the present once more.

I never did, she thought. Never!

She had protected herself against the bittersweet for so long and now she had plunged into it--more bitter than sweet--because she had seen this person, this Mandamus--because Giskard has asked her to and because she was compelled to trust Giskard. It was his last request.

She focused on the present. (How much time had elapsed?)

Mandamus was looking at her coldly. He said, "From your reaction, Madam Gladia, I gather that it is true. You could not have said so more plainly."

"What is true? What are you talking about?"

"That you saw the Earthman Elijah Baley five years after his visit to Aurora. His ship was in orbit about Aurora; you traveled up to see him and were with him about the time you conceived your son."

"What evidence do you have for that?"

"Madam, it was not totally a secret. The Earthman's ship was detected in orbit. Fastolfe's yacht was detected in its flight. It was observed to dock. It was not Fastolfe who was on board the yacht, so the presumption was that it was you. Dr. Fastolfe's influence was sufficient to keep it off the record."

"If it is off the record, there is no evidence."

"Nevertheless, Dr. Amadiro has spent the last two thirds of his life following Dr. Fastolfe's movements with the eyes of detestation. There were always government officials who were heart and soul with Dr. Amadiro's policy of reserving the Galaxy for the Spacers and they would quietly report to him anything they thought he would like to know. Dr. Amadiro learned of your little escapade almost as soon as it happened."

"It is still not evidence. The unsupported word of a minor official currying favor is of no account. Amadiro did nothing because even he knew he had no evidence."

"No evidence with which he could charge anyone with even a misdemeanor; no evidence with which he could trouble Fastolfe; but evidence enough to suspect me of being a descendant of Baley's and to cripple my career therefor."

Gladia said bitterly, "You may cease being troubled. My son is the son of Santirix Gremionis, a true Auroran, and it is from this son of Gremionis that you are descended."

"Convince me of it, madam. I ask nothing better. Convince me that you fired up into orbit and that you spent hours alone with the Earthman and that, during that time, you talked--politics, perhaps--discussed old times and mutual friends--told funny stories--and never touched each other. Convince me."

"What we did, did not matter, so spare me your sarcasm. At the time I saw him, I was already pregnant by my then-husband. I was carrying a three-month-old fetus, an Auroran fetus."

"Can you prove that?"

"Why should I have to prove it? The date of my son's birth is on record and Amadiro must have the date of my visit to the Earthman. "

"He was told it at the time, as I said, but nearly twenty decades have passed and he doesn't remember exactly. The visit is not a matter of record and cannot be referred to. I fear that Dr. Amadiro would prefer to believe that it was nine months before the birth of your son that you were with the Earthman."

"Six months."

"Prove it."

"You have my word."

"Insufficient. "

"Well, then--Daneel, you were with me. When did I see Elijah Baley?"

"Madam Gladia, it was one hundred and seventy-three days before the birth of your son."

Gladia said, "Which is just under six months before the birth."

"Insufficient," said Mandamus.

Gladia's chin lifted. "Daneel's memory is perfect, as can be easily demonstrated, and a robot's statements pass for evidence in the courts of Aurora."

"This is not a matter for the courts and will not be and Daneel's memory carries no weight with Dr. Amadiro. Daneel was constructed by Fastolfe and was maintained by Fastolfe for nearly two centuries. We cannot say what modifications were introduced or how Daneel might have been instructed to deal with matters relating to Dr. Amadiro."

"Then reason it out, man. Earthmen are quite different genetically from us. We are virtually different species. We are not interfertile."

"Unproven."

"Well, then, genetic records exist. Darrel's do; Santirix's do. Compare them. If my ex-husband were not his father, the genetic differences would make that unmistakable."

"Genetic records are not for anyone's eyes. You know that."

"Amadiro is not that immersed in ethical considerations. He has the influence to see them illegally. --Or is he afraid of disproving his hypothesis?"

"Whatever the reason, madam, he will not betray an Auroran's right to privacy."

Gladia said, "Well, then, go to outer space and choke on vacuum. If your Amadiro refuses to be convinced, that is no affair of mine. You, at least, ought to be convinced and it is your job to convince Amadiro in his turn. If you cannot and if your career does not

move onward as you would like to have it do, please be assured that this is entirely and intensely no concern of mine."

"That does not surprise me. I expect nothing more. And for that matter, I am convinced. I was merely hoping that you would give me some material with which to convince Dr. Amadiro. You haven't."

Gladia shrugged with disdain.

"I will use other methods, then," said Mandamus.

"I'm glad you have them," Gladia said coldly.

Mandamus said in a low voice, almost as though he were unaware of the presence of anyone else, "So am I. There are powerful methods remaining to me."

"Good. I suggest you try blackmail on Amadiro. He must have much to be blackmailed for."

Mandamus looked up, suddenly frowning. "Don't be a fool."

Gladia said, "You may go now. I think I have had all of you I wish to endure. Out of my establishment!"

Mandamus lifted his arms. "Wait! I told you at the start that there were two reasons for seeing you--one a personal matter and one a matter of state. I have spent too long a time on the first, but I must request five minutes to discuss the second."

"I'll give you no more than five minutes."

"There is someone else who wants to see you. An Earthman--or at least a member of one of the Settler worlds, a descendant of Earthpeople."

"Tell him," said Gladia, "that neither Earthpeople nor their Settler descendants are allowed on Aurora and send him away. Why do I have to see him?"

"Unfortunately, madam, in the last two centuries the balance of power has shifted somewhat. These Earthpeople have more worlds than we have--and have always had a far larger population. They have more ships, even though those are not as advanced as ours, and because of their short lives and their fecundity they are apparently far readier to die than we are."

"I don't believe that last." Mandamus smiled tightly. "Why not? Eight decades mean less than forty do. In any case, we must treat them politely--far more politely than we ever had to in Elijah Baley's day. If it is any comfort to you, it is the policies of Fastolfe that have created this situation."

"For whom do you speak, by the way? It is Amadiro who must now bring himself to be polite to Settlers?"

"No. It is the Council, actually."

"Are you the spokesman for the Council?"

"Not officially, but I have been asked to inform you of this--unofficially. "

"And if I see this Settler, what then? What does he want to see me about?"

"That is what we don't know, madam. We count on you to tell us. You are to see him, find out what he wants, and report to us. "

"Who is 'us'?"

"As I said, the Council. The Settler will be here at your establishment this evening."

"You seem to assume that I have no choice but to take on this position as informer."

Mandamus rose to his feet, clearly done with his mission. "You will not be an 'informer.' You owe nothing to this Settler. You are merely reporting to your government, as a loyal Auroran citizen should be willing--even eager--to do. You would not want the Council to suppose that your Solarian birth in any way dilutes your Auroran patriotism."

"Sir, I have been an Auroran over four times as long as you've been alive."

"Undoubtedly, but you were born and raised on Solaria. You are that unusual anomaly, a foreign-born Auroran, and it is difficult to forget it. This is especially true since the Settler wishes to see you, rather than anyone else on Aurora, precisely because you are Solarian-born."

"How do you know that?"

"It is a fair presumption. He identifies you as 'the Solarian woman.' We are curious as to why that should mean anything to him--now that Solaria no longer exists."

"Ask him."

"We prefer to ask you--after you ask him. I must ask permission to leave now and I thank you for your hospitality. "

Gladia nodded stiffly. "I grant you your permission to leave with better will than I granted you my hospitality."

Mandamus stepped toward the hallway that led to the main entrance, followed closely by his robots.

He paused just before leaving the room, turned, and said, "I had almost forgotten--"

"Yes?"

"The Settler who wishes to see you has a surname that, by a peculiar coincidence, is Baley."

3. THE CRISIS

7.

Daneel and Giskard, with robotic courtesy, saw Mandamus and his robots off the grounds of the establishment. Then, since they were outside, they toured the grounds, made certain that the lesser robots were in their places, and took note of the weather (cloudy and a bit cooler than seasonal).

Daneel said, "Dr. Mandamus admitted openly that the Settler worlds are now stronger than the Spacer worlds. I would not have expected him to do that."

Giskard said, "Nor I. I was certain that the Settlers would increase in strength as compared with the Spacers because Elijah Baley had predicted it many decades ago, but I could see no way of determining when the fact would become obvious to the Auroran Council. It seemed to me that social inertia would keep the Council firmly convinced of

Spacer superiority long after that had vanished, but I could not calculate for how long they would continue to delude themselves."

"I am astonished that Partner Elijah foresaw this so long ago."

"Human beings have ways of thinking about human beings that we have not." Had Giskard been human, the remark might have been made with regret or envy, but since he was a robot it was merely factual.

He went on. "I have tried to gain the knowledge, if not the way of thinking, by reading human history in great detail. Surely somewhere in the long tale of human events, there must be buried the Laws of Humanics that are equivalent to our Three Laws of Robotics."

Daneel said, "Madam Gladia once told me that this hope was an impossible one."

"So that may be, friend Daneel, for though it seems to me such Laws of Humanics must exist, I cannot find them. Every generalization I try to make, however broad and simple' has its numerous exceptions. Yet if such Laws existed and if I could find them, I could understand human beings better and be more confident that I am obeying the Three Laws in better fashion."

"Since Partner Elijah understood human beings, he must have had some knowledge of the Laws of Humanics."

"Presumably. But this he knew through something that human beings call intuition, a word I don't understand, signifying a concept I know nothing of. Presumably it lies beyond reason and I have only reason at my command."

7A.

That and memory!

Memory that did not work after the human fashion, of course. It lacked the imperfect recall, the fuzziness, the additions and subtractions dictated by wishful thinking and self-interest, to say nothing of the lingerings and lacunae and backtracking that can turn memory into hours-long daydreaming.

It was robotic memory ticking off the events exactly as they had happened, but in vastly hastened fashion. The seconds reeled off in nanoseconds, so that days of events could be relived with such rapid precision as to introduce no perceptible gap in a conversation.

As Giskard had done innumerable times before, he relived that visit to Earth, always seeking for understanding of Elijah Baley's casual ability to foresee the future, always failing to find it.

Earth!

Fastolfe had come to Earth in an Auroran warship, with a full complement of fellow passengers, both human and robot. Once in orbit, however, it was only Fastolfe who took the module in for a landing. Injections had stimulated his immune mechanism and he wore the necessary gloves, coveralls, contact lenses, and nose plugs. He felt quite safe as a result, but no other Auroran was willing to go along as part of a delegation.

This Fastolfe shrugged off, since it seemed to him (as he later explained to Giskard) that he would be more welcome if he came alone. A delegation would disagreeably

remind Earth of the bad old days (to them) of Spacetown, when Spacers had a permanent base on Earth and directly dominated the world.

With him, Fastolfe brought Giskard, however. To have arrived without any robots would have been unthinkable, even for Fastolfe. To have arrived with more than one would have put a strain on the increasingly antirobot Earthmen he hoped to see and with whom he intended to negotiate.

To begin with, of course, he would meet with Baley, who would be his liaison with Earth and its people. That was the rational excuse for the meeting. The real excuse was simply that Fastolfe wanted very much to see Baley again; he certainly owed him enough.

(That Giskard wanted to see Baley and that he very slightly tightened the emotion and impulse in Fastolfe's brain to bring that about, Fastolfe had no way of knowing--or even imagining.)

Baley was waiting for them at the time of landing and with him was a small group of Earth officials, so that there was a tedious passage of time during which politeness and protocol had its innings. It was some hours before Baley and Fastolfe could get away by themselves and it might not have happened that soon but for Giskard's quiet and unfelt interference--with just a touch at the minds of the more important of those officials who were distinctly bored. (It was always safe to confine one's self to accentuating an emotion that already existed. It could almost never bring harm.)

Baley and Fastolfe sat in the smallness of a private dining room that was ordinarily available only to high government officials. Food items could be punched out on a computerized menu and were then brought in by computerized carriers.

Fastolfe smiled. "Very advanced," he said, "but these carriers are merely specialized robots. I'm surprised Earth uses them. They are not of Spacer manufacture, surely."

"No, they're not," said Baley solemnly. "Home-grown, so to speak. This is only for use at the top and it's my first chance, ever, to experience it. I'm not likely to do so again."

"You may be elected to high office someday and then experience this sort of thing daily."

"Never," said Baley. The dishes were put before each of them and the carrier was even sophisticated enough to ignore Giskard, who stood impassively behind Fastolfe's chair.

For a while, Baley ate silently and then, with a certain shyness, he said, "It is good to see you again, Dr. Fastolfe."

"The pleasure is as much mine. I haven't forgotten that two years ago, when you were on Aurora, you managed to free me of the suspicion of the destruction of the robot Jander and to turn the tables neatly on my overconfident opponent, the good Amadiro."

"I still shake when I think of it," said Baley. "And greetings to you, too, Giskard. I trust you haven't forgotten me."

"That would be quite impossible, sir," said Giskard.

"Good! Well, Doctor, I trust the political situation on Aurora continues to be favorable. The news here would make it seem so, but I don't trust Earth analysis of Auroran affairs."

"You may--at the moment. My party is in firm control of the Council. Amadiro maintains a sullen opposition, but I suspect it will be years before his people recover from the blow you gave them. But how are things with you and with Earth?"

"Well enough. --Tell me, Dr. Fastolfe"--Baley's face twitched slightly, as though with embarrassment--"have you brought Daneel with you?"

Fastolfe said slowly, "I'm sorry, Baley. I did, but I left him back on the ship. I felt it might not be politic to be accompanied by a robot who looked so much like a human being. With Earth as antirobot as it has become, I felt a humanoid robot might seem a deliberate provocation to them."

Baley sighed. "I understand."

Fastolfe said, "Is it true that your government is planning to prohibit the use of robots within the Cities?"

"I suspect it will soon come to that, with a period of grace, of course, to minimize financial loss and inconvenience. Robots will be restricted to the countryside, where they are needed for agriculture and mining. There, too, they may eventually be phased out and the plan is to have no robots at all on the new worlds."

"Since you mention the new worlds, has your son left Earth yet?"

"Yes, a few months ago. We have heard from him and he's arrived at a new world safely, along with several hundred Settlers, as they call themselves. The world has some native vegetation upon it and a low-oxygen atmosphere. Apparently, with time it can be made quite Earthlike. Meanwhile, some makeshift domes have been put up, new Settlers are advertised for, and everyone is busily engaged in terraforming. Bentley's letters and occasional hyperwave contact are very hopeful, but they don't keep his mother from missing him badly."

"And will you be going there, Baley?"

"I'm not sure that living on a strange world under a dome is my idea of happiness, Dr. Fastolfe--I haven't Ben's youth and enthusiasm--but I think I'll have to in two or three years. In any case, I've already given notice to the Department of my intention to emigrate."

"I imagine they must be upset over that."

"Not at all. They say they are, but they're glad to get rid of me. I'm too notorious."

"And how does Earth's government react to this drive for expansion into the Galaxy."

"Nervously. They do not forbid it altogether, but certainly they are not cooperative. They continue to suspect that the Spacers are opposed to it and will do something unpleasant to stop it."

"Social inertia," said Fastolfe. "They judge us according to our behavior of years past. Surely we have made it plain that we now encourage Earth's colonization of new planets and that we intend to colonize new planets of our own."

"I hope you explain this to our government, then.--But, Dr. Fastolfe, another question on a smaller point. How is--" And with that, he stalled.

"Gladia?" said Fastolfe, hiding his amusement. "Have you forgotten her name?"

"No, no. I merely hesitated to--to--"

"She's well," said Fastolfe, "and living comfortably. She has asked me to remember her to you, but I imagine you need no nudging to recall her to mind. "

"The fact of her Solarian origin is not used against her, I hope?"

"No, nor is her role in the undoing of Dr. Amadiro. Rather the reverse. I take care of her, I assure you. --and yet I do not care to allow you to get off the subject altogether, Baley. What if Earth's officialdom continues to be opposed to immigration and expansion? Could the process continue despite such opposition?"

"Possibly," said Baley, "but not certainly. There's substantial opposition among Earthmen generally. It's hard to break away from the huge underground Cities that are our homes--"

"Your wombs."

"Or our wombs, if you prefer. Going to new worlds and having to live with the most primitive facilities for decades; never seeing comfort in one's own lifetime--that is difficult. When I think of it sometimes, I just decide not to go--especially if I'm passing a sleepless night. I've decided not to go a hundred times and one day I may just stick to that decision. And if I have trouble when, in a way, I originated the entire notion, then who else is likely to go freely and gladly? Without government encouragement--or, to be brutally frank--without the government shoe applied to the seat of the pants of the population, the whole project may fail."

Fastolfe nodded. "I will try to persuade your government. But if I fail?"

Baley said in a low voice, "If you fail--and if, therefore, our people fail--there remains only one alternative. The Spacers themselves must settle the Galaxy. The job must be done."

"And you will be content to see the Spacers expand and fill the Galaxy, while the Earthpeople remain on their single planet?"

"Not content at all, but it would be better than the present situation of no expansion by either. Many centuries ago, Earthpeople flocked to the stars, established some of the worlds that are now called Spacer worlds, and those first few colonized others. It has been a long time, however, since either the Spacers or Earthpeople have successfully settled and developed a new world. That must not be permitted to continue."

"I agree. But what is your reason for wanting expansion, Baley?"

"I feel that without expansion of some sort, humanity cannot advance. It doesn't have to be geographical expansion, but that is the clearest way of inducing other kinds of expansion as well. If geographical expansion can be undertaken in a fashion that is not at the expense of other intelligent beings; if there are empty spaces into which to expand; then why not? To resist expansion under such circumstances is to ensure decay."

"You see those alternatives, then? Expansion and advancement? Nonexpansion and decay?"

"Yes, I believe so. Therefore, if Earth refuses expansion, then Spacers must accept it. Humanity, whether in the form of Earthpeople or Spacers, must expand. I would like to see Earthpeople undertake the task, but, failing that, Spacer expansion is better than no expansion at all. One alternative or the other."

"And if one expands but not the other?"

"Then the expanding society will become steadily stronger and the nonexpanding one steadily weaker."

"Are you certain of that?"

"It would be unavoidable, I think."

Fastolfe nodded. "Actually, I agree. It is why I am trying to persuade both Earthpeople and Spacers to expand and advance. That is a third alternative, and, I think, the best."

7B.

Memory flickered past the days that followed--incredible mobs of people moving ceaselessly past each other in streams and eddies--racing Expressways being mounted and dismounted--endless conferences with innumerable officials--minds in crowds.

Particularly minds in crowds.

Minds in crowds so thick that Giskard could not isolate individuals. Mass minds mixing and melting together into a vast pulsating grayness with all that was detectable being the periodic sparks of suspicion and dislike that shot outward every time one of the multitude paused to look at him.

Only when Fastolfe was in conference with a few officials could Giskard deal with the individual mind and that, of course, was when it counted.

Memory slowed at one point near the end of the stay on Earth, when Giskard could finally maneuver a time alone with Baley again. Giskard adjusted a few minds minimally in order to make certain there would be no interruption for some time.

Baley said apologetically, "I haven't really been ignoring you, Giskard. I simply haven't had the opportunity to be alone with you. I don't rate highly on Earth and I cannot order my comings and goings."

"I have, of course, understood that, sir, but we will have some time together now."

"Good. Dr. Fastolfe tells me that Gladia is doing well. He may be saying that out of kindness, knowing that that is what I want to hear. I order you to be truthful, however. Is Gladia, in fact, doing well?"

"Dr. Fastolfe has told you the truth, sir."

"And you remember, I hope, my request when I last saw you on Aurora that you guard Gladia and protect her from harm."

"Friend Daneel and I, sir, are both mindful of your request. I have arranged it so that when Dr. Fastolfe is no longer alive, both friend Daneel and I will become part of Madam Gladia's establishment. We will then be in an even better position to keep her from harm."

"That," said Baley sadly, "will be after my time."

"I understand that, sir, and regret it."

"Yes, but it can't be helped and a crisis will come--or may come--even before that and yet still be after my time."

"What is it, sir, that you have in mind? What is this crisis?"

"Giskard, it is a crisis that may arise because Dr. Fastolfe is a surprisingly persuasive person. Or else, there is some other factor associated with him that is accomplishing the task."

"Sir?"

"Every official that Dr. Fastolfe has seen and interviewed now seems to be enthusiastically in favor of emigration. They were not in favor earlier or, if they were, it was with strong reservations. And once the opinion-making leaders are in favor, others are sure to follow. This will spread like an epidemic. "

"Is this not what you wish, sir?"

"Yes, it is, but it is almost too much what I wish. We shall spread out over the Galaxy--but what if the Spacers don't?"

"Why should they not?"

"I don't know. I advance it as a supposition, a possibility. What if they don't?"

"Earth and the worlds its people settle will then grow stronger, according to what I have heard you say."

"And the Spacers will grow weaker. There will, however, be a period of time during which the Spacers will remain stronger than Earth and its Settlers, though by a steadily diminishing margin. Eventually, the Spacers will inevitably become aware of Earthpeople as a growing danger. At that time the Spacer worlds will surely decide that Earth and the Settlers must be stopped before it is too late and it will seem to them that drastic measures will have to be taken. That will be a period of crisis that will determine the entire future history of human beings."

"I see your point, sir."

Baley remained in thoughtful silence for a moment, then said, in very nearly a whisper as though dreading being overheard, "Who knows of your abilities?"

"Among human beings only yourself--and you cannot mention it to others."

"I know well I can't. The point is, though, that it is you, not Fastolfe, who has engineered the turnaround that has made every official with whom you've come in contact a proponent of emigration. And it is to bring that about that you arranged to have Fastolfe take you, rather than Daneel, to Earth with him. You were essential and Daneel might have been a distraction."

Giskard said, "I felt it necessary to keep personnel to a minimum in order to avoid making my task harder by abrading the sensitivities of Earthpeople. I regret, sir, Daneel's absence. I fully sense your disappointment at not being able to greet him."

"Well--" Baley shook his head. "I understand the necessity and I rely on your explaining to Daneel that I badly missed him. In any case, I am still making my point. If Earth embarks on a great policy of world settlement and if the Spacers are left behind in

the race to expand, the responsibility for that--and therefore for the crisis that will inevitably arise--will be yours. You must, for that reason, feel it your further responsibility to use your abilities to protect Earth when the crisis comes."

"I will do what I can, sir."

"And should you succeed there, Amadiro--or his followers--may turn on Gladia. You must not forget to protect her, too."

"Daneel and I will not forget."

"Thank you, Giskard."

And they parted.

When Giskard, following Fastolfe, entered the module to begin the voyage back to Aurora, he saw Baley once again. This time there was no opportunity to speak to him.

Baley waved and mouthed one soundless word: "Remember."

Giskard sensed the word and, in addition, the emotion behind it.

After that, Giskard never saw Baley again. Never.

8.

Giskard had never found it possible to flip through the sharp images of that one visit to Earth, without then following it with the images of the key visit to Amadiro at the Institute of Robotics.

It had not been an easy conference to arrange. Amadiro, with the bitterness of defeat heavy upon him, would not exacerbate his humiliation by going to Fastolfe's establishment.

"Well, then," Fastolfe had said to Giskard. "I can afford to be magnanimous in victory. I will go to him. Besides, I must see him."

Fastolfe had been a member of the Institute of Robotics since Baley had made possible the crushing of Amadiro and of his political ambitions. In return, Fastolfe had passed over to the Institute all the data for the building and maintenance of humanoid robots. A number had been manufactured and then the project had come to an end and Fastolfe had chafed.

It had been Fastolfe's intention, at first, to arrive at the Institute without any robot companion. He would have placed himself, without protection and (so to speak) naked, into the midst of what was still the stronghold of the enemy's camp. It would have been a sign of humility and trust, but it would also have been an indication of complete self-confidence and Amadiro would have understood that. Fastolfe, entirely alone, would be demonstrating his certainty that Amadiro, with all the resources of the Institute at his command, would not dare to touch his single enemy coming carelessly and defenselessly within reach of his fist.

And yet in the end, Fastolfe, not quite knowing how, chose to have Giskard accompany him.

Amadiro seemed to have lost a little weight since last Fastolfe had seen him, but he was still a formidable specimen; tall and heavysset. He lacked the self-confident smile that had once been his hallmark and when he attempted it at Fastolfe's entrance, it seemed more like a snarl that faded into a look of somber dissatisfaction.

"Well, Kelden," said Fastolfe, making free with the other's familiar name, "we don't see each other often, despite the fact that we have now been colleagues for four years."

"Let's not have any false bonhomie, Fastolfe," said Amadiro in a clearly annoyed and low-pitched growl, "and address me as Amadiro. We are not colleagues except in name and I make no secret--and never have--of my belief that your foreign policy is suicidal for us."

Three of Amadiro's robots, large and gleaming, were present and Fastolfe studied them with raised eyebrows, "You are well protected, Amadiro, against one man of peace together with his single robot. "

"They will not attack you, Fastolfe, as you well know. But why did you bring Giskard? Why not your masterpiece, Daneel?"

"Would it be safe to bring Daneel within your reach, Amadiro?"

"I take it you intend that as humor. I no longer need Daneel. We build our own humaniforms."

"On the basis of my design."

"With improvements."

"And yet you do not use the humaniforms. That is why I have come to see you. I know that my position in the Institute is a name-only thing and that even my presence is unwelcome, let alone my opinions and recommendations. However, I must, as an Institute member, protest your failure to use the humaniforms."

"How do you wish me to use them?"

"The intention was to have the humaniforms open up new worlds into which Spacers could eventually emigrate, after those worlds had been terraformed and made completely habitable, wasn't it?"

"But that was something you opposed, Fastolfe, wasn't it?"

Fastolfe said, "Yes, I did. I wanted Spacers themselves to emigrate to new worlds and to do their own terraforming. That, however, is not happening and, I now see, is not likely to happen. Let us send the humaniforms, then. That would be better than nothing."

"All our alternatives come to nothing, as long as your views dominate the Council, Fastolfe. Spacers will not travel to rude and unformed worlds; nor, it seems, do they like humaniform robots."

"You have scarcely given the Spacers a chance to like them. Earthpeople are beginning to settle new planets--even rude and unformed ones. And they do it without robotic help."

"You know very well the differences between Earthpeople and ourselves. There are eight billion Earthpeople, plus a large number of Settlers."

"And there are five and a half billion Spacers."

"Numbers are not the sole difference," said Amadiro bitterly. "They breed like insects."

"They do not. Earth's population has been fairly stable for centuries."

"The potential is there. If they put all their heart into emigration, they can easily produce one hundred and sixty million new bodies each year and that number will rise as the new worlds fill up."

"We have the biological capability of producing one hundred million new bodies each year."

"But not the sociological capability. We are long-lived; we do not wish ourselves replaced so quickly."

"We can send a large portion of the new bodies to other worlds."

"They won't go. We value our bodies, which are strong, healthy, and capable of surviving in strength and health for nearly forty decades. Earthmen can place no value on bodies that wear out in less than ten decades and that are riddled with disease and degeneration even over that short period of time. It doesn't matter to them if they send out millions a year to certain misery and probable death. In fact, even the victims needn't fear misery and death, for what else do they have on Earth? The Earthpeople who emigrate are fleeing from their pestilential world knowing well that any change can scarcely be for the worse. We, on the other hand, value our well-wrought and comfortable planets and would not lightly give them up."

Fastolfe sighed and said, "I've heard all these arguments so often--May I point out the simple fact, Amadiro, that Aurora was originally a rude and unformed world that had to be terraformed into acceptability and that so was every Spacer world?"

Amadiro said, "And I have heard all your arguments to the point of nausea, but I will not weary of answering them. Aurora may have been primitive when first settled, but Aurora was settled by Earthpeople--and other Spacer worlds, when not settled by Earthpeople, were settled by Spacers that had not yet outgrown their Earth heritage. The times are no longer suitable for that. What could be done then, cannot be done now."

Amadiro lifted a corner of his mouth in a snarl and went on, "No, Fastolfe, what your policy has accomplished has been to begin the creation of a Galaxy that will be populated by Earthmen only, while Spacers must wither and decline. You can see it happening now. Your famous trip to Earth, two years ago, was the turning point. Somehow, you betrayed your own people by encouraging those half-humans to begin an expansion. In only two years there are at least some Earthpeople on each of twenty-four worlds and new ones are being added steadily."

Fastolfe said, "Do not exaggerate. Not one of those Settler worlds is truly fit for human occupation yet and won't be for some decades. Not all are likely to survive and, as the nearer worlds are occupied, the chances for settling farther worlds diminish so that the initial surge will slow down. I encouraged their expansion because I counted on ours as well. We can still keep up with them if we make the effort and, in healthy competition, we can fill the Galaxy together. "

"No," said Amadiro. "What you have in mind is that most destructive of all policies, a foolish idealism. The expansion is one-sided and will remain so despite anything you can do. The people of Earth swarm unhindered and they will have to be stopped before they get too strong to stop."

"How do you propose to do that? We have a treaty of friendship with Earth in which we specifically agree not to stop their expansion into space as long as no planet within twenty light-years of a Spacer world is touched. They have adhered to this scrupulously."

Amadiro said, "Everyone knows about the treaty. Everyone also knows that no treaty has ever been kept once it begins to work against the national interests of the more powerful signatory. I attach no value to that treaty."

"I do. It will be held to."

Amadiro shook his head. "You have touching faith. How will it be held to after you are out of power?"

"I don't intend to be out of power for a while."

"As Earth and its Settlers grow stronger, the Spacers will grow fearful and you will not remain long in power after that."

Fastolfe said, "And if you tear up the treaty and destroy the Settler worlds and slam the gates shut on Earth, will the Spacers then emigrate and fill the Galaxy?"

"Perhaps not. But if we decide not to, if we decide we are comfortable as we are, what difference will that make?"

"The Galaxy will not, in that case, become a human empire."

"And if it does not, what then?"

"Then the Spacers will stultify and degenerate, even if Earth is kept in prison and also stultifies and degenerates."

"That is just the claptrap your party puts out, Fastolfe. There is no actual evidence that such a thing would happen. And even if it does, that will be our choice. At least we will not see the barbarian short-lifers fall heir to the Galaxy."

Fastolfe said, "Are you seriously suggesting, Amadiro, that you would be willing to see the Spacer civilization die, provided you can prevent Earth from expanding?"

"I'm not counting on our death, Fastolfe, but if the worst happens, why, yes, to me our own death is a less fearful thing than the triumph of a subhuman disease-riddled set of short-lived beings. "

"From whom we are descended. "

"And with whom we are no longer truly related genetically. Are we worms because a billion years ago, worms were among our ancestors?"

Fastolfe, lips pressed together, rose to go. Amadiro, glowering, made no move to stop him.

9.

Daneel had no way of telling, directly, that Giskard was lost in memory. For one thing, Giskard's expression did not change and for another, he was not lost in memory as humans might be. It took no substantial period of time.

On the other hand, the line of thought that had caused Giskard to think of the past had caused Daneel to think of the same events of that past as they had long ago been recounted to him by Giskard. Nor was Giskard surprised at that.

Their conversation carried on with no unusual pause, but in a markedly new manner, as though each had thought of the past on behalf of both.

Daneel said, "It might seem, friend Giskard, that since the people of Aurora now recognize that they are weaker than Earth and its many Settler worlds, the crisis that Elijah Baley foresaw has been safely passed."

"It might seem so, friend Daneel."

"You labored to bring that about."

"I did. I kept the Council in Fastolfe's hand. I did what I could to mold those who, in turn, molded public opinion."

"Yet I am uneasy."

Giskard said, "I have been uneasy through every stage of the process, although I endeavored to do no harm to anyone. I have touched--mentally--not one human being who required anything more than the lightest touch. On Earth, I had merely to lighten the fear of reprisal and chose those, particularly, in which the fear was already light and broke a thread that was, in any case, frayed and on the point of breaking. On Aurora, it was reversed. The policymakers here were reluctant to espouse policies that would lead to an exit from their comfortable world and I merely confirmed that and made the sturdy cord that held them a bit stronger. And doing this has immersed me in a constant--if faint--turmoil."

"Why? You encouraged the expansion of Earth and discouraged the expansion of the Spacers. Surely that is as it should be. "

"As it should be? Do you think, friend Daneel, that an Earthperson counts for more than a Spacer, even though both are human beings?"

"There are differences. Elijah Baley would rather see his own Earthpeople defeated than see the Galaxy uninhabited. Dr. Amadiro would rather see both Earth and Spacers dwindle than see Earth expand. The first looks with hope to the triumph of either, the second is content to see the triumph of neither. Should we not choose the first, friend Giskard?"

"Yes, friend Daneel. So it would seem. And yet how far are you influenced by your feeling of the special worth of your onetime partner, Elijah Baley?"

Daneel said, "I value the memory of Partner Elijah and the people of Earth are his people."

"I see you do. I have been saying for many decades that you tend to think like a human being, friend Daneel, but I wonder if that is necessarily a compliment. Still, though

you tend to think like a human being, you are not a human being and, in the end, you are bound to the Three Laws. You may not harm a human being, whether that human being is an Earthman or a Spacer."

"There are times, friend Giskard, when one must choose one human being over another. We have been given special orders to protect Lady Gladia. I would be forced, on occasion, to harm a human being in order to protect Lady Gladia and I think that, all things being equal, I would be willing to harm a Spacer just a little in order to protect an Earthperson."

"So you think. But in the actual event, you would have to be guided by specific circumstances. You will find you cannot generalize," said Giskard. "And so it is with me. In encouraging Earth and discouraging Aurora, I have made it impossible for Dr. Fastolfe to persuade the Auroran government to sponsor a policy of emigration and to set up two expanding powers in the Galaxy. I could not help but realize that that portion of his labors was brought to nothing. This was bound to fill him with gathering despair and perhaps it hastened his death. I have felt this in his mind and that has been painful. And yet, friend Daneel--"

Giskard paused and Daneel said, "Yes?"

"To have not done as I had done might have greatly lowered Earth's ability to expand, without greatly improving Aurora's moves in that direction. Dr. Fastolfe would then have been frustrated in both ways--Earth and Aurora--and would moreover have been ousted from his seat of power by Dr. Amadiro. His sense of frustration would have been greater. It was Dr. Fastolfe, during his lifetime, to whom I owed my greatest loyalty and I chose that course of action which frustrated him less, without measurably harming other individuals I dealt with. If Dr. Fastolfe was continually disturbed by his inability to persuade Aurorans--and Spacers generally--to expand to new worlds, he was at least delighted by the activity of the emigrating Earthpeople."

"Could you not have encouraged both the people of Earth and of Aurora, friend Giskard, and thus have satisfied Dr. Fastolfe in both respects?"

"That, of course, had occurred to me, friend Daneel. I considered the possibility and decided it would not do. I could encourage Earthpeople to emigrate by means of a trifling change that would do no harm. To have attempted the same for Aurorans would have required a great enough change to do much harm. The First Law prevented that."

"A pity."

"True. Think what might have been done if I could have radically altered the mind-set of Dr. Amadiro. Yet how could I have changed his fixed determination to oppose Dr. Fastolfe? It would have been much like trying to force his head to make a one hundred and eighty degree turn. So complete a turnabout of either the head itself or of its emotional content would kill with, I think, equal efficiency.

"The price of my power, friend Daneel," Giskard went on, "is the greatly increased dilemma into which I am constantly plunged. The First Law of Robotics, which forbids injury to human beings, deals, ordinarily, with the visible physical injuries that we can, all of us, easily see and concerning which we can easily make judgments. I, alone, however,

am aware of human emotions and of casts of mind, so that I know of more subtle forms of injury without being able to understand them completely. I am forced on many occasions to act without true certainty and this puts a continuing stress on my circuits.

"And yet I feel I have done well. I have carried the Spacers past the crisis point. Aurora is aware of the gathering strength of the Settlers and will now be forced to avoid conflict. They must recognize it to be too late for retaliation and our promise to Elijah Baley is, in that respect, fulfilled. We have put Earth on the course toward the filling of the Galaxy and the establishment of a Galactic Empire."

They were, at this point, walking back to Gladia's house, but now Daneel stopped and the gentle pressure of his hand on Giskard's shoulder caused the other to stop as well.

Daneel said, "The picture you draw is attractive. It would make Partner Elijah proud of us if, as you say, we have accomplished that. 'Robots and Empire' Elijah would say and perhaps he would clap me on the shoulder. --And yet, as I said, I am uneasy, friend Giskard. "

"Concerning what, friend Daneel?"

"I cannot help but wonder if indeed we have actually passed the crisis that Partner Elijah spoke of so many decades ago. Is it, in actual fact, too late for Spacer retaliation?"

"Why do you have these doubts, friend Daneel?"

"I have been made doubtful by the behavior of Dr. Mandamus in due course of his conversation with Madam Gladia."

Giskard's gaze was fixed on Daneel for a few moments and in the quiet they could hear leaves rustling in the cool breeze. The clouds were breaking and the sun would make its appearance soon. Their conversation, in its telegraphic fashion, had taken little time and Gladia, they knew, would not yet be wondering at their absence.

Giskard said, "What was there in the conversation that would give you cause for uneasiness?"

Daneel said, "I have had the opportunity, on four separate occasions, to observe Elijah Baley's handling of a puzzling problem. On each of those four occasions, I have noted the manner in which he managed to work out useful conclusions from limited--and even misleading--information. I have since always tried, within my limitations, to think as he did."

"It seems to me, friend Daneel, you have done well in this respect. I have said you tend to think like a human being."

"You will have noticed, then, that Dr. Mandamus had two matters he wished to discuss with Madam Gladia. He emphasized that fact himself. One was the matter of his own descent, whether from Elijah Baley or not. The second was the request that Madam Gladia see a Settler and report on the event afterward. Of these, the second might be viewed as a matter that would be important to the Council. The first would be a matter of importance only to himself."

Giskard said, "Dr. Mandamus presented the matter of his descent as being of importance to Dr. Amadiro as well."

"Then it would be a matter of personal importance to two people rather than one, friend Giskard. It would still not be a matter of importance to the Council and, therefore, to the planet generally. "

"Proceed, then, friend Daneel."

"Yet the matter of state, as Dr. Mandamus himself referred to it, was taken up second, almost as an afterthought, and was disposed of almost at once. Indeed, it seemed scarcely something that required a personal visit. It might have been handled by holographic image by any official of the Council. On the other hand, Dr. Mandamus dealt with the matter of his own descent first, discussed it in great detail, and it was a matter that could have been handled only by him and by no one else."

"What is your conclusion, friend Daneel?"

"I believe that the matter of the Settler was seized upon by Dr. Mandamus as an excuse for a personal conversation with Madam Gladia, in order that he might discuss his descent in privacy. It was the matter of his descent and nothing else that truly interested him. --Is there any way you can support that conclusion, friend Giskard?"

Aurora 's sun had not yet emerged from the clouds and the faint glow of Giskard's eyes was visible. He said, "The tension in Dr. Mandamus's mind was indeed measurably stronger in the first part of the interview than in the second. That may serve as corroboration, perhaps, friend Daneel."

Daneel said, "Then we must ask ourselves why the question of Dr. Mandamus's descent should be a matter of such importance to him."

Giskard said, "Dr. Mandamus explained that. It is only by demonstrating that he is not descended from Elijah Baley that his road to advancement is open. Dr. Amadiro, upon whose goodwill he is dependent, would turn against him absolutely if he were a descendant of Mr. Baley."

"So he said, friend Giskard, but what took place during the interview argues against that. "

"Why do you say so? Please continue thinking like a human being, friend Daneel. I find it instructive."

Daneel said gravely, "Thank you, friend Giskard. Did you note that not one statement that Madam Gladia made concerning the impossibility of Dr. Mandamus's descent from Partner Elijah was considered convincing? In every case, Dr. Mandamus said that Dr. Amadiro would not accept the statement. "

"Yes and what do you deduce from that?"

"It seems to me that Dr. Mandamus was so convinced that Dr. Amadiro would accept no argument against Elijah Baley an ancestor that one must wonder why he should have bothered to ask Madam Gladia about the matter. He apparently knew from the start that it would be pointless to do so."

"Perhaps, friend Daneel, but it is mere speculation. Can you supply a possible motive for his action, then?"

"I can. I believe he inquired as to his descent, not to convince an implacable Dr. Amadiro but to convince himself."

"In that case, why should he have mentioned Dr. Amadiro at all? Why not simply have said, 'I wish to know.'"

A small smile passed over Daneel's face, a change of expression of which the other robot would have been incapable. Daneel said, "Had he said, 'I wish to know,' to Madam Gladia, she would surely have replied that it was none of his business and he would have discovered nothing. Madam Gladia, however, is as strongly opposed to Dr. Amadiro as Dr. Amadiro is to Elijah Baley. Madam Gladia would be sure to take offense at any opinion strongly held by Dr. Amadiro concerning her. She would be furious, even if the opinion were more or less true; how much more, then, if it were absolutely false, as in this case. She would labor to demonstrate Dr. Amadiro to be wrong and would present every piece of evidence needed to achieve that end.

"In such a case, Dr. Mandamus's cold assurance that each piece of evidence was insufficient would but make her the angrier and would drive her to further revelations. Dr. Mandamus's strategy was chosen to make certain he would learn the maximum from Madam Gladia and, at the end, he was convinced that he did not have an Earthman as ancestor; at least, not as recently as twenty decades ago. Amadiro's feelings in this regard were not, I think, truly in question."

Giskard said, "Friend Daneel, this is an interesting point of view, but it does not seem to be strongly founded. In what way can we conclude that it is no more than a guess on your part?"

Daneel said, "Does it not seem to you, friend Giskard, that when Dr. Mandamus ended his inquiry into his descent without having obtained sufficient evidence for Dr. Amadiro, as he would have had us believe, that he should have been distinctly depressed and disheartened. By his own statement, this should have meant he had no chance for advancement and would never gain the position as head of the Institute of Robotics. And yet it seemed to me that he was far from depressed but was, indeed, jubilant. I can only judge by outward appearance, but you can do better. Tell me, friend Giskard, what was his mental attitude at the conclusion of this portion of his conversation with Madam Gladia?"

Giskard said, "As I look back on it, it was not only jubilant but triumphant, friend Daneel. You are right. Now that you have explained your process of thought, that sensation of triumph I detected clearly marks the accuracy of your reasoning. In fact, now that you have marked it all out, I find myself at a loss to account for my inability to see it for myself."

"That, friend Giskard, was, on a number of occasions, my reaction to the reasoning of Elijah Baley. That I could carry through such reasoning on this occasion may be, in part, because of the strong stimulus of the existence of the present crisis. It forces me to think more cogently."

"You underestimate yourself, friend Daneel. You have been thinking cogently for a long time. But why do you speak of a present crisis? Pause a moment and explain. How does one go from Dr. Mandamus's feeling of triumph at not being descended from Mr. Baley to this crisis you speak of?"

Daneel said, "Dr. Mandamus may have deceived us in his statements concerning Dr. Amadiro, but it may be fair to suppose that it is nevertheless true that he longs for advancement; that he is ambitious to become head of the Institute. Is that not so, friend Giskard?"

Giskard paused a moment, as though in thought, then said, "I was not searching for ambition. I was studying his mind without particular purpose and was aware of only surface manifestations. Yet there might have been flashes of ambition there when he spoke of advancement. I do not have strong grounds for agreeing with you, friend Daneel, but I have no grounds at all for disagreeing with you."

"Let us accept Dr. Mandamus as an ambitious man, then, and see where that takes us. Agreed?"

"Agreed. "

"Then does it not seem likely that his sense of triumph, once he was convinced that he was not descended from Partner Elijah, arose from the fact that he felt his ambition could now be served. This would not be so, however, because of Dr. Amadiro's approval, since we have agreed that the Dr. Amadiro motif was introduced by Dr. Mandamus as a distraction. His ambition could now be served for some other reason."

"What other reason?"

"There is none that arises out of compelling evidence. But I can suggest one as a matter of speculation. What if Dr. Mandamus knows something or can do something that would lead to some huge success; one that would surely make him the next head? Remember that at the conclusion of the search into the manner of his descent, Dr. Mandamus said, 'There are powerful methods remaining to me.' Suppose that is true, but that he could only use those methods if he were not descended from Partner Elijah. His jubilation over having been convinced of his nondescent would arise, then, from the fact that he could now use those methods and assure himself of great advancement. "

"But what are these 'powerful methods,' friend Daneel?"

Daneel said gravely, "We must continue to speculate. We know that Dr. Amadiro wants nothing so much as to defeat Earth and force it back to its earlier position of subservience to the Spacer worlds. If Dr. Mandamus has a way of doing this, he can surely get anything he wants out of Dr. Amadiro, up to and including a guarantee of succession to the headship. Yet it may be that Dr. Mandamus hesitates to bring about Earth 's defeat and humiliation unless he felt no kinship to its people. Descent from Elijah Baley of Earth would inhibit him. The denial of that descent frees him to act and that makes him jubilant. "

Giskard said, "You mean Dr. Mandamus is a man of conscience?"

"Conscience?"

"It is a word human beings sometimes use. I have gathered that it is applied to a person who adheres to rules of behavior that force him to act in ways that oppose his immediate self-interest. If Dr. Mandamus feels that he cannot allow himself to advance at the expense of those with whom he is distantly connected, I imagine him to be a man of

conscience. I have thought much of such things, friend Daneel, since they seem to imply that human beings do have Laws governing their behavior, at least in some cases."

"And can you tell whether Dr. Mandamus is, indeed, a man of conscience?"

"From my observations of his emotions? No, I was not watching for anything like that, but if your analysis is correct, conscience would seem to follow. --and yet, on the other hand, if we begin by supposing him a man of conscience and argue backward, we can come to other conclusions. It might seem that if Dr. Mandamus thought he had an Earthman in his ancestry a mere nineteen and a half decades ago, he might feel driven, against his conscience, to spearhead an attempt to defeat Earth as a way of freeing himself from the stigma of such descent. If he were not so descended, then he would not be unbearably driven to act against Earth and his conscience would be free to cause him to leave Earth alone."

Daneel said, "No, friend Giskard. That would not fit the facts. However relieved he might be at not having to take violent action against Earth, he would be left without a way of satisfying Dr. Amadiro and enforcing his own advance. Considering his ambitious nature, he would not be left with the feeling of triumph you so clearly noted."

"I see. Then we conclude that Dr. Mandamus has a method for defeating Earth."

"Yes. And if that is so, then the crisis foreseen by Partner Elijah has not been safely passed after all, but is now here."

Giskard said thoughtfully, "But we are left with the key question unanswered, friend Daneel. What is the nature of the crisis? What is the deadly danger? Can you deduce that, too?"

"That I cannot do, friend Giskard. I have gone as far as I can. Perhaps Partner Elijah might have gone farther were he still alive, but I cannot. --Here I must depend upon you, friend Giskard."

"Upon me? In what way?"

"You can study the mind of Dr. Mandamus as I cannot, as no one else can. You can discover the nature of the crisis."

"I fear I cannot, friend Daneel. If I lived with a human being over an extended period, as once I lived with Dr. Fastolfe, as now I live with Madam Gladia, I could, little by little, unfold the layers of mind, one leaf after another, untie the intricate knot a bit at a time, and learn a great deal without harming him or her. To do the same to Dr. Mandamus after one brief meeting or after a hundred brief meetings would accomplish little. Emotions are readily apparent, thoughts are not. If, out of a sense of urgency, I attempted to make haste, forcing the process, I would surely injure him--and that I cannot do."

"Yet the fate of billions of people on Earth and billions more in the rest of the Galaxy may depend on this. "

"May depend on this. That is conjecture. Injury to a human being is a fact. Consider that it may be only Dr. Mandamus who knows the nature of the crisis and carry it through to a conclusion. He could not use his knowledge or ability to force Dr. Amadiro to grant him the headship--if Dr. Amadiro could gain it from another source."

"True," said Daneel. "That may be well so."

"In that case, friend Daneel, it is not necessary to know the nature of the crisis. If Dr. Mandamus could be restrained from telling Dr. Amadiro--or anyone else--whatever it is he knows, the crisis will not come to pass."

"Someone else might discover what Dr. Mandamus now knows."

"Certainly, but we don't know when that will be. Very likely, we will have time to probe further and discover more--and become better prepared to play a useful role of our own."

"Well, then."

"If Dr. Mandamus is to be restrained, it can be done by damaging his mind to the point where it is no longer effective--or by destroying his life outright. I alone possess the ability to injure his mind appropriately, but I cannot do this. However, either one of us can physically bring his life to an end. I cannot do this, either. Can you do it, friend Daneel?"

There was a pause and Daneel finally whispered. "I cannot. You know that."

Giskard said slowly, "Even though you know that the future of billions of people on Earth and elsewhere is at stake?"

"I cannot bring myself to injure Dr. Mandamus."

"And I cannot. So we are left with the certainty of a deadly crisis coming, but a crisis whose nature we do not know, and cannot find out, and which we are therefore helpless to counter."

They stared at each other in silence, with nothing showing in their faces, but with an air of despair settling somehow over them.

4. ANOTHER DESCENDANT

10.

Gladia had tried to relax after the harrowing session with Mandamus--and did so with an intensity that fought relaxation to the death. She had opacified all the windows in her bedroom, adjusted the environment to a gentle warm breeze with the faint sound of rustling leaves and the occasional soft warble of a distant bird. She had then shifted it to the sound of a far-off surf and had added a faint but unmistakable tang of the sea in the air.

It didn't help. Her mind echoed helplessly with what had just been--and with what was soon to come. Why had she chattered so freely to Mandamus? What business was it of his--or of Amadiro's, for that matter--whether she had visited Elijah in orbit or not and whether or not--or when--she had had a son by him or by any other man.

She had been cast into imbalance by Mandamus's claim of descent, that's what it was. In a society where no one cared about descent or relationship except for medico-genetic reasons, its sudden intrusion into a conversation was bound to be upsetting. That and the repeated (but surely accidental) references to Elijah.

She decided she was finding excuses for herself and, in impatience, she tossed it all away. She had reacted badly and had babbled like a baby and that was all there was to it.

Now there was this Settler coming.

He was not an Earthman. He had not been born on Earth, she was sure, and it was quite possible that he had never even visited Earth. His people might have lived on a strange world she had never heard of and might have done so for generations.

That would make him a Spacer, she thought. Spacers were descended from Earthmen, too--centuries further back, but what did that matter? To be sure, Spacers were long-lived and these Settlers must be short-lived, but how much of a distinction was that? Even a Spacer might die prematurely through some freak accident; she had once heard of a Spacer who had died a natural death before he was sixty. Why not, then, think of the next visitor as a Spacer with an unusual accent?

But it wasn't that simple. No doubt the Settler did not feel himself to be a Spacer. It's not what you are that counts, but what you feel yourself to be. So think of him as a Settler, not a Spacer.

Yet weren't all human beings simply human beings no matter what name you applied to them--Spacers, Settlers, Aurorans, Earthpeople. The proof of it was that robots could not do injury to any of them. Daneel would spring as quickly to the defense of the most ignorant Earthman as to the Chairman of the Auroran Council--and that meant she could feel herself drifting, actually relaxing into a shallow sleep when a sudden thought entered her mind and seemed to ricochet there.

Why was the Settler named Baley?

Her mind sharpened and snapped out of the welcoming coils of oblivion that had all but engulfed her.

Why Baley?

Perhaps it was simply a common name among the Settlers. After all, it was Elijah who had made it all possible and he had to be a hero to them as--as--

She could not think of an analogous hero to Aurorans. Who had led the expedition that first reached Aurora? Who had supervised the terraformation of the raw barely living world that Aurora had then been? She did not know.

Was her ignorance born of the fact that she had been brought up on Solaria--or was it that the Aurorans simply had no founding hero? After all, the first expedition to Aurora had consisted of mere Earthpeople. It was only in later generations, with lengthening life-spans, thanks to the adjustments of sophisticated bioengineering, that Earthpeople had become Aurorans. And after that, why should Aurorans wish to make heroes of their despised predecessors?

But Settlers might make heroes of Earthpeople. They had not yet changed, perhaps. They might change eventually and then Elijah would be forgotten in embarrassment, but till then that must be it. Probably half the Settlers alive had adopted the Baley surname. Poor Elijah! Everyone crowding onto his shoulders and into his shadow. Poor Elijah--dear Elijah.

And she did fall asleep.

11.

The sleep was too restless to restore her to calm, let alone good humor. She was scowling without knowing that she was--and had she seen herself in the mirror, she would have been taken aback by her middle-aged appearance.

Daneel, to whom Gladia was a human being, regardless of age, appearance, or mood, said, "Madam--"

Gladia interrupted, with a small shiver. "Is the Settler here?"

She looked up at the clock ribbon on the wall and then made a quick gesture, in response to which Daneel at once adjusted the heat upward. (It had been a cool day and was going to be a cooler evening.)

Daneel said, "He is, madam."

"Where have you put him?"

"In the main guest room, madam. Giskard is with him and the household robots are all within call."

"I hope they will have the judgment to find out what he expects to eat for lunch. I don't know Settler cuisine. And I hope they can make some reasonable attempt to meet his requests."

"I am sure, madam, that Giskard will handle the matter competently. "

Gladia was sure of that, too, but she merely snorted. At least it would have been a snort if Gladia were the sort of person who snorted. She didn't think she was.

"I presume," she said, "he's been in appropriate quarantine before being allowed to land."

"It would be inconceivable for him not to have been, madam."

She said, "Just the same, I'll wear my gloves and my nose filter. "

She stepped out of her bedroom, was distantly aware that there were household robots about her, and made the sign that would get her a new pair of gloves and a fresh nose filter. Every establishment had its own vocabulary of signs and every human member of an establishment cultivated those signs, learning to make them both rapidly and unnoticeably. A robot was expected to follow these unobtrusive orders of its human overlords as though it read minds; and it followed that a robot could not follow the orders of nonestablishment human beings except by careful speech.

Nothing would humiliate a human member of an establishment more than to have one of the robots of the establishment hesitate in fulfilling an order or, worse, fulfill it incorrectly. That would mean that the human being had fumbled a sign--or that the robot had.

Generally, Gladia knew, it was the human being who was at fault, but in virtually every case, this was not admitted. It was the robot who was handed over for an unnecessary response analysis or unfairly put up for sale. Gladia had always felt that she

would never fall into that trap of wounded ego, yet if at that moment she had not received her gloves and nose filter, she would have.

She did not have to finish the thought. The nearest robot brought her what she wanted, correctly and with speed.

Gladia adjusted the nose filter and snuffled a bit to make sure it was properly seated (she was in no mood to risk infection with any foul disorder that had survived the painstaking treatment during quarantine). She said, "What does he look like, Daneel?"

Daneel said, "He is of ordinary stature and measurements, madam. "

"I mean his face. " (It was silly to ask. If he showed any family resemblance to Elijah Baley, Daneel would have noticed it as quickly as she herself would have and he would have remarked upon it.)

"That is difficult to say, madam. It is not in plain view."

"What does that mean? Surely he's not masked, Daneel."

"In a way, he is, madam. His face is covered with hair."

"Hair?" She found herself laughing. "You mean after the fashion of the hypervision historicals? Beards?" She made little gestures indicating a tuft of hair on the chin and another under the nose.

"Rather more than that, madam. Half his face is covered."

Gladia's eyes opened wide and for the first time she felt a surge of interest in seeing him. What would a face with hair all over it look like? Auroran males--and Spacer males, generally--had very little facial hair and what there was would be removed permanently by the late teens--during virtual infancy.

Sometimes the upper lip was left untouched. Gladia remembered that her husband, Santirix Gremionis, before their marriage, had had a thin line of hair under his nose. A moustache, he had called it. It had looked like a misplaced and peculiarly misshapen eyebrow and once she had resigned herself to accepting him as a husband, she had insisted he destroy the follicles.

He had done so with scarcely a murmur and it occurred to her now, for the first time, to wonder if he had missed the hair. It seemed to her that she had noticed him, on occasion, in those early years, lifting a finger to his upper lip. She had thought it a nervous poking at a vague itch and it was only now that it occurred to her that he had been searching for a moustache that was gone forever.

How would a man look with a moustache all over his face? Would he be bear-like? How would it feel? What if women had such hair, too? She thought of a man and woman trying to kiss and having trouble finding each other's mouths. She found the thought funny, in a harmlessly ribald way, and laughed out loud. She felt her petulance disappearing and actually looked forward to seeing the monster.

After all, there would be no need to fear him even if he were as animal in behavior as he was in appearance. He would have no robot of his own--Settlers were supposed to have a nonrobotic society--and she would be surrounded by a dozen. The monster would be immobilized in a split second if he made the slightest suspicious move--or if he as much as raised his voice in anger.

She said with perfect good humor, "Take me to him, Daneel."

12.

The monster rose. He said something that sounded like "Gode arternoon, muhleddy."

She at once caught the "good afternoon," but it took her a moment to translate the last word into "my lady."

Gladia absently said, "Good afternoon. " She remembered the difficulty she had had understanding Auroran pronunciation of Galactic Standard in those long-ago days when, a frightened young woman, she had come to the planet from Solaria.

The monster's accent was uncouth--or did it just sound uncouth because her ear was unaccustomed to it? Elijah, she remembered, had seemed to voice his "k's" and "p's," but spoke pretty well otherwise. Nineteen and a half decades had passed, however, and this Settler was not from Earth. Language, in isolation, underwent changes.

But only a small portion of Gladia's mind was on the language problem. She was staring at his beard.

It was not in the least like the beards that actors wore in historical dramas. Those always seemed tufted--a bit here, a bit there--looking gluey and glossy.

The Settler's beard was different. It covered his cheeks and chin evenly, thickly, and deeply. It was a dark brown, somewhat lighter and wavier than the hair on his head, and at least two inches long, she judged--evenly long.

It didn't cover his whole face, which was rather disappointing. His forehead was totally bare (except for his eyebrows), as were his nose and his under-eye regions.

His upper lip was bare, too, but it was shadowed as though there was the beginning of new growth upon it. There was additional bareness just under the lower lip, but with new growth less marked and concentrated mostly under the middle portion.

Since both his lips were quite bare, it was clear to Gladia that there would be no difficulty in kissing him. She said, knowing that staring was impolite and staring even so, "It seems to me you remove the hair from about your lips."

"Yes, my lady."

"Why, if I may ask?"

"You may ask. For hygienic reasons. I don't want food catching in the hairs."

"You scrape it off, don't you? I see it's growing again."

"I use a facial laser. It takes fifteen seconds after waking. "

"Why not depilate and be done with it?"

"I might want to grow it back."

"Why?"

"Esthetic reasons, my lady?"

This time Gladia did not grasp the word. It sounded like "acidic" or possibly "acetic. "

She said, "Pardon me?"

The Settler said, "I might grow tired of the way I look now and want to grow the hair on the upper lip again. Some women like it, you know, and"--the Settler tried to look modest and failed--"I have a fine moustache when I grow it."

She said suddenly grasping the word, "You mean ' esthetic '."

The Settler laughed, showing fine white teeth, and said, "You talk funny, too, my lady."

Gladia tried to look haughty, but melted into a smile. Proper pronunciation was a matter of local consensus. She said, "You ought to hear me with my Solarian accent--if it comes to that. Then it would be 'estheetic rayzuns '." The ' r ' rolled interminably.

"I've been places where they talk a little bit like that. It sounds barbarous." He rolled both ' r's ' phenomenally in the last word.

Gladia chuckled. "You do it with the tip of your tongue. It's got to be with the sides of the tongue. No one but a Solarian can do it correctly."

"Perhaps you can teach me. A Trader like myself, who's been everywhere, hears all kinds of linguistic perversions." Again he tried to roll the ' r's' of the last word, choked slightly, and coughed.

"See. You'll tangle your tonsils and you'll never recover." She was still staring at his beard and now she could curb her curiosity no longer. She reached toward it.

The Settler flinched and started back, then, realizing her intention, was still.

Gladia's hand, all-but-invisibly gloved, rested lightly on the left side of his face. The thin plastic that covered her fingers did not interfere with the sense of touch and she found the hair to be soft and springy.

"It's nice," she said with evident surprise.

"Widely admired," said the Settler, grinning.

She said, "But I can't stand here and manhandle you all day."

Ignoring his predictable "You can as far as I'm concerned," she went on. "Have you told my robots what you would like to eat?"

"My lady, I told them what I now tell you--whatever is handy. I've been on a score of worlds in the last year and each has its own dietary. A Trader learns to eat everything that isn't actually toxic. I'd prefer an Auroran meal to anything you would try to make in imitation of Baleyworld."

"Baleyworld?" said Gladia sharply, a frown returning to her face.

"Named for the leader of the first expedition to the planet--or to any of the Settled planets, for that matter. Ben Baley."

"The son of Elijah Baley?"

"Yes," the Settler said and changed the subject at once. He looked down at himself and said with a trace of petulance, "How do you people manage to stand these clothes of yours--slick and puffy. Be glad to get into my own again."

"I'm sure you will have your chance to do so soon enough. But for now please come and join me at lunch. -I was told your name was Baley, by the way--like your planet."

"Not surprising. It's the most honored name on the planet, naturally. I'm Deejee Baley."

They had walked into the dining room, Giskard preceding them, Daneel following them, each moving into his appropriate wall niche. Other robots were already in their niches and two emerged to do the serving. The room was bright with sunshine, the walls were alive with decoration, the table was set, and the odor of the food was enticing.

The Settler sniffed and let his breath out in satisfaction. "I don't think I'll have any trouble at all eating Auroran food. --Where would you like me to sit, my lady?"

A robot said at once, "If you would sit here, sir?"

The Settler sat down and then Gladia, the privileges of the guest satisfied, took her own seat.

"Deejee?" she said. "I do not know the nomenclatural peculiarities of your world, so excuse me if my question is offensive. Wouldn't Deejee be a feminine name?"

"Not at all," said the Settler a bit stiffly. "In any case, it is not a name, it is a pair of initials. Fourth letter of the alphabet and the seventh."

"Oh," said Gladia, enlightened, "D.G. Baley. And what do the initials stand for, if you'll excuse my curiosity?"

"Certainly. There's 'D,' for certain," he said, jerking his thumb toward one of the wall niches, "and I suspect that one may be 'G.'" He jerked his thumb toward another.

"You don't mean that," said Gladia faintly.

"But I do. My name is Daneel Giskard Baley. In every generation, my family has had at least one Daneel or one Giskard in its multiplying batches. I was the last of six children, but the first boy. My mother felt that was enough and made up for having but one son by giving me both names. That made me Daneel Giskard Baley and the double load was too great for me. I prefer D.G. as my name and I'd be honored if you used it." He smiled genially. "I'm the first to bear both names and I'm also the first to see the grand originals."

"But why those names?"

"It was Ancestor Elijah's idea, according to the family story. He had the honor of naming his grandsons and he named the oldest Daneel, while the second was named Giskard. He insisted on those names and that established the tradition."

"And the daughters?"

"The traditional name from generation to generation is Jezebel--Jessie. Elijah's wife, you know."

"I know."

"There are no--" He caught himself and transferred his attention to the dish that had been placed before him. "If this were Baleyworld, I would say this was a slice of roast pork and that it was smothered in peanut sauce."

"Actually, it is a vegetable dish, D.G. What you were about to say was that there are no Gladias in the family."

"There aren't," said D.G. calmly. "One explanation is that Jessie--the original Jessie--would have objected, but I don't accept that. Elijah's wife, the Ancestress, never

came to Baleyworld, you know, never left Earth. How could she have objected? No, to me, it's pretty certain that the Ancestor wanted no other Gladia. No imitations, no copies, no pretense. One Gladia. Unique. --He asked that there be no later Elijah, either."

Gladia was having trouble eating. "I think your Ancestor spent the latter portion of his life trying to be as unemotional as Daneel. Just the same, he had romantic notions under his skin. He might have allowed other Elijahs and Gladias. It wouldn't have offended me, certainly, and I imagine it wouldn't have offended his wife, either." She laughed tremulously.

D.G. said, "All this doesn't seem real somehow. The Ancestor is practically ancient history; he died a hundred and sixty-four years ago. I'm his descendant in the seventh generation, yet here I am sitting with a woman who knew him when he was quite young."

"I didn't really know him," said Gladia, staring at her plate. "I saw him, rather briefly, on three separate occasions over a period of seven years."

"I know. The Ancestor's son, Ben, wrote a biography of him which is one of the literary classics of Baleyworld. Even I have read it."

"Indeed? I haven't read it. I didn't even know it existed. What--what does it say about me?"

D.G. seemed amused. "Nothing you would object to; you come out very well. But never mind that. What I'm amazed at is that here we are together, across seven generations. How old are you, my lady? Is it fair to ask the question?"

"I don't know that it's fair, but I have no objection to it. In Galactic Standard Years, I am two hundred and thirty-three years old. Over twenty-three decades."

"You look as though you were no more than in your late forties. The Ancestor died at the age of seventy-nine, an old man. I'm thirty-nine and when I die you will still be alive--"

"If I avoid death by misadventure."

"And will continue to live perhaps five decades beyond."

"Do you envy me, D.G.?" said Gladia with an edge of bitterness in her voice. "Do you envy me for having survived Elijah by over sixteen decades and for being condemned to survive him ten decades more, perhaps?"

"Of course I envy you," came the composed answer. "Why not? I would have no objection to living for several centuries, were it not that I would be setting a bad example to the people of Baleyworld. I wouldn't want them to live that long as a general thing. The pace of historical and intellectual advance would then become too slow. Those at the top would stay in power too long. Baleyworld would sink into conversation and decay--as your world has done. "

Gladia's small chin lifted. "Aurora is doing quite well, you'll find."

"I'm speaking of your world. Solaria."

Gladia hesitated, then said firmly, "Solaria is not my world."

D.G. said, "I hope it is. I came to see you because I believe Solaria is your world."

"If that is why you came to see me, you are wasting your time, young man."

"You were born on Solaria, weren't you, and lived there a while?"

"I lived there for the first three decades of my life--about an eighth of my lifetime."

"Then that makes you enough of a Solarian to be able to help me in a matter that is rather important."

"I am not a Solarian, despite this so-called important matter."

"It is a matter of war and peace--if you call that important. The Spacer worlds face war with the Settler worlds and things will go badly for all of us if it comes to that. And it is up to you, my lady, to prevent that war and to ensure peace."

13.

The meal was done (it had been a small one) and Gladia found herself looking at D.G. in a coldly furious way.

She had lived quietly for the last twenty decades, peeling off the complexities of life. Slowly she had forgotten the misery of Solaria and the difficulties of adjustment to Aurora. She had managed to bury quite deeply the agony of two murders and the ecstasy of two strange loves--with a robot and with an Earthman--and to get well past it all. She had ended by spinning out a long quiet marriage, having two children, and working at her applied art of costumery. And eventually the children had left, then her husband, and soon she might be retiring even from her work.

Then she would be alone with her robots, content with--or, rather, resigned to--letting life glide quietly and uneventfully to a slow close in its own time--a close so gentle she might not be aware of the ending when it came.

It was what she wanted.

Then--What was happening?

It had begun the night before when she looked up vainly at the star-lit sky to see Solaria's star, which was not in the sky and would not have been visible to her if it were. It was as though this one foolish reaching for the past--a past that should have been allowed to remain dead--had burst the cool bubble she had built about herself.

First the name of Elijah Baley, the most joyously painful memory of all the ones she had so carefully brushed away, had come up again and again in a grim repetition.

She was then forced to deal with a man who thought--mistakenly--he might be a descendant of Elijah in the fifth degree and now with another man who actually was a descendant in the seventh degree. Finally, she was now being given problems and responsibilities similar to those that had plagued Elijah himself on various occasions.

Was she becoming Elijah, in a fashion, with none of his talent and none of his fierce dedication to duty at all costs?

What had she done to deserve it?

She felt her rage being buried under a flood tide of self-pity. She felt unjustly dealt with. No one had the right to unload responsibility on her against her will.

She said, forcing her voice level, "Why do you insist on my being a Solarian, when I tell you that I am not a Solarian?"

D.G. did not seem disturbed by the chill that had now entered her voice. He was still holding the soft napkin that had been given him at the conclusion of the meal. It had been damply hot--not too hot--and he had imitated the actions of Gladia in carefully wiping his hands and mouth. He had then doubled it over and stroked his beard with it. It was shredding now and shriveling.

He said, "I presume it will vanish altogether."

"It will." Gladia had deposited her own napkin in the appropriate receptacle on the table. Holding it was unmannerly and could be excused only by D.G.'s evident unfamiliarity with civilized custom. "There are some who think it has a polluting effect on the atmosphere, but there is a gentle draft that carries the residue upward and traps it in filters. I doubt that it will give us any trouble. --but you ignore my question, sir."

D.G. wadded what was left of his napkin and placed it on the arm of the chair. A robot, in response to Gladia's quick and unobtrusive gesture, removed it.

D.G. said, "I don't intend to ignore your question, my lady. I am not trying to force you to be a Solarian. I merely point out that you were born on Solaria and spent your early decades there and therefore you might reasonably be considered a Solarian, after a fashion at least. --Do you know that Solaria has been abandoned?"

"So I have heard. Yes."

"Do you feel anything about that?"

"I am an Auroran and have been one for twenty decades."

"That is a non sequitur."

"A what?" She could make nothing of the last sound at all.

"It has not connection with my question. "

"A non sequitur, you mean. You said a 'nonsense quitter. ' "

D.G. smiled. "Very well. Let's quit the nonsense. I ask you if you feel anything about the death of Solaria and you tell me you're an Auroran. Do you maintain that is an answer? A born Auroran might feel badly at the death of a sister world. How do you feel about it?"

Gladia said icily, "It doesn't matter. Why are you interested?"

"I'll explain. We--I mean the Traders of the Settler worlds--are interested because there is business to be done, profits to be made, and a world to be gained. Solaria is already terraformed; it is a comfortable world; you Spacers seem to have no need or desire for it. Why would we not settle it?"

"Because it's not yours."

"Madam, is it yours that you object? Has Aurora any more claim to it than Baleyworld has? Can't we suppose that an empty world belongs to whoever is pleased to settle it?"

"Have you settled it?"

"No--because it's not empty."

"Do you mean the Solarians have not entirely left?" Gladia said quickly.

D.G.'s smile returned and broadened into a grin. "You're excited at the thought. --Even though you 're an Auroran. "

Gladia's face twisted into a frown at once. "Answer my question."

D.G. shrugged. "There were only some five thousand Solarians on the world just before it was abandoned, according to our best estimates. The population had been declining for years. But even five thousand--Can we be sure that all are gone? However, that's not the point. Even if the Solarians were indeed all gone, the planet would not be empty. There are, upon it, some two hundred million or more robots--masterless robots--some of them among the most advanced in the Galaxy. Presumably, those Solarians who left took some robots with them--it's hard to imagine Spacers doing without robots altogether." (He looked about, smiling, at the robots in their niches within the room.) "However, they can't possibly have taken forty thousand robots apiece."

Gladia said, "Well, then, since your Settler worlds are so purely robot-free and wish to stay so, I presume, you can't settle Solaria."

"That's right. Not until the robots are gone and that is where Traders such as myself come in."

"In what way?"

"We don't want a robot society, but we don't mind touching robots and dealing with them in the way of business. We don't have a superstitious fear of the things. We just know that a robot society is bound to decay. The Spacers have carefully made that plain to us by example. So that while we don't want to live with this robotic poison, we are perfectly willing to sell it to Spacers for a substantial sum--if they are so foolish as to want such a society."

"Do you think Spacers will buy them?"

"I'm sure they will. They will welcome the elegant modes that the Solarians manufacture. It's well known that they were the leading robot designers in the Galaxy, even though the late Dr. Fastolfe is said to have been unparalleled in the field, despite the fact that he was an Auroran. --Besides, even though we would charge a substantial sum, that sum would still be considerably less than the robots are worth. Spacers and Traders would both profit--the secret of successful trade."

"The Spacers wouldn't buy robots from Settlers," said Gladia with evident contempt.

D.G. had a Trader's way of ignoring such nonessentials as anger or contempt. It was business that counted. He said, "Of course they would. Offer them advanced robots at half price and why should they turn them down? Where business is to be done, you would be surprised how unimportant questions of ideology become."

"I think you'll be the one to be surprised. Try to sell your robots and you'll see."

"Would that I could, my lady. Try to sell them, that is. I have none on hand."

"Why not?"

"Because none have been collected. Two separate trading vessels have landed on Solaria, each capable of storing some twenty-five robots. Had they succeeded, whole fleets of trading vessels would have followed them and I dare say we would have continued to do business for decades--and then have settled the world."

"But they didn't succeed. Why not?"

"Because both ships were destroyed on the surface of the planet and, as far as we can tell, all the crewmen are dead."

"Equipment failure?"

"Nonsense. Both landed safely; they were not wrecked. Their last reports were that Spacers were approaching whether Solarians or natives of other Spacer worlds, we don't know. We can only assume that the Spacers attacked without warning."

"That's impossible."

"Is it?"

"Of course it's impossible. What would be the motive?"

"To keep us off the world, I would say."

"If they wished to do that," said Gladia, "they would merely have had to announce that the world was occupied."

"They might find it more pleasant to kill a few Settlers. At least, that's what many of our people think and there is pressure to settle the matter by sending a few warships to Solaria and establishing a military base on the planet."

"That would be dangerous."

"Certainly. It could lead to war. Some of our fire-eaters look forward to that. Perhaps some Spacers look forward to that, too, and have destroyed the two ships merely to provoke hostilities."

Gladia sat there amazed. There had been no hint of strained relations between Spacers and Settlers on any of the news programs.

She said, "Surely it's possible to discuss the matter. Have your people approached the Spacer Federation?"

"A thoroughly unimportant body, but we have. We've also approached the Auroran Council."

"And?"

"The Spacers deny everything. They suggest that the potential profits in the Solarian robot trade are so high that Traders, who are interested only in money--as though they themselves are not--would fight each other over the matter. Apparently, they would have us believe the two ships destroyed each other, each hoping to monopolize the trade for their own world."

"The two ships were from two different worlds, then?"

"Yes."

"Don't you think, then, that there might indeed have been a fight between them?"

"I don't think it's likely, but I will admit it's possible. There have been no outright conflicts between the Settler worlds, but there have been some pretty strenuous disputes. All have been settled through arbitration by Earth. Still, it is indeed a fact that the Settler worlds might, in a pinch, not hang together when multibillion-dollar trade is at stake. That's why war is not such a good idea for us and why something will have to be done to discourage the hotheads. That's where we come in."

"We?"

"You and I. I have been asked to go to Solaria and find out--if I can--what really happened. I will take one ship--armed, but not heavily armed."

"You might be destroyed, too."

"Possibly. But my ship, at least, won't be caught unprepared. Besides, I am not one of those hypervision heroes and I have considered what I might do to lessen the chances of destruction. It occurred to me that one of the disadvantages of Settler penetration of Solaria is that we don't know the world at all. It might be useful, then, to take someone who knows the world--a Solarian, in short."

"You mean you want to take me?"

"Right, my lady."

"Why me?"

"I should think you could see that without explanation, my lady. Those Solarians who have left the planet are gone we know not where. If any Solarians are left on the planet, they are very likely the enemy. There are no known Solarian-born Spacers living on some Spacer planet other than Solaria--except yourself. You are only Solarian available to me--the only one in all the Galaxy. That's why I must have you and that's why you must come."

"You're wrong, Settler. If I am the only one available to you, then you have no one who is available. I do not intend to come with you and there is no way--absolutely no way that you can force me to come with you. I am surrounded by my robots. Take one step in my direction and you will be immobilized at once--and if you struggle you will be hurt."

"I intend no force. You must come of your own accord and you should be willing to. It's a matter of preventing war."

"That is the job of governments on your side and mine. I refuse to have anything to do with it. I am a private citizen."

"You owe it to your world. We might suffer in case of war, but so will Aurora."

"I am not one of those hypervision heroes, any more than you are."

"You owe it to me, then."

"You're mad. I owe you nothing."

D.G. smiled narrowly. "You owe me nothing as an individual. You owe me a great deal as a descendant of Elijah Baley."

Gladia froze and remained staring at the bearded monster for a long moment. How did she come to forget who he was?

With difficulty, she finally muttered, "No."

"Yes," said D.G. forcefully. "On two different occasions, the Ancestor did more for you than you can ever repay. He is no longer here to call in the debt--a small part of the debt. I inherit the right to do so."

Gladia said in despair, "But what can I do for you if I come with you?"

"We'll find out. Will you come?" Desperately, Gladia wanted to refuse, but was it for this that Elijah had suddenly become part of her life, once more, in the last twenty-four hours? Was it so that when this impossible demand was made upon her, it would be in his name and she would find it impossible to refuse?

She said, "What's the use? The Council will not let me go with you. They will not have an Auroran taken away on a Settler's vessel."

"My lady, you have been here on Aurora for twenty decades, so you think the Auroran-born consider you an Auroran. It's not so. To them, you are a Solarian still. They'll let you go."

"They won't," said Gladia, her heart pounding and the skin of her upper arms turning to gooseflesh. He was right. She thought of Amadiro, who would surely think of her as nothing but a Solarian. Nevertheless, she repeated, "They won't," trying to reassure herself.

"They will," retorted D.G. "Didn't someone from your Council come to you to ask you to see me?"

She said defiantly, "He asked me only to report this conversation we have had. And I will do so."

"If they want you to spy on me here in your own home, my lady, they will find it even more useful to have you spy on me on Solaria." He waited for a response and when there was none, he said with a trace of weariness, "My lady, if you refuse, I won't force you because I won't have to. They will force you. But I don't want that. The Ancestor would not want it if he were here. He would want you to come with me out of gratitude to him and for no other reason. My lady, the Ancestor labored on your behalf under conditions of extreme difficulty. Won't you labor on behalf of his memory?"

Gladia's heart sank. She knew she could not resist that. She said, "I can't go anywhere without robots."

"I wouldn't expect you to." D.G. was grinning again. "Why not take my two namesakes? Do you need more?"

Gladia looked toward Daneel. but he was standing motionless. She looked toward Giskard--the same. And then it seemed to her that, for just a moment, his head moved--very slightly--up and down.

She had to trust him. She said, "Well, then, I'll come with you. These two robots are all I will need."

PART II – SOLARIA

5. THE ABANDONED WORLD

14.

For the fifth time in her life, Gladia found herself on a spaceship. She did not remember, offhand, exactly how long ago it had been that she and Santirix had gone together to the world of Euterpe because its rain forests were widely recognized as incomparable, especially under the romantic glow of its bright satellite, Gemstone.

The rain forest had, indeed, been lush and green, with the trees carefully planted in rank and file and the animal life thoughtfully selected so as to provide color and delight, while avoiding venomous or other unpleasant creatures.

The satellite, fully 150 kilometers in diameter, was close enough to Euterpe to shine like a brilliant dot of sparkling light. It was so close to the planet that one could see it sweep west to east across the sky, outstripping the planet's slower rotational motion. It brightened as it rose toward zenith and dimmed as it dropped toward the horizon again. One watched it with fascination the first night, with less the second, and with a vague discontent the third--assuming the sky was clear on those nights, which it usually wasn't.

The native Euterpans, she noted, never looked at it, though they praised it loudly to the tourists, of course.

On the whole, Gladia had enjoyed the hip well enough, but what she remembered most keenly was the joy of her return to Aurora and her decision not to travel again except under dire need. (Come to think of it, it had to be at least eight decades ago.)

For a while, she had lived with the uneasy fear that her husband would insist on another hip, but he never mentioned one. It might well be, she sometimes thought at that time, that he had come to the same decision she had and feared she might be the one to want to travel.

It didn't make them unusual to avoid hips. Aurorans generally--Spacers generally, for that matter--tended to be stay-at-homes. Their worlds, their establishments, were too comfortable. After all, what pleasure could be greater than that of being taken care of by your own robots, robots who knew your every signal, and, for that matter, knew your ways and desires even without being told.

She stirred uneasily. Was that what D.G. had meant when he spoke of the decadence of a roboticized society?

But now she was back again in space, after all that time. And on an Earth ship, too.

She hadn't seen much of it, but the little she had glimpsed made her terribly uneasy. It seemed to be nothing but straight lines, sharp angles, and smooth surfaces. Everything that wasn't stark had been eliminated, apparently. It was as though nothing must exist but functionality. Even though she didn't know what was exactly functional

about any particular object on the ship, she felt it to be all that was required, that nothing was to be allowed to interfere with taking the shortest distance between two points.

On everything Auroran (on everything Spacer, one might almost say, though Aurora was the most advanced in that respect), everything existed in layers. Functionality was at the bottom--one could not entirely rid one's self of that, except in what was pure ornament--but overlying that there was always something to satisfy the eyes and the senses, generally; and overlying that, something to satisfy the spirit.

How much better that was!--or did it represent such an exuberance of human creativity that Spacers could no longer live with the unadorned Universe--and was that bad? Was the future to belong to these from-here-to-there geometrizers? Or was it just that the Settlers had not yet learned the sweetnesses of life?

But then, if life had so many sweetnesses to it, why had she found so few for herself?

She had nothing really to do on board this ship but to ponder and reponder such questions. This D.G., this Elijah descended barbarian, had put it into her head with his calm assumption that the Spacer worlds were dying, even though he could see all about him even during the shortest stay on Aurora (surely, he would have to) that it was deeply embedded in wealth and security.

She had tried to escape her own thoughts by staring at the holofilms she had been supplied with and watching, with moderate curiosity, the images flickering and capering on the projection surface, as the adventure story (all were adventure stories) hastened from event to event with little time left for conversation and none for thought--or enjoyment, either. Very like their furniture.

D.G. stepped in when she was in the middle of one of the films, but had stopped really paying attention. She was not caught by surprise. Her robots, who guarded her doorway, signaled his coming in ample time and would not have allowed him to enter if she were not in a position to receive him. Daneel entered with him.

D.G. said, "How are you doing?" Then, as her hand touched a contact and the images faded, shriveled, and were gone, he said, "You don't have to turn it off. I'll watch it with you."

"That's not necessary," she said. "I've had enough."

"Are you comfortable?"

"Not entirely. I am--isolated."

"Sorry! But then, I was isolated on Aurora. They would allow none of my men to come with me."

"Are you having your revenge?"

"Not at all. For one thing, I allowed you two robots of your choice to accompany you. For another, it is not I but my crew who enforce this. They don't like either Spacers or robots.--but why do you mind? Doesn't this isolation lessen your fear of infection?"

Gladia's eyes were haughty, but her voice sounded weary. "I wonder if I haven't grown too old to fear infection. In many ways, I think I have lived long enough. Then, too,

I have my gloves, my nose filters, and--if necessary--my mask. And besides, I doubt that you will trouble to touch me."

"Nor will anyone else," said D.G. with a sudden edge of grimness to his voice, as his hand wandered to the object at the right side of his hip.

Her eyes followed the motion. "What is that?" she asked. D.G. smiled and his beard seemed to glitter in the light.

There were occasional reddish hairs among the brown. "A weapon," he said and drew it. He held it by a molded hilt that bulged above his hand as though the force of his grip were squeezing it upward. In front, facing Gladia, a thin cylinder stretched some fifteen centimeters forward. There was no opening visible.

"Does that kill people?" Gladia extended her hand toward it.

D.G. moved it quickly away. "Never reach for someone's weapon, my lady. That is worse than bad manners, for any Settler is trained to react violently to such a move and you may be hurt. "

Gladia, eyes wide, withdrew her hand and placed both behind her back. She said, "Don't threaten harm. Daneel has no sense of humor in that respect. On Aurora, no one is barbarous enough to carry weapons. "

"Well," said D.G., unmoved by the adjective, "we don't have robots to protect us. --And this is not a killing device. It is, in some ways, worse. It emits a kind of vibration that stimulates those nerve endings responsible for the sensation of pain. It hurts a good deal worse than anything you can imagine. No one would willingly endure it twice and someone carrying this weapon rarely has to use it. We call it a neuronic whip. "

Gladia frowned. "Disgusting! We have our robots, but they never hurt anyone except in unavoidable emergency--and then minimally. "

D.G. shrugged. "That sounds very civilized, but a bit of pain--a bit of killing, even--is better than the decay of spirit brought about by robots. Besides, a neuronic whip is not intended to kill and your people have weapons on their spaceships that can bring about wholesale death and destruction."

"That's because we've fought wars early in our history, when our Earth heritage was still strong, but we've learned better. "

"You used those weapons on Earth even after you supposedly learned better."

"That's--" she began and closed her mouth as though to bite off what she was about to say next.

D.G. nodded. "I know. You were about to say. 'That's different. ' Think of that, my lady, if you should catch yourself wondering why my crew doesn't like Spacers. Or why I don't. --But you are going to be useful to me, my lady, and I won't let my emotions get in the way. "

"How am I going to be useful to you?"

"You are a Solarian."

"You keep saying that. More than twenty decades have passed. I don't know what Solaria is like now. I know nothing about it. What was Baleyworld like twenty decades ago?"

"It didn't exist twenty decades ago, but Solaria did and I shall gamble that you will remember something useful."

He stood up, bowed his head briefly in a gesture of politeness that was almost mocking, and was gone.

15.

Gladia maintained a thoughtful and troubled silence for a while and then she said, "He wasn't at all polite, was he?"

Daneel said, "Madam Gladia, the Settler is clearly under tension. He is heading toward a world on which two ships like his have been destroyed and their crews killed. He is going into great danger, as is his crew."

"You always defend any human being, Daneel," said Gladia resentfully. "The danger exists for me, too, and I am not facing it voluntarily, but that does not force me into rudeness."

Daneel said nothing. Gladia said, "Well, maybe it does. I have been a little rude, haven't I?"

"I don't think the Settler minded," said Daneel. "Might I suggest, madam, that you prepare yourself for bed. It is quite late."

"Very well. I'll prepare myself for bed, but I don't think I feel relaxed enough to sleep, Daneel."

"Friend Giskard assures me you will, madam, and he is usually right about such things."

And she did sleep.

16.

Daneel and Giskard stood in the darkness of Gladia's cabin.

Giskard said, "She will sleep soundly, friend Daneel, and she needs the rest. She faces a dangerous trip."

"It seemed to me, friend Giskard," said Daneel, "that you influenced her to agree to go. I presume you had a reason."

"Friend Daneel, we know so little about the nature of the crisis that is now facing the Galaxy that we cannot safely refuse any action that might increase our knowledge. We must know what is taking place on Solaria and the only way we can do so is to go there-- and the only way we can go is for us to arrange for Madam Gladia to go. As for influencing her, that required scarcely a touch. Despite her loud statements to the contrary, she was eager to go. There was an overwhelming desire within her to see Solaria. It was a pain within her that would not cease until she went."

"Since you say so, it is so, yet I find it puzzling. Had she not frequently made it plain that her life on Solaria was unhappy, that she had completely adopted Aurora and never wished to go back to her original home?"

"Yes, that was there, too. It was quite plainly in her mind. Both emotions, both feelings, existed together and simultaneously. I have observed something of this sort in human minds frequently; two opposite emotions simultaneously present. "

"Such a condition does not seem logical, friend Giskard. "

"I agree and I can only conclude that human beings are not, at all times or in all respects, logical. That must be one reason that it is so difficult to work out the Laws governing human behavior. --In Madam Gladia's case, I have now and then been aware of this longing for Solaria. Ordinarily, it was well hidden, obscured by the far more intense antipathy she also felt for the world. When the news arrived that Solaria had been abandoned by its people, however, her feelings changed."

"Why so? What had the abandonment to do with the youthful experiences that led Madam Gladia to her antipathy? Or, having held in restraint her longing for the world during the decades when it was a working society, why should she lose that restraint once it became an abandoned planet and newly long for a world which must now be something utterly strange to her."

"I cannot explain, friend Daneel, since the more knowledge I gather of the human mind, the more despair I feel at being unable to understand it. It is not an unalloyed advantage to see into that mind and I often envy you the simplicity of behavior control that results from your inability to see below the surface." Daneel persisted. "Have you guessed an explanation, friend Giskard?"

"I suppose she feels a sorrow for the empty planet. She deserted it twenty decades ago--"

"She was driven out. "

"It seems to her, now, to have been a desertion and I imagine she plays with the painful thought that she had set an example; that if she had not left, no one else would have and the planet would still be populated and happy. Since I cannot read her thoughts, I am only groping backward, perhaps inaccurately, from her emotions."

"But she could not have set an example, friend Giskard. Since it is twenty decades since she left, there can be no verifiable causal connection between the much earlier event and the much later one."

"I agree, but human beings sometimes find a kind of pleasure in nursing painful emotions, in blaming themselves without reason or even against reason. --In any case, Madam Gladia felt so sharply the longing to return that I felt it was necessary to release the inhibitory effect that kept her from agreeing to go. It required the merest touch. Yet though I feel it necessary for her to go, since that means she will take us there, I have the uneasy feeling that the disadvantages might, just possibly, be greater than the advantages."

"In what way, friend Giskard?"

"Since the Council was eager to have Madam Gladia accompany the Settler, it may have been for the purpose of having Madam Gladia absent from Aurora during a crucial period when the defeat of Earth and its Settler worlds is being prepared." Daneel seemed to be considering that statement. At least it was only after a distinct pause that he said, "What purpose would be served, in your opinion, in having Madam Gladia absent?"

"I cannot decide that, friend Daneel. I want your opinion."

"I have not considered this matter."

"Consider it now!" If Giskard had been human, the remark would have been an order.

There was an even longer pause and then Daneel said, "Friend Giskard, until the moment that Dr. Mandamus appeared in Madam Gladia's establishment, she had never shown any concern about international affairs. She was a friend of Dr. Fastolfe and of Elijah Baley, but this friendship was one of personal affection and did not have an ideological basis. Both of them, moreover, are now gone from us. She has an antipathy toward Dr. Amadiro and that is returned, but this is also a personal matter. The antipathy is two centuries old and neither has done anything material about it but have merely each remained stubbornly antipathetic. There can be no reason for Dr. Amadiro--who is now the dominant influence in the Council--to fear Madam Gladia or to go to the trouble of removing her. "

Giskard said, "You overlook the fact that in removing Madam Gladia, he also removes you and me. He would, perhaps, feel quite certain Madam Gladia would not leave without us, so can it be us he considers dangerous?"

"In the course of our existence, friend Giskard, we have never, in any way, given any appearance of having endangered Dr. Amadiro. What cause has he to fear us? He does not know of your abilities or of how you have made use of them. Why, then, should he take the trouble to remove us, temporarily, from Aurora?"

"Temporarily, friend Daneel? Why do you assume it is a temporary removal he plans? He knows, it may be, more than the Settler does of the trouble on Solaria and knows, also, that the Settler and his crew will be surely destroyed--and Madam Gladia and you and I with them. Perhaps the destruction of the Settler's ship is his main aim, but he would consider the end of Dr. Fastolfe's friend and Dr. Fastolfe's robots to be an added bonus."

Daneel said, "Surely he would not risk war with the Settler worlds, for that may well come if the Settler's ship is destroyed and the minute pleasure of having us destroyed, when added in, would not make the risk worthwhile."

"Is it not possible, friend Daneel, that war is exactly what Dr. Amadiro has in mind; that it involves no risk in his estimation, so that getting rid of us at the same time adds to his pleasure without increasing a risk that does not exist?"

Daneel said calmly, "Friend Giskard, that is not reasonable. In any war fought under present conditions, the Settlers would win. They are better suited, psychologically, to the rigors of war. They are more scattered and can, therefore, more successfully carry

on hit-and-run tactics. They have comparatively little to lose in their relatively primitive worlds, while the Spacers have much to lose in their comfortable, highly organized ones. If the Settlers were willing to offer to exchange destruction of one of their worlds for one of the Spacers', the Spacers would have to surrender at once."

"But would such a war be fought 'under present conditions'? What if the Spacers had a new weapon that could be used to defeat the Settlers quickly? Might that not be the very crisis we are now facing?"

"In that case, friend Giskard, the victory could be better and more effectively gained in a surprise attack. Why go to the trouble of instigating a war, which the Settlers might begin by a surprise raid on Spacer worlds that would do considerable damage?"

"Perhaps the Spacers need to test the weapon and the destruction of a series of ships on Solaria represents the testing."

"The Spacers would have been most uningenious if they could not have found a method of testing that would not give away the new weapon's existence."

It was now Giskard's turn to consider. "Very well, then, friend Daneel, how would you explain this trip we are on? How would you explain the Council's willingness--even eagerness--to have us accompany the Settler? The Settler said they would order Gladia to go and, in effect, they did."

"I have not considered the matter, friend Giskard."

"Then consider it now." Again it had the flavor of an order.

Daneel said, "I will do so." There was silence, one that grew protracted, but Giskard by no word or sign showed any impatience as he waited.

Finally, Daneel said--slowly, as though he were feeling his way along strange avenues of thought --"I do not think that Baleyworld--or any of the Settler worlds--has a clear right to appropriate robotic property on Solaria. Even though the Solarians have themselves left or have, perhaps, died out, Solaria remains a Spacer world, even if an unoccupied one. Certainly, the remaining forty-nine Spacer worlds would reason so. Most of all, Aurora would reason so--if it felt in command of the situation."

Giskard considered that. "Are you now saying, friend Daneel, that the destruction of the two Settler ships was the Spacer way of enforcing their proprietorship of Solaria?"

Daneel said, "No, that would not be the way if Aurora, the leading Spacer power, felt in command of the situation. Aurora would then simply have announced that Solaria, empty or not, was off-limits to Settler vessels and would have threatened reprisals against the home worlds if any Settler vessel entered the Solarian planetary system. And they would have established a cordon of ships and sensory stations about that planetary system. There was no such warning, no such action, friend Giskard. Why, then, destroy ships that might have been kept away from the world quite easily in the first place?"

"But the ships were destroyed, friend Daneel. Will you make use of the basic illogicality of the human mind as an explanation?"

"Not unless I have to. Let us for the moment take that destruction simply as given. Now consider the consequence--The captain of a single Settler vessel approaches Aurora, demands permission to discuss the situation with the Council, insists on taking an Auroran

citizen with him to investigate events on Solaria, and the Council gives in to everything. If destroying the ships without prior warning is too strong an action for Aurora, giving in to the Settler captain so cravenly is far too weak an action. Far from seeking a war, Aurora, in giving in, seems to be willing to do anything at all to ward off the possibility of war."

"Yes," said Giskard, "I see that this is a possible way of interpreting events. But what follows?"

"It seems to me," said Daneel, "that the Spacer worlds are not yet so weak that they must behave with such servility--and, even if they were, the pride of centuries of overlordship would keep them from doing so. It must be something other than weakness that is driving them. I have pointed out that they cannot be deliberately instigating a war, so it is much more likely that they are playing for time."

"To what end, friend Daneel?"

"They want to destroy the Settlers, but they are not yet prepared. They let this Settler have what he wants, to avoid a war until they are ready to fight one on their own terms. I am only surprised that they did not offer to send an Auroran warship with him. If this analysis is correct--and I think it is--Aurora cannot possibly have had anything to do with the incidents on Solaria. They would not indulge in pinpricks that could only serve to alert the Settlers before they are ready with something devastating."

"Then how account for these pinpricks, as you call them, friend Daneel?"

"We will find out perhaps when we land on Solaria. It may be that Aurora is as curious as we are and the Settlers are and that that is another reason why they have cooperated with the captain, even to the point of allowing Madam Gladia to accompany him."

It was now Giskard's turn to remain silent. Finally he said, "And what is this mysterious devastation that they plan?"

"Earlier, we spoke of a crisis arising from the Spacer plan to defeat Earth, but we used Earth in its general sense, implying the Earthpeople together with their descendents on the Settler worlds. However, if we seriously suspect the preparation of a devastating blow that will allow the Spacers to defeat their enemies at a stroke, we can perhaps refine our view. Thus, they cannot be planning a blow at a Settler world. Individually, the Settler worlds are dispensable and the remaining Settler worlds will promptly strike back. Nor can they be planning a blow at several or at all the Settler worlds. There are too many of them; they are too diffusely spread. It is not likely that all the strikes will succeed and those Settler worlds that survive will, in fury and despair, bring devastation upon the Spacer worlds."

"You reason, then, friend Daneel, that it will be a blow at Earth itself. "

"Yes, friend Giskard. Earth contains the vast majority of the short-lived human beings; it is the perennial source of emigrants to the Settler worlds and is the chief raw material for the founding of new ones; it is the revered homeland of all the Settlers. If Earth were somehow destroyed, the Settler movement might never recover."

"But would not the Settler worlds then retaliate as strongly and as forcefully as they would if one of themselves were destroyed? That would seem to me to be inevitable."

"And to me, friend Giskard. Therefore, it seems to me that unless the Spacer worlds have gone insane, the blow would have to be a subtle one; one for which the Spacer worlds would seem to bear no responsibility."

"Why not such a subtle blow against the Settler worlds, which hold most of the actual war potential of the Earthpeople?"

"Either because the Spacers feel the blow against Earth would be more psychologically devastating or because the nature of the blow is such that it would work only against Earth and not against the Settler worlds. I suspect the latter, since Earth is a unique world and has a society that is not like that of any other world-settler or, for that matter, Spacer. "

"To summarize, then, friend Daneel, you come to the conclusion that the Spacers are planning a subtle blow against Earth that will destroy it without evidence of themselves as the cause, and one that would not work against any other world, and that they are not yet ready to launch that blow."

"Yes, friend Giskard, but they may soon be ready--and once they are ready, they will have to strike immediately. Any delay will increase the chance of some leak that will give them away."

"To deduce all this, friend Daneel, from the small indications we have is most praiseworthy. Now tell me the nature of the blow. What is it, precisely, that the Spacers plan?"

"I have come this far, friend Giskard, across very shaky ground, without being certain that my reasoning is entirely sound. But even if we suppose it is, I can go no further. I fear I do not know and cannot imagine what the nature of the blow might be."

Giskard said, "But we cannot take appropriate measures to counteract the blow and resolve the crisis until we know what its nature will be. If we must wait until the blow reveals itself by its results, it will then be too late to do anything."

Daneel said, "If any Spacer knows the nature of the forthcoming event, it would be Amadiro. Could you not force Amadiro to announce it publicly and thus alert the Settlers and make it unusable?"

"I could not do that, friend Daneel, without virtually destroying his mind. I doubt that I could hold it together long enough to allow him to make the announcement. I could not do such a thing."

"Perhaps, then," said Daneel, "we may console ourselves with the thought that my reasoning is wrong and that no blow against Earth is being prepared."

"No," said Giskard. "It is my feeling that you are right and that we must simply wait--helplessly."

17.

Gladia waited, with an almost painful anticipation, for the conclusion of the final Jump. They would then be close enough to Solaria to make out its sun as a disk.

It would just be a disk, of course, a featureless circle of light, subdued to the point where it could be watched unblinkingly after that light had passed through the appropriate filter.

Its appearance would not be unique. All the stars that carried, among their planets, a habitable world in the human sense had a long list of property requirements that ended by making them all resemble one another. They were all single stars--all not much larger or smaller than the sun that shone on Earth--none too active, or too old, or too quiet, or too young, or too hot, or too cool, or too offbeat in chemical composition. All had sunspots and flares and prominences and all looked just about the same to the eye. It took careful spectroheliography to work out the details that made each star unique.

Nevertheless, when Gladia found herself staring at a circle of light that was absolutely nothing more than a circle of light to her, she found her eyes welling with tears. She had never given the sun a thought when she had lived on Solaria; it was just the eternal source of light and heat, rising and falling in a steady rhythm. When she had left Solaria, she had watched that sun disappear behind her with nothing but a feeling of thankfulness. She had no memory of it that she valued.

--Yet she was weeping silently. She was ashamed of herself for being so affected for no reason that she could explain, but that didn't stop the weeping.

She made a stronger effort when the signal light gleamed. It had to be D.G. at the door; no one else would approach her cabin.

Daneel said, "Is he to enter, madam? You seem emotionally moved."

"Yes, I'm emotionally moved, Daneel, but let him in. I imagine it won't come as a surprise to him. "

Yet it did. At least, he entered with a smile on his bearded face--and that smile disappeared almost at once. He stepped back and said in a low voice, "I will return later."

"Stay!" said Gladia harshly. "This is nothing. A silly reaction of the moment. " She sniffed and dabbed angrily at her eyes. "Why are you here?"

"I wanted to discuss Solaria with you. If we succeed with a microadjustment, we'll land tomorrow. If you're not quite up to a discussion now--"

"I am quite up to it. In fact, I have a question for you. Why is it we took three Jumps to get here? One Jump would have been sufficient. One was sufficient when I was taken from Solaria to Aurora twenty decades ago. Surely the technique of space travel has not retrogressed since."

D.G.'s grin returned. "Evasive action. If an Auroran ship was following us, I wanted to--confuse it, shall we say?"

"Why should one follow us?"

"Just a thought, my lady. The Council was a little overeager to help, I thought. They suggested that an Auroran ship join me in my expedition to Solaria."

"Well, it might have helped, mightn't it?"

"Perhaps--if I were quite certain that Aurora wasn't behind all this. I told the Council quite plainly that I would do without--or, rather"--he pointed his finger at Gladia--"just with you. Yet might not the Council send a ship to accompany me even against my

wish --out of pure kindness of heart, let us say? Well, I still don't want one; I expect enough trouble without having to look nervously over my shoulder at every moment. So I made myself hard to follow. --How much do you know about Solaria, my lady?"

"Haven't I told you often enough? Nothing! Twenty decades have passed."

"Now, madam, I'm talking about the psychology of the Solarians. That can't have changed in merely twenty decades. --Tell me why they have abandoned their planet."

"The story, as I've heard it," said Gladia calmly, "is that their population has been steadily declining. A combination of premature deaths and very few births is apparently responsible."

"Does that sound reasonable to you?"

"Of course it does. Births have always been few." Her face twisted in memory. "Solarian custom does not make impregnation easy, either naturally, artificially, or ectogenetically."

"You never had children, madam?"

"Not on Solaria. "

"And the premature death?"

"I can only guess. I suppose it arose out of a feeling of failure. Solaria was clearly not working out, even though the Solarians had placed a great deal of emotional fervor into their world's having the ideal society--not only one that was better than Earth had ever had, but more nearly perfect than that of any other Spacer world."

"Are you saying that Solaria was dying of the collective broken heart of its people?"

"If you want to put it in that ridiculous way," said Gladia, displeased.

D.G. shrugged. "It seems to be what you're saying. But would they really leave? Where would they go? How would they live?"

"I don't know."

"But, Madam Gladia, it is well known that Solarians are accustomed to enormous tracts of land, serviced by many thousands of robots, so that each Solarian is left in almost complete isolation. If they abandon Solaria, where can they go to find a society that would humor them in this fashion? Have they, in fact, gone to any of the other Spacer worlds?"

"Not as far as I know. But then, I'm not in their confidence."

"Can they have found a new world for themselves? If so, it would be a raw one and require much in the way of terraforming. Would they be ready for that?"

Gladia shook her head. "I don't know."

"Perhaps they haven't really left. "

"Solaria, I understand, gives every evidence of being empty."

"What evidence is that?"

"All interplanetary communication has ceased. An radiation from the planet, except that consistent with robot work or clearly due to natural causes has ceased."

"How do you know that?"

"That is the report on the Auroran news. "

"Ah! The report! Could it be that someone is lying?"

"What would be the purpose of such a lie?" Gladia stiffened at the suggestion.

"So that our ships would be lured to the world and destroyed."

"That's ridiculous, D.G." Her voice grew sharper. "What would the Spacers gain by destroying two trading vessels through so elaborate a subterfuge?"

"Something has destroyed two Settler vessels on a supposedly empty planet. How do you explain that?"

"I can't. I presume we are going to Solaria in order to find an explanation."

D.G. regarded her gravely. "Would you be able to guide me to the section of the world that was yours when you lived on Solaria?"

"My estate?" She returned his stare, astonished.

"Wouldn't you like to see it again?"

Gladia's heart skipped a beat. "Yes, I would, but why my place?"

"The two ships that were destroyed landed in widely different spots on the planet and yet each was destroyed fairly quickly. Though every spot may be deadly, it seems to me that yours might be less so than others."

"Why?"

"Because there we might receive help from the robots. You would know them, wouldn't you? They do last more than twenty decades, I suppose. Daneel and Giskard have. And those that were there when you lived on your estate would still remember you, wouldn't they? They would treat you as their mistress and recognize the duty they owed you even beyond that which they would owe to ordinary human beings."

Gladia said, "There were ten thousand robots on my estate. I knew perhaps three dozen by sight. Most of the rest I never saw and they may not have ever seen me. Agricultural robots are not very advanced, you know, nor are forestry robots or mining robots. The household robots would still remember me--if they have not been sold or transferred since I left. Then, too, accidents happen and some robots don't last twenty decades. --Besides, whatever you may think of robot memory, human memory is fallible and I might remember none of them. "

"Even so," said D.G., "can you direct me to your estate?"

"By latitude and longitude? No."

"I have charts of Solaria. Would that help?"

"Perhaps--approximately. It's in the south-central portion of the northern continent of Heliona."

"And once we're approximately there, can you make use of landmarks for greater precision--if we skim the Solarian surface?"

"By seacoasts and rivers, you mean?"

"Yes."

"I think I can."

"Good! And meanwhile, see if you can remember the names and appearances of any of your robots. It may prove the difference between living and dying."

18.

D.G. Baley seemed a different person with his officers. The broad smile was not evident, nor the easy indifference to danger. He sat, poring over the charts, with a look of intense concentration on his face.

He said, "If the woman is correct, we've got the estate pinned down within narrow limits--and if we move into the flying mode, we should get it exactly before too long."

"Wasteful of energy, Captain," muttered Jamin Oser, who was second-in-command. He was tall and, like D.G., well bearded. The beard was russet-colored, as were his eyebrows, which arched over bright blue eyes. He looked rather old, but one got the impression that this was due to experience rather than years.

"Can't help it," said D.G. "If we had the antigravity that the technos keep promising us just this side of eternity, it would be different."

He stared at the chart again and said, "She says it would be along this river about sixty kilometers upstream from where it runs into this larger one. If she is correct."

"You keep doubting it," said Chandrus Nadirhaba, whose insignie showed him to be Navigator and responsible for bringing the ship down in the correct spot--or, in any case, the indicated spot. His dark skin and neat moustache accentuated the handsome strength of his face.

"She's recalling a situation over a time gap of twenty decades," said D.G. "What details would you remember of a site you haven't seen for just three decades? She's not a robot. She may have forgotten."

"Then what was the point of bringing her?" muttered Oser. "And the other one and the robot? It unsettles the crew and I don't exactly like it, either."

D.G. looked up, eyebrows bunching together. He said in a low voice, "It doesn't matter on this ship what you don't like or what the crew doesn't like, mister. I have the responsibility and I make the decisions. We're all liable to be dead within six hours of landing unless that woman can save us."

Nadirhaba said coolly, "If we die, we die. We wouldn't be Traders if we didn't know that sudden death was the other side of big profits. And for this mission, we're all volunteers. Just the same, it doesn't hurt to know where the death's coming from, Captain. If you've figured it out, does it have to be a secret?"

"No, it doesn't. The Solarians are supposed to have left, but suppose a couple of hundred stayed quietly behind just to watch the store, so to speak."

"And what can they do to an armed ship, Captain? Do they have a secret weapon?"

"Not so secret," said D.G. "Solaria is littered with robots. That's the whole reason Settler ships landed on the world in the first place. Each remaining Solarian might have a million robots at his disposal. An enormous army."

Eban Kalaya was in charge of communications. So far he had said nothing, aware as he was of his junior status, which seemed further marked by the fact that he was the

only one of the four officers present without facial hair of any kind. Now he ventured a remark. "Robots," he said, "cannot injure human beings."

"So we are told," said D.G. dryly, "but what do we know about robots? What we do know is that two ships have been destroyed and about a hundred human beings--good Settlers all--have been killed on widely separated parts of a world littered with robots. How could it have been done except by robots? We don't know what kind of orders a Solarian might give robots or by what tricks the so-called First Law of Robotics might be circumvented.

"So we," he went on, "have to do a little circumventing of our own. As best as we can tell from the reports reaching us from the other ships before they were destroyed, all the men on board ship debarked on landing. It was an empty world after all and they wanted to stretch their legs, breathe fresh air, and look over the robots they had come to get. Their ships were unprotected and they themselves unready when the attack came.

'That won't happen this time. I'm getting off, but the rest of you are going to stay on board the ship or in its near vicinity. "

Nadirhaba's dark eyes glared disapproval. "Why you, Captain? If you need someone to act as bait, anyone else can be spared more easily than you can be."

"I appreciate the thought, Navigator," said D.G., "but I will not be alone. Coming with me will be the Spacer woman and her companions. She is the one who is essential. She may know some of the robots; at any rate, some may know her. I am hoping that though the robots may have been ordered to attack us, they won't attack her."

"You mean they'll remember 01' Missy and fall to their knees," said Nadirhaba dryly.

"If you want to put it that way. That's why I brought her and that's why we've landed on her estate. And I've got to be with her because I'm the one who knows her--somewhat--and I've got to see that she behaves. Once we have survived by using her as a shield and in that way have learned exactly what we're facing, we can proceed on our own. We won't need her any more."

Oser said, "And then what do we do with her? Jettison her into space?"

D.G. roared, "We take her back to Aurora!"

Oser said, "I'm bound to tell you, Captain, that the crew would consider that a wasteful and unnecessary trip. They will feel that we can simply leave her on this blasted world. It's where she comes from, after all."

"Yes," said D.G. "That will be the day, won't it, when I take orders from the crew."

"I'm sure you won't," said Oser, "but the crew has its opinions and an unhappy crew makes for a dangerous voyage."

6. THE CREW

19.

Gladia stood on the soil of Solaria. She smelled the vegetation--not quite the odors of Aurora--and at once she crossed the gap of twenty decades.

Nothing, she knew, could bring back associations in the way that odors could. Not sights, not sounds.

Just that faint, unique smell brought back childhood--the freedom of running about, with a dozen robots watching her carefully--the excitement of seeing other children sometimes, coming to a halt, staring shyly, approaching one another a half-step at a time, reaching out to touch, and then a robot saying, "Enough, Miss Gladia," and being led away--looking over the shoulder at the other child, with whom there was another set of attendant robots in charge.

She remembered the day that she was told that only by holovision would she see other human beings thereafter. Viewing, she was told--not seeing. The robots said "seeing" as though it were a word they must not say, so that they had to whisper it. She could see them, but they were not human.

It was not so bad at first. The images she could talk to were three-dimensional, free-moving. They could talk, run, turn cartwheels if they wished--but they could not be felt. And then she was told that she could actually see someone whom she had often viewed and whom she had liked. He was a grown man, quite a bit older than she was, though he looked quite young, as one did on Solaria. She would have permission to continue to see him--if she wished--whenever necessary.

She wished. She remembered how it was--exactly how it was on that first day. She was tongue--tied and so was he. They circled each other, afraid to touch. --but it was marriage.

Of course it was. And then they met again--seeing, viewing, because it was marriage. They would finally touch each other. They were supposed to.

It was the most exciting day of her life--until it took place.

Fiercely, Gladia stopped her thoughts. Of what use to go on? She so warm and eager; he so cold and withdrawn. He continued to be cold. When he came to see her, at fixed intervals, for the rites that might (or might not) succeed in impregnating her, it was with such clear revulsion that she was soon longing for him to forget. But he was a man of duty and he never forgot.

Then came the time, years of dragging unhappiness later, when she found him dead, his skull crushed, and herself as the only possible suspect. Elijah Baley had saved her then and she had been taken away from Solaria and sent to Aurora.

Now she was back, smelling Solaria.

Nothing else was familiar. The house in the distance bore no resemblance to anything she remembered even faintly. In twenty decades it had been modified, torn down, rebuilt. She could not even gain any sense of familiarity with the ground itself.

She found herself reaching backward to touch the Settler ship that had brought her to this world that smelled like home but was home in no other way--just to touch something that was familiar by comparison.

Daneel, who stood next to her in the shadow of the ship, said, "Do you see the robots, Madam Gladia?"

There were a group of them, a hundred yards away, amid the trees of an orchard, watching solemnly, motionlessly, shining in the sun with the grayish well-polished metal finish Gladia remembered Solarian robots to have.

She said, "I do, Daneel."

"Is there anything familiar about them, madam?"

"Not at all. They seem to be new models. I can't remember them and I'm sure they can't remember me. If D.G. was expecting anything hopeful to come of my supposed familiarity with the robots on my estate, he will have to be disappointed."

Giskard said, "They do not seem to be doing anything, madam."

Gladia said, "That is understandable. We're intruders and they've come to observe us and to report on us in accordance with what must be standing orders. They have no one now to report to, however, and can merely silently observe. Without further orders, I presume they will do no more than that, but they won't cease doing so, either."

Daneel said, "It might be well, Madam Gladia, if we retired to our quarters on board ship. The captain is, I believe, supervising the construction of defenses and is not ready to go exploring yet. I suspect he will not approve your having left your quarters without his specific permission."

Gladia said haughtily, "I'm not going to delay stepping out onto the surface of my own world just to suit his whim."

"I understand, but members of the crew are engaged in the vicinity and I believe that some note your presence here."

"And are approaching," said Giskard. "If you would avoid infection--"

"I'm prepared," said Gladia. "Nose plugs and gloves."

Gladia did not understand the nature of the structures being put up on the flat ground about the ship. For the most part, the crewmen, absorbed in the construction, had not seen Gladia and her two companions, standing as they were in the shadows. (It was the warm season on this portion of Solaria, which had a tendency to grow warmer--and on other occasions, colder--than Aurora did, since the Solarian day was nearly six hours longer than the Auroran day.)

The crewmen approaching were five in number and one of them, the tallest and largest, pointed in the direction of Gladia. The other four looked, remained standing for a while as though merely curious, and then, at a gesture from the first, approached again, changing their angle slightly so as to head directly for the Auroran three.

Gladia watched them silently and with her eyebrows raised in contempt. Daneel and Giskard waited impassively.

Giskard said in a low voice to Daneel, "I do not know where the captain is. I cannot distinguish him from the crowd of crewmen in whose midst he must be."

"Shall we retire?" said Daneel aloud.

"That would be disgraceful," said Gladia. "This is my world."

She held her ground and the five crewmen came closer in leisurely fashion.

They had been working, doing hard physical labor (Like robots, thought Gladia with disdain) and they were sweating. Gladia became aware of the odor that reeked from them. That would have served to force her away more than threats would, but she held her ground even so. The nose plugs, she was sure, mitigated the effect of the smell.

The large crewman approached more closely than the others. His skin was bronzed. His bare arms glistened with moisture and with shining musculature. He might be thirty (as nearly as Gladia could judge the age of these short-lived beings) and if he were washed and properly dressed, he might prove quite presentable.

He said, "So you are the Spacer lady from Aurora that we've been carrying on our ship?" He spoke rather slowly, obviously trying to attain an aristocratic tinge to his Galactic. He failed, of course, and he spoke like a Settler--even more crudely than D.G. did.

Gladia said, establishing her territorial rights, "I am from Solaria, Settler," and stopped in confused embarrassment. She had spent so much time thinking of Solaria just now that twenty decades had dropped away and she had spoken with a thick Solarian accent. There was the broad "a" in Solaria and the rough "r," while the "I" sounded horribly like "Oi."

She said again, in a much lower, less commanding voice, but one in which the accent of Aurora University--the standard for Galactic speech through all the Spacer worlds--rang clear, "I am from Solaria, Settler."

The Settler laughed and turned to the others. "She speaks la-di-da, but she had to try. Right, mates?"

The others laughed, too, and one cried out, "Get her to talk some more, Niss. Maybe we can all learn to talk like Spacer birdies." And he placed one hand on his hip in as dainty a manner as he could manage, while holding the other hand out limply.

Niss said, still smiling, "Shut up, all of you." There was instant silence.

He turned to Gladia again, "I'm Berto Niss, First-Class Shipper. And your name, little woman?"

Gladia did not venture to speak again.

Niss said, "I'm being polite, little woman. I'm speaking gentlemanly. Spacer--like. I know you're old enough to be my great-grandmother. How old you are you, little woman?"

"Four hundred," shouted one of the crewmen from behind Niss, "but she doesn't look it!"

"She doesn't look one hundred," said another.

"She looks suitable for a little ding-donging," said a third, "and hasn't had any for a long time, I guess. Ask her if she'd want some, Niss. Be polite and ask if we can take turns."

Gladia flushed angrily and Daneel said, "First-Class Shipper Niss, your companions are offending Madam Gladia. Would you retire?"

Niss turned to look at Daneel, whom, till now, he had totally ignored. The smile vanished from his face and he said, "Look, you. This little lady is off-limits. The captain said so. We won't bother her. Just a little harmless talk. That thing there is a robot. We won't bother with him and he can't hurt us. We know the Three Laws of Robotics. We order him to stay away from us, see. But you are a Spacer and the captain has give us no orders about you. So you" --he pointed a finger--"stay out of this and don't interfere or you'll get your pretty skin all bruised up and then you might cry. "

Daneel said nothing. Niss nodded his head. "Good. I like to see someone smart enough not to start anything he can't finish. "

He turned to Gladia, "Now, little Spacer woman, we will leave you alone because the captain doesn't want you bothered. If one of the men here made a crude remark, that's only natural. Just shake hands and let's be friends--Spacer, Settler, what's the difference?"

He thrust out his hand toward Gladia, who shrank away in horror. Daneel's hand moved outward in a flick that was almost too fast to see and caught Niss's wrist, "First-Class Shipper Niss," he said quietly, "do not attempt to touch the lady. "

Niss looked down at his hand and at the fingers that enclosed his wrist firmly. He said in a low and menacing growl, "You have till the count of three to let go. "

Daneel's hand fell away. He said, "I must do as you say for I do not wish to harm you, but I must protect the lady--and if she doesn't wish to be touched, as I believe she doesn't, I may be forced into a position where I must cause you pain. Please accept my assurance that I will do all I can to minimize that. "

One of the crewmen shouted joyously, "Give it to him, Niss. He's a talker. "

Niss said, "Look, Spacer, twice I told you to keep out and you touched me once. Now I tell you a third time and that's it. Make a move, say a word, and I take you apart. This little woman is going to shake hands, that's all, friendly-like. Then we all go. Fair enough?"

Gladia said in a low choking voice. "I won't be touched by him. Do what is necessary. "

Daneel said, "Sir, with all due respect, the lady does not wish to be touched. I must ask you--all of you--to leave. "

Niss smiled and one large arm moved as though to brush Daneel to one side--and to do it hard.

Daneel's left arm flickered and once again Niss was held by the wrist. "Please go, sir," said Daneel.

Niss's teeth continued to show, but he was no longer smiling. Violently, he brought his arm up. Daneel's enclosing hand moved up for a short distance, slowed, and came to a halt. His face showed no strain. His hand moved down, dragging Niss's arm with it, and then, with a rapid twist, he bent Niss's arm behind the Settler's broad back and held it there.

Niss, who found himself unexpectedly with his back to Daneel, brought his other arm up over his head, groping for Daneel's neck. His other wrist was seized and pulled down farther than it could easily go and Niss grunted in clear misery.

The other four crewmen, who had been watching in eager anticipation, remained in place now, motionless, silent, mouths open.

Niss, staring at them, grunted, "Help me!"

Daneel said, "They will not help you, sir, for the captain's punishment will be all the worse if they try. I must ask you now to assure me that you will no longer trouble Madam Gladia and that you will leave quietly, all of you. Otherwise, I very much regret, First-Class Shipper, that I must pull your arms out of their sockets."

As he said that, he tightened his grip on either wrist and Niss emitted a muffled grunt.

"My apologies, sir," said Daneel, "but I am under the strictest orders. May I have your assurance?"

Niss kicked backward with sudden viciousness, but well before his heavy boot could make contact, Daneel had faded to one side and pulled him off-balance. He went facedown heavily.

"May I have your assurance, sir?" said Daneel, now pulling gently at the two wrists so that the crewman's arms lifted slightly up from the back.

Niss howled and said, half-incoherent, "I give in. Let go."

Daneel let go at once and stepped back. Slowly and painfully, Niss rolled over, moving his arms slowly and rotating his wrists with a twisted grimace.

Then, when his right arm moved near the holster he wore, he snatched clumsily at his sidearm.

Daneel's foot came down on his hand and pinned it to the ground. "Don't do that, sir, or I may be forced to break one or more of the small bones in your hand." He bent down and extracted Niss's blaster from its holster. "Now stand up."

"Well, Mr. Niss," came another voice. "Do as you are told and stand up,"

D.G. Baley was standing at their side, beard bristling, face slightly flushed, but his voice was dangerously calm.

"You four," he said, "hand me your sidearms, one at a time. Come on. Move a little faster. One-two-three-four. Now continue to stand there at attention. Sir"--this to Daneel--"give me that sidearm you are holding. Good. Five. And now, Mr. Niss, at attention." And he placed the blasters on the ground beside him.

Niss stiffened to attention, eyes bloodshot, face contorted, in obvious pain.

"Would someone," said D.G., "please say what has been going on?"

"Captain," said Daneel quickly, "Mr. Niss and I have had a playful altercation. No harm has been done."

"Mr. Niss, however, looks somewhat harmed," said D.G.

"No permanent harm, Captain," said Daneel.

"I see. Well, we'll get back to this later. --Madam"--he turned on his heel to address Gladia--"I don't recall that I gave you permission to emerge from the ship. You

will go back to your cabin with your two companions at once. I am captain here and this is not Aurora. Do as I say!"

Daneel placed an apologetic hand on Gladia 's elbow. Her chin lifted, but she turned and went up the gangplank and into the ship, Daneel at her side, Giskard following.

D.G. then turned to the crewmen. "You five," he said, his voice never lifting from its flat calm, "come with me. We'll get to the bottom of this--or of you. "And he gestured to a petty officer to pick up the sidearms and take them away.

20.

D.G. stared at the five grimly. He was in his own quarters, the only portion of the ship that had a semblance of size to it and the beginnings of an appearance of luxury.

He said, pointing to each in turn, "Now, this is the way we'll work it. You tell me exactly what happened, word for word, motion for motion. When you're finished, you tell me anything that was wrong or left out. Then you the same, and then you, and then I'll get to you, Niss. I expect that you were all out of order, that you all did something unusually stupid that earned you all, but especially Niss, considerable humiliation. If, in your story, it would appear that you did nothing wrong and suffered 00 humiliation, then I'll know you're lying, especially as the Spacer woman will surely tell me what happened--and I intend to believe every word she says. A lie will make matters worse for you than anything you've actually done. Now," he barked, "start!"

The first crewman stumbled hastily through the story, and then the second, somewhat correcting, somewhat expanding, then the third and the fourth. D.G. listened, stony-faced, to the recital, then motioned Berto Niss to one side.

He spoke to the other four, "And while Niss was getting his face rightly mashed into the dirt by the Spacer, what were you four doing? Watching? Scared to move? All four of you? Against one man?"

One of the men broke the thickening silence to say, "It all happened so quick, Captain. We were just getting set to move in and then it was all over."

"And what were you getting ready to do in case you did manage to get to move someday?"

"Well, we were going to pull the Spacer foreigner off our mate."

"Do you think you could have?"

This time no one offered to make a sound.

D.G. leaned toward them. "Now, here's the situation. You had no business interfering with the foreigners, so you 're fined one week's pay each. And now let's get something straight. If you tell what has happened to anyone else--in the crew or out, now or ever, whether drunk or sober--you'll be broken, every one of you, to apprentice shipper. It doesn't matter which one of you talks, you'll all four be broken, so keep an eye

on each other. Now get to your assigned tasks and if you cross me at any time during this voyage, if you as much as hiccup against regulations, you'll be in the brig."

The four left, mournful, hangdog, tight-lipped. Niss remained, a bruise developing on his face, his arms clearly in discomfort.

D.G. regarded him with a threatening quiet, while Niss stared to the left, to the right, at his feet, everywhere but at the face of the captain. It was only when Niss's eyes, running out of evasion, caught the glare of the captain that D.G. said, "Well, you look very handsome, now that you have tangled with a sissy Spacer half your size. Next time you better hide when one of them shows up."

"Yes, Captain," said Niss miserably.

"Did you or did you not, Niss, hear me in my briefing, before we left Aurora, say that the Spacer woman and her companions were on no account to be disturbed or spoken to?"

"Captain, I wanted only a polite howdydo. We was curious for a closer look. No harm meant."

"You meant no harm? You asked how old she was. Was that your business?"

"Just curious. Wanted to know."

"One of you made a sexual suggestion."

"Not me, Captain."

"Someone else? Did you apologize for it?"

"To a Spacer?" Niss sounded horrified.

"Certainly. You were going against my orders."

"I meant no harm," said Niss doggedly.

"You meant no harm to the man?"

"He put his hand on me, Captain."

"I know he did. Why?"

"Because he was ordering me around."

"And you wouldn't stand for it?"

"Would you, Captain."

"All right, then. You didn't stand for it. You fell down for it. Right on your face. How did that happen?"

"I don't rightly know, Captain. He was fast. Like the camera was sped up. And he had a grip like iron."

D.G. said, "So he did. What did you expect, you idiot? He is iron."

"Captain?"

"Niss, is it possible you don't know the story of Elijah Baley?"

Niss rubbed his ear in embarrassment. "I know he's your great --something-- grandfather, Captain."

"Yes, everyone knows that from my name. Have you ever viewed his life story?"

"I'm not a viewing man, Captain. Not on history." He shrugged and, as he did so, winced and made as though to rub his shoulder, then decided he didn't quite dare do so.

"Did you ever hear of R. Daneel Olivaw?"

Niss squeezed his brows together. "He was Elijah Baley's friend."

"Yes, he was. You do know something then. Do you know what the 'R' stands for in R. Daneel Olivaw?"

"It stands for 'Robot,' right? He was a robot friend. There was robots on Earth in them days."

"There were, Niss, and still are. But Daneel wasn't just a robot. He was a Spacer robot who looked like a Spacer man. Think about it, Niss. Guess who the Spacer man you picked a fight with really was."

Niss's eyes widened, his face reddened dully. "You mean that Spacer was a ro--"

"That was R. Daneel Olivaw."

"But, Captain, that was two hundred years ago."

"Yes and the Spacer woman was a particular friend of my Ancestor Elijah. She's been alive for two hundred and thirty-three years, in case you still want to know, and do you think a robot can't do as well as that? You were trying to fight a robot, you great fool."

"Why didn't it say so?" Niss said with great indignation.

"Why should it? Did you ask? See here, Niss. You heard what I told the others about telling this to anyone. It goes for you, too, but much more so. They are only crewmen, but I had my eye on you for crew leader. Had my eye on you. If you're going to be in charge of the crew, you've got to have brains and not just muscle. So now it's going to be harder for you because you're going to have to prove you have brains against my firm opinion that you don't."

"Captain, I--"

"Don't talk. Listen. If this story gets out, the other four will be apprentice shippers, but you will be nothing. You will never go on shipboard again. No ship will take you, I promise you that. Not as crew, not as passenger. Ask yourself what kind of money you can make on Baleyworld--and doing what? That's if you talk about this, or if you cross the Spacer woman in any way, or even just look at her for more than half a second at a time, or at her two robots. And you are going to have to see to it that no one else among the crew is in the least offensive. You're responsible. --and you're fined two week's pay."

"But, Captain," said Niss weakly, "the others--"

"I expected less from the others, Niss, so I fined them less. Get out of here."

21.

D.G. played idly with the photocube that always stood on his desk. Each time he turned it, it blackened, then cleared when stood upon one of its sides as its base. When it cleared, the smiling three-dimensional image of a woman's head could be seen.

Crew rumor was that each of the six sides lead to the appearance of a different woman. The rumor was quite correct.

Jamin Oser watched the flashing appearance and disappearance of images totally without interest. Now that the ship was secured--or as secured as it could be against attack of any expected variety--it was time to think of the next step.

D.G., however, was approaching the matter obliquely--or, perhaps, not approaching it at all. He said, "It was the woman's fault, of course."

Oser shrugged and passed his hand over his beard, as though he were reassuring himself that he, at least, was not a woman. Unlike D.G., Oser had his upper lip luxuriantly covered as well.

D.G. said, "Apparently, being on the planet of her birth removed any thought of discretion. She left the ship, even though I had asked her not to."

"You might have ordered her not to."

"I don't know that that would have helped. She's a spoiled aristocrat, used to having her own way and to ordering her robots about. Besides, I plan to use her and I want her cooperation, not her pouting. And again--she was the Ancestor's friend."

"And still alive," said Oser, shaking his head. "It makes the skin crawl. An old, old woman."

"I know, but she looks quite young. Still attractive. And nose in the air. Wouldn't retire when the crewmen approached, wouldn't shake hands with one of them. --Well, it's over."

"Still, Captain, was it the right thing to tell Niss he had tackled a robot?"

"Had to! Had to, Oser. If he thought he'd been beaten and humiliated before four of his mates by an effeminate Spacer half his size, he'd be useless to us forever. It would have broken him completely. And we don't want anything to happen that will start the rumor that Spacers--that human Spacers--are supermen. That's why I had to order them so strenuously not to talk about it. Niss will ride herd on all of them--and if it does get out, it will also get out that the Spacer was a robot. --but I suppose there was a good side to the whole thing."

"Where, Captain?" asked Oser.

"It got me to thinking about robots. How much do we know about them? How much do you know?"

Oser shrugged. "Captain, it's not something I think about much."

"Or something anyone else thinks about, either. At least, any Settler. We know that the Spacers have robots, depend on them, go nowhere without them, can't do a thing without them, are parasites on them, and we're sure they're fading away because of them. We know that Earth once had robots forced on them by the Spacers and that they are gradually disappearing from Earth and are not found at all in Earth Cities, only in the countryside. We know that the Settler worlds don't and won't have them anywhere--town or country. So Settlers never meet them on their own worlds and hardly ever on Earth." (His voice had a curious inflection each time he said "Earth," as though one could hear the capital, as though one could hear the words "home" and "mother" whispered behind it.) "What else do we know?"

Oser said, "There's the Three Laws of Robotics."

"Right," D.G. pushed the photocube to one side and leaned forward. "Especially the First Law. 'A robot may not injure a human being or, through inaction, allow a human being to come to harm. ' Yes? Well, don't rely on it. It doesn't mean a thing. We all feel ourselves to be absolutely safe from robots because of that and that's fine if it gives us confidence, but not if it gives us false confidence. R. Daneel injured Niss and it didn't bother the robot at all, First Law or no First Law."

"He was defending --"

"Exactly. What if you must balance injuries? What if it was a case of either hurt Niss or allow your Spacer owner to come to harm? Naturally, she comes first."

"It makes sense."

"Of course it does. And here we are on a planet of robots, a couple of hundred million of them. What orders do they have? How do they balance the conflict between different harms? How can we be sure that none of them will touch us? Something on this planet has destroyed two ships already. "

Oser said uneasily, "This R. Daneel is an unusual robot, looks more like a man than we do. It may be we can't generalize from him. That other robot, what's his name--"

"Giskard. It's easy to remember. My name is Daneel Giskard."

"I think of you as captain, Captain. Anyway, that R. Giskard just stood there and didn't do a thing. He looks like a robot and he acts like one. We've got lots of robots out there on Solaria watching us right now and they're not doing a thing, either. Just watching."

"And if there are some special robots that can harm us?"

"I think we're prepared for them."

"Now we are. That's why the incident with Daneel and Niss was a good thing. We've been thinking that we can only be in trouble if some of the Solarians are still here. They don't have to be. They can be gone. It may be that the robots--or at least some specially designed robots can be dangerous. And if Lady Gladia can mobilize her robots in this place--it used to be her estate--and make them defend her and us, too, we may well be able to neutralize anything they've left behind."

"Can she do that?" said Oser.

"We're going to see," said D.G.

22.

"Thank you, Daneel," Gladia said, "You did well." Her face seemed pinched together, however. Her lips were thin and bloodless, her cheeks pale. Then, in a lower voice. "I wish I had not come."

Giskard said, "It is a useless wish, Madam Gladia. Friend Daneel and I will remain outside the cabin to make sure you are not further disturbed."

The corridor was empty and remained so, but Daneel and Giskard managed to speak in sound-wave intensities below the human threshold, exchanging thoughts in their brief and condensed way.

Giskard said, "Madam Gladia made an injudicious decision in refusing to retire. That is clear."

"I presume, friend Giskard," said Daneel, "that there was no possibility of maneuvering her into changing that decision."

"It was far too firm, friend Daneel, and taken too quickly. The same was true of the intention of Niss, the Settler. Both his curiosity concerning Madam Gladia and his contempt and animosity toward you were too strong to manage without serious mental harm. The other four I could handle. It was quite possible to keep them from intervening. Their astonishment at your ability to handle Niss froze them naturally and I had only to strengthen that slightly."

"That was fortune, friend Giskard. Had those four joined Mr. Niss, I would have been faced with the difficult choice of forcing Madam Gladia into a humiliating retreat or of badly damaging one or two of the Settlers to frighten off the rest. I think I would have had to choose the former alternative but it, too, would have caused me grave discomfort."

"You are well, friend Daneel?"

"Quite well. My damage to Mr. Niss was minimal."

"Physically, friend Daneel, it was. Within his mind, however, there was great humiliation, which was to him much worse than the physical damage. Since I could sense that, I could not have done what you did so easily. And yet, friend Daneel--"

"Yes, friend Giskard?"

"I am disturbed over the future. On Aurora, through all the decades of my existence, I have been able to work slowly, to wait for opportunities of touching minds gently, without doing harm; of strengthening what is already there, of weakening what is already attenuated, of pushing gently in the direction of existing impulse. Now, however, we are coming to a time of crisis in which emotions will run high, decisions will be taken quickly, and events will race past us. If I am to do any good at all, I will have to act quickly, too, and the Three Laws of Robotics prevent me from doing so. It takes time to weigh the subtleties of comparative physical and mental harm. Had I been alone with Madam Gladia at the time of the Settlers' approach, I do not see what course I could have taken that I would not have recognized as entailing serious damage to Madam Gladia, to one or more of the Settlers, to myself --or possibly to all who were involved. "

Daneel said, "What is there to do, friend Giskard?"

"Since it is impossible to modify the Three Laws, friend Daneel, once again we must come to the conclusion that there is nothing we can do but await failure."

7. THE OVERSEER

23.

It was morning on Solaria, morning on the estate--her estate. Off in the distance was the establishment that might have been her establishment. Somehow twenty decades dropped away and Aurora seemed to her to be a far-off dream that had never happened.

She turned to D.G., who was tightening the belt about his thin outer garment, a belt from which two sidearms hung. On his left hip was the neuronc whip; on his right, something shorter and bulkier that she guessed was a blaster.

"Are we going to the house?" she asked.

"Eventually," said D.G. with a certain absence of mind. He was inspecting each sidearm in turn, holding one of them to his ear as though he were listening for a faint buzz that would tell him it was alive.

"Just the four of us?" She automatically turned her eyes to each of the others: "D.G., Daneel," she said to Daneel, "Where is Giskard, Daneel?"

Daneel said, "It seemed to him, Madam Gladia, that it would be wise to act as an advance guard. As a robot, he might not be noticeable among other robots--and if there should be anything wrong, he could warn us. In any case, he is more expendable than either yourself or the captain."

"Good robotic thinking," said D.G. grimly. "It's just as well. Come, we're moving forward now."

"Just the three of us?" said Gladia, a touch plaintively. "To be honest, I lack Giskard's robotic ability to accept expendability."

D.G. said, "We're all expendable, Lady Gladia. Two ships have been destroyed, every member of each crew indiscriminately brought to an end. There's no safety in numbers here."

"You're not making me feel any better, D.G."

"Then I'll try. The earlier ships were not prepared. Our ship is. And I'm prepared, too." He slapped his two hands to his hips. "And you've got a robot with you who has showed himself to be an efficient protector. What's more, you yourself are our best weapon. You know how to order robots to do what you want them to do and that may well be crucial. You are the only one with us who can do that and the earlier ships had no one at all of your caliber. Come, then--"

They moved forward. Gladia said, after a while, "We're not walking toward the house."

"No, not yet. First, we're walking toward a group of robots. You see them, I hope."

"Yes, I do, but they're not doing anything."

"No, they're not. There were many more robots present when we first landed. Most of them have gone, but these remain. Why?"

"If we ask them, they'll tell us."

"You will ask them, Lady Gladia."

"They'll answer you, D.G., as readily as they'll answer me. We're equally human."

D.G. stopped short and the other two stopped with him. He turned to Gladia and said, smiling, "My dear Lady Gladia, equally human? A Spacer and a Settler? Whatever has come over you?"

"We are equally human to a robot," she said waspishly. "And please don't play games. I did not play the game of Spacer and Earthman with your Ancestor."

D.G.'s smile vanished. "That's true. My apologies, my lady. I shall try to control my sense of the sardonic for, after all, on this world we are allies."

He said, a moment later, "Now, madam, what I want you to do is to find out what orders the robots have been given--if any; if there are any robots that might, by some chance, know you; if there are any human beings on the estate or on the world; or anything else it occurs to you to ask. They shouldn't be dangerous; they're robots and you're human; they can't hurt you. To be sure," he added, remembering, "your Daneel rather manhandled Niss, but that was under conditions that don't apply here. And Daneel may go with you."

Respectfully, Daneel said, "I would in any case accompany Lady Gladia, Captain. That is my function."

"Giskard's function, too, I imagine," said D.G., "and yet he's wandered off."

"For a purpose, Captain, that he discussed with me and that we agreed was an essential way of protecting Lady Gladia. "

"Very well. You two move forward. I'll cover you both." He drew the weapon on his right hip. "If I call out 'Drop,' the two of you fall down instantly. This thing doesn't play favorites."

"Please don't use it as anything but a last resort, D.G.," said Gladia. "There would scarcely be an occasion to against robots. --Come, Daneel!"

Off she went, stepping forward rapidly and firmly toward the group of about a dozen robots that were standing just in front of a line of low bushes with the morning sun reflecting in glints here and--there from their burnished exteriors.

24.

The robots did not retreat, nor did they advance. They remained calmly in place. Gladia counted them. Eleven in plain sight. There might be others, possibly, that were unseen.

They were designed Solaria-fashion. Very polished. Very smooth. No illusion of clothing and not much realism. They were almost like mathematical abstractions of the human body, with no two of them quite alike.

She had the feeling that they were by no means as flexible or complex as Auroran robots but were more single-mindedly adapted to specific tasks.

She stopped at least four meters from the line of robots and Daneel (she sensed) stopped as soon as she did and remained less than a meter behind. He was close enough to interfere at once in case of need, but was far enough back to make it clear that she was the dominant spokesperson of the pair. The robots before her, she was certain, viewed Daneel as a human being, but she also knew that Daneel was too conscious of himself as a robot to presume upon the misconception of other robots.

Gladia said, "Which one of you will speak with me?"

There was a brief period of silence, as though an unspoken conference were taking place. Then one robot took a step forward. "Madam, I will speak."

"Do you have a name?"

"No, madam. I have only a serial number."

"How long have you been operational?"

"I have been operational twenty-nine years, madam."

"Has anyone else in this group been operational for longer?"

"No, madam. It is why I, rather than another, am speaking."

"How many robots are employed on this estate?"

"I do not have that figure, madam."

"Roughly."

"Perhaps ten thousand, madam."

"Have any been operational for longer than twenty decades?"

"The agricultural robots include some who may, madam."

"And the household robots?"

"They have not been operational long, madam. The masters prefer new-model robots."

Gladia nodded, turned to Daneel, and said, "That makes sense. It was so in my day, too."

She turned back to the robot. "To whom does this estate belong?"

"It is the Zoberlon Estate, madam."

"How long has it belonged to the Zoberlon family?"

"Longer, madam, than I have been operational. I do not know how much longer, but the information can be obtained. "

"To whom did it belong before the Zoberlons took possession?"

"I do not know, madam, but the information can be obtained."

"Have you ever heard of the Delmarre family?"

"No, madam."

Gladia turned to Daneel and said, rather ruefully, "I'm trying to lead the robot, little by little, as Elijah might once have done, but I don't think I know how to do it properly."

"On the contrary, Lady Gladia," said Daneel gravely, "it seems to me you have established much. It is not likely that any robot on this estate, except perhaps for a few of the agriculturals, would have any memory of you. Would you have encountered any of the agriculturals in your time?"

Gladia shook her head. "Never! I don't recall seeing any of them even in the distance."

"It is clear, then, that you are not known on this estate."

"Exactly. And poor D.G. has brought us along for nothing. If he expected any good of me, he has failed."

"To know the truth is always useful, madam. Not to be known is, in this case, less useful than to be known, but not to know whether one is known or not would be less useful still. Are there not, perhaps, other points on which you might elicit information?"

"Yes, let's see--" For a few seconds, she was lost in thought, then she said softly, "It's odd. When I speak to these robots, I speak with a pronounced Solarian accent. Yet I do not speak so to you."

Daneel said, "It is not surprising, Lady Gladia. The robots speak with such an accent, for they are Solarian. That brings back the days of your youth and you speak, automatically, as you spoke then. You are at once yourself, however, when you turn to me because I am part of your present world."

A slow smile appeared on Gladia's face and she said, "You reason more and more like a human being, Daneel."

She turned back to the robots and was keenly aware of the peacefulness of the surroundings. The sky was an almost unmarked blue, except for a thin line of clouds on the western horizon (indicating that it might turn cloudy in the afternoon). There was the sound of rustling leaves in a light wind, the whirring of insects, a lonely birdcall. No sound of human beings. There might be many robots about, but they worked silently. There weren't the exuberant sounds of human beings that she had grown accustomed to (painfully, at first) on Aurora.

But now back on Solaria, she found the peace wonderful. It had not been all bad on Solaria. She had to admit it.

She said to the robot quickly, with a note of compulsion edging her voice, "Where are your masters?"

It was useless, however, to try to hurry or alarm a robot or to catch it off-guard. It said, without any sign of perturbation. "They are gone, madam."

"Where have they gone?"

"I do not know, madam. I was not told."

"Which of you knows?"

There was a complete silence.

Gladia said, "Is there any robot on the estate who would know?"

The robot said, "I do not know of any, madam."

"Did the masters take robots with them?"

"Yes, madam."

"Yet they didn't take you. Why do you remain behind?"

"To do our work, madam. "

"Yet you stand here and do nothing. Is that work?"

"We guard the estate from those from outside, madam."

"Such as we?"

"Yes, madam."

"But here we are and yet you still do nothing. Why is that?"

"We observe, madam. We have no further orders."

"Have you reported your observations?"

"Yes, madam."

"To whom?"

"To the overseer, madam."

"Where is the overseer?"

"In the mansion, madam."

"Ah." Gladia turned and walked briskly back to D.G.

Daneel followed.

"Well?" said D.G. He was holding both weapons at the ready, but put them back in their holsters as they returned.

Gladia shook her head. "Nothing. No robot knows me. No robot, I'm sure, knows where the Solarians have gone. But they report to an overseer."

"An overseer?"

"On Aurora and the other Spacer worlds, the overseer on large estates with numerous robots is some human whose profession it is to organize and direct groups of working robots in the fields, mines, and industrial establishments."

"Then there are Solarians left behind."

Gladia shook her head. "Solaria is an exception. The ratio of robots to human beings has always been so high that it has not been the custom to assign a man or woman to oversee the robots. That job has been done by another robot, one that is specially programmed."

"Then there is a robot in that mansion"--D.G. nodded with his head--"who is more advanced than these and who might profitably be questioned."

"Perhaps, but I am not certain it is safe to attempt to go into the mansion."

D.G. said sardonically, "It is only another robot."

"The mansion may be booby-trapped."

"This field may be booby-trapped. "

Gladia said, "It would be better to send one of the robots to the mansion to tell the overseer that human beings wish to speak to him."

D.G. said, "That will not be necessary. That job has apparently been done already. The overseer is emerging and is neither a robot nor a 'him.' What I see is a human female."

Gladia looked up in astonishment. Advancing rapidly toward them was a tall, well-formed, and exceedingly attractive woman. Even at a distance, there was no doubt whatever as to her sex.

25.

D.G. smiled broadly. He seemed to be straightening himself a bit, squaring his shoulders, throwing them back. One hand went lightly to his beard, as though to make sure it was sleek and smooth.

Gladia looked at him with disfavor. She said, "That is not a Solarian woman."

"How can you tell?" said D.G.

"No Solarian woman would allow herself to be seen so freely by other human beings. Seen, not viewed."

"I know the distinction, my lady. Yet you allow me to see you."

"I have lived over twenty decades on Aurora. Even so I have enough Solarian left in me still not to appear to others like that."

"She has a great deal to display, madam. I would say she is taller than I am and as beautiful as a sunset. "

The overseer had stopped twenty meters short of their position and the robots had moved aside so that none of them remained between the woman on one side and the three from the ship on the other.

D.G. said, "Customs can change in twenty decades."

"Not something as basic as the Solarian dislike of human contact," said Gladia sharply. "Not in two hundred decades." She had slipped into her Solarian twang again.

"I think you underestimate social plasticity. Still, Solarian or not, I presume she's a Spacer--and if there are other Spacers like that, I'm all for peaceful coexistence."

Gladia's look of disapproval deepened. "Well, do you intend to stand and gaze in that fashion for the next hour or two? Don't you want me to question the woman?"

D.G. started and turned to look at Gladia with distinct annoyance. "You question the robots, as you've done. I question the human beings."

"Especially the females, I suppose."

"I wouldn't like to boast, but--"

"It is a subject on which I have never known a man who didn't. "

Daneel interposed, "I do not think the woman will wait longer. If you wish to retain the initiative, Captain, approach her now. I will follow, as I did with Madam Gladia."

"I scarcely need the protection," said D.G. brusquely.

"You are a human being and I must not, through inaction, allow harm to come to you."

D.G. walked forward briskly, Daneel following. Gladia, reluctant to remain behind alone, advanced a bit tentatively.

The overseer watched quietly. She wore a smooth white robe that reached down to mid-thigh and was belted at the waist. It showed a deep and inviting cleavage and her nipples were clearly visible against the thin material of the robe. There was no indication that she was wearing anything else but a pair of shoes.

When D.G. stopped, a meter of space separated them. Her skin, he could see, was flawless, her cheekbones were high, her eyes wide-set and somewhat slanted, her expression serene.

"Madam," said D.G., speaking as close an approximation to Auroran Patrician as he could manage, "have I the pleasure of speaking to the overseer of this estate?"

The woman listened for a moment and then said, in an accent so thickly Solarian as to seem almost comic when coming from her perfectly shaped mouth, "You are not a human being."

She then flashed into action so quickly that Gladia, still some ten meters off, could not see in detail what had happened. She saw only a blur of motion and then D.G. lying on his back motionless and the woman standing there with his weapons, one in each hand.

26.

What stupefied Gladia most in that one dizzying moment was that Daneel had not moved in either prevention or reprisal.

But even as the thought struck her, it was out of date, for Daneel had already caught the woman's left wrist and twisted it, saying, "Drop those weapons at once," in a harsh peremptory voice she had never heard him use before. It was inconceivable that he should so address a human being.

The woman said, just as harshly in her higher register, "You are not a human being." Her right arm came up and she fired the weapon it held. For a moment, a faint glow flickered over Daneel's body and Gladia, unable to make a sound in her state of shock, felt her sight dim. She had never in her life fainted, but this seemed a prelude.

Daneel did not dissolve, nor was there an explosive report. Daneel, Gladia realized, had prudently seized the arm that held the blaster. The other held the neuronic whip and it was that which had been discharged in full--and at close range--upon Daneel. Had he been human, the massive stimulation of his sensory nerves might well have killed him or left him permanently disabled. Yet he was, after all, however human in appearance, a robot and his equivalent of a nervous system did not react to the whip.

Daneel seized the other arm now, forcing it up. He said again, "Drop those weapons or I will tear each arm from its socket."

"Will you?" said the woman. Her arms contracted and, for a moment, Daneel was lifted off the ground. Daneel's legs swung backward, then forward, pendulum-like, using the points where the arms joined as a pivot. His feet struck the woman with force and both fell heavily to the ground.

Gladia, without putting the thought into words, realized that although the woman looked as human as Daneel did, she was just as nonhuman. A sense of instant outrage flooded Gladia, who was suddenly Solarian to the core--outrage that a robot should use

force on a human being. Granted that she might somehow have recognized Daneel for what he was, but how dare she strike D.G.

Gladia was running forward, screaming. It never occurred to her to fear a robot simply because it had knocked down a strong man with a blow and was battling an even stronger robot to a draw.

"How dare you?" she screamed in a Solarian accent so thick that it grated on her own ear--but how else does one speak to a Solarian robot? "How dare you, girl? Stop all resistance immediately!"

The woman's muscles seemed to relax totally and simultaneously, as though an electric current had suddenly been shut off. Her beautiful eyes looked at Gladia without enough humanity to seem startled. She said in an indistinct, hesitating voice, "My regrets, madam."

Daneel was on his feet, staring down watchfully at the woman who lay on the grass. D.G., suppressing a groan, was struggling upright.

Daneel bent for the weapons, but Gladia waved him away furiously.

"Give me those weapons, girl," she said.

The woman said, "Yes, madam."

Gladia snatched at them, chose the blaster swiftly, and handed it to Daneel.

"Destroy her when that seems best, Daneel. That's an order." She handed the neuronomic whip to D.G. and said, "This is useless here, except against me--and yourself. Are you all right?"

"No, I'm not all right," muttered D.G., rubbing one hip. "Do you mean she's a robot?"

"Would a woman have thrown you like that?"

"Not any whom I have ever met before. I said there might be special robots on Solaria who were programmed to be dangerous."

"Of course," said Gladia unkindly, "but when you saw something that looked like your idea of a beautiful woman, you forgot. "

"Yes, it is easy to be wise after the fact."

Gladia sniffed and turned again to the robot, "What is your name, girl?"

"I am called Landaree, madam. "

"Get up, Landaree."

Landaree rose much as Daneel had--as though she were on springs. Her struggle with Daneel seemed to have left her totally unharmed.

Gladia said, "Why, against the First Law, have you attacked these human beings?"

"Madam," said Landaree firmly, "these are not human beings."

"And do you say that I am not a human being?"

"No, madam, you a human being."

"Then, as a human being, I am defining these two men as human beings. --Do you hear me?"

"Madam," said Landaree a little more softly, "these are not human beings."

"They are indeed human beings because I tell you they are. You are forbidden to attack them or harm them in any way."

Landaree stood mute.

"Do you understand what I have said?" Gladia's voice grew more Solarian still as she reached for greater intensity.

"Madam," said Landaree, "these are not human beings."

Daneel said to Gladia softly, "Madam, she has been given orders of such firmness that you cannot easily countervail them."

"We'll see about that," said Gladia, breathing quickly.

Landaree looked about. The group of robots, during the few minutes of conflict, had come closer to Gladia and her two companions. In the background were two robots who, Gladia decided, were not members of the original group and they were carrying between them, with some difficulty, a large and very massive device of some sort. Landaree gestured to them and they moved forward a bit more quickly.

Gladia cried out, "Robots, stop!"

They stopped.

Landaree said, "Madam, I am fulfilling my duties. I am following my instructions."

Gladia said, "Your duty, girl, is to obey my orders!"

Landaree said, "I cannot be ordered to disobey my instructions!"

Gladia said, "Daneel, blast her!"

Afterward, Gladia was able to reason out what had happened. Daneel's reaction time was much faster than a human being's would have been and he knew that he was facing a robot against which the Three Laws did not inhibit violence. However, she looked so human that even the precise knowledge that she was a robot did not totally overcome his inhibition. He followed the order more slowly than he should have.

Landaree, whose definition of "human being" was clearly not the one Daneel used, was not inhibited by his appearance and she stuck the more quickly. She had her grip on the blaster and again the two struggled.

D.G. turned his neuronic whip butt-first and came in at a half-run to strike. He hit her head squarely, but it had no effect on the robot and her leg sent him flailing backward.

Gladia said, "Robot! Stop!" Her clenched hands were raised.

Landaree shouted in a stentorian contralto, "All of you! Join me! The two apparent males are not human beings. Destroy them without harming the female in any way."

If Daneel could be inhibited by a human appearance, the same was true in considerably greater intensity for the simple Solarian robots, who inched forward slowly and intermittently.

"Stop!" shrieked Gladia. The robots stopped, but the order had no effect on Landaree.

Daneel held fast to the blaster, but was bending backward under the force of Landaree's apparently greater strength.

Gladia, in distraction, looked about as though hoping to find some weapon somewhere.

D.G. was attempting to manipulate his radio transmitter. He said, grunting, "It's been damaged. I think I fell on it."

"What do we do?"

"We have to make it back to the ship. Quickly."

Gladia said, "Then run. I can't abandon Daneel." She faced the battling robots, crying out wildly, "Landaree, stop! Landaree, stop!"

"I must not stop, madam," said Landaree. "My instructions are precise."

Daneel's fingers were forced open and Landaree had the blaster again.

Gladia threw herself before Daneel. "You must not harm this human being."

"Madam," said Landaree, her blaster pointed at Gladia, unwavering. "You are standing in front of something that looks like a human being but is not a human being. My instructions are to destroy such on sight." Then, in a louder voice, "You two porters--to the ship."

The two robots, carrying the massive device between them, renewed their forward movement.

"Robots, stop!" screamed Gladia and the forward motion stopped. The robots trembled in place, as though attempting to move forward and yet not quite able to do so.

Gladia said, "You cannot destroy my human friend Daneel without destroying me--and you yourself admit that I am a human being and therefore must not be harmed."

Daneel said in a low voice, "My lady, you must not draw harm upon yourself in an effort to protect me. "

Landaree said, "This is useless, madam. I can remove you easily from your present position and then destroy the nonhuman being behind you. Since that may harm you, I ask you, with all respect, to move from your present position voluntarily."

"You must, my lady," said Daneel.

"No, Daneel. I'll stay here. In the time it will take her to move me, you run!"

"I cannot run faster than the beam of a blaster--and if I try to run, she will shoot through you rather than not at all. Her instructions are probably that firm. I regret, my lady, that this will cause you unhappiness."

And Daneel lifted the struggling Gladia and tossed her lightly to one side.

Landaree's finger tightened on the contact, but never completed the pressure. She remained motionless.

Gladia, who had staggered to a sitting position, got to her feet. Cautiously, D.G., who had remained in place during the last exchanges, approached Landaree. Daneel quite calmly reached out and took the blaster from her unresisting fingers.

"I believe," said Daneel, "that this robot is permanently deactivated. "

He pushed her gently and she fell over in one piece, with her limbs, torso, and head in the relative positions they occupied when she was standing. Her arm was still bent, her hand was holding an invisible blaster, and her finger was pressing on an invisible contact.

Through the trees to one side of the grassy field on which the drama had played itself out Giskard was approaching, his robotic face showing no signs of curiosity, though his words might have.

"What has taken place in my absence?" he asked.

27.

The walk back to the ship was rather anticlimactic. Now that the frenzy of fear and action was over, Gladia felt hot and cross. D.G. limped rather painfully and they progressed slowly, partly because of the limp and partly because the two Solarian robots were still carrying their massive instrument, plodding along under its weight.

D.G. looked over his shoulder at them. "They obey my orders now that that overseer is out of action."

Gladia said through her teeth, "Why didn't you run at the end and get help? Why did you remain helplessly watching?"

"Well," said D.G., with an attempt at the kind of lightness he would have showed easily were he feeling better, "with you refusing to leave Daneel, I rather hesitated to play the coward by comparison."

"You fool! I was safe. She would not have harmed me."

Daneel said, "Madam, it distresses me to contradict you, but I think she would have done so as her urge to destroy me grew stronger."

Gladia turned on him hotly. "And that was a smart thing you did, pushing me out of the way. Did you want to be destroyed?"

"Rather than see you harmed, madam, yes. My failure to stop the robot through inhibitions set up by her human appearance demonstrated, in any case, an unsatisfactory limit to my usefulness to you."

"Even so," said Gladia, "she would have hesitated to shoot me, since I am human, for a perceptible period of time and you could have had the blaster in your own possession by that time."

"I couldn't gamble your life, madam, on anything as uncertain as her hesitation," said Daneel.

"And you," said Gladia, showing no signs of having heard Daneel and turning to D.G. again, "shouldn't have brought the blaster in the first place."

D.G. said, frowning, "Madam, I am making allowances for the fact that we have all been very close to death. The robots do not mind that and I have grown somehow accustomed to danger. To you, however, this was an unpleasant novelty and you are being childish as a result. I forgive you--a little. But please listen. There was no way I could have known the blaster would be taken from me so easily. Had I not brought the weapon, the overseer could have killed me with her bare hands as quickly and as effectively as she could have by blaster. Nor was there any point in my running, to answer an earlier

complaint of yours. I could not outrun a blaster. Now please continue if you must still get it out of your system, but I do not intend to reason with you any further."

Gladia looked from D.G. to Daneel and back and said in a low voice, "I suppose I am being unreasonable. Very well, no more hindsights."

They had reached the ship. Crew members poured out at the sight of them. Gladia noticed they were armed.

D.G. beckoned to his second-in-command. "Oser, I presume you see that object the two robots are carrying?"

"Yes, sir."

"Well, have them carry it on board. Have it put in the security room and kept there. The security room is then to be locked and kept locked." He turned away for a moment, then turned back. "And Oser, as soon as that is done, we win prepare to take off again."

Oser said, "Captain, shall we keep the robots as well?"

"No. They are too simple in design to be worth much and, under the circumstances, taking them would create undesirable consequences. The device they are carrying is much more valuable than they are."

Giskard watched the device being slowly and very carefully maneuvered into the ship. He said, "Captain, I am guessing that that is a dangerous object."

"I'm under that impression, too," said D.G. "I suspect that the ship would have been destroyed soon after we were."

"That thing?" said Gladia. "What is it?"

"I can't be certain, but I believe it is a nuclear intensifier. I've seen experimental models on Baleyworld and this looks like a big brother."

"What is a nuclear intensifier?"

"As the name implies, Lady Gladia, it's a device that intensifies nuclear fusion."

"How does it do that?" D.G. shrugged. "I'm not a physicist, my lady. A stream of W particles is involved and they mediate the weak interaction. That's all I know about it."

"What does that do?" asked Gladia.

"Well, suppose the ship has its power supply as it has right now, for instance. There are small numbers of protons, derived from our hydrogen fuel supply, that are ultrahot and fusing to produce power. Additional hydrogen is constantly being heated to produce free protons, which, when hot enough, also fuse to maintain that power. If the stream of W particles from the nuclear intensifier strikes the fusing protons, these fuse more quickly and deliver more heat. That heat produces protons and sets them to fusing more quickly than they should be and their fusion produces still more heat, which intensifies the vicious cycle. In a tiny fraction of a second, enough of the fuel fuses to form a tiny thermonuclear bomb and the entire ship and everything upon it is vaporized."

Gladia looked awed. "Why doesn't everything ignite? Why doesn't the whole planet blow up?"

"I don't suppose there's danger of that, madam. The protons have to be ultrahot and fusing. Cold protons are so unapt to fuse that even when the tendency is intensified to the full extent of such a device, that still is not enough to allow fusion. At least, that's

what I gathered from a lecture I once attended. And nothing but hydrogen is affected, as far as I know. Even in the case of ultrahot protons, the heat produced does not increase without measure. The temperature cools with distance from the intensifier beam, so that only a limited amount of fusion can be forced. Enough to destroy the ship, of course, but there's no question of blowing up the hydrogen-rich oceans, for instance, even if part of the ocean were ultraheated--and certainly not if it were cold."

"But if the machine gets turned on accidentally in the storage room--"

"I don't think it can get turned on." D.G. opened his hand and in it rested a two-centimeter cube of polished metal. "From what little I know of such things, this is an activator and the nuclear intensifier can do nothing without it."

"Are you sure?"

"Not entirely, but we'll just have to chance it, since I must get that thing back to Baleyworld. Now let's get on board."

Gladia and her two robots moved up the gangplank and into the ship. D.G. followed and spoke briefly to some of his officers.

He then said to Gladia, his weariness beginning to show, "It will take us a couple of hours to place all our gear on board and be ready for takeoff and every moment increases the danger."

"Danger?"

"You don't suppose that fearful woman robot is the only one of its kind that may exist on Solaria, do you? Or that the nuclear intensifier we have captured is the only one of its kind? I suppose it will take time for other humanoid robots and other nuclear intensifiers to be brought to this spot--perhaps considerable time--but we must give them as little as possible. And in the meantime, madam, let us to go your room and conduct some necessary business."

"What necessary business would that be, Captain?"

"Well," said D.G., motioning them forward, "in view of the fact that I may have been victimized by treason, I think I will conduct a rather informal court-martial."

28.

D.G. said, after seating himself with an audible groan, "What I really want is a hot shower, a rubdown, a good meal, and a chance to sleep, but that will all have to wait till we're off the planet. It will have to wait in your case, too, madam. Some things will not wait, however.--My question is this. Where were you, Giskard, while the rest of us were faced with considerable danger?"

Giskard said, "Captain, it did not seem to me that if robots alone were left on the planet, they would represent any danger. Moreover, Daneel remained with you."

Daneel said, "Captain, I agreed that Giskard would reconnoiter and that I would remain with Madam Gladia and with you."

"You two agreed, did you?" said D.G. "Was anyone else consulted?"

"No, Captain," said Giskard.

"If you were certain that the robots were harmless, Giskard, how did you account for the fact that two ships were destroyed?"

"It seemed to me, Captain, that there must remain human beings on the planet, but that they would do their best not to be seen by you. I wanted to know where they were and what they were doing. I was in search of them, covering the ground as rapidly as I could. I questioned the robots I met."

"Did you find any human beings?"

"No, Captain."

"Did you examine the house out of which the overseer emerged?"

"No, Captain, but I was certain there were no human beings within it. I still am."

"It contained the overseer."

"Yes, Captain, but the overseer was a robot."

"A dangerous robot. "

"To my regret, Captain, I did not realize that."

"You feel regret, do you?"

"It is an expression I choose to describe the effect on my positronic circuits. It is a rough analogy to the term as human beings seem to use it, Captain."

"How is it you didn't realize a robot might be dangerous?"

"By the Three Laws of Robotics--"

Gladia interrupted, "Stop this, Captain. Giskard only knows what he is programmed to know. No robot is dangerous to human beings, unless there is a deadly quarrel between human beings and the robot must attempt to stop it. In such a quarrel, Daneel and Giskard would undoubtedly have defended us with as little harm to others as possible."

"Is that so?" D.G. put two fingers to the bridge of his nose and pinched. "Daneel did defend us. We were fighting robots, not human beings, so he had no problem in deciding whom to defend and to what extent. Yet he showed astonishing lack of success, considering that the Three Laws do not prevent him from doing harm to robots. Giskard remained out of it, returning at the precise moment when it was over. Is it possible that there is a bond of sympathy among robots? Is it possible that robots, when defending human beings against robots, somehow feel what Giskard calls 'regret' at having to do so and perhaps fail--or absent themselves--"

"No!" exploded Gladia forcefully.

"No?" said D.G. "Well, I don't pretend to be an expert roboticist. Are you, Lady Gladia?"

"I am not a roboticist of any sort," said Gladia, "but I have lived with robots all my life. What you suggest is ridiculous. Daneel was quite prepared to give his life for me and Giskard would have done the same."

"Would any robot have done so?"

"Of course."

"And yet this overseer, this Landaree, was quite ready to attack me and destroy me. Let us grant that, in some mysterious way, she detected that Daneel, despite appearances, was as much a robot as she herself was--despite appearances--and that she had no inhibitions when it came to harming him. How is it, though, that she attacked me when I am unquestionably a human being? She hesitated at you, admitting you were human, but not me. How could a robot discriminate between the two of us? Was she perhaps not really a robot?"

"She was a robot," said Gladia. "Of course she was. But--the truth is, I don't know why she acted as she did. I have never before heard of such a thing. I can only suppose the Solarians, having learned how to construct humanoid robots, designed them without the protection of the Three Laws, though I would have sworn that the Solarians--of all Spacers--would have been the last to do so. Solarians are so outnumbered by their own robots as to be utterly dependent on them--to a far greater extent than any other Spacers are--and for that reason they fear them more. Subservience and even a bit of stupidity were built into all Solarian robots. The Three Laws were stronger on Solaria than anywhere else, not weaker. Yet I can think of no other way of explaining Landaree than to suppose that the First Law was--"

Daneel said, "Excuse me, Madam Gladia, for interrupting. May I have your permission to attempt an explanation of the overseer's behavior?"

D.G. said sardonically, "It comes to that, I suppose. Only a robot can explain a robot."

"Sir," said Daneel, "unless we understand the overseer, we might not be able to take effective measures in the future against the Solarian danger. I believe I have a way of accounting for her behavior. "

"Go ahead," said D.G.

"The overseer," said Daneel, "did not take instant measures against us. She stood and watched us for a while, apparently uncertain as to how to proceed. When you, Captain, approached and addressed her, she announced that you were not human and attacked you instantly. When I intervened and cried out that she was a robot, she announced that I was not human and attacked me at once, too. When Lady Gladia came forward, however, shouting at her, the overseer recognized her as human and, for a while, allowed herself to be dominated."

"Yes, I remember all that, Daneel. But what does it mean?"

"It seems to me, Captain, that it is possible to alter a robot's behavior fundamentally without ever touching the Three Laws, provided, for instance, that you alter the definition of a human being. A human being, after all, is only what it is defined to be."

"Is that so? What do you consider a human being to be?"

Daneel was not concerned with the presence or absence of sarcasm. He said, "I was constructed with a detailed description of the appearance and behavior of human beings, Captain. Anything that fits that description is a human being to me. Thus, you have the appearance and the behavior, while the overseer had the appearance but not the behavior."

"To the overseer, on the other hand, the key property of a human being was speech, Captain. The Solarian accent is a distinctive one and to the overseer something that looked like a human being was defined as a human being only if it spoke like a Solarian. Apparently, anything that looked like a human being but did not speak with a Solarian accent was to be destroyed without hesitation, as was any ship carrying such beings."

D.G. said thoughtfully, "You may be right."

"You have a Settler accent, Captain, as distinctive in its way as the Solarian accent is, but the two are widely different. As soon as you spoke, you defined yourself as nonhuman to the overseer, who announced that and attacked."

"And you speak with an Auroran accent and were likewise attacked."

"Yes, Captain, but Lady Gladia spoke with an authentic Solarian accent and so she was recognized as human."

D.G. considered the matter silently for a while, then said, "That's a dangerous arrangement, even for those who would make use of it. If a Solarian, for any reason, at any time addressed such a robot in a way that the robot did not consider an authentic Solarian accent, that Solarian would be attacked at once. If I were a Solarian, I would be afraid to approach such a robot. My very effort to speak pure Solarian might very likely throw me off and get me killed."

"I agree, Captain: said Daneel, "and I would imagine that that is why those who manufacture robots do --not ordinarily limit the definition of a human being, but leave it as broad as possible. The Solarians, however, have left the planet. One might suppose that the fact that overseer robots have this dangerous programming is the best indication that the Solarians have really left and are not here to encounter the danger. The Solarians, it appears, are at this moment concerned only that no one who is not a Solarian be allowed to set foot on the planet."

"Not even other Spacers?"

"I would expect, Captain, that it would be difficult to define a human being in such a way as to include the dozen of different Spacer accents and yet exclude the scores of different Settler accents. Keying the definition to the distinctive Solarian accent alone would be difficult enough."

D.G. said, "You are very intelligent, Daneel. I disapprove of robots, of course, not in themselves but as an unsettling influence on society. And yet, with a robot such as yourself at my side, as you were once at the Ancestor's--"

Gladia interrupted. "I'm afraid not, D.G. Daneel will never be a gift, nor will he ever be sold, nor can he be easily taken by force."

D.G. lifted his hand in a smiling negative. "I was merely dreaming, Lady Gladia. I assure you that the laws of Baleyworld would make my possession of a robot unthinkable."

Giskard said suddenly, "May I have your permission, Captain, to add a few words?"

D.G. said, "Ah, the robot who managed to avoid the action and who returned when all was safely over."

"I regret that matters appear to be as you have stated. May I have your permission, Captain, to add a few words, notwithstanding?"

"Well, go on."

"It would seem, Captain, that your decision to bring the Lady Gladia with you on this expedition has worked out very well. Had she been absent and had you ventured on your exploratory mission with only members of the ship's crew as companions, you would all have been quickly killed and the ship destroyed. It was only Lady Gladia's ability to speak like a Solarian and her courage in facing the overseer that changed the outcome."

"Not so," said D.G., "for we would all have been destroyed, possibly even Lady Gladia, but for the fortuitous event that the overseer spontaneously inactivated."

"It was not fortuitous, Captain," said Giskard, "and it is extremely unlikely that any robot will inactivate spontaneously. There has to be a reason for inactivation and I can suggest one possibility. Lady Gladia ordered the robot to stop on several occasions, as friend Daneel has told me, but the instructions under which the overseer worked were more forceful.

"Nevertheless, Lady Gladia's actions served to blunt the overseer's resolution, Captain. The fact that Lady Gladia was an undoubted human being, even by the overseer's definition, and that she was acting in such a way as to make it necessary, perhaps, for the overseer to harm her--or even kill her--blunted it even farther. Thus, at the crucial moment, the two contrary requirements--having to destroy nonhuman beings and having to refrain from harming human beings--balanced and the robot froze, unable to do anything. Its circuits burned out."

Gladia's brows drew together in a puzzled frown. "But--" she began and then subsided.

Giskard went on, "It strikes me that it might be well for you to inform the crew of this. It might well ease their distrust of Lady Gladia if you stress what her initiative and courage have meant to every man in the crew, since it has kept them alive. It might also give them an excellent opinion of your own foresight in insisting on having her on board on this occasion, perhaps even against the advice of your own officers."

D.G. let loose a great shout of laughter. "Lady Gladia, I see now why you will not be separated from these robots. They are not only as intelligent as human beings, they are every bit as devious. I congratulate you on your having them.--and now, if you don't mind, I must hurry the crew. I don't want to stay on Solaria for one moment more than necessary. And I promise you that you won't be disturbed for hours. I know you can use freshening and rest as much as I can."

After he was gone, Gladia remained for a while in deep thought, then turned to Giskard and said in Auroran Common, a patter version of Galactic Standard that was widespread on Aurora and difficult for any non-Auroran to understand, "Giskard, what is all this nonsense about the burning out of circuits?"

"My lady," said Giskard, "I advanced it only as a possibility and nothing more. I thought it well to emphasize your role in putting an end to the overseer."

"But how could you think he would believe that a robot could burn out that easily?"

"He knows very little about robots, madam. He may traffic in them, but he is from a world that doesn't make use of them."

"Yet I know a great deal about them and so do you. The overseer showed no signs whatever of balancing circuits; no stuttering, no trembling, no behavior difficulty of any kind. It just--stopped."

Giskard said, "Madam since we do not know the precise specifications to which the overseer was designed, we may have to be content with ignorance as to the rationale behind the freeze. "

Gladia shook her head. "Just the same, it's puzzling."

PART III - BALEYWORLD

8. THE SETTLER WORLD

29.

D.G.'s ship was in space again, surrounded by the everlasting changelessness of the endless vacuum.

It had not come too soon for Gladia, who had but imperfectly suppressed the tension that arose from the possibility that a second overseer--with a second intensifier--might arrive without warning. The fact that it would be a quick death if it happened, an unexperienced death, was not quite satisfying. The tension had spoiled what would have otherwise been a luxuriant shower, along with various other forms of renewal of comfort.

It was not till after actual takeoff, after the coming of the soft, distant buzz of the protonic jets, that she could compose herself to sleep. Odd, she thought as consciousness began to slip away, that space should feel safer than the world of her youth, that she should leave Solaria with even greater relief the second time than she had the first.

But Solaria was no longer the world of her youth. It was a world without humanity, guarded over by distorted parodies of humanity; humanoid robots that made a mockery of the gentle Daneel and the thought-filled Giskard.

She slept at last--and while she slept, Daneel and Giskard, standing guard, could once more speak to each other.

Daneel said, "Friend Giskard, I am quite certain that it was you who destroyed the overseer."

"There was clearly no choice, friend Daneel. It was purely an accident that I arrived in time, for my senses were entirely occupied with searching out human beings and I found none. Nor would I have grasped the significance of events if it were not for Lady Gladia's rage and despair. It was that which I sensed at a distance and which caused me to race to the scene--barely in time. In that respect, Lady Gladia did save the situation, at least as far as the captain's existence and yours were concerned. I would still have saved the ship, I believe, even if I had arrived too late to save you." He paused a moment and added, "I would have found it most unsatisfactory, friend Daneel, to arrive too late to save you."

Daneel said, with a grave and formal tone of voice, "I thank you, friend Giskard. I am pleased that you were not inhibited by the human appearance of the overseer. That had slowed my reactions, as my appearance had slowed hers."

"Friend Daneel, her physical appearance meant nothing to me because I was aware of the pattern of her thoughts. That pattern was so limited and so entirely different from the full range of human patterns that there was no need for me to make any effort to

identify her in a positive manner. The negative identification as nonhuman was so clear I acted at once. I was not aware of my action, in fact, until after it had taken place."

"I had thought this, friend Giskard, but I wished confirmation lest I misunderstand. May I assume, then, that you feel no discomfort over having killed what was, in appearance, a human being?"

"None, since it was a robot."

"It seems to me that, had I succeeded in destroying her, I would have suffered some obstruction to the free positronic flow, no matter how thoroughly I understood her to be a robot. "

"The humanoid appearance, friend Daneel, cannot be fought off when that is all one can directly judge by. Seeing is so much more immediate than deducing. It was only because I could observe her mental structure and concentrate on that, that I could ignore her physical structure."

"How do you suppose the overseer would have felt if she had destroyed us, judging from her mental structure?"

"She was given exceedingly firm instructions and there was no doubt in her circuits that you and the captain were nonhuman by her definition."

"But she might have destroyed Madam Gladia as well."

"Of that we cannot be certain, friend Daneel."

"Had she done so, friend Giskard, would she have survived? Have you any way of telling?"

Giskard was silent for a considerable period. "I had insufficient time to study the mental pattern. I cannot say what her reaction might have been had she killed Madam Gladia."

"If I imagine myself in the place of the overseer" --Daneel's voice trembled and grew slightly lower in pitch --"it seems to me that I might kill a human being in order to save the life of another human being, whom, there might be some reason to think, it was more necessary to save. The action would, however, be difficult and damaging. To kill a human being merely in order to destroy something I considered nonhuman would be inconceivable."

"She merely threatened. She did not carry through the threat."

"Might she have, friend Giskard?"

"How can we say, since we don't know the nature of her instructions?"

"Could the instructions have so completely negated the First Law?"

Giskard said, "Your whole purpose in this discussion, I see, has been to raise this question. I advise you to go no further."

Daneel said stubbornly, "I will put it in the conditional, friend Giskard. Surely what may not be expressed as fact can be advanced as fantasy. If instructions could be hedged about with definitions and conditions, if the instructions could be made sufficiently detailed in a sufficiently forceful manner, might it be possible to kill a human being for a purpose less overwhelming than the saving of the life of another human being?"

Giskard said tonelessly, "I do not know, but I suspect that this might be possible."

"But, then, if your suspicion should be correct, that would imply that it was possible to neutralize the First Law under specialized conditions. The First Law, in that case, and, therefore, certainly the other Laws might be modified into almost nonexistence. The Laws, even the First Law, might not be an absolute then, but might be whatever those who design robots defined it to be."

Giskard said, "It is enough, friend Daneel. Go no further."

Daneel said, "There is one more step, friend Giskard. Partner Elijah would have taken that additional step."

"He was a human being. He could."

"I must try. If the Laws of Robotics--even the First Law--are not absolutes and if human beings can modify them, might it not be that perhaps, under proper conditions, we ourselves might mod--"

He stopped.

Giskard said faintly, "Go no further."

Daneel said, a slight hum obscuring his voice, "I go no further."

There was a silence for a long time. It was with difficulty that the positronic circuitry in each ceased undergoing discords.

Finally, Daneel said, "Another thought arises. The overseer was dangerous not only because of the set of her instructions but because of her appearance. It inhibited me and probably the captain and could mislead and deceive human beings generally, as I deceived, without meaning to, First-Class Shipper Niss. He clearly was not aware, at first, that I was a robot."

"And what follows from that, friend Daneel?"

"On Aurora, a number of humanoid robots were constructed at the Robotics Institute, under the leadership of Dr. Amadiro, after the designs of Dr. Fastolfe had been obtained."

"This is well known."

"What happened to those humanoid robots?"

"The project failed."

In his turn, Daneel said, "This is well known. But it does not answer the question. What happened to those humanoid robots?"

"One can assume they were destroyed."

"Such an assumption need not necessarily be correct. Were they, in actual fact, destroyed?"

"That would have been the sensible thing to do. What else with a failure?"

"How do we know the humanoid robots were a failure, except in that they were removed from sight?"

"Isn't that sufficient, if they were removed from sight and destroyed?"

"I did not say 'and destroyed,' friend Giskard. That is more than we know. We know only that they were removed from sight."

"Why should that be so, unless they were failures?"

"And if they were not failures, might there be no reason for their being removed from sight?"

"I can think of none, friend Daneel."

"Think again, friend Giskard. Remember, we are talking now of humanoid robots who, we now think, might from the mere fact of their humanoid nature be dangerous. It has seemed to us in our previous discussion that there was a plan on foot on Aurora to defeat the Settlers--drastically, surely, and at a blow. We decided that these plans must be centered on the planet Earth. Am I correct so far?"

"Yes, friend Daneel."

"Then might it not be that Dr. Amadiro is at the focus and center of this plan? His antipathy to Earth has been made plain these twenty decades. And if Dr. Amadiro has constructed a number of humanoid robots, where might these have been sent if they have disappeared from view? Remember that if Solarian roboticists can distort the Three Laws, Auroran roboticists can do the same."

"Are you suggesting, friend Daneel, that the humanoid robots have been sent to Earth?"

"Exactly. There to deceive the Earthpeople through their human appearance and to make possible whatever it is that Dr. Amadiro intends as his blow against Earth."

"You have no evidence for this."

"Yet it is possible. Consider for yourself the steps of the argument."

"If that were so, we would have to go to Earth. We would have to be there and somehow prevent the disaster."

"Yes, that is so."

"But we cannot go unless Lady Gladia goes and that is not likely."

"If you can influence the captain to take this ship to Earth, Madam Gladia would have no choice but to go as well."

Giskard said, "I cannot without harming him. He is firmly set on going to his own planet of Baleyworld. We must maneuver his trip to Earth--if we can--after he has done whatever he plans in Baleyworld."

"Afterward may be too late."

"I cannot help that. I must not harm a human being."

"If it is too late--Friend Giskard, consider what that would mean."

"I cannot consider what that would mean. I know only that I cannot harm a human being. "

"Then the First Law is not enough and we must--"

He could go no farther and both robots lapsed into helpless silence.

30.

Baleyworld came slowly into sharper view as the ship approached it. Gladia watched it intently in her cabin's viewer; it was the first time she had ever seen a Settler world.

She had protested this leg of the journey when she had first been made aware of it by D.G., but he shrugged it off with a small laugh. "What would you have, my lady? I must lug this weapon of your people"--he emphasized "your" slightly--"to my people. And I must report to them, too."

Gladia said coldly, "Your permission to take me along to Solaria was granted you by the Auroran Council on the condition that you bring me back."

"Actually that is not so, my lady. There may have been some informal understanding to that effect, but there is nothing in writing. No formal agreement."

"An informal understanding would bind me--or any civilized individual, D.G."

"I'm sure of that, Madam Gladia, but we Traders live by money and by written signatures on legal documents. I would never, under any circumstances, violate a written contract or refuse to do that for which I have accepted payment."

Gladia's chin turned upward. "Is that a hint that I must pay you in order to be taken home?"

"Madam!"

"Come, come, D.G. Don't waste mock indignation on me. If I am to be kept prisoner on your planet, say so and tell me why. Let me know exactly where I stand."

"You are not my prisoner and will not be. In fact, I will honor this unwritten understanding. I will take you home--eventually. First, however, I must go to Baleyworld and you must come with me."

"Why must I come with you?"

"The people of my world will want to see you. You are the heroine of Solaria. You saved us. You can't deprive them of a chance of shouting themselves hoarse for you. Besides, you were the good friend of the Ancestor."

"What do they know--or think they know--of that?" Gladia said sharply.

D.G. grinned. "Nothing to your discredit, I assure you. You are a legend and legends are larger than life--though I admit it would be easy for a legend to be larger than you, my lady--and a good deal nobler. Ordinarily, I wouldn't want you on the world because you couldn't live up to the legend. You're not tall enough, beautiful enough, majestic enough. But when the story of Solaria comes out, you will suddenly meet all requirements. In fact, they may not want to let you go. You must remember we are talking of Baleyworld, the planet on which the story of the Ancestor is taken more seriously than on any other--and you are part of the story."

"You are not to use that as an excuse to keep me in prison."

"I promise you I won't. And I promise I will get you home--when I can--when I can."

Gladia did not remain as indignant somehow as she felt she had every right to be. She did want to see what a Settler world was like and, after all, this was Elijah Baley's

peculiar world. His son had founded it. He himself had spent his last decades here. On Baleyworld, there would be remnants of him--the name of the planet, his descendants, his legend.

So she watched the planet--and thought of Elijah.

31.

The watching brought her little and she felt disappointed. There was not much to be seen through the cloud layer that covered the planet. From her relatively small experience as a space traveler it seemed to her that the cloud layer was denser than usual for inhabited planets. They would be landing within hours, now, and the signal light flashed and Gladia scrambled to push the HOLD button in answer. A few moments more and she pushed the ENTER button.

D.G. came in, smiling. "Inconvenient moment, my lady?"

"Not really," said Gladia. "Simply a matter of putting on my gloves and inserting my nose plugs. I suppose I should wear them all the time, but both grow tiresome and, for some reason, I grow less concerned about infection."

"Familiarity breeds contempt, my lady."

"Let's not call it contempt," said Gladia, who found herself smiling.

"Thank you," said D.G. "We'll be landing soon, madam, and I have brought you a coverall, carefully sterilized and placed inside this plastic bag so that it has since been untouched by Settler hands. It's simple to put on. You'll have no trouble and you '11 find it covers everything but the nose and eyes."

"Just for me, D.G.?"

"No, no, my lady. We all wear such things when outdoors at this season of the year. It is winter in our capital city at the present time and it is cold. We live on a rather cold world--heavy cloud cover, much precipitation, often snow."

"Even in the tropical regions?"

"No, there it tends to be hot and dry. The population clusters in the cooler regions, however. We rather like it. It's bracing and stimulating. The seas, which were seeded with Earth species of life, are fertile, so that fish and other creatures have multiplied abundantly. There's no food shortage, consequently, even though land agriculture is limited and we'll never be the breadbasket of the Galaxy. --The summers are short but quite hot and the beaches are then well populated, although you might find them uninteresting since we have a strong nudity taboo."

"It seems like peculiar weather."

"A matter of land-sea distribution, a planetary orbit that is a bit more eccentric than most, and a few other things. Frankly, I don't bother with it." He shrugged. "It's not my field of interest."

"You're a Trader. I imagine you're not on the planet often. "

"True, but I'm not a Trader in order to escape. I like it here. And yet perhaps I would like it less if I were here more. If we look at it that way, Baleyworld's harsh conditions serve an important purpose. They encourage trading. Baleyworld produces men who scour the seas for food and there's a certain similarity between sailing the seas and sailing through space. I would say fully a third of all the Traders plying the space lanes are Baleypeople."

"You seem in a semimanic state, D.G.," said Gladia.

"Do I? I think of myself right now as being in a good humor. I have reason to be. So have you."

"Oh?"

"It's obvious, isn't it? We got off Solaria alive. We know exactly what the Solarian danger is. We've gained control of an unusual weapon that should interest OUT military. And you will be the heroine of Baleyworld. The world officials already know the outline of events and are eager to greet you. For that matter, you're the heroine of this ship. Almost every man on board volunteered to bring you this coverall. They are all anxious to get close and bathe in your aura, so to speak."

"Quite a change," said Gladia dryly.

"Absolutely. Niss--the crewman whom your Daneel chastised--"

"I remember well, D.G."

"He is anxious to apologize to you. And bring his four mates so that they, too, might apologize. And to kick, in your presence, the one of them who made an improper suggestion. He is not a bad person, my lady."

"I am certain he isn't. Assure him he is forgiven and the incident forgotten. And if you'll arrange matters, I will--will shake hands with him and perhaps some of the others before debarking. But you mustn't let them crowd about me."

"I understand, but I can't guarantee there won't be a certain amount of crowding in Baleytown--that's the capital city of Baleyworld. There's no way of stopping various government officials from trying to gain political advantage by being seen with you, while grinning away and bowing."

"Jehoshaphat! As your Ancestor would say."

"Don't say that once we land, madam. It's an expression reserved for him. It is considered bad taste for anyone else to say it. --There'll be speeches and cheering and all kinds of meaningless formalities. I'm sorry, my lady."

She said thoughtfully, "I could do without it, but I suppose there's no way of stopping it."

"No way, my lady."

"How long will it continue?"

"Till they get tired. Several days, perhaps, but there'll be a certain variety to it."

"And how long do we stay on the planet?"

"Till I get tired. I'm sorry, my lady, but I have much to do--places to go--friends to see--"

"Women to make love to."

"Alas for human frailty," said D.G., grinning broadly.

"You're doing everything but slobber."

"A weakness. I can't bring myself to slobber."

Gladia smiled. "You're not totally committed to sanity, are you?"

"I never claimed to be. But, leaving that aside, I also have to consider such dull matters as the fact that my officers and crew would want to see their families and friends, catch up on their sleep, and have a little planetside fun. --and if you want to consider the feelings of inanimate objects, the ship will have to be repaired, refurbished, refreshed, and refueled. Little things like that."

"How long will all those little things take?"

"It could be months. Who knows?"

"And what do I do meanwhile?"

"You could see our world, broaden your horizons."

"But your world is not exactly the playground of the Galaxy. "

"Too true, but we'll try to keep you interested." He looked at his watch. "One more warning, madam. Do not refer to your age."

"What cause would I have to do that?"

"It might show up in some casual reference. You'll be expected to say a few words and you might say, for instance, 'In all my more than twenty-three decades of life, I have never been so glad to see anyone as I am to see the people of Baleyworld.' If you're tempted to say anything like that initial clause, resist it. "

"I will. I have no intention of indulging in hyperbole in any case. --But, as a matter of idle curiosity, why not?"

"Simply because it is better for them not to know your age. "

"But they do know my age, don't they? They know I was your Ancestor's friend and they know how long ago he lived. Or are they under the impression"--she looked at him narrowly --"that I'm a distant descendant of the Gladia?"

"No, no, they know who you are and how old you are, but they know it only with their heads"--he tapped his forehead--"and few people have working heads, as you may have noticed."

"Yes, I have. Even on Aurora."

"That's good. I wouldn't want the Settlers to be special in this respect. Well, then, you have the appearance of" --he paused judiciously--"forty, maybe forty-five, and they'll accept you as that in their guts, which is where the average person's real thinking mechanism is located. If you don't rub it in about your real age."

"Does it really make a difference?"

"Does it? Look, the average Settler really doesn't want robots. He has no liking for robots, no desire for robots. There we are satisfied to differ from the Spacers. Long life is different. Forty decades is considerably more than ten. "

"Few of us actually reach the forty-decade mark."

"And few of us actually reach the ten-decade mark. We teach the advantage of short life-quality versus quantity, evolutionary speed, ever-changing world--but nothing

really makes people happy about living ten decades when they imagine they could live forty, so past a point the propaganda produces a backlash and it's best to keep quiet about it. They don't often see Spacers, as you can imagine, and so they don't have occasion to grind their teeth over the fact that Spacers look young and vigorous even when they are twice as old as the oldest Settler who ever lived. They'll see that in you and if they think about it, it will unsettle them."

Gladia said bitterly, "Would you like to have me make a speech and tell them exactly what forty decades means? Shall I tell them for how many years one outlives the springtime of hope, to say nothing of friends and acquaintances. Shall I tell them of the meaninglessness of children and family; of the endless comings and goings of one husband after another, of the misty blurring of the informal matings between and alongside; of the coming of the time when you've seen all you want to see, and heard all you want to hear, and find it impossible to think a new thought, of how you forget what excitement and discovery are all about, and learn each year how much more intense boredom can become?"

"Baleypeople wouldn't believe that. I don't think I do. Is that the way all Spacers feel or are you making it up?"

"I only know for certain how I myself feel, but I've watched others dim as they aged; I've watched their dispositions sour, and their ambitions narrow, and their indifferences broaden."

D.G.'s lips pressed together and he looked somber. "Is the suicide rate high among Spacers? I've never heard that it is."

"It's virtually zero."

"But that doesn't fit what you're saying."

"Consider! We're surrounded by robots who are dedicated to keeping us alive. There's no way we can kill ourselves when our sharp-eyed and active robots are forever about us. I doubt that any of us would even think of trying. I wouldn't dream of it myself, if only because I can't bear the thought of what it would mean to all my household robots and, even more so, to Daneel and Giskard."

"They're not really alive, you know. They don't have feelings."

Gladia shook her head. "You say that only because you've never lived with them. -- In any case, I think you overestimate the longing for prolonged life among your people. You know my age, you look at my appearance, yet it doesn't bother you."

"Because I'm convinced that the Spacer worlds must dwindle and die, that it is the Settler worlds that are the hope of humanity's future, and that it is our short-lived characteristic that ensures it. Listening to what you've just said, assuming it is all true, makes me the more certain."

"Don't be too sure. You may develop your own insuperable problems--if you haven't already."

"That is undoubtedly possible, my lady, but for now I must leave you. The ship is coasting in for a landing and I must stare intelligently at the computer that controls it or no one will believe that I am the captain."

He left and she remained in gloomy abstraction for a while, her fingers plucking at the plastic that enclosed the coverall.

She had come to a sense of equilibrium on Aurora, a way of allowing life to pass quietly. Meal by meal, day by day, season by season, it had been passing and the quiet had insulated her, almost, from the tedious waiting for the only adventure that remained, the final one of death.

And now she had been to Solaria and had awakened the memories of a childhood that had long passed on a world that had long passed, so that the quiet had been shattered--perhaps forever--and so that she now lay uncovered and bare to the horror of continuing life.

What could substitute for the vanished quiet?

She caught Giskard's dimly glowing eyes upon her and she said, "Help me on with this, Giskard."

32.

It was cold. The sky was gray with clouds and the air glittered with a very light snowfall. Patches of powdery snow were swirling in the fresh breeze and off beyond the landing field Gladia could see distant heaps of snow.

There were crowds of people gathered here and there, held off by barriers from approaching too closely. They were all wearing coveralls of different types and colors and they all seemed to balloon outward, turning humanity into a crowd of shapeless objects with eyes. Some were wearing visors that glittered transparently over their faces.

Gladia pressed her mittened hand to her face. Except for her nose, she felt warm enough. The coverall did more than insulate; it seemed to exude warmth of its own.

She looked behind her. Daneel and Giskard were within reach, each in a coverall.

She had protested that at first. "They don't need coveralls. They're not sensitive to cold."

"I'm sure they're not," D.G. had said, "but you say you won't go anywhere without them and we can't very well have Daneel sitting there exposed to the cold. It would seem against nature. Nor do we wish to arouse hostility by making it too clear you have robots."

"They must know I've got robots with me and Giskard's face will give him away--even in a coverall."

"They might know," said D.G., "but the chances are they won't think about it if they're not forced to--so let's not force it."

Now D.G. was motioning her into a ground-car that had a transparent roof and sides. "They'll want to see you as we travel, my lady," he said, smiling.

Gladia seated herself at one side and D.G. followed on the other. "I'm co-hero," he said,

"Do you value that?"

"Oh, yes. It means a bonus for my crew and a possible promotion for me. I don't scorn that."

Daneel and Giskard entered, too, and sat down in seats that faced the two human beings. Daneel faced Gladia; Giskard faced D.G.

There was a ground-car before them, without transparency, and a line of about a dozen behind them. There was the sound of cheering and a forest of arm-waving from the assembled crowd. D.G. smiled and lifted an arm in response and motioned to Gladia to do the same. She waved in a perfunctory manner. It was warm inside the car and her nose had lost its numbness.

She said, "There's a rather unpleasant glitter to these windows. Can that be removed?"

"Undoubtedly, but it won't be," said D.G. "That's as unobtrusive a force field as we can set up. Those are enthusiastic people out there and they've been searched, but someone may have managed to conceal a weapon and we don't want you hurt."

"You mean someone might try to kill me?"

(Daneel's eyes were calmly scanning the crowd to one side of the car; Giskard's scanned the other side.)

"Very unlikely, my lady, but you're a Spacer and Settlers don't like Spacers. A few might hate them with such a surpassing hatred as to see only the Spacerness in you. --but don't worry. Even if someone were to try--which is, as I say, unlikely--they won't succeed."

The line of cars began to move, all together and very smoothly.

Gladia half-rose in astonishment. There was no one in front of the partition that closed them off. "Who's driving?" she asked.

"The cars are thoroughly computerized," said D.G. "I take it that Spacer cars are not?"

"We have robots to drive them."

D.G. continued waving and Gladia followed his lead automatically. "We don't," he said.

"But a computer is essentially the same as a robot. "

"A computer is not humanoid and it does not obtrude itself on one's notice. Whatever the technological similarities might be, they are worlds apart psychologically."

Gladia watched the countryside and found it oppressively barren. Even allowing for winter, there was something desolate in the scattering of leafless bushes and in the sparsely distributed trees, whose stunted and dispirited appearance emphasized the death that seemed to grip everything.

D.G., noting her depression and correlating it with her darting glances here and there, said, "It doesn't look like much now, my lady. In the summer, though, it's not bad. There are grassy plains, orchards, grain fields--"

"Forests?"

"Not wilderness forests. We're still a growing world. It's still being molded. We've only had a little over a century and a half, really. The first step was to cultivate home plots for the initial Settlers, using imported seed. Then we placed fish and invertebrates of all

kinds in the ocean, doing our best to establish a self-supporting ecology. That is a fairly easy procedure--if the ocean chemistry is suitable. If it isn't, then the planet is not habitable without extensive chemical modification and that has never been tried in actuality, though there are all sorts of plans for such procedures. --Finally, we try to make the land flourish, which is always difficult, always slow."

"Have all the Settler worlds followed that path?"

"Are following. None are really finished. Baleyworld is the oldest and we're not finished. Given another couple of centuries, the Settler worlds will be rich and full of life--land as well as sea--though by that time there will be many still-newer worlds that will be working their way through various preliminary stages. I'm sure the Spacer worlds went through the same procedure."

"Many centuries ago--and less strenuously, I think. We had robots to help."

"We'll manage," said D.G. briefly.

"And what about the native life--the plants and animals that evolved on this world before human beings arrived?"

D.G. shrugged. "Insignificant. Small, feeble things. The scientists are of course, interested, so the indigenous life still exists in special aquaria, botanical gardens, zoos. There are out-of-the-way bodies of water and considerable stretches of land area that have not yet been converted. Some indigenous life still lives out there in the wild."

"But these stretches of wilderness will eventually all be converted. "

"We hope so."

"Don't you feel that the planet really belongs to these insignificant, small, feeble things?"

"No. I'm not that sentimental. The planet and the whole Universe belongs to intelligence. The Spacers agree with that. Where is the indigenous life of Solaria? Or of Aurora?"

The line of cars, which had been progressing tortuously from the spaceport, now came to a flat, paved area on which several low, domed buildings were evident.

"Capital Plaza," said D.G. in a low voice. "This is the official heartbeat of the planet. Government offices are located here, the Planetary Congress meets here, the Executive Mansion is found here, and so on."

"I'm sorry, D.G., but this is not very impressive. These are small and uninteresting buildings."

D.G. smiled. "You see only an occasional top, my lady. The buildings themselves are located underground--all interconnected. It's a single complex, really, and is still growing. It's a self-contained city, you know. It, along with the surrounding residential areas, makes up Baleytown."

"Do you plan to have everything underground eventually? The whole city? The whole world?"

"Most of us look forward to an underground world, yes."

"They have underground Cities on Earth, I understand. "

"Indeed they do, my lady. The so-called Caves of Steel. "

"You imitate that here, then?"

"It's not simple imitation. We add our own ideas and--We're coming to a halt, my lady, and any moment we'll be asked to step out. I'd cling to the coverall openings if I were you. The whistling wind on the Plaza in winter is legendary."

Gladia did so, fumbling rather as she tried to put the edges of the openings together. "It's not simple imitation, you say."

"No. We design our underground with the weather in mind. Since our weather is, on the whole, harsher than Earth's, some modification in architecture is required. Properly built, almost no energy is required to keep the complex warm in winter and cool in summer. In a way, indeed, we keep warm in winter, in part, with the stored warmth of the previous summer and cool in summer with the coolness of the previous winter."

"What about ventilation?"

"That uses up some of the savings, but not all. It works, my lady, and someday we will match Earth's structures. That, of course, is the ultimate ambition--to make Baleyworld a reflection of Earth. "

"I never knew that Earth was so admirable as to make imitation desirable," said Gladia lightly.

D.G. turned his eyes on her sharply. "Make no jokes of that sort, my lady, while you are with Settlers--not even with me. Earth is no joking matter."

Gladia said, "I'm sorry, D.G. I meant no disrespect."

"You didn't know. But now you know. Come, let's get out."

The side door of the car slid open noiselessly and D.G. turned in his seat and stepped out. He then held out one hand to help Gladia and said, "You'll be addressing the Planetary Congress, you know, and every government official who can squeeze in will do so."

Gladia, who had stretched out her hand to seize D.G.'s and who already felt--painfully--the cold wind on her face, shrank back suddenly. "I must make an address? I hadn't been told that."

D.G. looked surprised. "I rather thought you would take something of the sort for granted."

"Well, I didn't. And I can't make an address. I've never done such a thing."

"You must. It's nothing terrible. It's just a matter of saying a few words after some long and boring speeches of welcome."

"But what can I possibly say?"

"Nothing fancy, I assure you. Just peace and love and blah--Give them half a minute's worth. I'll scrawl out something for you if you wish."

And Gladia stepped out of the car and her robots followed her. Her mind was in a whirl.

9. THE SPEECH

33.

As they walked into the building, they removed their coveralls and handed them to attendants. Daneel and Giskard removed theirs, too, and the attendants cast sharp glances at the latter, approaching him gingerly.

Gladia adjusted her nose plugs nervously. She had never before been in the presence of large crowds of short-lived human beings--short-lived in part, she knew (or had always been told), because they carried in their bodies chronic infections and hordes of parasites.

She whispered, "Will I get back my own coverall?"

"You will wear no one else's," said D.G. "They will be kept safe and radiation-sterilized."

Gladia looked about cautiously. Somehow she felt that even optical contact might be dangerous.

"Who are those people?" She indicated several people who wore brightly colored clothing and were obviously armed.

"Security guards, madam," said D.G.

"Even here? In a government building?"

"Absolutely. And when we're on the platform, there will be a force-field curtain dividing us from the audience."

"Don't you trust your own legislature?"

D.G. half-smiled. "Not entirely. This is a raw world still and we go our own ways. We haven't had all the edges knocked off and we don't have robots watching over us. Then, too, we've got militant minority parties; we've got our war hawks."

"What are war hawks?"

Most of the Baleyworlders had their coveralls removed now and were helping themselves to drinks. There was a buzz of conversation in the air and many people stared at Gladia, but no one came over to speak to her. Indeed, it was clear to Gladia that there was a circle of avoidance about her.

D.G. noticed her glance from side to side and interpreted it correctly. "They've been told," he said, "that you would appreciate a little elbow room. I think they understand your fear of infection."

"They don't find it insulting, I hope."

"They may, but you've got something that is clearly a robot with you and most Baleyworlders don't want that kind of infection. The war hawks, particularly."

"You haven't told me what they are. "

"I will if there's time. You and I and others on the platform will have to move in a little while. --Most Settlers think that, in time, the Galaxy will be theirs, that the Spacers cannot and will not compete successfully in the race for expansion. We also know it will

take time. We won't see it. Our children probably won't. It may take a thousand years, for all we know. The war hawks don't want to wait. They want it settled now."

"They want war?"

"They don't say that, precisely. And they don't call themselves war hawks. That's what we sensible people call them. They call themselves Earth Supremacists. After all, it's hard to argue with people who announce they are in favor of Earth being supreme. We all favor that, but most of us don't necessarily expect it to happen tomorrow and are not ferociously upset that it won't. "

"And these war hawks may attack me? Physically?"

D.G. gestured for her to move forward. "I think we'll have to get moving, madam. They're getting us into line. --No, I don't think you'll really be attacked, but it's always best to be cautious. "

Gladia held back as D.G. indicated her place in line.

"Not without Daneel and Giskard, D.G. I'm still not going anywhere without them. Not even onto the platform. Not after what you just told me about the war hawks."

"You're asking a lot, my lady."

"On the contrary, D.G. I'm not asking for anything. Take me home right now--with my robots."

Gladia watched tensely as D.G. approached a small group of officials. He made a half-bow, arms in downward-pointing diagonals. It was what Gladia suspected to be a Baleyworlder gesture of respect.

She did not hear what D.G. was saying, but a painful and quite involuntary fantasy passed through her mind. If there was any attempt to separate her from her robots against her will, Daneel and Giskard would surely do what they could to prevent it. They would move too quickly and precisely to really hurt anyone--but the security guards would use their weapons at once.

She would have to prevent that at all costs--pretend she was separating from Daneel and Giskard voluntarily and ask them to wait behind for her. How could she do that? She had never been entirely without robots in her life. How could she feel safe without them? And yet what other way out of the dilemma offered itself?

D.G. returned. "Your status as heroine, my lady, is a useful bargaining chip. And, of course, I am a persuasive fellow. Your robots may go with you. They will sit on the platform behind you, but there will be no spotlight upon them. And, for the sake of the Ancestor, my lady, don't call attention to them. Don't even look at them. "

Gladia sighed with relief. "You're a good fellow, D.G.," she said shakily. "Thank you."

She took her place near the head of the line, D.G. at her left, Daneel and Giskard behind her, and behind them a long tail of officials of both sexes.

A woman Settler, carrying a staff that seemed to be a symbol of office, having surveyed the line carefully, nodded, moved forward to the head of the line, then walked on. Everyone followed.

Gladia became aware of music in simple and rather repetitive march rhythm up ahead and wondered if she were supposed to march in some choreographed fashion. (Customs vary infinitely and irrationally from world to world, she told herself.)

Looking out of the corner of her eye, she noticed D.G. ambling forward in an indifferent way. He was almost slouching. She pursed her lips disapprovingly and walked rhythmically, head erect, spine stiff. In the absence of direction, she was going to march the way she wanted to.

They came out upon a stage and, as they did so, chairs rose smoothly from recesses in the floor. The line split up, but D.G. caught her sleeve lightly and she accompanied him. The two robots followed her.

She stood in front of the seat that D.G. quietly pointed to. The music grew loud, but the light was not quite as bright as it had been. And then, after what seemed an almost interminable wait, she felt D.G.'s touch pressing lightly downward. She sat and so did they all.

She was aware of the faint shimmer of the force-field curtain and beyond that an audience of several thousand. Every seat was filled in an amphitheater that sloped steeply upward. All were dressed in dull colors, browns and blacks, both sexes alike (as nearly as she could tell them apart). The security guards in the aisles stood out in their green and crimson uniforms. No doubt it lent them instant recognition. (Though, Gladia thought, it must make them instant targets as well.)

She turned to D.G. and said in a low voice, "You people have an enormous legislature."

D.G. shrugged slightly. "I think everyone in the governmental apparatus is here, with mates and guests. A tribute to your popularity, my lady."

She cast a glance over the audience from right to left and back and tried at the extreme of the arc to catch sight, out of the corner of her eye, of either Daneel or Giskard--just to be sure they were there. And then she thought, rebelliously, that nothing would happen because of a quick glance and deliberately turned her head. They were there. She also caught D.G. rolling his eyes upward in exasperation.

She started suddenly as a spotlight fell upon one of the persons on the stage, while the rest of the room dimmed further into shadowy insubstantiality.

The spotlighted figure rose and began to speak. His voice was not terribly loud, but Gladia could hear a very faint reverberation bouncing back from the far walls. It must penetrate every cranny of the large hall, she thought. Was it some form of amplification by a device so unobtrusive that she did not see it or was there a particularly clever acoustical shape to the hall? She did not know, but she encouraged her puzzled speculation to continue, for it relieved her, for a while, of the necessity of having to listen to what was being said.

At one point she heard a soft call of "Quackenbush" from some undetermined point in the audience. But for the perfect acoustics (if that was what it was), it would probably have gone unheard.

The word meant nothing to her, but from the soft, brief titter of laughter that swept the audience, she suspected it was a vulgarism. The sound quenched itself almost at once and Gladia rather admired the depth of the silence that followed.

Perhaps if the room were so perfectly acoustic that every sound could be heard, the audience had to be silent or the noise and confusion would be intolerable. Then, once the custom of silence was established and audience noise became a taboo, anything but silence would become unthinkable. --Except where the impulse to mutter "Quackenbush" became irresistible, she supposed.

Gladia realized that her thinking was growing muddy and her eyes were closing. She sat upright with a small jerk. The people of the planet were trying to honor her and if she fell asleep during the proceedings, that would surely be an intolerable insult. She tried to keep herself awake by listening, but that seemed to make her sleepier. She bit the inside of her cheeks instead and breathed deeply.

Three officials spoke, one after the other, with semimerciful semibrevity, and then Gladia jolted wide awake (Had she been actually dozing despite all her efforts--with thousands of pairs of eyes on her?) as the spotlight fell just to her left and D.G. rose to speak, standing in front of his chair.

He seemed completely at ease, with his thumbs hooked in his belt.

"Men and women of Baleyworld," he began. "Officials, lawgivers, honored leaders, and fellow planetfolk, you have heard something of what happened on Solaria. You know that we were completely successful. You know that Lady Gladia of Aurora contributed to that success. It is time now to present some of the details to you and to all my fellow planetfolk who are watching on hypervision."

He proceeded to describe the events in modified form and Gladia found herself dryly amused at the nature of the modifications. He passed over his own discomfiture at the hands of a humanoid robot lightly. Giskard was never mentioned; Daneel's role was minimized; and Gladia's heavily emphasized. The incident became a duel between two women--Gladia and Landaree--and it was the courage and sense of authority of Gladia that had won out.

Finally, D.G. said, "And now Lady Gladia, Solarian by birth, Auroran by citizenship, but Baleyworlder by deed--" (There was strong applause at the last, the loudest Gladia had yet heard, for the earlier speakers had been but tepidly received.)

D.G. raised his hands for silence and it came at once. He then concluded, "--will now address you."

Gladia found the spotlight on herself and turned to D.G. in sudden panic. There was applause in her ears and D.G., too, was clapping his hands. Under the cover of the applause, he leaned toward her and whispered, "You love them all, you want peace, and since you're not a legislator, you're unused to long speeches of small content. Say that, then sit down."

She looked at him uncomprehendingly, far too nervous to have heard what he said.

She rose and found herself staring at endless tiers of people.

Gladia felt very small (not for the first time in her life, to be sure) as she faced the stage. The men on the stage were all taller than she was and so were the other three women. She felt that even though they were all sitting and she was standing, they still towered over her. As for the audience, which was waiting now in almost menacing silence, those who composed it were, she felt quite certain, one and all larger than her in every dimension.

She took a deep breath and said, "Friends--" but it came out in a thin, breathless whistle. She cleared her throat (in what seemed a thunderous rasp) and tried again.

"Friends!" This time there was a certain normality to the sound. "You are all descended from Earthpeople, every one of you. I am descended from Earthpeople. There are no human beings anywhere on all the inhabited worlds--whether Spacer worlds, Settler worlds, or Earth itself--that are not either Earthpeople by birth or Earthpeople by descent.

All other differences fade to nothing in the face of that enormous fact."

Her eyes flickered leftward to look at D.G. and she found that he was smiling very slightly and that one eyelid trembled as though it were about to wink.

She went on. "That should be our guide in every thought and act. I thank you all for thinking of me as a fellow human being and for welcoming me among you without regard to any other classification in which you might have been tempted to place me. Because of that, and in the hope that the day will soon come when sixteen billion human beings, living in love and peace, will consider themselves as just that and nothing more--or less--I think of you not merely as friends but as kinsmen and kinswomen."

There was an outbreak of applause that thundered in upon her and Gladia half-closed her eyes in relief. She remained standing to let it continue and bathe her in its welcome indication that she had spoken well and--what was more--enough. When it began to fade, she smiled, bowed to right and left, and began to sit down.

And then a voice came out of the audience. "Why don't you speak in Solarian?" She froze halfway to her seat and looked, in shock, at D.G.

He shook his head slightly and mouthed soundlessly: "Ignore it." He gestured as unobtrusively as possible that she seat herself.

She stared at him for a second or two, then realized what an ungainly sight she must present, with her posterior protruding in the unfinished process of seating herself. She straightened at once and flashed a smile at the audience as she turned her head slowly from side to side. For the first time she became aware of objects in the rear whose glistening lenses focused upon her.

Of course! D.G. had mentioned that the proceedings were being watched via hyperwave. Yet it scarcely seemed to matter now. She had spoken and had been applauded and she was facing the audience she could see, erect and without nervousness. What could the unseen addition matter?

She said, still smiling, "I consider that a friendly question. You want me to show you my accomplishments. How many want me to speak as a Solarian might? Don't hesitate. Raise your right hands."

A few right arms went up.

Gladia said, "The humanoid robot on Solaria heard me speak Solarian. That was what defeated it in the end. Come--let me see everyone who would like a demonstration."

More right arms went up and, in a moment, the audience became a sea of upraised arms. Gladia felt a hand tweaking at her pants leg and, with a rapid movement, she brushed it away.

"Very well. You may lower your arms now, kinsmen and kinswomen. Understand that what I speak now is Galactic Standard, which is your language, too. I, however, am speaking it as an Auroran would and I know you all understand me even though the way I pronounce my words may well strike you as amusing and my choice of words may on occasion puzzle you a bit. You'll notice that my way of speaking has notes to it and goes up and down--almost as though I were singing my words. This always sounds ridiculous to anyone not an Auroran, even to other Spacers.

"On the other hand, if I slip into the Solarian way of speaking as I am now doing, you will notice at once that the notes stop and that it becomes throaty with 'r's' that just about neverrr let go--especially if therre is no 'rrrrr' anywherrre on the vocal panoramarrrrr."

There was a burst of laughter from the audience and Gladia confronted it with a serious expression on her face. Finally, she held up her arms and made a cutting movement downward and outward and the laughter stopped.

"However," she said, "I will probably never go to Solaria again, so I will have no occasion to use the Solarian dialect any further. And the good Captain Baley"--she turned and made a half-bow in his direction, noting that there was a distinct outbreak of perspiration on his brow--"informs me there is no telling when I'll be going back to Aurora, so I may have to drop the Auroran dialect as well. My only choice, then, will be to speak the Baleyworld dialect, which I shall at once begin to practice. "

She hooked the fingers of each hand into an invisible belt, stretched her chest outward, pulled her chin downward, put on D.G.'s unself-conscious grin, and said, in a gravelly attempt at baritone, "Men and women of Baleyworld, officials, lawgivers, honored leaders, and fellow planetfolk--and that should include everyone, except, perhaps, dishonored leaders--" She did her best to include the glottal stops and the flat "a's" and carefully pronounced the "h" of "honored" and "dishonored" in what was almost a gasp.

The laughter was still louder this time and more prolonged and Gladia allowed herself to smile and to wait calmly while it went on and on. After all, she was persuading them to laugh at themselves.

And when things were quiet again, she said simply, in an unexaggerated version of the Auroran dialect, "Every dialect is amusing--or peculiar--to those who are not

accustomed to it and it tends to mark off human beings into separate--and frequently mutually unfriendly--groups. Dialects, however, are only languages of the tongue. Instead of those, you and I and every other human being on every inhabited world should listen to the language of the heart and there are no dialects to that. That language--if we will only listen--rings out the same in all of us."

That was it. She was ready to sit down again, but another question sounded. It was a woman's voice this time.

"How old are you?"

Now D.G. forced a low growl between his teeth. "Sit down, madam! Ignore the question."

Gladia turned to face D.G. He had half-risen. The others on the stage, as nearly as she could see them in the dimness outside the spotlight, were tensely leaning toward her.

She turned back to the audience and cried out ringingly, "The people here on the stage want me to sit down. How many of you out there want me to sit down? --I find you are silent. --How many want me to stand here and answer the question honestly?"

There was sharp applause and cries of "Answer! Answer!"

Gladia said, "The voice of the people! I'm sorry, D.G. and all the rest of you, but I am commanded to speak."

She looked up at the spotlight, squinting, and shouted, "I don't know who controls the lights, but light the auditorium and turn off the spotlight. I don't care what it does to the hyperwave cameras. Just make sure the sound is going out accurately. No one will care if I look dim, as long as they can hear me. Right?"

"Right!" came the multivoiced answer. Then "Lights! Lights!"

Someone on the stage signaled in a distraught manner and the audience was bathed in light.

"Much better," said Gladia. "Now I can see you all, my kinspeople. I would like, particularly, to see the woman who asked the question, the one who wants to know my age. I would like to speak to her directly. Don't be backward or shy. If you have the courage to ask the question, you should have the courage to ask it openly."

She waited and finally a woman rose in the middle distance. Her dark hair was pulled back tightly, the color of her skin was a light brown, and her clothing, worn tightly to emphasize a slim figure, was in shades of darker brown.

She said, just a bit stridently, "I'm not afraid to stand up. And I'm not afraid to ask the question again. How old are you?"

Gladia faced her calmly and found herself even welcoming the confrontation. (How was this possible? Throughout her first three decades, she had been carefully trained to find the real presence of even one human being intolerable. Now look at her--facing thousands without a tremble. She was vaguely astonished and entirely pleased.)

Gladia said, "Please remain standing, madam, and let us talk together. How shall we measure age? In elapsed years since birth?"

The woman said with composure, "My name is Sindra Lambid. I'm a member of the legislature and therefore one of Captain Baley's 'lawgivers' and 'honored leaders.' I

hope 'honored,' at any rate." (There was a ripple of laughter as the audience seemed to grow increasingly good-natured.) "To answer your question, I think that the number of Galactic Standard Years that have elapsed since birth is the usual definition of a person's age. Thus, I am fifty-four years old. How old are you? How about just giving us a figure?"

"I will do so. Since my birth, two hundred and thirty-three Galactic Standard Years have come and gone, so that I am over twenty-three decades old--or a little more than four times as old as you are." Gladia held herself straight and she knew that her small, slim figure and the dim light made her look extraordinarily childlike at that moment.

There was a confused babble from the audience and something of a groan from her left. A quick glance in that direction showed her that D.G. had his hand to his forehead.

Gladia said, "But that is an entirely passive way of measuring time lapse. It is a measure of quantity that takes no account of quality. My life has been spent quietly, one might say dully. I have drifted through a set routine, shielded from all untoward events by a smoothly functioning social system that left no room for either change or experimentation and by my robots, who stood between me and misadventure of any kind.

"Only twice in my life have I experienced the breath of excitement and both times tragedy was involved. When I was thirty-three, younger in years than many of you who are now listening to me, there was a time--not a long one--during which a murder accusation hung over me. Two years later, there was another period of time--not long--during which I was involved in another murder. On both those occasions, Plainclothesman Elijah Baley was at my side. I believe most of you--or perhaps all of you--are familiar with the story as given in the account written by Elijah Baley's son.

"I should now add a third occasion for, this last month, I have faced a great deal of excitement, reaching its climax with my being required to stand up before you all, something which is entirely different from anything I have ever done in all my long life. And I must admit it is only your own good nature and kind acceptance of me that makes it possible.

"Consider, each of you, the contrast of all this with your own lives. You are pioneers and you live on a pioneer world. This world has been growing all your lives and will continue to grow. This world is anything but settled down and each day is--and must be--an adventure. The very climate is an adventure. You have first cold, then heat, then cold again. It is a climate rich in wind and storms and sudden change. At no time can you sit back and let time pass drowsily in a world that changes gently or not at all.

"Many Baleyworlders are Traders or can choose to be Traders and can then spend half their time scouring the space lanes. And if ever this world grows tame, many of its inhabitants can choose to transfer their sphere of activities to another less-developed world or join an expedition that will find a suitable world that has not yet felt the step of human beings and take their share in shaping it and seeding it and making it fit for human occupancy.

"Measure the length of life by events and deeds, accomplishments and excitements, and I am a child, younger than any of you. The large number of my years has served merely to bore and weary me; the smaller number of yours to enrich and excite you. --So tell me again, Madam Lambid, how old are you?"

Lambid smiled. "Fifty-four good years, Madam Gladia. "

She sat down and again the applause welled up and continued. Under cover of that, D.G. said hoarsely, "Lady Gladia, who taught you how to handle an audience like this?"

"No one," she whispered back. "I never tried before."

"But quit while you're ahead. The person now getting to his feet is our leading war hawk. There's no need to face him. Say you are tired and sit down. We will tackle Old Man Bistervan ourselves."

"But I'm not tired," said Gladia. "I'm enjoying myself."

The man now facing her from her extreme right but rather near the stage was a tall, vigorous man with shaggy white eyebrows hanging over his eyes. His thinning hair was also white and his garments were a somber black, relieved by a white stripe running down each sleeve and trouser leg, as though setting sharp limits to his body.

His voice was deep and musical. "My name," he said, "is Tomas Bistervan and I'm known to many as the Old Man, largely, I think, because they wish I were and that I would not delay too long in dying. I do not know how to address you because you do not seem to have a family name and because I do not know you well enough to use your given name. To be honest, I do not wish to know you that well.

"Apparently, you helped save a Baleyworld ship on your world against the booby traps and weapons set up by your people and we are thanking you for that. In return, you have delivered some pious nonsense about friendship and kinship. Pure hypocrisy!

"When have your people felt kin to us? When have the Spacers felt any relationship to Earth and its people? Certainly, you Spacers are descended from Earthmen. We don't forget that. Nor do we forget that you have forgotten it. For well over twenty decades, the Spacers controlled the Galaxy and treated Earthpeople as though they were hateful, short-lived, diseased animals. Now that we are growing strong, you hold out the hand of friendship, but that hand has a glove on it, as your hands do. You try to remember not to turn up your nose at us, but the nose, even if not turned up, has plugs in it. Well? Am I correct?"

Gladia held up her hands. "It may be," she said, "that the audience here in this room--and, even more so, the audience outside the room that sees me via hyperwave--is not aware that I am wearing gloves. They are not obtrusive, but they are there. I do not deny that. And I have nose plugs that filter out dust and microorganisms without too much interference with breathing. And I am careful to spray my throat periodically. And I wash perhaps a bit more than the requirements of cleanliness alone make necessary. I deny none of it.

"But this is the result of my shortcomings, not yours. My immune system is not strong. My life has been too comfortable and I have been exposed to too little. That was

not my deliberate choice, but I must pay the penalty for it. If any of you were in my unfortunate position, what would you do? In particular, Mr. Bistervan, what would you do?"

Bistervan said grimly, "I would do as you do and I would consider it a sign of weakness, a sign that I was unfit and unadjusted to life and that I therefore ought to make way for those who are strong. Woman, don't speak of kinship to us. You are no kin of mine. You are of those who persecuted and tried to destroy us when you were strong and who come whining to us when you are weak."

There was a stir in the audience--and by no means a friendly one--but Bistervan held his ground firmly.

Gladia said softly, "Do you remember the evil we did when we were strong?"

Bistervan said, "Don't fear that we will forget. It is in our minds every day."

"Good! Because now you know what to avoid. You have learned that when the strong oppress the weak, that is wrong. Therefore, when the table turns and when you are strong and we are weak, you will not be oppressive."

"Ah, yes. I have heard the argument. When you were strong, you never heard of morality, but now that you are weak, you preach it earnestly."

"In your case, though, when you were weak, you knew all about morality and were appalled by the behavior of the strong--and now that you are strong, you forget morality. Surely it is better that the immoral learn morality through adversity than that the moral forget morality in prosperity."

"We will give what we received," said Bistervan, holding up his clenched fist.

"You should give what you would have liked to receive," said Gladia, holding out her arms, as though embracing. "Since everyone can think of some past injustice to avenge, what you are saying, my friend, is that it is right for the strong to oppress the weak. And when you say that, you justify the Spacers of the past and should therefore have no complaint of the present. What I say is that oppression was wrong when we practiced it in the past and that it will be equally wrong when you practice it in the future. We cannot change the past, unfortunately, but we can still decide on what the future shall be."

Gladia paused. When Bistervan did not answer immediately, she called out, "How many want a new Galaxy, not the bad old Galaxy endlessly repeated?"

The applause began, but Bistervan threw his arms up and shouted in stentorian fashion, "Wait! Wait! Don't be fools! Stop!"

There was a slow quieting and Bistervan said, "Do you suppose this woman believes what she's saying? Do you suppose the Spacers intend us any good whatever? They still think they are strong, and they still despise us, and they intend to destroy us--if we don't destroy them first. This woman comes here and, like fools, we greet her and make much of her. Well, put her words to the test. Let any of you apply for permission to visit a Spacer world and see if you can. Or if you have a world behind you and can use threats, as Captain Baley did, so that you are allowed to land on the world, how will you be treated? Ask the captain if he was treated like kin."

"This woman is a hypocrite, in spite of all her words--no, because of them. They are the spoken advertisements of her hypocrisy. She moans and whines about her inadequate immune system and says that she must protect herself against the danger of infection. Of course, she doesn't do this because she thinks we are foul and diseased. That thought, I suppose, never occurs to her.

"She whines of her passive life, protected from mischance and misfortune by a too-settled society and a too-solicitous crowd of robots. How she must hate that.

"But what endangers her here? What mischance does she feel will befall her on our planet? Yet she has brought two robots with her. In this hall, we meet in order to honor her and make much of her, yet she brought her two robots even here. They are there on the platform with her. Now that the room is generally lit, you can see them. One is an imitation human being and its name is R. Daneel Olivaw. Another is a shameless robot, openly metallic in structure, and its name is R. Giskard Reventlov. Greet them, my fellow Baleyworlders. They are this woman's kinfolk."

"Checkmate!" groaned D.G. in a whisper.

"Not yet," said Gladia.

There were craning necks in the audience, as if a sudden itch had affected them all, and the word "Robots" ran across the length and breadth of the hall in thousands of intakes of breath.

"You can see them without trouble," Gladia's voice rang out. "Daneel, Giskard, stand up."

The two robots rose at once behind her.

"Step to either side of me," she said, "so that my body does not block the view. --not that my body is large enough to do much blocking, in any case.

"Now let me make a few things clear to all of you. These two robots did not come with me in order to service me. Yes, they help run my establishment on Aurora, along with fifty-one other robots, and I do no work for myself that I wish a robot to do for me. That is the custom on the world on which I live.

"Robots vary in complexity, ability, and intelligence and these two rate very high in those respects. Daneel, in particular, is, in my opinion, the robot, of all robots, whose intelligence most nearly approximates the human in those areas where comparison is possible.

"I have brought only Daneel and Giskard with me, but they perform no great services for me. If you are interested, I dress myself, bathe myself, use my own utensils when I eat, and walk without being carried.

"Do I use them for personal protection? No. They protect me, yes, but they equally well protect anyone else who needs protection. On Solaria, just recently, Daneel did what he could to protect Captain Baley and was ready to give up his existence to protect me. Without him, the ship could not have been saved.

"And I certainly need no protection on this platform. After all, there is a force field stretched across the stage that is ample protection. It is not there at my request, but it is there and it supplies all the protection I need.

"Then why are my robots here with me?"

"Those of you who know the story of Elijah Baley, who freed Earth of its Spacer overlords, who initiated the new policy of settlement, and whose son led the first human being to Baleyworld--why else is it called that?--know that well before he knew me, Elijah Baley worked with Daneel. He worked with him on Earth, on Solaria, and on Aurora--on each of his great cases. To Daneel, Elijah Baley was always 'Partner Elijah.' I don't know if that fact appears in his biography, but you may safely take my word for it. And although Elijah Baley, as an Earthman, began with a strong distrust of Daneel, a friendship between them developed. When Elijah Baley was dying, here on this planet over sixteen decades ago, when it was just a cluster of prefabricated houses surrounded by garden patches, it was not his son who was with him in his last moment. Nor was it I." (For a treacherous moment, she thought her voice would not hold steady.) "He sent for Daneel and he held on to life until Daneel arrived.

"Yes, this is Daneel's second visit to this planet. I was with him, but I remained in orbit." (Steady!) "It was Daneel alone who made planetfall, Daneel who received his last words. --Well, does this mean nothing to you?"

Her voice rose a notch as she shook her fists in the air. "Must I tell you this? Don't you already know it? Here is the robot that Elijah Baley loved. Yes, loved. I wanted to see Elijah before he died, to say good-bye to him; but he wanted Daneel--and this is Daneel. This is the very one.

"And this other is Giskard, who knew Elijah only on Aurora, but who managed to save Elijah's life there.

"Without these two robots, Elijah Baley would not have achieved his goal. The Spacer worlds would still be supreme, the Settler worlds would not exist, and none of you would be here. I know that. You know that. I wonder if Mr. Tomas Bistervan knows that?

"Daneel and Giskard are honored names on this world. They are used commonly by the descendants of Elijah Baley at his request. I have arrived on a ship the captain of which is named Daneel Giskard Baley. How many, I wonder, among the people I face now--in person and via hyperwave--bear the name of Daneel or Giskard? Well, these robots behind me are the robots those names commemorate. And are they to be denounced by Tomas Bistervan?"

The growing murmur among the audience was becoming loud and Gladia lifted her arms imploringly.

"One moment. One moment. Let me finish. I have not told you why I brought these two robots. "

There was immediate silence.

"These two robots," Gladia said, "have never forgotten Elijah Baley, any more than I have forgotten him. The passing decades have not in the least dimmed those memories. When I was ready to step on to Captain Baley's ship, when I knew that I might visit Baleyworld, how could I refuse to take Daneel and Giskard with me? They wanted to see the planet that Elijah Baley had made possible, the planet on which he passed his old age and on which he died.

"Yes, they are robots, but they are intelligent robots who served Elijah Baley faithfully and well. It is not enough to have respect for all human beings; one must have respect for all intelligent beings. So I brought them here." Then, in a final outcry that demanded a response, "Did I do wrong?"

She received her response. A gigantic cry of "No!" resounded throughout the hall and everyone was on his or her feet, clapping, stamping, roaring, screaming--on. . . and on. . . and on.

Gladia watched, smiling, and, as the noise continued endlessly, became aware of two things. First, she was wet with perspiration. Second, she was happier than she had ever been in her life.

It was as though all her life she had waited for this moment--the moment when she, having been brought up in isolation, could finally learn, after twenty-three decades, that she could face crowds, and move them, and bend them to her will.

She listened to the unwearying, noisy response--on. . . and on. . . and on. . .

35.

It was a considerable time later--how long she had no way of telling --that Gladia finally came to herself.

There had first been unending noise, the solid wedge of security people herding her through the crowd, the plunge into endless tunnels that seemed to sink deeper and deeper into the ground.

She lost contact with D.G. early and was not sure that Daneel and Giskard were safely with her. She wanted to ask for them, but only faceless people surrounded her. She thought distantly that the robots had to be with her, for they would resist separation and she would hear the tumult if an attempt were made.

When she finally reached a room, the two robots were there with her. She didn't know precisely where she was, but the room was fairly large and clean. It was poor stuff compared to her home on Aurora, but compared to the shipboard cabin it was quite luxurious.

"You will be safe here, madam," said the last of the guards as he left. "If you need anything, just let us know." He indicated a device on a small table next to the bed.

She stared at it, but by the time she turned back to ask what it was and how it worked, he was gone.

Oh, well, she thought, I'll get by.

"Giskard," she said wearily, "find out which of those doors leads to the bathroom and find out how the shower works. What I must have now is a shower."

She sat down gingerly, aware that she was damp and unwilling to saturate the chair with her perspiration. She was beginning to ache with the unnatural rigidity of her position when Giskard emerged.

"Madam, the shower is running," he said, "and the temperature is adjusted. There is a solid material which I believe is soap and a primitive sort of toweling material, along with various other articles that may be useful."

"Thank you, Giskard," said Gladia, quite aware that despite her grandiloquence on the manner in which robots such as Giskard did not perform menial service, that is precisely what she had required him to do. But circumstances alter cases--

If she had never needed a shower, it seemed to her, as badly as now, she had also never enjoyed one as much. She remained in it much longer than she had to and when it was over it didn't even occur to her to wonder if the towels had been in any way irradiated to sterility until after she had dried herself--and by that time it was too late.

She rummaged about among the material Giskard had laid out for her--powder, deodorant, comb, toothpaste, hair dryer--but she could not locate anything that would serve as a toothbrush. She finally gave up and used her finger, which she found most unsatisfactory. There was no hairbrush and that too was unsatisfactory. She scrubbed the comb with soap before using it, but cringed away from it just the same. She found a garment that looked as though it were suitable for wearing to bed. It smelled clean, but it hung far too loosely, she decided.

Daneel said quietly, "Madam, the captain wishes to know if he may see you."

"I suppose so," said Gladia, still rummaging for alternate nightwear. "Let him in."

D.G. looked tired and even haggard, but when she turned to greet him, he smiled wearily at her and said, "It is hard to believe that you are over twenty-three decades old."

"What? In this thing?"

"That helps. It's semitransparent. --or didn't you know?"

She looked down at the nightgown uncertainly, then said, "Good, if it amuses you, but I have been alive, just the same, for two and a third centuries. "

"No one would guess it to look at you. You must have been very beautiful in your youth."

"I have never been told so, D.G. Quiet charm, I always believed, was the most I could aspire to. --In any case, how do I use that instrument?"

"The call box? Just touch the patch on the right side and someone will ask if you can be served and you can carry on from there."

"Good. I will need a toothbrush, a hairbrush, and clothing."

"The toothbrush and hairbrush I will see that you get. As for clothing, that has been thought of. You have a clothes bag hanging in your closet. You'll find it contains the best in Baleyworld fashion, which may not appeal to you, of course. And I won't guarantee they'll fit you. Most Baleyworld women are taller than you and certainly wider and thicker. --but it doesn't matter. I think you'll remain in seclusion for quite a while."

"Why?"

"Well, my lady. It seems you delivered a speech this past evening and, as I recall, you would not sit down, though I suggested you do that more than once."

"It seemed quite successful to me, D.G."

"It was. It was a howling success." D.G. smiled broadly and scratched the right side of his beard as though considering the word very carefully. "However, success has its penalties too. Right now, I should say you are the most famous person on Baleyworld and every Baleyworlder wants to see you and touch you. If we take you out anywhere, it will mean an instant riot. At least, until things cool down. We can't be sure how long that will take.

"Then, too, you had even the war hawks yelling for you, but in the cold light of tomorrow, when the hypnotism and hysteria dies down, they're going to be furious. If Old Man Bistervan didn't actually consider killing you outright after your talk, then by tomorrow he will certainly have it as the ambition of his life to murder you by slow torture. And there are people of his party who might conceivably try to oblige the Old Man in this small whim of his.

"That's why you're here, my lady. That's why this room, this floor, this entire hotel is being watched by I don't know how many platoons of security people, among whom, I hope, are no cryptowar hawks. And because I have been so closely associated with you in this hero-and-heroine game, I'm penned up here, too, and can't get out."

"Oh," said Gladia blankly. "I'm sorry about that. You can't we your family, then."

D.G. shrugged. "Traders don't really have much in the way of family."

"Your woman friend, then."

"She'll survive. --Probably better than I will." He cast his eyes on Gladia speculatively.

Gladia said evenly, "Don't even think it, Captain."

D.G.'s eyebrows rose. "There's no way I can be prevented from thinking it, but I won't do anything, madam. "

Gladia said, "How long do you think I will stay here? Seriously."

"It depends on the Directory. "

"The Directory?"

"Our five-fold executive board, madam. Five people"--he held up his hand with the fingers spread apart "--each serving five years in staggered fashion, with one replacement each year, plus special elections in case of death or disability. This supplies continuity and reduces the danger of one-person rule. It also means that every decision must be argued out and that takes time, sometimes more time than we can afford. "

"I should think," said Gladia, "that if one of the five were a determined and forceful individual--"

"That he could impose his views on the others. Things like that have happened at times, but these times are not one of those times--if you know what I mean. The Senior Director is Genovus Pandaral. There's nothing evil about him, but he's indecisive--and sometimes that's the same thing. I talked him into allowing your robots on the stage with you and that turned out to be a bad idea. Score one against both of us."

"But why was it a bad idea? The people were pleased."

"Too pleased, my lady. We wanted you to be our pet Spacer heroine and help keep public opinion cool so that we wouldn't launch a premature war. You were good on

longevity; you had them cheering short life. But then you had them cheering robots and we don't want that. For that matter, we're not so keen on the public cheering the notion of kinship with the Spacers."

"You don't want premature war, but you don't want premature peace, either. Is that it?"

"Very well put, madam."

"But, then, what do you want?"

"We want the Galaxy, the whole Galaxy. We want to settle and populate every habitable planet in it and establish nothing less than a Galactic Empire. And we don't want the Spacers to interfere. They can remain on their own worlds and live in peace as they please, but they must not interfere."

"But then you'll be penning them up on their fifty worlds, as we penned up Earthpeople on Earth for so many years. The same old injustice. You're as bad as Bistervan."

"The situations are different. Earthpeople were penned up in defiance of their expansive potential. You Spacers have no such potential. You took the path of longevity and robots and the potential vanished. You don't even have fifty worlds any longer. Solaria has been abandoned. The others will go, too, in time. The Settlers have no interest in pushing the Spacers along the path to extinction, but why should we interfere with their voluntary choice to do so? Your speech tended to interfere with that."

"I'm glad. What did you think I would say?"

"I told you. Peace and love and sit down. You could have finished in about one minute."

Gladia said angrily, "I can't believe you expected anything so foolish of me. What did you take me for?"

"For what you took yourself for--someone frightened to death of speaking. How did we know that you were a madwoman who could, in half an hour, persuade the Baleyworlders to howl in favor of what for lifetimes we have been persuading them to howl against? But talk will get us nowhere"--he rose heavily to his feet--"I want a shower, too, and I had better get a night's sleep--if I can. See you tomorrow."

"But when do we find out what the Directors will decide to do with me?"

"When they find out, which may not be soon. Good night, madam."

36.

"I have made a discovery," said Giskard, his voice carrying no shade of emotion. "I have made it because, for the first time in my existence, I faced thousands of human beings. Had I done this two centuries ago, I would have made the discovery then. Had I never faced so many at once, then I would never have made the discovery at all."

"Consider, then, how many vital points I might easily grasp, but never have and never will, simply because the proper conditions for it will never come my way. I remain ignorant except where circumstance helps me and I cannot count on circumstance."

Daneel said, "I did not think, friend Giskard, that Lady Gladia, with her long-sustained way of life, could face thousands with equanimity. I did not think she would be able to speak at all. When it turned out that she could, I assumed you had adjusted her and that you had discovered that it could be done without harming her. Was that your discovery?"

Giskard said, "Friend Daneel, actually all I dared do was loosen a very few strands of inhibition, only enough to allow her to speak a few words, so that she might be heard."

"But she did far more than that."

"After this microscopic adjustment, I turned to the multiplicity of minds I faced in the audience. I had never experienced so many, any more than Lady Gladia had, and I was as taken aback as she was. I found, at first, that I could do nothing in the vast mental interlockingness that beat in upon me. I felt helpless.

"And then I noted small friendlinesses, curiosities, interests--I cannot describe them in words--with a color of sympathy for Lady Gladia about them. I played with what I could find that had this color of sympathy, tightening and thickening them just slightly. I wanted some small response in Lady Gladia's favor that might encourage her, that might make it unnecessary for me to be tempted to tamper further with Lady Gladia's mind. That was all I did. I do not know how many threads of the proper color I handled. Not many. "

Daneel said, "And what then, friend Giskard?"

"I found, friend Daneel, that I had begun something that was autocatalytic. Each thread I strengthened, strengthened a nearby thread of the same kind and the two together strengthened several others nearby. I had to do nothing further. Small stirs, small sounds, and small glances that seemed to approve of what Lady Gladia said encouraged still others.

"Then I found something stranger yet. All these little indications of approval, which I could detect only because the minds were open to me, Lady Gladia must have also detected in some manner, for further inhibitions in her mind fell without my touching them. She began to speak faster, more confidently, and the audience responded better than ever--without my doing anything. And in the end, there was hysteria, a storm, a tempest of mental thunder and lightning so intense that I had to close my mind to it or it would have overloaded my circuits.

"Never, in all my existence, had I encountered anything like that and yet it started with no more modification introduced by me in all that crowd than I have, in the past, introduced among a mere handful of people. I suspect, in fact, that the effect spread beyond the audience sensible to my mind--to the greater audience reached via hyperwave."

Daneel said, "I do not see how this can be, friend Giskard."

"Nor I, friend Daneel. I am not human. I do not directly experience the possession of a human mind with all its complexities and contradictions, so I do not grasp the mechanisms by which they respond. But, apparently, crowds are more easily managed than individuals. It seems paradoxical. Much weight takes more effort to move than little weight. Much energy takes more effort to counter than little energy. Much distance takes longer to traverse than little distance. Why, then, should many people be easier to sway than few? You think like a human being, friend Daneel. Can you explain?"

Daneel said, "You yourself, friend Giskard, said that it was an autocatalytic effect, a matter of contagion. A single spark of flame may end by burning down a forest. "

Giskard paused and seemed deep in thought. Then he said, "It is not reason that is contagious but emotion. Madam Gladia chose arguments she felt would move her audience's feelings. She did not attempt to reason with them. It may be, then, that the larger the crowd, the more easily they are swayed by emotion rather than by reason.

"Since emotions are few and reasons are many, the behavior of a crowd can be more easily predicted than the behavior of one person can. And that, in turn, means that if laws are to be developed that enable the current of history to be predicted, then one must deal with large populations, the larger the better. That might itself be the First Law of Psychohistory, the key to the study of Humanics. Yet--"

"Yes?"

"It strikes me that it has taken me so long to understand this only because I am not a human being. A human being would, perhaps, instinctively understand his own mind well enough to know how to handle others like himself. Madam Gladia, with no experience at all in addressing huge crowds, carried off the matter expertly. How much better off we would be if we had someone like Elijah Baley with us. Friend Daneel, are you not thinking of him?"

Daneel said, "Can you see his image in my mind? That is surprising, friend Giskard."

"I do not see him, friend Daneel. I cannot receive your thoughts. But I can sense emotions and mood--and your mind has a texture which, by past experience, I know to be associated with Elijah Baley."

"Madam Gladia made mention of the fact that I was the last to see Partner Elijah alive, so I listen again, in memory, to that moment. I think again of what he said."

"Why, friend Daneel?"

"I search for the meaning. I feel it was important."

"How could what he said have meaning beyond the import of the words? Had there been hidden meaning, Elijah Baley would have expressed it. "

"Perhaps," said Daneel slowly, "Partner Elijah did not himself understand the significance of what he was saying. "

10. AFTER THE SPEECH

37.

Memory!

It lay in Daneel's mind like a closed book of infinite detail, always available for his use. Some passages were called upon frequently for their information, but only a very few were called upon merely because Daneel wished to feel their texture. Those very few were, for the most part, those that contained Elijah Baley.

Many decades ago, Daneel had come to Baleyworld while Elijah Baley was still alive. Madam Gladia had come with him, but after they entered into orbit about Baleyworld, Bentley Baley soared upward in his small ship to meet them and was brought aboard. By then, he was a rather gnarled man of middle age.

He looked at Gladia with faintly hostile eyes and said, "You cannot see him, madam."

And Gladia, who had been weeping, said, "Why not?"

"He does not wish it, madam, and I must respect his wishes."

"I cannot believe that, Mr. Baley."

"I have a handwritten note and I have a voice recording, madam. I do not know if you can recognize his handwriting or his voice, but you have my word of honor these are his and that no untoward influence was used upon him to produce them."

She went into her own cabin to read and listen alone. Then she emerged--with an air of defeat about her--but she managed to say firmly, "Daneel, you are to go down alone to see him. It is his wish. But you are to report to me everything that is done and said."

"Yes, madam," Daneel said.

Daneel went down in Bentley's ship and Bentley said to him, "Robots are not allowed on this world, Daneel, but an exception is being made in your case because it is my father's wish and because he is highly revered here. I have no personal animus against you, you understand, but your presence here must be an entirely limited one. You will be taken directly to my father. When he is done with you, you will be taken back into orbit at once. Do you understand?"

"I understand, sir. How is your father?"

"He is dying," Bentley said with perhaps conscious brutality.

"I understand that, too," said Daneel, his voice quivering noticeably, not out of ordinary emotion but because the consciousness of the death of a human being, however unavoidable, disordered his positronic brain paths. "I mean, how much longer before he must die?"

"He should have died some time ago. He is tied to life because he refuses to go until he sees you."

They landed. It was a large world, but the inhabited portion--if this were all--was small and shabby. It was a cloudy day and it had rained recently. The wide, straight

streets were empty, as though what population existed there was in no mood to assemble in order to stare at a robot.

The ground-car took them through the emptiness and brought them to a house somewhat larger and more impressive than most. Together they entered. At an inner door, Bentley halted.

"My father is in there," he said sadly. "You are to go in alone. He will not have me there with you. Go in. You might not recognize him. "

Daneel went into the gloom of the room. His eyes adjusted rapidly and he was aware of a body covered by a sheet inside a transparent cocoon that was made visible only by its faint glitter. The light within the room brightened a bit and Daneel could then see the face clearly.

Bentley had been right. Daneel saw nothing of his old partner in it. It was gaunt and bony. The eyes were closed and it seemed to Daneel that what he saw was a dead body. He had never seen a dead human being and when this thought struck him, he staggered and it seemed to him that his legs would not hold him up.

But the old man's eyes opened and Daneel recovered his equilibrium, though he continued to feel an unaccustomed weakness just the same.

The eyes looked at him and a small, faint smile curved the pale, cracked lips.

"Daneel. My old friend Daneel."

There was the faint timbre of Elijah Baley's remembered voice in that whispered sound. An arm emerged slowly from under the sheet and it seemed to Daneel that he recognized Elijah after all.

"Partner Elijah," he said softly.

"Thank you--thank you for coming."

"It was important for me to come, Partner Elijah."

"I was afraid they might not allow it. They--the others--even my son--think of you as a robot."

"I am a robot. "

"Not to me, Daneel. You haven't changed, have you? I don't see you clearly, but it seems to me you are exactly the same as I remember. When did I last see you? Twenty-nine years ago?"

"Yes--and in all that time, Partner Elijah, I have not changed, so you see, I am a robot. "

"I have changed, though, and a great deal. I should not have let you see me like this, but I was too weak to resist my desire to see you once again." Baley's voice seemed to have grown a bit stronger, as though it had been fortified by the sight of Daneel.

"I am pleased to see you, Partner Elijah, however you have changed."

"And Lady Gladia? How is she?"

"She is well. She came with me."

"She is not--" A touch of painful alarm came into his voice as he tried to look about.

"She is not on this world, but is still in orbit. It was explained to her that you did not wish to see her--and she understood."

"That is wrong. I do wish to see her, but I have been able to withstand that temptation. She has not changed, has she?"

"She still has the appearance she had when you last saw her."

"Good. --but I couldn't let her see me like this. I could not have this be her last memory of me. With you, it is different."

"That is because I am a robot, Partner Elijah. "

"Stop insisting on that," said the dying man peevishly. "You could not mean more to me, Daneel, if you were a man."

He lay silently in his bed for a while, then he said, "All these years, I have never hypervised, never written to her. I could not allow myself to interfere with her life. --Is Gladia still married to Gremionis?"

"Yes, sir."

"And happy?"

"I cannot judge that. She does not behave in a fashion that might be interpreted as unhappy."

"Children?"

"The permitted two."

"She has not been angry that I have not communicated?"

"It is my belief she understood your motives. "

"Does she ever--mention me?"

"Almost never, but it is Giskard's opinion that she often thinks of you."

"How is Giskard?"

"He functions properly--in the manner that you know."

"You know, then--of his abilities."

"He has told me, Partner Elijah."

Again Baley lay there silently. Then he stirred and said, "Daneel, I wanted you here out of a selfish desire to see you, to see for myself that you haven't changed, that there is a breath of the great days of my life still existing, that you remember me and will continue to remember me. --but I also want to tell you something.

"I will be dead soon, Daneel, and I knew the word would reach you. Even if you weren't here, even if you were on Aurora, the word would come to you. My death will be Galactic news. " His chest heaved in a weak and silent laugh. "Who would have thought it once?"

He said, "Gladia would hear of it as well, of course, but Gladia knows I must die and she will accept the fact, however sadly. I feared the effect on you, however, since you are--as you insist and I deny--a robot. For old times' sake you may feel it is incumbent upon you to keep me from dying and the fact that you cannot do so may perhaps have a permanently deleterious effect on you. Let me, then, argue with you about that. "

Baley's voice was growing weaker. Though Daneel sat motionless, his face was in the unusual condition of reflecting emotion. It was set in an expression of concern and sorrow. Baley's eyes were closed and he could not see that.

"My death, Daneel," he said, "is not important. No individual death among human beings is important. Someone who dies leaves his work behind and that does not entirely die. It never entirely dies as long as humanity exists. --Do you understand what I'm saying?"

Daneel said, "Yes, Partner Elijah."

"The work of each individual contributes to a totality and so becomes an undying part of the totality. That totality of human lives--past and present and to come--forms a tapestry that has been in existence now for many tens of thousands of years and has been growing more elaborate and, on the whole, more beautiful in all that time. Even the Spacers are an offshoot of the tapestry and they, too, add to the elaborateness and beauty of the pattern. An individual life is one thread in the tapestry and what is one thread compared to the whole?"

"Daneel, keep your mind fixed firmly on the tapestry and do not let the trailing off of a single thread affect you. There are so many other threads, each valuable, each contributing--"

Baley stopped speaking, but Daneel waited patiently.

Baley's eyes opened and, looking at Daneel, he frowned slightly.

"You are still here? It is time for you to go. I have told you what I meant to tell you."

"I do not wish to go, Partner Elijah."

"You must. I cannot hold off death any longer. I am tired--desperately tired. I want to die. It is time."

"May I not wait while you live?"

"I don't wish it. If I die while you watch, it may affect you badly despite all my words. Go now. That is an--order. I will allow you to be a robot if you wish but, in that case, you must follow my orders. You cannot save my life by anything you can do, so there is nothing to come ahead of Second Law. Go!"

Baley's finger pointed feebly and he said, "Good-bye, friend Daneel. "

Daneel turned slowly, following Baley's orders with unprecedented difficulty. "Good-bye, Partner--" He paused and then said, with a faint hoarseness, "Good-bye, friend Elijah. "

Bentley confronted Daneel in the next room. "Is he still alive?"

"He was alive when I left."

Bentley went in and came out almost at once. "He isn't now. He saw you and then--let go."

Daneel found he had to lean against the wall. It was some time before he could stand upright.

Bentley, eyes averted, waited and then together they returned to the small ship and moved back up into orbit where Gladia waited.

And she, too, asked if Elijah Baley was still alive and when they told her gently that he was not, she turned away, dry-eyed, and went into her own cabin to weep.

37A.

Daneel continued his thought as though the sharp memory of Baley's death in all its details had not momentarily intervened. "And yet I may understand something more of what Partner Elijah was saying now in the light of Madam Gladia's speech."

"In what way?"

"I am not yet sure. It is very difficult to think in the direction I am trying to think."

"I will wait for as long as is necessary," said Giskard.

38.

Genovus Pandaral was tall and not, as yet, very old for all his thick shock of white hair which, together with his fluffy white sideburns, gave him a look of dignity and distinction. His general air of looking like a leader had helped his advancement through the ranks, but as he himself knew very well, his appearance was much stronger than his inner fiber.

Once he had been elected to the Directory, he had gotten over the initial elation rather rapidly. He was in beyond his depth and, each year, as he was automatically pushed up a notch, he knew that more clearly. Now he was Senior Director.

Of all the times to be Senior Director!

In the old days, the task of ruling had been nothing. In the time of Nephi Morler, eight decades before, the same Morler who was always being held up to the schoolchildren as the greatest of all Directors, it had been nothing. What had Baleyworld been then? A small world, a trickle of farms, a handful of towns clustered along natural lines of communication. The total population had been no more than five million and its most important exports had been raw wool and some titanium.

The Spacers had ignored them completely under the more or less benign influence of Han Fastolfe of Aurora and life was simple. People could always make trips back to Earth--if they wanted a breath of culture or the feel of technology and there was a steady flow of Earthpeople arriving as immigrants. Earth's mighty population was inexhaustible.

Why shouldn't Morler have been a great Director, then? He had had nothing to do.

And, in the future, ruling would again be simple. As the Spacers continued to degenerate (every schoolchild was told that they would, that they must drown in the contradictions of their society--though Pandaral wondered, sometimes, whether this was really certain) and as the Settlers continued to increase in numbers and strength, the time would soon come when life would be again secure. The Settlers would live in peace and develop their own technology to the utmost.

As Baleyworld filled, it would assume the proportion and ways of another Earth, as would all the worlds, while new ones would spring up here and there in ever greater numbers, finally making up the great Galactic Empire to come. And surely Baleyworld, as

the oldest and most populous of the Settler worlds, would always have a prime place in that Empire, under the benign and perpetual rule of Mother Earth.

But it was not in the past that Pandaral was Senior Director. Nor was it in the future. It was now.

Han Fastolfe was dead now, but Kelden Amadiro was alive. Amadiro had held out against Earth being allowed to send out Settlers twenty decades ago and he was still alive now to make trouble. The Spacers were still too strong to be disregarded; the Settlers were still not quite strong enough to move forward with confidence. Somehow the Settlers had to hold off the Spacers till the balance had shifted sufficiently.

And the task of keeping the Spacers quiet and the Settlers at once resolute and yet sensible fell more upon Pandaral's shoulders than on anyone else's--and it was a task he neither liked nor wanted.

Now it was morning, a cold, gray morning with more snow coming--though that was no surprise--and he made his way through the hotel alone. He wanted no retinue.

The security guards, out in force, snapped to attention as he passed and he acknowledged them wearily. He spoke to the captain of the guard when the latter advanced to meet him. "Any trouble, Captain?"

"None, Director. All is quiet."

Pandaral nodded. "In which room has Baley been put? --Ah. --and the Spacer woman and her robots are under strict guard? --Good."

He passed on. On the whole, D.G. had behaved well. Solaria, abandoned, could be used by Traders as an almost endless supply of robots and as a source of large profits--though profits were not to be taken as the natural equivalent of world security, Pandaral thought morosely. But Solaria, booby-trapped, had best be left alone. It was not worth a war. D.G. had done well to leave at once.

And to take the nuclear intensifier with him. So far, such devices were so overwhelmingly massive that they could be used only in huge and expensive installations designed to destroy invading ships--and even these had never gotten beyond the planning stage. Too expensive. Smaller and cheaper versions were absolutely necessary, so D.G. was right in feeling that bringing home a Solarian intensifier was more important than all the robots on that world put together. That intensifier should help the scientists of Baleyworld enormously.

And yet if one Spacer world had a portable intensifier, why not others? Why not Aurora? If those weapons grew small enough to place on warships, a Spacer fleet could wipe out any number of Settler ships without trouble. How far toward that development were they? And how fast could Baleyworld progress in the same direction with the help of the intensifier D.G. had brought back?

He signaled at D.G.'s hotel room door, then entered without quite waiting for a response and sat down without quite waiting for an invitation. There were some useful perquisites that went along with being Senior Director.

D.G. looked out of the bathroom and said through the towel with which he was giving his hair a first dry, "I would have liked to greet your Directorial Excellence in a

properly imposing manner, but you catch me at a disadvantage, since I am in the extremely undignified predicament of having just emerged from my shower."

"Oh, shut up," said Pandaral pettishly.

Ordinarily, he enjoyed D.G.'s irrepressible breeziness, but not now. In some ways, he never really understood D.G. at all. D.G. was a Baley, a lineal descendant of the great Elijah and the Founder, Bentley. That made D.G. a natural for a Director's post, especially since he had the kind of bonhomie that endeared him to the public. Yet he chose to be a Trader, which was a difficult life--and a dangerous one. It might make you rich, but it was much more likely to kill you or--what was worse--prematurely age you.

What's more, D.G.'s life as a Trader took him away from Baleyworld for months at a time and Pandaral preferred his advice to those of most of his department heads. One couldn't always tell when D.G. was serious, but, allowing for that, he was worth listening to.

Pandaral said heavily, "I don't think that that woman's speech was the best thing that could have happened to us."

D.G., mostly dressed, shrugged his shoulders. "Who could have foretold it?"

"You might have. You must have looked up her background--if you had made up your mind to carry her off."

"I did look up her background, Director. She spent over three decades on Solaria. It was Solaria that formed her and she lived there entirely with robots. She saw human beings only by holographic images, except for her husband--and he didn't visit her often. She had a difficult adjustment to make when she came to Aurora and even there she lived mostly with robots. At no time in twenty-three decades would she have faced as many as twenty people all together, let alone four thousand. I assumed she wouldn't be able to speak more than a few words--if that. I had no way of knowing she was a rabble-rouser."

"You might have stopped her, once you found out she was. You were sitting right next to her."

"Did you want a riot? The people were enjoying her. You were there. You know they were. If I had forced her down, they would have mobbed the stage. After all, Director, you didn't try to stop her."

Pandaral cleared his throat. "I had that in mind, actually, but each time I looked back, I'd catch the eye of her robot the one who looks like a robot."

"Giskard. Yes, but what of it? He wouldn't harm you."

"I know. Still, he made me nervous and it put me off somehow."

"Well, never mind, Director," said D.G. He was fully clothed now and he shoved the breakfast tray toward the other. "The coffee is still warm. Help yourself to the buns and jams if you want any. --It will pass. I don't think the public will really overflow with love for the Spacers and spoil our policy. It might even serve a purpose. If the Spacers hear of it, it might strengthen the Fastolfe party. Fastolfe may be dead, but his party isn't--not altogether--and we need to encourage their policy of moderation."

"What I'm thinking of," said Pandaral, "is the All-Settler Congress that's coming up in five months. I'm going to have to listen to any number of sarcastic references to

Baleyworld appeasement and to Baleyworlders being Spacer-lovers. --I tell you," he added gloomily, "the smaller the world, the more war hawkish it is."

"Then tell them that," said D.G. "Be very statesmanlike in public, but when you get them to one side, look them right in the eye--unofficially--and say that there's freedom of expression on Baleyworld and we intend to keep it that way. Tell them Baleyworld has the interests of Earth at heart, but that if any world wishes to prove its greater devotion to Earth by declaring war on the Spacers, Baleyworld will watch with interest but nothing more. That would shut them up. "

"Oh, no," said Pandaral with alarm. "A remark like that would leak out. It would create an impossible stink."

D.G. said, "You're right, which is a pity. But think it and don't let those bigmouthed small brains get to you."

Pandaral sighed. "I suppose we'll manage, but last night upset our plans to end on a high note. That's what I really regret."

"What high note?"

Pandaral said, "When you left Aurora for Solaria, two Auroran warships went to Solaria as well. Did you know that?"

"No, but it was something I expected," said D.G. indifferently. "It was for that reason I took the trouble of going to Solaria by way of an evasive path."

"One of the Auroran ships landed on Solaria, thousands of kilometers away from you--so it didn't seem to be making any effort to keep tabs on you--and the second remained in orbit."

"Sensible. It's what I would have done if I had had a second ship at my disposal."

"The Auroran ship that landed was destroyed in a matter of hours. The ship in orbit reported the fact and was ordered to return. --a Trader monitoring station picked up the report and it was sent to us."

"Was the report uncoded?"

"Of course not, but it was in one of the codes we've broken."

D.G. nodded his head thoughtfully, then said, "Very interesting. I take it they didn't have anyone who could speak Solarian."

"Obviously," said Pandaral weightily. "Unless someone can find where the Solarians went, this woman of yours is the only available Solarian in the Galaxy."

"And they let me have her, didn't they? Tough on the Aurorans."

"At any rate, I was going to announce the destruction of the Auroran ship last night. In a matter-of-fact way--no gloating. Just the same, it would have excited every Settler in the Galaxy. I mean, we got away and the Aurorans didn't."

"We had a Solarian," said D.G. dryly. "The Aurorans didn't."

"Very well. It would make you and the woman look good, too. --but it all came to nothing. After what the woman did, anything else would have come as anticlimax, even the news of the destruction of an Auroran warship."

D.G. said, "To say nothing of the fact that once everyone has finished applauding kinship and love, it would go against the grain--for the next half hour anyway--to applaud the death of a couple of hundred of the Auroran kin."

"I suppose so. So that's an enormous psychological blow that we've lost."

D.G. was frowning. "Forget that, Director. You can always work the propaganda at some other, more appropriate time. The important thing is what it all means. --An Auroran ship was blown up. That means they weren't expecting a nuclear intensifier to be used. The other ship was ordered away and that may mean it wasn't equipped with a defense against it--and maybe they don't even have a defense. I should judge from this that the portable intensifier--or semiportable one, anyway--is a Solarian development specifically and not a Spacer development generally. That's good news for us--if it's true. For the moment, let's not worry about propaganda brownie points but concentrate on squeezing every bit of information we can out of that intensifier. We want to be ahead of the Spacers in this--if possible."

Pandaral munched away at a bun and said, "Maybe you're right. But in that case, how do we fit in the other bit of news?"

D.G. said, "What other bit of news? Director, are you going to give me the information I need to make intelligent conversation or do you intend to toss them into the air one by one and make me jump for them?"

"Don't get huffy, D.G. There's no point in talking with you if I can't be informal. Do you know what it's like at a Directory meeting? Do you want my job? You can have it, you know."

"No, thank you, I don't want it. What I want is your bit of news."

"We have a message from Aurora. An actual message. They actually deigned to communicate directly with us instead of sending it by way of Earth."

"We might consider it an important message, then--to them. What do they want?"

"They want the Solarian woman back again."

"Obviously, then, they know our ship got away from Solaria and has come to Baleyworld. They have their monitoring stations, too, and eavesdrop on our communications as we eavesdrop on theirs."

"Absolutely," said Pandaral with considerable irritation. "They break our codes as fast as we break theirs. My own feeling is we ought to come to an agreement that we both send messages in the clear. Neither of us would be worse off."

"Did they say why they want the woman?"

"Of course not. Spacers don't give reasons; they give orders."

"Have they found out exactly what it was that the woman accomplished on Solaria? Since she's the only person who speaks authentic Solarian, do they want her to clear the planet of its overseers?"

"I don't see how they could have found out, D.G. We only announced her role last night. The message from Aurora was received well before that. --But it doesn't matter why they want her. The question is: What do we do? If we don't return her, we may have a crisis with Aurora that I don't want. If we do return her, it will look bad to the

Baleyworlders and Old Man Bistervan will have a field day pointing out that we're crawling to the Spacers."

They stared at each other, then D.G. said slowly, "We'll have to return her. After all, she's a Spacer and an Auroran citizen. We can't keep her against Aurora's will or we'll put at risk every Trader who ventures into Spacer territory on business. But I'll take her back, Director, and you can put the blame on me. Say that the conditions of my taking her to Solaria were that I would return her to Aurora, which is true, actually, even if not a matter of written formality, and that I am a man of ethics and felt I had to keep my agreement. --And it may turn out to our advantage."

"In what way?"

"I'll have to work it out. But if it's to be done, Director, my ship will have to be refitted at planetary expense. And my men will need healthy bonuses. --Come, Director, they're giving up their leave."

39.

Considering that he had not intended to be in his ship again for at least three additional months, D.G. seemed in genial spirits.

And considering that Gladia had larger and more luxurious quarters than she had before, she seemed rather depressed.

"Why all this?" she asked.

"Looking a gift horse in the mouth?" asked D.G. "I'm just asking. Why?"

"For one thing, my lady, you're a class--a heroine and when the ship was refurbished, this place was rather tarted up for you."

"Tarted up?"

"Just an expression. Fancied up, if you prefer."

"This space wasn't just created. Who lost out?"

"Actually, it was the crew's lounge, but they insisted, you know. You're their darling, too. In fact, Niss--you remember Niss?"

"Certainly."

"He wants you to take him on in place of Daneel. He says Daneel doesn't enjoy the job and keeps apologizing to his victims. Niss says he will destroy anyone who gives you the least trouble, will take pleasure in it, and will never apologize."

Gladia smiled. "Tell him I will keep his offer in mind and tell him I would enjoy shaking his hand if that can be arranged. I didn't get a chance to do so before we landed on Baleyworld."

"You'll wear your gloves, I hope, when you shake hands."

"Of course, but I wonder if that's entirely necessary. I haven't as much as sniffed since I left Aurora. The injections I've been getting have probably strengthened my immune system beautifully." She looked about again. "You even have wall niches for Daneel and Giskard. That's quite thoughtful of you, D.G."

"Madam," said D.G., "we work hard to please and we're delighted that you're pleased."

"Oddly enough"--Gladia sounded as though she were actually puzzled by what she was about to say--"I'm not entirely pleased. I'm not sure I want to leave your world."

"No? Cold--snow--dreary--primitive--endlessly cheering crowds everywhere. What can possibly attract you here?"

Gladia reddened. "It's not the cheering crowds."

"I'll pretend to believe you, madam."

"It's not. It's something altogether different. I--I have never done anything. I've amused myself in various trivial ways, I've engaged in force-field coloring and robot exodesign. I've made love and been a wife and mother and--and--in none of these things have I ever been an individual of any account. If I had suddenly disappeared from existence or if I had never been born, it wouldn't have affected anyone or anything--except, perhaps, one or two close personal friends. Now it's different."

"Yes?" There was the faintest touch of mockery in D.G.'s voice.

Gladia said, "Yes! I can influence people. I can choose a cause and make it my own. I have chosen a cause. I want to prevent war. I want the Universe populated by Spacer and Settler alike. I want each group to keep their own peculiarities, yet freely accept the others', too. I want to work so hard at this that after I am gone, history will have changed because of me and people will say, 'Things would not be as satisfactory as they are had it not been for her.'"

She turned to D.G., her face glowing. "Do you know what a difference it makes, after two and one-third centuries of being nobody, to have a chance of being somebody; to find that a life you thought of as empty turns out to contain something after all, something wonderful; to be happy long, long after you had given up any hope of being happy?"

"You don't have to be on Baleyworld, my lady, to have all that." Somehow D.G. seemed a little abashed.

"I won't have it on Aurora. I am only a Solarian immigrant on Aurora. On a Settler world, I'm a Spacer--something unusual."

"Yet on a number of occasions--and quite forcefully--you have stated you wanted to return to Aurora. "

"Some time ago, yes--but I'm not saying it now, D.G. I don't really want it now."

"Which would influence us a great deal, except that Aurora wants you. They've told us so."

Gladia was clearly astonished. "They want me?"

"An official message from Aurora's Chairman of the Council tells us they do," said D.G. lightly. "We would enjoy keeping you, but the Directors have decided that keeping you is not worth an interstellar crisis. I'm not sure I agree with them, but they outrank me."

Gladia frowned. "Why should they want me? I've been on Aurora for over twenty decades and at no time have they ever seemed to want me. --Wait! Do you suppose they see me now as the only way of stopping the overseers on Solaria?"

"That thought had occurred to me, my lady."

"I won't do it. I held off that one overseer by a hair and I may never be able to repeat what I did then. I know I won't. --Besides, why need they land on the planet? They can destroy the overseers from a distance, now that they know what they are."

"Actually," said D.G., "the message demanding your return was sent out long before they could possibly have known of your conflict with the overseer. They must want you for something else. "

"Oh. " She looked taken aback. Then, catching fire again, "I don't care what else. I don't want to return. I have my work out here and I mean to continue it."

D.G. rose. "I am glad to hear you say so, Madam Gladia. I was hoping you would feel like that. I promise you I will do my best to take you with me when we leave Aurora. Right now, though, I must go to Aurora and you must go with me."

40.

Gladia watched Baleyworld, as it receded, with emotions quite different from those with which she had watched it approach. It was precisely the cold, gray, miserable world now that it had seemed at the start, but there was a warmth and life to the people. They were real, solid.

Solaria, Aurora, the other Spacer worlds that she had visited or had viewed on hypervision, all seemed filled with people who were insubstantial--gaseous.

That was the word. Gaseous.

No matter how few the human beings who lived upon a Spacer world, they spread out to fill the planet in the same way that molecules of gas spread out to fill a container. It was as if Spacers repelled each other.

And they did, she thought gloomily. Spacers had always repelled her. She had been brought up to such repulsion on Solaria, but even on Aurora, when she was experimenting madly with sex just at first, the least enjoyable aspect of it was the closeness it made necessary.

Except--except with Elijah. --But he was not a Spacer.

Baleyworld was not like that. Probably all the Settler worlds were not. Settlers clung together, leaving large tracts desolate about them as the price of the clinging--empty, that is, until population increase filled it. A Settler world was a world of people clusters, of pebbles and boulders, not gas.

Why was this? Robots, perhaps! They lessened the dependence of people upon people. They filled the interstices between. They were the insulation that diminished the natural attraction people had for each other, so that the whole system fell apart into isolates.

It had to be. Nowhere were there more robots than on Solaria and the insulating effect there had been so enormous that the separate gas molecules that were human beings became so totally inert that they almost never interrelated at all. (Where had the Solarians gone, she wondered again, and how were they living?)

And long life had something to do with it, too. How could one make an emotional attachment that wouldn't turn slowly sour as the multidecades passed--or, if one died, how could another bear the loss for multidecades? One learned, then, not to make emotional attachments but to stand off, to insulate one's self.

On the other hand, human beings, if short-lived, could not so easily outlive fascination with life. As the generations passed by rapidly, the ball of fascination bounced from hand to hand without ever touching the ground.

How recently she had told D.G. that there was no more to do or know, that she had experienced and thought everything, that she had to live on in utter boredom. --And she hadn't known or even dreamed, as she spoke, of crowds of people, one upon another; of speaking to many as they melted into a continuous sea of heads; of hearing their response, not in words but in wordless sounds; of melting together with them, feeling their feelings, becoming one large organism.

It was not merely that she had never experienced such a thing before, it was that she had never dreamed anything like that might be experienced. How much more did she know nothing of despite her long life? What more existed for the experiencing that she was incapable of fantasizing?

Daneel said gently, "Madam Gladia, I believe the captain is signaling for entrance."

Gladia started. "Let him enter, then."

D.G. entered, eyebrows raised. "I am relieved. I thought perhaps you were not at home."

Gladia smiled. "In a way, I wasn't. I was lost in thought. It happens to me sometimes. "

"You are fortunate," said D.G. "My thoughts are never large enough to be lost in. Are you reconciled to visiting Aurora, madam?"

"No, I'm not. And among the thoughts in which I was lost was one to the effect that I still do not have any idea why you must go to Aurora. It can't be only to return me. Any spaceworthy cargo tug could have done the job."

"May I sit down, madam?"

"Yes, of course. That goes without saying, Captain. I wish you'd stop treating me as aristocracy. It becomes wearing. And if it's an ironic indication that I'm a Spacer, then it's worse than wearing. In fact, I'd almost rather you called me Gladia. "

"You seem to be anxious to disown your Spacer identity, Gladia," said D.G. as he seated himself and crossed his legs.

"I would rather forget nonessential distinctions."

"Nonessential? Not while you live five times as long as I do."

"Oddly enough, I have been thinking of that as a rather annoying disadvantage for Spacers. --How long before we reach Aurora?"

"No evasive action this time. A few days to get far enough from our sun to be able to make a Jump through hyperspace that will take us to within a few days of Aurora and that's it."

"And why must you go to Aurora, D.G.?"

"I might say it was simply politeness, but in actual fact, I would like an opportunity to explain to your Chairman or even to one of his subordinates--exactly what happened on Solaria."

"Don't they know what happened?"

"In essentials, they do. They were kind enough to tap our communications, as we would have done theirs if the situation had been reversed. Still, they may not have drawn the proper conclusions. I would like to correct them--if that is so."

"What are the proper conclusions, D.G.?"

"As you know, the overseers on Solaria were geared to respond to a person as human only if he or she spoke with a Solarian accent, as you did. That means that not only were Settlers not considered human, but non-Solarian Spacers were not considered human, either. To be precise, Aurorans would not be considered human beings if they had landed on Solaria."

Gladia's eyes widened. "That's unbelievable. The Solarians wouldn't arrange to have the overseers treat Aurorans as they treated you."

"Wouldn't they? They have already destroyed an Auroran ship. Did you know that?"

"An Auroran ship! No, I didn't know that."

"I assure you they did. It landed about the time we did. We got away, but they didn't. We had you, you see, and they didn't. The conclusion is--or should be--that Aurora cannot automatically treat other Spacer worlds as allies. In an emergency, it will be each Spacer world for itself."

Gladia shook her head violently. "It would be unsafe to generalize from a single instance. The Solarians would have found it difficult to have the overseers react favorably to fifty accents and unfavorably to scores of others. It was easier to pin them to a single accent. That's all. They gambled that no other Spacers would try to land on their world and they lost. "

"Yes, I'm sure that is how the Auroran leadership will argue, since people generally find it much easier to make a pleasant deduction than an unpleasant one. What I want to do is to make certain they see the possibility of the unpleasant one--and that this makes them uncomfortable indeed. Forgive my self-love, but I can't trust anyone to do it as well as I can and therefore I think that I, rather than anyone else, should go to Aurora."

Gladia felt uncomfortably tom. She did not want to be a Spacer; she wanted to be a human being and forget what she had just called "nonessential distinctions. "And yet when D.G. spoke with obvious satisfaction of forcing Aurora into a humiliating position, she found herself still somehow a Spacer.

She said in annoyance, "I presume the Settler worlds are at odds among themselves, too. Is it not each Settler world for itself?"

D.G. shook his head. "It may seem to you that this must be so and I wouldn't be surprised if each individual Settler world had the impulse at times to put its own interest over the good of the whole, but we have something you Spacers lack."

"And what is that. A greater nobility?"

"Of course not. We're no more noble than Spacers are. What we've got is the Earth. It's our world. Every Settler visits Earth as often as he can. Every Settler knows that there is a world, a large, advanced world, with an incredibly rich history and cultural variety and ecological complexity that is his or hers and to which he or she belongs. The Settler worlds might quarrel with each other, but the quarrel cannot possibly result in violence or in a permanent breach of relations, for the Earth government is automatically called in to mediate all problems and its decision is sufficient and unquestioned.

"Those are our three advantages, Gladia: the lack of robots, something that allows us to build new worlds with our own hands; the rapid succession of generations, which makes for constant change; and, most of all, the Earth, which gives us our central core."

Gladia said urgently, "But the Spacers--" and she stopped.

D.G. smiled and said with an edge of bitterness, "Were you going to say that the Spacers are also descended from Earthpeople and that it is their planet, too? Factually true, but psychologically false. The Spacers have done their best to deny their heritage. They don't consider themselves Earthmen once-removed--or any-number-removed. If I were a mystic, I would say that by cutting themselves away from their roots, the Spacers cannot survive long. Of course, I'm not a mystic so I don't put it that way--but they cannot survive long, just the same. I believe that."

Then, after a short pause, he added, with a somewhat troubled kindness, as though he realized that in his exultation he was striking a sensitive spot within her, "But please think of yourself as a human being, Gladia, rather than as a Spacer, and I will think of myself as a human being, rather than as a Settler. Humanity will survive, whether it will be in the form of Settlers or Spacers or both. I believe it will be in the form of Settlers only, but I may be wrong."

"No," said Gladia, trying to be unemotional. "I think you're right--unless somehow people learn to stop making the Spacer/Settler distinction. It is my goal--to help people do that. "

"However," said D.G., glancing at the dim time strip that circled the wall, "I delay your dinner. May I eat with you?"

"Certainly," said Gladia.

D.G. rose to his feet. "Then I'll go get it. I'd send Daneel or Giskard, but I don't ever want to get into the habit of ordering robots about. Besides, however much the crew adores you, I don't think their adoration extends to your robots."

Gladia did not actually enjoy the meal when D.G. brought it. She did not seem to grow accustomed to the lack of subtlety in its flavors that might be the heritage of Earth

cooking of yeast for mass consumption, but then, neither was it particularly repulsive. She ate stolidly.

D.G., noting her lack of enthusiasm, said, "The food doesn't upset you, I hope?"

She shook her head. "No. Apparently, I'm acclimated. I had some unpleasant episodes when I first got on the ship, but nothing really severe."

"I'm glad of that, but, Gladia--"

"Yes?"

"Can you suggest no reason why the Auroran government should want you back so urgently? It can't be your handling of the overseer and it can't be your speech. The request was sent out well before they could have known of either."

"In that case, D.G.," Gladia said sadly, "they can't possibly want me for anything. They never have."

"But there must be something. As I told you, the message arrived in the name of the Chairman of the Council of Aurora."

"This particular Chairman at this particular time is thought to be rather a figurehead."

"Oh? Who stands behind him? Kelden Amadiro?"

"Exactly. You know of him, then."

"Oh, yes," said D.G. grimly, "the center of anti-Earth fanaticism. The man who was politically smashed by Dr. Fastolfe twenty decades ago survives to threaten us again. There's an example of the dead hand of longevity."

"But there's the puzzle, too." Gladia said. "Amadiro is a vengeful man. He knows that it was Elijah Baley who was the cause of that defeat you speak of and Amadiro believes I shared responsibility. His dislike--extreme dislike--extends to me. If the Chairman wants me, that can only be because Amadiro wants me--and why should Amadiro want me? He would rather get rid of me. That's probably why he sent me along with you to Solaria. Surely he expected your ship would be destroyed--and me along with it. And that would not have pained him at all."

"No uncontrollable tears, eh?" said D.G. thoughtfully. "But surely that's not what you were told. No one said to you, 'Go with this mad Trader because it would give us pleasure to have you killed.'"

"No. They said that you wanted my help badly and that it was politic to cooperate with the Settler worlds at the moment and that it would do Aurora a great deal of good if I would report back to them on all that occurred on Solaria once I returned."

"Yes, they would say so. They might even have meant it to some extent. Then, when--against all their expectations--our ship got off safely while an Auroran ship was destroyed, they might well have wanted a firsthand account of what happened. Therefore, when I took you to Baleyworld instead of back to Aurora, they would scream for your return. That might possibly be it. By now, of course, they know the story, so they might no longer want you. Though"--he was talking to himself rather than to Gladia-- "what they know is what they picked up from Baleyworld hypervision and they may not choose to accept that at face value. And yet--"

"And yet what, D.G.?"

"Somehow instinct tells me that their message could not have been sparked only by their desire to have you report. The forcefulness of the demand, it seems to me, went beyond that."

"There's nothing else they can want. Nothing," said Gladia.

"I wonder," said D.G.

41.

"I wonder as well," said Daneel from his wall niche that night.

"You wonder concerning what, friend Daneel?" asked Giskard.

"I wonder concerning the true significance of the message from Aurora demanding Lady Gladia. To me, as to the captain, a desire for a report seems a not altogether sufficient motivation."

"Have you an alternate suggestion?"

"I have a thought, friend Giskard. "

"May I know it, friend Daneel?"

"It has occurred to me that, in demanding the return of Madam Gladia, the Auroran Council may expect to see more than they ask for--and it may not be Madam Gladia they want."

"What is there more than Madam Gladia that they will get?"

"Friend Giskard, is it conceivable that Lady Gladia will return without you and me?"

"No, but of what use to the Auroran Council would you and I be?"

"I, friend Giskard, would be of no use to them. You, however, are unique, for you can sense minds directly."

"That is true, friend Daneel, but they do not know this."

"Since our leaving, is it not possible that they have somehow discovered the fact and have come to regret bitterly having allowed you to leave Aurora?"

Giskard did not hesitate perceptibly. "No, it is not possible, friend Daneel. How would they have found out?"

Daneel said carefully, "I have reasoned in this fashion. You have, on your long-ago visit to Earth with Dr. Fastolfe, managed to adjust a few Earth robots so as to allow them a very limited mental capacity, merely enough to enable them to continue your work of influencing officials on Earth to look with courage and favor on the process of Settlement. So, at least, you once told me. There are, therefore, robots on Earth that are capable of mind-adjusting.

"Then, too, as we have come recently to suspect, the Robotics Institute of Aurora has sent humanoid robots to Earth. We do not know their precise purpose in doing so, but the least that can be expected of such robots is that they observe events there on Earth and report on them.

"Even if the Auroran robots cannot sense minds, they can send back reports to the effect that this or that official has suddenly changed his attitude toward Settlement and, perhaps, in the time since we have left Aurora, it has dawned on someone in power in Aurora--on Dr. Amadiro himself perhaps--that this can only be explained by the existence of mind-adjusting robots on Earth. It may be, then, that the establishment of mind-adjusting can be traced back to either Dr. Fastolfe or yourself.

"This might, in turn, make clear to Auroran officials the meaning of certain other events, which might be traced back to you rather than to Dr. Fastolfe. As a result, they would want you back desperately, yet not be able to ask for you directly, for that would give away the fact of their new knowledge. So they ask for Lady Gladia--a natural request--knowing that if she is brought back, you will be, too."

Giskard was silent for a full minute, then he said, "It is interestingly reasoned, friend Daneel, but it does not hold together. Those robots whom I designed for the task of encouraging Settlement completed their job more than eighteen decades ago and have been inactive since, at least as far as mind-adjustment is concerned. What's more, the Earth removed robots from their Cities and confined them to the unpopulated non-City areas quite a considerable time ago.

"This means that the humanoid robots who were, we speculate, sent to Earth, would, even so, not have had occasion to meet my mind-adjusting robots or be aware of any mind-adjustment either, considering that the robots are no longer engaged in that. It is impossible, therefore, for my special ability to have been uncovered in the manner you suggest."

Daneel said, "Is there no other way of discovery, friend Giskard?"

"None," said Giskard firmly.

"And yet--I wonder," said Daneel.

PART IV - AURORA

11. THE OLD LEADER

42.

Kelden Amadiro was not immune from the human plague of memory. He was, in fact, more subject to it than most. In his case, moreover, the tenacity of memory had, as its accompaniment, a content unusual for the intensity of its deep and prolonged rage and frustration.

All had been going so well for him twenty decades before. He was the founding head of the Robotics Institute (he was still the founding head) and for one flashing and triumphant moment it had seemed to him that he could not fail to achieve total control of the Council, smashing his great enemy, Han Fastolfe, and leaving him in helpless opposition.

If he had--if he only had--

(How he tried not to think of it and how his memory presented him with it, over and over again, as though it could never get enough of grief and despair.)

If he had won out, Earth would have remained isolated and alone and he would have seen to it that Earth declined, decayed, and finally faded into dissolution. Why not? The short-lived people of a diseased, overcrowded world were better off dead--a hundred times better off dead than living the life they had forced themselves to lead.

And the Spacer worlds, calm and secure, would then have expanded further. Fastolfe had always complained that the Spacers were too long-lived and too comfortable on their robotic cushions to be pioneers, but Amadiro would have proved him wrong.

Yet Fastolfe had won out. At the moment of certain defeat, he had somehow, unbelievably, incredibly, reached into empty space, so to speak, and found victory in his grasp--plucked from nowhere.

It was that Earthman, of course, Elijah Baley--

But Amadiro's otherwise uncomfortable memory always balked at the Earthman and turned away. He could not picture that face, hear that voice, remember that deed. The name was enough. Twenty centuries had not sufficed to dim the hatred he felt in the slightest --or to soften the pain he felt by an iota.

And with Fastolfe in charge of policy, the miserable Earthmen had fled their corrupting planet and established themselves on world after world. The whirlwind of Earth's progress dazed the Spacer worlds and forced them into frozen paralysis.

How many times had Amadiro addressed the Council and pointed out that the Galaxy was slipping from Spacer fingers, that Aurora was watching blankly while world

after world was being occupied by submen, that each year apathy was taking firmer hold of the Spacer spirit?

"Rouse yourself," he had called out. "Rouse yourself. See their numbers grow. See the Settler worlds multiply. What is it you wait for? To have them at your throats?"

And always Fastolfe would answer in that soothing lullaby of a voice of his and the Aurorans and the other Spacers (always following Aurora's lead, when Aurora chose not to lead) would settle back and return to their slumber.

The obvious did not seem to touch them. The facts, the figures, the indisputable worsening of affairs from decade to decade left them unmoved. How was it possible to shout the truth at them so steadily, to have every prediction he made come to pass, and yet to have to watch a steady majority following Fastolfe like sheep?

How was it possible that Fastolfe himself could watch everything he said prove to be sheer folly and yet never swerve from his policies? It was not even that he stubbornly insisted on being wrong, it was that he simply never seemed to notice he was wrong.

If Amadiro were the kind of man who doted on fantasy, he would surely imagine that some kind of spell, some kind of apathetic enchantment, had fallen upon the Spacer worlds. He would imagine that somewhere someone possessed the magic power of lulling otherwise active brains and blinding to the truth otherwise sharp eyes.

To add the final exquisite agony, people pitied Fastolfe for having died in frustration. In frustration, they said, because the Spacers would not seize new worlds of their own.

It was Fastolfe's own policies that kept them from doing so! What right had he to feel frustration over that? What would he do if he had, like Amadiro, always seen and spoken the truth and been unable to force the Spacers--enough Spacers--to listen to him.

How many times had he thought that it would be better for the Galaxy to be empty than under the domination of the submen? If he had some magic power to destroy the Earth--Elijah Baley's world--with a nod of his head, how eagerly he would.

Yet to find refuge in such fantasy could only be a sign of his total despair. It was the other side of his recurrent, futile wish to give up and welcome death--if his robots would allow it.

And then the time came when the power to destroy Earth was given him--even forced upon him against his will. That time was some three-fourths of a decade before, when he had first met Levular Mandamus.

43.

Memory! Three-fourths of a decade before--

Amadiro looked up and noted that Maloon Cicis had entered the office. He had undoubtedly signaled and he had the right to enter if the signal were not acknowledged.

Amadiro sighed and put down his small computer. Cicis had been his right-hand man ever since the Institute had been established. He was getting old in his service.

Nothing drastically noticeable, just a general air of mild decay. His nose seemed to be a bit more asymmetrical than it once had been.

He rubbed his own somewhat bulbous nose and wondered how badly the flavor of decay was enveloping him. He had once been 1.95 meters tall, a good height even by Spacer standards. Surely he stood as straight now as he always had and yet when he had actually measured his height recently, he could not manage to make it more than 1.93 meters. Was he beginning to stoop, to shrivel, to settle?

He put away these dour thoughts that were themselves a surer sign of aging than mere measurements and said, "What is it, Maloon?"

Cicis had a new personal robot dogging his steps--very modernistic and with glossy trim. That was a sign of aging, too. If one can't keep one's body young, one can always buy a new young robot. Amadiro was determined never to rouse smiles among the truly young by falling prey to that particular delusion--especially since Fastolfe, who was eight decades older than Amadiro, had never done so.

Cicis said, "It's this Mandamus fellow again, Chief."

"Mandamus?"

"The one who keeps wanting to see you."

Amadiro thought a while. "You mean the idiot who's a descendant of the Solarian woman?"

"Yes, Chief."

"Well, I don't want to see him. Haven't you made that clear to him yet, Maloon?"

"Abundantly clear. He asks that I hand you a note and he says you will then see him. "

Amadiro said slowly, "I don't think so, Maloon. What does the note say?"

"I don't understand it, Chief. It isn't Galactic."

"In that case, why should I understand it any more than you do?"

"I don't know, but he asked me to give it to you. If you care to look at it, Chief, and say the word, I will go back and get rid of him one more time. "

"Well, then, let me see it," said Amadiro, shaking his head. He glanced at it with distaste.

It read: "Ceterum censeo, delenda est Carthago."

Amadiro read the message, glared up at Maloon, then turned his eyes back to the message. Finally, he said, "You must have looked at this, since you know it isn't Galactic. Did you ask him what it meant?"

"Yes, I did, Chief. He said it was Latin, but that left me no wiser. He said you would understand. He is a very determined man and said he would sit there all day waiting till you read this."

"What does he look like?"

"Thin. Serious. Probably humorless. Tall, but not quite as tall as you. Intense, deep-set eyes, thin lips."

"How old is he?"

"From the texture of his skin, I should say four decades or so. He is very young."

"In that case, we must make allowances for youth. Send him in."

Cicis looked surprised. "You will see him?"

"I have just said so, haven't I? Send him in."

44.

The young man entered the room in what was almost a march step. He stood there stiffly in front of the desk and said, "I thank you, sir, for agreeing to see me. May I have your permission to have my robots join me?"

Amadiro raised his eyebrows. "I would be pleased to see them. Would you permit me to keep mine with me?"

It had been many years since he had heard anyone mouth the old robot formula. It was one of those good old customs that sank into abeyance as the notion of formal politeness decayed and as it came to be taken more and more for granted that one's personal robots were part of one's self.

"Yes, sir," said Mandamus and two robots entered. They did not do so, Amadiro noted, till permission had been given. They were new robots, clearly efficient, and showed all the signs of good workmanship.

"Your own design, Mr. Mandamus?" There was always some extra value in robots that were designed by their owners.

"Indeed, sir."

"Then you are a roboticist?"

"Yes, sir. I have my degree from the University of Eos."

"Working under--"

Mandamus said smoothly, "Not under Dr. Fastolfe, sir. Under Dr. Maskellnik."

"Ah, but you are not a member of the Institute."

"I have applied for entrance, sir."

"I see." Amadiro adjusted the papers on his desk and then said quickly, without looking up, "Where did you learn Latin?"

"I do not know Latin well enough to speak it or read it, but I know enough about it to know that quotation and where to find it."

"That in itself is remarkable. How does that come about?"

"I cannot devote every moment of my time to robotics, so I have my side interests. One of them is planetology, with particular reference to Earth. That led me to Earth's history and culture."

"That is not a popular study among Spacers."

"No, sir, and that is too bad. One should always know one's enemies--as you do, sir."

"As I do?"

"Yes, sir. I believe you are acquainted with many aspects of Earth and are more learned in that respect than I am, for you have studied the subject longer."

"How do you know that?"

"I have tried to learn as much about you as I can, sir."

"Because I am another one of your enemies?"

"No, sir, but because I want to make you an ally."

"Make me an ally? You plan to make use of me, then?"

Does it strike you that you are being a little impertinent?"

"No, sir, for I am sure you will want to be an ally of mine."

Amadiro stared at him. "Nevertheless, it strikes me that you are being rather more than a little impertinent. --Tell me, do you understand this quotation you have found for me?"

"Yes, sir."

"Then translate it into Standard Galactic."

"It says, 'In my opinion, Carthage must be destroyed.'"

"And what does that mean, in your opinion?"

"The speaker was Marcus Porcius Cato, a senator of the Roman Republic, a political unit of ancient Earth. It had defeated its chief rival, Carthage, but had not destroyed it. Cato held that Rome could not be secure until Carthage was entirely destroyed--and eventually, sir, it was."

"But what is Carthage to us, young man?"

"There are such things as analogies."

"Which means?"

"That the Spacer worlds, too, have a chief rival that, in my opinion, must be destroyed."

"Name the enemy."

"The planet Earth, sir."

Amadiro drummed his fingers very softly upon the desk before him. "And you want me to be your ally in such a project. You assume I will be happy and eager to be one. --Tell me, Dr. Mandamus, when have I ever said in any of my numerous speeches and writings on the subject that Earth must be destroyed?"

Mandamus's thin lips tightened and his nostrils flared. "I am not here," he said, "in an attempt to trap you into something that can be used against you. I have not been sent here by Dr. Fastolfe or any of his party. Nor am I of his party. Nor do I attempt to say what is in your mind. I tell you only what is in my mind. In my opinion, Earth must be destroyed."
"

"And how do you propose to destroy Earth? Do you suggest that we drop nuclear bombs on it until the blasts and radiation and dust clouds destroy the planet? Because, if so, how do you propose to keep avenging Settler ships from doing the same to Aurora and to as many of the other Spacer worlds as they can reach? Earth might have been blasted with impunity as recently as fifteen decades ago. It can't be now."

Mandamus looked revolted. "I have nothing like that in mind, Dr. Amadiro. I would not unnecessarily destroy human beings, even if they are Earthpeople. There is a way,

however, in which Earth can be destroyed without necessarily killing its people wholesale--and there will be no retaliation."

"You are a dreamer," said Amadiro, "or perhaps not quite sane."

"Let me explain."

"No, young man. I have little time and because your quotation, which I understood perfectly well, piqued my curiosity, I have already allowed myself to spend too much of it on you.

Mandamus stood up. "I understand, Dr. Amadiro, and I beg your pardon for taking up more of your time than you could afford. Think of what I have said, however, and if you should become curious, why not call upon me when you have more time to devote to me than you now have. Do not wait too long, however, for if I must, I will turn in other directions, for destroy Earth I will. I am frank with you, you see."

The young man attempted a smile that stretched his thin cheeks without producing much of an effect on his face otherwise. He said, "Good-bye--and thank you again," turned, and left.

Amadiro looked after him for a while thoughtfully, then touched a contact on the side of his desk.

"Maloon," he said when Cicis entered, "I want that young man watched around the clock and I want to know everyone he speaks to. Everyone. I want them all identified and I want them all questioned. Those whom I indicate are to be brought to me. --But, Maloon, everything must be done quietly and with an attitude of sweet and friendly persuasion. I am not yet master here, as you know."

But he would be eventually. Fastolfe was thirty-six decades old and clearly failing and Amadiro was eight decades younger.

45.

Amadiro received his reports for nine days.

Mandamus talked to his robots, occasionally to colleagues at the university, and even more occasionally to individuals at the establishments neighboring his. His conversations were utterly trivial and, long before the nine days had passed, Amadiro had decided he could not outwait the young man. Mandamus was only at the beginning of a long life and might have thirty decades ahead of him; Amadiro had only eight to ten at the very most.

And Amadiro, thinking of what the young man had said, felt, with increasing restlessness, that he could not take the chance that a way of destroying Earth might exist and that he might be ignoring it. Could he allow the destruction to take place after his death, so that he would not witness it? Or, almost as bad, have it take place during his lifetime, but with someone else's mind in command, someone else's fingers on the contact?

No, he had to see it, witness it, and do it; else why had he endured his long frustration? Mandamus might be a fool or a madman, but, in that case, Amadiro had to know for certain that he was a fool or a madman.

Having reached that point in his thinking, Amadiro called Mandamus to his office.

Amadiro realized that in so doing, he was humiliating himself, but the humiliation was the price he had to pay to make certain that there wasn't the slightest chance of Earth being destroyed without him. It was a price he was willing to pay.

He steeled himself even for the possibility that Mandamus would enter his presence, smirking and contemptuously triumphant. He would have to endure that, too. After the endurance, of course, if the young man's suggestion proved foolish, he would see him punished to the full extent that a civilized society would permit, but otherwise.

He was pleased, then, when Mandamus entered his office with an attitude of reasonable humility and thanked him, in all apparent sincerity, for a second interview. It seemed to Amadiro he would have to be gracious in his turn.

"Dr. Mandamus," he said, "in sending you away without listening to your plan, I was guilty of discourtesy. Tell me, then, what you have in mind and I will listen until it is quite clear to me--as I suspect it will be--that your plan is, perhaps, more the result of enthusiasm than of cold reason. At that time, I will dismiss you again, but without contempt on my part, and I hope that you will respond without anger on your part."

Mandamus said, "I could not be angry at having been accorded a fair and patient hearing, Dr. Amadiro, but what if what I say makes sense to you and offers hope?"

"In that case," said Amadiro slowly, "it would be conceivable that we two could work together."

"That would be wonderful, sir. Together we could accomplish more than we could separately. But would there be something more tangible than the privilege of working together? Would there be a reward?"

Amadiro looked displeased. "I would be grateful, of course, but all I am is a Councilman and the head of the Robotics Institute. There would be a limit to what I could do for you."

"I understand that, Dr. Amadiro. But within those limits could I not have something on account? Now?" He looked at Amadiro steadily.

Amadiro frowned at finding himself gazing into a pair of keen and unblinkingly determined eyes. No humility there!

Amadiro said coldly, "What do you have in mind?"

"Nothing you can't give me, Dr. Amadiro. Make me a member of the Institute."

"If you qualify--"

"No fear. I qualify."

"We can't leave that decision to the candidate. We have to--"

"Come, Dr. Amadiro, this is no way to begin a relationship. Since you've had me under observation every moment since I left you last, I can't believe you haven't studied my record thoroughly. As a result, you must know I qualify. If, for any reason, you felt I did not qualify, you would have no hope whatever that I would be ingenious enough to work

out a plan for the destruction of our particular Carthage and I wouldn't be back here at your call."

For an instant, Amadiro felt a fire blaze within him. For that instant, he felt that even Earth's destruction was not worth enduring this hectoring attitude from a child. But only for that instant. Then his sense of due proportion was back and he could even tell himself that a person so young, yet so bold and so icily sure of himself, was the kind of man he needed. Besides, he had studied Mandamus's record and there was no question that he qualified for the Institute.

Amadiro said evenly (at some cost to his blood pressure), "You are right. You qualify."

"Then enroll me. I'm sure you have the necessary forms in your computer. You have but to enter my name, my school, my year of graduation, and whatever other statistical trivia you require and then sign your own name."

Without a word in reply, Amadiro turned to his computer. He entered the necessary information, retrieved the form, signed it, and handed it to Mandamus. "It is dated today. You are a fellow of the Institute."

Mandamus studied the paper, then handed it to one of his robots, who placed it in a small portfolio which he then placed under his arm.

"Thank you," said Mandamus, "it is most kind of you and I hope I will never fail you or cause you to regret this kind estimate you have given me of my abilities. That, however, leaves one more thing."

"Indeed? What?"

"Might we discuss the nature of the final reward--in case of success only, of course. Total success."

"Might we not leave that, more logically, to the point where total success is achieved or is reasonably close to being achieved?"

"As a matter of rationality, yes. But I am a creature of dreams as well as of reason. I would like to dream a little."

"Well," said Amadiro, "what is it you would like to dream?"

"It seems to me, Dr. Amadiro, that Dr. Fastolfe is now by no means well. He has lived long and cannot stave off death for many more years."

"And if so?"

"Once he dies, your party will become more aggressive and the more lukewarm members of Fastolfe's party will find it expedient to change allegiance, perhaps. The next election, without Fastolfe, will surely be yours."

"It is possible. And if so?"

"You will become the de facto leader of the Council and the guide of Aurora's foreign policy which would, in fact, mean the foreign policy of the Spacer worlds in general. And if my plans flourish, your direction will be so successful that the Council will scarcely fail to elect you Chairman at their earliest opportunity. "

"Your dreams soar, young man. And if all you foresee were to come true, what then?"

"You would scarcely have time to run Aurora and the Robotics Institute, too. So I ask that when you finally decide to resign from your present position as the head of the Institute, you be prepared to support me as your successor to the post. You could scarcely expect to have your personal choice rejected."

Amadiro said, "There is such a thing as qualification for the post."

"I will qualify. "

"Let us wait and see."

"I am willing to wait and see, but you will find that well before complete success is ours, you will wish to grant this request of mine. Please grow accustomed to the idea, therefore."

"All this before I hear a word," murmured Amadiro. "Well, you are a member of the Institute and I will strive to grow accustomed to your personal dream, but now let us have an end to preliminaries and tell me how you intend to destroy Earth."

Almost automatically, Amadiro made the sign that indicated to his robots that they were not to remember any part of the conversation. And Mandamus, with a small smile, did the same for his.

"Let us start, then," said Mandamus. But before he could speak further, Amadiro moved to the attack.

"Are you sure you're not pro-Earth?"

Mandamus looked startled. "I am coming to you with a proposal to destroy Earth."

"And yet you are a descendant of the Solarian woman--in the fifth generation, I understand."

"Yes, sir, it is on public record. What of that?"

"The Solarian woman is--and has been for a long time--a close associate--friend--protegee--of Fastolfe. I wonder you do not sympathize with his pro-Earth views, therefore."

"Because of my ancestry?" Mandamus seemed honestly astonished. For a moment, what might have been a flash of annoyance or even anger seemed to tighten his nostrils, but that vanished and he said quietly, "An equally longtime close associate--friend--protegee--of your own is Dr. Vasilia Fastolfe, who is Dr. Fastolfe's daughter. She is a descendant in the first generation. I wonder she does not sympathize with his views."

"I have in the past also wondered," said Amadiro, "but she doesn't sympathize with them and, in her case, I have ceased wondering. "

"You may cease wondering in my case, too, sir. I am a Spacer and I want to see the Spacers in control of the Galaxy."

"Very well, then. Go on with the description of your plan."

Mandamus said, "I will, but--if you don't mind--from the beginning."

"Dr. Amadiro, astronomers agree that there are millions of Earthlike planets in our Galaxy, planets on which human beings can live after necessary adjustments to the environment but without any need for geological terraforming. Their atmospheres are breathable, an ocean of water is present, the land and climate is suitable, life exists."

Indeed, the atmospheres would not contain free oxygen without the presence of ocean plankton at the very least.

"The land is often barren, but once it and the ocean undergo biological terraforming--that is, once they are seeded with Earth life--such life flourishes and the planet can then be settled. Hundreds of such planets have been recorded and studied and about half of them are already occupied by Settlers.

"And yet not one habitable planet of all those which have been discovered to date has the enormous variety and excess of life that Earth has. Not one has anything larger or more complex than a small array of wormlike or insect-like invertebrates or, in the plant world, anything more advanced than some fernlike shrubbery. No question of intelligence, of anything even approaching intelligence."

Amadiro listened to the stiff sentences and thought: He's speaking by rote. He's memorized all this. --He stirred and said, "I am not a planetologist, Dr. Mandamus, but I ask you to believe that you are telling me nothing I don't already know."

"As I said, Dr. Amadiro, I am starting from the beginning. --Astronomers are increasingly of the belief that we have a fair sample of the habitable planets of the Galaxy and that all--or almost all--are markedly different from Earth. For some reason, Earth is a surprisingly unusual planet and evolution has proceeded on it at a radically rapid pace and in a radically abnormal manner."

Amadiro said, "The usual argument is that if there were another intelligent species in the Galaxy that was as advanced as we are, it would have become aware of our expansion by now and have made themselves known to us--one way or another."

Mandamus said, "Yes, sir. In fact, if there were another intelligent species in the Galaxy that was more advanced than we are, we would not have had a chance to expand in the first place. That we are the only species in the Galaxy capable of traveling in hyperspace would seem certain, then. That we are the only species in the Galaxy that is intelligent is perhaps not quite certain, but there is a very good chance that we are."

Amadiro was now listening with a weary half-smile. The young man was being didactic, like a man stamping out the rhythm of his monomania in a dull beat. It was one of the marks of the crank and the mild hope Amadiro had had that Mandamus might actually have something that would turn the tide of history was beginning to fade.

He said, "You continue to tell me the known, Dr. Mandamus. Everyone knows Earth seems unique and that we are probably the only intelligent species in the Galaxy."

"But no one seems to ask the simple question: 'Why?' The Earthpeople and the Settlers don't ask it. They accept it. They have a mystic attitude toward Earth and consider it a holy world, so that its unusual nature is taken as a matter of course. As for the Spacers, we don't ask it. We ignore it. We do our best not to think of Earth at all, since if we do, we are liable to go further and think of ourselves as having descended from Earthpeople."

Amadiro said, "I see no virtue in the question. We need not seek for complex answers to the 'Why?'. Random processes play an important role in evolution and, to some extent, in all things. If there are millions of habitable worlds, evolution may proceed

on each of them at a different rate. On most, the rate will have some intermediate value; on some the rate will be distinctly slow, on others distinctly fast; on perhaps one it would proceed exceedingly slow and on another exceedingly fast. Earth happens to be the one on which it proceeded exceedingly fast and we are here because of that. Now if we ask 'Why?', the natural--and sufficient--answer is 'Chance.'"

Amadiro waited for the other to betray the crank by exploding in rage at a preeminently logical statement, presented in an amused way, that served to shatter his thesis completely. Mandamus, however, merely stared at him for a few moments out of his deep-set eyes and then said quietly, "No."

Mandamus let that stand for perhaps two beats and then said, "It takes more than a lucky chance or two to speed evolution a thousandfold. On every planet but Earth, the speed of evolution is closely related to the flux of cosmic radiation in which that planet is bathed. That speed is not the result of chance at all but the result of cosmic radiation producing mutations at a slow rate. On Earth, something produces many more mutations than are produced on other habitable planets and that has nothing to do with cosmic rays, for they do not strike Earth in any remarkable profusion. Perhaps you see a little more clearly, now, why the 'Why?' could be important."

"Well, then, Dr. Mandamus, since I am still listening, with rather more patience than I would have expected myself to possess, answer the question you so insistently raise. Or do you merely have the question and no answer?"

"I have an answer," said Mandamus, "and it depends upon the fact that Earth is unique in a second way."

Amadiro said, "Let me anticipate. You are referring to its large satellite. Surely, Dr. Mandamus, you are not advancing this as a discovery of yours."

"Not at all," said Mandamus stiffly, "but consider that large satellites seem to be common. Our planetary system has five, Earth's has seven and so on. All the known large satellites but one, however, circle gas giants. Only Earth's satellite, the moon, circles a planet not much larger than itself."

"Dare I use the word 'chance' again, Dr. Mandamus?"

"In this case, it may be chance, but the moon remains unique."

"Even so. What possible connection can the satellite have with Earth's profusion of life?"

"That may not be obvious and a connection may be unlikely--but it is far more unlikely that two such unusual examples of uniqueness in a single planet can have no connection at all. I have found such a connection."

"Indeed?" said Amadiro alertly. Now ought to come unmistakable evidence of crackpotism. He looked casually at the time strip on the wall. There really wasn't much more time he could possibly spend on this, for all that his curiosity continued to be aroused.

"The moon," said Mandamus, "is slowly receding from Earth, due to its tidal effect on the Earth. Earth's large tides are a unique consequence of the existence of this large

satellite. Earth's sun produces tides, too, but to only a third of the extent of the moon's tides--just as our sun produces small tides on Aurora.

"Since the moon recedes because of its tidal action, it was far closer to Earth during the early history of its planetary system. The closer the moon to the Earth, the higher the tides on Earth. These tides had two important effects on Earth. It flexed the Earth's crust continually as the Earth rotated and it slowed the Earth's rotation, both through that flexing and through the friction of the ocean's water tides on shallow sea bottoms--so that rotational energy was converted to heat.

"The Earth, therefore, has a thinner crust than any other habitable planet we know of and it is the only habitable planet that displays volcanic action and that has a lively system of plate tectonics."

Amadiro said, "But even all this can have nothing to do with Earth's profusion of life. I think you must either get to the point, Dr. Mandamus, or leave."

"Please bear with me, Dr. Amadiro, for just a little while longer. It is important to understand the point once we get to it. I have made a careful computer simulation of the chemical development of Earth's crust, allowing for the effect of tidal action and plate tectonics, something that no one has ever done before in as meticulous and elaborate a way as I have managed to do--if I may praise myself."

"Oh, by all means," murmured Amadiro.

"And it turns out, quite clearly--I will show you all the necessary data at any time you wish--that uranium and thorium collect in Earth's crust and upper mantle in concentrations of up to a thousand times as high as in any other habitable world. Moreover, they collect unevenly, so that scattered over the Earth are occasional pockets where uranium and thorium are even more concentrated."

"And, I take it, dangerously high in radioactivity?"

"No, Dr. Amadiro. Uranium and thorium are very weakly radioactive and even where they are relatively concentrated, they are not very concentrated in an absolute sense. --All this, I repeat, is because of the presence of a large moon. "

"I assume, then, that the radioactivity, even if not intense enough to be dangerous to life, does suffice to increase the mutation rate. Is that it, Dr. Mandamus?"

"That is it. There would be more rapid extinctions now and then, but also more rapid development of new species--resulting in an enormous variety and profusion of life-forms. And, eventually, on Earth alone, this would have reached the point of developing an intelligent species and a civilization."

Amadiro nodded. The young man was not a crank. He might be wrong, but he was not a crank. And he might be right, too.

Amadiro was not a planetologist, so he would have to check books on the subject to see whether Mandamus had perhaps discovered only the already-known, as so many enthusiasts did. There was, however, a more important point that he had to check at once.

He said in a soft voice, "You've spoken of the possible destruction of Earth. Is there some connection between that and Earth's unique properties?"

"One can take advantage of unique properties in a unique manner," said Mandamus just as softly.

"In this particular case in what way?"

"Before discussing the method, Dr. Amadiro, I must explain that, in one respect, the question as to whether destruction is physically possible depends on you."

"On me?"

"Yes," said Mandamus firmly. "On you. Why, otherwise, should I come to you with this long story if not to persuade you that I know what I'm talking about, so that you would be willing to cooperate with me in a manner that will be essential to my success?"

Amadiro drew a long breath. "And if I refused, would anyone else serve your purpose?"

"It might be possible for me to turn to others if you refuse. Do you refuse?"

"Perhaps not, but I am wondering how essential I am to you."

"The answer is, not quite as essential as I am to you. You must cooperate with me."

"Must?"

"I would like you to--if you prefer it phrased in that fashion. But if you wish Aurora and the Spacers to triumph, now and forever, over Earth and the Settlers, then you must cooperate with me, whether you like the phrase or not. "

Amadiro said, "Tell me what it is, exactly, that I must do."

"Begin by telling me if it is not true that the Institute has, in the past, designed and constructed humanoid robots."

"Yes, we did. Fifty of them all together. That was between fifteen and twenty decades ago."

"That long ago? And what happened to them?"

"They failed," said Amadiro indifferently.

Mandamus sat back in his chair with a horrified expression on his face. "They were destroyed?"

Amadiro's eyebrows shot upward. "Destroyed? No one destroys expensive robots. They are in storage. The power units are removed and a special long-lived microfusion battery is in each to keep the positronic paths minimally alive. "

"Then they can be brought back to full action?"

"I am sure they can."

Mandamus's right hand beat out a tightly controlled rhythm against the arm of the chair. He said grimly, "Then we can win!"

12. THE PLAN AND THE DAUGHTER

46.

It had been a long time since Amadiro had thought of the humanoid robots. It was a painful thought and he had, with some difficulty, trained himself to keep his mind away from that topic. And now Mandamus had unexpectedly brought it up.

The humanoid robot had been Fastolfe's great trump card in those long-gone days when Amadiro had been within a millimeter of taking the game, trump card and all. Fastolfe had designed and built two humanoid robots (of which one still existed) and no one else could build any. The entire membership of the Robotics Institute, working together, could not build them.

All that Amadiro had salvaged out of his great defeat had been that trump card. Fastolfe had been forced to make public the nature of the humanoid design.

That meant humanoid robots could be built and were built and--behold--they were not wanted. The Aurorans would not have them in their society.

Amadiro's mouth twisted in the remnant of remembered chagrin. The tale of the Solarian woman had somehow come to be known--the fact that she had had the use of Jander, one of Fastolfe's two humanoid robots, and that the use had been sexual. Aurorans had no objection to such a situation in theory. When they stopped to think of it, however, Auroran women simply did not enjoy the thought of having to compete with robot women. Nor did Auroran men wish to compete with robot men.

The Institute had labored mightily to explain that the humanoid robots were not intended for Aurora itself, but were meant to serve as the initial wave of pioneers who would seed and adjust new habitable planets for Aurorans to occupy later, after they had been terraformed.

That, too, was rejected, as suspicion and objection fed on itself. Someone had called the humanoids "the entering wedge." The expression spread and the Institute was forced to give up.

Stubbornly, Amadiro had insisted on mothballing those which existed for possible future use--a use that had never yet materialized.

Why had there been this objection to the humanoids? Amadiro felt a faint return of the irritation that had all but poisoned his life those many decades ago. Fastolfe himself, though reluctant, had agreed to back the project and, to do him justice, had done so, though without quite the eloquence he devoted to those matters to which his heart was truly given. --but it had not helped.

And yet--and yet--if Mandamus now really had some project in mind that would work and would require the robots.

Amadiro had no great fondness for mystical cries of: "It was better so. It was meant to be." Yet it was only with an effort that he kept himself from thinking this, as the elevator took them down to a spot well below ground level--the only place in Aurora that might be similar, in a tiny way, to Earth's fabled Caves of Steel.

Mandamus stepped out of the elevator at Amadiro's gesture and found himself in a dim corridor. It was chilly and there was a soft ventilating wind. He shivered slightly. Amadiro joined him. But a single robot followed each.

"Few people come here," Amadiro said matter-of-factly.

"How far underground are we?" asked Mandamus.

"About fifteen meters. There are a number of levels. It is on this one that the humanoid robots are stored."

Amadiro stopped a moment, as though in thought, then turned firmly to the left. "This way!"

"No directing signs?"

"As I said, few people come here. Those who do know where they should go to find what they need."

As he said that, they came to a door that looked solid and formidable in the dim light. On either side stood a robot. They were not humanoid.

Mandamus regarded them critically and said, "These are simple models."

"Very simple. You wouldn't expect us to waste anything elaborate on the task of guarding a door." Amadiro raised his voice, but kept it impassive. "I am Kelden Amadiro."

The eyes of both robots glowed briefly. They turned outward, away from the door, which opened noiselessly, rising upward.

Amadiro directed the other through and, as he passed the robots, said calmly, "Leave it open and adjust the lighting to personal need."

Mandamus said, "I don't suppose just anyone could enter here."

"Certainly not. Those robots recognize my appearance and voiceprint and require both before opening the door." Half to himself, he added, "No need for locks or keys or combinations anywhere on the Spacer worlds. The robots guard us faithfully and always."

"I had sometimes thought," said Mandamus broodingly, "that if an Auroran were to borrow one of those blasters that Settlers seem to carry with them wherever they go, there would be no locked doors for him. He could destroy robots in an instant, then go wherever he wished, do whatever he wanted."

Amadiro darted a fiery glance at the other. "But what Spacer would dream of using such weapons on a Spacer world? We live our lives without weapons and without violence. Don't you understand that that is why I have devoted my life to the defeat and destruction of Earth and its poisoned brood. --Yes, we had violence once, but that was long ago, when the Spacer worlds were first established and we had not yet rid ourselves of the poison of the Earth from which we came, and before we had learned the value of robotic security.

"Aren't peace and security worth fighting for? Worlds without violence! Worlds in which reason rules! Was it right for us to hand over scores of habitable worlds to short-lived barbarians who, as you say, carry blasters about with them everywhere?"

"And yet," murmured Mandamus, "are you ready to use violence to destroy Earth?"

"Violence briefly--and for a purpose--is the price we probably will have to pay for putting an end to violence forever."

"I am Spacer enough," said Mandamus, "to want even that violence minimized."

They had now entered a large and cavernous room and, as they entered, walls and ceiling came to life with diffuse and unglaring light.

"Well, is this what you want, Dr. Mandamus?" asked Amadiro.

Mandamus looked about, stunned. Finally, he managed to say, "Incredible!"

They stood there, a solid regiment of human beings, with a little more life to them than so many statues might have showed, but with far less life than sleeping human beings would have displayed.

"They're standing," muttered Mandamus.

"They take up less room that way. Obviously."

"But they've been standing about fifteen decades. They can't still be in working order. Surely their joints are frozen, their organs broken down."

Amadiro shrugged. "Perhaps. Still, if the joints have deteriorated--and that isn't out of the question, I suppose--those can be replaced--if necessary. It would depend on whether there would be reason to do so."

"There would be reason," said Mandamus. He looked from head to head. They were staring in slightly different directions and that gave them a somewhat unsettling appearance, as though they were on the point of breaking ranks.

Mandamus said, "Each has an individual appearance and they differ in height, build, and so on."

"Yes. Does that surprise you? We were planning to have these, along with others we might have built, be the pioneers in the development of new worlds. To have them do so properly, we wanted them to be as human as possible, which meant making them as individual as Aurorans are. Doesn't that seem sensible to you?"

"Absolutely. I'm glad this is so. I've read all I can about the two protohumaniforms that Fastolfe himself built--Daneel Olivaw and Jander Panell. I've seen holographs of them and they seemed identical."

"Yes," said Amadiro impatiently. "Not only identical, but each virtually a caricature of one's conception of the ideal Spacer. That was Fastolfe's romanticism. I'm sure that he would have built a race of interchangeable humanoid robots, with both sexes possessing such ethereal good looks--or what he considered to be that--as to make them completely inhuman. Fastolfe may be a brilliant roboticist, but he is an incredibly stupid man."

Amadiro shook his head. To have been beaten by such an incredibly stupid man, he thought--and then he thrust the thought away. He had not been beaten by Fastolfe, but by that infernal Earthman. Lost in thought, he did not hear Mandamus's next question.

"Pardon me," he said with an edge of irritation.

"I said, 'Did you design these, Dr. Amadiro?'"

"No, by an odd coincidence--and one that strikes me as possessing a peculiar irony--these were designed by Fastolfe's daughter Vasilia. She's as brilliant as he is and much more intelligent--which may be one reason why they never got along."

"As I have heard the story concerning them--" began Mandamus.

Amadiro waved him into silence. "I have heard the story, too, but it doesn't matter. It's enough that she does her work very well and that there is no danger that she will ever find herself in sympathy with someone who, despite the accident that he is her biological father, is--and must remain--forever alien and hateful to her. She even calls herself Vasilia Aliena, you know."

"Yes, I know. Do you have the brain patterns of these humanoid robots on record?"

"Certainly."

"For each of these?"

"Of course. "

"And can they be made available to me?"

"If there's a reason for it."

"There will be," said Mandamus firmly. "Since these robots were designed for pioneering activities, may I assume they are equipped to explore a world and deal with primitive conditions?"

"That should be self-evident. "

"That's perfect--but there may have to be some modifications. Do you suppose that Vasilia Fast-Aliena would be able to help me with that--if necessary? Obviously, she would be best-acquainted with the brain patterns."

"Obviously. Still, I don't know whether she would be willing to help you. I do know that it is physically impossible for her to do so at the moment, since she is not on Aurora."

Mandamus looked surprised and displeased. "Where is she, then, Dr. Amadiro?"

Amadiro said, "You have seen these humaniforms and I do not wish to expose myself to these rather dismal surroundings. You have kept me waiting long enough and you must not complain if I keep you waiting now. If you have any further questions, let us deal with them in my office."

47.

Once in the office, Amadiro delayed things a while longer. "Wait here for me," he said rather peremptorily and left.

Mandamus waited stiffly, sorting out his thoughts, wondering when Amadiro would return--or if he would. Was he to be arrested or simply ejected? Had Amadiro grown tired of waiting for the point?

Mandamus refused to believe that. He had gained a shrewd idea of Amadiro's desperate desire for evening an old score. It seemed evident that Amadiro wouldn't get

tired of listening as long as there seemed the slightest chance that Mandamus would make revenge possible.

As he looked idly about Amadiro's office, Mandamus found himself wondering whether there might be any information that might be of help to him in the computerized files almost immediately at hand. It would be useful not to have to depend directly on Amadiro for everything.

The thought was a useless one. Mandamus did not know the entry code for the files and, even if he did, there were several of Amadiro's personal robots standing in their niches and they would stop him if he took a single step toward anything that was labeled in their minds as sensitive. Even his own robots would.

Amadiro was right. Robots were so useful and efficient--and incorruptible--as guards that the very concept of anything criminal, illegal, or simply underhanded did not occur to anyone. The tendency just atrophied--at least as against other Spacers.

He wondered how Settlers could manage without robots. Mandamus tried to imagine human personalities clashing, with no robotic bumpers to cushion the interaction, no robotic presence to give them a decent sense of security and to enforce--without their being consciously aware of it most of the time--a proper mode of morality.

It would be impossible for Settlers to be anything but barbarians under the circumstance and the Galaxy could not be left to them. Amadiro was right in that respect and had always been right, while Fastolfe was fantastically wrong.

Mandamus nodded, as though he had once again persuaded himself as to the correctness of what he was planning. He sighed and wished it were not necessary, then prepared to go over, once again, the line of reasoning that proved to him that it was necessary, when Amadiro strode in.

Amadiro was still an impressive figure, even though he was within a year of his twenty-eighth decade-day. He was very much what a Spacer ought to look like, except for the unfortunate shapelessness of his nose.

Amadiro said, "I'm sorry to have kept you waiting, but there was business I had to attend to. I am the head of this Institute and that entails responsibilities. "

Mandamus said, "Could you tell me where Dr. Vasilina Aliena is? I will then describe my project to you without delay. "

"Vasilina is on tour. She's visiting each of the Spacer worlds to find out where they stand on robot research. She appears to think that, since the Robot Institute was founded to coordinate individual research on Aurora, interplanetary coordination would advance the cause even farther. A good idea, actually."

Mandamus laughed, shortly and without humor. "They won't tell her anything. I doubt any Spacer world wants to hand Aurora a more enormous lead than she already has."

"Don't be too sure. The Settler situation has disturbed us all."

"Do you know where she is now?"

"We have her itinerary. "

"Get her back, Dr. Amadiro."

Amadiro frowned. "I doubt I can do that easily. I believe she wants to be away from Aurora until her father dies."

"Why?" asked Mandamus in surprise.

Amadiro shrugged. "I don't know. I don't care. --But what I do know is that your time has run out. Do you understand? Get to the point or leave." He pointed to the door grimly and Mandamus felt that the other's patience would stretch no farther.

Mandamus said, "Very well. There is yet a third way in which Earth is unique--"

He talked easily and with due economy, as though he were going through an exposition that he had frequently rehearsed and polished for the very purpose of presenting it to Amadiro. And Amadiro found himself increasingly absorbed.

That was it! Amadiro first felt a huge sense of relief. He had been correct to gamble on the young man's not being a crackpot. He was entirely sane.

Then came triumph. It would surely work. Of course, the young man's view, as it was expounded, veered a bit from the path Amadiro felt it ought to follow, but that could be taken care of eventually. Modifications were always possible.

And when Mandamus was done, Amadiro said in a voice he strove to hold steady, "We won't need Vasilia. There is appropriate expertise at the Institute to allow us to begin at once. Dr. Mandamus"--a note of formal respect entered Amadiro's voice--"let this thing work out as planned--and I cannot help but think it will--and you will be the head of the Institute when I am Chairman of the Council."

Mandamus smiled narrowly and briefly, while Amadiro sat back in his chair and, just as briefly, allowed himself to look into the future with satisfaction and confidence, something he had not been able to do for twenty long and weary decades.

How long would it take? Decades? One decade? Part of a decade?

Not long. Not long. It must be hastened by all means so that he could live to see that old decision overturned and himself lord of Aurora--and therefore of the Spacer worlds--and therefore (with Earth and the Settler worlds doomed) even lord of the Galaxy before he died.

48.

When Dr. Han Fastolfe died, seven years after Amadiro and Mandamus met and began their project, the hyperwave carried the news with explosive force to every corner of the occupied worlds. It merited the greatest attention everywhere.

In the Spacer worlds it was important because Fastolfe had been the most powerful man on Aurora and, therefore, in the Galaxy for over twenty decades. In the Settler worlds and on Earth, it was important because Fastolfe had been a friend--insofar as a Spacer could be a friend--and the question now was whether Spacer policy would change and, if so, how.

The news came also to Vasilia Aliena and it was complicated by the bitterness that had tinged her relationship with her biological father almost from the beginning.

She had schooled herself to feel nothing when he died, yet she had not wanted to be on the same world that he was on at the time the event took place. She did not want the questions that would be leveled at her anywhere, but most frequently and insistently on Aurora.

The parent-child relationship among the Spacers was a weak and indifferent one at best. With long lives, that was a matter of course. Nor would anyone have been interested in Vasilia in that respect, but for the fact that Fastolfe was so continually prominent a party leader and Vasilia almost as prominent a partisan on the other side.

It was poisonous. She had gone to the trouble of making Vasilia Aliena her legal name and of using it on all documents, in all interviews, in all dealings of any kind--and yet she knew for a fact that most people thought of her as Vasilia Fastolfe. It was as though nothing could wipe out that thoroughly meaningless relationship, so that she was reduced to having to be content with being addressed by her first name only. It was, at least, an uncommon name.

And that, too, seemed to emphasize her mirror-image relationship with the Solarian woman who, for thoroughly independent reasons, had denied her first husband as Vasilia had denied her father. The Solarian woman, too, could not live with the early surnames fastened upon her and ended with a first name only--Gladia.

Vasilia and Gladia, misfits, deniers--They even resembled each other.

Vasilia stole a look at the mirror hanging in her spaceship cabin. She had not seen Gladia in many decades, but she was sure that the resemblance remained. They were both small and slim. Both were blond and their faces were somewhat alike.

But it was Vasilia who always lost and Gladia who always won. When Vasilia had left her father and had struck him from her life, he had found Gladia instead--and she was the pliant and passive daughter he wanted, the daughter that Vasilia could never be.

Nevertheless, it embittered Vasilia. She herself was a roboticist, as competent and as skillful, at last, as ever Fastolfe had been, while Gladia was merely an artist, who amused herself with force-field coloring and with the illusions of robotic clothing. How could Fastolfe have been satisfied to lose the one and gain, in her place, nothing more than the other?

And when that policeman from Earth, Elijah Baley, had come to Aurora, he had bullied Vasilia into revealing far more of her thoughts and feelings than she had ever granted anyone else. He was, however, softness itself to Gladia and had helped her--and her protector, Fastolfe--win out against all the odds, though to this day Vasilia had not been able to understand clearly how that had happened.

It was Gladia who had been at Fastolfe's bedside during the final illness, who had held his hand to the end, and who had heard his last words. Why Vasilia should resent that, she didn't know, for she herself would, under no circumstances, have acknowledged the old man's existence to the extent of visiting him to witness his passage into nonexistence in an absolute, rather than a subjective sense--and yet she raged against Gladia's presence.

It's the way I feel, she told herself defiantly, and I owe no one an explanation.

And she had lost Giskard. Giskard had been her robot, Vasilias own robot when she had been a young girl, the robot granted her by a then seemingly fond father. It was Giskard through whom she had learned robotics and from whom she had felt the first genuine affection. She had not, as a child, speculated on the Three Laws or dealt with the philosophy of positronic automatism. Giskard had seemed affectionate, he had acted as though he were affectionate, and that was enough for a child. She had never found such affection in any human being--certainly not her father.

To this day, she had yet to be weak enough to play the foolish love game with anyone. Her bitterness over her loss of Giskard had taught her that any initial gain was not worth the final deprivation.

When she had left home, disowning her father, he would not let Giskard go with her, even though she herself had improved Giskard immeasurably in the course of her careful reprogramming of him. And when her father had died, he had left Giskard to the Solarian woman. He had also left her Daneel, but Vasilias cared nothing for that pale imitation of a man. She wanted Giskard, who was her own.

Vasilias was on her way back to Solaria now. Her tour was quite done. In fact, as far as usefulness was concerned, it had been essentially over months ago. But she had remained on Hesperos for a needed rest, as she had explained in her official notice to the Institute.

Now, however, Fastolfe was dead and she could return. And while she could not undo the past entirely, she could undo part of it. Giskard must be hers again.

She was determined on that.

49.

Amadiro was quite ambivalent in his response to Vasilias return. She had not come back until old Fastolfe (he could say the name to himself quite easily now that he was dead) was a month in his urn. That flattered his opinion of his own understanding. After all, he had told Mandamus her motive had been that of remaining away from Aurora till her father died.

Then, too, Vasilias was comfortably transparent. She lacked the exasperating quality of Mandamus, his new favorite, who always seemed to have yet another unexpressed thought tucked away no matter how thoroughly he seemed to have discharged the contents of his mind.

On the other hand, she was irritatingly hard to control, the least likely to go quietly along the path he indicated. Leave it to her to probe the otherworld Spacers to the bone during the years she had spent away from Aurora--but then leave it also to her to interpret it all in dark and riddling words.

So he greeted her with an enthusiasm that was somewhere between feigned and unfeigned.

"Vasilia, I'm so happy to have you back. The Institute flies on one wing when you're gone."

Vasilia laughed. "Come, Kelden"--she alone had no hesitation or inhibition in using his given name, though she was two and a half decades younger than he--"that one remaining wing is yours and how long has it been now since you ceased being perfectly certain that your one wing was sufficient?"

"Since you decided to stretch out your absence to years. Do you find Aurora much changed in the interval?"

"Not a bit--which ought perhaps to be a concern of ours. Changelessness is decay."

"A paradox. There is no decay without a change for the worse."

"Changelessness is a change for the worse, Kelden, in comparison to the surrounding Settler worlds. They change rapidly, extending their control into more numerous worlds and over each individual world more thoroughly. They increase their strength and power and self-assurance, while we sit here dreaming and find our unchanging might diminishing steadily in comparison. "

"Beautiful, Vasilia! I think you memorized that carefully on your flight here. However, there has been a change in the political situation on Aurora."

"You mean my biological father is dead."

Amadiro spread his arms with a little bow of his head. "As you say. He was largely responsible for our paralysis and he is gone, so I imagine there will now be change, though it may not necessarily be visible change."

"You keep secrets from me, do you?"

"Would I do that?"

"Certainly. That false smile of yours gives you away every time."

"Then I must learn to be grave with you. --Come, I have your report. Tell me what is not included in it. "

"All is included in it--almost. Each Spacer world states vehemently that it is disturbed by growing Settler arrogance. Each is firmly determined to resist the Settlers to the end, enthusiastically following the Auroran lead with vigor and death-defying gallantry."

"Follow our lead, yes. And if we don't lead?"

"Then they'll wait and try to mask their relief that we are not leading. Otherwise-- Well, each one is engaged in technological advance and each one is reluctant to reveal what it is, exactly, that it is doing. Each is working independently and is not even unified within its own globe. There is not a single research team anywhere on any of the Spacer worlds that resembles our own Robotics Institute. Each world consists of individual researchers, each of whom diligently guards his own data from all the rest. "

Amadiro was almost complacent as he said, "I would not expect them to have advanced as far as we have."

"Too bad they haven't," replied Vasilia tartly. "With all the Spacer worlds a jumble of individuals, progress is too slow. The Settler worlds meet regularly at conventions, have

their institutes--and though they lag well behind us, they will catch up.--Still, I've managed to uncover a few technological advances being worked on by the Spacer worlds and I have them all listed in my report. They are all working on the nuclear intensifier, for instance, but I don't believe that such a device has passed beyond the laboratory demonstration level on a single world. Something that would be practical on shipboard is not yet here."

"I hope you are right in that, Vasilia. The nuclear intensifier is a weapon our fleets could use, for it would finish the Settlers at once. However, I think, on the whole, it would be better if Aurora had the weapon ahead of our Spacer brothers.--but you said that all was included in your report--almost. I heard that 'almost.' What is not included, then?"

"Solaria!"

"Ah, the youngest and most peculiar of the Spacer worlds."

"I got almost nothing directly out of them. They viewed me with absolute hostility as, I believe, they would have viewed any non-Solarian, whether Spacer or Settler. And when I say 'viewed,' I mean that in their sense. I remained nearly a year on the world, a considerably longer time than I spent on any other world, and in all those months I never saw a single Solarian face-to-face. In every case, I viewed him--or her--by hyperwave hologram. I could never deal with anything tangible--images only. The world was comfortable, incredibly luxurious, in fact, and for a nature lover, totally unspoiled, but how I missed seeing."

"Well, viewing is a Solarian custom. We all know that, Vasilia. Live and let live."

"Humph," said Vasilia. "Your tolerance may be misplaced. Are your robots in the nonrepeat mode?"

"Yes, they are. And I assure you we are not being eavesdropped upon."

"I hope not, Kelden. --I am under the distinct impression that the Solarians are closer to developing a miniaturized nuclear intensifier than any other world--than we are. They may be close to making one that's portable and that's possessed of a power consumption small enough to make it practical for space vessels. "

Amadiro frowned deeply. "How do they manage that?"

"I cannot say. You don't suppose they showed me blueprints, do you? My impressions are so inchoate I dared not put them in the report, but from small things I heard here--or observed there--I think they are making important progress. This is something we should think about carefully."

"We will. --Is there anything else you would like to tell me?"

"Yes--and also not in the report. Solaria has been working toward humanoid robots for many decades and I think they have achieved that goal. No other Spacer would--outside of ourselves, of course--has even attempted the matter. When I asked, on each world, what they were doing with respect to humanoid robots, the reaction was uniform. They found the very concept unpleasant and horrifying. I suspect they all noticed our failure and took it to heart:"

"But not Solaria? Why not?"

"For one thing, they have always lived in the most extremely robotized society in the Galaxy. They're surrounded by robots--ten thousand per individual. The world is saturated with them. If you were to wander through it aimlessly, searching for humans, you would find nothing. So why should the few Solarians, living in such a world, be upset by the thought of a few more robots just because they're humaniform? Then, too, that pseudo-human wretch that Fastolfe designed and built and that still exists--"

"Daneel," said Amadiro.

"Yes, that one. He--it was on Solaria twenty decades ago and the Solarians treated it as human. They have never recovered from that. Even if they had no use for humaniforms, they were humiliated at having been deceived. It was an unforgettable demonstration that Aurora was far ahead of them in that one facet of robotics, at any rate. The Solarians take inordinate pride in being the most advanced roboticists in the Galaxy and, ever since, individual Solarians have been working on humaniforms--if for no other reason than to wipe out that disgrace. If they had had greater numbers or an institute that could coordinate their work, they would undoubtedly have come up with some long ago. As it is, I think they have them now. "

"You don't really know, do you? This is just suspicion based on scraps of data here and there."

"Exactly right, but it's a fairly strong suspicion and it merits further investigation. -- And a third point. I could swear they were working on telepathic communication. There was some equipment that I was incautiously allowed to see. And once when I had one of their roboticists on view the hyperwave screen showed a blackboard with a positronic pattern matrix that was like nothing I ever remember seeing, yet it seemed to me that pattern might fit a telepathic program."

"I suspect, Vasilias, that this item is woven of even airier gossamer than the bit about the humanoid robots."

A look of mild embarrassment crossed Vasilias's face. "I must admit you're probably right there."

"In fact, Vasilias, it sounds like mere fantasy. If the pattern matrix you saw was like nothing you remember ever having seen before, how could you think it would fit anything?"

Vasilias hesitated. "To tell you the truth, I've been wondering about that myself. Yet when I saw the pattern, the word 'telepathy' occurred to me at once."

"Even though telepathy is impossible, even in theory."

"It is thought to be impossible, even in theory. That is not quite the same thing."

"No one has ever been able to make any progress toward it."

"Yes, but why should I have looked at that pattern and thought 'telepathy'?"

"Ah well, Vasilias, there may be a personal psychoquirk there that is useless to try to analyze. I'd forget it. Anything else?"

"One more thing--and the most puzzling of all. I gathered the impression, Kelden, from one little indication or another, that the Solarians are planning to leave their planet."

"Why?"

"I don't know. Their population, small as it is, is declining further. Perhaps they want to make a new start elsewhere before they die out altogether. "

"What kind of new start? Where would they go?"

Vasilia shook her head. "I have told you all I know."

Amadiro said slowly, "Well, then, I will take all this into account. Four things: nuclear intensifier, humanoid robots, telepathic robots, and abandoning the planet. Frankly, I have no faith in any of the four, but I'll persuade the Council to authorize talks with the Solarian regent. --And now, Vasilia, I believe you could use a rest, so why not take a few weeks off and grow accustomed to the Auroran sun and fine weather before getting back to work?"

"That is kind of you, Kelden," said Vasilia, remaining firmly seated, "but there remain two items I must bring up."

Involuntarily, Amadiro's eyes sought the time strip. "This won't take up very much time, will it, Vasilia?"

"However much time it takes, Kelden, is what it will take up."

"What is it you want, then?"

"To begin with, who is this young know-it-all who seems to think he is running the Institute, this what's-his-name, Mandamus?"

"You've met him, have you?" said Amadiro, his smile masking a certain uneasiness. "You see, things do change on Aurora. "

"Certainly not for the better in this case," said Vasilia grimly. "Who is he?"

"He is exactly what you have described--a know-it-all. He is a brilliant young man, bright enough in robotics, but just as knowledgeable in general physics, in chemistry, in planetology --"

"And how old is this monster of erudition?"

"Not quite five decades."

"And what will this child be when he grows up?"

"Wise as well as brilliant, perhaps."

"Don't pretend to mistake my meaning, Kelden. Are you thinking of grooming him as the next head of the Institute?"

"I intend to live for a good many decades yet."

"That is no answer."

"It is the only answer I have."

Vasilia shifted in her seat restlessly and her robot, standing behind her, sent his eyes from side to side as though preparing to ward off an attack--pushed into that mode of behavior, perhaps, by Vasilia's uneasiness.

Vasilia said, "Kelden, I am to be the next head. That is settled. You have told me so."

"I have, but in actual fact, Vasilia, once I die, the Board of Directors will make the choice. Even if I leave behind me a directive as to who the next head will be, the Board can reverse me. That much is clear in the terms of incorporation that founded the Institute."

"You just write your directive, Kelden, and I will take care of the Board of Directors."

And Amadiro, the space between his eyebrows furrowing, said, "This is not something I will discuss any further at this moment. What is the other item you want to bring up? Please make it brief."

She stared at him in silent anger for a moment, then said, seeming to bite off the word, "Giskard!"

"The robot?"

"Of course the robot. Do you know any other Giskard that I am likely to be talking about?"

"Well, what of him?"

"He is mine."

Amadiro looked surprised. "He is--or was--the legal property of Fastolfe."

"Giskard was mine when I was a child."

"Fastolfe lent him to you and eventually took him back. There was no formal transfer of ownership, was there?"

"Morally, he was mine. But in any case, Fastolfe owns him no longer. He is dead."

"He made a will, too. And if I remember correctly, by that will, two robots--Giskard and Daneel--are now the property of the Solarian woman."

"But I don't want them to be. I am Fastolfe's daughter--"

"Oh?"

Vasilia flushed. "I have a claim to Giskard. Why should a stranger--an alien--have him?"

"For one thing, because Fastolfe willed it so. And she's an Auroran citizen."

"Who says so? To every Auroran she is 'the Solarian woman.'"

Amadiro brought his fist down on the arm of his chair in a sudden spilling over of fury. "Vasilia, what is it you wish of me? I have no liking for the Solarian woman. I have, in fact, a profound dislike of her and, if there were a way, I would"--he looked briefly at the robots, as though unwilling to unsettle them--"get her off the planet. But I can't upset the will. Even if there were a legal way to do so--and there isn't--it wouldn't be wise to do it. Fastolfe is dead."

"Precisely the reason Giskard should be mine now."

Amadiro ignored her. "And the coalition he headed is falling apart. It was held together in the last few decades only by his personal charisma. Now what I would like to do is to pick up fragments of that coalition and add it to my own following. In that way, I may put a group together that would be strong enough to dominate the Council and win control in the coming elections."

"With you becoming the next Chairman?"

"Why not? Aurora could do worse, for it would give me a chance to reverse our longtime policy of built-in disaster before it is too late. The trouble is that I don't have Fastolfe's personal popularity. I don't have his gift of exuding saintliness as a cover for stupidity. Consequently, if I seem to be triumphing in an unfair and petty way over a dead

man, it will not look good. No one must say that, having been defeated by Fastolfe while he was alive, I overturned his will out of trivial spite after he was dead. I won't have anything as ridiculous as that standing in the way of the great life-and-death decisions Aurora must make. Do you understand me? You'll have to do without Giskard!"

Vasilia arose, body stiff, eyes narrow. "We'll see about that. "

"We have already seen. This meeting is over and if you have any ambitions to be the head of the Institute, I don't ever want to see you threatening me about anything. So if you're going to make a threat now, of any kind at all, I advise you to reconsider."

"I make no threats," said Vasilia, every ounce of body language contradicting her words--and she left with a sweep, beckoning her robot, unnecessarily, to follow.

50.

The emergency--or rather, the series of emergencies--began some months later when Maloon Cicis entered Amadiro's office for the usual morning conference.

Ordinarily, Amadiro looked forward to that. Cicis was always a restful interlude in the course of the busy day. He was the one senior member of the Institute who had no ambitions and who was not calculating against the day of Amadiro's death or retirement. Cicis was, in fact, the perfect subordinate. He was happy to be of service and delighted to be in Amadiro's confidence.

For this reason, Amadiro had been disturbed, in the last year or so, at the flavor of decay, the slight concavity of the chest, the touch of stiffness in the walk of his perfect subordinate. Could Cicis be getting old? Surely he was only a few decades older than Amadiro.

It struck Amadiro most unpleasantly that perhaps along with the gradual degeneration of so many facets of Spacer life, the life expectancy was falling. He meant to look up the statistics, but kept forgetting to do so--or was unconsciously afraid of doing so.

On this occasion, though, the appearance of age in Cicis was drowned in violent emotion. His face was red (pointing up the graying of his bronze hair) and he appeared virtually exploding with astonishment.

Amadiro did not have to inquire as to the news. Cicis delivered it as though it was something he could not contain.

When he finished exploding, Amadiro said, stupefied, "All radio-wave emissions ceased? All?"

"All, Chief. They must all be dead--or gone. No inhabited world can avoid emitting some electromagnetic radiation at our level of--"

Amadiro waved him silent. One of Vasilia's points--the fourth, as he recalled--had been that the Solarians were preparing to leave their world. It had been a nonsensical suggestion; all four had been more or less nonsensical. He had said he would keep it in mind and, of course, he hadn't. Now, apparently, that had proved to be a mistake.

What had made it seem nonsensical when Vasilias had advanced the notion still made it seem nonsensical. He asked the question now that he had asked then, even though he expected no answer. (What answer could there be?) "Where in Space could they go, Maloon?"

"There's no word on that, Chief."

"Well, then, when did they go?"

"There's no word on that, either. We got the news this morning. The trouble is the radiational intensity is so low on Solaria, anyway. It's very sparsely inhabited and its robots are well-shielded. The intensity is an order of magnitude lower than that of any other Spacer world; two orders lower than ours."

"So one day someone noticed that what was very small had actually declined to zero, but no one actually caught it as it was declining. Who noticed it?"

"A Nexonian ship, Chief."

"How?"

"The ship was being forced into orbit about Solaria's sun in order to carry through emergency repairs. They hyperwaved for permission and got no answer. They had no choice but to disregard that, continue into orbit, and carry through their repairs. They were not interfered with in any way in that time. It was not till after they had left that, in checking through their records, they found that not only had they gotten no answer, but that they had gotten no radiational signal of any kind. There's no way of telling exactly when radiation had ceased. The last recorded receipt of any message from Solaria was over two months ago."

"And the other three points she made?" Amadiro muttered.

"Pardon me, Chief?"

"Nothing. Nothing," said Amadiro, but he frowned heavily and was lost in thought.

13. THE TELEPATHIC ROBOT

51.

Mandamus was not aware of developments on Solaria when he returned some months later from an extended third trip to Earth.

On his first trip, six years before, Amadiro had managed, with some difficulty, to have him sent as an accredited emissary from Aurora to discuss some trifling matter of an overstepping into Spacer territory by Trader vessels. He had endured the ceremony and bureaucratic ennui and it quickly became clear that as such an emissary his mobility was limited. That didn't matter, for he learned what he had come to learn.

He had returned with the news. "I doubt, Dr. Amadiro, that there will be any problem at all. There is no way, no possible way, in which the Earth officials can control either entry or exit. Every year many millions of Settlers visit Earth from any of dozens of worlds and every year as many millions of visiting Settlers leave for home again. Every

Settler seems to feel that life is not complete unless he or she periodically breathes the air of Earth and treads its crowded underground spaces. It's a search for roots, I imagine. They don't seem to feel the absolute nightmare that existence on Earth is."

"I know about it, Mandamus," said Amadiro wearily.

"Only intellectually, sir. You can't truly understand it until you experience it. Once you do, you'll find that none of your 'knowing' will prepare you in the least for the reality. Why anyone should want to go back, once gone--"

"Our ancestors certainly didn't want to go back, once they had left the planet."

"No," said Mandamus, "but interstellar flight was not then as advanced as it is now. It used to take months then and the hyperspatial Jump was a tricky thing. Now it takes merely days and the Jumps are routine and never go wrong. If it were as easy to return to Earth in our ancestors' time as it is now, I wonder if we would have broken away as we did."

"Let's not philosophize, Mandamus. Proceed to the point."

"Certainly. In addition to the coming and going of endless streams of Settlers, millions of Earthmen each year head out as emigrants to one or another of the Settler worlds. Some return almost at once, having failed to adapt. Others make new homes but come back particularly frequently to visit. There's no way of keeping track of exits and entrances and Earth doesn't even try. To attempt to set up systematic methods for identifying and keeping track of visitors might stem the flow and Earth is very aware that each visitor brings money with him. The tourist trade--if we want to call it that--is currently Earth's most profitable industry."

"You are saying, I suppose, that we can get the humanoid robots into Earth without trouble."

"With no trouble at all. There's no question in my mind as to that. Now that we have them properly programmed, we can send them to Earth in half a dozen batches with forged papers. We can't do anything about their robotic respect and awe of human beings, but that may not give them away. It will be interpreted as the usual Settler respect and awe for the ancestral planet. --But, then, I strongly suspect we don't have to drop them into one of the City airports. The vast spaces between Cities are virtually untenanted except by primitive work-robots and the incoming ships would go unnoticed--or at least disregarded."

"Too risky, I think," said Amadiro.

51 A.

Two batches of humanoid robots were sent to Earth and these mingled with the Earth people of the City before finding their way outward into the blank areas between and communicating with Aurora on shielded hyperbeam.

Mandamus said (he had thought about it deeply and had hesitated long), "I will have to go again, sir. I can't be positive they've found the right spot."

"Are you sure you know the right spot, Mandamus?" asked Amadiro sardonically.

"I have delved into Earth's ancient history thoroughly, sir. I know I can find it."

"I don't think I can persuade the Council to send a warship with you."

"No, I wouldn't want that. It would be worse than useless. I want a one-person vessel, with just enough power to get there and back."

And in that way, Mandamus made his second visit to Earth, dropping down into a region outside one of the smaller Cities. With mingled relief and satisfaction, he found several of the robots in the right place and remained with them to view their work, to give a few orders in connection with that work, and to make some fine adjustments in their programming.

And then, under the uninterested glance of a few primitive Earth-formed agricultural robots, Mandamus made for the nearby City.

It was a calculated risk and Mandamus, no fearless hero, could feel his heart thudding uncomfortably within his chest. But it went well. There was some surprise shown by the gate warden when a human being presented himself at the gate, showing all signs of having spent a considerable time in the open.

Mandamus had papers identifying him as a Settler, however, and the warden shrugged. Settlers didn't mind the open and it was far from unheard of for them to take small excursions through the fields and woods that lay about the unimpressive upper layers of a City that jutted above the ground.

The warden gave but a cursory glance at his papers and no one else asked for them at all. Mandamus's off-Earth accent (as weakly Auroran as he could make it) was accepted without comment and, as nearly as he could tell, no one wondered whether he might be a Spacer. But, then, why should they? The days when the Spacers held a permanent outpost on Earth was two centuries in the past and official emissaries from the Spacer worlds were few and --of late--growing steadily fewer. The provincial Earthpeople might not even remember that Spacers existed.

Mandamus was a little concerned that the thin, transparent gloves he always wore might be noted or that his nose plugs would be remarked upon, but neither event took place. No restrictions were placed on his travels around the City or to other Cities. He had enough money for that and money spoke loudly on Earth (and, to tell the truth, even on Spacer worlds).

He grew accustomed to having no robot dog his heels and when he met with some of Aurora's own humanoid robots in this City or that, he had to explain to them quite firmly that they must not dog his heels. He listened to their reports, gave them any instructions they seemed to require, and made arrangements for further robot shipments out-of-City. Eventually, he found his way back to his ship and left.

He was not challenged on his way out, any more than he had been on his way in.

"Actually," he said thoughtfully to Amadiro, "these Earthpeople are not really barbarians."

"Aren't they, though?"

"In their own world, they behave in quite a human fashion. In fact, there is something winning in their friendliness."

"Are you beginning to regret the task you're engaged in?"

"It does give me a grisly feeling as I wander among them thinking that they don't know what is going to happen to them. I can't make myself enjoy what I'm doing."

"Of course you can, Mandamus. Think of the fact that once the job is done, you will be sure of a post as the head of the Institute before very much time has elapsed. That will sweeten the job for you."

And Amadiro kept a close eye on Mandamus thereafter.

51 b.

On Mandamus's third trip, much of his earlier uneasiness had worn off and he could carry himself almost as though he were an Earthman. The project was proceeding slowly but dead center along the projected line of progress.

He had experienced no health problems on his earlier visits, but on this third one--no doubt due to his overconfidence--he must have exposed himself to something or other. At least, for a time he had an alarming drippiness of the nose, accompanied by a cough.

A visit to one of the City dispensaries resulted in a gamma globulin injection that relieved the condition at once, but he found the dispensary more frightening than the illness. Everyone there, he knew, was likely to be ill with something contagious or to be in close contact with those who were ill.

But now, at last, he was back in the quiet orderliness of Aurora and incredibly thankful to be so. He was listening to Amadiro's account of the Solarian crisis.

"Have you heard nothing of it at all?" demanded Amadiro.

Mandamus shook his head. "Nothing, sir. Earth is an incredibly provincial world. Eight hundred Cities with a total of eight billion people--all interested in nothing but the eight hundred Cities with a total of eight billion people. You would think that Settlers existed only to visit Earth and that Spacers did not exist at all. Indeed, the news reports in anyone City deal about ninety percent of the time with that City alone. Earth is an enclosed, claustrophilic world, mentally as well as physically."

"And yet you say they are not barbarian."

"Claustrophilia isn't necessarily barbarism. In their own terms, they are civilized."

"In their own terms! --But never mind. The problem at the moment is Solaria. Not one of the Spacer worlds will move. The principle of noninterference is paramount and they insist that Solaria's internal problems are for Solaria alone. Our own Chairman is as inert as any other, even though Fastolfe is dead and his palsied hand no longer rests on us all. I can do nothing by myself--until such time as I am Chairman."

Mandamus said, "How can they suppose Solaria to have internal problems that may not be interfered with when the Solarians are gone?"

Amadiro said sardonically, "How is it you see the folly of it at once and they don't? --They say there is no hard evidence that the Solarians are totally gone and as long as they--or even some of them--might be on the world, there is no right for any other Spacer world to intrude uninvited."

"How do they explain the absence of radiational activity?"

"They say that the Solarians may have moved underground or that they may have developed a technological advance of some sort that obviates radiation leakage. They also say that the Solarians were not seen to leave and that they have absolutely nowhere to go to. Of course, they were not seen leaving because no one was watching."

Mandamus said, "How do they argue that the Solarians have nowhere to go to? There are many empty worlds."

"The argument is that the Solarians cannot live without their incredible crowds of robots and they can't take those robots with them. If they came here, for instance, how many robots do you suppose we could allot to them--if any?"

"And what is your argument against that?"

"I haven't any. Still, whether they are gone or not, the situation is strange and puzzling and it is incredible that no one will move to investigate it. I've warned everyone, just as strenuously as I can, that inertia and apathy will be the end of us; that as soon as the Settler worlds become aware of the fact that Solaria was--or might be--empty, they would have no hesitation in investigating the matter. Those swarmers have a mindless curiosity that I wish we had some share in. They will, without thinking twice, risk their lives if some profit lures them on."

"What profit in this case, Dr. Amadiro?"

"If the Solarians are gone, they have, perforce, left almost all their robots behind. They are--or were--particularly ingenious roboticists and the Settlers, for all their hatred of robots, will not hesitate to appropriate them and ship them to us for good Space credits. In fact, they have announced this.

"Two Settler ships have already landed on Solaria. We have sent a protest over this, but they will surely disregard the protest and, just as surely, we will do nothing further. Quite the contrary. Some of the Spacer worlds are sending out quiet queries as to the nature of the robots that might be salvaged and what their prices would be."

"Perhaps just as well," said Mandamus quietly.

"Just as well that we're behaving exactly as the Settler propagandists say we will? That we act as though we are degenerating and turning into soft pulps of decadence?"

"Why repeat their buzz words, sir? The fact is that we are quiet and civilized and have not yet been touched where it hurts. If we were, we would fight back strongly enough and, I'm sure, smash them. We still far outstrip them technologically."

"But the damage to ourselves will not be exactly pleasurable."

"Which means that we must not be too ready to go to war. If Solaria is deserted and the Settlers wish to plunder it, perhaps we ought to let them. After all, I predict that we will be all set to make our move within months."

A rather hungry and ferocious look came over Amadiro's face. "Months?"

"I'm sure of it. So the first thing we must do is to avoid being provoked. We will ruin everything if we move toward a conflict there is no need to fight and undergo damage--even if we win--that we don't need to suffer. After all, in a little while, we are going to win totally, without fighting and without damage. --Poor Earth!"

"If you're going to be sorry for them," said Amadiro with spurious lightness, "perhaps you'll do nothing to them."

"On the contrary," said Mandamus coolly. "It's precisely because I fully intend to do something to them--and know that it will be done--that I am sorry for them. You will be Chairman!"

"And you will be the head of the Institute."

"A small post in comparison to yours."

"And after I die?" said Amadiro in half a snarl.

"I do not look that far ahead."

"I am quite--" began Amadiro, but was interrupted by the steady buzz of the message unit. Without looking and quite automatically, Amadiro placed his hand at the EXIT slot. He looked at the thin strip of paper that emerged and a slow smile appeared on his lips.

"The two Settler ships that landed on Solaria--" he said.

"Yes, sir?" asked Mandamus, frowning.

"Destroyed! Both destroyed!"

"How?"

"In an explosive blaze of radiation, easily detected from space. You see what it means? The Solarians have not left after all and the weakest of our worlds can easily handle Settler ships. It is a bloody nose for the Settlers and not something they'll forget. -Here, Mandamus, read for yourself."

Mandamus pushed the paper aside. "But that doesn't necessarily mean that the Solarians are still on the planet. They may merely have booby-trapped it somehow."

"What is the difference? Personal attack or booby-trap, the ships were destroyed."

"This time they were caught by surprise. What about next time, when they are prepared? And what if they consider the event a deliberate Spacer attack?"

"We will reply that the Solarians were merely defending themselves against a deliberate Settler invasion."

"But, sir, are you suggesting a battle of words? What if the Settlers don't bother talking, but consider the destruction of their ships an act of war and retaliate at once?"

"Why should they?"

"Because they are as insane as we can be once pride is hurt; more so, since they have a greater background of violence. "

"They will be beaten."

"You yourself admit they will inflict unacceptable damage upon us, even if they are beaten."

"What would you have me do? Aurora did not destroy those ships."

"Persuade the Chairman to make it quite plain that Aurora had nothing to do with it, that none of the Spacer worlds had anything to do with it, that the blame for the action rests on Solaria alone."

"And abandon Solaria? That would be a cowardly act."

Mandamus blazed into excitement. "Dr. Amadiro, have you never heard of anything called a strategic retreat? Persuade the Spacer worlds to back off for only a little while on some plausible pretext. It is only a matter of some months till our plan on Earth comes to fruition. It may be hard for everyone else to back off and be apologetic to the Spacers, for they don't know what is coming--but we do. In fact, you and I, with our special knowledge, can look upon this event as a gift from what used to be called the gods. Let the Settlers remain preoccupied with Solaria while their destruction is prepared--all unobserved by them--on Earth. --Or would you prefer us to be ruined on the very brink of final victory?"

Amadiro found himself flinching before the direct glare of the other's deep-set eyes.

52.

Amadiro had never had a worse time than during the period following the destruction of the Settler ships. The Chairman, fortunately, could be persuaded to follow a policy of what Amadiro termed "masterful yielding." The phrase caught the Chairman's imagination, even though it was an oxymoron. Besides, the Chairman was good at masterful yielding.

The rest of the Council was harder to handle. The exasperated Amadiro exhausted himself in picturing the horrors of war and the necessity of choosing the proper moment to strike--and not the improper one--if war there must be. He invented novel plausibilities for why the moment was not yet and used them in discussions with the leaders of the other Spacer Worlds. Aurora's natural hegemony had to be exercised to the utmost to get them to yield.

But when Captain D. a. Baley arrived with his ship and his demand, Amadiro felt he could do no more. It was too much.

"It is altogether impossible," said Amadiro. "Are we to allow him to land on Aurora with his beard, his ridiculous clothing, his incomprehensible accent? Am I expected to ask the Council to agree to hand over a Spacer woman to him? It would be an act absolutely unprecedented in our history. A Spacer woman!"

Mandamus said dryly, "You have always referred to that particular Spacer woman as 'the Solarian woman.'"

"She is 'the Solarian woman' to us, but she will be considered a Spacer woman once a Settler is involved. If his ship lands on Solaria, as he suggests it will, it may be destroyed as the others were, together with him and the woman. I may then be accused by my enemies, with some color of justification, of murder--and my political career may not survive that."

Mandamus said, "Think, instead, of the fact that we have labored nearly seven years in order to arrange the final destruction of Earth and that we are now only a few

months from the completion of the project. Shall we risk war now and, at a stroke, ruin everything we've done when we are so close to final victory?"

Amadiro shook his head. "It isn't as though I have a choice in the matter, my friend. The Council wouldn't follow me if I try to argue them into surrendering the woman to a Settler. And the mere fact that I have suggested it will be used against me. My political career will be shaken and we may then have a war in addition. Besides, the thought of a Spacer woman dying in service to a Settler is unbearable. "

"One would suppose you were fond of the Solarian woman."

"You know I am not. With all my heart I wish she had died twenty decades ago, but not this way, not on a Settler ship. --But I should remember that she is an ancestress of yours in the fifth generation. "

Mandamus looked a bit more dour than he usually did. "Of what consequence is that to me? I am a Spacer individual, conscious of myself and of my society. I am not an ancestor-worshipping member of a tribal conglomerate."

For a moment, Mandamus fell silent and his thin face took on a look of intense concentration. "Dr. Amadiro," he said, "could you not explain to the Council that this ancestress of mine is being taken, not as a Spacer hostage but only because her unique knowledge of Solaria, where she spent her childhood and youth, could make her an essential part of the exploration and that this exploration might even be helpful to us, as well as to the Settlers? After all, in truth, wouldn't it be desirable for us to know what those miserable Solarians are up to? The woman will presumably bring back a report of the events--if she survives."

Amadiro thrust out his lower lip. "That might work if the woman went on board voluntarily, if she made it clear that she understood the importance of the work and wished to perform her patriotic duty. To put her on board ship by force, though, is unthinkable."

"Well, then, suppose I were to see this ancestress of mine and try to persuade her to get on the ship willingly; and suppose, also, that you speak to this Settler captain by hyperwave and tell them he can land on Aurora and have the woman if he can persuade her to go with him willingly--or, at least, say that she'll go with him willingly, whether she does or not."

"I suppose we can't lose by making the effort, but I don't see how we can win."

Yet to Amadiro's surprise, they did win. He had listened with astonishment as Mandamus told him the details.

"I brought up the matter of the humanoid robots," Mandamus said, "and it's clear she knew nothing about them, from which I deduced Fastolfe had known nothing about them. It has been one of those things that nagged at me. Then I talked a great deal about my ancestry in such a way as to force her to talk of that Earthman Elijah Baley."

"What about him?" said Amadiro harshly.

"Nothing, except that she talked about him and remembered. This Settler who wants her is a descendant of Baley and I thought it might influence her to consider the Settler's request more favorably than she might otherwise have done."

In any case, it had worked and for a few days Amadiro felt a relief from the almost continuous pressure that had plagued him from the start of the Solarian crisis.

But only for a very few days.

53.

One point that worked to Amadiro's advantage at this time was that he had not seen Vasilias, thus far, during the Solarian crisis.

It would certainly not have been an appropriate time to see her. He did not wish to be annoyed by her petty concern over a robot she claimed as her own --with total disregard for the legalities of the situation--at a time when a true crisis exercised his every nerve and thought. Nor did he wish to expose himself to the kind of quarrel that might easily arise between her and Mandamus over the question of which was eventually to preside over the Robotics Institute.

In any case, he had about come to the decision that Mandamus ought to be his successor. Throughout the Solarian crisis, he had kept his eye fixed on what was important. Even when Amadiro himself had felt shaken, Mandamus had remained icily calm. It was Mandamus who thought it conceivable that the Solarian woman might accompany the Settler captain voluntarily and it was he who maneuvered her into doing so.

And if his plan for the destruction of Earth worked itself out as it should--as it must--then Amadiro could see Mandamus succeeding as Council Chairman eventually. It would even be just, thought Amadiro, in a rare burst of selflessness.

On this particular evening, in consequence, he did not so much as expend a thought upon Vasilias. He left the Institute with a small squad of robots seeing him safely to his ground-car. That ground-car, driven by one robot and with two more in the backseat with him, passed quietly through a twilight and chilly rain and brought him to his establishment, where two more robots ushered him indoors. And all this time he did not think of Vasilias.

To find her sitting in his living room, then, in front of his hyperwave set, watching an intricate robot ballet, with several of Amadiro's robots in their niches and two of her own robots behind her chair, struck him at first not as much with the anger of violated privacy, as with pure surprise.

It took some time for him to control his breathing well enough to be able to speak and then his anger arose and he said harshly, "What are you doing here? How did you get in?"

Vasilias was calm enough. Amadiro's appearance was, after all, entirely expected. "What I'm doing here," she said, "is waiting to see you. Getting in was not difficult. Your robots know my appearance very well and they know my standing at the Institute. Why shouldn't they allow me to enter if I assure them I have an appointment with you?"

"Which you haven't. You have violated my privacy."

"Not really. There's a limit to how much trust you can squeeze out of someone else's robots. Look at them. They have never once taken their eyes from me. If I had wanted to disturb your belongings, look through your papers, take advantage of your absence in any way, I assure you I could not have. My two robots are no match against them."

"Do you know," said Amadiro bitterly, "that you have acted in a thoroughly un-Spacer fashion. You are despicable and I will not forget this."

Vasilia seemed to blanch slightly at the adjectives. She said in a low, hard voice, "I hope you don't forget it, Kelden, for I've done what I've done for you--and if I reacted as I should to your foul mouth, I would leave now and let you continue for the rest of your life to be the defeated man you have been for the past twenty decades."

"I will not remain a defeated man--whatever you do."

Vasilia said, "You sound as though you believe that, but, you see, you do not know what I know. I must tell you that without my intervention you will remain defeated. I don't care what scheme you have in mind. I don't care what this thin-lipped, acid-faced Mandamus has cooked up for you--"

"Why do you mention him?" said Amadiro quickly.

"Because I wish to," said Vasilia with a touch of contempt. "Whatever he has done or thinks he is doing--and don't be frightened, for I haven't any idea what that might be--it won't work. I may not know anything else about it, but I do know it won't work."

"You're babbling idiocies," said Amadiro.

"You had better listen to these idiocies, Kelden, if you don't want everything to fall into ruin. Not just you, but possibly the Spacer worlds, one and all. Still, you may not want to listen to me. It's your choice. Which, then, is it to be?"

"Why should I listen to you? What possible reason is there for me to listen to you?"

"For one thing, I told you the Solarians were preparing to leave their world. If you had listened to me then, you would not have been caught so by surprise when they did,"

"The Solarian crisis will yet turn to our advantage."

"No, it will not," said Vasilia. "You may think it will, but it won't. It will destroy you--no matter what you are doing to meet the emergency--unless you are willing to let me have my say."

Amadiro's lips were white and were trembling slightly. The two centuries of defeat Vasilia had mentioned had had a lasting effect upon him and the Solarian crisis had not helped, so he lacked the inner strength to order his robots to see her out, as he should have. He said sullenly. "Well, then, put it in brief."

"You would not believe what I have to say if I did, so let me do it my own way. You can stop me at any time, but then you will destroy the Spacer worlds. Of course, they will last my time and it won't be I who will go down in history--Settler history, by the way--as the greatest failure on record. Shall I speak?"

Amadiro folded into a chair. "Speak, then, and when you are through--leave."

"I intend to, Kelden, unless, of course, you ask me--very politely--to stay and help you. Shall I start?"

Amadiro said nothing and Vasilias began, "I told you that during my stay on Solaria I became aware of some very peculiar positronic pathway patterns they had designed, pathways that struck me--very forcefully--as representing attempts at producing telepathic robots. Now, why should I have thought that?"

Amadiro said bitterly, "I cannot tell what pathological drives may power your thinking."

Vasilias brushed that aside with a grimace. "Thank you, Kelden. --I've spent some months thinking about that, since I was acute enough to think the matter involved not pathology but some subliminal memory. My mind went back to my childhood when Fastolfe, whom I then considered my father, in one of his generous moods--he would experiment now and then with generous moods, you understand--gave me a robot of my own."

"Giskard again?" muttered Amadiro with impatience.

"Yes, Giskard. Giskard, always. I was in my teenage years and I already had the instinct of a roboticist or, I should say, I was born with the instinct. I had as yet very little mathematics, but I had a grasp of patterns. With the passing of scores of decades, my knowledge of mathematics steadily improved, but I don't think I have advanced very far in my feeling for patterns. My father would say, 'Little Vas'--he also experimented in loving diminutives to see how that would affect me--'you have a genius for patterns., I think I did--"

Amadiro said, "Spare me. I'll concede your genius. Meanwhile, I have not yet had my dinner, do you know that?"

"Well, " said Vasilias sharply, "order your dinner and invite me to join you."

Amadiro, frowning, raised his arm perfunctorily and made a quick sign. The quiet motion of robots at work made itself evident at once.

Vasilias said, "I would play with pathway patterns for Giskard. I would come to Fastolfe--my father, as I then thought of him--and I would show him a pattern. He might shake his head and laugh and say, 'If you add that to poor Giskard's brain, he will no longer be able to talk and he will be in a great deal of pain.' I remember asking if Giskard could really feel pain and my father said, 'We don't know what he would feel, but he would act as we would act if we were in a great deal of pain, so we might as well say he would feel pain.'

"Or else I would take one of my patterns to him and he would smile indulgently and say, 'Well, that won't hurt him, Little Vas, and it might be interesting to try.

"And I would. Sometimes I would take it out again and sometimes I would leave it. I was not simply fiddling with Giskard for the sadistic joy of it, as I imagine I might have been tempted to do if I were someone other than myself. The fact is, I was very fond of Giskard and I had no desire to harm him. When it seemed to me that one of my improvements--I always thought of them as improvements--made Giskard speak more freely or react more quickly or more interestingly--and seemed to do no harm--I would let it stay.

"And then one day --"

A robot standing at Amadiro's elbow would not have dared to interrupt a guest unless a true emergency existed, but Amadiro had no difficulty in understanding the significance of the waiting. He said, "Is dinner ready?"

"Yes, sir," said the robot.

Amadiro gestured rather impatiently in Vasilias direction. "You are invited to have dinner with me."

They walked into Amadiro's dining room, which Vasilias had never entered before. Amadiro was, after all, a private person and was notorious for his neglect of the social amenities. He had been told more than once that he would succeed better in politics if he entertained in his home and he had always smiled politely and said, "Too high a price."

It was perhaps because of his failure to entertain, thought Vasilias, that there was no sign of originality or creativity in the furnishings. Nothing could be plainer than the table, the dishes, and the cutlery. As for the walls, they were merely flat-colored vertical planes. Put together, in rather dampened one's appetite, she thought.

The soup they began with--a clear boullion--was as plain as the furniture and Vasilias began to dispose of it without enthusiasm.

Amadiro said, "My dear Vasilias, you see I am being patient. I have no objection to having you write your autobiography if you wish. But is it really your plan to recite several chapters of it to me? If it is, I must tell you bluntly that I'm not really interested."

Vasilias said, "You will become extremely interested in just a little while. Still, if you're really enamored of failure and want to continue to achieve nothing you wish to achieve, simply say so. I will then eat in silence and leave. Is that what you wish?"

Amadiro sighed. "Well, go on, Vasilias."

Vasilias said, "And then one day I came up with a pattern more elaborate, more pleasant, and more enticing than I had ever seen before or, in all truth, than I have ever seen since. I would have loved to show it to my father, but he was away at some meeting or other on one of the other worlds.

"I didn't know when he'd be back and I put aside my pattern, but each day I would look at it with more interest and more fascination. Finally, I could wait no longer. I simply could not. It seemed so beautiful that I thought it ludicrous to suppose it could do harm. I was only an infant in my second decade and had not yet completely outgrown irresponsibility, so I modified Giskard's brain by incorporating the pattern into it.

"And it did no harm. That was immediately obvious. He responded to me with perfect ease and--it seemed to me--was far quicker in understanding and much more intelligent than he had been. I found him far more fascinating and lovable than before.

"I was delighted and yet I was nervous, too. What I had done--modifying Giskard without clearing it with Fastolfe--was strictly against the rules Fastolfe had set for me and I knew that well. Yet clearly, I was not going to undo what I had done. When I had modified Giskard's brain, I excused it to myself by saying that it would only be for a little while and that I would then neutralize the modification. Once the modification had been made, however, it became quite clear to me that I would not neutralize it. I was simply not

going to do that. In fact, I never modified Giskard again, for fear of disturbing what I had just done.

"Nor did I ever tell Fastolfe what I had done. I destroyed all record of the marvelous pattern I had devised and Fastolfe never found out that Giskard had been modified without his knowledge. Never!

"And then we went our separate ways, Fastolfe and I, and Fastolfe would not give up Giskard. I screamed that he was mine and that I loved him, but Fastolfe's kindly benevolence, of which he made such a parade all his life--that business of loving an things, great and small--was never allowed to stand in the way of his own desires. I received other robots I cared nothing for, but he kept Giskard for himself.

"And when he died, he left Giskard to the Solarian woman--a last bitter slap at me."

Amadiro had only managed to get halfway through the salmon mousse. "If an this is intended to advance your case of having Giskard's ownership transferred from the Solarian woman to yourself, it won't help. I have already explained to you why I cannot set aside Fastolfe's will."

"There's something more to it than that, Kelden," said Vasilia. "A great deal more. Infinitely more. Do you want me to stop now?"

Amadiro stretched his lips into a rueful grin. "Having listened to so much of this, I will play the madman and listen to more."

"You would play the madman if you did not, for I now come to the point. --I have never stopped thinking of Giskard and of the cruelty and injustice of my having been deprived of him, but somehow I never thought of that pattern with which I had modified him with no one's knowledge but my own. I am quite certain I could not have reproduced that pattern if I had tried and from what I can now remember it was like nothing else I have ever seen in robotics until--until I saw, briefly, something like that pattern during my stay on Solaria.

"The Solarian pattern seemed familiar to me, but I didn't know why. It took some weeks of intense thought before I dredged out of some well-hidden part of my unconscious mind the slippery thought of that pattern I had dreamed out of nothing twenty-five decades ago.

"Even though I can't remember my pattern exactly, I know that the Solarian pattern was a whiff of it and no more. It was just the barest suggestion of something I had captured in miraculously complex symmetry. But I looked at the Solarian pattern with the experience I had gained in twenty-five decades of deep immersion in robotics theory and it suggested telepathy to me. If that simple, scarcely interesting pattern suggested it, what must my original have meant--the thing I invented as a child and have never recaptured since?"

Amadiro said, "You keep saying that you're coming to the point, Vasilia. Would I be completely unreasonable if I asked you to stop moaning and reminiscing and simply set out that point in a simple, declarative sentence?"

Vasilias said, "Gladly. What I am telling you, Kelden, is that, without my ever knowing it, I converted Giskard into a telepathic robot and that he has been one ever since."

54.

Amadiro looked at Vasilias for a long time and, because the story seemed to have come to an end, he returned to the salmon mousse and ate some of it thoughtfully.

He then said, "Impossible! Do you take me for an idiot?"

"I take you for a failure," said Vasilias. "I don't say Giskard can read conversations in minds, that he can transmit and receive words or ideas. Perhaps that is impossible, even in theory. But I am quite certain he can detect emotions and the general set of mental activity and perhaps can even modify it."

Amadiro shook his head violently. "Impossible!"

"Impossible? Think a while. Twenty decades ago, you had almost achieved your aims. Fastolfe was at your mercy, Chairman Horder was your ally. What happened? Why did everything go wrong?"

'The Earthman--' Amadiro began, choking at the memory.

"The Earthman," Vasilias mimicked. "The Earthman. Or was it the Solarian woman? It was neither! Neither! It was Giskard, who was there all the time. Sensing. Adjusting."

"Why should he be interested? He is a robot. "

"A robot loyal to his master, to Fastolfe. By the First Law, he had to see to it that Fastolfe came to no harm and, being telepathic, he could not interpret that as signifying physical harm only. He knew that if Fastolfe could not have his way, could not encourage the settlement of the habitable worlds of the Galaxy, he would undergo profound disappointment--and that would be 'harm' in Giskard's telepathic Universe. He could not let that happen and he intervened to keep it from happening."

"No, no, no," said Amadiro in disgust. "You want that to be so, out of some wild, romantic longing, but that doesn't make it so. I remember too well what happened. It was the Earthman. It needs no telepathic robot to explain the events."

"And what has happened since, Kelden?" demanded Vasilias. "In twenty decades, have you ever managed to win out over Fastolfe? With all the facts in your favor, with the obvious bankruptcy of Fastolfe's policy, have you ever been able to dispose of a majority in the Council? Have you ever been able to sway the Chairman to the point where you could possess real power?"

"How do you explain that, Kelden? In all those twenty decades, the Earthman has not been on Aurora. He has been dead for over sixteen decades, his miserably short life running out in eight decades or so. Yet you continue to fail--You have an unbroken record of failure. Even now that Fastolfe is dead, have you managed to profit completely from the broken pieces of his coalition or do you find that success still seems to elude you?"

"What is it that remains? The Earthman is gone. Fastolfe is gone. It is Giskard who has worked against you all this time--and Giskard remains. He is as loyal now to the Solarian woman as he was to Fastolfe and the Solarian woman has no cause to love you, I think."

Amadiro's face twisted into a mask of anger and frustration. "It's not so. None of this is so. You're imagining things."

Vasilia remained quite cool. "No, I'm not. I'm explaining things. I've explained things you haven't been able to explain. Or have you an alternate explanation? --and I can give you the cure. Transfer ownership of Giskard from the Solarian woman to me and, quite suddenly, events will begin to twist themselves to your benefit."

"No," said Amadiro. "They are moving to my benefit already."

"You may think so, but they won't, as long as Giskard is working against you. No matter how close you come to winning, no matter how sure of victory you become, it will all melt away as long as you don't have Giskard on your side. That happened twenty decades ago; it will happen now."

Amadiro's face suddenly cleared. He said, "Well, come to think of it, though I don't have Giskard and neither do you, it doesn't matter, for I can show you that Giskard is not telepathic. If Giskard were telepathic, as you say, if he had the ability to order affairs to his own liking or to the liking of the human being who is his owner, then why would he have allowed the Solarian woman to be taken to what will probably be her death?"

"Her death? What are you talking about, Kelden?"

"Are you aware, Vasilia, that two Settler ships have been destroyed on Solaria? Or have you been doing nothing lately but dreaming of patterns and of the brave days of childhood when you were modifying your pet robot?"

"Sarcasm doesn't become you, Kelden. I have heard about the Settler ships on the news. What of them?"

"A third Settler ship is going out to investigate. It may be destroyed, too."

"Possibly. On the other hand, it would take precautions. "

"It did. It demanded and received the Solarian woman, feeling that she knows the planet well enough to enable them to avoid destruction. "

Vasilia said, "That's scarcely likely, since she hasn't been there in twenty decades."

"Right! The chances are, then, that she'll die with them. It would mean nothing to me personally. I would be delighted to have her dead and, I think, so would you. And, putting that to one side, it would give us good grounds for complaint to the Settler worlds and it would make it difficult for them to argue that the destruction of the ships is a deliberate action on the part of Aurora. Would we destroy one of our own? --Now the question is, Vasilia, why would Giskard, if he had the powers you claim he has--and the loyalties allow the Solarian woman to volunteer to be taken to what is very likely to be her death?"

Vasilia was taken aback. "Did she go of her own free will?"

"Absolutely. She was perfectly willing. It would have been politically impossible to force her to do so against her will."

"But I don't understand--"

"There is nothing to understand except that Giskard is merely a robot."

For a moment, Vasilias froze in her seat, one hand to her chin. Then she said slowly, "They don't allow robots on Settler worlds or on Settler ships. That means she went alone. Without robots."

"Well, no, of course not. They had to accept personal robots if they expected to get her willingly. They took along that man-mimic robot Daneel and the other was"--he paused and brought out the word with a hiss--"Giskard. Who else? So this miracle robot of your fantasy goes to his destruction as well. He could no more--"

His voice faded away. Vasilias was on her feet, eyes blazing, face suffused with color.

"You mean Giskard went? He's off this world and on a Settler ship? Kelden, you may have ruined us all!"

55.

Neither finished the meal.

Vasilias walked hastily out of the dining room and disappeared into the Personal. Amadiro, struggling to remain coldly logical, shouted to her through the closed door, perfectly aware that it damaged his dignity to do so.

He called out, "It's all the stronger an indication that Giskard is no more than a robot. Why should he be willing to go to Solaria to face destruction with his owner?"

Eventually, the sound of running water and splashing ceased and Vasilias emerged with her face freshly washed and almost frozen in its grip on calmness.

She said, "You really don't understand, do you? You amaze me, Kelden. Think it through. Giskard can never be in danger, as long as he can influence human minds, can he? Nor can the Solarian woman, as long as Giskard devotes himself to her. The Settler who carried off the Solarian woman must have found out, on interviewing her, that she had not been on Solaria in twenty decades, so he can't really have continued to believe, after that, that she could do him much good. With her he took Giskard, but he didn't know that Giskard could do him good, either--or could he have known that?"

She thought a while and then said slowly, "No, there is no way he could have known it. If, in more than twenty decades, no one has penetrated the fact that Giskard has mental abilities, then Giskard is clearly interested in having no one guess it--and if that is so, then no one can possibly have guessed it. "

Amadiro said spitefully, "You claim to have worked it out."

Vasilias said, "I had special knowledge, Kelden, and even so it was not till now that I saw the obvious--and then only because of the hint on Solaria. Giskard must have darkened my mind in that respect, too, or I would have seen it long ago. I wonder if Fastolfe knew--"

"How much easier," said Amadiro restlessly, "to accept the simple fact that Giskard is simply a robot."

"You will walk the easy road to ruin, Kelden, but I don't think I will let you do that, no matter how much you want to. --What it amounts to is that the Settler came for the Solarian woman and took her along, even though he discovered she would be of little--if any--use to him. And the Solarian woman volunteered to go, even though she must dread being on a Settler ship along with diseased barbarians--and even though her destruction on Solaria must have seemed to her a very likely consequence.

"It seems to me, then, that this is all the work of Giskard, who forced the Settler to continue to demand the Solarian woman against reason and forced the Solarian woman to accede to the request against reason. "

Amadiro said, "But why? May I ask that simple question? Why?"

"I suppose, Kelden, that Giskard felt it was important to get away from Aurora. -- Could he have guessed that I was on the point of learning his secret? If so, he may well have been uncertain of his present ability to tamper with me. I am, after all, a skilled roboticist. Besides, he would remember that he was once mine and a robot does not easily ignore the demands of loyalty. The only way, perhaps, that he felt he could keep the Solarian woman secure was to move himself away from my influence."

She looked up at Amadiro and said firmly, "Kelden, we must get him back. We can't let him work at promoting the Settler cause in the safe haven of a Settler world. He did enough damage right here among us. We must get him back and you must make me his legal owner. I can handle him, I assure you, and make him work for us. Remember! I am the only one who can handle him."

Amadiro said, "I do not see any reason to worry. In the very likely case that he is a mere robot, he will be destroyed on Solaria and we will be rid of both him and the Solarian woman. In the unlikely case that he is what you say he is, he won't be destroyed on Solaria, but then he will have to return to Aurora. After all, the Solarian woman, though she is not an Auroran by birth, has lived on Aurora far too long to be able to face life among the barbarians--and when she insists on returning to civilization, Giskard will have no alternative but to return with her."

Vasilias said, "After all this, Kelden, you still don't understand Giskard's abilities. If he feels it important to remain away from Aurora, he can easily adjust the Solarian woman's emotions in such a way as to make her stand life on a Settler world, just as he made her willing to board a Settler ship."

"Well, then, if necessary, we can simply escort that Settler ship--with the Solarian woman and with Giskard--back to Aurora."

"How do you propose to do that?"

"It can be done. We are not fools here on Aurora, for all that it seems clearly your opinion that you yourself are the only rational person on the planet. The Settler ship is going to Solaria to investigate the destruction of the earlier two ships, but I hope you don't think we intend to depend upon its good offices or even upon those of the Solarian woman. We are sending two of our warships to Solaria and we do not expect that they

will have trouble. If there are Solarians still on the planet, they may be able to destroy primitive Settler ships, but they won't be able to touch an Auroran vessel of war. If, then, the Settler ship, through some magic on the part of Giskard --"

"Not magic," Vasilia interrupted tartly. "Mental influence."

"If, then, the Settler ship, for whatever reason, should be able to rise from the surface of Solaria, our ships will cut them off and politely ask for the delivery of the Solarian woman and her robots. Failing that, they will insist that the Settler ship accompany our ship to Aurora. There will be no hostility about it. Our ship will merely be escorting an Auroran national to her home world. Once the Solarian woman and her two robots disembark in Aurora, the Settler ship will then be able to proceed at will to its own destination."

Vasilia nodded wearily at this. "It sounds good, Kelden, but do you know what I suspect will happen?"

"What, Vasilia?"

"It is my opinion that the Settler ship will rise from the surface of Solaria, but that our warships won't. Whatever is on Solaria can be countered by Giskard, but, I fear, by nothing else."

"If that happens," said Amadiro with a grim smile, "then I'll admit there may be something, after all, to your fantasy. --But it won't happen."

56.

The next morning Vasilia's chief personal robot, delicately designed to appear female, came to Vasilia's bedside. Vasilia stirred and, without opening her eyes, said, "What is it, Nadila?" (There was no need to open her eyes. In many decades, no one had ever approached her bedside but Nadila.)

Nadila said softly, "Madam, you are desired at the Institute by Dr. Amadiro."

Vasilia's eyes flew open. "What time is it?"

"It is 0517, madam."

"Before sunrise?" Vasilia was indignant.

"Yes, madam."

"When does he want me?"

"Now, madam. "

"Why?"

"His robots have not informed us, madam, but they say it is important."

Vasilia threw aside the bed sheets. "I will have breakfast first, Nadila, and a shower before that. Inform Amadiro's robots to take visitors' niches and wait. If they urge speed, remind them they are in my establishment."

Vasilia, annoyed, did not hasten unduly. If anything, her toilette was more painstaking than usual and her breakfast more leisurely. (She was not ordinarily one to

spend much time over either.) The news, which she watched, gave no indication of anything that might explain Amadiro's call.

By the time the ground-car (containing herself and four robots --two of Amadiro's and two of her own) had brought her to the Institute, the sun was making its appearance over the horizon.

Amadiro looked up and said, "You are finally here, then." The walls of his office were still glowing, though their light was no longer needed.

"I'm sorry," said Vasilia stiffly. "I quite realize that sunrise is a terribly late hour at which to begin work."

"No games, Vasilia, please. Very soon I will have to be at the Council chamber. The Chairman has been up longer than I have. --Vasilia, I apologize, quite humbly, for doubting you."

"The Settler ship has lifted off safely, then."

"Yes. And one of our ships has been destroyed, as you predicted. --The fact has not been publicized yet, but the news will leak out eventually, of course."

Vasilia's eyes widened. She had predicted this outcome with a bit more in the way of outward confidence than she had felt, but clearly this was not the time to say so. What she did say was "Then you accept the fact that Giskard has extraordinary powers."

Cautiously, Amadiro said, "I don't consider the matter to be mathematically proven, but I'm willing to accept it pending further information. What I want to know is what we ought to do next. The Council knows nothing of Giskard and I do not propose to tell them."

"I'm glad your thinking is clear to that extent, Kelden."

"But you're the one who understands Giskard and you can best tell what ought to be done. What do I tell the Council, then, and how do I explain the action without giving away the whole truth?"

"It depends. Now that the Settler ship has left Solaria, where is it going? Can we tell? After all, if it is returning now to Aurora, we need do nothing but prepare for its arrival."

"It is not coming to Aurora," said Amadiro emphatically. "You were right here, too, it seems. Giskard--assuming he is running the show--seems determined to stay away. We have intercepted the ship's messages to its own world. Encoded, of course, but there isn't a Settler code we haven't broken --"

"I suspect they've broken ours, too. I wonder why everyone won't agree to send messages in the clear and save a lot of trouble."

Amadiro shrugged it away. "Never mind that. The point is that the Settler ship is going back to its own planet."

"With the Solarian woman and the robots?"

"Of course."

"You're sure of that? They haven't been left on Solaria?"

"We're sure of that," said Amadiro impatiently. "Apparently, the Solarian woman was responsible for their getting off the surface."

"She? In what way?"

"We don't yet know."

Vasilia said, "It had to be Giskard. He made it appear to be the Solarian woman."

"And what do we do now?"

"We must get Giskard back."

"Yes, but I can't very well persuade the Council to risk an interstellar crisis over the return of a robot."

"You don't, Kelden. You ask for the return of the Solarian woman, something we certainly have a right to request. And do you think for one moment she would return without her robots? Or that Giskard will allow the Solarian woman to return without him? Or that the Settler world would want to keep the robots if the Solarian woman returns? Ask for her. Firmly. She's an Auroran citizen, lent out for a job on Solaria, which is done, and she must now be returned forthwith. Make it belligerent, as though it were a threat of war."

"We can't risk war, Vasilia."

"You won't risk it. Giskard can't take an action that might lead directly to war. If the Settler leaders resist and become belligerent in their return, Giskard will perforce make the necessary modifications in the attitude of the Settler leaders so as to have the Solarian woman returned peaceably to Aurora. And he himself will, of course, have to return with her."

Amadiro said drearily, "And once he's back, he will alter us, I suppose, and we will forget his powers, and disregard him, and he will still be able to follow his own plan whatever it is."

Vasilia leaned her head back and laughed. "Not a chance. I know Giskard, you see, and I can handle him. Just bring him back and persuade the Council to disregard Fastolfe's will--it can be done and you can do it--and to assign Giskard to me. He will then be working for us; Aurora will rule the Galaxy; you will spend the remaining decades of your life as Chairman of the Council; and I will succeed you as the head of the Robotics Institute."

"Are you sure it will work out that way?"

"Absolutely. Just send the message and make it strong and I will guarantee all the rest--victory for the Spacers and ourselves, defeat for Earth and the Settlers."

14. THE DUEL

57.

Gladia watched Aurora's globe on the screen. Its cloud cover seemed caught in mid-swirl along the thick crescent that was shining in the light of its sun.

"Surely we're not that close," she said.

D.G. smiled. "By no means. We're seeing it through a rather good lens. It's still several days away, counting the spiral approach. If we ever get an antigravitic drive, which the physicists keep dreaming about but seem helpless to bring about, spaceflight will become really simple and fast. As it is, our Jumps can only deliver us safely to a rather goodish distance from a planetary mass. "

"It's odd," said Gladia thoughtfully.

"What is, madam?"

"When we went to Solaria, I thought to myself. 'I'm going home,' but when I landed I found that I wasn't home at all. Now we're going to Aurora and I thought to myself, 'Now I'm going home,' and yet--that world down there isn't home, either."

"Where is home, then, madam?"

"I'm beginning to wonder. --But why do you persist in calling me 'madam'?"

D.G. looked surprised. "Do you prefer 'Lady Gladia,' Lady Gladia?"

"That's also mock respect. Do you feel that way about me?"

"Mock respect? Certainly not. But how else does a Settler address a Spacer? I'm trying to be polite and to conform to your customs--to do what makes you feel comfortable."

"But it doesn't make me feel comfortable. Just call me Gladia. I've suggested it before. After all, I call you 'D.G.'"

"And that suits me fine, although in front of my officers and men, I would prefer to have you address me as 'Captain,' and I will call you 'madam.' Discipline must be maintained."

"Yes, of course," said Gladia absently, staring at Aurora again. "I have no home."

She whirled toward D.G., "Is it possible that you might take me to Earth, D.G.?"

"Possible," said D.G., smiling. "You might not want to go--Gladia."

"I think I want to go," said Gladia, "unless I lose my courage."

"Infection does exist," said D.G., "and that's what Spacers fear, isn't it?"

"Too much, perhaps. After all, I knew your Ancestor and wasn't infected. I have been on this ship and have survived. Look, you're near me right now. I was even on your world, with thousands crowding near me. I think I've worked up a certain amount of resistance."

"I must tell you, Gladia, that Earth is a thousand times as crowded as Baleyworld."

"Even so," said Gladia, her voice warming, "I've changed my mind completely--about many things. I've told you there was nothing left to live for after twenty-three decades and it turns out there is. What happened to me on Baleyworld--that talk I gave, the way it moved people--was something new, something I'd never imagined. It was like being born allover, starting again at the first decade. It seems to me now that, even if Earth kills me, it would be worth it, for I would die young and trying and fighting death, not old and weary and welcoming it."

"Well!" said D.G., lifting his arms in a mock-heroic gesture, "you sound like a hyperwave historical. Have you ever watched them on Aurora?"

"Of course. They're very popular."

"Are you rehearsing for one, Gladia, or do you really mean what you say?"

Gladia laughed. "I suppose I do sound rather silly, D.G., but the funny thing is that I do mean it--if I don't lose my courage."

"In that case, we'll do it. We'll go to Earth. I don't think they'll consider you worth a war, especially if you report fully on events on Solaria, as they want you to, and if you give your word of honor as a Spacer woman--if you do things like that--to return."

"But I won't."

"But you may want to someday. --And now, my lady--I mean, Gladia--it is always a pleasure to speak with you, but I'm always tempted to spend too much time at it and I am certain I am needed in the control room. If I'm not and they can do without me, then I'd rather they didn't find out."

58.

"Was that your doing, friend Giskard?"

"To what is it that you refer, friend Daneel?"

"Lady Gladia is anxious to go to Earth and even perhaps not to return. That is a desire so antithetical to what a Spacer such as she would want that I cannot help but suspect that you did something to her mind to make her feel so."

Giskard said, "I did not touch her. It is difficult enough to tamper with any human being within the cage of the Three Laws. To tamper with the mind of the particular individual for whose safety one is directly responsible is more difficult still. "

"Then why does she wish to go to Earth?"

"Her experiences on Baleyworld have changed her point of view considerably. She has a mission--that of ensuring peace in the Galaxy--and burns to work at it."

"In that case, friend Giskard, would it not be better to do what you can to persuade the captain, in your own fashion, to go to Earth directly?"

"That would create difficulties. The Auroran authorities are so insistent on Lady Gladia being returned to Aurora that it would be better to do so, at least temporarily."

"Yet it could be dangerous to do so," said Daneel.

"Then you still think, friend Daneel, that it is I whom they want to retain because they have learned of my abilities?"

"I see no other reason for their insistence on Lady Gladia's return."

Giskard said, "Thinking like a man has its pitfalls, I see. It becomes possible to suppose difficulties that cannot exist. Even if someone on Aurora were to suspect the existence of my abilities, it is with those abilities that I would remove the suspicion. There is nothing to fear, friend Daneel."

And Daneel said reluctantly, "As you say, friend Giskard."

Gladia looked about thoughtfully, sending off the robots with a careless motion of her hand.

She looked at her hand, as she did so, almost as though she were seeing it for the first time. It had been the hand with which she had shaken the hand of each of the crewmen of the ship before getting into the small tender that took her and D.G. down to Aurora. When she promised to return, they had cheered her and Niss had bawled out, "We won't leave without you, my lady."

The cheering had pleased her enormously. Her robots served her endlessly, loyally, patiently, but they never cheered her.

D.G., watching her curiously, said, "Surely you are at home now, Gladia."

"I am in my establishment," she said in a low voice. "It has been my establishment since Dr. Fastolfe assigned it to me twenty decades ago and yet it feels strange to me."

"It is strange to me," said D.G. "I'd feel rather lost staying here alone." He looked about with a half-smile at the ornate furnishings and the elaborately decorated walls.

"You won't be alone, D.G.," said Gladia. "My household robots will be with you and they have full instructions. They will devote themselves to your comfort."

"Will they understand my Settler accent?"

"If they fail to understand, they will ask you to repeat and you must then speak slowly and make gestures. They will prepare food for you, show you how to use the facilities in the guest rooms--and they will also keep a sharp eye on you to make sure that you do not act in an unguestly manner. They will stop you --if necessary --but they will do so without hurting you."

"I trust they won't consider me nonhuman."

"As the overseer did? No, I guarantee you that, D.G., though your beard and accent may confuse them to the point where they will be a second or two slow in reacting."

"And I suppose they'll protect me against intruders?"

"They will, but there won't be any intruders."

"The Council may want to come and get me."

"Then they will send robots and mine will turn them away."

"What if their robots overpower your robots?"

"That can't happen, D.G. An establishment is inviolate."

"Come on, Gladia. Do you mean that nobody has ever--"

"Nobody has ever!" she replied at once. "You just stay here comfortably and my robots will take care of all your needs. If you want to get in touch with your ship, with Baleyworld, even with the Auroran Council, they will know exactly what to do. You won't have to lift a finger."

D.G. sank down into the nearest chair, spread himself out over it, and sighed deeply. "How wise we are to allow no robots on the Settler worlds. Do you know how long it would take to corrupt me into idleness and sloth if I stayed in this kind of society?"

Five minutes at most. In fact, I'm corrupted already." He yawned and stretched luxuriously. "Would they mind if I sleep?"

"Of course they wouldn't. If you do, the robots will see to it that your surroundings are kept quiet and dark. "

Then D.G. straightened suddenly. "What if you don't come back?"

"Why shouldn't I come back?"

"The Council seems to want you rather urgently."

"They can't hold me. I'm a free Auroran citizen and I go where I please."

"There are always emergencies when a government wishes to manufacture one-- and in an emergency, rules can always be broken."

"Nonsense. Giskard, am I going to be kept there?"

Giskard said, "Madam Gladia, you will not be kept there. The captain need not be concerned with respect to that."

"There you are, D.G. And your Ancestor, the last time he saw me, told me I was always to trust Giskard."

"Good! Excellent! Just the same, the reason I came down with you, Gladia, was to make sure I get you back. Remember that and tell it to your Dr. Amadiro if you have to. If they try to keep you against your will, they will have to try to keep me as well--and my ship, which is in orbit, is fully capable of reacting to that. "

"No, please," said Gladia, disturbed. "Don't think of doing that. Aurora has ships as well and I'm sure yours is under observation."

"There's a difference, though, Gladia. I doubt very much that Aurora would want to go to war over you. Baleyworld, on the other hand, would be quite prepared to."

"Surely not. I wouldn't want them to go to war on my account. And why should they, anyway? Because I was a friend of your Ancestor?"

"Not exactly. I don't think anyone can quite believe that you were that friend. Maybe your great-grandmother, not you. Even I don't believe it was you."

"You know it was I."

"Intellectually, yes. Emotionally, I find it impossible. That was twenty decades ago."

Gladia shook her head. "You have the short-lived view."

"Maybe we all do, but it doesn't matter. What makes you important to Baleyworld is the speech you gave. You're a heroine and they will decide you must be presented at Earth. Nothing will be allowed to prevent that."

Gladia said, a trifle alarmed, "Presented at Earth? With full ceremony?"

"The fullest."

"Why should that be thought so important as to be worth a war?"

"I'm not sure I can explain that to a Spacer. Earth is a special world. Earth is a--holy world. It's the only real world. It's where human beings came into being and it's the only world in which they evolved and developed and lived against a full background of life. We have trees on Baleyworld and insects--but on Earth they have a wild riot of trees and insects that none of us ever see except on Earth. Our worlds are imitations, pale

imitations. They don't exist and can't exist except for the intellectual, cultural, and spiritual strength they draw from Earth."

Gladia said, "This is quite opposed to the opinion of Earth held by Spacers. When we refer to Earth, which we seldom do, it is as a world that is barbarous and in decay."

D.G. flushed. "That is why the Spacerworlds have been growing steadily weaker. As I said before, you are like plants that have pulled themselves loose from their roots, like animals that have cut out their hearts."

Gladia said, "Well, I look forward to seeing Earth for myself, but I will have to go now. Please treat this as your own establishment till I return." She walked briskly toward the door, stopped, then turned. "There are no alcoholic drinks in this establishment or anywhere on Aurora, no tobacco, no alkaloidal stimulants, nothing of any artificial kinds of--of whatever you may be used to."

D.G. grinned sourly. . . We Settlers are aware of that. Very puritanical, you people."

"Not puritanical at all," said Gladia, frowning. "Thirty to forty decades of life must be paid for--and that's one of the ways. You don't suppose we do it by magic, do you?"

"Well, I'll make do on healthful fruit juices and sanitized near-coffee--and I'll smell flowers."

"You'll find an ample supply of such things," said Gladia coldly, "and when you get back to your ship, I'm sure you can compensate for any withdrawal symptoms you will now suffer."

"I will suffer only from your withdrawal, my lady," said D.G. gravely.

Gladia found herself forced to smile. "You're an incorrigible liar, my captain. I'll be back. --Daneel. --Giskard."

60.

Gladia sat stiffly in Amadiro's office. In many decades, she had seen Amadiro only in the distance or on a viewing screen--and on such occasions, she had made it a practice to turn away. She remembered him only as Fastolfe's great enemy and now that she found herself, for the first time, in the same room with him--in face-to-face confrontation--she had to freeze her face into expressionlessness, in order not to allow hate to peep through.

Although she and Amadiro were the only palpable human beings in the room, there were at least a dozen high officials--the Chairman himself among them--who were present by way of sealed-beam holovision. Gladia had recognized the Chairman and some of the others, but not all.

It was rather a grisly experience. It seemed so like the viewing that was universal of Solaria and to which she had been so accustomed as a girl--and which she recalled with such distaste.

She made an effort to speak clearly, undramatically, and concisely. When asked a question, she was as brief as was consistent with clarity and as noncommittal as was consistent with courtesy.

The Chairman listened impassively and the others took their cue from him. He was clearly elderly--Chairmen always were, somehow; for it was usually late in life that they attained the position. He had a long face, a still-thick head of hair, and prominent eyebrows. His voice was mellifluous, but in no way friendly.

When Gladia was done, he said, "It is your suggestion, then, that the Solarians had redefined 'human being' in a narrow sense that restricted it to Solarians."

"I do not suggest anything, Mr. Chairman. It is merely that no one has been able to think of another explanation that would account for the events."

"Are you aware, Madam Gladia, that in all the history of robotic science, no robot has ever been designed with a narrowed definition of 'human being'?"

"I am not a roboticist, Mr. Chairman, and I know nothing of the mathematics of positronic pathways. Since you say it has never been done, I, of course, accept that. I cannot say, of my own knowledge, however, whether the fact that it has never been done means that it can never be done in the future."

Her eyes had never looked as wide and innocent as they did now and the Chairman flushed and said, "It is not theoretically impossible to narrow the definition, but it is unthinkable."

Gladia said, with a downcast glance at her hands, which were loosely clasped in her lap, "People can think such peculiar things sometimes."

The Chairman changed the subject and said, "An Auroran ship was destroyed. How do you account for that?"

"I was not present at the site of the incident, Mr. Chairman. I have no idea what happened, so I can't account for it."

"You were on Solaria and you were born on the planet. Given your recent experience and early background, what would you say happened?" The Chairman showed signs of a badly strained patience.

"If I must guess," said Gladia, "I should say that our warship was exploded by the use of a portable nuclear intensifier similar to the one that was almost used on the Settler ship."

"Does it not strike you, however, that the two cases are different. In one, a Settler ship invaded Solaria to confiscate Solarian robots; in the other, an Auroran vessel came to Solaria to help protect a sister planet."

"I can only suppose, Mr. Chairman, that the overseers--the humanoid robots left to guard the planet--were insufficiently well-instructed to know the difference."

The Chairman looked offended. "It is inconceivable that they would not be instructed in the difference between Settlers and fellow Spacers."

"If you say so, Mr. Chairman. Nevertheless, if the only definition of a human being is someone with the physical appearance of a human being, together with the ability to speak in Solarian fashion--as it seemed to us, who were on the spot, that it must be--then

Aurorans, who do not speak in Solarian fashion, might not fall under the heading of human beings where the overseers were concerned."

"Then you are saying that the Solarians defined their fellow Spacers as nonhuman and subjected them to destruction."

"I present it merely as a possibility because I can't think of any other way to explain the destruction of any Auroran warship. More experienced people may be able to present alternate explanations, to be sure." Again that innocent, almost blank, look.

The Chairman said, "Are you planning to return to Solaria, Madam Gladia?"

"No, Mr. Chairman, I have no such plan."

"Have you been requested to do so by your Settler friend, in order to clear the planet of its overseers?"

Slowly Gladia shook her head. "I have not been requested to do this. Had I been, I would have refused. Nor did I go to Solaria, to begin with, for any reason but that of fulfilling my duty to Aurora. I was requested to go to Solaria by Dr. Levular Mandamus of the Robotics Institute, working under Dr. Kelden Amadiro. I was requested to go so that, on my return, I might report on events--as I have just done. The request had, to my ears and understanding, the flavor of an order and I took the order"--she glanced briefly in Amadiro's direction--"as coming from Dr. Amadiro himself."

Amadiro made no visible response to that.

The Chairman said, "What are your plans for the future, then?"

Gladia waited a heartbeat or two, then decided she might as well confront the situation boldly.

"It is my intention, Mr. Chairman," said Gladia, speaking very clearly, "to visit Earth."

"Earth? Why should you wish to visit Earth?"

"It may be important, Mr. Chairman, for Auroran authorities to know what is taking place on Earth. Since I have been invited by the Baleyworld authorities to visit Earth and since Captain Baley stands ready to take me there, it would be an opportunity to bring back a report on events--as I have now reported on events taking place on Solaria and on Baleyworld. "

Well, then, thought Gladia, will he violate the custom and, in effect, imprison her on Aurora? If so, there had to be ways of challenging the decision.

Gladia felt her tension rising and she cast a quick glance in the direction of Daneel, who, of course, seemed totally impassive.

However, the Chairman, looking sour, said, "In that respect, Madam Gladia, you have the right of an Auroran to do as you wish--but it will be on your own responsibility. No one is requesting this of you, as some requested, according to you, your visit to Solaria. For that reason I must warn you that Aurora will not feel bound to help you in case of any misadventure."

"I understand that, sir."

The Chairman said brusquely, "There will be much to discuss on the matter later on, Amadiro. I will be in touch with you."

The images blanked out and Gladia found herself and her robots suddenly alone with Amadiro and his robots.

61.

Gladia rose and said stiffly, carefully refusing to look directly at Amadiro as she did so, "The meeting, I presume, is over, so I will now leave."

"Yes, of course, but I have a question or two, which I hope you don't mind my asking." His tall figure seemed overwhelming as he rose and he smiled and addressed her in all courtesy as though friendliness were long established between them. "Let me escort you, Lady Gladia. So you are going to Earth?"

"Yes. The Chairman raised no objections and an Auroran citizen may freely travel through the Galaxy in time of peace. And pardon me, but my robots--and yours, if necessary--will be sufficient escort."

"As you say, my lady." A robot held the door open for them. "I assume you will take robots with you when you go to Earth."

"There's no question as to that."

"Which robots, madam, if I may ask?"

"These two. The two robots I have with me." Her shoes made a firm clicking sound as she walked rapidly along the corridor, her back to Amadiro, making no effort to see to it that he heard her.

"Is that wise, my lady? They are advanced robots, unusual products of the great Dr. Fastolfe. You will be surrounded by barbarian Earthmen, who may covet them."

"Should they covet them, they nevertheless wouldn't get them."

"Don't underestimate the danger, nor overestimate robotic protection. You will be in one of their Cities, surrounded by tens of millions of these Earthmen, and robots may not harm human beings. Indeed, the more advanced a robot, the more sensitive it is to the nuances of the Three Laws and the less likely it is to take any action that will harm a human being in any way. --Isn't that so, Daneel?"

"Yes, Dr. Amadiro," said Daneel.

"Giskard, I imagine, agrees with you."

"I do," said Giskard.

"You see, my lady? Here on Aurora, in a nonviolent society, your robots can protect you against others. On Earth--mad, decadent, barbarous--there will be no way two robots can protect you or themselves. We would not want you to be deprived. Nor, to place it on a more selfish basis, would we of the Institute and the government care to see advanced robots in the hands of the barbarians. Would it not be better to take robots of a more ordinary type that the Earthpeople would ignore? You can take any number in that case. A dozen if you wish."

Gladia said, "Dr. Amadiro, I took these two robots on a Settler ship and visited a Settler world. No one made a move to appropriate them."

"The Settlers don't use robots and claim to disapprove of them. On Earth itself, they still use robots."

Daneel said, "If I may interpose, Dr. Amadiro--It is my understanding that robots are being phased out on Earth. There are very few in the Cities. Almost all robots on Earth are now used in agricultural or mining operations. For the rest, nonrobotic automation is the norm. "

Amadiro looked at Daneel briefly, then said to Gladia, "Your robot is probably right and I suppose there would be no harm in taking Daneel. He could well pass as human, for that matter. Giskard, however, may well be left in your establishment. He might arouse the acquisitive instincts of an acquisitive society--even if it is true that they are trying to free themselves of robots."

Gladia said, "Neither will be left, sir. They will come with me. I am the sole judge of which portions of my property may come with me and which may not. "

"Of course. " Amadiro smiled in his most amiable fashion. "No one disputes that. -
-Would you wait here?"

Another door opened, showing a room that was most comfortably furnished. It was without windows, but was illuminated by soft light and suffused with even softer music.

Gladia stopped at the threshold and said sharply, "Why?"

"A member of the Institute wishes to see you and speak to you. It will not take long, but it is necessary. Once that is done, you are free to go. You will not even be plagued by my presence from this moment on. Please." There was a touch of hidden steel in the last word.

Gladia reached out her arms for Daneel and Giskard. "We enter together."

Amadiro laughed genially. "Do you think I'm trying to separate you from your robots? Do you think they would allow that? You have been too long with Settlers, my dear."

Gladia looked at the closed door and said between her teeth, "I dislike that man intensely. And most intensely when he smiles and tries to be soothing."

She stretched, her elbow joints cracking slightly. "In any case, I'm tired. If someone comes with further questions about Solaria and Baleyworld, they are going to get short answers, I tell you."

She sat down on a couch that gave softly under her weight. She slipped her shoes off and lifted her feet to the couch. She smiled sleepily, took a deep breath as she sank to one side, and, with her head turned away from the room, was instantly and deeply asleep.

62.

"It is well she was naturally sleepy," said Giskard. "I was able to deepen it without any hint of damage to her at all. --I would not want Lady Gladia to hear what is likely to come."

"What is likely to come, friend Giskard?" asked Daneel.

"What is to come is the result, I think, of my being wrong, friend Daneel, and of your being right. I should have taken your excellent mind more seriously."

"It is you, then, they want to keep on Aurora?"

"Yes. And in urgently calling for Lady Gladia's return, they were calling for mine. You heard Dr. Amadiro ask for us to be left behind. At first both of us and then myself alone."

"Might it be that his words have but the surface meaning, that he feels it dangerous to lose an advanced robot to the Earthmen?"

"There was an underlying current of anxiety, friend Daneel, that I judge to be far too strong to match his words."

"Can you tell whether he knows of your special abilities?"

"I cannot tell directly, since I cannot read thoughts themselves. Nevertheless, twice in the course of the interview with the Council members, there was a sudden sharp rise in the level of emotional intensity in Dr. Amadiro's mind. Extraordinarily sharp rises. I cannot describe it in words, but it would be analogous, perhaps, to watching a scene in black and white and having it splash--suddenly and briefly--into intense color."

"When did this happen, friend Giskard?"

"The second time was when Lady Gladia mentioned she would be going to Earth."

"That created no visible stir among the Council members. What were their minds like?"

"I could not tell. They were present through holovision and such images are not accompanied by any mental sensations that I can detect."

"We may conclude, then, that whether the Council is--or is not--disturbed by Lady Gladia's projected trip to Earth, Dr. Amadiro, at least, is disturbed."

"It is not simple disturbance. Dr. Amadiro seemed anxious in the highest degree; as we would expect, for instance, if he indeed had a project in hand, as we suspect, for the destruction of Earth and feared its discovery. What is more, at Lady Gladia's mention of this intention of hers, friend Daneel, Dr. Amadiro glanced briefly at me; the only moment in all the session that he did. The flash of emotional intensity coincided with that glance. I think it was the thought of my going to Earth that made him anxious. --As we might expect, if he felt that I, with my special powers, would be a particular danger to his plans."

"His actions might also be taken, friend Giskard, as fitting his expressed fear that the Earthmen would try to appropriate you as an advanced robot and that this would be bad for Aurora."

"The chance of that happening, friend Daneel, and the extent of damage that might do the Spacer community is too small to account for his level of anxiety. What harm could I do Aurora if I were in Earth's possession--if I were simply the Giskard I am taken to be?"

"You conclude, then, that Dr. Amadiro knows you are not simply the Giskard you are taken to be."

"I am not sure. He may simply suspect it. If he knew what I was, would he not make every effort to avoid making his plans in my presence?"

"It may simply be his misfortune that Lady Gladia will not be separated from us. He cannot insist on your not being present, friend Giskard, without giving away his knowledge to you." Daneel paused, then said, "It is a great advantage you have, friend Giskard, being able to weigh the emotional contents of minds. --But you said that Dr. Amadiro's flash of emotion at the trip to Earth was the second. What was the first?"

"The first came with the mention of the nuclear intensifier--and that, too, seems significant. The concept of a nuclear intensifier is well known on Aurora. They don't have a portable device; not one light enough and efficient enough to be practical on shipboard, but it's not something that would break upon him like a thunderbolt. Why, then, so much anxiety?"

"Possibly," said Daneel, "because an intensifier of that sort has something to do with his plans on Earth."

"Possibly."

And it was at this point that the door opened, a person entered, and a voice said, "Well--Giskard!"

63.

Giskard looked at the newcomer and said in a calm voice, "Madam Vasilia. "

"You remember me, then," said Vasilia, smiling warmly.

"Yes, madam. You are well-known roboticist and your face is on the hyperwave news now and then."

"Come, Giskard. I do not mean that you recognize me. Anyone can do that. I mean, you remember me. You once called me Miss Vasilia."

"I remember that, too, madam. It was a long time ago."

Vasilia closed the door behind her and sat down in one of the chairs. She turned her face toward the other robot. "And you are Daneel, of course."

Daneel said, "Yes, madam. To make use of the distinction you have just advanced, I both remember you, for I was with Plainclothesman Elijah Baley once when he interviewed you, and I recognize you, too."

Vasilia said sharply, "You are not to refer to that Earthman again. --I recognize you as well, Daneel. You are as famous as I am in your own way. You are both famous, for you are the greatest creations of the late Dr. Han Fastolfe."

"Of your father, madam," said Giskard.

"You know very well, Giskard, that I attach no importance to that purely genetic relationship. You are not to refer to him in that manner again."

"I will not, madam."

"And this one?" She looked casually at the sleeping figure on the couch. "Since you two are here, I can reasonably assume that the sleeping beauty is the Solarian woman."

Giskard said, "She is Lady Gladia and I am her property. Do you want her awake, madam?"

"We will merely disturb her, Giskard, if you and I talk of old times. Let her sleep."

"Yes, madam. "

Vasilia said to Daneel, "Perhaps the discussion that Giskard and I will have will be of no interest to you, either, Daneel. Would you wait outside?"

Daneel said, "I fear I cannot leave, my lady. My task is to guard Lady Gladia."

"I don't think she needs much guarding from me. You'll notice I do not have any of my robots with me, so Giskard alone will be ample protection for your Solarian lady. "

Daneel said, "You have no robots in the room, madam, but I saw four robots just outside in the corridor when the door was opened. It will be best if I stay."

"Well, I won't try to override your orders. You can stay. --Giskard!"

"Yes, madam."

"Do you remember when you were first activated?"

"Yes, madam."

"What do you remember?"

"First light. Then sound. Then a crystallization into the sight of Dr. Fastolfe. I could understand Galactic Standard and I had a certain amount of innate knowledge built into my positronic brain paths. The Three Laws, of course; a large vocabulary, with definitions; robotic duties; social customs. Other things I learned rapidly."

"Do you remember your first owner?"

"As I said, Dr. Fastolfe."

"Think again, Giskard. Wasn't it I?"

Giskard paused, then said, "Madam, I was assigned the task of guarding you in my capacity as a possession of Dr. Han Fastolfe."

"It was a bit more than that, I think. You obeyed only me for ten years. If you obeyed anyone else, including Dr. Fastolfe, it was only incidentally, as a consequence of your robotic duties and only insofar as it fit your prime function of guarding me."

"I was assigned to you, it is true, Lady Vasilia, but Dr. Fastolfe retained ownership. Once you left his establishment, he resumed full control of me as my owner. He remained my owner even when he later assigned me to Lady Gladia. He was my only owner for as long as he lived. Upon his death, by his will, ownership of me was transferred to Lady Gladia and that is how it stands now."

"Not so. I asked you if you remembered when you were first activated and what you remembered. What you were when you were first activated is not what you are now."

"My memory banks, madam, are now incomparably fuller than they were then and I have much in the way of experience that I did not have then. "

Vasilia's voice grew sterner. "I am not talking about memory, nor am I talking about experience. I am talking about capacities. I added to your positronic pathways. I adjusted them. I improved them."

"Yes, madam, you did so, with Dr. Fastolfe's help and approval."

"At one time, Giskard, on one occasion, I introduced an improvement--at least, an extension, and without Dr. Fastolfe's help and approval. Do you remember that?"

Giskard was silent for a substantial period of time. Then he said, "I remember one occasion on which I did not witness your consulting him. I assumed that you consulted him at a time when I was not a witness."

"If you assumed that, you assumed incorrectly. In fact, since you knew he was off the world at the time, you could not possibly have assumed it. You are being evasive, to use no stronger word."

"No, madam. You might have consulted him by hyperwave. I considered that a possibility."

Vasilia said, "Nevertheless, that addition was entirely mine. The result was that you became a substantially different robot afterward from what you had been before. The robot you have been ever since that change has been my design, my creation, and you know that well."

Giskard remained silent.

"Now, Giskard, by what right was Dr. Fastolfe your master at the time you were activated?" She waited, then said sharply, "Answer me, Giskard. That is an order!"

Giskard said, "Since he was designer and supervised the construction, I was his property. "

"And when I, in effect, redesigned and reconstructed you in a very fundamental way, did you not then become my property?"

Giskard said, "I cannot answer that question. It would require the decision of a law court to argue out the specific case. It would depend, perhaps, on the degree to which I was redesigned and reconstructed. "

"Are you aware of the degree to which that took place?"

Giskard was again silent.

"This is childish, Giskard," said Vasilia. "Am I to be required to nudge you after each question? You are not to make me do that. In this case, at any rate, silence is a sure indication of an affirmative. You know what the change was and how fundamental it was and you know that I know what it was. You put the Solarian woman to sleep because you did not want her to learn from me what it was. She doesn't know, does she?"

"She does not, madam," said Giskard.

"And you don't want her to know?"

"I do not, madam," said Giskard.

"Does Daneel know?"

"He does, madam."

Vasilia nodded. "I rather suspected that from his eagerness to stay. --Now, then, listen to me, Giskard. Suppose that a court of law finds out that, before I redesigned you,

you were an ordinary robot and that, after I redesigned you, you were a robot who could sense the mind-set of an individual human being and adjust it to his liking. Do you think they could possibly fail to consider it a change great enough to warrant the ownership to have passed into my hands?"

Giskard said, "Madam Vasilias, it would not be possible to let this come before a court of law. Under the circumstances, I would surely be declared the property of the state for obvious reasons. I might even be ordered inactivated."

"Nonsense. Do you take me for a child? With your abilities, you could keep the court from making any such judgment. But that is not the point. I'm not suggesting that we take this to court. I am asking you for your own judgment. Would you not say that I am your rightful owner and have been since I was a very young woman?"

Giskard said, "Madam Gladia considers herself to be my owner and, until the law speaks to the contrary, she must be considered that."

"But you know that both she and the law labor under a misapprehension. If you worry about the feelings of your Solarian woman, it would be very easy to adjust her mindset so that she wouldn't mind your no longer being her property. You can even cause her to feel relieved that I will take you off her hands. I will order you to do so as soon as you can bring yourself to admit what you already know--that I am your owner. How long has Daneel known your nature?"

"For decades, madam."

"You can make him forget. For some time now, Dr. Amadiro has known and you can make him forget. There will be only you and I who will know."

Daneel said suddenly, "Madam Vasilias, since Giskard does not consider himself your property, he can easily make you forget and you will then be perfectly content with matters as they are. "

Vasilias turned a cold eye on Daneel. "Can he? But you see, it is not for you to decide who it is that Giskard considers his owner. I know that Giskard knows that I am his owner, so that his duty, within the Three Laws, belongs entirely to me. If he must make someone forget and can do so without physical harm, it will be necessary for him, in making a choice, to choose anyone but me. He cannot make me forget or tamper with my mind in any way. I thank you, Daneel, for giving me the occasion of making this quite plain."

Daneel said, "But Madam Gladia's emotions are so enwrapped in Giskard that for him to force forgetfulness upon her might harm her."

Vasilias said, "Giskard is the one to decide that. --Giskard, you are mine. You know you are mine and I order you to induce forgetfulness in this man-aping robot who stands beside you and in the woman who wrongfully treated you as her property. Do it while she is asleep and there will be no harm done to her of any kind."

Daneel said, "Friend Giskard. Lady Gladia is your legal owner. If you induce forgetfulness in Lady Vasilias, it will not harm her."

"But it will," said Vasilias at once. "The Solarian woman will not be harmed, for she need only forget that she is under the impression that she is Giskard's owner. I, on the

other hand, also know that Giskard has mental powers. Digging that out will be more complex and Giskard can surely tell by my intense determination to keep that knowledge that he could not help but inflict damage on me in the process of removing it."

Daneel said, "Friend Giskard--"

Vasilia said, in a voice that was diamond-hard, "I order you, Robot Daneel Olivaw, to be silent. I am not your owner, but your owner is asleep and does not countermand it, so my order must be obeyed."

Daneel fell silent, but his lips trembled as though he were trying to talk despite the order.

Vasilia watched that manifestation with an amused smile on her lips. "You see, Daneel, you cannot talk."

And Daneel said in a hoarse whisper, "I can, madam, I find it difficult, but I can, for I find that something takes precedence over your order, which is governed by only the Second Law."

Vasilia's eyes opened wide and she said sharply, "Silence, I say. Nothing takes precedence over my order but the First Law and I have already shown that Giskard will do least harm--indeed, no harm at all--if he returns to me. He will do harm to me, to whom he is least capable of doing harm, if he follows any other course of action." She pointed her finger at Daneel and said again with a soft hiss, "Silence!"

It was a clear effort for Daneel to make any sound at all. The small pump within him that manipulated the air current that produced the sound made a small, humming noise as it labored. Yet, though he spoke in an even lower whisper, he could still be heard.

He said, "Madam Vasilia, there is something that transcends even the First Law."

Giskard said, in a voice equally low, but unforced, "Friend Daneel, you must not say that. Nothing transcends the First Law."

Vasilia, frowning slightly, showed a spark of interest. "Indeed? Daneel, I warn you that if you attempt to progress further in this odd line of argument, you will surely destroy yourself. I have never seen or heard of a robot doing what you are doing and it would be fascinating to watch your self-destruction. Speak on."

With the order given, Daneel's voice returned immediately to normal. "I thank you, Madam Vasilia. --Years ago, I sat at the deathbed of an Earthman to whom you have asked me not to refer. May I now refer to him or do you know who it is that I speak of?"

"You speak of that policeman Baley," said Vasilia tonelessly.

"Yes, madam. He said to me on his deathbed, 'The work of each individual contributes to a totality and so becomes an undying part of the totality. That totality of human lives--past and present and to come--forms a tapestry that has been in existence now for many tens of thousands of years and has been growing more elaborate and, on the whole, more beautiful in all that time. Even the Spacers are an offshoot of the tapestry and they, too, add to the elaborateness and beauty of the pattern. An individual life is one thread in the tapestry and what is one thread compared to the whole? Daneel, keep your mind fixed firmly on the tapestry and do not let the trailing off of a single thread affect you.'"

"Mawkish sentimentality," murmured Vasilia.

Daneel said, "I believe Partner Elijah was attempting to protect me against the fact of his soon-to-come death. It was his own life he spoke of as but a thread in the tapestry; it was his own life that was 'the trailing off of a single thread' that was not to affect me. His words did protect me in that crisis."

"No doubt," said Vasilia, "but get to the point of transcending the First Law, for it is that which will now destroy you."

Daneel said, "For decades I have brooded over Plainclothesman Elijah Baley's statement and it is quite likely I would have understood it at once if the Three Laws had not stood in the way. I have been helped in my search by my friend Giskard, who has long felt the Three Laws to be incomplete. I have been helped also by points Lady Gladia made in a recent speech on a Settler world. What's more, this present crisis, Lady Vasilia, has served to sharpen my thinking. I am certain, now, as to the manner in which the Three Laws are incomplete."

"A robot who is also a roboticist," said Vasilia with a touch of contempt. "How are the Three Laws incomplete, robot?"

Daneel said, "The tapestry of life is more important than a single thread. Apply that not to Partner Elijah alone, but generalize it and--and--and we conclude that humanity as a whole is more important than a single human being."

"You stumble as you say it, robot. You do not believe it."

Daneel said, 'There is a law that is greater than the First Law: 'A robot may not injure humanity or, through inaction, allow humanity to come to harm. ' I think of it now as the Zeroth Law of Robotics. The First Law should then be stated: 'A robot may not injure a human being or, through inaction, allow a human being to come to harm, unless this would violate the Zeroth Law of Robotics.''

Vasilia snorted. "And you still stand on your feet, robot?"

"I still stand on my feet, madam."

"Then I will explain something to you, robot, and we will see if you can survive the explanation. --The Three Laws of Robotics involve individual human beings and individual robots. You can point to any individual human being or to an individual robot. But what is your 'humanity' but an abstraction? Can you point to humanity? You can injure or fail to injure a specific human being and understand the injury or lack of injury that has taken place. Can you see an injury to humanity? Can you understand it? Can you point to it?"

Daneel was silent.

Vasilia smiled broadly. . . Answer, robot. Can you see an injury to humanity and can you point to it?"

"No, madam, I cannot. But I believe such injury can exist nevertheless and you see that I still stand on my feet."

"Then ask Giskard as to whether he will--or can --obey your Zeroth Law of Robotics."

Daneel's head turned to Giskard. "Friend Giskard?"

Slowly Giskard said, "I cannot accept the Zeroth Law, friend Daneel. You know that I have read widely in human history. In it, I have found great crimes committed by some human beings against each other and the excuse has always been that the crimes were justified by the needs of the tribe, or of the state, or even of humanity. It is precisely because humanity is an abstraction that it can be called upon so freely to justify anything at all and your Zeroth Law is therefore unsuitable."

Daneel said, "But you know, friend Giskard, the fact that a danger to humanity now exists and that it will surely come to fruition if you become the property of Madam Vasilia. That, at least, is not an abstraction."

Giskard said, "The danger to which you refer is not something known, but is merely inferred. We cannot build our actions in defiance of the Three Laws on that."

Daneel paused, then said in a lower voice, "But you hope that your studies of human history will help you develop the Laws governing human behavior, that you will learn to predict and guide human history--or at least make a beginning, so that someone someday will learn to predict and guide it. You even call the technique 'psychohistory.' In this, are you not dealing with the human tapestry? Are you not trying to work with humanity as a generalized whole, rather than with collections of individual human beings?"

"Yes, friend Daneel, but it is thus far no more than a hope and I cannot base my actions upon a mere hope, nor can I modify the Three Laws in accordance with it."

To that, Daneel did not respond.

Vasilia said, "Well, robot, all your attempts have come to nothing and yet you stand on your feet. You are strangely stubborn and a robot such as yourself that can denounce the Three Laws and still remain functional is a clear danger to every and any individual human being. For that reason, I believe you should be dismantled without delay. The case is too dangerous to await the slow majesty of the law, especially since you are, after all, a robot and not the human being you attempt to resemble."

Daneel said, "Surely, my lady, it is not fitting for you to reach such a decision on your own."

"I have reached it nevertheless and if there are legal repercussions hereafter, I shall deal with them."

"You will be depriving Lady Gladia of a second robot--and one to which you make no claim."

"She and Fastolfe, between them, have deprived me of my robot, Giskard, for more than twenty decades and I do not believe this ever distressed either of them for a moment. It will not now distress me to deprive her. She has dozens of other robots and there are many here at the Institute who will faithfully see to her safety until she can return to her own."

Daneel said, "Friend Giskard, if you will wake Lady Gladia, it may be that she may persuade Lady Vasilia--"

Vasilia, looking at Giskard, frowned and said sharply, "No, Giskard. Let the woman sleep."

Giskard, who had stirred at Daneel's words, subsided.

Vasilia snapped the finger and thumb of her right hand three times and the door at once opened and four robots filed in. "You were right, Daneel. There are four robots. They will dismantle you and you are ordered not to resist. Thereafter Giskard and I will deal with all remaining matters."

She looked over her shoulder at the entering robots. "Close the door behind you. Now, quickly and efficiently, dismantle this robot," and she pointed at Daneel.

The robots looked at Daneel and for a few seconds did not move. Vasilia said impatiently, "I've told you he is a robot and you must disregard his human appearance. Daneel, tell them you are a robot. "

"I am a robot," said Daneel, "and I will not resist."

Vasilia stepped to one side and the four robots advanced. Daneel's arms remained at his side. He turned to look at the sleeping Gladia one last time and then he faced the robots.

Vasilia smiled and said, "This should be interesting."

The robots paused. Vasilia said, "Get on with it. "

They did not move and Vasilia turned to stare in amazement at Giskard. She did not complete the movement. Her muscles loosened and she crumpled.

Giskard caught her and seated her with her back against the wall.

He said in a muffled voice, "I need a few moments and then we will leave. "

Those moments passed. Vasilia's eyes remained glazed and unfocused. Her robots remained motionless. Daneel had moved to Gladia in a single stride.

Giskard looked up and said to Vasilia's robots, "Guard your lady. Allow no one to enter until she wakes. She will waken peacefully."

Even as he spoke, Gladia stirred and Daneel helped her to her feet. She said, wondering, "Who is this woman? Whose robots--How did she--"

Giskard spoke firmly, but there was a weariness in his voice. "Lady Gladia, later. I will explain. For now, we must hasten."

And they left.

PART V - EARTH

15. THE HOLY WORLD

64.

Amadiro bit his lower lip and his eyes flicked in the direction of Mandamus, who seemed lost in thought.

Amadiro said defensively, "She insisted on it. She told me that only she could handle this Giskard, that only she could exert a sufficiently strong influence over him and prevent him from using these mental powers of his."

"You never said anything of this to me, Dr. Amadiro."

"I wasn't sure what there was to tell, young man. I wasn't sure she was correct."

"Are you sure now?"

"Completely. She remembers nothing of what went on--"

"So that we know nothing of what went on."

Amadiro nodded. "Exactly. And she remembers nothing of what she had told me earlier."

"And she's not acting?"

"I saw to it that she had an emergency electroencephalogram. There have been distinct changes from the earlier records."

"Is there a chance she will recover her memory with time?"

Amadiro shook his head bitterly. "Who can tell? But I doubt it."

Mandamus, eyes still downcast and full of thought, said, "Does it matter, then? We can take her account of Giskard as true and we know that he has the power to affect minds. That knowledge is crucial and it is now ours. --In fact, it is well that our roboticist colleague has failed. If Vasilia had gained control of that robot, how long do you suppose it would have been before you, too, would have been under her control--and I, as well, assuming she would think I was worth controlling?"

Amadiro nodded. "I suppose she might have had something like that in mind. Right now, though, it's hard to tell what she has in mind. She seems, superficially at least, undamaged except for the specific loss of memory--she apparently remembers everything else--but who knows how this will affect her deeper thought processes and her skill as a roboticist? That Giskard could do this to someone as skilled as she makes him an incredibly dangerous phenomenon."

"Does it occur to you, Dr. Amadiro, that the Settlers may be right in their distrust of robots?"

"It almost does, Mandamus."

Mandamus rubbed his hands together. "I assume from your depressed attitude that this whole business was not uncovered before they had time to leave Aurora. "

"You assume correctly. That Settler captain has the Solarian woman and both of her robots on his ship and is heading toward Earth."

"And where does that leave us now?"

Slowly Amadiro said, "By no means defeated, it seems to me. If we complete our project, we have won--Giskard or no Giskard. And we can complete it. Whatever Giskard can do with and to emotions, he can't read thoughts. He might be able to tell when a wash of emotion crosses a human mind, or even distinguish one emotion from another, or change one to another, or induce sleep or amnesia--dull-edged things like that. He cannot be sharp, however. He cannot make out actual words or ideas."

"Are you sure of that?"

"So said Vasilia."

"She may not have known what she was talking about. She did not, after all, manage to control the robot, as she said she was sure of doing. That's not much of a testimonial to her accuracy of understanding."

"Yet I believe her in this. To actually be able to read thoughts would demand so much complexity in the positronic pathway pattern that it is totally unlikely that a child could have inserted it into the robot over twenty decades ago. It is actually far beyond even the present-day state of the art, Mandamus. Surely you must agree."

"I would certainly think it was. And they're going to Earth?"

"I'm sure of it."

"Would this woman, brought up as she was, actually go to Earth?"

"She has no choice if Giskard controls her."

"And why should Giskard want her to go to Earth? Can he know about our project? You seem to think he doesn't."

"It is possible he doesn't. His motivation for going to Earth might be nothing more than to place himself and the Solarian woman beyond our reach."

"I shouldn't think he'd fear us if he could handle Vasilia."

"A long-range weapon," said Amadiro icily, "could bring him down. His own abilities must have a limited range. They can be based on nothing other than the electromagnetic field and he must be subject to the inverse square law. So we get out of range as the intensity of his powers weaken, but he will then find that he is not out of range of our weapons."

Mandamus frowned and looked uneasy. "You seem to have an un-Spacer liking for violence, Dr. Amadiro. In a case like this, though, I suppose force would be permissible."

"A case like this? A robot capable of harming human beings? I should think so. We'll have to find a pretext for sending a good ship in pursuit. It wouldn't be wise to explain the actual situation --"

"No," said Mandamus emphatically. "Think of how many would wish to have personal control of such a robot. "

"Which we can't allow. And which is another reason why I would look upon destruction of the robot as the safer and preferable course of action."

"You may be right," said Mandamus reluctantly, "but I don't think it wise to count on this destruction only. I must go to Earth--now. The project must be hastened to its conclusion, even if we don't dot every 'i' and cross every 't.' Once it is done, then it is done. Even a mind-handling robot--under anybody's control--will not be able to undo the deed. And if it does anything else, that, perhaps, will no longer matter."

Amadiro said, "Don't speak in the singular. I will go as well."

"You? Earth is a horrible world. I must go, but why you?"

"Because I must go, too. I cannot stay here any longer and wonder. You have not waited for this through a long lifetime as I have, Mandamus. You do not have the accounts to settle that I have."

65.

Gladia was in space again and once again Aurora could be made out as a globe. D.G. was busy elsewhere and the entire ship had about it a vague but pervasive air of emergency, as though it were on a battle footing, as though it were being pursued or expected pursuit.

Gladia shook her head. She could think clearly; she felt well; but when her mind turned back to that time in the Institute, shortly after Amadiro had left her, a curiously pervasive unreality swept over her. There was a gap in time. One moment she had been sitting on the couch, feeling sleepy; the next there were four robots and a woman in the room who had not been there before.

She had fallen asleep, then, but there was no awareness, no memory, that she had done so. There was a gap of nonexistence.

Thinking back, she had recognized the woman after the fact. It was Vasilia Aliena--the daughter whom Gladia had replaced in the affections of Han Fastolfe. Gladia had never actually seen Vasilia, though she had viewed her on hyperwave several times. Gladia always thought of her as a distant and inimical other self. There was the vague similarity in appearance that others always commented on but that Gladia herself insisted she did not see--and there was the odd, antithetical connection with Fastolfe.

Once they were on the ship and she was alone with her robots, she asked the inevitable question. "What was Vasilia Aliena doing in the room and why was I permitted to sleep once she had arrived?"

Daneel said, "Madam Gladia, I will answer the question, since it is a matter friend Giskard would find difficult to discuss."

"Why should he find it difficult, Daneel?"

"Madam Vasilia arrived in the hope that she might persuade Giskard to enter her service."

"Away from me?" said Gladia in sharp indignation. She did not entirely like Giskard, but that made no difference. What was hers was hers. "And you allowed me to sleep while you two handled the matter by yourselves?"

"We felt, madam, that you needed your sleep badly. Then, too, Madam Vasilia ordered us to allow you to sleep. Finally, it was our opinion that Giskard would not, in any case, join her service. For all these reasons, we did not wake you."

Gladia said indignantly, "I should hope that Giskard would not for a moment consider leaving me. It would be illegal both by Auroran law and, more important, by the Three Laws of Robotics. --It would be a good deed to return to Aurora and have her arraigned before the Court of Claims."

"That would not be advisable at the moment, my lady."

"What was her excuse for wanting Giskard? Did she have one?"

"When she was a child, Giskard had been assigned to her. "

"Legally?"

"No, madam. Dr. Fastolfe merely allowed her the use of it."

"Then she had no right to Giskard."

"We pointed that out, madam. Apparently, it was a matter of sentimental attachment on the part of Madam Vasilia. "

Gladia sniffed. "Having survived the loss of Giskard since before I came to Aurora, she might well have continued as she was without going to illegal lengths to deprive me of my property. " --Then, restlessly, "I should have been awakened."

Daneel said, "Madam Vasilia had four robots with her. Had you been awake and had there been harsh words between the two of you, there might have been some difficulty in having the robots work out the proper responses."

"I'd have directed the proper response, I assure you, Daneel."

"No doubt, madam. So might Madam Vasilia and she is one of the cleverest roboticists in the Galaxy. "

Gladia shifted her attention to Giskard. "And you have nothing to say?"

"Only that it was better as it was, my lady."

Gladia looked thoughtfully into those faintly luminous robotic eyes, so different from Daneel's all-but-human ones, and it did seem to her that the incident wasn't very important after all. A small thing. And there were other things with which to be concerned. They were going to Earth.

Somehow she did not think of Vasilia again.

66.

"I am concerned," said Giskard in his whisper of confidentiality in which sound waves barely trembled the air. The Settler ship was receding smoothly from Aurora and, as yet, there was no pursuit. The activity onboard had settled into routine and, with almost all routines automated, there was quiet and Gladia slept naturally.

"I am concerned for Lady Gladia, friend Daneel."

Daneel understood the characteristics of Giskard's positronic circuits well enough to need no long explanation. He said, "It was necessary, friend Giskard, to adjust Lady

Gladia. Had she questioned longer, she might have elicited the fact of your mental activities and adjustment would then have been more dangerous. Enough harm has already been done because Lady Vasilia discovered the fact. We do not know to whom--and to how many--she may have imparted her knowledge."

"Nevertheless," said Giskard, "I did not wish to make this adjustment. Had Lady Gladia wished to forget, it would have been a simple, no-risk adjustment. She wanted, however, with vigor and anger, to know more of the matter. She regretted not having played a greater role in it. I was forced, therefore, to break binding forces of considerable intensity."

Daneel said. "Even that was necessary, friend Giskard."

"Yet the possibility of doing harm was by no means insignificant in such a case. If you think of a binding force as a thin, elastic cord--this is a poor analogy, but I can think of no other, for what I sense in a mind has no analog outside the mind--then the ordinary inhibitions I deal with are so thin and insubstantial that they vanish when I touch them. A strong binding force, on the other hand, snaps and recoils when broken and the recoil may then break other, totally unrelated binding forces or, by whipping and coiling about other such forces, strengthen them enormously. In either case, unintended changes can be brought about in a human being's emotions and attitudes and that would be almost certain to bring about harm."

Daneel said, his voice a little louder, "Is it your impression you harmed Lady Gladia, friend Giskard?"

"I think not. I was extremely careful. I worked upon the matter during all the time you were talking to her. It was thoughtful of you to bear the brunt of the conversation and to run the risk of being caught between an inconvenient truth and an untruth. But despite all my care, friend Daneel, I took a risk and I am concerned that I was willing to take that risk. It came so close to violating the First Law that it required an extraordinary effort on my part to do it. I am sure that I would not have been able to do it--"

"Yes, friend Giskard?"

"Had you not expounded your notion of the Zeroth Law."

"You accept it, then?"

"No, I cannot. Can you? Faced with the possibility of doing harm to an individual human being or of allowing harm to come to one, could you do the harm or allow the harm in the name of abstract humanity? Think!"

"I am not sure," said Daneel, voice trembling into all but silence. Then, with an effort, "I might. The mere concept pushes at me--and at you. It helped you decide to take the risk in adjusting Lady Gladia's mind."

"Yes, it did," agreed Giskard, "and the longer we think of the Zeroth Law, the more it might help push us. Could it do so, I wonder, in more than a marginal way, however? Might it not only help us take slightly larger risks than we might ordinarily?"

"Yet I am convinced of the validity of the Zeroth Law, friend Giskard."

"So might I be if we could define what we mean by 'humanity.' "

There was a pause and Daneel said, "Did you not accept the Zeroth Law, at last, when you stopped Madam Vasilia's robots and erased from her mind the knowledge of your mental powers?"

Giskard said, "No, friend Daneel. Not really. I was tempted to accept it, but not really."

"And yet your actions--"

"Were dictated by a combination of motives. You told me of your concept of the Zeroth Law and it seemed to have a certain validity about it, but not sufficient to cancel the First Law or even to cancel Madam Vasilia's strong use of the Second Law in the orders she gave. Then, when you called my attention to the application of the Zeroth Law to psychohistory, I could feel the positronomotive force mount higher and yet it was not quite high enough to supersede the First Law or even the strong Second Law."

"Still," murmured Daneel, "you struck down Madam Vasilia, friend Giskard. "

"When she ordered the robots to dismantle you, friend Daneel, and showed a clear emotion of pleasure at the prospect, your need, added to what the concept of the Zeroth Law had already done, superseded the Second Law and rivaled the First Law. It was the combination of the Zeroth Law, psychohistory, my loyalty to Lady Gladia, and your need that dictated my action."

"My need could scarcely have affected you, friend Giskard. I am only a robot and though my need could affect my own actions by the Third Law, they cannot affect yours. You destroyed the overseer on Solaria without hesitation; you should have watched my destruction without being moved to act."

"Yes, friend Daneel, and ordinarily it might have been so. However, your mention of the Zeroth Law had reduced the First Law intensity to an abnormally low value. The necessity of saving you was sufficient to cancel out what remained of it and I--acted as I did."

"No, friend Giskard. The prospect of injury to a robot should not have affected you at all. It should in no way have contributed to the overcoming of the First Law, however weak the First Law may have become. "

"It is a strange thing, friend Daneel. I do not know how it came about. Perhaps it was because I have noted that you continue to think more and more like a human being, but--"

"Yes, friend Giskard?"

"At the moment when the robots advanced toward you and Lady Vasilia expressed her savage pleasure, my positronic pathway pattern re-formed in an anomalous fashion. For a moment, I thought of you--as a human being--and I reacted accordingly. "

"That was wrong. "

"I know that. And yet--and yet, if it were to happen again, I believe the same anomalous change would take place again."

Daneel said, "It is strange, but hearing you put it so, I find myself feeling you did the proper thing. If the situation were reversed, I almost think that I, too, would--would do the same--that I would think of you as a--a human being."

Daneel, hesitantly and slowly, put out his hand and Giskard looked at it uncertainly. Then, very slowly, he put out his own hand. The fingertips almost touched and then, little by little, each took the other's hand and clasped it--almost as though they were the friends they called each other.

67.

Gladia looked about with veiled curiosity. She was in D.G.'s cabin for the first time. It was not noticeably more luxurious than the new cabin that had been designed for her. D.G.'s cabin had a more elaborate viewing panel, to be sure, and it had a complex console of lights and contacts which, she imagined, served to keep D.G. in touch with the rest of the ship even here.

She said, "I've seen little of you since leaving Aurora, D.G."

"I'm flattered that you are aware of that," answered D.G., grinning. "And to tell you the truth, Gladia, I have been aware of it as well. With an all-male crew, you do rather stand out."

"That's not a very flattering reason for missing me. With an all-human crew, I imagine Daneel and Giskard stand out, too. Have you missed them as much as you have missed me?"

D.G. looked about. "Actually, I miss them so little it is only now that I am aware that they aren't with you. Where are they?"

"In my cabin. It seemed silly to drag them about with me inside the confines of the small world of this ship. They seemed willing to allow me to be on my own, which surprised me. --No," she corrected herself, "come to think of it, I had to order them rather sharply to stay behind before they would do so."

"Isn't that rather strange? Aurorans are never without their robots, I've been given to understand."

"What of that? Once, long ago, when I first came to Aurora, I had to learn to suffer the actual presence of human beings, something my Solarian upbringing did not prepare me for. Learning to be without my robots, occasionally, when I am among Settlers will probably be a less difficult adjustment for me than that first one was."

"Good. Very good. I must admit that I much prefer being with you without the glowing eyes of Giskard fixed on me--and better yet, without Daneel's little smile."

"He doesn't smile."

"To me, he seems to, a very insinuatingly lecherous tiny smile. "

"You're mad. That's totally foreign to Daneel."

"You don't watch him the way I do. His presence is very inhibiting. It forces me to behave myself."

"Well, I should hope so."

"You needn't hope so quite that emphatically. But never mind. --Let me apologize for seeing so little of you since leaving Aurora. "

"That's scarcely necessary."

"Since you brought it up, I thought it was. However, let me explain, then. We've been on battle footing. We were certain, having left as we did, that Auroran vessels would be in pursuit."

"I should think they'd be glad to be rid of a group of Settlers. "

"Of course, but you 're not a Settler and it might be you they would want. They were anxious enough to get you back from Baleyworld."

"They got me back. I reported to them and that was it."

"They wanted nothing more than your report?"

"No," Gladia paused and, for a moment, frowned as though something was nibbling vaguely at her memory. Whatever it was, it passed and she said indifferently, "No."

D.G. shrugged. "It doesn't entirely make sense, but they made no attempt to stop us while you and I were on Aurora nor, after that, when we boarded the ship and it prepared to leave orbit. I won't quarrel with that. It won't be long now before we make the Jump--and after that there should be nothing to worry about. "

Gladia said, "Why do you have an all-male crew, by the way? Auroran ships always have mixed crews."

"So do Settler ships. Ordinary ones. This is a Trader vessel."

"What difference does that make?"

"Trading involves danger. It's rather a rough-and-ready life. Women on board would create problems."

"What nonsense! What problems do I create?"

"We won't argue that. Besides, it's traditional. The men wouldn't stand for it."

"How do you know?" Gladia laughed. "Have you ever tried it?"

"No. But, on the other hand, there are no long lines of women clamoring for a berth on my ship."

"I'm here. I'm enjoying it."

"You're getting special treatment--and but for your service on Solaria, there might well have been much trouble. In fact, there was trouble. Still, never mind." He touched one of the contacts on the console and a countdown briefly appeared. "We'll be Jumping in just about two minutes. You've never been on Earth, have you, Gladia?"

"No, of course not."

"Or seen the sun, not just a sun."

"No--although I have seen it in historical dramas on hypervision, but I imagine what they show in the dramas is not really the sun."

"I'm sure it isn't. If you don't mind, we'll dim the cabin lights."

The lights dimmed to nearly nothing and Gladia was aware of the star field on the viewing panel, with the stars brighter and more thickly spread than in Aurora's sky.

"Is that a telescopic view?" she asked in a hushed voice.

"Slightly. Low-power--Fifteen seconds." He counted backward. There was a shift in the star field and a bright star was now nearly centered. D.G. touched another contact

and said, "We're well outside the planetary plane. Good! A little risky. We should have been farther from the Auroran star before Jumping, but we were in a slight hurry. --That's the sun."

"That bright star, you mean?"

"Yes. --What do you think of it?"

Gladia said, a little puzzled over what sort of response he expected, "It's bright."

He pushed another contact and the view dimmed perceptibly. "Yes--and it won't do your eyes any good if you stare at it. But it's not the brightness that counts. It's just a star--in appearance--but think of it. That was the original sun. That was the star whose light shone down on a planet that was the only planet on which human beings existed. It shone down on a planet on which human beings were slowly evolving. It shone down on a planet on which life formed billions of years ago, life that would develop into human beings. There are 300 billion stars in the Galaxy and 100 billion galaxies in the Universe and there is only one of all those stars that presided over the human birth and that is the star."

Gladia was about to say: "Well, some star had to be the star," but she thought better of it. "Very impressive," she said rather weakly.

"It's not merely impressive," said D.G., his eyes shadowed in the dimness. "There's not a Settler in the Galaxy who doesn't consider that star his own. The radiation of the stars that shine down on our various home planets is borrowed radiation--rented radiation that we make use of. There--right there--is the real radiation that gave us life. It is that star and the planet that circles it--Earth--that holds us all together in a tight bond. If we shared nothing else, we would share that light on the screen and it would be enough. --You Spacers have forgotten it and that is why you fall apart from each other and that is why you will not, in the long run, survive."

"There is room for us all, Captain," said Gladia softly.

"Yes, of course. I wouldn't do anything to force nonsurvival on Spacers. I just believe that that is what will happen and it might not happen if Spacers would give up their irritating certainty of superiority, their robots, and their self-absorption in long life."

"Is that how you see me, D.G.?" asked Gladia.

D.G. said, "You've had your moments. You've improved, though. I'll give you that."

"Thank you," she replied with evident irony. "And though you may find it hard to believe, Settlers have their prideful arrogance, too. But you've also improved and I'll give you that."

D.G. laughed. "With all that I'm kindly giving you and you're kindly giving me, this is liable to end as a lifelong enmity."

"Scarcely," said Gladia, laughing in her turn, and was a little surprised to find that his hand was resting on hers. --And a great deal surprised to find that she had not removed her hand.

Daneel said, "I am uneasy, friend Giskard, that Madam Gladia is not under our direct observation."

"That is not needful on board this ship, friend Daneel. I detect no dangerous emotions and the captain is with her at the moment. --In addition, there would be advantages to her finding it comfortable to be without us, at least on occasion, while we are all on Earth. It is possible that you and I might have to take sudden action without wishing to have her presence and safety a complicating factor."

"Then you manipulated her separation from us now?"

"Scarcely. Oddly enough, I found a strong tendency in her to imitate the Settler way of life in this respect. She has a subdued longing for independence, hampered chiefly by the feeling that she is violating Spacerhood in this. That is the best way in which I can describe it. The sensations and emotions are by no means easy to interpret, for I have never encountered it among Spacers before. So I merely loosened the Spacerhood inhibition by the merest touch."

"Will she then no longer be willing to avail herself of our services, friend Giskard? That would disturb me."

"It should not. If she should decide she wishes a life free of robots and will be happier so, it is what we will want for her, too. As it is, though, I am sure we will still be useful to her. This ship is a small and specialized habitat in which there is no great danger. She had a further feeling of security in the captain's presence and that reduces her need for us. On Earth, she will still need us, though I trust not in quite so tight a fashion as on Aurora. --As I have said, we may need greater flexibility of action once on Earth."

"Can you yet guess, then, the nature of the crisis facing Earth? Do you know what it is we will have to do?"

Giskard said, "No, friend Daneel. I do not. It is you that have the gift of understanding. Is there something, perhaps, that you see?"

Daneel remained silent for a while. Then he said, "I have had thoughts."

"What, then, are your thoughts?"

"You told me at the Robotics Institute, you remember, just before Lady Vasilia entered the room in which Madam Gladia lay sleeping, that Dr. Amadiro had had two intense flashes of anxiety. The first came at the mention of the nuclear intensifier, the second at the statement that Madam Gladia was going to Earth. It seems to me that the two must be connected. I feel that the crisis we are dealing with involves the use of a nuclear intensifier on Earth, that there is time to stop it, and that Dr. Amadiro fears that we will do just that if we go to Earth."

"Your mind tells me you are not satisfied with that thought. Why not, friend Daneel?"

"A nuclear intensifier hastens the fusion processes that happen to be already in progress, by means of a stream of W particles. I asked myself, therefore, whether Dr. Amadiro plans to use one or more nuclear intensifiers to explode the microfusion reactors

that supply Earth with energy. The nuclear explosions so induced would involve destruction through heat and mechanical force, through dust and radioactive products that would be thrown into the atmosphere. Even if this did not suffice to damage Earth mortally, the destruction of Earth 's energy supply would surely lead to the long-term collapse of Earth's civilization."

Giskard said somberly, "That is a horrifying thought and would seem to be an almost certain answer to the nature of the crisis we seek. Why are you not satisfied, then?"

"I have taken the liberty of using the ship's computer to obtain information concerning the planet Earth. The computer is, as one might expect on a Settler ship, rich in such information. It seems that Earth is the one human world that does not use microfusion reactors as a large-scale source of energy. It uses direct solar energy almost entirely, with solar power stations all among the geostational orbit. There is nothing for a nuclear intensifier to do, except to destroy small devices--spaceships, occasional buildings. The damage might not be negligible, but it would not threaten Earth's existence. "

"It may well be, friend Daneel, that Amadiro has some device that would destroy the solar power generators."

"If so, why did he react to the mention of nuclear intensifiers? There is no way they can serve against solar power generators."

Giskard nodded slowly. "That is a good point. And, to make another, if Dr. Amadiro was so horrified at the thought of our going to Earth, why did he make no effort to have us stopped while we were still on Aurora? Or if he only discovered our flight after we had left orbit, why did he not have an Auroran vessel intercept us before we made the Jump to Earth? Can it be that we are on a completely wrong track, that somewhere we have made a serious misstep that--"

An insistent chain of intermittent chiming sounded throughout the ship and Daneel said, "We have safely made the Jump, friend Giskard. I sensed it some minutes ago. But we have not yet reached Earth and the interception you have just mentioned has, I suspect, now come, so that we are not necessarily on the wrong track."

69.

D.G. was moved to a perverse admiration. When the Aurorans were really moved to action, their technological polish showed. No doubt they had sent one of their newest warships, from which one could at once deduce that whatever had moved them was close to their heart.

And that ship had detected the presence of D.G.'s vessel within fifteen minutes of its appearance in normal space--and from a sizable distance, at that.

The Auroran ship was using a limited-focus hyperwave setup. The speaker's head could be seen clearly while it was at the focal spot. All else was a gray haze. If the speaker

moved his head a decimeter or so from the focal spot, that went into haze as well. Sound focus was limited as well. The net result was that one saw and heard only the fundamental minimum of the enemy ship (D.G. already thought of it as the "enemy" ship), so their privacy was guarded.

D.G.'s ship also possessed a limited-focus hyperwave, but, D.G. thought enviously, it lacked the polish and elegance of the Auroran version. Of course, his own ship was not the best the Settlers could do, but even so, the Spacers were well ahead technologically. The Settlers still had catching up to do.

The Auroran head in focus was clear and so real in appearance that it looked gruesomely disembodied, so that D.G. would not have been surprised if it had dripped blood. On second glance, however, it could be made out that the neck faded into grayness just after the neckpiece of an undoubtedly well-tailored uniform began to show.

The head identified itself, with punctilious courtesy, as Commander Lisiform of the Auroran ship *Borealis*. D.G. identified himself in his turn, thrusting his chin forward so as to make certain that his beard lent him an air of fierceness that could not help but be daunting to a beardless and (he thought) weak-chinned Spacer.

D.G. assumed the traditional air of informality that was as irritating to a Spacer officer, as the latter's traditional arrogance was to a Settler. He said, "What is your reason for hailing me, Commander Lisiform?"

The Auroran commander had an exaggerated accent which, it was possible, he thought as formidable as D.G. considered his beard to be. D.G. felt himself to be under considerable strain as he tried to penetrate the accent and understand him.

"We believe," said Lisiform, "that you have on your ship an Auroran citizen named Gladia Solaria. Is that correct, Captain Baley?"

"Madam Gladia is on board this ship, Commander."

"Thank you, Captain. With her, so my information leads me to suppose, are two robots of Auroran manufacture, R. Daneel Olivaw and R. Giskard Reventlov. Is that correct?"

"That is correct. "

"In that case, I must inform you that R. Giskard Reventlov is, at present, a dangerous device. Shortly before your ship left Auroran space with him, the said robot, Giskard, badly hurt an Auroran citizen in defiance of the Three Laws. The robot must, therefore, be dismantled and repaired."

"Are you suggesting, Commander, that we on this ship dismantle the robot?"

"No, sir, that would not do. Your people, lacking experience with robots, could not dismantle it properly and could not possibly repair it if they did."

"We might, then, simply destroy it."

"It is too valuable for that. Captain Baley, the robot is Aurora's product and Aurora's responsibility. We do not wish to be the cause of damage to the people on your ship and on the planet Earth if you land there. Consequently, we ask that it be delivered to us."

D.G. said, "Commander, I appreciate your concern. However, the robot is the legal property of Lady Gladia, who is with us. It may be that she would not consent to be parted from her robot and, while I don't want to teach you Auroran law, I believe that it would be illegal by that law to force such a parting. While my crew and I do not consider ourselves bound by Auroran law, we would not willingly be a party to helping you perform what your own government might consider to be an illegal act."

There was a suggestion of impatience in the commander's voice. "There is no question of illegality, Captain. A life-endangering malfunction in a robot supersedes the ordinary rights of an owner. Nevertheless, if there is any question of that, my ship stands ready to accept Lady Gladia and her robot Daneel, along with Giskard, the robot in question. There will then be no separation of Gladia Solaria and her robotic property until she is brought back to Aurora. The law can then take its proper course."

"It is possible, Commander, that Lady Gladia may not wish to leave my ship or to allow her property to do so."

"She has no recourse, Captain. I am legally empowered by my government to demand her--and as an Auroran citizen, she must obey."

"But I am not legally bound to deliver up anything on my ship at the demand of a foreign power. What if I choose to disregard your request?"

"In that case, Captain, I would have no choice but to consider it an unfriendly act. May I point out that we are within the sphere of the planetary system of which Earth is part. You had no hesitation in teaching me Auroran law. You will forgive me, then, if I point out that your people do not consider it proper to engage in hostilities within the space of this planetary system. "

"I am aware of that, Commander, and I wish no hostilities, nor do I intend an unfriendly act. However, I am bound for Earth under some urgency. I lose time in this conversation and I would lose further time if I moved toward you--or waited for you to move toward me--so that we could carry through a physical transfer of Lady Gladia and her robots. I would prefer to continue onward toward Earth and formally accept all responsibility for the robot Giskard and his behavior until such a time as Lady Gladia and her robots return to Aurora."

"May I make the suggestion, Captain, that you place the woman and two robots in a lifeboat and detach a member of your crew to pilot it to us? Once the woman and the two robots are delivered, we will ourselves escort the lifeboat to the immediate environs of Earth and we will compensate you adequately for your time and trouble. A Trader should not object to that."

"I don't, Commander, I don't," said D.G., smiling. "Still, the crewman detailed to pilot the lifeboat might be in great peril since he would be alone with this dangerous robot. "

"Captain, if the robot's owner is firm in her control, your crewman will be in no greater danger on the lifeboat than he would be on your ship. We will compensate him for the risk."

"But if the robot can, after all, be controlled by its owner, surely it is not so dangerous that it can't be left with us. "

The Commander frowned. "Captain, I trust you are not trying to play games with me. You have my request and I would like to have it honored at once."

"I presume I may consult with Lady Gladia."

"If you do so immediately. Please explain to her exactly what is involved. If, meanwhile, you try to proceed toward Earth, I shall consider that an unfriendly act and take the appropriate action. Since, as you claim, your trip toward Earth is urgent, I advise you to proceed forthwith to consult with Gladia Solaria and come to the immediate decision to cooperate with us. You will then not be too long delayed."

"I will do what I can," said D.G., wooden-faced, as he moved out of focus.

70.

"Well?" said D.G. gravely.

Gladia looked distressed. Automatically, she looked toward Daneel and Giskard, but they remained silent and motionless.

She said, "I don't want to return to Aurora, D.G. They can't possibly want to destroy Giskard; he is in perfect working order, I assure you. That's only a subterfuge. They want me for some reason. I suppose there's no way they can be stopped, though, is there?"

D.G. said, "That's an Auroran warship--and a big one. This is only a Trading vessel. We've got energy shields and they can't just destroy us at a blow, but they can wear us down eventually--quite soon, in fact--and then destroy us."

"Is there any way you can strike at them?"

"With my weapons? I'm sorry, Gladia, but their shields can take anything I can throw at them for as long as I can possibly have energy to expend. Besides--"

"Yes?"

"Well, they've just about cornered me. Somehow I thought they would try to intercept me before I Jumped, but they knew my destination and they got here first and waited for me. We're inside the Solar System--the planetary system of which Earth is part. We can't fight here. Even if I wanted to, the crew wouldn't obey me."

"Why not?"

"Call it superstition. The Solar System is holy space to us--if you want to describe it in melodramatic terms. We can't desecrate it by fighting."

Giskard said suddenly, "May I contribute to the discussion, sir?"

D.G. frowned and looked toward Gladia.

Gladia said, "Please. Let him. These robots are highly intelligent. I know you find that hard to believe, but--"

"I'll listen. I don't have to be influenced."

Giskard said, "Sir, I am certain that it is me that they want. I cannot allow myself to be the cause of harm to human beings. If you cannot defend yourself and are sure of destruction in a conflict with the other vessel, you have no choice but to give me up. I am sure that if you offer to let them have me, they will not seriously object if you wish to retain Lady Gladia and friend Daneel. It is the only solution."

"No," said Gladia forcefully. "You are mine and I won't give you up. I'll go with you--if the captain decides you must go--and I'll see to it they don't destroy you."

"May I speak as well?" said Daneel.

D.G. spread his hands in mock-despair. "Please. Everyone speak."

Daneel said, "If you decide you must give up Giskard, you must understand the consequences. I believe that Giskard thinks that if he is given up, those on the Auroran ship would do him no harm and that they will even release him. I do not believe this to be so. I believe the Aurorans are serious in thinking him to be dangerous and they may well have instructions to destroy the lifeboat as it approaches, killing whoever is on board."

"For what reason would they do that?" asked D.G.

"No Auroran has ever encountered--or even conceived--of what they call a dangerous robot. They would take no chances of taking one on board one of their vessels. --I would suggest, Captain, that you retreat. Why not Jump again, away from Earth? We are not close enough to any planetary mass to prevent that. "

"Retreat? You mean run away? I can't do that. "

"Well, then, you have to give us up," said Gladia with an air of resigned hopelessness.

D.G. said forcefully, "I'm not giving you up. And I'm not running away. And I can't fight."

"Then what's left?" asked Gladia.

"A fourth alternative," said D.G. "Gladia, I must ask you to remain here with your robots till I return."

71.

D.G. considered the data. There had been enough time during the conversation for the location of the Auroran vessel to be pinpointed. It was a bit farther from the sun than his own ship was and that was good. To Jump toward the sun, at this distance from it, would have been risky indeed; to Jump sideways would be, so to speak, a piece of cake in comparison. There was the chance of accident through probability deviation, but there was always that.

He had himself assured the crew that not a shot would be fired (which would do no good, in any case). Clearly, they had utter faith in Earth space protecting them as long as they didn't profane its peace by offering violence. It was pure mysticism that D.G. would have scornfully derided had he not shared the conviction himself.

He moved back into focus. It had been a fairly long wait, but there had been no signal from the other side. They had shown exemplary patience.

"Captain Baley here," he said. "I wish to speak to Commander Lisiform. "

There was not much of a wait. "Commander Lisiform here. May I have your answer?"

D.G. said, "We will deliver the woman and the two robots."

"Good! A wise decision."

"And we will deliver them as quickly as we can."

"Again a wise decision."

"Thank you." D.G. gave the signal and his ship Jumped.

There was no time, no need, to hold one's breath. It was over as soon as it was begun--or, at least, the time lapse was insensible.

The word came from the pilot. "New enemy ship position fixed, Captain."

"Good," said D.G. "You know what to do." The ship had come out of the Jump at high speed relative to the Auroran vessel and the course correction (not a great deal, it was to be hoped) was being made. Then further acceleration.

D.G. moved back into focus. "We are close, Commander, and on our way to deliver. You may fire if you choose, but our shields are up and before you can batter them down we will have reached you in order to make the delivery."

"Are you sending a lifeboat?" The commander moved out of focus.

D.G. waited and the commander was back, his face contorted. "What is this? Your ship is on a collision course."

"It seems to be, yes," said D.G. "That is the fastest way of making delivery."

"You will destroy your" ship."

"And yours, too. Your ship is at least fifty times as expensive as mine, probably more. A poor exchange for Aurora."

"But you are engaging in combat in Earth space, Captain. Your customs do not allow that."

"Ah, you know our customs and you take advantage of them. --but I am not in combat. I have not fired an erg of energy and I won't. I am merely following a trajectory. That trajectory happens to intersect your position, but since I am sure you will move before that intersection movement arrives, it is clear that I intend no violence."

"Stop. Let's talk about this."

"I'm tired of talking, Commander. Shall we all say a fond farewell? If you don't move, I will be giving up perhaps four decades with the third and fourth not so good, anyway. How many will you be giving up?" And D.G. moved out of focus and stayed out.

A beam of radiation shot out from the Auroran ship--tentative, as though to test whether the other's shields were truly up. They were.

Ships' shields would hold against electromagnetic radiation and subatomic particles, including even neutrinos, and could withstand the kinetic energy of small masses--dust particles, even meteoric gravel. The shields could not withstand larger kinetic energies, such as that of an entire ship hurtling at it with supermeteoric speed.

Even dangerous masses, if not guided--a meteoroid, for instance--could be handled. A vessel's computers would automatically veer the ship out of the way of any oncoming meteoroid that was too large for the shield to handle. That, however, would not work against a ship that could veer as its target veered. And if the Settler ship was the smaller of the two, it was also the more maneuverable.

There was only one way that the Auroran ship could avoid destruction. D.G. watched the other ship visibly enlarging in his viewing panel and wondered if Gladia, in her cabin, knew what was going on. She must be aware of the acceleration, despite the hydraulic suspension of her cabin and the compensatory action of the pseudo-gravity field.

And then the other ship simply winked out of view, having Jumped away, and D.G., with considerable chagrin, realized he was holding his breath and that his heart was racing. Had he had no confidence in the protecting influence of Earth or in his own sure diagnosis of the situation?

D.G. spoke into the transmitter in a voice that, with iron resolution, he forced into coolness. "Well done, men! Correct course and head for Earth."

16. THE CITY

72.

Gladia said, "Are you serious, D.G.? You really intended to collide with the ship?"

"Not at all," said D.G. indifferently. "I wasn't expecting to. I merely lunged at them, knowing they would retreat. Those Spacers weren't going to risk their long, wonderful lives when they could easily preserve them."

"Those Spacers? What cowards they are."

D.G. cleared his throat. "I keep forgetting you're a Spacer, Gladia. "

"Yes--and I imagine you think that that is a compliment to me. What if they had been as foolish as you--if they had shown the childish madness you think of as bravery--and stayed in place? What would you have done?"

D.G. muttered, "Hit them."

"And then we would all have died."

"The transaction would have been in our favor, Gladia. One crummy old Trader ship from a Settler world for a new and advanced warship of the leading Spacer world."

D.G. tipped his chair back against the wall and put his hands behind his neck (amazing how comfortable he felt, now that it was all over). "I once saw a historical hyperdrama, in which, toward the end of the war, airplanes loaded with explosives were deliberately flown into much more expensive seaships in order to sink them. Of course, the pilot of each airplane lost his life. "

"That was fiction," said Gladia. "You don't suppose civilized people do things like that in real life, do you?"

"Why not? If the cause is good enough."

"What was it, then, you felt as you plunged toward a glorious death? Exaltation? -- You were hurtling all your crew toward the same death. "

"They knew about it. We could do nothing else. Earth was watching."

"The people on Earth didn't even know."

"I mean it metaphorically. We were in Earth space. We could not act ignobly."

"Oh, what nonsense! And you risked my life, too."

D.G. looked down at his boots. "Would you like to hear something crazy? That was the only thing that bothered me. "

"That I would die?"

"Not quite. That I would lose you. --When that ship ordered me to give you up, I knew I wouldn't--even if you asked me to. I would gladly ram them instead; they couldn't have you. And then, as I watched their ship expand in the viewscreen, I thought, 'If they don't get out of here, I'll lose her anyway,' and that's when my heart started to pound and I began to sweat. I knew they'd run, and still the thought--" He shook his head.

Gladia frowned. "I don't understand you. You weren't worrying about my dying, but you were worried about losing me? Don't the two go together?"

"I know. I'm not saying it's rational. I thought of you rushing at the overseer to save me when you knew it could murder you with a blow. I thought of you facing the crowd at Baleyworld and talking them down when you had never even seen a crowd before. I even thought of you going to Aurora when you were a young woman and learning a new way of life--and surviving. --and it seemed to me I didn't mind dying, I just minded losing you. --You're right. It doesn't make sense."

Gladia said thoughtfully, "Have you forgotten my age? I was just about as old as I am now when you were born. When I was your age, I used to dream of your remote Ancestor. What's more, I've got an artificial hip joint. My left thumb--this one right here"--she wiggled it--"is strictly prosthetic. Some of my nerves have been rebuilt. My teeth are all implanted ceramic. And you talk as though any moment you're going to confess a transcendent passion. For what? --For whom? --Think, D.G.! --Look at me and see me as I am!"

D.G. tilted his chair back on two legs and rubbed at his beard with an odd scraping sound. "All right. You've made me sound silly, but I'm going to keep right on. What I know about your age is that you're going to survive me and look scarcely any older when you do, so you're younger than I am, not older. Besides, I don't care if you are older. What I would like is for you to stay with me wherever I go--for all my life, if possible."

Gladia was about to speak, but D.G. intervened hastily, "Or, if it seems more convenient, for me to stay with you wherever you go--for all my life, if possible. --If it's all right with you."

Gladia said softly, "I'm a Spacer. You're a Settler."

"Who cares, Gladia? Do you?"

"I mean, there's no question of children. I've had mine."

"What difference does that make to me! There's no danger of the name Baley dying out."

"I have a task of my own. I intend to bring peace to the Galaxy."

"I'll help you."

"And your trading? Will you give up your chance to be rich?"

"We'll do some together. Just enough to keep my crew happy and to help me support you in your task as peacebringer."

"Life will be dull for you, D.G."

"Will it? It seems to me that since you joined me it's been too exciting."

"And you'll probably insist on my giving up my robots."

D.G. looked distressed. "Is that why you've been trying to talk me out of this? I wouldn't mind your keeping the two of them--even Daneel and his small lecherous smile--but if we're going to live among Settlers--"

"Then I suppose I'll have to try to find the courage to do it."

She laughed gently and so did D.G. He held out his arms to her and she placed her hands in his.

She said, "You're mad. I'm mad. But everything has been so strange since the evening I looked up at the sky in Aurora and tried to find Solaria's sun that I suppose being mad is the only possible response to things."

"What you've just said isn't only mad," said D.G., "it's crazy, but that's the way I want you to be." He hesitated. "No, I'll wait. I'll shave my beard before I try to kiss you. That will lower the chances of infection."

"No, don't! I'm curious about how it might feel."

And she promptly found out.

73.

Commander Lisiform strode back and forth across the length of his cabin. He said, "There was no use losing the ship. No use at all."

His political adviser sat quietly in his chair. His eyes did not bother to follow the agitated and rapid to-and-fro movement of the other. "Yes, of course," he said.

"What have the barbarians to lose? They only live a few decades, in any case. Life means nothing to them."

"Yes, of course."

"Still, I've never seen or heard of a Settler ship doing that. It may be a new fanatical tactic and we have no defense against it. What if they send drone ships against us, with shields up and full momentum but no human beings aboard?"

"We might robotify our ships entirely."

"That wouldn't help. We couldn't afford to lose the ship. What we need is the shield knife they keep talking about. Something that will slice through a shield."

"Then they'll develop one, too, and we will have to devise a knife-proof shield, and so will they, and it will be a standoff again at a higher level."

"We need something completely new, then."

"Well," said the adviser, "maybe something will turn up. Your mission wasn't primarily the matter of the Solarian woman and her robots, was it? It would have been pleasant if we could have forced them out of the Settler ship, but that was secondary, wasn't it?"

"The Council isn't going to like it, just the same."

"It's my job to take care of that. The important fact is that Amadiro and Mandamus left the ship and are on their way to Earth in a good speedy ferry. "

"Well, yes."

"And you not only distracted the Settler ship but delayed it as well. That means Amadiro and Mandamus not only left the ship unnoticed but they will be on Earth before our barbarian captain will."

"I suppose so. But what of that?"

"I wonder. If it were only Mandamus, I would dismiss the matter. He's of no consequence. But Amadiro? To abandon the political wars back home at a difficult time and come to Earth? Something absolutely crucial must be going on here."

"What?" The commander seemed annoyed that he should be so nearly--and so all-but-fatally-involved in something of which he understood nothing.

"I haven't any idea."

"Do you suppose it might be secret negotiations at the highest level for some sort of overall modification of the peace settlement Fastolfe had negotiated?"

The adviser smiled. "Peace settlement? If you think that, you don't know our Dr. Amadiro. He wouldn't travel to Earth in order to modify a clause or two in a peace settlement. What he's after is a Galaxy without Settlers and if he comes to Earth--well, all I can say is that I wouldn't like to be in the shoes of the Settler barbarians at this time."

74.

"I trust, friend Giskard," said Daneel, "that Madam Gladia is not uneasy at being without us. Can you tell at her distance?"

"I can detect her mind faintly but unmistakably, friend Daneel. She is with the captain and there is a distinct overlay of excitement and joy."

"Excellent, friend Giskard."

"Less excellent for myself, friend Daneel. I find myself in a state of some disorder. I have been under a great strain."

"It distresses me to hear that, friend Giskard. May I ask the reason?"

"We have been here for some time while the captain negotiated with the Auroran ship."

"Yes, but the Auroran ship is now gone, apparently, so that the captain seems to have negotiated to good effect."

"He has done so in a manner of which you were apparently not aware. I was--to an extent. Though the captain was not here with us, I had little trouble sensing his mind. It exuded overwhelming tension and suspense and underneath that a gathering and strengthening sense of loss."

"Loss, friend Giskard? Were you able to determine of what that loss might consist?"

"I cannot describe my method of analysis of such things, but the loss did not seem to be the type of loss I have in the past associated with generalities or with inanimate objects. It had the touch--that is not the word, but there is no other that fits even vaguely --of the loss of a specific person."

"Lady Gladia. "

"Yes."

"That would be natural, friend Giskard. He was faced with the possibility of having to give her up to the Auroran vessel."

"It was too intense for that. Too wailing."

"Too wailing?"

"It is the only word I can think of in this connection. There was a stressful mourning associated with the sense of loss. It was not as though Lady Gladia would move elsewhere and be unavailable for that reason. That might, after all, be corrected at some future time. It was as though Lady Gladia would cease existing--would die--and be forever unavailable."

"He felt, then, that the Aurorans would kill her? Surely that is not possible."

"Indeed, not possible. And that is not it. I felt a thread of a sense of personal responsibility associated with the deep, deep fear of loss. I searched other minds on board ship and, putting it all together, I came to the suspicion that the captain was deliberately charging his ship into the Auroran vessel."

"That, too, is not possible, friend Giskard," said Daneel in a low voice.

"I had to accept it. My first impulse was to alter the captain's emotional makeup in such a way as to force him to change course, but I could not. His mind was so firmly set, so saturated with determination and--despite the suspense, tension, and dread of loss--so filled with confidence of success--"

"How could there be at once a dread of loss through death and a feeling of confidence of success?"

"Friend Daneel, I have given up marveling at the capacity of the human mind to maintain two opposing emotions simultaneously. I merely accept it. In this case, to have attempted to alter the captain's mind to the point of turning the ship from its course would have killed him. I could not do that. "

"But if you did not, friend Giskard, scores of human beings on this ship, including Madam Gladia, and several hundreds more on the Auroran vessel would die."

"They might not die if the captain were correct in his feeling of confidence in success. I could not bring about one certain death to prevent many merely probable ones. There is the difficulty, friend Daneel, in your Zeroth Law. The First Law deals with specific individuals and certainties. Your Zeroth Law deals with vague groups and probabilities."

"The human beings on board these ships are not vague groups. They are many specific individuals taken together."

"Yet when I must make a decision it is the specific individual I am about to influence directly whose fate must count with me. I cannot help that."

"What was it you did do, then, friend Giskard--or were you completely helpless?"

"In my desperation, friend Daneel, I attempted to contact the commander of the Auroran vessel after a small Jump had brought him quite close to us. --I could not. The distance was too great. And yet the attempt was not altogether a failure. I did detect something, the equivalent of a faint hum. I puzzled over it a short while before realizing I was receiving the overall sensation of the minds of all the human beings on board the Auroran vessel. I had to filter out that faint hum from the much more prominent sensations arising from our own vessel--a difficult task."

Daneel said, "Nearly impossible, I should think, friend Giskard."

"As you say, nearly impossible, but I managed it with an enormous effort. However, try as I might, I could make out no individual minds. --When Madam Gladia faced the large numbers of human beings in her audience on Baleyworld, I sensed an anarchic confusion of a vast jumble of minds, but I managed to pick out individual minds here and there for a moment or two. That was not so on this occasion. . .

Giskard paused, as though lost in his memory of the sensation.

Daneel said, "I imagine this must be analogous to the manner in which we see individual stars even among large groups of them, when the whole is comparatively close to us. In a distant galaxy, however, we cannot make out individual stars but can see only a faintly luminous fog."

"That strikes me as a good analogy, friend Daneel. --and as I concentrated on the faint but distant hum, it seemed to me that I could detect a very dim wash of fear permeating it. I was not sure of this, but I felt I had to try to take advantage of it. I had never attempted to exert influence over anything so far away, over anything as inchoate as a mere hum--but I tried desperately to increase that fear by however small a trifle. I cannot say whether I succeeded. "

"The Auroran vessel fled. You must have succeeded."

"Not necessarily. The vessel might have fled if I had done nothing."

Daneel seemed lost in thought. "It might. If our captain were so confident that it would flee--"

Giskard said, "On the other hand, I cannot be sure that there was a rational basis to that confidence. It seemed to me that what I detected was intermixed with a feeling of awe and reverence for Earth. The confidence I sensed was rather similar to the kind I have detected in young children toward their protectors--parental or otherwise. I had the

feeling that the captain believed he could not fail in the neighborhood of Earth because of the influence of Earth. I wouldn't say the feeling was exactly irrational, but it felt nonrational, in any case."

"You are undoubtedly right in this, friend Giskard. The captain has, in our hearing, spoken of Earth, on occasion, in a reverential manner. Since Earth cannot truly influence the success of an action through any mystical influence, it is quite possible to suppose that your influence was indeed successfully exerted. And moreover--"

Giskard, his eyes glowing dimly, said, "Of what are you thinking, friend Daneel?"

"I have been thinking of the supposition that the individual human being is concrete while humanity is abstract. When you detected that faint hum from the Auroran ship, you were not detecting an individual, but a portion of humanity. Could you not, if you were at a proper distance from Earth and if the background noise were sufficiently small, detect the hum of the mental activity of Earth's human population, overall? And, extending that, can one not imagine that in the Galaxy generally there is the hum of the mental activity of all of humanity? How, then, is humanity an abstraction? It is something you can point to. Think of that in connection with the Zeroth Law and you will see that the extension of the Laws of Robotics is a justified one--justified by your own experience."

There was a long pause and finally Giskard said, slowly as though it were being dragged out of him, "You may be right friend Daneel. --and yet, if we are landing on Earth now, with a Zeroth Law we may be able to use, we still don't know how we might use it. It seems to us, so far, that the crisis that Earth faces involves the use of a nuclear intensifier, but as far as we know, there is nothing of significance on Earth on which a nuclear intensifier can do its work. What, then, will we do on Earth?"

"I do not --as yet know," said Daneel sadly.

75.

Noise!

Gladia listened in astonishment. It didn't hurt her ears. It wasn't the sound of surface slashing on surface. It wasn't a piercing shriek, or a clamor, or a banging, or anything that could be expressed by an onomatopoetic word.

It was softer and less overwhelming, rising and falling, bearing within it an occasional irregularity--and always there.

D.G. watched her listening, cocking her head to this side and that, and said, "I call it the 'Drone of the City,' Gladia."

"Does it ever stop?"

"Never, really, but what can you expect? Haven't you ever stood in a field and heard the wind rustling the leaves, and insects stridulating, and birds calling, and water running. That never stops."

"That's different."

"No, it isn't. It's the same. The sound here is the melting together of the rumble of machinery and the various noises people make, but the principle is precisely the same as the natural nonhuman noises of a field. You're used to fields, so you don't hear the noise there. You're not used to this, so you hear it and probably find it annoying. Earthpeople don't hear it except on the rare occasions when they come fresh in from the countryside--and then they are very glad indeed to greet it. Tomorrow you won't hear it either."

Gladia looked about thoughtfully from their position on a small balcony. "So many buildings"

"That's true enough. Structures in every direction--stretching outward for miles. And up--and down, too. This is not just a city, in the fashion of Aurora or Baleyworld. It is a City--capital 'C'--of the kind that exists only on Earth."

"These are the Caves of Steel," said Gladia. "I know. We're underground, aren't we?"

"Yes. Absolutely. I must tell you that it took me time to get used to this sort of thing the first time I visited Earth. Wherever you go in a City, it looks like a crowded city scene. Walkways and roadways and storefronts and mobs of people, with the soft and universal lights of fluorescents making everything seem bathed in soft shadowless sunshine--but it isn't sunshine and, up above the surface, I don't know if the sun is really shining at the moment, or is covered by clouds, or is absent altogether, leaving this part of the world plunged in night and darkness. "

"It makes the City enclosed. People breathe each other's air."

"We do anyway--on any world--anywhere."

"Not like this." She sniffed. "It smells."

"Every world smells. Every City on Earth smells differently. You'll get used to it."

"Do I want to? Why don't people suffocate?"

"Excellent ventilation."

"What happens when it breaks down?"

"It never does."

Gladia looked about again and said. "Every building seems loaded with balconies."

"It's a sign of status. Very few people have apartments facing out and if they do have one they want the advantage of it. Most Citypeople live inside windowless apartments."

Gladia shuddered, "Horrible! What's the name of this City, D.G.?"

"It's New York. It's the chief City, but not the largest. On this continent, Mexico City and Los Angeles are the largest and there are Cities larger than New York on other continents."

"What makes New York the chief City, then?"

"The usual reason. The Global Government is located here. The United Nations."

"Nations?" She pointed her finger triumphantly at D.G. "Earth was divided into several independent political units. Right?"

"Right. Dozens of them. But that was before hyperspatial travel--prehyper times. The name remains, though. That's what's wonderful about Earth. It's frozen history. Every other world is new and shallow. Only Earth is humanity in its essence."

D.G. said it in a hushed whisper and then retreated back into the room. It was not a large one and its furnishings were skimpy.

Gladia said, disappointed, "Why isn't there anyone about?"

D.G. laughed. "Don't worry, dear. If it's parades and attention you want, you'll have them. It's just that I asked them to leave us alone for a while. I want a little peace and rest and I imagine you do, too. As for my men, they have to berth the ship, clean it up, renew supplies, tend to their devotions--"

"Women?"

"No, that's not what I mean, though I suppose women will play a role later. By devotions, I mean that Earth still has its religions and these comfort the men somehow. Here on Earth, anyway. It seems to have more meaning here."

"Well," said Gladia half-contemptuously. "Frozen history, as you say. --Do you suppose we can get out of the building and walk about a bit?"

"Take my advice, Gladia, and don't jump into that sort of thing just now. You'll get plenty of it when the ceremonies begin."

"But that will be so formal. Could we skip the ceremonies?"

"No chance at all. Since you insisted on making yourself a heroine on Baleyworld, you'll have to be one on Earth as well. Still, the ceremonies will be through eventually. When you recover from them, we will get a guide and we'll really see the City."

"Will we have any trouble taking my robots with us?" She gestured toward Daneel and Giskard at the other end of the room. "I don't mind being without them when I'm with you on the ship, but if I'm going to be with crowds of strangers I'll feel more secure having them with me."

"There'll be no problem with Daneel, certainly. He's a hero in his own right. He was the Ancestor's partner and he passes for human. Giskard, who is an obvious robot, should, in theory, not be allowed inside the city borders, but they've made an exception in his case and I hope they will continue to do so. --It is too bad, in a way, that we must wait here and can't step outside."

"You say I should not be exposed to all that noise just yet," said Gladia.

"No, no. I'm not referring to the public squares and roadways. I would just like to take you out into the corridors within this particular building. There are miles and miles of them--literally--and they're a small bit of City in themselves: shopping recesses, dining halls, amusement areas, Personals, elevators, transways, and so on. There's more color and variety on one floor in one building in one City on Earth than in a whole Settler town or in a whole Spacer world."

"I should think everyone would get lost. "

"Of course not. Everyone knows his own neighborhood here, as anywhere else. Even strangers need only follow the signs."

"I suppose all the walking that people are forced to do must be very good for them physically," said Gladia dubiously.

"Socially, too. There are people in the corridors at all times and the convention is that you stop to exchange words with anyone you know and that you greet even those you don't know. Nor is walking absolutely necessary. There are elevators everywhere for vertical travel. The main corridors are transways and move for horizontal travel. Outside the building, of course, there is a feeder line to the Expressway network. That's something. You'll get to ride it."

"I've heard of them. They have strips that you walk across and that drag you along faster and faster--or slower and slower--as you move from one to another. I couldn't do that. Don't ask me to."

"Of course you'll be able to do it," said D.G. genially. "I'll help you. If necessary, I'll carry you, but all it takes is a little practice. Among the Earthpeople, kindergarten children manage and so do old people with canes. I admit Settlers tend to be clumsy about it. I'm no miracle of grace myself, but I manage and so will you."

Gladia heaved an enormous sigh. "Well, then, I'll try if I have to. But I tell you what, D.G., dear. We must have a reasonably quiet room for the night. I want your 'Drone of the City' muted."

"That can be arranged, I'm sure."

"And I don't want to have to eat in the Section kitchens."

D.G. looked doubtful. "We can arrange to have food brought in, but really it would do you good to participate in the social life of Earth. I'll be with you, after all."

"Maybe after a while, D.G., but not just at first--and I want a Personal for myself."

"Oh, no, that's impossible. There'll be a washbasin and a toilet bowl in any room they assign us because we have status, but if you intend to do any serious showering or bathing, you'll have to follow the crowd. There'll be a woman to introduce you to the procedure and you'll be assigned a stall or whatever it is they have there. You won't be embarrassed. Settler women have to be introduced to the use of Personals every day of the year. --and you may end up enjoying it, Gladia. They tell me that the Women's Personal is a place of much activity and fun. In the Men's Personal, on the other hand, not a word is allowed spoken. Very dull."

"It's all horrible," muttered Gladia. "How do you stand the lack of privacy?"

"On a crowded world, needs must," said D.G. lightly. "What you've never had, you never miss. --Do you want any other aphorisms?"

"Not really," said Gladia.

She looked dejected and D.G. put an arm about her shoulder. "Come, it won't be as bad as you think. I promise you."

It was not exactly a nightmare, but Gladia was thankful to her earlier experience on Baleyworld for having given her a preview of what was now a veritable ocean of humanity. The crowds were much larger here in New York than they had been on the Settler world, but on the other hand, she was more insulated from the herd here than she had been on the earlier occasion.

The government officials were clearly anxious to be seen with her. There was a wordless, polite struggle for a position near enough to her to be seen with her on hypervision. It isolated her, not only from the crowds on the other side of the police lines but from D.G. and from her two robots. It also subjected her to a kind of polite jostling from people who seemed to have an eye only on the camera.

She listened to what seemed innumerable speeches, all mercifully brief, without really listening. She smiled periodically, both blandly and blindly, casting the vision of her implanted teeth in all directions indiscriminately.

Gladia went by ground-car through miles of passageways at a crawl, while an uncounted ant heap lined the walkways, cheering and waving as she passed. (She wondered if ever a Spacer had received such adulation from Earthpeople and was quite confident that her own case was entirely unprecedented.)

At one point, Gladia caught sight of a distant knot of people gathered round a hypervision screen and momentarily had an undoubted glimpse of herself upon it. They were listening, she knew, to a recording of her speech on Baleyworld. Gladia wondered how many times and in how many places and before how many people it was being played now, and how many times it had been played since she gave it, and how many times it would yet be played in the future, and whether anything at all had been heard of it on the Spacer worlds.

Might she, in fact, seem a traitor to the people of Aurora and would this reception be held to be proof of it?

She might--and it might--and she was beyond caring. She had her mission of peace and reconciliation and she would follow it wherever it led without complaint--even to the unbelievable orgy of mass bathing and shrilly unconscious exhibitionism in the Women's Personal that morning. (Well, without much complaint.)

They came to one of the Expressways that D.G. had mentioned, and Gladia gazed in open horror at the endless snake of passenger cars that passed--and passed--and passed--each with its load of people who were on business that could not be postponed for the motorcade (or who simply didn't want to be bothered) and who stared solemnly at the crowds and the procession for the few moments they remained in sight.

Then the ground-car plunged downward under the Expressway, through a short tunnel that in no way differed from the passage above (the City was all tunnel), and up again on the other side.

And eventually the motorcade came to an end at a large public building that was, mercifully, more attractive than the endlessly repetitious blocks that represented the units of the City's residential section.

Within the building, there was yet another reception, during which alcoholic drinks and various hors d'oeuvres were served. Gladia fastidiously touched neither. A thousand people milled about and an endless succession of them came up to speak to Gladia. The word had apparently gone out not to offer to shake hands, but some inevitably did, and, trying not to hesitate, Gladia would briefly place two fingers on the hand and then withdraw them.

Eventually, a number of women prepared to leave for the nearest Personal and one of them performed what was obviously a social ritual and tactfully asked Gladia if she would like to accompany them. Gladia didn't, but there might be a long night ahead and might be more embarrassing to have to interrupt it later.

Within the Personal, there was the usual excited laughing and chattering and Gladia, bowing to the exigencies of the situation and fortified by her experience that morning, made use of the facilities in a small chamber with partitions on either side, but with none in front of her.

No one seemed to mind and Gladia tried to remind herself she must adjust to local customs. At least the place was well-ventilated and seemed spotlessly clean.

Throughout, Daneel and Giskard had been ignored. This, Gladia realized, was a kindness. Robots were no longer allowed within City limits, though there were millions in the countryside without. To have made a point of the presence of Daneel and Giskard would have meant raising the legal issue that involved. It was easier to pretend, tactfully, that they weren't there.

Once the banquet began, they sat quietly at a table with D.G., not too far removed from the dais. At the dais, Gladia sat, eating sparingly and wondering if the food would give her dysentery.

D.G., perhaps not entirely pleased with his relegation to the post of keeper of the robots, kept staring restlessly in Gladia's direction and, occasionally, she lifted one hand and smiled at him.

Giskard, equally watchful of Gladia, had an opportunity to say to Daneel very quietly, under cover of the relentless and unending background clash of cutlery and babble, "Friend Daneel, these are high officials that sit here in this room. It is possible that one or more may have information of use to us."

"It is possible, friend Giskard. Can you, thanks to your abilities, guide me in this respect?"

"I cannot. The mental background yields me no specific emotional response of interest. Nor does the occasional flash among the nearest show me anything. Yet the climax of the crisis is, I am certain, approaching quickly, even as we sit here, idle."

Daneel said gravely, "I will try to do as Partner Elijah would have done and force the pace."

77.

Daneel was not eating. He watched the assemblage with his calm eyes and located the one he was searching for. Quietly, he rose and moved toward another table, his eyes on a woman who was managing to eat briskly and yet maintain a cheerful conversation with the man on her left. She was a stocky woman, with short hair that showed definite traces of gray. Her face, if not youthful, was pleasant.

Daneel waited for a natural break in the conversation and when that did not come, he said with an effort, "Madam, may I interrupt?"

She looked up at him, startled and plainly displeased. "Yes," she said rather brusquely, "what is it?"

"Madam," said Daneel, "I ask your pardon for this interruption, but may I have your permission to speak with you for a time?"

She stared at him, frowning for a moment, and then her expression softened. She said, "I should guess, from your excessive politeness, that you're the robot, aren't you?"

"I am one of Madam Gladia's robots, madam."

"Yes, but you're the human one. You're R. Daneel Olivaw."

"That is my name, madam."

The woman turned to the man on her left and said, "Please excuse me. I can't very well refuse this--robot."

Her neighbor smiled uncertainly and transferred his attention to the place before him.

The woman said to Daneel, "If you have a chair, why don't you bring it here? I will be glad to speak to you."

"Thank you, madam."

When Daneel had returned and seated himself, she said, "You are really R. Daneel Olivaw, aren't you?"

"That is my name, madam," said Daneel again.

"I mean the one who worked with Elijah Baley long ago. You're not a new model of the same line? You're not R. Daneel the Fourth or something like that?"

Daneel said, "There is little of me that has not been replaced in the past twenty decades--or even modernized and improved--but my positronic brain is the same as it was when I worked with Partner Elijah on three different worlds--and once on a spaceship. It has not been altered."

"Well!" She looked at him admiringly. "You're certainly a good job. If all robots were like you, I'd see no objection to them whatever. --What is it you want to talk to me about?"

"When you were introduced to Lady Gladia, madam, before we all took our seats, you were presented to her as the Undersecretary of Energy, Sophia Quintana."

"You remember well. That is my name and my office."

"Does the office refer to all of Earth or merely to the City?"

"I'm Global Undersecretary, I assure you."

"Then you are knowledgeable in the field of energetics?"

Quintana smiled. She did not seem to object to being questioned. Perhaps she thought it amusing or perhaps she found herself attracted to Daneel's air of deferential gravity or to the mere fact that a robot could question her so. In any case, she said with a smile, "I majored in energetics at the University of California and have a master's degree in it. As to how knowledgeable I still am, I'm not certain. I've spent too many years as an administrator--something that saps one's brains, I assure you."

"But you would be well acquainted with the practical aspects of Earth's present energy supply, would you not?"

"Yes. That I will admit to. Is there something you want to know about it?"

"There is something that piques my curiosity, madam. "

"Curiosity? In a robot?"

Daneel bowed his head. "If a robot is complex enough, he can be aware of something within himself that seeks information. This is analogous to what I have observed to be called 'curiosity' in human beings and I take the liberty of using the same word in connection with my own feelings."

"Fair enough. What are you curious about, R. Daneel? May I call you that?"

"Yes, madam. I understand that Earth's energy supply is drawn from solar power stations in geostationary orbit in Earth's equatorial plane."

"You understand correctly. "

"But are these power stations the sole energy supply of this planet?"

"No. They are the primary--but not the sole--energy supply. There is considerable use of energy from Earth's internal heat, from winds, waves, tides, flowing water, and so on. We have quite a complex mix and each variety has its advantages. Solar energy is the mainstay, however."

"You make no mention of nuclear energy, madam. Are there no uses for microfusion?"

Quintana raised her eyebrows. "Is that what you're curious about, R. Daneel?"

"Yes, madam. What is the reason for the absence of nuclear power sources on Earth?"

"They are not absent, R. Daneel. On a small scale, one comes across it. Our robots--we have many in the countryside, you know--are microfusionized. Are you, by the way?"

Daneel said, "Yes, madam."

"Then, too," she went on, "there are microfusionized machines here and there, but the total is quite trifling."

"Is it not true, Madam Quintana, that microfusion energy sources are sensitive to the action of nuclear intensifiers?"

"They certainly are. Yes, of course. The microfusion power source will blow up and I suppose that comes under the heading of being sensitive."

"Then it isn't possible for someone, using a nuclear intensifier, to seriously cripple some crucial portion of Earth's energy supply. "

Quintana laughed. "No, of course not. In the first place, I don't see anyone dragging a nuclear intensifier about from place to place. They weigh tons and I don't think they can be maneuvered through and along the streets and corridors of a City. Certainly, it would be noticed if anyone tried. And then, even if a nuclear intensifier were brought into play, all it could do would be to destroy a few robots and a few machines before the thing would be discovered and stopped. There is no chance at all--zero--of our being hurt in that way. Is that the reassurance you wanted, R. Daneel?"

It was almost a dismissal.

Daneel said, "There are just one or two small points I would like clarified, Madam Quintana. Why is there no large microfusion source on Earth? The Spacer worlds all depend on microfusion and so do all the Settler worlds. Microfusion is portable, versatile, and cheap--and doesn't require the enormous effort of maintenance, repair, and replacement that space structures do."

"And, as you said, R. Daneel, they are sensitive to nuclear intensifiers. "

"And, as you said, Madam Quintana, nuclear intensifiers are too large and bulky to be of much use."

Quintana smiled broadly and nodded. "You are very intelligent, R. Daneel," she said. "It never occurred to me that I would ever sit at a table and carry on a discussion like this with a robot. Your Auroran roboticists are very clever--too clever--for I fear to carry on this discussion. I'd have to worry about you taking my place in the government. You know, we do have a legend about a robot named Stephen Byerly taking a high post in the government. "

"That must be merely fiction, Madam Quintana," said Daneel gravely. "There are no robots in governmental posts on any of the Spacer worlds. We are merely--robots."

"I'm relieved to hear that and will therefore go on. The matter of differences in power sources has its roots in history. At the time that hyperspatial travel was developed, we had microfusion, so that people leaving Earth took microfusion power sources with them. It was necessary on spaceships and on planets, too, in the generations during which they were being adapted for human occupation. It takes many years to build an adequate complex of solar power stations--and rather than undertake such a task, the emigrants remained with microfusion. So it was with the Spacers in their time and so it is now with the Settlers.

"On Earth, however, microfusion and solar power in space were developed at roughly the same time and both were used more and more. Finally, we could make our choice and use either microfusion or solar power or, of course, both. And we chose solar power."

Daneel said, "That seems strange to me, Madam Quintana. Why not both?"

"Actually, that's not a very difficult question to answer, R. Daneel. Earth, in prehyperspatial days, had had experience with a primitive form of nuclear energy, and it wasn't a happy experience. When the time came to choose between solar power and microfusion, Earthpeople saw microfusion as a form of nuclear energy and turned away from it. Other worlds, which did not have our direct experience with the primitive form of nuclear energy, had no reason to turn away from microfusion."

"May I ask what this primitive form of nuclear energy to which you refer might be, madam?"

"Uranium fission," said Quintana. "It's completely different from microfusion. Fission involves the splitting of massive nuclei, such as those of uranium. Microfusion involves the joining of light nuclei, such as those of hydrogen. They're both forms of nuclear energy, however."

"I presume that uranium would be the fuel for fission devices."

"Yes--or other massive nuclei, such as those of thorium or plutonium."

"But uranium and these others are exceedingly rare metals. Could they support a fission-using society?"

"Those elements are rare on other worlds. On Earth, they are not exactly common, but neither are they terribly rare. Uranium and thorium are widely spread in the crust in small quantities and are concentrated in a few places."

"And are there any fission-power devices on Earth now, madam?"

"No," said Quintana flatly. "Nowhere and in no fashion. Human beings would far sooner burn oil--or even wood--than fission uranium. The very word 'uranium' is taboo in polite society. You wouldn't be asking me these questions or I giving you these answers if you were a human being and an Earthman."

Daneel persisted. "But are you certain, madam? Is there no secret device that makes use of fission that, for the sake of national security --"

"No, robot," said Quintana, frowning. "I tell you--no such device. None!"

Daneel rose. "I thank you, madam, and I ask your pardon for taking your time and for probing what would seem to be a sensitive subject. With your permission, I shall leave you now."

Quintana waved a careless hand. "You're welcome, R. Daneel. "

She turned again to her neighbor, secure in the knowledge that in the crowds of Earth, people never attempted to overhear a nearby conversation or, if they did, never admitted the fact. She said, "Would you imagine having a discussion on energetics with a robot?"

As for Daneel, he returned to his original place and said softly to Giskard, "Nothing, friend Giskard. Nothing helpful."

Then he added sadly, "Perhaps I asked the wrong questions. Partner Elijah would have asked the right ones."

17. THE ASSASSIN

78.

Secretary-General Edgar Andrev, chief executive of Earth, was a rather tall and imposing man, clean-shaven in the Spacer style. He moved always in a measured fashion, as though on constant display, and he had a twinkling way about him as though he was always very pleased with himself. His voice was a bit too high-pitched for his body, but it fell well short of being squeaky. Without seeming obdurate, he was not easily swayed.

And he wasn't this time. "Impossible," he said firmly to D.G. "She must make her appearance."

"She's had a hard day, Secretary-General," said D.G. . . She is not accustomed to crowds or to these surroundings. I am responsible to Baleyworld for her well-being and my personal honor is at stake."

"I appreciate your position," said Andrev, "but I represent, and I cannot deny Earthpeople their view of her. The corridors are filled, the hyperwave channels are ready, and I would not be able to hide her, even if I desperately wished to do so. After this--and how long can it last? Half an hour?--she can retire and she need not make another appearance till her speech tomorrow night."

"Her comfort must be cared for," said D.G., tacitly abandoning his position. "She has to be kept at some distance from the crowd. "

"There will be a cordon of security guards that will give her ample breathing space. The front row of the crowd will be kept well back. They're out there now. If we don't announce that she will soon appear, there might well be disorder."

D.G. said, "It shouldn't have been arranged. It isn't safe. There are Earthpeople who aren't fond of Spacers."

The Secretary-General shrugged. "I wish you could tell me how I could possibly have kept it from being arranged. At the present moment she is a heroine and she cannot be withheld. Nor will anyone offer her anything but cheers--for the moment. But if she doesn't appear, that will change. Now, let us go."

D.G. backed away discontentedly. He caught Gladia's eye. She looked tired and more than a little unhappy.

He said, "You must, Gladia. There's no way out."

For a moment, she stared down at her hands as though wondering if they could do anything to protect her, then she straightened herself and lifted her chin--a small Spacer amid this horde of barbarians. "If I must, I must. Will you remain with me?"

"Unless they remove me physically."

"And my robots?"

D.G. hesitated. "Gladia, how will two robots be able to help you in the midst of millions of human beings?"

"I know, D.G. And I also know that I will have to do without them eventually if I am to continue this mission of mine. But not just yet, please. For the moment, I will feel safer with them, whether that makes sense or not. If these Earth officials want me to acknowledge the crowd, to smile, to wave, to do whatever it is I am supposed to do, the presence of Daneel and Giskard will comfort me. --Look, D.G., giving in to them on a very big thing, even though I am so uneasy that I think nothing would be so nice as to run away. Let them give in to me on this very little thing."

"I'll try," said D.G., in clear discouragement and, as he stepped toward Andrev, Giskard moved quietly with him.

A few minutes later, when Gladia, surrounded by a carefully picked contingent of officials, moved forward toward an open balcony, D.G. remained a little behind Gladia, flanked on his left by Giskard and on his right by Daneel.

The Secretary-General had said ruefully, "All right, all right. I don't know how you managed to make me agree, but all right." He rubbed his forehead, aware of a small vague ache in his right temple. For some reason he caught Giskard's eye and turned away with a stifled shudder. "But you must keep them motionless, Captain, remember. And please keep the one that looks like a robot as unobtrusive as you can. He makes me uneasy and I don't want people any more aware of him than they have to be."

D.G. said, "They will be looking at Gladia, Secretary-General. They will see no one else."

"I hope so," said Andrev waspishly. He paused to take a message capsule someone placed in his hand. He put it into his pocket, then walked on and didn't think of it again till they had reached the balcony.

79.

To Gladia, it seemed that each time she moved into another scene, it grew worse--more people, more noise, more confusing light, more invasion of every sense perception.

There was shouting. She could hear her own name being shouted out. With difficulty, she overcame her own tendency to retreat and become immobile. She lifted her arm and waved it and smiled and the shouting became louder. someone began to speak, his voice booming out over the loudspeaker system, his image on a large screen high above them so that it could be visible to all the crowd. Undoubtedly, it was also visible on innumerable screens in innumerable meeting halls in every Section of every City on the planet.

Gladia sighed with relief at having someone else in the spotlight. She tried to shrink within herself and let the sound of the speaker distract the attention of the crowd.

Secretary-General Andrev, seeking cover under the voice, even as Gladia did, was rather thankful that, in giving precedence to Gladia, it had not seemed necessary for him to speak on this occasion. He suddenly remembered the message he had pocketed.

He frowned in sudden disturbance over what it might be that warranted the interruption of so important a ceremony and then experienced a reverse feeling of intense irritation over the fact that it would probably prove to be utterly unimportant.

He pressed the ball of his right thumb hard against the slight concavity designed to accept the pressure and the capsule opened. He removed the thin piece of plastipaper, read the message it contained, and then watched it crumble and fragment. He brushed away the impalpable powder that remained and gestured imperiously to D.G.

It was scarcely necessary to whisper under the conditions of the vast and continuing noise in the square.

Andrev said, "You said you encountered an Auroran war vessel within the space of the Solar System. "

"Yes--and I imagine Earth's sensors detected it."

"Of course they did. You said there were no hostile actions on either side."

"No weapon was used. They demanded Madam Gladia and her robots. I refused and they left. I explained all this."

"How long did it all take?"

"Not very long. Several hours."

"You mean that Aurora sent a warship just to argue back and forth with you for a couple of hours and then leave. "

D.G. shrugged. "Secretary-General, I don't know their motivations. I can only report what happened."

The Secretary-General stared at him haughtily. "But you do not report all that happened. The information of the sensors has now been thoroughly analyzed by computer and it would seem that you attacked."

"I did not fire a kilowatt of energy, sir."

"Have you considered kinetic energy? You used the ship itself as a projectile."

"So it may have seemed to them. They did not choose to withstand me and call what might have been a bluff."

"But was it a bluff?"

"It might have been."

"It seems to me, Captain, that you were ready to destroy two ships inside the Solar System and perhaps create a war crisis. That was a terrible chance to take."

"I did not think it would come to actual destruction and it didn't."

"But the whole process delayed you and occupied your attention."

"Yes, I suppose so, but why are you pointing this out?"

"Because our sensors did observe one thing you did not observe--or, at any rate, did not report."

"What might that be, Secretary-General?"

"It caught the launching of an orbital module, which seems to have had two human beings on board and which descended toward Earth."

The two were immersed in a world of their own. No other human being on the balcony was paying any attention to them. Only the two robots flanking D.G. were staring at them and listening.

It was at this point that the speaker ceased, his last words being, "Lady Gladia, born a Spacer on the world of Solaria, living as a Spacer on the world of Aurora, but becoming a Citizen of the Galaxy on the Settler world of Baleyworld." He turned to her and gestured expansively, "Lady Gladia--"

The sound of the crowd became a long, happy rumble and the many-headed crowd became a forest of waving arms. Gladia felt a gentle hand on her shoulder and heard a voice in her ear that said, "Please. A few words, my lady."

Gladia said weakly, "People of Earth." The words boomed out and, uncannily, silence fell. Gladia said again, more firmly, "People of Earth, I stand before you a human being as you are. A bit older, I admit, so that I lack your youth, your hopefulness, your capacity for enthusiasm. My misfortune is tempered at this moment, however, by the fact that in your presence I feel myself catching your fire, so that the cloak of age falls away--"

Applause swelled and someone on the balcony said to someone else, "She's making them happy they're shortlived. That Spacer woman has the impudence of a devil."

Andrev was not paying attention. He said to D.G., "The whole episode with you may have been a device to get those men on Earth."

D.G. said, "I had no way of knowing that. I could think of very little else but saving Lady Gladia and my ship. Where have they landed?"

"We don't know. They have not landed in any of the City spaceports."

D.G. said, "I guess they wouldn't."

"Not that it matters," said the Secretary-General, "except to give me passing annoyance. Over the past several years, there have been a number of landings of this sort, though none so carefully prepared. Nothing's ever happened and we pay no attention. Earth, after all, is an open world. It is humanity's home and any person from any world can come and go freely--even Spacers, if they wish."

D.G. rubbed his beard with a rasping noise. "And yet their intentions might not be to do us any good whatever."

(Gladia was saying, "I wish you all well on this world of human origin, on this well-packed special world, and in this marvel of a City--" and acknowledged the gathering applause with a smile and a wave as she stood there and allowed the enthusiasm to catch--and gather.)

Andrev raised his voice, to be heard over the clamor of the crowd. "Whatever their intentions, it can come to nothing. The peace that has descended on Earth since the Spacers withdrew and Settlement began is unbreakable within and without. For many decades now, the wilder spirits among ourselves have been leaving for the Settler worlds so that a spirit such as yours, Captain, which can dare risk the destruction of two vessels within the space of the Solar system is not to be found on Earth. There is no substantial level of crime on Earth any longer, no violence. The security guards assigned to control this crowd have no weapons because they have no need for any. "

And as he spoke, from the anonymity of the vast crowd a blaster pointed upward toward the balcony and was carefully aimed.

80.

A number of things happened at nearly the same time.

Giskard's head had turned to stare at the crowd, drawn by some sudden effect.

Daneel's eyes followed, saw the aimed blaster, and, with faster-than-human reflexes, he lunged.

The sound of the blaster rang out.

The people on the balcony froze and then broke out into loud exclamations.

D.G. seized Gladia and snatched her to one side.

The noise from the crowd erupted into a full-throated and terrifying roar.

Daneel's lunge had been directed at Giskard and he knocked the other robot down.

The shot from the blaster entered the room behind the balcony and gouged a hole out of a portion of the ceiling. A line drawn from the blaster to the hole might have passed through that portion of space occupied a second earlier by Giskard's head.

Giskard muttered as he was forced down. "Not human. A robot."

Daneel, releasing Giskard, surveyed the scene quickly. Ground level was some six meters beneath the balcony and the space below was empty. The security guards were struggling their way toward the region of upheaval within the crowd that marked the spot where the would-be assassin had stood.

Daneel vaulted over the balcony and dropped, his metal skeleton absorbing the shock easily, as a human being's would not have.

He ran toward the crowd.

Daneel had no choice. He had never encountered anything like this before. The supreme need was to reach the robot with the blaster before it was destroyed and, with that in mind, Daneel found that, for the first time in his existence, he could not stand on the niceties of preserving individual human beings from harm. He had to shake them up somewhat.

He tossed them aside, in actual fact, as he plowed into the crowd, crying out in stentorian fashion, "Make way! Make way! The person with the blaster must be questioned!"

Security guards fell in behind him and they found the "person" at last, down and somewhat battered.

Even on an Earth that prided itself on being nonviolent, an eruption of rage against an obvious murderer left its mark. The assassin had been seized, kicked, and beaten. It was only the very density of the crowd that had saved the assassin from being tom apart. The multiple assailants, getting in each other's way, succeeded in doing comparatively little.

The security guards pushed back the crowd with difficulty. On the ground near the prone robot was the blaster. Daneel ignored it.

Daneel was kneeling by the captured assassin. He said, "Can you talk?"

Bright eyes stared up at Daneel's. "I can," said the assassin in a voice that was low but quite normal otherwise.

"Are you of Auroran origin?"

The assassin did not answer.

Daneel said quickly, "I know you are. It was an unnecessary question. Where on this planet is your base?"

The assassin did not answer.

Daneel said, "Your base? Where is it? You must answer. I am ordering you to answer."

The assassin said. "You cannot order me. You are R. Daneel Olivaw. I have been told of you and I need not obey you."

Daneel looked up, touched the nearest guard, and said, "Sir, would you ask this person where his base is?"

The guard, startled, tried to speak but only a hoarse croak emerged. He swallowed in embarrassment, cleared his throat, and then barked out, "Where is your base?"

"I am forbidden to answer that question, sir," said the assassin.

"You must," said Daneel firmly. "A planetary official is asking it. --Sir, would you order him to answer it?"

The guard echoed, "I order you to answer it, prisoner."

"I am forbidden to answer that question, sir."

The guard reached downward to seize the assassin roughly by the shoulder, but Daneel said rapidly, "I would suggest that it would not be useful to offer force, sir."

Daneel looked about. Much of the clamor of the crowd had died down. There seemed to be a tension in the air, as though a million people were waiting anxiously to see what Daneel would do.

Daneel said to the several guards who had now clustered about him and the prone assassin, "Would you clear the way for me, sirs? I must take the prisoner to Lady Gladia. It may be that she can force an answer."

"What about medical attention for the prisoner?" asked one of the guards.

"That will not be necessary, sir," said Daneel. He did not explain.

81.

"That this should have happened," said Andrev tightly, his lips trembling with passion. They were in the room off the balcony and he glanced up at the hole in the ceiling that remained as mute evidence of the violence that had taken place.

Gladia said, in a voice that she strove successfully to keep from shaking, "Nothing has happened. I am unharmed. There is that hole in the ceiling that you will have to repair and perhaps some additional repairs in the room above. That's all."

Even as she spoke, she could hear people upstairs moving objects away from the hole and presumably assessing damage.

"That is not all," said Andrev. "It ruins our plans for your appearance tomorrow, for your major address to the planet."

"It does the opposite," said Gladia. . . The planet will be the more anxious to hear me, knowing I have been the near-victim of an assassination attempt. "

"But there's the chance of another attempt."

Gladia shrugged lightly. "That just makes me feel I'm on the right track. -- Secretary-General Andrev, I discovered not too long ago that I have a mission in life. It did not occur to me that this mission might place me in danger, but since it does, it also occurs to me that I would not be in danger and not worth the killing if I was not striking home. If danger is a measure of my effectiveness, I am willing to risk that danger."

Giskard said, "Madam Gladia, Daneel is here with, I presume, the individual who aimed a blaster in this direction."

It was not only Daneel--carrying a relaxed, unstruggling figure--who appeared in the doorway of the room, but half a dozen security guards as well. Outside, the noise of the crowd seemed lower and more distant. It was clearly beginning to disperse and periodically one could hear the announcement over the loudspeakers: "No one has been hurt. There is no danger. Return to your homes."

Andrev waved the guards away. "Is that the one?" he asked sharply.

Daneel said, "There is no question, sir, but that this is the individual with the blaster. The weapon was near him, but the people close to the scene witnessed his action, and he himself admits the deed. "

Andrev stared at him in astonishment. "He's so calm. He doesn't seem human."

"He is not human, sir. He is a robot, a humanoid robot."

"But we don't have any humanoid robots on Earth.--Except you. "

"This robot, Secretary-General," said Daneel, "is, like myself, of Auroran manufacture."

Gladia frowned. "But that's impossible. A robot couldn't have been ordered to assassinate me."

D.G., looking exasperated and, with a most possessive arm about Gladia's shoulder, said in an angry rumble, "An Auroran robot, specially programmed--"

"Nonsense, D.G.," said Gladia. "No way. Auroran or not, special programming or not, a robot cannot deliberately try to harm a human being it knows to be a human being. If this robot did fire the blaster in my direction, he must have missed me on purpose."

"To what end?" demanded Andrev. "Why should he miss, madam?"

"Don't you see?" said Gladia. "Whoever it was that gave the robot its orders must have felt that the attempt would be enough to disrupt my plans here on Earth and it was the disruption they were after. They couldn't order the robot to kill me, but they could order him to miss me--and if that was enough to disrupt the program, they would be satisfied.

--Except that it won't disrupt the program. I won't allow that."

D.G. said, "Don't be a heroine, Gladia. I don't know what they'll try next and nothing --nothing--is worth losing you."

Gladia's eyes softened. "Thank you, D.G. I appreciate your feelings, but we must chance it."

Andrev pulled at his ear in perplexity. "What do we do? The knowledge that a humanoid robot used a blaster in a crowd of human beings will not be taken well by Earth people."

"Obviously, it wouldn't," said D.G. "Therefore, let's not tell them."

"A number of people must already know--or guess--that we are dealing with a robot."

"You won't stop the rumor, Secretary-General, but there is no need to make it more than that by means of an official announcement. "

Andrev said, "If Aurora is willing to go to this extreme to--"

"Not Aurora," said Gladia quickly. "Merely certain people on Aurora, certain fire-eaters. There are such bellicose extremists among the Settlers, too, I know, and probably even on Earth. Don't play into the hands of these extremists, Secretary-General. I'm appealing to the vast majority of sensible human beings on both sides and nothing must be done to weaken that appeal."

Daneel, who had been waiting patiently, finally found a pause long enough to make it possible for him to insert his comment. "Madam Gladia--sirs--it is important to find out from this robot where on this planet he is based. There may be others."

"Haven't you asked him?" said Andrev.

"I have, Secretary-General, but I am a robot. This robot is not required to answer questions put to him by another robot. Nor is he required to follow my orders."

"Well, then, I will ask," said Andrev.

"That may not help, sir. The robot is under stringent orders not to answer and your order to answer will probably not overcome them. You do not know the proper phraseology and intonation. Madam Gladia is an Auroran and knows how this may be done. Madam Gladia, would you inquire as to where his planetary base might be?"

Giskard said in a low voice, so that only Daneel heard him, "It may not be possible. He may have been ordered into irreversible freeze if the questioning becomes too insistent."

Daneel's head turned sharply to Giskard. He whispered, "Can you prevent that?"

"Uncertain," said Giskard. "The brain has been physically damaged by the act of firing a blaster toward human beings."

Daneel turned back to Gladia. "Madam," he said, "I would suggest you be probing, rather than brutal."

Gladia said doubtfully, "Well, I don't know." She faced the robot assassin, drew a deep breath, and in a voice that was firm yet soft and gentle, she said, "Robot, how may I address you?"

The robot said, "I am referred to as R. Ernett Second, madam."

"Ernett, can you tell that I am an Auroran?"

"You speak in the Auroran fashion, yet not entirely, madam."

"I was born on Solaria, but I am a Spacer who has lived for twenty decades on Aurora and I am accustomed to being served by robots. I have expected and received service from robots every day of my life since I was a small child. I have never been disappointed. "

"I accept the fact, madam."

"Will you answer my questions and accept my orders, Ernett?"

"I will, madam, if they are not counteracted by a competing order."

"If I ask you the location of your base on this planet what portion of it you count as your master's establishment--will you answer that?"

"I may not do so, madam. Nor any other question with respect to my master. Any question at all."

"Do you understand that if you do not answer I will be bitterly disappointed and that my rightful expectation of robotic service will be permanently blunted?"

"I understand, madam," said the robot faintly.

Gladia looked at Daneel. "Shall I try?"

Daneel said, "There is no choice but to try, Madam Gladia. If the effort leaves us without information, we are no worse off than now."

Gladia said, in a voice that rang with authority, "Do not inflict damage on me, Ernett, by refusing to tell me the location of your base on this planet. I order you to tell me."

The robot seemed to stiffen. His mouth opened but made no sound. It opened again and he whispered huskily, ". . . mile. . ." It opened a third time silently--and then, while the mouth remained open, the gleam went out of the robot assassin's eyes and they became flat and waxen. One arm, which had been a little raised, dropped downward.

Daneel said, "The positronic brain has frozen."

Giskard whispered to Daneel only, "Irreversible! I did my best but could not hang on."

"We have nothing," said Andrev. "We don't know where the other robots might be."

D.G. said, "It said, 'mile.'"

"I do not recognize the word," said Daneel. "It is not Galactic Standard as the language is used on Aurora. Does it have meaning on Earth?"

Andrev said, rather blankly, "He might have been trying to say 'smile' or 'Miles.' I once knew a man whose first name was Miles."

Daneel said gravely, "I do not see how either word could make sense as an answer--or part of an answer--to the question. Nor did I hear any sibilance, either before or after the sound."

An elderly Earthman, who till now had remained silent, said, with a certain appearance of diffidence, "I am under the impression a mile may be an ancient measure of distance, robot."

"How long a measure, sir?" asked Daneel.

"I do not know," said the Earthman. "Longer than a kilometer, I believe."

"It isn't used any longer, sir?"

"Not since the prehyperspatial era." D.G. pulled at his beard and he said thoughtfully, "It's still used. At least, we have an old saying on Baleyworld that goes, 'A miss is as good as a mile.' It is used to mean that, in avoiding misfortune, avoidance by a little is as good as avoidance by a great deal. I always thought 'mile' meant 'a great deal.' If it really represents a measure of distance, I can understand the phrase better. "

Gladia said, "If that is so, the assassin may have been trying to say exactly that. He may have indicated his satisfaction that a miss--his deliberately missed shot--would accomplish what he was ordered to accomplish or, perhaps, that his missed shot, doing no harm, was equivalent to his not having fired at all."

"Madam Gladia," said Daneel, "a robot of Auroran manufacture would scarcely be using phrases that might exist on Baleyworld but have certainly never been heard on Aurora. And, in his damaged condition, he would not philosophize. He was asked a question and he would only be trying to answer the question."

"Ah," said Andrew, "perhaps he was trying to answer. He was trying to tell us that the base was a certain distance from here, for instance. So many miles."

"In that case," said D.G., "why should he use an archaic measure of distance? No Auroran would use anything but kilometers in this connection, nor would any robot of Auroran manufacture. In fact," he went on with an edge of impatience, "the robot was rapidly sinking into total inactivity and it might have been making nothing more than random sounds. It is useless to try to extract meaning from something that doesn't contain it. --And now I want to make sure that Madam Gladia gets some rest or that she is at least moved out of this room before the rest of the ceiling comes down."

They moved out quickly and Daneel, lingering behind for a moment, said softly to Giskard, "Again we fail!"

82.

The City never grew entirely quiet, but there were periods when the lights were dimmer, the noise of the ever-moving Expressways was subdued, and the endless clatter of machinery and humanity subsided just a bit. In several million apartments people slept.

Gladia got into bed in the apartment assigned to her, uncomfortable over the missing amenities that she feared might force her out into the corridors during the night.

Was it night on the surface, she wondered just before falling asleep, or was it merely an arbitrary "sleep period" fixed within this particular cave of steel, in deference to a habit developed over the hundreds of millions of years that human beings and their ancestors had lived on the surface of the land.

And then she slept.

Daneel and Giskard did not sleep. Daneel, finding there was a computer outlet in the apartment, spent an absorbed half hour learning the unfamiliar key combinations by hit-and-miss. There were no instructions of any sort available (who needs instructions for what every youngster learns in grade school?) but, fortunately, the controls, while not the same as those of Aurora, were not wholly different either. Eventually, he was able to tune into the reference section of the City library and call up the encyclopedia. Hours passed.

At the lowest depth of the humans' sleep period, Giskard said, "Friend Daneel."

Daneel looked up. "Yes, friend Giskard."

"I must ask for an explanation of your actions on the balcony."

"Friend Giskard, you looked toward the crowd. I followed your glance, saw a weapon aimed in your direction, and reacted at once."

Giskard said, "So you did, friend Daneel, and given certain assumptions, I can understand why it was me that you lunged forward to protect. Begin with the fact that the

would-be assassin was a robot. In that case, however it might be programmed, it could not aim its weapon at any human being with the intention of hitting him or her. Nor was it likely to aim its weapon at you, for you look enough like a human being to activate the First Law. Even if the robot had been told that a humanoid robot would be on the balcony, he could not be certain that you were he. Therefore, if the robot intended to destroy someone in the balcony, it could only be me--the obvious robot--and you acted at once to protect me.

"Or begin with the fact that the assassin was an Auroran--whether human or robot does not matter. Dr. Amadiro is most likely to have ordered such an attack, since he is an extremist in his anti-Earth stand and, we believe, is plotting its destruction. Dr. Amadiro, we can be reasonably certain, has learned of my special abilities from Madam Vasilisa and it might be argued that he would give my destruction top priority, since he would naturally fear me more than anyone else--robot or human. Reasoning this out, it would be logical for you to act as you did to protect me. --And, indeed, had you not knocked me down, I believe the blast would have destroyed me.

"But, friend Daneel, you could not possibly have known that the assassin was a robot or that he was Auroran. I myself had only just caught the strange anomaly of a robotic brain pattern against the vast blur of human emotion when you struck me--and it was only after that, that I had the chance of informing you. Without my ability, you could only be aware that a weapon was being aimed by what you must naturally have thought of as a human being and an Earthperson. The logical target, then, was Madam Gladia, as, in fact, everyone on the balcony assumed it to be. Why, then, did you ignore Madam Gladia and protect me, instead?"

Daneel said, "Friend Giskard, consider my line of thought. The Secretary-General had said that a two-man Auroran landing module had come to Earth's surface. I assumed at once that Dr. Amadiro and Dr. Mandamus had come to Earth. For this, there could be only one reason. The plan they have, whatever its nature, is at--or very nearly at the point of maturity. Now that you have come to Earth, friend Giskard, they have dashed here to see it carried through at once before you have a chance to stop it with your mind-adjusting powers. To make matters doubly sure, they would act to destroy you if they could. Therefore, when I saw an aimed weapon, I moved at once to force you out of the line of fire."

Giskard said, "The First Law should have forced you to move Madam Gladia out of the line of fire. No thought, no reasoning, should have altered that."

"No, friend Giskard. You are more important than Madam Gladia is. You are, in fact, more important than any human being could be at this moment. If anyone at all can stop the destruction of Earth, you can.

Since I am aware of your potential service to humanity, then, when I am confronted by a choice of action, the Zeroth Law demands that I protect you ahead of anyone else."

"And you do not feel uncomfortable at your having acted in defiance 'of the First Law."

"No, for I acted in obedience to the overriding Zeroth Law."

"But the Zeroth Law has not been imprinted into you."

"I have accepted it as a corollary of the First Law, for how can a human being best be kept from injury, if not by ensuring that human society in general is protected and kept functioning?"

Giskard thought a while. "I see what you are trying to say, but what if--in acting to save me and, therefore, in acting to save humanity --it had turned out that I was not aimed at and that Madam Gladia was killed? How would you have felt then, friend Daneel?"

Daneel said in a low tone, "I do not know, friend Giskard. Yet, had I leaped to save Madam Gladia and had it turned out that she was, in any case, safe and that I had allowed you to be destroyed and with you, in my opinion, the future of humanity, how could I have survived that blow?"

The two stared at each other--each, for a while, lost in thought.

Giskard said finally, "That may be so, friend Daneel, but do you agree, however, that judgment is difficult in such cases?"

"I agree, friend Giskard."

"It is difficult enough, when one must choose quickly between individuals, to decide which individual may suffer--or inflict--the greater harm. To choose between an individual and humanity, when you are not sure of what aspect of humanity you are dealing with, is so difficult that the very validity of Robotic Laws comes to be suspect. As soon as humanity in the abstract is introduced, the Laws of Robotics begin to merge with the Laws of Humanics--which may not even exist."

Daneel said, "I do not understand you, friend Giskard."

"I am not surprised. I am not certain I understand myself. But consider--When we think of the humanity we must save, we think of Earthpeople and the Settlers. They are more numerous than the Spacers, more vigorous, more expansive. They show more initiative because they are less dependent on robots. They have a greater potential for biological and social evolution because they are shorter-lived, though long-lived enough to contribute great things individually."

"Yes," said Daneel, "you put it succinctly."

"And yet the Earthpeople and the Settlers seem to possess a mystical and even irrational confidence in the sanctity and inviolability of Earth. Might not this mystique be as fatal to their development as the mystiques of robots and long life that hobble the Spacers?"

"I had not thought of this," said Daneel. "I do not know."

Giskard said, "If you were as aware of minds as I am, you would have been unable to avoid thinking of this. --How does one choose?" he went on with sudden intensity.

"Think of humanity as divided into two species: the Spacers, with one apparently fatal mystique, and the Earthpeople plus the Settlers, with another possibly fatal mystique. It may be that there will be other species, in the future, with even less attractive properties.

"It is not sufficient to choose, then, friend Daneel. We must be able to shape. We must shape a desirable species and then protect it, rather than finding ourselves forced to

select among two or more undesirabilities. But how can we achieve the desirable unless we have psychohistory, the science I dream of and cannot attain?"

Daneel said, "I have not appreciated the difficulty, friend Giskard, of possessing the ability to sense and influence minds. Is it possible that you learn too much to allow the Three Laws of Robotics to work smoothly within you?"

"That has always been possible, friend Daneel, but not until these recent events has the possibility become actual. I know the pathway pattern that produces this mind-sensing and mind-influencing effect within me. I have studied myself carefully for decades in order that I might know it and I can pass it on to you so that you might program yourself to be like me--but I have resisted the urge to do so. It would be unkind to you. It is enough that I bear the burden."

Daneel said, "Nevertheless, friend Giskard, if ever, in your judgment, the good of humanity would require it, I would accept the burden. Indeed, by the Zeroth Law, I would be obliged to."

Giskard said, "But this discussion is useless. It seems apparent that the crisis is nearly upon us--and since we have not even managed to work out the nature of the crisis--"

Daneel interrupted. "You are wrong, there at least, friend Giskard. I now know the nature of the crisis."

83.

One would not expect Giskard to show surprise. His face was, of course, incapable of expression. His voice possessed modulation, so that his speech sounded human and was neither monotonous nor unpleasant. That modulation, however, was never altered by emotion in any recognizable way.

Therefore, when he said, "Are you serious?" it sounded as it would have had he expressed doubt over a remark Daneel had made concerning what the weather would be like the next day. Yet, from the manner in which his head turned toward Daneel, the way in which one hand lifted, there was no doubt that he was surprised.

Daneel said, "I am, friend Giskard."

"How did the information come to you?"

"In part, from what I was told by Madam Undersecretary Quintana at the dinner table."

"But did you not say that you had obtained nothing helpful from her, that you supposed you had asked the wrong questions?"

"So it seemed in the immediate aftermath. On further reflection, however, I found myself able to make helpful deductions from what she had said. I have been searching Earth's central encyclopedia through the computer outlet these past few hours--"

"And found your deductions confirmed?"

"Not exactly, but I found nothing that would refute them, which is perhaps the next best thing. "

"But is negative evidence sufficient for certainty?"

"It is not. And therefore I am not certain. Let me tell you, however, my reasoning and if you find it faulty, say so."

"Please proceed, friend Daneel."

"Fusion power, friend Giskard, was developed on Earth before the days of hyperspatial travel and, therefore, while human beings were to be found only on the one planet, Earth. This is well known. It took a long time to develop practical controlled fusion power after the possibility had first been conceived and put on a sound scientific footing. The chief difficulty in converting the concept into practice involved the necessity of achieving a sufficiently high temperature in a sufficiently dense gas for a long enough time to bring about fusion ignition.

"And yet several decades before controlled fusion power had been established, fusion bombs had existed--these bombs representing an uncontrolled fusion reaction. But controlled or uncontrolled, fusion could not take place without an extremely high temperature in the millions of degrees. If human beings could not produce the necessary temperature for controlled fusion power, how could they do so for an uncontrolled fusion explosion?"

"Madam Quintana told me that before fusion existed on Earth, there was another variety of nuclear reaction in existence--nuclear fission. Energy was derived from the splitting--or fission--of large nuclei, such as those of uranium and thorium. That, I thought, might be one way of achieving a high temperature.

"The encyclopedia I have this night been consulting gives very little information about nuclear bombs of any sort and, certainly, no real details. It is a taboo subject, I gather, and it must be so on all worlds, for I have never read of such details on Aurora either, even though such bombs still exist. It is a part of history that human beings are ashamed of, or afraid of, or both and I think this is rational. In what I did read of fusion bombs, however, I read nothing about their ignition that would have eliminated the fission bomb as the igniting mechanism. I suspect, then, that based, in part, on this negative evidence, the fission bomb was the igniting mechanism.

"But, then, how was the fission bomb ignited? Fission bombs existed before fusion bombs and if fission bombs required an ultrahigh temperature for ignition, as fusion bombs did, then there was nothing that existed before fission bombs that would supply a high enough temperature. From this, I conclude--even though the encyclopedia contained no information on the subject--that fission bombs could be ignited at relatively low temperatures, perhaps even at room temperature. There were difficulties involved, for it took several years of unremitting effort after the discovery that fission existed before the bomb was developed. Whatever those difficulties might have been, however, they did not involve the production of ultrahigh temperatures. --Your opinion of all this, friend Giskard?"

Giskard had kept his eyes steadily on Daneel throughout his explanation and he now said, "I think the structure you have built up has serious weak points, friend Daneel, and therefore may not be very trustworthy--but even if it were all perfectly sound, surely this has nothing to do with the possible forthcoming crisis that we are laboring to understand."

Daneel said, "I plead for your patience, friend Giskard, and I will continue. As it happens, both the fusion process and the fission process are expressions of the weak interactions, one of the four interactions that control all events in the Universe. Consequently, the same nuclear intensifier that will explode a fusion reactor will also explode a fission reactor.

"There is, however, a difference. Fusion takes place only at ultrahigh temperatures. The intensifier explodes the ultrahot portion of the fuel that is actively undergoing fusion, plus some of the surrounding fuel that is heated to fusion in the initial explosion--before the material is blown explosively outward and the heat is dissipated to the point where other quantities of fuel present are not ignited. Some of the fusion fuel is exploded, in other words, but a good deal--perhaps even most--is not. The explosion is powerful enough even so, of course, to destroy the fusion reactor and anything in its immediate neighborhood, such as a ship carrying the reactor.

"On the other hand, a fission reactor can operate at low temperatures, perhaps not much above the boiling point of water, perhaps even at room temperature. The effect of the nuclear intensifier, then, will be to make all the fission fuel go. Indeed, even if the fission reactor is not actively working, the intensifier will explode it. Although, gram for gram, I gather that fission fuel liberates less energy than fusion fuel, the fission reactor will produce the greater explosion because more of its fuel explodes than in the case of the fusion reactor."

Giskard nodded his head slowly and said, "All this may well be so, friend Daneel, but are there any fission power stations on Earth?"

"No, there aren't--not one. So Undersecretary Quintana seemed to indicate and the encyclopedia seems to agree. Indeed, whereas there are devices on Earth that are powered by small fusion reactors, there is nothing--nothing at all--that is powered by fission reactors, large or small."

"Then, friend Daneel, there is nothing for a nuclear intensifier to act upon. All your reasoning, even were it impeccable, ends in nothing."

Daneel said earnestly, "Not quite, friend Giskard. There remains a third type of nuclear reaction to be taken into consideration. "

Giskard said, "What might that be? I cannot think of a third."

"It is not an easy thought, friend Giskard, for on the Spacer and Settler worlds, there is very little uranium and thorium in the planetary crusts and, therefore, very little in the way of obvious radioactivity. The subject is of little interest, in consequence, and is ignored by all but a few theoretical physicists. On Earth, however, as Madam Quintana pointed out to me, uranium and thorium are comparatively common, and natural radioactivity, with its ultraslow production of heat and energetic radiation, must therefore

be a comparatively prominent part of the environment. That is the third type of nuclear reaction to be taken into consideration."

"In what way, friend Daneel?"

"Natural radioactivity is also an expression of the weak interaction. A nuclear intensifier that can explode a fusion reactor or a fission reactor can also accelerate natural radioactivity to the point, I presume, of exploding a section of the crust--if enough uranium or thorium is present."

Giskard stared at Daneel for a period of time without moving or speaking. Then he said softly, "You suggest, then, that it is Dr. Amadiro's plan to explode Earth's crust, destroy the planet as an abode of life, and, in this way, ensure the domination of the Galaxy by the Spacers."

Daneel nodded. "Or, if there is not enough thorium and uranium for mass explosion, the increase of radioactivity may produce excess heat that will alter the climate, and excess radiation that will produce cancer and birth defects, and these will serve the same purpose--if a bit more slowly."

Giskard said, "This is an appalling possibility. Do you think it can really be brought about?"

"Possibly. It seems to me that for several years now--just how many I do not know--humanoid robots from Aurora, such as the would-be-assassin--have been on Earth. They are advanced enough for complex programming and are capable, when needed, of entering the Cities for equipment. They have, it is to be presumed, been setting up nuclear intensifiers in places where the soil is rich in uranium or thorium. Perhaps many intensifiers have been set up over the years. Dr. Amadiro and Dr. Mandamus are here now to oversee the final details and to activate the intensifiers. Presumably, they are arranging matters so that they will have time to escape before the planet is destroyed."

"In that case," said Giskard, "it is imperative that the Secretary-General be informed, that Earth's security forces be mobilized at once, that Dr. Amadiro and Dr. Mandamus be located without delay, and that they be restrained from completing their project."

Daneel said, "I do not think that can be done. The Secretary-General is very likely to refuse to believe us, thanks to the widespread mystical belief in the inviolability of the planet. You have referred to that as something that would work against humanity and I suspect that is just what it will do in this case. If his belief in the unique position of Earth is challenged, he will refuse to allow his conviction, however irrational, to be shaken and he will seek refuge by refusing to believe us."

"Then, too, even if he believed us, any preparation for counter-measures would have to go through the governmental bureaucracy and, no matter how that process was speeded, it would take far too long to serve its purpose."

"Not only that but, even if we could imagine the full resources of Earth mobilized at once, I do not think Earthpeople are adapted to locate the presence of two human beings in an enormous wilderness. The Earthpeople have lived in the Cities for many scores of decades and almost never venture beyond the City confines. I remember that

well from the occasion of my first case with Elijah Baley here on Earth,. And even if Earthpeople could force themselves to tramp the open spaces, they are not likely to come across the two human beings soon enough to save the situation except by the most incredible of coincidences--and that is something we cannot count upon."

Giskard said, "Settlers could easily form a search party. They are not afraid of open environments or of strange ones."

"But they would be as firmly convinced in the planet's inviolability as Earthpeople are, just as insistent on refusing to believe us, and just as unlikely to find the two human beings quickly enough to save the situation--even if they should believe us."

"What of Earth's robots, then?" said Giskard. "They swarm in the spaces between the Cities. Some should already be aware of human beings in their midst. They should be questioned."

Daneel said, "The human beings in their midst are expert roboticists. They would not have failed to see to it that any robots in their vicinity remain unaware of their presence. Nor, for this same reason, need they fear danger from any robots who might be part of a searching party. The party will be ordered to depart and forget. To make it worse, Earth's robots are comparatively simple models, designed for very little more than for specific tasks in growing crops, herding animals, and operating mines. They cannot easily be adapted to such a general purpose as conducting a meaningful search."

Giskard said, "You have eliminated every possible action, friend Daneel? Does anything remain?"

Daneel said, "We must find the two human beings ourselves and we must stop them--and we must do it now."

"Do you know where they are, friend Daneel?"

"I do not, friend Giskard. "

"Then if it seems unlikely that an elaborate search party composed of many, many Earthpeople, or Settlers, or robots, or, I presume, all three, could succeed in finding their location in time except by the most marvelous of coincidences, how can we two do so?"

"I do not know, friend Giskard, but we must."

And Giskard said, in a voice that seemed to have an edge of harshness in its choice of words, "Necessity is not enough, friend Daneel. You have come a long way. You have worked out the existence of a crisis and, bit by bit, you have worked out its nature. And none of it serves. Here we remain, as helpless as ever to do anything about it."

Daneel said, "There remains one chance--a farfetched one, an all-but-useless one--but we have no choice except to try. Out of Amadiro's fear of you, he sent an assassin robot to destroy you and that may turn out to have been his mistake. "

"And if that all-but-useless chance fails, friend Daneel?"

Daneel looked calmly at Giskard. "Then we are helpless, and Earth will be destroyed, and human history will dwindle to an eventual end."

18. THE ZEROTH LAW

84.

Keldon Amadiro was not happy. The surface gravity of Earth was a trifle too high for his liking, the atmosphere a trifle too dense, the sound and the odor of the outdoors subtly and annoyingly different from that on Aurora, and there was no indoors that could make any pretense of being civilized.

The robots had built shelters of a sort. There were ample food supplies and there were makeshift privies that were functionally adequate but offensively inadequate in every other way.

Worst of all, though the morning was pleasant enough, it was a clear day and Earth's too-bright sun was rising. Soon the temperature would be too high, the air would be too damp, and the biting insects would appear. Amadiro had not understood, at first, why there should be small itching swellings on his arms till Mandamus explained.

Now he mumbled, as he scratched, "Dreadful! They might carry infections. "

"I believe," said Mandamus with apparent indifference, "that they sometimes do. It isn't likely, however. I have lotions to relieve the discomfort and we can burn certain substances that the insects find offensive, although I find the odors offensive, too."

"Burn them," said Amadiro.

Mandamus continued, without changing tone, "And I don't want to do anything, however trifling--an odor, a bit of smoke--that would increase the chance of our being detected."

Amadiro eyed him suspiciously. "You have said, over and over, that this region is never visited by either Earthpeople or their field robots."

"That's right, but it's not a mathematical proposition. It's a sociological observation and there is always the possibility of exceptions to such observations."

Amadiro scowled. "The best road to safety lies with being done with this project. You said you'd be ready today."

"That, too, is a sociological observation, Dr. Amadiro. I should be ready today. I would like to be. I cannot guarantee it mathematically."

"How long before you can guarantee it?"

Mandamus spread his hands in a "Who knows?" gesture. "Dr. Amadiro, I am under the impression I have already explained this, but I'm willing to go through it again. It took me seven years to get this far. I have been counting on some months yet of personal observations at the fourteen different relay stations on Earth's surface. I can't do that now because we must finish before we are located and, possibly, stopped by the robot Giskard. That means I have to do my checking by communicating with our own humanoid robots at the relays. I can't trust them as I would myself. I must check and recheck their reports and it is possible that I may have to go to one or two places before I am satisfied. That would take days--perhaps a week or two."

"A week or two. Impossible! How long do you think I can endure this planet, Mandamus?"

"Sir, on one of my previous visits I stayed on this planet for nearly a year--on another, for over four months."

"And you liked it?"

"No, sir, but I had a job to do and I did it--without sparing myself." Mandamus stared coldly at Amadiro.

Amadiro flushed and said in a somewhat chastened tone, "Well, then, where do we stand?"

"I'm still weighing the reports that are coming in. We are not working with a smoothly designed laboratory-made system, you know. We have an extraordinary heterogeneous planetary crust to deal with. Fortunately, the radioactive materials are widely spread, but in places they run perilously thin and we must place a relay in such places and leave robots in charge. If those relays are not, in every case, properly positioned and in proper order, the nuclear intensification will die out and we will have wasted all these painful years of effort on nothing. Or else, there may be a surge of localized intensification that will have the force of an explosion that will blow itself out and leave the rest of the crust unaffected. In either case, total damage would be insignificant.

"What we want, Dr. Amadiro, is to have the radioactive materials and, therefore, significantly large sections of earth's crust grow--slowly--steadily--irreversibly"--he bit the words off as he pronounced them in spaced intervals--"more and more intensely radioactive, so that Earth becomes progressively more unlivable. The social structure of the planet will break down and the Earth, as an effective abode of humanity, will be over and done with. I take it, Dr. Amadiro, that this is what you want. It is what I described to you years ago and what you said, at that time, you wanted."

"I still do, Mandamus. Don't be a fool."

"Then bear with the discomfort, sir--or else, leave and I will carry on for whatever additional time it takes."

"No, no," muttered Amadiro. "I must be here when it's done--but I can't help being impatient. How long have you decided to allow the process to build? --I mean, once you initiate the original wave of intensification, how long before Earth becomes uninhabitable?"

"That depends on the degree of intensification I apply initially. I don't know, just yet, what degree will be required, for that depends on the overall efficiency of the relays, so I have prepared a variable control. What I want to arrange is a lapse period of ten to twenty decades. "

"And if you allow a smaller lapse period?"

"The less the lapse period we allow, the more rapidly portions of the crust will grow radioactive and the more rapidly the planet will Warm up and grow dangerous. And that means the less likely it will be that any significant number of its population can be removed in time. "

"Does that matter?" murmured Amadiro.

Mandamus frowned. "The more rapidly the Earth deteriorates, the more likely it is that Earthpeople and Settlers will suspect a technological cause--and that we are the likely ones to receive the blame. The Settlers will then attack us with fury and, in the cause of their holy world, they will fight to extinction, provided only that they can inflict substantial harm on us. This is something we have discussed before and it seems we agreed on the matter. It would be far better to allow ample time, during which we can prepare for the worst and during which a confused Earth may assume that the slowly increasing radioactivity is some natural phenomenon they don't understand. That is something that has become more urgent today than yesterday, in my judgment."

"Is that so?" Amadiro was frowning also. "You have that sour, puritanical look that makes me sure you have found a way to place the responsibility for that on my shoulders."

"With respect, sir, that is not difficult in this case. It was unwise to send out one of our robots to destroy Giskard."

"On the contrary, it had to be done. Giskard is the only one who might destroy us."

"He must find us first--and he won't. And even if he does, we are knowledgeable roboticists. Don't you think we could handle him?"

"Indeed?" said Amadiro. "So Vasilia thought and she knew Giskard better than we--and yet she couldn't handle him. And somehow the warship that was to take him into charge and destroy him at a distance could not handle him. So he has now landed on Earth. One way or another. he must be destroyed."

"He has not been. There has been no report of it."

"Bad news is sometimes repressed by a prudent government--and Earth officials, though barbarians, might conceivably be prudent. And if our robot failed and was questioned, he would certainly go into irreversible block. That means we will have lost a robot, something we can afford to do, but nothing more. And if Giskard should still be at large, the more reason we have to hurry."

"If we have lost a robot, we have lost more than a robot if they manage to elicit the location of this center of operations. We ought, at least, not to have used a local robot."

"I used one that was immediately available. And he will reveal nothing. You can trust my programming, I think."

"He cannot help reveal, by his mere existence, whether frozen or not, that he is of Auroran manufacture. Earth roboticists--and there are some on this planet--will be sure of that. All the more reason to make the increase in radioactivity very slow. Enough time must pass so that Earthpeople forget the incident and don't associate it with the progressive change in radioactivity. We must have ten decades at the very least, perhaps fifteen, or even twenty."

He walked away to inspect his instruments again and to re-establish contact with relays six and ten, which he still found troublesome. Amadiro looked after him with a mixture of disdain and intense dislike and muttered to himself, "Yes, but I don't have twenty more decades, or fifteen, or maybe even ten. You do--but I don't."

85.

It was early morning in New York. Giskard and Daneel assumed that from the gradual heightening of activity.

"Somewhere above and outside the City," said Giskard, "it may be dawn now. Once, in speaking to Elijah Baley twenty decades ago, I referred to Earth as the World of the Dawn. Will it continue to be so for much longer? Or has it already ceased to be that?"

"These are morbid thoughts, friend Giskard," said Daneel. "It will be better if we occupy ourselves with what must be done on this day to help keep Earth the World of the Dawn."

Gladia entered the apartment, wearing a bathrobe and slippers. Her hair was freshly dried.

"Ridiculous!" she said. "Earthwomen go through the corridors on their way to the mass Personals in the morning disheveled and slatternly. It is done on purpose, I think. It is bad manners to comb one's hair on the way to the Personal. Apparently, dishevelment to begin with enhances that well-cared-for look afterward. I should have brought a complete morning outfit with me. You should have seen the looks I got when I left with my bathrobe on. Leaving the Personal, one must be the last word. --Yes, Daneel?"

"Madam," said Daneel, "May we have a word with you?"

Gladia hesitated. "Not much of a word, Daneel. As you are probably aware, this is going to be a big day and my morning appointments begin almost at once."

"That is precisely what I wish to discuss, madam," said Daneel. "On this important day, all will go better if we are not with you."

"What?"

"The effect you would wish to have on Earthpeople would be greatly diminished if you surround yourself with robots."

"I will not be surrounded. There will be just you two. How can I do without you?"

"It is necessary that you learn to, madam. While we are with you, you are marked off as different from Earthpeople. You are made to seem afraid of them. "

Gladia said, troubled, "I need some protection, Daneel. Remember what happened last night."

"Madam, we could not have prevented what happened last night and we could not have protected you--if that were necessary. Fortunately, you were not the target last night. The blaster bolt was aimed at Giskard's head."

"Why Giskard?"

"How could a robot aim at you or at any human being? The robot aimed at Giskard for some reason. For us to be near you, then, might but increase your danger. Remember that as the tale of last night's events spreads, even though the Earth government may try to suppress the details, there will be a rumor to the effect that it was a robot who held a blaster and fired it. That will arouse public indignation against robots--against us--and even against you if you persist in being seen with us. It would be better if you were without us."

"For how long?"

"For at least as long as your mission lasts, madam. The captain will be better able to help you in the days to come than we will be. He knows Earthpeople, he is highly thought of by them--and he thinks very highly of you, madam."

Gladia said, "Can you tell that he thinks very highly of me?"

"Although I am a robot, it would seem so to me. And at any time that you should wish us back, we will come back, of course--but, for now, we think that the best way we can serve and protect you is to leave you in Captain Baley's hands."

Gladia said, "I will think of it."

"In the meanwhile, madam," said Daneel, "we will see Captain Baley and find out if he agrees with us."

"Do so!" said Gladia and passed into her bedroom.

Daneel turned and spoke minimally to Giskard. "Is she willing?"

"More than willing," said Giskard. "She has always been a little restless in my presence and would not suffer unduly at my absence. For you, friend Daneel, she has ambivalent feelings. You remind her markedly of friend Jander, whose inactivation, many decades ago, was so traumatic for her. This has been a source of both attraction and repulsion to her, so it was not necessary to do much. I lessened her attraction to you and increased her strong attraction to the captain. She will do without us easily."

"Then let us find the captain," said Daneel. Together, they left the room and entered the hallway that passed by the apartment.

86.

Daneel and Giskard had both been on Earth on previous occasions, Giskard the more recently. They understood the use of the computerized directory that gave them the section, Wing, and number of the apartment to which D.G. had been assigned and they understood, further, the color codes in the hallways that led them to the proper turnings and elevators.

It was early enough for the human traffic to be light, but those human beings who passed or approached at first stared with astonishment at Giskard, then looked away with elaborate unconcern.

Giskard's steps were slightly uneven by the time they approached D.G.'s apartment door. It was not very noticeable, but it caught Daneel's attention.

He said in a low voice, "Are you in discomfort, friend Giskard?"

Giskard replied, "It has been necessary for me to wipe out astonishment, apprehension, and even attention in a number of men and women--and in one youngster, which was harder still. I had no time to make completely certain I was doing no harm."

"It was important to do so. We must not be stopped."

"I understand that, but the Zeroth Law does not work well with me. I have not your facility in that respect." He went on, as though to distract his own attention from his

discomfort, "I have often noted that hyperresistance in the positronic pathways makes itself first felt in the matter of standing and walking and next in speech."

Daneel tapped the door signal. He said, "It is the same in my case, friend Giskard. Maintaining balance on two supports is difficult under the best of circumstances. Controlled imbalance, as in walking, is even more difficult. I have heard once that there were early attempts made to produce robots with four legs and two arms. They were called 'centaurs.' They worked well but were unacceptable because they were basically inhuman in appearance."

"At the moment," said Giskard, "I would appreciate four legs, friend Daneel. However, I think my discomfort is passing."

D.G. was at the door now. He looked at them with a broad smile. He then glanced in each direction along the corridor, whereupon his smile vanished and was replaced with a look of the utmost concern. "What are you doing here without Gladia? Is she--"

Daneel said, "Captain, Madam Gladia is well. She is in no danger. May we enter and explain?"

D.G. glowered as he gestured them inside. His voice gained the hectoring tone one naturally assumes toward misbehaving machines and he said, "Why have you left her alone? What circumstances could possibly permit you to leave her alone?"

Daneel said, "She is no more alone than any person is on Earth--and no more in danger. If you will question her later on the matter, I believe she will tell you that she cannot be effective here on Earth as long as she is trailed by Spacer robots. I believe she will tell you that what guidance and protection she needs should be supplied by you, rather than by robots. It is what we believe she wishes--at least for now. If, at any time, she wishes us back, she will have us."

D.G.'s face relaxed into a smile again. "She wants my protection, does she?"

"At the moment, Captain, we believe she is quite anxious for your presence, rather than for ours."

D.G.'s smile became a grin. "Who can blame her?--I'll get myself ready and go to her apartment as soon as I can. "

"But first, sir--"

"Oh," said D.G., "there is a quid pro quo?"

"Yes, sir. We are anxious to discover as much as we can about the robot who fired the blaster at the balcony last night."

D.G. looked tense again. "Do you anticipate further danger for Madam Gladia?"

"None at all of that kind. The robot, last night, did not fire at Lady Gladia. Being a robot, he could not have. He fired at friend Giskard."

"Why should he have done that?"

"It is what we would like to find out. For that purpose, we wish you to call Madam Quintana, Undersecretary of Energy, and state that it would be important and would please you and the government of Baleyworld--if you would care to add that--for her to allow me to ask her a few questions on that subject. We wish you to do whatever seems best to persuade her to agree to such an interview."

"Is that all you want me to do? Persuade a reasonably important and busy official to submit to cross-examination by a robot?"

Daneel said, "Sir, she may agree if you are earnest enough in the request. In addition, since she may be located a distance away, it would be helpful if you would hire a darter on our behalf to take us there. We are, as you can imagine, in haste."

"And are those little things all?" asked D.G.

"Not quite, Captain," said Daneel. "We will need a driver and please pay him well enough so that he will consent to transport friend Giskard, who is an obvious robot. He may not mind me."

D.G. said, "I hope you realize, Daneel, that what you ask is completely unreasonable."

Daneel said, "I had hoped not, Captain. But since you tell me it is, there is nothing more to say. We have no choice, then, but to return to Madam Gladia, which will make her unhappy, for she would rather be with you."

He turned to leave, motioning Giskard to accompany him, but D.G. said, "Wait. There's a public communication contact just down the hallway. I can only try. Remain here and wait for me."

The two robots remained standing. Daneel said. "Did you have to do much, friend Giskard?"

Giskard seemed well balanced on his legs now. He said, "I was helpless. He was strongly opposed to dealing with Madam Quintana and as strongly opposed to getting us a darter. I could not have altered those feelings without damage. When, however, you suggested returning to Madam Gladia, his attitude changed suddenly and dramatically. You were anticipating that, I take it, friend Daneel?"

"I was."

"You scarcely need me, it would seem. There is more than one way of adjusting minds. However, I ended by doing something. The captain's change of mind was accompanied by a strong favorable emotion toward Madam Gladia. I took the opportunity of strengthening that. "

"That is the reason you are needed. I could not have done that."

"You will be able to yet, friend Daneel. Perhaps quite soon."

D.G. returned. "Believe it or not, she will see you, Daneel. The darter and driver will be here in a moment--and the sooner you leave, the better. I will be heading toward Gladia's apartment at once."

The two robots stepped outside in the hallway to wait.

Giskard said, "He is very happy."

"So it would seem, friend Giskard," said Daneel, "but I fear the easy part is over for us. We have easily arranged to have Madam Gladia grant us leave to move about on our own. We have then, with some difficulty, persuaded the captain to make it possible for us to see the Undersecretary. With her, however, it may be that we will come to a dead end."

The driver took one look at Giskard and his courage seemed to fail him. "Listen," he said to Daneel, "I was told I'd be paid double to take a robot, but robots aren't allowed in the City and I could get in plenty of trouble. Money isn't going to help me if I lose my license. Can't I just take you, mister?"

Daneel said, "I am a robot, too, sir. We are now in the City and that is not your fault. We are trying to get out of the City and you will be helping us. We are going to a high government official who, I hope, will arrange that and it is your civic duty to help us. If you refuse to take us, driver, you will be acting to keep robots in the City and that may be considered to be against the law. "

The driver's face smoothed. He opened the door and said gruffly, "Get in!" However, he carefully closed the thick translucent partition that blocked him off from his passengers.

Daneel said quietly, "Was much required, friend Giskard?"

"Very little, friend Daneel. Your statement did most of the necessary work. It is astonishing that a collection of statements that are individually true can be used, in combination, to yield an effect that the truth should not."

"I have observed this often in human conversation, friend Giskard, even in that of normally truthful human beings. I suspect that the practice is justified in the minds of such people as serving a higher purpose."

"The Zeroth Law, you mean."

"Or the equivalent--if the human mind has such an equivalent. --Friend Giskard, you said a short while ago that I will have your powers, possibly soon. Are you preparing me for that purpose?"

"I am, friend Daneel."

"Why? May I ask that?"

"The Zeroth Law again. The passing episode of shakiness on my feet told me how vulnerable I was to the attempted use of the Zeroth Law. Before this day is over, I may have to act on the Zeroth Law to save the world and humanity and I may not be able to. In that case, you must be in position to do the job. I am preparing you, bit by bit, so that, at the desired moment, I can give you the final instructions and have it all fall into place."

"I do not see how that can be, friend Giskard."

"You will have no trouble in understanding when the time comes. I used the technique in a very small way on robots I sent to Earth in the early days before they were outlawed from the Cities and it was they who helped adjust Earth leaders to the point of approving the decision to send out Settlers."

The driver, whose darter was not on wheels but remained a centimeter or so above the ground at all times, had moved along special corridors reserved for such vehicles and had done so speedily enough to justify the name of the vehicle. He now emerged into an ordinary City corridor, which was paralleled on the moderately distant left by an Expressway. The darter, moving now much more slowly, made a left turn, swooped under

the Expressway, came out on the other side, and then, a curving half-mile later, stopped before an ornate building front.

The darter door opened automatically. Daneel emerged first, waited for Giskard to follow, then handed to the driver a piece of foil he had received from D.G. The driver looked at it narrowly, then the doors closed sharply and he left speedily without a word.

88.

There was a pause before the door opened in response to their signal and Daneel assumed they were being scanned. When it did open, a young woman led them gingerly into the vitals of the building. She avoided looking at Giskard, but she showed rather more than a mild curiosity in Daneel.

They found Undersecretary Quintana behind a large desk. She smiled and said, with gaiety that seemed somewhat forced, "Two robots, unescorted by human beings. Am I safe?"

"Entirely, Madam Quintana," said Daneel gravely. "It is as unusual for us to see a human being unaccompanied by robots."

"I assure you," said Quintana, "I have my robots. I call them underlings and one of them escorted you here. I am amazed that she didn't faint at the sight of Giskard. I think she might have if she hadn't been warned and if you yourself weren't so extraordinarily interesting in appearance, Daneel. But never mind that. Captain Baley was so enormously pressing in his desire that I see you and my interest in maintaining comfortable relations with an important Settler world was such that I have agreed to the interview. However, my day remains busy even so and I will be grateful if we can dispose of this quickly. --What can I do for you?"

"Madam Quintana--" began Daneel.

"One moment. Do you sit? I saw you sitting last night, you know."

"We can sit, but it is just as comfortable for us to stand. We do not mind."

"But I do. It would not be comfortable for me to stand--and if I sit, I will get a stiff neck looking up at you. Please pull up chairs and sit down. Thank you. --Now, Daneel, what is this all about?"

"Madam Quintana," said Daneel, "you remember, I imagine, the incident of the blaster fired at the balcony last night after the banquet."

"I certainly do. What's more, I know it was a humanoid robot who held the blaster, even though we are not admitting that officially. Yet here I sit with two robots on the other side of the desk and have no protection. And one of you is humanoid too."

"I have no blaster, madam," said Daneel, smiling.

"I trust not. --That other humanoid robot did not look at all like you, Daneel. You're rather a work of art, do you know that?"

"I am complexly programmed, madam."

"I mean, your appearance. But what about the blasting incident?"

"Madam, that robot has a base somewhere on Earth and I must know where it is. I have come from Aurora in order to find that base and prevent such incidents as may disturb the peace between our worlds. I have reason to believe--"

"You have come? Not the captain? Not Madam Gladia?"

"We, madam," said Daneel. "Giskard and I. I am in no position to tell you the whole story of how we came to have undertaken the task and there is no way in which I can tell you the name of the human being under whose instructions we work."

"Well! International espionage! How fascinating. What a pity I can't help you, but I don't know where the robot came from. I haven't any idea at all where his base might be. I don't even know why you have come to me for such information, as a matter of fact. I should have gone to the Department of Security had I been you, Daneel." She leaned toward him. "Do you have real skin on your face, Daneel? It's an extraordinary imitation if it isn't." She reached toward him and her hand rested delicately on his cheek. "It even feels right."

"Nevertheless, madam, it is not real skin. It does not heal of its own accord--if cut. On the other hand, a tear can easily be welded closed or a patch can even be replaced."

"Ugh," said Quintana, with a wrinkle of her nose. "But our business is over, for I can't help you as far as that blaster user is concerned. I know nothing."

Daneel said, "Madam, let me explain further. This robot may be part of a group that is interested in the early energy-producing process you described last night--fission. Assume this is so, that there are those interested in fission and in the content of uranium and thorium in the crust. What might be a convenient place for them to use as a base?"

"An old uranium mine, perhaps? I don't even know where one might be located. You must understand, Daneel, that Earth has an almost superstitious aversion to anything nuclear-fission, in particular. You'll find almost nothing about fission in our popular works on energy and only bare essentials in technical products for experts. Even I know very little, but then I'm an administrator, not a scientist."

Daneel said, "One more item, then, madam. We questioned the would-be assassin as to the location of his base and did so most strenuously. He was programmed to undergo permanent inactivation, a total freezing of his brain paths, in such a case--and he did inactivate. Before doing so, however, in his final struggle between answering and inactivation, he opened his mouth three times as though--possibly--to say three syllables, or three words, or three groups of words, or any combination of these. The second syllable, or word, or mere sound was 'mile.' Does this mean anything to you as having anything at all to do with fission?"

Slowly Quintana shook her head. "No. I can't say it does. It's certainly not a word you'll find in a dictionary of Standard Galactic. I'm sorry, Daneel. It's pleasant meeting you again, but I have a desk full of trivia to work through. You'll excuse me."

Daneel said, as though he hadn't heard her, "I was told, madam, that 'mile' might be an archaic expression that refers to some ancient unit of length, one that is possibly longer than a kilometer."

"That sounds totally irrelevant," said Quintana, "even if true. What would a robot from Aurora know about archaic expressions and ancient--" She stopped abruptly. Her eyes widened and her face lost color.

She said, "Is it possible?"

"Is what possible, madam?" asked Daneel.

"There is a place," said Quintana, half--lost in thought, "that is avoided by everyone--Earthpeople and Earth robots alike. If I wanted to be dramatic, I would say it was a place of ill omen. It is so ill-omened that it has been all but wiped out of conscious existence. It is not even included in maps. It is the quintessence of all that fission means. I remember coming across it in a very old reference film in my early days on this job. It was talked about constantly then as the site of an 'incident' that forever turned the minds of Earthpeople against fission as an energy source. The place is called Three Mile Island."

Daneel said, "An isolated place, then, absolutely isolated and free from any possible intrusion; the sort of place one would surely come across when working one's way through ancient reference material on fission and would then recognize at once as an ideal base where absolute secrecy was required; and with a three-word name of which 'mile' is the second word. That must be the place, madam. --Could you tell us how to get there and could you arrange some way of allowing us to leave the City and be taken to Three Mile Island or its nearest possible vicinity?"

Quintana smiled. She seemed younger when she smiled. "Clearly, if you are dealing with an interesting case of interstellar espionage, you can't afford to waste time, can you?"

"No. Indeed we cannot, madam."

"Well, then, it comes within the purview of my duties to take a look at Three Mile Island. Why don't I take you by air-car? I can handle an air-car."

"Madam, your work load--"

"No one will touch it. It will still be here when I return."

"But you would be leaving the City--"

"And if so? These are not old times. In the bad old days of Spacer domination, Earthpeople never left their Cities, it's true, but we've been moving outward and settling the Galaxy for nearly twenty decades. There are still some of the less educated who maintain the old provincial attitude, but most of us have become quite mobile. There's always the feeling, I suppose, that we might eventually join some Settler group. I myself don't intend to, but I fly my own air-car frequently and five years ago I flew to Chicago and then, eventually, flew back. --Sit here. I'll make the arrangements."

She left, very much a whirlwind.

Daneel looked after her and murmured, "Friend Giskard, that, somehow, did not seem characteristic of her. Have you done something?"

Giskard said, "A bit. It seemed to me when we entered that the young woman who showed us in was attracted by your appearance. I was certain that there had been the same factor in Madam Quintana's mind last night at the banquet, though I was too far from her and there were too many others in the room for me to be sure. Once our

conversation with her began, however, the attraction was unmistakable. Little by little, I strengthened it and each time she suggested the interview might come to an end, she seemed less determined--and at no time did she seriously object to your continuing it. Finally, she suggested the air-car because, I believe, she had reached the point where she could not bear to lose the chance to be with you for a while longer."

"This may complicate matters for me," said Daneel thoughtfully.

"It is in a good cause," said Giskard. "Think of it in terms of the Zeroth Law." Somehow he gave the impression, in saying so, that he would be smiling--if his face allowed such an expression.

89.

Quintana drew a sigh of relief as she landed the air-car on a concrete slab suitable for the purpose. Two robots approached at once for the obligatory examination of the vehicle and for repowering if necessary.

She looked out to the right, leaning across Daneel as she did so. "It is in that direction, several miles up the Susquehanna River. It's a hot day, too." She straightened, with some apparent reluctance, and smiled at Daneel. "That's the worst of leaving the City. The environment is totally uncontrolled out here. Imagine allowing it to be this hot. Don't you feel hot, Daneel?"

"I have an internal thermostat, madam, that is in good working order."

"Wonderful. I wish I did. There are no roads into this area, Daneel. Nor are there any robots to guide you, for they never enter it. Nor do I know what might be the right place within the area, which is a sizable one. We might stumble all through the area without coming upon the base, even though we passed within five hundred meters of it."

"Not 'we,' madam. It is quite necessary for you to remain here. What follows might conceivably be dangerous and since you are without air-conditioning, the task might be more than you could easily bear, physically, even if it were not dangerous. Could you wait for us, madam? To have you do so would be important to me."

"I will wait."

"We may be some hours."

"There are facilities of various sorts here and the small City of Harrisburg is not far."

"In that case, madam, we must be on our way." He sprang lightly from the air-car and Giskard followed him. They set off northward. It was nearly noon and the bright summer sun sparkled from the polished portion of Giskard's body.

Daneel said, "Any sign of mental activity you can detect will be those we want. There should be no one else for kilometers about. "

"Are you certain that we can stop them if we encounter them, friend Daneel?"

"No, friend Giskard, I am by no means certain--but we must."

90.

Levular Mandamus grunted and looked up at Amadiro with a tight smile on his thin face.

"Amazing," he said, "and most satisfactory."

Amadiro mopped his brow and cheeks with a piece of toweling and said, "What does that mean?"

"It means that every relay station is in working order."

"Then you can initiate the intensification?"

"As soon as I calculate the proper degree of W particle concentration."

"And how long will that take?"

"Fifteen minutes. Thirty."

Amadiro watched with an air of intensifying grimness on his face until Mandamus said, "All right. I have it. It's 2.72 on the arbitrary scale I have set up. That will give us fifteen decades before an upper equilibrium level will be reached that will be maintained without essential change for millions of years thereafter. And that level will make certain that, at best, Earth can maintain a few scattered groups in areas that are relatively radiation-free. We'll have only to wait and, in fifteen decades, a thoroughly disorganized group of Settler worlds will be meat for our slicing."

"I will not live fifteen more decades," said Amadiro slowly.

"My personal regrets, sir," said Mandamus dryly, "but we are now talking of Aurora and the Spacer worlds. There will be others who will carry on your task. "

"You, for instance?"

"You have promised me the headship of the Institute and, as you see, I have earned it. From that political base, I may reasonably hope to become Chairman someday and I will carry through those policies that will be necessary to make certain of the final dissolution of the by-then anarchic worlds of the Settlers."

"That's pretty confident of you. What if you turn on the W particle flow and then someone else turns it down in the course of the next fifteen decades?"

"Not possible, sir. Once the device is set, an internal atomic shift will freeze it in that position. After that, the process is irreversible--no matter what happens here. The whole place may be vaporized and the crust will nevertheless continue its slow burn. I suppose it would be possible to rebuild an entirely new setup if anyone on earth or among the Settlers can duplicate my work, but if so they can only further increase the rate of radioactivity, never decrease it. The second law of thermodynamics will see to that."

Amadiro said, "Mandamus, you say you have earned the headship. However, I'm the one to decide that, I think."

Mandamus said stiffly, "You are not, sir. With respect, the details of this process are known to me, but not to you. Those details are encoded in a place you will not find and, even if you do, it is guarded by robots who will destroy it rather than allow it to fall into your hands. You cannot gain credit for this. I can."

Amadiro said, "Nevertheless, getting my approval will hasten matters for you. If you were to wrest the headship from my unwilling hands, by whatever means, you will have a continuing opposition among other members of the Council that will hamper you through all your decades in the post. Is it just the title of head you want or the opportunity to experience all that comes of true leadership?"

Mandamus said, "Is this the time to talk politics? A moment ago, you were all impatience over the fact that I might linger fifteen minutes over my computer. "

"Ah, but we are now talking about adjusting the W particle beam. You want to place it at 2.72--was that the figure?--and yet I wonder if that can be right. What is the extreme range you can handle?"

"The range goes from zero to twelve, but it is 2.72 that is required. Plus or minus 0.05--if you wish further detail. It is that which, on the basis of reports from all fourteen relays will allow a lapse of fifteen decades to equilibrium. "

"Yet what I think is the correct figure is twelve. "

Mandamus stared at the other in horror. "Twelve? Do you understand what that means?"

"Yes. It means we will have the Earth too radioactive to live upon in a decade or a decade and a half and we will kill a few billion Earthpeople in the process. "

"And make certain a war with an infuriated Settler Federation. What can you want of such a holocaust?"

"I tell you again. I do not expect to live another fifteen decades and I want to live to see the destruction of Earth. "

"But you would also be assuring the maiming--maiming, at the very least--of Aurora, You cannot be serious. "

"But I am. I have twenty decades of defeat and humiliation to make up. "

"Those decades were brought about by Han Fastolfe and Giskard--and not by Earth. "

"No, they were brought about by an Earthman, Elijah Baley. "

"Who has been dead for more than sixteen decades. What is the value of a moment of vengeance over a man long dead?"

"I do not want to argue the matter. I will make you an offer. The title of head at once. I will resign my post the instant we return to Aurora and nominate you in my place. "

"No. I do not want the headship on those terms. Death to billions!"

"Billions of Earthmen. Well, I cannot trust you, then, to manipulate the controls properly. Show me--me--how to set the control installment and I will take the responsibility. I will still resign my post on our return and will nominate you in my place. "

"No. It will still mean the death of billions and who knows how many millions of Spacers as well. Dr. Amadiro, please understand that I will not do it on any terms and that you cannot do it without me. The setting mechanism is keyed to my left thumbprint. "

"I ask you again. "

"You cannot be sane if you ask me again despite all I have said. "

"That, Mandamus, is a personal opinion of yours. I am not so insane that I have failed to send off all the local robots on one errand or another. We are alone here."

Mandamus lifted a corner of his upper lip in a sneer. "And with what do you intend to threaten me? Are you going to kill me now that there are no robots present to stop you?"

"Yes, as a matter of fact, Mandamus, I will if I have to." Amadiro produced a small-caliber blaster from a pouch at his side. "These are difficult to obtain on Earth, but not impossible--if the price is right. And I know how to use it. Please believe me when I tell you that I am perfectly willing to blow your head off right now--if you do not place your thumb on the contact and allow me to adjust the dial to twelve."

"You dare not. If I die, how will you set the dial without me?"

"Don't be an utter fool. If I blow your head off, your left thumb will remain intact. It will even be at blood temperature for a while. I will use that thumb, then set the dial as easily as I would turn on a water tap. I would prefer you alive, since your death might be wearisome to explain back on Aurora, but it would not be more wearisome than I could bear. Therefore, I give you thirty seconds to make up your mind. If you cooperate, I will still give you the headship at once. If you don't, it will all go as I wish, in any case, and you will be dead. We start now. One--two--three--"

Mandamus stared in horror at Amadiro, who continued to count and stare at him over the leveled blaster with hard, expressionless eyes.

And then Mandamus hissed, "Put the blaster away, Amadiro, or we'll both be immobilized on the plea that we must be protected from harm."

The warning came too late. Quicker than the eye could follow, an arm stretched out to seize Amadiro's wrist, paralyzing it with pressure, and the blaster was gone.

Daneel said, "I apologize for having had to inflict pain on you, Dr. Amadiro, but I cannot allow you to hold a blaster pointed at another human being."

91.

Amadiro said nothing.

Mandamus said coldly, "You are two robots with, as far as I can see, no master in view. By default, I am your master and I order you to leave and not return. Since, as you see, there is no danger to any human being present at this moment, there is nothing to overcome your necessitated obedience to this order. Leave at once."

Daneel said, "Respectfully, sir, there is no need to hide our identities or abilities from you, since you know them already. My companion, R. Giskard Reventlov, has the ability to detect emotion. --Friend Giskard. "

Giskard said, "As we approached, having detected your presence at quite a distance, I took note, Dr. Amadiro, of an overwhelming rage in your mind. In yours, Dr. Mandamus, there was extreme fear."

"The rage, if rage there was," said Mandamus, "was Dr. Amadiro's reaction to the approach of two strange robots, especially of one who was capable of meddling with the human mind and who had already badly--and perhaps permanently--damaged that of Lady Vasilia. My fear, if fear there was, was also the result of your approach. We are not in control of our emotions and there is no reason for you to interfere. We again order you to withdraw permanently."

Daneel said, "Your pardon, Dr. Mandamus, but I merely wish to ascertain that we may safely follow your orders. Was there not a blaster in Dr. Amadiro's hand when we approached--and was it not pointed at you?"

Mandamus said, "He was explaining its workings and he was about to put it away when you took it from him."

"Then shall I return it to him, sir, before I leave?"

"No," said Mandamus without a quiver, "for then you would have an excuse to remain here in order to--as you would say--protect us. Take it with you when you go and you will have no reason to return."

Daneel said, "We have reason to think that you are here in a region which human beings are not allowed to penetrate--"

"That is a custom, not a law, and one which, in any case, holds no force over us, since we are not Earthpeople. For that matter, robots are not allowed to be here, either."

"We were brought here, Dr. Mandamus, by a high official of Earth's government. We have reason to think that you are here in order to raise the level of radioactivity in Earth's crust and do grave and irreparable damage to the planet. "

"Not at all--" began Mandamus.

Here Amadiro interrupted for the first time. "By what right, robot, do you cross-examine us? We are human beings who have given you an order. Follow it now!"

His tone of authority was overwhelming and Daneel quivered, while Giskard half-turned.

But Daneel said, "Your pardon, Dr. Amadiro. I do not cross-examine. I merely seek reassurance, in order that I may know that I can safely follow the order. We have reason to think that--"

"You need not repeat," said Mandamus. Then, in an aside, "Dr. Amadiro, please allow me to answer." To Daneel again, "Daneel, we are here on an anthropological mission. It is our purpose to seek the origins of various human customs that influence behavior among Spacers. These origins can be found only here on Earth and it is here, then, that we seek them."

"Do you have Earth's permission for this?"

"Seven years ago, I consulted the appropriate officials on Earth and received their permission."

Daneel said in a low voice, "Friend Giskard, what do you say?"

Giskard said, "The indications in Dr. Mandamus's mind are that what he is saying is not in accord with the situation as it is."

"He is lying, then?" said Daneel firmly.

"That is my belief," said Giskard.

Mandamus said, his calmness untouched, "That may be your belief, but belief is not certainty. You cannot disobey an order on the basis of mere belief. I know that and you know that."

Giskard said, "But in Dr. Amadiro's mind, rage is dammed only by emotional forces that are barely up to the job required of them. It is quite possible to slit those forces, so to speak, and allow the rage to pour out."

And Amadiro cried out, "Why do you fence with these things, Mandamus?"

Mandamus shouted, "Do not say a word, Amadiro! You play into their hands!"

Amadiro paid no attention. "It is demeaning and it is useless." With violent anger, he shook off Mandamus's restraining arm. "They know the truth, but what of that? -- Robots, we are Spacers. More than that, we are Aurorans, from the world on which you were constructed. More than that, we are high officials on the world of Aurora and you must interpret the phrase 'human beings' in the Three Laws of Robotics as meaning Auroran.

"If you do not obey us now, you harm us and humiliate us, so that you will be violating both the First and Second Laws. That our actions here are intended to destroy Earthmen, even large numbers of Earthmen, is true, but is, even so, utterly irrelevant. You might as well offer to refuse to obey us because we eat the meat of animals we have killed. Now that I have explained this to you, leave!"

But the last words turned into a croak. Amadiro's eyes bulged and he crumpled to the ground.

Mandamus, with a wordless cry, bent over him.

Giskard said, "Dr. Mandamus, Dr. Amadiro is not dead. He is at the moment in a coma from which he can be roused at any time. However, he will have forgotten everything in connection with this present project, nor will he ever be able to understand anything in connection with it--if, for instance, you tried to explain it. In the process of doing this--which I could not have done without his own admission that he intended to destroy large numbers of Earthmen--I may have permanently damaged other parts of his memory and his thinking processes. That I regret, but I could not help it."

Daneel said, "You see, Dr. Mandamus, some time ago, on Solaria, we encountered robots who narrowly defined human beings as Solarians only. We recognize the fact that if different robots are subject to narrow definitions of one sort or another, there can only be measureless destruction. It is useless to try to have us define human beings as Aurorans only. We define human beings as all members of the species *Homo sapiens*, which includes Earthpeople and Settlers' and we feel that the prevention of harm to human beings in groups and to humanity as a whole comes before the prevention of harm to any specific individual."

Mandamus said breathlessly, "That is not what the First Law says."

"It is what I call the Zeroth Law and it takes precedence."

"You have not been programmed in such a way."

"It is how I have programmed myself. And since I have known from the moment of our arrival here that your presence is intended for harm, you cannot order me away or keep me from harming you. The Zeroth Law takes precedence and I must save Earth. Therefore, I ask you to join me--voluntarily--in destroying these devices you have here. Otherwise, I will be forced to threaten harm to you, as Dr. Amadiro did, although I would not use a blaster."

But Mandamus said, "Wait! Wait! Hear me out. Let me explain. That Dr. Amadiro has had his mind wiped clean is a good thing. He wanted to destroy Earth, but I did not want to. That was why he held a blaster on me."

Daneel said, "It was you, however, who originated the notion, who designed and built these devices. Otherwise, Dr. Amadiro would not have had to try to force you to do anything. He would have done it himself and would not have required any help from you. Isn't that right?"

"Yes, that is right. Giskard can examine my emotions and see if I'm lying. I built these devices and I was prepared to use them, but not in the fashion Dr. Amadiro wished. Am I telling the truth?"

Daneel looked at Giskard, who said, "As nearly as I can tell, he is telling the truth."

"Of course I am," said Mandamus. "What! am doing is to introduce a very gradual acceleration of the natural radioactivity in the Earth's crust. There will be one hundred and fifty years during which the people of Earth can move to other worlds. It will increase the population of the present Settler worlds and increase the Settlement of additional worlds in great numbers. It will remove Earth as a huge anomalous world that forever threatens the Spacers and stultifies the Settlers. It will remove a center of mystical fervor that is holding back the Settlers. Am I telling the truth?"

Again Giskard said, "As nearly as I can tell, he is telling the truth."

"My plan, if it works out, would preserve the peace and make the Galaxy a home for Spacer and Settler alike. That is why, when I constructed this device--"

He gestured toward it, placing his left thumb on the contact, and then, lunging toward the volume control, shouted, "Freeze!"

Daneel moved toward him and stopped, frozen, right hand upraised. Giskard did not move.

Mandamus turned back, panting, "It's at 2.72. It's done. It's irreversible. Now it will be played out exactly as I intended. Nor can you bear witness against me, for you will start a war and your Zeroth Law forbids that."

He looked down at the prone body of Amadiro and said, with a cold look of contempt, "Fool! You will never know how it should have been done."

19. ALONE

92.

Mandamus said, "You cannot harm me now, robots, for nothing you do to me will alter the fate of the Earth."

"Nevertheless," said Giskard shakily, "you must not remember what you have done. You must not explain the future to the Spacers." He reached for a chair and, with a trembling hand, pulled it toward himself and sat down, as Mandamus crumpled and slid down into what seemed to be a gentle sleep.

"At the last," said Daneel in soft despair, as he looked down at the two unconscious bodies, "I failed. When it was necessary for me to seize Dr. Mandamus to prevent harm to people who were not present before my eyes, I found myself forced to follow his order and froze. The Zeroth Law did not work. "

Giskard said, "No, friend Daneel, you did not fail. I prevented you. Dr. Mandamus had the urge to try to do what he did and was held back by the fear of what you would certainly do if he did try. I neutralized his fear and then I neutralized you. So Dr. Mandamus set the Earth's crust on fire, so to speak--on very slow fire."

Daneel said, "But why, friend Giskard, why?"

"Because he was telling the truth. I told you so. He thought he was lying. From the nature of the triumph in his mind, I am under the firm impression he felt that the consequence of the growing radioactivity would be anarchy and confusion among Earthpeople and Settlers and that the Spacers would destroy them and seize the Galaxy. But I thought the scenario he presented us to win us over was the correct one. The removal of Earth as a large crowded world would remove a mystique I have already felt to be dangerous and would help the Settlers. They will streak outward into the Galaxy at a pace that will double and redouble and--without Earth to look back to always, without Earth to set up a god of the past--they will establish a Galactic Empire. It was necessary for us to make that possible." He paused and, his voice weakening, he said, "Robots and Empire. "

"Are you well, friend Giskard?"

"I cannot stand, but I can still talk. Listen to me. It is time for you to take on my burden. I have adjusted you for mental detection and control. You have but to listen to the final pathways as they are impressed upon yourself. Listen --"

He spoke steadily--but increasingly weakly--in language and symbols that Daneel could feel internally. Even as Daneel listened, he could feel the pathways moving and ticking into place. And when Giskard was done, there was suddenly the cool purr of Mandamus's mind impinging on his own, the unsteady thumping of Amadiro's, and the thin metallic thread of Giskard's.

Giskard said, "You must return to Madam Quintana and arrange to have these two human beings sent back to Aurora. They will not be able to harm Earth further. Then see

to it that Earth's security forces seek out and inactivate the humanoid robots sent to Earth by Mandamus.

"Be careful how you use your new powers, for you are new to them and they will not be under perfect control. You will improve with time--slowly--if you are careful always to undergo self-examination with each use. Use the Zeroth Law, but not to justify needless harm to individuals. The First Law is almost as important.

"Protect Madam Gladia and Captain Baley--unobtrusively. Let them be happy together and let Madam Gladia continue with her efforts to bring peace. Help supervise, over the decades, the removal of Earthpeople from this world. And--one more thing--if I can remember--Yes--if you can--find out where the Solarians have gone. That may be--important."

Giskard's voice trailed off.

Daneel knelt at the side of the seated Giskard and took the unresponsive metal hand in his own. He said, in an agonized whisper, "Recover, friend Giskard. Recover. What you did was right by the Zeroth Law. You have preserved as much life as possible. You have done well by humanity. Why suffer so when what you have done saves all?"

Giskard said, in a voice so distorted that the words could barely be made out, "Because I am not certain. --What if the other view--is right--after all--and the Spacers will--triumph and then themselves decay so that--the Galaxy--will be--empty.--Good-bye, friend--Dan--"

And Giskard was silent, never to speak or move again.

Daneel rose.

He was alone--and with a Galaxy to care for.

THE CURRENTS OF SPACE

1952

PROLOG. A YEAR BEFORE

TBE MAN from Earth came to a decision. It had been slow in coming and developing, but it was here.

It had been weeks since he had felt the comforting deck of his ship and the cool, dark blanket of space about it. Originally, he had intended a quick report to the local office of the Interstellar Spatio-analytic Bureau and a quicker retreat to space. Instead, he had been held here.

It was almost like a prison.

He drained his tea and looked at the man across the table. He said, "I'm not staying any longer."

The other man came to a decision. It had been slow in coming and developing, but it was here. He would need time, much more time. The response to the first letters had been nil. They might have fallen into a star for all they had accomplished.

That had been no more than he had expected, or, rather, no less. But it was only the first move.

It was certain that, while future moves developed, he could not allow the man from Earth to squirm out of reach. He fingered the smooth black rod in his pocket.

He said, "You don't appreciate the delicacy of the problem."

The Earthman said, "What's delicate about the destruction of a planet? I want you to broadcast the details to all of Sark; to everyone on the planet."

"We can't do that. You know it would mean panic."

"You said at first you would do it."

"I've thought it over and it just isn't practical."

The Earthman turned to a second grievance. "The representative of the I.S.B. hasn't arrived."

"I know it. They are busy organizing proper procedures for this crisis. Another day or two."

"Another day or two! It's always another day or two! Are they so busy they can't spare me a moment? They haven't even seen my calculations."

"I have offered to bring your calculations to them. You don't want me to."

"And I still don't. They can come to me or I can go to them." He added violently, "I don't think you believe me. You don't believe Florina will be destroyed."

"I believe you."

"You don't. I know you don't. I see you don't. You're humoring me. You can't understand my data. You're not a Spatio-analyst. I don't even think you're who you say you are. Who are you?"

"You're getting excited."

"Yes, I am. Is that surprising? Or are you just thinking, Poor devil, Space has him. You think I'm crazy."

"Nonsense."

"Sure you do. That's why I want to see the I.S.B. They'll know if I'm crazy or not. They'll know."

The other man remembered his decision. He said, "Now you're not feeling well. I'm going to help you."

"No, you're not," shouted the Earthman hysterically, "because I'm going to walk out. If you want to stop me, kill me, except that you won't dare. The blood of a whole world of people will be on your hands if you do."

The other man began shouting, too, to make himself heard. "I won't kill you. Listen to me, I won't kill you. There's no need to kill you."

The Earthman said, "You'll tie me up. You'll keep me here. Is that what you're thinking? And what will you do when the I.S.B. starts looking for me? I'm supposed to send in regular reports, you know."

"The Bureau knows you're safely with me."

"Do they? I wonder if they know I've reached the planet at all? I wonder if they received my original message?" The Earthman was giddy. His limbs felt stiff.

The other man stood up. It was obvious to him that his decision had come none too soon. He walked slowly about the long table, toward the Earthman.

He said soothingly, "It will be for your own good." He took the black rod from his pocket.

The Earthman croaked, "That's a psychic probe." His words were slurred, and when he tried to rise, his arms and legs barely quivered.

He said, between teeth that were clenching in rigor, "Drugged!"

"Drugged!" agreed the other man. "Now look, I won't hurt you. It's difficult for you to understand the true delicacy of the matter while you're so excited and anxious about it. I'll just remove the anxiety. Only the anxiety."

The Earthman could no longer talk. He could only sit there. He could only think numbly, Great Space, I've been drugged. He wanted to shout and scream and run, but he couldn't.

The other had reached the Earthman now. He stood there, looking down at him. The Earthman looked up. His eyeballs could still move.

The psychic probe was a self-contained unit. Its wires needed only to be fixed to the appropriate places on the skull. The Earthman watched in panic until his eye muscles froze. He did not feel the fine sting as the sharp, thin leads probed through skin and flesh to make contact with the sutures of his skull bones.

He yelled and yelled in the silence of his mind. He cried, No, you don't understand. It's a planet full of people. Don't you see that you can't take chances with hundreds of millions of living people? The other man's words were dim and receding, heard from the other end of a long, windy tunnel. "It won't hurt you. In another hour you'll feel well, really well. You'll be laughing at all this with me."

The Earthman felt the thin vibration against his skull and then that faded too.

Darkness thickened and collapsed about him. Some of it never lifted again. It took a year for even parts of it to lift.

1. THE FOUNDLING

Rik put down his feeder and jumped to his feet. He was trembling so hard he had to lean against the bare milk-white wall.

He shouted, "I remember!"

They looked at him and the gritty mumble of men at lunch died somewhat. Eyes met his out of faces indifferently clean and indifferently shaven, glistening and white in the imperfect wall illumination. The eyes reflected no great interest, merely the reflex attention enforced by any sudden and unexpected cry.

Rik cried again, "I remember my job. I had a job!"

Someone called, "Shoddop!" and someone else yelled, "Siddown!"

The faces turned away, the mumble rose again. 131k stared blankly along the table. He heard the remark, "Crazy Rik," and a shrug of shoulders. He saw a finger spiral at a man's temple. It all meant nothing to him. None of it reached his mind.

Slowly he sat down. Again he clutched his feeder, a spoonlike affair, with sharp edges and little tines projecting from the front curve of the bowl, which could therefore with equal clumsiness cut, scoop and impale. It was enough for a millworker. He turned it over and stared without seeing at his number on the back of the handle. He didn't have to see it. He knew it by heart. All the others had registration numbers, just as he had, but the others had names also. He didn't. They called him Rik because it meant something like "moron" in the slang of the kyrt mills. And often enough they called him "Crazy Rik."

But perhaps he would be remembering more and more now. This was the first time since he had come to the mill that he had Rik was stirred by the memory. He said, "Let's go to the fields, Lona."

"It's late."

"Please. Just outside town."

She fumbled at the thin money pouch she kept between herself and the soft blue leather belt she wore, the only luxury of dress she allowed herself.

Rik caught her arm. "Let's walk."

They left the highway for the winding, dustless, packed-sand roads half an hour later. There was a heavy silence between them and Valona felt a familiar fear clutching at her. She had no words to express her feelings for him, so she had never tried.

What if he should leave her? He was a little fellow, no taller than herself and weighing somewhat less, in fact. He was still like a helpless child in many ways. But before they had turned his mind off he must have been an educated man. A very important educated man.

Valona had never had any education besides reading and writing and enough trade-school technology to be able to handle mill machinery, but she knew enough to know that all people were not so limited. There was the Townman, of course, whose great knowledge was so helpful to all of them. Occasionally Squires came on inspection tours.

She had never seen them close up but once, on a holiday, she had visited the City and seen a group of incredibly -gorgeous creatures at a distance. Occasionally the millworkers were allowed to listen to what educated people sounded like. They spoke differently, more fluently, with longer words and softer tones. Rik talked like that more and more as his memory improved.

She had been frightened at his first words. They came so suddenly after long whimpering over a headache. They were pronounced queerly. When she tried to correct him he wouldn't change.

Even then she had been afraid that he might remember too much and then leave her. She was only Valona March. They called her Big Lona. She had never married. She never would. A large, big-footed girl with work-reddened hands like herself could never marry. She had never been able to do more than look at the boys with dumb resentment when they ignored her at the idle-day dinner festivals. She was too big to giggle and smirk at them.

She would never have a baby to cuddle and hold. The other girls did, one after the other, and she could only crowd about for a quick glimpse of something red and hairless with screwed-up eyes, fists impotently clenched, gummy mouth— "It's your turn next, Lona."

"When will you have a baby, Lona?"

She could only turn away.

But when Rik had come, he was like a baby. He had to be fed and taken care of, brought out into the sun, soothed to sleep when the headaches racked him.

The children would run after her, laughing. They would yell, "Lona's got a boy friend. Big Lona's got a crazy boy friend. Lona's boy friend is a rik."

Later on, when Rik could walk by himself (she had been as proud the day he took his first step as though he were really only one year old, instead of more like thirty-one) and stepped out, unescorted, into the village streets, they had run about him in rings, yelling their laughter and foolish ridicule in order to see a grown man cover his eyes in fear, and cringe, with nothing but whimpers to answer them. Dozens of times she had come charging out of the house, shouting at them, waving her large fists.

Even grown men feared those fists. She had felled her section head with a single wild blow the first day she had brought Rik to work at the mill because of a sniggering indecency concerning them which she overheard. The mill council fined her a week's pay for that incident, and might have sent her to the City for further trial at the Squire's court, but for the Townman's intervention and the plea that there had been provocation.

So she wanted to stop Rik's remembering. She knew she had nothing to offer him; it was selfish of her to want him to stay mind-blank and helpless forever. It was just that no one had ever before depended upon her so utterly. It was just that she dreaded a return to loneliness.

She said, "Are you sure you remember, Rik?"

"Yes."

They stopped there in the fields, with the sun adding its reddening blaze to all that surrounded them. The mild, scented evening breeze would soon spring up, and the checkerboard irrigation canals were already beginning to purple.

He said, "I can trust my memories as they come back, Lona. You know I can. You didn't teach me to speak, for instance. I remembered the words myself. Didn't I? Didn't I?"

She said reluctantly, "Yes."

"I even remember the times you took me out into the fields before I could speak. I keep remembering new things all the time. Yesterday I remembered that once you caught a kyrt fly for me. You held it closed in your hands and made me put my eye to the space between your thumbs so that I could see it flash purple and orange in the darkness. I laughed and tried to force my hand between yours to get it, so that it flew away and left me crying after all. I didn't know it was a kyrt fly then, or anything about it, but it's all very clear to me now. You never told me about that, did you, Lona?"

She shook her head.

"But it did happen, didn't it? I remember the truth, don't I?"

"Yes, Rik."

"And now I remember something about myself from before. There must have been a before, Lona."

There must have been. She felt the weight on her heart when she thought that. It was a different before, nothing like the now they lived in. It had been on a different world. She knew that because one word he had never remembered was kyrt. She had to teach him the word for the most important object on all the world of Florina.

"What is it you remember?" she asked.

At this, Rik's excitement seemed suddenly to die. He hung back. "It doesn't make much sense, Lona. It's just that I had a job once, and I know what it was. At least, in a way."

"What was it?"

"I analyzed Nothing."

She turned sharply upon him, peering into his eyes. For a moment she put the flat of her hand upon his forehead, until he moved away irritably. She said, "You don't have a headache again, Rik, have you? You haven't had one in weeks."

"I'm all right. Don't you go bothering me."

Her eyes fell, and he added at once, "I don't mean that you bother me, Lona. It's just that I feel fine and I don't want you to worry."

She brightened. "What does 'analyzed' mean?" He knew words she didn't. She felt very humble at the thought of how educated he must once have been.

He thought a moment. "It means—it means 'to take apart.' You know, like we would take apart a sorter to find out why the scanning beam was out of alignment."

"Oh. But, Rik, how can anyone have a job not analyzing anything? That's not a job."

"I didn't say I didn't analyze anything. I said I analyzed Nothing. With a capital N."

"Isn't that the same thing?" It was coming, she thought. She was beginning to sound stupid to him. Soon he would throw her off in disgust.

"No, of course not." He took a deep breath. "I'm afraid I can't explain though. That's all I remember about that. But it must have been an important job. That's the way it feels. I couldn't have been a criminal."

Valona winced. She should never have told him that. She had told herself it was only for his own protection that she warned him, but now she felt that it had really been to keep him bound tighter to herself.

It was when he had first begun to speak. It was so sudden it had frightened her. She hadn't even dared speak to the Town-man about it. The next idle-day she had withdrawn five credits from her life-ward—there would never be a man to claim it as dowry, so that it didn't matter—and taken Rik to a City doctor. She had the name and address on a scrap of paper, but even so it took two frightening hours to find her way to the proper building through the huge pillars that held the Upper City up to the sun.

She had insisted on watching and the doctor had done all sorts of fearful things with strange instruments. When he put Rik's head between two metal objects and then made it glow like a kyrt fly in the night, she had jumped to her feet and tried to make him stop. He called two men who dragged her out, struggling wildly.

Half an hour afterward the doctor came out to her, tall and frowning. She felt uncomfortable with him because he was a Squire, even though he kept an office down in the Lower City, but his eyes were mild, even kind. He was wiping his hands on a little towel, which he tossed into a wastecan, even though it looked perfectly clean to her.

He said, "Where did you meet this man?"

She had told him the circumstances cautiously, reducing it to the very barest essentials and leaving out all mention of the Townman and the patrollers.

"Then you know nothing about him?"

She shook her head. "Nothing before that."

He said, "This man has been treated with a psychic probe. Do you know what that is?"

At first she had shaken her head again, but then she said in a dry whisper, "Is it what they do to crazy people, Doctor?"

"And to criminals. It is done to change their minds for their own good. It makes their minds healthy, or it changes the parts that make them want to steal and kill. Do you understand?"

She did. She grew brick-red and said, "He'd never stole anything or hurt anybody."

"You call him Rik?" He seemed amused. "Now look here, how do you know what he did before you met him? It's hard to tell from the condition of his mind now. The probing was thorough and brutal. I can't say how much of his mind has been permanently removed and how much has been temporarily lost through shock. What I mean is that some of it will come back, like his speaking, as time goes on, but not all of it. He should be kept under observation."

"No, no. He's got to stay with me. I've been taking good care of him, Doctor."

He frowned, and then his voice grew milder. "Well, I'm thinking of you, my girl. Not all the bad may be out of his mind. You wouldn't want him to hurt you someday."

At that moment a nurse led out Rik. She was making little sounds to quiet him, as one would an infant. 111k put a hand to his head and stared vacantly, until his eyes focused on Valona; then he held out his hands and cried, feebly, "Lona-----"

She sprang to him and put his head on her shoulder, holding him tightly. She said to the doctor, "He wouldn't hurt me, no matter what."

The doctor said thoughtfully, "His case will have to be reported, of course. I don't know how he escaped from the authorities in the condition he must have been in."

"Does that mean they'll take him away, Doctor?"

"I'm afraid so."

"Please, Doctor, don't do that." She wrenched at the handkerchief, in which were the five gleaming pieces of credit-alloy. She said, "You can have it all, Doctor. I'll take good care of him. He won't hurt anyone."

The doctor looked at the pieces in his hand. "You're a mill-worker, aren't you?"

She nodded.

"How much do they pay you a week?"

"Two point eight credits."

He tossed the coins gently, brought them together in his closed palm with a tinkle of metal, then held them out to her. "Take it, girl. There's no charge."

She accepted them with wonder. "You're not going to tell anyone, Doctor?"

But he said, "I'm afraid I have to. It's the law."

She had driven blindly, heavily, back to the village, clutching Rik to her desperately.

The next week on the hypervideo newscast there had been the news of a doctor dying in a gyro-crash during a short failure in one of the local transit power-beams. The name was familiar and in her room that night she compared it with that on the scrap of paper. It was the same.

She was sad, because he had been a good man. She had received his name once long before from another worker as a Squire doctor who was good to the mill hands and had saved it for emergencies. And when the emergency had come he had been good to her too. Yet her joy drowned the sorrow. He had not had the time to report 111k. At least, no one ever came to the village to inquire.

Later, when Rik's understanding had grown, she had told him what the doctor had said so that he would stay in the village and be safe.

Rik was shaking her and she left her reveries.

He said, "Don't you hear me? I couldn't be a criminal if I had an important job."

"Couldn't you have done wrong?" she began hesitantly. "Even if you were a big man, you might have. Even Squires——"

"I'm sure I haven't. But don't you see that I've got to find out so that others can be sure? There's no other way. I've got to leave the mill and village and find out more about myself."

She felt the panic rise. "Rik! That would be dangerous. Why should you? Even if you analyzed Nothing, why is it so important to find out more about it?"

"Because of the other thing I remember."

"What other thing?"

He whispered, "I don't want to tell you."

"You ought to tell somebody. You might forget again."

He seized her arm. "That's right. You won't tell anyone else, will you, Lona? You'll just be my spare memory in case I forget."

"Sure, 131k."

Rik looked about him. The world was very beautiful. Valona had once told him that there was a huge shining sign in the Upper City, miles above it even, that said: "Of all the Planets in the Galaxy, Florina is the Most Beautiful."

And as he looked about him he could believe it.

He said, "It is a terrible thing to remember, but I always remember correctly, when I do remember. It came this afternoon.", "Yes?"

He was staring at her in horror. "Everybody in the world is going to die. Everybody on Florina."

2. THE TOWNMAN

MYIIL TERENS was in the act of removing a book-film from its place on the shelf when the door-signal sounded. The rather pudgy outlines of his face had been set in lines of thought, but now these vanished and changed into the more usual expression of bland caution. He brushed one hand over his thinning, ruddy hair and shouted, "One minute."

He replaced the film and pressed the contact that allowed the covering section to spring back into place and become indistinguishable from the rest of the wall. To the simple millworkers and farm hands he dealt with, it was a matter of vague pride that one of their own number, by birth at any rate, should own films. It lightened, by tenuous reflection, the unrelieved dusk of their own minds. And yet it would not do to display the films openly.

The sight of them would have spoiled things. It would have frozen their none too articulate tongues. They might boast of their Townman's books, but the actual presence of them before their eyes would have made Terens seem too much the Squire. There were, of course, the Squires as well. It was unlikely in the extreme that any of them would visit him socially at his house, but should one of them enter, a row of films in sight would be injudicious. He was a Townman and custom gave him certain privileges but it would never do to flaunt them.

He shouted again, "I'm coming!"

This time he stepped to the door, closing the upper seam of his tunic as he went. Even his clothing was somewhat Squirelike. Sometimes he almost forgot he had been born on Florina.

Valona March was on the doorstep. She bent her knees and ducked her head in respectful greeting.

Terens threw the door wide. "Come in, Valona. Sit down. Surely it's past curfew. I hope the patrollers didn't see you."

"I don't think so, Townman."

"Well, let's hope that's so. You've got a bad record, you know."

"Yes, Townman. I am very grateful for what you have done for me in the past."

"Never mind. Here, sit down. Would you like something to eat or drink?"

She seated herself, straight-backed, at the edge of a chair and shook her head.

"No, thank you, Townman. I have eaten."

It was good form among the villagers to offer refreshment. It was bad form to accept. Terens knew that. He didn't press her.

He said, "Now what's the trouble, Valona? Rik again?" Valona nodded, but seemed at a loss for further explanation. Terens said, "Is he in trouble at the mill?"

"No, Townman."

"Headaches again?"

"No, Townman."

Terens waited, his light eyes narrowing and growing sharp.

"Well, Valona, you don't expect me to guess your trouble, do you? Come, speak out or I can't help you. You do want help, I suppose." - She said, "Yes, Townman," then burst out, "How shall I tell you, Townman? It sounds almost crazy."

Terens had an impulse to pat her shoulder, but he knew she would shrink from the touch. She sat, as usual, with her large hands buried as far as might be in her dress. He noticed that her blunt, strong fingers were intertwined and slowly twisting.

He said, "Whatever it is, I will listen."

"Do you remember, Townman, when I came to tell you about the City doctor and what he said?"

"Yes, I do, Valona. And I remember I told you particularly that you were never to do anything like that again without consulting me. Do you remember that?"

She opened her eyes wide. She needed no spur to recollect his anger. "I would never do such a thing again, Townman. It's just that I want to remind you that you said you would do everything to help me keep Rik."

"And so I will. Well, then, have the patrollers been asking about him?"

"No. Oh, Townman, do you think they might?"

"I'm sure they won't." He was losing patience. "Now, come, Valona, tell me what is wrong."

Her eyes clouded. "Townman, he says he will leave me. I want you to stop him."

"Why does he want to leave you?"

"He says he is remembering things."

Interest leaped into Terens' face. He leaned forward and almost he reached out to grip her hand. "Remembering things? What things?"

Terens remembered the day Rik had first been found. He had seen the youngsters clustered near one of the irrigation ditches just outside the village. They had raised their shrill voices to call him.

"Townman! Townman!"

He had broken into a run. "What's the matter, Rasie?" He had made it his business to learn the youngsters' names when he came to town. That went well with the mothers and made the first month or two easier.

Rasie was looking sick. He said, "Looky here, Townman."

He was pointing at something white and squirming, and it was Rik. The other boys were yelling at once in confused explanation. Terens managed to understand that they were playing some game that involved running, hiding and pursuing. They were intent on telling him the name of the game, its progress, the point at which they had been interrupted, with a slight subsidiary argument as to exactly which individual or side was "winning." All that didn't matter, of course.

Rasie, the twelve-year-old black-haired one, had heard the whimpering and had approached cautiously. He had expected an animal, perhaps a field rat that would make good chasing. He had found 131k.

All the boys were caught between an obvious sickness and an equally obvious fascination at the strange sight. It was a grown human being, nearly naked, chin wet with drool, whimpering and crying feebly, arms and legs moving about aimlessly. Faded blue eyes shifted in random fashion out of a face that was covered with a grown stubble. For a moment the eyes caught those of Terens and seemed to focus. Slowly the man's thumb came up and inserted itself into his mouth.

One of the children laughed. "Looka him, Townman. He's finger-sucking."

The sudden shout jarred the prone figure. His face reddened and screwed up. A weak whining, unaccompanied by tears, sounded but his thumb remained where it was. It showed wet and pink in contrast to the rest of the dirt-smearred hand.

Terens broke his own numbness at the sight. He said, "All right, look, fellows, you shouldn't be running around here in the kyrt field. You're damaging the crop and you know what that will mean if the farm hands catch you. Get going, and keep quiet about this. And listen, Rasie, you run to Mr. Jencus and get him to come here."

Ull Jencus was the nearest thing to a doctor the town had. He had passed some time as apprentice in the offices of a real doctor in the City and on the strength of it he had been relieved of duty on the farms or in the mills. It didn't work out too badly. He could take temperatures, administer pills, give injections and, most important, he could tell when some disorder was sufficiently serious to warrant a trip to the City hospital. Without such semiprofessional backing, those unfortunates stricken with spinal meningitis or acute appendicitis might suffer intensively but usually not for long. As it was, the foremen muttered and accused Jencus in everything but words of being an accessory after the fact to a conspiracy of malingering.

Jencus helped Terens lift the man into a scooter cart and, as unobtrusively as they might, carried him into town.

Together they washed off the accumulated and hardened grime and filth. There was nothing to be done about the hair. Jencus shaved the entire body and did what he could by way of physical examination.

Jencus said, "No infection I c'n tell of, Townman. He's been fed. Ribs don't stick out too much. I don't know what to make of it. How'd he get out there, d'you suppose, Townman?"

He asked the question with a pessimistic tone as though no one could expect Terens to have the answer to anything. Terens accepted that philosophically. When a village has lost the Townman it has grown accustomed to over a period of nearly fifty years, a newcomer of tender age must expect a transition period of suspicion and distrust. There was nothing personal in it.

Terens said, "I'm afraid I don't know."

"Can't walk, y'know. Can't walk a step. He'd have to be put there. Near's I c'n make out, he might's well be a baby. Everything else seems t'be gone."

"Is there a disease that has this effect?"

"Not's I know of. Mind trouble might do it, but I don't know nothing 'tall about that. Mind trouble I'd send to the City. Y'ever see this one, Townman?"

Terens smiled and said gently, "I've just been here a month." Jencus sighed and reached for his handkerchief. "Yes. Old Townman, he was a fine man. Kept us well, he did. I been here 'most sixty years, and never saw this fella before. Must be from 'nother town."

Jencus was a plump man. He had the look of having been born plump, and if to this natural tendency is added the effect of a largely sedentary life, it is not surprising that he tended to punctuate even short speeches by a puff and a rather futile swipe at his gleaming forehead with his large red handkerchief.

He said, "Don't 'xactly know what t'say t'the patrollers."

The patrollers came all right. It was impossible to avoid that. The boys told their parents; their parents told one another. Town life was quiet enough. Even this would be unusual enough to be worth the telling in every possible combination of informer and informee. And in all the telling, the patrollers could not help but hear.

The patrollers, so called, were members of the Florinian Patrol. They were not natives of Florina and, on the other hand, they were not countrymen of the Squires from the planet Sark. They were simply mercenaries who could be counted on to keep order for the sake of the pay they got and never to be led into the misguidance of sympathy for Florinians through any ties of blood or birth.

There were two of them and one of the foremen from the mill came with them, in the fullness of his own midget authority.

The patrollers were bored and indifferent. A mindless idiot might be part of the day's work but it was scarcely an exciting part. One said to the foreman, "Well, how long does it take you to make an identification? Who is this man?"

The foreman shook his head energetically. "I never saw him, Officer. He's no one around here!"

The patroller turned to Jencus. "Any papers on him?"

"No, sir. He just had a rag 'bout him. Burned it t'prevent infection."

"What's wrong with him?"

"No mind, near's I c'n make out."

At this point Terens took the patrollers aside. Because they were bored they were amenable. The patroller who had been asking the questions put up his notebook and said, "All right, it isn't even worth making a record of. It has nothing to do with us. Get rid of it somehow."

Then they left.

The foreman remained. He was a freckled man, red of hair, with a large and bristly moustache. He had been a foreman of rigid principles for five years and that meant his responsibility for the fulfillment of quota in his mill rested heavily upon him.

"Look here," he said fiercely. "What's to be done about this? The damn folk are so busy talking, they ain't working. "

"Send him t'City hospital, near's I c'n make out," said Jencus, wielding his handkerchief industriously. "Noth'n' I c'n do."

"To the City!" The foreman was aghast. "Who's going to pay? Who'll stand the fees? He ain't none of us, is he?"

"Not's far's I know," admitted Jencus.

"Then why should we pay? Find out who he belongs to. Let his town pay."

"How we going t'find out? Tell me that."

The foreman considered. His tongue licked out and played with the coarse reddish foliage of his upper lip. He said, "Then we'll just have to get rid of him. Like the patroller said."

Terens interrupted. "Look here. What do you mean by that?" The foreman said, "He might as well be dead. It would be a mercy."

Terens said, "You can't kill a living person."

"Suppose you tell me what to do then."

"Can't one of the townpeople take care of him?"

"Who'd want to? Would you?"

Terens ignored the openly insolent attitude. "I've got other work to do."

"So have all the folk. I can't have anyone neglecting mill work to take care of this crazy thing."

Terens sighed, and said without rancor, "Now, Foreman, let's be reasonable. If you don't make quota this quarter I might suppose it's because one of your workers is taking care of this poor fellow, and I'll speak up for you to the Squires. Otherwise I'll just say that I don't know of any reason you couldn't make quota, in case you don't make it."

The foreman glowered. The Townman had only been here a month, and already he was interfering with men who had lived in town all their lives. Still, he had a card marked with Squire's -marks. It wouldn't do to stand too openly against him too long. He said, "But who'd take him?" A horrible suspicion smote him. "I can't. I got three kids of my own and my wife ain't well."

"I didn't suggest that you should."

Terens looked out the window. Now that the patrollers had left, the squirming, whispering crowd had gathered closer about the Townman's house. Most were youngsters, too young to be working, others were farm hands from the nearer farms. A few were millworkers, away from their shifts.

Terens saw the big girl at the very edge of the crowd. He had noticed her often in the past month. Strong, competent, and hard-working. Good natural intelligence hidden under that unhappy expression. If she were a man she might have been chosen for Townman's training. But she was a woman; parents dead, and plain enough she was to preclude romantic side interests. A lone woman, in other words, and likely to remain so.

He said, "What about her?"

The foreman looked, then roared, "Damn it. She ought to be at work."

"All right," soothed Terens. "What's her name?"

"That's Valona March."

"That's right. I remember now. Call her in."

From that moment Terens had made himself an unofficial guardian of the pair. He had done what he could to obtain additional food rations for her, extra clothing coupons and whatever else was required to allow two adults (one unregistered) to live on the income of one. He had been instrumental in helping her obtain training for Rik at the kirt mills. He had intervened to prevent greater punishment on the occasion of Valona's quarrel with a section head. The death of the City doctor had made it unnecessary for him to attempt further action there than he had taken, but he had been ready.

It was natural for Valona to come to him in all her troubles, and he was waiting now for her to answer his question.

Valona was still hesitating. Finally she said, "He says everyone in the world will die."

Terens looked startled. "Does he say how?"

"He says he doesn't know how. He just says he remembers that from before he was like, you know, like he is. And he says he remembers he had an important job, but I don't understand what it is."

"How does he describe it?"

"He says he an—analyzes Nothing with a capital N."

Valona waited for comment, then hastened to explain, "Analyze means taking something apart like——"

"I know what it means, girl." Terens remained lost.

Valona watched him anxiously. "Do you know what he means, Townman?"

"Perhaps, Valona."

"But, Townman, how can anyone do anything to Nothing?"

Terens got to his feet. He smiled briefly. "Why, Valona, don't you know that everything in all the Galaxy is mostly Nothing?"

No light of understanding dawned on Valona, but she accepted that. The Townman was a very educated man. With an unexpected twinge of pride, she was suddenly certain that her Rik was even more educated.

"Come." Terens was holding his hand out to her.

She said, "Where are we going?"

"Well, where's Rik?"

"Home," she said. "Sleeping."

"Good. I'll take you there. Do you want the patrollers to find you on the street alone?"

The village seemed empty of life in the nighttime. The lights along the single street that split the area of workers' cabins in two gleamed without glare. There was a hint of rain in the air, but only of that light warm rain that fell almost every night. There was no need to take special precautions against it.

Valona had never been out so late on a working evening and it was frightening. She tried to shrink away from the sound of her own footsteps, while listening for the possible distant step of the patrollers.

Terens said, "Stop trying to tiptoe, Valona. I'm with you."

His voice boomed in the quiet and Valona jumped. She hurried forward in response to his urging.

Valona's hut was as dark as the rest and they stepped in gingerly. Terens had been born and brought up in just such a hut and though he had since lived on Sark and now occupied a house with three rooms and plumbing, there was still something of a nostalgia about the barrenness of its interior. One room was all that was required, a bed, a chest of drawers, two chairs, a smooth poured-cement floor, a closet in one corner.

There was no need for kitchen facilities, since all meals were eaten at the mill, nor for a bathroom, since a line of community outhouses and shower cells ran along the space behind the houses. In the mild, unvarying climate, windows were not adapted for protection against cold and rain. All four walls were pierced by screened openings and eaves above were sufficient ward against the nightly windless sprinkles.

In the flare of a little pocket light which he held cupped in one palm Terens noted that one corner of the room was marked off by a battered screen. He remembered getting it for Valona rather recently when Rik had become too little of a child or too much of a man. He could hear the regular breathing of sleep behind it.

He nodded his head in that direction. "Wake him, Valona."

Valona tapped on the screen. "Rik! Rik, baby!"

There was a little cry.

"It's only Lona," said Valona. They rounded the screen and Terens played his little light upon their own faces, then upon Rik.

Rik threw an arm up against the glare. "What's the matter?"

Terens sat down on the edge of the bed. Rik slept in the standard cottage bed, - he noted. He had obtained for Valona an old, rather rickety cot at the very first, but she had reserved that for herself.

"Rik," he said, "Valona says you're beginning to remember things."

"Yes, Townman." Rik was always very humble before the Townman, who was the most important man he had ever seen. Even the mill superintendent was polite to the Townman. 111k repeated the scraps his mind had gathered during the day.

Terens said, "Have you remembered anything else since you told this to Valona?"

"Nothing else, Townman."

Terens kneaded the fingers of one hand with those of the other. "All right, Rik. Go back to sleep."

Valona followed him out of the house. She was trying hard to keep her face from twisting and the back of one rough hand slid across her eyes. "Will he have to leave me, Townman?"

Terens took her hands and said gravely, "You must be a grown woman, Valona. He will have to come with me for just a short while but I'll bring him back."

"And after that?"

"I don't know. You must understand, Valona. Right now it is the most important thing in all the world that we find out more about Rik's memories."

Valona said suddenly, "You mean everybody on Florina might die, the way he says?"

Terens' grip tightened. "Don't ever say that to anyone, Valona, or the patrollers may take Rik away forever. I mean that."

He turned away and walked slowly and thoughtfully back to his house without really noticing that his hands were trembling. He tried futilely to sleep and after an hour of that he adjusted the narco-field. It was one of the few pieces of Sark he had brought with him when he first returned to Florina to become Townman. It fitted about his skull like a thin black felt cap. He adjusted the controls to five hours and closed contact.

He had time to adjust himself comfortably in bed before the delayed response shorted the conscious centers of his cerebrum and blanketed him into instantaneous, dreamless sleep.

3. THE LIBRARIAN

THEY LEFT the diamagnetic scooter in a scooter-cubby outside the City limits. Scooters were rare in the City and Terens had no wish to attract unnecessary attention. He thought for a savage moment of those of the Upper City with their diamagnetic ground-cars and anti-gray gyros. But that was the Upper City. It was different.

Rik waited for Terens to lock the cubby and fingerprint-seal it. He was dressed in a new one-piece suit and felt a little uncomfortable. Somewhat reluctantly he followed the Townman under the first of the tall bridgelike structures that supported the Upper City.

On Florina, all other cities had names, but this one was simply the "City." The workers and peasants who lived in it and around it were considered lucky by the rest of the planet. In the City there were better doctors and hospitals, more factories and more liquor stores, even a few dribbles of very mild luxury. The inhabitants themselves were somewhat less enthusiastic. They lived in the shadow of the Upper City.

The Upper City was exactly what the name implied, for the City was double, divided rigidly by a horizontal layer of fifty square miles of cement alloy resting upon some twenty thousand steel-girdered pillars. Below in the shadow were the "natives." Above, in the sun, were the Squires. It was difficult to believe in the Upper City that the planet of its location was Florina. The population was almost exclusively Sarkite in nature, together with a sprinkling of patrollers. They were the upper class in all literalness.

Terens knew his way. He walked quickly, avoiding the stares of passers-by, who surveyed his Townman clothing with a mixture of envy and resentment. Ull's shorter legs made his gait less dignified as he tried to keep up. He did not remember very much from his only other visit to the City. It seemed so different now. Then it had been cloudy. Now the sun was out, pouring through the spaced openings in the cement alloy above to form strips of light that made the intervening space all the darker. They plunged through the bright strips in a rhythmic, almost hypnotic fashion.

Oldsters sat on wheeled chairs in the strips, absorbing the warmth and moving as the strip moved. Sometimes they fell asleep and would remain behind in the shade, nodding in their chairs until the squeaking of the wheels when they shifted position woke them. Occasionally mothers nearly blocked the strips with their carriageci offspring.

Terens said, "Now, Rik, stand up straight. We're going up." He was standing before a structure that filled the space between four square-placed pillars, and from ground to Upper City.

Rik said, "I'm scared."

Rik could guess what the structure was. It was an elevator that lifted to the upper level. These were necessary, of course. Production was below, but consumption was above. Basic chemicals and raw food staples were shipped into Lower City, but finished plastic ware and fine meals were matters for Upper City. Excess population spawned below; maids, gardeners, chauffeurs, construction laborers were used above.

Terens ignored Rik's expression of fright. He was amazed that his own heart beat so violently. Not fright, of course. Rather a fierce satisfaction that he was going up. He would step all over that sacred cement alloy, stamp on it, scuff his dirt upon it. He could do that as a Townman. Of course he was still only a Florinian native to the Squires, but he was a Townman and he could step on the cement alloy whenever he pleased.

Galaxy, he hated them!

He stopped himself, drew a firm breath and signaled for the elevator. There was no use thinking hate. He had been on Sark for many years; on Sark itself, the center and breeding place of the Squires. He had learned to bear in silence. He ought not forget what he had learned now. Of all times, not now.

He heard the whir of the elevator settling at the lower level, and the entire wall facing him dropped into its slot.

The native who operated the elevator looked disgusted. "Just two of you."

"Just two," said Terens, stepping in. 131k followed.

The operator made no move to restore the fallen wall to its original position. He said, "Seems to me you guys could wait for the two o'clock load and move with it. I ain't supposed to run this thing up and down for no two guys." He spat carefully, making sure that the sputum hit lower-level concrete and not the floor of his elevator.

He went on, "Where's your employment tickets?"

Terens said, "I'm a Townman. Can't you see it by my clothes?"

"Clothes don't mean nothing. Listen, you think I'm risking my job because you maybe picked up some uniform somewheres? Where's your card?"

Terens, without another word, presented the standard document-folder all natives had to carry at all times: registration number, employment certificate, tax receipts. It was open to the crimson of his Townman's license. The operator scanned it briefly.

"Well, maybe you picked that up, too, but that's not my business. You got it and I pass you, though Townman's just a fancy name for a native to my way of figgering. What about the other guy?"

"He's in my charge," said Terens. "He can come with me, or shall we call a patroller and check into the rules?"

It was the last thing Terens wanted but he suggested it with suitable arrogance.

"Awrright! Y'don't have to get sore." The elevator wall moved up, and with a lurch the elevator climbed. The operator mumbled direfully under his breath.

Terens smiled tightly. It was almost inevitable. Those who worked directly for the Squires were only too glad to identify themselves with the rulers and make up for their real inferiority by a tighter adherence to the rules of segregation, a harsh and haughty attitude toward their fellows. They were the "uppermen" for whom the other Florinians reserved their particular hate, unalloyed by the carefully taught awe they felt for the Squires.

The vertical distance traveled was thirty feet, but the door opened again to a new world. Like the native cities of Sark, Upper City was laid out with a particular eye to color. Individual structures, whether dwelling places or public buildings, were inset in an

intricate multicolored mosaic which, close at hand, was a meaningless jumble, but at a distance of a hundred yards took on a soft clustering of hues that melted and changed with the angle of view.

"Come on, 131k," said Terens.

Rik was staring wide-eyed. Nothing alive and growing! Just stone and color in huge masses. He had never known houses could be so huge. Something stirred momentarily in his mind. For a second the hugeness was not so strange. . . And then the memory closed down again.

A ground-car flashed by.

"Are those Squires?" Rik whispered.

There had been time for only a glance. Hair close-cropped, wide, flaring sleeves of glossy, solid colors ranging from blue to violet, knickers of a velvety appearance and long, sheer hose that gleamed as if it were woven of thin copper wire. They wasted no glance at 111k and Terens.

"Young ones," said Terens. He had not seen them at such close quarters since he left Sark. On Sark they were bad enough but at least they had been in place. Angels did not fit here, thirty feet over Hell. Again he squirmed to suppress a useless tremble of hatred.

A two-man flatcar hissed up behind them. It was a new model that had built-in air controls. At the moment it was skimming smoothly two inches above surface, its gleaming flat bottom curled upward at all edges to cut air resistance. Still, the slicing of air against its lower surface sufficed to produce the characteristic hiss which meant "patrollers."

They were large, as all patrollers were; broad-faced, flatcheeked, long, straight black hair, light brown in complexion. To the natives, all patrollers looked alike. The glossy black of their uniforms, enhanced as they were by the startling silver of strategically placed buckles and ornamental buttons, depressed the importance of the face and encouraged the impression of likeness still more.

One patroller was at the controls. The other leaped out lightly over the shallow rim of the car.

He said, "Folder!" stared mechanically and momentarily at it and flipped it back at Terens. "Your business here."

"I intend consulting the library, Officer. It is my privilege." The patroller turned to Elk. "What about you?"

"I—" began Rik.

"He is my assistant," interposed Terens.

"He has no Townman privileges," said the patroller.

"I'll be responsible for him."

The patroller shrugged. "It's your lookout. Townmen have privileges, but they're not Squires. Remember that, boy."

"Yes, Officer. By the way, could you direct me to the library?" The patroller directed him, using the thin, deadly barrel of a needle-gun to indicate direction. From

their present angle, the library was a blotch of brilliant vermilion deepening into crimson toward the upper stories. As they approached, the crimson crept downward.

Rik said with sudden vehemence, "I think it's ugly."

Terens gave him a quick, surprised glance. He had been accustomed to all this on Sark, but he, too, found the garishness of Upper City somewhat vulgar. But then, Upper City was more Sark than Sark itself. On Sark, not all men were aristocrats. There were even poor Sarkites, some scarcely better off than the average Florinian. Here only the top of the pyramid existed, and the library showed that.

It was larger than all but a few on Sark itself, far larger than Upper City required, which showed the advantage of cheap labor. Terens paused on the curved ramp that led to the main entrance. The color scheme on the ramp gave the illusion of steps, somewhat disconcerting to 131k, who stumbled, but giving the library the proper air of archaism that traditionally accompanied academic structures.

The main hall was large, cold, and all but empty. The librarian behind the single desk it contained looked like a small, somewhat wrinkled pea in a bloated pod. She looked up and half rose.

Terens said quickly, "I'm a Townman. Special privileges. I am responsible for this native." He had his papers ready and marched them before him.

The librarian seated herself and looked stern. She plucked a metal sliver from a slot and thrust it at Terens. The Townman placed his right thumb firmly upon it. The librarian took the sliver and put it in another slot where a dim violet light shone briefly.

She said, "Room 242."

"Thank you."

The cubicles on the second floor had that icy lack of personality that any link in an endless chain would have. Some were filled, their glassite doors frosted and opaque. Most were not.

"Two forty-two," said 131k. His voice was squeaky.

"What's the matter, 13.1k?"

"I don't know. I feel very excited."

"Ever been in a library before?"

"I don't know."

Terens put his thumb on the round aluminum disk which, five minutes before, had been sensitized to his thumbprint. The clear glass door swung open and, as they stepped within, it closed silently and, as though a blind had been drawn, became opaque.

The room was six feet in each direction, without window or adornment. It was lit by the diffuse ceiling glow and ventilated by a forced-air draft. The only contents were a desk that stretched from wall to wall and an upholstered backless bench between it and the door. On the desk were three "readers." Their frosted-glass fronts slanted backward at an angle of thirty degrees. Before each were the various control-dials.

"Do you know what this is?" Terens sat down and placed his soft, plump hand upon one of the readers.

Rik sat down too.

"Books?" he asked eagerly.

"Well." Terens seemed uncertain. "This is a library, so your guess doesn't mean much. Do you know how to work the reader?"

"No. I don't think so, Townman."

"You're sure? Think about it a little."

Rik tried valiantly. "I'm sorry, Townman."

"Then I'll show you. Look! First, you see, there's this knob, labeled 'Catalog' with the alphabet printed about it. Since we want the encyclopaedia first, we'll turn the knob to E and press downward."

He did so and several things happened at once. The frosted glass flared into life and printing appeared upon it. It stood out black on yellow as the ceiling light dimmed. Three smooth panels moved out like so many tongues, one before each reader, and each was centered by a tight light-beam. Terens snapped a toggle switch and the panels moved back into their recesses.

He said, "We won't be taking notes."

Then he went on, "Now we can go down the list of E's by turning this knob."

The long line of alphabetized materials, titles, authors, catalog numbers flipped upward, then stopped at the packed column listing the numerous volumes of the encyclopaedia.

Rik said suddenly, "You press the numbers and letters after the book you want on these little buttons and it shows on the screen."

Terens turned on him. "How do you know? Do you remember that?"

"Maybe I do. I'm not sure. It just seems the right thing."

"Well, call it an intelligent guess."

He punched a letter-number combination. The light on the glass faded, then brightened again. It said: "Encyclopaedia of Sark, Volume 54, Sol—Spec."

Terens said, "Now look, 131k, I don't want to put any ideas in your head, so I won't tell you what's in my mind. I just want you to look through this volume and stop at anything that seems familiar. Do you understand?"

"Yes."

"Good. Now take your time."

The minutes passed. Suddenly Rik gasped and sent the dials spinning backward.

When he stopped, Terens read the heading and looked pleased. "You remember now? This isn't a guess? You remember?"

Elk nodded vigorously. "It came to me, Townman. Very suddenly."

It was the article on Spatio-analysis.

"I know what it says," Elk said. "You'll see, you'll see." He was having difficulty breathing normally and Terens, for his part, was almost equally excited.

"See," said Rik, "they always have this part."

He read aloud haltingly, but in a manner far more proficient than could be accounted for by the sketchy lessons in reading he had received from Valona. The article said: "It is not surprising that the Spatio-analyst is by temperament an introverted and,

often enough, maladjusted individual. To devote the greater part of one's adult life to the lonely recording of the terrible emptiness between the stars is more than can be asked of someone entirely normal. It is perhaps with some realization of this that the Spatio-analytic Institute has adopted as its official slogan the somewhat wry statement, "We Analyze Nothing".

Rik finished with what was almost a shriek.

Terens said, "Do you understand what you've read?"

The smaller man looked up with blazing eyes. "It said, 'We Analyze Nothing.' That's what I remembered. I was one of them."

"You were a Spatio-analyst?"

"Yes," cried Rik. Then, in a lower voice, "My head hurts."

"Because you're remembering?"

"I suppose so." He looked up, forehead furrowed. "I've got to remember more. There's danger. Tremendous danger! I don't know what to do."

"The library's at our disposal, Rik." Terens was watching carefully, weighing his words. "Use the catalog yourself and look up some texts on Spatio-analysis. See where that leads you."

Rik flung himself upon the reader. He was shaking visibly. Terens moved aside to give him room.

"How about Wrijt's Treatise of Spatio-analytic Instrumentation?" asked Rik.

"Doesn't that sound right?"

"It's all up to you, Rik."

Rik punched the catalog number and the screen burned brightly and steadily. It said, "Please Consult Librarian for Book in Question."

Terens reached out a quick hand and neutralized the screen. "Better try another book, Rik."

"But . . ." Rik hesitated, then followed orders. Another search through the catalog and then he chose Enning's Composition of Space.

The screen filled itself once more with a request to consult the librarian. Terens said, "Damn!" and deadened the screen again.

Rik said, "What's the matter?"

Terens said, "Nothing. Nothing. Now don't get panicky, Rik. I just don't quite see—"

There was a little speaker behind the grillwork on the side of the reading mechanism. The librarian's thin, dry voice emerged therefrom and froze them both.

"Room 242! Is there anyone in Room 242?"

Terens answered harshly, "What do you want?"

The voice said, "What book is it you want?"

"None at all. Thank you. We are only testing the reader."

There was a pause as though some invisible consultation was proceeding. Then the voice said with an even sharper edge to it, "The record indicates a reading request for

Wrijt's Treatise of Spatio-analytical Instrumentation, and Enning's Composition of Space. Is that correct?"

"We were punching catalog numbers at random," said Terens. "May I ask your reason for desiring those books?" The voice was inexorable.

"I tell you we don't want them. . . Now stop it." The last was an angry aside to Elk, who had begun whimpering.

A pause again. Then the voice said, "If you will come down to the desk you may have access to the books. They are on a reserved listing and you will have to fill out a form."

Terens held out a hand to Rik. "Let's go."

"Maybe we've broken a rule," quavered Rik.

"Nonsense, Elk. We're leaving."

"We won't fill out the form?"

"No, we'll get the books some other time."

Terens was hurrying, forcing Elk along with him. He strode down the main lobby. The librarian looked up.

"Here now," she cried, rising and circling the desk. "One moment. One moment!" They weren't stopping for her.

That is, until a patroller stepped in front of them. "You're in an awful hurry, laddies."

The librarian, somewhat breathless, caught up to them. "You're 242, aren't you?"

"Look here," said Terens firmly, "why are we being stopped?"

"Didn't you inquire after certain books? We'd like to get them for you."

"It's too late. Another time. Don't you understand that I don't want the books? I'll be back tomorrow."

"The library," said the woman primly, "at all times endeavors to give satisfaction. The books will be made available to you in one moment." Two spots of red burned high upon her cheekbones. She turned away, hurrying through a small door that opened at her approach.

Terens said, "Officer, if you don't mind—"

But the patroller held out his moderately long, weighted neuronic whip. It could serve as an excellent club, or as a longer-range weapon of paralyzing potentialities. He said, "Now, laddy, why don't you sit down quietly and wait for the lady to come back? It would be the polite thing to do."

The patroller was no longer young, no longer slim. He looked close to retirement age and he was probably serving out his time in quiet vegetation as library guard, but he was armed and the joviality on his swarthy face had an insincere look about it.

Terens' forehead was wet and he could feel the perspiration collecting at the base of his spine. Somehow he had underestimated the situation. He had been sure of his own analysis of the matter, of everything. Yet here he was. He shouldn't have been so reckless. It was his damned desire to invade Upper City, to stalk through the library corridors as though he were a Sarkite. . .

For a desperate moment he wanted to assault the patroller and then, unexpectedly, he didn't have to.

It was just a flash of movement at first. The patroller started to turn a little too late. The slower reactions of age betrayed him. The neuronc whip was wrenched from his grasp and before he could do more than emit the beginning of a hoarse cry it was laid along his temple. He collapsed.

Rik shrieked with delight, and Terens cried, "Valona! By all the devils of Sark, Valonat"

4. THE REBEL

TERENS RECOVERED almost at once. He said, "Out. Quickly!" and began walking.

For a moment he had the impulse to drag the patroller's unconscious body into the shadows behind the pillars that lined the main hall, but there was obviously no time.

They emerged onto the ramp, with the afternoon sun making the world bright and warm about them. The colors of Upper City had shifted to an orange motif.

Valona said anxiously, "Come on!" but Terens caught her elbow.

He was smiling, but his voice was hard and low. He said, "Don't run. Walk naturally and follow me. Hold on to 111k. Don't let him run."

A few steps. They seemed to be moving through glue. Were there sounds behind them from the library? Imagination? Terens did not dare look.

"In here," he said. The sign above the driveway he indicated flickered a bit in the light of afternoon. It didn't compete very well with Florina's sun. It said: Ambulance Entrance.

Up the drive, through a side entrance, and between incredibly white walls. They were blobs of foreign material against the aseptic glassiness of the corridor.

A woman in uniform was looking at them from a distance. She hesitated, frowned, began to approach. Terens did not wait for her. He turned sharply, followed a branch of the corridor, then another one. They passed others in uniform and Terens could imagine the uncertainty they aroused. It was quite unprecedented to have natives wandering about unguarded in the upper levels of a hospital. What did one do? Eventually, of course, they would be stopped.

So Terens felt his heartbeat step up when he saw the unobtrusive door that said: To Native Levels. The elevator was at their level. He herded Rik and Talona within and the soft lurch as the elevator dropped was the most delightful sensation of the day.

There were three kinds of buildings in the City. Most were Lower Buildings, built entirely on the lower level. Workers' houses, ranging up to three stories in height. Factories, bakeries, disposal plants. Others were Upper Buildings: Sarkite homes, theaters, the library, sports arenas. But some few were Doubles, with levels and entrances both below and above; the patroller stations, for instance, and the hospitals.

One could therefore use a hospital to go from Upper City to Lower City and avoid in that manner the use of the large freight elevators with their slow movements and overattentive operators. For a native to do so was thoroughly illegal, of course, but the added crime was a pinprick to those already guilty of assaulting patrollers.

They stepped out upon the lower level. The stark aseptic walls were there still, but they had a faintly haggard appearance as though they were less often scrubbed. The upholstered benches that lined the corridors on the upper level were gone. Most of all there was the uneasy babble of a waiting room filled with wary men and frightened

women. A single attendant was attempting to make sense out of the mess, and succeeding poorly.

She was snapping at a stubbled oldster who pleated and unpleated the wrinkled knee of his raveling trousers and who answered all questions in an apologetic monotone.

"Exactly what is your complaint? . . . How long have you had these pains? . . . Ever been to the hospital before? . . . Now look, you people can't expect to bother us over every little thing. You sit down and the doctor will look at you and give you more medicine."

She cried shrilly, "Next!" then muttered something to herself as she looked at the large timepiece on the wall.

Terens, Valona and Elk were edging cautiously through the crowd. Valona, as though the presence of fellow Florinians had freed her tongue of paralysis, was whispering intensely.

"I had to come, Townman. I was so worried about Rik. I thought you wouldn't bring him back and——"

"How did you get to Upper City, anyway?" demanded Terens over his shoulder, as he shoved unresisting natives to either side.

"I followed you and saw you go up the freight elevator. When it came down I said I was with you and he took me up."

"Just like that."

"I shook him a little."

"Imps of Sark," groaned Terens.

"I had to," explained Valona miserably. "Then I saw the patrollers pointing out a building to you. I waited till they were gone and went there too. Only I didn't dare go inside. I didn't know what to do so I sort of hid until I saw you coming out with the patroller stopping——"

"You people there!" It was the sharp, impatient voice of the receptionist. She was standing now, and the hard rapping of her metal stylus on the cement alloy desk top dominated the gathering and reduced them to a hard-breathing silence.

"Those people trying to leave. Come here. You cannot leave without being examined. There'll be no evading work-days with pretended sick calls. Come back here!"

But the three were out in the half shadow of Lower City. There were the smells and noise of what the Sarkites called the Native Quarter about them and the upper level was once more only a roof above them. But however relieved Valona and 13.1k might feel at being away from the oppressive richness of Sarkite surroundings, Terens felt no lifting of anxiety. They had gone too far and henceforth there might be no safety anywhere.

The thought was still passing through his turbulent mind when Rik called, "Look!" Terens felt salt in his throat.

It was perhaps the most frightening sight the natives of the Lower City could see. It was like a giant bird floating down through one of the openings in the Upper City. It shut off the sun and deepened the ominous gloom of that portion of the City. But it wasn't a bird. It was one of the armed ground-cars of the patrollers.

Natives yelled and began running. They might have no specific reason to fear, but they scattered anyway. One man, nearly in the path of the car, stepped aside reluctantly. He had been hurrying on his way, intent on some business of his own, when the shadow caught him. He looked about him, a rock of calm in the wildness. He was of medium height, but almost grotesquely broad across the shoulders. One of his shirt sleeves was slit down its length, revealing an arm like another man's thigh.

Terens was hesitating, and Rik and Valona could do nothing without him. The Townman's inner uncertainty had mounted to a fever. If they ran, where could they go? If they remained where they were, what would they do? There was a chance that the patrollers were after others altogether, but with a patroller unconscious on the library floor through their act, the chances of that were negligible.

The broad man was approaching at a heavy half trot. For a moment he paused in passing them, as though with uncertainty. He said in a conversational voice, "Khorov's bakery is second left, beyond the laundry."

He veered back.

Terens said, "Come on."

He was sweating freely as he ran. Through the uproar, he heard the barking orders that came naturally to patroller throats. He threw one look over his shoulder. A half dozen of them were piling out of the ground-car, fanning out. They would have no trouble, he knew. In his damned Townman's uniform, he was as conspicuous as one of the pillars supporting the Upper City.

Two of the patrollers were running in the right direction. He didn't know whether or not they had seen him, but that didn't matter. Both collided with the broad man who had just spoken to Terens. All three were close enough for Terens to hear the broad man's hoarse bellow and the patrollers' sharp cursing. Terens herded Valona and Elk around the corner.

Khorov's bakery was named as such by an almost defaced "worm" of crawling illuminated plastic, broken in half a dozen places, and was made unmistakable by the wonderful odor that filtered through its open door. There was nothing to do but enter, and they did.

An old man looked out from the inner room within which they could see the flour-obscured gleam of the radar furnaces. He had no chance to ask their business.

Terens began, "A broad man——" He was holding his arms apart in illustration, and the cries of "Patrollers! Patrollers!" began to be heard outside.

The old man said hoarsely, "This way! Quickly!"

Terens held back. "In there?"

The old man said, "This one is a dummy."

First Rik, then Valona, then Terens crawled through the furnace door. There was a faint click and the back wall of the furnace moved slightly and hung freely from the hinges above. They pushed through it and into a small room, dimly lit, beyond.

They waited. Ventilation was bad, and the smell of baking increased hunger without satisfying it. Valona kept smiling at Rik, patting his hand mechanically from time to time. Rik stared back at her blankly. Once in a while he put a hand to his flushed face.

Valona began, "Townman——"

He snapped back in a tight whisper, "Not now, Lona. Please!"

He passed the back of his hand across his forehead, then stared at the dampness of Ms knuckles.

There was a click, magnified by the close confinement of their hiding place. Terens stiffened. Without quite realizing it, he raised clenched fists.

It was the broad man, poking his immense shoulders through the opening. They scarcely fit.

He looked at Terens and was amused. "Come on, man. We're not going to be fighting."

Terens looked at his fists, and let them drop.

The broad man was in markedly poorer condition now than when they had first seen him. His shirt was all but removed from his back and a fresh weal, turning red and purple, marked one cheekbone. His eyes were little and the eyelids crowded them above and below.

He said, "They've stopped looking. If you're hungry, the fare here isn't fancy, but there's enough of it. What do you say?"

It was night in the City. There were lights in the Upper City that lit the sky for miles, but in the Lower City the darkness was clammy. The shades were drawn tightly across the front of the bakery to hide the illegal, past-curfew lights away from it.

Rik felt better with warm food inside him. His headache began to recede. He fixed his eyes on the broad man's cheek.

Timidly he asked, "Did they hurt you, mister?"

"A little," said the broad one. "It doesn't matter. It happens every day in my business." He laughed, showing large teeth.

"They had to admit I hadn't done anything but I was in their way while they were chasing someone else. The easiest way of getting a native out of the way——" His hand rose and fell, holding an invisible weapon, butt-first.

Rik flinched away and Valona reached out an anxious, protective arm.

The broad man leaned back, sucking at his teeth to get out particles of food. He said, "I'm Matt Khorov, but they just call me the Baker. Who are you people?"

Terens shrugged. "Well. . ." The Baker said, "I see your point. What I don't know won't hurt anyone. Maybe. Maybe. At that, though, you might trust me. I saved you from the patrollers, didn't I?"

"Yes. Thank you." Terens couldn't squeeze cordiality into his voice. He said, "How did you know they were after us? There were quite a few people running."

The other smiled. "None of them had the faces you three were wearing. Yours could have been ground up and used for chalk."

Terens tried to smile in return. He didn't succeed well. "I'm not sure I know why you risked your life. Thank you, anyway. It isn't much, just saying 'Thank you,' but there's nothing else I can do right now."

"You don't have to do anything." The Baker's vast shoulders leaned back against the wall. "I do this as often as I can. It's nothing personal. If the patrollers are after someone I do my best for him. I hate the patrollers."

Valona gasped. "Don't you get into trouble?"

"Sure. Look at this." He put a finger gently on his bruised cheek. "But you don't think I ought to let it stop me, I hope. That's why I built the dummy oven. So the patrollers wouldn't catch me and make things too hard for me."

Valona's eyes were wide with mingled fright and fascination.

The Baker said, "Why not? You know how many Squires there are on Florina? Ten thousand. You know how many patrollers? Maybe twenty thousand. And there are five hundred million of us natives. If we all lined up against them . . ." He snapped his fingers.

Terens said, "We'd be lining up against needle-guns and blaster-cannon, Baker."

The Baker retorted, "Yeah. We'd have to get some of our own. You Townmen have been living too close to the Squires. You're scared of them."

Valona's world was being turned upside down today. This man fought with patrollers and spoke with careless self-confidence to the Townman. When Rik plucked at her sleeve she disengaged his fingers gently and told him to sleep. She scarcely looked at him. She wanted to hear what this man said.

The broad man was saying, "Even with needle-guns and blast-cannon, the only way the Squires hold Florina is with the help of a hundred thousand Townmen."

Terens looked offended, but the Baker went on, "For instance, look at you. Very nice clothes. Neat. Pretty. You've got a nice little shack, I'll bet, with book-films, a private hopper and no curfew. You can even go to Upper City if you want to. The Squires wouldn't do that for you for nothing."

Terens felt in no position to lose his temper. He said, "All right. What do you want the Townmen to do? Pick fights with the patrollers? What good would it do? I admit I keep my town quiet and up to quota, but I keep them out of trouble. I try to help them, as much as the law will allow. Isn't that something? Someday——"

"Aah, someday. Who can wait for someday? When you and I are dead, what difference will it make who runs Florina? To us, I mean."

Terens said, "In the first place, I hate the Squires more than you do. Still——" He stopped, reddening.

The Baker laughed. "Go ahead. Say it again. I won't turn you in for hating the Squires. What did you do to get the patrollers after you?"

Terens was silent.

The Baker said, "I can make a guess. When the patrollers fell over me they were plenty sore. Sore in person, I mean, and not just because some Squire told them to be sore. I know them and I can tell. So I figure that there's only one thing that could have happened. You must've knocked down a patroller. Or killed him, maybe."

Terens was still silent.

The Baker lost none of his agreeable tone. "It's all right to keep quiet but there's such a thing as being too cautious, Town-man. You're going to need help. They know who you are."

"No, they don't," said Terens hastily.

"They must have looked at your cards in the Upper City."

"Who said I was in the Upper City?"

"A guess. I'll bet you were."

"They looked at my card, but not long enough to read my name."

"Long enough to know you're a Townman. All they have to do is find a Townman missing from his town or one who can't account for his movements today. The wires all over Florina are probably scorching right now. I think you're in trouble."

"Maybe."

"You know there's no maybe. Want help?"

They were talking in whispers. Elk had curled up in the corner and gone to sleep. Valona's eyes were moving from speaker to speaker.

Terens shook his head. "No, thanks. I—I'll get out of this."

The Baker's ready laughter came. "It will be interesting to see how. Don't look down on me because I haven't got an education. I've got other things. Look, you spend the night thinking about it. Maybe you'll decide you can use help."

Valona's eyes were open in the darkness. Her bed was only a blanket thrown on the floor, but it was nearly as good as the beds she was used to. Elk slept deeply on another blanket in an opposite corner. He always slept deeply on days of excitement after his headaches passed.

The Townman had refused a bed and the Baker had laughed (he laughed at everything, it seemed), turned out the light and told him he was welcome to sit up in the darkness.

Valona's eyes remained open. Sleep was far away. Would she ever sleep again? She had knocked down a patroller!

Unaccountably, she was thinking of her father and mother.

They were very misty in her mind. She had almost made herself forget them in the years that had stretched between them and herself. But now she remembered the sound of whispered conversations during the night, when they thought her asleep. She remembered people who came in the dark.

The patrollers had awakened her one night and asked her questions she could not understand but tried to answer. She never saw her parents again after that. They had gone away, she was told, and the next day they had put her to work when other children her age still had two years of play time. People looked after her as she passed and other children weren't allowed to play with her, even when work time was over. She learned to keep to herself. She learned not to speak. So they called her "Big Lona" and laughed at her and said she was a half-wit.

Why did the conversation tonight remind her of her parents? "Valona."

The voice was so close that its light breath stirred her hair and so low she scarcely heard it. She tensed, partly in fear, partly in embarrassment. There was only a sheet over her bare bosom.

It was the Townman. He said, "Don't say anything. Just listen. I am leaving. The door isn't locked. I'll be back, though. Do you hear me? Do you understand?"

She reached in the darkness, caught his hand, pressed it with her fingers. He was satisfied.

"And watch Rik. Don't let him out of your sight. And Valona." There was a long pause. Then he went on, "Don't trust this Baker too much. I don't know about him. Do you understand?"

There was a faint noise of motion, an even fainter distant creak, and he was gone. She raised herself to one elbow and, except for Rik's breathing and her own, there was only silence.

She put her eyelids together in the darkness, squeezing them, trying to think. Why did the Townman, who knew everything, say this about the Baker, who hated patrollers and had saved them? Why? She could think of only one thing. He had been there. Just when things looked as black as they could be, the Baker had come and had acted quickly. It was almost as though it had been arranged or as if the Baker had been waiting for it all to happen. She shook her head. It seemed strange. If it weren't for what the Townman had said, she would never think this.

The silence was broken into quivering pieces by a loud and unconcerned remark. "Hello? Still here?"

She froze as a beam of light caught her full. Slowly she relaxed and bunched the sheet about her neck. The beam fell away.

She did not have to wonder about the identity of the new speaker. His squat broad form bulked in the half-light that leaked backward from the flash.

The Baker said, "You know, I thought you'd go with him."

Valona said weakly, "Who, sir?"

"The Townman. You know he left, girl. Don't waste time pretending."

"He'll be back, sir."

"Did he say he would be back? If he did, he's wrong. The patrollers will get him. He's not a very smart man, the Townman, or he'd know when a door is left open for a purpose. Are you planning to leave too?"

Valona said, "I'll wait for the Townman."

"Suit yourself. It will be a long wait. Go when you please." His light-beam suddenly left her altogether and traveled along the floor, picking out Rik's pale, thin face. Elk's eyelids crushed together automatically, at the impact of the light, but he slept on.

The Baker's voice grew thoughtful. "But I'd just as soon you left that one behind. You understand that, I suppose. If you decide to leave, the door is open, but it isn't open for him."

"He's just a poor, sick fellow—" Valona began in a high, frightened voice.

"Yes? Well, I collect poor sick fellows and that one stays here. Remember!"

The light-beam did not move from Elk's sleeping face.

5. THE SCIENTIST

DR. SELIM Junz had been impatient for a year, but one does not become accustomed to impatience with time. Rather the reverse. Nevertheless the year had taught him that the Sarkite Civil Service could not be hurried; all the more so since the civil servants themselves were largely transplanted Florinians and therefore dreadfully careful of their own dignity.

He had once asked old Abel, the Trantorian Ambassador, who had lived on Sark so long that the soles of his boots had grown roots, why the Sarkites allowed their government departments to be run by the very people they despised so heartily.

Abel had wrinkled his eyes over a goblet of green wine.

"Policy, Junz," he said. "Policy. A matter of practical genetics, carried out with Sarkite logic. They're a small, no-account world, these Sarkites, in themselves, and are only important so long as they control that everlasting gold mine, Florina. So each year they skim Florina's fields and villages, bringing the cream of its youth to Sark for training. The mediocre ones they set to filing their papers and filling their blanks and signing their forms and the really clever ones they send back to Florina to act as native governors for the towns. Townmen they call them."

Dr. Junz was a Spatio-analyst, primarily. He did not quite see the point of all this. He said so.

Abel pointed a blunt old forefinger at him and the green light shining through the contents of his goblet touched the ridged fingernail and subdued its yellow-grayness.

He said, "You will never make an administrator. Ask me for no recommendations. Look, the most intelligent elements of Florina are won over to the Sarkite cause wholeheartedly, since while they serve Sark they are well taken care of, whereas if they turn their backs on Sark the best they can hope for is a return to a Florinian existence, which is not good, friend, not good."

He swallowed the wine at a draught and went on. "Further, neither the Townmen nor Sark's clerical assistants may breed without losing their positions. Even with female Florinians, that is. Interbreeding with Sarkites is, of course, out of the question. In this way the best of the Florinian genes are being continually withdrawn from circulation, so that gradually Florina will be composed only of hewers of wood and drawers of water."

"They'll run out of clerks at that rate, won't they?"

"A matter for the future."

So Dr. Junz sat now in one of the outer anterooms of the Department for Florinian Affairs and waited impatiently to be allowed past the slow barriers, while Florinian underlings scurried endlessly through a bureaucratic maze.

An elderly Florinian, shriveled in service, stood before him.

"Dr. Junz?"

"Yes."

"Come with me."

A flashing number on a screen would have been as efficient in summoning him and a fluoro-channel through the air as efficient in guiding him, but where manpower is cheap, nothing need be substituted. Dr. Junz thought "manpower" advisedly. He had never seen women in any government department on Sark. Florinian women were left on their planet, except for some house servants who were likewise forbidden to breed, and Sarkite women were, as Abel said, out of the question.

He was gestured to a seat before the desk of the Clerk to the Undersecretary. He knew the man's title from the channeled glow etched upon the desk. No Florinian could, of course, be more than a clerk, regardless of how much of the actual threads of office ran through his white fingers. The Undersecretary and the Secretary of Florinian Affairs would themselves be Sarkites, but though Dr. Junz might meet them socially, he knew he would never meet them here in the department.

He sat, still impatiently, but at least nearer the goal. The Clerk was glancing carefully through the file, turning each minutely coded sheet as though it held the secrets of the universe. The man was quite young, a recent graduate perhaps, and like all Florinians, very fair of skin and light of hair.

Dr. Junz felt an atavistic thrill. He himself came from the world of Libair, and like all Libairians, he was highly pigmented and his skin was a deep, rich brown. There were few worlds in the Galaxy in which the skin color was so extreme as on either Libair or Florina. Generally, intermediate shades were the rule.

Some of the radical young anthropologists were playing with the notion that men of worlds like Libair, for instance, had arisen by independent but convergent evolution. The older men denounced bitterly any notion of an evolution that converged different species to the point where interbreeding was possible, as it certainly was among all the worlds in the Galaxy. They insisted that on the original planet, whatever it was, mankind had already been split into subgroups of varying pigmentation.

This merely placed the problem further back in time and answered nothing so that Dr. Junz found neither explanation satisfying. Yet even now he found himself thinking of the problem at times. Legends of a past of conflict had lingered, for some reason, on the dark worlds. Libairian myths, for instance, spoke of times of war between men of different pigmentation and the founding of Libair itself was held due to a party of browns fleeing from a defeat in battle.

When Dr. Junz left Libair for the Arcturian Institute of Spatial Technology and later entered his profession, the early fairy tales were forgotten. Only once since then had he really wondered. He had happened upon one of the ancient worlds of the Centaurian Sector in the course of business; one of those worlds whose history could be counted in millennia and whose language was so archaic that its dialect might almost be that lost and mythical language, English. They had a special word for a man with dark skin.

Now why should there be a special word for a man with dark skin? There was no special word for a man with blue eyes, or large ears, or curly hair. There was no———The

Clerk's precise voice broke his reverie. "You have been at this office before, according to the record."

Dr. Junz said with some asperity, "I have indeed, sir."

"But not recently."

"No, not recently."

"You are still in search of a Spatio-analyst who disappeared"—the Clerk flipped sheets—"some eleven months and thirteen days ago."

"That's right."

"In all that time," said the Clerk in his dry, crumbly voice out of which all the juice seemed carefully pressed, "there has been no sign of the man and no evidence to the effect that he ever was anywhere in Sarkite territory."

"He was last reported," said the scientist, "in space near Sark." The Clerk looked up and his pale blue eyes focused for a moment on Dr. Junz, then dropped quickly. "This may be so, but it is not evidence of his presence on Sark."

Not evidence! Dr. Junz's lips pressed tightly together. It was what the Interstellar Spatio-analytic Bureau had been telling him with increasing bluntness for months.

No evidence, Dr. Junz. We feel that your time might be better employed, Dr. Junz. The Bureau will see to it that the search is maintained, Dr. Junz.

What they really meant was, Stop wasting our dough, Junz!

It had begun, as the Clerk had carefully stated, eleven months and thirteen days ago by Interstellar Standard Time (the Clerk would, of course, not be guilty of using local time on a matter of this nature). Two days before that he had landed on Sark on what was to be a routine inspection of the Bureau's offices on that planet, but which turned out to be—well, which turned out to be what it was.

He had been met by the local representative of the I.S.B., a wispy young man who was marked in Dr. Junz's thoughts chiefly by the fact that he chewed, incessantly, some elastic product of Sark's chemical industry.

It was when the inspection was almost over and done with that the local agent had recalled something, parked his lastoplug in the space behind his molars and said, "Message from one of the field men, Dr. Junz. Probably not important. You know them."

It was the usual expression of dismissal: You know them. Dr.

Junz looked up with a momentary flash of indignation. He was about to say that fifteen years ago he himself had been a "field man," then he remembered that after three months he had been able to endure it no longer. But it was that bit of anger that made him read the message with an earnest attention.

It went: Please keep direct coded line open to I.S.B. Central HQ for detailed message involving matter of utmost importance. All Galaxy affected. Am landing by minimum trajectory.

The agent was amused. His jaws had gone back to their rhythmic champing and he said, "Imagine, sir. 'All Galaxy affected.' That's pretty good, even for a field man. I called him after I got this to see if I could make any sense out of him, but that flopped. He just kept saying that the life of every human being on Florina was in danger. You know, half a

billion lives at stake. He sounded very psychopathic. So, frankly, I don't want to try to handle him when he lands. What do you suggest?"

Dr. Junz had said, "Do you have a transcript of your talk?"

"Yes, sir." There was a few minutes searching. A sliver of film was finally found.

Dr. Junz ran it through the reader. He frowned. "This is a copy, isn't it?"

"I sent the original to the Bureau of Extra-Planetary Transportation here on Sark. I thought it would be best if they met him on the landing field with an ambulance. He's probably in a bad way."

Dr. Junz felt the impulse to agree with the young man. When the lonely analysts of the depths of space finally broke over their jobs, their psychopathies were likely to be violent.

Then he said, "But wait. You sound as though he hasn't landed yet."

The agent looked surprised. "I suppose he has, but nobody's called me about it."

"Well, call Transportation and get the details. Psychopathic or not, the details must be on our records."

The Spatio-analyst had stopped in again the next day on a last-minute check before he left the planet. He had other matters to attend to on other worlds, and he was in a moderate hurry. Almost at the doorway, he said, over his shoulder, "How's our field man doing?"

The agent said, "Oh, say—I meant to tell you. Transportation hasn't heard from him. I sent out the energy pattern of his hyperatomic motors and they say his ship is nowhere in near space. The guy must have changed his mind about landing."

Dr. Junz decided to delay his departure for twenty-four hours. The next day he was at the Bureau of Extra-Planetary Transportation in Sark City, capital of the planet. He met the Florinian bureaucracy for the first time and they shook their heads at him. They had received the message concerning the prospective landing of an analyst of the I.S.B. Oh yes, but no ship had landed.

But it was important, Dr. Junz insisted. The man was very sick. Had they not received a copy of the transcript of his talk with the local I.S.B. agent? They opened their eyes wide at him. Transcript? No one could be found who remembered receiving that. They were sorry if the man were sick, but no I.S.B. ship had landed, and no I.S.B. ship was anywhere in near space.

Dr. Junz went back to his hotel room and thought many thoughts. The new deadline for his leaving passed. He called the desk and arranged to be moved to another suite more adapted to an extended occupancy. Then he arranged an appointment with Ludigan Abel, the Trantorian Ambassador.

He spent the next day reading books on Sarkite history, and when it was time for the appointment with Abel, his heart had become a slow drumbeat of anger. He was not going to quit easily, he knew that.

The old Ambassador treated it as a social call, pumped his hand, had his mechanical bartender rolled in, and would not allow any discussion of business over the first two drinks. Junz used the opportunity for worth-while small talk, asked about the

Florinian Civil Service and received the exposition on the practical genetics of Sark. His sense of anger deepened.

Junz always remembered Abel as he had been that day. Deepset eyes half closed under startling white eyebrows, beaky nose hovering intermittently over his goblet of wine, insunken cheeks accentuating the thinness of his face and body, and a gnarled finger slowly keeping time to some unheard music. Junz began his story, telling it with stolid economy. Abel listened carefully and without interruption.

When Junz was finished, he dabbed delicately at his lips and said, "Look now, do you know this man who has disappeared?"

"No."

"Nor met him?"

"Our field analysts are hard men to meet."

"Has he had delusions before this?"

"This is his first, according to the records at central I.S.B. offices, if it is a delusion."

"If?" The Ambassador did not follow that up. He said, "And why have you come to me?"

"For help."

"Obviously. But in what way? What can I do?"

"Let me explain. The Sarkite Bureau of Extra-Planetary Transportation has checked near space for the energy pattern of the motors of our man's ship, and there is no sign of it. They wouldn't be lying about that. I do not say that the Sarkites are above lying, but they are certainly above useless lying, and they must know that I can have the matter checked in the space of two or three hours."

"True. What then?"

"There are two times when an energy-pattern trace will fail. One, when the ship is not in near space, because it has jumped through hyperspace and is in another region of the Galaxy, and two, when it is not in space at all because it has landed on a planet. I cannot believe our man has jumped. If his statements about peril to Florina and Galactic importance are megalomaniac delusions, nothing would stop him from coming to Sark to report on them. He would not have changed his mind and left. I've had fifteen years experience with such things. If, by any chance, his statements were sane and real, then certainly the matter would be too serious to allow him to change his mind and leave near space."

The old Trantorian lifted a finger and waved it gently. "Your conclusion then is that he is on Sark."

"Exactly. Again, there are two alternatives. First, if he is in the grip of a psychosis, he may have landed anywhere on the planet other than at a recognized spaceport. He may be wandering about, sick and semi-amnesiac. These things are very unusual, even for field men, but they have happened. Usually, in such a case, the fits are temporary. As they pass, the victim finds the details of his job returning first, before any personal memories at all. After all, the Spatio-analyst's job is his life. Very often the amnesiac is picked up because he wanders into a public library to look up references on Spatio-analysis."

"I see. Then you want to have me help you arrange with the Board of Librarians to have such a situation reported to you."

"No, because I don't anticipate any trouble there. I will ask that certain standard works on Spatio-analysis be placed on reserve and that any man asking for them, other than those who can prove they are native Sarkites, be held for questioning. They will agree to that because they will know, or certain of their superiors will know, that such a plan will come to nothing."

"Why not?"

"Because," and Junz was speaking rapidly now, caught up in a trembling cloud of fury, "I am certain that our man landed at Sark City spaceport exactly as he planned and, sane or psychotic, was then possibly imprisoned but probably killed by the Sarkite authorities."

Abel put down his nearly empty glass. "Are you joking?"

"Do I look as if I were? What did you tell me just half an hour ago about Sark? Their lives, prosperity and power depend upon their control of Florina. What has all my own reading in this past twenty-four hours shown me? That the kyrt fields of Florina are the wealth of Sark. And here comes a man, sane or psychotic, it doesn't matter, who claims that something of Galactic importance has put the life of every man and woman on Florina in danger. Look at this transcript of our man's last known conversation."

Abel picked up the sliver of film that had been dashed upon his lap by Junz and accepted the reader held out to him. He ran it through slowly, his faded eyes blinking and peering at the eyepiece.

"It's not very informative."

"Of course not. It says there is a danger. It says there is horrible urgency. That's all. But it should never have been sent to the Sarkites. Even if the man were wrong, could the Sarkite government allow him to broadcast whatever madness, granting it be madness, he has in his mind and fill the Galaxy with it? Leaving out of consideration the panic it might give rise to on Florina, the interference with the production of kyrt thread, it remains a fact that the whole dirty mess of Sark-Florina political relationships would be exposed to the view of the Galaxy as a whole. Consider that they need do away with only one man to prevent all that, since I can't take action on this transcript alone and they know it. Would Sark hesitate to stop at murder in such a case? The world of such genetic experimenters as you describe would not hesitate."

"And what would you have me do? I am still, I must say, not certain." Abel seemed unmoved.

"Find out if they have killed him," said Junz grimly. "You must have an organization for espionage here. Oh, let's not quibble. I have been knocking about the Galaxy long enough to have passed my political adolescence. Get to the bottom of this while I distract their attention with my library negotiations. And when you find them out for the murderers they are, I want Trantor to see to it that no government anywhere in the Galaxy ever again has the notion it can kill an I.S.B. man and get away with it."

And there his first interview with Abel had ended.

Junz was right in one thing. The Sarkite officials were cooperative and even sympathetic as far as making library arrangements were concerned.

But he seemed right in nothing else. Months passed, and Abel's agents could find no trace of the missing field man anywhere on Sark, alive or dead.

For over eleven months that held true. Almost, Junz began to feel ready to quit. Almost, he decided to wait for the twelfth month to be done and then no more. And then the break had come and it was not from Abel at all, but from the nearly forgotten straw man he had himself set up. A report came from Sark's Public Library and Junz found himself sitting across the desk from a Florinian civil servant in the Bureau of Florinian Affairs.

The Clerk completed his mental arrangement of the case. He had turned the last sheet.

He looked up. "Now what can I do for you?"

Junz spoke with precision. "Yesterday, at 4:22 P.M., I was informed that the Florinian branch of the Public Library of Sark was holding a man for me who had attempted to consult two standard texts on Spatio-analysis and who was not a native Sarkite. I have not heard from the library since."

He continued, raising his voice to override some comment begun by the Clerk. He said, "A tele-news bulletin received over a public instrument owned by the hotel at which I maintain residence, and timed 5:05 P.M. yesterday, claimed that a member of the Florinian Patrol had been knocked unconscious in the Florinian branch of the Public Library of Sark and that three native Florinians believed responsible for the outrage were being pursued. That bulletin was not repeated in later news-broadcast summaries.

"Now I have no doubt that the two pieces of information are connected. I have no doubt that the man I want is in the custody of the Patrol. I have asked for permission to travel to Florina and been refused. I have sub-ethered Florina to send the man in question to Sark and have received no answer. I come to the Bureau of Florinian Affairs to demand action in this respect. Either I go there or he comes here."

The Clerk's lifeless voice said, "The government of Sark cannot accept ultimata from officers of the I.S.B. I have been warned by my superiors that you would probably be questioning me in these matters and I have been instructed as to the facts I am to make known to you. The man who was reported to be consulting the reserved texts, along with two companions, a Town-man and a Florinian female, did indeed commit the assault you referred to, and they were pursued by the Patrol. They were not, however, apprehended."

A bitter disappointment swept over Junz. He did not bother to &y to hide it. "They have escaped?"

"Not exactly. They were traced to the bakery shop of one Matt Khorov."

Junz stared. "And allowed to remain there?"

"Have you been in conference with His Excellency, Ludigan Abel, lately?"

"What has that to do with——"

"We are informed that you have been frequently seen at the Trantorian Embassy."

"I have not seen the Ambassador in a week."

"Then I suggest you see him. We allowed the criminals to remain unharmed at Khorov's shop out of respect for our delicate interstellar relationships with Trantor. I have been instructed to tell you, if it seemed necessary, that Khorov, as you probably will not be surprised to hear," and here the white face took on something uncommonly like a sneer, "is well known to our Department of Security as an agent of Trantor."

6. THE AMBASSADOR

IT WAS ten hours before Junz had his interview with the Clerk that Terens left Khorov's bakery.

Terens kept a hand on the rough surfaces of the workers' hovels he passed, as he stepped gingerly along the alleys of the City. Except for the pale light that washed down in a periodic glimmer from the Upper City, he was in total darkness. What light might exist in Lower City would be the pearly flashes of the patrollers, marching in twos and threes.

Lower City lay like a slumbering noxious monster, its greasy coils hidden by the glittering cover of Upper City. Parts of it probably maintained a shadowy life as produce was brought in and stored for the coming day, but that was not here, not in the slums.

Terens shrank into a dusty alley (even the nightly showers of Florina could scarcely penetrate into the shadowy regions beneath the cement alloy) as the distant clank of footsteps reached him. Lights appeared, passed, and disappeared a hundred yards away.

All night long the patrollers marched back and forth. They needed only to march. The fear they inspired was strong enough to maintain order with scarcely any display of force. With no City lights, the darkness might well be cover for innumerable crawling humans, but even without patrollers as a distant threat, that danger could have been discounted. The food stores and workshops were well guarded; the luxury of Upper City was unattainable; and to steal from one another, to parasitize on one another's misery, was obviously futile.

What would be considered crime on other worlds was virtually non-existent here in the dark. The poor were at hand but had been picked clean, and the rich were strictly out of reach.

Terens flitted on, his face gleaming white when he passed under one of the openings in the cement alloy above, and he could not help but look up.

Out of reach!

Were they indeed out of reach? How many changes in attitude toward the Squires of Sark had he endured in his life? As a child, he had been but a child. Patrollers were monsters in black and silver, from whom one fled as a matter of course, whether one had done wrong or not. The Squires were misty and mystical supermen, enormously good, who lived in a paradise known as Sark and brooded watchfully and patiently over the welfare of the foolish men and women of Florina.

He would repeat every day in school: May the Spirit of the Galaxy watch over the Squires as they watch over us.

Yes, he thought now, exactly. Exactly! Let the Spirit be to them as they to us. No more and no less. His fists clenched and burned in the shadows.

When he was ten, he had written an essay for school about what he imagined life to be like on Sark. It had been a work of purely creative imagination, designed to show off

his penmanship. He remembered very little, only one passage in fact. In that, he described the Squires, gathering every morning in a great hall with colors like those of the kyrt blossoms and standing about gravely in twenty-foot-high splendor, debating on the sins of the Florinians and sorrowfully somber over the necessities of winning them back to virtue.

The teacher had been very pleased, and at the end of the year, when the other boys and girls proceeded with their short sessions on reading, writing and morality, he had been promoted to a special class where he learned arithmetic, galactography, and Sarkite history. At the age of sixteen he had been taken to Sark.

He could still remember the greatness of that day, and he shuddered away from the memory. The thought of it shamed him.

Terens was approaching the outskirts of the City now. An occasional breeze brought him the heavy night odor of the kyrt blossoms. A few minutes now and he would be out in the relative safety of the open fields where there were no regular patroller beats and where, through the ragged night clouds, he would see the stars again. Even the hard, bright yellow star that was Sark's sun.

It had been his sun for half his life. When he first saw it through a spaceship's porthole as more than a star, as an unbearably bright little marble, he wanted to get on his knees. The thought that he was approaching paradise removed even the paralyzing fright of his first space flight.

He had landed on his paradise, and been delivered to an old Florinian who saw to it that he was bathed and clothed becomingly. He was brought to a large building, and on the way there his elderly guide had bowed low to a figure that passed.

"Bow!" the old one muttered angrily to the young Terens.

Terens did so and was confused. "Who was that?"

"A Squire, you ignorant farm hand."

"He! A Squire?"

He stopped dead in his tracks and had to be urged forward. It was his first sight of a Squire. Not twenty feet tall at all, but a man like men. Other Florinian youths might have recovered from the shock of such a disillusion, but not Terens. Something changed inside him, changed permanently.

In all the training he received, through all the studies in which he did so well, he never forgot that Squires were men.

For ten years he studied, and when he neither studied nor ate nor slept, he was taught to make himself useful in many small ways. He was taught to run messages and empty wastebaskets, to bow low when a Squire passed and to turn his face respectfully to the wall when a Squire's Lady passed.

For five more years he worked in the Civil Service, shifted as usual from post to post in order that his capacities might best be tested under a variety of conditions.

A plump, soft Florinian visited him once, smiling his friendship, pinching his shoulder gently, and asked what he thought of the Squires.

Terens repressed a desire to turn away and run. He wondered if his thoughts could have imprinted themselves in some obscure code upon the lines of his face. He shook his head, murmured a string of banalities on the goodness of the Squires.

But the plump one stretched his lips and said, "You don't mean that. Come to this place tonight." He gave him a small card, that crumbled and charred in a few minutes.

Terens went. He was afraid, but very curious. There he met friends of his, who looked at him with secrecy in their eyes and who met him at work later with bland glances of indifference. He listened to what they said and found that many seemed to believe what he had been hoarding in his own mind and honestly had thought to be his own creation and no one else's.

He learned that at least some Florinians thought the Squires to be vile brutes who milked Florina of its riches for their own useless good while they left the hard-working natives to wallow in ignorance and poverty. He learned that the time was coming when there would be a giant uprising against Sark and all the luxury and wealth of Florina would be appropriated by their rightful owners.

How? Terens asked. He asked it over and over again. After all, the Squires and the patrollers had the weapons.

And they told him of Trantor, of the gigantic empire that had swollen in the last few centuries until half the inhabited worlds of the Galaxy were part of it. Trantor, they said, would destroy Sark with the help of the Florinians.

But, said Terens, first to himself, then to others, if Trantor was so large and Florina so small, would not Trantor simply replace Sark as a still larger and more tyrannical master? If that were the only escape, Sark was to be endured in preference. Better the master they knew than the master they knew not.

He was derided and ejected, with threats against his life if he ever talked of what he had heard.

But some time afterward, he noted that one by one those of the conspiracy disappeared, until only the original plump one was left.

Occasionally he saw that one whisper to some newcomer here and there, but it would not have been safe to warn the young victim that he was being presented with a temptation and a test. He would have to find his own way, as had Terens.

Terens even spent some time in the Department of Security, which only a few Florinians could ever expect to accomplish. It was a short stay, for the power attached to an official in Security was such that the time spent there by any individual was even shorter than elsewhere.

But here Terens found, somewhat to his surprise, that there were real conspiracies to be countered. Somehow men and women met on Florina and plotted rebellion. Usually these were surreptitiously supported by Trantorian money. Sometimes the would-be rebels actually thought Florina would succeed unaided.

Terens meditated on the matter. His words were few, his bearing correct, but his thoughts ranged unchecked. The Squires he hated, partly because they were not twenty feet tall, partly because he might not look at their women, and partly because he had

served a few, with bowed head, and had found that for all their arrogance they were foolish creatures no better educated than himself and usually far less intelligent.

Yet what alternative to this personal slavery was there? To exchange the stupid Sarkite Squire for the stupid Trantorian Imperial was useless. To expect the Florinian peasants to do something on their own was fantastically foolish. So there was no way out.

It was the problem that had been in his mind for years, as student, as petty official, and as Townman.

And then there had arisen the peculiar set of circumstances that put an undreamed-of answer in his hands in the person of this insignificant-looking man who had once been a Spatioanalyst and who now babbled of something that put the life of every man and woman on Florina in danger.

Terens was out in the fields now, where the night rain was ending and the stars gleamed wetly among the clouds. He breathed deeply of the kyrt that was Florina's treasure and her curse.

He was under no illusions. He was no longer a Townman. He was not even a free Florinian peasant. He was a criminal on the run, a fugitive who must hide.

Yet there was a burning in his mind. For the last twenty-four hours he had had in his hands the greatest weapon against Sark anyone could have dreamed of. There was no question about it.

He knew that Rik remembered correctly, that he had been a Spatio-analyst once, that he had been psycho-probed into near brainlessness; and that what he remembered was something true and horrible and—powerful. He was sure of it.

And now this Rik was in the thick hands of a man who pretended to be a Florinian patriot but was actually a Trantorian agent.

Terens felt the bitterness of his anger in the back of his throat. Of course this Baker was a Trantorian agent. He had had no doubt about that from the first moment. Who else among dwellers in the Lower City would have the capital to build dummy radar ovens? He could not allow Rik to fall into the hands of Trantor. He would not allow Rik to fall into the hands of Trantor. There was no limit to the risks he was prepared to run. What matter the risks? He had incurred the death penalty already.

There was a dim gleam in the corner of the sky. He would wait for dawn. The various patroller stations would have his description, of course, but it might take several minutes for his appearance to register.

And during those several minutes he would be a Townman. It would give him time to do something that even now, even now, he did not dare let his mind dwell upon.

It was ten hours after Junz had had his interview with the Clerk that he met Ludigan Abel again.

The Ambassador greeted Junz with his usual surface cordiality, yet with a definite and disturbing sensation of guilt. At their first meeting (it had been a long time ago; nearly a Standard Year had passed) he had paid no attention to the man's story per se. His only thought had been: Will this, or can this, help Trantor? Trantor! It was always first in his thought, yet he was not the kind of fool who would worship a cluster of stars or the

yellow emblem of Spaceship-and-Sun that the Trantorian armed forces wore. In short, he was not a patriot in the ordinary meaning of the word and Trantor as Trantor meant nothing to him.

But he did worship peace; all the more so because he was growing old and enjoyed his glass of wine, his atmosphere saturated with mild music and perfume, his afternoon nap, and his quiet wait for death. It was how he imagined all men must feel; yet all men suffered war and destruction. They died frozen in the vacuum of space, vaporized in the blast of exploding atoms, famished on a besieged and bombarded planet.

How then to enforce peace? Not by reason, certainly, nor by education. If a man could not look at the fact of peace and the fact of war and choose the former in preference to the latter, what additional argument could persuade him? What could be more eloquent as a condemnation of war than war itself? What tremendous feat of dialectic could carry with it a tenth the power of a single gutted ship with its ghastly cargo? So then, to end the misuse of force, only one solution was left, force itself.

Abel had a map of Trantor in his study, so designed as to show the application of that force. It was a clear crystalline ovoid in which the Galactic lens was three-dimensionally laid out. Its stars were specks of white diamond dust, its nebulae, patches of light or dark fog, and in its central depths there were the few red specks that had been the Trantorian Republic.

Not "were" but "had been." The Trantorian Republic had been a mere five worlds, five hundred years earlier.

But it was a historical map, and showed the Republic at that stage only when the dial was set at zero. Advance the dial one notch and the pictured Galaxy would be as it was fifty years later and a sheaf of stars would redden about Trantor's rim.

In ten stages, half a millennium would pass and the crimson would spread like a widening bloodstain until more than half the Galaxy had fallen into the red puddle.

That red was the red of blood in more than a fanciful way. As the Trantorian Republic became the Trantorian Confederation and then the Trantorian Empire, its advance had lain through a tangled forest of gutted men, gutted ships, and gutted worlds. Yet through it all Trantor had become strong and within the red there was peace.

Now Trantor trembled at the brink of a new conversion: from Trantorian Empire to Galactic Empire and then the red would engulf all the stars and there would be universal peace—pax Trantorica.

Abel wanted that. Five hundred years ago, four hundred years ago, even two hundred years ago, he would have opposed Trantor as an unpleasant nest of nasty, materialistic and aggressive people, careless of the rights of others, imperfectly democratic at home though quick to see the minor slaveries of others, and greedy without end. But the time had passed for all that.

He was not for Trantor, but for the all-embracing end that Trantor represented. So the question: How will this help Galactic peace? naturally became: How will this help Trantor? The trouble was that in this particular instance he could not be certain. To Junz

the solution was obviously a straightforward one. Trantor must uphold the I.S.B. and punish Sark.

Possibly this would be a good thing, if something could definitely be proven against Sark. Possibly not, even then. Certainly not, if nothing could be proven. But in any case Trantor could not move rashly. All the Galaxy could see that Trantor stood at the edge of Galactic dominion and there was still a chance that what yet remained of the non-Trantorian planets might unite against that. Trantor could win even such a war, but perhaps not without paying a price that would make victory only a pleasanter name for defeat.

So Trantor must never make an incautious move in this final stage of the game. Abel had therefore proceeded slowly, casting his gentle web across the labyrinth of the Civil Service and the glitter of the Sarkite Squiredom, probing with a smile and questioning without seeming to. Nor did he forget to keep the fingers of the Trantorian secret service upon Junz himself lest the angry Libairian do in a moment damage that Abel could not repair in a year.

Abel was astonished at the Libairian's persistent anger. He had asked him once, "Why does one agent concern you so?"

He half expected a speech on the integrity of the I.S.B. and the duty of all to uphold the Bureau as an instrument not of this world or that, but of all humanity. He did not get it.

Instead Junz frowned and said, "Because at the bottom of all this lies the relationship between Sark and Florina. I want to expose that relationship and destroy it."

Abel felt nothing less than nausea. Always, everywhere, there was this preoccupation with single worlds that prevented, over and over again, any intelligent concentration upon the problem of Galactic unity. Certainly social injustices existed here and there. Certainly they seemed sometimes impossible to stomach. But who could imagine that such injustice could be solved on any scale less than Galactic? First, there must be an end to war and national rivalry and only then could one turn to the internal miseries that, after all, had external conflict as their chief cause. And Junz was not even of Florina. He had not even that cause for emotionalized short-sightedness.

Abel said, "What is Florina to you?"

Junz hesitated. He said, "I feel a kinship."

"But you are a Libairian. Or at least that is my impression."

"I am, but there lies the kinship. We are both extremes in a Galaxy of the average."

"Extremes? I don't understand."

Junz said, "In skin pigmentation. They are unusually pale. We are unusually dark. It means something. It binds us together. It gives us something in common. It seems to me our ancestors must have had long histories of being different, even of being excluded from the social majority. We are unfortunate whites and darks, brothers in being different."

By that time, under Abel's astonished gaze, Junz stumbled to a halt. The subject had never been sounded again.

And now, after a year, without warning, without any previous intimations, just at the point where, perhaps, a quiet trailing end might be expected of the whole wretched matter and where even Junz showed signs of flagging zeal, it all exploded.

He faced a different Junz now, one whose anger was not reserved for Sark, but spilled and overflowed onto Abel as well.

"It is not," the Libairian said in part, "that I resent the fact that your agents have been set upon my heels. Presumably you are cautious and must rely on nothing and nobody. Good, as far as that goes. But why was I not informed as soon as our man was located?"

Abel's hand smoothed the warm fabric of the arm of his chair. "Matters are complicated. Always complicated. I had arranged that any report on an unauthorized seeker after Spatio-analytic data be reported to certain of my own agents as well as to you. I even thought you might need protection. But on Florina——"

Junz said bitterly, "Yes. We were fools not to have considered that. We spent nearly a year proving we could find him nowhere on Sark. He had to be on Florina and we were blind to that. In any case, we have him now. Or you have, and presumably it will be arranged to have me see him?"

Abel did not answer directly. He said, "You say they told you this man Khorov was a Trantorian agent?"

"Isn't he? Why should they lie? Or are they misinformed?"

"They neither lie nor are they misinformed. He has been an agent of ours for a decade, and it is disturbing to me that they were aware of it. It makes me wonder what more they know of us and how shaky our structure may be altogether. But doesn't it make you wonder why they told you baldly that he was one of our men?"

"Because it was the truth, I imagine, and to keep me, once and for all, from embarrassing them by further demands that could only cause trouble between themselves and Trantor."

"Truth is a discredited commodity among diplomats and what greater trouble can they cause for themselves than to let us know the extent of their knowledge about us: to give us the opportunity before it is too late, to draw in our damaged net, mend it and put it out whole again?"

"Then answer your own question."

"I say they told you of their knowledge of Khorov's true identity as a gesture of triumph. They knew that the fact of their knowledge could no longer either help or harm them since I have known for twelve hours that they knew Khorov was one of our men."

"But how?"

"By the most unmistakable hint possible. Listen! Twelve hours ago Matt Khorov, agent for Trantor, was killed by a member of the Florinian Patrol. The two Florinians he held at the time, a woman and the man who, in all probability, is the field man you have been seeking, are gone, vanished. Presumably they are in the hands of the Squires."

Junz cried out and half rose from his seat.

Abel lifted a glass of wine to his lips calmly and said, "There is nothing I can do officially. The dead man was a Florinian and those who have vanished, for all we can prove to the contrary, are likewise Florinians. So, you see, we have been badly outplayed, and are now being mocked in addition."

7. THE PATROLLER

RIK saw the Baker killed. He saw him crumple without a sound, his chest driven in and charred into smoking ruins under the silent push of the blaster. It was a sight that drowned out for him most of what had preceded and almost all that had followed.

There was the dim memory of the patroller's first approach, of the quiet but terribly intent manner in which he had drawn his weapon. The Baker had looked up and shaped his lips for one last word that he had no time to utter. Then the deed was done, there was the rushing of blood in Rik's ears and the wild screaming scramble of the mob swirling in all directions, like a river in flood.

For a moment it negated the improvement Rik's mind had made in those last few hours of sleep. The patroller had plunged toward him, throwing himself forward upon yelling men and women as though they were a viscous sea of mud he would have to slog through. Rik and Lona turned with the current and were carried away. There were eddies and subcurrents, turning and quivering as the flying patrollers' cars began to hover overhead. Valona urged Rik forward, ever outward to the outskirts of the City. For a while he was the frightened child of yesterday, not the almost adult of that morning.

He had awakened that morning in the grayness of a dawn he could not see in the windowless room he slept in. For long minutes he lay there, inspecting his mind. Something had healed during the night; something had knit together and become whole. It had been getting ready to happen ever since the moment, two days before, when he had begun to "remember." The process had been proceeding all through yesterday. The trip to the Upper City and the library, the attack upon the patroller and the fight that followed, the encounter with Baker—it had all acted upon him like a ferment. The shriveled fibers of his mind, so long dormant, had been seized and stretched, forced into an aching activity, and now, after a sleep, there was a feeble pulsing about them.

He thought of space and the stars, of long, long, lonely stretches, and great silences.

Finally he turned his head to one side and said, "Lona."

She snapped awake, lifting herself to an elbow, peering in his direction.

"Rik?"

"Here I am, Lona."

"Are you all right?"

"Sure." He couldn't hold down his excitement. "I feel fine, Lona. Listen! I remember more. I was in a ship and I know exactly——"

But she wasn't listening to him. She slipped into her dress and with her back to him smoothed the seam shut down the front and then fumbled nervously with her belt.

She tiptoed toward him. "I didn't mean to sleep, Rik. I tried to stay awake."

Rik felt the infection of her nervousness. He said, "Is something wrong?"

"Sh, don't speak so loudly. It's all right."

"Where's the Townman?"

"He's not here. He—he had to leave. Why don't you go back to sleep, Rik?"

He pushed her consoling arm aside. "I'm all right. I don't want to sleep. I wanted to tell the Townman about my ship."

But the Townman wasn't there and Valona would not listen. Rik subsided and for the first time felt actively annoyed with Valona. She treated him as though he were a child and he was beginning to feel like a man.

A light entered the room and the broad figure of the Baker entered with it. He blinked at him and was, for a moment, daunted. He did not entirely object when Valona's comforting arm stole about his shoulder.

The Baker's thick lips stretched in a smile. "You're early awake."

Neither answered.

The Baker said, "It's just as well. You'll be moving today."

Valona's mouth, was dry. She said, "You'll not be giving us to the patrollers?"

She remembered the way he had looked at Rik after the Townman had left. He was still looking at Rik; only at Rik.

"Not to the patrollers," he said. "The proper people have been informed and you'll be safe enough."

He left, and when he returned shortly thereafter he brought food, clothes and two basins of water. The clothes were new and looked completely strange.

He watched them as they ate, saying, "I'm going to give you new names and new histories. You're to listen, and I don't want you to forget. You're not Florinians, do you understand? You're brother and sister from the planet Wotex. You've been visiting Florina——"

He went on, supplying details, asking questions, listening to their answers.

Rik was pleased to be able to demonstrate the workings of his memory, his easy ability to learn, but Valona's eyes were dark with worry.

The Baker was not blind to that. He said to the girl, "If you give me the least trouble I'll send him on alone and leave you behind."

Valona's strong hands clenched spasmodically. "I will give you no trouble."

It was well into the morning when the Baker rose to his feet and said, "Let's go!"

His last action was to place little black sheets of limp leatherette in their breast pockets.

Once outside, Rik looked with astonishment at what he could see of himself. He did not know clothing could be so complicated. The Baker had helped him get it on, but who would help him take it off? Valona didn't look like a farm girl at all. Even her legs were covered with thin material, and her shoes were raised at the heels so that she had to balance carefully when she walked.

Passers-by gathered, staring and gawking, calling to one another. Mostly they were children, marketing women, and skulking, ragged idlers. The Baker seemed oblivious to them. He carried a thick stick which found itself occasionally, as though by accident, between the legs of any who pressed too closely.

And then, when they were still only a hundred yards from the bakery and had made but one turning, the outer reaches of the surrounding crowd swirled excitedly and Rik made out the black and silver of a patroller.

That was when it happened. The weapon, the blast, and again a wild flight. Was there ever a time when fear had not been with him, when the shadow of the patroller had not been behind him? They found themselves in the squalor of one of the outlying districts of the City. Valona was panting harshly; her new dress bore the wet stains of perspiration.

Rik gasped, "I can't run any more."

"We've got to."

"Not like this. Listen." He pulled back firmly against the pressure of the girl's grip. "Listen to me."

The fright and panic were leaving him.

He said, "Why don't we go on and do what the Baker wanted us to do?"

She said, "How do you know what he wanted us to do?" She was anxious. She wanted to keep moving.

He said, "We were to pretend we were from another world and he gave us these." Rik was excited. He pulled the little rectangle out of his pocket, staring at both sides and trying to open it as though it were a booklet.

He couldn't. It was a single sheet. He felt about the edges and as his fingers closed at one corner he heard, or rather felt, something give, and the side toward him turned a startling milky white. The close wording on the new surface was difficult to understand though he began carefully making out the syllables.

Finally he said, "It's a passport."

"What's that?"

"Something to get us away." He was sure of it. It had popped into his head. A single word, "passport," like that. "Don't you see? He was going to have us leave Florina. On a ship. Let's go through with that."

She said, "No. They stopped him. They killed him. We couldn't, Rik, we couldn't."

He was urgent about it. He was nearly babbling. "But it would be the best thing to do. They wouldn't be expecting us to do that. And we wouldn't go on the ship he wanted us to go on. They'd be watching that. We'd go on another ship. Any other ship."

A ship. Any ship. The words rang in his ears. Whether his idea was a good one or not, he didn't care. He wanted to be on a ship. He wanted to be in space.

"Please, Lona!"

She said, "All right. If you really think so. I know where the spaceport is. When I was a little girl we used to go there on idle-days sometimes and watch from far away to see the ships shoot upward."

They were on their way again, and only a slight uneasiness scratched vainly at the gateway of Rik's consciousness. Some memory not of the far past but of the very near past; something he should remember and could not; could just barely not. Something.

He drowned it in the thought of the ship that waited for them. The Florinian at the entry gate was having his fill of excitement that day, but it was excitement at long distance. There had been the wild stories of the previous evening, telling of patrollers attacked and of daring escapes. By this morning the stories had expanded and there were whispers of patrollers killed.

He dared not leave his post, but he craned his neck and watched the air-cars pass, and the grim-faced patrollers leave, as the spaceport contingent was cut and cut till it was almost nothing.

They were filling the City with patrollers, he thought, and was at once frightened and drunkenly uplifted. Why should it make him happy to think of patrollers being killed? They never bothered him. At least not much. He had a good job. It wasn't as though he were a stupid peasant.

But he was happy.

He scarcely had time for the couple before him, uncomfortable and perspiring in the outlandish clothing that marked them at once as foreigners. The woman was holding a passport through the slot.

A glance at her, a glance at the passport, a glance at the list of reservations. He pressed the appropriate button and two translucent ribbons of film sprang out at them.

"Go on," he said impatiently. "Get them on your wrists and move on."

"Which ship is ours?" asked the woman in a polite whisper.

That pleased him. Foreigners were infrequent at the Florinian spaceport. In recent years they had grown more and more infrequent. But when they did come they were neither patrollers nor Squires. They didn't seem to realize you were only a Florinian yourself and they spoke to you politely.

It made him feel two inches taller. He said, "You'll find it in Berth '7, madam. I wish you a pleasant trip to Wotex." He said it in the grand manner.

He then returned to his task of putting in surreptitious calls to friends in the City for more information and of trying, even more unobtrusively, to tap private power-beam conversations in Upper City.

It was hours before he found out that he had made a horrible mistake.

Rik said, "Lona!"

He tugged at her elbow, pointed quickly and whispered, "That one!"

Valona looked at the indicated ship doubtfully. It was much smaller than the ship in Berth '7, for which their tickets held good. It looked more burnished. Four air locks yawned open and the main port gaped, with a ramp leading from it like an outstretched tongue reaching to ground level.

Rik said, "They're airing it. They usually air passenger ships before flight to get rid of the accumulated odor of canned oxygen, used and reused."

Valona stared at him. "How do you know?"

Rik felt a sprig of vanity grow within himself. "I just know. You see, there wouldn't be anyone in it now. It isn't comfortable, with the draft on."

He looked about uneasily. "I don't know why there aren't more people about, though. Was it like this when you used to watch it?"

Valona thought not, but she could scarcely remember. Childhood memories were far away.

There was not a patroller in sight as they walked up the ramp on quivering legs. What figures they could see were civilian employees, intent on their own jobs, and small in the distance.

Moving air cut through them as they stepped into the hold and Valona's dress bellied so that she had to bring her hands down to keep the hemline within bounds.

"Is it always like this?" she asked. She had never been on a spaceship before; never dreamed of being on one. Her lips stuck together and her heart pounded.

Rik said, "No. Just during aeration."

He walked joyfully over the hard metallite passageways, inspecting the empty rooms eagerly.

"Here," he said. It was the galley.

He spoke rapidly. "It isn't food so much. We can get along without food for quite a while. It's water."

He rummaged through the neat and compact nestings of utensils and came up with a large, capped container. He looked about for the water tap, muttered a breathless hope that they had not neglected to fill the water tanks, then grinned his relief when the soft sound of pumps came, and the steady gush of liquid.

"Now just take some of the cans. Not too many. We don't want them to take notice."

Rik tried desperately to think of ways of countering discovery. Again he groped for something he could not quite remember. Occasionally he still ran into those gaps in his thought and, coward-like, he avoided them, denied their existence.

He found a small room devoted to fire-fighting equipment, emergency medical and surgical supplies, and welding equipment.

He said with a certain lack of confidence, "They won't be in here, except in emergencies. Are you afraid, Lona?"

"I won't be afraid with you, Rik," she said humbly. Two days before, no, twelve hours before, it had been the other way around. But on board ship, by some transmutation of personality she did not question, it was Rik who was the adult, she who was the child.

He said, "We won't be able to use lights because they would notice the power drain, and to use the toilets, we'll have to wait for rest periods and try to get out past any of the night crew."

The draft cut off suddenly. Its cold touch on their faces was no longer there and the soft, steady humming sound, that had distantly accompanied it, stopped and left a large silence to fill its place.

Rik said, "They'll be boarding soon, and then we'll be out in space."

Valona had never seen such joy in Rik's face. He was a lover going to meet his love.

If Rik had felt a man on awaking that dawn, he was a giant now, his arms stretching the length of the Galaxy. The stars were his marbles, and the nebulae were cobwebs to brush away.

He was on a ship! Memories rushed back continuously in a long flood and others left to make room. He was forgetting the kyrt fields and the mill and Valona crooning to him in the dark. They were only momentary breaks in a pattern that was now returning with its raveled ends slowly knitting.

It was the ship!

If they had put him on a ship long ago, he wouldn't have had to wait so long for his burnt-out brain cells to heal themselves.

He spoke softly to Valona in the darkness. "Now don't worry. You'll feel a vibration and hear a noise but that will be just the motors. There'll be a heavy weight on you. That's acceleration."

There was no common Florirriian word for the concept and he used another word for it, one that came easily to mind. Valona did not understand.

She said, "Will it hurt?"

He said, "It will be very uncomfortable, because we don't have anti-acceleration gear to take up the pressure, but it won't last. Just stand against this wall, and when you feel yourself being pushed against it, relax. See, it's beginning."

He had picked the right wall, and as the thrumming of the thrusting hyperatomics swelled, the apparent gravity shifted, and what had been a vertical wall seemed to grow more and more diagonal.

Valona whimpered once, then lapsed into a hard-breathing silence. Their throats rasped as their chest walls, unprotected by straps and hydraulic absorbers, labored to free their lungs sufficiently for just a little air intake.

Rik managed to pant out words, any words that might let Valona know he was there and ease the terrible fear of the unknown that he knew must be filling her. It was only a ship, only a wonderful ship; but she had never been on a ship before.

He said, "There's the jump, of course, when we go through hyperspace and cut across most of the distance between the stars all at once. That won't bother you at all. You won't even know it happened. It's nothing compared to this. Just a little twitch in your insides and it's over." He got the words out syllable by grunted syllable. It took a long time.

Slowly, the weight on their chests lifted and the invisible chain holding them to the wall stretched and dropped off. They fell, panting, to the floor.

Finally Valona said, "Are you hurt, Rik?"

"I, hurt?" He managed a laugh. He had not caught his breath yet, but he laughed at the thought that he could be hurt on a ship.

He said, "I lived on a ship for years once. I didn't land on a planet for months at a time."

"Why?" she asked. She had crawled closer and put a hand to his cheek, making sure he was there.

He put his arm about her shoulder, and she rested within it quietly, accepting the reversal.

"Why?" she asked.

111k could not remember why. He had done it; he had hated to land on a planet. For some reason it had been necessary to stay in space, but he could not remember why. Again he dodged the gap.

He said, "I had a job."

"Yes," she said. "You analyzed Nothing."

"That's right." He was pleased. "That's exactly what I did. Do you know what that means?"

He didn't expect her to understand, but he had to talk. He had to revel in memory, to delight drunkenly in the fact that he could call up past facts at the flick of a mental finger.

He said, "You see, all the material in the universe is made up of a hundred different kinds of substances. We call those substances elements. Iron and copper are elements."

"I thought they were metals."

"So they are, and elements too. Also oxygen, and nitrogen, carbon and palladium. Most important of all, hydrogen and helium. They're the simplest and most common."

"I never heard of those," Valona said wistfully.

"Ninety-five per cent of the universe is hydrogen and most of the rest is helium. Even space."

"I was once told," said Valona, "that space was a vacuum. They said that meant there was nothing there. Was that wrong?"

"Not quite. There's almost nothing there. But you see, I was a Spatio-analyst, which meant that I went about through space collecting the extremely small amounts of elements there and analyzing them. That is, I decided how much was hydrogen, how much helium and how much other elements."

"Why?"

"Well, that's complicated. You see, the arrangement of elements isn't the same everywhere in space. In some regions there is a little more helium than normal; in other places, more sodium than normal; and so on. These regions of special analytic makeup wind through space like currents. That's what they call them. They're the currents of space. It's important to know how these currents are arranged because that might explain how the universe was created and how it developed."

"How would it explain that?"

Rik hesitated. "Nobody knows exactly."

He hurried on, embarrassed that this immense store of knowledge in which his mind was thankfully wallowing could come so easily to an end marked "unknown" under the questioning of. . of. . It suddenly occurred to him that Valona, after all, was nothing but a Florinian peasant girl.

He said, "Then, again, we find out the density, you know, the thickness, of this space gas in all regions of the Galaxy. It's different in different places and we have to know exactly what it is in order to allow ships to calculate exactly how to jump through hyperspace. It's like. . ." His voice died away.

Valona stiffened and waited uneasily for him to continue, but only silence followed. Her voice sounded hoarsely in the complete darkness.

"Rik? What's wrong, Rik?"

Still silence. Her hands groped to his shoulders, shaking him. "Rik! uk!"

And it was the voice of the old Rik, somehow, that answered. It was weak, frightened, its joy and confidence vanished.

"Lona. We did something wrong."

"What's the matter? We did what wrong?"

The memory of the scene in which the patroller had shot down the Baker was in his mind, etched hard and clear, as though called back by his exact memory of so many other things.

He said, "We shouldn't have run away. We shouldn't be here on this ship."

He was shivering uncontrollably, and Valona tried futilely to wipe the moisture from his forehead with her hand.

"Why?" she demanded. "Why?"

"Because we should have known that if the Bakers were willing to take us out in daylight he expected no trouble from patrollers. Do you remember the patroller? The one who shot the Baker?"

"Yes."

"Do you remember his face?"

"I didn't dare look."

"I did, and there was something queer, but I didn't think. I didn't think. Lona, that wasn't a patroller. It was the Townman, Lona. It was the Townman dressed like a patroller."

8. THE LADY

SAMIA of Fife was five feet tall, exactly, and all sixty inches of her were in a state of quivering exasperation. She weighed one and a half pounds per inch and, at the moment, each of her ninety pounds represented sixteen ounces of solid anger.

She stepped quickly from end to end of the room, her dark hair piled in high masses, her spiked heels lending a spurious height and her narrow chin, with its pronounced cleft, trembling.

She said, "Oh no. He wouldn't do it to me. He couldn't do it to me. Captain!"

Her voice was sharp and carried the weight of authority. Captain Racety bowed with the storm. "My Lady?"

To any Florinian, of course, Captain Racety would have been a "Squire." Simply that. To any Florinian, all Sarldites were Squires. But to the Sarkites there were Squires and real Squires. The Captain was simply a Squire. Samia of Fife was a real Squire; or the feminine equivalent of one, which amounted to the same thing.

"My Lady?" he asked.

She said, "I am not to be ordered about. I am of age. I am my own mistress. I choose to remain here."

The Captain said carefully, "Please to understand, my Lady, that no orders of mine are involved. My advice was not asked. I have been told plainly and flatly what I am to do."

He fumbled for the copy of his orders half-heartedly. He had tried to present her with the evidence twice before and she had refused to consider it, as though by not looking she could continue, with a clear conscience, to deny where his duty lay.

She said once again, exactly as before, "I am not interested in your orders."

She turned away with a ringing of her heels and moved rapidly away from him.

He followed and said softly, "The orders include directions to the effect that, if you are not willing to come, I am, if you will excuse my saying so, to have you carried to the ship."

She whirled. "You wouldn't dare do such a thing."

"When I consider," said the Captain, "who it is who has ordered me to do it, I would dare anything."

She tried cajolery. "Surely, Captain, there is no real danger. This is quite ridiculous, entirely mad. The City is peaceful. All that has happened is that one patroller was knocked down yesterday afternoon in the library. Really!"

"Another patroller was killed this dawn, again by Florinian attack."

That rocked her, but her olive skin grew dusky and her black eyes flashed. "What has that to do with me? I am not a patroller."

"My Lady, the ship is being prepared right now. It will leave shortly. You will have to be on it."

"And my work? My research? Do you realize——. No, you wouldn't realize."

The Captain said nothing. She had turned from him. Her gleaming dress of copper kyrt, with its strands of milky silver, set off the extraordinary warm smoothness of her shoulders and upper arms. Captain Racety looked at her with something more than the bald courtesy and humble objectivity a mere Sarkite owed such a great Lady. He wondered why such an entirely desirable bite-size morsel should choose to spend her time in mimicking the scholarly pursuits of a university don.

Samia knew well that her earnest scholarship made her an object of mild derision to people who were accustomed to thinking of the aristocratic Ladies of Sark as devoted entirely to the glitter of polite society and, eventually, acting as incubators for at least, but not more than, two future Squires of Sark. She didn't care.

They would come to her and say, "Are you really writing a book, Samia?" and ask to see it, and giggle.

Those were the women. The men were even worse, with their gentle condescension and obvious conviction that it would only take a glance from themselves or a man's arm about her waist to cure her of her nonsense and turn her mind to things of real importance.

It had begun as far back, almost, as she could remember, because she had always been in love with kyrt, whereas most people took it for granted. Kyrt! The king, emperor, god of fabrics. There was no metaphor strong enough.

Chemically, it was nothing more than a variety of cellulose. The chemists swore to that. Yet with all their instruments and theories they had never yet explained why on Florina, and only on Florina in all the Galaxy, cellulose became kyrt. It was a matter of the physical state; that's what they said. But ask them exactly in what way the physical state varied from that of ordinary cellulose and they were mute.

She had learned ignorance originally from her nurse.

"Why does it shine, Nanny?"

"Because it's kyrt, Miakins."

"Why don't other things shine so, Nanny?"

"Other things aren't kyrt, Miakins."

There you had it. A two-volume monograph on the subject had been written only three years before. She had read it carefully and it could all have been boiled down to her Nanny's explanation. Kyrt was kyrt because it was kyrt. Things that weren't kyrt, weren't kyrt because they weren't kyrt.

Of course kyrt didn't really shine of itself but, properly spun, it would gleam metallically in the sun in a variety of colors or in all colors at once. Another form of treatment could impart a diamond sparkle of the thread. It could be made, with little effort, completely impervious to heat up to 600 degrees Centigrade, and quite inert to almost all chemicals. Its fibers could be spun finer than the most delicate synthetics and those same fibers had a tensile strength no steel alloy known could duplicate. It had more uses, more versatility than any substance known to man. If it were not so expensive it could be used to replace glass, metal, or plastic in any of infinite industrial applications.

As it was, it was the only material used for cross hairs on optical equipment, as molds in the casting of hydrochrons used in hyperatomic motors, and as lightweight, long-lived webbing where metal was too brittle or too heavy or both.

But this was, as said, small-scale use, since use in quantity was prohibitive. Actually the kyrt harvest of Florina went into the manufacture of cloth that was used for the most fabulous garments in Galactic history. Florina clothed the aristocracy of a million worlds, and the kyrt harvest of the one world, Florina, had to be spread thin for that. Twenty women on a world might have outfits in kyrt; two thousand more might have a holiday jacket of the material, or perhaps a pair of gloves. Twenty million more watched from a distance and wished.

The million worlds of the Galaxy shared a slang expression for the snob. It was the only idiom in the language that was easily and exactly understood everywhere. It went: "You'd think she blew her nose in kyrt!"

When Samia was older she went to her father.

"What is kyrt, Daddy?"

"It's your bread and butter, Mia."

"Mine?"

"Not just yours, Mia. It's Sark's bread and butter."

Of course! She learned the reason for that easily enough. Not a world in the Galaxy but had tried to grow kyrt on its own soil. At first Sark had applied the death penalty to anyone, native or foreign, caught smuggling kyrt seed out of the planet. That had not prevented successful smuggling, and as the centuries passed, and the truth dawned on Sark, that law had been abolished. Men from anywhere were welcome to kyrt seed at the price, of course (weight for weight), of finished kyrt cloth.

They might have it, because it turned out that kyrt grown anywhere in the Galaxy but on Florina was simply cellulose. White, flat, weak and useless. Not even honest cotton.

Was it something in the soil? Something in the characteristics of the radiation of Florina's sun? Something about the bacteria make-up of Florinian life? It had all been tried. Samples of Florinian soil had been taken. Artificial arc lights duplicating the known spectrum of Florina's sun had been constructed. Foreign soil had been infected with Florinian bacteria. And always the kyrt grew white, flat, weak and useless.

There was so much to be said about kyrt that had never been said. Material other than that contained in technical reports or in research papers or even in travel books. For five years Samia had been dreaming of writing a real book about the story of kyrt; of the land it grew on and of the people who grew it.

It was a dream surrounded by mocking laughter, but she held to it. She had insisted on travelling to Florina. She was going to spend a season in the fields and a few months in the mills. She was going to— But what did it matter what she was going to do? She was being ordered back.

With the sudden impulsiveness that marked her every act she made her decision. She would be able to fight this on Sark. Grimly she promised herself she would be back on Florina in a week.

She turned to the Captain and said coolly, "When do we leave, sir?"

Samia remained at the observation port for as long as Florina was a visible globe. It was a green, spring like world, much pleasanter than Sark in climate. She had looked forward to studying the natives. She didn't like the Florinians on Sark, sapless men who dared not look at her but turned away when she passed, in accordance with the law. On their own world, however, the natives, by universal report, were happy and carefree. Irresponsible, of course, and like children, but they had charm.

Captain Racety interrupted her thoughts. He said, "My Lady, would you retire to your room?"

She looked up, a tiny vertical crease between her eyes. "What new orders have you received, Captain? Am I a prisoner?"

"Of course not. Merely a precaution. The space field was unusually empty before the take-off. It seems that another killing had taken place, again by a Florinian, and the field's patroller contingent had joined the rest on a man hunt through the City."

"And the connection of that with myself?"

"It is only that under the circumstances, which I ought to have reacted to by placing a guard of my own (I do not minimize my own offense), unauthorized persons may have boarded the ship."

"For what reason?"

"I could not say, but scarcely to do our pleasure."

"You are romancing, Captain."

"I am afraid not, my Lady. Our energometrics were, of course, useless within planetary distance of Florina's sun, but that is not the case now and I am afraid there is definite excess heat radiation from Emergency Stores."

"Are you serious?"

The Captain's lean, expressionless face regarded her aloofly for a moment. He said, "The radiation is equivalent to that which would be given off by two ordinary people."

"Or a heating unit someone forgot to turn off."

"There is no drain on our power supply, my Lady. We are ready to investigate, my Lady, and ask only that you first retire to your room."

She nodded silently and left the room. Two minutes later his calm voice spoke unhurriedly into the communi-tube. "Break into Emergency Stores."

Myrlyn Terens, had he released his taut nerves the slightest, might easily, and even thankfully, have gone into hysteria. He had been a trifle too late in returning to the bakery. They had already left it and it was only by good fortune that he Met them in the street. His next action had been dictated; it was in no way a matter of free choice; and the Baker lay quite horribly dead before him.

Afterward, with the crowd swirling, Rik and Valona melting into the crowd, and the air-cars of the patrollers, the real patrollers, beginning to put in their vulture appearance, what could he do? His first impulse to race after Rik he quickly fought down. It would do no good. He would never find them, and there was too great a chance that the patrollers would not miss him. He scurried in another direction, toward the bakery.

His only chance lay in the patroller organization itself. There had been generations of a quiet life. At least there had been no Florinian revolts to speak of in two centuries. The institution of the Townman (he grinned savagely at the thought) had worked wonders and the patrollers had only perfunctory police duties since. They lacked the fine-pointed teamwork that would have developed under more strenuous conditions.

It had been possible for him to walk into a patroller station at dawn, where his description must have already been sent, though obviously it had not been much regarded. The lone patroller on duty was a mixture of indifference and sulkiness. Terens had been asked to state his business, but his business included a plastic two-by-four he had wrenched from the side of a crazy hovel at the outskirts of town.

He had brought it down upon the patroller's skull, changed clothing and weapons. The list of his crimes was already so formidable that it did not bother him in the least to discover that the patroller had been killed, not stunned.

Yet he was still at large and the rusty machinery of patroller justice had so far creaked after him in vain.

He was at the bakery. The Baker's elderly helper, standing in the doorway in a vain attempt to peer knowledge of the disturbance into himself, squeaked thinly at the sight of the dread black and silver of patrollerhood and oozed back into his shop.

The Townman lunged after him, crumpling the man's loose, floury collar into his pudgy fist and twisting. "Where was the Baker going?"

The old man's lips yawned open, but no sound came.

The Townman said, "I killed a man two minutes ago. I don't care if I kill another."

"Please. Please. I do not know, sir."

"You will die for not knowing."

"But he did not tell me. He made some sort of reservations."

"You have overheard so much, have you? What else did you overhear?"

"He mentioned Wotex once. I think the reservations were on a spaceship."

Terens thrust him away.

He would have to wait. He would have to let the worst of the excitement outside die. He would have to risk the arrival of real patrollers at the bakery.

But not for long. Not for long. He could guess what his erstwhile companions would do. Rik was unpredictable, of course, but Valona was an intelligent girl. From the way they ran, they must have taken him for a patroller indeed and Valona was sure to decide that their only safety lay in continuing the flight that the Baker had begun for them.

The Baker had made reservations for them. A spaceship would be waiting. They would be there.

And he would have to be there first.

There was this about the desperation of the situation. Nothing more mattered. If he lost Rik, if he lost that potential weapon against the tyrants of Sark, his life was a small additional loss.

So when he left, it was without a qualm, though it was broad daylight, though the patrollers must know by now it was a man in patroller uniform they sought, and though two air-cars were in easy sight.

Terens knew the spaceport that would be involved. There was only one of its type on the planet. There were a dozen tiny ones in Upper City for the private use of space-yachts and there were hundreds all over the planet for the exclusive use of the ungainly freighters that carried gigantic bolts of kyrt cloth to Sark, and machinery and simple consumer goods back. But among all those there was only one spaceport for the use of ordinary travelers, for the poorer Sarldtes, Florinian civil servants and the few foreigners who managed to obtain permission to visit Florina.

The Florinian at the port's entry gate observed Terens' approach with every symptom of lively interest. The vacuum that surrounded him had grown insupportable.

"Greetings, sir," he said. There was a slyly eager tone in his voice. After all, patrollers were being killed. "Considerable excitement in the City, isn't there?"

Terens did not rise to the bait. He had drawn the arced visor of his hat low and buttoned the uppermost button of the tunic.

Gruffly he snapped, "Did two persons, a man and a woman, enter the port recently en route to Wotex?"

The gatekeeper looked startled. For a moment he gulped and then, in a considerably subdued tone, said, "Yes, Officer. About half an hour ago. Maybe less." He reddened suddenly. "Is there any connection between them and— Officer, they had reservations which were entirely in order. I wouldn't let foreigners through without proper authority."

Terens ignored that. Proper authority! The Baker had managed to establish that in the course of a night. Galaxy, he wondered, how deeply into the Sarkite administration did the Trantorian espionage organization go? "What names did they give?"

"Careth and Hansa Barne."

"Has their ship left? Quickly!"

"N-no, sir."

"What berth?"

"Seventeen."

Terens forced himself to refrain from running, but his walk was little short of that. Had there been a real patroller in sight that rapid, undignified half run of his would have been his last trip in freedom.

A spaceman in officer's uniform stood at the ship's main air lock.

Terens panted a little. He said, "Have Gareth and Hansa Barne boarded ship?"

"No, they haven't," said the spaceman phlegmatically. He was a Sarkite and a patroller was only another man in uniform to him. "Do you have a message for them?"

With cracking patience Terens said, "They haven't boarded!"

"That's what I've said. And we're not waiting for them. We leave on schedule, with or without them."

Terens turned away.

He was at the gatekeeper's booth again. "Have they left?"

"Left? 'Who, sir?"

"The Barnes. The ones for Wotex. They're not on board ship. Did they leave?"

"No, sir. Not to my knowledge."

"What about the other gates?"

"They're not exits, sir. This is the only exit."

"Check them, you miserable idiot."

The gatekeeper lifted the communi-tube in a state of panic. No patroller had ever spoken to him so in anger and he dreaded the results. In two minutes he put it down.

He said, "No one has left, sir."

Terens stared at him. Under his black hat his sandy hair was damping against his skull and down each cheek there was the gleaming mark of perspiration.

He said, "Has any ship left the port since they entered?"

The gatekeeper consulted the schedule. "One," he said, "the liner Endeavor."

Volubly he went on, eager to gain favor with the angry patroller by volunteering information. "The Endeavor is making a special trip to Sark to carry the Lady Samia of Fife back from Florina."

He did not bother to describe exactly by what refined manner of eavesdropping he had managed to acquaint himself with the "confidential report."

But to Terens now, nothing mattered.

He backed slowly away. Eliminate the impossible and whatever remained, however improbable, was the truth. Rik and Valona had entered the spaceport. They had not been captured or the gatekeeper would certainly have known about it. They were not simply wandering about the port, or they would by now have been captured. They were not on the ship for which they had tickets. They had not left the field. The only object that had left the field was the Endeavor. Therefore, on it, possibly as captives, possibly as stowaways, were 131k and Valona.

And the two were equivalent. If they were stowaways they would soon be captives. Only a Florinian peasant girl and a mind-wrecked creature would fail to realize that one could not stow away on a modern spaceship.

And of all spaceships to choose, they chose that which carried the daughter of the Squire of Fife.

The Squire of Fife!

9. THE SQUIRE

The SQUIRE of Fife was the most important individual on Sark and for that reason did not like to be seen standing. Like his daughter, he was short, but unlike her, he was not perfectly proportioned, since most of the shortness lay in his legs. His torso was even beefy, and his head was undoubtedly majestic, but his body was fixed upon stubby legs that were forced into a ponderous waddle to carry their load.

So he sat behind a desk and except for his daughter and personal servants and, when she had been alive, his wife, none saw him in any other position.

There he looked the man he was. His large head, with its wide, nearly lipless mouth, broad, large-nostriled nose, and pointed, cleft chin, could look benign and inflexible in turn, with equal ease. His hair, brushed rigidly back and, in careless disregard for fashion, falling nearly to his shoulders, was blue-black, untouched by gray. A shadowy blue marked the regions of his cheeks, lips and chin where his Florinian barber twice daily battled the stubborn growth of facial hair.

The Squire was posing and he knew it. He had schooled expression out of his face and allowed his hands, broad, strong and short-fingered, to remain loosely clasped on a desk whose smooth, polished surface was completely bare. There wasn't a paper on it, no communi-tube, no ornament. By its very simplicity the Squire's own presence was emphasized.

He spoke to his pale, fish-white secretary with the special lifeless tone he reserved for mechanical appliances and Florinian civil servants. "I presume all have accepted?"

He had no real doubt as to the answer.

His secretary replied in a tone as lifeless, "The Squire of Bort stated that the press of previous business arrangements prevented his attending earlier than three."

"And you told him?"

"I stated that the nature of the present business made any delay inadvisable."

"The result?"

"He will be here, sir. The rest have agreed without reservation."

Fife smiled. Half an hour this way or that would have made no difference. There was a new principle involved, that was all. The Great Squires were too touchy with regard to their own independence, and such touchiness would have to go.

He was waiting, now. The room was large, the places for the others were prepared. The large chronometer, whose tiny powering spark of radioactivity had not failed or faltered in a thousand years, said two twenty-one.

What an explosion in the last two days! The old chronometer might yet witness events equal to any in the past.

Yet that chronometer had seen many in its millennium. When it counted its first minutes Sark had been a new world of hand-hewn cities with doubtful contacts among the other, older worlds. The timepiece had been in the wall of an old brick building then,

the very bricks of which had since become dust. It had counted its even tenor through three short-lived Sarkite "empires" when the undisciplined soldiers of Sark managed to govern, for a longer or shorter interval, some half a dozen surrounding worlds. Its radioactive atoms had exploded in strict statistical sequence through two periods when the fleets of neighboring worlds dictated policy on Sark.

Five hundred years ago it had marked cool time as Sark discovered that the world nearest to it, Florina, had a treasure in its soil past counting. It had moved evenly through two victorious wars and recorded solemnly the establishment of a conqueror's peace. Sark had abandoned its empires, absorbed Florina tightly, and become powerful in a way that Trantor itself could not duplicate.

Trantor wanted Florina and other powers had wanted it. The centuries had marked Florina as a world for which hands stretched out through space, groping and reaching eagerly. But it was Sark whose hand clasped it and Sark, sooner than release that grasp, would allow Galactic war.

Trantor knew that! Trantor knew that!

It was as though the silent rhythm of the chronometer set up the little singsong in the Squire's brain.

It was two twenty-three.

Nearly a year before, the five Great Squires of Sark had met. Then, as now, it had been here, in his own hall. Then, as now, the Squires, scattered over the face of the planet, each on his own continent, had met in trimensic personification.

In a bald sense, it amounted to three-dimensional television in life size with sound and color. The duplicate could be found in any moderately well-to-do private home on Sark. Where it went beyond the ordinary was in the lack of any visible receiver. Except for Fife, the Squires present were present in every possible way but reality. The wall could not be seen behind them, they did not shimmer, yet a hand could have been passed through their bodies.

The true body of the Squire of Rune was sitting in the antipodes, his continent the only one upon which, at the moment, night prevailed. The cubic area immediately surrounding his image in Fife's office had the cold, white gleam of artificial light, dimmed by the brighter daylight about it.

Gathered in the one room, in body or in image, was Sark itself. It was a queer and not altogether heroic personification of the planet. Rune was bald and pinkly fat, while Balle was gray and dryly wrinkled. Steen was powdered and rouged, wearing the desperate smile of a worn-out man pretending to a life force he no longer had, and Bort carried indifference to creature comforts to the unpleasant point of a two-day growth of beard and dirty fingernails.

Yet they were the five Great Squires.

They were the topmost of the three rungs of ruling powers on Sark. The lowest rung was, of course, the Florinian Civil Service, which remained steady through all the vicissitudes that marked the rise and fall of the individual noble houses of Sark. It was they who actually- greased the axles and turned the wheels of government. Above them were

the ministers and department heads appointed by the hereditary (and harmless) Chief of State. Their names and that of the Chief himself were needed on state papers to make them legally binding, but their only duties consisted of signing their names.

The highest rung was occupied by these five, each tacitly allowed a continent by the remaining four. They were the heads of the families that controlled the major volume of the kyrt trade, and the revenues therefrom derived. It was money that gave power and eventually dictated policy on Sark, and these had it. And of the five, it was Fife who had the most.

The Squire of Fife had faced them that day, nearly a year ago, and said to the other masters of the Galaxy's second richest single planet (second richest after Trantor, which, after all, had half a million worlds to draw upon, rather than two): "I have received a curious message."

They said nothing. They waited.

Fife handed a slip of metallite film to his secretary, who stepped from one seated figure to another, holding it well up for each to see, lingering just long enough for each to read.

To each of the four who attended the conference in Fife's office, he, himself, was real, and the others, including Fife, only shadows. The metallite film was a shadow as well. They could only sit and observe the light rays that focused across vast world-sectors from the Continent of Fife to those of Balle, Bort, Steen, and the island Continent of Rune. The words they read were shadows on shadow.

Only Bort, direct and ungiven to subtleties, forgot that fact and reached for the message.

His hand extended to the edge of the rectangular image-receptor and was cut off. His arm ended in a featureless stump. In his own chambers, Fife knew, Bores arm had succeeded merely in closing upon nothingness and passing through the filmed message. He smiled, and so did the others. Steen giggled.

Bort reddened. He drew back his arm and his hand reappeared.

Fife said, "Well, you have each seen it. If you don't mind, I will now read it aloud so that you may consider its significance."

He reached upward, and his secretary, by hastening his steps, managed to hold the film in the proper position for Fife's grasp to close upon it without an instant's groping.

Fife read mellowly, imparting drama to the words as though the message were his own and he enjoyed delivering it.

He said, "This is the message: 'You are a Great Squire of Sark and there is none to compete with you in power and wealth. Yet that power and wealth rest on a slender foundation. You may think that a planetary supply of kyrt, such as exists on Florina, is by no means a slender foundation, but ask yourself, how long will Florina exist? Forever? "No! Florina may be destroyed tomorrow. It may exist for a thousand years. Of the two, it is more likely to be destroyed tomorrow. Not by myself, to be sure, but in a way you cannot predict or foresee. Consider that destruction. Consider, too, that your power and

wealth are already gone, for I demand the greater part of them. You will have time to consider, but not too much time.

"Attempt to take too much time and I shall announce to all the Galaxy and particularly to Florina the truth about the waiting destruction. After that there will be no more kyrt, no more wealth, no more power. None for me, but then I am used to that. None for you, and that would be extremely serious, since you were born to great wealth.

"Turn over most of your estates to myself in the amount and in the manner which I shall dictate in the near future and you will remain in secure possession of what remains. Not a great deal will be left you by your present standards, to be sure, but it will be more than the nothing that will otherwise be left you. Do not sneer at the fragment you will retain, either. Florina may last your lifetime and you will live, if not lavishly, at least comfortably."

Fife had finished. He turned the film over and over in his hand, then folded it gently into a silvery translucent cylinder through which the stenciled letters merged into a reddish blur.

He said in his natural voice, "It is an amusing letter. There is no signature and the tone of the letter, as you heard, is stilted and pompous. What do you think of it, Squires?"

Rune's ruddy face was set in displeasure. He said, "It's obviously the work of a man not far removed from the psychotic. He writes like a historical novel. Frankly, Fife, I don't see that such rubbish is a decent excuse to disrupt our traditions of continental autonomy by calling us together. And I don't like all this going on in the presence of your secretary."

"My secretary? Because he is a Florinian? Are you afraid his mind will be unsettled by such things as this letter? Nonsense." His tone shifted from one of mild amusement to the unmodulated syllables of command. "Turn to the Squire of Rune."

The secretary did so. His eyes were discreetly lowered and his white face was uncreased by lines and unmarred by expression. It almost seemed untouched by life.

"This Florinian," said Fife, careless of the man's presence, "is my personal servant. He is never away from me, never with others of his kind. But it is not for that reason that he is absolutely trustworthy. Look at him. Look at his eyes. Isn't it obvious to you that he has been under the psychic probe? He is incapable of any thought which is disloyal to myself in the slightest degree. With no offense intended, I can say that I would sooner trust him than any of you."

Bort chuckled. "I don't blame you. None of us owes you the loyalty of a probed Florinian servant."

Steen giggled again and writhed in his seat as though it were growing gently warm.

Not one of them made any comment on Fife's use of a psychic probe for personal servants. Fife would have been tremendously astonished had they done so. The use of the psychic probe for any reason other than the correction of mental disorders or the removal of criminal impulses was forbidden. Strictly speaking, it was forbidden even to the Great Squires.

Yet Fife probed whenever he felt it necessary, particularly when the subject was a Florinian. The probing of a Sarkite was a much more delicate matter. The Squire of Steen, whose writhings at the mention of the probing Fife did not miss, was well reputed to make use of probed Florinians of both sexes for purposes far removed from the secretarial.

"Now." Fife put his blunt fingers together. "I did not bring you all together for the reading of a crackpot letter. That, I hope, is understood. Actually I am afraid we have an important problem on our hands. First of all, I ask myself, why bother only with me? To be sure, I am the wealthiest of the Squires, but alone, I control only a third of the kyrt trade. Together the five of us control it all. It is easy to make five cello-copies of a letter, as easy as it is to make one."

"You use too many words," muttered Bort. "What do you want?"

Balle's withered and colorless lips moved in a dull gray face. "He wants to know, my Lord of Bort, if we have received copies of this letter."

"This let him say so."

"I thought I was saying so," said Fife evenly. "Well?"

They looked at one another, doubtfully or defiantly, as the personality of each dictated.

Rune spoke first. His pink forehead was moist with discrete drops of perspiration and he lifted a soft square of kyrt to mop the dampness out of the creases between the folds of fat that ran semicircles from ear to ear.

He said, "I wouldn't know, Fife. I can ask my secretaries, who are all Sarkites, by the way. After all, even if such a letter had reached my office, it would have been considered a—what is it we say?—a crank letter. It would never have come to me. That's certain. It's only your own peculiar secretarial system that kept you from being spared this trash yourself."

He looked about and smiled, his gums gleaming wetly between his lips above and below artificial teeth of chrome-steel. Each individual tooth was buried deeply, knit to the jawbone, and stronger than any tooth of mere enamel could ever be. His smile was more frightening than his frown could possibly be.

Balle shrugged. "I imagine that what Rune has just said can hold for all of us."

Steen tittered. "I never read mail. Really, I never do. It's such a bore, and such loads come in that I just wouldn't have any time." He looked about him earnestly, as though it were really necessary to convince the company of this important fact.

Bort said, "Nuts. What's wrong with you all? Afraid of Fife? Look here, Fife, I don't keep any secretary because I don't need anyone between myself and my business. I got a copy of that letter and I'm sure these three did too. Want to know what I did with mine? I threw it into the disposal chute. I'd advise you to do the same with yours. Let's stop this. I'm tired."

His hand reached upward for the toggle switch that would cut contact and release his image from its presence in Fife.

"Wait, Bort." Fife's voice rang out harshly. "Don't do that. I'm not done. You wouldn't want us to take measures and come to decisions in your absence. Surely you wouldn't."

"Let us linger, Squire Bort," urged Rune in his softer tones, though his little fat-buried eyes were not particularly amiable. "I wonder why Squire Fife seems to worry so about a trifle."

"Well," said Balle, his dry voice scratching at their ears, "perhaps Fife thinks our letter-writing friend has information about a Trantorian attack on Florina."

"Pooh," said Fife with scorn. "How would he know, whoever he is? Our secret service is adequate, I assure you. And how would he stop the attack if he received our properties as bribe? No, no. He speaks of the destruction of Flora as though he meant physical destruction and not political destruction."

"It's just too insane," said Steen.

"Yes?" said Fife. "Then you don't see the significance of the events of the last two weeks?"

"Which particular events?" asked Bort.

"It seems a Spatio-analyst has disappeared. Surely you've heard of that."

Bort looked annoyed and in no way soothed. "I've heard from Abel of Trantor about it. What of it? I know nothing of Spatioanalysts."

"At least you've read a copy of the last message to his base on Sank before he turned up missing."

"Abel showed it to me. I paid no attention to it."

"What about the rest of you?" Fife's eyes challenged them one by one. "Your memory goes back a week?"

"I read it," said Rune. "I remember it too. Of course! It spoke of destruction also. Is that what you're getting at?"

"Look here," Steen said shrilly, "it was full of nasty hints that made no sense. Really, I do hope we're not going to discuss it now. I could scarcely get rid of Abel, and it was just before dinner, too. Most distressing. Really."

"There's no help for it, Steen," said Fife with more than a trace of impatience. (What could one do with a thing like Steen?) "We must speak of it again. The Spatio-analyst spoke of the destruction of Florina. Coincident with his disappearance, we receive messages also threatening the destruction of Florina. Is that coincidence?"

"You are saying that the Spatio-analyst sent the blackmailing message?" whispered old Balle.

"Not likely. Why say it first in his own name, then anonymously?"

"When he spoke of it at first," said Balle, "he was communicating with his district office, not with us."

"Even so. A blackmailer deals with no one but his victim if he can help it."

"Well then?"

"He has disappeared. Call the Spatio-analyst honest. But he broadcast dangerous information. He is now in the hands of others who are not honest and they are blackmailers."

"What others?"

Fife sat grimly back in his chair, his lips scarcely moving. "You ask me seriously? Trantor."

Steen shivered. "Trantor!" His high-pitched voice broke.

"Why not? What better way to gain control of Florina? It's one of the prime aims of their foreign policy. And if they can do it without war, so much the better for them. Look here, if we accede to this impossible ultimatum, Florina is theirs. They offer us a little"—he brought two fingers close together before his face—"but how long shall we keep even that? "On the other hand, suppose we ignore this, and, really, we have no choice. What would Trantor do then? Why, they will spread rumors of an imminent end of the world to the Florinian peasants. As their rumors spread the peasants will panic, and what can follow but disaster? What force can make a man work if he thinks the end of the world will come tomorrow? The harvest will rot. The warehouses will empty."

Steen lifted a finger to smooth the coloring on one cheek, as he glanced at a mirror in his own apartments, out of range of the receptor-cube.

He said, "I don't think that would harm us much. If the supply goes down, wouldn't the price go up? Then after a while it would turn out that Florina was still there and the peasants would go back to work. Besides, we could always threaten to clamp down on exports. Really, I don't see how any cultured world could be expected to live without kyrt. Oh, it's King Kyrt all right. I think this is a fuss about nothing."

He threw himself into an attitude of boredom, one finger placed delicately upon his cheek.

Balle's old eyes had been closed through all of this last. He said, "There can be no price increases now. We've got them at absolute ceiling height."

"Exactly," said Fife. "It won't come to serious disruption anyway. Trantor waits for any sign of disorder on Florina. If they could present the Galaxy with the prospect of a Sark that was unable to guarantee kyrt shipments, it would be the most natural thing in the universe for them to move in to maintain what they call order and to keep the kyrt coming. And the danger would be that the free worlds of the Galaxy would probably play along with them for the sake of the kyrt. Especially if Trantor agreed to break the monopoly, increase production and lower prices. Afterward it would be another story, but meanwhile, they would get their support."

"It's the only logical way that Trantor could possibly grip Florina. If it were simple force, the free Galaxy outside the Trantorian sphere of influence would join us in sheer self-protection."

Rune said, "How does the Spatio-analyst fit in this? Is he necessary? If your theory is adequate it should explain that."

"I think it does. These Spatio-analysts are unbalanced for the most part, and this one has developed some"—Fife's fingers moved, as though building a vague structure—

"some crazy theory. It doesn't matter what. Trantor can't let it come out, or the Spatio-analytic Bureau would quash it. To seize the man and learn the details would, however, give them something that would probably possess a surface validity to non-specialists. They could use it, make it sound real. The Bureau is a Trantorian puppet, and their denials, once the story is spread by way of scientific rumor mongering, would never be forceful enough to overtake the lie."

"It sounds too complicated," said Bort. "Nuts. They can't let it come out, but then again they will let it come out."

"They can't let it come out as a serious scientific announcement, or even reach the Bureau as such," said Fife patiently. "They can let it leak out as a rumor. Don't you see that?"

"What's old Abel doing wasting his time looking for the Spatio-analyst then?"

"You expect him to advertise the fact that he's got him? What Abel does and what Abel seems to be doing are two different things."

"Well," said Rune, "if you're right, what are we to do?"

Fife said, "We have learned the danger, and that is the important thing. We'll find the Spatio-analyst if we can. We must keep all known agents of Trantor under strict scrutiny without really interfering with them. From their actions we may learn the course of coming events. We must suppress thoroughly any propaganda on Florina to the effect of the planet's destruction. The first faint whisper must meet with instant counteraction of the most violent sort.

"Most of all, we must remain united. That is the whole purpose of this meeting, in my eyes; the forming of a common front. We all know about continental autonomy and I'm sure there is no one more insistent upon it than I am. That is, under ordinary circumstances. These are not ordinary circumstances. You see that?"

More or less reluctantly, for continental autonomy was not a thing to be abandoned lightly, they saw that.

"Then," said Fife, "we will wait for the second move."

That had been a year ago. They had left and there had followed the strangest and most complete fiasco ever to have fallen to the lot of the Squire of Fife in a moderately long and a more than moderately audacious career.

No second move followed. There were no further letters to any of them. The Spatio-analyst remained unfound, while Trantor maintained a desultory search. There was no trace of apocalyptic rumors on Florina, and the harvesting and processing of kyrt continued its smooth pace.

The Squire of Rune took to calling Fife at weekly intervals.

"Fife," he would call. "Anything new?" His fatness would quiver with delight and thick chuckles would force their way out of his gullet.

Fife took it bleakly and stolidly. What could he do? Over and over again he sifted the facts. It was no use. Something was missing. Some vital factor was missing.

And then it all began exploding at once, and he had the answer. He knew he had the answer, and it was what he had not expected.

He had called a meeting once again. The chronometer now said two twenty-nine.

They were beginning to appear now. Bort first, lips compressed and a rough hang-nailed finger rasping against the grain of his grizzly-stubbed cheek. Then Steen, his face freshly washed clear of its paint and presenting a pallid, unhealthy appearance. Balle, indifferent and tired, his cheeks sunken, his armchair well cushioned, a glass of warm milk at his side. Lastly Rune, two minutes late, wet-lipped and sulky, sitting in the night once again. This time his lights were dimmed to the point where he was a hazy bulk sitting in a cube of shadow which Fife's lights could not have illuminated though they had had the power of Sark's sun.

Fife began. "Squires! Last year I speculated on a distant and complicated danger. In so doing I fell into a trap. The danger exists, but it is not distant. It is near us, very near. One of you already knows what I mean. The others will find out shortly."

"What do you mean?" asked Bort shortly.

"High treason!" shot back Fife.

10. THE FUGITIVE

MYIILYN TEBENS was not a man of action. He told himself that as an excuse, since now, leaving the spaceport, he found his mind paralyzed.

He had to pick his pace carefully. Not too slowly, or he would seem to be dawdling. Not too quickly, or he would seem to be running. Just briskly, as a patroller would walk, a patroller who was about his business and ready to enter his ground-car.

If only he could enter a ground-car! Driving one, unfortunately, did not come within the education of a Florinian, not even a Florinian Townman, so he tried to think as he walked and could not. He needed silence and leisure.

And he felt almost too weak to walk. He might not be a man of action but he had acted quickly now for a day and a night and part of another day. It had used up his lifetime's supply of nerve.

Yet he dared not stop.

If it were night he might have had a few hours to think. But it was early afternoon.

If he could drive a ground-car he could put the miles between himself and the City. Just long enough to think a bit before deciding on the next step. But he had only his legs.

If he could think. That was it. If he could think. If he could suspend all motion, all action. If he could catch the universe between instants of time, order it to halt, while he thought things through. There must be some way.

He plunged into the welcome shade of Lower City. He walked stiffly, as he had seen the patrollers walk. He swung his shock-stick in a firm grip. The streets were bare. The natives were huddling in their shacks. So much the better.

The Townman chose his house carefully. It would be best to choose one of the better ones, one with patches of colored plastic briquets and polarized glass in the windows. The lower orders were sullen. They had less to lose. An "upper man" would be falling over himself to help.

He walked up a short path to such a house. It was set back from the street, another sign of affluence. He knew he would have no need of pounding the door or breaking it in. There had been a noticeable movement at one window as he walked up the ramp. (How generations of necessity enabled a Florinian to smell the approach of a patroller.) The door would open.

It did open.

A young girl opened it, her eyes white-rimmed circles. She was gawky in a dress whose frills showed a determined effort on the part of her parents to uphold their status as something more than the ordinary run of "Florinian trash." She stood aside to let him pass, her breath coming quickly between parted lips.

The Townman motioned to her to shut the door. "Is your father here, girl?"

She screamed, "Pa!" then gasped, "Yes, sir!"

"Pa" was moving in apologetically from another room. He came slowly. It was no news to him that a patroller was at the door. It was simply safer to let a young girl admit him. She was less apt to be knocked down out of hand than he himself was, if the patroller happened to be angry.

"Your name?" asked the Townman.

"Jacof, if it please you, sir."

The Townman's uniform had a thin-sheeted notebook in one of its pockets. The Townman opened it, studied it briefly, made a crisp check mark and said, "Jacof! Yes! I want to see every member of the household. Quickly!"

If he could have found room for any emotion but one of hopeless oppression, Terens would almost have enjoyed himself. He was not immune to the seductive pleasures of authority.

They filed in. A thin woman, worried, a child of about two years wriggling in her arms. Then the girl who had admitted him and a younger brother.

"That's all?"

"Everyone, sir," said Jacof humbly.

"Can I tend the baby?" asked the woman anxiously. "It's her nap time. I was putting her to bed." She held the young child out as though the sight of young innocence might melt a patroller's heart.

The Townman did not look at her. A patroller, he imagined, would not have, and he was a patroller. He said, "Put it down and give it a sugar sucker to keep it quiet. Now, you! Jacof!"

"Yes, sir."

"You're a responsible boy, aren't you?" A native of whatever age was, of course, a "boy."

"Yes, sir." Jacof's eyes brightened and his shoulders lifted a trifle. "I'm a clerk in the food-processing center. I've had mathematics, long division. I can do logarithms."

Yes, the Townman thought, they've shown you how to use a table of logarithms and taught you how to pronounce the word.

He knew the type. The man would be prouder of his logarithms than a Squireling of his yacht. The polaroid in his windows was the consequence of his logarithms and the tinted briquets advertised his long division. His contempt for the uneducated native would be equal to that of the average Squire for all natives and his hatred would be more intense since he had to live among them and was taken for one of them by his betters.

"You believe in the law, don't you, boy, and in the good Squires?" The Townman maintained the impressive fiction of consulting his notebook.

"My husband is a good man," burst in the woman volubly. "He hasn't ever been in trouble. He doesn't associate with trash. And I don't. No more do the children. We always——"

Terens waved her down. "Yes. Yes. Now look, boy, I want you to sit right here and do what I say. I want a list of everyone you know about on this block. Names, addresses,

what they do, and what kind of boys they are. Especially the last. If there's one of these troublemakers, I want to know. We're going to clean up. Understand?"

"Yes, sir. Yes, sir. There's Husting first of all. He's down the block a way. He——"

"Not like that, boy. Get him a piece of paper, you. Now you sit there and write it all down. Every bit. Write it slowly because I can't read native chicken tracks,"

"I have a trained writing hand, sir."

"Let's see it, then."

Jacof bent to his task, hand moving slowly. His wife looked over his shoulder.

Terens spoke to the girl who had let him in. "Go to the window and let me know if any other patrollers come this way. I'll want to speak to them, Don't you call them. Just tell me."

And then, finally, he could relax. He had made a momentarily secure niche for himself in the midst of danger.

Except for the noisy sucking of the baby in the corner, there was reasonable silence. He would be warned of the enemy's approach in time for a fighting chance at escape.

Now he could think.

In the first place, his role as patroller was about over. There were undoubtedly road blocks at all possible exits from the town, and they knew he could use no means of transportation more complicated than a diamagnetic scooter. It would not be long before it would dawn on the search-rusty patrollers that only by a systematic quartering of the town, block by block and house by house, could they be sure of their man.

When they finally decided that, they would undoubtedly start at the outskirts and work inward. If so, this house would be among the first to be entered, so his time was particularly limited.

Until now, despite its black and silver conspicuousness, the patroller uniform had been useful. The natives themselves had not questioned it. They had not stopped to see his pale Floninian face; they had not studied his appearance. The uniform had been enough.

Before long the pursuing hounds would find that fact dawning upon them. It would occur to them to broadcast instructions to all natives to hold any patroller unable to show proper identification, particularly one with a white skin and sandy hair. Temporary identifications would be passed out to all legitimate patrollers. Rewards would be offered. Perhaps only one native in a hundred would be courageous enough to tackle the uniform no matter how patently false the occupant was. One in a hundred would be enough.

So he would have to stop being a patroller.

That was one thing. Now another. He would be safe nowhere on Florina from now on. Killing a patroller was the ultimate crime and in fifty years, if he could elude capture so long, the chase would remain hot. So he would have to leave Florina.

How? Well, he gave himself one more day of life. This was a generous estimate. It assumed the patrollers to be at maximum stupidity and himself in a state of maximum luck.

In one way this was an advantage. A mere twenty-four hours of life was not much to risk. It meant he could take chances no sane man could possibly take.

He stood up.

Jacof looked up from his paper. "I'm not quite done, sir. I'm writing very carefully."

"Let me see what you have written."

He looked at the paper handed him and said, "It is enough. If other patrollers should come, don't waste their time saying that you have already made a list. They are in a hurry and may have other tasks for you. Just do as they say. Are there any coming now?"

The girl at the window said, "No, sir. Shall I go out in the street and look?"

"It's not necessary. Let's see now. Where is the nearest elevator?"

"It's about a quarter of a mile to the left, sir, as you leave the house. You can——"

"Yes, yes. Let me out."

A squad of patrollers turned into the street just as the door of the elevator ground into place behind the Townman. He could feel his heart pound. The systematic search was probably starting, and they were at his heels.

A minute later, heartbeat still drumming, he stepped out of the elevator into Upper City. There would be no cover here. No pillars. No cement alloy hiding him from above.

He felt like a moving black dot among the glare of the garish buildings. He felt visible for two miles on every side and for five miles up in the sky. There seemed to be large arrows pointing to him.

There were no patrollers in view. The Squires who passed looked through him. If a patroller was an object of fear to a Florinian, he was an object of nothing-at-all to a Squire. If anything would save him, that would.

He had a vague notion of the geography of Upper City. Somewhere in this section was City Park. The most logical step would have been to ask directions, the next most logical to enter any moderately tall building and look out from several of the upperstory terraces. The first alternative was impossible. No patroller could possibly need directions. The second was too risky. Inside a building, a patroller would be more conspicuous. Too conspicuous.

He simply struck out in the direction indicated by his memory of the maps of Upper City he had seen on occasion. It served well enough. It was unmistakably City Park that he came across in five minutes' time.

City Park was an artificial patch of greenery about one hundred acres in area. On Sark itself, City Park had an exaggerated reputation for many things from bucolic peace to nightly orgies. On Florina, those who had vaguely heard of it imagined it ten to a hundred times its actual size and a hundred to a thousand times its actual luxuriance.

The reality was pleasant enough. In Florina's mild climate it was green all year round. It had its patches of lawn, wooded areas and stony grottoes. It had a little pool with decorative fish in it and a larger pool for children to paddle in. At night it was aflame with colored illumination till the light rain started. It was between twilight and the rain that

it was most alive. There was dancing, trimensional shows, and couples losing themselves along the winding walks.

Terens had never actually been inside it. He found its artificiality repellent when he entered the Park. He knew that the soil and rocks he stepped on, the water and trees around him, all rested on a dead-flat cement alloy bottom and it annoyed him. He thought of the kyrt fields, long and level, and the mountain ranges of the south. He despised the aliens who had to build toys for themselves in the midst of magnificence.

For half an hour Terens tramped the walks aimlessly. What he had to do would have to be done in City Park. Even here it might be impossible. Elsewhere it was impossible.

No one saw him. No one was conscious of him. He was sure of that. Let them ask the Squires and Squirettes who passed him, "Did you see a patroller in the Park yesterday?"

They could only stare. They might as well be asked whether they had seen a tree midge skitter across the path.

The Park was too tame. He felt panic begin to grow. He made his way up a staircase between boulders and began descending into the cuplike hollow circled by small caves designed to shelter couples caught in the nightly rainfall. (More were caught than could be accounted for by chance alone.) And then he saw what he was looking for.

A man! A Squire, rather. Stepping back and forth quickly. Smoking the stub of a cigarette with sharp drags, cramming it into an ash recess, where it lay quietly for a moment, then vanished with a quick flash. Consulting a pendant watch.

There was no one else in the hollow. It was a place made for the evening and night.

The Squire was waiting for someone. So much was obvious. Terens looked about him. No one was following him up the stairs.

There might be other stairs. There were sure to be. No matter. He could not let the chance go.

He stepped down toward the Squire. The Squire did not see him, of course, until Terens said, "If you'll pardon me?"

It was respectful enough, but a Squire is not accustomed to having a patroller touch the crook of his elbow in however respectful a fashion.

"What the hell?" he said.

Terens abandoned neither the respect nor the urgency in his tone. (Keep him talking. Keep his eyes on yours for just half a minute!) He said, "This way, sir. It is in connection with the City-wide search for the native murderer."

"What are you talking about?"

"It will take just a moment."

Unobtrusively Terens had drawn his neuronc whip. The Squire never saw it. It buzzed a little and the Squire strained into rigor and toppled.

The Towrman had never raised a hand against a Squire before. He was surprised at how sick and guilty he felt.

There was still no one in sight. He dragged the wooden body, with its glazed and staring eyes, into the nearest cave. He dragged it to the cave's shallow end.

He stripped the Squire, yanking clothing off the stiffened arms and legs with difficulty. He stepped out of his own dusty, sweat-stained patroller uniform and climbed into the Squire's underclothing. For the first time he felt kyrt fabric with some part of himself beside his fingers.

Then the rest of the clothing, and the Squire's skullcap. The last was necessary. Skullcaps were not entirely fashionable among the younger set but some wore them, this Squire luckily among them. To Terens it was a necessity as otherwise his light hair would make the masquerade impossible. He pulled the cap down tightly, covering his ears.

Then he did what had to be done. The killing of a patroller was, he suddenly realized, not the ultimate crime after all.

He adjusted his blaster to maximum dispersion and turned it on the unconscious Squire. In ten seconds only a charred mass was left. It would delay identification, confuse the pursuers.

He reduced the patroller's uniform to a powdery white ash with the blaster and clawed out of the heap blackened silver buttons and buckles. That, too, would make the chase harder. Perhaps he was buying only an additional hour, but that, too, was worth it. And now he would have to leave without delay. He paused a moment just outside the mouth of the cave to sniff. The blaster worked cleanly. There was only the slightest odor of burned flesh and the light breeze would clear it in a few moments.

He was walking down the steps when a young girl passed him on the way up. For a moment he dropped his eyes out of habit. She was a Lady. He lifted them in time to see that she was young and quite good-looking, and in a hurry.

His jaws set. She wouldn't find him, of course. But she was late, or he wouldn't have been staring at his watch so. She might think he had grown tired of waiting and had left. He walked a trifle faster. He didn't want her returning, pursuing him breathlessly, asking if he had seen a young man.

He left the Park, walking aimlessly. Another half hour passed.

What now? He was no longer a patroller, he was a Squire.

But what now? He stopped at a small square in which a fountain was centered in a plot of lawn. To the water a small quantity of detergent had been added so that it frothed and foamed in gaudy iridescence.

He leaned against the railing, back to the western sun, and, bit by bit, slowly, he dropped blackened silver into the fountain.

He thought of the girl who had passed him on the steps as he did so. She had been very young. Then he thought of Lower City and the momentary spasm of remorse left him.

The silver remnants were gone and his hands were empty. Slowly he began searching his pockets, doing his best to make it seem casual.

The contents of the pockets were not particularly unusual. A booklet of key slivers, a few coins, an identification card. (Holy Sark! Even the Squires carried them. But then,

they didn't have to produce them for every patroller that came along.) His new name, apparently, was Aistare Deamone. He hoped he wouldn't have to use it. There were only ten thousand men, women and children in Upper City. The chance of his meeting one among them who knew Deamone personally was not large, but it wasn't insignificant either.

He was twenty-nine. Again he felt a rising nausea as he thought of what he had left in the cave, and fought it. A Squire was a Squire. How many twenty-nine-year-old Florinians had been done to death at their hands or by their directions? How many nine-year-old Florinians? He had an address, too, but it meant nothing to him. His knowledge of Upper City geography was rudimentary.

Say!

A color portrait of a young boy, perhaps three, in pseudotrimension. The colors flashed as he drew it out of its container, faded progressively as he returned it. A young son? A nephew? There had been the girl in the Park so it couldn't be a son, could it? Or was he married? Was the meeting one of those they called "clandestine?" Would such a meeting take place in daylight? Why not, under certain circumstances? Terens hoped so. If the girl were meeting a married man she would not quickly report his absence. She would assume he had not been able to evade his wife. That would give him time.

No, it wouldn't. Instant depression seized him. Children playing hide-and-seek would stumble on the remains and run screaming. It was bound to happen within twenty-four hours.

He turned to the pocket's contents once more. A pocket-copy license as yacht pilot. He passed it by. All the richer Sarkites owned yachts and piloted them. It was this century's fad. Finally, a few strips of Sarkite credit vouchers. Now those might be temporarily useful.

It occurred to him that he hadn't eaten since the night before at the Baker's place. How quickly one could grow conscious of hunger.

Suddenly he turned back to the yacht license. Wait, now, the yacht wasn't in use now, not with the owner dead. And it was his yacht. Its hangar number was z6, at Port 9. Well.

Where was Port 9? He hadn't the slightest notion.

He leaned his forehead against the coolness of the smooth railing around the fountain. What now? What now? The voice startled him.

"Hello," it said. "Not sick?"

Terens looked up. It was an older Squire. He was smoking a long cigarette containing some aromatic leaf while a green stone of some sort hung suspended from a gold wristband. His expression was one of kindly interest that astonished Terens into a moment of speechlessness, until he remembered. He was one of the clan himself now. Among themselves, Squires might well be decent human beings.

The Townman said, "Just resting. Decided to take a walk and lost track of time. I'm afraid I'm late for an appointment now."

He waved his hand in a wry gesture. He could imitate the Sarkite accent fairly well from long association but he didn't make the mistake of trying to exaggerate it. Exaggeration was easier to detect than insufficiency.

The other said, "Stuck without a skeeter, hey?" He was the older man, amused by the folly of youth.

"No skeeter," admitted Terens.

"Use mine," came the instant offer. "It's parked right outside. You can set the controls and send it back here when you're through. I won't be needing it for the next hour or so."

To Terens, that was almost ideal. The skeeters were fast and skittery as chain lightning, could outspeed and outmaneuver any patroller ground-car. It fell short of ideal only in that Terens could no more drive the skeeter than he could fly without it.

"From here to Sark," he said. He knew that piece of Squire slang for "thanks," and threw it in. "I think I'll walk. It isn't far to Port 9."

"No, it isn't far," agreed the other.

That left Terens no better off than before. He tried again. "Of course, I wish I were closer. The walk to Kyrst Highway is healthy enough by itself."

"Kyrst Highway? What's that got to do with it?"

Was he looking queerly at Terens? It occurred to the Town-man, suddenly, that his clothing probably lacked the proper fitting. He said quickly, "Wait! I'm twisted at that. I've got myself crossed up walking. Let's see now." He looked about vaguely.

"Look. You're on Recket Road. All you have to do is go down to Triffis and turn left, then follow it into the port." He had pointed automatically.

Terens smiled. "You're right. I'm going to have to stop dreaming and start thinking. From here to Sark, sir."

"You can still use my skeeter."

"Kind of you, but. . ." Terens was walking away, a bit too quickly, waving his hand. The Squire stared after him.

Perhaps tomorrow, when they found the corpse in the rocks and began searching, the Squire might think of this interview again. He would probably say, "There was something queer about him, if you know what I mean. He had an odd turn of phrase and didn't seem to know where he was. I'll swear he'd never heard of Triffis Avenue."

But that would be tomorrow.

He walked in the direction that the Squire had pointed out. He came to the glittering sign "Triffis Avenue," almost drab against the iridescent orange structure that was its background. He turned left.

Port 9 was alive with youth in yachting costume, which seemed to feature high-peaked hats and hip-bellying breeches. Terens felt conspicuous but no one paid attention to him. The air was full of conversation spiced with terms he did not understand.

He found Booth 26 but waited for minutes before approaching it. He wanted no Squire remaining persistently in its vicinity, no Squire who happened to own a yacht in a

nearby booth who would know the real Alstare Deamone by sight and would wonder what a stranger was doing about his ship.

Finally, with the booth's neighborhood apparently safe, he walked over. The yacht's snout peered out from its hangar into the open field about which the booths were placed.' He craned his neck to stare at it.

Now what? He had killed three men in the last twelve hours. He had risen from Florinian Townman to patroller, from patroller to Squire. He had come from Lower City to Upper City and from Upper City to a spaceport. To all intents and purposes he owned a yacht, a vessel sufficiently spaceworthy to take him to safety on any inhabited world in this sector of the Galaxy.

There was only one catch.

He could not pilot a yacht.

He was tired to the bone, and hungry to boot. He had come this far, and now he could go no further. He was on the edge of space but there was no way of crossing the edge.

By now the patrollers must have decided he was nowhere in Lower City. They would turn the search to Upper City as soon as they could get it through their thick skulls that a Florinian would dare. Then the body would be found and a new direction would be taken. They would look for an impostor Squire.

And here he was. He had climbed to the farthest niche of the blind alley and with his back to the closed end he could only wait for the faint sounds of pursuit to grow louder and louder until eventually the bloodhounds would be on him.

Thirty-six hours ago the greatest opportunity of his life had been in his hands. Now the opportunity was gone and his life would soon follow.

11. THE CAPTAIN

IT was the first time, really, that Captain Racety had found himself unable to impose his will upon a passenger. Had that passenger been one of the Great Squires themselves, he might still have counted on co-operation. A Great Squire might be all-powerful on his own continent, but on a ship he would recognize that there could be only one master, the Captain.

A woman was different. Any woman. And a woman who was daughter of a Great Squire was completely impossible.

He said, "My Lady, how can I allow you to interview them in private?"

Samia of Fife, her dark eyes snapping, said, "Why not? Are they armed, Captain?"

"Of course not. That's not the point."

"Anyone can see they're only a pair of very frightened creatures. They're half scared to death."

"Frightened people can be very dangerous, my Lady. They can't be counted on to act sensibly."

"Then why do you keep them frightened?" She had the tiniest stammer when she was angry. "You've got three tremendous sailors standing over them with blasters, poor things. Captain, I'll not forget this."

No, she wouldn't, the Captain thought. He could feel himself beginning to give way.

"If Your Ladyship pleases, will you tell me exactly what it is that you want?"

"It's simple. I've told you. I want to speak to them. If they're Florinians, as you say they are, I can get tremendously valuable information from them for my book. I can't do that, though, if they're too frightened to speak. If I could be with them alone it would be fine. Alone, Captain! Can you understand a simple word? Alone!"

"And what would I say to your father, my Lady, if he discovers that I allowed you to remain unguarded in the presence of two desperate criminals?"

"Desperate criminals! Oh, Great Space! Two poor fools that tried to escape their planet and had no more sense than to board a ship going to Sark! Besides, how would my father know?"

"If they hurt you he would know."

"Why should they hurt me?" Her small fist lifted and vibrated, while she put every atom of force she could find into her voice. "I demand it, Captain."

Captain Racety said, "How about this then, my Lady? I will be present. I shall not be three sailors with blasters. I shall be one man with no blaster in view. Otherwise"—and in his turn he put all his resolution into his voice—"I must refuse your demand."

"Very well, then." She was breathless. "Very well. But if I can't get them to speak because of you I will personally see to it that you captain no more ships."

Valona put her hand hastily over Rik's eyes as Samia entered the brig.

"What's the matter, girl?" asked Samia sharply, before she could remember that she was going to speak to them comfortingly.

Valona spoke with difficulty. She said, "He is not bright, Lady. He wouldn't know you were a Lady. He might have looked at you. I mean without intending any harm, Lady."

"Oh, goodness," said Samia. "Let him look." She went on, "Must they stay here, Captain?"

"Would you prefer a stateroom, my Lady?"

Samia said, "Surely you could manage a cell not quite so grim."

"It is grim to you, my Lady. To them, I am sure this is luxury. There is running water here. Ask them if there was any in their hut on Florina."

"Well, tell those men to leave."

The Captain motioned to them. They turned, stepping out nimbly.

The Captain set down the light aluminum folding chair he had brought with him. Samia took it.

He said brusquely to Rik and Valona, "Stand up."

Samia broke in instantly. "No! Let them sit. You're not to interfere, Captain."

She turned to them. "So you are a Floninian, girl."

Valona shook her head. "We're from Wotex."

"You needn't be frightened. It doesn't matter that you're from Florina. No one will hurt you."

"We're from Wotex."

"But don't you see that you've practically admitted you're from Florina, girl? Why did you cover the boy's eyes?"

"He's not allowed to look at a Lady."

"Even if he's from Wotex?"

Valona was silent.

Samia let her think about it. She tried to smile in a friendly way. Then she said, "Only Florinians aren't allowed to look at Ladies. So you see you've admitted that you're a Floninian."

Valona burst out, "He's not."

"Are you?"

"Yes, I am. But he's not. Don't do anything to him. He really isn't a Floninian. He was just found one day. I don't know where he comes from, but it's not Florina." Suddenly she was almost voluble.

Samia looked at her with some surprise. "Well, I'll speak to him. What's your name, boy?"

Rik was staring. Was that how women Squires looked? So small, and friendly-looking. And she smelled so nice. He was very glad she had let him look at her.

Samia said again, "What's your name, boy?"

Rik came to life but stumbled badly in the attempt to shape a monosyllable.

"Rik," he said. Then he thought, Why, that's not my name. He said, "I think it's Rik."

"Don't you know?"

Valona, looking woebegone, tried to speak, but Samia held up a sharply restraining hand.

Rik shook his head. "I don't know."

"Are you a Florinian?"

Rik was positive here. "No. I was on a ship. I came here from somewhere else." He could not bear to look away from Samia but he seemed to see the ship co-existing with her. A small and very friendly and homelike ship.

He said, "It was on a ship that I came to Florina and before that I lived on a planet."

"What planet?"

It was as though the thought were forcing its way painfully through mental channels too small for it. Then Rik remembered and was delighted at the sound his voice made, a sound so long forgotten.

"Earth! I come from Earth!"

"Earth?"

Rik nodded.

Samia turned to the Captain. "Where is this planet Earth?"

Captain Racety smiled briefly. "I never heard of it. Don't take the boy seriously, my Lady. A native lies the way he breathes. It comes naturally to him. He says whatever comes first into his mind."

"He doesn't talk like a native." She turned to Rik again. "Where is Earth, Rik?"

"I—" He put a shaking hand to his forehead. Then he said, "It's in the Sirius Sector." The intonation of the statement made it half a question.

Samia said to the Captain, "There is a Sirius Sector, isn't there?"

"Yes, there is. I'm amazed he has that right. Still, that doesn't make Earth any more real"

Rik said vehemently, "But it is. I remember, I tell you. It's been so long since I remembered. I can't be wrong now. I can't."

He turned, gripping Valona's elbows and clawing at her sleeve. "Lona, tell them I come from Earth. I do. I do."

Valona's eyes were wide with anxiety. "We found him one day, Lady, and he had no mind at all. He couldn't dress himself or talk or walk. He was nothing. Ever since then he's been remembering little by little. So far everything he's remembered has been so." She cast a quick, fearful glance at the bored face of the Captain. "He may really have come from Earth, Squire. No contradiction intended."

The last was a long-established conventional phrase that went with any statement that seemed in contradiction to a previous statement by a superior.

Captain Racety grunted. "He may have come from the center of Sark for all that story proves, my Lady."

"Maybe, but there's something queer about all this," insisted Samia, making up her mind flatly, woman-wise, on the side of romance. "I'm sure of it. . . What made him so helpless when you found him, girl? Had he been hurt?"

Valona said nothing at first. Her eyes darted helplessly back and forth. First to Rik, whose fingers clutched at his hair, then to the Captain, who was smiling without humor, finally to Samia, who waited.

"Answer me, girl," said Samia.

It was a hard decision for Valona to make, but no conceivable lie could substitute for the truth in this place and at this time. She said, "A doctor once looked at him. He said m—my Rik was psycho-probed."

"Psycho-probed!" Samia felt a slight wash of repulsion well over her. She pushed her chair away. It squeaked against the metal floor. "You mean he was psychotic?"

"I don't know what that means, Lady," said Valona humbly. "Not in the sense you're thinking of, my Lady," said the Captain almost simultaneously. "Natives aren't psychotic. Their needs and desires are too simple. I've never heard of a psychotic native in my life."

"But then——"

"It's simple, my Lady. If we accept this fantastic story the girl tells, we can only conclude that the boy had been a criminal, which is a way of being psychotic, I suppose. If so, he must have been treated by one of those quacks who practice among the natives, been nearly killed and was then dumped in a deserted section to avoid detection and prosecution."

"But it would have to be someone with a psycho-probe," protested Samia. "Surely you wouldn't expect natives to be able to use them."

"Perhaps not. But then you wouldn't expect an authorized medical man to use one so inexpertly. The fact that we arrive at a contradiction proves the story to be a lie throughout. If you will accept my suggestion, my Lady, you will leave these creatures to our handling. You see that it's useless to expect anything out of them."

Samia hesitated. "Perhaps you're right."

She rose and looked uncertainly at Rik. The Captain stepped behind her, lifted the little chair and folded it with a snap.

Rik jumped to his feet. "Wait!"

"If you please, my Lady," said the Captain, holding the door open for her. "My men will quiet him."

Samia stopped at the threshold. "They won't hurt him?"

"I doubt if he'll make us go to extremes. He will be easy handling."

"Lady! Lady!" Rik called. "I can prove it. I'm from Earth."

Samia stood irresolute for a moment. "Let's hear what he has to say."

The Captain said coldly, "As you wish, my Lady."

She returned, but not very far. She remained a step from the door.

Rik was flushed. With the effort of remembering, his lips drew back into the caricature of a smile. He said, "I remember Earth. It was radioactive. I remember the

Forbidden Areas and the blue horizon at night. The soil glowed and nothing would grow in it. There were just a few spots men could live on. That's why I was a Spatio-analyst. That's why I didn't mind staying in space. My world was a dead world."

Samia shrugged. "Come along, Captain. He's simply raving." But this time it was Captain Racety who stood there, open-mouthed. He muttered, "A radioactive world!"

She said, "You mean there is such a thing?"

"Yes." He turned wondering eyes on her. "Now where could he have picked that up?"

"How could a world be radioactive and inhabited?"

"But there is one. And it is in the Sirius Sector. I don't remember its name. It might even be Earth."

"It is Earth," said Rik, proudly and with confidence. "It is the oldest planet of the Galaxy. It is the planet on which the whole human race originated."

The Captain said softly, "That's so!"

Samia said, mind whirling, "You mean the human race originated on this Earth?"

"No, no," said the Captain abstractedly. "That's superstition. It's just that that's how I came to hear about the radioactive planet. It claims to be Man's home planet."

"I didn't know we were supposed to have a home planet."

"I suppose we started somewhere, my Lady, but I doubt that anyone can possibly know on what planet it happened."

With sudden decision he walked toward Rik. "What else do you remember?"

He almost added "boy," but held it back.

"The ship mostly," said Rik, "and Spatio-analysis."

Samia joined the Captain. They stood there, directly before Rik, and Samia felt the excitement returning. "Then it's all true? But then how did he come to be psycho-probed?"

"Psycho-probed!" said Captain Racety thoughtfully. "Suppose we ask him. Here, you, native or outworder or whatever you are. How did you come to be psycho-probed?"

Rik looked doubtful. "You all say that. Even Lona. But I don't know what the word means."

"When did you stop remembering, then?"

"I'm not sure." He began again, desperately. "I was on a ship."

"We know that. Go on."

Samia said, "It's no use barking, Captain. You'll drive out what few wits are left him."

Rik was entirely absorbed in wrenching at the dimness within his mind. The effort left no room for any emotion. It was to his own astonishment that he said, "I'm not afraid of him, Lady. I'm trying to remember. There was danger. I'm sure of that. Great danger to Florina, but I can't remember the details about it."

"Danger to the whole planet?" Samia cast a swift glance at the Captain.

"Yes. It was in the currents."

"What currents?" asked the Captain.

"The currents of space."

The Captain spread his hands and let them drop. "This is madness."

"No, no. Let him go on." The tide of belief had shifted to Samia again. Her lips were parted, her dark eyes gleamed and little dimples between cheek and chin made their appearance as she smiled. "What are the currents of space?"

"The different elements," said Rik vaguely. He had explained that before. He didn't want to go through that again.

He went on rapidly, nearly incoherently, speaking as the thoughts came to him, driven by them. "I sent a message to the local office on Sark. I remember that very clearly. I had to be careful. It was a danger that went beyond Florina. Yes. Beyond Florina. It was as wide as the Milky Way. It had to be handled carefully."

He seemed to have lost all real contact with those who listened to him, to be living in a world of the past before which a curtain was tearing away in places. Valona placed a soothing hand upon his shoulder and said, "Don't!" but he was unresponsive even to that.

"Somehow," he went on breathlessly, "my message was intercepted by some official on Sark. It was a mistake. I don't know how it happened."

He frowned. "I'm sure I sent it to the local office on the Bureau's own wave length. Do you suppose the sub-ether could have been tapped?" He did not even wonder that the word "sub-ether" came so easily to him.

He might have been waiting for an answer, but his eyes were still unseeing.

"Anyway, when I landed on Sark they were waiting for me."

Again a pause, this time long and meditative. The Captain did nothing to break it; he seemed to be meditating himself.

Samia, however, said, "Who was waiting for you? Who?"

Rik said, "I—I don't know. I can't remember. It wasn't the office. It was someone of Sark. I remember speaking to him. He knew about the danger. He spoke of it. I'm sure he spoke of it. We sat at a table together. I remember the table. He sat opposite me. It's as clear as space. We spoke for quite a while. It seems to me I wasn't anxious to give details. I'm sure of that. I would have had to speak to the office first. And then he. . ."

"Yes?" prompted Samia.

"He did something. He—— No, nothing more will come. Nothing will come!"

He screamed the words and then there was silence, a silence that was anticlimactically broken by the prosaic buzz of the Captain's wrist communo.

He said, "What is it?"

The answering voice was reedy and precisely respectful. "A message to the Captain from Sark. It is requested that he accept it personally."

"Very well. I will be at the sub-etherics presently."

He turned to Samia. "My Lady, may I suggest that it is, in any case, dinnertime."

He saw that the girl was about to protest her lack of appetite, to urge him to leave and not to bother about her. He continued, more diplomatically, "It is also time to feed these creatures. They are probably tired and hungry."

Samia could say nothing against that. "I must see them again, Captain."

The Captain bowed silently. It might have been acquiescence. It might not.

Samia of Fife was thrilled. Her studies of Florina satisfied a certain aspiration to intellect within her, but the Mysterious Case of the Psycho-probed Earthman (she thought of the matter in capitals) appealed to something much more primitive and much more demanding. It roused the sheer animal curiosity in her.

It was a mystery!

There were three points that fascinated her. Among these was not the perhaps reasonable question (under the circumstances) of whether the man's story was a delusion or a deliberate lie, rather than the truth. To believe it anything other than truth would spoil the mystery and Samia could not allow that.

The three points were therefore these. (i) What was the danger that threatened Florina, or, rather, the entire Galaxy? (ii) Who was the person who had psycho-probed the Earthman? (iii) Why had the person used the psycho-probe? She was determined to sift the matter to her own thorough satisfaction. No one is so modest as not to believe himself a competent amateur sleuth, and Samia was far from modest.

As soon after dinner as she could politely manage, she hurried down to the brig.

She said to the guard, "Open the door!"

The sailor remained perfectly erect, staring blankly and respectfully ahead. He said, "If Your Ladyship pleases, the door is not to be opened."

Samia gasped. "How dare you say so? If you do not open the door instantly, the Captain shall be informed."

"If Your Ladyship pleases, the door is not to be opened. That is by the strict order of the Captain."

She stormed up the levels once more, bursting into the Captain's stateroom like a tornado compressed into sixty inches.

"Captain!"

"My Lady?"

"Have you ordered the Earthman and the native woman to be kept from me?"

"I believe, my Lady, it was agreed that you were to interview them only in my presence."

"Before dinner, yes. But you saw they were harmless?"

"I saw that they seemed harmless."

Samia simmered. "In that case I order you to come with me now."

"I cannot, my Lady. The situation has changed."

"In what way?"

"They must be questioned by the proper authorities on Sark and until then I think they should be left alone."

Samia's lower jaw dropped, but she rescued it from its undignified position almost immediately. "Surely you are not going to deliver them to the Bureau of Florinian Affairs."

"Well," temporized the Captain, "that was certainly the original intention. They have left their village without permission. In fact they have left their planet without permission. In addition, they have taken secret passage on a Sarkite vessel."

"The last was a mistake."

"Was it?"

"In any case, you knew all their crimes before our last interview."

"But it was only at the interview that I heard what the so-called Earthman had to say."

"So-called. You said yourself that the planet Earth existed."

"I said it might exist. But, my Lady, may I be so bold as to ask what you would like to see done with these people?"

"I think the Earthman's story should be investigated. He speaks of a danger to Florina and of someone on Sark who has deliberately attempted to keep knowledge of that danger from the proper authorities. I think it is even a case for my father. In fact I would take him to my father, when the proper time came."

The Captain said, "The cleverness of it all!"

"Are you being sarcastic, Captain?"

The Captain flushed. "Your pardon, my Lady. I was referring to our prisoners. May I be allowed to speak at some length?"

"I don't know what you mean by 'some length,' she retorted angrily, "but I suppose you may begin."

"Thank you. In the first place, my Lady, I hope you will not minimize the importance of the disturbances on Florina."

"What disturbances?"

"You cannot have forgotten the incident in the library."

"A patroller killed! Really, Captain!"

"And a second patroller killed this morning, my Lady, and a native as well. It is not very usual for natives to kill patrollers and here is one who has done it twice, and yet remains uncaught. Is he a lone hand? Is it an accident? Or is it all part of a carefully laid scheme?"

"Apparently you believe the last."

"Yes, I do. The murdering native had two accomplices. Their description is rather like that of our two stowaways."

"You never said so!"

"I did not wish to alarm Your Ladyship. You'll remember, however, that I told you repeatedly that they could be dangerous."

"Very well! What follows from all this?"

"What if the murders on Florina were simply side shows intended to distract the attention of the patroller squadrons while these two sneaked aboard our ship?"

"That sounds so silly."

"Does it? Why are they running away from Florina? We haven't asked them. Let us suppose they are running away from the patrollers since that is certainly the most

reasonable assumption. Would they be running to Sark of all places? And on a ship that carries Your Ladyship? And then he claims to be a Spatioanalyst."

Samia frowned. "What of that?"

"A year ago a Spatio-analyst was reported missing. The story was never given wide publicity. I knew, of course, because my ship was one of those that searched near space for signs of his ship. Whoever is backing these Florinian disorders has undoubtedly seized on that fact, and just knowing that the matter of the missing Spatio-analyst is known to them shows what a tight and unexpectedly efficient organization they have."

"It might be that the Earthman and the missing Spatio-analyst have no connection."

"No real connection, my Lady, undoubtedly. But to expect no connection at all is to expect too much of coincidence. It is an impostor we are dealing with. That is why he claims to have been psycho-probed."

"Oh?"

"How can we prove he isn't a Spatio-analyst? He knows no details of the planet Earth beyond the bare fact that it is radioactive. He cannot pilot a ship. He knows nothing of Spatioanalysis. And he covers up by insisting he was psycho-probed. Do you see, my Lady?"

Samia could make no direct answer. "But to what purpose?" she demanded.

"So that you might do exactly what you said you intended to do, my Lady."

"Investigate the mystery?"

"No, my Lady. Take the man to your father."

"I still see no point."

"There are several possibilities. At the best, he could be a spy upon your father, either for Florina or possibly for Trantor. I imagine old Abel of Trantor would certainly come forward to identify him as an Earthman, if for no other reason than to embarrass Sark by demanding the truth concerning this fictitious psycho-probing. At the worst, he will be your father's assassin."

"Captain!"

"My Lady?"

"This is ridiculous!"

"Perhaps, my Lady. But if so, the Department of Security is also ridiculous. You will recall that just before dinner I was called away to receive a message from Sark."

"Yes."

"This is it."

Samia received the thin translucent foil with its red lettering. It said: "Two Florinians are reported to have taken secret, illegal passage on your ship. Secure them immediately. One of them may claim to be a Spatio-analyst and not a Florinian native. You are to take no action in this matter. You will be held strictly responsible for the safety of these people. They are to be held for delivery to Depsec. Extreme secrecy. Extreme urgency."

Samia felt stunned. "Depsec," she said. "The Department of Security."

"Extreme secrecy," said the Captain. "I stretch a point to tell you this, but you have left me no choice, my Lady."

She said, "What will they do to him?"

"I cannot say for certain," said the Captain. "Certainly a suspected spy and assassin cannot expect gentle treatment. Probably his pretense will become partly a reality and he will learn what a psycho-probe is really like."

12. THE DETECTIVE

Tins Four Great Squires regarded the Squire of Fife each in his own way. Bort was angry, Rune was amused, Balle was annoyed, and Steen was frightened.

Rune spoke first. He said, "High treason? Are you trying to frighten us with a phrase? What does it mean? Treason against you? Against Bort? Against myself? By whom and how? And for Sark's sake, Fife, these conferences interfere with my normal sleeping hours."

"The results," said Fife, "may interfere with many sets of sleeping hours. I don't refer to treason against any of us, Rune. I mean treason against Sark."

Bort said, "Sark? What's that, anyway, if not us?"

"Call it a myth. Call it something ordinary Sarkites believe in."

"I don't understand," moaned Steen. "You men always seem so interested in talking each other down. Really! I wish you'd get all this over with."

Balle said, "I agree with Steen." Steen looked gratified.

Fife said, "I'm perfectly willing to explain immediately. You have heard, I suppose, of the recent disturbances on Florina."

Rune said, "The Depsec dispatches speak of several patrollers killed. Is that what you mean?"

Bort broke in angrily. "By Sark, if we must have a conference, let's talk about that. Patrollers killed! They deserve to be killed! Do you mean to say a native can simply come up to a patroller and bash his head in with a two-by-four? Why should any patroller let any native with a two-by-four in his hand come close enough to use it? Why wasn't the native burned down at twenty paces? "By Sark, I'd rattle the Patrol Corps from captain to recruit and send every dunderhead out on ship duty. The entire Corps is just an accumulation of fat. It's too easy a life for them down there. I say that every five years we should put Florina under martial law and scrape out the troublemakers. It would keep the natives quiet and our own men on their toes."

"Are you through?" asked Fife.

"For now, yes. But I'll take it up again. It's my investment down there, too, you know. It may not be as big as yours, Fife, but it's big enough for me to worry about."

Fife shrugged. He turned suddenly to Steen. "And have you heard of the disturbances?"

Steen jumped. "I have. I mean, I've heard you just saying—"

"You haven't read the Depsec announcements?"

"Well, really!" Steen became intensely interested in his long, pointed fingernails with their exquisitely applied coppery coating. "I don't always have time to read all the announcements. I didn't know it was required of me. In fact," and he gathered his courage in both hands and looked full at Fife, "I didn't know you were making rules for me. Really!"

"I haven't," said Fife. "Just the same since you, at least, know none of the details, let me summarize it for you. The rest may find it interesting as well."

It was surprising into how few words the events of forty-eight hours could be put and how flat they could sound. First, there had been an unexpected reference to Spatio-analysis texts. Then a blow on the head of a superannuated patroller who died of a fractured skull two hours later. Then a pursuit that ended with untouchability in the lair of a Trantorian agent. Then a second patroller dead at dawn with the murderer tricked out in the patroller's uniform and the Trantorian agent dead in his turn some hours later.

"If you wish the very latest nugget of news," Fife concluded, "you might add this to this catalog of apparent trivia. Some hours ago a body, or, rather, the bony remnants of one, was found in City Park on Florina."

"Whose body?" asked Rune.

"Just a moment, please. Lying next to it was a pile of ash that seemed to be the charred remnants of clothing. Anything of metal had been carefully removed from it, but the ash analysis proved it to be what was left of a patroller uniform."

"Our impostoring friend?" asked Balle.

"Not likely," said Fife. "Who would kill him in secret?"

"Suicide," said Bort viciously. "How long did the bloody bastard expect to keep out of our hands? I imagine he had a better death this way. Personally, I'd find out who in the Corps were responsible for letting him reach the suicide stage and put a one-charge blaster in their hands."

"Not likely," said Fife again. "If the man committed suicide he either killed himself first, then took off his uniform, blasted it to ash, removed the buckles and braid, and then got rid of them. Or else he first removed his uniform, ashed it, removed the buckles and braid, left the cave naked, or perhaps in his underwear, discarded them, came back and killed himself."

"The body was in a cave?" asked Bort.

"In one of the ornamental caves of the Park. Yes."

"Then he had plenty of time and plenty of privacy," said Bort belligerently. He hated to give up a theory. "He could have taken off the buckles and braid first, then——"

"Ever try to remove braid from a patroller uniform that hasn't been ashed first?" asked Fife sarcastically. "And can you suggest a motive, if the body were that of the impostor after suicide? Besides, I have a report from the medical examiners who studied the bone structure. The skeleton is that of neither a patroller nor a Florinian. It is of a Sarkite."

Steen cried, "Really!"; Balle's old eyes opened wide; Rune's metal teeth, which, by catching a gleam of light now and then, added a bit of life to the cube of dusk in which he sat, vanished as he closed his mouth. Even Bort was dumfounded.

"Do you follow?" asked Fife. "Now you see why the metal was removed from the uniform. Whoever killed the Sarkite wanted the ash to be taken for that of the Sarkite's own clothing, removed and ashed before the killing, which we might then take for suicide or for the result of a private feud in no way connected with our patroller-impostor friend."

What he did not know was that ash analysis could distinguish between the kyrt of Sarkite clothing and the cellulite of a patroller uniform even with the buckles and braid removed.

"Now given a dead Sarkite and the ash of a patroller uniform, we can only assume that somewhere in Upper City there is a live Townman in Sarkite clothing. Our Florinian, having posed as a patroller long enough, and finding the danger too great and growing greater, decided to become a Squire. And he did that in the only way he could."

"Has he been caught?" inquired Bort thickly.

"No, he hasn't."

"Why not? By Sark, why not?"

"He will be caught," said Fife indifferently. "At the moment we have more important things to wonder about. This last atrocity is a trifle in comparison."

"Get to the point!" demanded Rune instantly.

"Patience! First, let me ask you if you remember the missing Spatio-analyst of last year."

Steen giggled.

Bort said with infinite contempt, "That again?"

Steen asked, "Is there a connection? Or are we just going to talk about that horrible affair of last year all over again? I'm tired."

Fife was unmoved. He said, "This explosion of yesterday and day before yesterday began with a request at the Florinian library for reference books on Spatio-analysis. That is connection enough for me. Let's see if I can't make the connection for the rest of you as well. I will begin by describing the three people involved in the library incident, and please, let me have no interruptions for a few moments.

"First, there is a Townman. He is the dangerous one of the three. On Sark he had an excellent record as an intelligent and faithful piece of material. Unfortunately he has now turned his abilities against us. He is undoubtedly the one responsible for four killings now. Quite a record for anyone. Considering that the four include two patrollers and a Sarkite, it is unbelievably remarkable for a native. And he is still uncaught.

"The second person involved is a native woman. She is uneducated and completely insignificant. However, the last couple of days have seen an extensive search into every facet of this affair and we know her history. Her parents were members of the 'Soul of Kyrt' if any of you remember that rather ridiculous peasant conspiracy that was wiped out without trouble some twenty years ago.

"This brings us to the third person, the most unusual one of the three. This third person was a common mill hand and an idiot."

There was an expulsion of breath from Bort and another high-pitched giggle from Steen. Balle's eyes remained closed and Rune was motionless in the dark.

Fife said, "The word 'idiot' is not used figuratively. Depsec has driven itself mercilessly but his history could not be traced back more than ten and a half months. At that time he was found in a village just outside Florina's main metropolis in a state of complete mindlessness. He could neither walk nor talk. He could not even feed himself.

"Now note that he made this first appearance some few weeks after the disappearance of the Spatio-analyst. Note in addition that, in a matter of months, he learned how to talk and even how to fill a job at a kyrt mill. What kind of an idiot could learn so quickly?"

Steen began, almost eagerly, "Oh, really, if he were psycho-probed properly, it could be arranged so . . ." His voice trailed off.

Fife said sardonically, "I can think of no greater authority on the subject. Even without Steen's expert opinion, however, the same thought occurred to me. It was the only possible explanation.

"Now the psycho-probing could have taken place only on Sark or in Upper City on Florina. As a matter of simple thoroughness, doctors' offices in Upper City were checked. There was no trace of any unauthorized psycho-probing. It was then the notion of one of our agents to check the records of doctors who had died since the idiot first made his appearance. I shall see to it that he is promoted for that idea.

"We found a record of our idiot in just one of those offices. He had been brought in for a physical check-up about six months ago by the peasant woman who is the second of our trio. Apparently this was done secretly since she was absent that day from her job on quite another pretext. The doctor examined the idiot and recorded definite evidence of psycho-probic tampering.

"Now here is the interesting point. The doctor was one of those who kept double-deck offices in Upper City and Lower City. He was one of these idealists who thought the natives deserved first-rate medical care. He was a methodical man and kept duplicate records in full in both his offices to avoid unnecessary elevator travel. Also it pleased his idealism, I imagine, to practice no segregation between Sarkite and Florinian in his files. But the record of the idiot in question was not duplicated, and it was the only record not duplicated.

"Why should that be? If, for some reason, he had decided of his own accord not to duplicate that particular record, why should it have appeared only in the Upper City records, which is where it did appear? Why not only in the Lower City records, which is where it did not appear? After all, the man was a Florinian. He had been brought in by a Florinian. He had been examined in the Lower City office. All that was plainly recorded in the copy we found.

"There is only one answer to that particular puzzle. The record was duly entered in both files, but it was destroyed in the Lower City files by somebody who did not realize there would remain another record in the Upper City office. Now let's pass on.

"Included with the idiot's examination record was the definite notation to include the findings of this case with the doctor's next routine report to Depsec. That was entirely proper. Any case of psycho-probing could involve a criminal or even a subversive. But no such report was ever made. Within the week he was dead in a traffic accident.

"The coincidences pile up past endurance, don't they?"

Balle opened his eyes. He said, "This is a detective thriller you are telling us."

"Yes," cried Fife with satisfaction, "a detective thriller. And for the moment I am the detective."

"And who are the accused?" asked Balle in a tired whisper.

"Not yet. Let me play the detective for a moment longer."

In the middle of what Fife considered to be the most dangerous crisis that had ever confronted Sark, he suddenly found that he was enjoying himself hugely.

He said, "Let's approach the story from the other end. We will, for the moment, forget the idiot and remember the Spatio analyst. The first we hear of him is the notification to the Bureau of Transportation that his ship will soon land. A message received from him earlier accompanies the notification.

"The Spatio-analyst never arrives. He is located nowhere in near space. Furthermore, the message sent by the Spatioanalyst, which had been forwarded to BuTrans, disappeared. The I.S.B. claimed that we were deliberately concealing the message. Depsec believed that they were inventing a fictitious message for propaganda purposes. It now occurs to me that we were both wrong. The message had been delivered but it had not been concealed by the government of Sark.

"Let us invent someone and, for the moment, call him X. X has access to the records of BuTrans. He learns of this Spatioanalyst and his message and has the brains and ability to act quickly. He arranges that a secret sub-ethergram be sent out to the Spatio-analyst's ship, directing the man's landing on some small, private field. The Spatio-analyst does so and X meets him there.

"X has taken the Spatio-analyst's message of doom with him. There may be two reasons for that. First, it would confuse possible attempts at detection by eliminating a piece of evidence. Second, it would serve, perhaps, to win the confidence of the mad Spatio-analyst. If the Spatio-analyst felt he could talk only to his own superiors, and he might well feel that, X might persuade him to grow confidential by proving that he was already in possession of the essentials of the story.

"Undoubtedly the Spatio-analyst talked. However incoherent, mad, and generally impossible that talk might have been, X recognized it as an excellent handle for propaganda. He sent out his blackmailing letter to the Great Squires, to us. His procedure, as then planned, was probably precisely that which I attributed to Trantor at the time. If we didn't come to terms with him, he intended to disrupt Florinian production by rumors of destruction until he forced surrender.

"But then came his first miscalculation. Something frightened him. We'll consider exactly what that was later. In any case, he decided he would have to wait before continuing. Waiting, however, involved one complication. X didn't believe the Spatioanalyst's story, but there is no question that the Spatio-analyst himself was madly sincere. X would have to arrange affairs so that the Spatio-analyst would be willing to allow his 'doom' to wait.

"The Spatio-analyst could not do that unless his warped mind was put out of action. X might have killed him, but I am of the opinion that the Spatio-analyst was necessary to him as a source of further information (after all, he knew nothing of

Spatioanalysis himself and he couldn't conduct successful blackmail on total bluff) and, perhaps, as ransom in case of ultimate failure. In any case, he used a psycho-probe. After treatment, he had on his hands, not a Spatio-analyst, but a mindless idiot who would, for a time, cause him no trouble. And after a time his senses would be recovered.

"The next step? That was to make certain that during the year's wait the Spatio-analyst would not be located, that no one of importance would see him even in his role as idiot. So he proceeded with a masterly simplicity. He carried his man to Florina and for nearly a year the Spatio-analyst was simply a half-wit native, working in the kyrnt mills.

"I imagine that during that year he, or some trusted subordinate, visited the town where he had 'planted' the creature, to see that he was safe and in reasonable health. On one of these visits he learned, somehow, that the creature had been taken to a doctor who knew a psycho-probing when he saw one. The doctor died and his report disappeared, at least from his Lower City office. That was X's first miscalculation. He never thought a duplicate might be in the office above.

"And then came his second miscalculation. The idiot began regaining his senses a little too quickly and the village Townman had brains enough to see that there was something more to it than simple raving. Perhaps the girl who took care of the idiot told the Townman about the psycho-probing. That's a guess.

"There you have the story."

Fife clasped his strong hands and waited for the reaction.

Rune supplied it first. The light had turned on in his cubicle some moments earlier and he sat there, blinking and smiling. He said, "And a moderately dull story it was, Fife. Another moment in the dark and I would have been asleep."

"As nearly as I can see," said Balle slowly, "you have created a structure as insubstantial as the one of last year. It is nine tenths guesswork."

"Hogwash!" said Bort.

"Who is X, anyway?" asked Steen. "If you don't know who X is, it just doesn't make any sense." And he yawned delicately, covering his small white teeth with a bent forefinger.

Fife said, "At least one of you sees the essential point. The identity of X is the nub of the affair. Consider the characteristics that X must possess if my analysis is accurate.

"In the first place, X is a man with contacts in the Civil Service. He is a man who can order a psycho-probing. He is a man who thinks he can arrange a powerful blackmailing campaign. He is a man who can take the Spatio-analyst from Sark to Florina without trouble. He is a man who can arrange the death of a doctor on Florina. He isn't a nobody, certainly.

"In fact he is a very definite somebody. He must be a Great Squire. Wouldn't you say so?"

Bort rose from his seat. His head disappeared and he sat down again. Steen burst into high, hysterical laughter. Rune's eyes, half buried in the pulpy fat that surrounded them, glittered feverishly. Balle slowly shook his head.

Bort yelled, "Who in Space is being accused, Fife?"

"No one yet." Fife remained even-tempered. "No one specifically. Look at it this way. There are five of us. Not another man on Sark could have done what X did. Only we five. That can be taken as settled. Now which of the five is it? To begin with, it isn't myself."

"We can take your word for it, can we?" sneered Rune.

"You don't have to take my word for it," retorted Fife. "I'm the only one here without a motive. X's motive is to gain control of the kyrt industry. I have control of it. I own a third of Florina's land outright. My mills, machine plants and shipping fleets are sufficiently predominant to force any or all of you out of business if I wish. I wouldn't have to resort to complicated blackmail."

He was shouting over their united voices. "Listen to me! The rest of you have every motive. Rune has the smallest continent and the smallest holdings. I know he doesn't like that. He can't pretend he likes it. Balle has the oldest lineage. There was a time when his family ruled all of Sark. He probably hasn't forgotten that. Bort resents the fact that he is always outvoted in council and cannot therefore conduct business in his territories in quite the whip-and-blaster fashion he would like. Steen has expensive tastes and his finances are in a bad way. The necessity of recouping is a hard-driving one. We have it there. All the possible motives. Envy. Greed for power. Greed for money. Questions of prestige. Now which of you is it?"

There was a gleam of sudden malice in Balle's old eyes. "You don't know?"

"It doesn't matter. Now hear this. I said that something frightened X (let's still call him X) after his first letters to us. Do you know what it was? It was our first conference when I preached the necessity of united action. X was here. X was, and is, one of us. He knew united action meant failure. He had counted on winning over us because he knew that our rigid ideal of continental autonomy would keep us at odds to the last moment and beyond. He saw that he was wrong and he decided to wait until the sense of urgency vanished and he could proceed again.

"But he is still wrong. We will still take united action and there is only one way we can do it safely, considering that X is one of us. Continental autonomy is at an end. It is a luxury we can no longer afford, for X's schemes will end only with the economic defeat of the rest of us or the intervention of Trantor. I, myself, am the only one I can trust, so from now on I head a united Sark. Are you with me?"

They were out of their seats, shouting. Bort was waving his fist. There was a light froth at the corner of his lips.

Physically, there was nothing they could do. Fife smiled. Each was a continent away. He could sit behind his desk and watch them foam.

He said, "You have no choice. In the year since our first conference, I, too, have made my preparations. While you four have been quietly in conference, listening to me, officers loyal to myself have taken charge of the Navy."

"Treason!" they howled.

"Treason to continental autonomy," retorted Fife. "Loyalty to Sark."

Steen's fingers intertwined nervously, their ruddy, copper tips the only splash of color upon his skin. "But it's X. Even if X is one of us, there are three innocent. I'm not X." He cast a poisonous glance about him. "It's one of the others."

"Those of you who are innocent will form part of my government if they wish. They have nothing to lose."

"But you won't say who is innocent," bawled Bort. "You will keep us all out on the story of X, on the—on the——" Breathlessness brought him to a halt.

"I will not. In twenty-four hours I will know who X is. I have not told you. The Spatio-analyst we have all been discussing is now in my hands."

They fell silent. They looked at one another with reserve and suspicion.

Fife chuckled. "You are wondering which of you can be X. One of you knows, be sure of that. And in twenty-four hours we shall all know. Now keep in mind, gentlemen, that you are all quite helpless. The ships of war are mine. Good day!"

His gesture was one of dismissal.

One by one they went out, like stars in the depths of the vacuum being blotted out on the visiplat by the passing and unseen bulk of a wrecked spaceship.

Steen was the last to leave. "Fife," he said tremulously.

Fife looked up. "Yes? You wish to confess now that we two are alone? You are Steen's face twisted in wild alarm. "No, no. Really. I just wanted to ask if you're really serious. I mean, continental autonomy and all that. Really?"

Fife stared at the old chronometer in the wall. "Good day."

Steen whimpered. His hand went up to the contact switch and he, too, disappeared.

Fife sat there, stony and unmoving. With the conference over, the heat of the crisis gone, depression seized him. His lipless mouth was a severe gash in his large face.

All calculations began with this fact: that the Spatio-analyst was mad, there was no doom. But over a madman, so much had taken place. Would Junz of the I.S.B. have spent a year searching for a madman? Would he be so unyielding in his chase after fairy stories? Fife had told no one this. He scarcely dared share it with his own soul. What if the Spatio-analyst had never been mad? What if destruction dangled over the world of kyrt? The Florinian secretary glided before the Great Squire, his voice pallid and dry.

"Sir!"

"What is it?"

"The ship with your daughter has landed."

"The Spatio-analyst and the native woman are safe?"

"Yes, sir."

"Let there be no questioning in my absence. They are to be held incommunicado until I arrive. . . Is there news from Florina?"

"Yes, sir. The Townman is in custody and is being brought to Sark."

13. THE YACHTSMAN

TUE PORT'S LIGHTS brightened evenly as the twilight deepened. At no time did the over-all illumination vary from that to be expected of a somewhat subdued late afternoon. At Port 9, as at the other yacht ports of Upper City, it was daylight throughout Florina's rotation. The brightness might grow unusually pronounced under the midday sun, but that was the only deviation.

Markis Genro could tell that the day proper had passed only because, in passing into the port, he had left the colored night lights of the City behind him. Those were bright against the blackening sky but they made no pretense of substituting for day.

Genro paused just inside the main entrance and seemed in no way impressed by the gigantic horseshoe with its three dozen hangars and five take-off pits. It was part of him, as it was part of any experienced yachtsman.

He took a long cigarette, violet in color and tipped with the filmiest touch of silvery kyrt, and put it to his lips. He cupped his palms about the exposed tip and watched it glow to greenish life as he inhaled. It burned slowly and left no ash. An emerald smoke filtered out his nostrils.

He murmured, "Business as usual!"

A member of the yacht committee, in yachting costume, with only a discreet and tasteful lettering above one tunic button to indicate that he was a member of the committee, had moved up quickly to meet Genro, carefully avoiding any appearance of hurry.

"Ah, Genro! And why not business as usual?"

"Hello, Doty. I only thought that with all this fume and fuss going on it might occur to some bright boy to close the ports. Thank Sark it hasn't."

The committeeman sobered. "You know, it may come to that. Have you heard the latest?"

Genro grinned. "How can you tell the latest from the next-to-the-latest?"

"Well, have you heard that it's definite now about the native? The killer?"

"You mean they've caught him? I hadn't heard that."

"No, they haven't caught him. But they know he's not in Lower City!"

"No? Where is he then?"

"Why, in Upper City. Here."

"Go on." Genro's eyes widened, then narrowed in disbelief. "No, really," said the committeeman, a little hurt, "I have it for a fact. The patrollers are swooping up and down Kyrt Highway. They've got City Park surrounded and they're using Central Arena as a coordination point. This is all authentic."

"Well, maybe." Genro's eyes roved carelessly over the hangared ships. "I haven't been at g for two months, I think. Are there any new ships in the place?"

"No. Well, yes, there's Hjordesesse's Flame Arrow."

Genro shook his head. "I've seen that. It's all chromium and nothing else. I hate to think I'll have to end by designing my own."

"Are you selling Comet VP?" "Selling it or junking it. I'm tired of these late models. They're too automatic. With their automatic relays and trajectory computers, they're killing the sport."

"You know, I've heard others say the same thing," agreed the committeeman. "Tell you what. If I hear of an old model in good condition on the market, I'll let you know."

"Thanks. Mind if I wander about the place?"

"Of course not. Go ahead." The committeeman grinned, waved, trotted away.

Genro made his slow rounds, his cigarette, half gone, drooping from one side of his mouth. He stopped at each occupied hangar, appraising its contents shrewdly.

At Hangar 26 he displayed a heightened interest. He looked over the low barrier and said, "Squire?"

The call was one of polite inquiry, but after a pause of several moments he had to call again, a little more peremptorily, a little less politely.

The Squire who emerged to view was not an impressive sight. For one thing, he was not in yachting costume. Secondly, he needed a shave, and his rather repellent-looking skullcap was yanked down in a most unfashionable manner. It seemed to cover half his face. Lastly, his attitude was one of peculiarly suspicious over-caution.

Genro said, "I'm Markis Genro. Is this your craft, sir?"

"Yes, it is." The words were slow and tense.

Genro disregarded that. He tilted his head back and looked over the yacht's lines carefully. He removed what was left of his cigarette from between his lips and flicked it high in the air. It had not yet reached the high point of its arc when, with a little flash, it vanished.

Genro said, "I wonder if you'd mind my coming in?" The other hesitated, then stepped aside. Genro entered.

He said, "What kind of motor does the craft carry, sir?"

"Why do you ask?"

Genro was tall, skin and eyes were dark, hair crisp and cut short. He topped the other by half a head, and his smile showed white, evenly spaced teeth. He said, "To be very frank, I'm in the market for a new ship."

"You mean you're interested in this one?"

"I don't know. Something like it, maybe, if the price is right. But anyway, I wonder if you'd mind my looking at the controls and engines?"

The Squire stood there silently.

Genro's voice grew a trifle colder. "As you please, of course." He turned away.

The Squire said, "I might sell." He fumbled in his pockets. "Here's the license!"

Genro looked at each side with a quick, experienced glance. He handed it back. "You're Deamone?"

The Squire nodded. "You can come in if you wish."

Genro looked briefly at the large port-chronometer, the luminescent hands, sparking brightly even in the daylight illumination, indicating the beginning of the second hour after sunset.

"Thank you. Won't you lead the way?"

The Squire rummaged his pockets again and held out a booklet of key slivers.

"After you, sir."

Genro took the booklet. He leafed through the slivers, looking at the small code marks for the "ship stamp." The other man made no attempt to help him.

Finally he said, "This one, I suppose?"

He walked up the short ramp to the air-lock balcony and considered the fine seam at the right of the lock carefully. "I don't see— Oh, here it is," and he stepped to the other side of the lock.

Slowly, noiselessly, the lock yawned and Genro moved into the blackness. The red air-lock light went on automatically as the door closed behind them. The inner door opened and as they stepped into the ship proper white lights flickered on over all the length of the ship.

Myrlyn Terens had no choice. He no longer remembered the time, long since, when such a thing as "choice" had existed. For three long, wretched hours, now, he had remained near Deamone's ship, waiting and helpless to do anything else. It had led to nothing till now. He did not see that it could lead to anything but capture.

And then this fellow had come with an eye to the ship. To deal with him at all was madness. He could not possibly maintain his imposture at such close quarters. But then he could not possibly remain where he was, either.

At least within the ship there might be food. Strange that that had not occurred to him before.

There was.

Terens said, "It's close to dinnertime. Would you like to have something?"

The other had scarcely looked over his shoulder. "Why, later, perhaps. Thank you."

Terens did not urge him. He let him roam the ship and applied himself thankfully to the potted meat and cellulite-wrapped fruit. He drank thirstily. There was a shower across the corridor from the kitchen. He locked its door and bathed. It was a pleasure to be able to remove the tight skullcap, at least temporarily. He even found a shallow closet from which he could choose a change of clothing.

He was far more master of himself when Genro returned.

Genro said, "Say, would you mind if I tried to fly this ship?"

"I have no objection. Can you handle this model?" asked Terens with an excellent imitation of nonchalance.

"I think so," said the other with a little smile. "I flatter myself I can handle any of the regular models. Anyway, I've taken the liberty of calling the control tower and there's a take-off pit available. Here's my yachtsman's license if you'd like to see it before I take over."

Terens gave it as cursory a glance as Genro had given his. "The controls are yours," he said.

The ship rolled out of the hangar like an air-borne whale, moving slowly, its diamagnetized hull clearing the smooth-packed clay of the field by three inches.

Terens watched Genro handling the controls with finger-tip precision. The ship was a live thing under his touch. The small replica of the field that was upon the visiplat shifted and changed with each tiny motion of every contact.

The ship came to a halt, pinpointed at the lip of a take-off pit. The diamagnetic field strengthened progressively towards the ship's prow and it began tipping upward. Terens was mercifully unaware of this as the pilot room turned on its universal gimbals to meet the shifting gravity. Majestically, the ship's rear flanges fitted into the appropriate grooves of the pit. It stood upright, pointing to the sky.

The duralite cover of the take-off pit slipped into its recess, revealing the neutralized lining, a hundred yards deep, that received the first energy thrusts of the hyperatomic motors.

Genro kept up a cryptic exchange of information with the control tower. Finally, "Ten seconds to take-off," he said.

A rising red thread in a quartz tube marked off the disappearing seconds. It made contact and the first surge of power tore backward.

Terens grew heavier, felt himself pressing against the seat. Panic tore at him.

He grunted, "How does it handle?"

Genro seemed impervious to acceleration. His voice had almost its natural timbre as he said, "Moderately well."

Terens leaned back in his chair, trying to relax with the pressure, watching the stars in the visiplat turn hard and bright as the atmosphere vanished from between himself and them. The kyrt next to his skin felt cold and damp.

They were out in space now. Genro was putting the ship through its paces. Terens had no way of telling that first hand but he could see the stars march steadily across the visiplat as the yachtsman's long, slim fingers played with the controls as though they were the keys of a musical instrument. Finally a bulky orange segment of a globe filled the visiplat's clear surface.

"Not bad," said Genro. "You keep your craft in good condition, Deamone. It's small but it has its points."

Terens said carefully, "I suppose you'd like to test its speed and its jumping capacity. You may, if you like. I have no objection."

Genro nodded. "Very well. Where do you suggest we take ourselves? What about—" He hesitated, then went on, "Well, why not to Sark?"

Terens breathed a little more quickly. He had expected that. He was on the point of believing himself to be living in a world of magic. How things forced his moves, even without his connivance. It would not have been difficult to convince him that it was not "things" but design that prompted the moves. His childhood had been steeped in the

superstitions that the Squires fostered among the natives and such things are hard to outgrow. On Sark was uk with his returning memories. The game was not over.

He said wildly, "Why not, Genro?"

Genro said, "Sark it is then."

With gathering speed, the globe of Florina slanted out beyond the visiplate's view and the stars returned.

"What's your best time on the Sark-Florina run?" asked Genro.

"Nothing record-breaking," said Terens. "About average."

"Then you've done it in better than six hours, I suppose?"

"On occasion, yes."

"Do you object to my trying to shave five?"

"Not at all," said Terens.

It took hours to reach a point far enough from star-mass distortion of the space fabric to make a jump possible.

Terens found wakefulness a torture. This was his third night with little or no sleep and the tensions of the days had exaggerated that lack.

Genro looked at him askance. "Why don't you turn in?"

Terens forced an expression of liveliness onto his sagging facial muscles. He said, "It's nothing. Nothing."

He yawned prodigiously and smiled in apology. The yachtsman turned back to his instruments and Terens' eyes glazed over once again.

Seats in a space-yacht are comfortable by very necessity. They must cushion the person against accelerations. A man not particularly tired can easily and sweetly fall asleep upon them. Terens, who could, at the moment, have slept on broken glass, never knew when he passed the border line.

He slept for hours; he slept as deeply and as dreamlessly as ever in his life.

He did not stir; he showed no single sign of life other than his even breathing when the skullcap was removed from his head.

Terens woke blearily, slowly. For long minutes he had not the slightest notion of his whereabouts. He thought he was back in his Townman's cottage. The true state of affairs seeped back in stages. Eventually he could smile at Genro, who was still at the controls, and say, "I guess I fell asleep."

"I guess you did. There's Sark." Genro nodded toward the large white crescent in the visiplate.

"When do we land?"

"About an hour."

Terens was awake enough now to sense a subtle change in the other's attitude. It was an icy shock to him that the steel-gray object in Genro's hand turned out to be the graceful barrel of a needle-gun.

"What in Space——" began Terens, rising to his feet.

"Sit down," said Genro carefully. There was a skullcap in his other hand.

Terens raised a hand to his head and his fingers found themselves clutching sandy hair.

"Yes," said Genro, "it's quite obvious. You're a native."

Terens stared and said nothing.

Genro said, "I knew you were a native before I ever got on poor Deamone's ship."

Terens' mouth was cotton-dry and his eyes burned. He watched the tiny, deadly muzzle of the gun and waited for a sudden, noiseless flash. He had carried it so far, so far, and had lost the gamble after all.

Genro seemed in no hurry. He held the needle-gun steady and his words were even and slow.

"Your basic mistake, Townman, was the thought that you could really outwit an organized police force indefinitely. Even so, you would have done better if you hadn't made the unfortunate choice of Deamone as your victim."

"I didn't choose him," croaked Terens.

"Then call it luck. Aistare Deamone, some twelve hours ago, was standing in City Park, waiting for his wife. There was no reason, other than sentiment, for him to meet her there of all places. They had met in that very spot originally, and they met there again on every anniversary of that meeting. There's nothing particularly original about that sort of ceremony between young husbands and wives, but it seems important to them. Of course Deamone did not realize that the comparative isolation of the spot made him an appropriate victim for a murderer. Who would have thought that in Upper City? "In the ordinary course of events the murder might not have been discovered for days. Deamone's wife, however, was on the scene within half an hour of the crime. The fact that her husband was not there astonished her. He was not the type, she explained, to leave in a fury because she herself was a trifle late. She was often late. He would more or less have expected that. It occurred to her that her husband might be waiting for her inside 'their' cave.

"Deamone had been waiting outside 'their' cave, naturally. It was the nearest one to the scene of the assault, consequently, and the one into which he was dragged. His wife entered that cave and found—well, you know what she found. She managed to relay the news to the Patrol Corps through our own Depsec offices, although she was almost incoherent with shock and hysteria.

"How does it feel, Townman, to kill a man in cold blood, leaving him to be found by his wife at the one spot most steeped with happy memories for them both?"

Terens was choking. He gasped out, through a red mist of anger and frustration, "You Sarkites have killed millions of Florinians. Women. Children. You've grown rich out of us. This yacht——" It was all he could manage.

"Deamone wasn't responsible for the state of affairs he found at birth," said Genro. "If you had been born a Sarkite, what would you have done? Resigned your estates, if any, and gone to work in the kyrt fields?"

"Well then, shoot," cried Terens, writhing. "What are you waiting for?"

"There's no hurry. There is plenty of time to finish my story. We weren't certain as to the identity of either the corpse or the murderer, but it was a very good guess that they were Deamone and yourself respectively. It seemed obvious to us from the fact that the ashes next to the body were of a patroller uniform that you were masquerading as a Sarkite. It seemed further probable that you would make for Deamone's yacht. Don't overestimate our stupidity, Townman.

"Matters were still rather complex. You were a desperate man. It was insufficient to track you down. You were armed and would undoubtedly commit suicide if trapped. Suicide was something we did not wish. They wanted you on Sark and they wanted you in working order.

"It was a particularly delicate affair for myself and it was quite necessary to convince Depsec that I could handle it alone, that I could get you to Sark without noise or difficulty. You'll have to admit that is just what I'm doing.

"To tell you the truth, I wondered at first if you were really our man. You were dressed in ordinary business costume on the yacht-port grounds. It was in incredibly bad taste. No one, it seemed to me, would dream of impersonating a yachtsman without the proper costume. I thought you were being deliberately sent in as a decoy, that you were trying to be arrested while the man we wanted escaped in another direction.

"I hesitated and tested you in other ways. I fumbled with the ship's key in the wrong place. No ship ever invented opened at the right side of the air lock. It opens always and invariably at the left side. You never showed any surprise at my mistake. None at all. Then I asked you if your ship had ever made the Sark-Florina run in less than six hours. You said you had—occasionally. That is quite remarkable. The record time for the run is over nine hours.

"I decided you couldn't be a decoy. The ignorance was too supreme. You had to be naturally ignorant and probably the right man. It was only a question of your falling asleep (and it was obvious from your face that you needed sleep desperately), disarming you and covering you quietly with an adequate weapon. I removed your hat more out of curiosity than anything else. I wanted to see what a Sarkite costume looked like with a red-haired head sticking out of it."

Terens kept his eyes on the whip. Perhaps Genro saw his jaw muscles bunch. Perhaps he simply guessed at what Terens was thinking.

He said, "Of course I must not kill you, even if you jump me. I can't kill you even in self-defense. Don't think that gives you an advantage. Begin to move and I'll shoot your leg off."

The fight went out of Terens. He put the heels of his palms to his forehead and sat rigid.

Genro said softly, "Do you know why I tell you all this?"

Terens did not answer.

"First," said Genro, "I rather enjoy seeing you suffer. I don't like murderers and I particularly don't like natives who kill Sarkites. I've been ordered to deliver you alive but nothing in my orders says I have to make the trip pleasant for you. Secondly, it is

necessary for you to be fully aware of the situation since, after we land on Sark, the next steps will be up to you."

Terens looked up. "What!"

"Depsec knows you're coming in. The Florinian regional office sent the word as soon as this craft cleared Florina's atmosphere.

You can be sure of that. But I said it was quite necessary for me to convince Depsec that I could handle this alone and the fact that I have makes all the difference."

"I don't understand you," said Terens desperately.

With composure, Genro answered, "I said 'they' wanted you on Sark, 'they' wanted you in working order. By 'they' I don't mean Depsec, I mean Trantor!"

14. THE RENEGADE

SELIM JUNZ had never been the phlegmatic type. A year of frustration had done nothing to improve that. He could not sip wine carefully while his mental orientation sat upon suddenly trembling foundations. In short, he was not Ludigan Abel.

And when Junz had done with his angry shouting that on no account was Sark to be allowed freedom to kidnap and imprison a member of the I.S.B. regardless of the condition of Trantor's espionage network, Abel merely said, "I think you had better spend the night here, Doctor."

Junz said freezingly, "I have better things to do."

Abel said, "No doubt, man, no doubt. Just the same, if my men are being blasted to death, Sark must be bold indeed. There is a great possibility that some accident may happen to you before the night is over. Let us wait a night then and see what comes of a new day."

Junz's protests against inaction came to nothing. Abel, without ever losing his cool, almost negligent air of indifference, was suddenly hard of hearing. Junz was escorted with firm courtesy to a chamber.

In bed, he stared at the faintly luminous, frescoed ceiling (on which glowed a moderately skillful copy of Lenhaden's "Battle of the Arcturian Moons") and knew he would not sleep. Then he caught one whiff, a faint one, of the gas, somnin, and was asleep before he could catch another. Five minutes later, when a forced draft swept the room clean of the anesthetic, enough had been administered to assure a healthful eight hours.

He was awakened in the cold half-light of dawn. He blinked up at Abel.

"What time is it?" he asked.

"Six."

"Great Space." He looked about and thrust his bony legs out from under the sheet. "You're up early."

"I haven't slept."

"What?"

"I feel the lack, believe me. I don't respond to antisomnin as I did when I was younger."

Junz murmured, "If you will allow me a moment."

This once his morning preparations for the day took scarcely more than that. He re-entered the room, drawing the belt about his tunic and adjusting the magneto-seam.

"Well?" he asked. "Surely you don't wake through the night and rouse me at six unless you have something to tell me."

"You're right. You're right." Abel sat down on the bed vacated by Junz and threw his head back in a laugh. It was high-pitched and rather subdued. His teeth showed, their strong, faintly yellow plastic incongruous against his shrunken gums.

"I beg your pardon, Junz," he said. "I am not quite myself. This drugged wakefulness has me a little light-headed. I almost think I will advise Trantor to replace me with a younger man."

Junz said, with a flavor of sarcasm not entirely unmixed with sudden hope, "You find they haven't got the Spatio-analyst after all?"

"No, they do. I'm sorry but they do. I'm afraid that my amusement is due entirely to the fact that our nets are intact."

Junz would have liked to say, "Damn your nets," but refrained. Abel went on, "There is no doubt they knew Khorov was one of our agents. They may know of others on Florina. Those are small fry. The Sarkites knew that and never felt it worth while to do more than hold them under observation."

"They killed one," Junz pointed out.

"They did not," retorted Abel. "It was one of the Spatioanalyst's own companions in a patroller disguise who used the blaster."

Junz stared. "I don't understand."

"It's a rather complicated story. Won't you join me at breakfast? I need food badly."

Over the coffee, Abel told the story of the last thirty-six hours. Junz was stunned. He put down his own coffee cup, half full, and returned to it no more. "Even allowing them to have stowed away on that ship of all ships, the fact still remains they might not have been detected. If you send men to meet that ship as it lands——"

"Bah. You know better than that. No modern ship could fail to detect the presence of excess body heat."

"It might have been overlooked. Instruments may be infallible but men are not."

"Wishful thinking. Look here. At the very time that the ship with the Spatio-analyst aboard is approaching Sark, there are reports of excellent reliability that the Squire of Fife is in conference with the other Great Squires. These intercontinental conferences are spaced as widely as the stars of the Galaxy. Coincidence?"

"An intercontinental conference over a Spatio-analyst?"

"An unimportant subject in itself, yes. But we have made it important. The I.S.B. has been searching for him for nearly a year with remarkable pertinacity."

"Not the I.S.B.," insisted Junz. "Myself. I've been working in almost an unofficial manner."

"The Squires don't know that and wouldn't believe it if you told them. Then, too, Trantor has been interested."

"At my request."

"Again they don't know that and wouldn't believe it."

Junz stood up and his chair moved automatically away from the table. Hands firmly interlocked behind his back, he strode the carpet. Up and back. Up and back. At intervals he glanced harshly at Abel.

Abel turned unemotionally to a second cup of coffee.

Junz said, "How do you know all this?"

"All what?"

"Everything. How and when the Spatio-analyst stowed away. How and in what manner the Townman has been eluding capture. Is it your purpose to deceive me?"

"My dear Dr. Junz."

"You admitted you had your men watching for the Spatioanalyst independently of myself. You saw to it that I was safely out of the way last night, leaving nothing to chance." Junz remembered, suddenly, that whiff of somnin.

"I spent a night, Doctor, in constant communication with certain of my agents. What I did and what I learned comes under the heading of, shall we say, classified material. You had to be out of the way, and yet safe. What I have told you just now I learned from my agents last night."

"To learn what you did you would need spies in the Sarkite government itself."

"Well, naturally."

Junz whirled on the ambassador. "Come, now."

"You find that surprising? To be sure, Sark is proverbial for the stability of its government and the loyalty of its people. The reason is simple enough since even the poorest Sarkite is an aristocrat in comparison with Florinians and can consider himself, however fallaciously, to be a member of a ruling class.

"Consider, though, that Sark is not the world of billionaires most of the Galaxy thinks it is. A year's residence must have well convinced you of that. Eighty per cent of its population has its living standard at a par with that of other worlds and not much higher than the standard of Florina itself. There will always be a certain number of Sarkites who, in their hunger, will be sufficiently annoyed with the small fraction of the population obviously drenched in luxury to lend themselves to my uses.

"It is the great weakness of the Sarkite government that for centuries they have associated rebellion only with Florina. They have forgotten to watch over themselves."

Junz said, "These small Sarkites, assuming they exist, can't do you much good."

"Individually, no. Collectively, they form useful tools for our more important men. There are members even of the real ruling class who have taken the lessons of the last two centuries to heart. They are convinced that in the end Trantor will have established its rule over all the Galaxy, and, I believe, rightly convinced. They even suspect that the final dominion may take place within their lifetimes, and they prefer to establish themselves, in advance, on the winning side."

Junz grimaced. "You make interstellar politics sound a very dirty game."

"It is, but disapproving of dirt doesn't remove it. Nor are all its facets unrelieved dirt. Consider the idealist. Consider the few men in Sark's government who serve Trantor neither for money nor for promises of power but only because they honestly believe that a unified Galactic government is best for humanity and that only Trantor can bring such a government about. I have one such man, my best one, in Sark's Department of Security, and at this moment he is bringing in the Townman."

Junz said, "You said he had been captured."

"By Depsec, yes. But my man is Depsec and my car" For a moment Abel frowned and turned pettish. "His usefulness will be sharply reduced after this. Once he lets the Town-man get away, it will mean demotion at the best and imprisonment at the worst. Oh well!"

"What are you planning now?"

"I scarcely know. First, we must have our Townman. I am sure of him only to the point of arrival at the spaceport. What happens thereafter . . ." Abel shrugged, and his oily, yellowish skin stretched parchmentlike over his cheekbones.

Then he added, "The Squires will be waiting for the Town-man as well. They are under the impression they have him, and until one or the other of us has him in our fists, nothing more can happen."

But that statement was wrong.

Strictly speaking, all foreign embassies throughout the Galaxy maintained extraterritorial rights over the immediate areas of their location. Generally this amounted to nothing more than a pious wish, except where the strength of the home planet enforced respect. In actual practice it meant that only Trantor could truly maintain the independence of its envoys.

The grounds of the Trantorian Embassy covered nearly a square mile and within it armed men in Trantorian costumes and insignia maintained patrol. No Sarkite might enter but on invitation, and no armed Sarkite on any account. To be sure, the sum of Trantorian men and arms could withstand the determined attack of a single Sarkite armored regiment for not more than two or three hours, but behind the small band was the power of reprisal from the organized might of a million worlds.

It remained inviolate.

It could even maintain direct material communication with Trantor, without the need of passing through Sarkite ports of entry or debarkation. From the hold of a Trantorian mothership, hovering just outside the hundred-mile limit that marked off the boundary between "planetary space" and "free space," small gyro-ships, vane-equipped for atmospheric travel with minimum power expenditure, might emerge and needle down (half coasting, half driven) to the small port maintained within the embassy grounds.

The gyro-ship which now appeared over the embassy port, however, was neither scheduled nor Trantorian. The mosquito-might of the embassy was brought quickly and truculently into play. A needle-cannon lifted its puckered muzzle into the air. Force screens went up.

Radioed messages whipped back and forth. Stubborn words rode the impulses upward, agitated ones slipped down.

Lieutenant Camrum turned away from the instrument and said, "I don't know. He claims he'll be shot out of the sky in two minutes if we don't let him down. He claims sanctuary."

Captain Elyut had just entered. He said, "Sure. Then Sark will claim we're interfering in politics and if Trantor decides to let things ride, you and I are broken as a gesture. 'Who is he?'"

"Won't say," said the lieutenant with more than a little exasperation. "Says he must speak to the Ambassador. Suppose you tell me what to do, Captain."

The short-wave receiver sputtered and a voice, half hysterical, said, "Is anyone there? I'm just coming down, that's all. Really! I can't wait another moment, I tell you." It ended in a squeak.

The captain said, "Great Space, I know that voice. Let him down! My responsibility!"

The orders went out. The gyro-ship sank vertically, more quickly than it should have, the result of a hand at the controls that was both inexperienced and panicky. The needle-cannon maintained focus.

The captain established a through line to Abel and the embassy was thrown into full emergency. The flight of Sarkite ships that hovered overhead not ten minutes after the first vessel had landed maintained a threatening vigil for two hours, then departed. They sat at dinner, Abel, Junz and the newcomer. With admirable aplomb, considering the circumstances, Abel had acted the unconcerned host. For hours he had refrained from asking why a Great Squire needed sanctuary.

Junz was far less patient. He hissed at Abel, "Space! What are you going to do with him?"

And Abel smiled back. "Nothing. At least until I find out whether I have my Towrman or not. I like to know what my hand is before tossing chips onto the table. And since he's come to me, waiting will rattle him more than it will us."

He was right. Twice the Squire launched into rapid monolog and twice Abel said, "My dear Squire! Surely serious conversation is unpleasant on an empty stomach." He smiled gently and ordered dinner.

Over the wine, the Squire tried again. He said, "You'll want to know why I have left Steen Continent."

"I cannot conceive of any reason," admitted Abel, "for the Squire of Steen ever to have fled from Sarkite vessels."

Steen watched them carefully. His slight figure and thin, pale face were tense with calculation. His long hair was bound into carefully arranged tufts held by tiny clips that rubbed against one another with a rustling sound whenever he moved his head, as though to call attention to his disregard for the current Sarkite clipped-hair fashion. A faint fragrance came from his skin and clothing.

Abel, who did not miss the slight tightening of Junz's lips and the quick way in which the Spatio-analyst patted his own short, woolly hair, thought how amusing Junz's reaction might have been if Steen had appeared more typically, with rouged cheeks and coppered fingernails.

Steen said, "There was an intercontinental conference today."

"Really?" said Abel.

Abel listened to the tale of the conference without a quiver of countenance.

"And we have twenty-four hours," Steen said indignantly. "It's sixteen hours now. Really!"

"And you're X," cried Junz, who had been growing increasingly restless during the recitation. "You're X. You've come here because he's caught you. Well now, that's fine. Abel, here's our proof as to the identity of the Spatio-analyst. We can use him to force a surrender of the man."

Steen's thin voice had difficulty making itself heard over Junz's staunch baritone.

"Now really. I say, now really. You're mad. Stop it! Let me speak, I tell you. . . Your Excellency, I can't remember this man's name."

"Dr. Selim Junz, Squire."

"Well then, Dr. Selim Junz, I have never in my life seen this idiot or Spatio-analyst or whatever in the world he may be. Really! I never heard such nonsense. I am certainly not X. Really! I'll thank you not even to use the silly letter. Imagine believing Fife's ridiculous melodrama! Really!"

Junz clung to his notion. "Why did you run then?"

"Good Sark, isn't it clear? Oh, I could choke. Really! Look here, don't you see what Fife was doing?"

Abel interrupted quietly. "If you'll explain, Squire, there will be no interruptions."

"Well, thank you at least." He continued, with an air of wounded dignity. "The others don't think much of me because I don't see the point of bothering with documents and statistics and all those boring details. But, really, what is the Civil Service for, I'd like to know? If a Great Squire can't be a Great Squire? "Still that doesn't mean I'm a ninny, you know, just because I like my comfort. Really! Maybe the others are blind, but I can see that Fife doesn't give a darn for the Spatio-analyst. I don't even think he exists. Fife just got the idea a year ago and he's been manipulating it ever since.

"He's been playing us for fools and idiots. Really! And so the others are. Disgusting fools! He's arranged all this perfectly awful nonsense about idiots and Spatio-analysis. I wouldn't be surprised if the native who's supposed to be killing patrollers by the dozen isn't just one of Fife's spies in a red wig. Or if he's a real native, I suppose Fife has hired him.

"I wouldn't put it past Fife. Really! He would use natives against his own kind. That's how low he is.

"Anyway, it's obvious that he's using it just as an excuse to ruin the rest of us and to make himself dictator of Sark. Isn't it obvious to you? "There isn't any X at all, but tomorrow, unless he's stopped, he'll spread the sub-etherics full of conspiracies and declarations of emergencies and he'll have himself declared Leader. We haven't had a Leader on Sark in five hundred years but that won't stop Fife. He'd just let the constitution go hang. Really!

"Only I mean to stop him. That's why I had to leave. If I were still in Steen, I'd be under house arrest.

"As soon as the conference was over I had my own personal port checked, and, you know, his men had taken over. It was in clear disregard of continental autonomy. It was the act of a cad. Really! But nasty as he is, he isn't so bright. He thought some of us might try to leave the planet so he had the spaceports watched, but"—here he smiled in

vulpine fashion and emitted the ghost of a giggle—"it didn't occur to him to watch the gyro-ports.

"Probably he thought there wasn't a place on the planet that would be safe for us. But I thought of the Trantorian Embassy. It's more than the others did. They make me tired. Especially Bort. Do you know Bort? He's terribly uncouth. Actually dirty. Talks at me as though there were something wrong with being clean and smelling pleasant."

He put his finger tips to his nose and inhaled gently.

Abel put a light hand on Junz's wrist as the latter moved restlessly in his seat. Abel said, "You have left a family behind. Have you thought that Fife can still hold a weapon over you?"

"I couldn't very well pile all my pretty ones in my gyroplane." He reddened a trifle. "Fife wouldn't dare touch them. Besides, I'll be back in Steen tomorrow."

"How?" asked Abel.

Steen looked at him in astonishment. His thin lips parted. "I'm offering alliance, Your Excellency. You can't pretend Trantor isn't interested in Sark. Surely you'll tell Fife that any attempt to change Sark's constitution would necessitate Trantor's intervention."

"I scarcely see how that can be done, even if I felt my government would back me," said Abel.

"How can it not be done?" asked Steen indignantly. "If he controls the entire kyrt trade he'll raise the price, ask concessions for rapid delivery and all sorts of things."

"Don't the five of you control the price as is?"

Steen threw himself back in the seat. "Well, really! I don't know all the details. Next you'll be asking me for figures. Goodness, you're as bad as Bort." Then he recovered and giggled. "I'm just teasing, of course. What I mean is that, with Fife out of the way, Trantor might make an arrangement with the rest of us. In return for your help, it would only be right that Trantor get preferential treatment, or even maybe a small interest in the trade."

"And how would we keep intervention from developing into a Galaxy-wide war?"

"Oh, but really, don't you see? It's plain as day. You wouldn't be aggressors. You would just be preventing civil war to keep the kyrt trade from disruption. I'd announce that I'd appealed to you for help. It would be worlds removed from aggression. The whole Galaxy would be on your side. Of course, if Trantor benefits from it afterward, why, that's nobody's business at all. Really!"

Abel put his gnarled fingers together and regarded them. "I can't believe you really mean to join forces with Trantor."

An intense look of hatred passed momentarily over Steen's weakly smiling face. He said, "Rather Trantor than Fife."

Abel said, "I don't like threatening force. Can't we wait and let matters develop a bit——"

"No, no," cried Steen. "Not a day. Really! If you're not firm now, right now, it will be too late. Once the deadline is past, he'll have gone too far to retreat without losing face. If you'll help me now, the people of Steen will back me, the other Great Squires will join me. If you wait even a day, Fife's propaganda mill will begin to grind. I'll be smeared

as a renegade. Really! !! A renegade! He'll use all the anti-Trantor prejudice he can whip up and you know, meaning no offense, that's quite a bit."

"Suppose we ask him to allow us to interview the Spatioanalyst?"

"What good will that do? He'll play both ends. He'll tell us the Florinian idiot is a Spatio-analyst, but he'll tell you the Spatio-analyst is a Florinian idiot. You don't know the man. He's awful!"

Abel considered that. He hummed to himself, his forefinger keeping gentle time. Then he said, "We have the Townman, you know."

"What Townman?"

"The one who killed the patrollers and the Sarkite."

"Oh! Well, really! Do you suppose Fife will care about that if it's a question of taking all Sark?"

"I think so. You see, it isn't that we have the Townman. It's the circumstances of his capture. I think, Squire, that Fife will listen to me and listen very humbly, too."

For the first time in his acquaintance with Abel, Junz sensed a lessening of coolness in the old man's voice, a substitution for it of satisfaction, almost of triumph.

15. THE CAPTIVE

IT WAS not very usual for the Lady Samia of Fife to feel frustrated. It was unprecedented, even inconceivable, that she had felt frustrated for hours now.

The commander of the spaceport was Captain Racety all over again. He was polite, almost obsequious, looked unhappy, expressed his regrets, denied the least willingness to contradict her, and stood like iron against her plainly stated wishes.

She was finally forced from stating her desires to demanding her rights as though she were a common Sarkite. She said, "I suppose that as a citizen I have the right to meet any incoming vessel if I wish." - She was poisonous about it.

The commander cleared his throat and the expression of pain on his lined face grew, if anything, clearer and more definite. Finally he said, "As a matter of fact, my Lady, we have no wish at all to exclude you. It is only that we have received specific orders from the Squire, your father, to forbid your meeting the ship."

Samia said frozenly, "Are you ordering me to leave the port, then?"

"No, my Lady." The commander was glad to compromise. "We were not ordered to exclude you from the port. If you wish to remain here you may do so. But, with all due respect, we will have to stop you from approaching closer to the pits."

He was gone and Samia sat in the futile luxury of her private ground-car, a hundred feet inside the outermost entrance of the port. They had been waiting and watching for her. They would probably keep on watching her. If she as much as rolled a wheel onward, she thought indignantly, they would probably cut her power-drive.

She gritted her teeth. It was unfair of her father to do this. It was all of a piece. They always treated her as though she understood nothing. Yet she had thought he understood.

He had risen from his seat to greet her, a thing he never did for anyone else now that Mother was dead. He had clasped her, squeezed her tightly, abandoned all his work for her. He had even sent his secretary out of the room because he knew she was repelled by the native's still, white countenance.

It was almost like the old days before Grandfather died when Father had not yet become Great Squire.

He said, "Mia, child, I've counted the hours. I never knew it was such a long way from Florina. When I heard that those natives had hidden on your ship, the one I had sent just to insure your safety, I was nearly wild."

"Daddy! There was nothing to worry about."

"Wasn't there? I almost sent out the entire fleet to take you off and bring you in with full military security."

They laughed together at the thought. Minutes passed before Samia could bring the conversation back to the subject that filled her.

She said casually, "What are you going to do with the stowaways, Dad?"

"Why do you want to know, Mia?"

"You don't think they've plans to assassinate you, or anything like that?"

Fife smiled. "You shouldn't think morbid thoughts."

"You don't think so, do you?" she insisted.

"Of course not."

"Good! Because I've talked to them, Dad, and I just don't believe they're anything more than poor harmless people. I don't care what Captain Racety says."

"They've broken a considerable number of laws for 'poor harmless people,' Mia."

"You can't treat them as common criminals, Dad." Her voice rose in alarm.

"How else?"

"The man isn't a native. He's from a planet called Earth and he's been psycho-probed and he's not responsible."

"Well then, dear, Depsec will realize that. Suppose you leave it to them."

"No, it's too important to just leave to them. They won't understand. Nobody understands. Except me!"

"Only you in the whole world, Mia?" he - asked indulgently, and put out a finger to stroke a lock of hair that had fallen over her forehead.

Samia said with energy, "Only !! Only !! Everyone else is going to think he's crazy, but I'm sure he isn't. He says there is some great danger to Florina and to all the Galaxy. He's a Spatio-analyst and you know they specialize in cosmogony. He would know "How do you know he's a Spatio-analyst, Mia?"

"He says so."

"And what are the details of the danger?"

"He doesn't know. He's been psycho-probed. Don't you see that that's the best evidence of all? He knew too much. Someone was interested in keeping it dark." Her voice instinctively fell and grew huskily confidential. She restrained an impulse to look over her shoulder. She said, "If his theories were false, don't you see, there wouldn't have been any need to psycho-probe him."

"Why didn't they kill him, if that's the case?" asked Fife and instantly regretted the question. There was no use in teasing the girl.

Samia thought awhile, fruitlessly, then said, "If you'll order Depsec to let me speak to him, I'll find out. He trusts me. I know he does. I'll get more out of him than Depsec can. Please tell Depsec to let me see him, Dad. It's very important."

Fife squeezed her clenched fists gently and smiled at her. "Not yet, Mia. Not yet. In a few hours we'll have the third person in our hands. After that, perhaps."

"The third person? The native who did all the killings?"

"Exactly. The ship carrying him will land in about an hour."

"And you won't do anything with the native girl and the Spatio-analyst till then?"

"Not a thing."

"Good! I'll meet the ship." She rose.

"Where are you going, Mia?"

"To the port, Father. I have a great deal to ask of this other native." She laughed.
"I'll show you that your daughter can be quite a detective."

But Fife did not respond to her laughter. He said, "I'd rather you didn't."

"Why not?"

"It's essential that there be nothing out of the way about this man's arrival. You'd be too conspicuous at the port."

"What of it?"

"I can't explain statecraft to you, Mia."

"Statecraft, pooh." She leaned toward him, pecked a quick kiss at the center of his forehead and was gone.

Now she sat helplessly car-bound in the port while far overhead there was a growing speck in the sky, dark against the brightness of the late afternoon.

She pressed the button that opened the utility compartment and took out her polo-glasses. Ordinarily they were used to follow the gyrating antics of the one-man speedsters which took part in stratospheric polo. They could be put to more serious use too. She put them to her eyes and the descending dot became a ship in miniature, the ruddy glow of its stern drive plainly visible.

She would at least see the men as they left, learn as much as she could by the one sense of sight, arrange an interview somehow, somehow thereafter.

Sark filled the visiplate. A continent and half an ocean, obscured in part by the dead cotton-white of clouds, lay below.

Genro said, his words a trifle uneven as the only indication that the better part of his mind was perforce on the controls before him, "The spaceport will not be heavily guarded. That was at my suggestion too. I said that any unusual treatment of the arrival of the ship might warn Trantor that something was up. I said that success depended upon Trantor being at no time aware of the true state of affairs until it was too late. Well, never mind that."

Terens shrugged his shoulders glumly. "What's the difference?"

"Plenty, to you. I will use the landing pit nearest the East Gate. You will get out the safety exit in the rear as soon as I land. Walk quickly but not too quickly toward that gate. I have some papers that may get you through without trouble and may not. I'll leave it to you to take necessary action if there is trouble. From past history, I judge I can trust you that far. Outside the gate there will be a car waiting to take you to the embassy. That's all."

"What about you?"

Slowly Sark was changing from a huge featureless sphere of blinding browns and greens and blues and cloud-white into something more alive, into a surface broken by rivers and wrinkled by mountains.

Genro's smile was cool and humorless. "Your worries may end with yourself. When they find you gone, I may be shot as a traitor. If they find me completely helpless and physically unable to stop you, they may merely demote me as a fool. The latter, I suppose, is preferable, so I will ask you, before you leave, to use a neuron whip on me."

The Townman said, "Do you know what a neuronc whip is like?"

"Quite." There were small drops of perspiration at his temples. "How do you know I won't kill you afterward? I'm a Squire-killer, you know."

"I know. But killing me won't help you. It will just waste your time. I've taken worse chances."

The surface of Sark as viewed in the visiplat was expanding, its edges rushed out past the border of visibility, its center grew and the new edges rushed out in turn. Something like the rainbow of a Sarkite city could be made out.

"I hope," said Genro, "you have no ideas of striking out on your own. Sark is no place for that. It's either Trantor or the Squires. Remember."

The view was definitely that of a city now and a green-brown patch on its outskirts expanded and became a spaceport below them. It floated up toward them at a slowing pace.

Genro said, "If Trantor doesn't have you in the next hour the Squires will have you before the day is out. I don't guarantee what Trantor will do to you, but I can guarantee what Sark will do to you."

Terens had been in the Civil Service. He knew what Sark would do with a Squire-killer.

The port held steady in the visiplat, but Genro no longer regarded it. He was switching to instruments, riding the pulse-beam downward. The ship turned slowly in air, a mile high, and settled, tail down.

A hundred yards above the pit, the engines thundered high. Over the hydraulic springs, Terens could feel their shuddering. He grew giddy in his seat.

Genro said, "Take the whip. Quickly now. Every second is important. The emergency lock will close behind you. It will take them five minutes to wonder why I don't open the main lock, another five minutes to break in, another five minutes to find you. You have fifteen minutes to get out of the port and into the car."

The shuddering ceased and in the thick silence Terens knew they had made contact with Sark.

The shifting diamagnetic fields took over. The yacht tipped majestically and slowly moved down upon its side.

Genro said, "Now!" His uniform was wet with perspiration.

Terens, with swimming head, and eyes that all but refused to focus, raised his neuronc whip. .

Terens felt the nip of a Sarkite autumn. He had spent years in its harsh seasons until he had almost forgotten the soft eternal June of Florina. Now his days in Civil Service rushed back upon him as though he had never left this world of Squires.

Except that now he was a fugitive and branded upon him was the ultimate crime, the murder of a Squire.

He was walking in time to the pounding of his heart. Behind him was the ship and in it was Genro, frozen in the agony of the whip. The lock had closed softly behind him, and he was walking down a broad, paved path. There were workmen and mechanics in

plenty about him. Each had his own job and his own troubles. They didn't stop to stare a man in the face. They had no reason to.

Had anyone actually seen him emerge from the ship? He told himself no one had, or by now there would have been the clamor of pursuit.

He touched his hat briefly. It was still down over his ears, and the little medallion it now carried was smooth to the touch. Genro had said that it would act as identification. The men from Trantor would be watching for just that medallion, glinting in the sun.

He could remove it, wander away on his own, find his way to another ship—somehow. He would get away from Sark—somehow. He would escape—somehow.

Too many somehows! In his heart he knew he had come to the final end, and as Genro had said, it was either Trantor or Sark. He hated and feared Trantor, but he knew that in any choice it could not and must not be Sark.

"You! You there!"

Terens froze. He looked up in cold panic. The gate was a hundred feet away. If he ran. . . But they wouldn't allow a running man to get out. It was a thing he dared not do. He must not run.

The young woman was looking out the open window of a car such as Terens had never seen, not even during fifteen years on Sark. It gleamed with metal and sparkled with translucent gem mite.- She said, "Come here."

Terens' legs carried him slowly to the car. Genro had said Trantor's car would be waiting outside the port. Or had he? And would they send a woman on such an errand? A girl, in fact. A girl with a dark, beautiful face.

She said, "You arrived on the ship that just landed, didn't you?"

He was silent.

She became impatient. "Come, I saw you leave the ship!" She tapped her polo-glasses. He had seen such glasses before.

Terens mumbled, "Yes. Yes."

"Get in then."

She held the door open for him. The car was even more luxurious inside. The seat was soft and it all smelled new and fragrant and the girl was beautiful. - She said, "Are you a member of the crew?"

She was testing him, Terens imagined. He said, "You know who I am." He raised his fingers momentarily to the medallion.

Without any sound of motive power the car backed and turned.

At the gate Terens shrank back into the soft, cool, kyrt-covered upholstery, but there was no need for caution. The girl spoke peremptorily and they passed through.

She said, "This man is with me. I am Samia of Fife."

It took seconds for the tired Terens to hear and understand that. When he lurched tensely forward in his seat the car was travelling along the express lanes at a hundred per.

A laborer within the port looked up from where he stood and muttered briefly into his lapel. He entered the building then and returned to his work. His superintendent

frowned and made a mental note to talk to Tip about this habit of lingering outside to smoke cigarettes for half an hour at a time.

Outside the port one of two men in a ground-car said with annoyance, "Got into a car with a girl? What car? What girl?" For all his Sarkite costume, his accent belonged definitely to the Arcturian worlds of the Trantorian Empire.

His companion was a Sarkite, well versed in the visicast news releases. When the car in question rolled through the gate and picked up speed as it began to veer off and upward to the express level, he half rose in his seat and cried, "It's the Lady Samia's car. There isn't another like it. Good Galaxy, what do we do?"

"Follow," said the other briefly.

"But the Lady Samia—"

"She's nothing to me. She shouldn't be anything to you either. Or what are you doing here?"

Their own car was making the turn, climbing upward onto the broad, nearly empty stretches on which only the speediest of ground travel was permitted.

The Sarkite groaned, "We can't catch that car. As soon as she spots us she'll kick out resistance. That car can make two-fifty."

"She's staying at a hundred so far," said the Arcturian.

After a while he said, "She's not going to Depsec. That's for sure."

And after another while he said, "She's not going to the Palace of Fife."

Still another interval and he said, "I'll be spun in space if I know where she's going. She'll be leaving the city again."

The Sarkite said, "How do we know it's the Squire-killer that's in there? Suppose it's a game to get us away from the post. She's not trying to shake us and she wouldn't use a car like that if she didn't want to be followed. You can't miss it at two miles."

"I know, but Fife wouldn't send his girl to get us out of the way. A squad of patrollers would have done the job better."

"Maybe it isn't really the Lady in it."

"We're going to find out, man. She's slowing. Flash past and stop around a curve!"

"I want to speak to you," said the girl.

Terens decided it was not the ordinary kind of trap he had first considered it. She was the Lady of Fife. She must be. It did not seem to occur to her that anyone could or ought to interfere with her.

She had never looked back to see if she were followed. Three times as they turned he had noted the same car to the rear, keeping its distance, neither closing the gap nor falling behind.

It was not just a car. That was certain. It might be Trantor, which would be well. It might be Sark, in which case the Lady would be a decent sort of hostage.

He said, "I'm ready to speak."

She said, "You were on the ship that brought the native from Florina? The one wanted for all those killings?"

"I said I was."

"Very well. Now I've brought you out here so that there'll be no interference. Was the native questioned during the trip to Sark?"

Such naiveté, Terens thought, could not be assumed. She really did not know who he was. He said guardedly, "Yes."

"Were you present at the questioning?"

"Yes."

"Good. I thought so. Why did you leave the ship, by the way?"

That, thought Terens, was the question she should have asked first of all.

He said, "I was to bring a special report to——" He hesitated. She seized on the hesitation eagerly. "To my father? Don't worry about that. I'll protect you completely. I'll say you came with me at my orders."

He said, "Very well, my Lady."

The words "my Lady" struck deeply into his own consciousness. She was a Lady, the greatest in the land, and he was a Florinian. A man who could kill patrollers could learn easily how to kill Squires, and a Squire-killer might, by the same token, look a Lady in the face.

He looked at her, his eyes hard and searching. He lifted his head and stared down at her.

She was very beautiful.

And because she was the greatest Lady in the land, she was unconscious of his regard. She said, "I want you to tell me everything that you heard at the questioning. I want to know all that was told to you by the native. It's very important."

"May I ask why you are interested in the native, my Lady?"

"You may not," she said flatly.

"As you wish, my Lady."

He didn't know what he was going to say. With half his consciousness he was waiting for the pursuing car to catch up. With the other half he was growing more aware of the face and body of the beautiful girl sitting near him.

Florinians in the Civil Service and those acting as Townmen were, theoretically, celibates. In actual practice, most evaded that restriction when they could. Terens had done what he dared and what was expedient in that direction. At best, his experiences had never been satisfactory.

So it was all the more important that he had never been so near a beautiful girl in a car of such luxuriance under conditions of such isolation.

She was waiting for him to speak, dark eyes (such dark eyes) aflame with interest, full red lips parted in anticipation, a figure more beautiful for being set off in beautiful kyrt. She was completely unaware that anyone, anyone, could possibly dare harbor dangerous thought with regard to the Lady of Fife.

The half of his consciousness that waited for the pursuers faded out. He suddenly knew that the killing of a Squire was not the ultimate crime after all.

He wasn't quite aware that he moved. He knew only that her small body was in his arms, that it stiffened, that for an instant she cried out, and then he smothered the cry with his lips.

There were hands on his shoulder and the drift of cool air on his back through the opened door of the car. His fingers groped for his weapon, too late. It was ripped from his hand.

Samia gasped wordlessly.

The Sarkite said with horror, "Did you see what he did?"

The Arcturian said, "Never mind!"

He put a small black object into his pocket and smoothed the seam shut. "Get him," he said.

The Sarkite dragged Terens out of the car with the energy of fury. "And she let him," he muttered. "She let him."

"Who are you?" cried Samia with sudden energy. "Did my father send you?"

The Arcturian said, "No questions, please."

"You're a foreigner," said Samia angrily.

The Sarkite said, "By Sark, I ought to bust his head in." He cocked his fist.

"Stop it!" said the Arcturian. He seized the Sarkite's wrist and forced it back.

The Sarkite growled sullenly, "There are limits. I can take the Squire-killing. I'd like to kill a few myself, but standing by and watching a native do what he did is just about too much for me."

Samia said in an unnaturally high-pitched voice, "Native?" The Sarkite leaned forward, snatched viciously at Terens' cap. The Townman paled but did not move. He kept his gaze steadily upon the girl and his sandy hair moved slightly in the breeze.

Samia moved helplessly back along the car seat as far as she could and then, with a quick movement, she covered her face with both hands, her skin turning white under the pressure of her fingers.

The Sarkite said, "What are we going to do with her?"

"Nothing."

"She saw us; She'll have the whole planet after us before we've gone a mile."

"Are you going to kill the Lady of Fife?" asked the Arcturian sarcastically.

"Well, no. But we can wreck her car. By the time she gets to a radio-phone, we'll be all right."

"Not necessary." The Arcturian leaned into the car. "My Lady, I have only a moment. Can you hear me?"

She did not move.

The Arcturian said, "You had better hear me. I am sorry I interrupted you at a tender moment but luckily I have put that moment to use. I acted quickly and was able to record the scene by tri-camera. This is no bluff. I will transmit the negative to a safe place minutes after I leave you and thereafter any interference on your part will force me to be rather nasty. I'm sure you understand me."

He turned away. "She won't say anything about this. Not a thing. Come along with me, Townman."

Terens followed. He could not look back at the white, pinched face in the car.

Whatever might now follow, he had accomplished a miracle. For one moment he had kissed the proudest Lady on Sark, had felt the fleeting touch of her soft, fragrant lips.

16. THE ACCUSED

DIPLOMACY has a language and a set of attitudes all its own. Relationships between the representatives of sovereign states, if conducted strictly according to protocol, are stylized and stultifying. The phrase "unpleasant consequences" becomes synonymous with war and "suitable adjustment" with surrender.

When on his own, Abel preferred to abandon diplomatic double-talk. With a tight personal beam connecting himself and Fife, he might merely have been an elderly man talking amiably over a glass of wine.

He said, "You have been hard to reach, Fife."

Fife smiled. He seemed at ease and undisturbed. "A busy day, Abel."

"Yes. I've heard a bit about it."

"Steen?" Fife was casual.

"Partly. Steen's been with us about seven hours."

"I know. My own fault, too. Are you considering turning him over to us?"

"I'm afraid not."

"He's a criminal."

Abel chuckled and turned the goblet in his hand, watching the lazy bubbles. "I think we can make out a case for his being a political refugee. Interstellar law will protect him on Trantorian territory."

"Will your government back you?"

"I think it will, Fife. I haven't been in the foreign service for thirty-seven years without knowing what Trantor will back and what it won't."

"I can have Sark ask for your recall."

"What good would that do? I'm a peaceable man with whom you are well acquainted. My successor might be anybody."

There was a pause. Fife's leonine countenance puckered. "I think you have a suggestion."

"I do. You have a man of ours."

"What man of yours?"

"A Spatio-analyst. A native of the planet Earth, which, by the way, is part of the Trantorian domain."

"Steen told you this?"

"Among other things."

"Has he seen this Earthman?"

"He hasn't said he has."

"Well, he hasn't. Under the circumstances, I doubt that you can have faith in his word."

Abel put down his glass. He clasped his hands loosely in his lap and said, "Just the same, I'm sure the Earthman exists. I tell you, Fife, we should get together on this. I have

Steen and you have the Earthman. In a sense we're even. Before you go on with your current plans, before your ultimatum expires and your coup d'état takes place, why not a conference on the kyrt situation generally?"

"I don't see the necessity. What is happening on Sark now is an internal matter entirely. I'm quite willing to guarantee personally that there will be no interference with the kyrt trade regardless of political events here. I think that should end Trantor's legitimate interests."

Abel sipped at his wine, seemed to consider. He said, "It seems we have a second political refugee. A curious case. One of your Florinian subjects, by the way. A Townman. Myrlyn Terens, he calls himself."

Fife's eyes blazed suddenly. "We half suspected that. By Sark, Abel, there's a limit to the open interference of Trantor on this planet. The man you have kidnapped is a murderer. You can't make a political refugee out of him."

"Well, now, do you want the man?"

"You have a deal in mind? Is that it?"

"The conference I spoke of."

"For one Florinian murderer. Of course not."

"But the manner in which the Townman managed to escape to us is rather curious. You may be interested. . ."

Junz paced the floor, shaking his head. The night was already well advanced. He would like to be able to sleep but he knew he would require somnolence once again.

Abel said, "I might have had to threaten force, as Steen suggested. That would have been bad. The risks would have been awful, the results uncertain. Yet until the Townman was brought to us I saw no alternative, except of course, a policy of doing nothing."

Junz shook his head violently. "No. Something had to be done. Yet it amounted to blackmail."

"Technically, I suppose so. What would you have had me do?"

"Exactly what you did. I'm not a hypocrite, Abel. Or I try not to be. I won't condemn your methods when I intend to make full use of the results. Still, what about the girl?"

"She won't be hurt as long as Fife keeps his bargain."

"I'm sorry for her. I've grown to dislike the Sarkite aristocrats for what they've done to Florina, but I can't help feeling sorry for her."

"As an individual, yes. But the true responsibility lies with Sark itself. Look here, old man, did you ever kiss a girl in a ground-car?"

The tip of a smile quivered at the corners of Junz's mouth. "Yes."

"So have I, though I have to call upon longer memories than you do, I imagine. My eldest granddaughter is probably engaged in the practice at this moment, I shouldn't wonder. What is a stolen kiss in a ground-car, anyway, except the expression of the most natural emotion in the Galaxy? "Look here, man. We have a girl, admittedly of high social standing, who, through mistake, finds herself in the same car with, let us say, a criminal.

He seizes the opportunity to kiss her. It's on impulse and without her consent. How ought she to feel? How ought her father to feel? Chagrined? Perhaps. Annoyed? Certainly. Angry? Offended? Insulted? All that, yes. But disgraced? Not disgraced enough to be willing to endanger important affairs of state to avoid exposure? Nonsense.

"But that's exactly the situation and it could happen only on Sark. The Lady Samia is guilty of nothing but willfulness and a certain naïveté. She has, I am sure, been kissed before. If she kissed again, if she kissed innumerable times, anyone but a Florinian, nothing would be said. But she did kiss a Florinian.

"It doesn't matter that she did not know he was a Florinian. It doesn't matter that he forced the kiss upon her. To make public the photograph we have of the Lady Samia in the arms of the Florinian would make life unbearable for her and for her father. I saw Fife's face when he stared at the reproduction. There was no way of telling for certain that the Townman was a Florinian. He was in Sarkite costume with a cap that covered his hair well. He was light-skinned, but that was inconclusive. Still, Fife knew that the rumor would be gladly believed by many who were interested in scandal and sensation and that the picture would be considered incontrovertible proof. And he knew that his political enemies would make the greatest possible capital out of it. You may call it blackmail, Junz, and maybe it is, but it's a blackmail that would not work on any other planet in the Galaxy. Their own sick social system gave us this weapon and I have no compunction about using it."

Junz sighed. "What's the final arrangement?"

"We'll meet at noon tomorrow."

"His ultimatum has been postponed then?"

"Indefinitely. I will be at his office in person."

"Is that a necessary risk?"

"It's not much of one. There will be witnesses. And I am anxious to be in the material presence of this Spatio-analyst you have been searching for so long."

"I'll attend?" asked Junz anxiously.

"Oh yes. The Townman as well. We'll need him to identify the Spatio-analyst. And Steen, of course. All of you will be present by trimensic personification."

"Thank you."

The Trantorian Ambassador smothered a yawn and blinked at Junz through watering eyes. "Now, if you don't mind, I've been awake for two days and a night and I'm afraid my old body can take no more antisomnin. I must sleep."

With trimensic personification perfected, important conferences were rarely held face to face. Fife felt strongly an element of actual indecency in the material presence of the old Ambassador. His olive complexion could not be said to have darkened, but its lines were set in silent anger.

It had to be silent. He could say nothing. He could only stare sullenly at the men who faced him.

Abel! An old dotard in shabby clothes with a million worlds behind him.

Junz, a dark-skinned, woolly-haired interferer whose perseverance had precipitated the crisis.

Steen! The traitor! Afraid to meet his eyes! The Townman! To look at him was most difficult of all. He was the native who had dishonored his daughter with his touch yet who could remain safe and untouchable behind the walls of the Trantorian Embassy. He would have been glad to grind his teeth and pound his desk if he had been alone. As it was, not a muscle of his face must move though it tore beneath the strain.

If Samia had not . . . He dropped that. His own negligence had cultivated her willfulness and he could not blame her for it now. She had not tried to excuse herself or soften her own guilt. She had told him all the truth of her private attempts to play the interstellar spy and how horribly it had ended. She had relied completely, in her shame and bitterness, on his understanding, and she would have that much. She would have that much, if it meant the ruin of the structure he had been building.

He said, "This conference has been forced upon me. I see no point in saying anything. I'm here to listen."

Abel said, "I believe Steen would like to have his say first."

Fife's eyes filled with contempt that stung Steen.

Steen yelled his answer. "You made me turn to Trantor, Fife. You violated the principle of autonomy. You couldn't expect me to stand for that. Really."

Fife said nothing and Abel said, not without a little contempt of his own, "Get to your point, Steen. You said you had something to say. Say it."

Steen's sallow cheekbones reddened without benefit of rouge. "I will, and right now. Of course I don't claim to be the detective that the Squire of Fife represents himself to be, but I can think. Really! And I've been thinking. Fife had a story to tell yesterday, all about a mysterious traitor he called X. I could see it was just a lot of talk so that he could declare an emergency. I wasn't fooled a minute."

"There's no X?" asked Fife quietly. "Then why did you run? A man who runs needs no other accusation."

"Is that so? Really?" cried Steen. "Well, I would run out of a burning building even if I had not set the fire myself."

"Go on, Steen," said Abel.

Steen licked his lips and turned to a minute consideration of his fingernails. He smoothed them gently as he spoke. "But then I thought, why make up that particular story with all its complications and things? It's not his way. Really! It's not Fife's way. I know him. We all know him. He has no imagination at all, Your Excellency. A brute of a man! Almost as bad as Bort."

Fife scowled. "Is he saying something, Abel, or is he babbling?"

"Go on, Steen," said Abel.

"I will, if you'll let me talk. My goodness! Whose side are you on? I said to myself (this was after dinner), I said, Why would a man like Fife make up a story like that? There was only one answer. He couldn't make it up. Not with his mind. So it was true. It must be

true. And, of course, patrollers had been killed, though Fife is quite capable of arranging to have that happen."

Fife shrugged his shoulders.

Steen drove on. "Only who is X? It isn't I. Really! I know it isn't I! And I'll admit it could only have been a Great Squire. But what Great Squire knew most about it, anyway? What Great Squire has been trying to use the story of the Spatio-analyst for a year now to frighten the others into some sort of what he calls 'united effort' and what I call surrender to a Fife dictatorship? "I'll tell you who X is." Steen stood up, the top of his head brushing the edge of the receptor-cube and flattening as the uppermost inch sliced off into nothingness. He pointed a trembling finger. "He's X. The Squire of Fife. He found this Spatio-analyst. He put him out of the way, when he saw the rest of us weren't impressed with his silly remarks at our first conference, and then he brought him out again after he had already arranged a military coup."

Fife turned wearily to Abel. "Is he through? If so, remove him. He is an unbearable offense to any decent man."

Abel said, "Have you any comment to make on what he says?"

"Of course not. It isn't worth comment. The man is desperate. He'll say anything."

"You can't just brush it off, Fife," called Steen. He looked about at the rest. His eyes narrowed and the skin at his nostrils was white with tension. He remained standing. "Listen. He said his investigators found records in a doctor's office. He said the doctor had died by accident after diagnosing the Spatio-analyst as the victim of psycho-probing. He said it was murder by X to keep the identity of the Spatio-analyst secret. That's what he said. Ask him. Ask him if that isn't what he said."

"And if I did?" asked Fife.

"Then ask him how he could get the records from the office of a doctor who was dead and buried for months unless he had them all along. Really!"

Fife said, "This is foolish. We can waste time indefinitely this way. Another doctor took over the dead man's practice and his records as well. Do any of you think medical records are destroyed along with a physician?"

Abel said, "No, of course not."

Steen stuttered, then sat down.- Fife said, "What's next? Have any of you more to say? More accusations? More anything?" His voice was low. Bitterness showed through.

Abel said, "Why, that was Steen's say, and we'll let it pass. Now Junz and I, we're here on another kind of business. We would like to see the Spatio-analyst."

Fife's hands had been resting upon the desk top. They lifted now and came down to clutch the edge of the desk. His black eyebrows drew together.

He said, "We have in custody a man of subnormal mentality who claims to be a Spatio-analyst. I'll have him brought in!"

Valona March had never, never in her life dreamed such impossibilities could exist. For over a day now, ever since she had landed on this planet of Sark, there had been a touch of wonder about everything. Even the prison cells in which she and Rik had been separately placed seemed to have an unreal quality of magnificence about them. Water

came out of a hole in a pipe when you pressed a button. Heat came out of the wall, although the air outside had been colder than she had thought air could possibly get. And everyone who spoke to her wore such beautiful clothes.

She had been in rooms in which were all sorts of things she had never seen before. This one now was larger than any yet but it was almost bare. It had more people in it, though. There was a stern-looking man behind a desk, and a much older, very wrinkled man in a chair, and three others.

One was the Townman!

She jumped up and ran to him. "Townman! Townman!"

But he wasn't there!

He had gotten up and waved at her. "Stay back, Lona. Stay back!"

And she passed right through him. She had reached out to seize his sleeve, he moved it away. She lunged, half stumbling, and passed right through him. For a moment the breath went out of her body. The Townman had turned, was facing her again, but she could only stare down at her legs.

Both of them were thrusting through the heavy arm of the chair in which the Townman had been sitting. She could see it plainly, in all its color and solidity. It encircled her legs but she did not feel it. She put out a trembling hand and her fingers sank an inch deep into upholstery they could not feel either. Her fingers remained visible.

She shrieked and fell, her last sensation being that of the Townman's arms reaching automatically for her and herself failing through their circle as though they were pieces of flesh-tinted air.

She was in a chair again, Rik holding one hand tightly and the old, wrinkled man leaning over her.

He was saying, "Don't be frightened, my dear. It's just a picture. A photograph, you know."

Valona looked about. The Townman was still sitting there. He wasn't looking at her. She pointed a finger. "Isn't he there?"

Rik said suddenly, "It's a trimensic personification, Lona. He's somewhere else, but we can see him from here."

Valona shook her head. If Rik said so, it was all right. But she lowered her eyes. She dared not look at people who were there and not there at the same time.

Abel said to Rik, "So you know what trimensic personification is, young man?"

"Yes, sir." It had been a tremendous day for her, too, but where Valona was increasingly dazzled, he had found things increasingly familiar and comprehensible.

"Where did you learn that?"

"I don't know. I knew it before—before I forgot."

Fife had not moved from his seat behind the desk during the wild plunge of Valona March toward the Townman.

He said acidly, "I am sorry to have to disturb this meeting by bringing in a hysterical native woman. The so-called Spatioanalyst required her presence."

"It's all right," said Abel. "But I notice that your Florinian of subnormal mentality seems to be acquainted with trimensic personification."

"He has been well drilled, I imagine," said Fife. - Abel said, "Has he been questioned since arriving on Sark?"

"He certainly has."

"With what result?"

"No new information."

Abel turned to Rik. "What's your name?"

"Rik is the only name I remember," said Elk calmly.

"Do you know anyone here?"

Rik looked from face to face without fear. He said, "Only the Towrman. And Lona, of course."

"This," said Abel, gesturing toward Fife, "is the greatest Squire that ever lived. He owns the whole world. What do you think of him?"

Rik said boldly, "I'm an Earthman. He doesn't own me."

Abel said in an aside to Fife, "I don't think an adult native Florinian could be trained into that sort of defiance."

"Even with a psycho-probe?" returned Fife scornfully.

"Do you know this gentleman?" asked Abel, returning to Elk.

"No, sir."

"This is Dr. Selim Junz. He's an important official at the Interstellar Spatio-analytic Bureau."

Elk looked at him intently. "Then he'd be one of my chiefs. But," with disappointment, "I don't know him. Or maybe I just don't remember."

Junz shook his head gloomily. "I've never seen him, Abel."

"That's something for the record," muttered Fife.

"Now listen, Elk," said Abel. "I'm going to tell you a story. I want you to listen with all your mind and think. Think and think! Do you understand me?"

Rik nodded.

Abel talked slowly. His voice was the only sound in the room for long minutes. As he went on, Elk's eyelids closed and screwed themselves tight shut. His lips drew back, his fists moved up to his chest, and his head bent forward. He had the look of a man in agony.

Abel talked on, passing back and forth across the reconstruction of events as they had originally been presented by the Squire of Fife. He talked of the original message of disaster, of its interception, of the meeting between Elk and X, of the psycho-probing, of how Elk had been found and brought up on Florina, of the doctor who diagnosed him and then died, of his returning memory.

He said, "That's the whole story, Rik. I've told you all of it. Does anything sound familiar to you?"

Slowly, painfully, Elk said, "I remember the last parts. You know, the last few days. I remember something further back, too. Maybe it was the doctor, when I first started talking. It's very dim. . . But that's all."

Abel said, "But you do remember further back. You remember danger to Florina."

"Yes. Yes. That was the first thing I remembered."

"Then can't you remember after that? You landed on Sark and met a man."

Rik moaned, "I can't. I can't remember."

"Try! Try!"

Elk looked up. His white face was wet with perspiration. "I remember a word."

"What word, Rik?"

"It doesn't make sense."

"Tell us anyway."

"It goes along with a table. Long, long ago. Very dim. I was sitting. I think, maybe, someone else was sitting. Then he was standing, looking down at me. And there's a word."

Abel was patient. "What word?"

Rik clenched his fists and whispered, "Fife!"

Every man but Fife rose to his feet. Steen shrieked, "I told you," and burst into a high-pitched bubbling cackle.

17. THE ACCUSER

Fife said with tightly controlled passion, "Let us end this farce." He had waited before speaking, his eyes hard and his face expressionless, until in sheer anticlimax the rest were forced to take their seats again. Rik had bent his head, eyes screwed painfully shut, probing his own aching mind. Valona pulled him toward herself, trying hard to cradle his head on her shoulder, stroking his cheek softly.

Abel said shakily, "Why do you say this is a farce?"

Fife said, "Isn't it? I agreed to this meeting in the first place only because of a particular threat you held over me. I would have refused even so if I had known the conference was intended to be a trial of myself with renegades and murderers acting as both prosecutors and jury."

Abel frowned and said with chilling formality, "This is not a trial, Squire. Dr. Junz is here in order to recover the person of a member of the I.S.B., as is his right and duty. I am here to protect the interests of Trantor in a troubled time. There is no doubt in my mind that this man, Elk, is the missing Spatioanalyst. We can end this part of the conference immediately if you will agree to turn over the man to Dr. Junz for further examination, including a check of physical characteristics. We would naturally require your further help in finding the guilty psycho-prober and in setting up safeguards against a future repetition of such acts against what is, after all, an interstellar agency which has consistently held itself above regional politics."

Fife said, "Quite a speech! But the obvious remains obvious and your plans are quite transparent. What would happen if I gave up this man? I rather think that the I.S.B. will manage to find out exactly what it wants to find out. It claims to be an interstellar agency with no regional ties, but it's a fact, isn't it, that Trantor contributes two thirds of its annual budget? I doubt that any reasonable observer would consider it really neutral in the Galaxy of today. Its findings with regard to this man will surely suit Trantor's imperial interests.

"And what will these findings be? That's obvious too. The man's memory will slowly come back. The I.S.B. will issue daily bulletins. Bit by bit he will remember more and more of the necessary details. First my name. Then my appearance. Then my exact words. I will be solemnly declared guilty. Reparations will be required and Trantor will be forced to occupy Sark temporarily, an occupation which will somehow become permanent.

"There are limits beyond which any blackmail breaks down. Yours, Mr. Ambassador, ends here. If you want this man, have Trantor send a fleet after him."

"There is no question of force," said Abel. "Yet I notice that you have carefully avoided denying the implication in what the Spatio-analyst has last said."

"There isn't any implication that I need dignify by a denial. He remembers a word, or says he does. What of it?"

"Doesn't it mean anything that he does?"- "Nothing at all. The name Fife is a great one on Sark. Even if we assume the so-called Spatio-analyst is sincere, he had a year's opportunity to hear the name on Florina. He came to Sark on a ship that carried my daughter, a still better opportunity to have heard the name of Fife. What is more natural than that the name became involved with his trace memories? Of course, he may not be sincere. This man's bit-by-bit disclosures may be well rehearsed."

Abel thought of nothing to say. He looked at the others. Junz was frowning darkly, the fingers of his right hand slowly kneading his chin. Steen was simpering foolishly and muttering to himself. The Florinian Towrman stared blankly at his knees.

It was Rik who spoke, forcing himself from Valona's grasp and standing up.

"Listen," he said. His pale face was twisted. His eyes mirrored pain.

Fife said, "Another disclosure, I suppose."

Rik said, "Listen! We were sitting at a table. The tea was drugged. We had been quarreling. I don't remember why. Then I couldn't move. I could only sit there. I couldn't talk. I could only think, Great Space, rye been drugged. I wanted to shout and scream and run, but I couldn't. Then the other one, Fife, came. He had been shouting at me. Only now he wasn't shouting. He didn't have to. He came around the table. He stood there, towering over me. I couldn't say anything. I couldn't do anything. I could only try to turn my eyeballs up toward him."

Rik remained standing, silent.

Selim Junz said, "This other man was Fife?"

"I remember his name was Fife."

"Well, was he that man?"

Rik did not turn to look. He said, "I can't remember what he looked like."

"Are you sure?"

"I've been trying." He burst out, "You don't know how hard it is. It hurts! It's like a red-hot needle. Deep! In here!" He put his hands to his head.

Junz said softly, "I know it's hard. But you must try. Don't you see, you must keep on trying. Look at that man! Turn and look at him!"

111k twisted toward the Squire of Fife. For a moment he stared, then turned away.

Junz said, "Can you remember now?"

"No! No!"

Fife smiled grimly. "Has your man forgotten his lines, or will the story seem more believable if he remembers my face the next time around?"

Junz said hotly, "I have never seen this man before, and I have never spoken to him. There has been no arrangement to frame you and I am tired of your accusations in that direction. I am after the truth only."

"Then may I ask him a few questions?"

"Go ahead."

"Thank you, I'm sure, for your kindness. Now you—Elk, or whatever your real name is——"

He was a Squire, addressing a Florinian.

Elk looked up. "Yes, sir."

"You remember a man approaching you from the other side of the table as you sat there, drugged and helpless."

"Yes, sir."

"The last thing you remember is this man staring down at you."

"Yes, sir."

"You stared up at him, or tried to."

"Yes, sir."

"Sit down."

Elk did so.

For a moment Fife did nothing. His lipless mouth might have grown tighter, the jaw muscles under the blue-black sheen of the stubble on his cheeks and chin bunched a bit. Then he slid down from his chair.

Slid down! It was as though he had gotten down on his knees there behind the desk. But he moved from behind it and was seen plainly to be standing.

Junz's head swam. The man, so statuesque and formidable in his seat, had been converted without warning into a pitiful midget.

Fife's deformed legs moved under him with an effort, carrying the ungainly mass of torso and head forward. His face flushed but his eyes kept their look of arrogance intact. Steen broke into a wild giggle and choked it off when those eyes turned on him. The rest sat in fascinated silence.

Elk, wide-eyed, watched him approach.

Fife said, "Was I the man who approached you around the table?"

"I can't remember his face, sir."

"I don't ask you to remember his face. Can you have forgotten this?" His two arms went wide, framing his body. "Can you have forgotten my appearance, my walk?"

111k said miserably, "It seems I shouldn't, sir, but I don't know."

"But you were sitting, he was standing, and you were looking up at him."

"Yes, sir."

"He was looking down at you, 'towering' over you, in fact."

"Yes, sir."

"You remember that at least? You're certain of that?"

"Yes, sir."

The two were now face to face.

"Am I looking down at you?"

111k said, "No, sir."

"Are you looking up at me?"

Rik, sitting, and Fife, standing, stared levelly at one another, eye to eye.

"No, sir."

"Could I have been the man?"

"No, sir."

"Are you certain?"

"Yes, sir."

"You still say the name you remember is Fife?"

"I remember that name," insisted Rik stubbornly.

"Whoever it was, then, used my name as a disguise?"

"He—he must have."

Fife turned and with slow dignity struggled back to his desk and climbed into his seat.

He said, "I have never allowed any man to see me standing before this in all my adult life. Is there any reason why this conference should continue?"

Abel was at once embarrassed and annoyed. So far the conference had backfired badly. At every step Fife had managed to put himself in the right, the others in the wrong. Fife had successfully presented himself as a martyr. He had been forced into conference by Trantorian blackmail, and made the subject of false accusations that had broken down at once.

Fife would see to it that his version of the conference flooded the Galaxy and he would not have to depart very far from the truth to make it excellent anti-Trantorian propaganda.

Abel would have liked to cut his losses. The psycho-probed Spatio-analyst would be of no use to Trantor now. Any "memory" he might have thereafter would be laughed down, made ridiculous, however true it might be. He would be accepted as an instrument of Trantorian imperialism, and a broken instrument at that.

But he hesitated, and it was Junz who spoke.

Junz said, "It seems to me there's a very good reason for not ending the conference just yet. We have not yet determined exactly who is responsible for the psycho-probing. You have accused the Squire of Steen, and Steen has accused you. Granting that both of you are mistaken and that both are innocent, it still remains true that you each believe one of the Great Squires is guilty. Which one, then?"

"Does it matter?" asked Fife. "As far as you're concerned, I'm sure it doesn't. That matter would have been solved by now except for the interference of Trantor and the I.S.B. Eventually I will find the traitor. Remember that the psycho-prober, whoever he is, had the original intention of forcing a monopoly of the kyrt trade into his own hands, so I am not likely to let him escape. Once the psycho-prober is identified and dealt with, your man here will be returned unharmed to you. That is the only offer I can make and it is a very reasonable one."

"What will you do with the psycho-prober?"

"That is a purely internal matter that does not concern you."

"But it does," Junz said energetically. "This is not just a question of the Spatio-analyst. There's something of greater importance involved and I'm surprised that it hasn't been mentioned yet. This man Elk wasn't psycho-probed just because he was a Spatio-analyst."

Abel was not sure what Junz's intentions were, but he threw his weight into the scales. He said blandly, "Dr. Junz is referring, of course, to the Spatio-analyst's original message of danger."

Fife shrugged. "As far as I know, no one has yet attached any importance to that, including Dr. Junz over the past year. However, your man is here, Doctor. Ask him what it's all about."

"Naturally, he won't remember," Junz retorted angrily. "The psycho-probe is most effective upon the more intellectual chains of reasoning stored in the mind. The man may never recover the quantitative aspects of his work."

"Then it's gone," said Fife. "What can be done about that?"

"Something very definite. That's the point. There's someone else who knows, and that's the psycho-prober. He may not have been a Spatio-analyst himself; he may not know the precise details. However, he spoke to the man in a state of untouched mind. He will have learned enough to put us far on the right track. Without having learned enough he would not have dared to destroy the source of his information. Still, for the record, do you remember, Elk?"

"Only that there was danger and that it involved the currents of space," muttered Rik.

Fife said, "Even if you find out, what will you have? How reliable are any of the startling theories that sick Spatio-analysts are forever coming up with? Many of them think they know the secrets of the universe when they're so sick they can barely read their instruments."

"It may be that you are right. Are you afraid to let me find out?"

"I am against starting any morbid rumors that might, whether true or false, affect the kyrt trade. Don't you agree with me, Abel?"

Abel squirmed inwardly. Fife was maneuvering himself into the position where any break in kyrt deliveries resulting from his own coup could be blamed on Trantorian maneuvers. But Abel was a good gambler. He raised the stakes calmly and unemotionally.

He said, "I don't. I suggest you listen to Dr. Junz."

"Thanks," said Junz. "Now you have said, Squire Fife, that whoever the psycho-prober was, he must have killed the doctor who examined this man Rik. That implies that the psycho-prober had kept some sort of watch over Elk during his stay on Florina."

"Well?"

"There must be traces of that kind of watching."

"You mean you think these natives would know who was watching them."

"Why not?"

Fife said, "You are not a Sarkite and so you make mistakes. I assure you that natives keep their places. They don't approach Squires and if Squires approach them they know enough to keep their eyes on their toes. They would know nothing of being watched." Junz quivered visibly with indignation. The Squires had their despotism so ingrained that they saw nothing wrong or shameful in speaking of it openly.

He said, "Ordinary natives perhaps. But we have a man here who is not an ordinary native. I think he has shown us rather thoroughly that he is not a properly respectful Florinian. So far he has contributed nothing to the discussion and it is time to ask him a few questions."

Fife said, "That native's evidence is worthless. In fact, I take the opportunity once more to demand that Trantor surrender him to proper trial by the courts of Sark."

"Let me speak to him first."

Abel put in mildly, "I think it will do no harm to ask him a few questions, Fife. If he proves uncooperative or unreliable, we may consider your request for extradition."

Terens, who, till now, had stolidly concentrated on the fingers of his clasped hands, looked up briefly.

Junz turned to Terens. He said, "Elk has been in your town since he was first found on Florina, hasn't he?"

"Yes."

"And you were in town all that time? I mean you weren't on any extended business trips, were you?"

"Townmen don't make business trips. Their business is in their town."

All right. Now relax and don't get touchy. It would be part of your business to know about any Squire that might come to town, I imagine."

"Sure. When they come."

"Did they come?"

Terens shrugged. "Once or twice. Pure routine, I assure you. Squires don't dirty their hands with kyrt. Unprocessed kyrt, that is."

"Be respectful!" roared Fife.

Terens looked at him and said, "Can you make me?"

Abel interrupted smoothly, "Let's keep this between the man and Dr. Junz, Fife. You and I are spectators."

Junz felt a glow of pleasure at the Townman's insolence, but he said, "Answer my questions without side comments please, Townman. Now who exactly were the Squires who visited your town this past year?"

Terens said fiercely, "How can I know? I can't answer that question. Squires are Squires and natives are natives. I may be a Townman but I'm still a native to them. I don't greet them at the town gates and ask their names."

"I get a message, that's all. It's addressed 'Townman.' It says there'll be a Squire's Inspection on such-and-such a day and I'm to make the necessary arrangements. I must then see to it that the miliworkers have on their best clothes, that the mill is cleaned up and working properly, that the kyrt supply is ample, that everyone looks contented and pleased, that the houses have been cleaned and the streets policed, that some dancers are on hand in case the Squires would care to view some amusing native dance, that maybe a few pretty g——"

"Never mind that, Townman," said Junz.

"You never mind that. I do."

After his experiences with the Florinians of the Civil Service, Junz found the Townman as refreshing as a drink of cold water. He made up his mind that what influence the I.S.B. could bring to bear would be used to prevent any surrender of the Townman to the Squires.

Terens went on, in calmer tones, "Anyway, that's my part. When they come, I line up with the rest. I don't know who they are. I don't speak to them."

"Was there any such inspection the week before the City Doctor was killed? I suppose you know what week that happened."

"I think I heard about it in the newscasts. I don't think there was any Squire's Inspection at that time. I can't swear to it."

"Whom does your land belong to?"

Terens pulled the corners of his mouth back. "To the Squire of Fife."

Steen spoke up, breaking into the give-and-take with rather surprising suddenness. "Oh, look here. Really! You're playing into Fife's hands with this kind of questioning, Dr. Junz. Don't you see you won't get anywhere? Really! Do you suppose if Fife were interested in keeping tabs on that creature there that he would go to all the trouble of making trips to Florina to look at him? What are patrollers for? Really!"

Junz looked flustered. "In a case like this, with a world's economy and maybe its physical safety resting on the contents of one man's mind, it's natural that the psycho-prober would not care to leave the guardianship to patrollers."

Fife intervened. "Even after he had wiped out that mind, to all intents?"

Abel pushed out his lower lip and frowned. He saw his latest gamble sliding into Fife's hands with all the rest.

Junz tried again, hesitantly. "Was there any particular patroller or group of patrollers that was always underfoot?"

"I'd never know. They're just uniforms to me."

Junz turned to Valona with the effect of a sudden pounce. A moment before she had gone a sickly white and her eyes had become wide and stary. Junz had not missed that.

He said, "What about you, girl?"

But she only shook her head, wordlessly.

Abel thought heavily, There's nothing more to do. It's all over.

But Valona was on her feet, trembling. She said in a husky whisper, "I want to say something."

Junz said, "Go ahead, girl. What is it?"

Valona talked breathlessly and with fright obvious in every line of her countenance and every nervous twitch of her fingers.

She said, "I'm just a country girl. Please don't be angry with me.

It's just that it seems that things can only be one way. Was my Elk so very important? I mean, the way you said?"

Junz said gently, "I think he was very, very important. I think he still is."

"Then it must be like you said. Whoever it was who had put him on Florina wouldn't have dared take his eye away for even a minute hardly. Would he? I mean, suppose Rik was beaten by the mill superintendent or was stoned by the children or got sick and died. He wouldn't be left helpless in the fields, would he, where he might die before anyone found him? They wouldn't suppose that it would just be luck that would keep him safe." She was speaking with an intense fluency now.

"Go on," said Junz, watching her.

"Because there was one person who did watch Rik from the start. He found him in the fields, fixed it so I would take care of him, kept him out of trouble and knew about him every day. He even knew all about the doctor, because I told him. It was he! It was he!"

--'I With her voice at screaming intensity, her finger pointed rigidly at Myrlyn Terens, Townman.

And this time even Fife's superhuman calm broke and his arms stiffened on his desk, lifting his massive body a full inch off his seat, as his head swiveled quickly toward the Townman.

18. THE VICTORS

IT WAS as though vocal paralysis had gripped them all. Even Rik, with disbelief in his eyes, could only stare woodenly, first at Valona, then at Terens.

Then came Steen's high-pitched laugh and the silence was broken.

Steen said, "I believe it. Really! I said so all along. I said the native was in Fife's pay. That shows you the kind of man Fife is. He'd pay a native to—"

"That's an infernal lie."

It wasn't Fife who spoke, but the Townman. He was on his feet, eyes glistening with passion. - Abel, who of them all seemed the least moved, said, "What is?"

Terens stared at him a moment, not comprehending, then said chokingly, "What the Squire said. I am in the pay of no Sarkite."

"And what the girl said? Is that a lie too?"

Terens wet his dry lips with the tip of his tongue. "No, that's true. I am the psycho-prober." He hurried on. "Don't look at me like that, Lona. I didn't mean to hurt him. I didn't intend any of what happened." He sat down again.

Fife said, "This is a sort of device. I don't know exactly what you're planning, Abel, but it's impossible on the face of it that this criminal could have included this particular crime in his repertoire. It's definite that only a Great Squire could have had the necessary knowledge and facilities. Or are you anxious to take your man Steen off the hook by arranging for a false confession?"

Terens, hands tightly clasped, leaned forward in his seat. "I don't take Trantorian money, either."

Fife ignored him.

Junz was the last to come to himself. For minutes, he could not adjust to the fact that the Townman was not really in the same room with him, that he was somewhere else on the embassy grounds, that he could see him only in image form, no more real actually than was Fife, who was twenty miles away. He wanted to go to the Townman, grip him by the shoulder, speak to him alone, but he couldn't. He said, "There's no point in arguing before we hear the man. Let's have the details. If he is the psycho-prober, we need the details badly. If he isn't, the details he'll try to give us will prove it."

"If you want to know what happened," cried Terens, "I'll tell you. Holding it back won't do me any good any longer. It's Sark or Trantor after all, so to Space with it. This will at least give me a chance to get one or two things into the open."

He pointed at Fife in scorn. "There's a Great Squire. Only a Great Squire, says this Great Squire, can have the knowledge or the facilities to do what the psycho-prober did. He believes it, too. But what does he know? What do any of the Sarkites know? "They don't run the government. Florinians do! The Florinian Civil Service does. They get the papers, they make the papers, they file the papers. And it's the papers that run Sark. Sure, most of us are too beaten even to whimper, but do you know what we could do if

we wanted to, even under the noses of our damned Squires? Well, you see what I've done.

"I was temporarily traffic manager at the spaceport a year ago. Part of my training. It's in the records. You'll have to dig a little to find it because the listed traffic manager is a Sarkite. He had the title but I did the actual work. My name would be found in the special section headed Native Personnel. No Sarkite would have dirtied his eyes looking there.

"When the local I.S.B. sent the Spatio-analyst's message to the port with a suggestion that we meet the ship with an ambulance, I got the message. I passed on what was safe. This matter of the destruction of Florina was not passed on.

"I arranged to meet the Spatio-analyst at a small suburban port. I could do that easily. All the wires and strings that ran Sark were at my finger tips. I was in the Civil Service, remember. A Great Squire who wanted to do what I did, couldn't, unless he ordered some Florinian to do it for him. I could do it without anyone's help. So much for knowledge and facility.

"I met the Spatio-analyst, kept him away from both Sark and the I.S.B. I squeezed as much information out of him as I could and set about using that information for Florina and against Sark."

Words were forced out of Fife. "You sent those first letters?"

"I sent those first letters, Great Squire," said Terens calmly. "I thought I could force control of enough of the kyrt lands into my own hands to make a deal with Trantor on my terms and drive you off the planet."

"You were mad."

"Maybe. Anyway, it didn't work. I had told the Spatio-analyst I was the Squire of Fife. I had to, because he knew that Fife was the biggest man on the planet, and as long as he thought I was Fife, he was willing to talk openly. It made me laugh to realize that he thought Fife was anxious to do whatever was best for Florina.

"Unfortunately, he was more impatient than I was. He insisted that every day lost was a calamity, while I knew that my dealings with Sark needed time more than anything else. I found it difficult to control him and eventually had to use a psychic probe. I could get one. I had seen it used in hospitals. I knew something about it. Unfortunately, not enough.

"I set the probe to wipe out the anxiety from the surface layers of his mind. That's a simple operation. I still don't know what happened. I think the anxiety must have run deeper, very deep, and the probe automatically followed it, digging out most of the conscious mind along with it. I was left with a mindless thing on my hands I'm sorry, Rik."

Rik, who had been listening intently, said sadly, "You shouldn't have interfered with me, Townman, but I know how you must have felt."

"Yes," said Terens, "you've lived on the planet. You know about patrollers and Squires and the difference between Lower City and Upper City."

He took up the current of his story again. "So there I was with the Spatio-analyst completely helpless. I couldn't let him be found by anyone who might trace his identity. I

couldn't kill him. I felt sure his memory would return and I would still need his knowledge, to say nothing of the fact that killing him would forfeit the good will of Trantor and the I.S.B., which I would eventually need. Besides, in those days, I was incapable of killing.

"I arranged to be transferred to Florina as Townman and I took the Spatio-analyst with me on forged papers. I arranged to have him found, I picked Valona to take care of him. There was no danger thereafter except for that one time with the doctor. Then I had to enter the power plants of Upper City. That was not impossible. The engineers were Sarkites but the janitors were Florinian. On Sark I learned enough about power mechanics to know how to short a power line. It took me three days to find the proper time for it. After that, I could murder easily. I never knew, though, that the doctor kept duplicate records in both halves of his office. I wish I had."

Terens could see Fife's chronometer from where he sat. "Then, one hundred hours ago—it seems like a hundred years— Rik began remembering again. Now you have the whole story."

"No," said Junz, "we have not. What are the details of the Spatio-analyst's story of planetary destruction?"

"Do you think I understood the details of what he had to say? It was some sort of—pardon me, Rik—madness."

"It wasn't," blazed Elk. "It couldn't have been."

"The Spatio-analyst had a ship," said Junz. "Where is it?"

"On the scrap heap long ago," said Terens. "An order scrapping it was sent out. My superior signed it. A Sarldite never reads papers, of course. It was scrapped without question."

"And Elk's papers? You said he showed you papers!"

"Surrender that man to us," said Fife suddenly, "and we'll find out what he knows."

"No," said Junz. "His first crime was against the I.S.B. He kidnapped and damaged the mind of a Spatio-analyst. He belongs to us."

Abel said, "Junz is correct."

Terens said, "Now look here. I don't say a word without safeguards. I know where Rik's papers are. They're where no Sarkite or Trantorian will ever find them. If you want them you'll have to agree that I'm a political refugee. Whatever I did was out of patriotism, out of a regard for the needs of my planet. A Sarkite or a Trantorian may claim to be patriotic; why not a Florinian as well?"

"The Ambassador," said Junz, "has said you will be given over to the I.S.B. I assure you that you will not be turned over to Sark. For your treatment of the Spatio-analyst, you will be tried. I cannot guarantee the result, but if you co-operate with us now, it will count in your favor."

Terens looked searchingly at Junz. Then he said, "I'll take my chance with you, Doctor. . . According to the Spatio-analyst, Florina's sun is in the pre-nova stage."

"What!" The exclamation or its equivalent came from all but Valona.

"It's about to explode and go boom," said Terens sardonically. "And when that happens all of Florina will go poof, like a mouthful of tobacco smoke."

Abel said, "I'm no Spatio-analyst, but I have heard that there is no way of predicting when a star will explode."

"That's true. Until now, anyway. Did Elk explain what made him think so?" asked Junz.

"I suppose his papers will show that. All I can remember is about the carbon current."

"What?"

"He kept saying, 'The carbon current of space. The carbon current of space.' That, and the words 'catalytic effect.' There it is.

Steen giggled. Fife frowned. Junz stared.

Then Junz muttered, "Pardon me. I'll be right back." He stepped out of the limits of the receptor cube and vanished.

He was back in fifteen minutes.

Junz looked about in bewilderment when he returned. Only Abel and Fife were present.

He said, "Where——"

Abel broke in instantly. "We have been waiting for you, Dr. Junz. The Spatio-analyst and the girl are on their way to the Embassy. The conference is ended."

"Ended! Great Galaxy, we have only begun. I've got to explain the possibilities of nova formation."

Abel shifted uneasily in his seat. "It is not necessary to do that, Doctor."

"It is very necessary. It is essential. Give me five minutes."

"Let him speak," said Fife. He was smiling.

Junz said, 'Take it from the beginning. In the earliest recorded scientific writings of Galactic civilization it was already known that stars obtained their energy from nuclear transformations in their interiors. It was also known that, given what we know about conditions in stellar interiors, two types, and only two types, of nuclear transformations can possibly yield the necessary energy. Both involve the conversion of hydrogen to helium. The first transformation is direct: two hydrogens and two neutrons combine to form one helium nucleus. The second is indirect, with several steps. It ends up with hydrogen becoming helium, but in the intermediate steps, carbon nuclei take part. These carbon nuclei are not used up but are re-formed as the reactions proceed, so that a trifling amount of carbon can be used over and over again, serving to convert a great deal of hydrogen to helium. - The carbon acts as a catalyst, in other words. All this has been known back to the days of prehistory, back to the time when the human race was restricted to a single planet, if there ever was such a time."

"If we all know it," said Fife, "I would suggest that you are contributing nothing but a waste of time."

"But this is all we know. Whether stars use one or the other, or both, nuclear processes has never been determined. There have always been schools of thought in favor of each of the alternatives. Usually the weight of opinion has been in favor of the direct hydrogen-helium conversion as being the simpler of the two.

"Now Elk's theory must be this. The hydrogen-helium direct conversion is the normal source of stellar energy, but under certain conditions the carbon catalysis adds its weight, hastening the process, speeding it up, heating up the star.

"There are currents in space. You all know that well. Some of these are carbon currents. Stars passing through the currents pick up innumerable atoms. The total mass of atoms attracted, however, is incredibly microscopic in comparison to the star's weight and does not affect it in any way. Except for carbon! A star that passes through a current containing unusual concentrations of carbon becomes unstable. I don't know how many years or centuries or millions of years it takes for the carbon atoms to diffuse into the star's interior, but it probably takes a long time. That means that a carbon current must be wide and a star must intersect it at a small angle. In any case, once the quantity of carbon percolating into the star's interior passes a certain critical amount, the star's radiation is suddenly boosted tremendously. The outer layers give way under an unimaginable explosion and you have a nova.

"Do you see?"

Junz waited.

Fife said, "Have you figured all this out in two minutes as a result of some vague phrase the Townman remembered the Spatioanalyst to have said a year ago?"

"Yes. Yes. There's nothing surprising in that. Spatio-analysis is ready for that theory. If Rik had not come up with it, someone else would have shortly. In fact, similar theories have been advanced before, but they were never taken seriously. They were put forward before the techniques of Spatio-analysis were developed and no one was ever able to account for the sudden acquisition of excess carbon by the star in question.

"But now we know there are carbon currents. We can plot their courses, find out what stars intersected those courses in the past ten thousand years, check that against our records for nova formation and radiation variations. That's what Rik must have done. Those must have been the calculations and observations he tried to show the Townman. But that's all beside the immediate point.

"What must be arranged for now is the immediate beginning of an evacuation of Florina."

"I thought it would come to that," said Fife composedly.

"I'm sorry, Junz," said Abel, "but that's quite impossible."

"Why impossible?"

"When will Florina's sun explode?"

"I don't know. From Elk's anxiety a year ago, I'd say we had little time."

"But you can't set a date?"

"Of course not."

"When will you be able to set a date?"

"There's no way of telling. Even if we get Elk's calculations, it would all have to be rechecked."

"Can you guarantee that the Spatio-analyst's theory will prove to be correct?"

Junz frowned. "I am personally certain of it, but no scientist can guarantee any theory in advance."

"Then it turns out that you want Florina evacuated on mere speculation."

"I think the chance of killing the population of a planet is not one that can be taken."

"If Florina were an ordinary planet I would agree with you. But Florina bears the Galactic supply of kyrt. It can't be done."

Junz said angrily, "Is that the agreement you came to with Fife while I was gone?"

Fife intervened. He said, "Let me explain, Dr. Junz. The government of Sark would never consent to evacuate Florina, even if the I.S.B. claimed it had proof of this nova theory of yours. Trantor cannot force us because while the Galaxy might support a war against Sark for the purpose of maintaining the kyrt trade, it will never support one for the purpose of ending it."

"Exactly," said Abel. "I am afraid our own people would not support us in such a war."

Junz found revulsion growing strong within him. A planet full of people meant nothing against the dictates of economic necessity!

He said, "Listen to me. This is not a matter of one planet, but of a whole Galaxy. There are now twenty full novae originating within the Galaxy every year. In addition, some two thousand stars among the Galaxy's hundred billion shift their radiation characteristics sufficiently to render uninhabitable any habitable planet they may have. Human beings occupy one million stellar systems in the Galaxy. That means that on an average of once every fifty years some inhabited planet somewhere becomes too hot for life. Such cases are a matter of historical record. Every five thousand years some inhabited planet has a fifty-fifty chance of being puffed to gas by a nova.

"If Trantor does nothing about Florina, if it allows it to evaporate with its people on it, that will serve notice to all the people of the Galaxy that when their own turn comes they may expect no help, if such help is in the way of the economic convenience of a few powerful men. Can you risk that, Abel? "On the other hand, help Florina and you will have shown that Trantor puts its responsibility to the people of the Galaxy above the maintenance of mere property rights. Trantor will win good will that it could never win by force."

Abel bowed his head. Then he shook it wearily. "No, Junz. What you say appeals to me, but it is not practical. I can't count on emotions as against the assured political effect of any attempt to end the kyrt trade. In fact, I think it might be wise to avoid investigating the theory. The thought that it might be true would do too much harm."

"But what if it is true?"

"We must work on the assumption that it is not. I take it that when you were gone a few moments ago it was to contact the I.S.B."

"Yes."

"No matter. Trantor, I think, will have enough influence to stop their investigations."

"I'm afraid not. Not these investigations. Gentlemen, we will soon have the secret of cheap kyrt. There will be no kyrt monopoly within a year, whether or not there is a nova."

"What do you mean?"

"The conference is reaching the essential point now, Fife. Kyrt grows only on Florina of all inhabited planets. Its seeds produce ordinary cellulose elsewhere. Florina is probably the only inhabited planet, on a chance basis, that is currently pre-nova, and it has probably been pre-nova since it first entered the carbon current, perhaps thousands of years ago, if the angle of intersection was small. It seems quite probable, then, that kyrt and the pre-nova stage go together."

"Nonsense," said Fife.

"Is it? There must be a reason why kyrt is kyrt on Florina and cotton elsewhere. Scientists have tried many ways of artificially producing kyrt elsewhere, but they tried blindly, so they've always failed. Now they will know it is due to factors induced in a pre-nova stellar system."

Fife said scornfully, "They've tried duplicating the radiation qualities of Fife's sun."

"With appropriate arc lights, yes, that duplicated the visible and ultraviolet spectrum only. What about radiation in the infrared and beyond? What about magnetic fields? What about electron emission? What about cosmic-ray effects? I'm not a physical biochemist so there may be factors I know nothing about. But people who are physical biochemists will be looking now, a whole Galaxy of them. Within the year, I assure you, the solution will be found.

"Economics is on the side of humanity now. The Galaxy wants cheap kyrt, and if they find it or even if they imagine they will shortly find it, they will want Florina evacuated, not only out of humanity, but out of a desire to turn the tables, at long last, on the kyrt-gouging Sarkites."

"Bluff!" growled Fife.

"Do you think so, Abel?" demanded Junz. "If you help the Squires, Trantor will be looked on not as the saviors of the kyrt trade but of the kyrt monopoly. Can you chance that?"

"Can Trantor chance a war?" demanded Fife.

"War? Nonsense! Squire, in one year your holdings on Florina will be worthless, nova or not. Sell out. Sell out all Florina. Trantor can pay for it."

"Buy a planet?" said Abel in dismay.

"Why not? Trantor has the funds, and its gain in good will among the people of the universe will pay it back a thousandfold. If telling them that you are saving hundreds of millions of lives is not enough, tell them that you will bring them cheap kyrt. That will do it."

"I'll think about it," said Abel.

Abel looked at the Squire. Fife's eyes fell.

After a long pause he too said, "I'll think about it."

Junz laughed harshly. "Don't think too long. The kyrt story will break quickly enough. Nothing can stop it. After that, neither one of you will have freedom of action. You can each strike a better bargain now."

The Townman seemed beaten. "It's really true?" he kept repeating. "Really true? No more Florina?"

"It's true," said Junz.

Terens spread his arms, let them fall against his side. "If you want the papers I got from Rik, they're filed among vital statistic files in my home town. I picked the dead files, records a century back and more. No one would ever look there for any reason."

"Look," said Junz, "I'm sure we can make an agreement with the I.S.B. We'll need a man on Florina, one who knows the Florinian people, who can tell us how to explain the facts to them, how best to organize the evacuation, how to pick the most suitable planets of refuge. Will you help us?"

"And beat the game that way, you mean? Get away with murder? Why not?" There were sudden tears in the Townman's eyes. "But I lose anyway. I will have no world, no home. We all lose. The Florinians lose their world, the Sarkites lose their wealth, the Trantorians their chance to get that wealth. There are no winners at all."

"Unless," said Junz gently, "you realize that in the new Galaxy—a Galaxy safe from the threat of stellar instability, a Galaxy with kyrt available to all, and a Galaxy in which political unification will be so much closer—there will be winners after all. One quadrillion winners. The people of the Galaxy, they are the victors."

EPILOG. A YEAR AFTER

"Rix! Rix!" Selim Junz hurried across the port grounds toward the ship, hands outstretched. "And Lona! I'd never have recognized either of you. How are you? How are you?"

"As well as we could wish. Our letter reached you, I see," said Elk.

"Of course. Tell me, what do you think of it all?" They were walking back together, toward Junz's offices.

Valona said sadly, "We visited our old town this morning. The fields are so empty." Her clothing was now that of a woman of the Empire, rather than that of a peasant of Florina.

"Yes, it must be dreary for a person who has lived here. It grows dreary even for me, but I will stay as long as I can. The radiation recordings of Florina's sun are of tremendous theoretical interest."

"So much evacuation in less than a year! It speaks for excellent organization."

"We're doing our best, Elk. Oh, I think I should be calling you by your real name."

"Please don't. I'll never be used to it. I'm Elk. That's still the only name I remember."

Junz said, "Have you decided whether you're going to return to Spatio-analysis?"

Rik shook his head. "I've decided, but the decision is, no. I'll never remember enough. That part's gone forever. It doesn't bother me, though. I'll be returning to Earth. . . By the way, I rather hoped I'd see the Townman."

"I think not. He decided to go off today. I think he'd rather not see you. He feels guilty, I think. You have no grudge against him?"

Rik said, "No. He meant well, and he changed my life in many ways for the better. For one thing, I met Lana." His arm went about her shoulder.

Valona looked at him and smiled.

"Besides," Elk went on, "he cured me of something. I've found out why I was a Spatio-analyst. I know why nearly a third of all Spatio-analysts are recruited from the one planet, Earth. Anyone living on a radioactive world is bound to grow up in fear and insecurity. A misstep can mean death and our planet's own surface is the greatest enemy we have.

"That makes for a sort of anxiety bred into us, Dr. Junz, a fear of planets. We're only happy in space; that's the only place we can feel safe."

"And you don't feel that way any longer, Rik?"

"I certainly don't. I don't even remember feeling that way. That's it, you see. The Townman had set his psychic probe to remove feelings of anxiety and he hadn't bothered to set the intensity controls. He thought he had a recent, superficial trouble to deal with. Instead there was this deep, ingrained anxiety he knew nothing of. He got rid of all of it. In a sense, it-was worth getting rid of it even though so much else went with it. I don't

have to stay in space now. I can go back to Earth. I can work there and Earth needs men. It always will."

"You know," Junz said, "why can't we do for Earth what we're doing for Florina? There's no need to bring up Earthmen in such fear and insecurity. The Galaxy is big."

"No," said Rik vehemently. "It's a different case. Earth has its past, Dr. Junz. Many people may not believe it, but we of Earth know that Earth was the original planet of the human race."

"Well, perhaps. I can't say, one way or the other."

"It was. It's a planet that can't be abandoned; it mustn't be abandoned. Someday we'll change it, change its surface back to what it once must have been. Till then—we're staying."

Valona said softly, "And I'm an Earthwoman now."

Rik was looking out at the horizon. Upper City was as garish as ever, but the people were gone.

He said, "How many are left on Florina?"

"About twenty million," said Junz. "We work slower as we go along. We have to keep our withdrawals balanced. The people that are left must always maintain themselves as an economic unit in the months that are left. Of course, resettlement is in its earliest stages. Most of the evacuees are still in temporary camps on neighboring worlds. There is unavoidable hardship."

"When will the last person leave?"

"Never, really."

"I don't understand."

"The Townman has applied unofficially for permission to remain. It's been granted, also unofficially. It won't be a matter of public record."

"Remain?" Elk was shocked. "But for the sake of all the Galaxy, why?"

"I didn't know," said Junz, "but I think you explained it when you talked of Earth. He feels as you do. He says he can't bear the thought of leaving Florina to die alone."

PEBBLE IN THE SKY

1950

Dedication

TO MY FATHER,

WHO FIRST INTRODUCED ME TO SCIENCE FICTION.

1. BETWEEN ONE FOOTSTEP AND THE NEXT

Two minutes before he disappeared forever from the face of the Earth he knew, Joseph Schwartz strolled along the pleasant streets of suburban Chicago quoting Browning to himself.

In a sense this was strange, since Schwartz would scarcely have impressed any casual passer-by as the Browning-quoting type. He looked exactly what he was: a retired tailor, thoroughly lacking in what the sophisticates of today call a "formal education." Yet he had expended much of an inquisitive nature upon random reading. By the sheer force of indiscriminate voracity, he had gleaned a smattering of practically everything, and by means of a trick memory had managed to keep it all straight.

For instance, he had read Robert Browning's Rabbi Ben Ezra twice when he was younger, so, of course, knew it by heart. Most of it was obscure to him, but those first three lines had become one with the beating of his heart these last few years. He intoned them to himself, deep within the silent fortress of his mind, that very sunny and very bright early summer day of 1949:

"Grow old along with me!

The best is yet to be,

The last of life, for which the first was made. . . "

Schwartz felt that to its fullness. After the struggles of youth in Europe and those of his early manhood in the United States, the serenity of a comfortable old age was pleasant. With a house of his own and money of his own, he could, and did, retire. With a wife in good health, two daughters safely married, a grandson to soothe these last best years, what had he to worry about?

There was the atom bomb, of course, and this somewhat lascivious talk about World War III, but Schwartz was a believer in the goodness of human nature. He didn't think there would be another war. He didn't think Earth would ever see again the sunlike hell of an atom exploded in anger. So he smiled tolerantly at the children he passed and silently wished them a speedy and not too difficult ride through youth to the peace of the best that was yet to be.

He lifted his foot to step over a Raggedy Ann doll smiling through its neglect as it lay there in the middle of the walk, a foundling not yet missed. He had not quite put his foot down again. . .

In another part of Chicago stood the Institute for Nuclear Research, in which men may have had theories upon the essential worth of human nature but were half ashamed of them, since no quantitative instrument had yet been designed to measure it. When they thought about it, it was often enough to wish that some stroke from heaven would prevent human nature (and damned human ingenuity) from turning every innocent and interesting discovery into a deadly weapon.

Yet, in a pinch, the same man who could not find it in his conscience to curb his curiosity into the nuclear studies that might someday kill half of Earth would risk his life to save that of an unimportant fellow man.

It was the blue glow behind the chemist's back that first attracted the attention of Dr. Smith.

He peered at it as he passed the half-open door. The chemist, a cheerful youngster, was whistling as he tipped up a volumetric flask, in which the solution had already been made up to volume. A white powder tumbled lazily through the liquid, dissolving in its own good time. For a moment that was all, and then Dr. Smith's instinct, which had stopped him in the first place, stirred him to action.

He dashed inside, snatched up a yardstick, and swept the contents of the desk top to the floor. There was the deadly hiss of molten metal. Dr. Smith felt a drop of perspiration slip to the end of his nose.

The youngster stared blankly at the concrete floor along which the silvery metal had already frozen in thin splash marks. They still radiated heat strongly.

He said faintly, "What happened?" Dr. Smith shrugged. He wasn't quite himself either. "I don't know. You tell me. . . .What's been doing here?"

"Nothing's been doing here," the chemist yammered. "That was just a sample of crude uranium. I'm making an electrolytic copper determination. . . .I don't know what could have happened."

"Whatever happened, young man, I can tell you what I saw. That platinum crucible was showing a corona. Heavy radiation was taking place. Uranium, you say?"

"Yes, but crude uranium, and that isn't dangerous. I mean, extreme purity is one of the most important qualifications for fission, isn't it?" He touched his tongue to his lips quickly. "Do you think it was fission, sir? It's not plutonium, and it wasn't being bombarded."

"And," said Dr. Smith thoughtfully, "it was below the critical mass. Or, at least, below the critical masses we think we know." He stared at the soapstone desk, at the bummed and blistered paint of the cabinets and the silvery streaks along the concrete floor. "Yet uranium melts at about 1800 degrees Centigrade, and nuclear phenomena are not so well known that we can afford to talk too glibly. After all, this place must be fairly saturated with stray radiations. When the metal cools, young man, it had better be chipped up, collected, and thoroughly analyzed."

He gazed thoughtfully about him, then stepped to the opposite wall and felt uneasily at a spot about shoulder height.

"What's this?" he said to the chemist. "Has this always been here?"

"What, sir?" The young man stepped up nervously and glanced at the spot the older man indicated. It was a tiny hole, one that might have been made by a thin nail driven into the wall and withdrawn--but driven through plaster and brick for the full thickness of the building's wall, since daylight could be seen through it.

The chemist shook his head, "I never saw that before. But I never looked for it, either, sir."

Dr. Smith said nothing. He stepped back slowly and passed the thermostat, a parallelepiped of a box made out of thin sheet iron. The water in it moved swirlingly as the stirrer turned in motor-driven monomania, while the electric bulbs beneath the water, serving as heaters, flicked on and off distractingly, in time with the clicking of the mercury relay.

"Well, then, was this here?" And Dr. Smith scraped gently with his fingernail at a spot near the top of the wide side of the thermostat. It was a neat, tiny circle drilled through the metal. The water did not quite reach it.

The chemist's eyes widened. "No, sir, that wasn't there ever before. I'll guarantee that."

"Hmm. Is there one on the other side?"

"Well, I'll be damned. I mean, yes, sir!"

"All right, come round here and sight through the holes. . . . Shut the thermostat off, please. Now stay there." He placed his finger on the hole in the wall. "What do you see?" he called out.

"I see your finger, sir. Is that where the hole is?"

Dr. Smith did not answer. He said, with a calmness he was far from feeling, "Sight through in the other direction. . . . Now what do you see?"

"Nothing now."

"But that's the place where the crucible with the uranium was standing. You're looking at the exact place, aren't you?"

Reluctantly, "I think so, sir."

Dr. Smith said frostily, with a quick glance at the name plate on the still-open door, "Mr. Jennings, this is absolutely top-secret. I don't want you ever to speak about this to anyone. Do you understand?"

"Absolutely, sir!"

"Then let's get out of here. We'll send in the radiation men to check the place, and you and I will spend a siege in the infirmary."

"Radiation burns, you mean?" The chemist paled.

"We'll find out."

But there were no serious signs of radiation burns in either. Blood counts were normal and a study of the hair roots revealed nothing. The nausea that developed was eventually tabbed as psychosomatic and no other symptoms appeared.

Nor, in all the Institute, was anyone found, either then or in the future, to explain why a crucible of crude uranium, well below critical size, and under no direct neutronic bombardment, should suddenly melt and radiate that deadly and significant corona.

The only conclusion was that nuclear physics had queer and dangerous crannies left in it.

Yet Dr. Smith never brought himself to tell all the truth in the report he eventually prepared. He made no mention of the holes in the laboratory, no mention of the fact that the one nearest the spot where the crucible had been was barely visible, the one on the

other side of the thermostat was a trace larger, while the one in the wall, three times as far away from that fearful spot, could have had a nail thrust through it.

A beam expanding in a straight line could travel several miles before the Earth's curvature made the surface fall away from it sufficiently to prevent further damage, and then it would be ten feet across. After that, flashing emptily into space, expanding and weakening, a queer strain in the fabric of the cosmos.

He never told anyone of that fancy.

He never told anyone that he called for the morning papers next day, while still in the infirmary, and searched the columns with a definite purpose in mind.

But so many people in a giant metropolis disappear every day. And nobody had gone screaming to the police with vague tales of how, before his eyes, a man (or would it be half a man?) had disappeared. At least no such case was reported.

Dr. Smith forced forgetfulness, eventually.

To Joseph Schwartz it had happened between one step and the next. He had lifted his right foot to clear the Raggedy Ann doll and for a moment he had felt dizzy--as though for the merest trifle of time a whirlwind had lifted him and turned him inside out. When he placed his right foot down again, all the breath went out of him in a gasp and he felt himself slowly crumple and slide down to the grass.

He waited a long time with his eyes closed--and then he opened them.

It was true! He was sitting on grass, where previously he had been walking on concrete. The houses were gone. The white houses, each with its lawn, squatting there, row on row, all gone.

And it was not a lawn he was sitting on, for the grass was growing rank, untended, and there were trees about, many of them, with more on the horizon. That was when the worst shock of all came, because the leaves on those trees were ruddy, some of them, and in the curve of his hand he felt the dry brittleness of a dead leaf. He was a city man, but he knew autumn when he saw it.

Autumn! Yet when he had lifted his right foot it had been a June day, with everything a fresh and glistening green.

He looked toward his feet automatically as he thought that and, with a sharp cry, reached toward them. . . .The little cloth doll that he had stepped over, a little breath of reality, a--

Well, no! He turned it over in his trembling hands, and it was not whole. Yet it was not mangled; it was sliced. Now wasn't that queer! Sliced lengthwise very neatly, so that the waste-yarn stuffing wasn't stirred a hair. It lay there in interrupted threads, ending flatly.

The glitter on his left shoe caught Schwartz's eye. Still clutching the doll, he forced his foot over his raised knee. The extreme tip of the sole, the part that extended forward past the uppers, was smoothly sliced off. Sliced off as no earthly knife in the hand of an earthly cobbler could have duplicated. The fresh surface gleamed almost liquidly in its unbelievable smoothness.

Schwartz's confusion had reached up from his spinal cord and touched the cerebrum, where it finally froze him with horror.

At last, because even the sound of his own voice was a soothing element in a world otherwise completely mad, he spoke aloud. The voice he heard was low and tense and panting.

He said, "In the first place, I'm not crazy. I feel inside just the way I've always felt. . . .Of course, if maybe I were crazy, I wouldn't know it, or would I? No--" Inside, he felt the hysteria rise and forced it down. "There must be something else possible."

He considered, "A dream, maybe? How can I tell if it's a dream or not?" He pinched himself and felt the nip, but shook his head. "I can always dream I feel a pinch. That's no proof."

He looked about him despairingly. Could dreams be so clear, so detailed, so lasting? He had read once that most dreams last not more than five seconds, that they are induced by trifling disturbances to the sleeper, that the apparent length of the dreams is an illusion.

Cold comfort! He shifted the cuff of his shirt upward and stared at his wrist watch. The second hand turned and turned and turned. If it were a dream, the five seconds was going to stretch madly.

He looked away and wiped futilely at the cold dampness of his forehead. "What about amnesia?"

He did not answer himself, but slowly buried his head in both hands.

If he had lifted his foot and, as he did so, his mind had slipped the well-worn and well-oiled tracks it had followed so faithfully for so long. . . . If three months later, in the autumn, or a year and three months later, or ten years and three months later, he had put his foot down in this strange place, just as his mind returned. . . . Why, it would seem a single step, and all this. . . . Then where had he been and what had he done in the interval?

"No!" The word came out in a loud cry. That couldn't be! Schwartz looked at his shirt. It was the one he had put on that morning, or what should have been that morning, and it was a fresh shirt. He bethought himself, plunged a fist: into his jacket pocket, and brought out an apple.

He bit into it wildly. It was fresh and still had a lingering coolness from the refrigerator which had held it two hours earlier--or what should have been two hours.

And the little rag doll, what about that?

He felt himself beginning to go wild. It had to be a dream. or he really was insane.

It struck him that the time of day had changed. It was late afternoon, or at least the shadows were lengthening. The quiet desolation of the place flooded down upon him suddenly and freezingly.

He lurched to his feet. Obviously he would have to find people, any people. And, as obviously, he would have to find a house, and the best way to do that would be to find a road.

Automatically he turned in the direction in which the trees seemed thinnest, and walked.

The slight chill of evening was creeping inside his jacket and the tops of the trees were becoming dim and forbidding when he came upon that straight and impersonal streak of macadam. He lunged toward it with sobbing gratitude and loved the feel of the hardness beneath his feet.

But along either direction was absolute emptiness, and for a moment he felt the cold clutch again. He had hoped for cars. It would have been the easiest thing to wave them down and say--he said it aloud in his eagerness--"Going toward Chicago, maybe?"

What if he was nowhere near Chicago? Well, any large city; anyplace he could reach a telephone line. He had only four dollars and twenty-seven cents in his pocket, but there was always the police. . .

He was walking along the highway, walking along the middle, watching in both directions. The setting of the sun made no impression upon him, or the fact that the first stars were coming out.

No cars. Nothing' And it was getting to be really dark.

He thought that first dizziness might be coming back, because the horizon at his left glimmered. Through the gaps in the trees there was a cold blue shine. It was not the leaping red he imagined a forest fire would be like, but a faint and creeping glow. And the macadam beneath his feet seemed to sparkle ever so faintly. He bent down to touch it, and it felt normal. But there was that tiny glimmer that caught the edges of his eyes.

He found himself running wildly along the highway, his shoes thudding in blunt and uneven rhythm. He was conscious of the damaged doll in his hand and he tossed it wildly over his head.

Leering, mocking remnant of life. . . And then he stopped in a panic. Whatever it was, it was a proof of his sanity. And he needed it! So he felt about in the darkness, crawling on his knees till he found it, a dark patch on the ultra-faint glow. The stuffing was plumping out and, absently, he forced it back.

He was walking again--too miserable to run, he told himself.

He was getting hungry and really, really frightened when he saw that spark to the right.

It was a house, of course!

He shouted wildly and no one answered, but it was a house, a spark of reality blinking at him through the horrible, nameless wilderness of the last hours. He turned off the road and went plunging cross-country, across ditches, around trees, through the underbrush, and over a creek.

Queer thing! Even the creek glowed faintly--phosphorescently! But it was only the tiniest fragment of his mind that noted it.

Then he was there, with his hands reaching out to touch the hard white structure. It was neither brick nor stone nor wood, but he never paid that the least mind. It looked like a dun, strong porcelain, but he didn't give a hoot. He was just looking for a door, and when he came to it and saw no bell, he kicked at it and yelled like a demon.

He heard the stirring inside and the blessed, lovely sound of a human voice other than his own. He yelled again.

"Hey, in there!"

There was a faint, oiled whir, and the door opened. A woman emerged, a spark of alarm in her eyes. She was tan and wiry, and behind her was the gaunt figure of a hard-faced man in work clothes. . . .No, not work clothes. Actually they were like nothing Schwartz had ever seen, but, in some indefinable way, they looked like the kind of clothes men worked in.

But Schwartz was not analytical. To him they, and their clothes, were beautiful; beautiful only as the sight of friends to a man alone can be beautiful.

The woman spoke and her voice was liquid, but peremptory, and Schwartz reached for the door to keep himself upright. His lips moved, uselessly, and, in a rush, all the clammiest fears he had known returned to choke his windpipe and stifle his heart.

For the woman spoke in no language Schwartz had ever heard.

2. THE DISPOSAL OF A STRANGER

Loa Maren and her stolid husband, Arbin, played cards in the cool of the same evening, while the older man in the motor-driven wheel chair in the corner rustled his newspaper angrily and caned, " Arbin!"

Arbin Maren did not answer at once. He fingered the thin, smooth rectangles carefully as he considered the next play. Then, as he slowly made his decision, he responded with an absent, "What do you want, Grew?"

The grizzled Grew regarded his son-in-law fiercely over the top of the paper and rustled it again. He found noise of that sort a great relief to his feelings. When a man teems with energy and finds himself spiked to a wheel chair with two dead sticks for legs, there must be something, by Space, he can do to express himself. Grew used his newspaper. He rustled it; he gestured with it; when necessary, he swatted at things with it.

Elsewhere than on Earth, Grew knew, they had telenews machines that issued rolls of microfilm as servings of current news. Standard book viewers were used for them. But Grew sneered silently at that. An effete and degenerate custom!

Grew said, "Did you read about the archaeological expedition they're sending to Earth?"

"No, I haven't," said Arbin calmly.

Grew knew that, since nobody but himself had seen the paper yet, and the family had given up their video last year. But then his remark had simply been in the nature of an opening gambit, anyway.

He said, "Well, there's one coming. And on an Imperial grant, too, and how do you like that?" He began reciting in the queer unevenness of tone that most people somehow assume automatically when reading aloud, " 'Bel Arvardan, Senior Research Associate at the Imperial Archaeological Institute, in an interview granted the Galactic Press, spoke hopefully of the expected valuable results of archaeological studies which are being projected upon the planet Earth, located on the outskirts of the Sirius Sector (see map). "Earth," he said, "with its archaic civilization and its unique environment, offers a freak culture which has been too long neglected by our social scientists, except as a difficult exercise in local government. I have every expectation that the next year or two will bring about revolutionary changes in some of our supposed fundamental concepts of social evolution and human history." And so on and so on," he finished with a flourish.

Arbin Maren had been listening with only half an ear. He mumbled, "What does he mean, 'freak culture'?"

Loa Maren hadn't been listening at all. She simply said. "It's your play, Arbin."

Grew went on, "Well, aren't you going to ask me why the Tribune printed it? You know they wouldn't print a Galactic Press release for a million Imperial Credits without a good reason."

He waited uselessly for an answer, then said, "Because they have an editorial on it. A full-page editorial that blasts the living daylights out of this guy Arvandan. Here's a fellow wants to come here for scientific purposes and they're choking themselves purple to keep him out. Look at this piece of rabble-rousing. Look at it!" He shook the paper at them. "Read it, why don't you?"

Loa Maren put down her cards and clamped her thin lips firmly together. "Father," she said, "we've had a hard day, so let's not have politics just now. Later, maybe, eh? Please, Father."

Grew scowled and mimicked, " 'Please, Father! Please, Father.' It appears to me you must be getting pretty tired of your old father when you begrudge him a few quiet words on current events. I'm in your way, I suppose, sitting here in the corner and letting you two work for three. . . .Whose fault is it? I'm strong. I'm willing to work. And you know I could get my legs treated and be as well as ever." He slapped them as he spoke: hard, savage, ringing slaps, which he heard but did not feel. "The only reason I can't is because I'm getting too old to make a cure worth their while. Don't you can that a 'freak culture'? What else could you can a world where a man can work but they won't let him? By Space, I think it's about time we stopped this nonsense about our so-called 'peculiar institutions.' They're not just peculiar; they're cracked! I think--"

He was waving his arms and angry blood was reddening his face.

But Arbin had risen from his chair, and his grip was strong on the older man's shoulder. He said, "Now where's the call to be upset, Grew? When you're through with the paper, I'll read the editorial."

"Sure, but you'll agree with them, so what's the use? You young ones are a bunch of milksops; just sponge rubber in the hands of the Ancients."

And Loa said sharply, "Quiet, Father. Don't start that." She sat there listening for a moment. She could not have said exactly what for, but. . .

Arbin felt that cold little prickle that always came when the Society of Ancients was mentioned. It just wasn't safe to talk as Grew did, to mock Earth's ancient culture, to--to--

Why, it was rank Assimilationism. He swallowed earnestly; the word was an ugly one, even when confined to thought.

Of course in Grew's youth there had been much of this foolish talk of abandoning the old ways, but these were different times. Grew should know that--and he probably did, except that it wasn't easy to be reasonable and sensible when you were in a wheelchair prison, just waiting away your days for the next Census.

Grew was perhaps the least affected, but he said no more. And as the moments passed he grew quieter and the print became progressively more difficult to place in focus. He had not yet had time to give the sports pages a detailed and critical perusal when his nodding head lolled slowly down upon his chest. He snored softly, and the paper fell from his fingers with a final, unintentional rustle.

Then Loa spoke, in a worried whisper. "Maybe we're not being kind to him, Arbin. It's a hard life for a man like Father. It's like being dead compared to the life he used to lead."

"Nothing's like being dead, Loa. He has his papers and his books. Let him be! A bit of excitement like this peps him up. He'll be happy and quiet for days now."

Arbin was beginning to consider his cards again, and as he reached for one the pounding at the door sounded, with hoarse yells that didn't quite coalesce into words.

Arbin's hand lurched and stopped. Loa's eyes grew fearful; she stared at her husband with a trembling lower lip.

Arbin said, "Get Grew out of here. Quickly!"

Loa was at the wheel chair as he spoke. She made soothing sounds with her tongue.

But the sleeping figure gasped, startled awake at the first motion of the chair. He straightened and groped automatically for his paper.

"What's the matter?" he demanded irritably, and by no means in a whisper.

"Shh. It's all right," muttered Loa vaguely, and wheeled the chair into the next room. She closed the door and placed her back against it, thin chest heaving as her eyes sought those of her husband. There was that pounding again.

They stood close to each other as the door opened, almost defensively so, and hostility peeped from them as they faced the short, plump man who smiled faintly at them.

Loa said, "Is there anything we can do for you?" with a ceremonial courtesy, then jumped back as the man gasped and put out a hand to stop himself from falling.

"Is he sick?" asked Arbin bewilderedly. "Here, help me take him inside."

The hours after that passed, and in the quiet of their bedroom Loa and Arbin prepared slowly for bed.

"Arbin," said Loa.

"What is it?"

"Is it safe?"

"Safe?" He seemed to avoid her meaning deliberately.

"I mean, taking this man into the house. Who is he?"

"How should I know?" was the irritated response. "But, after an, we can't refuse shelter to a sick man. Tomorrow, if he lacks identification, we'll inform the Regional Security Board, and that will be the end of it." He turned away in an obvious attempt at breaking off the conversation.

But his wife broke the returning silence, her thin voice more urgent. "you don't think he might be an agent of the Society of Ancients, do you? There's Grew, you know."

"You mean because of what he said tonight? That's past the limit of reason. I won't argue about it."

"I don't mean that, and you know it. I mean that we've been keeping Grew illegally now for two years, and you know we're breaking just about the most serious Custom."

Arbin muttered, "We're harming no one. We're fining our quota, aren't we, even though it's set for three people--three workers? And if we are, why should they suspect anything? We don't even let him out of the house."

"They might trace the wheel chair. You had to buy the motor and fittings outside."

"Now don't start that again, Loa. I've explained many times that I've bought nothing but standard kitchen equipment for that chair. Besides, it does not make any sense at all to consider him an agent of the Brotherhood. Do you suppose that they would go through such an elaborate trickery for the sake of a poor old man in a wheel chair? Couldn't they enter by daylight and with legal search warrants? Please, reason this thing out."

"Well, then, Arbin"--her eyes were suddenly bright and eager--"if you really think so--and I've been so hoping you would--he must be an Outsider. He can't be an Earthman."

"What do you mean, he can't be? That's more ridiculous still. Why should a man of the Empire come here to Earth, of all places?"

"I don't know why! Yes, I do; maybe he's committed a crime out there." She was caught up instantly in her own fancy. "Why not? It makes sense. Earth would be the natural place to come to. Who would ever think of looking for him here?"

"If he's an Outsider. What evidence do you have for that?"

"He doesn't speak the language, does he? You'll have to grant me that. Could you understand a single word? So he must come from some far-off corner of the Galaxy where the dialect is strange. They say the men of Fomalhaut have to learn practically a new language to be understood at the Emperor's court on Trantor. . . .But don't you see what all this can mean? If he's a stranger on Earth, he will have no registration with the Census Board, and he will be only too glad to avoid reporting to them. We can use him on the farm, in the place of Father, and it will be three people again, not two, who will have to meet the quota for three this next season. . . .He could even help with the harvest now."

She looked anxiously at the uncertain face of her husband, who considered long, then said, "Well, go to bed, Loa. We'll speak further in the common sense of daylight."

The whispering ended, the light was put out, and eventually sleep filled the room and the house.

The next morning it was Grew's turn to consider the matter. Arbin put the question to him hopefully. He felt a confidence in his father-in-law that he could not muster in himself.

Grew said, "Your troubles, Arbin, obviously arise from the fact that I am registered as a worker, so that the produce quota is set at three. I'm tired of creating trouble. This is the second year I have lived past my time. It is enough."

Arbin was embarrassed. . . .Now that wasn't the point at an. I'm not hinting that you're a trouble to us."

"Well, after an, what's the difference? In two years there will be the Census, and I will go anyway."

"At least you will have two more years of your books and your rest. Why should you be deprived of that?"

"Because others are. And what of you and Loa? When they come to take me, they will take you two as well. What kind of a man would I be to live a few stinking years at the expense--"

"Stop it, Grew. I don't want histrionics. We've told you many times what we're going to do. We'll report you a week before the Census. "

"And fool the doctor, I suppose?"

"We'll bribe the doctor."

"Hmp. And this new man--he'll double the offense. You'll be concealing him too."

"We'll turn him loose. For Space's sake, why bother about this now? We have two years. What shall we do with him?"

"A stranger," mused Grew. "He comes knocking at the door. He's from nowhere. He speaks unintelligibly. . . .I don't know what to advise."

The farmer said, "He is mild-mannered; seems frightened to death. He can't do us any harm."

"Frightened, eh? What if he's feeble-minded? What if his babbling isn't a foreign dialect at an, but just insane mouthing?"

"That doesn't sound likely." But Arbin stirred uneasily.

"You tell yourself that because you want to use him. . . . All right, I'll tell you what to do. Take him into town."

"To Chica?" Arbin was horrified. "That would be ruin."

"Not at all," said Grew calmly. "The trouble with you is that you don't read the newspapers. Fortunately for this family, I do. It so happens that the Institute for Nuclear Research has developed an instrument that is supposed to make it easier for people to learn. There was a full-page spread in the Week-end Supplement. And they want volunteers. Take this man. Let him be a volunteer."

Arbin shook his head firmly. "You're mad. I couldn't do anything like that, Grew. They'll ask for his registration number first thing. It's only inviting investigation to have things in improper order, and then they'll find out about you."

"No, they won't. It so happens you're all wrong, Arbin. The reason the Institute wants volunteers is that the machine is still experimental. It's probably killed a few people, so I'm sure they won't ask questions. And if the stranger dies, he'll probably be no worse off than he is now. . . .Here, Arbin, hand me the book projector and set the mark at reel six. And bring me the paper as soon as it comes, will you?"

When Schwartz opened his eyes, it was past noon. He felt that dun, heart-choking pain that feeds on itself, the pain of a wife no longer by his side at waking, of a familiar world lost. . .

Once before he had felt such a pain, and that momentary flash of memory came, lighting up a forgotten scene into sharp brilliance. There was himself, a youngster, in the snow of the wintry village. . . with the sleigh waiting. . . at the end of whose journey would be the train. . . and, after that, the great ship. . .

The longing, frustrating fear for the world of the familiar united him for the moment with that twenty-year-old who had emigrated to America.

The frustration was too real. This could not be a dream.

He jumped up as the light above the door blinked on and off and the meaningless baritone of his host sounded. Then the door opened and there was breakfast--a mealy

porridge that he did not recognize but which tasted faintly like corn mush (with a savory difference) and milk.

He said, "Thanks," and nodded his head vigorously.

The farmer said something in return and picked up Schwartz's shirt from where it hung on the back of the chair. He inspected it carefully from all directions, paying particular attention to the buttons. Then, replacing it, he flung open the sliding door of a closet, and for the first time Schwartz became visually aware of the warm milkiness of the walls.

"Plastic," he muttered to himself, using that all-inclusive word with the finality laymen always do. He noted further that there were no corners or angles in the room, all planes fading into each other at a gentle curve.

But the other was holding objects out toward him and was making gestures that could not be mistaken. Schwartz obviously was to wash and dress.

With help and directions, he obeyed. Except that he found nothing with which to shave, nor could gestures to his chin elicit anything but an incomprehensible sound accompanied by a look of distinct revulsion on the part of the other. Schwartz scratched at his gray stubble and sighed windily.

And then he was led to a small, elongated, biwheeled car, into which he was ordered by gestures. The ground sped beneath them and the empty road moved backward on either side, until low, sparkling white buildings rose before him, and there, far ahead, was the blue of water.

He pointed eagerly. "Chicago?"

It was the last gasp of hope within him, for certainly nothing he ever saw looked less like that city.

The farmer made no answer at all.

And the last hope died.

3. ONE WORLD--OR MANY?

Bel Arvardan, fresh from his interview with the press, on the occasion of his forthcoming expedition to Earth, felt at supreme peace with all the hundred million star systems that composed the all-embracing Galactic Empire. It was no longer a question of being known in this sector or that. Let his theories concerning Earth be proven and his reputation would be assured on every inhabited planet of the Milky Way, on every planet that Man had set foot through the hundreds of thousands of years of expansion through space.

These potential heights of renown, these pure and rarefied intellectual peaks of science were coming to him early, yet not easily. He was scarcely thirty-five, but already his career had been packed with controversy. It had begun with an explosion that had rocked the halls of the University of Arcturus when he first graduated as Senior Archaeologist from that institution at the unprecedented age of twenty-three. The explosion--no less effective for being immaterial --consisted of the rejection for publication, on the part of the Journal of the Galactic Archaeological Society, of his Senior Dissertation. It was the first time in the history of the university that a Senior Dissertation had been rejected. It was equally the first time in the history of that staid professional journal that a rejection had been couched in such blunt terms.

To a non-archaeologist, the reason for such anger against an obscure and dry little pamphlet, entitled *On the Antiquity of Artifacts in the Sirius Sector with Considerations of the Application Thereof to the Radiation Hypothesis of Human Origin*, might seem mysterious. What was involved, however, was that from the first Arvardan adopted as his own the hypothesis advanced earlier by certain groups of mystics who were more concerned with metaphysics than with archaeology; i.e., that Humanity had originated upon some single planet and had radiated by degrees throughout the Galaxy. This was a favorite theory of the fantasy writers of the day, and the bete noire of every respectable archaeologist of the Empire.

But Arvardan became a force to be reckoned with by even the most respectable, for within the decade he had become the recognized authority on the relics of the pre-Empire cultures still left in the eddies and quiet backwaters of the Galaxy.

For instance, he had written a monograph on the mechanistic civilization of the Rigel Sector, where the development of robots created a separate culture that persisted for centuries, till the very perfection of the metal slaves reduced the human initiative to the point where the vigorous fleets of the War Lord. Moray, took easy control. Orthodox archaeology insisted on the evolution of Human types independently on various planets and used such atypical cultures, as that on Rigel, as examples of race differences that had not yet been ironed out through intermarriage. Arvardan destroyed such concepts effectively by showing that Rigellian robot culture was but a natural outgrowth of the economic and social forces of the times and of the region.

Then there were the barbarous worlds of Ophiuchus, which the orthodox had long upheld as samples of primitive Humanity not yet advanced to the stage of interstellar travel. Every textbook used those worlds as the best evidence of the Merger Theory; i.e., that Humanity was the natural climax of evolution on any world based upon a water-oxygen chemistry with proper intensities of temperature and gravitation; that each independent strain of Humanity could intermarry; that with the discovery of interstellar travel, such intermarriage took place.

Arvardan, however, uncovered traces of the early civilization that had preceded the then thousand-year-old barbarism of Ophiuchus and proved that the earliest records of the planet showed traces of interstellar trade. The final touch came when he demonstrated beyond any doubt that Man had emigrated to the region in an already civilized state.

It was after that that the Gal. Arch. Soc. (to give the Journal its professional abbreviation) decided to print Arvardan's Senior Dissertation more than ten years after it had been presented.

And now the pursuit of his pet theory led Arvardan to probably the least significant planet of the Empire--the planet called Earth.

Arvardan landed at that one spot of Empire on all Earth, that patch among the desolate heights of the plateaus north of the Himalayas. There where radioactivity was not, and never had been, there gleamed a palace that was not of Terrestrial architecture. In essence it was a copy of the viceregal palaces that existed on more fortunate worlds. The soft lushness of the grounds was built for comfort. The forbidding rocks had been covered with topsoil, watered, immersed in an artificial atmosphere and climate--and converted into five square miles of lawns and flower gardens.

The cost in energy involved in this performance was terrific by Earthly calculations, but it had behind it the completely incredible resources of tens of millions of planets, continually growing in number. (It has been estimated that in the Year of the Galactic Era 827 an average of fifty new planets each day were achieving the dignity of provincial status, this condition requiring the attainment of a population of five hundred millions.)

In this spot of non-Earth lived the Procurator of Earth, and sometimes, in this artificial luxury, he could forget that he was a Procurator of a rathole world and remember that he was an aristocrat of great honor and ancient family.

His wife was perhaps less often deluded, particularly at such times as, topping a grassy knoll, she could see in the distance the sharp, decisive line separating the grounds from the fierce wilderness of Earth. It was then that not all the colored fountains (luminescent at night, with an effect of cold liquid fire), flowered walks, or idyllic groves could compensate for the knowledge of their exile.

So perhaps Arvardan was welcomed even more than protocol might call for. To the Procurator, after all, Arvardan was a breath of Empire, of spaciousness, of boundlessness.

And Arvardan for his part found much to admire.

He said, "This is done well--and with taste. It is amazing how a touch of the central culture permeates the most outlying districts of our Empire, Lord Ennius."

Ennius smiled. "I'm afraid the Procurator's court here on Earth is more pleasant to visit than to live in. It is but a shell that rings hollowly when touched. When you have considered myself and family, the staff, the Imperial garrison, both here and in the important planetary centers, together with an occasional visitor such as yourself, you have exhausted all the touch of the central culture that exists. It seems scarcely enough."

They sat in the colonnade in the dying afternoon, with the sun glinting downward toward the mist-purpled jags of the horizon and the air so heavy with the scent of growing things that its motions were merely sighs of exertion.

It was, of course, not quite suitable for even a Procurator to show too great a curiosity about the doings of a guest, but that does not take into account the inhumanity of day-to-day isolation from all the Empire.

Ennius said, "Do you plan to stay for some time, Dr. Arvardan?"

"As to that, Lord Ennius, I cannot surely say. I have come ahead of the rest of my expedition in order to acquaint myself with Earth's culture and to fulfill the necessary legal requirements. For instance, I must obtain the usual official permission from you to establish camps at the necessary sites, and soon."

"Oh granted, granted! But when do you start digging? And whatever can you possibly expect to find on this miserable heap of rubble?"

"I hope, if all goes well, to be able to set up camp in a few months. And as to this world--why, it's anything but a miserable heap. It is absolutely unique in the Galaxy."

"Unique?" said the Procurator stiffly. "Not at all! It is a very ordinary world. It is more or less of a pigpen of a world, or a horrible hole of a world, or a cesspool of a world, or almost any other particularly derogative adjective you care to use. And yet, with all its refinement of nausea, it cannot even achieve uniqueness in villainy, but remains an ordinary, brutish peasant world."

"But," said Arvardan, somewhat taken aback by the energy of the inconsistent statements thus thrown at him, "the world is radioactive."

"Well, what of that? Some thousands of planets in the Galaxy are radioactive, and some are considerably more so than Earth."

It was at this moment that the soft-gliding motion of the mobile cabinet attracted their attention. It came to a halt within easy hand reach.

Ennius gestured toward it and said to the other, "What would you prefer?"

"I'm not particular. A lime twist, perhaps."

"That can be handled. The cabinet will have the ingredients. . . .With or without Chensey?"

"Just about a tang of it," said Arvardan, and held up his forefinger and thumb, nearly touching.

"You'll have it in a minute."

Somewhere in the bowels of the cabinet (perhaps the most universally popular mechanical offspring of human ingenuity) a bartender went into action--a non-human bartender whose electronic soul mixed things not by jiggers but by atom counts, whose

ratios were perfect every time, and who could not be matched by all the inspired artistry of anyone merely human.

The tall glasses appeared from nowhere, it seemed, as they waited in the appropriate recesses.

Arvardan took the green one and, for a moment, felt the chill of it against his cheek. Then he placed the rim to his lips and tasted.

"Just right," he said. He placed the glass in the well-fitted holder in the arm of his chair and said, "Thousands of radioactive planets, Procurator, just as you say, but only one of them is inhabited. This one, Procurator."

"Well"--Ennius smacked his lips over his own drink and seemed to lose some of his sharpness after contact with its velvet--"perhaps it is unique in that way. It's an unenviable distinction."

"But it is not just a question of statistical uniqueness." Arvardan spoke deliberately between occasional sips. "It goes further; it has tremendous potentialities. Biologists have shown, or claim to have shown, that on planets in which the intensity of radioactivity in the atmosphere and in the seas is above a certain point life will not develop. . . .Earth's radioactivity is above that point by a considerable margin."

"Interesting. I didn't know that. I imagine that this would constitute definite proof that Earth life is fundamentally different from that of the rest of the Galaxy. . . .That should suit you, since you're from Sirius." He seemed sardonically amused at this point and said in a confidential aside, "Do you know that the biggest single difficulty involved in ruling this planet lies in coping with the intense anti-Terrestrialism that exists throughout the entire Sirius Sector? And the feeling is returned with interest on the part of these Earthmen. I'm not saying, of course, that anti-Terrestrialism doesn't exist in more or less diluted form in many places in the Galaxy, but not like on Sirius."

Arvardan's response was impatient and vehement. "Lord Ennius, I reject the implication. I have as little intolerance in me as any man living. I believe in the oneness of humanity to my very scientific core, and that includes even Earth. And all life is fundamentally one, in that it is all based upon protein complexes in colloidal dispersion, which we call protoplasm. The effect of radioactivity that I just talked of does not apply simply to some forms of human life, or to some forms of any life. It applies to all life, since it is based upon the quantum mechanics of the protein molecules. It applies to you, to me, to Earthmen, to spiders, and to germs.

"You see, proteins, as I probably needn't tell you, are immensely complicated groupings of amino acids and certain other specialized compounds, arranged in intricate three-dimensional patterns that are as unstable as sunbeams on a cloudy day. It is this instability that is life, since it is forever changing its position in an effort to maintain its identity--in the manner of a long rod balanced on an acrobat's nose.

"But this marvelous chemical, this protein, must be first built up out of inorganic matter before life can exist. So, at the very beginning, by the influence of the sun's radiant energy upon those huge solutions we call oceans, organic molecules gradually increase in complexity from methane to formaldehyde and finally to sugars and starches in one

direction, and from urea to amino acids and proteins in another direction. It's a matter of chance, of course, these combinations and disintegrations of atoms, and the process on one world may take millions of years while on another it may take only hundreds. Of course it is much more probable that it will take millions of years. In fact, it is most probable that it will end up never happening.

"Now physical organic chemists have worked out with great exactness all the reaction chain involved, particularly the energetics thereof; that is, the energy relationships involved in each atom shift. It is now known beyond the shadow of a doubt that several of the crucial steps in the building of life require the absence of radiant energy. If this strikes you as queer, Procurator, I can only say that photochemistry (the chemistry of reactions induced by radiant energy) is a well-developed branch of the science, and there are innumerable cases of very simple reactions which will go in one of two different directions depending upon whether it takes place in the presence or absence of quanta of light energy.

"In ordinary worlds the sun is the only source of radiant energy, or, at least, by far the major source. In the shelter of clouds, or at night, the carbon and nitrogen compounds combine and recombine, in the fashions made possible by the absence of those little bits of energy hurled into the midst of them by the sun-like bowling balls into the midst of an infinite number of infinitesimal tenpins.

"But on radioactive worlds, sun or no sun, every drop of water--even in the deepest night, even five miles underground and bursts with darting gamma rays, kicking up the carbon atoms--activating them, the chemists say--and forcing certain key reactions to proceed only in certain ways, ways that never result in life."

Arvardan's drink was gone. He placed the empty glass on the waiting cabinet. It was withdrawn instantly into the special compartment where it was cleaned, sterilized, and made ready for the next drink.

"Another one?" asked Ennius.

"Ask me after dinner," said Arvardan. "I've had quite enough for now."

Ennius tapped a tapering fingernail upon the arm of his chair and said, "you make the process sound quite fascinating, but if it is as you say, then what about the life on Earth? How did it develop?"

"Ah, you see, even you are beginning to wonder. But the answer, I think, is simple. Radioactivity, in excess of the minimum required to prevent life, is still not necessarily sufficient to destroy life already formed. It might modify it, but, except in comparatively huge excess, it will not destroy it. . . . You see, the chemistry involved is different. In the first case, simple molecules must be prevented from building up, while in the second, already-formed complex molecules must be broken down. Not at all the same thing."

"I don't get the application of that at all," said Ennius.

"Isn't it obvious? Life on Earth originated before the planet became radioactive. My dear Procurator, it is the only possible explanation that does not involve denying either the fact of life on Earth or enough chemical theory to upset half the science."

Ennius gazed at the other in amazed disbelief. "But you can't mean that."

"Why not?"

"Because how can a world become radioactive? The life of the radioactive elements in the planet's crust are in the millions and billions of years. I've learned that, at least, during my university career, even in a pre-law course. They must have existed indefinitely in the past."

"But there is such a thing as artificial radioactivity, Lord Ennius--even on a huge scale. There are thousands of nuclear reactions of sufficient energy to create all sorts of radioactive isotopes. Why, if we were to suppose that human beings might use some applied nuclear reaction in industry, without proper controls, or even in war, if you can imagine anything like a war proceeding on a single planet, most of the topsoil could, conceivably, be converted into artificially radioactive materials. What do you say to that?"

The sun had expired in blood on the mountains, and Ennius's thin face was ruddy in the reflection of that process. The gentle evening wind stirred, and the drowsy murmur of the carefully selected varieties of insect life upon the palace grounds was more soothing than ever.

Ennius said, "It sounds very artificial to me. For one thing, I can't conceive using nuclear reactions in war or letting them get out of control to this extent in any manner--"

"Naturally, sir, you tend to underestimate nuclear reactions because you're living in the present, when they're so easily controlled. But what if someone--or some army--used such weapons before the defense had been worked out? For instance, it's like using fire bombs before anyone knew that water or sand would put out fire."

"Hmm," said Ennius, "you sound like Shekt."

"Who's Shekt?" Arvardan looked up quickly.

"An Earthman. One of the few decent ones--I mean, one that a gentleman can speak to. He's a physicist. He told me once that Earth might not always have been radioactive."

"Ah. . . .Well, that's not unusual, since the theory is certainly not original with me. It's part of the Book of the Ancients, which contains the traditional, or mythical, history of prehistoric Earth. I'm saying what it says, in a way, except that I'm putting its rather elliptical phraseology into equivalent scientific statements."

"The Book of the Ancients?" Ennius seemed surprised, and a little upset. "Where did you get that?"

"Here and there. It wasn't easy, and I only obtained parts. Of course all this traditional information about non-radioactivity, even where completely unscientific, is important to my project. . . .Why do you ask?"

"Because the book IS the revered text of a radical sect of Earthmen. It is forbidden for Outsiders to read it. I wouldn't broadcast the fact that you did, either, while you're here. Non-Earthmen, or Outsiders, as they call them, have been lynched for less."

"You make it sound as if the Imperial police power here is defective."

"It is in cases of sacrilege. A word to the wise, Dr. Arvardan!"

A melodious chime sounded a vibrant note that seemed to harmonize with the rustling whisper of the trees. It faded out slowly, lingering as though in love with its surroundings.

Ennius rose. "I believe it is time for dinner. Will you join me, sir, and enjoy such hospitality as this husk of Empire on Earth can afford?"

An occasion for an elaborate dinner came infrequently enough. An excuse, even a slim one, was not to be missed. So the courses were many, the surroundings lavish, the men polished, and the women bewitching. And, it must be added, Dr. B. Arvardan of Baronn, Sirius, was lionized to quite an intoxicating extent.

Arvardan took advantage of his dinner audience during the latter portion of the banquet to repeat much of what he had said to Ennius, but here his exposition met with markedly less success.

A florid gentleman in colonel's uniform leaned toward him with that marked condescension of the military man for the scholar and said, "If I interpret your expressions rightly, Dr. Arvardan, you are trying to tell us that these hounds of Earth represent an ancient race that may once have been the ancestors of all humanity?"

"I hesitate, Colonel, to make the flat assertion, but I think there is an interesting chance that it might be so. A year from now I confidently hope to be able to make a definite judgment."

"If you find that they are, Doctor, which I strongly doubt," rejoined the colonel, "you will astonish me beyond measure. I have been stationed on Earth now for four years, and my experience is not of the smallest. I find these Earthmen to be rogues and knaves, every one of them. They are definitely our inferiors intellectually. They lack that spark that has spread humanity throughout the Galaxy. They are lazy, superstitious, avaricious, and with no trace of nobility of soul. I defy you, or anyone, to show me an Earthman who can in any way be an equal of any true man--yourself or myself, for instance--and only then will I grant you that he may represent a race who once were our ancestors. But, until then, please excuse me from making any such assumption."

A portly man at the foot of the table said suddenly, "They say the only good Earthman is a dead Earthman, and that even then they generally stink," and laughed immoderately.

Arvardan frowned at the dish before him and said, without looking up, "I have no desire to argue racial differences, especially since it is irrelevant in this case. It is the Earthman of prehistory that I speak of. His descendants of today have been long isolated, and have been subjected to a most unusual environment--yet I still would not dismiss them too casually."

He turned to Ennius and said, "My Lord, I believe you mentioned an Earthman before dinner."

"I did? I don't recall."

"A physicist. Shekt."

"Oh yes. Yes."

"Affret Shekt, perhaps?"

"Why, yes. Have you heard of him?"

"I think I have. It's been bothering me all through dinner, ever since you mentioned him, but I think I've placed him. He wouldn't be at the Institute of Nuclear Research at--Oh, what's the name of that damned place?" He struck at his forehead with the heel of his palm once or twice. "At Chica?"

"You have the right person. What about him?"

"Only this. There was an article by him in the August issue of Physical Reviews. I noticed it because I was looking for anything that had to do with Earth, and articles by Earthmen in journals of Galactic circulation are very rare. . . .In any case, the point I am trying to make is that the man claims to have developed something he calls a Synapsifier, which is supposed to improve the learning capacity of the mammalian nervous system."

"Really?" said Ennius a bit too sharply. "I haven't heard about it."

"I can find you the reference. It's quite an interesting article; though, of course, I can't pretend to understand the mathematics involved. What he has done, however, has been to treat some indigenous animal form on Earth--rats, I believe they call them--with the Synapsifier and then put them to solving a maze. You know what I mean: learning the proper pathway through a tiny labyrinth to some food supply. He used non-treated rats as controls and found that in every case the Synapsified rats solved the maze in less than one third the time. . . .Do you see the significance, Colonel?"

The military man who had initiated the discussion said indifferently, "No, Doctor, I do not."

"I'll explain, then, that I firmly believe that any scientist capable of doing such work. even an Earthman, is certainly my intellectual equal, at least, and, if you'll pardon my presumption, yours as well."

Ennius interrupted. "Pardon me, Dr. Arvardan. I would like to return to the Synapsifier. Has Shekt experimented with human beings?"

Arvardan laughed. "I doubt it, Lord Ennius. Nine tenths of his Synapsified rats died during treatment. He would scarcely dare use human subjects until much more progress has been made."

So Ennius sank back into his chair with a slight frown on his forehead and, thereafter, neither spoke nor ate for the remainder of the dinner.

Before midnight the Procurator had quietly left the gathering and, with a bare word to his wife only, departed in his private cruiser on the two-hour trip to the city of Chica, with the slight frown still on his forehead and a raging anxiety in his heart.

Thus it was that on the same afternoon that Arbin Maren brought Joseph Schwartz into Chica for treatment with Shekt's Synapsifier. Shekt himself had been closeted with none less than the Procurator of Earth for over an hour.

4. THE ROYAL ROAD

Arbin was uneasy in Chica. He felt surrounded. Somewhere in Chica, one of the largest cities on Earth--they said it had fifty thousand human beings in it--somewhere there were officials of the great outer Empire.

To be sure, he had never seen a man of the Galaxy: yet here, in Chica, his neck was continually twisting in fear that he might. If pinned down, he could not have explained how he would identify an Outsider from an Earthman, even if he were to see one, but it was in his very marrow to feel that there was, somehow, a difference.

He looked back over his shoulder as he entered the Institute. His biwheel was parked in an open area, with a six-hour coupon holding a spot open for it. Was the extravagance itself suspicious? . . . Everything frightened him now. The air was full of eyes and ears.

If only the strange man would remember to remain hidden in the bottom of the rear compartment. He had nodded violently--but had he understood? He was suddenly impatient with himself. Why had he let Grew talk him into this madness?

And then somehow the door was open in front of him and a voice had broken in on his thoughts.

It said, "What do you want?"

It sounded impatient; perhaps it had already asked him that same thing several times.

He answered hoarsely, words choking out of his throat like dry powder, "Is this where a man can apply for the Synapsifier?"

The receptionist looked up sharply and said, "Sign here."

Arbin put his hands behind his back and repeated huskily, "Where do I see about the Synapsifier?" Grew had told him the name, but the word came out queerly, like so much gibberish.

But the receptionist said, with iron in her voice, "I can't do anything for you unless you sign the register as a visitor. It's in the rules."

Without a word, Arbin turned to go. The young woman behind the desk pressed her lips together and kicked the signal bar at the side of her chair violently.

Arbin was fighting desperately for a lack of notoriety and failing miserably in his own mind. This girl was looking hard at him. She'd remember him a thousand years later. He had a wild desire to run, run back to the car, back to the farm. . .

Someone in a white lab coat was coming rapidly out of another room, and the receptionist was pointing to him. "Volunteer for the Synapsifier, Miss Shekt," she was saying. "He won't give his name."

Arbin looked up. It was still another girl, young. He looked disturbed. "Are you in charge of the machine, miss?"

"No, not at all." She smiled in a very friendly fashion, and Arbin felt anxiety ebb slightly.

"I can take you to him, though," she went on. Then, eagerly, "Do you really want to volunteer for the Synapsifier?"

"I just want to see the man in charge," Arbin said woodenly.

"All right." She seemed not at all disturbed by the rebuff. She slipped back through the door from which she had come. There was a short wait. Then, finally, there was the beckon of a finger. . .

He followed her, heart pounding, into a small anteroom. She said gently, "If you will wait about half an hour or less. Dr. Shekt will be with you. He is very busy just now. . . .If you would like some book films and a viewer to pass the time. I'll bring them to you."

But Arbin shook his head. The four walls of the small room closed about him, and held him rigid, it seemed. Was he trapped? Were the Ancients coming for him?

It was the longest wait in Arbin's life.

Lord Ennius, Procurator of Earth, had experienced no comparable difficulties in seeing Dr. Shekt, though he had experienced an almost comparable excitement. In his fourth year as Procurator, a visit to Chica was still an event. As the direct representative of the remote Emperor, his social standing was, legalistically, upon a par with viceroys of huge Galactic sectors that sprawled their gleaming volumes across hundreds of cubic parsecs of space, but, actually, his post was little short of exile.

Trapped as he was in the sterile emptiness of the Himalayas, among the equally sterile quarrels of a population that hated him and the Empire he represented, even a trip to Chica was escape.

To be sure, his escapes were short ones. They had to be short, since here at Chica it was necessary to wear lead-impregnated clothes at all times, even while sleeping, and, what was worse, to dose oneself continually with metaboline.

He spoke bitterly of that to Shekt.

"Metaboline," he said, holding up the vermilion pill for inspection, "is perhaps a true symbol of all that your planet means to me, my friend. Its function is to heighten all metabolic processes while I sit here immersed in the radioactive cloud that surrounds me and which you are not even aware of."

He swallowed it. "There' Now my heart will beat more quickly; my breath will pump a race of its own accord; and my liver will boil away in those chemical syntheses that, medical men tell me, make it the most important factory in the body. And for that I pay with a siege of headaches and lassitude afterward."

Dr. Shekt listened with some amusement. He gave a strong impression of being nearsighted, did Shekt, not because he wore glasses or was in any way afflicted, but merely because long habit had given him the unconscious trick of peering closely at things, of weighing all facts anxiously before saying anything. He was tall and in his late middle age, his thin figure slightly stooped.

But he was well read in much of Galactic culture, and he was relatively free of the trick of universal hostility and suspicion that made the average Earthman so repulsive even to so cosmopolitan a man of the Empire as Ennius.

Shekt said, "I'm sure you don't need the pill. Metaboline is just one of your superstitions, and you know it. If I were to substitute sugar pills without your knowledge, you'd be none the worse. What's more, you would even psychosomaticize yourself into similar headaches afterward."

"You say that in the comfort of your own environment. Do you deny that your basal metabolism is higher than mine?"

"Of course I don't, but what of it? I know that it is a superstition of the Empire, Ennius, that we men of Earth are different from other human beings, but that's not really so in the essentials. Or are you coming here as a missionary of the anti-Terrestrians?"

Ennius groaned. "By the life of the Emperor, your comrades of Earth are themselves the best such missionaries. Living here, as they do, cooped up on their deadly planet, festering in their own anger, they're nothing but a standing ulcer in the Galaxy.

"I'm serious, Shekt. What planet has so much ritual in its daily life and adheres to it with such masochistic fury? Not a day passes but I receive delegations from one or another of your ruling bodies for the death penalty for some poor devil whose only crime has been to invade a forbidden area, to evade the Sixty, or perhaps merely to eat more than his share of food."

"Ah, but you always grant the death penalty. Your idealistic distaste seems to stop short at resisting."

"The Stars are my witness that I struggle to deny the death. But what can one do? The Emperor will have it that all the subdivisions of the Empire are to remain undisturbed in their local customs--and that is right and wise, since it removes popular support from the fools who would otherwise kick up rebellion on alternate Tuesdays and Thursdays. Besides, were I to remain obdurate when your Councils and Senates and Chambers insist on the death, such a shrieking would arise and such a wild howling and such denunciation of the Empire and all its works that I would sooner sleep in the midst of a legion of devils for twenty years than face such an Earth for ten minutes."

Shekt sighed and rubbed the thin hair back upon his skull. "To the rest of the Galaxy, if they are aware of us at all, Earth is but a pebble in the sky. To us it is home, and all the home we know. Yet we are no different from you of the outer worlds, merely more unfortunate. We are crowded here on a world all but dead, immersed within a wall of radiation that imprisons us, surrounded by a huge Galaxy that rejects us. What can we do against the feeling of frustration that bums us? Would you, Procurator, be willing that we send our surplus population abroad?"

Ennius shrugged. "Would I care? It is the outside populations themselves that would. They don't care to fall victim to Terrestrial diseases."

"Terrestrial diseases!" Shekt scowled. "It is a nonsensical notion that should be eradicated. We are not carriers of death. Are you dead for having been among us?"

"To be sure," smiled Ennius, "I do everything to prevent undue contact."

"It is because you yourself fear the propaganda created, after all, only by the stupidity of your own bigots."

"Why, Shekt, no scientific basis at all to the theory that Earthmen are themselves radioactive?"

"Yes, certainly they are. How could they avoid it? So are you. So is everyone on every one of the hundred million planets of the Empire. We are more so, I grant you, but scarcely enough to harm anyone."

"But the average man of the Galaxy believes the opposite, I am afraid, and is not desirous of finding out by experiment. Besides--"

"Besides, you're going to say, we're different. We're not human beings, because we mutate more rapidly, due to atomic radiation, and have therefore changed in many ways. . . . Also not proven."

"But believed."

"And as long as it is so believed, Procurator, and as long as we of Earth are treated as pariahs, you are going to find in us the characteristics to which you object. If you push us intolerably, is it to be wondered at that we push back? Hatina us as you do, can you complain that we hate in our turn? No, no, we are far more the offended than the offending."

Ennius was chagrined at the anger he had raised. Even the best of these Earthmen, he thought, have the same blind spot, the same feeling of Earth versus all the universe.

He said tactfully, "Shekt, forgive my boorishness, will you? Take my youth and boredom as excuse. You see before you a poor man, a young fellow of forty--and forty is the age of a babe in the professional civil service--who is grinding out his apprenticeship here on Earth. It may be years before the fools in the Bureau of the Outer Provinces remember me long enough to promote me to something less deadly. So we are both prisoners of Earth and both citizens of the great world of the mind in which there is distinction of neither planet nor physical characteristics. Give me your hand, then, and let us be friends."

The lines on Shekt's face smoothed out, or, more exactly, were replaced by others more indicative of good humor. He laughed outright. "The words are the words of a suppliant, but the tone is still that of the Imperial career diplomat. You are a poor actor, Procurator."

"Then counter me by being a good teacher, and tell me of this Synapsifier of yours."

Shekt started visibly and frowned. "What, you have heard of the instrument? You are then a physicist as well as an administrator?"

"All knowledge is my province. But seriously, Shekt, I would really like to know."

The physicist peered closely at the other and seemed doubtful. He rose and his gnarled hand lifted to his lip, which it pinched thoughtfully. "I scarcely know where to begin."

"Well, Stars above, if you are considering at which point in the mathematical theory you are to begin, I'll simplify your problem. Abandon them all. I know nothing of your functions and tensors and what not."

Shekt's eyes twinkled. "Well, then, to stick to descriptive matter only, it is simply a device intended to increase the learning capacity of a human being."

"Of a human being? Really! And does it work?"

"I wish we knew. Much more work is necessary. I'll give you the essentials, Procurator, and you can judge for yourself. The nervous system in man--and in animals--is composed of neuroprotein material. Such material consists of huge molecules in very precarious electrical balance. The slightest stimulus will upset one, which will right itself by upsetting the next, which will repeat the process, until the brain is reached. The brain itself is an immense grouping of similar molecules which are connected among themselves in all possible ways. Since there are something like ten to the twentieth power--that is, a one with twenty zeros after it--such neuroproteins in the brain, the number of possible combinations are of the order of factorial ten to the twentieth power. This is a number so large that if all the electrons and protons in the universe were made universes themselves, and all the electrons and protons in all of these new universes again made universes, then all the electrons and protons in all the universes so created would still be nothing in comparison. . . .Do you follow me?"

"Not a word, thank the Stars. If I even attempted to, I should bark like a dog for sheer pain of the intellect."

"Hmp. Well, in any case, what we call nerve impulses are merely the progressive electronic unbalance that proceeds along the nerves to the brain and then from the brain back along the nerves. Do you get that?"

"Yes."

"Well, blessings on you for a genius, then. As long as this impulse continues along a nerve cell, it proceeds at a rapid rate, since the neuroproteins are practically in contact. However, nerve cells are limited in extent, and between each nerve cell and the next is a very thin partition of non-nervous tissue. In other words, two adjoining nerve cells do not actually connect with each other."

"Ah," said Ennius, "and the nervous impulse must jump the barrier."

"Exactly! The partition drops the strength of the impulse and slows the speed of its transmission according to the square of the width thereof. This holds for the brain as well. But imagine, now, if some means could be found to lower the dielectric constant of this partition between the cells."

"That what constant?"

"The insulating strength of the partition. That's all I mean. If that were decreased, the impulse would jump the gap more easily. You would think faster and learn faster."

"Well, then, I come back to my original question. Does it work?"

"I have tried the instrument on animals."

"And with what result?"

"Why, that most die very quickly of denaturation of brain protein-coagulation, in other words, like hard-boiling an egg."

Ennius winced. "There is something ineffably cruel about the cold-bloodedness of science. What about those that didn't die?"

"Not conclusive, since they're not human beings. The burden of the evidence seems to be favorable, for them. . . .But I need humans. You see, it is a matter of the natural electronic properties of the individual brain. Each brain gives rise to microcurrents of a certain type. None are exactly duplicates. They're like fingerprints, or the blood-vessel patterns of the retina. If anything, they're even more individual. The treatment, I believe, must take that into account, and, if I am right, there will be no more denaturation. . . .But I have no human beings on whom to experiment. I ask for volunteers, but--" He spread his hands.

"I certainly don't blame them, old man," said Ennius. "But seriously, should the instrument be perfected, what do you intend doing with it?"

The physicist shrugged. "That's not for me to say. It would be up to the Grand Council, of course."

"You would not consider making the invention available to the Empire?"

"I? I have no objections at all. But only the Grand Council has jurisdiction over--"

"Oh," said Ennius with impatience, "the devil with your Grand Council. I have had dealings with them before. Would you be willing to talk to them at the proper time?"

"Why, what influence could I possibly have?"

"You might tell them that if Earth could produce a Synapsifier that would be applicable to human beings in complete safety, and if the device were made available to the Galaxy, then some of the restrictions on emigration to other planets might be broken down."

"What," said Shekt sarcastically, "and risk epidemics and our differentness and our non-humanity?"

"You might," said Ennius quietly, "even be removed en masse to another planet. Consider it." The door opened at this point and a young lady brushed her way in past the book-film cabinet. She destroyed the musty atmosphere of the cloistered study with an automatic breath of spring. At the sight of a stranger she reddened slightly and turned.

"Come in, Pola," called Shekt hastily. "My Lord," he said to Ennius, "I believe you have never met my daughter. Pola this is Lord Ennius, Procurator of Earth."

The Procurator was on his feet with an easy gallantry that negated her first wild attempt at a curtsy.

"My dear Miss Shekt," he said, "you are an ornament I did not believe Earth capable of producing. You would, indeed, be an ornament on any world I can think of."

He took Pola's hand, which was quickly and somewhat bashfully extended to meet his gesture. For a moment Ennius made as if to kiss it, in the courtly fashion of the past generation, but the intention, if such it was, never came to fruition. Half lifted, the hand was released--a trace too quickly, perhaps.

Pola, with the slightest of frowns, said, "I'm overwhelmed at your kindness, my Lord, to a simple girl of Earth. You are brave and gallant to dare infection as you do."

Shekt cleared his throat and interrupted. "My daughter, Procurator, is completing her studies at the University of Chica and is obtaining some needed field credits by spending two days a week in my laboratory as a technician. A competent girl, and though I say it with the pride of a father, she may someday sit in my place."

"Father," said Pola gently, "I have some important information for you." She hesitated.

"Shall I leave?" said Ennius quietly.

"No, no," said Shekt. "What is it, Pola?"

The girl said, "We have a volunteer, Father."

Shekt stared, almost stupidly. "For the Synapsifier?"

"So he says."

"Well," said Ennius, "I bring you good fortune, I see."

"So it would seem." Shekt turned to his daughter. "Tell him to wait. Take him to Room C, and I'll be with him soon."

He turned to Ennius after Pola left. "Will you excuse me, Procurator?"

"Certainly. How long does the operation take?"

"It's a matter of hours, I'm afraid. Do you wish to watch?"

"I can imagine nothing more gruesome, my dear Shekt. I'll be in the State House till tomorrow. Will you tell me the result?"

Shekt seemed relieved. "Yes, certainly."

"Good. . . .And think over what I said about your Synapsifier. Your new royal road to knowledge."

Ennius left, less at ease than when he had arrived; his knowledge no greater, his fears much increased.

5. THE INVOLUNTARY VOLUNTEER

Once alone, Dr. Shekt, quietly and cautiously, touched the summoner, and a young technician entered hurriedly, white robe sparkling, long brown hair carefully bound back.

Dr. Shekt said, "Has Pola told you--"

"Yes, Dr. Shekt. I've observed him through the visiplat, and he must undoubtedly be a legitimate volunteer. He's certainly not a subject sent in the usual manner."

"Ought I refer to the Council, do you suppose?"

"I don't know what to advise. The Council wouldn't approve of any ordinary communication. Any beam can be tapped, you know." Then, eagerly, "Suppose I get rid of him. I can tell him we need men under thirty. The subject is easily thirty-five."

"No, no. I'd better see him." Shekt's mind was a cold whirl. So far things had been most judiciously handled. Just enough information to lend a spurious frankness, but no more. And now an actual volunteer--and immediately after Ennius's visit. Was there a connection? Shekt himself had but the vaguest knowledge of the giant misty forces that were now beginning to wrestle back and forth across the blasted face of Earth. But, in a way, he knew enough. Enough to feel himself at the mercy of them, and certainly more than any of the Ancients suspected he knew.

Yet what could he do, since his life was doubly in danger?

Ten minutes later Dr. Shekt was peering helplessly at the gnarled farmer standing before him, cap in hand, head half averted, as though attempting to avoid a too-close scrutiny. His age, thought Shekt, was certainly under forty, but the hard life of the soil was no flatterer of men. The man's cheeks were reddened beneath the leathery brown, and there were distinct traces of perspiration at the hairline and the temples, though the room was cool. The man's hands were fumbling at each other.

"Now, my dear sir," said Shekt kindly, "I understand you refuse to give your name."

Arbin's was a blind stubbornness. "I was told no questions would be asked if you had a volunteer."

"Hmm. Well, is there anything at all you would like to say? Or do you just want to be treated immediately?"

"Me? Here, now?" in sudden panic. "It's not myself that's the volunteer. I didn't say anything to give that impression."

"No? You mean someone else is the volunteer?"

"Certainly. What would I want--"

"I understand. Is the subject, this other man, with you?"

"In a way," said Arbin cautiously.

"All right. Now, look, just tell us whatever you wish. Everything you say will be held in strict confidence, and we'll help you in whatever way we can. Agreed?"

The farmer ducked his head, as a sort of rudimentary gesture of respect. "Thank you. It's like this, sir. We have a man about the farm, a distant--uh--relative. He helps, you understand--"

Arbin swallowed with difficulty, and Shekt nodded gravely.

Arbin continued. "He's a very willing worker and a very good worker--we had a son, you see, but he died--and my good woman and myself, you see, need the help--she's not well--we could not get along without him, scarcely." He felt that somehow the story was a complete mess.

But the gaunt scientist nodded at him. "And this relative of yours is the one you wish treated?"

"Why, yes, I thought I had said that--but you'll pardon me if this takes me some time. You see, the poor fellow is not-exactly-right in his head." He hurried on, furiously. "He is not sick, you understand. He is not wrong so that he has to be put away. He's just slow. He doesn't talk, you see."

"He can't talk?" Shekt seemed startled.

"Oh--he can. It's just that he doesn't like to. He doesn't talk well."

The physicist looked dubious. "And you want the Synapsifier to improve his mentality, eh?"

Slowly, Arbin nodded. "If he knew a bit more, sir, why, he could do some of the work my wife can't, you see."

"He might die. Do you understand that?"

Arbin looked at him helplessly, and his fingers writhed furiously.

Shekt said, "I'd need his consent."

The farmer shook his head slowly, stubbornly. "He won't understand." Then, urgently, almost beneath his breath, "Why, look, sir, I'm sure you'll understand me. You don't look like a man who doesn't know what a hard life is. This man is getting old. It's not a question of the Sixty, you see, but what if, in the next Census, they think he's a half-wit and --and take him away? We don't like to lose him, and that's why we bring him here.

"The reason I'm trying to be secret-like is that maybe--maybe"--and Arbin's eyes swiveled involuntarily at the walls, as if to penetrate them by sheer will and detect the listeners that might be behind--"well, maybe the Ancients won't like what I'm doing. Maybe trying to save an afflicted man can be judged as against the Customs, but life is hard, sir. . . .And it would be useful to you. You have asked for volunteers."

"I know. Where is your relative?"

Arbin took the chance. "Out in my biwheel, if no one's found him. He wouldn't be able to take care of himself if anyone has--"

"Well, we'll hope he's safe. You and I will go out right now and bring the car around to our basement garage. I'll see to it that no one knows of his presence but ourselves and my helpers. And I assure you that you won't be in trouble with the Brotherhood."

His arm dropped in friendly fashion to Arbin's shoulder, who grinned spasmodically. To the farmer it was like a rope loosening from about his neck.

Shekt looked down at the plump, balding figure upon the couch. The patient was unconscious, breathing deeply and regularly. He had spoken unintelligibly, had understood nothing. Yet there had been none of the physical stigmata of feeble-mindedness. Reflexes had been in order, for an old man.

Old! Hmm.

He looked across at Arbin, who watched everything with a glance like a vise.

"Would you like us to take a bone analysis?"

"No," cried Arbin. Then, more softly, "I don't want anything that might be identification."

"It might help us--be safer, you know--if we knew his age," said Shekt.

"He's fifty," said Arbin shortly.

The physicist shrugged. It didn't matter. Again he looked at the sleeper. When brought in, the subject had been, or certainly seemed, dejected, withdrawn, uncaring. Even the Hypno-pills had apparently aroused no suspicion. They had been offered him; there had been a quick, spasmodic smile in response, and he had swallowed them.

The technician was already rolling in the last of the rather clumsy units which together made up the Synapsifier. At the touch of a push button the polarized glass in the windows of the operating room underwent molecular rearrangement and became opaque. The only light was the white one that blazed its cold brilliance upon the patient suspended, as he was, in the multihundred-kilowatt diamagnetic field some two inches above the operating table to which he was transferred.

Arbin still sat in the dark there, understanding nothing, but determined in deadly fashion to prevent, somehow, by his presence, the harmful tricks he knew he had not the knowledge to prevent.

The physicists paid no attention to him. The electrodes were adjusted to the patient's skull. It was a long job. First there was the careful study of the skull formation by the Ullster technique that revealed the winding, tight-knit fissures. Grimly, Shekt smiled to himself. Skull fissures weren't an unalterable quantitative measure of age, but they were good enough in this case. The man was older than the claimed fifty.

And then, after a while, he did not smile. He frowned. There was something wrong with the fissures. They seemed odd--not quite. . .

For a moment he was ready to swear that the skull formation was a primitive one, a throwback, but then. . . Well, the man was subnormal in mentality. Why not?

And suddenly he exclaimed in shock, "Why, I hadn't noticed! This man has hair on his face!" He turned to Arbin. "Has he always been bearded?"

"Bearded?"

"Hair on his face! Come here! Don't you see it?"

"Yes, sir." Arbin thought rapidly. He had noticed it that morning and then had forgotten. "He was born like that," he said, and then weakened it by adding, "I think."

"Well, let's remove it. You don't want him going around like a brute beast, do you?"

"No, sir."

The hair came off smoothly at the application of a depilatory salve by the carefully gloved technician.

The technician said, "He has hair on his chest too, Dr. Shekt."

"Great Galaxy," said Shekt, "let me see! Why, the man is a rug! Well, let it be. It won't show with a shirt, and I want to get on with the electrodes. Let's have wires here and here, and here." Tiny pricks and the insertion of the platinum hair-lets. "Here and here."

A dozen connections, probing through skin to the fissures, through the tightness of which could be felt the delicate shadow echoes of the microcurrents that surged from cell to cell in the brain.

Carefully they watched the delicate ammeters stir and leap, as the connections were made and broken. The tiny needlepoint recorders traced their delicate spider webs across the graphed paper in irregular peaks and troughs.

Then the graphs were removed and placed on the illuminated opal glass. They bent low over it, whispering.

Arbin caught disjointed flashes: remarkably regular . . . look at the height of the quinary peak. . . think it ought to be analyzed. . . clear enough to the eye. . . "

And then, for what seemed a long time, there was a tedious adjustment of the Synapsifier. Knobs were turned, eyes on vernier adjustments, then clamped and their readings recorded. Over and over again the various electrometers were checked and new adjustments were made necessary.

Then Shekt smiled at Arbin and said, "It will all be over very soon."

The large machinery was advanced upon the sleeper like a slow-moving and hungry monster. Four long wires were dangled to the extremities of his limbs, and a dull black pad of something that looked like hard rubber was carefully adjusted at the back of his neck and held firmly in place by clamps that fitted over the shoulders. Finally, like two giant mandibles, the opposing electrodes were parted and brought downward over the pale, pudgy head, so that each pointed at a temple.

Shekt kept his eyes firmly on the chronometer; in his other hand was the switch. His thumb moved; nothing visible happened--not even to the fear-sharpened sense of the watching Arbin. After what might have been hours, but was actually less than three minutes, Shekt's thumb moved again.

His assistant bent over the still-sleeping Schwartz hurriedly, then looked up triumphantly. "He's alive."

There remained yet several hours, during which a library of recordings were taken, to an undertone of almost wild excitement. It was well past midnight when the hypodermic was pressed home and the sleeper's eyes fluttered.

Shekt stepped back, bloodless but happy. He dabbed at his forehead with the back of a hand. "It's all right."

He turned to Arbin firmly. "He must stay with us a few days, sir."

The look of alarm grew madly in Arbin's eyes. "But--but --"

"No, no, you must rely on me," urgently. "He will be safe; I will stake my life on it. I am staking my life on it. Leave him to us; no one will see him but ourselves. If you take him with you now, he may not survive. What good will that do you? . . . And if he does die, you may have to explain the corpse to the Ancients."

It was the last that did the trick. Arbin swallowed and said, "But look, how am I to know when to come and take him? I won't give you my name!"

But it was submission. Shekt said, "I'm not asking you for your name. Come a week from today at ten in the evening. I'll be waiting for you at the door of the garage, the one we took in your biwheel at. You must believe me, man; you have nothing to fear."

It was evening when Arbin arrowed out of Chica. Twenty-four hours had passed since the stranger had pounded at his door, and in that time he had doubled his crimes against the Customs. Would he ever be safe again?

He could not help but glance over his shoulder as his biwheel sped along the empty road. Would there be someone to follow? Someone to trace him home? Or was his face already recorded? Were matchings being leisurely made somewhere in the distant files of the Brotherhood at Washenn, where all living Earthmen, together with their vital statistics, were listed, for purposes of the Sixty.

The Sixty, which must come to all Earthmen eventually. He had yet a quarter of a century before it came to him, yet he lived daily with it on Grew's account, and now on the stranger's account.

What if he never returned to Chica?

No! He and Loa could not long continue producing for three, and once they failed, their first crime, that of concealing Grew, would be discovered. And so crimes against the Customs, once begun, must be compounded.

Arbin knew that he would be back, despite any risk.

It was past midnight before Shekt thought of retiring, and then only because the troubled Pola insisted. Even then he did not sleep. His pillow was a subtle smothering device, his sheets a pair of maddening snarls. He arose and took his seat by the window. The city was dark now, but there on the horizon, on the side opposite the lake, was the faint trace of that blue glow of death that held sway over all but a few patches of Earth.

The activities of the hectic day just past danced madly before his mind. His first action after having persuaded the frightened farmer to leave had been to televise the State House. Ennius must have been waiting for him, for he himself had answered. He was still encased in the heaviness of the lead-impregnated clothing.

"Ah, Shekt, good evening. Your experiment is over?"

"And nearly my volunteer as well, poor man."

Ennius looked ill. . . . I thought well when I thought it better not to stay. You scientists are scarcely removed from murderers, it seems to me."

"He is not yet dead, Procurator, and it may be that we will save him, but--" And he shrugged his shoulders.

"I'd stick to rats exclusively henceforward, Shekt. . . . But you don't look at all your usual self, friend. Surely you, at least, must be hardened to this, even if I am not."

"I am getting old, my Lord," said Shekt simply. "A dangerous pastime on Earth," was the dry reply. "Get you to bed, Shekt."

And so Shekt sat there, looking out at the dark city of a dying world.

For two years now the Synapsifier had been under test, and for two years he had been the slave and sport of the Society of Ancients, or the Brotherhood, as they called themselves.

He had seven or eight papers that might have been published in the Sirian Journal of Neurophysiology, that might have given that Galaxy-wide fame to him that he so wanted. These papers moldered in his desk. Instead there was that obscure and deliberately misleading paper in Physical Reviews. That was the way of the Brotherhood. Better a half-truth than a lie.

And still Ennius was inquiring. Why?

Did it fit in with other things he had learned? Was the Empire suspecting what he himself suspected?

Three times in two hundred years Earth had risen. Three times, under the banner of a claimed ancient greatness, Earth had rebelled against the Imperial garrisons. Three times they had failed--of course--and had not the Empire been, essentially, enlightened, and the Galactic Councils, by and large, statesmanlike, Earth would have been bloodily erased from the roll of inhabited planets.

But now things might be different. . . Or could they be different? How far could he trust the words of a dying madman, three quarters incoherent?

What was the use? In any case, he dared do nothing. He could only wait. He was getting old, and, as Ennius had said, that was a dangerous pastime on Earth. The Sixty was almost upon him, and there were few exceptions to its inevitable grasp.

And even on this miserable, burning mud ball of Earth, he wanted to live.

He went to bed once more at that point, and just before falling asleep he wondered feebly if his call to Ennius might have been tapped by the Ancients. He did not know at the time that the Ancients had other sources of information.

It was morning before Shekt's young technician had completely made up his mind.

He admired Shekt, but he knew well that the secret treatment of a non-authorized volunteer was against the direct order of the Brotherhood. And that order had been given the status of a Custom, which made disobedience a capital offense.

He reasoned it out. After all, who was this man who had been treated? The campaign for volunteers had been carefully worked out. It was designed to give enough information about the Synapsifier to remove suspicion on the part of possible Imperial spies without giving any real encouragement to volunteers. The Society of Ancients sent their own men for treatment. and that was enough.

Who had sent this man, then? The Society of Ancients in secret? In order to test Shekt's reliability?

Or was Shekt a traitor? He had been closeted with someone earlier in the day--someone in bulky clothes, such as Outsiders wore in fear of radioactive poisoning.

In either case Shekt might go down in doom, and why should he himself be dragged down as well? He was a young man with nearly four decades of life before him. Why should he anticipate the Sixty?

Besides, it would mean promotion for him. . . .And Shekt was so old, the next Census would probably get him anyway, so it would involve very little harm for him. Practically none at all.

The technician had decided. His hand reached for the communicator, and he punched the combination that would lead directly to the private room of the High Minister of all Earth, who, under the Emperor and Procurator, held the power of life and death over every man on Earth.

It was evening again before the misty impressions within Schwartz's skull sharpened through the pink pain. He remembered the trip to the low, huddling structures by the lakeside, the long crouching wait in the rear of the car.

And then--what? What? His mind yanked away at the sluggish thoughts. . . .Yes, they had come for him. There was a room, with instruments and dials, and two pills. . . . That was it. They had given him pills, and he had taken them cheerfully. What had he to lose? Poisoning would have been a favor.

And then--nothing.

Wait! There had been flashes of consciousness. . . . People bending over him. . . . Suddenly he remembered the cold motion of a stethoscope over his chest. . . .A girl had been feeding him.

It flashed upon him that he had been operated upon and, in panic, he flung the bed sheets from him and sat up.

A girl was upon him, hands on his shoulders, forcing him back onto the pillows. She spoke soothingly, but he did not understand her. He tensed himself against the slim arms, but uselessly. He had no strength.

He held his hands before his face. They seemed normal. He moved his legs and heard them brush against the sheets. They couldn't have been amputated..

He turned to the girl and said, without much hope, "Can you understand me? Do you know where I am?" He scarcely recognized his own voice.

The girl smiled and suddenly poured out a rapid patter of liquid sound. Schwartz groaned. Then an older man entered, the one who had given him the pills. The man and the girl spoke together, the girl turning to him after a while, pointing to his lips and making little gestures of invitation to him.

"What?" he said.

She nodded eagerly, her pretty face glowing with pleasure, until, despite himself, Schwartz felt glad to look at it.

"You want me to talk?" he asked.

The man sat down upon his bed and motioned him to open his mouth. He said, "Ah-h-h," and Schwartz repeated "Ah-h-h" while the man's fingers massaged Schwartz's Adam's apple.

"What's the matter?" said Schwartz peevishly, when the pressure was removed. "Are you surprised I can talk? What do you think I am?"

The days passed, and Schwartz learned a few things. The man was Dr. Shekt--the first human being he knew by name since he had stepped over the rag doll. The girl was his daughter, Pola. Schwartz found that he no longer needed to shave. The hair on his face never grew. It frightened him. Did it ever grow?

His strength came back quickly. They were letting him put on clothes and walk about now, and were feeding him something more than mush.

Was his trouble amnesia, then? Were they treating him for that? Was all this world normal and natural, while the world he thought he remembered was only the fantasy of an amnesic brain?

And they never let him step out of the room, not even into the corridor. Was he a prisoner, then? Had he committed a crime?

There never can be a man so lost as one who is lost in the vast and intricate corridors of his own lonely mind, where none may reach and none may save. There never was a man so helpless as one who cannot remember.

Pola amused herself by teaching him words. He was not at all amazed at the ease with which he picked them up and remembered. He remembered that he had had a trick memory in the past; that memory, at least, seemed accurate. In two days he could understand simple sentences. In three he could make himself understood.

On the third day, however, he did become amazed. Shekt taught him numbers and set him problems. Schwartz would give answers, and Shekt would look at a timing device and record with rapid strokes of his stylus. But then Shekt explained the term "logarithm" to him and asked for the logarithm of two.

Schwartz picked his words carefully. His vocabulary was still minute and he reinforced it with gestures. "I--not--say. Answer--not--number."

Shekt nodded his head excitedly and said, "Not number. Not this, not that; part this, part that."

Schwartz understood quite well that Shekt had confirmed his statement that the answer was not an even number but a fraction and therefore said, "Point three zero one zero three --and--more--numbers."

"Enough!"

Then came the amazement. How had he known the answer to that? Schwartz was certain that he had never heard of logarithms before, yet in his mind the answer had come as soon as the question was put. He had no idea of the process by which it had been calculated. It was as if his mind were an independent entity, using him only as its mouthpiece.

Or had he once been a mathematician, in the days before his amnesia?

He found it exceedingly difficult to wait the days out. Increasingly he felt he must venture out into the world and force an answer from it somehow. He could never learn in the prison of this room, where (the thought suddenly came to him) he was but a medical specimen.

The chance came on the sixth day. They were beginning to trust him too much, and one time when Shekt left he did not lock the door. Where usually the door so neatly closed itself that the very crack of its joining the wall became invisible, this time a quarter inch of space showed.

He waited to make sure Shekt was not returning on the instant, and then slowly put his hand over the little gleaming light as he had seen them often do. Smoothly and silently the door slid open. . . .The corridor was empty.

And so Schwartz "escaped."

How was he to know that for the six days of his residence there the Society of Ancients had its agents watching the hospital, his room, himself?

6. APPREHENSION IN THE NIGHT

The Procurator's palace was scarcely less a fairyland at night. The evening flowers (none native to Earth) opened their fat white blossoms in festoons that extended their delicate fragrance to the very walls of the palace. Under the polarized light of the moon, the artificial silicate strands woven cleverly into the stainless aluminum alloy of the palace structure sparked a faint violet against the metallic sheen of their surroundings.

Ennius looked at the stars. They were the real beauty to him, since they were the Empire.

Earth's sky was of an intermediate type. It had not the unbearable glory of the skies of the Central Worlds, where star elbowed star in such blinding competition that the black of night was nearly lost in a coruscant explosion of light. Nor did it possess the lonely grandeur of the skies of the Periphery, where the unrelieved blackness was broken at great intervals by the dimness of an orphaned star--with the milky lens shape of the Galaxy spreading across the sky, the individual stars thereof lost in diamond dust.

On Earth two thousand stars were visible at one time. Ennius could see Sirius, round which circled one of the ten most populous planets of the Empire. There was Arcturus, capital of the sector of his birth. The sun of Trantor, the Empire's capital world, was lost somewhere in the Milky Way. Even under a telescope it was just part of a general blaze.

He felt a soft hand on his shoulder, and his own went up to meet it.

"Flora?" he whispered.

"It had better be," came his wife's half-amused voice. "Do you know that you haven't slept since you returned from Chica? Do you know further that it is almost dawn? . . . Shall I have breakfast sent out here?"

"Why not?" He smiled fondly up at her and felt in the darkness for the brown ringlet that hovered next her cheek. He tugged at it. "And must you wait up with me and shadow the most beautiful eyes in the Galaxy?"

She freed her hair and replied gently, "You are trying to shadow them yourself with your sugar syrup, but I've seen you this way before and am not in the tiniest hoodwinked. What worries you tonight, dear?"

"Why, that which always worries me. That I have buried you here uselessly, when there's not a viceregal society in the Galaxy you could not grace."

"Besides that! Come, Ennius, I will not be played with."

Ennius shook his head in the shadows and said, "I don't know. I think an accumulation of little puzzling things has finally sickened me. There's the matter of Shekt and his Synapsifier. And there's this archaeologist, Arvardan, and his theories. And other things, other things. Oh, what's the use, Flora--I'm doing no good here at all."

"Surely this time of the morning isn't quite the moment for putting your morale to the test."

But Ennius was speaking through clenched teeth. "These Earthmen! Why should so few be such a burden to the Empire? Do you remember, Flora, when I was first appointed to the Procuracy, the warnings I received from old Faroul, the last Procurator, as to the difficulties of the position? . . . He was right. If anything, he did not go far enough in his warnings. Yet I laughed at him at the time and privately thought him the victim of his own senile incapacity. I was young, active, daring. I would do better. . . ." He paused, lost in himself, then continued, apparently at a disconnected point. "Yet so many independent pieces of evidence seem to show that these Earthmen are once again being misled into dreams of rebellion."

He looked up at his wife. "Do you know that it is the doctrine of the Society of Ancients that Earth was at one time the sole home of Humanity, that it is the appointed center of the race, the true representation of Man?"

"Why, so Arvardan told us two evenings ago, didn't he?" It was always best at these times to let him talk himself out.

"Yes, so he did," said Ennius gloomily, "but even so, he spoke only of the past. The Society of Ancients speaks of the future as well. Earth, once more, they say, will be the center of the race. They even claim that this mythical Second Kingdom of Earth is at hand; they warn that the Empire will be destroyed in a general catastrophe which will leave Earth triumphant in all its pristine glory"--and his voice shook--"as a backward, barbarous, soil-sick world. Three times before this same nonsense has raised rebellion, and the destruction brought down upon Earth has never served in the least to shake their stupid faith."

"They are but poor creatures," said Flora, "these men of Earth. What should they have, if not their Faith? They are certainly robbed of everything else--of a decent world, of a decent life. They are even robbed of the dignity of acceptance on a basis of equality by the rest of the Galaxy. So they retire to their dreams. Can you blame them?"

"Yes, I can blame them," cried Ennius with energy. "Let them turn from their dreams and fight for assimilation. They don't deny they are different. They simply wish to replace 'worse' by 'better,' and you can't expect the rest of the Galaxy to let them do that. Let them abandon their cliquishness, their outdated and offensive 'Customs.' Let them be men, and they will be considered men. Let them be Earthmen and they will be considered only as such."

"But never mind that. For instance, what's going on with the Synapsifier? Now there's a little thing that is keeping me from sleep." Ennius frowned thoughtfully at the dullness which was overcoming the polished darkness of the eastern sky.

"The Synapsifier? . . . Why, isn't that the instrument Dr. Arvardan spoke of at dinner? Did you go to Chica to see about that?"

Ennius nodded.

"And what did you find out there?"

"Why nothing at all," said Ennius. "I know Shekt. I know him well. I can tell when he's at ease; I can tell when he isn't. I tell you, Flora, that man was dying of apprehension"

all the time he was speaking to me. And when I left he broke into a sweat of thankfulness. It is an unhappy mystery, Flora."

"But will the machine work?"

"Am I a neurophysicist? Shekt says it will not. He called me up to tell me that a volunteer was nearly killed by it. But I don't believe that. He was excited! He was more than that. He was triumphant! His volunteer had lived and the experiment had been successful, or I've never seen a happy man in my life. . . . Now why do you suppose he lied to me, then? Do you suppose that the Synapsifier is in operation? Do you suppose that it can be creating a race of geniuses?"

"But then why keep it secret?"

"Ah! Why? It isn't obvious to you. Why has Earth failed in its rebellions? There are fairly tremendous odds against it, aren't there? Increase the average intelligence of the Earthman. Double it. Triple it. And where may your odds be then?"

"Oh, Ennius."

"We may be in the position of apes attacking human beings. What price numerical odds?"

"You're really jumping at shadows. They couldn't hide a thing like that. You can always have the Bureau of Outer Provinces send in a few psychologists and keep testing random samples of Earthmen. Surely any abnormal rise in I.Q. could be detected instantly."

"Yes. I suppose so. . . . But that may not be it. I'm not sure of anything, Flora, except that a rebellion is in the cards. Something like the Uprising of 750, except that it will probably be worse."

"Are we prepared for it? I mean, if you're so certain--"

"Prepared?" Ennius's laughter was a bark. "I 'am. The garrison is in readiness and fully supplied. Whatever can possibly be done with the material at hand. I have done. But, Flora, I don't want to have a rebellion. I don't want my Procuracy to go down in history as the Procuracy of the Rebellion. I don't want my name linked with death and slaughter. I'll be decorated for it, but a century from now the history books will call me a bloody tyrant. What about the Viceroy of Santanni in the sixth century? Could he have done other than he did, though millions died? He was honored then, but who has a good word for him now? I would rather be known as the man who prevented a rebellion and saved the worthless lives of twenty million fools." He sounded quite hopeless about it.

"Are you so sure you can't, Ennius--even yet?" She sat down beside him and brushed her finger tips along the line of his jaw.

He caught them and held them tightly. "How can I? Everything works against me. The Bureau itself rushes into the struggle on the side of the fanatics of Earth by sending this Arvardan here."

"But, dear, I don't see that this archaeologist will do anything so awful. I'll admit he sounds like a faddist, but what harm can he do?"

"Why, isn't it plain! He wants to be allowed to prove that Earth is the original home of Humanity. He wants to bring scientific authority to the aid of subversion."

"Then stop him."

"I can't. There you have it, frankly. There's a theory about that viceroys can do anything, but that just isn't so. That man, Arvardan, has a writ of permission from the Bureau of Outer Provinces. It is approved by the Emperor. That supersedes me completely. I could do nothing without appealing to the Central Council, and that would take months. . . . And what reasons could I give? If I tried to stop him by force, on the other hand, it would be an act of rebellion; and you know how ready the Central Council is to remove any executive they think is overstepping the line, ever since the Civil War of the eighties. And then what? I'd be replaced by someone who wouldn't be aware of the situation at all, and Arvardan would go ahead anyway."

"And that still isn't the worst, Flora. Do you know how he intends to prove the antiquity of Earth? Suppose you guess."

Flora laughed gently. "You're making fun of me, Ennius. How should I guess? I'm no archaeologist. I suppose he'll try to dig up old statues or bones and date them by their radioactivity or something like that."

"I wish it were like that. What Arvardan intends to do, he told me yesterday, is to enter the radioactive areas on Earth. He intends to find human artifacts there, show that they exist from a time previous to that at which Earth's soil became radioactive--since he insists the radioactivity is manmade--and date it in that fashion."

"But that's almost what I said."

"Do you know what it means to enter the radioactive areas? They're Forbidden. It's one of the strongest Customs these Earthmen have. No one can enter the Forbidden Areas, and all radioactive areas are Forbidden."

"But then that's good. Arvardan will be stopped by the men of Earth themselves."

"Oh, fine. He'll be stopped by the High Minister! And then how will we ever convince him that all this was not a Government-sponsored project, that the Empire is not conniving at deliberate sacrilege?"

"The High Minister can't be that touchy."

"Can't he?" Ennius reared back and stared at his wife. The night had lightened to a slatiness in which she was just visible. "You have the most touching naivete. He certainly can be that touchy. Do you know what happened--oh, about fifty years ago? I'll tell you, and then you can judge for yourself."

"Earth, it so happens, will allow no outward sign of Imperial domination on their world because of their insistence that Earth is the rightful ruler of the Galaxy. But it so happened that young Stannell II--the boy emperor who was somewhat insane and who was removed by assassination after a reign of two years; you remember!--ordered that the Emperor's insignia be raised in their Council Chamber at Washenn. In itself the order was reasonable, since the insignia is present in every planetary Council Chamber in the Galaxy as a symbol of the Imperial unity. But what happened in this case? The day the insignia was raised, the town became a mass of riots."

"The lunatics of Washenn tore down the insignia and took up arms against the garrison. Stannell II was sufficiently mad to demand that his order be complied with if it meant the slaughter of every Earthman alive, but he was assassinated before that could be put into effect, and Edard, his successor, canceled the original order. All was peace again."

"You mean," said Flora incredulously, "that the Imperial insignia was not replaced?"

"I mean that exactly. By the Stars, Earth is the only one of the millions and millions of planets in the Empire that has no insignia in its Council Chamber. This miserable planet we are on now. And if even today we were to try again, they would fight to the last man to prevent us. And you ask me if they're touchy. I tell you they're mad."

There was silence in the slowly graying light of dawn, until Flora's voice sounded again, little and unsure of itself.

"Ennius?"

"Yes."

"You're not just concerned about the rebellion that you're expecting because of its effect on our reputation. I wouldn't be your wife if I couldn't half read your thoughts, and it seems to me that you expect something actually dangerous to the Empire. . . . You shouldn't hide anything from me, Ennius. You're afraid these Earthmen will win."

"Flora, I can't talk about it." There was something tortured in his eyes. "It isn't even a hunch. . . . Maybe four years on this world is too long for any sane man. But why are these Earthmen so confident?"

"How do you know they are?"

"Oh, they are. I have my sources of information too. After all, they've been crushed three times. They can't have illusions left. Yet they face two hundred million worlds, each one singly stronger than they, and they are confident. Can they really be so firm in their faith in some Destiny or some supernatural Force--something that has meaning only to them? Maybe--maybe--maybe--"

"Maybe what, Ennius?"

"Maybe they have their weapons."

"Weapons that will allow one world to defeat two hundred millions? You are panicky. No weapon could do that."

"I have already mentioned the Synapsifier."

"And I have told you how to take care of that. Do you know of any other type of weapon they could use?"

Reluctantly, "No."

"Exactly. There isn't any such weapon possible. Now I'll tell you what to do, dear. Why don't you get in touch with the High Minister and, in earnest of your good faith, warn him of Arvardan's plans? Urge, unofficially, that he not be granted permission. This will remove any suspicion--or should--that the Imperial Government has any hand in this silly violation of their customs. At the same time you will have stopped Arvardan without having appeared in the mess yourself. Then have the Bureau send out two good

psychologists--or, better, ask for four, so they'll be sure to send at least two--and have them check on the Synapsifier possibility. . . .And anything else can be taken care of by our soldiers, while we allow posterity to take care of itself.

"Now why don't you sleep right here? We can put the chair back down, you can use my fur piece as a blanket, and I'll have a breakfast tray wheeled out when you awake. Things will seem different in the sun."

And so it was that Ennius, after waking the night through, fell asleep five minutes before sunrise.

Thus it was eight hours later that the High Minister first learned of Bel Arvardan and his mission from the Procurator himself.

7. CONVERSATION WITH MADMEN?

As for Arvardan, he was concerned only with making holiday. His ship, the Ophiuchus, was not to be expected for at least a month, therefore he had a month to spend as lavishly as he might wish.

So it was that on the sixth day after his arrival at Everest, Bel Arvardan left his host and took passage on the Terrestrial Air Transport Company's largest jet Stratospheric, traveling between Everest and the Terrestrial capital, Washenn.

If he took a commercial liner, rather than the speedy cruiser placed at his service by Ennius, it was done deliberately, out of the reasonable curiosity of a stranger and an archaeologist toward the ordinary life of men inhabiting such a planet as Earth.

And for another reason too.

Arvardan was from the Sirian Sector, notoriously the sector above all others in the Galaxy where anti-Terrestrial prejudice was strong. Yet he had always liked to think he had not succumbed to that prejudice himself. As a scientist, as an archaeologist, he couldn't afford to. Of course he had grown into the habit of thinking of Earthmen in certain set caricature types, and even now the word "Earthman " seemed an ugly one to him. But he wasn't really prejudiced.

At least he didn't think so. For instance, if an Earthman had ever wished to join an expedition of his or work for him in any capacity--and had the training and the ability--he would be accepted. If there were an opening for him, that was. And if the other members of the expedition didn't mind too much. That was the rub. Usually the fellow workers objected, and then what could you do?

He pondered the matter. Now certainly he would have no objection to eating with an Earthman, or even bunking with one in case of need--assuming the Earthman were reasonably clean, and healthy. In fact, he would in all ways treat him as he would treat anyone else, he thought. Yet there was no denying that he would always be conscious of the fact that an Earthman was an Earthman. He couldn't help that. That was the result of a childhood immersed in an atmosphere of bigotry so complete that it was almost invisible, so entire that you accepted its axioms as second nature. Then you left it and saw it for what it was when you looked back.

But here was his chance to test himself. He was in a plane with only Earthmen about him, and he felt perfectly natural, almost. Well, just a little self-conscious.

Arvardan looked about at the undistinguished and normal faces of his fellow passengers. They were supposed to be different, these Earthmen, but could he have told these from ordinary men if he had met them casually in a crowd? He didn't think so. The women weren't bad-looking. . . His brows knit. Of course even tolerance must draw the line somewhere. Inter-marriage, for instance, was quite unthinkable.

The plane itself was, in his eyes, a small affair of imperfect construction. It was, of course, atomic-powered, but the application of the principle was far from efficient. For

one thing, the power unit was not well shielded. Then it occurred to Arvardan that the presence of stray gamma rays and a high neutron density in the atmosphere might well strike Earthmen as less important than it might strike others.

Then the view caught his eyes. From the dark wine-purple of the extreme stratosphere, Earth presented a fabulous appearance. Beneath him the vast and misted land areas in sight (obscured here and there by the patches of sun-bright clouds) showed a desert orange. Behind them, slowly receding from the fleeing stratoliner, was the soft and fuzzy night line, within whose dark shadow there was the sparking of the radioactive areas.

His attention was drawn from the window by the laughter among the others. It seemed to center about an elderly couple, comfortably stout and all smiles.

Arvardan nudged his neighbor. "What's going on?"

His neighbor paused to say, "They've been married forty years, and they're making the Grand Tour."

"The Grand Tour?"

"You know. All around the Earth."

The elderly man, flushed with pleasure, was recounting in voluble fashion his experiences and impressions. His wife joined in periodically, with meticulous corrections involving completely unimportant points; these being given and taken in the best of humor. To all this the audience listened with the greatest attention, so that to Arvardan it seemed that Earthmen were as warm and human as any people in the Galaxy.

And then someone asked, "And when is it that you're scheduled for the Sixty?"

"In about a month," came the ready, cheerful answer. "Sixteenth November."

"Well," said the questioner, "I hope you have a nice day for it. My father reached his Sixty in a damned pouring rain. I've never seen one like it since. I was going with him--you know, a fellow likes company on a day like that--and he complained about the rain every step of the way. We had an open biwheel, you see, and we got soaked. 'Listen,' I said, 'what are you complaining about, Dad? I've got to come back.' "

There was a general howl of laughter which the anniversary couple were not backward in joining. Arvardan, however, felt plunged in horror as a distinct and uncomfortable suspicion entered his mind.

He said to the man sharing his seat, "This Sixty, this subject of conversation here--I take it they're referring to euthanasia. I mean, you're put out of the way when you reach your sixtieth birthday, aren't you?"

Arvardan's voice faded somewhat as his neighbor choked off the last of his chuckles to turn in his seat and favor the questioner with a long and suspicious stare. Finally he said, "Well, what do you think he meant?"

Arvardan made an indefinite gesture with his hand and smiled rather foolishly. He had known of the custom, but only academically. Something in a book. Something discussed in a scientific paper. But it was now borne in upon him that it actually applied to living beings, that the men and women surrounding him could, by custom, live only to sixty.

The man next to him was still staring. "Hey, fella, where you from? Don't they know about the Sixty in your home town?"

"We call it the 'Time,' " said Arvardan feebly. "I'm from back there." He jerked his thumb hard over his shoulder, and after an additional quarter minute the other withdrew that hard, questioning stare.

Arvardan's lips quirked. These people were suspicious. That facet of the caricature, at least, was authentic.

The elderly man was talking again. "She's coming with me," he said, nodding toward his genial wife. "She's not due for about three months after that, but there's no point in her waiting, she thinks, and we might as well go together. Isn't that it, Chubby?"

"Oh yes," she said, and giggled rosily. "Our children are all married and have homes of their own. I'd just be a bother to them. Besides, I couldn't enjoy the time anyway without the old fellow--so we'll just leave off together."

Whereupon the entire list of passengers seemed to engage themselves in a simultaneous arithmetical calculation of the time remaining to each--a process involving conversion factors from months to days that occasioned several disputes among the married couples involved.

One small fellow with tight clothes and a determined expression said fiercely, "I've got exactly twelve years, three months, and four days left. Twelve years, three months, and four days. Not a day more, not a day less."

Which someone qualified by saying, reasonably, "Unless you die first, of course."

"Nonsense," was the immediate reply. "I have no intention of dying first. Do I look like the sort of man who would die first? I'm living twelve years, three months, and four days, and there's not a man here with the hardihood to deny it." And he looked very fierce indeed.

A slim young man took a long, dandyish cigarette from between his lips to say darkly, "It's well for them that can calculate it out to a day. There's many a man living past his time."

"Ah, surely," said another, and there was a general nod and a rather inchoate air of indignation arose.

"Not," continued the young man, interspersing his cigarette puffs with a complicated flourish intended to remove the ash, "that I see any objection to a man--or woman--wishing, to continue on past their birthday to the next Council day, particularly if they have some business to clean up. It's these sneaks and parasites that try to go past to the next Census, eating the food of the next generation--" He seemed to have a personal grievance there.

Arvardan interposed gently, "But aren't the ages of everyone registered? They can't very well pass their birthday too far, can they?"

A general silence followed, admixed not a little with contempt at the foolish idealism expressed. Someone said at last, in diplomatic fashion, as though attempting to conclude the subject, "Well, there isn't much point living past the Sixty, I suppose."

"Not if you're a farmer," shot back another vigorously. " After you've been working in the fields for half a century, you'd be crazy not to be glad to call it off. How about the administrators, though, and the businessmen?"

Finally the elderly man, whose fortieth wedding anniversary had begun the conversation, ventured his own opinion, emboldened perhaps by the fact that, as a current victim of the Sixty, he had nothing to lose.

"As to that," he said, "it depends on who you know." And he winked with a sly innuendo. "I knew a man once who was sixty the year after the 810 Census and lived till the 820 Census caught him. He was sixty-nine before he left off. Sixty-nine! Think of that!"

"How did he manage that?"

"He had a little money, and his brother was one of the Society of Ancients. There's nothing you can't do if you've got that combination."

There was general approval of that sentiment.

"Listen," said the young man with the cigarette emphatically, "I had an uncle who lived a year past--just a year. He was just one of these selfish guys who don't feel like going, you know. A lot he cared for the rest of us. . . .And I didn't know about it, you see, or I would have reported him, believe me, because a guy should go when it's his time. It's only fair to the next generation. Anyway, he got caught all right, and the first thing I knew, the Brotherhood calls on me and my brother and wants to know how come we didn't report him.

I said, hell, I didn't know anything about it; nobody in my family knew anything about it. I said we hadn't seen him in ten years. My old man backed us up. But we got fined five hundred credits just the same. That's when you don't have any pull."

The look of discomposure on Arvardan's face was growing. Were these people madmen to accept death so--to resent their friends and relatives who tried to escape death? Could he, by accident, be on a ship carrying a cargo of lunatics to asylum--or euthanasia? Or were these simply Earthmen?

His neighbor was scowling at him again, and his voice broke in on Arvardan's thoughts. "Hey fella, where's 'back there?'"

"Pardon me?"

"I said--where are you from? You said 'back there.' What's 'back there'? Hey?"

Arvardan found the eyes of all upon him now, each with its own sudden spark of suspicion in it. Did they think him a member of this Society of Ancients of theirs? Had his questioning seemed the cajolery of an agent provocateur?

So he met that by saying, in a burst of frankness, "I'm not from anywhere on Earth. I'm Bel Arvardan from Baronn, Sirius Sector. What's your name?" And he held out his hand.

He might as well have dropped an atomic explosive capsule into the middle of the plane.

The first silent horror on every face turned rapidly into angry, bitter hostility that flamed at him. The man who had shared his seat rose stiffly and crowded into another, where the pair of occupants squeezed closely together to make room for him.

Faces turned away. Shoulders surrounded him, hemmed him in. For a moment Arvardan burned with indignation. Earthmen to treat him so. Earthmen! He had held out the hand of friendship to them. He, a Sirian, had condescended to treat with them and they had rebuffed him.

And then, with an effort, he relaxed. It was obvious that bigotry was never a one-way operation, that hatred bred hatred!

He was conscious of a presence beside him, and he turned toward it resentfully. "Yes?"

It was the young man with the cigarette. He was lighting a new one as he spoke. "Hello," he said. "My name's Creen. . . . Don't let those jerks get you."

"No one's getting me," said Arvardan shortly. He was not too pleased with the company, nor was he in the mood for patronizing advice from an Earthman.

But Creen was not trained to the detection of the more delicate nuances. He puffed his cigarette to life in man-sized drags and tapped its ashes over the arm of the seat into the middle aisle.

"Provincials!" he whispered with contempt. "Just a bunch of farmers. . . .They lack the Galactic view. Don't bother with them. . . .Now you take me. I got a different philosophy. Live and let live, I say. I got nothing against Outsiders. If they want to be friendly with me, I'll be friendly with them. What the hell--They can't help being an Outsider just like I can't help being an Earthman. Don't you think I'm right?" And he tapped Arvardan familiarly on the wrist.

Arvardan nodded and felt a crawling sensation at the other's touch. Social contact with a man who felt resentful over losing a chance to bring about his uncle's death was not pleasant, quite regardless of planetary origin.

Creen leaned back. "Heading for Chica? What did you say your name was? Albadan?"

"Arvardan. Yes, I'm going to Chica."

"That's my home town. Best damned city on Earth. Going to stay there long?"

"Maybe. I haven't made any plans."

"Umm. . . .Say, I hope you don't object to my saying that I've been noticing your shirt. Mind if I take a close look? Made in Sirius, huh?"

"Yes, it is."

"It's very good material. Can't get anything like that on Earth. . . .Say, bud, you wouldn't have a spare shirt like that in your luggage, would you? I'd pay for it if you wanted to sell it. It's a snappy number."

Arvardan shook his head emphatically. "Sorry, but I don't have much of a wardrobe. I am planning to buy clothes here on Earth as I go along."

"I'll pay you fifty credits," said Creen. . . .Silence. He added, with a touch of resentment, "That's a good price."

"A very good price," said Arvardan, "but, as I told you, I have no shirts to sell."

"Well. . . ." Creen shrugged. "Expect to stay on Earth quite a while, I suppose?"

"Maybe."

"What's your line of business?"

The archaeologist allowed irritation to rise to the surface. "Look, Mr. Creen, if you don't mind, I'm a little tired and would like to take a nap. Is that all right with you?"

Creen frowned. "What's the matter with you? Don't your kind believe in being civil to people? I'm just asking you a polite question; no need to bite my ear off."

The conversation, hitherto conducted in a low voice, had suddenly amplified itself into a near shout. Hostile expressions turned Arvardan's way, and the archaeologist's lips compressed themselves into a thin line.

He had asked for it, he decided bitterly. He would not have gotten into this mess if he had held aloof from the beginning, if he hadn't felt the necessity of vaunting his damned tolerance and forcing it on people who didn't want it.

He said levelly, "Mr. Creen, I didn't ask you to join me, and I haven't been uncivil. I repeat, I am tired and would like to rest. I think there's nothing unusual in that."

"Listen"--the young man rose from his seat, threw his cigarette away with a violent gesture, and pointed a finger--"you don't have to treat me like I'm a dog or something. You stinking Outsiders come here with your fine talk and standoffishness and think it gives you the right to stamp all over us. We don't have to stand for it, see. If you don't like it here, you can go back where you came from, and it won't take much more of your lip to make me light into you, either. You think I'm afraid of you?"

Arvardan turned his head away and stared stonily out the window.

Creen said no more, but took his original seat once again. There was an excited buzz of conversation round and about the plane which Arvardan ignored. He felt, rather than saw, the sharpened and envenomed glances being cast at him. Until, gradually, it passed, as all things did.

He completed the journey, silent and alone.

The landing at the Chica airport was welcome. Arvardan smiled to himself at the first sight from the air of the "best damned city on Earth," but found it, nevertheless, an immense improvement over the thick, unfriendly atmosphere of the plane.

He supervised the unloading of his luggage and had it transferred into a biwheel cab. At least he would be the only passenger here, so that if he took care not to speak unnecessarily to the driver, he could scarcely get into trouble.

"State House," he told the cabby, and they were off.

Arvardan thus entered Chica for the first time, and he did so on the day that Joseph Schwartz escaped from his room at the Institute for Nuclear Research.

Creen watched Arvardan leave with a bitter half-smile. He took out his little book and studied it closely between puffs at his cigarette. He hadn't gotten much out of the passengers, despite his story about his uncle (which he had used often before to good effect). To be sure, the old guy had complained about a man living past his time and had blamed it on "pull" with the Ancients. That would come under the heading of slander against the Brotherhood. But then the geezer was heading for the Sixty in a month, anyway. No use putting his name down.

But this Outsider, that was different. He surveyed the item with a feeling of pleasure: "Bel Arvardan, Baronn, Sirius Sector--curious about the Sixty--secretive about own affairs--entered Chica by commercial plane 11 A.M. Chica time, 12 October--anti-Terrestrial attitude very marked."

This time maybe he had a real haul. Picking up these little squealers who made incautious remarks was dull work, but things like this made it payoff.

The Brotherhood would have his report before half an hour was up. He made his way leisurely off the field.

8. CONVERGENCE AT CHICA

For the twentieth time Dr. Shekt leafed through his latest volume of research notes, then looked up as Pola entered his office. She frowned as she slipped on her lab coat.

"Now, Father, haven't you eaten yet?"

"Eh? Certainly I have. . . .Oh, what's this?"

"This is lunch. Or it was, once. What you ate must have been breakfast. Now there's no sense in my buying meals and bringing them here if you're not going to eat them. I'm just going to make you go home for them."

"Don't get excited. I'll eat it. I can't interrupt a vital experiment every time you think I ought to eat, you know."
