The "snuffing" or "snorting" method is well known, primarily for its use with cocaine (and for a few other substances on a much lower scale). The use of "snuffing" for the majority of phenethylamines is very uncomfortable or painful for these compounds, since they are available only as the hydrochloride salt. The hydrochloride salt is extremely painful for individuals who use cocaine regularly. We have found that the hydrobromide or tartrate salts are much less harsh on the mucous membranes. However, these salts of the phenethylamines are difficult if not impossible to obtain on the street. It is also not an easy thing to convert a hydrochloride salt to a hydrobromide salt or to a tartrate salt. Since none of these salts are completely without discomfort to the mucous membranes, we found that by grinding one oral dose in a small mortar and pestle with equal amount of procaine hydrochloride (novocaine) and then snuffing small lines (about 1/4 of the total per person), the discomfort is diminished substantially in the nearly all individuals. This method works fairly well with the hydrochloride salts of the phenethylamines; it is not as smooth as with the hydrobromide or the tartrate, however.

The ratio of procaine hydrochloride to the substance may be varied to suit your nose. The procaine hydrochloride is a common cut for cocaine and your street supplier should be able to get some for you at a reasonable price. If it is not available, cocaine can be substituted for procaine, but may change the quality of the alteration. The reason for their use is to anesthetize or numb the mucous membranes in order that the phenethylamine not cause discomfort.

[NOTE: It used to be that procaine was commonly available at headshops. However, I recently checked into this by cruising the streets of Berkeley. There was no procaine to be found in any of the four headshops that I went into, and none of the young kids working these shops had any idea what I was asking for. A quick search on the web only brought up hits for the life-extension product G-3; and while this contains procaine as its primary active ingredient, it also contains a number of other things that most people wouldn't want to cram up their noses. Procaine is available from the research-chemical company ESHU; they offer 5 grams procaine HCl for \$25.00, and also offer 5 grams of lidocaine for \$30.00. I am currently unaware of any other sources that sell to individuals, but suspect that most major chemical suppliers, such as SIGMA, will carry procaine. It is worth noting that one individual pointed out that a doctor told him that pain in the nose from snuffing powders was generally a good indication that damage was being done, and that numbing away this pain might allow one to do more damage than they normally would. Still, the nasal doses for most of the phenethylamines being discussed are pretty low, and it isn't likely that one would be using them frequently or repeatedly. — DAVID AARDVARK]

## NOW AVAILABLE!

"*Ayahuasca Analogues and Plant-based Tryptamines* is really great. Many questions I have had are being answered. It's such a little treasure. I have grown *production* botanicals a little myself, and not only is the shared research forum a total blessing and incredible time saver, but is relevant to chemical, biochemical, and botanical experiments I have run also."  
— NICK SAND, underground chemist and drug war prisoner.

*Ayahuasca Analogues and Plant-based Tryptamines* combines every entry from past issues of *ER* related to ayahuasca, ayahuasca analogues, and plant-based tryptamines. New editorial remarks provide fresh commentary and bring the text up-to-date. Chapters include: Ayahuasca and Its Analogues; Mushroom Ayahuasca; Phenethylamines and MAOI; Miscellaneous and MAOI; The *Passiflora* Genus; The *Phalaris* Genus; *Arundo donax*; *Desmanthus illinoensis*; *Mucuna pruriens*; *Phragmites australis*; *Psychotria viridis*; *Mimosa tenuiflora* (= *M. hostilis*); The *Acacia* Genus, DMT & 5-MeO-DMT; Pipes & Vaporizers; Book Reviews; Degree of Intensity Scale; a complete Bibliography, and a Botanical Index (238 pages).

\$23.00 (USA), \$26.00 (foreign), postpaid from:

The Entheogen Review, POB 19820, Sacramento, CA 95819, USA.

Street compounds are occasionally cut with some diluting agent to make them easier to press into tabs or put into gelatin capsules. A pure phenethylamine hydrochloride with a 20 mg dosage in a tablet will be  $\frac{1}{8}$  inch in diameter and  $\frac{1}{16}$  inch thick. This is a very small tablet and if what you get is larger than this, then the compound will have been cut with something. The dosage range for each compound can be found in *PIHKAL* and you can determine if what you are getting has been cut with binders and/or fillers. Also there can be the problem of misrepresentation of what the compound really is, making it important to cultivate a reliable source.

A last comment about snuffing 2C-B: the hydrochloride salt is absorbed slowly into the mucous membranes—so slowly that the anesthetic effect of the procaine wears off leaving the undissolved and hence unabsorbed 2C-B particles hurting your nose. The hydrobromide salt of 2C-B is absorbed faster and works much better.

## NASAL SPRAY

The next method is the use of these compounds in a nasal spray with procaine hydrochloride. The same discomfort is noted with hydrochloride salts and the addition of procaine hydrochloride pretty much eliminates the discomfort or pain. After considerable experimentation with various solution strengths and application guidelines, the optimum for our testing group is as follows:

For this example we will discuss 2C-T-2. Add 25 mg of the phenethylamine salt and 15 mg of procaine hydrochloride per ml (or about 20 drops of water). Warm to dissolve if necessary. Place 5 drops of this solution in a small glass atomizer and spray (with inhalation) into each nostril. (Small glass atomizers with a rubber bulb are generally available in pharmacies.) Immediately lie on your side so that the spray will stay in the sinus passages and be absorbed instead of draining down your throat or out of your nose. After a minute or so turn over to your other side. During this absorption period you will most likely feel the material taking effect. When you feel that all has been absorbed sit up and enjoy.

Following is a typical report for the use of 2C-T-2 nasal spray:

6:00 5 drops atomized into nostrils.  
6:02 Feeling it. This is really fast!  
6:19 Getting really high.

6:35 Absolutely great feeling, especially considering the tiny amount of material taken. I have peaked out and am cruising the plateau. Great space. Wonderful love making. Exquisite!  
7:15 Coming down a little, still fine.  
8:29 Really coming off of the material now. Getting hungry.  
8:42 Cashew nuts good! Mild case of gourmet munchies.  
9:00 Back at base-line.  
9:30 Crashed, went right to sleep, good rest. Refreshed and clear next morning. This is worth repeating!

2C-B hydrochloride works well this way, but needs warming to dissolve the substance, because of its limited solubility. We have reports of some people making up an amount of solution containing their favorite phenethylamine and putting it in a common decongestant nasal spray bottle and even using it in business meetings! Many have used the same practice for cocaine. The little plastic nasal spray bottles tend to spray too much in a coarse spray and if you use them, a more dilute solution of about one half strength of that given above, works well. You may have to repeat spraying to titrate to the desired level of alteration.

## VAPORIZING THE AMINE

The practice of smoking various psychedelic compounds with combustible material such as *Cannabis* or mint leaves has been going on for some time. The greatest difficulty with this practice in its use with phenethylamines is that the hydrohalide salts do not thermally dissociate into the amines efficiently. There is a tendency for the salts to decompose to some extent, depending on conditions, and you not only lose some of the precious compound, but the by-products of such decomposition may detract from the positive aspects of the altered state or may be harmful.

By heating the phenethylamine hydrochloride salt with an excess of sodium bicarbonate (baking soda), the hydrochloride part combines with the soda to form sodium chloride (table salt), carbon dioxide, and water vapor leaving the amine as the base, which can then be volatilized and inhaled. [See also pp. 25–27 for some additional information on creating base compounds.] Conversion efficiencies are very good and onset of the altered state is rapid, however, some individuals find the condensed vapors or smoke to be harsh and irritating to their throats, non-smokers especially.

A set-up for vaporizing the material is easy to construct. Basically all that is needed is:

- 1) A small glass or metal tube to heat the mixture of sodium bicarbonate and the phenethylamine salt
- 2) A support for the tube while heating
- 3) A heat source
- 4) A tube to inhale vapors through

Following are more details on these four items:

A small glass or metal tube to heat the ingredients:  $\frac{3}{8}$  inch to  $\frac{3}{4}$  inch diameter and 1 inch to  $1\frac{1}{2}$  inches high. A metal thimble works well, or you can form a tube from heavy duty aluminum foil. Use a cylindrical object for forming the foil, such as a pen or a dowel. Diameters larger than  $\frac{3}{8}$  inch should be closed at the top with a  $\frac{1}{4}$  inch hole size washer. This will prevent convection currents from sweeping vapors from the tube before you can capture them.

A piece of cardboard about 4 inches by 8 inches with a hole in the center will hold the tube vertically. Two stacks of books can support the cardboard and tube while it is heating.

A good simple heating device is a short piece of candle, stuck to a small square of cardboard. The height of the tube is adjusted with the two stacks of books so the tip of the candle flame is very close or just touches the bottom of the tube. Be careful not to set fire to the cardboard.

A tube to inhale vapors into your mouth. A glass tube works great, and even a clean, inverted metal pipe will work. (Do *not* use plastic straws, as the plastic *will* melt and the fumes are toxic.) The vapors are drawn into your mouth and then inhaled with air or drawn directly into your lungs. If the vapors are too irritating to your throat try inhaling them through your nose. It feels strange, but doesn't hurt your throat. Also adding a little procaine to the mix in the pyrolyzer numbs the throat after the first inhalation (which is harsh).

For two people, we grind one half oral dosage (or a little more if an increased degree of alteration is desired) of a phenethylamine with about 150 mg of sodium bicarbonate (a pile the size of half of a large pea) in a small mortar and pestle. This is divided into four equal portions and put into four tubes. The tubes are heated one at a time and the participants can catch their breath between heating the tubes. The degree of alteration can be titrated to the desired level with this method.

## CONCLUSION

The above covers the three methods that we investigated and found to be most useful. Unfortunately, none of them is without drawbacks and the effectiveness of each method will vary considerably with different persons. So explore the area of different ingestion methods and find the one that is easiest, most comfortable, and gives the results desired for you. Do not be afraid to improvise a little, which is what we did. ✧

# NETWORK FEEDBACK

## POTENTIATION AND TURNING UP THE BASE

I recently acquired 1 gram of harmine HCl. A run-through of the literature I have, led to a plethora of conclusions as to the administration of this substance. In *Ayahuasca Analogues*, OTT was ingesting 100–200 mg in his experiments. On page 62 of *ER's Ayahuasca Analogues and Plant-based Tryptamines*, a reader opines that 50 mg significantly potentiated his mushroom trip. Lastly, SHULGIN's harmine entry in *TIHKAL* gives wildly differing amounts/routes of administration/results, and he really gives no conclusive final opinion. So, my question is, what would be the best method for ingesting this HCl? Dissolved in a glass of water and then drunk? Insufflated? How much of this substance should be ingested (mg/kg body weight)? Would the amount be the same no matter what entheogen (mescaline-containing cacti, mushrooms, DMT-containing plant-material, LSD)? And when should the harmine be administered? An hour before the entheogen? A half-hour? At the same time? Or possibly even afterward? On page 44 of *Ayahuasca Analogues and Plant-based Tryptamines*, TOAD recommends vaporizing 50–75 mg. Is it possible for a non-chemist such as myself to convert the HCl to a free-base for smoking?

I also recently acquired 1 gram of DPT oil. In the past, this was obtainable on parsley (ready for pyrolytic bioassay). So I called the company that I ordered this product from and asked for some advice for an oil-to-parsley conversion method, and the person I spoke with kindly and patiently gave me the following outline:

- 1) Pour DPT oil into a larger container
- 2) Pour chloroform into vial to remove the last of the DPT oil residue
- 3) Add this to container with bulk of DPT oil, then add more chloroform
- 4) Allow chemical reaction of oil and chloroform to take place (a couple of minutes)
- 5) Pour this mixture into a Pyrex dish containing a pre-measured amount of finely sifted parsley leaves
- 6) Allow this mixture to dry (a few days), possibly under heat or dehydrator

Wow. This is enough to make my non-chemist head spin. I didn't feel comfortable asking for more specifics, due to the legal grey-areas involved and the fact that I could have kept the company representative on the phone for hours until I grokked the concept completely. So, my questions:

- 1) Exactly how much chloroform should be used in steps 2 and 3?
- 2) Exactly when do I know the reaction in step 4 has occurred?
- 3) Exactly how much parsley leaf (weight) would be appropriate for 1 gram of oil?
- 4) How do I know when step 6 has finished?
- 5) And finally, how/where do you acquire chloroform without arousing suspicion?

My final questions involve potentiation via prescription drugs. On page 32 of *Ayahuasca Analogues and Plant-based Tryptamines*, Deprenyl and Piracetam are mentioned as possible MAOI. What's the final verdict? In *The Essential Psychedelic Guide*, D.M. TURNER repeatedly extols the virtues of Ludiomil in combination with LSD. Have you tried this method, and if so, do you feel it is worth the time and effort to track down Ludiomil? And, at the risk of sounding like a broken record—Moclobemide—is it available? Or can I finally give up on ever acquiring this Holy Grail MAOI?

Well, I guess that's about it. Thanks for all your kind answers and support. Who knows, if I can get the weekend off, maybe I'll bump into some folks from *ER* at the MIND STATES conference in May. You'll recognize me, as I'll be the one who needs to have everything explained five times. Your extraction-challenged friend. —M.S., CA

*You've asked a lot of good questions, and we'll try to answer them in order as best as possible*

*It is worth pointing out again that JONATHAN OTT has at several conferences and seminars described the "potentiation effect" caused by the insufflation and sublingual routes of administration of harmine in conjunction with tryptamines. We'd like to see some further reports to confirm this. Apparently one could get away with using much less tryptamine material by including the 5–10 mg harmine as an insufflated or sublingual pre-dose. So in this case it does indeed seem to poten-*

tiate when the tryptamine is subsequently (or even concurrently) administered via insufflated or sublingual routes.

When people are talking about potentiation of things, this word is sometimes so vaguely defined as to approach meaninglessness. As well, all such claims seem to be for substances that are orally active on their own. With DMT, for instance, most people have reported no potentiation of the per dose effects—simply oral activation and a prolonged action. We've heard mixed reports on the 5-MeO-DMT and harmala alkaloid combination in general. And it is only recently that the claim has been made by OTT that 5–10 mg is adequate for anything, but this might be quite important in light of reports of “potentiation” from smoking *Banisteriopsis caapi*, *Peganum harmala* seeds, or the extracted alkaloids from either of these plants. (See page 48 of True Hallucinations by TERENCE MCKENNA for one report on the effects of smoking *B. caapi* while on *Psilocybe cubensis*.) It is unlikely that insufflation or sublingual consumption of 5–10 mg of harmine will have any appreciable effect on the oral consumption of tryptamines or phenethylamines, and psychonautical experimentation has shown that these minuscule quantities exert no central effects (OTT 2000). JACE CALLAWAY has noted that a threshold dose of mushrooms for himself can be made fully-active by taking a MAOI (CALLAWAY 1996), and JONATHAN OTT has written of threshold mescaline hydrochloride effects being felt at the low dose of 100 mg, when combined with 150 mg harmaline salt, dubbing the combination “peyohuasca” (OTT 1994), and the potentiation of *T. pachanoi* with *P. harmala* was reported the same year in the pages of *The Entheogen Review* (B.C., WA 1994). JUSTIN CASE has noticed a distinct potentiation of LSD when combined with hoasca; he experienced substantially more effects per dose, but without any increased duration (CASE 2001).

As far as the oil-onto-parsley process goes, it is our feeling that the use of chloroform for this may not be a good idea. Sure it works great, but it is also a proven liver toxin and a strongly suspected liver carcinogen that may or may not be completely removed by evaporation. The only “chemical reaction” we can think of would perhaps be that it took a couple minutes to fully dissolve the material. A true chemical reaction would be very undesirable. The company's representative probably said something about it taking a couple of minutes to react, and meant by this comment that it took a couple minutes to fully dissolve it, and perhaps you misconstrued this as meaning that a chemical reaction was occurring?

It might not be as good of a solvent but surely warm ethanol—if it works—would be adequate and safer for more readers' purposes. However, we lack any solubility data regarding this. (Anyone out there know if DPT will dissolve easily into warm ethanol?)

As for volume of solvent, we would say the least amount that will fully dissolve the material is always a good choice. For DMT we believe that this is less than 10 ml of 95% ethanol (190 proof) for 1 gram, but this amount requires gentle heating in a water bath and a couple minutes of stirring to get it all dissolved. The less excess solvent, the less that will end up

on the walls of the evaporation dish (which is another reason frequent stirring during evaporation is needed).

100 mg of harmine for oral activation seems like a sensible level at which to begin experimentation. The amount of  $\beta$ -carbolines necessary to achieve activation seems to vary quite a bit from person to person (OTT 1999; TOAD 2001), and most prefer to discover what the minimum amount of  $\beta$ -carbolines necessary for activation is and stay at this lowest effective level.

We asked TOAD about this, and he responded:

“I've never worked with pure harmine before in my huasca experiments. At the time I was using an extract from *Peganum harmala*. My standard dosage of the *P. harmala* complex (obtained via acid/base extraction method) was 150 mg and this was quite effective for me. The interesting thing I found with OTT's reports was that he is much more sensitive to oral tryptamine activation than I was. It took me 120–180 mg of DMT to achieve what I would call a full-on ayahuasca effect, even with higher doses of the *P. harmala* extract involved. [OTT's comments from the SUMMER SOLSTICE 1999 issue of ER, pp. 38–39, are interesting to revisit in this context: ‘Whereas 100 mg DMT is surely a stiff dose (about 3 x minimal visionary dose for me, and I am more resistant than most to tryptamines), and I have found as little as 40 mg harmaline to activate tryptamines orally for me, it turned out I have a lower titre of gastric MAO than most. One trial of pharmahuasca with 20 mg 5-MeO-DMT (equivalent to about 100 mg DMT) plus 50 mg harmaline (as free-base) was inactive in each of six individuals, and I have found at least 60 mg harmaline (as free-base; and about twice as much harmine) is required reliably to activate tryptamines orally in most people.’] For huasca experiments try sublingual or oral and work it up to find your optimal. I used to take mine 30–45 minutes prior to ingestion of the tryptamine material, but I think it would also work fine if taken at the same time. Different materials may require different methods and strategies, and there is lots of room for experimentation here. I've had experience combining oral *P. harmala* extract with mushrooms and LSD, before and during, both of which provided interesting results. Smoking *P. harmala* extract base during a trip provided added flavoring to the mix. I've noticed that I don't seem to be repeating these experiments, so I guess I'm not particularly fond of the  $\beta$ -carboline's effects.

“As far as creating a harmine free-base, here's how I converted DPT and made a parsley mix. The same basic strategy can be used for any number of alkaloid compounds. Keeping the ER comments above on chloroform in mind, various non-polar solvents may be used in place of chloroform. (I used

## Further Notes on Basifying Coke

The following is adapted from instructions found on-line; caveat lector. Although it may seem strange to find a "recipe for crack" within the pages of The Entheogen Review, we feel that this information will have other handy applications in light of the desire by some to create base forms of tryptamines and phenethylamines. Certainly, we don't recommend that novice chemists work with the highly flammable compound ether (as mentioned in one option below). Those readers who actually are interested in various forms of cocaine probably already know that street cocaine is usually "stepped on" (cut with a diluting agent) one or more times as it moves down the line from wholesaler to retailer, to smaller dealer, etc. Whether snorted or smoked (and especially if injected), a general "harm reduction" policy indicates that it is a good idea to remove these cuts and other possible impurities, which can include such things as B vitamins, lactose, lidocaine, mannitol, procaine, and even baby laxative and/or other powdered pharmaceuticals. The easiest way to "wash" cocaine is to mix it with a quantity of acetone, and then filter this. Cocaine HCl is not soluble in acetone, but many cuts and impurities are, and the acetone can take on a yellowish color from them. Additional washes with fresh acetone until it comes through clean are recommended. According to one source, there may be a 5% to 20% reduction of the original weight of the cocaine after a thorough washing (MARNEL 1997).

The correct molar ratio of cocaine HCl to baking soda is almost exactly 4:1. That's right, not half as much soda to coke as most people think, but rather  $\frac{1}{4}$  as much.

cocaine base = C<sub>17</sub>H<sub>21</sub>N<sub>3</sub>O<sub>4</sub> = ~ 303 g/mol  
 HCl = ~ 36 g/mol  
 sodium bicarbonate = CH<sub>3</sub>NaO<sub>3</sub> = ~ 84 g/mol

1 mol cocaine hydrochloride = 303 + 36 = 339 g  
 1 mol cocaine hydrochloride + 1 mol CH<sub>3</sub>NaO<sub>3</sub> --> 1 mol cocaine base + CH<sub>3</sub>NaO<sub>3</sub>-HCl(aq) 84 g/339 g = .2477 = ~ .25

Dissolve powdered cocaine hydrochloride in the minimum amount of hot distilled water. If it seems that after a certain point all the water solubles have dissolved, and that there are some water insolubles in your coke as a cut, then stop adding water. Assuming there's no insoluble cut in the coke, and everything has dissolved, heat it up to around 95–110 degrees C, and then add the correct molar amount of base. It is preferable to have it in solution. At this point you can either a) let the rock float to the top and then dunk the whole thing in cold distilled water and collect the hardened rocks or b) if there are insolubles in the mixture, add a non-polar solvent such as ether to the hot water layer with crack oil floating on top. The ether will absorb the crack and form a layer over the water. Decant off the solvent layer, filter if necessary, and evaporate off the solvent to yield the pure crack. The way this works is that the salts produced between the reaction of the base with the HCl are dissolved in the water and the crack is either a) dunked in water and washed of all water soluble salt traces or b) dissolved in a non-polar which no water solubles will dissolve into, as well as being filtered of any solid that may have become suspended in the non-polar.

chloroform because it was a known DPT solvent, it was on hand, and it is my understanding that its fairly low boiling point makes it very easy to evaporate completely and shouldn't leave any residue if properly heated. I'd like to hear further details to find out whether it is indeed a risk. I haven't tried ethanol, but it would be easy if it works):

"2 grams of DPT HCl was dissolved in 150 ml of water. It was difficult to get the crystals to go into solution and it required a small amount of heat. (Be careful not to apply too much heat, as DPT is very heat sensitive.) Once the DPT was in solution, the water mixture was added to a separatory funnel and ammonia hydroxide was then added drop-wise to basify. After each drop, I swirled the mixture to distribute the ammonia evenly, observing a white cloud of free-base forming out of solution. When it reached a pH 8–9, I added 75 ml of chloroform. This mixture was swirled and thoroughly shaken for about 5–10 minutes with the chloroform layer settling on the bottom. The chloroform extraction was then poured off and saved in a flask. This process was repeated 3 more times, with each extraction requiring additional ammonia hydroxide to keep the pH level at 8–9. The last extraction was left to sit for 5 hours just to make sure that all of the DPT was recovered from the water solution.

"The combined chloroform extractions were then evaporated in a baking dish leaving a semi-clear/white DPT free-base oil behind. 2 grams of finely ground dried parsley was added to the baking dish and scraped and thoroughly mixed with a razor blade until the parsley was completely saturated. The mixture was still somewhat sticky but relatively easy to handle. It was then placed in a glass vial for easy use and storage. As an aside, I've noticed that vaporizing the pure DPT oil isn't nearly as effective as the parsley mix. Strange but true for a number of friends. [This has also been reported from ER subscribers as well.]

"Perhaps an easier method for producing a free-base material would be to use a similar strategy as the recipe used to convert cocaine HCl to crack. Here's one recipe a friend sent me:

"Crack is usually made by mixing two parts of hydrochloride with one part baking soda in about 20 ml of water. [See side-bar to the left for other thoughts on the proportions.] The solution is then heated gently until a white precipitate forms. Heating is halted when precipitation stops. The precipitate is filtered and retained. The precipitate may then be washed with water, although this procedure is usually omitted in the

street product. The product may then be dried for 24 hours under a heat-lamp. It is then cut or broken into small 'bits' weighing a few tenths of a gram."

[K. Trout responds: I had always thought chloroform and methylene dichloride evaporated cleanly but a few years ago came across a report that they only evaporated out of plant material down to some parts per billion. I don't think that's a huge enough risk to get overly concerned about having used (especially considering small amounts of chloroform used to be included in the ingredients of Nyquil until at least the 1970s). If ethanol works okay it would be a better choice though. My concern is actually directed less towards the people smoking the product yielded by people who know what they are doing (and who know how to handle solvents) then it is directed towards people using product produced by people who don't have a clue (and those same people handling chloroform).]

Finally, yes, moclobemide is available through the "smart drug" company INTERNATIONAL ANTI-AGING SYSTEMS ([www.antiaging-systems.com](http://www.antiaging-systems.com)); 30 x 150 mg tablets for about \$60.00 (check for current prices). They also carry Deprenyl and Piracetam. While Deprenyl is a MAOI (and its use as a "potentiator" has been reported by a few psychonauts), Piracetam is not a MAOI as far as we know, and the mechanism of possible potentiation is unknown. We have not heard of too much experimen-

tation with either of these compounds as "potentiators," and hope that our readers keep us apprised of any experimentation that they participate in or hear about, especially in the case of Piracetam, which is the greater unknown of the two. Aside from D.M. TURNER's glowing reports, we have seen absolutely nothing about the combination of Ludiomil (maprotiline hydrochloride) and LSD or other entheogens. Ludiomil is a tetracyclic antidepressant that works by increasing the levels of the neurotransmitter norepinephrine, via selective inhibition of norepinephrine reuptake. Again, we'd love to hear about anything related to combinations of Ludiomil and entheogens. — DAVID AARDVARK and K. TROUT (with thanks to TOAD)

## DRUG TESTING FOR ENTHEOGENS?

I make use of mostly psychedelics like San Pedro, morning glory seeds, etc., as meditation aids and an occasional stimulant during my art activity, as they improve my perception of color. I am concerned lately of impending possible random drug-testing where I work. Would you happen to have the latest rap about this Draconian intrusion into privacy—particularly as it concerns the range of my own involvement? Thanks. — D., PA

## CONSCIOUSNESS TECHNOLOGIES JULY 19–22, 2001

A conference in the exploration of various techniques for accessing and navigating novel states of consciousness. Join us for an experience of informative seminars, creative workshops, discussion groups, music by The Crystal Awareness Project, and more.

DALE PENDELL offers his unique blend of history, poetry, and science. DALE is the author of *Pharmako/Poeia* and the forthcoming *Pharmako/Dynamis*.

CLARK HEINRICK has been published in the journals *Integration* and *Eleusis*. He is author of *Strange Fruit: Alchemy, Religion and Magical Foods*, and co-author (with CARL RUCK and BLAISE STAPLES) of *The Apples of Apollo*.

PHILLIP FARBER is the author of *Future Ritual: Magic for the 21st Century* and *Breaks: The Adventures of Richard Nixon in the 21st Century*. He can be found on-line at <http://members.aol.com/pstuart>.

DJENABA is an advanced personal trainer, holistic health consultant, fitness counselor, advanced aerobics instructor, Tai Chi instructor, and yoga instructor.

DJENABA pursues fitness as a parallel course to healing modalities.

TODD ROETKEN is a long-time contributor to *The Entheogen Review* under various pen names. TODD leads us on a tour of the frontiers of neuropharmacology.

EILEEN KILGALLON demonstrates how sound, dance, and breath can be facilitators in the entheogenic experience.

JOHNNY APPLESEED was an early contributor to *The Entheogen Review* who has done ground-breaking work on North American ayahuasca analogues.

JIM RANSOM has a background that is so varied and eclectic, that he can only be described as a Renaissance man of the clown-shaman tradition.

THE CRYSTAL AWARENESS PROJECT will provide an evening of space music. CRYSTAL, owner of the GARDEN OF SCENTUAL DELIGHTS, also offers aromatherapy workshops.

Cost of the experience is \$350.00, which includes all seminars, workshops, and events, on-site camping, and three meals a day. Meals begin with dinner on Thursday the 19th, and end with lunch on Sunday the 22nd. Please specify if you would like vegetarian meals when you register. The conference site is a short drive from Sisters, nestled in the Deschutes National Forest. If traveling by air, Redmond is the closest airport (30 minutes away), or choose Eugene as your destination to enjoy a beautiful drive over the Cascades. To register send \$350.00 in check or money order to: I-9 RESEARCH, POB 1506 (Dept. ER), Sisters, OR 97759. Registration packet will contain more detailed travel information and a map to the conference site. If you have any questions or need more information, call or e-mail RICHARD NELSON at (541) 420-7038, [19rern@hotmail.com](mailto:19rern@hotmail.com). Also check out our web site at [www.charm.net/~profpan/ct](http://www.charm.net/~profpan/ct).

To some extent, your question is answered in the following quote taken from the Summer 1997 issue of *The Entheogen Law Reporter*:

...the vast majority of employment-related urine tests screen for only five drugs or classes of drugs because that is all that a testing lab must qualify for to obtain FDA approval. The five drugs or classes are: marijuana, cocaine, opiates, phencyclidine, and amphetamines.

Testing just for the above drugs costs employers approximately \$50.00 per test. Testing for additional drugs would further increase the cost.

This is not to say that drug labs are incapable of testing urine for...entheogens—they are (BOIRE 1997).

*Of additional note is the fact that two large drug-testing labs, ASSOCIATED PATHOLOGISTS LABORATORY and PSYCHEMEDICS CORPORATION, have fairly recently added MDMA detection to their hair-testing service—generally used as a pre-employment drug screen (BOIRE 2000). You mention the use of mescaline- and ergine-containing plants, and it is unlikely that these drugs would be specifically tested for. Similarly, it is unlikely that any tryptamines (DMT, psilocybin, etc...) would be specifically tested for. And most of these drugs are metabolized fairly rapidly. However, a greater worry for the person facing a random drug test would be that they give a “false positive” to the test for other reasons. Indeed, it has been reported that under-qualified lab technicians have actually converted over-the-counter medications such as ephedrine and pseudoephedrine in urine into methamphetamine during GC/MS tests (HOLTORF 1998). Urine testing as it is practiced is disturbingly unreliable, and it is a known fact that “more tests are positive due to prescribed medication, over-the-counter preparations, cross reacting food products, and testing apparatus errors than are positive due to illicit drug use” (HOLTORF 1998). Some drugs, foods, and physical conditions that can cause a “false positive” include: (for Cannabis) over-the-counter (OTC) NSAIDS such as Ibuprofen, Naproxen, and Ketoprofen, as well as numerous prescription NSAIDS; OTC allergy preparations, sleep aids, and anti-nausea medications that contain promethazine; vitamin B2, hempseed oil, and Marinol; (for amphetamines) OTC cold and allergy remedies that contain ephedrine, pseudoephedrine, propylephedrine, phenylephedrine, or desoxyephedrine; OTC diet aids containing phenylpropanolamine; OTC nasal sprays such as Vicks inhaler (which contains l-methamphetamine) and Afrin; asthma medications; and numerous prescription medications such as phendimetrazine, phenmetrazine, benzphetamine, fenfluramine, dexfenfluramine, dexdendramine, mephentermine, methoxyphenamine, phentermine, amineptine, Pholedrine, hydro-methamphetamine, amifepromone, clobenzorex, fenproporex, mefenorex, fenellylline, dextroamphetamine, methphenidate, pemoline, and selegiline; various NSAIDS; (for cocaine) Amoxicillin; tonic water; (for opioids) poppy seeds; most prescription pain medication such as codeine, Vicodin, Percodan, Percocet,*

*Wygesic; the antibiotic rifampicin; and cough-preparations containing dextromethorphan; (for PCP) promethazine. And, although they are unlikely to be tested for in most urine tests, false positives can show up with: (for barbiturates) the tension headache medicine Fiorinol; some sleeping pills; the IBS and stomach ulcer medicine Donnatal; asthma preparations containing phenobarbital; and various NSAIDS; (for benzodiazepines) most prescription sleeping pills and anti-anxiety medication, as well as various NSAIDS; (for LSD) some migraine medications containing ergot-based drugs; the “smart drug” Hydergine; bromocriptine; methysergide; lisuride; lysergol; triprolidine; the anti-depressant amitriptyline; the gastro-intestinal antispasmodic dicyclomine; and OTC allergy preparations, sleep aids, and anti-nausea medications that contain promethazine.*

*As well, kidney infection or disease, liver disease, and diabetes, can cause a “false positive” for Cannabis, amphetamines, cocaine, opioids, and benzodiazepines.*

*The above incomplete list was adapted from the excellent book *Ur-ine Trouble* by Dr. KENT HOLTORF (ISBN 0-9657467-4-7, VANDALAY PRESS, POB 847, Scottsdale, AZ 85252, (602) 945-5336), which we highly recommend for those who wish to learn more about the unjust, ineffective policies of urine testing. The book also contains good information on various methods (some effective, some not) that people use to pass urine tests when they are concerned. (It is interesting to note that goldenseal root is not effective when taken as a tea for masking Cannabis use, and that none of the various detox teas offered for this purpose out of 50 that were tested were able to exert any effect. Basically, any effect that they claimed to have was due only to the consumption of large amounts of water prior to the test, which in itself can be an effective way to dilute the concentration of drugs and metabolites in one’s urine.)*

*Considering the fact that so many drugs will cause “false positives,” it would not surprise us to learn that phenethylamines such as mescaline or 2C-B might show up as evidence of amphetamine use, and certainly it seems likely that MDMA could show up as such.*

*Ur-ine Trouble also relates the “approximate time interval for detection of drugs in urine after use,” noting that with Cannabis, metabolites are detectable after a single use for 1–11 days, and after chronic use 7–30 days; with cocaine, metabolites are detectable for 1–3 days; with opiates, metabolites are detectable for 1–2 days; PCP is detectable for 3–7 days; and amphetamines are detectable for 1–3 days (and methamphetamine for 1–4 days).*

*It should also be noted that it is quite probable that ketamine use may show up as a “false positive” for PCP. And—just like chronic Cannabis users—those who use ketamine on a regular basis should be concerned about detectable metabolites remaining in their system for a longer period of time. — DAVID AARDVARK*

## SEVERAL QUESTIONS

*ER* remains an invaluable source of “classified,” cutting-edge information for the psychonaut. Keep up the good work. However, I have a few questions.

- 1) JLF, a company of really dubious reputation (prompt service, shitty goods), advertises *kratom* from India for \$20.00. Have you heard anything about this, pro or con? Any other sources for the leaf? Isn't yours from Thailand?
- 2) Is the second edition of *ER's Salvia divinorum* folio available yet, and if so what does it cost?
- 3) All the entheogenic conferences are always on the West Coast. How about one here in RUDY's Hell Hole (aka New York)?
- 4) Do you have a mailing address for ROBERT ANTON WILSON? I tried his publisher, but this was no good.
- 5) Does anybody have 4-AcO-DIPT for sale? ESHU has been promising it since last July and still can't come up with the goods. Is SASHA the only chemist who can synthesize this stuff?

Thanks. Live long and prosper. — G.J.B., NY

*We'll try and answer your questions as best we can:*

1) *JLF is an interesting company; their primary concern appears to be simply the correct identification of the material that they sell. Since these products are specifically not being sold for consumption, it appears that they don't care at all about the alkaloid content or potency of what they sell. This can be unfortunate. Of course, alkaloid content in natural products is highly variable anyhow. And by selling their products specifically as poisonous non-consumables, JLF has been able to legally offer many interesting selections and skate about as close to the edge with their offerings as any company ever has. Still, there is no guarantee that anything they are selling hasn't sat on a shelf for months or years, with whatever alkaloid content it did have at one point deteriorating over time. Since the plant is still correctly identified, it is still saleable as a poisonous non-consumable. It is true that we have heard many complaints over the years about the products that JLF sells having a “low” alkaloid content. However, to be fair, we have also heard glowing reports about the alkaloid content of some of their offerings. Clearly it is a crap shoot. Their particular method of sale can be a double-edged sword for the consumer who is concerned about securing a plant with a high alkaloid content, or a compound that hasn't*

*deteriorated. (JLF actually sells over-the-counter medications that have expired. In some cases these may still be of high potency, while in other cases it seems possible that they could be of lesser potency—although it is also likely that some “expiration” dates on medicines are simply there to get people to chuck perfectly good meds and buy new ones.) Certainly it is reasonable to ask any company before you buy a specific product from them, when that product was obtained and how it has been stored. Of course, they may not answer such a question, but in that case it might be time to find another source. Buying the smallest amount possible and testing it prior to buying a larger amount is also a good idea.*

*We contacted JLF and asked them about the Indian “kratom.” Unfortunately, they didn't answer any of our questions and only stated that they no longer carry this product. We did find out from one source that what they were carrying may have been another species of *Mitragyna* that has been either reported as not being active or not active in the same way as *M. speciosa*. Our source said that he believed there have been alkaloid studies done that showed *M. speciosa* to be the only *Mitragyna* species with mitragynine, the “major”*

# THEATRUM BOTANICUM

Rare Plants

Theatrum Botanicum  
POB 488 (Dept. ER)  
Laytonville, CA 95454

[www.hepting.com/thebot](http://www.hepting.com/thebot)  
(Catalog \$2)

alkaloid in *M. speciosa*, but he was unable to cite a source for this information. He said that he thought that JLF may have been selling *Mitragyna parvifolia* (sp?), but he wasn't certain.

He also said that he was of the belief that JLF did mention that they were not certain that their material was actually *Mitragyna speciosa*, or they had mentioned this at one point (since we did not see the advertisement for this, we are unable to comment). Our source doubted that JLF was selling true *M. speciosa*, as he felt that it is both very difficult to come across, and also hard to get out of Thailand, which appears to be the only country that it is really used in traditionally. The *M. speciosa* that has been recently commercially available from other sources did indeed come from Thailand.

The only two sources for kratom that we are aware of are SHAMAN AUSTRALIS (POB 1103, Byron Bay 2481, Australia, shaman@shaman-australis.com, <http://www.shaman-australis.com>), for live plants offered as tissue-cultures (hard to grow-out for many people not skilled with the proper technique), and the BOTANICAL PRESERVATION CORPS (POB 1368, Sebastopol, CA 95473, bpccexpeditions@yahoo.com), for dried leaf (apparently they only have a limited amount, and may not be able to restock when this is gone).

2) We must offer an apology to all of those who have ordered the second edition of the monograph, *Salvia divinorum* and *Salvinorin A: The Best of The Entheogen Review, 1992–2000*. Production of this volume has seen repeated delays. We are determined to have it completed by the middle of the year, and hope that there will be an advertisement noting its availability in the SUMMER SOLSTICE 2001 issue of ER. It will sell for \$23.00, postpaid (USA) and \$26.00, postpaid (foreign). Thanks to everyone who has been patiently waiting for this book.

3) Actually, it looks like your wish has been granted. The PROPHETS CONFERENCE is indeed going to be held in New York. And while it isn't specifically geared towards entheogens, there are a few speakers who are directly involved in this area of interest, such as HUSTON SMITH, RALPH METZNER, STANISLAV GROF, and PETER GORMAN. See the "Events Calendar" in the WINTER SOLSTICE 2000 issue of ER for more information on this conference.

4) Unfortunately, the only mailing address that is easily available for some authors is their publisher. If you include an appropriately stamped, blank envelope, in most cases publishers are happy to forward mail to their authors. However, in some situations the publisher may slack on this, and of course even if a letter is forwarded, there is no guarantee that the author will respond. (This is understandable to a degree, in that many authors receive voluminous amounts of mail, and they wouldn't get anything else written if they actually answered all of their correspondence.) The address that we had seen at one time for RAW was: ROBERT ANTON WILSON, c/o THE PERMANENT PRESS, POB 700305, San Jose, CA 95170 (we have no idea if this is current), and he might also be reachable through NEW FALCON PUBLICATIONS, the folks

that currently publish some of his books (NFP, 1739 East Broadway Road #1, PMB 277, Tempe, AZ, 85282, (602) 708-1409, (602) 708-1410 fax, [info@newfalcon.com](mailto:info@newfalcon.com), <http://www.newfalcon.com>). Finally, RAW is one of the speakers at the PROPHETS CONFERENCE mentioned above, and you may be able to get the event's producers to forward a piece of mail to him (MYSTERY SCHOOL, POB 567, Kula, HI 96790, (888) 777-5981, [axiom@greatmystery.org](mailto:axiom@greatmystery.org), [www.greatmystery.org/nyconference.html](http://www.greatmystery.org/nyconference.html)).

5) We aren't aware of any company other than ESHU that has 4-AcO-DIPT for sale. We asked ESHU about this, and they responded:

Ah yes, we've heard this question more times than we care to repeat. The good news is we just finished 5 grams using our new method and we have more completing this week, from there we should be able to scale this baby up and have plenty of material available by the end of March. Knock on wood...

Hopefully we've answered your questions to some degree.  
— DAVID AARDVARK

## TRICHOCEREUS?

Regarding ER's recent series on cacti; I enjoyed the first article, and look forward to the next installment. I want to bring to your attention something that gave me a little trouble. I was looking for more information on *Trichocereus* in my excellent book *American Horticultural Society Plant Propagation* by ALAN TOOGOOD, but I noticed that *T. pachanoi* is really listed as *Echinopsis pachanoi*. The book says that the *Echinopsis* genus includes cacti formerly classified as *Lobivia* and *Trichocereus*. Apparently, *Trichocereus* is a synonym for tall-growing species, and actually may not be correctly applied to what was shown in Figure 6 (p. 130, WINTER SOLSTICE 2000), *Trichocereus bridgesii* f. *monstrosus* (Clone B). I am by no means certain of this, but I don't mind adding my 2¢ worth if you think it may be helpful. (If you investigate further, you may realize that this isn't even worth 2¢.) Best regards. — M.S., FEDERAL PRISON CAMP, EGLIN, FL

The *Trichocereus* species were renamed *Echinopsis* species some years ago based on floral and seed-coat morphology, along with not just most of *Lobivia*, but also at least 8 other genera (FRIEDRICH 1974A, FRIEDRICH 1974B, FRIEDRICH & GLAETZLE 1983, ROWLEY 1974). The comments of the botanists FRIEDRICH and GLAETZLE (1983) related to the seed-coat method of classification are worth considering:

In their general characters the seeds of all *Echinopsis* species are referable to a type which is common in the

subfamily *Cereoideae*. It is thus scarcely possible to recognize with certainty that some unfamiliar seed definitely belongs to *Echinopsis*. Similar seed forms also occur in quite unrelated genera. To this extent, therefore, seed forms are unsuited for determination beyond the genus.

*The renaming has created a huge mess as many of the genera had species that shared names. For instance according to this merger, T. bridgesii is now E. lageniformis as there already was an Echinopsis bridgesii. While Echinopsis is now considered correct by taxonomists, it is not used by most horticulturists, due to the unresolved confusion it creates. As BACKEBERG (1977) commented:*

The choice is clearly between the narrowly conceived genus, or a continuation without demarcations of the “lumping” process, whereby the concept of a “type-species of a genus” loses all meaning. These attempted combinations start an unwarranted series of chain-reactions.

*FRIEDRICH and GLAETZLE, recognizing the seriousness of the issue, suggested subgenera would need to be created. Trichocereus is no doubt best viewed as a subgenus of Echinopsis, as BERGER had suggested in 1905, but it should also be added that no one has ever bothered to describe more than a couple of Trichocerei under the new revision despite some of the listed species never having been de-*

*scribed (like KNIZE's nomen nudums). Until an actual revision/monograph gets published and taxonomists can be bothered to describe these, it is as much a matter of politics as science, since there are some serious issues that FRIEDRICH, GLAETZLE, and ROWLEY have never adequately addressed. See <http://trout.yage.net/sc/mergercomment.htm> for more comments on this issue.*

*Worse, many modern taxonomists consider Trichocereus peruvianus to be simply a spiny form of T. pachanoi since there appears to be no clear dividing line between the species (RITTER 1981, MADSEN 1989). So T. peruvianus is also now E. pachanoi! (Interestingly FRIEDRICH and ROWLEY 1974 kept them separate, as does OSTOLAZA). We'll follow RITTER's example (1980) and stick to the old names simply to avoid confusion, as it is clearly the lesser of the two evils.*

*As for monstrose and cristate forms, these are not simply non-normal growth forms but many of these do not have clear species identification as their current identity has been inferred entirely from their appearance. However, the one you mention illustrates one of the problems with the proposed view. Trichocereus bridgesii f. monstrosus (Clone B) apparently originated as a single mutant that BACKEBERG spotted in a batch of normal T. bridgesii seedlings (BACKEBERG 1959), and has been intensely propagated ever since. It has not been collected from the wild. Despite its appearance, it came from a tall columnar, and even though it is no longer a tall columnar, its parentage is unchanged. — K. TROUT*

# MOVING INTO THE SACRED WORLD OF DMT

by ∞AYES

The world of DMT is incredibly vast. What DMT opens in us is so profound that it is impossible to truly express. I have been making, using, and initiating people into DMT use, for around 40 years. I was the one who first discovered that the free-base could be smoked. It has never ceased to amaze me, nor have I ever felt that one could fairly arrive at any hard and fast conclusions about what was happening during a DMT trip. I do think that there are general rules for approaching the DMT journey such as diet, preparation, set and setting, and intention. But DMT is about the beyond. “Beyond what?” you may ask. Beyond the intellect, beyond the senses, beyond any devices and biological instruments for dealing with the external world. When you journey through the realms of the interior, the rules of the intellect and the values of the material world are not only irrelevant, but using them as yardsticks can create confusion. Tools of intellect are analytical, and as such are divisive. The processes of expression, communication, analysis, and intellect are tools for the ignorant. With these tools, we work our way out of the dark; but this ignorance is of the *material* world, not the spirit realm.

DMT is about unity and the healing of division, conflict, and the sickness brought about by compartmentalization. It is on a higher order of reality than the intellect, but it will weave message-laden images with any mental state or environmental input. The trick is seeing the pattern in the fabric and not getting hung up on the colors and threads. Thus, when I see someone trying to understand the DMT experience from a non-mystical, intellectual viewpoint—subsuming the whole by the parts—I am strongly motivated to share a critical viewpoint in the hope of extending our understanding of DMT and its use by travelling toward the beyond, which is its proper landscape.

World consciousness is changing and expanding very rapidly. The part that freaks everyone out is the idea that we will have to bid a fond farewell to the absolute authority of the intellect and the senses. These are the crutches of the material world. In the material world we fall down without them—we would remain as cripples. However, in the vast beyond, they are just distractions. These tools need to be dropped when you enter the ocean of consciousness, as they will only drag you down when you need to float.

When I read the excerpt in *ER* from *DMT: The Spirit Molecule* by Dr. RICK STRASSMAN, I was struck by what I feel are a few fundamental misunderstandings that he made, and his failure to notice the crucial effect that the presence of he and his crew, as well as the overall environment, was having on his subjects. I wish to point these out and to put this type of research back into the vast perspective to which it belongs, lest this materialistic viewpoint create decades of misunderstanding.

First off, DMT is not a re-run of the *X-Files*. There are no aliens squiggling through psychospace to do experiments on us. That idea is just plain silly. It is fine to wonder how these perceptions occur, but it's another matter to jump to conclusions. Wouldn't it make sense to first examine the environmental design rather than look to alien origins? Over and over, STRASSMAN's subjects describe being examined by numerous strange beings in highly technical environments during the visual phase of their DMT experience. They are being examined, discussed, measured, probed, and observed. They are in high-tech nurseries and alien laboratories. There are 3–4 people moving around operating machinery according to some design or agenda.

Now let's look at what the physical surroundings are. These experiments are being done in a hospital room. There are a number of people in attendance, helping the one who is in charge, Dr. STRASSMAN. He has an agenda and an experimental scientific viewpoint based on intellectual assumptions. There are people from NIDA, a government agency overseeing these experiments. They are labelled “Mr. V.” and “Mr. W.” It seems clear to me that these individuals are the “aliens” represented in many of the experimental subjects' trips. The elements of the experimental environment seem to be cropping up in the trip world that the subjects are experiencing. Why haven't other environmental designs been considered?

One of my many memorable DMT trips (at about 0.9 mg per kg of body weight, intramuscular of the HCl) was sitting on a Persian carpet listening to a recording of SHARAN RANI playing a love raga on a sarod. I had my two trip buddies with me. There were candles and incense. The room was set

up as a temple space for tripping. As I arrived at my internal trip space, I was filled with overwhelming feelings of womanly love and sensuality. I looked down and was very surprised to see myself dressed in filmy harem pants and no shirt on. I had a beautiful copper-colored female body—breasts and all. I had many bangles on my arms, and ankle bells on my legs. I looked around and found that I was dancing a seductive love raga to the two musicians facing me playing sarod and tabla. We were performing in the courtyard of a beautiful Indian temple similar to BUBHANESHWAR TEMPLE, famed for its erotic sculpture and soaring towers. My dancing was an exact counterpart in rhythmic motion to the melodies and rhythms of the music. It was an exquisite act of love. It was so beautiful that when I came down, I declared that if I died right at that moment, I would regret nothing as I had experienced beauty more exquisite than I could ever imagine. Perfect love and unity. As I came down, I saw my beautiful breasts shimmer away and the bangles slide off my arms twinkling into nothing. There was a momentary ache in my heart as all of this love withdrew. As the room reappeared around me, I experienced a confusion; I could not remember if I was a sacred temple dancer dreaming I was a man, or if I was a man dreaming I was a female dancer. This was ob-

viously a very touching and profound trip that infused my being with a new appreciation of love and harmony, something I carry as a memory and a perspective on life to this day. Obviously, I am not a woman, but I was so profoundly influenced by a woman playing a love raga that I created myself in accordance to what was entering into me from my environment. So it is apparent that set and setting are extremely influential in acting upon the DMT state, which is clearly a magnifying, creative, and sensitizing medium.

Now what would have happened if I had been injected with DMT in a clinical setting with two authorities from the NATIONAL INSTITUTE ON “DRUG ABUSE” watching me while little machines were beeping and orderlies and nurses were moving about? How different is this from the early CIA experiments with LSD? Granted that this orientation is clearly not the evil, murderous purposes that the government was entertaining at *that* time, and the “compromised assets” (subjects) were not thrown from the windows to create an urban myth imprinted on everyone’s mind that LSD makes you “jump” out of windows, but there are certain elements that are similar. [NOTE: We are not aware of any documented incidents of government officials chucking dosed subjects from win-

<http://www.ethnobotanicals.com>

*dows. There was one incident where a chemical weapons specialist, FRANK OLSEN, was unknowingly dosed during an ARMY CHEMICAL CORPS gathering. Mr. OLSEN later became depressed (apparently related to his being dosed) and was to be committed in a mental hospital. However, "the night before commitment, he died after crashing through a window on the tenth floor" of a hotel (STAFFORD 1992). Did he jump or was he thrown? We don't know. Nevertheless, we seriously doubt that this incident was orchestrated in order to create an urban legend that LSD causes one to jump from windows, even if it may have contributed to this idea. Although I doubt that jumping from windows while on LSD is common, the fact is that it can play a part in such an activity, as I actually witnessed an individual on acid jump from my own second-story apartment window. — DAVID AARDVARK]* These are experiments being done by government agencies examining the use of these psychedelic substances in the pursuit of more power, money, and success (and based on the fallacious concepts of "drugs" and "abuse"). Remember, these are the same folks that rub elbows with the masters of disinformation that create absurd commercials like a frying egg in a pan saying, "This is your brain on drugs."

The assumptions are all wrong. Dr. STRASSMAN's interpretation is about the recording of specific hallucinations, psychological modalities, and intellectual structuring. In actuality, the hallucinations are only visual by-products of a mystical state. What is important are the feelings and the hidden meanings you experience from entering into the vastness, and the new consciousness that can result; this is the glimpse that can open your soul to the sacred.

At the end of the excerpt, STRASSMAN decides to "act as if the worlds volunteers visited and the inhabitants with whom they interacted were real," so that he can show more "empathy." It is difficult for me to interpret this "acting" as *allowing true* empathy. It seems more like psychological role-playing to me. His concern that this approach might create a communal psychosis is valid, however.

The administration of DMT in these highly artificial and agenda-driven environments may very well create a warped impression of assumed importance and reality that does not allow DMT to function as it should. Let STRASSMAN take his subjects into the forest or a temple, and turn on with them after he has mastered it himself, and I think he will find that the little alien doctors will disappear and be replaced by other mystic beings—beings that can tell you about yourself. Or you can go to a completely non-representative space of the rare "level three" state, where there is no light, no design,

just the voice of God using your soul as a silent tuning fork. Alas, this is unlikely to happen, as STRASSMAN would probably lose his job or grant, might very well be prosecuted and jailed, and worst of all, like LEARY and ALPERT, lose his scientific "objectivity" (another great myth).

Moving from this critical mode into a more expansive mode, I would like to address this topic from a mystical/religious point of view. The "objective" viewpoint was adopted by science as a more realistic way of describing reality than the "subjective" views filled with rigid dogma espoused by various organized religions. Actually, this understanding of objective (standing aloof from an experiment so as not to have one's judgment distorted) and subjective (being so immersed in what one is observing that meaningful observations cannot be made) are really misnomers. Subjective consciousness can be thought of as the personal inward journey involving mystical experience and self-realization. Objectivity has to do with the outward application of the mind for the realization of materialistic goals and intellectual pursuits in the world of practical life applications—for communication and social survival.

I would like to consider this topic from the subjective point of view, to share a perspective that I feel can lead to a much richer appreciation of where one can go with the sacramental substances, should it be decided to use them in this manner.

One of the two "commandments" we had in the religious institution that we established in the '60s called the LEAGUE FOR SPIRITUAL DISCOVERY was "Thou shall not change the consciousness of another person without their consent." On the surface, this means don't dose anyone without their knowledge. Dosing someone without them knowing it is a mean-spirited form of violence. Our consciousness, limited as it may be, is ours. It is intensely personal. It is also our entry and connection with Divine consciousness. So to dose someone without their knowledge is to mess around with their connection with God. To do this for fun or revenge is nothing short of an abomination. It is disgusting and the height of unconsciousness. *This* is sin.

Now, let's look at changing someone's consciousness with their knowledge and permission. When one enters into the field of consciousness to explore or find God, unity, healing, inspiration, beauty, or love, one is making a commitment to meditate or work, or to take a psychedelic in a conscious or purposeful way to find one's self or gain some hidden inner

knowledge. This is one's promise to one's self. This is extremely personal. It is between one's own heart and mind, and God's. No one else's.

When you take an inner voyage, you may be asking someone to assist you. This someone may know more about this journey than you do. This person has made the trip before. This person knows, perhaps, how to navigate his or her path without fear and stumbling. This person does not know your path. Nevertheless, a calm, loving presence while you are passing through the rough patches and sticky bits may be helpful to you, if you want it. This is your trip. Your mind. Your idea. Your freedom. You take the responsibility for your trip. This is not really social. Even if you are in a cuddle-puddle this is your personal connection with love. The other person is only a mirror, a friend, a companion, a helper.

So when someone sets up an experiment—a program with some “idea” behind it, some agenda—they are imposing a kind of mind-trip on the psychedelic experience. The environment may then have to accord with medical, psychological, or even governmental rules, precepts, and regulations. Even if the person running the program wants to demonstrate how useful and helpful these substances are, the very fact that there is an exterior organized program controlling the way in which the substance is administered interferes with the nature of the experience. Such a program in a clinical environment may produce some interesting results, but this is not the entheogenic or sacramental use of these substances. This applied program (curing, drug abuse, psychotomimetic model, or whatever) is a linear kind of thing—a control and concept modality that does not even begin touch on the *true* potential of what can be a very profound multi-levelled experience. It is but one very small window, a tiny part of what is possible, and the part cannot subsume the whole. Holistic, deep spiritual research *cannot* be authorized by its very nature. Authority does not command God. If authority is an organized and limited temporary utilitarian structure, when its use is finished, it is disposable. God is not disposable. Neither are people.

Consciousness research and exploration must always be unauthorized to be authentic. Authorization is simply irrelevant. This does not mean we cast psychedelics hither and yon all over the landscape irresponsibly. It means that this is a deeply personal, tender, passionate search for self-realization. No one can tell you this. You must learn it for yourself. This is your love dance with yourself. For anyone to diddle with the controls in a gross or even subtle way, it distorts

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus* ...  
*Epithelantha* ... *Pelecypora* ...  
 obscure *Trichocereus* species  
 including new hybrids  
 and cristate/monstrose  
 San Pedros and others ...  
*Turbinicarpus* ... *Aloe* ...  
*Bursera* (source of copal) ...  
*Delosperma* ... *Ipomoea* ...  
*Pedilanthus* ... *Sceletium* ...  
 and more!

We also offer an extensive guide to grafting cacti and other succulents.

Our catalog is fully illustrated, and loaded with ethnobotanical and horticultural information.

Please send \$2.00 to receive a catalog and additional rare plant & seed supplements throughout the year.

## Sacred Succulents

POB 781 (Dept. ER)  
 Sebastopol, CA 95473  
 USA

things (to put it “objectively”). To put it subjectively, it’s simply perversion.

Let’s look at it from another angle—a scientific angle. There is a concept sometimes referred to as the HEISENBERG Uncertainty Principle. Put simply, it means that the act of observing something changes the nature of that which is being observed (in subatomic particles). The very act of just observing it. In our social life this happens all of the time.

For example, you walk into a room full of people. They look at you. You act very differently than you would if that room were empty. What might the fundamental effect of having substances administered by strangers (albeit possibly friendly strangers) who are taking notes, monitoring heart rate, respiration, video and audio taping, talking, whispering, or what-have you, in a technical, clinical environment? Obviously the nature of the journey will be profoundly influenced and changed from what it could be if the “subject” were in a natural, private, aesthetically pleasing environment. No one is going to be entirely comfortable in a clinical setting. There is an agenda here. This agenda is not up to the standard of a spiritual, friendly, and supportive environment. Strange smells, strange sounds, and the wrong kind of lighting, pervade. Past memories of doctor’s offices—pain, poking, injections, *etc.*—can arise. This *has to* change the nature of the experience. It is simply laboratory experiments with human beings being used as experimental lab animals.

The highest use of psychedelics and the empathogens is for finding love, beauty, joy, ecstasy, unity, and integration. This search for our essential inner perfection and Godliness is the spiritual search. When these substances are used this way, they are used for the highest good. Then they are sacraments, and we can call them *entheogens*. We must never forget, no matter how much disinformation is spread, that these substances are inert, innocent materials. It is we who interact with them and confer the variety of qualities that we attribute to them. It is we who have the choice to malign, terrorize, or scandalize them. It is also we who have the choice to treat them with the respect due to a gift from existence that can help in our search to find ourselves. And in doing so, to find the glory of love and illumination.

There may be some skeptics who say, “How did we get so deeply into spiritualism and God?” Yet, we have many accounts of elves, guardians, extra-terrestrials, and magicians that we see on DMT. What’s going on here? If we can acceptimps, little monsters, and elves from this DMT spirit world,

why cannot we accept God?

Let’s approach this topic from another neglected aspect. What *is* happening when we ingest DMT and reach this level of elves? Perhaps we are accessing the ultimate significant spirit of life when we apprehend these animated and symbolic representations. We may be intuiting the universal life code—the DNA molecule—which is found by the trillions all over the body. Perhaps the elves andimps are small sub-loops of information that we are accessing, which show how we can re-unify parts of our program that have gotten out of kilter. It has to come from somewhere, so why not look closer, rather than further? It seems that man’s search for knowledge started from the stars with the Greeks, and slowly worked its way closer and inward, until we are finally looking at the genetic engineering that is the basis of life. It is looking like the DNA molecule is possibly the origin of our spirituality also.

Let’s look at the feelings that occur during these visions, by examining them via a format for smoking DMT. I used to have a portable temple of very simple design—a beautiful handkerchief like a mandala, plus a candle. We’d sit around and smoke, one person assisting the smoker with matches and anything else he/she could do, like catching the pipe when the smoker went beyond physical coordination. We never passed the pipe around the circle, since that would mean you were already coming down by the time the pipe circulated again. The candle and mandala served as centering devices. As the DMT came on, the edges of the cloth would start moving, and so would the designs on the handkerchief. 2-dimensional surfaces would become 3-dimensional, independently moving in and out, up and down, relative to each other. The center would become a vast depth reaching away into infinity. The feelings that accompanied this were a sense of intense profundity, as though one had just arrived at the edge of the Grand Canyon. There was a sense of hidden inner meaning just about to be revealed. Everything seemed especially precious, and the *real* meaning of the word “sacred” resonated in my entire being. This is a feeling of coming into oneness with everything. It is the end of loneliness and emptiness, and the feeling of unity and completeness. It doesn’t get any better than that. In this space, anything can happen. Curing can happen. It can be accompanied by “agents,” little doctors working on you, signifying monsters, or even magicians teaching you lost knowledge. Worship and prayer suddenly have a whole new depth and meaning, because the sacred opens up the infinite.

One time many years ago in the penitentiary on McNEIL ISLAND we had managed to get a group of psychedelic prisoners living all together in one of the 8-man cells. Every Saturday night we would sit together in a circle around a little makeshift shrine, and take LSD, as well as smoke DMT. One of our cell mates, whom we could not dislodge from the cell, was an exception. He was a Mafia hitman. Sick as he was, he eventually gave it a try. The night he smoked DMT he came out of it with a look of astonishment and awe, and he said, "That's the first time I've gone to church in 30 years." Even this stone-cold killer could recognize the sacred. DMT creates a well-spring into a type of infinite space. You can feel and taste it, as it moves through your whole being like a cool refreshing breeze on a hot sticky day. Like a mother's soothing touch on your fevered brow, but much deeper and more profound. You can feel the wind of the Divine blowing through your soul. Not every time—it is a trial and error process of finding the best moment, the best preparation, a moment when you are already in a great space. Then you can catapult into the vastness of Godliness, and this is the highest fulfillment in life.

So much time is wasted trying to find a rational excuse for using the psychedelics. A use that can open the door for government approval. Let's cure some junkies of their habit. What for? The government-backed prosecution of drug users *creates* the problem. The problem is fictional. So we are going to use a sacrament to cure a non-existent problem? It has been said that the psychedelic voyage is a trip from wellness to even greater wellness. I agree. To use these sacraments only in a perverse application is to bring them down to a much lower level than their potential. What my experience indicates is that the most profound way to use psychedelics is to create ideal, healthy, high-energy environments with people who are in top form—then you will be able to approach the highest. Yes, the sacraments are curative and can be used that way, but it is *all* about curing, on any level.

Look at it as though consciousness were a set of stairs. Each stair represents a higher level of health, integration, and preparedness. At the bottom one can use the psychedelics with beer, opium, and cocaine to have a wilder party. One can use them to lose one's self, have great sex, *etc.* Fine and good; nothing really wrong, if that's what you want to do—it beats shooting people and raping the environment! This is, however, a low level of consciousness. Then you go up a few levels and you think that you can do some good with these compounds. Let's use them for studying madness or curing addiction. Still a pretty low level of consciousness and no real commitment to personal development. This use is directed outward, not inward. Change comes from within—it can never be imposed from the outside. The next step up it occurs that maybe you could use psychedelics for finding answers to questions in your life, perhaps even for vision questing. Now we're beginning to start on a more consciousness-oriented trip. But how are we doing it? Are we really arranging it so that we are creating an environment that unequivocally sets the stage for a leap into consciousness, or are we programming the trip with interruptions (telephone calls, visitors)? The purer our intention, the greater the possible results become. It can be quite subtle. You cannot plan it all out beyond a certain point or it becomes a control trip. You cannot program out spontaneity, but you can be intelligent and sensitive, and remember not to make the same mistake too many times in a row. Then you can use the psychedelics as an adjunct to tantra, meditation and/or yoga, devoting your entire trip to learning to go deep in these

## KETAMINE: DREAMS & REALITIES

The Authoritative New Book  
by Dr. Karl Jansen  
published by the  
Multidisciplinary Association  
for Psychedelic Studies (MAPS)

"Karl Jansen's book *Ketamine: Dreams and Realities* is a goldmine of information on this fascinating substance that combines in a unique way the properties of an anesthetic and a psychedelic. It is clearly written, well researched and documented, and presents a balanced and objective view point. The author's broad perspective, which covers all the aspects of ketamine from pharmacology to its use at raves, makes this book interesting for clinicians and researchers, as well as the general public."

— Stan Grof, M.D., author of  
*Psychology of the Future: Lessons From  
Modern Consciousness Research  
and LSD Psychotherapy*

"Indispensable reading for those with any interest in ketamine. Entertaining, thought-provoking, and thorough."

— Rick Strassman, M.D., author of  
*DMT: The Spirit Molecule: A Doctor's  
Revolutionary Research into the Biology  
of Near-Death and Mystical Experiences*

"It is an excellent book... a well done comprehensive review of the entire history of ketamine."

— Evgeny Krupitsky, M.D., Ph.D.  
Pioneer researcher into the use of  
ketamine-assisted psychotherapy in the  
treatment of alcoholism and heroin  
addiction

*Ketamine: Dreams and Realities*, \$14.95 + S&H.  
To order, call 1-888-868-6277 or use the secure  
server at [www.maps.org](http://www.maps.org). Also available, MAPS'  
new edition of Dr. Stan Grof's classic  
*LSD Psychotherapy*,  
with an introduction by Dr. Andrew Weil,  
\$12.95 + S&H. Please consider joining MAPS  
to support psychedelic and medical marijuana  
research. Details about research and MAPS at:

disciplines while continuing these practices on a long-term basis. This is the highest, most visionary, and most productive level. From whatever level you begin, the psychedelics will enhance, intensify, deepen, or broaden your experience, but they are working with the level of consciousness you provide them.

I have been using psychedelics for over 40 years productively and creatively. Of course, how I take them has changed over the years, otherwise it would be senseless repetition. Many people, especially youngsters, take them for a while, change from that experience a bit, and then turn away without discovering the staircase effect that is the practice of consciously choosing the highest level of existence possible at that time of your life, and launching your trip from that place. Even less known is that DMT, according to your readiness, will manifest on one of three levels: 1) the design and symbol level; 2) the messenger level; and 3) an ineffable level of total communion with the Mystery.

The saddest thing is to waste these potentials when experimenting with this truly great psychedelic. To hear of doctors dancing on government's strings for carrots of money, power and prestige, while cringing from whips of criticism and disenfranchisement, during the very act of turning someone on and polluting their trip with this nonsense, strikes me as the height of unconsciousness. If this is not appropriate behavior for a *curandero*, how is this acceptable for a doctor in a modern society?

The proof of the pudding is that STRASSMAN's subjects have formed a support group because they thought that they might be losing their minds! What they need is an entirely supportive environment and free access to more DMT so that they can create their own sacred space away from government agents and all of that paranoid and polluting programming that occurs in "authorized" settings.

Unauthorized settings are free settings. Authority is slavery. Only in a free and supportive environment of grace and love, aesthetic and compassionate caring, can this sacrament be used to attain the highest. The freedom to practice this fundamental religious use of DMT must be found again.

Once there was a time when we could gather together lovingly, and peacefully take sacraments together. Hardly anyone remembers that time now. The ambience of government terrorism against psychedelics produces a very different set and setting. I was a guide at the Millbrook LEAGUE FOR SPIRITUAL DISCOVERY. This was a legally-incorporated religion whose charter included the use of psychedelic sacraments. When one night the door was criminally kicked in by G. GORDON LIDDY (now convicted burglar of WATERGATE infamy), that changed forever. Overnight the quality of magic that we had created was invested with fear. Although nothing illegal had been found and psychedelics had not yet been scheduled, the reign of terror had begun. The Inquisition had arrived. It is flourishing even more now. The negative effects of the government-supported substances of alcohol, tobacco, and caffeine are more than a hundred times worse than all illegal drugs together. (If you consider *only* the psychedelics, empathogens, and herbs such as *Cannabis*, these government supported drugs are *thousands* of times more harmful.) Yet we are criminals, and soon we may go to federal prison for only talking or writing about scheduled plants and compounds!

The Bill of Rights is dead. No religious freedom. No free speech. No right of association. No right of assembly. The

people who call us “druggies” are the *true* criminals. Explorers of consciousness are persecuted, jailed, and vilified by the people in charge of this inquisition—hypocrites, who are rarely called “druggies,” despite their frequent addictions to alcohol, nicotine, and caffeine (some of the most consciousness *lowering* drugs known to man). These “drug warriors” fear expanded consciousness because it exposes the lies and perversions of their loveless and violent lives. In desperate acts of self-serving stupidity, they blame others for the very sins of which they would rid themselves. Although the consciousness explorers are the victims of this reign of terror, it has nothing to do with us. It is just the mindless raging of the beast. It is important to remain transparent and cloud-like in the face of this. This incredibly vast wash of lies and cruelty must be ignored. This is their battle with themselves. Do not be washed away in the waves of disinformation and lies. Stay centered. Know thyself. Stay with that thread of truth and love that you have discovered within; even though it fades in and out, it is your inner truth and the doorway to your own authority.

I am a “criminal.” I am a fugitive. I have been for 40 years. But I have been true to myself and my friends. It has been hard. But I have a vision. Someday, somewhere, I will estab-

lish the UNIVERSITY FOR PSYCHEDELIC STUDIES. There will be a department of psychedelic botany and chemistry. There will be a beautiful park and temple with lawns and ponds, peacocks, swans, and wildlife walking fearlessly. There will be pavilions for initiation. There will be a department of entheogenic worship. There will be a school of psychedelic medicine and curing. There will be acres of psychedelic herb gardens. There will be places to dance and places to meditate. There will be a school of yoga, tantra, and a “Mystery” school. A school for breathing, for art, music, for meditation, for ecological and planetary studies as well as applications. A school for love and one for beauty. There will be no government inspectors or police. They will not be necessary. There will be guides, friends, helpers, and lovers. On the new level of consciousness struggling to be born now, this will be how it is, for the old way of competition, murder, and exploitation is fast becoming an impossible situation. This planet must be lovingly cared for or we are all doomed. We are the guardians of life and planetary harmony. This is where we are going. That is what I have seen in my visions, and that is what I have been working for all of my life. That is what I will continue to do until my last breath.

Care to dance? ✧

# EVENTS CALENDAR

## THE ADVENTURE OF SELF-DISCOVERY APRIL 20–22, 2001

A Holotropic Breathwork™ experience, held by STANISLAV GROF, M.D. and TAV SPARKS, will be held Atlanta, Georgia. The workshop is a final opportunity to experience Holotropic Breathwork with its co-ordinator and teacher, STAN GROF, as this will be his last workshop before his retirement. Friday night's lecture, titled "The Healing Potential of Non-Ordinary States of Consciousness," is open to the public for a \$10.00 fee. The experiential weekend workshop, Saturday from 8:45 am until 8:00 pm (lunch included) and Sunday from 9:00 am until 12:30 pm, is \$295.00. Send payment to HOLOTROPICS, 38 Miller Avenue, PMB 158 (Dept. ER), Mill Valley, CA 94941. For more information contact GLENN WILSON at (520) 749-8884, or HoloGrof@aol.com.

## DRUG POLICIES FOR THE NEW MILLENNIUM MAY 30 — JUNE 2, 2001

THE LINDESMITH CENTER/DRUG POLICY FOUNDATION 2001 International Conference will be held Wednesday through Saturday, May 30 through June 2, 2001 at the HYATT REGENCY in Albuquerque. The 2001 Conference is the first of the recently merged LINDESMITH CENTER/DRUG POLICY FOUNDATION, and it seeks to mirror the exciting developments in the drug policy reform movement. Programs will feature dynamic speakers and cutting-edge themes. New Mexico Governor GARY JOHNSON and Salt Lake City Mayor ROCKY ANDERSON have already committed to speak.

You can expect sessions to address, among other things, drug reform legislative developments, heroin overdose, the emerging youth and student movement, Hispanic/Latino issues, international developments, syringe availability, drug education, pain treatment, hallucinogens and religious freedom, ecstasy, drug treatment, Mexico/Colombia, movement building, asset forfeiture reform, and various workshops that

will reflect all aspects of the drug reform movement. Please join us for what promises to be a landmark event in the effort to bring about more reasoned and compassionate drug policies.

For more information on registration and available scholarships, visit [www.drugpolicy.org/conference](http://www.drugpolicy.org/conference).

## CONSCIOUSNESS TECHNOLOGIES JULY 19–22, 2001

A conference in the exploration of various techniques for accessing and navigating novel states of consciousness; informative seminars, creative workshops, discussion groups, music by THE CRYSTAL AWARENESS PROJECT, and more. Presenters include DALE PENDELL, CLARK HEINRICK, PHILLIP FARBER, DJENABA, TODD ROETKEN, EILEEN KILGALLON, JOHNNY APPLESEED, and JIM RANSOM.

Cost of the experience is \$350.00, which includes all seminars, workshops, and events, on-site camping, and three meals a day. Meals begin with dinner on Thursday the 19th, and end with lunch on Sunday the 22nd. Please specify if you would like vegetarian meals when you register. The conference site is a short drive from Sisters, nestled in the Deschutes National Forest. If traveling by air, Redmond is the closest airport (30 minutes away), or choose Eugene as your destination to enjoy a beautiful drive over the Cascades. To register send \$350.00 in check or money order to: I-9 RESEARCH, POB 1506 (Dept. ER), Sisters, OR 97759. Registration packet will contain more detailed travel information and a map to the conference site. If you have any questions or need more information, call or e-mail RICHARD NELSON at (541) 420-7038, [I9rern@hotmail.com](mailto:I9rern@hotmail.com). Also check out our web site at [www.charm.net/~profpan/ct](http://www.charm.net/~profpan/ct).

## ASK DR. SHULGIN

<http://www.alchemind.org/shulgin>

A service of the ALCHEMIND SOCIETY's web page, ASK DR. SHULGIN is a brilliant idea. Anyone who wants to posit an inquiry to the world's most knowledgeable phenethylamine and tryptamine chemist and psychopharmacologist can do so on-line (although clearly, since only one question per week is answered, there will be many inquiries that don't get a response).

Stating that "the Government has abdicated its responsibility to provide unbiased and accurate drug education and is thereby increasing the individual and social harms that may be associated with drug use," the ALCHEMIND SOCIETY has unveiled a new on-line service aimed at providing real drug education. Following in the wake of such successful similar sites as ASK DR. WEIL ([www.drweil.com](http://www.drweil.com)) and ASK EROWID ([www.erowid.org/ask](http://www.erowid.org/ask)), ASK DR. SHULGIN first went on-line on February 2, 2001. All of the questions are being archived so that past questions can be perused by anyone interested. (Strangely, there is no direct link from the "current" question to the archives, and I would hope that they correct this oversight in the future.)

There are too few questions posted at the moment to *really* get a sense of where this is going, but unfortunately some of the questions chosen seemed to be of pretty low sophistication—the sort of stuff one might find on USENET—and the answers for which could easily be accessed in many places on the web. Surely Dr. SHULGIN could be put to better use than answering such queries as "Is MDMA the same as methamphetamine?" and "[...Is it true that LSD never leaves your body, and can stay in your brain for many years], and is this what causes the so called 'flashbacks?'" But even with these sorts of mind-numbing questions, Dr. SHULGIN's *answers* shine, showcasing his particularly enjoyable style of writing that combines garrulous meandering, hard fact, social criticism, current and historical drug lore, finished off with a dash of humor. As a series of short answers on a variety of topics,

this archive is sure to eventually grow into a body of work that will be fun to surf for minutes or hours. The focus of the questions presented is quite broad—indeed, some have suggested that it is so broad it holds little relevance to the primary goals promoted by the ALCHEMIND SOCIETY, since the questions themselves don't focus specifically on areas of cognitive liberty. Perhaps this is true, but who cares?! Although there aren't too many questions and responses posted as of yet, there were a couple more interesting bits about fairly obscure compounds such as para-methoxyamphetamine (PMA) and Parahexyl.

Clearly such a site holds a bounty of potential; indeed, I could see this project someday archived in bound form and sold as a book, similar to *Cannabis* guru ED ROSENTHAL'S book *Marijuana Question? Ask Ed*, which features excerpts from his *High Times* column. Kudos to the *Alchemind Society* and Dr. SHULGIN for coming together in such a fun and helpful way.

## HEURISTICON

POB 2974 (Dept. ER)

Livermore, CA 94551-2974

(925) 455-4384

HEURISTICON sells a variety of "pollen collection/cleaning" trays, as well as a "pollen mini-press." Although these devices are sold to be used for the production of various pollen-based "herbal hash" type products, they could also quite easily be used to produce "the real thing."

With that in mind, I passed the collection tray and mini-press along to a friend to test out (the same woman who reviewed the JIZZMO butane *Cannabis* extractor in the AUTUMNAL EQUINOX 2000 issue of *ER*), as I know that she tends to keep herself well-stocked. Here are her comments:

"I had obtained a fairly large quantity of *Cannabis* from a friend. Although this herb had started its life as a high-potency green bud, my friend neglected the plants and the buds dried 'on the plant,' due to lack of water. They were brown and way too dry, which is why my friend let me have a large quantity at a low price. However, smoking this stuff straight was pretty harsh, and I planned to extract it using the JIZZMO.

"After obtaining the collection tray and press, I decided that I would use this instead, to see how well they worked. Even

though I have been aware of these collection trays for years, I'd never actually used one or seen one used. I processed about 45 grams of the *Cannabis* (which had already been broken up through a loose-mesh pasta strainer). It took about an hour and a half to process the 45 grams; using the pollen collection tray is much more labor intensive than using the JIZZMO. However, the results are spectacular. Rather than producing an oil/taffy, as the JIZZMO does, the pollen collection tray produces a fine 'kif,' that looks like yellow powder. It was so fine, that I was tempted to snort a line of it, but I suspected that this wouldn't be the most effective or painless method of ingestion.

"I must digress to interject that *everyone* who enjoys *Cannabis* should pick up a handy, dandy RADIO SHACK Slide Microscope (Cat. No. 63-853). These illuminated 100X power scopes, with 8X magnifiers, cost about \$15.00, and until now my primary use for mine was to marvel at the trichome 'hairs' on buds (although the scope is also useful for removing small splinters or cactus thorns). Even schwag Mexican brown shows off a carpet of crystalline hairs under these devices.

"Now, when I 'scoped' the pollen produced after vigorously rubbing the 45 grams of herb on top of the screen, I expected to see tiny bits of green powder throughout, as I figured that some dried plant matter *had* to have made it through. However, there was absolutely *no* green powder, just a blanket of golden, translucent crystalline hairs and globs. Fantastic!

"When I was sharing some of this kif with a friend who came by, she pointed out that the underside of the screen had a *lot* of resin stuck to it. The instructions failed to mention that you must *also* scrape the bottom of the screen off (perhaps this should have been obvious). There was over 2.5 grams of kif to press when I was done. The press itself is beautifully simple; machined steel with a base that attaches via two hex bolts. A  $\frac{3}{8}$ " stainless steel rod is used to tamp down the pollen, and then you whack it with a hammer (while rotating the base between hits), to pound the pollen into a compressed plug of trichrome hash. (Here's a tip; mark one end of the rod with an indelible marker, and then always pound on this marked side; this way you won't risk eventually misshaping *both* ends of the rod, causing it not to fit in the press.) After removing the base, the plug is pushed out by tapping the steel rod until the plug is released. This was a bit hard to do, until I figured out to rest the press on a plastic baby bottle (at the top), so that there was some support on the sides of the press and somewhere for the plug to get pushed into. (This difficulty might be avoided if the press is warmed

slightly—a process explained in the instructions that also allows for pollen which is too dry to stick together better. Since the 'pollen' that I was using had no problem sticking together, I didn't attempt any heating.)

"After the whole process, I was left with a plug of yellow/tan hash, reminiscent of a wood pellet for a pellet-burning stove, or perhaps one of those alfalfa plugs used as rabbit food (but larger). Nearly an inch long, and  $\frac{3}{8}$ " in diameter, such a preparation is likely to store much better than loose kif, due to it having less opportunity to oxidize. (Still, this baby will be kept in a sealed glass container in the freezer.)

"I still plan to run the de-trichomed *Cannabis* material through the JIZZMO, as there should be another 2 grams or so of cannabinoids left in it that can be obtained through a butane extraction. However, from now on when I extract *Cannabis*, I will *always* use a pollen screen and press first, and the JIZZMO extractor second. There's nothing like seeing those beautiful golden trichomes!"

My friend was kind enough to share some of her kif with me, and it was quite tasty and mind-blowing. There are a variety of sizes and models of pollen collection trays offered by HEURISTICON, ranging in price from \$69.00 to \$139.00. The pollen mini-press is \$69.00. S&H for any sized order is \$10.00, and CA residents must add sales tax. They also sell an 8" X 10" stainless steel screen (with 117 micron mesh) by itself for \$15.00, postpaid, for those who want to make their own collection boxes. A larger ( $\frac{3}{8}$ " diameter and  $\frac{1}{2}$ " taller) pollen press should also be available soon.

**auto101536@hushmail.com**

A new wholesale entheobotanical company run by the founding owner of WILDFLOWERS OF HEAVEN, which also sells retail to individuals. There is a minimum order of \$20.00 on "sample" items, and \$75.00 if "bulk" items are included in the order. Their prices on sample items appear to be fairly comparable to those charged by other retailers, but their bulk prices are quite good, and a wholesale order that is too large for one individual could be split amongst friends. It can be a valuable thing to have access to a company that is selling larger quantities at lower prices. Contact them for a catalog.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled, or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

# A TWENTIETH-CENTURY SPRUCE

by JONATHAN OTT

I met RICHARD EVANS SCHULTES in Seattle late in 1973, when he lectured at the UNIVERSITY OF WASHINGTON. He packed full the largest auditorium available, and it was quite impossible to approach him afterwards, owing to the mob of admirers that instantly enveloped him when the applause had abated. As luck would have it, SCOTT CHILTON, a UW chemist with whom I was studying while a student at THE EVERGREEN STATE COLLEGE, wrangled an invitation to a dinner in his honor at the home of one of the botany professors, and invited me to tag along, which I eagerly did. Not surprisingly, the freshwater algologists and other sundry specialists in botanical arcana hadn't the slightest knowledge of SCHULTES' work, much less interest in it. Were I a misanthrope, I might conjecture there were some among them who resented the fact that SCHULTES' lecture had attracted more than 2000 students, when doubtless they had trouble getting 20 to sign up for their classes. In any case, they could hardly dismiss the Boston Brahman botanical superstar as a drug-addled hippie like me. It wasn't long before the small-talk stretched thinner than the botany department's budget, and SCOTT and I basically had SCHULTES to ourselves. Indeed, he straightaway apprised me with a mischievous twinkle in his eye that he hadn't much interest in trading taxonomic minutiae with his colleagues, astutely adjudging he could thereby hope for precious few nuggets of information useful to him, and was delighted to be able to speak with a student having some knowledge of his field. He told me he was a teacher first and foremost, and we passed a splendid evening, after which SCOTT and I dropped him off at his hotel. He invited me briefly up to his room to give me some reprints of recent articles, and before we parted, said I must come to Cambridge to use the excellent library of economic botany at the HARVARD BOTANICAL MUSEUM, of which he was then director. I had also asked him to write an introduction for my first book, which I was then writing as a student-project, which he generously did, and this contributed greatly to my finding a publisher for it

(*Hallucinogenic Plants of North America*, published in 1976; revised edition in 1979).

I visited him at the first opportunity, to wit, the following summer, having shouldered my backpack and hitchhiked across the full breadth of the country to my native New England (I'm nominally a Connecticut Yankee, but in fact have only lived in my home state for four years in total, which will be the grand total, whatever happens).

Ensnared in a cheap student-hostel in Cambridge, I spent about a week delving into the riches of the OAKES AMES LIBRARY OF ECONOMIC BOTANY, and SCHULTES took care to give me a personal tour of the museum, and to introduce me to his students and colleagues. One afternoon we were sitting in his air-conditioned office, which was a relief... in the corner there was a refrigerator-sized safe, rather like what one might see being blasted-open in a cheesy Western film. He explained that a research project on *coca* was underway, and in order to get the permit to import substantial amounts of *coca*-leaves, the DEA had insisted these be secured in

a safe in the director's office. To be sure, given the fact that SCHULTES had long since written that he had chewed *coca* every day for fourteen years during fieldwork in the Amazon, and had dismissed out-of-hand the notion that *coca* was an "addictive narcotic," this was rather like having the rabbit guard the lettuce... suffice to say that this was the first time I had the pleasure of sampling that particular delicacy. I also recall his large battle-scarred desk was strewn with numerous bags of what looked suspiciously like marijuana. Gesturing towards these, he jokingly explained, again with that mischievous twinkle in his eye which always defined him for me, that these were samples of "evidence" in diverse criminal cases in which he had become involved as expert witness. SCHULTES had earlier published an article advancing the "polytypic" concept of the genus *Cannabis*—that is, that

there were in fact three *Cannabis* species, and not one, as had been the botanical consensus, on which the anti-marijuana laws had been based. By testifying that it was impossible to specify whether the samples—in those days, of course, dry and crumbly “Mexican dirt-weed”—were in fact the illicit species *Cannabis sativa*—as opposed to *C. indica* or *C. ruderalis*—he was able to secure acquittals for some lucky defendants. This outraged some of his more conservative colleagues, one of whom famously declared in a more than snide scientific article, that “taxonomy must serve the needs of society” (to which SCHULTES penned a stalwart rejoinder)! This species of mischief was short-lived, and soon enough led to the “socially necessary” amendment of the statutes in question.

Suddenly, out of the blue, SCHULTES declared with enthusiasm: “you must meet GORDON WASSON!” In truth, this was beyond my wildest dreams, much as I wished it, and I had already entered into correspondence with WASSON... but hoping to meet him had seemed rather like shooting for the moon. Before I could recover from my surprised delight, SCHULTES had taken up the ‘phone and in a trice was speaking with WASSON. After exchanging a few pleasantries, he said simply: “there is a young man here you should meet,” and then passed me the ‘phone! WASSON invited me to dine at his home in Danbury a few days later (not far from Litchfield where my grandfather had had a cabin, an occasional vacation-idyll of my youth), and this was the start of a close relationship with WASSON, which was to last until his death in 1986.

In the spring of 1977 I visited SCHULTES in Cambridge for the third time, thankfully having been able to scrape together airfare, and I was staying with WASSON in Danbury. I had come to invite him to a conference I was then organizing in Port Townsend, Washington that fall, an invitation he immediately accepted. I also asked him whether he might be able to introduce me by ‘phone to ALBERT HOFMANN, to which he readily assented, and before I knew it I was speaking to the “father of LSD,” who, based on this gold-plated introduction, also graciously accepted my invitation, again inaugurating a close relationship that endures to this day. I spent memorable times with SCHULTES, WASSON and HOFMANN during the idyllic Port Townsend conference (Fort Worden, SECOND INTERNATIONAL CONFERENCE ON HALLUCINOGENIC MUSHROOMS, 27–30 October 1977), and I recall some people present were surprised when SCHULTES shared in one of the ubiquitous joints being passed ‘round, but I was not among them (to be surprised, that is; of course

I joined in). We also enjoyed a delightful reunion the following year at another conference I later organized, HALLUCINOGENS IN NATIVE AMERICAN SHAMANISM AND MODERN LIFE (JAPAN CENTER THEATRE, San Francisco, 28 September–1 October 1978, which featured the greatest cast of visionary characters ever assembled in one place).

I again visited SCHULTES in Cambridge in spring of 1981, when I was researching my chocolate-book (*The Cacahuatl Eater: Ruminations of an Unabashed Chocolate Addict*, 1985), after which a lucky coincidence took place. It happened that in the summer of 1981, my field-trip to México to further that research coincided with some big-wig governmental conference to which both SCHULTES and HOFMANN were invited. Of course I attended (and there met ALLEN GINSBERG for the first and only time), and one humorous incident stands out from our time together in México City. The wife of then-President JOSÉ LÓPEZ-PORTILLO (he who had been taken by Mexicans to be a master at dipping into the till, ‘til shamed as a rank amateur by CARLOS SALINAS DE GORTARI), a notorious bohemian (and spendthrift) had taken quite a shine to GINSBERG, who was being chauffeured around in a presidential limousine. Be that as it may, one night we were all GINSBERG’s (read: the long-suffering Mexican taxpayers’) guests at a posh eatery in Polanco, which featured not one, but *two* bleating and brassy *Mariachi* bands. Now, the place was rather large, but few restaurants are large enough for *one* *Mariachi* band, much less a brace of them blaring away at full-volume (naturally enough, in true Mexican style, playing simultaneously, but *not* the same score). Regrettably, we were stationed at an immense table (there must have been more than 20 in the party) more or less in the midst of this bugley battle of the bands, and in truth ‘twas a cacophonous din little short of painful. This was the only time I ever saw SCHULTES lose his cool—he became progressively more and more irritated by ever more thunderous trumpeting as the bands endeavored to drown one another out. Finally, he seemed thoroughly disgusted, could hardly speak of anything else, cursed them roundly, and we were all relieved to get the hell out of the joint, although I confess the food was superb.

Shortly after our *Mariachi* martyrdom, I found myself with SCHULTES and HOFMANN, rather delightfully ensconced in a mercifully quiet and lovely colonial hotel in the center of Oaxaca City, and one morning SCHULTES led us on a tour of the magnificent herb-section of the Oaxaca marketplace. Inasmuch as I was “working” on the chocolate-book, he wished to initiate me into the mysteries of *Quararibea funebris*, an important chocolate- and tobacco-additive on which he had

written a pioneering paper nearly three decades before (and which I had already collected for WASSON many years prior to this). I recall him scouring the numerous stands for the dried flowers, which were nowhere in sight. Abruptly, ALBERT and I were astonished when SCHULTES was able to sniff them out—he had detected their distinctive scent, and with a little rummaging at length found a tiny basket of them well buried under many other herbs, which he held-up triumphantly! This was an important lesson for me, and ever since it has been my habit to first apply my nose to 'most any botanical specimen I encounter. The following morning we all went to the nearby village of San Andrés Huayapan, where many of the families subsist on the proceeds garnered from selling the flowers of a single, massive specimen of this bombacaceous tree (the dried flowers are worth more than processed Macadamia nuts). Curiously, the tree appears to be all but extinct in the wild in México, but has survived in a sort of dusty *refugium* in the arid Valle de Oaxaca, quite distinct from its tropical-montane rain forest habitat. Indeed, some six or seven years ago I returned to San Andrés Huayapan and collected about 200 seeds, half of which I was able to germinate, and the reforestation of part of the

habitat of *Q. funebris*, the vicinity of Xalapa, is well under way. SCHULTES gave me an impromptu botany lesson under a magnificent flowering specimen in bucolic San Andrés, and that night, with fresh specimens we had collected that day and under the watchful eyes of my mentors, I conducted a bioassay with a massive dose of the fresh flowers, which elicited barely noticeable effects, although I have since experienced mild psychoactivity from smoking them.

The last time I saw SCHULTES was on Maui, Hawai'i, when he participated as honored speaker at the BOTANICAL PRESERVATION CORPS' PLANTS OF THE GODS (from the title of the popular book by SCHULTES and HOFMANN) seminar at Camp Keanæ, 1–6 August 1993. During the event, SCHULTES was eager to enlist me in a project he had initiated, an English translation of the second book (by a matter of a month or two) written on psychoactive plants, ERNST FREIHERR VON BIBRA'S 1855 *Die Narkotischen Genussmittel und der Mensch*—he wished me to check and edit the rough translation, which I of course readily assented to. This was scientifically-rewarding, and in the end I updated the book with extensive notes and a bibliography (*Plant Intoxicants*, HEALING ARTS PRESS,

Photo by PATRICIA NEELY

1995). I was indirectly involved with SCHULTES in another similar project. He had once told me there were only two copies in the United States of MORDECAI CUBITT COOKE'S 1860 *the Seven Sisters of Sleep*, and had been astonished when I told him I'd read one of them, that *had been sent via post on interlibrary loan* from the NATIONAL LIBRARY OF MEDICINE (I dutifully returned it, of course). When a copy came on the market early in the 1980s, I purchased it for \$500, even though that was an extravagance for me then (and remains one of the most expensive books I've ever bought). SCHULTES so coveted this for the OAKES AMES LIBRARY, that a few years later, when thankfully I could do with a tax write-off, I donated it to HARVARD. From this copy SCHULTES later had a facsimile published (QUARTERMAN PUBLICATIONS, 1989), so making this classic available to a wider public (I have only once seen another copy for sale, in 1994, for \$1000, but am content with the facsimile—when I learned of it, I explained the circumstances to the publisher, and declared I thought \$500 had been enough to spend on one book, and they graciously sent me a complimentary copy!). When cleaning-up after the seminar, I found a dirty sheet of yellow notebook-paper with some technical terms in SCHULTES' fine hand, which of course I preserved.

It had been my hope that we could honor SCHULTES in person at the ENTHEOBOTANY conference in San Francisco in 1996 (PALACE OF FINE ARTS THEATRE, 18–20 October), but, alas, this was not to be. Although he had accepted my invitation, his tragic illness supervened and he was unable to attend. Nevertheless, several of us honored his immense contribution to our field, and one of his best-known students, E. WADE DAVIS, then on tour to promote his biography of SCHULTES and another of his famous students, the late TIMOTHY C. PLOWMAN (*One River*, SIMON & SCHUSTER, 1996), closed the conference with an eloquent and moving tribute to his revered teacher. I am not a botanist and my relationship with SCHULTES was more collegial and friendly than master-disciple. Nevertheless, he has had a profound impact on my life and career, and I dedicated my 1997 *Pharmacophilia* to him, and have always acknowledged him in my books, and will continue to do so. It remains true, as I wrote in 1993 in *Pharmacotheon*, that “one cannot take one's first steps in the study of any aspect of entheogenic plant science, without first becoming familiar with Prof. Schultes' contributions.” To paraphrase a hoary maxim of science, RICHARD EVANS SCHULTES was a great giant, on whose kind and firm shoulders I have been privileged to stand... and as long as I live...I shall ever cherish and honor his memory...

# IN DEFENSE OF RICK STRASSMAN

by ISTARA

I am a reader of *The Entheogen Review*, a social worker, and a fledgling psychonaut. I am writing in response to the article “Moving in the Sacred World of DMT,” which appeared in the VERNAL EQUINOX 2001 issue of *ER*.

First and foremost, I would like to acknowledge that the views of someone who has “...been making, using, and initiating people into DMT use for around 40 years” are certainly valid and worthy of respect. As I explore the realm of psychedelics, I find continuing admiration for the forerunners of this movement. I enjoy the fact that at this point, there is more than one generation of brave individuals who actively seek out novel states of consciousness. My predecessors have written articles and books that have informed me well on one of the most important aspects of my life, and for that I am extremely grateful.

Despite this, it is my opinion that ∞AYES, in his article, was unfairly harsh about the important work done by Dr. RICK STRASSMAN. I understand the viewpoint of someone who regards DMT as a sacred material (hence the term “entheogen”) and therefore inappropriate for use in such a cold setting as a hospital. I understand why the source of funding and support for Dr. STRASSMAN’S research would come under some suspicion as well—certainly large governmental institutions have not been friends to the psychedelic movement.

I appreciate more, however, the viewpoint of someone who was simply trying to bring to light information about the beneficial properties of psychedelics. In my profession, I often have insight into how psychedelics could be helpful to the people that I serve. In the introduction of *The Spirit Molecule*, Dr. STRASSMAN states that his research “generated a wealth of biological and psychological data, much of which [had been] published... (p. xvi, *DMT: The Spirit Molecule*).” The purpose of research is to generate information to justify services and to potentiate new ideas. Imagine if enough people were as brave as Dr. STRASSMAN as to take on the medical model establishment in order to justify using entheogens as a powerful healing tool. Perhaps we would someday be able to see at least some limited use of psychedelics for the benefit of humankind. (Or perhaps I’m

just dreaming.) ∞AYES made a reference in his article about a Mafia hit man in prison who used DMT and stated: “That’s the first time I’ve gone to church in 30 years.” What if entheogen research engendered some psychological interventions for violent offenders that were genuinely reformative? (Okay, now I’m *really* dreaming!) I’m aware of the fact that there are many extenuating circumstances in the prison system and society which make this unlikely. The point I’m trying to make is that truthful information about the benefits of consciousness-raising substances could be advantageous on many levels.

∞AYES stated several times in his article that he felt that Dr. STRASSMAN had not given enough attention to the matter of set and setting. On the contrary, it seemed to me that the good doctor was painfully aware of the matter of set and setting. In fact, Part III of his book was entitled “Set, Setting, and DMT.” Dr. STRASSMAN was careful in picking out his volunteers; he specifically chose people who had some experience with psychedelics, and seemed to show a great deal of concern for their welfare during the sessions. He was clear in *The Spirit Molecule* that he was not fond of the setting, but the fact was, he was constrained by the system in which he was working. I also disagree with ∞AYES’ statement that Dr. STRASSMAN failed to notice “the crucial effect that the presence of he and his crew” had upon the volunteers. Again, it seemed to me that he and his crew made every attempt to be helpful and supportive of the volunteers. ∞AYES criticized Dr. STRASSMAN for deciding to “act as if the worlds visited and the inhabitants with whom they interacted were real,” so that he can show more “empathy... for the volunteers.” He stated that this did not allow for genuine empathy to occur. I know from my own experiences, limited though they may be, that sometimes when you are assisting someone who is on a psychonautic journey, that you don’t always know or understand where they have been, even if you yourself have taken that substance many times. The best thing I can think of to do in such situations is to listen and support. It seems to me that is what Dr. STRASSMAN and his colleagues did.

The volunteers’ experiences described in *The Spirit Molecule* were of three major categories: personal, invisible, and transpersonal. The transpersonal experiences seemed to be

the most transcendent, the “level three” state, “where there is no light, no design, just the voice of God using your soul as a silent tuning fork.” The personal experiences offered some awareness of the user’s psychology and, in and of themselves, seemed to offer powerful insights and revelations. The excerpt of *The Spirit Molecule* that appeared in *The Entheogen Review* illustrated the “invisible” category of experience—most of them involved alien encounters—and were the focus of ∞AYES’ review. These sessions were compared unfavorably with ∞AYES’ own DMT experiences, one of which was described in his article.

While I am sure that the setting of the DMT trip described by ∞AYES directly affected the nature of his “love raga” experience, the set (or mindset), of the “tripper” must have also been an influence. Note that ∞AYES was listening to SHARAN RANI playing a love raga for the trip. Clearly the music and/or the subject’s preference for that music indicate a leaning towards that mythology and culture. The stuff of myth and the collective unconscious will evolve for as long as there is an unconscious. The alien abduction experience has been described as a spiritual one, and the alien as a proliferating image has been likened to the re-emergence of the Green Man—a potent mythological image found in pagan/neo-pagan culture and mythology. I myself have had an “alien encounter” in the midst of a *Salvia divinorum* meditation. I observed the landing of a space-ship straight out of *Close Encounters of the Third Kind*, and aliens emerged, streaming out of a portal that opened onto the earth. At first, I shunned the image (preferring the Green Man). Then, one of them looked directly at me and asked, “Would you like me better if I looked like this?” Presto! My alien friend grew long blond hair and a set of pointed ears, transforming into a kind of

alien elf. I had to laugh. Perhaps the “invisible” experiences described in *The Spirit Molecule* were affected by “an exterior organized program controlling the way in which the substance is administered”—a.k.a. Dr. STRASSMAN and his colleagues. Still, it’s hard to know exactly what lies beneath our skulls and in the depth of our souls. I therefore think that it is a mistake to marginalize the alien encounters described in “Through the Veil” as a “rerun of the *X-Files*.”

I understand ∞AYES’ preference of considering the DMT experience from a subjective viewpoint finding an appreciation therein of the substance as a sacrament. However, by objectively categorizing his volunteers’ subjective experiences, Dr. STRASSMAN creates a greater understanding of the mind and our intimate connection to the sacred. ∞AYES suggests that “the most profound way to use psychedelics is to create ideal, healthy, high energy environments with people who are in top form.” I agree that this is probably correct. I do not however, think that this is the *only* useful way to use psychedelics. If it is true when the author suggests that objectivity can be used for the “materialistic goals and intellectual pursuits in the world of practical life applications—for communication and social survival,” then I say bravo! If psychedelics have affirmed anything for me, it is that this material world is our sacred vehicle. This being the case, I believe that we are in a major pickle, and we could truly use better tools for communication and social survival.

Dr. STRASSMAN had good intentions as a scientist performing studies of the mystical experience. He was not an agent from the CIA. Perhaps the road to hell is paved with good intentions, but to me, Dr. STRASSMAN represents someone who is trying to create change from inside of the system. Recently, at the MIND STATES II conference, ANN SHULGIN encouraged listeners to become involved politically in the interest of creating a saner, more tolerant world. I happen view the introduction of information about a powerful psychedelic into the mainstream scientific community as a profoundly political act, similar to the way that the introduction of women into more male designated places in the work environment was the political strategy of the liberal feminist movement. Dr. STRASSMAN did his important work in the face of a great deal of scrutiny from his colleagues. He even received admonishments from his religious community who disputed his contention that the DMT experience was in any way connected with the mystical experience. It is my hope that Dr. STRASSMAN can find support in the entheogen community, who understands well the synonymous nature of the psychedelic and mystical experience. ☉

Yage.Net specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers. We’re also home to the largest collection of ayahuasca resources on the web. ▼ Hosting for ethnobotanical web sites. ▼ Web site development and design. ▼ On-line shopping cart solutions

# JUST A WEE BIT MORE ABOUT DMT

by ∞AYES

After the first article by ∞Ayes, titled "Moving Into the Sacred World of DMT," which appeared in the Vernal Equinox 2001 issue of *The Entheogen Review*, we were deluged with people writing in regarding this piece. Primarily, the response was resoundingly positive; clearly this piece deeply touched many of our subscribers. But there was some small amount of contention too. A few people felt as though the piece was overly or even unfairly critical of the work that Dr. Rick Strassman did, which formed the basis of his book *DMT: The Spirit Molecule*. (See page 49 for one such letter.)

∞Ayes was inspired to write his piece after reading a chapter from Dr. Strassman's book that appeared in the Autumnal Equinox 2000 issue of *ER*. He was compelled to share his alternate approach to working with DMT due to a feeling that Strassman's non-mystical, intellectual viewpoint on DMT was "subsuming the whole by the parts." Similarly, it can be said that it is unfair to judge a whole book by reading a single chapter. Now that we, the editors of *ER*, have had a chance to read Strassman's entire book—it is clear that Strassman and ∞Ayes actually see the problems and potentials of DMT in a fairly similar light. Although it was the excerpt that inspired ∞Ayes to write, it should be made clear that his piece was not intended specifically as a review or critique of Dr. Strassman's work or book, but rather of the entire process of "authorized" investigations.

And yet, it is undoubtedly a good thing that such sorts of investigations occur. Dr. Strassman is to be commended for his work, especially considering the difficult hurdles to such work that the government forces one to traverse. Dr. Strassman took greater pains than any previous worker to try and create safe and supportive environments and work in an entirely ethical manner within the constraints he had to follow. Discovering the basic physiological reactions to any drug is important, as it allows users to make intelligent choices about what they consume. (Strassman's work indicates that folks with high blood-pressure may want to stay away from DMT.) While the "authorized" setting certainly may not be the most conducive to a spiritual experience, the information gained from such experiments is still quite valuable. Both approaches are necessary for a holistic viewpoint.

— David Aardvark & K. Trout

Consciousness is very flexible. Like a gas, it will fill any container in the form of that container. It is as ubiquitous as the universe, subsuming and interweaving with the fabric of nothingness, matter, and energy. This fabric is a naturally evolving pattern out of which we and the cosmos are woven. This for me is the level on which DMT functions. We can focus on any part of this pattern, minuscule or cosmic, depending on our orientation, environment, expectations, fears, and if we are dedicated to having a transcendent vision, our intention.

By and large, it strikes me that *intention* is the basic formative influence on the type of vision one will experience on DMT. Of all the psychedelics, DMT might be the most visionary one. I have many reasons for this declaration: DMT is produced by the body; it is found in hundreds of different plants and animals all over the planet; its tryptamine structure is woven into numerous important psychedelics (psilocybin/psilocin, LSD, ibogaine, the β-carbolines, *etc.*); and it is one of the most purifying and curing of the psychedelics. It is also very close in structure to serotonin, possibly the most important nerve impulse facilitator. This is not to say that mescaline, LSD, psilocybin, *et al.*, are not important; it just strikes me that DMT is the touchstone of the psychedelics. The body and consciousness recognize DMT and work with it almost instantaneously. The visions it produces are here and gone in a matter of minutes by clock time, but by our existential clock, time has been transformed—by the concentrated and incredible fullness of the experience—into eons. All this and only 15 minutes have passed? Wow!

We create our reality. We are all individually responsible to ourselves for the reality we create, whether we are miserable or joyous, this is our choice—our design. We are not alone; we exist as an integral part of all life, breathing, pulsating, vibrating, giving off plant food, absorbing animal food, in a multi-level fabric of incredibly beautiful designs and patterns. This is what DMT shows us—those patterns, as much as we can absorb at one time—to realign us to the sacred design of which we are a part. DMT works with the energy that surrounds and enters you. If you are an artist, you are likely to see an array of color and design that will fascinate and delight you. If you are a psychiatrist, you may interpret what is happening according to the psychological fashions or, perhaps, as a model of psychosis. Demons, doctors, elves, guardians, magicians, guides and Gods are the manner in which we sometimes manifest this paradigm-revealing substance. Is it we who are choosing the manifestation, or the DMT? Where do these creatures come from? Why do we see them? To what good effect can we put these visions? These are a few of the questions that I needed to answer for myself during the 40 years in which I made and used DMT. From the first time I made it and took it, I knew I had discovered something so deep, so magnificent, so profound, that it blew away everything I had ever experienced before. Period.

I have taken DMT thousands of times. I never had two trips that were the same. Mostly I had good trips—only a few were unpleasant. But I figured out why; it was always a mistake in preparation, set, or setting. I began to investigate and plan how to best use this divine sacrament to find my place in the Grand Design. The best trips always seemed to come when I was in the best place. If I had used *Cannabis*, alcohol, or amphetamine in the day preceding a DMT journey, I usually had the more unpleasant type of trip. Once after an intramuscular injection of 60 mg of DMT, following a bit of *Cannabis* use, overeating junk food, and an inappropriate setting, I had a stressful period building up to the trip's peak.

It put me right into a field of pretty cartoon flowers, with little faces waving their petals and leaves in unison, singing together, "You know that this is not the way to use DMT." I looked up and saw the monolith from *2001* hovering above me, massive and dark; then instantly it came crashing down on me again and again, beating me down and spasming my whole body with cramps. I crawled to the toilet to puke huge amounts of vomit. The toilet bowl was crawling with mysterious interlocking hieroglyphs that seemed to be the keys to the universe. This was a clear message to enter into the DMT space with my system clean and no hectic social scene going on around me.

Another time I had been travelling in México, and wound up on a deserted beach in Zihuatanejo, leaning against a huge rock. I was tired, and I had just had a fight with my wife. I went for a walk and sat down against this rock at the end of the beach to smoke some DMT. It was a dark night, and a distant street light cast a wan light over the sand, as soft sounds of the jungle surrounded me. I lit up my DMT pipe and took 3 or 4 tokes. Suddenly, I shot upwards and was at an upscale cocktail party. The colors were rich and enchantingly beautiful. The men were very big and handsome, dressed in well-cut suits. The women were gorgeous in gowns and cocktail dresses. They were gathered in groups of 4 or 5, discussing very arcane, deep, and interesting topics. I couldn't quite hear and my head barely reached up to their shoulders. I felt like a juvenile trying to crash an adult party. I was standing on my tip-toes, looking into one of these groups, trying to hear, when an intelligent-looking large fellow in a light grey suit turned to look at me. He regarded me with a benign expression of friendly sympathy and said, "You know you are too tired to be here." With a wave of his hand, he threw a lightning bolt at my feet. There was a flash of light, an explosion under me, and I was falling into a black void at whose depth I settled slowly, finding myself seated

cross-legged on the beach with the pipe in my hands. I was clear. I was completely unintoxicated, as though I had not smoked any DMT. I understood one of the many lessons that these guardians were to teach me over the years about the proper and most enlightened way to use the sacrament. Who are these creatures? Where do they come from? I don't know, but I have my ideas.

What is most important is that I recognize that I have touched a really beautiful place, the source of all creation and healing, and that the projections I see are beneficent beings spun out of consciousness—as everything is, but just on a higher plane of realization. On this plane, there is no "other," no subjective/objective—no duality at all; just convenient structures for teaching ourselves those sacred lessons that we have known, but forgotten. These guardians are a reminder of this knowledge, whose pattern is that of which we are also composed.

Perhaps you are finding this a little hard to follow, but at the same time it seems like common sense? I feel the same way. But some things just have to remain mysteries—we cannot analyze and dissect everything. At some point we have to put it back together. HUMPTY-DUMPTY wants to be whole again. When we constantly pull everything apart trying to see how it works, we may end up with only an understanding of how to destroy something. We can have piles of spokes, rims and axles, but the beauty only happens when we see the wheel rolling. The guardians are our inner Gods, teaching us from the well-springs of unity. That's my conclusion anyway. I have learned to listen to them and come to them clean and pure, and let the nectar of their approval bless my soul. This is what I have found with DMT through the experiences of myself and those of fellow psychonauts, in environments of support and love. The environment makes a big difference, as it does with all psychedelics.

DMT is the weaver. Whatever you give DMT, it weaves this into patterns. If you are a doctor sitting in a hospital room filled with people watching a "subject" and injecting said subject with DMT while people are acting out their roles of nurse, doctor, researcher, government representative, *etc.*, and your subjects have little alien robots, insects, reptiles or what have you, crawling all over them, probing and examining, is this *really* so strange? You are just seeing a DMT woven projection of the very environment you have created. What would happen if you changed the environment?

Suppose now, that instead of a hospital room with beepers and weird electromagnetic currents in the subliminal environment and medical personnel with odd motivations and curiosities, you were in a beautiful wooden house in the woods with a stream outside making gurgling and tinkling sounds. Inside there are friends in casual clothing—soft, tastefully-colored robes. Men and women dressed for a celebration, seated on velvet cushions on oriental carpets with candles and flowers, and beautiful music. Flowers in vases, mandalas, and wondrous paintings on the walls, aesthetically lit by natural and traditional lights, not fluorescents. A fire glowing in the hearth, multicolored fish swimming in an aquarium. Before you is a teacher who has decades of personal DMT experiences who is serving as your travel facilitator. You've prepared for days with yoga, meditation, and pure food. What kinds of trips do you think happen in this type of environment?

Instead of reptiles, aliens, and robot doctors, you have Gods, magicians, celestial and magical beings—intimating, winking, indicating, and even speaking to your inner being with lessons of love, healing, inspiration, and creation. You enter into the temple of the source of creation. Everything is enconced with magical, crystalline beauty. Your heart and mind fuse in loving understanding that heals the rifts in your heart. Tears of gratitude stream down your face, joy lights in your being. Everyone around you understands your bliss—you don't need a support group of fellow "subjects," so that you won't think that you are losing your mind. Perhaps this is the difference between unauthorized research and "authorized" research. What I wonder about is, what authority has the nerve to dictate to God? But before I get lost in a rant...

There is no danger of descending into some communal psychosis. We are already there! (Obviously, in case you hadn't noticed.)

Below the surface levels of subliminal advertising and purposeful disinformation, we can move toward truth. Below the level of our contradictory morals and values, and the walled labyrinths in our minds that keep them from explosive collision, we can move deeper towards the truth. Below our myths, below our method of splintered and fragmented communication called language, we can move still deeper towards truth. Below our culture and the conditioning embedded in our minds and egos, we can move deeper toward truth. Passing beyond all this, we penetrate the limits of perception and ride on the electric-energy-impulse highways at the center of our hard-wired biological construction; mov-

ing further towards truth, until we move past even this, and find ourselves joining ourselves in the cosmic hard-drive.

We have arrived at truth, and now we find truth is a mystery—a play of joy, creation, and energy. This is *Source*. This is the mystic touchstone that heals and renews. This is the beginning again. *This* is entheogenic.

Once I was chatting with JONATHAN OTT when I had dropped in on an ENTHEOBOTANY conference at Palenque. At the time I had been underground for about 30 years, and a fugitive for about 20. No one knew who I was. We were discussing sacraments, and I used the word "psychedelic." JONATHAN responded, "*We* prefer to use the word *entheogen*." I replied, "When it is used sacramentally, *then* it is an entheogen. Until then, it is just a psychedelic, or perhaps only just a drug."

*Intention* is everything. The more care and love and consciousness that you put into your preparation, the better the results, of course. But, if you knew completely what to do before the experience, you might not even need the experience. So this is an adventure into the unknown, an experiment or series of explorations in which there is a great deal of trial and error. We are moving into our own unique inner terrain, and it is difficult to find a set of instructions that will fit everyone perfectly. This is your uniqueness, your inner journey, your own quest for truth or answers that you have hidden away inside you. Everyone has those answers inside, but only those truly seeking self realization will have the courage to go beyond the veils to the center. Having made this journey many times, and mostly failing and wasting a lot of time, I would like to relate what I have found in the hope that this will help others to access the cosmic hard-drive and find some answers.

We live in a maze of conditioned responses and conflicting directives, our programmed biocomputer functions to produce a distracting nonstop wash of unconscious noise. Waves of voices, fears, thoughts, plans, ambitions, *etc.*, wash over us constantly. We follow these directives of our mind like robots. We don't think; we are *thought* by our minds. We are in a swamp of impulses and thoughts that never let us rest, and prevent self-realization (whatever that is).

This quest then, is about re-emerging from the swamp of forgetfulness and distraction in which we live, and being reborn in consciousness. Here there are no landmarks, no limits, no boundaries, no road signs. We progress in this nether landscape, this cosmic interiority, by accessing intuition, by

observing carefully all that happens, and by following penetrating vision. And above all, by following the heart. Intently, we listen for the single true voice that sings out from a unified heart and mind, beyond the infernal chorus of conditioned commands and conflicting directives. Let me backtrack a bit now.

Having set up one's space as aesthetically as possible (eliminating the possibility of any interruptions), one readies one's self for a DMT trip. Having followed the previous indications of peaceful set and setting, sensible diet, and totally supportive companions, one sits down and ingests the DMT. Here is what I have found: *DMT can be used to find answers.*

You can enter into the trip with a strong desire to find an answer to something that is bothering you, something you need to know, either in your practical life or to find a direction or vision to carry you forward on your spiritual quest. You can draw answers from the Akashic record in this DMT space. However, there are some problems and difficulties that have to be overcome. Let us consider some of these.

The contradictory programming and natural impulses that course through us are not just ideas. We are a unity, and the body, the heart, and the mind are all together on the most basic level. If there are any contradictions in you, it will manifest physically, emotionally, and mentally. You will be a little sick from this. Most disease is psychosomatic. This means that faulty programming manifests itself in sickness. This can happen by being in the wrong place at the wrong time, or by eating incorrectly, or being unmotivated to properly exercise and care for your body. This can cause an effect on your immune system (which normally protects you from invasion of foreign organisms).

DMT is a healer. It is a curing drug. DMT purifies your systems by quickly eliminating the toxins that have built up from unconscious living. If your gut is filled with junk food, you may spend your trip vomiting. DMT will clean you out. If you are coming down from too much smoking, drinking, eating, drugs, *etc.*, you may have to go through some unpleasantness, as DMT cleans your house with awesome efficiency. Even having mental conflicts and worries will produce toxins that need to be cleaned out. This can take some time, and since DMT is of fairly short duration, you may be down by the time this is over. So DMT can be used for curing and it can be used for getting answers. If you want the big answers, then you do not want to waste your DMT trips on junk food habits or whatever negative conditioning you want to

escape from. I have found that pretreatment with LSD and subsequent ingestion of DMT works very well in this regard and produces an impressive *synergistic* effect. For example, 200 ug of LSD followed by 60 mg DMT HCl or 80 mg DMT fumarate IM in the tenth hour works very well. Or simply smoke the DMT base until you disappear. No *Cannabis*.

All of the psychedelics are curing and purifying agents. What happens with this combination is that by the time you reach the tenth hour of an LSD trip, most of the pushing through the envelope and inner cleansing has happened. LSD is not as acutely dramatic as DMT is. It lasts so long though, that the inner cleansing can happen. When this stage is reached, then you can approach the DMT experience more efficiently and access deeper levels of understanding and realization without wasting valuable DMT clock time on gross clean-outs. IM injection need not be the only route; smoking the DMT can work quite well also. Three or four good tokes will usually do the trick. If you do it in the eighth or tenth hour of your acid trip, you can move right into the DMT levels as I have experienced them. My experience has shown me three distinct levels. The first level is the region of incredible design. Multi-colored grids flexing and slowly twisting, carnivals of colorful patterns, and little people peering through fences; hieroglyphs of arcane and hauntingly familiar aspects, but not quite decipherable. Floating spheres of lambent iridescence descending through diaphanous veils of woven infinity and passing away leaving a poignant feeling of missing, of not quite understanding, and aching to find the meaning behind it all. Although something is definitely indicating a deeper level, this region is incredibly beautiful and worth the trip just for this.

For a variety of reasons, probably youth, psychological readiness, and spiritual naïveté, I stayed on the level described above for hundreds of trips. Part of it was probably that there was no one who could teach me how to use this sacrament or had any idea how deep you could go with it. I had to blaze my own trails through my jungles of ignorance, conflict, and confusion. There was much I was not ready to accept, especially about myself. So I had to let DMT seduce me along the path of the vision quest, through beauty and mystery, until my rigid psychological structures and boundaries had relaxed enough and I had gathered enough courage to look beyond the veils of these incredible designs.

At some point I had gotten sated with all of these beautiful patterns and designs, and I understood that there was a much deeper level of knowledge that I could access. I had also

gathered my courage and was ready to look at myself in a deeper way and see how *I* was the only obstacle in my path. I became aware that self-realization meant going deeper, and all I had to do was give up this exquisite layer of beauty. I began to realize that these beautiful patterns and designs were disguises that protected my limited mind from seeing a deeper reality that would be disturbing until I had reached a stage of readiness. Of course, this understanding cued the arrival of that stage of readiness. I began to realize that all the designs were symbols of psychological states that were in this form because I didn't want to see that truth about myself yet.

Inside I said, "Let all these pretty baubles be gone, and let me see beyond," and immediately the beyond opened as the pretty designs disappeared. Suddenly, I was walking up a steep road carved into the side of a sheer, jagged wall of grey rock. On my right was the mountain, on my left a cliff that dropped straight down into a huge canyon whose other side was a range of these jagged mountains. I was hiking up this steep mountain to a higher place of knowledge. I had penetrated the veil of superficial distractions of the lower mind, and I was approaching the region of the higher mind—a land of magic and realization. As I trudged along this road I saw a gate—a huge ornate rusty portcullis beside which stood a small but very nasty looking beast with piercing red eyes, no

neck, large fangs, and an obviously very bad temper. This demon or demigod was without doubt the guardian to the gate of higher knowledge. Humbly, I begged permission, "May I please pass?" The guardian choked and snarled, then fixing me with a penetrating stare, nodded unpleasantly while he hauled laboriously on a chain that slowly lifted the gate. As I passed through, everything faded away and I was back sitting with the pipe in my hand. I was totally disappointed that I had gotten through the gate but had not made it to the magic land just beyond.

In my ignorance I did not realize that I had passed from level one to level two, and the gatekeeper was my initiation. This was the first of many encounters with various teachers who were all symbolic representations of an immanent state of realization of a higher order of understanding and interpretation.

Another time, I smoked and found myself in a beautiful wood-paneled and crystal-windowed room with easy chairs and couches all around. Next to me was an incredibly beautiful white-haired old woman crocheting doilies. The designs on the doilies were all symbols of the world's religions. I looked at her and said (without speaking), "Where is this place? What are we doing here?" It seemed like a very beautiful waiting room. She peered at me over her spectacles with

her piercing blue eyes, and smiled at me kindly, patiently, while she indicated with a flicker. Suddenly it dawned on me—I was in God’s waiting room! All I had to do was wait to be called, and I could step through the door.

The beings and creatures I’ve seen have been curious and various, but they have never looked like anyone I’ve ever seen, nor any mythical creature from history. Nor did I ever feel that these creatures were extra-terrestrial. Although they were totally original and amazing, never did I feel that they were strangers. I recognized them immediately. They had a bizarre but faintly and curiously familiar feeling to them. I think that this is significant, in that the lesson is one of personal responsibility. These are our creatures created by the infinitely capable creative force to teach us about ourselves. They are mirrors that help us to do the difficult job of looking at ourselves, and remembering who we are. In the overworld and underworld of shamanic journeying to the beat of the shaman’s horse—the drum—we also experience passageways, guardians, and guides. The denizens of *these* netherworlds, although symbolic, do not resemble those of the DMT worlds—they differ. This mind we wear has infinite creative abilities.

Getting back to the ascent from level one DMT experiences to level two for a moment, I remember coming down from that trip thinking, “Boy, that was really a bit disappointing. Here I’ve found the gate, and been grudgingly passed through by some terrifyingly ferocious curmudgeon who I had best pass by humbly with folded hands because I inherently knew he could slap me down with a flick of a finger, and then I am on this same road and everything fades. DMT is too short—that’s the problem with it.” And so on, my mind went. That’s the way the mind is; it is always thinking *more is better*. So why didn’t I arrive at the promised land, and have all of my questions answered? The point I was missing was that I *had* gone through that gate. I had moved from a series of colorful hallucinations to a completely different place—going up to a higher place—and I had found the gate. And by an act of sincere humility, I had been permitted to go past this gate to a new level of consciousness, to which I had not had access before. This was a great thing, but the mind is such that it is always rushing hither and yonder, looking for a new distraction out there, that it misses the simple profundity that comes from looking inward. *I had passed through the gate*. Not only had I passed through the gate, I had *found* the gate in the first place! Such simplicity. The road was the same rocky road through a dangerous mountain, defiled on either side of the gate, so what was so great? This precious entry into a place

so fascinating was the entry into the inner world of spiritual messengers, the land of teachers. And I had figured out how to get there, all by myself. At the time I didn’t realize that. I just thought, “Here I am on that same rough piece of road.” It *was* the same road, but my attitude and intention had almost totally undergone some subtle and unconscious change (underneath that trite chattering mind that never shuts the fuck up), and on that road I had my first touch of the whisper of creation that underlies all things. This is to me the point about DMT. It can be a doorway to the Divine.

Used with the intention of contacting our inner creativity, we meet our higher selves. The higher the intention, the more devout the sincere supplication will be. While crying for a vision, the higher will be that aspect of self we meet. Properly prepared, we enter into a fluid multi-dimensional field of interpenetrating realities, which are all things to all people. On this path, when we are ready, we meet the Gods that live deep within all of us. In that meeting we experience intense recognition of the oneness of all things. We receive true and simple instructions. We experience such poignant realizations that we are swept away by the exquisite beauty and truth of this inner knowing, which is utterly undeniable.

Dimethyltryptamine is unique and extremely powerful. If I were asked what its most important attribute was, I would have to say that it is the doorway to the intensely personal temple of our own sacredness. It opens the doorway to the vastness of the soul; this is at once our own personal soul, and its intrinsic connection to the universal soul. When the underlying unity of this fictional duality is seen and felt, one experiences a completeness and interconnection with all things. This experience, when we attain it, is extremely beautiful and good. It is a song that rings and reverberates through the lens of God. Now we know why we were born; to have this intense experience of the sacred, the joyous, the beauty, and the blessing of just being alive in the arms of God.

So there it is. And it *is* there. The mystery. Beyond the known, beyond logic, there is the experience. Each one is a unique journey. There are way-markers, however, and signposts at every turn. And if we are but intelligent enough, we understand that the language of mystery is written on water. fleetingly, we glimpse the ordinary, and in that momentary flash—if we are quick enough—we see the doorway. When we see it, we must knock. Remember though, that there are no guarantees for the explorer; only the frontiers of consciousness and the blazing of new trails. ☉

# SOME ACTIVE *TRICHOCEREI* (PART III)

by K. TROUT

To conclude our discussion, we must mention the most obvious yet arguably the most important part of the process of identifying and propagating active clones. Namely, knowing what you have and what you bioassay. Without positive identification, bioassay results are of little value to anyone except the person who ate the plant. Proper identification involves several distinct issues:

## ASSIGNING NAMES AND SHARING IDENTITIES

While this should be simple, it is also very important. Plants should be designated as what they are and when/where they originated (or some other identifier assigned to those which assayed well but lack a good name). For example: *Trichocereus peruvianus* "Blue Form" J.L. HUDSON 1997 or more simply "*T. peruvianus* BF-JLH-97." The goal is not to rename all your cacti but rather to create a meaningful way to recognize, and eventually track, any clones in need of intensive propagation.

## MARKING AND LABELING

Marking plants can be tricky since they will often receive a lot of sun exposure. Labels can fade to complete illegibility within months to years. Pencil is a better alternative to pens or markers as it will last longer than either one. (Black wax pencil is also fairly durable but both it and pencil will need updating as they age.) Some plastic tags last much longer than others do but, if the reader can afford to do so, the use of aluminum or zinc tags is strongly recommended (scratch using a nail, pen or pencil). Wooden tags are favored by many but are only slightly more durable than most plastic tags once exposed to direct sun and the elements.

It may be advantageous to assign a unique tracking number to each clone by physically writing it on the plant itself. This will prevent lost tags from becoming unsolvable problems. The most permanent route available in a pen is "Industrial Superpermanent" SHARPIES (SANFORD'S item no.13601) These substantially outlast regular SHARPIES, which soon fade away if exposed to sun.

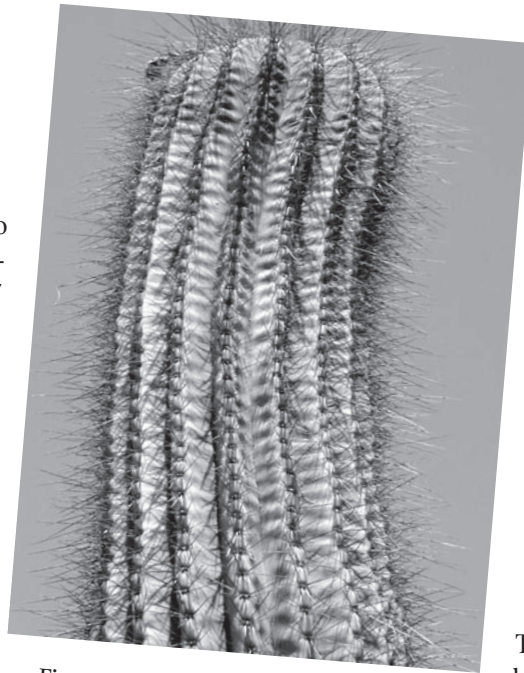

Figure 1: *Trichocereus werdermannianus*.

All labels should be periodically inspected and redone *before* the names vanish. Plant markings should be rewritten and plant tags should be replaced as rapidly as they start to fade or become brittle. Metal tags are more trouble-free so long as they do not get separated from the plant. The use of both permanent tags and direct marking of the plant is strongly suggested.

## MORE ACTIVE CLONES

The following have been proven by human bioassays to be in need of focused propagation efforts. Note that we have presented only a partial list

of the *Trichocerei* that are known to be active, and there is no reason to expect that dozens more species, varieties, and clones will not be identified and better understood in the future.

*Trichocereus werdermannianus* is a large and impressive columnar species. It has been renamed by some as *Echinopsis werdermanniana* but it is important for readers to be aware that there is also a far smaller, globular *Echinopsis werdermannii* that exists, which is a completely different plant. *T. werdermannianus* is often overlooked due to analytical results having been presented in the form of ranges of alkaloid concentration (AGURELL 1969B). While *T. pachanoi* was in the lower-most portion of the range that most assume to

Figure 2 (above):  
*Trichocereus werdermannianus*

Figure 3 (below):  
*Trichocereus pallarensis*

indicate usefulness, *T. werdermannianus* was in the uppermost portion of the range below it (AGURELL 1969A). It has been reported in human bioassays to be extremely variable in potency and to range from inactive to 2–3 times the potency of *T. pachanoi*. It is presently believed that this is clone-dependent, an observation suggesting that identification and selective propagation of the most potent clones is in order. There also exists a claim that at least one *T. werdermannianus* strain is non-slimy.

*Trichocereus pallarensis* is another beautiful but rarely encountered species that has been found to be reliably potent. Lying in between *T. bridgesii* and *T. peruvianus* in appearance, it has been reported to be 2–3 times the potency of *T. pachanoi* in human bioassays. There appear to be few sources for the plant outside of the sales held at botanical gardens, but seeds are readily available through companies like SACRED SUCCULENTS, AZTEKIA, KOEHRES, and other European cactus seed sources. Germination rates have been good and the seedlings fast growing.

Figure 4:  
*Trichocereus pallarensis*

*Trichocereus* sp. TORRES & TORRES is a spiny pachanoid found by MANUEL and DONNA TORRES in northern Chile. It proved to be highly effective in bioassay. While not presently available in large numbers, it is being both propagated and sold to the general public. It too appears to be fast-growing and moderately hardy.

*Trichocereus* affinity *huanucoensis* is an unidentified and unnamed species that lies in between *T. huanucoensis* (which seems to have only mild stimulant activity) or *Trichocereus* cv. TOM JUUL'S GIANT HORT. (which seems to exist in at least two or more forms ranging from inactive to active). It is readily available in southern California as a large landscaping plant but almost always without any specific labeling. The activity of *T. aff. huanucoensis* has been proven in human bioassays.

Figure 5 (above):  
*Trichocereus* sp. TORRES & TORRES

Figure 6 (left) and Figure 7 (below):  
*Trichocereus* affinity *huanucoensis*

While there are in fact many different *Trichocereus peruvianus* strains and forms, we felt it would be a good idea to show another truly excellent one. This fat, heavily-frosted, stout-spined *T. peruvianus* is similar to what appears in some major botanical gardens and has both large areoles, very bluish young growth, and large spines. Branches are commonly around 6 inches in diameter. Potency is said to be substantially greater than *T. pachanoi*.

Figure 8 (above) and Figure 9 (right):  
*Trichocereus peruvianus*

## KAK-TALL-A-TREE

K. TROUT says:

*"Awesome plants!"*

*Essential additions to any Trichocereus garden."*

Tip cuttings \$35.00 per foot:

*T. peruvianus* #RS0001

*T. macrogonus* #RS0004

Rooted cutting in pot, \$25.00 per foot:

*T. bridgesii* #RS0005 "eusaporus"

All prices postpaid. Send well-wrapped cash or postal money order with names and addresses spaces left blank to:

**KAK-TALL-A-TREE**

3128 — 16th Street, #225

San Francisco, CA 94103

*Trichocereus* sp. LUMBERJACK is an interesting peruvianoid that originated as an unlabeled plant obtained some years ago at a LUMBERJACK hardware store in Sacramento. The grower encountering it was struck by its resemblance to a *T. pachanoi* with long spines and began propagating it. Bioassays eventually proved it to be their favored choice due to a potency greater than *T. pachanoi* and their perception of it producing a “cleaner” experience. This source and discovery of such active material should be carefully considered by our readers. A surprising number of active *Trichocereus* can be (and have been) found in precisely this way. Again, keep in mind that it is a good idea to “grow out” such plants for several seasons, using only new growth for bioassays, due to the common use of systemic poisons in commercial horticulture.

Figure 10:  
*Trichocereus* sp. LUMBERJACK

## RECORD KEEPING

Individual assignment of tracking numbers to each plant may create more confusion than it resolves. Nevertheless, several points need to be stressed. Assignment of special permanent designations to forever accompany specific clones or strains should only be for those clones proven potent and effective in human bioassays and these should be assigned by whoever is growing the plants that were bioassayed unless they had such a designation when they obtained them. Meticulous labeling and record keeping is not being suggested as a means to create tracking for any and all plants that will then find a place in commercial horticulture. However, keeping records about your plant acquisitions and notes on their cultivation can prove invaluable for your own needs. It is often of direct benefit to the individual to know what plants they have and where they came from. If they also know *when* they obtained their plants and their size, it is a simple matter to know how much growth occurred and how long it took.

A permanent record book or index card file is a simple way for most people to address this. Recording name, source, price paid, date of acquisition, size at time of purchase, and any comments concerning origin (your source’s source), ethnomedicine, or identification, or even questions about the validity of its retail labeling, can all prove of value later. If an index card file is used, this is easily updated and edited. It also is a valuable place to record such things as appearance of new growth, flowering dates, time to set seed, number of flowers in a given year and many other observations. Knowing potential flowering periods in advance is of great aid when planning hybridization. Similarly knowing when seeds were planted, how long they took to germinate, and what percentage of germination occurred, are quite valuable to a grower and nearly impossible to reconstruct if not recorded.

It is good to record every scrap of data and history that can be obtained about a plant at the time of its purchase. If the retail seller does not know details, try to get the name of the actual grower and ask them. While some sellers might initially hesitate when asked about *their* sources, most will rapidly become cooperative if they realize that the data is being compiled not to try and get a better deal but to know everything possible about a plant you have just bought from them. An approach that often can overcome a seller’s reluctance to share such information is to ask *them* to obtain such information on your behalf. (Most would rather that *you* searched for such data rather than doing it themselves but there are

exceptions.) Asking questions like:

- 1) Where did this plant originate from?
- 2) Can more of the same plant be special ordered from them?
- 3) Can I get a contact information for this company, to discuss the origin of their plants with them?
- 4) What is your name?

And then, when contacting the wholesaler:

- 1) What is known concerning the origin of this plant?
- 2) Are you aware of any voucher specimens of this plant that are housed in botanical collections?
- 3) Do you know the name of the person who first collected this plant or who first made it commercially available?

The answers to such questions can create a useful set of data to accompany the plant. Expressing a sincere desire for detailed information about a plant's history will normally be seen as an indication that one is a serious collector and can often aid in cementing new and valuable friendships as well as eliciting more information than would have been possible otherwise. There are few things a serious cactus collector likes to do more than to find another collector willing to "talk cactus." Such discussions may even open up new avenues of plant access not available to casual collectors due to the love of serious cactus growers to trade cuttings of *their* personal rarities in exchange for the rarities of other collectors.

## SHARING BIOASSAY DATA AND CLONES

This is one of the most important yet trickiest aspects for the lover of psychoactive cacti. We would be much further along if there was not a blanket of deliberate and protective secrecy kept tightly wrapped around these plants by most of those who use them. This is understandable, as we would also be far worse off if there had been widespread promotion of these plants and laws had been passed against them. The perception of "drug problems" linked with several *Trichocereus* species directly led to their being dropped from the retail stock of several cactus companies. It is important to be cautious so that one does not create public perception of a new "drug problem" or cause other problems for the growers of cacti. (We would, however, like to ask our readers to stop asking us where to buy cacti. All they need to do is *look* and they may have success. Learning to recognize plants visually and

thus be able to purchase useful unlabeled cuttings or specimens is a valuable skill that can help one to be less reliant on a very few commercial suppliers selling known material. Visit [www.troutsnotes.com](http://www.troutsnotes.com) or [http://trout.yage.net/sc/Trichocereus\\_List\\_0.htm](http://trout.yage.net/sc/Trichocereus_List_0.htm) to see lots of examples in color.)

At the same time bioassay information (both positive and negative) needs to be shared with potential growers to enable them to make better decisions about what they deliberately propagate.

Web-based bulletin boards can provide a wealth of contacts who love growing cacti. Starting open dialogues and e-relationships could rapidly form small growers' networks sharing and exchanging both information and live plants. Caution is advised though, as law enforcement is known to use the web for intelligence-gathering purposes. All cactus lovers stand to benefit the most not by hiding a select few plants for their own use but rather by conscientiously sharing their knowledge and, most importantly, living material with others who can assist in increasing the numbers of their offspring.

With a little care, a delicate balance between protection of these plants and dissemination of knowledge about them can be maintained, and we can all ensure that a diverse range of the best plants have a lasting and mutually beneficial relationship with humans in the future. ☉

Figure 11: The RS0004 *Trichocereus macrogonus* mentioned in the first installment of this article is reported to be *non-slimy*, but other *T. macrogonus* strains can be. The "pot of snot" pictured above was shared with us by a reader requesting anonymity.

## AN ENTHEOGENIC ELDER'S VIEW OF MIND STATES II

by WILL PENNA

*WILL PENNA is a retired high school English and English as a Second Language teacher and department chair (1960–1995) who first took LSD in his fifth year teaching before it was scheduled, when a former student and his girlfriend knocked on his cottage door and offered him that fateful sugar cube. You can read about this and some of the effects on his next 30 years teaching in his article in the MAPS Bulletin Vol. X No. 3, "Psychedelics & Creativity" issue.*

First, I must give my reflections on this conference some background. I missed the many psychedelic confabs over the years until I finally participated in the two California celebratory gatherings for LSD's 50th in 1993 held in Santa Cruz and San Francisco. But having been thus initiated I jumped on the bandwagon and became a regular psychedelic scenester, attending events ranging from JONATHAN OTT's mega-conference in San Francisco, to the BPC México experience, to RALPH METZNER's ayahuasca conference, to the first *Salvia divinorum* conferences at BREITENBUSH, to the recent day-long STATE OF ECSTASY conference in San Francisco's Presidio. Naturally I also participated the first MIND STATES conference, held nearly four years ago at the same site as was this one was—the INTERNATIONAL HOUSE in Berkeley. So while I'm a psychedelic conference newbie, in these 12 or so years I have seen them flower much more than the professional conferences I attended as a teacher ever did over that span of 35 years. This is especially so of the MIND STATES events!

We are undergoing a kind of psychedelic renaissance. It's not like "the sixties all over again," as DJ GOA GIL says in OMANANDA's otherwise excellent video shown at the conference, *Liquid Crystal Vision*. But it definitely is a re-birth in

terms of the volume of psychedelic publications, breadth of psychoactive products, topics and directions, many generations and life-styles involved, myriad models of entheogenic eco-touring, and even, I suspect, money to be made. There's gold in them thar hills—and in the golden poppies that cover them. (Although I'm not concerned about the ranges of California's *Eschsholtzia californica* being raped and plundered as the Mexican state of Sonora's were some 25 years ago of *Lophophora williamsii*, after friends of mine and thousands of others followed the CASTANEDA imperative. On the other hand, have you—as I have—ever smoked dried California poppy flowers or used its root as an anodyne?)

Entheogenic conferences like this one are getting more "professional." We are hearing speakers who generally have honed better presentation skills; the timing of presentations and other activities move at a more satisfying clip; the variety and quality of products, activities, sellers and purveyors of services is broader and better; overall, the value one gets now has considerably more bang for the buck!

I find a more informed and conscious mix of conference attendees and participants. Some may complain that there's less unanimity than in "the old days," whenever those were. This seems to depend mainly on the age of the complainant: remember those halcyon days of the first magic gram, parties in the park, the Diggers, the Summer of Love, ecstasy clubs in Austin, going down the K-hole with you-know-who, etc., etc.? You don't? Well, then, you're hopelessly out of it and your opinion couldn't possibly mean diddley-squat! My response to this point of view is I find a much broader, more mature and more widely educated group than I did in those

MIND STATES II "Panel of Elders:" ANN SHULGIN, SASHA SHULGIN, LAURA HUXLEY, MYRON STOLAROFF and CYNTHIA PALMER

MIND STATES II “Panel of Elders”  
(continued, from top to bottom):  
ROSEMARY WOODRUFF LEARY  
& MICHAEL HOROWITZ,  
HUSTON SMITH,  
JEAN MILLAY,  
and M.C./moderator ERIK DAVIS.

days of yore. We are the people our parents warned us about and in becoming them we’ve learned a lot. After all, while I missed some of the earlier—and historic—conferences, I was there in most of those other scenarios from the early sixties on. The schmoozing is definitely a higher level of discourse, both among us who were there and with our elders and “younger.”

So what specifically of the speakers and other experiences at MIND STATES II? I can only give it highest marks in all the criteria I’ve listed above. There really was something for everyone. For example, while I still have trepidation about trepanation (surgically boring a hole in the skull for releasing pressure on the brain as a route to enlightenment), I stayed all through Lady FEILDING’s video of her trepanning herself. The streams of mainly guys fleeing the auditorium when the blood started flowing down her forehead reminded me of all the jocks who fled my college health class back in the late fifties when the birth of a baby film was shown! Another sort of stimulation was generated by ERIK DAVIS’s marvelous intellectual wrap-up of the generation that has passed since the cultural explosion of the psychedelic age. His exegesis and examples were brilliant and I’ll be looking for his presentation in print. JON HANNA delighted many of us with his beautiful slide show of psychedelic art. And the entertainments, the videos, the elder’s panel, and especially the music of DALE PENDELL and the ORACULAR MADNESS CHOIR, amazed me. However, it was two of the presentations that particularly stood out for me: KARL JANSEN’s and NICK SAND’s.

KARL JANSEN’s brilliant book on ketamine that just came out, *Ketamine: Dreams and Realities*, could—and, I think, should—be a model for a future book on *Salvia divinorum* as well as other substances that so far have not had such a treatment. Because of its wide spectrum and positively provocative and thoughtful content it is much more satisfying than the much-heralded but ultimately disappointing new book on DMT by RICK STRASSMAN, *DMT: The Spirit Molecule*. STRASSMAN’s book is limited by the reductionist scientific approach he takes and leaves the reader—especially the experienced reader—with little or nothing of personal value, while JANSEN’s book (and his presentation at MIND STATES II) is a rich treasure trove, especially for one familiar with his subject.

I was fascinated by JANSEN not only because of his focus as both a psychiatrist and a neuroscientist on ketamine, but also because of his frequent reference to TIMOTHY LEARY’s work and concepts as the basis for much of his own inspiration and work. At a time when many, even in our own community, especially some among the younger ones, look down on LEARY without having any awareness of the corpus or even the actual contents of his work, I was both surprised and enlightened to find how intimate JANSEN was with LEARY’s work, including *Neuropolitics*, *Flashbacks*, and others. JANSEN outlined how important a place LEARY’s neurologic concepts have played in his own research and practice. His presentation, and *Ketamine: Dreams and Realities*, are magnificent learning tools because he does not limit himself to the lab perspective as, for example, STRASSMAN’s recent book on DMT largely was. I believe that in JANSEN we finally have a bright trailblazer whose wide-ranging intelligence, education, experience, broad humane perspective, and—not least—lively humor are uniquely reminiscent of LEARY and his generation!

Convicted and imprisoned underground chemist NICK SAND's talk was on the value of adversity and its necessity in life for growth and enlightenment, which in his case meant more than 10 years of imprisonment. I wish I had a tape recording of NICK SAND's presentation, but I guess I'm just going to have to wait for the book. My impressions of him have broadened considerably. I used to think of him as someone mainly like his mentor, OWSLEY/BEAR, one of the first rank of psychedelic alchemists, hermetic and tending towards arrogance.

SAND read from his forthcoming autobiographical book on the positive power of adversity in changing his perspective without (in my view and I'm sure most listeners') dimming his determination, brilliance or significance in psychedelic culture. His basic thesis, developed through his many telling and poignant anecdotes from the last 15 years of his life, was one that some of us in our own life journey have become intimately familiar with in one way or another: that it is only

in the crucible of hard experience that we grow and transform in totally amazing and spiritual ways.

Listening to him was like being present to hear a NELSON MANDELA or a TIM LEARY after "justice" had been meted out to them! What an articulate—and now compassionate—man SAND is! I was bowled over as I never have been by the likes of a 'deep-pockets' CHOPRA or his new age ilk. Even before the standing ovation he received at the conclusion of his presentation, I knew many others present were both personally inspired and conceptually stimulated; I could feel it in the electricity of the silence and sense it in the upwelling I could feel in those around me. I look forward to reading the whole story when it appears in his book.

Thanks to everyone who made MIND STATES II a reality. I'll end this as all the alchemists ended their treatises: take this review *con grano salis!* [ED. NOTE: Or perhaps *con cubo sucrose?*] ☉

## CONSCIOUSNESS TECHNOLOGIES

JULY 19–22, 2001

A conference on the exploration of various techniques  
for accessing and navigating novel states of consciousness.  
Informative seminars, creative workshops, discussion groups, and more.

### NEW PRESENTERS ADDED!

K. TROUT is the author of *Sacred Cacti* and presently serves as technical editor of *The Entheogen Review*. He has written a number of books and smaller publications about the cultivation and chemistry of various plants. He is currently creating a taxonomic and visual database for the genus *Trichocereus*. See [www.troutnotes.com](http://www.troutnotes.com).

RICHARD and IONA MILLER co-authored *The Modern Alchemist* and are published in *Psychedelic Monographs and Essays*. Richard is also the author of *The Magical and Ritual Use of Herbs*. They can be visited at [www.nwbotanicals.org](http://www.nwbotanicals.org) and [www.geocities.com/iona\\_m](http://www.geocities.com/iona_m)

PAUL BARTSCHER and MICAH NILSSON founded Al-kemi ([www.al-kemi.com](http://www.al-kemi.com)), a company dedicated to the research and revival of Alchemy, the West's lost lineage of energy healing.

### PLUS

DALE PENDELL offers his unique blend of history, poetry, and science. DALE is the author of *Pharmako/Poeia* and the forthcoming *Pharmako/Dynamis*.

CLARK HEINRICK has been published in the journals *Integration* and *Eleusis*. He is author of *Strange Fruit: Alchemy, Religion and Magical Foods*, and co-author (with CARL RUCK and BLAISE STAPLES) of *The Apples of Apollo*.

PHILLIP FARBER is the author of *Future Ritual: Magic for the 21st Century* and *Breaks: The Adventures of Richard Nixon in the 21st Century*. He can be found on-line at <http://members.aol.com/pstuart>.

DJENABA is an advanced personal trainer, holistic health consultant, fitness counselor, advanced aerobics instructor, Tai Chi instructor, and yoga instructor.

DJENABA pursues fitness as a parallel course to healing modalities.

TODD ROETKEN is a long-time contributor to *The Entheogen Review* under various pen names. TODD leads us on a tour of the frontiers of neuropharmacology.

EILEEN KILGALLON demonstrates how sound, dance, and breath can be facilitators in the entheogenic experience.

JOHNNY APPLESEED was an early contributor to *The Entheogen Review* who has done ground-breaking work on North American ayahuasca analogues.

JIM RANSOM has a background that is so varied and eclectic, that he can only be described as a Renaissance man of the clown-shaman tradition.

THE CRYSTAL AWARENESS PROJECT will provide an evening of space music. CRYSTAL, owner of the GARDEN OF SCENTUAL DELIGHTS, also offers aromatherapy workshops.

Cost of the experience is \$350.00, which includes all seminars, workshops, and events, on-site camping, and three meals a day. Meals begin with dinner on Thursday the 19th, and end with lunch on Sunday the 22nd. Please specify if you would like vegetarian meals when you register. The conference site is a short drive from Sisters, nestled in the Deschutes National Forest. If traveling by air, Redmond is the closest airport (30 minutes away), or choose Eugene as your destination to enjoy a beautiful drive over the Cascades. To register send \$350.00 in check or money order to: I-9 RESEARCH, POB 1506 (Dept. ER), Sisters, OR 97759. Registration packet will contain more detailed travel information and a map to the conference site. If you have any questions or need more information, call or e-mail RICHARD NELSON at (541) 420-7038, [i9research@earthlink.net](mailto:i9research@earthlink.net). Also check out our web site at [www.charm.net/~profpan/ct](http://www.charm.net/~profpan/ct).

## ALBERT HOFMANN SPEAKS...

A commencement address presented by MYRON STOLAROFF  
at the MIND STATES II conference, May 25, 2001

---

Photo by KENT MARTIN, NFB

My dear friend MYRON STOLAROFF informed me about your conference MIND STATES II, and asked me if I would say some words to this meeting. Being a chemist and natural scientist, at the very beginning of my philosophical thinking I became interested in the problem between the relationship between the material and the spiritual world.

The spiritual and the material world are often regarded to exist as two separate realms, even to be existentially contradictory. But the opposite is true; they are complementary, forming all-embracing human reality.

The material world is the topic of natural science research. Deep insights were provided into the macrocosmos of the galaxies as into the microcosmos of the atoms and into the material and energetic mechanisms of life processes. This knowledge formed the basis for the development of technical industrial civilization. It would be difficult to accept that this was the true role of the natural sciences, namely to provide us with the comfort of industrial society, including the catastrophic ecological and social problems. I believe that the true, evolutionary value and importance of the natural sciences in the history of mankind consist in providing deep spiritual insights into the material cosmos, into the riddle and wonder of creation.

The Creator does not speak with words to His creatures. As PARACELUS, the great natural scientist, philosopher, and physician of the Renaissance said: "The Creation is the book, written by the finger of God, in which we should learn to read."

The chemical and physical mechanisms of life processes are described—not explained—by natural scientific investigations. If these investigations are meditated upon, they will fulfill us with astonishment and awe.

As an example, take the elucidation of the process of seeing. It shows that in the outer world no colors exist; the colored picture of the world is formed inside, on an inner screen, in the consciousness of the individual. Every individual bears inside his self-made, private picture of the world. The Creator used a trick: letting us experience different lengths of electromagnetic light waves as different colors, in order that we may enjoy the beauty of a colored world.

Natural science has disclosed innumerable examples of such tricks which prove that the Creation is designed to make mankind happy. In a meditative state of mind we become conscious of this grace.

Looking over the top of my typewriter on a meadow strewn with yellow flowers, I send cordial regards and best wishes for a joyous and fruitful meeting.

Yours,

*Albert Hofmann*

# EVENTS CALENDAR

## MDMA/ECSTASY RESEARCH JULY 19–20, 2001

MDMA/ECSTASY RESEARCH: ADVANCES, CHALLENGES, FUTURE DIRECTIONS is sponsored by the NATIONAL INSTITUTE ON DRUG ABUSE and NATIONAL INSTITUTES OF HEALTH, and will be held at the NATCHER Auditorium, on the NIH campus. More info. can be found at [www.nida.nih.gov/Meetings/MDMA/index.html](http://www.nida.nih.gov/Meetings/MDMA/index.html).

## PSYCHOINTEGRATOR PLANTS JULY 22–31, 2001

This seminar focuses on ayahuasca, visionary art, psychotherapy, ethnobotany, body work, and healing massage. Spend ten days in the Amazon rain forest of Brazil, and learn to develop a heightened awareness through modified states of consciousness. There will be lectures on Amazonian and African ethnobotany and anthropology, ritual plant ceremonies with ayahuasca, group sharing, creative art work expression, Chi Kung practice and healing massage and body reading. Presenters include LUIS EDUARDO LUNA, SILVIA POLIVOY, GIORGIO SAMORINI, ANTONIO ESCOHOTADO, ISABELA HARTZ, MARIE BRAIN, and ALEX MARQUEZ.

Our lodge, located in the rain forest 1.5 hours from Manaus, has excellent facilities, phone, and a swimming pool. All rooms are double-occupancy, with air conditioning and private bath. For more info. e-mail [silviap@house.com.ar](mailto:silviap@house.com.ar).

## PSYCHOACTIVITY IN NEPAL SEPTEMBER 22–28, 2001 OCTOBER 1–7, 2001

NEPALESE SHAMANISM, TRANCE AND PSYCHOACTIVE PLANTS, held September 22–28 and October 1–7, 2001 at the DHULIKEL MOUNTAIN RESORT in Nepal. This will be the first

conference ever held on Nepalese Shamanism. We wish to stimulate an exchange between the shamans of Nepal, with their knowledge and use of visionary plants, and Western scientists who research psychoactive plants throughout the world. Payments of \$1,500.00 in cash and money orders, only with registered mail, accompanied by the registration form, can be sent to: PSYCHOACTIVITY, Schinkelkade 59-61 (Dept. ER), 1075 VL Amsterdam, The Netherlands. Space is limited to 80 participants for each seminar; early registration is recommended! For more info. see: [www.psychoactivity.org](http://www.psychoactivity.org).

## ALTERED STATES OF CONSCIOUSNESS NOVEMBER 2–7, 2001

Held in Albuquerque, New Mexico, this conference will be an exploration of enlightenment,entheogens, shamanism and peak experiences. The theme of this conference is "Awakening Awareness through Sacred Technologies." Come investigate the space between ordinary and non-ordinary reality, expand personal awareness and participate in the exploration of consciousness. Presenters include HUSTON SMITH, STANLEY KRIPPNER, BROOKE MEDICINE EAGLE, DOUGLAS HARDING, BRUCE EISNER, ARTHUR DEIKMAN, STEVEN HALPERN, LAURA HUXLEY, BARBARA MARX HUBBARD, MARGOT ANAND, VICTOR SANCHEZ, JOSEPH RAE, TINA DE SOUZA, ROBERT ANTON WILSON, CHARLES TART, ADNAN SARHAN, RUSSELL TARG, KEN EAGLE FEATHER, ONYE ONYEMAECHE and many more.

Top researchers from Brazil, Russia, Mexico, Finland, Iraq, UK, France, Chile, Nigeria, all across the US, and from many indigenous traditions, will be contributing. Experience new dimensions of consciousness through dance, music, sound, meditation, fire walking, and other embodied explorations.

For more information, contact THE MESSAGE COMPANY (505) 474-0998, fax: (505) 471-2584, [message@bizspirit.com](mailto:message@bizspirit.com), [www.bizspirit.com/alteredstates](http://www.bizspirit.com/alteredstates).

# IN PRAISE OF “MINOR” ENTHEOGENS

by S. BEAR

If one pages through back-issues of *ER*, there are plenty of letters characterizing a wide range of substances as “non-entheogenic.” On various occasions, *Amanitas*, *Datura*, morning glory seeds, and other materials have been dismissed as merely “sedative,” “deliriant,” or just plain “inactive.” Apparently for a lot of readers, the only paradigm for entheogens is the LSD/mescaline/psilocybin model, with geometric visuals being the main clue as to whether the substance is entheogenic or not. Without debating what is meant by entheogen (for many in the world, wine is a sacred substance, and I myself have had some numinous experiences under its influences), I caution that this article is focused on substances that do not *precisely* fit the LSD/mescaline/psilocybin model. They are nonetheless, in my view, quite valuable for those who bring their minds and spirits properly prepared.

## ACORUS CALAMUS AND ACORUS AMERICANUS

I have heard about *Acorus calamus* (aka sweet flag) for years; it was frequently brought up in early issues of *ER*. Unfortunately, no one ever tested it at entheogenic doses. Most information about *A. calamus* as an entheogen can be traced back to HOFFER and OSMOND’s *The Hallucinogens*, where it is referred to by a translation of its Cree name of “rat root” or “muskrat root;” *wekas* in Cree. This report of entheogenic use reads, in its entirety:

The informant and his wife, a trained psychiatric nurse, were both sophisticated subjects with hallucinogens. They had taken LSD several times in well-controlled experiments at one of our research laboratories. They had both taken 10 inches of rat root 5 times and both agreed it produced an experience very similar to LSD (HOFFER & OSMOND 1967).

The report then goes on to attribute the psychedelic activity of the plant to the asarones. JONATHAN OTT refers to the plant, and *A. americanus*, but notes that it is far from clear—particularly in the later case—that asarones are responsible for any stimulant or psychoptic effects (OTT 1996; OTT 2001).

Indeed, the asarones appear to be responsible for the *sedative* properties of *A. calamus* when used in traditional Asian medicine, whereas in North America medicinal uses of the root consistently refer to its stimulant properties. *A. calamus* has been banned by the FDA as a food additive based on its content of beta-asarone (a known carcinogen), but it appears that the North American strains of the plant are often free of all asarones. Indeed, these North American plants have been designated as the distinct species *Acorus americanus* (PACKER & RINGIUS 1984; see also FOSTER & DUKE 2000). Nevertheless, “caution” when using these plants is advised, since some strains *may* contain beta-asarone. It has been suggest that certain diploid strains tested by the Germans are clearly safe, while others may be questionable (FOSTER & DUKE 2000). The picture is complicated considerably by the fact that European settlers may have introduced the European strain or species into the northeastern United States in the early Colonial Period, thus accounting for sterile triploids in the Northeast (MORGAN 1980). European strains are also sterile, and propagate only vegetatively.

Unfortunately, I am unsure how someone would go about procuring such strains. Instead I contented myself with wild-grown, dried North American roots offered by JLF. As it turns out, sweet flag roots vary quite a bit in diameter. After repeated weighings, I came up with an average weight of 1.095 grams/inch for the large sample I had received; if this is comparable to the material harvested by HOFFER and OSMOND’s informants, then their “10 inch” dose is comparable to about 11 grams dry weight.

*Acorus calamus* is very light and woody, and my initial attempts to chew it as in traditional North American use made it clear that I was not going to be able to consume 10 inches in this fashion. (Perhaps HOFFER and OSMOND’s informants used fresh root?) Nonetheless, even the consumption of 2 inches by direct chewing had a highly stimulating effect—the alertness engendered was comparable to a full pot of coffee, but without the slightly queasy feeling that large volumes of coffee can give. The taste is hard to describe, but it is very strong; ginger, pepper, and licorice are all called to mind, and it leaves a distinct buzzing sensation in the mouth.

For my first real test, I ground up 11 grams of the root in a powerful blender; once reduced to a powder I mixed it with water and quickly downed it. This is easier said than done; the volume is substantial, and it is akin to trying to drink down a 10-oz glass of sawdust mixed with water. Nonetheless, for those who are accustomed to downing *Trichocereus* in its various forms, this is a breeze. There was an immediate urge for the material to come back up, but the “nausea” was entirely psychological; within moments my stomach calmed, and then began to feel very good indeed. Sweet flag has traditionally been used to settle upset stomachs, and it continues to have this effect even at high doses.

Within 15 minutes I had my first “alerts,” and within half an hour I was feeling powerfully energized. Sweet flag is definitely a powerful stimulant, but is unlike any stimulant I have ingested before. It gives a swelling, euphoric feeling that is at the same time calm and very controlled. There is no twitching, no grinding of teeth, no edginess; it would be perfectly possible to sit and read a book or meditate. On the other hand, it would be even better to climb a mountain, go for a walk, or attempt difficult yoga postures. It is terrifically energizing, and it is clear why Native Americans employed it on long journeys.

Naturally, I went walking. My senses were heightened, and the visual effects were indeed somewhat similar to the early stages of LSD (and even more similar to mescaline); light was powerful, and natural features almost seemed to emanate light rather than simply reflect it. Lawns had a dazzling variety of greens, showing patterns that usually cannot be seen. I had that uplifted, exhilarated joy in every growing plant that is one of the hallmarks of a good day-trip for me.

The effects peaked at about 90 minutes after ingestion, and remained strong for about 3 hours. This has the smoothest comedown of any upper I have ever taken; the after-effects were minimal—there is no real crash, and none of the burned-out feeling that usually comes with over-stimulation.

I have since tried this plant several more times, sharing it with a friend on two occasions. I have increased the dosage by about 50%, up to 16 grams. Is it “like LSD?” Well, there are some aspects that are a little like LSD, but it is a friendlier substance—more akin to mescaline, with lots of energy and light, but without LSD’s edginess and unpredictability. (And I say this as a *fan* of LSD; I have taken it more often than any other drug with the possible exception of aspirin.) It lacks the insistent geometric elaborations of the LSD/mescaline/psilocybin clan, and the sky-rocketing chains of mental associations common to LSD are absent. Anyone who consumes this plant expecting to have an LSD-like experience will probably be disappointed.

That said, I would claim that at the dosages we have experimented with, *Acorus americanus* fits my definition of an entheogen. It is strongly psychoactive and provides alternate mental states that allow access to the sacred. It is a plant that I plan to cultivate and continue to use, and it is probably a very useful adjunct to the consumption of other psychoactive plants, since it tends to settle the stomach!

## KETAMINE: DREAMS & REALITIES

The Authoritative New Book  
by Dr. Karl Jansen  
published by the  
Multidisciplinary Association  
for Psychedelic Studies (MAPS)

“Karl Jansen’s book *Ketamine: Dreams and Realities* is a goldmine of information on this fascinating substance that combines in a unique way the properties of an anesthetic and a psychedelic. It is clearly written, well researched and documented, and presents a balanced and objective view point. The author’s broad perspective, which covers all the aspects of ketamine from pharmacology to its use at raves, makes this book interesting for clinicians and researchers, as well as the general public.”

– Stan Grof, M.D., author of  
*Psychology of the Future: Lessons From Modern Consciousness Research and LSD Psychotherapy*

“Indispensable reading for those with any interest in ketamine. Entertaining, thought-provoking, and thorough.”

– Rick Strassman, M.D., author of  
*DMT: The Spirit Molecule: A Doctor’s Revolutionary Research into the Biology of Near-Death and Mystical Experiences*

“It is an excellent book... a well done comprehensive review of the entire history of ketamine.”

– Evgeny Krupitsky, M.D., Ph.D.  
Pioneer researcher into the use of ketamine-assisted psychotherapy in the treatment of alcoholism and heroin addiction

# TROUT'S NOTES

More than you need to know?

## SACRED CACTI, SECOND EDITION

422 pages, perfect-bound, with 40 illustrations \$39.95  
Detailed coverage of botany, chemistry, pharmacology,  
cultivation & utilization.

## THE CULTIVATION AND PROPAGATION OF CACTI

56-page booklet with 50 illustrations \$9.95  
Care, cultivation, propagation, and disease control of some  
selected cacti. Revised & illustrated excerpt from SC2.

## SUMMARY OF THE OCCURRENCES OF Mescaline

16-page booklet with 26 illustrations \$4.95  
List with yields and/or bioassay reports for the  
more than 70 species containing at least traces.  
Also includes notes of published errors.

## CACTUS CHEMISTRY BY SPECIES

74 pages, perfect-bound, with structural tables. \$19.95  
Comprehensive, extensively referenced summary of published  
analytical reports, included percentages and human bioassays.

## NARCOTIC & HALLUCINOGENIC CACTI OF THE NEW WORLD

By M.S. Smith, 90 pages, perfect-bound. \$17.95  
Summary of ALL species of cacti & other plants known as a  
"peyote" and the cacti used for medicinal or spiritual uses by the  
inhabitants of the Americas.

## CLOSET CACTUS CARE

By M.S. Smith, 14-page booklet with 11 illustrations \$4.95  
A concise, helpful instructions on growing cacti from seeds.

Shipping is \$6 for *Sacred Cacti*. All others \$3.50 for the first item  
and \$1 for each additional item. Bookrate is \$3 for first and \$1 each add.  
Non-USA orders see [www.troutnotes.com](http://www.troutnotes.com). Catalog \$1.  
Cash, check, or money order payable to Trout's Notes.

TROUT'S NOTES, POB 161061 (DEPT. ER), AUSTIN, TX, 78716

We can no longer sell to TEXAS residents.

At higher doses than I have used to date, it is possible that different kinds of effects would become apparent; after all, 75 mics of LSD is qualitatively different from 250 mics of LSD. To experiment with higher dosages, however, would probably require some sort of extraction of the active principle (potentially tricky, since we have no idea what it is!); one can only drink down so much sawdust. It is also quite possible that fresh roots may be more potent than dried ones, or that, as with so many psychoactive plants, potency varies with by strain and by time of harvest. In any case, this is a plant teacher with whom I plan to become better acquainted.

## ANADENANTHERA COLUBRINA

*Anadenanthera* seeds are the source of the South American entheogenic snuffs. The dominant alkaloid is bufotenine, whose entheogenicity has often been questioned, although the tide seem to be turning on this topic (OTT 1996; OTT 2001).

My brief experiments with using the toasted and ground seeds as a snuff were unpleasant, to say the least (and *A. peregrina* is often cited as being even more unpleasant (OTT 1999)). Perhaps I was unable to grind the seeds into a fine enough powder. In any case, despite definite and strong psychoactivity, the discomfort in my nasal passages was acute enough to make it unappealing to continue with snuffing experiments.

A source on the web ([www.shaman-australis.com](http://www.shaman-australis.com)), however, suggested that the seeds could also be ground and smoked—a rather obvious gambit, but one that had not occurred to me. This proves to be a very effective approach. The smoke from the seeds leaves a peculiar, rather unpleasant aftertaste, but there is no question about their psychoactivity via this route. One-third to one-half of a toasted and ground seed is plenty to observe the effects.

The first impact is a powerful, but not necessarily unpleasant, body response. Whether this is interpreted as a body rush or as a body load may be a matter of taste and/or circumstance. On occasion I have experienced it as an exciting, almost orgasmic movement of energy through my body; at other times, it feels like I am being squeezed in the fist of a giant. In either case, the somatic effects are profound, and one can see why this *Anadenanthera* snuffs are often associated with dancing, movement, or outright collapse; this is physically very pushy stuff.

There can also be strong sensations of muscle tension or bodily tightness, and there may—I say *may*—be some of the blood-pressure-raising effects that are associated with reports of IV administration of bufotenine. (I haven't been in a position to measure my blood pressure change, but it certainly feels like it is being pushed upwards.)

Beyond this, there are strong visual distortions and color changes, with major transformations in light and shadow, but not—at least not at the doses I have utilized to date—any strong geometric patterning. There is considerable closed-eye visual activity, but this is also big, rounded, and amorphous in nature—more like the organic elaborations of *Amanita pantherina* or *Salvia divinorum* than an LSD-like experience.

When the body energy slows down, the mental effects become more pronounced, and states of deep thought or hypercognition can occur, like the late stages of a mescaline experience.

Recently a very experienced fellow psychonaut alerted me to the interesting synergistic effects of *Anadenanthera colubrina* smoked in combination with 5x *Salvia divinorum*. I have since experimented with smoking blends of these two, and can testify that the mixture is both potent and in many ways more profound and pleasant than either smoked separately. The *S. divinorum* gives extra reach to the experience, but the *A. colubrina* seems to ground the body strongly so that a lot of the *Salvia* weirdness is better contained.

Once again, this is not a plant that fits the standard “Western” entheogenic paradigm (although there is plenty of experience with it in traditional South American cultures), and the smoking route is non-traditional. Mixing the seeds with *Salvia* is unlikely to have any historical precedent. Nonetheless, I think both the smoked seeds and the smoking mixture have potential in the hands (or, rather, lungs) of experienced explorers. Proceed with caution, however; this is uncharted territory, and the possibility of adverse blood-pressure effects should be kept in mind.

### **SALVIA DIVINORUM, LIQUID EXTRACT**

Smoking *Salvia divinorum* (particularly the 5x and 10x concentrated versions) has become the most common means of administration, despite the fact that it is not traditionally

ITALY

<http://www.eleusis.ws>

used in this fashion. When taken at dosages sufficient to produce a strong experience, most users find the weirdness coefficient to be extremely high. Those who have tried the more traditional quid approach, on the other hand, have usually found it to be a smoother, more user-friendly ride—but many also find it to be difficult to chew the needed volume of bitter plant material (or lack access to quantities of fresh leaf).

At his SAGE WISDOM web site ([www.sagewisdom.com](http://www.sagewisdom.com)), DANIEL SIEBERT offers a stabilized ethanolic extract of *Salvia divinorum* under the name “Emerald Goddess.” I purchased a bottle and have worked my way through most of it, and can vouch for its potency and effectiveness. It can be very strong indeed at higher dosages, but it seems to lack a lot of the vaguely threatening weirdness of high doses of smoked *S. divinorum*. The experience lasts longer than smoking, and effects can come in waves; sometimes when you believe that you are nearly back to baseline, you find the walls and ceiling suddenly going spherical again.

Much has been written cautioning against the casual use of *Salvia divinorum*, and almost all writers state that sounds can be highly irritating, and public places should be avoided. While I don’t want to encourage anyone to do anything rash—especially to get in any kind of public trouble that would draw attention to this substance—I have to take issue with some of this conventional advice. A greatly increased sensitivity to sound is undeniably an effect of *S. divinorum* for most people (no matter what the route of administration), but I and fellow travelers have found that this can result in a vast enhancement of music. We have concluded that this goes beyond the kind of increased music appreciation that occurs on other entheogens—*Salvia divinorum* actually seems to do something that increases hearing sensitivity, and this effect can linger for several hours (some report that it lingers through the next day).

With the liquid extract, I have been able to enjoy live music in an expanded state of awareness without any strong edge. Among other live music experiences, I was lucky enough to hear *Stravinsky’s* “Rite of Spring” performed by the *Los Angeles Philharmonic*—a truly soul-shaking experience under the influence of *Salvia divinorum* extract. I have also smoked *S. divinorum* before listening to live music, but find it to be a far less relaxed experience.

A word of caution, however. Any use of *Salvia divinorum* impairs coordination, and the degree of incoordination can fluctuate across time. You are certainly not competent to drive after taking *S. divinorum*, even if you are absolutely sure you are down. I also would not recommend concert venues that demand standing up or navigating crowds in the dark; mosh pits are out. But affairs with assigned seating, where you have a designated driver to bring you and get you home again, can offer a powerful experience.

Even if you decide that live music is not an option, I urge readers who use *Salvia divinorum* to experiment with recorded music—especially when ingestion is via liquid extract or the quid method. The Shepherdess turns out to be a music lover. ☉

## SHAMANIC SNUFFS OR ENTHEOGENIC ERRHINES

a new book by  
*Jonathan Ott*

A comprehensive review of diverse insufflated plant-preparations used as shamanic inebriants, primarily in South America, where such have been studied in greatest detail.

The first three chapters focus on the three major classes of snuffs—*cebill/cohoba/ñopo*, prepared from triturated seeds of *Anadenanthera* trees (legume-family); *epéna/hakúdu/a/yá-kee*, derived from bark, bark exudates and extracts of *Virola* trees (nutmeg-family); and that most important, and geographically-widespread sort derived from *Nicotiana*, or tobacco-leaves—and detail the history, ethnobotany, and chemistry of each.

A fourth chapter features 57 monographs of lesser-known types of ethnomedicinal snuffs, covering some 134 species, including many ill-studied African shamanic snuffs, and a *vademecum* of 16 stimulating and hunting-enhancing snuffs for hounds and horses!

The final chapter presents the results of the author’s pharmacological modeling of these three major classes of shamanic snuffs: 26 psychonautic bioassays of bufotenine, 17 of 5-methoxy-dimethyltryptamine, and 17 of nicotine, which are shown to represent the major psychoptic principles of intranasal, sublingual, oral, fumatory, and intrarectal shamanic inebriants of *Anadenanthera*, *Virola*, and *Nicotiana*, respectively. The long-extinct Taíno snuff-culture is sensually evoked by a passionate prose-poem, and the book is documented by a 19-page bibliography of 465 sources; its wealth of detailed information made accessible by a 15-page index with 1341 entries.

Published by ENTHEOBOTANICA [Kronengasse, 11 / 4502 Solothurn, Switzerland / tel. 0041(0)32-621-8949], 2001. A limited edition of 1026 copies, hand-bound in leather, with cloth-bound slipcase, signed and numbered; with 1 color and 11 black-and-white illustrations; 160 pages. First edition price: US \$100.00 / SFR 180.00.

# THE EARLY HISTORY OF *SALVIA DIVINORUM*

by LEANDER J. VALDÉS III

Unless you believe that *Salvia divinorum* is the old Mexica (Aztec) psychoactive plant *pipiltzintzintli* (I don't), the story of this fascinating mint began in the late 1930s. When R. GORDON WASSON and ALBERT HOFMANN brought back material for CARL EPLING to identify (WASSON 1962, WASSON 1963; EPLING & JÁTIVA-M 1962), they ended a search that had lasted nearly a quarter of a century. Their party traveled through Oaxaca under the auspices of a famous Mexican anthropologist, ROBERTO WEITLANER (an Austrian by birth), who had been guiding expeditions to Oaxaca for decades (POMPA Y POMPA 1966). I've quoted everything relative to *S. divinorum* from each of the following rather rare references, translating to English where necessary.

In the summer of 1938, JEAN B. JOHNSON (WEITLANER'S son-in-law), visited the Mazatec town of Huautla de Jiminéz, Oaxaca, with a group of young anthropologists. He wrote a couple of articles based on their findings. The first one covered various aspects of Mazatec culture and language. In the section on curing and witchcraft he discussed the magic mushrooms:

Shamans, as well as other persons, use certain narcotic plants in order to find lost objects. In some cases **teonanácatl** is used, while in others a seed called "semillas de la Virgen" is used. "Hierba María" is similarly used. The Zapotecs use a plant called "bador", the little children, and the Aztecs used narcotic plants in a similar manner (JOHNSON 1939A).

"Semilla de la Virgen" is "the Virgin's seed," and "Hierba (or Yerba) MARÍA" is MARY'S herb; both refer to the VIRGIN MARY, the mother of JESUS CHRIST. In the second article JOHNSON covered the activities of Mazatec shamans in greater detail. It is an excellent and interesting source of information, being based on interviews with a shaman. Concerning the Mazatec trio of magic plants he wrote:

To find a lost animal or object, one takes some mushrooms at night. One commences to speak (after falling asleep). It is not permitted to keep an animal around which might cry out and disturb the sleeper, who goes on speaking while another person listens. The sleeper tells where the lost animal or thing is, and the next day,

there it is when they go to find it. In addition to the mushrooms, some people use a seed called "*Semilla de la Virgen*", others use "*Hierba María*" ...The use of various magical plants to find lost objects is not restricted to the Mazatec alone; the Zapotec use a plant called "*bador*, the little children," which is administered the same way as *yerba María* by the Mazatec. The leaf is beaten well, and a tea is made thereof. It is probable that the Chinantec use it, since it well known to those who live in the vicinity of Ojitlan. The Aztecs used narcotic plants in a similar way (JOHNSON 1939B).

*Bador*, or *badoh*, was later identified as the morning glory, *Rivea corymbosa*, and it is the seeds that are used, not the leaves (WASSON 1963). JOHNSON was killed in Africa during World War II.

BLAS PABLO REKO, like WEITLANER, was an Austrian expatriate. He was a doctor and naturalist, and often worked in collaboration with the anthropologist (REKO 1945; POMPA Y POMPA 1966). In his book on medicinal plants, he wrote:

I cannot leave unmentioned here another magical plant whose leaves produce visions and which the Cuicatecs and Mazatecs (of the districts of Cuicatlán and Teotitlán) call "leaf of prophecy." The loose leaves I have obtained do not allow its scientific identification at the present time (REKO 1945).

Teotitlán is in the Valley of Oaxaca, in the upper central part of the state. It is Mazatec country. Cuicatlán is the district directly adjacent to the southeast. A search engine such as GOOGLE™ can find you some good maps. As an aside, the credit for discovering the magic mushrooms is sometimes given to RICHARD EVANS SCHULTES (1939), and later to R. GORDON WASSON. Actually, at the time SCHULTES was in the Sierra Mazateca, working on his Ph.D. thesis (SCHULTES 1941). He was accompanying REKO, who had been puzzling out the mushroom mystery since 1919. During the late 1930s, it was REKO who sent specimens he had collected to various American taxonomists for identification.

WEITLANER, himself, was trained and worked for a while as an engineer, but later switched to anthropology after emigrating to México (POMPA Y POMPA 1966). He led numerous

expeditions throughout México and was an expert on the peoples of Oaxaca. While collecting data on the Chinantecs, he came across a person who gave him a lot of information about Mazatec healing rites, including the use of *Yerba de María*, or *Salvia divinorum*. The interview covering the mint went as follows:

#### 4. USE OF PLANTS IN HEALING

Asking Don S. about the mushroom *Teonanacatl*, which is found in Huautla de Jiménez, he said it wasn't used in Jalapa, but he mentioned another plant that was called Yerba de María.

The plant somewhat resembles yerba mora but its leaves are a little wider; only the leaves are used, and they are put in water. First they are rubbed (crushed) in the hands, the water is not boiled, and they are used for very specific means. When the *curandero* goes to the mountain to search for this plant, he has to kneel down and pray to it before cutting it. There are only two or three specialists who know this remedy. They aren't *brujos*, and they cut the plants only when they need them, after praying.

For example, if someone is ill, and the doctors don't know the disease, then with this herb they can divine the illness. The *curandero* who brings the leaves first asks the sick person if they are addicted to alcohol, for a person who doesn't drink is prescribed fifty leaves, but one who

does is prescribed one hundred. The ill one drinks the water in which the leaves have been squeezed; at midnight the *curandero* goes with them and another person to a place where there is no noise, as for example, a house where the sick person drinks the potion. They wait a quarter of an hour for the effects of the drug, and the sick person begins to describe the type of illness they are suffering from. The sick one finds themselves in a semi-delirious state, they speak as if in a trance and the others listen attentively to what they say, they throw off their clothing as if with the herb they could free themselves of the animals. [Note: *The reference to being infested with animals is a belief that "worms" or similar small animals can infect a person and be removed by a curandero who sucks them out.*] At daybreak the *curandero* bathes the sick person with the same water that they took, and with this they are cured.

It is said that this bath ends the intoxicated state of the sick person who has taken the herb.

When one is trying to uncover a robbery or loss, the *curandero* listens to what the person who has taken the plant says and in this manner the deeds are discovered.

There is a man called Felipe Miranda in Jalapa de Díaz who goes to the mountain every three to six months to collect the herb; he performs excellent cures and he is doing quite well, economically; they say he grows the plant, but he won't reveal what type of herb it is.

## NOW AVAILABLE!

"*Ayahuasca Analogues and Plant-based Tryptamines* is really great. Many questions I have had are being answered. It's such a little treasure. I have grown *production* botanicals a little myself, and not only is the shared research forum a total blessing and incredible time saver, but is relevant to chemical, biochemical, and botanical experiments I have run also."

— NICK SAND, former underground chemist and drug war prisoner.

*Ayahuasca Analogues and Plant-based Tryptamines* combines every entry from past issues of *ER* related to ayahuasca, ayahuasca analogues, and plant-based tryptamines. New editorial remarks provide fresh commentary and bring the text up-to-date. Chapters include: Ayahuasca and Its Analogues; Mushroom Ayahuasca; Phenethylamines and MAOI; Miscellaneous and MAOI; The *Passiflora* Genus; The *Phalaris* Genus; *Arundo donax*; *Desmanthus illinoensis*; *Mucuna pruriens*; *Phragmites australis*; *Psychotria viridis*; *Mimosa tenuiflora* (= *M. hostilis*); The *Acacia* Genus, DMT & 5-MeO-DMT; Pipes & Vaporizers; Book Reviews; Degree of Intensity Scale; a complete Bibliography, and a Botanical Index (238 pages).

\$23.00 (USA), \$26.00 (foreign), postpaid from:

The Entheogen Review, POB 19820, Sacramento, CA 95819, USA.

Later WEITLANER continued:

It seems odd that the use of the mushroom called *Teonanacatl* was categorically denied, when we know that in the Mazatecan capital of Huautla de Jiménez its esoteric use is very well known. As has been said, here it gives way to the plant known as *Yerba de María*.

Perhaps it may be of interest to point out the fact that a plant called *Yerba de la Virgen* is used in almost the identical manner in the Otomí town of Santa Ana Hueytalpan, in the region of Tulancingo, Hidalgo, according to Dr. J. Soustelle, who learned of it and wrote us. However, he didn't mention an auto-diagnosis as takes place in our Mazatecan town (WEITLANER 1952).

*Yerba mora* is black nightshade or *Solanum nigrum*. The illness *Salvia divinorum* is used to treat can be physical, psychological, or magical. There is a more detailed description of crushing the *Salvia* leaves by hand (VALDÉS *et al.* 1983). WEITLANER's article is excellent reading.

When I was in Mexico City in 1980, I visited the NATIONAL HERBARIUM to look at their collection of *Salvia divinorum*. I

learned that in 1957 the Mexican botanist, ARTURO GÓMEZ POMPA, while in the Sierra Mazateca collecting mushrooms for the drug firm CIBA, found a *Salvia* species known by the Mazatecs as *xka Pastora*. He noted that it was hallucinogenic (*alucinante*) and a dose was 8–12 pair of leaves. Flowering material was unavailable (floral description is almost always necessary to define a new species), so it couldn't be identified past the genus level. Unable to return to the area before WASSON and HOFMANN's visit, he missed the chance to get the credit for identifying *xka MARÍA Pastora* (GÓMEZ POMPA 1957; GÓMEZ POMPA 2001).

This, then, is what was known about *Salvia divinorum* before WASSON and HOFMANN set out to collect the magic plant. These old articles pose some very important unanswered questions. REKO noted possible use of *S. divinorum* by the Cuicatecs, and WEITLANER by the Otomí. These people live in areas surrounding the Mazatecan heartland, and they as well as the Chinantecs are long overdue for study. These old explorers used horses and mules for their traveling, I used a car and a jeep, but I'm sure that now one could do it all by bus, if he or she were brave enough (traveling on rural Mexican buses can be a real learning experience). ☉

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold book exploring  
the legal substrate underlying  
shamanic mushrooms  
and their active principles.  
**NEW THIRD EDITION OUT NOW!**

\$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES  
POB 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is director of the ALCHEMIND SOCIETY ([www.alchemind.org](http://www.alchemind.org)), editor of the *Journal of Cognitive Liberties*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL MINDUSTRIES, POB 73401 (Dept. ER), Davis, CA 95617, or visit [www.specmind.com](http://www.specmind.com).

## PHARMACO PROHIBITA:

### “*Pschedelia*” and the Politics of Terminology

by RICHARD GLEN BOIRE

As of mid-April, 2001, information has been circulating that there may be a significant change in the way psilocybian mushrooms are classified by the INTERNATIONAL CODE OF BOTANICAL NOMENCLATURE (ICBN), the official system of nomenclature used by botanists in all countries. In addition to establishing the names of plants, the ICBN covers fungi. As discussed in the third edition of my book *Sacred Mushrooms and the Law*, most—but not all—mushrooms that naturally produce the entheogenic substances psilocybin and psilocin are currently classified within the genus *Psilocybe*. However, not all species of mushrooms within the genus *Psilocybe* are psychoactive (BOIRE 2001). Rumor has it that the current taxonomy may be revised to create a new genus that will contain only those (formerly) *Psilocybe* mushrooms that are indeed psychoactive. In other words, if the change occurs, the genus known as *Psilocybe* will contain only non-psychoactive mushroom species, and the new genus will contain only psychoactive species that can produce psilocybin or psilocin.

The preamble to the ICBN notes the importance of maintaining stable, or unchanging, nomenclature, and states that changes to established plant or fungi names are disfavored. “The only proper reasons for changing a name,” states the ICBN “are either a more profound knowledge of the facts resulting from adequate taxonomic study or the necessity of giving up a nomenclature that is contrary to the rules.” It is not entirely clear what new “profound knowledge” about *Psilocybes* may now exist, or whether the existing nomenclature for *Psilocybe* is “contrary to the rules.” The proposed change is based on DNA analyses that may have pinpointed a genetic difference between *Psilocybe* species that can produce psilocybin or psilocin and those that do not. (Partial gene sequences of some of these *Psilocybes* are posted on the web at [www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=Nucleotide&term=Psilocybe](http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=Nucleotide&term=Psilocybe).)

From the law and freedom perspective, such a change in nomenclature is problematic. Currently, no state law (except California’s) or federal law specifically outlaws mushrooms of the genus *Psilocybe*. Instead the laws all proscribe the active principles psilocybin and psilocin, and prosecutors must argue that any mushroom containing those principles is an illegal “mixture” or “material” containing a controlled substance. Thus, when a person is arrested in possession of a *Psilocybe* mushroom, the prosecutor (if challenged by a savvy defense attorney) is not only required to factually establish that the mushroom actually contains a controlled substance, but he or she must also establish that mushrooms that naturally contain the controlled substance are properly considered “mixtures” or “materials” as those terms are used in the controlled substances laws. This is a pretty significant burden on a prosecutor and can lead to a defendant’s acquittal. Creating a new genus that contains only psilocybin- or psilocin-

producing mushrooms may spur legislation expressly scheduling any mushroom in that genus. The new genus would provide legislators with a tidy and targetable category, which they could easily add to the list of scheduled substances. Were this to occur, all the existing obstacles that stand in the way of a mushroom prosecution would be removed. Rather than require a prosecutor to prove that a mushroom actually contains psilocybin or psilocin and that it is properly considered a "mixture" or "material," the new nomenclature would only require a prosecutor to prove the identity of the mushroom as one contained within the newly scheduled genus.

Further, if a new psilocybin-producing genus is created, and if it does spur scheduling legislation, the new legislation will likely also outlaw *spores* of the new genus (which do not, themselves, contain any controlled substances). This would be analogous to current law with regard to *Cannabis* plants. State and federal laws proscribe viable *Cannabis* seeds, even though they contain no appreciable THC.

Matters could be made even worse if the new taxonomic name gives an overt nod to the fact that the mushrooms are psychoactive. For example, at one point a reliable source told me that one name proposed for the new genus was "*Psychedelia*." While this name is, thankfully, no longer being considered, it is pretty clear that any similar name could paint a prominent bull's eye on the new genus for legislators to outlaw it.

Mycologist RYTAS VILGALYS, a professor of biology at DUKE UNIVERSITY, is said to be involved with the proposal for this taxonomic change. When *The Entheogen Review's* editor asked him for more details regarding this possible change in taxonomy, VILGALYS simply and somewhat mysteriously responded, "Nothing has been submitted, at least not yet. I can't say more than that."

Hopefully, the legal implications of any pending name change will be taken into consideration by any mycologists involved in such a proposal. ☉

## Journal of Cognitive Liberties

Each issue of the *Journal of Cognitive Liberties* reports on the latest threats to cognitive liberty: new court cases and legislation, law enforcement actions, and cultural closures related to entheogens.

More than just a law reporter, the *Journal of Cognitive Liberties* is a voice of inspiration and hope, a forum for expressing ideas on the value of visionary experience, and for discussing the politics, policy, and prospects of reintegrating full-spectrum thinking into modern society.

The *Journal of Cognitive Liberties* is sent free to members of the ALCHEMIND SOCIETY: THE INTERNATIONAL ASSOCIATION FOR COGNITIVE LIBERTIES. Members of this SOCIETY believe that the unique qualities of entheogens distinguish them from other drugs, and call for particularized legal treatment in keeping with society's highest traditions for protecting religious freedom, privacy, and basic human rights.

Basic membership in the ALCHEMIND SOCIETY is \$40.00 per year. Subscriptions to the *Journal of Cognitive Liberties* without membership in the Society are \$25.00 (USA), \$35.00 (foreign), for three issues. For more information, please visit our web site.

# MOVING INTO THE LIGHT...

My introduction to ELIZABETH GIPS came when I read her book *The Scrapbook of a Haight Ashbury Pilgrim: Spirit, Sacraments and Sex in 1967/68*. What the book did best was to present honest snapshots of what it was like to be a participant in the spiritual questioning that blossomed in the '60s. While reading this book, I was surprised to find myself infected by the enthusiasm of the time. GIPS was always a warrior, fighting the good fight with love as her weapon of choice.

After reading her book, I began a correspondence with ELIZABETH via snail mail, but it rapidly moved into cyberspace, with e-mails flipped back and forth. A few times she invited me and my family to Santa Cruz for a visit and interview (she was constantly interviewing people "in the scene" for her radio show "Changes," which had been on the air since 1975). But it wasn't until 1997 that we actually met in the flesh, at the MIND STATES conference. I had asked her to provide the commencement address, which she was happy to do. I should mention that anyone who knew ELIZABETH, knew that she had a mind of her own and she wasn't afraid to express it. She hopped on stage and began the benediction by saying, "I need to start with a bit of a downer, because this particular forum of having a pyramid with somebody up on a stage telling all you bodhisatvas 'where it's at,' seems *really* anachronistic to me." Only ELIZABETH would lambast the very forum that she was participating in, and I had to wonder if this wasn't part of the reason that she accepted the invitation.

ELIZABETH contacted me when she was busted for growing pot, asking if I knew of a good defense attorney. (This was the first that I learned of *Cannabis* being a good treatment for irritable bowel syndrome!) Clearly, she said, her use was medicinal (even before the proliferation of medical marijuana

initiatives). Of course the charges got dropped; as with "Brownie" MARY RATHBURN, who wants to bust a little old lady? Nevertheless, gardening was a love of ELIZABETH'S, and it wouldn't surprise me to learn that she planted a few more seeds after the situation had blown over.

ELIZABETH was someone who cared deeply about the happiness of others. And even when she was sick on and off for the last years of her life, she still radiated happiness herself. I recall one time when she sincerely queried an e-mailing list, asking about what plants might be useful for someone who wanted to end her life. There was no sense of self-pity in the request for information, but rather a clear note of self-knowledge. Before she was too sick to be able to participate, she held a party celebrating her "life and death." And even from beyond the grave, I got a letter *and* an e-mail from her, saying good-bye.

It was an odd synchronicity that I heard of ELIZABETH passing away on the last day of the second MIND STATES conference that I produced in Berkeley. Our common interest in altered mind states allowed us to say hello at this event, and it was also where mentally I sent off my farewell wishes.

With her strong love of life and her activist bent, ELIZABETH was a living example of the MARGARET MEED quote: "Never doubt that a small group of thoughtful, committed citizens can change the world. Indeed, it's the only thing that ever has." And, as ELIZABETH herself said, "Be happy. It's in our happiness and our growth that we create change."

ELIZABETH, I am happy that I had the chance to know you.  
— JON HANNA

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

Copyright © 2001 by *The Entheogen Review*. Nothing in this journal may be reproduced in any manner, either in whole or in part, without written permission of the editors. All rights reserved. All advertising and advertised products void where prohibited.

## SECURITY ISSUES IN A WORLD AT WAR (PART I)

by JON HANNA

*The unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives.* — The FEDERAL BUREAU OF INVESTIGATION's definition of "terrorism."

International terrorism has recently invaded the United States in a most horrific manner. The destruction at the World Trade Center and the Pentagon is disturbing, and yet domestic terrorism—created by our own government—goes on all the time and is rarely reported on in the mainstream media. Let me begin by describing four acts of such domestic terrorism—some worse than others—perpetuated against law-abiding Americans by their own government. I will then note possible ways in which such situations might be avoided in the future by similar businesses and organizations. In Part II of this article, which will appear in the WINTER SOLSTICE 2001 issue, I will discuss security ideas for the individual psychonaut.

**NIGHTBLOOMERS.** In 1979 this Berkeley company run by SAM PEDRO made its debut selling *Trichocereus pachanoi*—perfectly legal to do. They also provided ethnographic information about how this plant has been used as an entheogen by Peruvian cultures. In 1987 they were raided by California narcotics agents, their greenhouses were trashed, and thousands of pounds of living cacti were seized and destroyed. The charges were eventually dropped, but SAM PEDRO was left awash with bills due to damages and attorney fees, that forced him to close his business (BOIRE in GOTTLIEB 1997; OTT 1996). Eventually Mr. PEDRO opened a new related business, ROSETTA, which provides information only and doesn't sell plants.

**HERBAL-SHAMAN.** In the fall of 1998, this botanical vendor had a shipment of 100 kilos of *Voacanga africana* seeds (costing \$1,500.00 wholesale) seized by the U.S. CUSTOMS DEPARTMENT. I suspect that the name of the addressee on the box, "HERBAL-SHAMAN," piqued their curiosity. CUSTOMS found out more about this vendor easily enough, by accessing their web page on the Internet. CUSTOMS also found information about the plant at that web site, which stated that it contained the active chemicals "voacangine, ibogamine and other ibogoid alkaloids." Perhaps worried that some of these chemicals were scheduled, CUSTOMS contacted the DEA. The

DEA seemed concerned, and CUSTOMS would not release the package. (It is worth pointing out that even if these seeds *did* contain ibogaine or some other scheduled compound, there are hundreds of plants that contain scheduled compounds that are not illegal, and nowhere is *V. africana* listed as a scheduled plant. I have not heard of anyone targeting sellers of Asiatic jasmine, which *does* contain small quantities of ibogaine.) The situation was clearly one of deliberate harassment without legal basis, and it eventually resolved with CUSTOMS releasing the seeds after nearly a year. Why did it take so long to get them back? The seeds went to the DEA for analysis to find out if they actually contained appreciable amounts of ibogaine, which they apparently did not. The seeds then went to some department of the USDA where they actually germinated some to verify the identity of the plant (TRENER 2001)!

**THE PEYOTE FOUNDATION.** On January 8th, 1999, several officers of the Pinal County Multi-Jurisdictional Narcotics Task Force used an arrest warrant for a negligent child support payment as an excuse to enter the property on which THE PEYOTE FOUNDATION was located on. The next day, without any search warrant being served, they raided the property and confiscated 11,323 peyote plants, as well as slashing the covers on the greenhouses and trashing the interior of the home at the FOUNDATION. Three computers, all cash (\$177.00), and cancelled checks were taken, as well as family photo albums and scrapbooks with newspaper articles concerning peyote and the FOUNDATION's history. (The FOUNDATION had previously suffered the confiscation *and eventual return* of 1,000 peyote plants at the hands of Pinal County authorities in the winter of 1995.) The plants taken from the 1999 raid were never returned, despite the fact that no charges were filed. In December of 2000, the folks who ran THE PEYOTE FOUNDATION were forced off of the property that they rented. The Pinal County authorities threatened to charge the landlord with money laundering and racketeering, due to his making money from renting the property to the FOUNDATION, which according to the Pinal County

authorities was guilty of possessing, selling, or transferring an illegal drug to “non-Native American guests.” Never mind that no charges had ever been filed related to the second act of government-instigated theft (and the peyote had been returned following the first instance of such theft). The intimidated landlord, however, bowed to the Pinal County authorities threats. Officers of THE PEYOTE FOUNDATION moved off the land, and the organization no longer operates. All of this occurred despite the fact that Arizona law is very clear that the bona fide religious use of peyote is legal for all races.

RECENT RAID. On September 7, 2001 a company (who wishes to remain un-named) providing a wide variety of plants and chemicals sold under the stipulation of being “not for consumption,” was raided by agents from the FDA and DEA, as well as various other law enforcement agencies. Virtually all of their business records and a substantial quantity of their inventory were seized, including all their computers and computer data, all paper records, a vehicle, various items of inventory, postage stamps, scales, the blank business checkbooks, and many more items. None of the products that this company sold are known to be specifically proscribed by law; they operated a legal business. Nevertheless, their bank accounts were frozen, presumably leaving them without even the means to pay their attorney. At the time of this writing no charges have been filed, and no property has been returned.

It doesn't matter that a business or organization may be operating in a completely legal manner. In each of the cases mentioned above, no laws appear to have been broken. In some of the cases there was never even an attempt to file charges. The government can harass, invade, threaten, and steal, and unless one has substantial resources to fight for their rights (including a large amount of soluble assets and good legal advice), the businesses and organizations subject to such terrorism can't do much about it. One DEA representative has actually stated that the DEA would not hesitate to arrest “anyone who we thought needed to be, even if we knew for a fact ahead of time that no prosecutions would follow” (TROUT 2001). Due to this situation, there are a few things that might be considered by a business that caters to those interested in growing legal botanicals and performing legal research with novel chemicals, in order to try to avoid an attack by domestic terrorists.

KEEP A LOW PROFILE. This can mean *not* having a web page (although this might be a difficult option if one wants to retain a competitive edge). Rather than listing the name of your

business or organization on any mail—should your operation's name contain words that might arouse suspicion by CUSTOMS' agents or mail carriers—merely list the initials of your business or organization. “LEGAL HIGH BOTANICALS” is sure to raise more eyebrows than “L.H.B.” will. (Indeed, a name that implies consumption should be avoided entirely *in the first place*.) Businesses that might want to consider such a strategy include those whose name contains any of the following words or variations on these words (all of which appear in currently operating organizations): ayahuasca, bong, botany, *Cannabis*, dope, drug, entheobotany, entheogen, ethnobotany, hemp, herb/herbal, high, magic/magical, marijuana, mind, mushroom, peyote, *Psilocybe*, psychedelic, sacred, shaman, 'shrooms, trip, weed, and similar words. If suspicion is aroused and your organization *does* have a web page, then any government policing force is just a click away from confirming their *belief* that they may have some reason to look into your mail more closely.

KNOW YOUR RISK LEVEL. With regard to selling botanical products (not counting those that are specifically illegal, of course), it strikes me that the safest thing is to sell live plants and seeds. If the *plant* is the “drug” material, selling the seeds may be safer; if the *seeds* are the “drug” material, selling the live plants may be safer. Plants and seeds should be noted as being sold “for ornamental use only.” Using this phrase is better than saying that the plants are “not sold for consumption,” since by including the word “consumption” you have—as a seller—tipped your hat with regard to knowledge that some people *might* want to consume the plants. However, you *could* safely state that some of the plants you sell are poisonous. Selling *dried* plant material carries the next real level of risk, since it clearly is not intended for horticultural use. Selling extracts is more risky than this. Finally, selling pure compounds extracted from plants (or synthesized) may be the most risky. These risk levels are, of course, subject to some degree of debate—depending on what specifically is being sold, and in what *manner* it is being sold. But as a general rule, they probably hold true—especially in those cases where the legal botanical contains an illegal substance. Live plants and seeds absolutely should be sold with cultivation advice (or such advice should be provided on a web page), except in the odd situation where it is only legal to *eat* the seeds, such as with *Papaver somniferum* (poppy seeds). Cultivation advice should also be nixed for seeds that are legal *as seeds*, which grow into plants that may be specifically scheduled or considered de facto illegal (due to statements in the *Federal Register*), such as *Erythroxylum coca*, *Tabernanthe iboga*, *Catha edulis*, and psilocybian mushroom spores. (Note that

psilocybian mushroom spores are only themselves specifically illegal in California and Georgia.) As far as botanicals go, none should be sold with or have web page information—or even links—related to their chemistry, pharmacology, ethnographic use, or preparation for consumption. In the early 1990s, when there was only a handful of specialty botanical suppliers and no general Internet access, I could understand why a company may have felt that it was necessary to include such information. Today, with the *massive* amount of data available on the Internet, as well as the proliferation of small press publications dedicated to this topic, there is *no* reason to include this sort of information. Any such inclusion can only be argued—should it come down to that—that the seller was aware the consumer intended to use the products for a drug effect. Indeed, including any links to drug sites, or referencing publications such as *ER*, *Pharmactheon*, and/or *PIHKAL* is a bad idea, and *there is no reason to do so*. Most people have *some* access to the Internet, and a search engine can provide them with links to a lot of what they need to know. This is not only a concern from the perspective of specifically scheduled compounds that may occur in legal plants, but it is also a concern from the perspective of actions that the FDA might take on any plant that doesn't have their GRAS status (generally recognized as safe). The FDA has in the past simply made statements in the *Federal Register* of “bans” on particular products or plants (such as GHB and *Catha edulis*), which have resulted in them being yanked from sale in most instances, and those who did not comply were hassled and in some cases prosecuted. You can quote law to a cop all you want, but it won't stop him from trashing your home, possibly beating you, and/or sticking you in jail.

CONSIDER YOUR IMAGE. There is an idea that if materials are offered only as non-consumables, that they will be considered legal. Indeed, it is always better to offer botanicals for ornamental use, as voucher specimens, or for incense purposes (for example), than to explicitly state anything related to their consumption. (It should be noted, however, that the “standardized” *Salvia divinorum* products that are sold as incense might easily be seen as an “unauthorized drug” by the FDA—why else would the active drug ingredient be listed by mg amount?) The letter of the law may be on the side of someone selling pure compounds as “research chemicals,” and most big chemical supply companies—such as SIGMA/ALDRICH and LANCASTER—specifically state in their terms of purchase that the buyer must agree that the product is not being purchased for consumption (or even resale, that might result in consumption). While the ornamental/non-consumptive approach is the way to go, it is clear that—should a bust go down—one of the things that the prosecutor will be trying to prove is that the seller knew the products sold were being purchased for consumption. How can they do this? Well, if the only place that one advertises their botanicals or research chemicals is in *High Times*, *Trip*, or *The Entheogen Review*, this could be brought into evidence to show that the seller *did* know that their buyer might be using the product for consumption. There have been “paraphernalia” sellers who have been busted, or coerced into turning over their customer mailing lists, due to their advertisements in *High Times*. Based on where they were advertising, claims that their pipes were sold “for tobacco only” didn't fly. It is worth pointing out that concern over the marketing of legal herbs as illegal drug substitutes resulted in a FEDERAL TRADE COMMISSION decision

## SHAMANIC SNUFFS OR ENTHEOGENIC ERRHINES

a new book by

*Jonathan Ott*

A comprehensive review of diverse insufflated plant-preparations used as shamanic inebriants, primarily in South America, where such have been studied in greatest detail.

The first three chapters focus on the three major classes of snuffs—*cebill/cohoba/ñopo*, prepared from triturated seeds of *Anadenanthera* trees (legume-family); *epéna/hakúdu<sup>ra</sup>/yá-kee*, derived from bark, bark exudates and extracts of *Virola* trees (nutmeg-family); and that most important, and geographically-widespread sort derived from *Nicotiana*, or tobacco-leaves—and detail the history, ethnobotany, and chemistry of each.

A fourth chapter features 57 monographs of lesser-known types of ethnomedicinal snuffs, covering some 134 species, including many ill-studied African shamanic snuffs, and a *vademecum* of 16 stimulating and hunting-enhancing snuffs for hounds and horses!

The final chapter presents the results of the author's pharmacological modeling of these three major classes of shamanic snuffs: 26 psychonautic bioassays of bufotenine, 17 of 5-methoxy-dimethyltryptamine, and 17 of nicotine, which are shown to represent the major psychoptic principles of intranasal, sublingual, oral, fumatory, and intrarectal shamanic inebriants of *Anadenanthera*, *Virola*, and *Nicotiana*, respectively. The long-extinct Taíno snuff-culture is sensually evoked by a passionate prose-poem, and the book is documented by a 19-page bibliography of 465 sources; its wealth of detailed information made accessible by a 15-page index with 1341 entries.

Published by ENTHEOBOTANICA [Kronengasse, 11 / 4502 Solothurn, Switzerland / tel. 0041(0)32-621-8949], 2001. A limited edition of 1026 copies, hand-bound in leather, with cloth-bound slipcase, signed and numbered; with 1 color and 11 black-and-white illustrations; 160 pages.

— Please make checks payable to Jonathan Ott.—

that states that the producer of “Herbal Ecstasy”—an *Ephedra*-containing product marketed as a replacement for MDMA—cannot have their advertisements appear “in publications whose readers younger than twenty-one (21) years of age constitute fifty percent (50%) or more of the total readership” (*FTC File No. 962-3210*). Clearly it is a good idea to advertise in a wide variety of places, so that it can’t be shown that the only place you advertise is in “drug” publications. On the topic of age, placing an age restriction such as “customers must be at least 18 years old to place an order” could also be construed as an admission that the products are being sold for consumption, regardless of any disclaimers. Traditionally, age restrictions are placed on drug items such as tobacco and alcohol; why would a person reasonably have to reach a certain age to have a legitimate interest in gardening? Of course, if customers need to sign some sort of release form in order to purchase your products, then it does make sense that they would need to be an adult in order to legally be held accountable.

DEA vs. FDA. Many people interested in entheogens consider the DEA to be the main threat. It is true that at least one DEA representative has said that the use of any plant or drug to get high other than alcohol is illegal (TROUT 2001). While there no doubt could be some debate on this matter, it is important to understand that at least some factions of the DEA appear to be acting on the belief that this is true, and hence it *might as well be true* for anyone who gets thrown into jail or has their chemicals or plant products confiscated. Although it was some number of years ago that this comment was made by a DEA representative, the agent who uttered it may have had been a bit prescient. On April 3, 2000, the FDA published a notice in the *Federal Register* stating that it intends to act against the producers of “various products that are being manufactured, marketed, or distributed as alternatives to illicit street drugs.” Apparently, the FDA now considers any such product as an unapproved and/or misbranded drug and a violation of the FOOD AND COSMETIC ACT. This is despite the fact that the *very same* ingredients at the same (or larger) amounts could be used in a product that was entirely legal, as long as it was not marketed as a replacement for an illegal drug! For example, if a *kava*-based product was sold as a replacement for quaalude—such as the ridiculously named “E-LUDES” that are currently on the market—it could be considered illegal. But if the exact same *kava* was sold in an “herbal beverage,” such as PEPSI-Co’s “SoBe Shen Essentials,” it would be legal. Since the government can not find fault with a product’s ingredients, they target the method of marketing! This exemplifies that the recreational

drug user has become a government scapegoat, even when the drugs themselves are not scheduled. The FDA has stated that because these products are for “recreational use,” they can’t be considered as, and legally sold as, “food supplements.” (The notice defines *recreational use* as “to get high, to promote euphoria or to induce hallucinations.” Hell, a high-fructose caffeinic soda certainly isn’t a nutritional beverage—it’s something that one drinks for reasons of pleasure and stimulation, and hence can only be seen as being consumed for its “recreational,” euphoria-producing effect. “The Joy of PEPSI,” indeed!) This is a *very* disturbing FDA notice, that has gotten little press. It could be used as the “end run” that prohibits *Salvia divinorum* (one example, among multitudes), and I see no reason why the FDA can’t immediately say that sales of *S. divinorum* for consumption are currently illegal, due to this notice. The FDA has issued a “guidance” for manufacturers, which is meant to notify them of the FDA’s current thinking on this, and act as a “fair warning” to get manufacturers to quit production, prior to the FDA taking legal action. I see this as being very similar to what happened in the early days with GHB, and to what is currently happening to some sellers of 1,4-butanediol—even though it is not explicitly illegal anywhere that I am aware of. What it boils down to is that even if a plant is not scheduled, it can now be considered illegal based on the *intended use* promoted by the seller. This is another very good reason why those selling plants, seeds, or plant products would be wise *not* to market them as consumables, nor include any information about their pharmacology or ethnographic uses. (The FDA also says that you can’t make “unsubstantiated” curative medical claims on herbal products sold for consumption, which is why many such products include the disclaimer, “These statements have not been evaluated by the FDA.”)

KNOW THE ANALOG LAWS. The case mentioned above with the *Voacanga* seeds that were seized is an interesting one. To my knowledge, there has never been a conviction made based on the ANALOG ACT wherein a non-scheduled plant or animal that naturally produces a chemical that is “substantially similar” to an illegal chemical has been determined to be illegal. (The closest a case has come to this was when a married couple was busted for toad venom. It was threatened that the prosecutor would argue that the 5-MeO-DMT that the *Bufo alvarius* toad created was an analogue of the scheduled drug bufotenine. The defendants’ attorney reasonably responded that the ANALOG ACT was passed to protect against “designer drugs” that are created in an attempt to skirt the laws that schedule specific substances, and that no

plant or animal is creating these compounds for that purpose (VOGEL 1994)! In the end, the defendants pleaded “no contest,” (as they were also being charged with possession of LSD, morphine, and *Cannabis*), and hence no legal precedent was set in this case related to the ANALOG ACT.) With regard to the HERBAL-SHAMAN situation, since the seeds were eventually returned, the authorities clearly didn’t feel that there was a substantial case against the vendor. Still, this was before the FDA published their notice in the *Federal Register* regarding product sales, and it may be possible within the current climate to argue that the vendor of such seeds is selling them as an alternative to the scheduled drug ibogaine. Although I’ve said it before, it bears repeating: it is a bad idea to include chemical, pharmacological, or ethnographic data about consumptive use along with or in any way connected to the business that is selling the botanical product. For an important interpretation of the ANALOG ACT, I highly recommend reading Issue No. 9, (pp. 85–86) of *The Entheogen Law Reporter* (BOIRE 1995; see [www.specmind.com](http://www.specmind.com)).

**DON’T ADVERTISE UNNECESSARILY.** Minimize packaging that has the name and address of your business on it. The people who have already bought your product *know* where they got it from. Even if you operate in a careful manner, and set up your business by all of the rules, this won’t stop the cops from knocking down your door when some stupid kid has “overdosed” on the GHB, *Datura*, 2C-T-7, salvinorin A, *etc.* that you are selling and his or her parents find the package that the product came in with your company’s return address on it. I recall the story of BORDERS BOOKS nixing their distribution deal for JIM HOGSHIRE’s zine *Pills-A-Go-Go*, when a parent whose kid had overdosed found a copy of this in his bedroom, and they called BORDERS to complain. Clearly this isn’t as bad as it could be for the person who sold whatever product the kid ODed on!

**LIVE IMPECCABLY.** Don’t keep anything that is explicitly illegal anywhere on your property. The domestic terrorists may kick in your door, and trash your place, but hopefully (eventually) the charges—if filed—will be dropped or you will win your case. This will not be the case if you actually are breaking the law. Any broken law can be used as an excuse to get at you, as exemplified by the arrest warrant served for a late child support payment that got the cops on the property at THE PEYOTE FOUNDATION. Similarly, if you are running a business, pay your taxes.

**SHUT UP.** If you are in a business that is selling products as non-consumables, don’t discuss the consumption of your

products with anyone for any reason. This may seem like a no-brainer, but you would be surprised at how many conversations I have had about consuming non-consumable products with the owners of different businesses that are selling such products. There is no reason at all to jeopardize your business by having such discussions with anyone.

**HIDE RECORDS.** This protects you and it protects your customers. There are a number of businesses that claim to destroy all business records after an order is shipped. If they actually *do* this, great. But most people running a mail-order business (especially one with a web presence) keep some sort of customer records. It is standard business procedure to keep an “in house” mailing list. One of the best stories I heard was when the Arizona DEA sent a subpoena to RONIN PUBLISHING, demanding a list of all of their Arizona customers who had purchased *Cannabis* grow books, and RONIN responded that they were unable to cooperate, because they didn’t keep records related to what people specifically purchased. I have no reason to believe that RONIN was being dishonest about this, but they provided the *exact right* answer. At the least, customers’ contact information should be kept encrypted. Hell, access to *anything* on a business computer should be password-protected and/or encrypted these days. [Note: ER keeps its mailing list encrypted, and destroys all correspondence after transcription. — DAVID AARDVARK]

If all of the above suggestions seem to be too paranoid for someone who is running a completely legal business—they probably are. There are now hundreds of companies that sell specialty botanicals and dozens that sell research compounds of some sort. The fact is that most of these companies will not run into any problems. But why take the chance? Those who feel as though fear isn’t a reasonable motivating factor might wish to consider that in the light of the most recent raid mentioned in this article, several companies selling chemicals and/or botanicals have decided to close their doors. Even if one *takes* all of the precautions mentioned in this article, there is no guarantee that there won’t be a knock on the door someday. Nevertheless, appropriate harm reduction steps can’t hurt.

In Part II of this article, I will present the case for “pragmatic paranoia” from the point of view of a *customer* of specialty botanical companies. We must remain even more vigilant against domestic terrorism than we are against international terrorism; the fact is, it happens more often. ☉

# GALIUM ODORATUM, “MAY WINE,” AND COUMARIN

by DAVID AARDVARK

A subscriber to *The Entheogen Review*, D.C. from England, recently wrote in asking about the use of the herb *Galium odoratum*, also called “woodruff.” He noted that some Europeans (especially Germans), ferment this plant in sweet white wine to produce a drink called *Maitrank*, and that the resulting brew is said to produce an inebriation “more than that of the wine alone.” Researching this beverage turned up some interesting data.

*Galium odoratum* (formerly known as *Asperula odorata*, and commonly known as sweet woodruff, odorous asperule, or Queen of the Wood) is a short perennial that grows in Europe. When dry, it smells like freshly-mown hay. Due to this smell, it was frequently used as a “strewing herb” in the Middle Ages, to stuff pillows and mattresses, and one legend suggests that it was used to form the bed of the Virgin MARY (ANDREWS 2000). It is sometimes used as a fragrance ingredient, and is said to also smell a bit like vanilla, due to its coumarin content. Indeed, it has been pointed out that the coumarin-containing tonka bean, *Dipterxy odorata*, is commonly used as an adulterant in inexpensive Mexican “vanilla” extracts (OTT in VON BIBRA 1995).

Chemical constituents of *Galium odoratum* include asperuloside (about 0.05%) and monotropein, both of which are mildly purgative in animals. It also contains miscellaneous tannins, anthraquinones, flavonoids, and nicotinic acid (WREN 1988). Most sources state that it contains coumarin, C<sub>9</sub>H<sub>6</sub>O<sub>2</sub> (ANDREWS 2000; RÄTSCH 1998, ROSE 1983; VON BIBRA 1855/1995), but this has been disputed (BURNET & THOMSOM 1968; LEUNG 1980). Many plants do contain coumarin, including *Sida acuta*—a purported *Cannabis* substitute (OTT 1996). Coumarin has also been noted as a component of *Justicia pectoralis*, in a paper that discusses this plant’s use as a hallucinogenic snuff ingredient, which notes: “At doses approaching the toxic level, coumarin has sedative and hypnotic activity” (MACRAE & TOWERS 1984, citing KREITMAIR 1949; ITO *et al.* 1951; KITAGAWA 1956A,B). In medicine, *G. odoratum* has been used as a diuretic, tonic, antispasmodic, sedative, and hepatic; the plant has also been shown to have anti-inflammatory activity in animals (WREN 1988).

In BARON ERNST VON BIBRA’S classic *Plant Intoxicants*, within the context of speculations about the activity of *Angraecum fragrans*, or “Fahan tea,” it is noted that *A. fragrans* contains coumarin. Additionally, VON BIBRA states:

...coumarin is also contained in woodruff (*Asperula odorata* L.)<sup>1</sup> It is well-known that in many places in Germany and France, woodruff is added to wine, allegedly to make it more tasty but in truth to make it more stimulant (VON BIBRA 1995).

Hepatotoxic coumarin-like compounds in plants such as *Melilotus alba* and *M. officinalis* (“sweet clover”) have been produced when wet sweet clover turned into hay becomes contaminated with molds, which metabolize the coumarin into dicoumarol. As dicoumarol is similar to vitamin K, consumption of it inhibits the body’s production of vitamin K, which is necessary for the blood-clotting process. Wet summers led to an epidemic of “bleeding disease” in cattle, and these plants are less commonly used as feed today. *Galium odoratum* is said to cause the same problem (DOBELIS 1990). A synthetic coumarin-derived toxicant, *Warfarin*, is used in rat, gopher, and squirrel poisons.

In 1940 the FDA restricted the use of coumarin in food products, and on March 5, 1954, they banned its use in foods entirely. Nevertheless, the plant *Galium odoratum* (listed as *Asperula odorata*) strangely still holds its GRAS (generally recognized as safe) status for use in alcoholic beverages (*Code of Federal Regulations*, Title 21, Volume 3, Sec. 172.510 Revised as of April 1, 2001).

Even after the FDA ban, coumarin was for years used as a flavoring in the production of tobacco. Due to health concerns about coumarin as a tobacco additive, cigarette manufacturers removed coumarin from the permitted list of additives in September of 1997 (BATES *et al.* 1999); cigarette companies were required to report all cigarette ingredients to the US DEPARTMENT OF HEALTH AND HUMAN SERVICES, and coumarin had been shown to be a lung-specific carcinogen in laboratory mice and rats. Interestingly, there were no such reporting requirements for the ingredients in pipe tobacco, and coumarin was *not* at the same time removed from pipe tobacco (WIGAND 2000).

Does coumarin have additional psychoactive effects that add to those already present in tobacco? The following 1884 quotes from *A Manual of the Medical Botany of North America* by LAURENCE JOHNSON, M.D., related to *Trilisa odoratissima*—a plant that contains about 1.6% coumarin, as well as dihydrocoumarin (WREN 1988)—are certainly interesting:

[*Trilisa*] *odoratissima* deserves much more attention from the fact that it is largely used as an adulterant of smoking tobacco ... There is abundant evidence to show that the leaves of this plant enter largely into the manufacture of many grades of smoking tobacco, especially those employed in our domestic cigarettes. And the author is convinced, from personal experience and observation, that the deleterious effects produced by smoking tobacco thus adulterated are much greater than those produced by the consumption of pure tobacco in even great excess.

The inhalation of a few whiffs of the smoke from a cigarette made of this adulterated material, provided the inhalations are made in quick succession, produces a train of cerebral sensations of an intoxicating character as much different from any effect of tobacco alone as could be imagined; and prolonged use of such cigarettes invariably produces great derangement of the digestive organs, very little resembling the dyspepsia induced by excessive use of tobacco, together with cardiac symptoms of a distressing character.

And again, the habit of smoking coumarin in this form appears to be more inveterate, more exacting, than that of the use of tobacco alone, so that the unhappy victim—for this he should be called—is never comfortable except when indulging. Hence it happens that cigarette-smoking in this country, in its effects upon adolescents especially, is assuming the proportions of a great national evil, and is producing far more deleterious effects than in other countries where it is practised to a greater extent but with different material (JOHNSON 1884).

Returning our discussion to the *Maitrank*, or “drink of May,” the first recorded mention of it is said to be in the year 854 by a Benedictine monk from the ABBEY OF PRÜM in West Germany. It is produced in the city of Arlon in the south of Belgium, as well as other areas. In 1963 the “Brotherhood of the Defenders and Promoters of the *Maitrank*” was founded, and “The Festivals of *Maitrank*” traditionally occur during the third or fourth weekend of May. It apparently is not uncommon for German wine makers to adulterate certain white wines with seasonal fruits and/or plants. In the past, *Maitrank* was consumed only for one short period from 6 to 8 weeks, due to the seasonal ingredients and the fact that

this wine is best drunk “young.” And even today, small “personal use” quantities are still produced from April through May.

The *Galium odoratum* is supposed to be gathered before it flowers, when it is about 10 to 12 cm in length. The plants are then dried in darkness. One recipe I found on the Internet combines 4 cups of fruity white wine (Elzas or Luxembourg Moselle), the juice of 2 oranges, 3.3 ounces of cognac, 3 *G. odoratum* plants (without roots) 3.3 ounces of champagne, and 3.3 ounces of curacao. After mixing the wine, the orange juice, and cognac in a big bowl, one lets the *G. odoratum* soak in this for two days, and then strains the liquid and adds the champagne and the curacao. Served very cold, this produces enough for four people. Another recipe requires that one use 10 liters of a young, slightly acidic Gewürztraminer or Riesling-type wine (Bordeaux or Burgundy apparently won't cut it), and add 100 to 150 fresh strands of *G. odoratum*, 500 ml of juniper, 200 ml of cognac, 200 ml of liquor of oranges, 300 grams of sugar, and 3 oranges cut in pieces. In this case all of the ingredients are mixed and left to sit for two days.

To what extent the extracted *Galium odoratum* adds to the effects of this alcoholic beverage—and whether or not this is due to coumarin content—is hard to say. Hopefully this article will inspire some European *ER* subscribers to track down a couple bottles of *Maitrank* next year (kindly mailing one to us here, of course), or maybe even make their own. Perhaps we might be able to persuade someone to run GC/MS on a sample? I look forward to hearing some first-hand reports on this! ☉

# 4-ACETOXY-DET PRIMER

by TOAD

It could be said that the 4th-position tryptamines represent some of the best psychedelics in the tryptamine family. Among the classics, psilocin and psilocybin rank right up near the top. Many possible substitution patterns exist in this family, some of which have been synthesized and extensively tested. One such 4th-position tryptamine that deserves consideration and investigation is the *N,N*-diethyl cousin of psilocin/psilocybin called 4-hydroxy-DET (see entry #16 in *TIHKAL*) or more commonly referred to as CZ-74 in the scientific literature. CZ-74 and its phosphoryloxy sister compound CEY-19 have an interesting history. They were first synthesized in the SANDOZ lab by ALBERT HOFMANN and F. TROXLER in the late 1950s (HOFMANN 1958; TROXLER *et al.* 1959). A few years later these compounds were provided to several German research scientists for evaluation and testing under the direction of HOFMANN and A. CERLETTI (LEUNER & BAER 1965).

Several possible esters can be attached to the 4th position of the indole ring, which all share a similar pharmacologic profile. Those compounds that have been extensively tested are the 4-hydroxy, 4-phosphoryloxy, and 4-acetoxy esters. Once inside the human body, the 4-phosphoryloxy ester of DMT (psilocybin) has been shown to rapidly metabolize into 4-hydroxy-DMT (psilocin) by phosphatase enzymes (HASLER *et al.* 1997). It is theorized that the 4-acetoxy ester behaves in a similar way and gets metabolized into the active 4-hydroxy compound via esterase enzymes (SHULGIN 1999).

In our last report, titled "4-acetoxy-DIPT Primer," we mentioned that initial trials indicated the effects of the 4-acetoxy and 4-hydroxy esters were essentially the same. After further experimentation with 4-hydroxy and 4-acetoxy esters we have come to a different conclusion. While our experimental data points are still somewhat limited, it seems that there are definite subjective differences between the esters. Most notable was the extended duration, slight increase in potency, and smoother effects with the 4-acetoxy compound. Test subjects reported the same alteration scheme and general psychedelic effects with 4-hydroxy and 4-acetoxy esters, however all said they preferred the 4-acetoxy, even though some of them couldn't exactly put their finger on why. From the standpoint of chemical stability the 4-acetoxy ester is better since it

doesn't rapidly degrade in the presence of oxygen like the 4-hydroxy form does. It's quite possible the acetoxy compound may be transported into the brain prior to being deacetylated by the blood esterases, and thus would be considered an entirely separate and individual drug. These pharmacological questions form yet another fascinating chapter to the 4th-position story.

In the mid 1960s, Dr. HANSCARL LEUNER and G. BAER published a series of studies involving extensive clinical trials of CZ-74 with human volunteers (LEUNER & BAER 1965; BAER 1967; LEUNER 1962). They found CZ-74 to produce a psychedelic effect that differed only slightly from LSD and psilocybin. The overall effects were virtually identical in terms of the qualitative experience reported by their test subjects, with the only major differences being the dosage levels and duration. The physiological effects were found to be slight and within normal limits, even with high doses (LEUNER & BAER 1965).

LEUNER and BAER provided multiple sessions for their test subjects and noticed the pattern of inebriation changed over the course of repeated administrations. The most marked changes in the reports were the reduction of side-effects involving concentration and the thinking process (BAER 1967; LEUNER 1962). Clearly, as one gets more comfortable and adept with navigating a new psychedelic space the negative effects tend to be perceived as being less dramatic.

In looking at the results of LEUNER and BAER some observations can be made regarding the nature of CZ-74 and 4-acetoxy-DET. The physical effects were well established. There were slight increases in pulse rate, body temperature, and blood pressure, nausea, hypersalivation, reduced reaction of the pupils indicating mydriasis, somewhat increased reflexes, and coordination disturbances observed. The classic paranormal psychic effects of psilocin, LSD, and mescaline were also clearly present. The most frequent effects reported were a distortion of body image (100%), and optical hallucinations (90%), with optical sensations forming the biggest group of psychedelic effects reported in the study. The second largest grouping of reported effects were inhibition of speech articulation, nausea, euphoria, dysphoria, restless-

ness, and clouded consciousness, followed by acoustic hallucinations, paranoid thoughts, cosmic-mystical experience, age regression, and time distortion. Rarely, and only with the highest doses, did they notice extreme psychotic symptoms, with depersonalization, delirium, schizophrenic behavior with catatonic fits, and temporary paranoia happening (BAER 1967).

## DOSING STRATEGIES

Recently, I had the opportunity to experiment with 4-acetoxy-DET and provide it to a few friends. This compound shares in some of the positive qualities and attributes of psilocin/psilocybin yet has a shorter duration of 3–6 hours when taken orally. Similar to our results with other obscure tryptamine and phenethylamine research compounds, I have noticed a fairly wide variance in personal preference of dosage for 4-acetoxy-DET. Dosage levels varied from 10–33 mg orally with 18–22 mg being the average. I would liken the dosage response curve and effects to psilocin/psilocybin in that things get much more serious beyond a certain point. The line seems to hover around 25 mg with a sharp rise in the potential for ego dissolution beyond that. More sensitive individuals may find the line to be much lower. My advice is to tread carefully when experimenting with this powerful tryptamine and work it up slowly in progressive trials starting with 10–20 mg. In my experiments I have preferred higher dosages of this compound, feeling more fluent and free to explore the space as the veil gets completely lifted. However, I have witnessed several difficult trips with this material and I'm by no means suggesting that high doses (above 25 mg) will be appropriate for the majority of readers. If you choose to experiment with high doses I would recommend that you do your low- and medium-dose homework first and then have a sitter on board. *Caveat Emptor!*

The free-base form of 4-acetoxy-DET also lends itself to pyroassay technique. Smoking anywhere from 5–20 mg can provide an immersive full-flavored tryptamine experience. It takes a bit longer to fully develop and is longer lasting than DMT. Be prepared for the unexpected. There are only a few reports of this route thus far, and some variance in personal sensitivity has been observed. One person was completely smashed with 15 mg while another found the experience to be quite mild at the same level.

As far as I know no one has tried insufflating 4-acetoxy-DET yet. I will wager it's quite active via this route. Extreme caution is advised. I would start with no more than a few mg and then wait several hours before bumping it up any further. Please be careful folks—there's no need to repeat the tragic mistakes that others have made snorting large amounts of 2C-T-7.

4-acetoxy-DET can also be utilized for IM injection in HCl salt form. LEUNER and BAER used between 0.05 mg and 0.28 mg per kg of body weight of the similar compound 4-hydroxy-DET, with the duration of effects averaging 3.5 hours. I suggest mixing up only enough solution for one session at a time since the material is quite unstable in water. It will begin turning black with decomposition within several hours time. For this reason 4-acetoxy-DET isn't suitable for liquid measure technique or long-term storage in solution. 4-acetoxy-DET has also been known to degrade from a crystalline powder into a dark brown goo if kept in a hot and/or humid environment. We currently have very little data on whether this affects the potency or quality of the experience. I recommend that it be kept in dry, crystalline form in a well-sealed glass vial, frozen if possible.

I feel compelled to describe the synergistic potential that exists between ketamine and the high-power tryptamines. Similar to our results with combining DMT/DPT/5-MeO-DMT with ketamine, combining 4-acetoxy-DET with ketamine also provides an incredible synergy. Ketamine is the perfect lubricant for a full-impact tryptamine bardo experience. A precisely matched yin for the yang allows the well-oiled universal gears to run full throttle straight to the source. Providing cooling dissociative waters to the white hot fire of the rising phoenix greatly reduces the physical and emotional aspects of the experience and makes the space much easier to navigate. Highly recommended for the cosmic-mystical near-death inclined! I would suggest that experimenters be well-versed with ketamine before trying it in combination. Be very cautious, start with low doses, and always have a sitter present while you are working it up. I find the optimal configuration to be a medium-to-high dose of the tryptamine and a low-to-medium dose of ketamine administered at the same time via IM injection. Of the many things I have tried the DMT/K combination is my favorite medicine for complete access to the source. Xenon gas while on mushrooms or LSD comes in at a close second. Perhaps if I had the good fortune to own as much xenon as the US government does, I would reconsider my vote. More on this topic in the months to come...

## PROTOCOLS

The protocols of Leuner and Baer were quite different from my informal testings of relatively new compounds over the years. My experiments are usually conducted with experienced psychonauts, who are informed of the structure, probable pharmacology, and reported effects. One thing I have noticed is how my expectations can dramatically influence my first experiences with a new compound. It has been quite interesting to watch how the real pharmacodynamics of a new substance only get truly defined after a substantial number of people have taken it. This was clearly the case with 2C-T-2, 2C-T-7, DPT, 5-MeO-DIPT and 4-acetoxy-DIPT. Wider distribution and testing provided additional data showing the effects and personal preferences for these compounds are quite variable. Expectations aside, data provided by experienced psychonauts has much to offer. They can provide direct comparisons and detailed descriptions of the subtle nuances that inexperienced test subjects cannot. It would seem optimal for future articles to include data points from both sides of the coin—the neophyte and the well-trained psychedelic connoisseur.

## SET & SETTING

What I found particularly interesting about the approach of LEUNER and BAER was that no suggestions were given to their subjects and the setting was as unstructured as possible. The test subjects were not told anything about the nature of the drug and had no idea what to expect. Most of the subjects were not even aware of the existence of psychedelic drugs in general, as these experiments were done before the LSD hysteria of the '60s. The set and setting was minimized and all external stimuli avoided. After administration via intramuscular injection each subject was brought into a darkened room and asked to relax. This kind of protocol seems to provide a balanced picture of the overall possible physical and psychological effects.

It was very surprising to note that cosmic-mystical type experiences occurred for only 14% of the test subjects in LEUNER and BAER's studies, and the majority of these were cases of theologically-conscious individuals who had some predisposition towards such an experience. This says a lot for set and setting! Perhaps mystical experience is reserved for those who actively create it in their lives. Yet another clear example of the "what you think is what you get" precept. How you wish to create your experience is entirely up to you. A lot will depend on your preparation and intention going in to the experience.

This material can most closely be compared to psilocin/psilocybin in terms of the overall psychedelic effects, however it is clearly unique with its own vibration and experience. In lower-dose experiments you may find yourself completely functional and able to be active in a peaceful nature setting or safe outdoor environment. For medium- and high-dose trips I would strongly recommend that you have a plush and protected tripping pad set up so that you may relax and fully immerse yourself without any distractions. There is a good possibility of nausea occurring during the first half hour of the experience but it seems to pass relatively quickly for most people. As with other psychedelics it works best if you go into the experience with an empty stomach. There have been several reports of muscle tightness and/or tremors similar to what we have seen with 4-acetoxy-DIPT and DPT. However the physical side-effects observed thus far seem relatively benign. The visual element is particularly striking with this material. You will most likely enjoy a menagerie of rainbow visions and color hues. Music and sound can be incredibly influential in creating a specific and desired effect—sound creates space. This is quite evident by the many shamanic and mystical traditions that make use of sound to influence the course of consciousness. Alternatively you may wish to explore sensory deprivation, with eyes covered in darkness and ears padded in complete silence. Many possible configurations for inner exploration abound. That said, 4-acetoxy-DET seems best suited for small intimate groups or individual exploration in controlled settings. It demands respect, foresight, and careful consideration. This definitely isn't the type of drug you gobble down prior to heading off to your neighbors 4th-of-July BBQ. There are other new compounds that are much more suited to enhance social debauchery.

As a caveat readers should note that this primer was written by someone who has a vested interest in the dissemination of this material and the spread of pertinent information regarding its use. Although the author has tried to present a balanced collection of the available reports, the reader is reminded that everyone's reactions vary and extrapolating from this small collection of generally "glowing" reports should be done with caution.

## TRIP REPORTS

### 5 MG AND 10 MG (ORALLY?)

[The following report was adapted from the SHROOMERY forum on the Internet.] I've tried it twice at 5 mg and 10 mg. I've had a bad trip with 5 mg—this is definitely a potent tryptamine! Second trip at 10 mg was okay and very much like psilo(cyb)ine-containing mushrooms. I don't think I could differentiate between them in a blind test. But there are several worrisome signs: in both trials muscle tremors much nastier than the ones of 4-acetoxy-DIPT, and during the 10 mg trial I had some severe jaw tightening (this is not fun at all; my jaws were completely blocked for a full hour). Also in both cases there was a certain dark and ominous touch to the trip—mushrooms don't have that for me. Perhaps this is only my own idiosyncrasies and not something specific about this substance. My final judgement on this tryptamine is that if you have an easy access to mushrooms don't bother! — MEILIKHIOS

### 10 MG ORALLY

I started with a low dose to get my feet wet. I don't enjoy psilocybin as much as other entheogens because of the trance and intoxication I experience; many times I find myself jerking straight up as if waking from a disturbing dream.

Tryptamine buzz begins in 20 minutes. (I had eaten no food for 6 hours prior to taking the drug.) I'm at the equivalent high of 1 gram of mushrooms in 50 minutes. From this time until 1.5 hours, my thinking becomes conceptual (like mushrooms), I have slight anxiety, colors are brighter (like mushrooms), I'm getting slightly intoxicated (not as bad as mushrooms), and I feel in control even though I'm unsure of the direction I'm heading. By two hours I've definitely peaked. My thinking is slightly trance-like, not at all like the more

controllable, amphetamine-like thinking on phenethylamines. Very much mushroom-like, except I don't feel the usual "perhaps I've poisoned myself" toxicity. This is a clean substance. At this dose there is no great insight, weak visuals, slight euphoria, little anxiety, trance-like thinking, medium body load, no nausea, and a desire to try it at 15 mg. I was down in 4 hours. For two days after the experience I was able to clearly see through my sometimes self-defeating, habitual responses to negative stimuli. — SMITH

### 13 MG ORALLY

Dissolved into ginger ale quite easily. It came on within 10 minutes of swallowing it on an empty stomach. Taste was barely noticeable. The visual iridescence I typically note with psilocybian mushrooms was definitely there. Conversation was easy, and we spent some time moving through personal material.

At one point in the conversation, I had a flash of memory from early childhood, being carried on my father's shoulders through the woods, including sunshine on the skin, a light breeze, and a sense of extraordinary well-being that was transmitted from the heart of the Universe. This flowered into a deep recognition that I was one with the Creator, and I felt I had come home to myself once again. Nothing I haven't experienced before, but with a renewal and deepening that was wonderfully wholesome and strengthening. I noted that I have had similar experiences with mescaline.

Still feeling the heart vibrate serenely with the Source, which revealed itself very deeply at the peak of the experience. We also processed a lot of interpersonal material in a very healing way. This is one of the deeper experiences I have ever had. The elusive plus-4 was definitely touched this evening.

After becoming one with the Father Creator, I began to gradually re-enter my ordinary awareness, and observed some of the side-effects of the material. This included a slight muscle tension, particularly in the neck and shoulders, that eased up a little with some stretching. Later that evening, EVENSTAR noted that I had some involuntary twitching and leg jumping that is usually only noticed when I take mescaline or certain other phenethylamines. I was quite tired the next day and spent the day lounging and occasionally dozing. Felt fine the third day, though I noted a slight slowing of my usual cognitive acumen.

The euphoria persisted well into the next week. On the way into work that Monday, I became so bucolic at one point that I inadvertently bumped my car into a truck in front of me at the light, a slight paint scrape on my bumper, but no major damage done. All in all, a material worth exploring further.

I would add that 4-acetoxy-DET is similar in some ways to psilocybin, lacking the “dark side.” This could be advantageous in some circumstances. (NOTE: *I have seen one report that suggested exactly the opposite. Personal idiosyncracies and differences are to be expected.* — TOAD) However, it has been my experience that psilocybin does not affect my system like a stimulant at all. It is somewhat neutral with regard to the emergence of psychological/spiritual material, which allows for a greater psychic sensitivity and deeper journeying with it. The ability to tap into shadow material makes it quite powerful for plumbing the depths of the psyche in a way that I can't accomplish with say mescaline, or 4-acetoxy-DET (based on my one experience). I also think that to the degree I can plumb the deeper, darker regions of my psyche, I can also equally extend the antipodes of consciousness toward the higher regions as well. — ELFSTONE

#### 18 MG ORALLY

#### ±14 MG PYROLYZED

Oh my. This is some surprise. I had recently tried 4-acetoxy-DET at 18 mg orally, and the effects were quite different. They were very similar to smoked DET experiences of some 35 years ago, my first and most enjoyable tryptamine experiences. During this last oral experience, there were no open-eye-visuals except for a shifting of visual gears through which everything was visually altered but nothing was melting. There *were* some slight closed-eye-visuals. Conversation and following a line of thought was not hampered by the substance and those of us present felt that while the substance was enjoyable by us older psychonauts, some of the younger ones might find it slightly boring. Empathogenic effects were noted by all present and it was agreed by all that a larger dose would be welcomed. The effects had been stated as “similar to three grams of *Psilocybe cubensis*,” but those of us who tried 18 mg orally all felt that it was not anywhere near as strong as advertised. Still, it was a worthwhile experience.

So, some three weeks later, I pyrolyzed ~15 mg (actually 14 mg or less), which I had heard was an effective and potent dosage for this method. Pouring the carefully measured 15 mg from the capsule onto a bed of herbal material, it was

covered with some more herb material to make enough for one good inhalation, which was then ignited and inhaled. Within seconds the familiar “DET rush” began, but this was *much* stronger and different than the oral dose. Almost immediately the DET threshold was somewhere in the far distant past; this was an immediate and extreme electric melt-down. Space became filled with floating luminous transparent brightly colored spheres that drifted randomly as if under the sea, and was shot through with multicolored flashes of ephemeral lightning. I was still visually in the same room from which I started, unlike some other trips. I was indeed in a space similar to that experienced after ingesting a large amount of psilocybian mushrooms. This was quite a surprise. I had been expecting a nice, quiet, calm evening of DET and instead got suddenly and unexpectedly whirled into the center of a psilocybian maelstrom. Oh well, nothing to do now but sit back and enjoy it. For the first 45 minutes there was somewhat of a problem due to the immense amount of energy I had to channel, and for which I was unprepared. I was not expecting this intense a trip, but rather one similar to DET, which is much more like that period of time *after* the peak of an entheogenic experience. I have some nerve damage due to an automobile accident some years ago, which manifests as leg twitching during the peak portion of the most potent of entheogenic experiences.

I experienced continued and severe twitching in my calf and thigh muscles, which was only relieved by lying on the bed and moving sinuously, like a fish through water. This allowed me to channel the energy without spasms. During this time I continued to see floating spheres and experience the sensation of being under water. This was whether my eyes were open or closed. This experience of seeing the same thing whether one's eyes were open or closed is something I was familiar with from other tryptamines. However, with my eyes open, the room my body was in was always there behind the visuals. At no time did I feel threatened or experience any depersonalization or ego loss. I was still the same person I always am, just under a different set of reality issues. I had the RADIOHEAD *Kid A* CD on the player and about halfway through it, I had to replace it with something more melodic. It was during this time that the twitching was at its most severe. I replaced it with STEVE HILLAGE's *Fish Rising*, a somewhat more melodic if just as exotic piece, which helped a lot with the trembling.

After 45 minutes or so, the trembling subsided, everything ceased to melt endlessly, and I went to go sit in a chair. At this point the experience became much more fun.

My white cat LATEX jumped into my lap and curled up upside down. I remember stroking the cat into a trance and talking it through an “out-of-kitty-experience.” Both of us had a great time, and the cat’s personality has become much more relaxed overall. What used to be a skittish cat is now open and friendly to visitors it has not met previously, something completely new. I remember eating some snacks I had left out about two hours into the experience. The fruit and juice was the best I had ever tasted, of course. The erotic side of this substance kept making itself known during the course of the journey and sex would be something remarkable, in my opinion. I was still some distance away from baseline after more than 5 hours when I retired for the evening. Sleep was somewhat difficult. The next day I had a headache and a hangover. I am not certain if this was due to the extremely taxing physical nature of the experience or my getting old, but I am not used to hangovers from psychedelics. I would not hesitate to try this substance again, but would use a smaller dose next time. I think it might be more fun without some of the extreme effects, if they can be mitigated. I would also like to try it again orally to confirm the vast difference in effects in similar dosages when pyrolyzed or ingested orally. The next day I looked at the capsule that had contained the powder and there was still at least 1 mg remaining in it. This only reinforces my opinion that a smaller dose would be worth trying. I look forward to having the opportunity to try pyrolytic assays of 5 mg and 10 mg sometime in the future, as well.

As my 4-acetoxy-DET experiences have been consistently marred by about 1 hour of uncontrollable muscle spasms in the thighs before settling down to something more enjoyable, I don’t think that I want to try the high-end just yet.  
— TAO JONES

#### 16–18 MG ORALLY

Very similar to mushrooms, almost identical “waves” and overall duration. Smooth on the body; no side-effects noted. Definitely an interesting material. Not completely satisfied—there was something uncomfortable about it when compared to psilocybin/mushrooms. Maybe it is just because I’m very used to psilocybian mushrooms and this is different; maybe not. I would take it again but at a higher level (25 mg?). At this level (16–18 mg) I often felt like being between the worlds and out of touch with the experience—like being a detached spectator. I imagine this could be different with higher dosages!? Its cousin 4-acetoxy-DIPT

proved to be much more spectacular for me. While this one is very similar to psilocybin the 4-acetoxy-DIPT is a show of its own—a *very* interesting show! — CROCODILE

#### 5–35 MG PYROLYZED

#### 16–20 MG ORALLY

My first experience with 4-acetoxy-DET was a bust. Having heard that 20 mg was active when smoked, I tried it with a friend. Unfortunately, we didn’t have a pipe handy, so I poured two piles of the stuff directly onto the electric range, and we rolled up some paper straws. After it liquefied and began to vaporize, I realized that we had made a mistake making two piles, since—when we each took a break after the first hit (to breath some air)—the vapor was still rising and drifting off without being consumed. I probably got 5–10 mg, and then I was hit with the overpowering need to *immediately* vomit. I turned towards the sink and blew chunks (my recently-consumed roadside taco-stand lunch). Meanwhile, my friend kept at sucking up the vapors from both piles. He probably got about a 20–30 mg dose, although it is pretty hard to say for sure what either of us got. The only

## THEATRUM BOTANICUM

Rare Plants  
(Catalog \$2)

Theatrum Botanicum

[www.GreenStranger.com](http://www.GreenStranger.com)

effect I experienced was a slight enhancement of color. My friend said that it hit him like a ton of bricks—similar to DMT. He felt as though he were fully-immersed in a 3 gram mushroom trip, and he had to sit down. However, his effects rapidly wore down to about 1 gram of mushrooms.

I had heard from one individual who tried smoking 15 mg, and then later 20 mg, who had little to no effect from both attempts. He was surprised and perhaps skeptical to learn from me that I had heard that 18 mg was a reasonably-active oral dose. I get the feeling that the smoked dose may be more variable, and it could be harder to hit the nail on the head. It is possible that the heat breaks down the activity. Certainly, if I ever smoked it again, I would do so on an empty stomach (since I have never before had such an immediate need to vomit). Orally, however, this compound was another story...

While at BURNING MAN, I had the opportunity to sample a 16–20 mg dose. (My scale weighs within an accuracy of  $\pm 2$  mg—and I weighed out 18 mg—but due to the potential to over- or under-weigh by 2 mg, I can't *really* say for sure that this is what I took. I have often wondered whether or not the psychonauts reporting in *ER* have better scales than I do, or if perhaps the *exact* doses reported on aren't *really* so exact.)

I was hanging out after dark at the “Lush” camp, near “Emerald City,” waiting to hear the band LOST AT LAST, whom I first heard about a year ago at the “Countdown to 2012” party in San Francisco. The drug came on before the band started. I first noticed that my stomach felt as though it was a rubber ball, being gripped firmly by two hands that were squeezing just slightly. No *real* nausea to speak of, but I was aware that something was going on. It is hard to characterize the effects of a new compound *at* BURNING MAN, since the environment is already so surreal. Nevertheless, if forced to make comparisons, I would say that this stuff is *very* similar to psilocybian mushrooms. Indeed, I'd go so far as to say that with known doses of this as a pure compound available, I don't know that I'll ever need/want to do mushrooms again. My “about 18 mg” dose was strong enough to get the full flavor of the effects, but not so strong to be overwhelming. The perfect dose for being where I was at the time (although I occasionally felt slightly claustrophobic in more dense areas of the crowd while the band was playing, and had to move to the less populated playa). If I was at home or with a small group of friends, I would definitely take a higher dose, more suited to a vision quest. This is an excellent material, which is sure to find a well-worn spot as a favored pharmactheon.

— DAVID AARDVARK

## 20 MG ORALLY

T+20: Slight head change.

T+45: That head change increased gradually, and at the 45 minute point it was kicking in pretty strongly. The walls and ceiling were moving in waves and fluid patterns. There were electrical looking color waves in the air, like thin lines of rainbow colors squirming through. All not unlike a psilocybin experience. I felt a hint of nausea but not too uncomfortable. It was gone in another 1/2 hour.

T+1 to 1:15: I am definitely peaking at this moment. I have the mushroom-drunk inebriation feeling, but not as confusing. Spiritually/emotionally I am pretty intact although I would compare the audio/visuals of this dose to about 3–5 grams of psilocybian mushrooms. I feel that I am capable of pushing myself in any direction for exploration but this time I choose not to. I get an overwhelming feeling of happiness at times, where I just want to laugh and feel like I have a perma-grin on my face. I also feel stimulated to the point where I have to get up and walk around. Time seems to be going slower—I feel like I have been tripping for 3 hours.

T+2: I have passed the peak and can definitely feel the decline at this time. Although I still have a good amount of audio/visual effects, I know that in another 1 to 1.5 hours the visuals will subside and go away completely. I notice that I can see sound and perhaps hear light—I enjoy this greatly. I watch my girlfriend speak and can see the words come out of her mouth and see her “energy,” which is very amusing.

T+4: No more visuals, although I don't feel like I have just taken a drug with *that* much potency. I don't feel tired and exhausted like I might from 2-CT-7 or LSD, or even 5-MeO-DIPT. I still continue to have a vibrant conversation with my girlfriend for another 2–3 hours before I am completely baseline.

T+6: I don't feel exhausted, but just have the feeling that I want to sleep. And I sleep well.

I agree with ELFSTONE when he says that this substance is neutral in where it goes. It didn't seem to push me in any particular direction but I could also sense that if I choose to push my self, I would be easily transported. I know that if I had closed my eyes and focused I could easily be taken away to a beautiful mystical place. IMHO, this stuff is great—too good. — BENDER420

20 MG ORALLY (I tried this level three times, with one 18–20 mg dose eyeballed by comparison to a known amount; all other doses and consumption methods have only been tried once.)

20 MG PYROLYZED

22 MG ORALLY

25 MG ORALLY

~27 MG ORALLY

At around 20 mg this is a wondrous material. It shares much of the best of psilocybian mushrooms but in a friendly and pleasant package. In contrast to 'shrooms it produces a very steady state and user-friendly response rather than the wave-like and often unpredictable experience of 'shrooms. It strikes me as a truly empathogenic psychedelic. Although sometimes a little too much so. Some of the boundary-dissolving experiences have created surprising and unexpected juxtapositions of perception such as (with 27 mg) finding myself, a chest of drawers, and an unpotted *Ariocarpus kotschoubeyanus* partially overlapping in a transpatial/-temporal melange. Within small, localized regions of overlap we seemingly co-existed as a fused chimera but existed separately outside of those areas. It was quite a bizarre sensation. I have *no* clue how the cactus got mixed in as I hadn't seen it except in my mind at that time.

Partially merging or overlapping with solid objects or other things around me has been fairly common for me at 25 mg or above. Most people would find 18–22 mg enjoyable and useful. Many experienced people would appreciate 25 mg even more, despite the increase in boundary-dissolving experiences (lots of us *like* having our boundaries dissolved and aren't threatened by ego-loss). Above 25 mg: whether a person likes this or not appears to hinge around their level of experience and comfort with intense peak states and potential depersonalization. It appears to be an excellent solvent for removing boundaries and illusions. Preparedness may have a lot to do with this, as might mental state, but my level of experience with it is inadequate to know—*yet*.

At a dose of around 30 mg a friend experienced a complete ego-death rivaling anything he had experienced previously with high-dose LSD, and found himself obliterated in total fusion with the Universal Mind. He also perceived himself as partially merged with two or more malevolent entities, which he perceived as feeding off his mind and emotions while attempting to direct or influence his behavior. This was found intensely distressing and bothered him a great deal

even after the fact. What I found fascinating is that this type of astral parasitism was in complete accord with what he *believed* as a part of his healing practices, yet it had never bothered him prior to *experiencing* it as real.

Of any new substance I've experienced in the last 20 years *nothing* has impressed me more than this one. I'd place it right up there with mescaline, 'shrooms, and DMT as one of my absolute favorite experiences and with no more potentially negative elements than *any* of those three. The euphoric elements are excellent. The clarity of mind, visual perception, and wonderfully-delicate colored imagery, are nothing short of remarkable.

The feeling of shared space and mind is great. I've left every trip feeling as if my connections between both friends and universe have been greatly enriched. In fact anyone I've tripped around while using this material feels like family to me now. At all but the highest level experienced so far there has been a calm sense of belonging wherever I was and a distinct feeling as if I was smiling inside. Even at the higher levels it has been incredible despite a touch of edginess in spots.

I'd recommend that people *don't* use over 25 mg unless they can deal with potential depersonalization and universal fusion accompanied by extremely altered body perception. If this is not a threat to people then higher levels might be found quite valuable to experience. I would suspect a truly transcendent experience might be possible.

It has also left me with a lot of residuals in thought, perception, and my phosphenes. I've liked feeling more connected with the world; keenly aware of both the needs and limitations of others and much more tolerant and less judgmental. My sense of empathy even for people I disagree with has persisted long after the drug has worn off. I'm not certain that portions of my mind weren't rewired in a very positive direction after only a few experiences with it. Certain aspects of the experience (at 25–27 mg) have been perplexing and defy definition.

Smoking 20 mg proved overwhelming and distressing mentally and was very hard on my lungs (very much like DMT in the physical impact on my lungs). It caused a literal tsunami of images, sensations, thoughts and colors swirling through me. Something in-between 'shrooms and DMT but with a character all its own. I remember relatively little about the experience except being glad that it was over. I wish I'd read TAO JONES' account prior to smoking, so as not to have felt

like I wasted some precious material without a productive result. In retrospect, I'd probably start out by smoking a relatively few mg and working my way up slowly. (I'd likely use the same low dose of 5 mg, with 2–5 mg bumps as needed, if insufflating it.)

I also noticed that when using 18–22 mg, the experience lasted about 2 hours with a roughly 20 minute onset and a nice mild “glow” after the fact (used orally). When using 25 mg to ~27 mg (the most I've done so far in a handful of trials), the peak still ran around 2 hours but the experience was quite discernible at a diminished intensity for 3–4 more hours. A fascinating thing observed with friends and also noted by LEUNER and BAER is that not simply the level of effects but also the duration can vary dramatically from one person to the next. For instance the first time I tried it was with 3 friends. One person was back in 90 minutes, 2 of us were back in around 2 hours whereas the 4th was going for almost an hour longer.

I suspect that for psycholytic therapy currently involving LSD or 'shrooms, this substance might prove a favorite among therapists. Verbal interaction is easy, duration is short, and effectiveness is excellent. Depersonalization seems to be controllable by regulating dosage, permitting a wide range of applications. For people *seeking* depersonalization and ego-death experiences, this material (at 30 mg or above) might prove a better choice than LSD due to its shorter duration and greater clarity of mind. My impression though—based on only a few experiences—is that applications of this substance should be restricted to normal or fairly normal people. I'd suggest that psychotics and overly sensitive or fearful/anxious people be strongly discouraged from its use, or else be accompanied by professionals who are both competent at dealing with potential crisis states and extremely experienced (specifically including the prior use of this material by themselves). — JUSTIN CASE

### 18–30 MG ORALLY

I was excited to try this compound, as it was the first that I would actually get to try in a pure form so closely related to psilocybin. Granted I have had plenty of tryptamine experience, with some synthetic materials but most of natural origin. *Psilocybe cubensis* is native to my area so I have explored this mushroom in depth. The variability in the experience between strains and species of the natural mushrooms is obvious. My interest in trying synthetic psilocin or psilocybin

is much more to confirm that the additional indoles baecocystine and norbaecocystine color the mushroom experience. So when the opportunity to try 4-acetoxy-DET arrived, I was delighted.

*Wow!* This stuff is one of the cleanest, least body-load tryptamine I've ever experienced. It has a duration that mimics psilocin, onset 10–20 minutes, peak 2–3 hours, and an easy half hour glide down. I assayed it first at 18 mg and found it much to my liking. The color visuals induced by this oral dose were very prominent—beautiful and fast geometries. It had a bit of a psilocin nature, but not totally. It was nearly overwhelming, although I never lost sight of the place I was in. It was very beautiful. But visuals alone, as much as I love them, do not entirely define a good psychedelic for me. This substance kept my head clear, my thinking was absolutely impeccable, despite the sensory overload. This was a *good* overload, by the way. The bodily sensations were incredible. I can only describe them as wave after wave of full-body orgasms washing over me. Later investigations brought the dosages up to 30 mg with nothing but the positive effects increasing. There were *more* colorful visuals washing over me in orgasmic glory. Absolutely no nausea. Absolutely no dark corners. This is definitely one of my top tryptamines. I rank it right up there with DMT and psilocin. (Note that DPT did not agree with me at all, so it's not like I'm disposed to liking all tryptamines.) — AUGUST

# PSYCHOINTEGRATOR PLANTS SEMINAR

by MIKY DOOM

I had seen advertisements for these gatherings at various other seminars, most recently at the AYAHUASCA CONFERENCE in San Francisco last year. When I looked at the cost of it and the expense of getting to Manaus, Brazil, I thought it was just too expensive. I was wrong. The quality of the lectures was superb, as well as the lecturers themselves.

JONATHAN OTT has said that ANTONIO ESCOHOTADO's three-volume *Historia General de las Drogas* is "the definitive source of the usage of drugs by humans throughout history." Written while ESCOHOTADO was in jail for possession of illegal substances, this series of books tracks the use of mind altering substances by all cultures over the course of recorded history. His talks were very informative, amusing, and disturbing at the same time. The information he presented was both factual and well documented. (For example, ESCOHOTADO related the case of NUGAN HAND, INC.—the largest holding company in the Pacific Rim—which went bankrupt in 1980. F. NUGAN, the company's head banker, was found dead—apparently of a self-inflicted gunshot wound. His partner M. HAND disappeared along with a significant part of the company archives. Two Australian government investigations reported the company's involvement with "persons known or suspected to have connections with the drug trade," to whom the company had contributed funds in several countries. Intensive banking operations resided in Florida, including a number of accounts that were confiscated by narcotic agents. The company was also involved in the sale of military equipment, and some evidence points to a connection with the FBI, which had systematically put up road blocks to the investigation, citing "reasons of national security." Apparently for good reason! The president of NUGAN HAND, INC. in Hawai'i was General E.F. BLACK, a counterespionage veteran and former member of the NATIONAL SECURITY COUNCIL. The president in Manila was General L.J. MANOR, an expert in special operations and the supreme chief of Pacific operations in 1976. The president in Taiwan was D. HOLMGREN, manager of an airline company established by the CIA to supply guerillas in the Golden Triangle. The president of the holding company was until then Admiral E.P. YATES, chief of strategic planning at the Pentagon for Asia and the Pacific. NUGAN HAND, INC.'s counsels included W. MACDONALD—former financial director of the CIA, G.

PAULKNER—KISSINGER's personal assistant under NIXON, and W. COLBY—former director general of the CIA. It was COLBY who installed HAND as NUGAN's partner. HAND was a person without a university education who had worked as a military instructor in the Golden Triangle. Of course all US military personal denied any knowledge or involvement. It seems that the good guys are the bad guys, although I guess we always knew that.) I found ESCOHOTADO's talks to be quite informative, and he was a treat to meet—very engaging and one of the most hedonistic (in the best sense of the word) folks I've ever met. My conversations with him will always be treasured. He is someone who enjoys life to its fullest.

The other faculty members were equally inspirational and conversations with them were easy and fun. MARIE BRAIN, who provided instruction in movement (a variation of Chi Kung), and massage was a wonderful person. Her classes were a great way to start the day. ISABELA HARTZ, the artist in residence, offered insights on the creative process and how ayahuasca can help facilitate it. Her paintings were exceptional. Her textured painting "Cosmic Buddha" was majestic. (She is listed along with ALEX GREY as invited staff for the January sessions.)

ANDREA LALO, from Buenos Aires, worked perhaps the hardest of the staff. She was the group's translator. Trying to render into a different language that which is difficult to talk about anyway *has* to be a demanding task. Her sense of humor and playfulness was infectious. She added a quality of levity that was helpful to all, especially myself.

Instructor SILVIA POLIVOV is a transpersonal psychologist who has explored most of the South American entheogens. She provided knowledge and guidance to us all during the sessions. She showed me different thinking patterns and inspired me to focus on the issues I was trying to deal with during the experiences. She helped more than she knows. It proved very beneficial to speak with her both before and after the sessions. With ayahuasca as the catalyst, POLIVOV encouraged our integration of the experience in a manner that allowed us to obtain the most benefit. I am thankful for her suggestions and help.

POLIVOY and LUIS EDUARDO LUNA, a professor from Columbia, were the main facilitators. TERENCE MCKENNA first introduced LUNA to ayahuasca. Since that time he has acquired 30 years experience with the brew and it shows. A very kind man, author of several books and films on the subject of ayahuasca and shamanism, he was helpful to all of us. LUNA's *icaros* were beautiful and soothing. He has learned through the use of ayahuasca how to heal other people during the rough times of their trips, and was called on several times to do so. Even though they participated in the experiences with us, both POLIVOY and LUNA were always there to help anyone who needed it. They are wonderful people.

This was not a conference like we have here in the states. Here we can only "talk the talk," while in Brazil we were doing nothing illegal so we were able to "walk the walk" too. We had ayahuasca sessions every other night—a great regimen! Each person started with one cup of about 4 ounces, and if more was felt to be needed, a supplement was offered after an hour. The brew was of very high quality, and having POLIVOY and LUNA there as "sitters" made it easier to let go into the experience. Before we arrived we were asked to stick to a diet; no salt, sugar, red meat, alcohol, or sex. And while OTT sees no pharmacological reason that these restrictions should be of any help, in my opinion they do help. The sessions down there were more beneficial to me than the ones I've had in the states, and I believe the diet has something to do with it. It seemed to heighten the experience with each successive session. While such a diet sounds bland, it doesn't have to be. I ate fish every day, and while I don't know what kind it was, it was all delicious, as was the fruit and the many new treats I was unfamiliar with.

GIORGIO SAMORINI was a scheduled speaker as well, but his mother fell ill and he had to cancel. Since LUNA felt we didn't get what we expected, he added another ayahuasca session to the itinerary. I heard no one complain. We drank the sacrament every other night and related our experiences to the group the next day. The trips ran the gamut—everything from death experiences to ecstatic states of healing bliss. Our ritual was held in a large circular building with a section of rope being passed to each member who would state his or her intentions, or focus for the evening, while tying a knot in the rope. As the rope reached the first person to tie a knot the two ends were tied together symbolizing our connection as a group. The next day, as we related our experiences, the rope was passed amongst us again, with each of us untying a knot as we related our trip. This ritual that reminded us that we were all in this together and part of a de facto family.

The term they used to describe ayahuasca, *psychointegrator*, intrigued me, as that is how I've come to view the brew. With the right focus and concentration on a problem before the experience, it seems to help the brain rewire itself to remove old modes of thinking, or habits, or to view things in a different light. That is true in my case and seems to be the consensus of the group of participants of which I was a part. Contrary to what OTT said at the San Francisco AYAHUASCA CONFERENCE—that he believed ayahuasca was no different than the other entheogens—I have come to believe that it is something very special. For myself, I find it unlike the many other entheogens I've tried. Being able to have the experience in a country where it's legal, surrounded by noises from the rain forest, only served to make it more unique. I had heard the word "healing" used with ayahuasca in the past and took it with a grain of salt. With continued use of this unique tea I now know that for me it is true. It has helped me deal with several issues in my life that needed changing, all in a very positive way.

Our group was made up of 25 people representing 13 different countries. These weren't folks just out looking for a party—every one of us had serious intentions. Many of us represented the medical community: doctors from Stanford, Switzerland, Germany and Cyprus. Lawyers, ex-CEOs, artists, spiritual advisors, patent researchers, and myself—the token Deadhead. The group members were so unlike each other, yet it was amazing how we had all come together as a family by the last experience. For many in the group it was their first experience with an entheogen. You've got to admire someone who goes through a death/rebirth experience one night, then turns around and dives back into "the Other" two days later. It was truly the most unique, and in many ways, profound experience in my life. I would recommend these special seminars to everyone.

While the price is a bit high, the proceeds are for an extremely worthy cause. So far the conference has helped one of the Barquinha churches in Rio Blanco purchase their own land so they may cultivate their own *Banisteriopsis caapi* and *Psychotria viridis*. The Brazilian Government's environmental agency, IBAMA, requires all religious organizations using ayahuasca as a sacrament to produce their own plant material. The proceeds from the July 2001 event are helping to build a house for the growers of *chacrana*—a worthy goal, for sure. You can learn more about these seminars at their web site <http://psychointegrator.yage.net>. It is truly worth the effort to attend. ☉

# NETWORK FEEDBACK

## SALVIA DIVINORUM AND MUSIC, WEAK EXTRACTIONS

Another year come and gone, and I have more *Salvia divinorum* than I know what to do with. At least it's pretty. I have found that either it has diminished in intensity, or I have gotten used to it. An alcohol extraction, concentrating the leaves, got me back to the kick that fresh leaves alone used to produce. Are others encountering this phenomena?

I had an extraordinary interaction with chewed *Salvia divinorum* and music last fall at a ZIGGY MARLEY/OTHER ONES concert. (MARLEY without BOB and the DEAD without JERRY—nobody told me there'd be days like these...) I tucked a good solid pinch of dried leaves under my tongue on the way in, and partway through ZIGGY's set, I found myself totally dissolved into the music in a most inspiring way. The feeling lasted perhaps 20 minutes to a half-hour, and was pretty well gone by the time the OTHER ONES kicked in—and they were much better than I was afraid they might be. Worth going again, for sure. Just for fun, before and after the concert I laid out a blanket with a few good-sized potted *S. divinorum* plants on it, to see what kind of conversations I could get going. Most of the very young crowd ignored me, but a few folks stopped and talked and did or didn't know what I was offering. I got to swap stories and practices, which was enjoyable.

One question I have for your chemistry department is, what to do with extractions that come out weak? I have (I thought) very carefully followed several slightly different sets of instructions at various times, and ended up with a drawer full of weakly active 5-MeO-DMT crystals and tars. I tried re-extracting one of these, and ended up with the same yield I started with. Sometimes it seems that when I leave a hunk in my pipe for a while and keep smoking it, it gets stronger, and I wonder if this is what JIM DEKORNE was referring to in his rather peculiar section on spagyric alchemical extraction techniques. One notable success I have had was extracting from *Psychotria viridis* leaves, carefully gathered through several years of growing six plants. I got two pipe-loads of a truly extraordinary material—not the flash-bang into another universe of classical DMT, but about an hour's worth of

something like a very strong mushroom trip. It was definitely worth the wait, and has inspired my care of these slow-growing allies. That's all for now; thanks for keeping the faith.  
— M.H., TN

As far as diminishing intensity of effects from *Salvia divinorum* goes, it seems quite possible that the plants may have seasonal or environmental fluctuations in the content of their psychoactive chemicals, and this could be the reason for what you are reporting. This seems a likely explanation, since you still get strong effects from concentrated extracts. Very little (if any) work has been done systematically comparing different growing environments and seasonal fluctuations of salvinorin A content, although such an experiment would be easy to set up—especially for commercial growers of the plant, who have a lot of biomass to play around with.

With regard to weak extractions, again the problem is likely due to plants that don't have high enough alkaloid contents to begin with. It may not be possible, short of chromatography, to concentrate these weak extracts to a point where they deliver much of a punch via the smoked route. However, they could be taken sublingually in ethanol, or orally with a MAOI, and in either of these cases they probably wouldn't need to be as concentrated as is necessary when smoking them. A while back I asked DEKORNE about his inclusion of the odd spagyric alchemical extraction technique for mescaline that he published in *Psychedelic Shamanism*, and he admitted that he had never tried this extraction process himself. (His inclusion of this was clearly more romantic than practical.) I can't say that I see exactly how your comparison of increasingly potent material left in your pipe really relates to this method, and I am at a loss to explain why the material would become more potent. (One would think that repeated exposure to heat might make it less potent, due to heat-degradation of the active compound.) I also have no idea why the smoked *Psychotria viridis* extract would produce such anomalously long-lasting effects, but it is encouraging to see people growing and extracting these plants and you are to be commended for your efforts in this area. (It is all too easy these days to just buy the exported dried material ripped from the rain forest; growing the plants is where it is at.) — DAVID AARDVARK

## METHYLENE CHLORIDE SAFE?

I was looking through old issues of the *ER* and came across some statements concerning methylene chloride (dichloromethane/DCM) that are not entirely correct. The statements are contained in the VERNAL EQUINOX 1999 edition under the header "Easy Extractions." K. TROUT states that:

1. Methylene chloride is a known carcinogen, and
2. That he has evaporated “pure” methylene chloride and was left with a white powdery residue.

Both statements are misleading: while it is true that all halogenated solvents should be considered possible carcinogens (and most actually are), dichloromethane (DCM) is pretty safe. According to several *Material Safety Data Sheets* it is significantly safer than chloroform (which was contained in many consumer products in small amounts until recently) and most others I’ve checked. I decided to get to the bottom of this and found out that DCM is a proven carcinogen only in rats and mice but not in hamsters—indeed the *MSDS* say “suspected human carcinogen.” (Emphasis added.) Data from over 30 studies suggests that the mechanisms responsible for the carcinogenic action in mice and rats are not significant in humans. There are also five studies on workers exposed to DCM and there was no higher rate of mortality, no higher incidence of tumors and no correlation of mortality to exposure levels/duration. The point I’m trying to make is that while no halogenated solvent can be considered completely safe, DCM seems to be pretty benign.

With regard to the residue, I wonder what K. TROUT means when he says “pure methylene chloride.” The bottles of analytical grade DCM that I have here list all contaminants and say: “Total residue upon evaporation: <0.001%.” Since DCM has a density of 1.325 that means that 1 liter of DCM, weighing 1325 grams will *at most* contain a residue of 13.25 mg! This 13.25 mg is composed mostly of harmless stuff like calcium, sodium, and so on. In other words, if TROUT got a significant amount of residue his DCM was not technically pure. (I am aware that it can be difficult to obtain analytical-grade reagents but that’s a different story.) Regarding the price of analytical-grade DCM, it is indeed more expensive than the industrial grade but still darn cheap—about USD \$8.00 per liter from university suppliers. Yours from somewhere in Europe. — CROCODILE

#### Where to start?

1) First, something worth remembering is that the information in the *MSDS* is often presented by companies with a vested interest in manufacturing and selling the material. It’s common for them to down-play or even gloss over problem areas. It’s far from uncommon for such companies to throw out the results of any tests they don’t like and selectively present the ones they do agree with. (If this sounds outrageous, read the cerium oxide *MSDS*, which is based on the fairly benign oral ingestion and then compare it with data in any good industrial hygiene texts, where it will note that most industrial exposures are via inhalation, which is quite different and

more than a bit hazardous.) Selective presentation of toxicological studies is almost the norm when big money comes into the picture—aspartame and tobacco are both good examples.

The manufacturers of asbestos and cigarettes insisted these were safe for many years after they knew for a fact that they were not, and selectively presented only the data they liked. In my opinion the *MSDS* are among the worst possible sources of toxicological data. With published toxicological studies it is quite important to look at *who* conducted and/or funded the studies. Even with 30 studies cited, it is important to know how many studies were actually conducted. I suspect anyone can easily find 30 studies attesting to aspartame’s safety.

As for chloroform being in many consumer products until recently, or that DCM is “safer” than chloroform: This is a fatuous argument. Chloroform was ordered removed once it became considered a cancer risk, not simply in animals but in humans. Not many years ago asbestos was used almost everywhere for insulation. Could that be considered an indication that it is not too unsafe? “Proof” of human carcinogenicity is always a tricky issue since so many factors can cause cancer and to demonstrate unequivocal proof requires those factors be eliminated. It took many years and some interesting industrial accidents to “prove” the carcinogenicity of chloroform in humans and will likely take the same for DCM. While it is only a “suspected” carcinogen in humans, it is *proven* to be carcinogenic in animals such as rats and mice—unlike the *MSDS* you saw, the 1991 *Handbook of Toxic and Hazardous Chemicals and Carcinogens* (my source for all of this), says “Carcinogen (Animal Positive)” —and it is known to cause birth defects in chickens. It is also known to have caused liver damage in humans. The type of liver damage inflicted by chlorinated hydrocarbons is simply not trivial. Further DCM is known to be “changed to carbon monoxide in the human body” making it “particularly hazardous for those with a history of heart trouble!” I can’t see how any of that can be considered to imply either “pretty safe” or “pretty benign.”

I’m a little perplexed that those studies you refer to found no correlation of exposure with mortality since “death” is one of the known side-effects listed for overexposure in humans (SITTIG 1991). The fact that some heavy cigarette smokers live well into their 90s and develop neither cancer nor heart problems does not suggest smoking should be viewed casually.

2) The residue was from both analytical grade and technical grades. Once I started wondering, a handful of friends were asked to check if theirs did the same and it appeared routine. It is nice to know it is most likely mineral salts but since other solvents evaporate cleanly I’d rather opt for them. Any residue in something you plan to ingest is significant in my mind. Not simply calcium but heavy metals also commonly show up in such minuscule traces even in analytical grade reagents (this can vary by batch and manufacturer hence the analysis on the side of your reagent bottle) and although mere milligrams might result, is not a bad idea to prevent. For a large-scale extraction, especially if done by an amateur, up to several gallons of DCM may be evaporated. I know of one person who goes through 55 gallon drums of the stuff!

I wish I could find DCM for \$8.00 a liter in an analytical grade. Universities frequently enjoy much better prices than does the

general public. The suppliers here want \$31.90 for 500 ml. Even the technical grade is presently \$34.00 a gallon (plus these are packaged in plastic not glass). Perhaps the lower price in Europe reflects the excessive hazardous shipping regulations now in place in the USA? (\$17.00 per bottle is the HAZMAT charge on top of shipping.) Xylene, although most certainly toxic, evaporates cleanly even obtained from the local hardware store, and costs around \$6.00 a gallon.

Something of great importance to remember is that most of our readers are going to be obtaining technical-grade products designed for use as cleaning agents, not for preparative drug applications. We can't operate under the assumption that they are going to be buying analytical grade products since we know for a fact many are not. Many aren't even versed in safe chemical handling procedures. This is perhaps the most important thing to remember about the subscribers of *ER*; sure, we have some professionals who are loyal readers—but most of our subscribers are amateurs. I've run into people who used plastic-ware in their processing and others whose finished product of hash-oil or DMT still strongly reeked of DCM; yet they had little concern about smoking it! Amateurs need information that will keep them safe. Alas, the *LYCAEUM* has one set of alkaloid-purification instructions posted that recommends the use of DCM with Ziploc® baggies as crude separatory funnels, suggesting that one "pinch off" the corner with fingertips to get the flow started. If someone has training, a lab, a fume hood and access to high-grade solvents they should of course use whatever works for them. Under those conditions chloroform presents no problems. All organic solvents are dangerous; their danger should never be underestimated. If I had to choose erring one way or the other, the correct error is on the side of our readers' health. *ER* would like to be around for many years and hopes that you and our other readers will be too!

— K. TROUT

## SINGLE SOLVENT AND ACID/BASE EXTRACTIONS

Are there any DMT-containing plants (without 5-MeO-DMT or 5-HO-DMT) that can be boiled in methanol and/or ethanol, then filtered, with the solvent evaporated, leaving an extract strong enough to smoke? I read in *TIHKAL* of someone boiling *Acacia maidenii* bark in methanol to make a smokable extract. Seeing as some *A. maidenii* is said to contain about 0.3% DMT by dry weight, and some root-bark of *Mimosa tenuiflora* [= *M. hostilis*] is said to contain 1.0%, I figured that I would try this with *M. tenuiflora*.

My first try was with finely-ground root-bark; the extraction process only reduced 50 grams to 12.5 grams—not potent enough to smoke. My second try was with unground root-bark, and this produced almost the same results. Perhaps other plants leave less fine sediment. The solvent was repeatedly filtered through regular paper coffee-filters, until no

residues were left in the filter. Are there finer filters easily available?

A number of things need comment. Of those 12.5 grams you obtained, a lot of this is going to be material other than what you desire. The fine sediment you mention may be a number of things including fine particulates from the powder itself, fine dust from soil adhering to the roots and/or tannin complexes that precipitated out of solution, potentially carrying alkaloids along with them. Use of heat with any tannin-containing material is going to potentially increase the loss from the tannins if using a water-based solution (especially if acidified) or alcohol. Exposing the extract to alkaline conditions while in solution will also increase the loss. No matter what the source of the sediment though, coffee filters are inadequate for anything but crude filtrations. A filter cloth will work better but won't do what *WHATMAN* filter paper can. Of course to use it, a vacuum filtration set up is required. A vacuum pump can be had cheaply with some creativity but poses risks unless a person take the time to educate themselves adequately. A hand-held pump is more work but much safer for amateurs. Aspirators that attach to sink faucets are easy to use, and inexpensive. (Remember to attach a water-trap though, as any fluctuation in water pressure can cause water to flood backwards into your flask if you don't have one on the line between the aspirator and your filtration flask.) We recommend that everyone who does extractions purchase a vacuum filtration set-up. A complete set-up should cost about \$60.00, and it will provide a lifetime's worth of joyous extractions. — Eds.

I was also curious as to whether temperature is important when getting alkaloids into solution, and vice-versa? Would it be possible to soak plant material in alcohol chilled in the refrigerator or freezer (and kept there), repeatedly soaking and straining until the solvent came out clear, in order to remove the unwanted solubles that *would* dissolve in the cold solvent, and then boil the plant material—leaving a more concentrated extract?

This is an interesting idea, which would require one to test the solubility of whatever alkaloid was desired in chilled solvent. Another idea is to use a solvent that the desired compound is known to not extract into. We have considered, for example, that a mescaline-containing cactus—treated first with a solution of sulfuric acid, to make sure that the mescaline was converted to mescaline sulfate—might be soaked first in acetone, in order to remove anything that was soluble in acetone. Since mescaline sulfate isn't soluble in acetone, after filtering off the acetone, the dried marc could be extracted with a solvent appropriate to mescaline, and one might get an extract with less crud in it, due to this pretreatment. We'd love to hear more from people who experiment with issues of solubility and pre-extracting for purity. Another potential approach for dealing with tannin-containing materials is to mix them with a solid base like calcium carbonate (available in the pool chemical section to raise pH) or magnesium oxide, and then use a nonpolar organic solvent like xylene or toluene to extract. This will only dissolve the alkaloids since tannins aren't soluble in such solvents. Filtration is of course still going to be an issue. — Eds.

Concerning acid/base extractions, I've had absolutely no luck. All of the easily available organic solvents I have obtained left oily contaminants upon evaporation. I know of nowhere to buy clean organic solvents without raising suspicion.

You don't mention what solvents you mean so it's hard to know how to answer this one. Neither xylene nor toluene straight out of the can from the hardware store will leave a residue. Any solvent leaving an oily residue is inappropriate. We are assuming you mean that a residue is left after the "clean" solvent is evaporated, *prior* to extraction. Many plants produce oily extracts if not defatted. Many times DMT itself comes out as an oil when separated and only later crystallizes. If traces of water are present it may remain oily and not crystallize.

To get around this, I figured once the free-base is in the organic solvent, it could be mixed with fresh HCl water to pull the compound back into the aqueous solution to be evaporated leaving the alkaloid's HCl salt. (Or, should the HCl be added to the organic solvent first, and then mixed with water to get it into aqueous solution?) Another method, not tried yet, would be to bubble HCl gas through the organic solvent with the free-base in it, causing crystals to come out of solution (or so it's said).

The first approach is the one to use in this case. The last one is great; assuming you have anhydrous solvents and are able to work with HCl gas. This is one for professionals only, not amateurs! There are a lot of details you are leaving out, which makes it hard to answer your questions. Solvent choice, target alkaloid, base choice, all can affect how you approach this.

My problem is that after trying the first method, the water evaporated leaving nothing. So I tried soaking a considerable amount of *Peganum harmala* seed-powder (cheap, high-alkaloid-content, legal to extract—great practice material) in HCl water (pH about 1.0), strained, basified slowly until the solution became milky (presumably the free-base coming out of solution). I then added and mixed in an organic solvent. (I put the aqueous/organic mixture into a blender on high for 2–5 minutes to really blend the layers. Is this a good idea, or maybe part of the problem?) Once separated, the solvent was evaporated. Even with the oily impurities there should have been an obvious amount of harmaline/harmine in the mix (a few grams), which was totally absent. What went wrong? This should be a straightforward procedure. Do the impurities in the organic solvents prevent the alkaloids from going into them? What are the best pH levels for the acidic and basifying steps? Can too high or low of pH levels destroy the alkaloids or lock them up?

Actually, *Peganum harmala* is unfortunately one of the worst choices for a practice material. The behavior of the harmala alkaloids is quite different than for tryptamines and is much better approached using another process altogether. Again, 'though, there are not enough details included for a real answer. For instance, you also do not mention how long the seeds were soaked. We're also perplexed that you could strain these yet had trouble straining the *Mimosa tenuiflora* root-bark. More detail here would be great. We can point to a few problems though. First and most glaring is use of HCl at pH 1! You only need between pH 3–5 for this. pH 1 can degrade all sorts of alkaloids, especially if you are evaporating it to dryness afterwards! You also don't mention your choice of base. Nor how you determined when to stop adding base or the pH when you stopped. You are right in assuming what you saw as milkiness was most likely harmala alkaloids crystallizing out of solution as you added the base (ammonia is my first guess based on your description). You also don't mention what pH it was after this was done. For DMT you should get it to pH 8.6 or above for full extraction; 5-MeO-DMT should use 9.3 or above. (Our use of the phrase "or above" should not imply a whopping overload!) A pH meter is ideal but they are expensive and require proper care; pH paper can work but be aware that they exist for different pH ranges. Again you don't mention what solvent was used (not all are equal even discounting this approach being applied to harmala alkaloids). Knowing if it is a top or bottom layer is critical for providing a meaningful answer. Since you mention it was oily we are assuming it formed a top layer. The harmala alkaloids *could* have ended up on the bottom of the flask at this point but there are not enough details to know that this is what happened. It's also amazing you were able to get the liquids to separate after running them in a blender. (Hopefully this was stainless steel or glass with no plastic parts!) Careful repeated inversions (many of them; 100 is not too many) to mix them is ideal. Shaking may be fine, depending on your plant, solvent, and base choices, but over-shaking often creates mixtures that don't like to separate.

Of course, if a compound like DMT HCl was extracted by one of the two methods mentioned above, it could be turned into the smokable free-base by the methods mentioned in the last issue of *ER*. — ANONYMOUS

It's a far better approach to isolate the tryptamines starting with an acid solution. (This is all assuming you are working with something not containing a bunch of tannins of course—that is actually an issue too long to go into. Assuming you want to start with an acidic extract for something with tannins, very short extraction times would be better if using this type of approach. If extraction was insufficient, just repeat the process until the material is exhausted. The longer you expose alkaloids to tannins in solution, especially if heated, the greater your risk of loss becomes.) Then neutralize your solution with a base like strong ammonia or a strong lye solution and extract with an organic solvent. (Xylene, or toluene are suggested. Hexane or heptane aren't as good but will work fine for personal sized amounts and are easy to find in products like some brands of rubber cement thinners—be sure you read the label—avoid what is called naphtha in the US). Evaporation of that solvent will often leave a smokable residue; albeit crude. If you want to clean it up, dissolve the goo in a dilute acid (dilute is the key word here; pH 1 is not dilute!), if it won't dissolve with some stirring, filter it and keep only

what goes through the filter. If concerned you might be losing something, repeat this process with whatever sticks to the filter, but use less liquid. Take that acidic liquid, neutralize it with base and again extract with solvent. Evaporate the solvent to a residue. You could also have washed it with a very strong lye solution and added some desiccant (then removed it) prior to evaporating to aid in getting crystals but even an oily DMT will be smokable and can be weighed (weigh the container first), dissolved in a few ml of ethanol and suspended on a known amount of some herb to create a smokable mixture.

Please don't take offense at our comments—none is intended; we just are concerned for your health and safety. Having a solid theoretical understanding of why those processes that work *do* work, prior to taking a hands-on approach, is always best. One can seriously harm one's self with chemical experimentation. Obtaining a text book designed to accompany organic chemistry lab would be of great help (if not available at your local library, a university library or bookstore should have such a book). Please pay particular attention to the section on lab safety and ventilation requirements. One such text that may be helpful is H.J.E. LOEWENTHAL'S 1990 *A Guide for the Perplexed Organic Experimentalist*.

The two primary published sources that we have seen have listed the DMT content of *Mimosa tenuiflora* root-bark as 0.31% and 0.57% (GONÇALVES DE LIMA 1946; PATCHER *et al.* 1959). JONATHAN OTT has stated that this root-bark contains from 1% to 11% DMT (OTT 2001), but he didn't cite any specific analysis to back this up. If this higher range is the norm, then *M. tenuiflora* root-bark would contain the highest amounts of DMT of any plant that we are aware of. As far as other potentially-potent plants go, *Acacia simplicifolia* bark might be a good choice, as one analysis found 0.81% (POUPAT *et al.* 1976), and *A. confusa* root-bark has been reported with 1.15% (LIU *et al.* 1977), and we shouldn't forget the "AQ-1" *Phalaris aquatica*, with "over 1%" (FESTI & SAMORINI 1994), although this plant also contains some 5-MeO-DMT. Putting OTT's range aside for the moment, and working with a theoretical 0.5% content, if one reduced 100 grams of *M. tenuiflora* to 25 grams via extraction (which is about the ratio you reported), this might have 500 mg of DMT in it—or about 10 good doses, if someone could be expected to smoke 2.5 grams of material! Clearly a 0.5% DMT content will not be enough for a direct extraction, and even a 1% DMT content would leave one smoking 1.25 grams of material! (Assuming that the plant used allowed for it to be soluble in alcohol and filtered out.) At a 2% DMT content, we reach 625 mg of smokable material, and even though this is the size of some *Cannabis* joints, "tolerance" to the DMT might build up before one could finish smoking the material. (Note too, that with such an extraction, one is likely to obtain a goo that is hard to dry to the point that it can't be smoked without being first mixed with some dry material, which then raises the amount of total material that needs to be smoked; a glass pipe might circumvent this problem.) Unfortunately, those plants that are the best candidates for extraction are the ones that are potent enough that they can produce some effect on their own, without any extraction necessarily being required. Such plants include *Cannabis* (THC and related cannabinoids), *Salvia divinorum* (salvinorin A), *Papaver somniferum* (opoids), *Artemisia absinthium* and *Salvia officinalis* (thujones), numerous Solanaceae (tropanes), and *Anadenanthera colubrina* (bufotenine and trace amounts of related tryptamines). Using the latter as an example, one sample of *A. colubrina* var. *cebil* that was taken from a shaman's

garden from Misión Wichi/Mataco, Salta, Argentina, tested-out as having 12.4% bufotenine, with trace amounts of DMT (TORRES & REPKE 1996), and it has recently been noted that bufotenine is active when vaporized in the ranges of 2–8 mg (OTT 2001)! However, most *A. colubrina* seeds are likely to contain around 1–2% bufotenine. As far as 5-MeO-DMT content goes, the only thing offhand that we can think of that would be worthy of the single-solvent direct extraction procedure are the excretions from the parotid glands of *Bufo alvarius*, which have been shown to contain 5–15% by dry weight (ERSPAMER *et al.* 1967). Although it is not necessary to create a more potent extract for most of the above-mentioned drug sources, doing so is easy enough and it means that less smoke need be inhaled. —EDS.

## PSYCHOACTIVE MULBERRY?

What do you know about the mulberry tree? I learned that the green berries have a psychoactive effect from a video on wild edible plants. I've tried them several times at the 20–40 berries range, and I've never had any unpleasant side-effects. The effect is somewhat like *Cannabis*, in that it relaxes and numbs the senses. A friend ate a larger quantity of about 60 berries, and claimed to have a more entheogenic effect. However, I would say it is not an entheogen so much as it is a deliriant. I have found it interesting to experiment with. JLF sells mulberry twigs and fruit, but I doubt that the dried material is useful, and anyway, mulberries are quite abundant. —R.D., MO

The "mulberry" comes from any of the following related species: red or American mulberry (*Morus rubra*), white mulberry (*M. alba*), black mulberry (*M. nigra*). The red or American mulberry is native to eastern United States from Massachusetts to Kansas and down to the Gulf coast. The white mulberry is native to China, became naturalized in Europe hundreds of years ago, and during the early American colonial period it was introduced for silkworm culture (at which point it naturalized and hybridized with *M. rubra*). The black mulberry is native to western Asia and has been grown for its fruits in Europe since before Roman times. So the question may be, which mulberry?

We had never heard of unripe mulberries being psychoactive, and decided to look into this further. Alas, it is not currently the season for unripe mulberries, but we'll have access to a lot of these when it is, and report back. For now, our investigation into this area can only be on an intellectual level.

One recipe for a "sleeping sponge," used as an anaesthetic by 13th-century surgeons, contained an ounce each of the juice of the unripe mulberry and of the forest mulberry (species?), along with opium (*Papaver somniferum*), henbane (*Hyoscyamus* species), hemlock (*Conium maculatum*), mandrake (*Mandragora* species), wood ivy (species?), lettuce seeds (*Lactuca* species), dock seeds (*Rumex* species?), and water hemlock (*Cicuta douglasii*). With the many other known psychoactive and toxic plants listed, it is hard to say for sure that unripe mulberries would have been an additive factor here.

*The Herbage Database* states that "the uncooked shoots and unripe fruits [of *Morus alba*] are hallucinogenic." The methods of action this web site attributed to the plant were: "antidiarrheal, astringent, cathartic, decreases blood sugar, diuretic, emollient, entheogen, expectorant, lactagogue, laxative, nervine, purgative," and it was said to be used to treat "depurative, dermatosis, diarrhea, dyspepsia, fever, gonorrhoea, high blood pressure, inflammation, melancholy, sore, tumor, tumor (faucis), wounds," as well as having been used by the Cherokee in a gargle (JOHNSON 1995).

Interestingly, *Cannabis* and *Humulus lupulus* (hops) used to be classified in the same family, Moraceae, as the mulberry, before being moved to their own family, Cannabaceae (RAUFFAUF 1996). As well, according to R.E. SCHULTES, "The Moraceae also provide one of the most poorly understood hallucinogens: [*Maquira sclerophylla*, a jungle tree, the fruits of which reputedly were the source of an intoxicating snuff employed formerly by Indians of the Pariana region of the central part of the Amazon Valley. It is now known only by its

Portuguese name *rapé dos índios*, 'Indian snuff.' No chemical study of this plant nor of the snuff have been published, and direct observations of the preparation and use of the snuff have been impossible to date" (SCHULTES 1969).

Aside from water, protein, fat, carbohydrates, fiber, ash, calcium, potassium, iron, vitamin A, thiamine, riboflavin, nicotinic acid, and ascorbic acid (DUKE 1983), according to *Dr. Duke's Phytochemical and Ethnobotanical Databases* ([www.ars-grin.gov/duke](http://www.ars-grin.gov/duke)), the fruit also contains chrysanthemine, cyanidin, cyanidin-3-glucoside, isoquercetin, mucilage, pelargonidin-3-glucoside, petunidin-3-rutinoside, phosphorus, potassium, rutin, sodium, and thiamine; many of these chemicals have no known activity. There is nothing here listed that would seem a particularly likely candidate for psychoactive effects, but we assume that this is a study of the ripe, rather than the unripe fruit. Clearly there should be some more investigations, both chemical and psychonautical, into the unripe fruit of the mulberry! — DAVID AARDVARK

**LSD Psychotherapy** (2nd edition) by Stan Grof, M.D.  
40 color plates (8 new), introduction by Dr. Andrew Weil.

"I know of no work that so well incorporates the findings of Freud, Jung, and Rank... I do not doubt that others working in this field will find Dr. Grof's discoveries a basis for a whole new strategy of research."

— Joseph Campbell, author of *The Hero With a Thousand Faces*

**Ketamine: Dreams and Realities** by Karl Jansen, M.D., Ph.D.

"...clearly written, well researched and documented... presents a balanced and objective view point... covers all the aspects of ketamine from pharmacology to its use in raves... interesting for clinicians and researchers as well as the general public."

— Stan Grof, M.D., author of *Psychology of the Future*

**The Secret Chief** by Myron Stolaroff

"In the illegality of his time it was unthinkable to publish the excellent results of his therapy... today nine years after his death, a friend has undertaken the task of publishing the details of the therapeutic methodology of this intrepid Ph.D. psychologist..."

— Albert Hofmann, Ph.D., author of *LSD: My Problem Child*

— **FREE WITH PURCHASE OF ANY BOOK!** —  
The MAPS Bulletin: "Creativity Issue"

This issue breaks important ground for MAPS. We've moved into even more controversial territory than usual, since there is not yet a cultural consensus surrounding the approval of the use of psychedelics and marijuana to enhance creativity.

## SMOOTH SNUFF

Regarding the preparation of *Anadenanthera* seeds for snuff. One reader mentioned in Vol. X, No. 2 that they were unable to prepare a fine-grained snuff. Do include the husks. Boil the seeds until they soften. Remove and discard the shells. Dry and powder the seed kernels. The resulting powder is velvety smooth. — B.B., NY

By "husk" do you mean the "pod?" Husks are papery coverings that enclose seed heads or fruit. We know of no legume that produces a husk, although some grasses and nightshades do. The pods are included in preps for *Anadenanthera peregrina* based snuff but we don't recall seeing them in *A. colubrina* snuff, nor have we gotten these along with these seeds from the suppliers we've dealt with.

Creating a velvety-smooth snuff would certainly be a useful thing. We would have a bit of concern though about losing some of the active component into the boiling water if left there for a long time; a short boil would be best. We agree that removing the seed coat is a good thing, as the seeds can burn enough on their own without it. Most people cut the snuff with baking soda, and we're unclear if this is recommended or not in the preparation above. The only person we know who did not combine this with baking soda or a base found it to be non-burning but inactive. The same material with  $\frac{1}{4}$  to  $\frac{1}{3}$  baking soda was dramatically active. We have heard from several people who use a 50/50 mix of seed powder to baking soda, although we'd suggest a 75/25 mix. After snorting small amounts of pure baking soda on its own, we can definitively state that this burns more than the seed powder on its own, and the combination seems to burn the worst. At least one traditional means of preparation includes the toasting of the seeds, which may be a means to dry them out more, and ash is also traditionally added, which aside from making the preparation more basic might also aid in drying the powder and making it less prone to sticking together in clumps, which the seed powder on its own can do. One approach towards powdering the seeds is to powder them in a coffee-bean grinder and then use only the finest powdery dust that clings to the top of the lid of the grinder (and this can be run through a tea-ball first, just to make sure that there are no larger seed particles left in it).

It's worth noting that 1–3 *Anadenanthera colubrina* seeds of many available on the market is plenty when snuffed or smoked (some have reported  $\frac{1}{2}$  a seed being enough) but *A. peregrina* will take far more (a level tablespoonful has been reported). This is due to the active ingredient in the latter being DMT rather than bufotenine and being present at substantially lower concentrations. It's also important to remember that *A. colubrina* seeds can contain under 1% or over 12% bufotenine, with 1–2% being common. Trial and error seems the only way for most people to know. We'd suggest starting low and working your way up. Bufotenine is excellent but only if you don't use too much. — Eds.

## CACTUS CAPERS

I want to thank you for your series on *Trichocereus*. I hope that even though the series has concluded, that bioassay reports and other pertinent info can be a continuing part of *ER* issues in the future, as much more info needs to be collected and verified.

As for the specific clones that have been bioassayed, is there any information on amounts used (fresh or dried) in each experiment, and what their potency was? Since most people have little to no mescaline experience, comparing one mescaline experience to another may not be the most helpful. I've found, when comparing potency of lesser-known compounds, that using 100 mics of LSD as a standard "dose" works quite well. This is for comparing potency only, not nature or duration (this is comparing potency of peaks). For example, while 20 mg (oral) or 7 mg (insufflated) of 2C-T-7 or 50 mg DPT (insufflated) are quite different in nature and duration to 100 mics of LSD, the potency of the peaks are pretty-much equivalent (at least for me).

Alas, we can't necessarily say that the 100-mic comparison test will work for everyone. Many people *think* they know what 100 mics of LSD feels like, but we wonder how many people really *do* know? Street acid is highly variable in its actual LSD content, and blotter acid is thought to degrade in potency fairly quickly if it isn't stored properly. We have heard of some high-quality acid recently available in the S.F. Bay Area that is said to be a constant 62.5 mics per hit, but—despite claims of standard potency by distributors and users alike in this case—it seems likely in most cases that doses will vary and won't necessarily be what is claimed, due to storage/degradation issues. Also, the effects of mescaline are *only* comparable to LSD when considering very low doses of both substances. While a better gauge for comparison might be a standard amount of some research chemical that is known to be pure, this too can be problematic, since individual response to many of these research chemicals can be highly variable. The *best* thing to do is to use a set "dose" of pure mescaline as the standard to compare cacti experiments to. Pure mescaline can occasionally be obtained on the street for about \$100.00 a gram, or it could be extracted from cacti using an acid/base procedure and recrystallized to purify it. See K. TROUT'S *Sacred Cacti* for details on these procedures. Getting back to your original question about the specific clones that have been bioassayed, unfortunately there is no way to know with accuracy what people used. A number of reasons are involved, two of which are most notable:

1) Most people don't weigh their material. A common unit of measurement is "inches." 6 inches of a 4–5 inch in diameter plant is far more than 6 inches of a 3–4 inch in diameter plant. Hence as a unit of dose this is meaningless without further information or some way for the listener to know what a typical diameter of that plant is. *Trichocereus pachanoi* can be 2–4 inches in the commonly available stock, but again this can vary in either direction.

2) There is no standard for ingestion. A person ingesting 100 grams of dry material might be expected to be using the same as a person ingesting a kilo of fresh cooked into a citrate tea, but this assumes that the tea maker got a full extraction *and* consumed it all, plus it assumes neither one puked before getting full absorption. — Eds.

Any/all cacti from ethnobotanical suppliers or nurseries that are accessible to all need bioassay reports followed by verified follow-ups. A very preliminary experiment with myself and three others used a 6.5-inch long by approximately 2-inch in diameter cutting of *Trichocereus peruvianus* from the BASEMENT SHAMAN. This was a while ago, and I don't remember the weight if it was taken, but it couldn't have been more than a half-pound (225 grams). Anyway, it was sliced, diced, and put in a blender with some water. Then blended and strained, with the plastic skins re-blended with a little water to get any remaining mescaline from the skins. This was strained, added to the previous liquid, some lime juice added, and heated at a low boil for about 20 minutes. The end-product was not too bitter or slimy and produced no nausea, but did produce threshold effects—and it was evenly split between *four* people. All reported definite, but low-level effects. I would rate my experience as 30–40% of a dose, or about as potent as 30–40 mics of LSD. This was with a cutting that was about 1 5/8" thick by 2" in diameter, suggesting significant potency, which of course requires repeat verification (coming soon).

I have also tried both 100 and 200 grams (fresh) on two different occasions of the *Trichocereus peruvianus* from SELECT SEED/QUALITY CACTUS with no results, except some nausea. I will try it again at 450–500 grams (fresh), but if this fails to produce significant effects, I will not try again. One pound of fresh material, for me, is as much as I'm willing to consume.

Even 100 mg of mescaline will produce noticeable effects. Nobody would call it a "trip," but it is most certainly discernible. A full-on mescaline dose produces visions; in my mind this threshold happens approaching 400 mg but most people prefer the dose to be a bit higher for optimum results. For most commercially-available stock, a kilogram or so of fresh material is a good starting point. Some *Trichocereus peruvianus* will take less (around 1/3 to 1/2 this much) but most *T. peruvianus* and almost all *T. pachanoi* this will take this much or more for obtaining a "400–500 mg mescaline equivalency." This is the "unit" used by most cactophiles since it best describes what most people regard as a good tripping dose. But everyone has their own tastes, and some people like less. A kilogram sounds like a lot, but for a *T. peruvianus* that is 4.5–5 inches in diameter it is going to be somewhere between 4 and 6 inches in length depending on several factors that can't be conveniently crunched into a standard rule.

One major problem is that the potency of cacti varies based on many factors—nutritional history, watering, and time of year can all play a role. Light, regular feedings with an ammonium source or blood meal, completely starving them for water for a few months prior to use, and harvesting in late summer and fall can all help increase results. Strain is the most important factor though. We'd suggest that anyone interested in consuming cactus adopt the mantra "know your material." It's probably a mistake to try and extrapolate the data from any other source and apply it to what you have in your yard. We'd further suggest that you first familiarize yourself with all of your mature active *Trichocerei* and determine those for which a kilogram or less is fully active. Then sell, give away or otherwise get rid of every other one so as to make room for the ones that need intensive propagation.

On that note, I was curious of the suggested starting amounts in Part II of the *ER* articles on *Trichocereus*. If we assume that fresh weight is about 10 times dry weight, then starting with 1000 grams fresh would equal 100 grams dried. If the cactus used was 1% mescaline by dried weight, that would be a dose of 1000 mg of mescaline! Not only quite a dose, but this amount has been called the "maximum safe dose" of mescaline. Perhaps I'm a bit naive, since I don't have much mescaline experience, but I can't imagine any cacti with less than 1% mescaline by dried weight being worth pursuing. Believable reports suggest the real possibility of finding cacti with 1–3% mescaline by dried weight (1–2% being more probable).

Perhaps true, but to date the highest known mescaline isolation for any intact *Trichocereus* was 2% from *T. pachanoi* (POISSON 1960), and they will often be closer to 0.3% if they are acceptable [Example: CROSBY & McLAUGHLIN 1973, 0.33%; AGURELL 1969, 0.67%] and many are even lower than that (PUMMANGURA *et al.* 1982, 0.1%). CRUZ-SÁNCHEZ (1948) recovered 5%, but only used the outer layer of the same species (in Peru). The published values in excess of 2% [GENNARO *et al.* 1996, 2.06% averaged from 3 Italian specimens, and HELMLIN & BRENNISEN 1992, 0.1%–2.375% in 6 Swiss cuttings] were based on HPLC *estimations*, and *not* isolations (all figures dry weight). For years I use to tell people the best rule of thumb for commercial San Pedro was to use their height. (This is not entirely a joke.) Many of the better *Trichocereus* strains that are available in the US are in the neighborhood of 0.8–1%. Some are even more potent but these are the most rare presently. If you have access to wild Peruvian material of a tried-and-true strain or one of the rare higher-potency strains, you can in fact find plants where 30–50 grams is plenty. Sadly, this is not what you are most likely to encounter in the US. Even wild-harvested peyote is these days very likely to be less than 1% maximum (dry weight). This is one reason the *ER* series of articles was written; namely to help people recognize some of the better strains in need of intensive propagation. Whoever first made that often-repeated statement about the "maximum safe dose" needs his or her head examined. At least one person has knowingly ingested 8 grams of mescaline (ANDERSON 1996). Native Americans, around the turn of the century when peyote was likely some 5 times as strong as today, have been recorded ingesting nearly a hundred buttons at one sitting (and these contain far more dangerous

alkaloids than mescaline). While it's true that it can be uncomfortable as you get to around a gram, it would take many times that to cause you physical harm. That is not to say, however, that a mentally-unbalanced individual might not be caused serious cognitive problems at that level or even less, but this is true for most psychedelics at any effective dosage level. The oral lethal dose is not known but is likely to be substantially in excess of an ounce of pure mescaline. (Around half an ounce taken intravenously might prove fatal though.) — K. TROUT

If 1% dry weight is set as a minimum requirement for useful cacti, then 300–450 grams fresh, or 30–45 grams dry should be the most material needed for a suitable dose of 300–450 mg of mescaline.

Again, we'd like to stress this is only going to be encountered in exceptional domestic strains or in the better ones that can be encountered in Peru. It is worth noting that one *ER* editor thinks that a reasonable dose of mescaline is 500–600 mg, and the other editor prefers 600–800 mg. (However, our copy editor—after reading these comments—remarked that 300 mg was plenty for her.) It is also worth noting that most home-experimentalists are unlikely to extract *all* of the mescaline in any cacti they are processing. — EDS.

It seems wasteful when samples of cacti containing between 2–3% mescaline (which are reported in the literature), are not collected, propagated, and made available to all.

This is quite true, and we should all take steps to change that. We would even encourage those psychonauts who don't particularly *like* mescaline to seek out and propagate known-potent strains, and share these with friends. Since they are legal, there is no reason not to get as many people growing them as possible, even if one doesn't intend to use them personally.

Speaking of chemical tests of plant material, what about PHARMCHEM? Didn't they test various compounds for chemical analysis, or is this no longer legal? If not in the U.S., how about mailing numerous samples to labs in countries where it is legal?

PHARMCHEM is no longer around, as far as we know. Another company, DRUG DETECTION LABS, does perform qualitative analysis on street drugs—pills—but apparently the DEA discourages reporting on quantitative tests in the USA when a scheduled compound is involved. We are currently on the lookout for a good overseas lab, and will mention this in a future issue of *ER*, should we find one.

Does anyone know about the potency of *Trichocereus peruvianus* of "KK242" cuttings from LEGENDARY ETHNOBOTANICAL RESOURCES. These were the first cuttings I got—way overpriced (\$50.00 for a 10-inch cutting), and quite diseased, although they grew healthy pups. I just don't want to waste much time growing useless material.

It is impossible to say whether or not any non-specific clone known by a generic name is active or potent. However, in this case you might think that you have a specific clone. Unfortunately, KARL KNIZE has not been too careful about what he is selling, and any of the "KK" numbers sold through various retailers are probably suspect. We have heard reports of both activity and of inactivity from L.E.R.'s "*Trichocereus peruvianus*," and judging from the wide variety of L.E.R. *T. peruvianus* that people have growing it appears there is a good reason for this. Which KK242? and which L.E.R. *T. peruvianus*? are the first questions. Since L.E.R. buys stock directly from KARL KNIZE, and KNIZE recognizes nine *different* KK242's ranging from inactive to good (and since their stock has seemed to change from year to year), more variables need to be known to even be sure we are talking about the same plant. Even if you buy direct from KNIZE (*NOT* recommended!) you are most likely to obtain a number of different plants with the same labels if you are lucky enough for him to bother labeling them at all (much less actually send your order)! An interesting overview of KK242s in horticulture and obtained directly from KARL KNIZE is at the TROUT'S NOTES web site (<http://trout.yage.net/sc/Knize2000.htm>) and K. TROUT'S PHOTOPOINT web site (<http://albums.photopoint.com/j/AlbumIndex?u=665768>). The best thing to do would be to complete a bioassay when the plants are large enough, and if they are good, actively propagate and share them (and add an additional clone-code number on them, so that folks will know that they are active). It is also hard to determine "activity" based on any specific retailer selling non-specific clones, because the company might change what wholesaler they buy from, and could be getting totally different plants. — EDS.

On another note, does anyone know how early you can test seedlings for usefulness? The sooner valuable seedlings can be determined, the better (although no doubt full potency may take longer to determine). Propagating cacti by seeds, in addition to growing cuttings, can be a nice way to raise lots of cacti cheap, and can also add new genetic material to shared collections. I am hoping—and it would be advisable for anyone interested in these cacti—to grow at least *some* seeds of every known mescaline-containing *Trichocereus* and from as many different sources as possible, so that every possible mescaline-containing cacti that can be grown is. It would obviously be of great help if any information on definitively high-quality (or useless quality) seeds were known, so as to put an emphasis on growing potent cacti from seeds while avoiding wasting years growing useless plants. I will be sending in info as it becomes available. However, it may be years before seedlings can be determined as to levels of usefulness or uselessness. I currently have many young seedlings of *Trichocereus peruvianus* #427 from J.L. HUDSON seeds growing. It would be great to know if they are worthy, as they grow well and seeds are very reasonably-priced (10,000 for \$45.00 or 100,000 for \$300.00, gibberellic-acid-treated).

5–10 years would be a minimum recommended time. Put them in the ground after their third year and it will help speed things along

nicely. If you live in a freeze-prone area, build winter protection around them. Sadly, there isn't likely to be any easy way to know whether or not seeds will turn into potent plants. It is possible that selective-breeding of two potent *Trichocereus* plants might produce seeds for potent plants, but too little is known at this point. Such experimentation should indeed be encouraged, and the payoff—in perhaps five years—isn't so long that it is an unattainable goal. Although people frequently select the fastest growing plants for purpose of biomass generation, it is possible (and has been suggested) that—by weight—the slower-growing plants may have a higher concentration of mescaline. Fast-growing stock can be used for the base-material of grafts, in order to increase the growth of other plants. Indeed, it could be that tacking a 5-year-old slow-growing tip onto a 5-year-old fast-growing base might eventually produce a large amount of highly-potent biomass. There are many sorts of experiments that can and should be done. — EDS.

Also, on preparation—I've heard a lot of people using dried material to make a tea and the consistency of starting with dry material for gauging potency is a good idea. However, I've heard that too much heating can degrade the mescaline a bit, and that juicing fresh cacti in a centrifugal juicer works very well. One report boiled the pulp in acidified water, strained and added to the juice. Another made the pulp tea and consumed it separately with no effects, concluding that the vast majority of mescaline comes out in the juice. Either

way, making a pulp tea and adding the juice doesn't take long and can't hurt. Possibly bringing the juice to a quick boil and then cooling would be advisable. The mention of side-effects (noted in Part I) from raw *Trichocereus bridgesii* that were absent when the same material was consumed cooked may point to the need for at least some heating. My 200 grams of fresh *T. peruvianus* (from SS/QC) experiment was with raw juice and the nausea could have been due to lack of cooking. My next 450–500 grams juiced will be shortly heated and the results should tell something.

We're sold on finely dicing or chopping the fresh cactus like salsa and using the juice of 1–2 limes per pound of material, half a cup of water (if needed) for the first cooking and around a cup of water for the second, not squeezing the excess from the pulp until after the second one is done. Bringing to boiling then reducing heat and then simmering 25–30 minutes each time if not pressurized and 15–20 each time if pressurized. This probably wastes 15% or so by leaving it behind but also is incredibly effective, rarely produces nausea and has never resulted in vomiting (so far). While this sounds like a shameless plug, the 2001 edition of *Sacred Cacti* discusses a variety of approaches. We have heard from numerous *ER* subscribers who cook the hell out of their extracts and have great success—some claim that they have much better success with such a process, having tried it both ways. Mescaline is very stable, and it can take prolonged heating fairly well. However, it is our experience that the longer you cook, the more likely you are to wind up with a nauseating brew. This is especially true for acidified mixtures. We suspect it's due to other things getting pulled into the tea. (It is also important to remember that *pure* mescaline, extracted or synthetic, commonly produces nausea and sometimes vomiting in people.) Mescaline citrate is absurdly water soluble and a long cooking is not needed. If you aren't using an acid though, lots more water and 4–6 hours of simmering are a better choice. The prep above will yield under a quart from over a kilogram of cactus if water is controlled as suggested. Most of the liquid will come from the plant.

It's also possible to ingest only the dried powdered outer layers of the plant (the ribs). They can be swallowed as powder and chased with water or made into a gruel and swallowed. This is a highly effective route and allows direct comparison of strain to strain since variables like water content are eliminated. The material will also store well for a long time. Using only the outer layers of the plant further increases the mescaline concentration over that which is possible if using the whole plant, due to an uneven distribution in the tissues. Understand, however, that easily 40% or more of the mescaline will be left behind in the central parts so it should be dried too and saved for some future extraction (or given to friends). — EDS.

Do you know if the claim of increasing mescaline content significantly by injecting cacti with a solution of dopamine HCl, as mentioned in ADAM GOTTLIEB'S *Peyote and Other Psychoactive Cacti* is valid? This would be a really useful procedure if it works.

**RIVER'S ETHNOBOTANY**  
Scores of plants, herbs,  
and extracts to choose from.  
Extra low prices on bulk orders.

**YAGE.NET**

Yage.Net specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers. We're also home to the largest collection of ayahuasca resources on the web. ▼ Hosting for ethnobotanical web sites. ▼ Web site development and design. ▼ On-line shopping cart solutions.

[www.yage.net](http://www.yage.net)

Currently hosting sites for *The Entheogen Review*, Trout's Notes, Luis Eduardo Luna, James Arthur, John Allen, Ayahuasca.Com, EntheogenUK, and many more, at [www.yage.net/hosted](http://www.yage.net/hosted).

It is a terrible idea to inject dopamine into one's mescaline-containing cacti, and GOTTLEB's underinformed speculations have effectively started an urban myth that won't seem to go away. We cover this point in detail in the WINTER SOLSTICE 1998 issue of *ER* (Vol. VII, No. 4), and refer readers to this issue for more information. — DAVID AARDVARK

On another note, I've heard conflicting reports on the growth-rate of *Trichocereus terscheckii*. Some say it grows very slow, while others claim it grows quite fast. Perhaps variations in the species? In any event, if one had a fast-growing, very large cacti, like *T. terscheckii*, *T. werdermannianus*, *Carnegiea gigantea*, etc., and grafted their most potent *Trichocereus* onto it, the potential for huge, potent clones would be incredible! Would that work? Imagine a potent plant like SS02 growing one foot or more in diameter!

Although there is probably a genetic limit that would be reached, when the graft would start pupping, it certainly can't hurt to try such experiments, and we encourage readers to share any data they have related to such experiments. We have seen softball sized peyote on grafts, but they seem to explode into pupping when they reach a certain point. If the pups could be kept trimmed off as they appear, it is possible that the limits could be pushed even further. Still, since one of the editors has personally witnessed peyote plants well in excess of 6 inches in diameter for single heads (quite a rare thing) it must be questioned if this actually exceeds the maximum possible diameter. An increase in diameter is suggested but the right word is "bloating." This happens very commonly with globulars but we have never witnessed it with columnars. It's going to be readily possible to get more "growth" from a columnar by grafting it onto a more robust stock but an increase in diameter is unlikely. Of course if readers learn otherwise we'd love to hear! *Trichocereus terscheckii* can grow a foot a year if they are happy. Or may just sit there for 3 years and do nothing. Same story with *T. pachanoi*. The same strain can grow a less than a foot or over 3 feet on every column within a single year. It's important to remember they are living creatures that do what they feel like and not mechanical devices with a predictable output. Make them happy and you'll get the best results. — Eds.

Also, to anyone in the Los Angeles area, or willing to drive there, there is a potentially great wholesale source, CACTUS PLUS ([www.cactusplus.com](http://www.cactusplus.com)), which has *Trichocereus peruvianus* at \$4.00 per foot, and *T. terscheckii* for \$15.00 per foot. These are large, landscaping plants—so if they are of good potency, they may be great finds for cheap. Unfortunately they don't ship, so they won't be of use to most of us.

One final question: are there any solid reports of the psychoactivity of *Ariocarpus fissuratus* or any other *Ariocarpus* cacti, or *Mammillaria craigii*, *M. grahamii*, *M. heyderi*, or other *Mammillaria*? These are beautiful just to grow, but it would be nice to know if they can be used (though it would be very limited due to their slow growth and rarity, probably best to

grow from seed and have a few experiences some decades down the road). Thanks for the shared forum! — ANONYMOUS

My advice is to stick with mescaline—it has a proven safety record and it's highly effective. The most important thing to notice about the various ethnological reports of other "active" plants is not a single one of the reporters ever bioassayed one. Sometimes they didn't even get the species right! *Mammillaria heyderi* for instance turned out to actually be *M. craigii*. Its also worth remembering that these plants are not necessarily used for purposes synonymous with those sought by "trippers." The people who know these plants often let their children start eating active doses of peyote at age 6, yet they consider these plants to be extremely dangerous, potentially "evil," reserved for use by only the rare and highly-trained specialists, capable of causing permanent insanity, injury or even death. Yet somehow other people only hear "it's active," and never bother to listen to the rest or think about what it means in the context of being peyote-using people's opinions. I ate *Coryphantha macromeris* once and never will again. I have considerable respect for these native people's opinions, now more than ever. I'd suggest that readers might consider them as well. — K. TROUT

# EVENTS CALENDAR

## **PAINTING THE FANTASTIC ROBERT VENOSA & MARTINA HOFFMANN OCTOBER 26—NOVEMBER 2, 2001**

Revolutionary psychedelic artists ROBERT VENOSA and Martina Hoffmann state that “the ‘fantastic’ implies a lack of restraint in the imagination, and such is the approach to painting taken in this unique workshop. For beginners and accomplished artists alike, this workshop is for all those wishing to tap into the artistic capabilities that lie within their reach and discover the joy and illuminating power of painting.” Limited to 20 participants, these workshops fill up quite fast, and early registration is recommended. The workshop will be conducted in the ART HARDWARE STUDIO at 1135 Broadway in Boulder. Tuition is \$525.00, sent to: ROBERT JOHN LTD., 1430 High Street Boulder, CO 80304. For more information: (303) 440-8905, [workshop@venosa.com](mailto:workshop@venosa.com), [www.venosa.com](http://www.venosa.com), [www.martinahoffmann.com](http://www.martinahoffmann.com).

## **ALEX GREY NOVEMBER 2–4, 2001**

## **MICHAEL & SANDRA HARNER NOVEMBER 10–11, 2001**

*Visionary Art: Eye of the Soul.* On Friday, November 2, from 7:00 pm until 9:00 pm, artist ALEX GREY will be presenting an eye-catching multi-media presentation that discusses the cross-cultural history of visionary art, looking at the differences between sacred art of the past and contemporary spiritual art. Admission is \$20.00, and the presentation will be held at the UNITARIAN UNIVERSALIST CHURCH, on 1187 Franklin Street in San Francisco. On November 3–4, GREY will be conducting a weekend workshop for novices and experienced artists alike who wish to develop the intuitive realm of inner sight. Drawing from a live nude model and using guided imagery, meditation, and shamanic journeying, participants will enter this realm through the doors of

imagination. Cost for the two-day workshop, 10:00 am to 5:00 pm each day, is \$225.00 (which includes admission to the Friday night presentation). The workshop will be held at the CALIFORNIA INSTITUTE OF INTEGRAL STUDIES.

*The Way of the Shaman: The Shamanic Journey, Power, and Healing.* On November 10–11, MICHAEL HARNER, Ph.D. and SANDRA HARNER, Ph.D. will hold a weekend workshop to introduce participants to core shamanism, the universal and near-universal basic methods of the shaman to enter non-ordinary reality for problem-solving, well-being, and healing, aided by drumming and other techniques for experiencing the shamanic state of consciousness and for awakening dormant spiritual abilities. Cost for the two-day workshop, held 10:00 am to 5:30 pm on Saturday, and 9:30 am to 5:00 pm on Sunday, is \$225.00. The workshop will be held in the Pacific Rim Room of the LONE MOUNTAIN CONFERENCE CENTER at USF in San Francisco.

To register for either of the above, contact the CALIFORNIA INSTITUTE OF INTEGRAL STUDIES, 1435 Mission Street, San Francisco, CA 94103, (415) 575-6175, [www.ciis.edu](http://www.ciis.edu).

## **PSYCHOINTEGRATOR PLANTS JANUARY 10–19, 2002**

*Psychointegrator Plants (Ayahuasca), Visionary Art, Psychotherapy, Ethnobotany, Body Work, and Healing Massage.* Spend ten days in the Amazon rain forest of Brazil and develop a heightened awareness through modified states of consciousness. There will be lectures on Amazonian and African ethnobotany and anthropology, ritual plant ceremonies with ayahuasca, group sharing, art, Chi Kung practice, healing massage, and body reading. Instructors include: anthropologist LUIS EDUARDO LUNA, Ph.D; psychologist SILVIA POLIVOV, MA; artist ALEX GREY; techno-psychonaut ZOE7; and artist ISABELA HARTZ. Located 1.5 hours from Manaus, the lodge has excellent facilities, phone, and a swimming pool. All rooms are double occupancy, have air conditioning, and a private bath. See <http://psychointegrator.yage.net>, or contact SILVIA at [silviap@house.com.ar](mailto:silviap@house.com.ar) for more info.

**ARCHAIC HERBS**  
**POB 103, (Dept. ER)**  
**Bexleyheath, DA16 3YD**  
**ENGLAND**  
**info@archaicherbs.com**  
**www.archaicherbs.com**

ARCHAIC HERBS is a new European company that looks quite promising. They don't have a huge selection yet, but they do have the essentials: *Argyrea nervosa*, *Banisteriopsis caapi*, *Diplopterys cabrerana*, *Ipomea violacea*, *Nicotiana*, *Peganum harmala*, *Psychotria viridis*, and *Salvia divinorum*. Their prices are great, and due to this I hope that they can become one of the premiere entheobotanical companies in Europe. Hell, their prices are even good for people in the USA. For example, they sell the exact same high-quality standardized *S. divinorum* extract that JODY HORD offers. Their price per gram is £14.00 (or about \$20.55), and JODY HORD sells this in the USA for \$20.00. For this product (made in the USA) to be exported to Europe and only cost 55¢ more is amazing to me. These are the sorts of prices that deserve support regardless of where you live.

**ECSTASYDATA.ORG**  
**www.EcstasyData.org**

"EcstasyData.org is an independent project, co-sponsored by Erowid, Dancesafe, MAPS, & the Promind Foundation. Its purpose is to collect, manage, review, and present laboratory pill testing results from a variety of organizations. The information is made publicly available to help harm reduction organizations, medical personnel, and researchers. Some government agencies and other organizations analyze pill contents, but choose to restrict the data they collect and their data is not available for public use or review. EcstasyData.org collects lab testing results from a variety of organizations, but also commissions its own tests which are conducted by Drug Detection Lab (DDL) in Sacramento."

Such a pill-testing web site used to be run by DANCESAFE's national office. However, due to their ongoing reorganiza-

tion, they are no longer managing a pill-testing project of their own, choosing instead to co-sponsor with other groups. This new site, managed by EROWID, features a database that can be searched by name, color, contents or combinations, marquis reaction, location, and/or date. Search results can be sorted by category, and individual pills are viewable with their own result pages, where additional information about a pill may be displayed. ECSTASYDATA.ORG is an improvement over the pill database pioneered by DANCESAFE, taking testing and publication of results to the next level, with room for creating a database of test results gathered outside the United States. I'm happy to see the continuation of this sort of site, and the improvements are a welcome change.

**ENTHEOGEN UK**  
**http://entheogenuk.yage.net**

ENTHEOGENUK is an e-mailing list about entheogens geared towards those who live in the United Kingdom. To subscribe to ENTHEOGENUK, send an e-mail to majordomo@yage.net with a blank subject line, and the words "Subscribe ENTHEOGENUK" in the main message body. Once this is done you should receive an e-mail detailing actions you need to take to confirm your subscription.

Their FAQ states that although there "are a number of similar forums and email lists available on the internet [...] most of these [...] have a very strong bias towards American information. [While] some of this information is useful, a large amount is incorrect, or useless to people based in Britain." The FAQ then goes on to say that "...a bar of chocolate contains a large amount of caffeine..." which certainly doesn't exemplify *correct* information—what with an average milk chocolate bar only containing 5 mg of caffeine, compared to 1–35 mg in a cup of "decaffeinated coffee," or 74–155 mg in a regular cup o' joe (OTT 1985). Still, their point that American e-mailing lists might not be as useful to Brits is certainly a valid one. Overall the knowledge level of the participants in this list has seemed comparable to many American e-mailing lists that I have joined, and there is the benefit that (at least so far) the folks discoursing seem to be less inclined towards rude comments and flame wars than many USA-based lists I have surveyed. It is also quite valuable to get a European perspective on entheogen use, especially with regard to what is available where, and what the legal climate there is. I find this list to be a treat to lurk on. Plus the traffic is low.

**THE LYCAEUM****www.lycaeum.org**

You may have heard the rumor that the LYCAEUM was closing. While it was one of the earliest *massive* drug sites, in recent years it has suffered from disorganization. Word was that it would be shut down, due to disinterest on the part of its founder and the folks who were hosting the site. However, a take-over has emerged, and there is now “a small group of dedicated individuals” at the helm, who claim:

“A plan has been made to turn it into something more than just a vast archive of interesting and accurate information, but also into a vehicle to help promote and inspire the positive change that the tools which cause altered states of awareness are capable of generating. The Lycaeum will now also be focusing largely on harm reduction, visionary art (including poetry & music), drug policy reform & activism, and the profound effects mind altering substances have had throughout the history of mankind.”

If there is a will, there is a way. I wish the best of luck to the new crew at the LYCAEUM.

**MUSHROOM JOHN****John W. Allen****C/O Exotic Forays CD-Products Ltd.****POB 45164 (Dept. ER)****Seattle, WA 98105****<http://mjshroomer.yage.net/cd-productsad1.html>****[mjshroomer@yage.net](mailto:mjshroomer@yage.net)**

Readers of *The Entheogen Review* may be aware of amateur mycologist JOHN W. ALLEN’s work in the field of psilocybian mushrooms. However, I recently learned that ALLEN (aka “MUSHROOM JOHN”) is also an accomplished visual artist.

There is no doubt that psychedelics have had a profound influence on art. Visions beheld are later manifest, through pen, brush, or word. Yet it is generally believed that creating high-quality art while *under the influence* of these drugs is difficult, if not impossible. Due to advances in computer graphics and a pioneering vision, JOHN ALLEN proves with his art that this maxim can no longer be clung to. Many of his beautiful digital abstractions have been created *as* his mind wandered the psychedelic labyrinths produced by various entheogens. Technology has finally caught up with the speed of ancient pharmacology, and ALLEN’s work blends the two with brilliant illumination. While I have enjoyed looking at ALLEN’s

art on-line, the slow downloads due to my dial-up connection have been a bit frustrating. I am happy that he decided to release this material in a format that can be accessed with the speed of a disk-drive.

MUSHROOM JOHN’S CD-ROM of *Psychedelic Inspired Art* contains more than 1045 images, all with thumbnail views. Over 600 of these are newly-created, never-before-seen images, and 4 animated filmstrips are also included. The CD is \$19.95, plus \$4.00 S/H. (WA residents add 8% sales tax.) Make payment out to JOHN W. ALLEN. Other CD-ROM projects in the works include *Mushroom Pioneers* (100 photos plus enlargements, 200 pages), and *Psilocybian Mushroom Cultivation: A Brief History* (100 photo, 200 pages, co-authored by JOCHEN GARTZ, Ph.D.). Visit the web page for more details and to view some of ALLEN’S art.

**SALVIA DIVINORUM DEFENSE FUND****[www.alchemind.org/salvia\\_defense\\_fund.htm](http://www.alchemind.org/salvia_defense_fund.htm)**

As the DEA is now aware of *Salvia divinorum* and is in the process of considering whether or not to schedule the plant, the ALCHEMIND SOCIETY’S CENTER FOR COGNITIVE LIBERTY & ETHICS (CCLE) has established the SALVIA DIVINORUM DEFENSE FUND (SDDF) and is collaborating with experts on the plant to prepare a report for submission to the DEA. It is critical that the DEA now receive reliable information showing that *S. divinorum* does not warrant or merit scheduling. Your donation to the SDDF will permit the CCLE to: professionally monitor federal regulatory notices and congressional actions that may concern the plant; help offset printing, mailing, faxing, and telephone costs; demand a public hearing if the DEA does act with regard to the plant; coordinate and fly experts to Washington D.C. for the purpose of testifying before the DEA if a hearing is held; work to build a larger coalition of organizations, experts, and activists who object to any scheduling of *S. divinorum*; and maintain the SALVIA DIVINORUM MONITOR ([www.alchemind.org/DLL/salvia\\_divinorum\\_monitor.htm](http://www.alchemind.org/DLL/salvia_divinorum_monitor.htm)), a web site with the latest news on the plant’s legal status and a place for reporters to obtain accurate information about the plant, including why it should not be outlawed. See the URL listed for info on how to make a tax-deductible donation. Donors of \$20.00 or more will get a copy of the CCLE report submitted to the DEA.

CCLE’s testimony at the recent MDMA hearings was fucking brilliant, and the SDDF needs support. Send them some money; if you don’t help defend *Salvia divinorum*, who will?

**SOLARIA/ETERRA**

Last year I was disappointed to learn that GREEN METALS, producers of the Flash Evaporator and the Eterra vaporizers, would be closing their doors. These units were my favorite “smokeless” smoking accessories, due to their classy and efficient design. However, it turns out that the rights to manufacture these devices have been sold, and the new company SOLARIA has taken over where GREEN METALS left off.

The basic design/function of these units consists of a metal tube contained within an attractive hardwood dowel that is heated to a temperature that is appropriate to vaporize the active constituents of herb without burning it. The metal tip on a “one-hit” style pipe is then loosely filled with a small amount of crushed herb, and this is inserted into the hot guts of the wooden dowel. The device works as one inhales through the pipe, drawing hot air over the herb and vaporizing the active compounds. There is no loss due to vapor condensing on a large glass jar or globe (as with many other commercial vaporizers), and there is no loss due to slip-stream smoke either (as might occur with a joint, pipe, or bong). Due to its design, I suspect that the Eterra may be the most efficient vaporizer on the market.

After one has heated the herb and sucked down the vapor, theoretically the remaining toasty brown material should be devoid of much if any activity. However, I was surprised to learn of a friend who collected and extracted this material, for use in cooking. Apparently the Eterra didn’t (doesn’t?) release all of the active chemicals as a vapor. Note that this reuse of “spent” material was with the older GREEN METALS version of the Eterra. Since SOLARIA took over production of the unit, they have made some changes—one of which is that they raised the temperature that the unit’s metal guts reach, in order to provide a slightly hotter airflow. I would assume that they did this in order to increase the efficiency of vaporization, and it is possible that with the new units one would not be able to reuse the spent material. A friend using one of the new units sent me the following comments:

“The spent material does next to nothing when rolled in a fat joint and the whole thing is smoked (even if said material is green and comes from high-dollar bud). The worst

commercial Mexican is far superior in taste and buzz. Quite a while back I tried using the spent material in this manner, just to see what might be wasted, and I gave up after 3–4 such attempts. It may leave a tiny bit of something behind, but if so it sure is not much. The higher boiling point materials could still be there though, so cooking with it will likely produce some sedative effects—relaxation and body lethargy, just like *Cannabis* tea does.”

Other improvements made by SOLARIA include the use of an ultrasonic cleaner to assure that all parts are very clean. As well, in a past review of the Eterra, I commented that the wooden body experienced some degree of cracking from the internal heat. Apparently the SOLARIA version has “much less to mostly zero cracking” (mine hasn’t cracked yet), and they also make the claim of “improved electronics, and improved stem reliability.” The body of the new Eterra is smaller, and made of a lighter mahogany hardwood said to be of “a higher quality” and obtained from a sustained-yield harvested forest. Functionally, I find there to be no difference between the GREEN METAL version and the SOLARIA version; both work great for me. I have heard one complaint from an acquaintance about the SOLARIA model. She said that it “didn’t seem to work at all.” It is hard for me to say what the problem was in her case, as I don’t know exactly what she meant by her comment. (Did the unit heat up fine, but she just didn’t seem to get high when using it? Or did the unit not heat at all?) It may have been that a wire came loose. I actually got a non-functioning unit from GREEN METALS once. I let them know about this, returned the unit, and they promptly sent a functioning one. SOLARIA is also willing to repair any models that arrive non-functioning. My friend who loves his Eterra as much as I do also noted that, “Some people *like* the feeling of smoking. Those people won’t find the Eterra satisfying because they won’t feel their lungs being singed.”

The Eterra now comes with two stems (quite nice, as you can have a second one loaded and at the ready), a small cylindrical hardwood stem holder, and complete instructions for \$150.00, postpaid. CA residents please add 8% sales tax (\$12.00). SOLARIA is also offering a limited number of cosmetic “seconds” with one stem (but no stem holder) and a one-year guarantee, \$135.00 each, postpaid (CA residents add 8% sales tax). SOLARIA offers a “trial basis” on these “seconds;” if not satisfied, one can return the “second,” to their special drop box within 45 days and they will refund all but \$10.00 (to cover S/H). SOLARIA provides excellent service, and with their guarantees and return policy on “seconds,” you can’t lose. Contact them for free flyers about the Eterra.

**TRIP MAGAZINE**

1122 East Pike Street, #679 (Dept. ER)

 (305) 768-7606 Voice & Fax  
 info@tripzine.com  
 www.tripzine.com

*The Resonance Project (TRP)* magazine has finally resurfaced, under the new name *Trip*, and it is just as fabulous as its predecessor. The current issue has some silly (though well-executed) cartoons by DAVID LASKY accompanying an R.E. SCHULTES memorial. Commentary on the 2C-T-7 deaths brings us up-to-date on this "phenomenon." MICRODOT's "I was a Drug Research Guinea Pig" is reminiscent of JIM HOGSHIRE's *Sell Yourself to Science*, and RICHARD and FINN BOIRE show us why blurry photographs can be cool, while bulldogging our rights to free thought. ERIK DAVIS waxes thoughtful on whether or not psychedelic culture is "One or Many?" Harm reduction is promoted in an exposé of Seattle's DANCESAFE chapter. CHARLES HAYES, author of *Tripping*, is grilled in an interview by JODY FRANKLIN, and PACO XANDER NATHAN dissects "Corporate Metabolism" to see what makes it purr. Then there is SCOTTO MOORE's humorous slam/review of ZOE7's book *Into the Void* (a book that I enjoyed much more than SCOTTO did), and more flattering reviews by SCOTTO of KARL JANSEN's *Ketamine: Dreams and Realities* and *DMT: The Spirit Molecule* by RICK STRASSMAN, *Maximizing Harm: Losers and Winners in the Drug War* by STEPHEN YOUNG, *The Other Side of Haight* by JAMES FADIMAN, and the CD *The Kissing Tree* by BED OF ROSES. Indeed, this issue of *Trip* is a bit heavy on the reviews, with JAMES KENT weighing in on the PROTEUS (a mind machine), *Confessions of a Dope Dealer* by SHELDON NORBERG, and *Kolinar: The Rock 'N' Roll State of Mind* by JOHNNY ROCKIT, as well as DEBORAH LYNN SIEGEL review of the digital video *Tragos: A Cyber-Noir Witch Hunt* by ANTERO ALLI, and *Failure of the Doping Summit* by DAVID GOODRICH. Add to this the "exotic substance review" and the "MissingMatter" web site review, and there were so many reviews that I started feeling like I was reading *FactSheet Five!* My favorite part of this issue was the accidentally hilarious interview that JAMES KENT did with the late (9/30/01; R.I.P.) Dr. JOHN LILLY. (Suffice it to say that LILLY clearly wasn't the easiest guy to interview in the world.) The new *Trip* is a pleasant capsule of pop-culture psychedelia to ingest. I encourage folks to subscribe, though be forewarned that these guys are still pondering the ultimate meaning of the word "quarterly," and haven't come to any hard-and-fast conclusions. \$25.00 (USA), \$35.00 (Canada), \$45.00 (overseas) for four issues, whenever they can get 'em to ya.

# BOOK REVIEWS

*Transfigurations* by ALEX GREY. Foreword by ALBERT HOFMANN, contributions from STEPHEN LARSEN, DONALD KUSPIT, and KEN WILBER. 2001 (INNER TRADITIONS INTERNATIONAL, One Park Street, Rochester, VT 05767, (800) 246-8648, fax (802) 767-3726, orders@InnerTraditions.com, www.InnerTraditions.com), ISBN 0-89281-851-4 [10.5" x 13.5" hardcover, \$49.95]. 176 pp., 202 color and 93 black & white images. Autographed copies available direct from the artist, see [www.alexgrey.com](http://www.alexgrey.com).

After much anticipation, I am quite happy to say that the new art book from ALEX GREY will finally be available in November of this year—just in time to make a wonderful holiday gift for your favorite art-loving psychonaut. *Transfigurations* is a beautiful companion to GREY's first art book, *Sacred Mirrors: The Visionary Art of Alex Grey* (1990, INNER

TRADITIONS). I was impressed with the art featured on the cover of this book, *Over-soul* (1998–1999, left), when I first saw it in 1999 on a print at the ALLCHEMICAL ARTS conference. It seemed to be a perfect complement to *Praying* (1984, lower right), the piece used on his first book's cover. While *Praying* focuses on an inward journey, *Over-soul* is an explosion into the collective consciousness of all of humanity. Both the style and the content of this piece exemplify a new approach that GREY appears to be taking in his art. Most earlier works by GREY utilized his "spiritual X-ray" approach, and dealt with aspects of the perennial philosophy that KEN WILBER has described as *different modes of knowing*: "the eye of the flesh, which discloses the material, concrete, and sensual world; the eye of the mind, which discloses the symbolic, conceptual, and linguistic world; and the eye of contemplation, which discloses the spiritual, transcendental, and transpersonal world." GREY's

early paintings predominantly dealt with the **spiritual anatomy** and quest of the *individual*, with works like the *Sacred Mirrors* (1979–1989), *Journey of the Wounded Healer* (1984–1985), *Holy Fire* (1986–1987), *Theologue* (1986), *Dying* (1990), and of

course *Praying*. Also during this period, GREY depicted the spiritual/sexual life-giving relationship between man and woman, in works such as *Kissing* (1983), *Copulating* (1984), *Pregnancy* (1988–89), and *Nursing* (1985). These paintings were featured in his first book, and his recent release continues this exploration into sexual spirituality, with works such as *Tantra* (1991), *Promise* (1997), and *Newborn* (1995, lower left). GREY's work has also conveyed specific religious/spiri-

tual iconography, in pieces such as *Avalokitesvara* (1982–1983), *Christ* (1982–1985), and *Sophia* (1989). This focus is also presented in his new book. In *Adam and Eve* (1988, detail right), we see Neanderthal-like humans perhaps displaying a slightly worried “shit, we’ve done it now” look, after biting from the tree of knowledge of good and evil. (Along with the traditionally-depicted apples, GREY has thrown in some *Amanita muscaria* and psilocybian mushrooms for good measure.) In *The Visionary Origin of Language* (1991–1998, lower left), we find what could be an advertisement for TERENCE MCKENNA’s theory of the development of language in humans. An early hominoid, with psilocybian mushrooms in tow, taps into the universal visual language, while a tryptamine-elf whispers secrets in his ear. His eyes too appear to be drinking in new knowledge, but of a more enlightened sort. *Nature of Mind* (1995–1996, not shown) is a seven-panel narrative in a gorgeous sculpted gilded frame, which presents an individual’s spiritual quest within a Buddhist perspective. DONALD KUSPIT, an art critic who wrote a chapter titled “Alex Grey’s Mysticism” for the book, calls this piece the “grand climax of Grey’s art.” And while I agree that the piece superbly exemplifies GREY’s style and thematic presentations, I wouldn’t call this piece the “grand climax,” as GREY is clearly still forging ahead in new directions. (Should I be cornered into describing the “grand climax” of his art I would have to say that his still-theoretical CHAPEL OF SACRED MIRRORS will probably be a shoe-in, should this materialize. Nevertheless, since GREY no-doubt has much more to offer, even *this* might be a drop in the bucket of future works to come.) With regard to one new direction that GREY’s art has taken, I return to my discussion of his piece *Over-soul*. Although

this work still contains familiar iconography, such as the flames and disembodied eyes that have appeared in earlier works, it has moved away from depicting the individual via *spiritual X-ray*, and moved into a new *trans-human* style—a fiery grid-like exoskeleton

that invokes the “larger picture.” The most powerful example of this style and these “Universal Beings,” which GREY says he first began working with in 1998, is his *Cosmic Christ* (1999–2000, detail below right). This painting has two distinct layers; the flaming grid-work that composes the ÜBER-CHRIST, and numerous “background” scenes depicted within the gaps of the grid, that represent mankind’s struggles and triumphs throughout our existence. Of all of GREY’s work, this piece might be seen as the most complex narrative (and this aspect of it reminds me of much of the “low-brow” art that has

become more popular, due to magazines such as *Juxtapoz*). Horrible acts, such as slavery, the Holocaust, alien abduction experimentation, wars, killing whales, and capitalist greed are portrayed right along with the saints of humanity—GANDHI, MOTHER TERESA, the DALAI LAMA, and even Dr. ALBERT HOFMANN. Peaceful nature scenes, technological advances, the cosmos and beyond, are all depicted. When a logger clear-cuts a forest, he seems a bit surprised to see a ghostly shroud of the face of JESUS looking back at him from within the rings of a tree. There is so much going on in this large painting (about 4' wide by 8.5' tall), that one can enjoy looking at the myriad details for some time. To get a good overall sense of this piece, visit [www.alexgrey.com](http://www.alexgrey.com) and check out the beautiful photo by DEAN CHAMBERLAIN (whose R.E. SCHULTES photo graced the cover of the last *ER*). CHAMBERLAIN's photo, of GREY in his studio with the *Cosmic Christ* and other works, also appears at the front of *Transfigurations*.

The trans-human grids of fire have allowed GREY to showcase much of his unique symbolism and take it to a new level. In some cases, he seems to be revisiting old ground with this new approach, such as with the painting *White Light* (1999, lower right), which may be a disembodied (or more advanced) version of a similar state of consciousness depicted in *Collective Vision* (1992, above left). It is heartening to see GREY's recent stylistic development being applied in both new and familiar ways; the mark of a good artist is one who isn't afraid to reinvent himself from time to time. Clearly GREY has his chops down, and I am pleased to see the new directions that he is taking, while retaining the spiritual

focus that causes his art to rise above the nihilist, post-modern abstractions that litter the art community like so many disturbing—yet dull—abortions.

*Transfigurations* has an excellent foreword by Dr. ALBERT HOFMANN, who eloquently intones his timeless refrain that material science need not be the bane of spiritual questioning, and indeed it can be a great instigation for such. STEPHEN LARSEN presents a detailed biographical discussion of GREY and his work, complete with images of GREY's art and projects as a youth (including a 1967 newspaper photo clipping of ALEX as a 12-year-old boy presenting his Science Fair research report on the "LSD Phenomena"). As mentioned earlier, DONALD KUSPIT opines on the meaning of GREY's work, and the book also includes a chapter of conversation between GREY and KEN WILBER.

I always prefer to purchase my books directly from the author whenever possible, and *Transfigurations* is no exception. Indeed, *autographed* hardcover copies will be available directly from GREY via the web at [www.alexgrey.com](http://www.alexgrey.com). As the only ALEX GREY images that I have bought recently appeared on the cover of the new *Tool* CD, I am glad to be able to obtain a copy of this book by an artist who has been a great inspiration to me in recent years. — JON HANNA

*Tripping: An Anthology of True-life Psychedelic Adventures* by CHARLES HAYES. Featuring a conversation with the late TERENCE MCKENNA. 2000 (PENGUIN COMPASS/THE PENGUIN GROUP, 375 Hudson Street, New York, NY 10014, [www.penguinputnam.com](http://www.penguinputnam.com)), ISBN 0-14-019574-2 [6" x 9" paperback, \$18.00]. 492 pp., illustrated, with an appendix providing brief descriptions of various psychedelics, notes, a bibliography and resources section, and an index. Autographed copies (\$22.00, postpaid) available direct from the author—see [www.psychedelicaadventures.com](http://www.psychedelicaadventures.com).

CHARLES HAYES has brought together a mind-blowing collection of first-person psychonautical voyages in his book *Tripping: An Anthology of True-life Psychedelic Adventures*. HAYES is a gifted writer whose edgy style accurately conveys the various nuances of the psychedelic experience without being overblown. The book's introduction provides the appropriate historical nods, while showcasing HAYES' exhaustive knowledge and understanding of the topic, and exposing the cutting edge of current underground drug culture.

While HAYES presents his psychedelic synopsis and relates some of his own larger-than-life experiences, his function is primarily as a sociological editor—seeking out and including the good, the bad, and the ugly of “trip reports” that span from the 1960s through the late 1990s. Although many accounts presented deal with LSD, there are also the occasional forays into mushrooms, *Peganum harmala*, *Datura* seeds, DMT, 5-MeO-DMT, salvinorin A, MDA, MDMA, mescaline, PCP, 2C-B, and other compounds. While those narratives

that relate the good times which psychedelics can provide are certainly plentiful, I suspect that the “bad” and the “ugly” descriptions are even more abundant. HAYES is aware that psychedelic use is not a bed of roses, and this book could certainly be read as a cautionary tale, rather than being something that *promotes* the use of psychedelics. There's the pathetic tale of an over-dosed and out-of-it tripper at BURNING MAN, who—after failing to pay for admission to the event—lost his clothes and car keys, stole a pair of too-tight pants from a new friend, and wandered off dehydrated in the desert, crashing in someone else's camper without permission and losing track of what day it was (not to mention a seeming long-term memory loss of what *year* it was, since he claims this occurred in 1995, yet all of the landmarks he describes were clearly from the 1996 BURNING MAN). His conclusion from this experience was that he “didn't want to take LSD again until [he had] worked on” his sense of organization, simplifying his life, and treating people with more compassion—perhaps making that BURNING MAN experience his last LSD trip for a long time! Then there was the guy who decked his algebra teacher at a school dance, and was hauled off by the police. And the non-gay man who, overcome with his own sexual vibes, asked his male friend to “suck [his] cock, right here, right now” at a GRATEFUL DEAD concert (which didn't fly). And the tripper who in a hallucinogenic rapture threw away his glasses (not that uncommon a gesture, apparently) at a RAINBOW GATHERING and decided that he was destined to mate (again, right at *that* moment) with a beautiful naked dancing woman, who didn't appreciate his amorous advances. And the guy who began speaking in tongues and broke his brain—experiencing headaches, permanent psychological scars, and occasional flashbacks. And the man who ended up in both jail and mental institutions. And the person who believed that he was telepathically communicating with his friends while camping, and decided to lay down in their camp fire, precipitating a lengthy stay in a hospital's burn unit (in serious condition).

But along with the bad and the ugly, HAYES includes some beautiful accounts as well. Spiritual voyaging/cosmic consciousness and a deep psychological understanding of self and humanity are all touched upon. I was a bit surprised at how many people, whether looking in mirrors or into a friend's or lover's eyes, have the same experience of viewing themselves or the person they were looking at as “every man and every woman,” or “God and Goddess.” (I wonder if this experience is as common as the book makes it seem, or if perhaps there was a plenitude of these sorts of trips due to editorial selection?)

I was also surprised to see how many of the narratives came from interviews with people I either know (or know of), leading me to think that the psychedelic community may be a bit smaller than I had imagined. (Perhaps this just exemplifies that those who are willing to *talk* about their experiences tend to be more “public” figures in general.) Accounts by psychedelic noteworthies such as ALICE DEE, JOHN PERRY BARLOW, LEONARD MERCADO, MATTHEW S. KENT, PAUL DEVEREUX, and CLARK HEINRICH are sprinkled in with the more anonymous “first-name-only” stories. (The tales from HEINRICH are worth the price of the book on their own.) Add to this a lengthy original interview with TERENCE MCKENNA, wherein he discusses his thoughts, drug-by-drug, on LSD, tryptamines, ketamine, *Salvia divinorum*, *Cannabis*, and DMT (as well as pontificating on psychedelics and religion, freak-outs, the dangers of inner exploration, the rave scene, the pagan scene, shamans and shamanism, Novelty Theory and the end of time, science, consciousness evolution, and more). This is one of the most detailed, hard-hitting interviews of TERENCE that I have ever seen. The book also features numerous beautiful works (in black-and-white, alas) by visionary artists ALEX GREY, BROOKS COLE, BRIAN MORIARTY, MAURICE TANI, and JON A. BELL. There is an appendix/glossary that defines many of the specific psychedelics mentioned in the book and discusses their chemistry and pharmacology. Endnotes and citation information for each of the chapters is provided, and there is an excellent resource section noting relevant books, periodicals, articles, films/TV shows, and web sites. Strangely, HAYES missed mentioning the *Psychedelic Resource List*, *The Entheogen Review*, and TROUT’S NOTES—a tribute perhaps to the underground nature of these publications, since his resource list is otherwise quite current and detailed. (Indeed, I learned about numerous resources of which I was totally unaware—HAYES has done *a lot* of research in this area!)

My only complaint about the book is that the paper it is printed on is too thin. This is the sort of book that both the novice and the experienced psychonaut will enjoy having in their libraries for years to come, and a hardbound edition with better paper and color illustrations would be much appreciated. *Tripping* need not be read cover-to-cover, but is perfect to keep on one’s nightstand for short random bursts of psychedelia or to take on a plane trip and read while flying. Although drug “trip reports” are common these days on web forums and e-mailing lists, it is the excellent job of selection and editing that HAYES has done, which make every story in this compilation an interesting read. I highly recommend this book to all. — JON HANNA

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

Copyright © 2001 by *The Entheogen Review*. Nothing in this journal may be reproduced in any manner, either in whole or in part, without written permission of the editors. All rights reserved. All advertising and advertised products void where prohibited.

# PRAGMATIC PARANOIA?

## SECURITY ISSUES IN A WORLD AT WAR (PART II)

by JON HANNA

Since most *ER* readers don't run businesses selling botanical products or research chemicals, it seems prudent to discuss security measures that individuals interested in entheogens can take. Different people will have different degrees to which they wish to "play it safe." By making the following suggestions, it is my hope that I am giving people something to think about without encouraging paranoia. Even if you ignore these suggestions, it is unlikely that anything will happen to you unless you are pretty careless—there simply isn't enough interest in busting entheogen users, yet. Nevertheless, I'll begin by describing a few busts that *have* occurred to individuals from which we can learn something.

**THE HOGSHIRE BUST:** Author of several books including *Opium for the Masses* (LOOMPANICS, 1994), JIM HOGSHIRE was arrested in 1996. The warrant issued authorized cops to search for a multitude of different drugs. What they found was: of dried poppy pods still in their original florist's box, some scales, some weapons, numerous drug-related books, "pipes and tubes" said to be drug paraphernalia, and photos of HOGSHIRE lancing poppy pods. HOGSHIRE's wife HEIDI, who was also arrested, was charged with "possession of opium poppies." JIM was charged with "possession with intent to manufacture or distribute" and with a "sentence enhancement" due to his owning (legally) a rifle. While the judge ended up permitting the prosecution of HEIDI, all of the charges against JIM were dropped due to lack of *prima facie* evidence of guilt. However, HEIDI was then badgered into signing a statement against JIM, which the prosecutors used to file new charges. HOGSHIRE eventually struck a deal with the prosecutors, who agreed to abandon the poppy charge as long as JIM agreed to a misdemeanor charge of "attempted possession of an improvised explosive device," which was—in reality—merely a flare that had been found in his apartment (BOIRE 1996A; HOGSHIRE 1997). The events that lead up to this bust are too detailed to describe in their entirety here. In a nutshell, HOGSHIRE's publisher had set him up as host for another one of their authors, BOB BLACK. At HOGSHIRE's apartment, the two got into an argument, and BLACK later told the police that JIM had a drug lab and weapons in his apartment.

**GEORGE SINGLETON:** An African American organic farmer with dreadlocks, Mr. SINGLETON was pulled over in 1998 by an Oklahoma state trooper, for "speeding and weaving." The cop found a bag of herbs and decided that they looked like *Cannabis*; these were seized and tested, while SINGLETON spent 25 days in jail. The herbs turned out to be rosemary and mullein, which SINGLETON used medicinally to treat his tuberculosis. At one point they threatened to charge him with "possession of an imitation controlled substance." He was never charged with speeding or drug possession, but they did charge him with "driving under the influence of an intoxicating substance," even though his blood tests came back negative for the presence of any drugs. The district attorney was willing to reduce this charge to one of "careless driving," and impose a fine of \$50.00 and court costs less than \$100.00, but SINGLETON wouldn't agree to this (GRAM 1998). When this case finally went to court, Judge HARRY WYATT dismissed the charge, although the 49-year-old SINGLETON did plead "no contest" to another charge of failing to display current license tags. Amazingly, the prosecutors said they intended to appeal the decision (ASSOCIATED PRESS 1998). SINGLETON estimates the case cost him over \$2,000.00 in legal, travel, and other expenses (KOZACZEK 1998).

**FORBIDDEN DONUT:** A frequent writer for early issues of *The Entheogen Review*, in 1996 DONUT was arrested and charged with three counts of possession of Schedule I substances (LSD, psilocybian mushrooms, and mescaline sulfate). DONUT plead guilty under a plea bargain that stipulated there would be no conviction shown on his record if he completed a year-long in-patient drug treatment program, with six months of follow-up and five years on probation. He also had to forfeit his car and the bond that he posted. DONUT's arrest was precipitated due to being pulled over for speeding. When asked if the car contained anything illegal, DONUT said "no" and refused to let the cop search his car; the cop then used a drug-sniffing dog, which "alerted" on the car, providing the cop with a reason to search against DONUT's will. Although this search may have been unconstitutional, DONUT and his attorney decided that accepting the plea was a better approach than fighting this point (BOIRE 1996c). Now that

his five years of probation are over, DONUT says that the entire incident cost him about \$50,000.00, for the loss of his car, legal fees, drug treatment costs, and other expenses (DONUT 2001).

**THE DOCTOR WASN'T IN:** In May of 1996 a medical doctor with an interest in entheogens was arrested after police found suspected psilocybian mushroom cultures in his office. This material was located when police responded to a burglar alarm that had been accidentally triggered by window washers. The doctor arrested was a member of the on-line VISIONARY PLANTS LIST (the e-mailing list that was the predecessor to the LYCAEUM), and the doctor's computer that was seized from the office contained over a year's worth of archived messages from this forum (BOIRE 1996B). Alas, no information is currently available regarding what charges may or may not have been filed in this case, nor is their any data on what the police may or may not have done with the computer files. At the time, there were rumors that the doctor's medical license might be suspended.

Although none of the above situations had anything to do with procuring legal entheogens or related products from supply companies, they do provide some points of departure for our discussion on how to stay out of trouble. The most basic rule is to keep a low profile. Unfortunately, those folks who are vocal about their work in the area of entheogens may be easier targets; one only has to look at some of the names of people who have had legal actions taken against them: ANTONIO ESCOHOTADO, JOCHEN GARTZ, ELIZABETH GIPS, STEVE KUBBY, TIMOTHY LEARY, PETER MCWILLIAMS, DENNIS PERON, SASHA SHULGIN, and STRIKE, for example. JIM HOGSHIRE's case clearly shows that prosecutors will attempt to use what one writes (and reads) against them. Some ways to keep a low profile include:

1) Don't use your real name. It seems unlikely that there would be anything illegal about ordering any product from any company using an alias.

2) Don't use your real address for any entheogen-related purchases, even if what you are getting is perfectly legal (and don't pay by credit card). The DEA has been known to have seized or subpoenaed entheogen-related businesses' mailing lists from companies that sell products as varied as extraction gear (BOIRE 1998), books, indoor lighting equipment, and mushroom spore-syringes, (for examples, see BOIRE 1993–1999) and in some cases used this information to go after the folks on these lists. Such activities have resulted in

raids on the homes of people who are entirely innocent of any wrongdoing (such as the grandparents' home of one individual who purchased a grow light with their credit card, as well as situations where cops burst into "grow operations" of hothouse tomatoes). The best approach is to get a mail drop that can't be traced to you, and use an alias. A discussion of how to obtain a mail drop is beyond the scope of this article, but books on this subject are available from EDEN PRESS ([www.edenpress.com](http://www.edenpress.com)) and LOOMPANICS ([www.loompanics.com](http://www.loompanics.com)).

3) Don't manufacture or deal drugs. Clearly these activities open one up to many potential problems; a manufacturer or a dealer is more likely to get busted (and do serious time in prison) than an individual user. Prosecutors may attempt to paint the individual user as a manufacturer or a dealer; this was seen in the HOGSHIRE case, when they noted that he had scales, chemicals, and books describing how to make drugs. One should avoid owning these sorts of products (although a pipe or bong might actually be argued as evidence of personal use). One should also avoid owning a gun (even if legally owned), since—again as was shown in the HOGSHIRE case—this can be used to attempt an increased sentence.

4) Consider the potential security leaks in the methods of communication that you use. In general, I feel that the following applies, moving from most secure to least secure:

**PERSON TO PERSON:** Preferably via a hushed whisper in a moving rental car with the stereo turned up. Person to person is the only truly safe method of communication, provided that the person you are speaking with can be trusted (and isn't bugged and taping what you are saying, or coerced into using the conversation against you in the future).

**FIRST-CLASS USPS SNAIL MAIL:** Protected by law, domestic first-class mail can only be opened with a warrant. (Note that mail sent via any other "class" is not protected in this manner, nor is mail sent via private mail carriers.) Risks to this method of communication include mail being lost (dead letters and packages *are* routinely opened) or mangled and accidentally opened (surprisingly, this doesn't occur *that* often). To protect against possible accidental opening, it is a good idea to seal any letters in a blank envelope first, and then reseal this in a second larger outer envelope. Sending via registered and/or insured mail may help protect one's mailings, as I suspect that such mail receives better handling.

**THE TELEPHONE:** Some may feel that this method of commu-

nication is fairly safe—perhaps even safer than first-class mail. Generally speaking, it probably is pretty safe, since your line would have to be tapped in most cases in order for someone to listen in. Be aware that it is much easier (technologically-speaking) to eavesdrop on a conversation that is held on a cordless phone, and cell phones may also be particularly easy targets. Also, you should know that your phone number will appear on the bill of anyone you call using an 800 or 888 toll-free number, and it is easy enough for the police to target such lists during an investigation of some botanical or lighting supply store. Using a pay phone is best for toll-free calls, and pay phone to pay phone calls are best when one needs to discuss entheogens with a friend. (Sadly, it is becoming increasingly hard to *locate* pay phones that accept incoming calls.) Also, keep in mind that it is much better to actually *own* an answering machine (where you can erase the messages yourself) than use a voice-mail service (where your calls are stored somewhere else out of your immediate control). You never know when someone might leave you a message that you wish they hadn't. A fax has about the same level of security as a phone call, "interception-wise," except that there will be a physical representation of the transaction at the point where it is received.

E-MAIL: This is the least secure method of communication. There is no legal protection of any e-mail, and courts have ruled that employers have the right to read their employees' e-mail. Most Internet service providers will happily turn over your e-mail to any cop that asks. As policy, one should *routinely* delete all messages from their service provider's storage, after they have been downloaded or sent. Using an "anonymous remailer" is a good way to reduce the likelihood of "JOE BLOW" tracking your mail, but these are not much protection against someone who is truly determined to locate the sender. A friend was after me for years to install and use PRETTY GOOD PRIVACY (PGP) on my e-mails, and when I finally did so he said that he no longer used it himself. "Sooner or later, you *will* get a message from some knucklehead who has forgotten to hit the 'encrypt' button... perhaps a message that you wish hadn't been sent that way," he warned. Apparently it had happened to him. PGP can give a false sense of security for this reason, and people might be tempted to send messages via encrypted e-mail that they wouldn't send via normal e-mail. In addition, after the person you've sent the mail to decrypts it, you have no idea what they are going to do with it. As in the case described with the doctor who belonged to the VPL, your message might sit unencrypted on someone else's hard drive for years. And no matter how safely you conduct your own actions, do you re-

ally want to bank on the idea that someone else is being as safe? The best time to use PGP is when you are sending e-mails that don't *need* to be encrypted (and indeed, I look forward to the day when encryption is standard e-mailing procedure, if only for the sake of returning to the ethos that an individual's privacy is an important thing). On the other hand, PGP can be invaluable for encrypting your own files stored on your own computer (although you should remember to store the decryption key on some other device). It is worth noting that it has been suggested that the AL-QUEDA terrorists used PGP, and because of this use, *any* e-mails sent using PGP might be seen as suspect. Finally, while LSD may give one access to collective consciousness, DSL can give the collective access to your consciousness—or, at least to that part of it you store on your computer. DSL leaves a continually open line to access your computer; those who have DSL should also have a "firewall" installed to restrict access to their machines. Cable connections can also be more easily hacked than direct dial-up (EROWID & EROWID 2001). Don't talk about drugs via e-mail, and don't subscribe to any e-mail lists that discuss drugs, and you will be playing it safe.

5) Hide records. As noted in Part I of this article when discussing businesses, password-protect and/or encrypt your computer. And burn any non-essential paper records.

6) Don't carry drugs outside the home. The law provides your home with the most privacy protection, and you also have the greatest control over what happens there. Store your drugs at the office (as in the example of the doctor and his mushrooms), and you are at the whim of tripped alarm systems and nosey employees, co-workers, or bosses. Store your drugs in a car, as DONUT did, and there's the risk of getting pulled over. And while you should always refuse to consent to a search, this doesn't mean that one won't happen. If you have to carry drugs, you are much safer on foot. (Or take a bus or a cab and let someone else drive, assuming the drugs you are carrying aren't overly aromatic.) Driving with drugs in the car opens one up to numerous possibilities that are out of one's control. Merely giving the *impression* of having illegal drugs is enough to get a person busted, as was shown with the SINGLETON example. If you *have* to drive, make sure that your car is in perfect operating order (no need to be stopped for a tail light that is out), don't drive more than 5 miles over or under the speed limit, and store your drugs in a locked briefcase, inside a locked trunk.

7) Cut your hair. The police categorize people as "types," and treat them accordingly. While there is little doubt that

SINGLETON's arrest was a case of racial profiling, it might have helped him to have short hair rather than long dreadlocks. This goes for white hippies too; DONUT's appearance matched that of the typical "head," with long hair, a mustache and goatee, and this no doubt played a large part in why the cop wanted to search his vehicle (DONUT 2001). A conservative appearance is less likely to draw attention.

8) Don't prepare large quantities of consumable controlled substances from legal live plants at one time. Since the living plants are less likely to get you in trouble, it is best to only prepare enough to consume in a single setting. Along these same lines, it is much less risky to grow entheogens that are not specifically scheduled: *Trichocereus* are safer than *Lophophora williamsii*, *Salvia divinorum* is safer than *Canabis*, and ayahuasca plants are safer than opium poppies.

9) Avoid electronic communications. Other ways that you can be tracked include web sites and IRC or chat programs. Visit web sites that provide information about drugs from a library, instead of using your home or office computer. All web sites have log files, that tell the system administrator what your IP address is, your host-name, the browser that you used, the operating system that you used, and what site you were on just prior to visiting that site. With IRC, your IP address will be accessible to anyone using the service, and you can be "fingere" (where someone might even be able to locate your home directory, your real name, and your e-mail address). Also worth noting, the FBI has set up CARNIVORE, an electronic surveillance program that inserts a "packet sniffer" box on-line. This can be used as a "content wiretap," to capture all e-mails to and from a specific account and capture all network traffic to and from a specific user or IP address, or it can be used as a "tap-and-trace/pen-register," to capture all e-mail headers and addresses going to and from an e-mail account (but not the actual contents or "Subject" line), list all the servers that the suspect accesses, track everyone who accesses a specific web page or FTP file, and track all web pages or FTP files that a suspect accesses. Previously, CARNIVORE could only be used with a court order, although who knows what the situation is now, due to the USA PATRIOT ACT. According to the FBI—as of August 2000—CARNIVORE had only been used about 25 times, predominantly to counter terrorism, but also in some cases for hacking and drug trafficking (GRAHAM 2000). Part of the reason that it has been used so infrequently is probably because wiretaps are considered secondary sources of information, and the same information can easily be provided in "primary" form by the ISP itself (which they generally turn over without a

fuss). Sniffer boxes like CARNIVORE are not difficult to create or install however, and could be in use illegally (or for information gathering that won't be used in court) by anyone with the know-how. A new aspect of CARNIVORE is the proposed MAGIC LANTERN program, that would install "keylogging" software onto a suspect's computer, capturing all keystrokes that are typed (potentially allowing critical encryption key information to be gathered). There is also the NATIONAL SECURITY AGENCY's project called ECHELON. This project's goal appears to be to intercept all electronic communication globally (phone, fax, e-mail, web, wireless, satellite, etc.), and use a system of computers referred to as DICTIONARY to search for specific key words and addresses. Although the U.S. government's "official" stance is to deny any knowledge of this program, it is known that it does in fact exist, due to information leaked from other governments that use it in cooperation with the USA (ACLU 2001). It is reasonable to assume that much of what one uses his or her computer for can be (and perhaps *is*) tracked by the government, although unless one is actively involved in highly illegal activities (terrorism, large-scale drug manufacture or smuggling, etc.), it seems pretty unlikely that any action will be taken.

Finally, I would be remiss not to mention the recent anti-terrorist USA PATRIOT ACT, that resulted from the 9/11 attacks on the WORLD TRADE CENTER and the PENTAGON. This ACT is most certainly unconstitutional, as it guts the Fourth Amendment, allowing the government to search homes and offices surreptitiously, read e-mail, and follow web surfing habits without a court order. The government now has full reign to ignore the rights to privacy of anyone and everyone, so long as they can reasonably argue that they have done so in an effort to fight terrorism (HAGERTY 2001). Alas, "terrorism" has not been well-defined, and there is concern that numerous domestic political organizations, such as EARTH FIRST, GREENPEACE, and others, may become targets. It is not that far of a stretch to assume that drug dealers and even drug users could be considered "domestic terrorists" in the future. (Indeed, the politicians have said that the War on Terrorism needs to be fought *in the same manner* as the War on Drugs has been; as if the latter war has been *any* kind of a success!) Screaming patriots follow like lemmings, unaware that we have had our freedom stolen from us—not by terrorists, but by our own government claiming to fight for us. It is a sad sort of irony. Let's all try to stay as safe as possible within the context of this new world order. ☉

# THE LAND OF THE LOTUS SMOKERS

by TAO JONES

When I was in school and we were reading the classics of literature, one of the authors we studied was HOMER, who produced such famous works as the *Iliad* and the *Odyssey*. In the *Odyssey*, which deals with the attempts of the Trojan warriors to return home, the trip took 20 years due to one of the crewmen accidentally unleashing every foul wind and bad weather spirit contained in a bag given to them by a sorceress. If the evil spirits were kept sealed in the bag it would have guaranteed them a safe journey home. As it was, they were blown all over the seas and found themselves out of food and water and with an unknown island on the horizon. They decided to put into the harbor and try to find food and water. Men were sent ashore to secure food and water, but they did not return to the ship. More men were sent to find out why the first group did not return; they also did not return. ULYSSES then decided to go ashore himself to determine the cause of the problem. He found his men in a village partying with the inhabitants. They were all non-responsive to his demands that they return to the ship. They had been eating lotus (*Nelumbo nucifera*) flowers with the local people and would not pay any attention to him. They smiled at him and refused to leave. They were completely happy and wanted him to eat the flowers and remain there with them. He returned to the ship, gathered up his most trusted men and went ashore and forcibly moved the vehemently protesting (but not resisting) crew members back to the ship where they were tied up until they “came down” in a few days and returned to normal.

In school we were taught that lotus was a metaphor, and that HOMER really meant opium. This did not seem right to me, since there was no reason to use a metaphor, and so I determined, one day, to try lotus flowers. I finally obtained some flowers and smoked them on several occasions, sometimes by themselves and other times mixed 50/50 with *Cannabis*. The following is a recounting of the experiences from notes taken at the time and from memory.

LOTUS FLOWERS ALONE: I rolled a cigarette containing dried and crushed material and smoked it. This produced a clarity and euphoria that was quite pleasant and slightly similar to *Cannabis*, but without any body load or mental dullness. None of the inertia—as mentioned below when smoking the

flowers with *Cannabis*—was noted, but I still found myself less inclined than normal to be productive. I was reminded of the effects of smoking *Nymphaea caerulea* flowers but without the empathogenic component. However, as I was alone during all of these experiments I may have missed noticing any empathogenic effects. I would not be at all surprised to find them when using this material in the company of others. The effects seemed primarily cerebral, but were quite noticeable and very enjoyable. There was a feeling of joy that permeated my whole body, emanating from every cell. This was delightfully wonderful and lasted for some time. I felt perfectly content to sit in the sun and do nothing. This was very unusual for me; I usually have a compulsion to keep busy and be creative, but this was noticeably diminished by the effects from smoking the flowers. I felt light and airy, almost weightless, and this feeling led me to try more and see if the effects become any stronger. After a second cigarette, a slight dizziness was noted, but this soon vanished and left me in approximately the same place as after the first cigarette. I noticed no increase in effects, but the dizziness I tentatively attributed to aporphine [and possibly proaporphine] alkaloids, the chemicals that may be the active principles in *N. caerulea* flowers. I have not yet been able to conclusively demonstrate that this is indeed the cause of the effects, but these effects are similar enough to *N. caerulea* to allow me to speculate. The effects lasted a total of approximately four hours. The flowers I smoked were probably two years old so they may have lost considerable potency. I plan to obtain fresh flowers and will update this report when I assay these.

LOTUS FLOWERS MIXED WITH *CANNABIS*: The first thing I noticed was a sharpening of visual detail. Patterns, textures, and weaves were more noticeable and colors were brighter, but with a subdued intensity that was quite unusual. I felt completely relaxed and content; the universe was functioning perfectly and needed no assistance or attention from me. I felt like I had a completely empty day off in front of me; nothing needed to be done and I could just forget about everything that normally concerns me. This was a wonderful, calm (but not sedating) feeling. I experienced an exquisite sensation of full-body cellular euphoria. Every cell in my body was singing for joy and I felt a radiant energy beaming from each one. The sense of fullness and completeness was like a thick

blanket of joy enveloping me. I was in a state of total peace and complete satisfaction. I was astounded by the quality and quantity of the euphoria. There was much more going on here than could be expected from just the effects of *Cannabis*. Amazing thoughts and ideas welled up into my brain but I was too euphoric to act, thinking instead to write them down later when I was not feeling so wonderful. I just did not want to interrupt the experience for anything so trivial. Of course, when that time arrived, I could not remember most of the revelations and ideas that had impressed me so. The inspired thought processes did not include memory enhancement, unfortunately. I had two different types of experience when trying to write down what was going on. In the first one it was easy to move from passive to active and write down thoughts and feelings. In the second it was impossible to even consider writing until the euphoria abated somewhat. These were interspersed throughout the course of the event. I realized after some time that I had been sitting in one position, unmoving, for a long while. My body was totally pain free, relaxed and untired. I was content to remain in one position for some time after realizing this. I did not get stiff, but remained relaxed with no muscle cramping although I did not move for probably two hours. I had no sense of passing time—I was totally swept into the moment. After four hours I took a nap and awoke two hours later refreshed and still very much aware of the lotus effect. I was very happily lazy and got absolutely nothing done the rest of the day. It was very easy to identify with HOMER's crew who wanted to do nothing but enjoy the lotus and not be bothered with anything else. It was very difficult to accomplish the simplest task without first debating the pros and cons in my head, and usually the cons won.

I tried the combination again the next Sunday, but started in the middle of the day when I was already tired and consequently fell asleep. When I awoke all the euphoric effects had passed but the lack of motivation and unconquerable inertia were still present. This made the whole day go like dragging oneself through waist-deep water in order to accomplish the easiest things. The two things that impressed me the most about these experiences were the euphoria and the inertia. Usually I find euphoria quite the stimulus for getting things done and being creative. Here it was exactly the opposite. It was okay to do nothing. Indeed, it was almost required. The next day I felt fine with no hangover, though during the experience I was certain the effects were strongly narcotic.

LOTUS FLOWERS FOLLOWED BY *CANNABIS*: The *Cannabis* was smoked at approximately three hours after smoking the

lotus flowers, which amplified the effects, but did not change them otherwise. The lotus effects were not replaced or overlain by the *Cannabis*. The *Cannabis* effects were primarily unnoticeable except as accentuating the effects already present from the lotus flowers. A slight body load was noticed that had not been present prior to smoking the *Cannabis*, primarily manifesting as a feeling of being flushed in the face. Upon looking in the mirror no flushing was visible. The inertia that was first noticed when combining the lotus flowers with *Cannabis* did not seem to be present when *Cannabis* use follows lotus use by an interval of a few hours. The light and airy feeling from the lotus remained the dominant note. Smoking *Nymphaea caerulea* flowers combined with *Cannabis* did not produce an inertia similar to the one experienced with the combination of lotus flowers and *Cannabis*—no inertia was experienced at all with this combination. ☉

The choice to combine some "unknown" smokable with *Cannabis* seems to be one that is far from uncommon, especially among chronic smokers. Such a choice can be criticized as being "unscientific," since clearly the *Cannabis* will contribute some (if not all) of the effects by itself. In addition, mental effects can be produced through the synergy of two or more compounds that are quite different from those obtained using the plants or drugs on their own. Timing of ingestion (which is taken first, and when) can also play a strong role in the outcome. Nevertheless, there may be unique benefits gained by such an approach. Reportedly, ayahuasca shamans sometimes add a small quantity of an unknown plant to their brew, in order to "understand" the character or spirit of the new plant. It seems reasonable to assume that those who are quite familiar with the effects of *Cannabis* could use the induced mind state as a sort of oracle, to better understand new plants and compounds from this particular alternative viewpoint. Another such example of this sort of approach may include the claim made by some people that minuscule amounts of amphetamine, or DMT, or 5-MeO-DMT are noticeable when one is already in the throes of an LSD voyage or when parenteral harmine or harmaline is administered following or with an active dose of psychotropic tryptamines. These amounts are so small that they would cause no effects if they were taken alone. Are the effects produced purely psychosomatic? Or does the altered state of mind actually heighten one's ability to perceive even the smallest of changes induced in the nervous system? We're dealing with a tricky area, since these are compounds that affect the mind in the first place.

I am curious why TAO JONES smoked the flowers, since HOMER clearly wrote about oral consumption. (Perhaps this was the only "obvious" approach for a *Cannabis* shaman?) I do applaud the fact that Mr. JONES actually *did* test lotus flowers on their own to see what effects they had. And yet I am also interested in the idea that concurrent *Cannabis* use might be a valuable analytical tool. Finally, I remain hopeful that someone might check out the activity of the various compounds in this plant in pure form. Although the chemistry of the lotus is fairly well known, the flowers themselves have not been extensively tested and the pharmacology hasn't yet been elucidated as far as I know. — DAVID AARDVARK

# MUSHROOM CULTIVATION: FROM FALCONER TO FANATICUS AND BEYOND

by YACHAJ

The first successful cultivation of psilocybian mushrooms from México was accomplished by the French mycologists ROGER HEIM and ROGER CAILLEUX in Paris during the late 1950s. The first kitchen cultivation methods for basement shamans came to light in the 1970s. But the *real* breakthroughs only recently became accessible to the public.

The roots of psilocybian cultivation techniques go back to 18th century France, when *Agaricus* (white button) mushrooms were first cultivated; King LOUIS XIV (1643–1715) may have been among the original European mushroom growers. The mushroom “sewing seed” (or spawn) was obtained by digging up mycelium from meadows where wild agarics grew and horses were active. The mycelium was then transferred to special caves near Paris, set aside for this unique form of agriculture. From France, the gardeners of England found mushrooms an easy crop to grow, requiring little labor, investment, and space. English mushroom cultivation increased in popularity, due to more experimentation with spawn and publicity in journals and magazines. In the late 19th century, mushroom production made its way across the Atlantic to the United States, where curious home gardeners in the east tried their luck at growing this unique crop. Then, in 1891, the first book on mushroom growing was published, and it shed new light on the theory of cultivation on horse manure compost. WILLIAM FALCONER, a mushroom grower and experimenter from Long Island, agreed with the recommendations of agricultural journalists and compiled their theories into *Mushrooms: How to Grow Them; A Practical Treatise on Mushroom Culture for Profit and Pleasure* (available on-line at <http://chla.library.cornell.edu/cgi-bin/chla/chla-idx?notisid=AAM1556>).

The early methods of finding, digging up, and perpetuating the wild mycelium were uncertain and unreliable. The first manufactured spawn combined a mixture of horse and cow manure pressed into bricks—the original source being the wild mycelium. The bricks were not sterilized, however, and could harbor pathogens and weed fungi. Interestingly, the psilocybian *Panaeolus subbalteatus* used to be a common weed mushroom when these classic methods were applied.

On a few occasions people ate mixed batches of *Agaricus* and *P. subbalteatus*, and experienced the first (involuntary) “trips” in Western history (GARTZ 1993). Hence, FALCONER’s book is still among the most informative publications for home cultivators of potent psilocybian mushrooms like *Panaeolus cyanescens* and *P. tropicalis*. He describes mushroom cultivation in cellars and greenhouses on horse manure compost in better detail than any recent author. Introduced as “Mr. Gardener’s method,” FALCONER even devotes a full chapter on the yield-boosting effects of a casing—a top layer of soil placed on the mushroom bed, made from loam (a mixture of clay, sand, silt and organic matter). This important discovery was soon forgotten and only eighty years later “rediscovered.”

The techniques for cultivating psilocybian mushrooms in the 1950s were still largely based on the methods as described in FALCONER’s book. For instance, in 1956 the first 100 grams of cultivated *Psilocybe mexicana* was successfully grown on compost by ROGER HEIM. The details of the methods of HEIM, and his collaborator ROGER CAILLEUX, were not published in English before 1977, in the now hard-to-obtain book *Magic Mushroom Cultivation* by the late Dr. STEPHEN POLLOCK, who writes:

Spawn of *P. mexicana* was grown in flasks under sterile conditions on composted straw that had been well washed. Unwashed straw compost was placed in earthenware pots and sterilized. The pots of compost were then inoculated with spawn from the flasks and set in a greenhouse. After about two weeks the compost was well invaded by the mycelia and covered with a thin layer of casing material. The casing material consisted of an unspecified mixture of various sands and calcareous (chalky) earths. The greenhouse temperature oscillated between about 19 to 25 centigrade. In three to six weeks after casing, mushrooms appeared. It was found that spawn could not be easily grown in the flasks unless the compost was well washed prior to sterilization. In contrast, unwashed compost was observed to be superior for obtaining mushroom fruit. Composted corn debris (leaves and stalks) worked almost as well as composted straw for fruiting *P. mexicana* in the clay pots.

*Psilocybe mexicana* was not the only species that was tested. POLLOCK continues:

*Psilocybe caerulescens* was grown in a similar manner but would not produce fruit on composted straw. Composted corn debris served as a suitable medium, however, for fruiting *Psilocybe caerulescens* in greenhouse culture. Less abundant crops of *Psilocybe caerulescens* were obtained using a mixture of straw and corn debris composts. *Psilocybe semperviva* readily fruited on composted straw, but yielded more luxuriant flushes on the corn debris compost. *Psilocybe mixaensis* produced mushrooms on various composted media, such as wheat straw, corn debris, and horse dung. Mexican strains of *Psilocybe yungensis* were fruited after five or more months of culture on a moss medium in glass flasks. *Psilocybe zapotecorum*, a species first fruited on a medium of moss, was grown both on straw and horse dung composts in glazed earthenware pots designed to retain water. The mycelial laden compost was cased with calcareous sand and then completely submerged under water. Magnificent *Psilocybe zapotecorum* mushrooms came up right through the water! This interesting phenomenon is in keeping with the “subaquatic” ecological nature of the species. *Psilocybe cubensis* was fruited on cased horse dung compost in earthenware pots. Some specimens attained a full twenty centimeters (almost eight inches) in pileus diameter.

## LITERATURE FROM UNDERGROUND

In the two decades between the research of HEIM and CAILLEUX and the book of POLLOCK, few original discoveries were published. “Underground” booklets and pamphlets began to circulate, some describing the cultivation of psilocybian mushrooms. Notable among these was *The Psychedelic Guide to Preparation of the Eucharist*, a 1968 book that described cultivation of *Psilocybe cubensis* on agar, liquid culture, uncased rye grain, and compost, and *P. mexicana* on potato dextrose yeast (PDY) agar and liquid culture. This booklet also detailed the synthesis of psilocin and other psychedelics. An identical technique appeared at about the same time in another booklet, entitled *The Turn On Book*. In 1970, a little booklet entitled *A Key to the American Psilocybin (sic) Mushroom* was published by LEONARD ENOS. This contained more detailed information on tissue culture techniques, borrowed from scientific and popular literature. However, the cultivation techniques required too many additives to the agar and were overly complicated; hence, this pamphlet did little to stimulate the cultivation of psilocybian mushrooms. Another pamphlet, *Field Guide to the Psilocybin (sic) Mushroom*, appeared in 1972, and was sold through

advertisements in counter-culture newspapers and by the thriving “head shop” businesses of the time. This pamphlet advised cultivating *P. cubensis* on compost in FALCONER style, but starting from pieces of a fresh mushroom cap instead of collected mycelium.

## OUTDOOR EXPERIMENTS

In 1972, UNIVERSITY OF WASHINGTON students in Seattle discovered a mushroom that began to fruit abundantly on bark mulch and lawns on the UNIVERSITY campus. This event triggered the development of outdoor cultivation techniques for psilocybian mushrooms. According to JONATHAN OTT, who wrote about this phenomenon in his books *Hallucinogenic Plants of North America* (1976) and *Teonanácatl: Hallucinogenic Mushrooms of North America* (1978), the mushrooms were usually found on the cedar bark mulch that the gardeners spread around landscaped areas of the campus. Intrepid student experimenters soon learned that these mushrooms were psychedelic, and their use as recreational drugs became very popular. An article in the student newspaper then warned that the mushrooms were dangerous (despite the fact that no illness resulting from the use of them was ever reported), and the gardeners were instructed to destroy any specimens and to put fungicides on the mulch. In 1974 they fruited abundantly in Olympia and Tumwater, Washington, and again on the campus of the UNIVERSITY OF WASHINGTON. An increasing number of students learned that the old French method of collecting mycelium and transplanting it to fresh substrate worked extremely well for mushrooms of this group, which were later identified as belonging to the “caramel caps.” In fact, as mushroom pioneer PAUL STAMETS explains in his cultivators’ bible, *Growing Gourmet and Medicinal Mushrooms*, “they are common in urban and suburban areas and are actually rare in natural settings. Ideal locations for collecting this mushroom are in the landscaped property of government facilities: courthouses, libraries, utility companies, and even police stations.”

The main difficulty of the “caramel cap” *Psilocybes*, such as *P. azurescens*, *P. bohemica*, and *P. cyanescens*, was that they only could be harvested one season per year in cool climates (and they were nearly impossible to fruit in more controlled conditions). So in his 1977 book, POLLOCK predominantly wrote about mushrooms that could be grown all year round, like *Panaeolus cambodginiensis*, *P. cyanescens*, *P. subbalteatus*, *Psilocybe argentipes*, *P. baeocystis*, *P. caerulescens*, *P. coprophila*, *P. cubensis*, *P. fasciata*, *P. semilanceata*, *P. subaeruginascens*, *P. subaeruginosa*, *P. subcaerulipes*, and *P. zapotecorum*. Most of

the tested species yielded less biomass, were of lower potency, and fruited much later than *P. cubensis*. Mexican strains of *P. yungensis*, for instance, fruited after five or more months of culture on a moss medium in glass flasks. “Such a lag is entirely impractical for psilocybian mushroom fanciers,” wrote POLLOCK in the introduction of *Magic Mushroom Cultivation*, “therefore, I will focus primarily on cultivation of species that can be grown easily and relatively rapidly.” The rest of his book is almost exclusively dedicated to cultivation techniques for the potent *Panaeolus cyanescens* and the robust *Psilocybe cubensis*.

### MORE COMPOST EXPERIMENTS

The larger-scale techniques that POLLOCK described were still not very different from the ones presented in FALCONER’S book. Industrial compost production for mushroom growing commonly uses about 95% straw and 5% horse manure for compost starter. According to POLLOCK, an excellent compost recipe in the Pacific Northwest is created from a pickup truck load of fresh leached cow manure available from dairy farms, 2–5 bales of well-soaked wheat straw, 25 pounds of horticultural gypsum, 5 pounds of cottonseed meal/oil, and commercial compost starter. In his compost experiments POLLOCK experimented with several different types of straw: wheat (*Triticum aestivum*), oats (*Avena sativa*), barley (*Hordeum vulgare*), JOHNSON grass (*Sorghum halepense*), TIMOTHY grass (*Phleum pratense*), alfalfa (*Medicago sativa*) and clovers (*Trifolium* species), as well as manure of cattle, sheep, horse and poultry. All proved to be useful to some extent, but horse manure and wheat straw were the best. POLLOCK writes:

For outdoor cultivation compost beds at least a foot high and several feet wide should be made. The beds are inoculated with spawn and kept moist by watering with a hose using a spray nozzle or running a lawn sprinkler system. It is necessary to water at least once a day in hot dry climates but not necessary to water at all in wet climates. Spawn from canning jars or other containers is broken up and placed about six inches under the surface of the compost bed. A couple of quarts of spawn is plenty for a six foot long bed but more can be used to reduce the chance of takeover by “weed” mushrooms. Outdoor compost cultivation works especially well for coprophilous mushrooms such as *Psilocybe cubensis*, *Psilocybe coprophila*, and many *Panaeolus* species. There are other magic mushrooms that can be grown this way, but none are as easily fruited as dung-inhabiting species. In fact, beds of fresh uncomposted horse manure may be used to grow coprobious mushrooms outdoors, especially *Panaeolus* species. It usually takes about a month to six

weeks for mushrooms to appear on outdoor beds and flushes may continue for over two months, but the fruition is largely dependent on rain. Rain is what it takes for successful outdoor mushroom growing. Without adequate rain, crops can be induced to appear by frequent watering with sprinklers or a hose set in place with a sprinkler attachment. Compost beds inoculated with *Panaeolus* mycelia should not be cased and it is not necessary to case compost beds when growing *Psilocybe cubensis* (POLLOCK 1977).

Although *Panaeolus cyanescens* is among the most potent of the easy to grow psilocybian (STIJVE 1992), it has not become the most popular home-grown species. The main reason is that this mushroom so far has only been grown on manure. This may be a wonderful substrate for cultivators in the countryside, but for basement shamans in urban areas it has disadvantages. In most big cities fresh organic horse manure is unavailable. Another problem is that the use of manure as medium makes the grower unpopular with roommates, considering the way it needs to be prepared—filling a large plastic turkey baking bag with manure then adding one quart of water to moisten and cooking in the oven at 200° F for three hours. (The author of this very article has been forced to live on his own just because of this hobby.)

Fortunately, in 1960 the mycologist Dr. LEON R. KNEEBONE published a small scale adaptation of the current industrial method of growing *Agaricus* mushrooms for use with *Psilocybe cubensis* (KNEEBONE 1960). For the background of his discovery we have to return to the beginning of the 20th century, when FALCONER’S book was the only available one on the subject, the risk for *Panaeolus subbalteatus* “weed” mushrooms was still severe, and the hunt for a better method had just began.

### THE SPAWN OF SINDEN

In 1903, after much experimentation, U.S. DEPARTMENT OF AGRICULTURE scientists produced the perfect pure-culture virgin *Agaricus* spawn. In 1915, pure culture spawn was produced on sterilized horse manure compost in bottles. The development of uncontaminated horse manure spawn, however, did not eliminate the problem of obtaining productive, reliable spawn. In 1930, PENNSYLVANIA STATE COLLEGE employed Dr. JAMES W. SINDEN to work on mushroom production problems. During one of his first series of experiments he found a medium on which the mycelium would grow more vigorously and that would provide a more uniform product: grain (specifically wheat), which was placed in flasks with a

This is Dr. STEPHEN POLLOCK's rice cake technique of 1977 (drawing by POLLOCK), the predecessor of the PF TEK. A more low-tech process for producing SINDEN spawn is currently not known.

If McALPINE's agar medium is used to germinate the spores and grow mycelium, and peroxidated par-boiled brown rice is used as substrate, all steps can be performed without eyedropper/syringe/pipette and without a dry vermiculite contaminant barrier in an unsterile still-air environment. See WAYNE's manuals at [www.mycomasters.com](http://www.mycomasters.com) if you want to know why only peroxidated par-boiled brown rice can be used.

Unfortunately the mycelium needs a lot more time to colonize brown rice when it grows from an agar wedge compared to a liquid inoculation as in the PF TEK. But when it finally is colonized, COUNTZERO's technique can be applied (both on the agar culture and the colonized SINDEN spawn) to inoculate lots of contaminant barrier-topped PF Substrate jars by syringe or pipette. In my experience liquid inoculations without a contaminant barrier ("free pouring") in a nonsterile environment are too sensitive to contamination.

Note also that the moist vermiculite casing is missing in this drawing; while it is not necessary, it really promotes fruiting if it is added.

small amount of water and heat sterilized. On introduction of the mycelium, he found that it grew very vigorously and in a manner entirely different than anything previously seen. Thus grain spawn was born (U.S.A. Patent No. 1,869,517), (see [www.mycocell.com/uspatent.htm](http://www.mycocell.com/uspatent.htm)) and has changed very little since.

KNEEBONE's important discovery was that *Psilocybe cubensis* did not need compost, but could be fruited on SINDEN's spawn (pure grain medium). POLLOCK followed KNEEBONE's path further and tested grains/seeds of crimped oats (*Avena sativa*), hemp (*Cannabis sativa*), coffee grounds (*Coffea arabica*), soy bean (*Glycine max*), rye grass (*Lolium perenne*), brown rice (*Oryza sativa*), rye (*Secale cereale*), milo (*Sorghum vulgare*), millet (*Panicum miliaceum*), Canary seed (*Phalaris canariensis*), wheat (*Triticum aestivum*) and corn (*Zea mays*). POLLOCK soon concentrated on cheap and commonly available brown rice grains. He found that brown rice medium was highly selective for *P. cubensis* (no other mushroom could be fruited on it). Indeed, the selective quality of brown rice protects newbie psilonauts against accidentally growing toxic mushrooms. But there are more reasons to think of brown rice as superb. In the 1980s, German mycologist Dr. JOCHEN GARTZ, went so far as to file a patent (No. 88-09773, Akad. Wiss. DDR) on brown rice after his discovery that this medium supported the cultivation of *P. cubensis* of unprecedented potency—1% psilocybin/psilocin by dry weight (which almost equals *Panaeolus cyanescens*), the highest natural potency ever reported of this mushroom.

## THE BROWN RICE MEDIUM

For growers of today it is difficult to imagine how much work it must have been to test so many mushrooms on so many different substrates before a compost alternative was found that met all demands (especially when we keep in mind that cultivation techniques were in their infancy). Many experiments only resulted in huge outbreaks of green molds. Nevertheless POLLOCK came to a conclusion. Considering that *Psilocybe cubensis* was the psilocybian of choice, he pointed out brown rice as the most commonly available, most economical, and therefore most convenient substrate for home cultivators. GARTZ' discovery that highly potent *P. cubensis* could be grown on brown rice was a huge bonus too. "Nevertheless," wrote GARTZ, "it appears unlikely that cultivation of *Psilocybe cubensis* mushrooms by laypersons will significantly heighten the mushroom's popularity or widen its area of distribution anytime soon" (GARTZ 1996).

## THE CASING LAYER

GARTZ was right. The solution of the compost problem came with a double price tag. The first problem was that yields on pure grain substrates were unpredictable. An answer was not found until 1971, when mycologist JAMES P. SAN ANTONIO tried FALCONER's loam casing on SINDEN's grain spawn for producing *Agaricus brunnescens*, with fabulous results. He showed that covering the mycelium (or vegetative state) of this mushroom with about half an inch of slightly alkaline soil could greatly increase the yield by causing it to "fruit" repeatedly in "flushes" appearing periodically.

At <http://groups.yahoo.com/group/diggers350/message/316> is a post in which DENNIS MCKENNA claims to be the person who first tested SAN ANTONIO's finding on *Psilocybe cubensis*. He writes:

Basically, I developed the technology for growing cubensis on sterilized rye in mason jars. Actually, all I did was adapt the technology first developed by J.P. San Antonio. [...] I just adapted the method to cubensis and it worked. Your tax dollars at work! It was Terence who saw the entrepreneurial possibilities in the method and helped to scale-up the operation.

In *Pharmacotheon* (1993), JONATHAN OTT noted that the mason jars (American one-quart home-canning jars) of grain substrate permeated by mycelia were sold for about \$10.00 each. DENNIS and TERENCE MCKENNA then worked together to write a book about the method, along with illustrations by KATHLEEN HARRISON and photographs by JEREMY BIGWOOD. That book, *Psilocybin: Magic Mushroom Grower's Guide—A Handbook for Psilocybin Enthusiasts* (1976) became, the single best-selling counter-cultural drug book ever published. The casing mixture the authors recommended was made with 3.5 liters fine vermiculite, 4.0 liters washed fine sand, 2.5 liters peat moss and 2.0 liters finely crushed oyster shells.

Just in time before the publication of his own book, POLLOCK found a shortcut to the mixture by using potting soil that comes pre-mixed with plenty of vermiculite, peat moss, and sand. In 1983 the substrate was further simplified when mycologist EDMOND BADHAM found that damp brown rice with a casing layer of *only* moist vermiculite was sufficient—the results of his experiments were published in the journal *Mycologia* and in his thesis, *Cultural Studies on the Mushroom Psilocybe cubensis* (BADHAM 1982, 1983).

The second problem with using grain spawn as fruiting substrate—especially by laypersons—is that it is extremely contamination sensitive. Without sophisticated techniques most attempts are thwarted by the presence of bacteria and molds. For too many growers this meant that they had to invest in laboratory equipment, an investment that they could only recover through large-scale commercial production.

According to PETER STAFFORD, author of the *Psychedelics Encyclopedia*, this was not what the authors of *Psilocybin* had in mind. STAFFORD writes:

[With the publication of their book they] hoped that users cultivating these mushrooms in their homes would be independent of the illicit market, which at the time was producing and selling many spurious products. Further, they hoped that this technique would become a permanent part of the subculture, immune from surveillance and anti-drug crusades. To a certain extent, these ends have been met. However, the authors did not realize that there would be as many large growers as have emerged.

Their technique was still so complicated that only a small percentage of users have even tried it. A large pressure-cooker is needed, and many couldn't get the hang of the spore-growing and sterilization requirements for inoculation of the rye jars.

The reason that such equipment was necessary was that the MCKENNA's primarily reproduced the existing 1932 patent of SINDEN. Mushroom spores were first germinated on agar, and the resulting mycelium was transferred to grain jars. To speed up the colonization of the substrate the grains had to be mixed every few days by shaking the jars. Because brown rice usually is too sticky to be shaken, the authors recommended the less productive (and in urban environments often difficult to obtain) rye grains. Finally the colonized grains had to be covered with a casing mixture. In the laboratory all these steps are performed in a sterile work-space. The average basement shaman lacks such an environment, and unfortunately all the MCKENNA's offered as a solution was a poorly designed glovebox.

The single most contamination-sensitive step has always been the transfer of a colonized agar "wedge" into an open jar of sterile grains. However, the MCKENNA's mentioned an alternative method. In the first edition of their manual they write:

Sterilize a bit of water, take up about 10 cc in a presterilized syringe and inject it onto the surface of an agar mycelial culture (slant test-tube cultures are ideal for this). Reseal the culture and swirl the water around vigorously until fragments of mycelium become visible suspended in the water. Then take up the water-mycelial suspension in the syringe, and inject 1 or 2 cc's into each jar. Mycelial growth should become visible from one or more points in the jar by 3–4 days after inoculation.

They also described liquid spore inoculations of the agar:

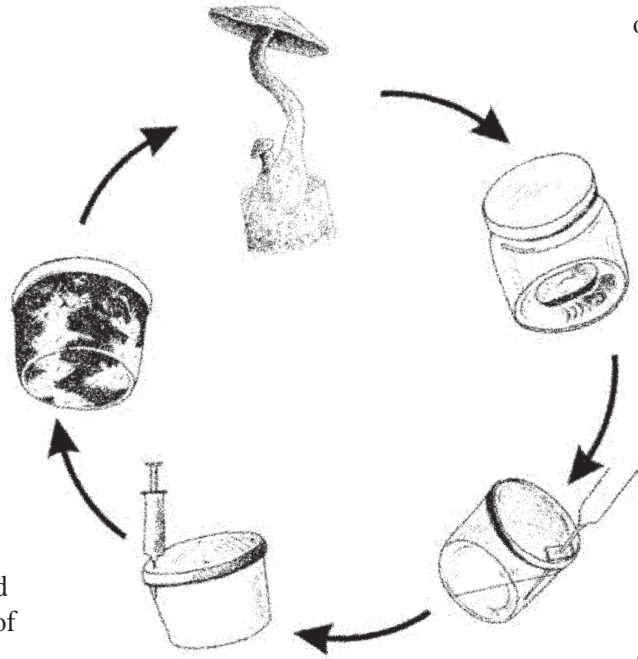

[The spores] can be scraped into 10 ml of sterilized water, then dilute to 100 ml by adding sterile water, take up 2–3 ml of diluted spore solution into a syringe, and point-inoculate the petri plate by placing a drop of the solution at two or three separate points on the agar.

Strangely enough, they never put their techniques together, and these ideas are dropped entirely from later editions of their manual.

## THE NEW TECHNIQUES EMERGE

The credit for combining these techniques goes to the author of a September 1991 publication titled the *Psilocybe Fanaticus Technique* (or *PF TEK*). This manual described, for the first time, the method of injecting a spore solution directly onto a fruiting substrate of brown rice and vermiculite. The touch of genius in the technique was in the use of a vermiculite casing layer as a contamination barrier during the inoculation and substrate colonization. The glovebox was no longer necessary. A syringe needle could easily penetrate the layer and be withdrawn without exposing sterilized substrate to unsterile air. Incoming airborne contaminants could not germinate in the casing nor reach the moist substrate. At the same time, the mycelium below the layer could thrive because filtered air exchange remained possible. By choosing half-pint rather than quart jars, the frequent shaking (and

thus the choice for non-sticky rye grains) became unnecessary. And instead of shouldered MASON jars the author recommended straight or slightly tapered BALL or KERR canning jars, which could be removed from the substrate. This simple idea enabled the harvesting of mushrooms that grew at the sides of the substrate, without needing to break the jar.

To top it off, *PSYLOCYBE FANATICUS* replaced the moist whole kernel rice with an airy mixture of powdered brown rice, vermiculite, and water. To PF's own surprise, this mixture acted as a fruiting substrate and casing layer in one: the mushrooms fruited all over the substrate cake, making a separate casing almost superfluous. The *Psilocybe cubensis* mycelium also colonized this substrate much faster than plain brown rice. More important was that this "PF Substrate," as it became known, did not need a pressure canner to get sterilized—one hour of boiling was sufficient (at least

at sea level). The combination of liquid inoculation with PF Substrate, made the three most problematic parts of the MCKENNA's method—glovebox, agar transfers, and pressure canner—obsolete. (Pictorial overview of the *PF TEK* by HANS VOGT, 1996.)

Other PF innovations were the "Double Chamber Terrarium"—a growing environment designed to create a foggy atmosphere that mushrooms like best to grow in, but which at the same time protected substrate cakes against puddles of sprayed water, and his cold desiccation drying method—mushrooms were first pre-dried in a sieve and then put in an open Ziploc™ baggie that was placed in a glass jar with a one inch layer of calcium chloride on the bottom. The jar was closed and put in a refrigerator for a week. The calcium chloride was dried by baking the jar, without lid, in an oven.

From its first publication, the *PF TEK* was an instant success. As the world wide web became increasingly accessible,

many *PF TEK*-based cultivation techniques were published on-line (see [www.erowid.org/plants/mushrooms/mushrooms\\_cultivation.shtml](http://www.erowid.org/plants/mushrooms/mushrooms_cultivation.shtml)). Together, these techniques have been downloaded over a million times, which may make the *PF TEK* the best distributed cultivation technique for any organism of all time.

In 1996 the popularization of the *PF TEK* accelerated tremendously, when the Internet newsgroup [alt.nature.mushrooms](http://alt.nature.mushrooms) was founded. The newsgroup soon turned into a *PSYLOCYBE FANATICUS* fan club. By 1998 most of the *Psilocybe cubensis* growers on the newsgroup had moved to the newly created [alt.drugs.mushrooms](http://alt.drugs.mushrooms). At the same time, law enforcement agencies in Minnesota were beginning to see an increased number of mushroom growing operations. Since it is illegal to possess any material, compound, mixture or preparation that contains any quantity of psilocybin and/or psilocin—while mushrooms themselves are not specifically scheduled—it became important for law enforcement personnel and forensic chemists to know in what stage of development the psychoactive drugs can be identified. Since many articles are published about the production of psilocybin by mycelial cultures on agar and liquid media, the FBI forensic sciences laboratory first tested the spore-syringes and later the mycelial mat on the *PF Substrate* for controlled substances (see [www.fanaticus.com/forensic.htm](http://www.fanaticus.com/forensic.htm)). Psilocybin and psilocin were not found, and repeated tests confirmed the lack thereof. It was determined that the mycelium “knot” stage of the mushroom was the earliest point when the drugs could be detected. In other words: when *PF Substrate* is used, the colonized cakes are not illegal *before the pinning stage of the mushrooms*. (Be aware that such cakes can be considered illegal when they are used as “precursors” to produce a psilocybin/psilocin-containing crop, which certainly can be argued if the cakes are seized along with harvested mushrooms!) Why the non-pinning *PF Substrate* doesn’t produce the drugs, and agar or liquid cultures do produce them, is still an unanswered question. But the advantage for basement shamans is clear.

ABOVE you see the dry vermiculite contaminant barrier in action. It is an original *PF* invention: a needle can penetrate it without exposing the substrate to unsterile air. It allows respiration of the mycelium, doubles up as casing layer (moisten the layer when the substrate is colonized) and is re-usable. In my opinion, no filter disk can match it in simplicity and effectiveness.

BELOW presents the inoculation procedure. When the shot-glass has cooled down and the needle is wiped clean with alcohol, just lift the tinfoil and inject. Place the foil back on top and write the mushroom genotype, the date, and the total weight of the jar on the foil.

### LEAVE IT TO A HIPPIE...

The best use of these findings was made in 1999 by a home-cultivator nicknamed “HIPPIE.” As often is the case, innovations in simplifying a given task are made by people who hate doing it but have to. HIPPIE was among the laziest mushroom cultivators of the last decade. He implemented the FBI findings (without knowing it, by the way, since he had not yet read the FBI article) into the “mycro-tek.” In HIPPIE’S own words:

I have discovered that it is feasible to grow decent crops of high potency shrooms with no terrarium, no perlite, no misting, no ventilation, [nada]. What

is “micro-tek,” you ask? It is essentially the PF TEK cut in half. Cakes are made and inoculated as per standard PF TEK. Instead of incubating/colonizing in darkness, the jars are exposed to light [through] the entire colonization process. This triggers in vitro pinning, usually by the time the jar is fully colonized. There is no “birthday.” Instead of being birthed, and fruited in humidified terrariums, the cakes are left in the jars, exposed to light, and kept warm. The pins will continue to grow, conforming to the jar’s shape. The fruit are allowed to grow until either the caps begin to open, or [there are] any signs of damage to the pins. The jar lid is removed, cake shaken out, pins/shrooms harvested, then the cakes are returned to the jars for additional flushes. ([www.fanaticus.com/hip-tek.htm](http://www.fanaticus.com/hip-tek.htm))

HIPPIE’s observation was correct except for two things: exposing the jars to daylight through “the entire colonization process” is not necessary, nor are the BALL/KERR canning jars. As early as 1980, the aforementioned mycologist EDMOND R. BADHAM had published an article about the effect of light upon mushroom formation of *Psilocybe cubensis* (BADHAM 1980). He found that a lighting period as short as 0.0025 second was sufficient to initiate pinning, provided that the light was of a wavelength of max 460 nm (blue daylight) and that the substrate was fully colonized. Combined with HIPPIE’s observations, this meant that “backpack cultivation”—as well as sending colonizing cakes through the mail—was possible. Combined with the FBI finding, this meant that colonizing mushroom cakes would be legal as long as the cakes were kept in total darkness. Both ideas were successfully tested during the summer of 2001. Also, the BALL

or KERR canning jars that are recommended in the *PF TEK* may be replaced by a large shot-glass, as is shown below. Such a glass does not break during the sterilization process, provided that it is not directly placed on the bottom of the pan. The metal screw-lid of canning jars can safely be replaced by tinfoil. And if the dry vermiculite top layer is at least two fingers deep, it is not necessary to inoculate the substrate through four pinholes—the tinfoil covering can simply be lifted and replaced after inoculation. The needle of the syringe does not need to be flame-sterilized for this step—it is sufficient to wipe it clean with a tissue that was soaked in 140–200 proof alcohol (which may be denatured).

Another recent improvement is the method to supply water to the mycelium. In the basic *PF TEK* the cakes are protected against direct watering by being placed in an environment where a foggy atmosphere can be replicated. HIPPIE found that it is also possible to rehydrate dried-out cakes by keeping them for 12–24 hours under water, a technique that largely parallels the rehydration method for *Lentinula edodes* as described in *Growing Gourmet and Medicinal Mushrooms* by PAUL STAMETS. Yet another—and often easier—method is to add water to the dry top layer of the cake (PSYLOCYBE FANATICUS recommends two such layers: one on top and one at the bottom of the cake). To ensure that too much water isn’t added, the glasses should be weighed immediately after sterilization. After each harvest, water is added to the top layer, but just enough that the substrate glass weighs the same weight as it did in the beginning. Also worth mentioning is a simple method to keep the glasses cool after pinning—important to do because the psilocybin content is retained best

This is a Slim Matías Romero (SMR) genotype of *Psilocybe cubensis* grown with the HIPPIE’s “micro-tek” (PF TEK without terrarium). The SMR has PF’s “classic” Matías Romero (MR) as a parent (it came up from PF spores). It is a mutation that first appeared in January 1997 in the Netherlands. The SMR differs from PF’s classic MR in that it has a more *Stropharia*-like shape; *i.e.* scales on the caps of the mature mushrooms (not bald as you would expect from a true *Psilocybe*) and a persistent ring or annulus around the stem.

During 2001 the SMR proved to be exceptionally useful for the “micro-tek”. The flesh blues in seconds after bruising, the minimum psychoactive dose is about 0.6 g dried, it easily produces very dark spore-prints, and about 1/6 of the dry weight of the brown rice is converted into dry mushrooms with unopened caps in 2–3 months.

The SMR is currently being tested and compared to other genotypes by PSYLOCYBE FANATICUS. If he finds the SMR as good as I think it is, the genotype will probably be available via PF in spring 2002.

at temperatures around 20° C. Even in the hottest summers the substrate glass can be kept cool when it is put in a sock, dipped in cold water, and hung somewhere. The jar is then cooled by evaporation of the water so it is important to keep the sock wet. Further cooling of the cakes to 4° C also is useful—colonized but pre-pinning cakes can be stalled from fruiting for up to 3 months in this manner, only to then fruit on demand when they are returned to room-temperature.

By using the new simplified methods it has been demonstrated that more than 1/6 of the dry weight of the brown rice powder in the “maximum fruiting formula” of PF Substrate (= 2 volume parts of vermiculite with a kernel size of 0–3 mm, 1 volume part of powdered brown rice, and 1 volume part of water) can be converted into dried *Psilocybe cubensis* mushrooms (young, with unopened caps) in as little as two months. (For these results, the mushroom genotypes used were those distributed by PSYLOCYBE FANATICUS under the names “Matías Romero” and “Hawaiian.”)

All the recent good news however can not mask the fact that the *PF TEK* has one weak point: the production of uncontaminated inoculant still requires a skilled cultivator and a sterile working place. The method as described at [www.fanaticus.com/syringe.htm](http://www.fanaticus.com/syringe.htm) is as simple as possible, but still not suited for backpack cultivators.

For producing viable spore-water, this need for a sterile environment may be forever true. But for *mycelium*-water, new techniques recently became available. And as usual, the “new” techniques came with an interesting history, which in this case goes back almost half a century.

## ORCHID SEED BREAKTHROUGH

In the 1940s, the orchid grower K.L. McALPINE was looking for a better method to clean orchid seeds prior to germinating them on a sterile agar medium. This was necessary because the agar was easily contaminated by the bacteria and molds typically found on dirty seeds. Seeds were routinely cleaned with sodium hypochlorite, but in many cases a bit of this disinfectant ended up in the agar medium, which effectively killed the plant over time. McALPINE sat down and pondered what sterilizing agent (as well as its possible products of decomposition) might kill the undesired fungi, without affecting the orchid seeds or the reaction of the medium. Furthermore, its effective concentration should not be critical. “Such a substance,” wrote McALPINE later, “could be added directly to the culture medium and the seeds then sown with complete disregard to sterility.”

McALPINE discovered that wishful thinking can saddle the wisher with a lot of work. He tested several *hundred* chemicals (each in thirty different concentrations!), as an additive in his agar media. Only *one* proved to be useful: hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>). In *The Orchid Review* of January 1947 we read that he mixed a 30% solution of hydrogen peroxide in the medium to give final concentrations of 0.0003–0.3%. Within the range of 0.009–0.18%, he found that fungal growth was inhibited but seed germination was not impaired. Higher concentrations killed both the fungus and the seeds, while lower concentrations did not kill the fungus. McALPINE wrote:

The agar does not even need to be steam-sterilized for this but just heated to dissolve in its components. While still warm, the agar medium is poured into small jars containing the peroxide dissolved in a minimum amount of water. The jars used for comparative purposes were one-ounce, clear-glass, screwcap ointment jars. So soon as the agar has set, dry orchid seeds are evenly distributed over the surface. The lid is then screwed home and the jar placed in a suitable location for the seeds to develop. Hydrogen peroxide does not change the reaction of the medium: it is highly fungo-static and does not decompose into toxic substances. This method probably more closely than any other before described, duplicates the natural process.

McALPINE was quite right. Hydrogen peroxide (water with one additional oxygen atom), is a chemical that is extremely effective in destroying single-celled organisms: the extra oxygen is very reactive and burns holes in cell membranes. Since hydrogen peroxide is made from (and decomposes in) water and oxygen it is easily formed in nature. It is the among the first chemicals that life forms need to defend themselves against. Since single-celled organisms (bacteria, yeasts, spores) have but one cell they can lose, they are the primary victims of this chemical, while each and every multi-cellular organism (as well as a colony of single-celled organisms) has peroxidase enzymes to defend itself. Many such organisms even produce hydrogen peroxide as an antibacterial weapon. Bees for instance, produce hydrogen peroxide to keep collected nectar and honey (a perfect medium for most molds) sterile.

Unfortunately, McALPINE’s pioneering work was not followed up, perhaps because hydrogen peroxide was generally believed to be an unstable, even explosive, compound. Indeed, it *was* such a compound in McALPINE’s time. But since 1950, new methods for keeping hydrogen peroxide stable

were implemented (a tiny bit of phosphoric acid did the trick). Also, 3% peroxide, which is much safer to work with, became widely available. Still, it would take almost four decades before the botanist RICHARD SNOW rediscovered McALPINE's method and published commentary about it in the *American Orchid Society Bulletin* of February 1985.

SNOW tested McALPINE's findings by deliberately inoculating a culture medium with a mold, and found that a concentration of 0.1% hydrogen peroxide killed the mold, while concentrations between 0.01–0.05% didn't harm its growth.

Nine years later SNOW's article was read by RUSH WAYNE, a would-be mushroom cultivator who was not too strict in housekeeping routines, living in a dusty house with a refrigerator full of green and white fuzzy things. For some reason WAYNE decided not to use his time to clean everything up, but to find a way to grow mushrooms despite the load of contaminants. And as we saw earlier with HIPPIE, this is the perfect attitude to formulate a breakthrough. After WAYNE had read about the peroxide concentrations that weren't harmful to harm the mold, he decided to perform a few tests with mushroom mycelia. As WAYNE wrote in the first edition of his 1996 manual *Growing Mushrooms with Hydrogen Peroxide*:

What followed was a fairly complicated and non-linear process of learning about growing various mushrooms, trying different concentrations, learning about different culture media and how they interacted with the mushrooms and the peroxide, trying various degrees and techniques of pasteurization and sterilization, going back over earlier ground with better pH measurements, experimenting with supplements, tracking down sources of contamination, tightening my procedures, and on and on, until I developed some fairly reliable guidelines for what I was doing. It all took far longer than I ever would have guessed. But the upshot of it was that, yes, hydrogen peroxide can be used to help keep mushroom culture media free of contaminants without killing the mushroom cultures themselves.

Eventually WAYNE found a whole collection of specialized cultivation techniques for mushrooms, all without the need for a pressure canner or sterile working environment. Most of the techniques are meant for indoor cultivation of non-*psilocybian* mushrooms on bulk substrates of sawdust and straw. They are not very useful for *Psilocybe cubensis* cultivation in backpacks and shot-glasses. Nevertheless, I cannot over-recommend WAYNE's writings on this topic (available

via [www.mycomasters.com](http://www.mycomasters.com)) to anyone who wants to use peroxide techniques in his or her cultivation routine, as peroxide is only useful in specific occasions. If used in the wrong way peroxide will not protect against contamination—or even worse, work too well and kill everything, including the desired mushroom mycelium.

It is remarkable the *only* peroxide approach that has proven its usefulness in a *PF TEK* environment, is one that didn't make it to the second edition of WAYNE's manual. It is the technique for making peroxidated liquid inoculants. In the first edition, WAYNE writes:

Here's what I have done: I clean my blender out well with soap and hot water, rinse with tap water, then rinse the blender and a lid with boiling water (get a pair of heavy rubber gloves for doing this kind of thing and you'll have far fewer scalds). Next I fill the blender most of the way with boiling water and let it sit for 10 minutes or so. Then I empty out the water and cool the blender with the lid in place. Now the blender is ready for use. With my jars of sterilized grain at the ready (previously treated with peroxide), I add enough sterile water to the blender to cover the blades, and one or two milliliters of 3% hydrogen peroxide as well. Then I cut a donut of mycelium out of an agar culture with a flamed scalpel (leaving behind the outer edge and the center of the culture) and carefully drop this donut into the blender. With two or three one-second bursts of the blender, the agar is chopped into modest-sized chunks. At this point, the peroxide in the blender begins to bubble off oxygen rapidly because of the enzymes released by cell breakage, so I immediately free-pour the resulting slurry into my waiting spawn jars, trying to add about 15 to 20 mls per jar. Finally I seal the jars and shake them to distribute the slurry. Growth can be observed from the larger chunks of agar in two or three days."

In the second edition of 1999, WAYNE changed his mind:

[F]or two reasons. The first is that any method of inoculating a liquid culture is likely to require blenderizing the inoculum (or in some other way breaking up the mycelium), which releases significant quantities of peroxide-decomposing enzymes into the medium upon inoculation. The second reason is that, even assuming the first problem could be overcome, I would still expect the peroxide concentration to decline rapidly in a liquid culture as the intact fungal material with its internal peroxide-decomposing enzymes circulates throughout the liquid. The decline in peroxide could be compensated for by regular addition of fresh peroxide, but this might require

a method of measuring peroxide concentration in very dilute solutions.

But in January 2001 an improved and simplified technique to make peroxidated mycelium-water appeared at the alt.drugs.mushrooms newsgroup, written by "COUNTZERO," who claimed that:

You just need to cut a piece of mycelium from a cake that [you] just birthed and quickly put it in a jar full of distilled water and some pieces of glass which you should have sterilized and let it cool down. Seal the jar again and [shake it like] hell so the mycelium will break to pieces (because of the glass). Add 1 cc of 3% hydrogen peroxide and let it sit for a day, shaking [occasionally]. Then draw the water into syringes. A small piece of mycelium can give you many strong syringes. But you'll have to use them within a week or so. If used immediately the germination is massive.

Strangely enough, WAYNE and COUNTZERO, are both right: peroxidated slurries can only be used in combination with a contaminant barrier, such as the dry vermiculite top layer in the *PF TEK*. Peroxidated slurries cannot be poured without an extreme risk for contamination, but only transported by pipette or syringe. And mycelium-water does not have a long shelf-life compared to spore-water. It is *these* problems that this article will now address, by outlining a new simple add-on technique to the *PF TEK*—an original method that enables backpack cultivators to "copy" a just colonized substrate cake. In short, I recommend that one follow COUNTZERO's process, but without glass, presterilized water, or an extra jar. It only works with a just-colonized cake that has not been out of the glass yet, when performed on a clean tabletop and in a still air environment (no wind).

### IT'S A PIECE OF CAKE... IN A SYRINGE BARREL

First, get a glass with a substrate cake—preferably one that is just recently colonized. Place it in a wind-free environment on a clean table top (if you work in the kitchen, close the doors and windows). Bring a small pan of water to a boil. Fill an empty syringe with boiling water. Place a sharp knife with the blade in the pan of boiling water and turn off the heat. Place the substrate glass upside down on a piece of paper on the table top. After a minute or so, empty the syringe back into the pan. Then take the plunger out of the syringe barrel, put the plunger in the hot water, remove the glass from the substrate cake and stick the empty syringe, needle down, in the top of the cake. Get the knife out of the hot water, cut a

small wedge out of the cake and place it in the syringe barrel. Remove the syringe barrel from the cake and re-insert the plunger. Point the needle upwards and eject the air from the syringe. Put the glass back on the substrate cake and store this "mother cake" in the fridge. If everything is right you will now have a clean piece of cake in a clean empty syringe.

Now draw 1 cc of cold, clean (tap or bottled) water into the syringe, 0.2 cc of 3% hydrogen peroxide (preferably from a fresh unopened bottle) and the cleanest air you have available (you may draw in air from just above an alcohol lamp's flame to ensure that it is clean). Shake the syringe vigorously, eject the air from the syringe (needle pointing upwards) and fill the syringe with clean cold water. Allow the peroxide to work for five minutes and then inoculate a new glass of *PF Substrate* with it.

A piece of substrate cake inside the syringe barrel with the plunger balanced on top, ready to be made into a mycelium slurry.

## ALTERNATIVES?

There are two fairly sketchy alternatives for keeping a “mother cake” in the fridge. One is to make peroxidated mycelium-water with COUNTZERO’s technique and store that. The other is to not use a mother cake but copy each cake at the moment it is colonized (making copies from copies, from copies, *etc.*). While both of these alternatives may look like shortcuts, they are dead-ends in reality.

The reason for not storing mycelium-water was mentioned earlier by WAYNE and COUNTZERO. If there is plenty of peroxide in the water it will overpower the peroxidase enzymes and kill the mycelium over time. If, on the other hand, the peroxidase enzymes manage to destroy the peroxide, the mycelium-water is prone to contamination. But even if no contamination occurs, *Psilocybe cubensis* mycelium-water doesn’t have a long shelf-life compared to spore-water. It is much better to store solid spawn.

Making copies from copies is not a good idea either, because no living organism is designed for an unlimited amount of cell divisions. Mycelium is no exception. Eventually it will go senescent and lose the ability to make mushrooms. The idea to keep a mother cake for cloning is meant to delay that moment as long as possible by maintaining a young cell line.

So eventually each cultivator has to germinate a fresh strain from spores. Since spores are unicellular it is not possible to make viable peroxidated spore-water. Fortunately, even in an unsterile environment it is possible to germinate spores in a test tube without the addition of peroxide. You only need a lighter to do it. (Obtain the second volume of WAYNE’s manual if you want to read about this process.)

With these new techniques it is finally possible to grow mushrooms from spores or mycelium without the need of a sterile working space and without the need of buying a spore-syringe. However, these methods are probably not a real substitute for the spore-syringe. This is because the germination of mushroom spores on a medium other than the fruiting substrate (and the production of a mycelium slurry which can be injected in the latter) easily requires one to three extra weeks compared to a simple inoculation by spore-syringe. More important is that the new techniques for making mycelium slurries are still not as “idiot proof” (= contamination proof) as the spore-syringe method, provided that the spore-syringe is obtained from a vendor that guarantees the viability of it. As well, considering that several vendors now offer

spore-syringes for \$10.00 or less, there is the question of whether or not the techniques required to collect spores, germinate them in test tubes, and make peroxidated mycelium-water are really worth pursuing, since these steps will take more than an hour to complete, and for many people an hour of their time is worth more than \$10.00. Especially if a spore-syringe is obtained from one of the vendors that guarantee viability, it will be difficult to find a more cost effective method. At the time I wrote this article, PSYLOCYBE FANATICUS offered the best guarantee of viability, stating: “The syringes are absolutely guaranteed to be clean, viable and authentic, or your money refunded or syringes replaced until satisfaction is achieved.”

## THE FUTURE

The combination of the spore-syringe, the powdered brown rice/vermiculite substrate, and the dry vermiculite contaminant barrier, into one method for backpack cultivation may very well be the ultimate simplification for *Psilocybe cubensis*. The large shot-glass method links up the *PF TEK* with the most recent developments for mass production of other edible mushrooms. In the third edition of the mushroom cultivator’s bible *Growing Gourmet and Medicinal Mushrooms* (TEN SPEED PRESS, 2000), author PAUL STAMETS explains this as follows:

The ultimate shortcut for culturing mushrooms is via spore mass/liquid-inoculation directly into fruiting substrates (p. 133). Bottle culture is an effective means for growing a variety of gourmet and medicinal mushrooms on sterilized substrates. Currently, Asian growers have adapted bottle culture, originally designed for the easy cropping of Enoki mushrooms (*Flammulina velutipes*), to the cultivation of many other gourmet and medicinal mushrooms, including Lion’s Mane (*Hericium erinaceus*), Buna-shimeji (*Hypsizyguis tessulatus*), Reishi (*Ganoderma lucidum*), Wood Ears (*Auricularia polytricha*), and some varieties of Oyster mushrooms. The advantage of bottle culture is that the process can be highly compartmentalized and easily incorporated into the many high-speed production systems adapted from other industries. With the natural evolution of techniques, Asian cultivators have replaced bottles with similarly shaped, cylindrical bags. Many growers in Thailand, Taiwan, and Japan prefer this hybrid method. Liquid-inoculation of sterilized, supplemented medium allows for inoculation methods resembling the high-production systems seen in a soda pop factory. With reengineering, such high-speed assembly-line machinery could be retrofitted for commercial bottle and bag cultivation. (pp. 191–193)

*PF TEK*-like methods equally catch on in introductory textbooks on microbiology and biotechnology (see [www.fpl.fs.fed.us/documnts/PDF1997/croan97a.pdf](http://www.fpl.fs.fed.us/documnts/PDF1997/croan97a.pdf)). It is now established that *Psilocybe cubensis* is the primary candidate for easy biosynthesis of psilocin and psilocybin. The shot-glass version of the *PF TEK* is the easiest method for professional and beginning cultivators and the “Matías Romero” and “Golden Teacher” varieties of *P. cubensis* are the best performing mushrooms on brown rice powder and vermiculite (at least for the moment). But this does not mean that all innovation has ceased on the psilocybian frontier—at least two new directions are being currently surveyed. The first one is the search for other, preferably more potent, mushroom species that can be fruited on grain-based media. In the 1980s, GARTZ reported success with *P. bohemica*, *P. natalensis* and *Gymnopilus purpuratus*. At the web-based forum [www.shroomery.org](http://www.shroomery.org) are a couple of beautiful pictures from another German researcher named ELECTROLURCH, who fruited a new strain of the majestic *P. zapotecorum* that he had collected in México. Every month, more “new” cultivable *Psilocybe* species are reported about on this and similar forums, such as [www.theforestfloor.org](http://www.theforestfloor.org), [www.mycotopia.net](http://www.mycotopia.net), and [alt.drugs.mushrooms](http://alt.drugs.mushrooms).

The other interesting direction is the formulation of a growth medium that enables psilocybian fungi to biosynthesize tryptamines that are usually created artificially in a laboratory, like 4-hydroxy-DET, 4-hydroxy-DPT, and their phosphoryloxy counterparts. Other interesting psychoactive compounds that could possibly be biosynthesized this way are ergine, 4-hydroxy- $\alpha$ MT, baeocystine, norbaeocystine, non-phosphoryl esters of methylated alkyl tryptamines, and 5-substituted alkyl tryptamines. For these experiments the sclerotia-forming grassland psilocybian *Conocybe cyanopus*, *Inocybe aeruginascens*, *Psilocybe mexicana*, *P. semilanceata* and *P. tampanensis* as well as some non-sclerotia-formers like *P. azurescens*, *Panaeolus cyanescens*, *P. tropicalis*, and *Pluteus salicinus* might be very useful. Yet none of these species currently has a simple, established, well-performing, non-sterile in vitro method of cultivation. “Designer biosynthesis” via mushrooms is a largely uncharted territory.

In short there is still plenty to discover for the basement shaman who has just started his or her hobby. Much of the equipment of the 20th century is no longer needed, so not being skilled in laboratory techniques is no longer an excuse. The only necessary ingredient for a breakthrough is a curious mind, as the days of easy home-cultivation and independence from “street dealers” have definitely arrived. ☉

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus* ...  
*Epithelantha* ... *Pelecypora* ...  
 obscure *Trichocereus* species  
 including new hybrids  
 and cristate/monstrose  
 San Pedros and others ...  
*Turbinicarpus* ... *Aloe* ...  
*Bursera* (source of copal) ...  
*Delosperma* ... *Ipomoea* ...  
*Pedilanthus* ... *Sceletium* ...  
 and more!

We also offer an extensive guide to grafting cacti and other succulents.

Our catalog is fully illustrated, and loaded with ethnobotanical and horticultural information.

Please send \$2.00 to receive a catalog and additional rare plant & seed supplements throughout the year.

# SOME EFFECTS THAT SMOKING CANNABIS HAS ON THE BRAINWAVES OF VOLUNTEERS

by JEAN MILLAY, Ph.D.

---

The following article has been excerpted and expanded from a chapter in the book *Multidimensional Mind: Remote Viewing in Hyperspace*. It relates details of unauthorized research performed in the mid-1970s describing the effect of *Cannabis* on human brainwaves. We found it intriguing to see the same spirit of independent underground research that has fueled *The Entheogen Review* through the 1990s and early 2000s, alive and well nearly 30 years ago. We offer this article as both a historic snapshot and, hopefully, an inspiration for researchers in the decades to come. — DAVID AARDVARK

---

In 1974, it was clear that the government was not going to conduct the kind of research needed for those who found smoking *Cannabis* to be useful for their lives. The only EEG equipment available for research at that time was very large, very expensive, and therefore limited to politically approved institutions that could receive large grants. Even these institutions would have to follow government guidelines to get those grants. Institutions that wanted to stay active in the mental health arena had to develop “grant proposal consciousness.” That meant that they had to know what was politically acceptable and they had to submit their research plans to suggest that their expected result would support the government’s point of view. Earlier, one researcher had published results that indicated positive medical uses for *Cannabis*. He was promptly fired from government service.

In 1971, TIM SCULLY, Ph.D., designed the small, portable AQUARIAN ELECTRONICS BRAINWAVE ANALYZERS. Each of these machines could measure the EEG independently, sorting the signals into the frequency ranges of beta (13Hz–25Hz), alpha (8Hz–12Hz) and theta (4Hz–7Hz). The sound could be set for feedback in any frequency range. When SCULLY added the isolation switching boxes in 1972, I was then able to design the first *Stereo Brainwave Biofeedback Light Sculpture*, and was invited to demonstrate this at the METROPOLITAN MUSEUM OF ART in New York City. The *Light Sculpture* consisted of eight panels of Plexiglas® in which I had carved mandala patterns. The colored lights for each panel were operated directly by the brainwaves. Two green panels represented the beta range—one from each of the two separate analyzers. Two blue panels were for the alpha range and two red panels were for the theta range. Two white panels in the back were activated only if the subject moved too much or there was too much noise in the system for the brainwaves to be measured accurately. One person could watch the colors change with the brain’s electrical activity

for both hemispheres simultaneously, or two people could be hooked up and watch how their brainwaves were related. I was hoping that we could use this system to train couples to match their EEG, and that perhaps this might help them learn to improve their telepathic communication.

The light sculpture was great fun to watch. It was also very useful for an individual to explore the brainwave frequencies of different thoughts, compared to the sense of EEG synchrony, which needed a focus on pure vibration. However, it was soon apparent that the feedback was not precise enough to train couples to “synchronize” their brainwaves with each other. We needed a feedback tone when both signals matched more closely. In 1974, SCULLY added a phase comparator, and this allowed the signals from both analyzers to be compared for phase relationship.

After two years of practicing biofeedback on my own to learn what thought processes were required to gain voluntary control of each of the major frequency categories, I was able to determine how I wanted the equipment to work and what it should measure. Now the first phase of the research was over. SCULLY donated the equipment to me, so I could begin the research in a formal way. The first step was to establish a baseline of the EEG ranges for each of our volunteers.

In our first study, couples attempted to send and receive telepathic information. Then the brainwave biofeedback training began (described below). After that, additional telepathy trials were attempted. We found a statistically significant correlation between the scores of those couples who were able to “synchronize” their brainwaves and their blind-match scores in sending and receiving information telepathically: ( $p < .001$ ) (MILLAY 1978). The term “synchronize” is a general term for easy reference. The actual feedback sounds were provided when the two EEG signals were phase-coherent.

For the *Cannabis* research discussed in this article, telepathy was not included as part of the study. First we established the baseline scores, as before. The next step was to train individuals to be able to “synchronize” their own brainwaves between cerebral hemispheres. This training was done using the alpha range, because it is most closely related to relaxation. For our purposes, the alpha feedback range was extended from the standard 8Hz–12Hz to 7Hz–13Hz. After each member of the couple had learned some voluntary control of their own alpha range and what “interhemispheric EEG synch” felt like personally, the next step would be to attempt to train couples to “synchronize” with each other. This was a much more difficult process.

There have been a number of problems with some government research into the pharmacology of *Cannabis*. A major problem with early studies was the rigid idea that since THC (specifically (–)- $\Delta^1$ -3,4-*trans*-tetrahydrocannabinol) is the primary psychoactive compound in most strains of *Cannabis*, it is the only chemical worth studying. It was well known by users that there can be strong variations of effects among different types of *Cannabis* grown in different parts of the world. In the 1960s, one underground lab performed a basic alumina chromatography study on a kilo of “Acapulco Gold.” This lab found at least twelve bands, indicating at least twelve unique chemicals. Through the bioassay of each band, the volunteers found that each one produced a different mental or physical effect (*e.g.*, the results of smoking one band made them sleepy, another had visual effects with no physical sensations, another seemed to enhance feelings of sensuality, *etc.*). In *Marihuana [sic], The Forbidden Medicine*, LESTER GRINSPOON, M.D. and JAMES B. BAKALAR remark:

The marihuana [*sic*] plant contains more than 460 known compounds, of which more than 60 have the 21-carbon structure typical of cannabinoids. The only cannabinoid that is both highly psychoactive and present in large amounts...is delta-9-THC... A few other tetrahydrocannabinols are about as potent as THC, but are present in only a few varieties of cannabis...

A native of central Asia, cannabis may have been cultivated as much as ten thousand years ago. It was... cultivated in China by 4000 BC and in Turkestan by 3000 BC. It has long been used as a medicine in India, China, the Middle East, Southeast Asia, South Africa, and South America.

The cannabis preparations used in India often serve as a folk standard of potency. The three varieties are known

as bhang, ganja, and charas. The least potent and cheapest preparation, bhang, is produced from the dried and crushed leaves, seeds, and stems. Ganja, prepared from the flowering tops of cultivated female plants, is two or three times as strong as bhang; the difference is somewhat akin to the difference between beer and fine Scotch. Charas is the pure resin, also known as hashish in the Middle East. Any of these preparations can be smoked, eaten, or mixed in drinks. The marihuana [*sic*] used in the United States is equivalent to bhang or, increasingly in the past two decades, to ganja (GRINSPOON & BAKALAR 1997).

In Northern California, entheobotanists cultivated varieties of *Cannabis* for their different mental and physical properties. The dominance of each of the plants’ many components seemed to vary in percentage from one plant to another and from one type of growing condition to another. By then, many of us wanted to know what kind of effect smoking *Cannabis* (that was as strong or stronger than *ganja*) might have on our previously established ability to control our brainwaves. All of the volunteers had three practice sessions with brainwave biofeedback to learn as much voluntary control as possible, to establish a baseline score for the study.

Since this experiment was done in Northern California, it was therefore easy to obtain enough high quality *Cannabis*, so that every volunteer would be using the same substance. The procedure was as follows: A set of electrodes from each brainwave analyzer was used and the positive leads were placed in symmetrical places on both sides of the occipital areas of the scalp. Each brainwave analyzer produced a warbling tone as feedback to indicate the range of EEG frequencies between 6Hz and 25Hz. The phase comparator, mentioned earlier, limited the available range to an expanded alpha of 7Hz to 13Hz. These were the signals that would be compared for phase-coherence feedback. A gentle “aum” tone was given when both signals were in the alpha range simultaneously, and another tone—harmonic to the first one—was added when both signals matched the same frequency in a slowly varying phase angle.

First each individual practiced voluntary control of alpha phase coherence with the biofeedback tones. Then using the same biofeedback equipment, couples practiced alpha phase coherence with each other. This was a much more difficult task. One signal from an individual was sent through the phase comparator along with one signal from a partner.

YAGE.NET specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers. We're also home to the largest collection of ayahuasca resources on the web.

The first two graphs shows three scores for each individual:

- 1) The average interhemispheric alpha scores from the first biofeedback practice session (e.g., synchronization scores between signals received from both sides of the cerebral cortex for one individual = IH Synch).
- 2) The average (IH Synch) scores from two training sessions used as baselines.
- 3) The average (IH Synch) scores from one session after smoking *Cannabis*.

The (R = Relative) scores refer to the average time spent in simple simultaneous alpha (e.g., since we used the alpha frequency range from 7Hz to 13Hz, the dominant frequency as measured from each side might be different within that range). The (A = Absolute) scores refer to the average time spent in phase-coherent alpha (e.g., the frequencies are the same, and they are related in a slowly varying phase angle). The APCR scores refer to the Alpha Phase Coherence Ratio between the percent of simultaneous alpha that was also in phase (e.g., this is different from the total "Absolute" score. It refers only to the percent of "Relative" that was also phase-coherent). For example, if I spend 30% of the mea-

Session 1 = Average IH Synch score of first BFB practice session  
 Session 2 = Average IH Synch score of two BFB sessions used as baseline  
 Session 3 = Average IH Synch score from one session after smoking *Cannabis*

sured time in simultaneous alpha, perhaps about 50% of that may be in phase, but that phase is actually only 15% of the total time measured. If I spend 80% of the measured time in simultaneous alpha, the 50% ratio may still apply. However, when the ratio shoots up to 90%, I may very well experience an important insight resulting from the extended time in phase coherence.

The same type of three scores are shown on the third graph for couples (page 144). These are identified as interpersonal scores (IP Team Synch). Naturally, the overall scores for couples are much lower than are those for individuals.

As you can see in the graphs, after smoking the *Cannabis*, all of the individuals showed an increase over baseline in amplitude and percent-time of IH Synch, both in Relative (R), which indicates simultaneous alpha and in Absolute (A), which indicates phase-coherent alpha. All of the couples also produced IP Team Synch (R) scores at rates above their baseline scores. The latter increase might be considered to be the automatic mathematical result of the first; however, quite significantly, the scores for IP Team Synch (A) failed to show the same direct relationship to the increase in the other scores, as one might expect. This strongly suggests that the intention and ability to sustain a focus of attention

on each other played a larger role in their final IP phase-coherence scores than did their use of *Cannabis* alone. Some couples are very comfortable together and feel very close while producing only simultaneous alpha. It is assumed that because they are freely following their own separate thoughts, that their phase-coherence scores are lower.

The IP phase coherence scores were higher for Teams A and B than they were for their previously recorded averages. Both of these couples reported having focused their attention directly on each other during the precise moment in time identified by the biofeedback tones. They were also able to associate the phase-coherent tones with moments when their feelings of rapport and their sense of touch were most intense. Teams C and D found the opposite result. The individual members of these two teams reported that they had allowed their minds to drift to other times and places (*i.e.*, they “spaced out”). For example, both members of Team C had drifted off into thoughts about their personal concerns. Afterward, the man declared that he had received a major insight about an important project he was working on. The woman found a way to resolve an interpersonal problem she was having with a co-worker at her job. They were not synchronizing their brainwaves with each other, even though they were both in high-amplitude alpha IH Synch at the time. Nevertheless, they were both very happy with the personal insights each had received during this experiment.

The wife of Team D began thinking about their child and how pleased she was with the creative relationship the girl was enjoying with her sitter. Both the girl and the sitter planned to paint pictures this evening. The husband of Team D allowed his mind to drift to a pleasant time when he was swimming in a warm river. This

Session 1 = Average IH Synch score of first BFB practice session  
 Session 2 = Average IH Synch score of two BFB sessions used as baseline  
 Session 3 = Average IH Synch score from one session after smoking *Cannabis*

subjective evidence, like the statistical results of our other studies, supports the conclusion that the production of IP team phase coherence is an intentional act that is distinct from the production of IP simultaneous alpha, and beyond the simple mathematical relationship of both alpha signals.

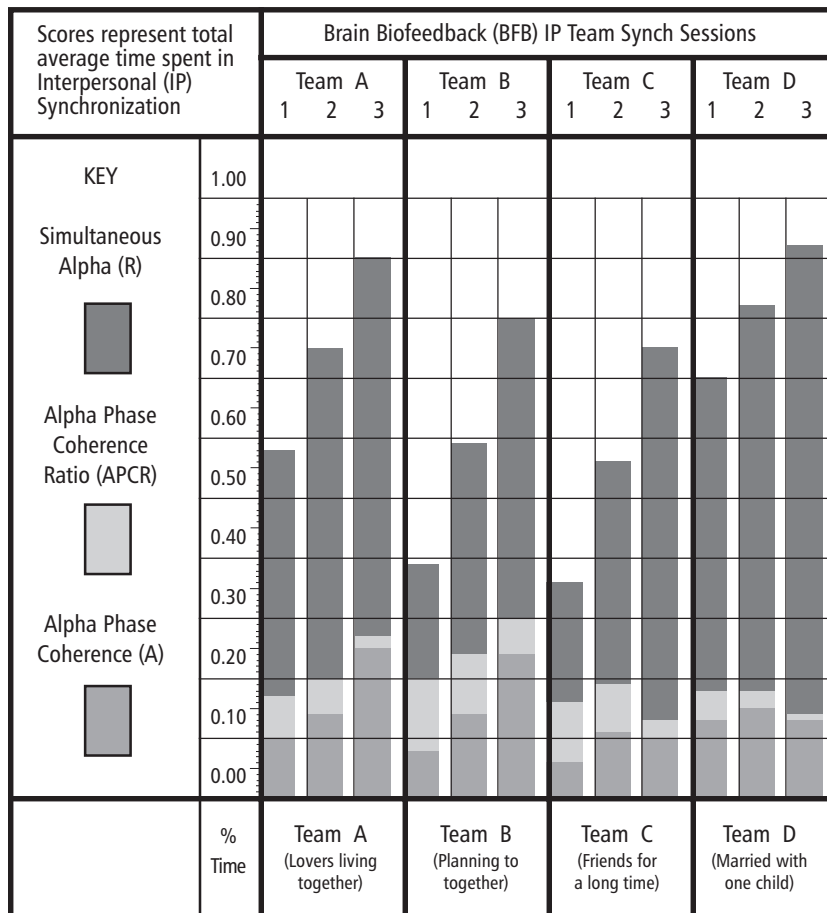

In this first *Cannabis* study, the (A) and (R) synchronization scores for individuals (IH Synch) and for teams (IP Synch) were separately averaged over the whole session. In a later study done with different participants, we were able to measure the IH Synch and IP Synch scores in a different way with a better counter that had been provided for us. This one produced two numerical scores for each sixty-second epoch—(A) and (R). These instant scores allowed us to compare the results as they changed during each session, rather than have to wait to determine the scores from their averages over the entire session. The fast feedback also helped the participants identify those strategies that increased their synchronization.

Again a new supply of high-grade *Cannabis* was obtained so that all six participants could smoke the same material. After a practice period with the biofeedback tones, baseline scores for IP Synch in both (R) and (A) were established.

After smoking the *Cannabis*, the average alpha scores were increased over the baseline scores for all participants. Since each epoch was only sixty seconds, fewer of them drifted into their separate fantasies in that short period of time than did those in the previous study.

The scores for Team K/A are illustrated in graph four. Epoch #1 represents the initial hook up, before the couple had settled into an internal resonance with the biofeedback tones. After an introductory period of practice with the biofeedback, epochs #2 and #3 represent the average baseline scores achieved, epoch #4 shows the results immediately following the first few puffs of smoke. The IP team synch scores for both Relative (R) and Absolute (A) rise substantially. Epochs numbered #5 through #9 were taken at random periods during the next twenty minutes. Gradually, the phase coherence for each team dropped somewhat, and after thirty minutes, the scores seemed to level out. At the end, the phase coherence scores were still slightly higher than the original baseline scores. If the couple chose to smoke again, the EEG alpha pattern of rising and then falling was repeated. The total effect of smoking did not seem to last more than an hour or two at the most. All volunteers reported positive experiences that ranged from mildly pleasant to euphoric.

Team J/O achieved the highest score of all for simultaneous alpha after smoking *Cannabis*. Their phase coherence scores, however, raised only slightly during that time. Both partners reported that they were enjoying the internal effects of the high-quality material so much, that their focus of attention periodically shifted from each other to personal projects. Both reported that they achieved some important insights relative to those projects.

Session 1 = Average IP Synch score of first BFB practice session  
 Session 2 = Average IP Synch score of two BFB sessions used as baseline  
 Session 3 = Average IP Synch score from one session after smoking *Cannabis*

Team B/C found the highest scores in phase coherence through choosing to focus on touch. When they both imagined that his fingers were sending light into a specific spot on her hand (an area that they agreed upon ahead of time), the feedback tone for phase coherence was sustained for an unusual length of time.

In subsequent studies, we also found that after drinking one glass of wine, a person's brainwaves are somewhat similar to those of a person who has smoked *Cannabis*. Most people become more relaxed and their alpha rhythms are usually increased. The continued use of alcohol, however, seems to cause the IH Synch to become reduced, and asynchrony to be increased. That is when the drinker begins to lose the ability to focus attention or when his/her muscle coordination becomes unbalanced. We have observed that EEG asynchrony accompanies this lack of coordination. However, among the people who smoke additional *Cannabis*, we have observed that their brainwaves continue to show IH Synch in

both (R) and (A). Gradually, though, the smoker will lose voluntary control of the faster brainwaves and he or she becomes sleepy. Sleep inducement is well known to be one of the many medical uses of *Cannabis*.

DON DOUGLAS wrote, "The nice thing about alcohol is the way it slows down mental activity. The nice thing about *Cannabis* is the way it speeds up thinking and ideas" (DOUGLAS 1996). For example, after a very busy day when a lot of thoughts are still whirling around your head (and you do not have to drive anywhere), "slowing down" through the use of alcohol can be helpful. "Speeding up" your thinking through the use of *Cannabis* may be due in part to the way in which it increases enjoyment of the current moment. Music, comedy, visual art, and other entertainment, all appear enhanced under the influence of *Cannabis*, and the exploration of creative ideas may also be instigated. Enjoyment of sensuality can be greatly increased. Some people have claimed that intense focus in sensuality is the essence of Tantric sexuality

for them. Even couples, who are well passed seventy years old, have told me that *Cannabis* is better than Viagra™ as an aid to their continued enjoyment of the sensuality that accompanies their sexuality.

Casual observations over time revealed that the biofeedback equipment could act as a sort of “quality control” for the substances used to alter consciousness. The rule of thumb we established was this: If the substance decreased voluntary control of the brainwaves, then the user would eventually lose something in his/her thought-process or ability. If the substance increased voluntary control of the brainwaves, than it might be classified as having the potential (when properly used) for becoming mind-expanding.

Any chemical used to excess can be harmful. However, it is well known that in our fast-paced society, stress contributes significantly to poor health. The medical community now preaches the advantages of stress management and pharmaceutical companies advertise expensive pills to reduce stress. Small amounts of alcohol or *Cannabis* are commonly used for relaxation. Our studies here involved only the moderate user. To my knowledge, none of our volunteers ever became addicted to either substance.

People who use a lot of low-grade *Cannabis* that may have a higher concentration of chemicals that induce sleep in it, could lose voluntary control of some of their faster beta brainwaves. Though these people may have felt occasional insights and new ideas that came as a result of smoking, they gradually lost the motivation to act on them anymore. If they were in school, their grades would fall off. Like the alcoholic who abuses cheap wine, the abuser of low-grade grass has to smoke more of it to get any effect at all, and then that person has too few fast-frequency brainwaves to put his/her ideas into good use.

However, the moderate use of high-grade *Cannabis*, by millions of people, allows creative ideas to flow; partly because of the increased ability to focus attention beyond space-time, and partly because they have established an intention to allow this to happen. The results of that creativity grace our bookshelves, films, CD music collections, stage plays, and art galleries—winning for their creators countless honors. Even snowboarder ROSS REBAGLIATI, winner of the gold medal in the 1998 WINTER OLYMPICS, was not slowed down by his casual use of high-grade *Cannabis* (SIND 2001). Many term papers and dissertations have been inspired by its use and completed successfully because the high-grade material

did not diminish the faster frequencies of the brainwaves. I am not claiming that all creative people use *Cannabis*, or any other mind-altering chemical. I am saying that many creative people do use it with good results.

It should be pointed out that the distinction based on effects of *Cannabis* due to its chemistry—what is being called “high grade” and “low grade”—may be entirely independent of the effects based on its frequency of use. Dr. MILLAY has blurred the two lines a bit here. Nevertheless, I know numerous highly-creative individuals who are “wake-and-bake” chronic *Cannabis* smokers. Since all of them smoke high-grade material, some might see this as anecdotal evidence that any amount of high-grade material is unlikely to “put one’s brainwaves to sleep.” However, there is no direct evidence that *Cannabis* is responsible for the creative output of these people; they may very well be just as creative without smoking. Clearly there are many factors involved. As well, the chemistry of *Cannabis* may be varied enough that it could be tough to categorize into a mere two grades, “high” and “low.” While chemistry and frequency of use may indeed each play some part, the genetics and attitude of each individual smoker should also be considered. — DAVID AARDVARK

Our work studying the effects of high-grade *Cannabis* on brainwaves indicates that more such research should be done, and specifically, with the many different chemicals that can be isolated from *Cannabis* (both on their own, and in various combinations). Such work might allow for particular strains of *Cannabis* to eventually be cultivated that have properties which act in a variety of therapeutic and creativity-enhancing ways. To some extent (without the help of EEG machines), this is already being done via trial-and-error, through medical *Cannabis* clubs, where patients can purchase strains known to be effective for nausea, appetite increase, pain, sleep inducement, and other specific symptoms. In order for the largest benefits from therapeutic *Cannabis* to occur, the laws proscribing it need to be relaxed, so that above-ground high tech investigations can proceed. ☉

# TALES OF DELPHIC ORACLE CONFIRMED

by K.M. REESE

Reprinted with permission from *Chemical & Engineering News* 2001, 79(35): 104.

Copyright 2001 AMERICAN CHEMICAL SOCIETY

Ancient tradition linked the Delphic oracle in Greece to specific geological phenomena. Modern scholars have tended to dismiss these views as mistaken or fraudulent. The geological explanation may be correct, however, according to JELLE Z. DE BOER of WESLEYAN UNIVERSITY, Middletown, Conn.; JOHN R. HALE of the UNIVERSITY OF LOUISVILLE, in Kentucky; and JEFFREY P. CHANTON of FLORIDA STATE UNIVERSITY, Tallahassee [*Geology*, 29, 707 (2001)].

The sanctuary of Delphi is on the southern slope of Mount Parnassus. A settlement was established there in the late Bronze Age, around 1600 B.C. People came from all over to seek the oracle's guidance in private affairs, colonizing ventures, wars, and changes of government. The oracle went out of business in A.D. 392 by order of a Christian king.

Ancient authorities thought the prophetic power of the Delphic oracle arose from three geologic phenomena: a fissure in the bedrock, a release of intoxicating vapor, and a spring. However, French archeologists who excavated the sanctuary a century ago found no obvious evidence for this scenario; they concluded that the tradition of intoxicating gas was a myth. Since 1995, DE BOER and colleagues have been studying the site, using field surveys and chemical analyses of spring water and mineral deposits. Their data, they say, indicate that both fracturing and emission of gaseous hydrocarbons occurred at the site of the TEMPLE OF APOLLO at Delphi; both, were connected directly to the work of the oracle.

The oracles at Delphi were spoken by a local woman, the Pythia, who acted as a medium for APOLLO. She sat on a stool inside a small, enclosed chamber below the floor level of the TEMPLE OF APOLLO and inhaled gases rising from a natural fissure or a spring. The Pythia appears to have been only mildly swacked during routine sessions, but if forced into the oracular chamber against her will, the authors say, might have suffered "an abnormal and occasionally fatal state of delirium or frenzy."

The authors conclude that the ancient belief in emission of an intoxicating gas at the site of the Delphic oracle is not a myth. An unusual, but hardly unique, combination of faults, bituminous limestone, and rising groundwater combined to bring hydrocarbon gases to the surface. Methane, ethane, and ethylene all came out; modern research has shown that inhaling ethylene produces effects that "match the well-documented effects of the ancient prophetic vapors." Say the authors, "Our research has confirmed the validity of the ancient sources in virtually every detail, suggesting their testimony on geology is of more value than has recently been held to be the case." ☉

## SHAMANIC SNUFFS OR ENTHEOGENIC ERRHINES

a new book by

*Jonathan Ott*

A comprehensive review of diverse insufflated plant-preparations used as shamanic inebriants, primarily in South America, where such have been studied in greatest detail.

The first three chapters focus on the three major classes of snuffs—*cebill/cohoba/nipo*, prepared from triturated seeds of *Anadenanthera* trees (legume-family); *epéna/hakúdu/a/yá-kee*, derived from bark, bark exudates and extracts of *Virola* trees (nutmeg-family); and that most important, and geographically-widespread sort derived from *Nicotiana*, or tobacco-leaves—and detail the history, ethnobotany, and chemistry of each.

A fourth chapter features 57 monographs of lesser-known types of ethnomedicinal snuffs, covering some 134 species, including many ill-studied African shamanic snuffs, and a *vademecum* of 16 stimulating and hunting-enhancing snuffs for hounds and horses!

The final chapter presents the results of the author's pharmacological modeling of these three major classes of shamanic snuffs: 26 psychonautic bioassays of bufotenine, 17 of 5-methoxy-dimethyltryptamine, and 17 of nicotine, which are shown to represent the major psychoptic principles of intranasal, sublingual, oral, fumatory, and intrarectal shamanic inebriants of *Anadenanthera*, *Virola*, and *Nicotiana*, respectively. The long-extinct Taíno snuff-culture is sensually evoked by a passionate prose-poem, and the book is documented by a 19-page bibliography of 465 sources; its wealth of detailed information made accessible by a 15-page index with 1341 entries.

Published by ENTHEOBOTANICA [Kronengasse, 11 / 4502 Solothurn, Switzerland / tel. 0041 (0)32-621-8949], 2001. A limited edition of 1026 copies, hand-bound in leather, with cloth-bound slipcase, signed and numbered; with 1 color and 11 black-and-white illustrations; 160 pages.

Order direct from: Leonardo Cruz / A.P. 13 bis / Coatepec, Veracruz / México 91500. us \$100.00 / sfr 180.00, plus \$5.00 NAm, \$10.00 elsewhere for S&H. Contact Leocruz3@hotmail.com with questions about ordering. — Please make checks payable to Jonathan Ott.—

# NETWORK FEEDBACK

## MELTING POINT OF TRYPTAMINES

Since “hot” smoking of DPT was mentioned in a past issue of *ER*, here are the melting points of some free-bases:

DMT approx.	116° F	(46.6° C)
5-MeO-DMT	154° F	(67.7° C)
DPT	280° F	(137.7° C)
bufotenine	295° F	(146.1° C)

With the DPT melting point being 70° F above boiling water, it is definitely a bit higher in vaporization temperature than the first two compounds. — J.S., OR

OTT's experiments with isolated free-base bufotenine placed the melting point at about 124–126° C. However he points out that others have reported isoforms melting from [123–]124–126[–129]° C and 146–147[–150]° C from isolated material and 146–147° C and 138–140° C from synthetic material. This suggests that there are three isoforms, and the melting point may vary depending on what one has on hand. Citing SHULGIN & SHULGIN 1997, OTT also mentions that three distinct DMT isoforms with melting points ranging from 44–74° C have been reported (OTT 2001), and at least two of these forms have been produced by the drug underground (SAND 2000). As well as different isoforms creating different melting points, the method of crystallization, purity, and several other factors can affect the melting point. DPT hydrochloride has been listed as having a melting point of 174.5–178° C (even higher than that presented above), and 5-MeO-DMT at 67.5–68.5° C (OTT 1996). It is also worth noting that different salts will have different melting points.

All of which in no way negates the point brought up by J.S., which is that if one is vaporizing DPT or bufotenine, one is going to have to use more heat than is needed for DMT or 5-MeO-DMT. It is worth pointing out though, that the melting point is not the final temperature that one wants to reach when vaporizing the free-base, but rather it is the *boiling point* that is key; this is the only temperature that changes a liquid into a gas, and it is sometimes twice as high as the melting point — DAVID AARDVARK

## SERIOUSLY AMPED!

I haven't seen a lot of reports on 5-MeO- $\alpha$ MT, so I thought I'd share my only experience so far with this compound, as anyone interested in it *needs* info. I want to note that “AMT”

(pronounced “amped”) is a perfect acronym for this substance, as “amped” is what it surely gets you.

Prior to taking this substance, I could find no specific information on 5-MeO- $\alpha$ MT, only for  $\alpha$ MT. Since then info on 5-MeO- $\alpha$ MT has been added to [www.erowid.org](http://www.erowid.org) and [www.lyceaum.org](http://www.lyceaum.org), and I found out that it is listed as *TIHKAL* #5 under its primary chemical name  $\alpha$ ,O-DMS (dimethylserotonin).

Well anyway, after reading a few  $\alpha$ MT reports, I decided that 40 mg  $\alpha$ MT would be a good dose, and assuming (correctly, it turned out) that 5-MeO- $\alpha$ MT was about four times as potent as  $\alpha$ MT, I decided to go for 10 mg. Well, what happened was that I had one of the most powerful trips in a long time!

It was about equal in potency to 300 mics of LSD! It took about two to three hours to finally come on, during which time there was moderate nausea along with some moderate diarrhea and some moderate regurgitation. After this, the nausea went away, and the full effects arrived. The peak was about 6 hours long, with a definite speedy feeling during the first half, which then dissipated and was fairly similar to LSD with some differences. It had the trademark “freight train” feel I get from DPT, DMT, and 5-MeO-DMT (not a favorite); that solid forcefulness that really lets you know you've got a potent tryptamine. After the peak, there was a long slow comedown, with at least six more hours of good tripping and still not baseline upon waking the next day!

To sum up, to anyone wanting to try 5-MeO- $\alpha$ MT, I would recommend starting with about 3 mg as a dose (or less if you prefer). This is what I will try when I do it again. Remember, you're in this for over 12 hours; you don't want to bite off more than you can chew. You'll be chewing for a long, long time! I ended up having a great time with the experience, but that was luck/fate/karma. I wouldn't choose to tempt that fate again. I would be interested in hearing any comparisons of 5-MeO- $\alpha$ MT to  $\alpha$ MT, as I haven't tried  $\alpha$ MT yet. Remember, when in doubt, do less! — ANONYMOUS

## BEWARE OF STALE CALAMUS!

Yesterday afternoon I went to an herb shop in San Francisco to buy some *Acorus calamus* root. It was kept on a shelf in a glass bowl similar to those used for goldfish, with a cork. When I got it home, I noticed it didn't have that nice smell that *A. calamus* usually has—in fact, it hardly had any odor at all. Like a fool, I decided to take some anyway. I put 10 grams (powdered) in a glass of chocolate milk and chugged it down. As it turned out, this was one of the biggest mistakes I ever made. A couple hours later, I had the symptoms of a classic case of food poisoning. Throwing up everything I had in my stomach in five minute intervals; when my stomach was empty, I was throwing up bile and then had dry

heaves. Talk about miserable! If I had a gun within reach, I might have shot myself. By morning I was okay, but weak and dehydrated. I've had many good trips with *A. calamus* in the past, so I know that it wasn't me (or my wife's cooking—she was beside herself thinking it was her fault, but I told her if it had been the food, she would have been puking right beside me). I don't want to see anybody have to go through this, so please make this letter public knowledge. I've included some of this "poison" for you to check out or perhaps run a chemical analysis on to see if it may have been tampered with. Since I have a History Doctorate, and not an M.D., I don't have the means to do so. If my experience isn't unique, please let me know. Thanks. Take care. — Dr. M.P., CA

### BOOKS PUBLISHED BY MAPS

[www.maps.org](http://www.maps.org)

**\$12.95**

**\$14.95**

**\$10.95**

**LSD Psychotherapy** (2nd edition) by Stan Grof, M.D.  
40 color plates (8 new), introduction by Dr. Andrew Weil.

"I know of no work that so well incorporates the findings of Freud, Jung, and Rank... I do not doubt that others working in this field will find Dr. Grof's discoveries a basis for a whole new strategy of research."  
— Joseph Campbell, author of *The Hero With a Thousand Faces*

**Ketamine: Dreams and Realities** by Karl Jansen, M.D., Ph.D.

"...clearly written, well researched and documented... presents a balanced and objective view point... covers all the aspects of ketamine from pharmacology to its use in raves... interesting for clinicians and researchers as well as the general public."  
— Stan Grof, M.D., author of *Psychology of the Future*

**The Secret Chief** by Myron Stolaroff

"In the illegality of his time it was unthinkable to publish the excellent results of his therapy... today nine years after his death, a friend has undertaken the task of publishing the details of the therapeutic methodology of this intrepid Ph.D. psychologist..."  
— Albert Hofmann, Ph.D., author of *LSD: My Problem Child*

— **FREE WITH PURCHASE OF ANY BOOK!** —

The MAPS Bulletin: "Creativity Issue"

This issue breaks important ground for MAPS. We've moved into even more controversial territory than usual, since there is not yet a cultural consensus surrounding the approval of the use of psychedelics and marijuana to enhance creativity.

I compared the sample that you sent to a sample of "*Calamus*" that was purchased at the local health food store. They both looked, smelled, and tasted quite similar, so I doubt it was simply a case of some herb-shop employee sticking the wrong herb into a jar. (While I expect that the dried and milled roots of many different plants have a similar appearance, they may smell and/or taste different. Even so, if the roots come from two different species in the same genus, it could be quite hard to distinguish them.) Unfortunately, *ER* doesn't have any regular way to get plant products analyzed. It is possible that the root you bought could have been contaminated in some manner during growth or drying. It's a fairly common thing for herb shops to sell old herbs that have been in stock for years. (Taste and smell can be quite valuable tools, with regard to herbs containing essential oils.) The storage you describe is not acceptable for any aromatic herb even if they sell lots of it, although this method of storage unfortunately seems to be the norm in most herb shops or health food stores (the herbs at the store I went to were also stored in glass fish-bowl-style jars with loose lids, susceptible to degradation from both light and air).

Another potential problem is that there are two very different chemical forms of *Acorus*—one from the old world and one from the new. (This was discussed in the Summer Solstice 2001 issue of *ER*, see pp. 68–69.) It's the former that has seen most of the published chemical work and which is frequently sold. However, it's the latter which is involved in *all* bioassay reports producing effects such as you are seeking. Without knowing the source or having some way to analyze them there is simply no way to know which one was being sold. When I purchased some "*Calamus*" at the health food store mentioned above, all of their herbs were only identified by their common name. (Perhaps complaints to the management of such stores might help?) Some psychonauts say that *A. calamus* is best used fresh, and certainly if one is growing the plant, he or she is less likely to consume something that has been accidentally misidentified. — DAVID AARDVARK

## SMOKED SCORPION?

What sort of scorpions are these do you suppose? (See [http://webcenter.newssearch.netscape.com/aolns\\_display.adp?key=200111071048000247887\\_aolns.src](http://webcenter.newssearch.netscape.com/aolns_display.adp?key=200111071048000247887_aolns.src)) What might be in the venom? Are there any published scientific articles, or underground articles, which examine snake, scorpion, and spider venoms for psychoactivity—such that we might have some new goodies we can get our mits on? — R.G.B., CA

The article that you cite ("Junkies, Getting High in the Pits," REUTERS, Tuesday Nov. 20, 2001) mentions GHULAM RAZA, a heroin addict in Quetta, Pakistan, who smokes dried and ground scorpion stingers. When asked if this practice gets him high, RAZA remarks: "Oh yes. When I smoke scorpion, then the heroin is like nothing to me."

RAZA and the other heroin addicts in the story are painted as victims of the war in Afghanistan, and this "human interest" story reads like

the typical xenophobic spin that is commonly spewed during wartime, to help paint the enemy in a bad light. Adding exotic drugs to the mix is a frequently played card, since mainstream America is already primed on a continuous diet of War on Drugs propaganda. We recall the "dangerous narcotic plant *qat*" being repeatedly demonized during and following Desert Storm: "The social despair and violence of Somalian youth is generally blamed on *khat* addiction" (STEVENSON 1992) being typical of the lead sentences. Indeed, *qat* has resurfaced as an "enemy of America," in a recent article that claims the sale of *qat* helps to pad OSAMA BIN LADEN'S coffers (ITH 2001).

Determining exactly what species of scorpion RAZA was sticking in his pipe would be very difficult, unless one was willing to venture out for some ethnographic fieldwork, visiting the specific graveyards of Quetta that were mentioned in the article and perhaps tracking down RAZA himself for help with identification. The reason for this difficulty is that, depending on which expert one cites, there are 16 to 20 different families of scorpion, with over 160 genera (and obviously, an even higher number of specific species), many of which may exist in the geographical area being discussed (LOURENÇO 2001). There are multiple species in Pakistan alone.

The biggest problem is that, while many active species of invertebrates exist, not a lot is known of the pharmacology or toxicity. Much of what little is recorded is seemingly veiled in uncertainty as well. Most arachnids like scorpions have proteins as the primary toxic component of their venom. Many contain serotonin so there is the potential for one to exist with a methylated tryptamine (ERSPAMER 1954, WELSCH & BATTY 1963). A similar story is true with spiders, some of which also have a reputation for being potentially psychoactive (KENNEDY 1987; MU 1994); at least one species contains 5-methoxytryptamine as its primary venom component (GREEN & ODELL 1984). Work with both scorpion and tarantula venom has resulted in the creation of potent analgesics ([www.futureframe.de/news/991217-3.htm](http://www.futureframe.de/news/991217-3.htm) and [http://arachnophilic.com/burrow/news/pink\\_spider\\_offers.htm](http://arachnophilic.com/burrow/news/pink_spider_offers.htm)) but the active agents appear to be proteins so activity from smoking these compounds seems unlikely unless perhaps some active degradation product is produced. Just getting stung by some scorpions is rather mind-expanding despite being painful. The same is said about black widow bites—many victims become delirious or delusional, and some survivors only slowly recover their mental faculties, while a few never fully recover (MARETIC 1977). (The bites of cobras are also said to produce powerful mental changes and/or enhancement of perceptual abilities and energy levels.) The one known instance of a human bioassay of smoked venom from the red-back spider *Latrodectus hasselti*, a type of black widow, resulted in "paralysis and an anti-cholinergic-like central effect," but the guy did survive (VOOGELBREINDER 2002; in press), and another sketchy report notes that smoked *Latrodectus mactans* venom is "a complete bummer" (KENNEDY 1987). Psychoactivity might also be suspected for the centipede but little appears to be known beyond its playing an unclear role as a power animal in some tribes' rites of passage. As for insects, *Phromnia marginella* OLIV. (a lantern insect of the order Fulgaridae) are said to be used for their "narcotic properties" in Garhwal, Uttar Pradesh, India but this use is thought to be mostly forgotten about (REICHEL-DOLMATOFF 1975, citing BREHM 1915, although we are unable to confirm that this reference actually mentions it).

Many ants seem to be active. Some are mild stimulants, like the red and black ants marketed in extracted form. Others are used by Native Americans, swallowed live, wrapped in down, as ritual entheogens said to be akin to *Datura* in effects. This includes at least one California *Pogonomyrmex* sp. of "red ants" but probably also involves more species as both red and yellow ants appear in the ethnological accounts (GROARK 1996; BLACKBURN 1976).

Ants are also said to be smoked, or crushed with the vapors that emit from them sniffed, in the Middle East, and this practice has resulted in youths being arrested for public intoxication (ASSOCIATED PRESS 1995; ANON. 1997). Three compounds related to nepetalactone (the active chemical in catnip) and several alkaloids related to the deadly poison coniine are known from a number of ant species and may be involved in producing psychoactive effects, but neither an identity nor direct analysis of the actual ants used is available, and activity based on these compounds is purely speculative to date (BLACKBURN 1976; VOOGELBREINDER 2002).

A friend of K. TROUT, who was obsessed with witchcraft many years ago, swore by smoked ladybug shells, which he claimed produced effects similar to morphine. (TROUT notes that this person was "more than a bit nuts, but doesn't necessarily dismiss his claim entirely on that basis, as he did repeatedly use them.")

The bamboo-dwelling moth larvae of *Myelobia smerintha* HUEB., from Minas Gerais, Brazil, are used as hallucinogens (BRITTON 1984) but it does not appear that any chemical or pharmacological work has been done on them. It has been suggested that they sequester something out of the bamboo but we can't determine that this was actually evaluated, just surmised. As is the case for scorpions and spiders (and jellyfish, coral, sea anemones, molluscs, and many others) serotonin also occurs in many (but not all) insect stings (ERSPAMER 1954, 1961; KAWAMOTO & KUMADA 191984; TU 1977, 1984; WELSCH & BATTY 1963). It is often accompanied by acetylcholine, ATP, GABA, free glutamic acid (occasionally in high amounts), epinephrine and/or histamine, and other physiologically active compounds (GRAY & SUTHERLAND 1978; RASKOVA 1971; SCHENBERG & PEREIRA LIMA 1977; TU 1977).

With so little known about the specific pharmacological activity of venoms from scorpions, spiders, and insects, it seems extremely foolish to rush headlong into bioassays in this area. Thanks to SNU VOOGELBREINDER and JONATHAN OTT for leads and some fascinating tidbits of data. — Eds.

# AN ENTHEOGENIC ELDER'S TALE OF TWO CONFERENCES:

PSYCHOACTIVITY II & THE 2001 INTERNATIONAL CONFERENCE ON ALTERED STATES OF CONSCIOUSNESS

by WILL PENNA

WILL PENNA's poetic essay about his ayahuasca experiences in the Peruvian Amazon seven years ago appears in the recently published book *Psychoactive Sacramentals: Essays on Entheogens and Religion* (edited by THOMAS ROBERTS, and published by the COUNCIL ON SPIRITUAL PRACTICES, 2001). In the following article, his second review of 21st century confabs for ER, PENNA brings back tales from Dhulikhel and Albuquerque.

It was the best of times and it was the worst of times, to paraphrase DICKENS' opening of his *A Tale of Two Cities*. Since last year, my friends and I—different friends in each case—had planned on attending these conferences, one in Nepal at the beginning of October, the other in Albuquerque at the beginning of November. Then September 11 happened, making getting out of the country both problematic and worrisome. Airports closed three days before we were to leave for Kathmandu, and friends urged us to cancel, fearing the worst. But the conference organizers, our travel consultants, and our own internal dithers told us all systems were still go. So, three days after we were originally to fly to the East we took off, sans metal knives for the on-board meals and without nail clippers or razors in our carry-ons.

PSYCHOACTIVITY II was held at the DHULIKHEL MOUNTAIN RESORT—\$1,300.00 for the week, food and lodging included (The first PSYCHOACTIVITY conference was held in 1997 in Amsterdam). By the time we got to the RESORT, some 30 miles out of the noxiously polluted Kathmandu valley, we had already spent two weeks of our month in Nepal—trekking, rafting, hanging out at a jungle lodge in the ROYAL CHITWAN NATURAL PARK riding elephants, spotting rhinos, and looking for tigers. We'd gotten the infamous "Kathmandu bug" in the toxic miasma of this once lovely valley that's now home to a constantly burgeoning populace of more than two million. We'd been hassled by the money babas at the Hindu shrine PASHU-PATINATH, jostled by screaming monkeys at the Buddhist SWAYAMBHUNATH, and hustled by the ubiquitous tiger balm salesmen (why tiger balm?) in Kathmandu's streets—full to overflowing with rickshaws, tuk-tuks, cars, taxis, trucks, and other humans moving in all directions with no apparent system or plan to it all.

So arriving at DHULIKHEL was like getting to a cross between GILLIGAN's *Island* and Shangri-La. Our taxi driver, who had assured us he could locate the resort, had to ask the traditional number of native informants—three—before finding the resort's hillside aerie. It sits high atop the village offering a breathtaking view of the Himalayas above valleys obscured by clouds. (It immediately reminded me of the PINK FLOYD sound-track and the 1972 French movie.) Relieved, we trekked up its several flights of stone stairways to its outdoor reception desk. We all glowed in the first rays of a sunset making rough rubies and ancient amber of the snowy peaked Machhapuchhare (Fishtail), eerily resembling the Matterhorn or the PARAMOUNT PICTURES logo. Glowing as much, from the previous week's identical session of the conference, were familiar psychedelic researchers CLAUDIA MÜLLER-EBELING and CHRISTIAN RÄTSCH, authors of the recently published *Schamanismus und Tantra in Nepal*, which will appear in an English edition in 2002. ROB MONTGOMERY and JONATHAN OTT, also familiars of Palenques past, were hanging out, and I immediately sent off for a copy of OTT's latest opus, the limited edition *Shamanic Snuffs or Entheogenic Errhines* (ENTHEOBOTANICA, 2001). I had come, partly, to explore further that altered state of "the shaman," having experienced shamanic readings, healings, and cleansings in—among other places—the American southwest, southern México, Guatemala, and Peru. Nepalese shamanism, far less known than Siberian or Tuvan, was definitely my drawing card for a first Asian shamanic experience.

So, too, was my purpose in going to the following month's six-day ALTERED STATES OF CONSCIOUSNESS conference in Albuquerque (\$595.00 to \$745.00, food and lodging *not* included). STANLEY KRIPPNER, in his presentation on "Shamanism, Dreams and Drugs," defined shamans as: "socially-designated practitioners who self-regulate their attention to access information not available to their peers." I especially liked his emphasis on shamans using their attention in service to their community. Like me, he excluded those faux shamans who get their degrees and callings from weekend drumming shaman mills, club ayahuasca Amazonian resorts, or abbreviated excursions to peyote playgrounds.

Also in Albuquerque, VICTOR SANCHEZ, author of *Toltecs of the New Millennium*, described himself as an “anti-anthropologist, anti-shaman.” In his keynote address he reinforced the notion of using one’s own spiritual technologies for both enhancing awareness and service in the world. He noted that for too many the spiritual search has become a trap, merely a way to get away from everyday reality. He emphasized that when the mountain Toltec survivors he has known travel to the other side of silent knowledge from the world of reason (or from the *tonal* to the *nagual*), they do so to bring things back, to find ways to be healthier and happier and live more purposefully in the world. He contrasted the power (*podería*) of the real don PEDRO he has known with that of the more famous don JUAN spawned from years of library research. Don PEDRO’s is a practical art of “dreaming,” the purpose of which is to grow in personal responsibility, not just to experience and manipulate strange things in isolation, selfishness and inevitably, sickness. Further, these visions need no intermediary to explain them: don PEDRO asks, “If you really want to know, why do you ask me? I’m just a person. People tell lies. I’m a liar. Go to the sacred place and ask your questions. Ask the one who can tell you.” SANCHEZ said the question really should be: “What can I give back to the world for all it has given me?” Our integration is to be found in our commitment to and offering of a sacred pact between the magical and the everyday. Our interaction will always take us back to practice and service in the world—not to gurus or human masters, not to “Pleiadians.” For SANCHEZ, one example of someone who knew the real powers of the world, who rose from the mundane misery of human existence, and who used that “silent knowledge” to change the world is GANDHI. Lest you think this point of view was the only one, Albuquerque also featured KEN EAGLE FEATHER (author of *Traveling with Power* and *A Toltec Path*), whose presentation “An Energy-Body Approach to Altered States” explored the kind of personal growth techniques he learned from his apprenticeship with the fabled Toltec-seer don JUAN MATUS. KEN has been on staff with THE ASSOCIATION FOR RESEARCH AND ENLIGHTENMENT, the MONROE INSTITUTE, HAMPTON ROADS PUBLISHING COMPANY, and the EDGAR CAYCE legacy.

In DHULIKHEL as well, one could sense the contrast between hermetic points of view, those more scientific, and those that emphasized everyday life and service. The first night in Nepal we signed up for shamanic reading sessions, or *chintas*. Each person was asked if he or she would like to have the whole group in attendance hear the shaman’s reading from the translator. We were told that the traditional healing sessions are always public and even noisy, with families present

and sometimes partying. Shamans in Nepal, only about ten percent of whom are women, come from many of the 68 cultural and language groups in the country. They are chosen in their community by inheritance, or sometimes by some sign or incident coming at any time in their life. Most have other daytime jobs and existences, so serving as a shaman tends to be an additional service they perform. We were asked to give an offering of 20 to 50 Nepalese rupees (about 75¢ to \$1.00) for our reading. To see what they understand to be spirits or ghosts that might be making one ill or holding one back, they use repetitive drumming and singing to go into a trance that they can also leave at will. In preparation for the readings, CHRISTIAN explained, many factors need to be in place, including: incensing, dressing in the proper vestments, preparing the altar, and reciting, singing and drumming to mantras to call in the spirits. Various shamanic tools such as drums, *phurbas* and *khukuris* (symbolic knives and swords with elaborate imagery), as well as mineral, plant, and animal elements, play an important part on the *chinta* altars. As they do their work, shamans travel between the three worlds and four directions, visibly vibrating in a snake-like movement, not unlike what happens when one has a righteous hit of DMT.

The sessions were extraordinary experiences for all of us. We saw shamans shift-shape into HANUMAN the monkey god, sniffing over the whole body of the seeker, lightly biting toes and chattering in a high pitched primate voice. Or become what the Newari—one of the groups our shamans came from—call “the Queen of the Jungle,” a fairy creature with a falsetto voice we never heard at any other time come from the mouth of INDRA, a male shaman. His movements and body language were unique here also, so feminine and delicate that his body seemingly transgendered itself before us. The first night of the readings, two of the four of us going before the shamans had given permission for the translator to share their reading aloud. The first we heard probably put the damper on most people’s decision to go public after that. He was a 38-year-old German fellow who’d attended the first week’s session as well, and was the roommate I’d been assigned on arrival. After the shaman’s reading, the translator told us this man was greatly in need of healing, was too stiff and formal—even off-putting—in his relations and dealings with others, especially women, was arrogant and had a tendency to be over-judgmental of others. I saw knowing eyes roll and even a few stifled smirks and subtle nudges among those who also had been around that first week with this guy. Needless to say, volunteering for sharing one’s reading in public went way down.

However, true to my extroverted nature, a few days later I went public with my reading. The most remarkable quality about this experience was how in several specifics my shaman—MAILE LAMA, a woman from the Tamang culture—was right on. After saying, “This is not a big story to tell,” she identified my troubled childhood; my moving many times in my life, and my considering moving again now. She knew that I have had three love relationships in my life, and that the conclusion of the one I had when I was 42 was traumatic for me (that “42” was as specific as DOUGLAS ADAMS’ “answer to the universe, *etc.*”); that I have always had good relations with my family, and that I have the best friendship ever in my life now. She reaffirmed what others have said and that I know—that I heal with my heart energy. She also told what only I and close friends know—that the vivid dreams I have almost every night move me physically and noisily, and that I often use them for, as she put it, “your own profit.” (I call it my “night school.”) Her conclusion: “Everything is very fine. MAILE cannot do anything for you.” Somehow she missed my stubborn, controlling, know-it-all, and excessive aspects, but that was okay with me—especially with an audience!

In Albuquerque as in Nepal, we had a rich mix of lectures and participation, of head and heart engagement. We started day one with transpersonal psychologist CHARLES TART (recent book: *Mind Body Spirit: Exploring the Parapsychology of Spirituality*) keynoting “Reflections on Four Decades of Altered States of Consciousness Research,” a presentation that was essentially the same as his chapter in the recent book *Psychoactive Sacramentals*. We ended that day participating in “Meditative Drum and Finger Cymbal Concert and Dance.” The next day LAURA HUXLEY, widow of ALDOUS HUXLEY, presented “One Example of Visionary Common Sense,” related to CHILDREN, OUR ULTIMATE INVESTMENT, an organization she founded in 1977. She emphasized love as an altered state, children as our doors of perception, and the final and finest vision of ALDOUS HUXLEY, *Island*, his last philosophical novel, about a society built on the principle of using entheogens as spiritual technologies.

Back in DHULIKHEL, in an Asian setting not unlike that of the fictional Pala in *Island*, CHRISTIAN, JONATHAN, and ROB showed us plants and plant parts, including fungi, took us on plant walks, helped us mount specimens, and guided us in ingesting, insufflating, and vaporizing them. I realized these were educational experiences not unlike those that the first settlers in Pala might have.

In the southwest morning, drop-dead gorgeous elder and teacher of Tantra, MARGOT ANAND (author of *The Art of Everyday Ecstasy*), guided us “From Orgasm to Ecstasy: Love Is the Way to Altered States of Consciousness.” She lamented the fact that the average American orgasm is only 10 seconds long, adding up therefore (at two of those a week), to a miserable 18 minutes of sexual ecstasy a year. She led us out of our mind and into our body with the intention, “What do we want to accomplish tonight?” and the admonition that achieving full size or erection doesn’t matter, but that couples “letting go” and taking half an hour or so to enter “dream-time” together does. That was the morning after a hundred of us—newbies as well as old-timers at it—fire-walked with ROBERT “CORK” KALLEN, president of THE ACHIEVEMENT GROUP, and fire-walk instructor extraordinaire.

In the east we spent an afternoon doing entheogenic art, using canvas, acrylics, and other media, under the direction of noted European spiritual painter NANA NAUWALD who studied with shamans in Peru, Brazil and west Africa, and whose work with sacred plants and trance techniques have gained her art a worldwide reputation. Another afternoon we used watercolors to paint sacred plants with DONNA TORRES, who teaches botanical illustration and whose exquisite works have served as the apropos covers for such JONATHAN OTT books as *The Age of Entheogens & The Angels’ Dictionary* and *Pharmacophilia or The Natural Paradises*. Also, just as CLAUDIA in DHULIKHEL guided us through the art of the *thanka*, those spiritual meditative hangings of Tibet and Nepal, so in Albuquerque HANNIAH MORGAN’S “Breath Ecstasy” workshops (sort of mini Holotropic Breathwork™ sessions) had us ecstatically hyperventilating, and TONI BERGINS (who produces JourneyDance events) had us heart-dancing into ecstasy with each other and our selves.

Have I made it sound too artsy-fartsy and loosey-goosey? Well, neither conference was that at all. BRUCE EISNER thoughtfully provoked us in two presentations in Albuquerque. His re-visioning of “MDMA: Healing Potentialities and Human Nature,” examined, among other topics, the value of the recently-approved protocol for PTSD Ecstasy studies, as well as called into question the reality of “brain damage” from MDMA use. In “The History and Future of LSD,” he outlined his studies of LSD purity, looked at the promise of new compounds that DAVID NICHOLS and his students are developing, and called for the founding of a “psychedelic homeland” offshore on an island out of the reaches of BIG BROTHER, modeled on HUXLEY’S *Island* (see [www.island.org](http://www.island.org) for more on this idea). By the way, I’m an old-timer who

knows the difference between the ninety percent or more of shwag acid we see now, and the good stuff which I had before legalization and which only comes around—since back in the day—as much as women practitioners exist among the Nepali shamans. In DHULIKHEL, free-lance natural-products chemist JONATHAN OTT, Mexican mycologist GASTON GUZMAN, and ethnographer-archeologist MANUEL TORRES challenged our thinking about ancient people's knowledge and practice of advanced spiritual technologies using plant and animal substances.

This brings up the question of informal “lab sessions” to go along with the classroom learning and lectures of each conference. Were they like the storied days and nights of the south-of-the-border confabs when St. TERENCE was with us? Well, in a word, yes. The penultimate day of DHULIKHEL, two enterprising New Age travelers and biochemists showed up, altering and illuminating many by rendering opportunities

for the direct experience of “science meeting shamanism.” In the mild southwest autumn that Albuquerque was basking in this November, some partook of an evening or so of the local fungal fare and traipsed languidly and lovingly along the Rio Grande as it and they meandered below the watermelon sunset of the aptly-named Sandia mountains. Perhaps many are called and few are chosen, but also much is revealed for those who have eyes to see and ears to hear.

Were these conferences worth it? Even if I had to have second-mortgaged my house I would answer enthusiastically “yes.” Friends and acquaintances who stayed home, glued to a brainwashing media blitz, the likes of which I have not experienced since reading GEORGE ORWELL's *1984*, immersing themselves in paroxysms of Kafkaesque angst still don't understand. Perhaps they never will, poor things. To paraphrase LOUIS ARMSTRONG when he was asked what Jazz was: if I have to explain it to you, you'll never understand it! ☉

sometime in January.*

## NEW INCENSES

*Nymphaea caerulea* (blue lotus): This little known flower has been considered sacred for several thousand years, where it was used medicinally and ritually by the Egyptian priesthood. Its pleasing aroma is said to induce deep relaxation and a euphoric state of mind.

*Nelumbo nucifera* (sacred lotus): Another obscure sacred flower from the East, it is quickly becoming very popular with those who have been lucky enough to try it. This plant mixes well with other common burning herbs, but is also very much enjoyed by itself.

*Scelletium tortousum* (*kanna*): A very rare succulent from the deserts of South Africa. The Bwiti culture uses this plant as an important part of their ritual life, and consider it to be an indispensable ally. We offer this plant in the manner dictated by tradition, fermented and finely powdered.

*Mimosa hostilis* (*jurema*): This thorny tree is used medicinally and spiritually by several Central and South American cultures. Wild-crafted in México for us by a well-known ethnobotanist, we offer fresh, dried whole chunks of both root-bark and stem-bark.

*Voacanga africana* root-bark: After years of searching we have finally procured a small supply of this exotic botanical. Used in the adolescent initiation ceremonies by East African shamans, this powerful teacher was treated as a divine spirit. Very limited supplies.

All incenses are sold strictly to adults as non-consumables and should not be ingested in any manner.

# EVENTS CALENDAR

## PLANT PEOPLE REUNION JANUARY 24–27, 2002

Join us on the island of Maui at a private camp on the Hana Coast for a weekend gathering and celebration with fellow plant people, featuring *kava*-drinking, *betel*-chewing, fresh and healthful island food, fine Maui music, and bonfire revelry. We are highlighting the little-known pleasure-inducing *betel* experience, with its arecoline alkaloid stimulation and complex chewing additives, as well as the cultural depth surrounding traditional lactone-laden *kava*. Fresh island-grown *kava* and *betel* will be available for everyone to share and enjoy. Presentations include: BRET BLOSSER on divination with *Salvia divinorum* and other entheogens in colonial México; KAT HARRISON on healing with *Salvia divinorum* and tobacco among Mazatecs in Oaxaca and with ayahuasca in the Peruvian Amazon; MARK MERLIN on the ethnobotany of *kava* and *betel* in South Pacific cultures; ROB MONTGOMERY will share propagation tips and recipes for *kava*, *betel*, *Salvia divinorum*, and ayahuasca gleaned from fieldwork (and homework) in Nepal, Laos, Maui, and South America; DAVID ORR will guide us on a walking exploration of a Maui ethnobotanical garden to meet many important Pacific plants.

\$250.00 per person, send payment to: BPC MAUI, YMCA CAMP KEANAE, 13375 Hana Highway, Keanae, Maui HI 96708. To pay by credit card, call ANDY GETTE at (808) 248-8355 (please remember to consider time zone difference when calling: 9 am on the US west coast is 6 am in Hawai'i). For questions about the event, call BRET at (435) 259-6507. To be added to our e-mail list for future announcements, contact us at: [bpmaui@yahoo.com](mailto:bpmaui@yahoo.com).

## ETHNOBOTANICA II FEBRUARY 15–17, 2002

This second Australian ETHNOBOTANICA seminar features presentations by CHRISTIAN RÄTSCH, CLAUDIA MÜLLER-EBELING, PIERS GIBBON, TORSTEN WIEDEMANN, DUTCHIE, FLOYD DAVIS, HENRY COX, BENJAMIN THOMAS, GENBANK, SOLANDRA, ALLISON, DES TRAMACCHI, ROBERT, REVILLE,

SHROOMSTER, GERALD TAYLOR, NEIL PIKE, MICHELE FANTON, JUDE FANTON, BURKE, KATH, and JULIAN PALMER. There will also be workshops: EARTHALCHEMIST (plant researcher) will present the "Sage Goddess Advanced Workshop;" RAY and ELIZABETH (of HAPPY HIGH HERBS) will explain herb preparation; DAVID (botanist) will guide us through the subtropical rain forest and will also run a workshop on taxonomy and nomenclature; and there will be an "Aboriginal Dancing & Face-painting" workshop in preparation for a Corroboree. Entertainment will be provided by NEIL PIKE (guitar), ALLISON (Baroque classical guitar), BURKE (didgeeridoo), and more to be announced. A "Kava Bar" will provide traditional *kava* beverages, exotic herbal teas, guarana drinks, juices, smoking herbs, etc. Market stalls include: HAPPY HIGH HERBS, SHAMAN AUSTRALIS (books, plants, and seeds), MYSTICAL MYCOLOGY (shroom supplies), EARTHALCHEMY, cactus seeds, zines, psychedelic fine arts & crafts, massage, and Reiki. Tickets are limited to 120, sold in advance only. This event does not aim to make a profit and is a community effort: all presenters donate their time. Tickets (AU\$ 240.00) include all presentations, workshops, food and camping for 3 days. Contact [ethnobotanica@shaman-australis.com](mailto:ethnobotanica@shaman-australis.com). More info at: [www.shaman-australis.com/Website/Events/EB2002/Ethnobotanica2002.htm](http://www.shaman-australis.com/Website/Events/EB2002/Ethnobotanica2002.htm).

## THE PROPHETS CONFERENCE MARCH 29–31, 2002

Held March 29–31, 2002 at the ASILOMAR conference grounds, presenters include RAM DASS, BARBARA MARX HUBBARD, RIANE EISLER, STANISLAV GROF, GREGG BRADEN, PAUL RAY, SHERRY ANDERSON, BROOKE MEDICINE EAGLE, FRED ALAN WOLF, ROBERT ANTON WILSON, PETER RUSSELL, HANK WESSELMAN, RUSSELL TARG, NICKI SCULLY, KEVIN RYERSON, and JAI UTTAL with GEOFFREY GORDON. The first 100 people who register will be able to do so for only \$179.00. Thereafter, tickets are \$245.00 through Jan. 31, \$295.00 through Feb. 28, and \$345.00 through March 29. THE PROPHETS CONFERENCE welcomes parents to bring their children. Arrangements are being made for childcare through our volunteer/staff program and on Sunday we will have an Easter egg hunt. See [www.greatmystery.org/montereyregister.html](http://www.greatmystery.org/montereyregister.html) or call (888) 777-5981 for more information.

## ETHNOBOTANY GARDEN

<http://ethnobotany.yage.net>

“The ethnobotany garden is a community of people looking for plant knowledge of all kinds.” A few articles of interest posted at this site include: “The Herbal Holocaust” from *Cannabis Culture*; “Inca Energy Fudge” by the ETHNOBOTANY GARDEN staff; “Tobacco: A Cross-Cultural Comparison” by DAN McDONLEY; “Cultural Role of Peyote in Native American Society” by DAN McDONLEY; “Standardized Extracts: Boon or Bane?” from *Nutrition Science News On-line*; “Wildcrafting for Beginners” by HOWIE BROUNSTEIN; and “J.L. HUDSON on seed germination,” electronically formatted by GLIDER. While in some ways this site acts as the *Reader's Digest* of ethnobotany articles, by compiling stuff that has already been published elsewhere, what they have pulled together is definitely of interest, and they have a good amount of original content as well.

## ETHNOGARDEN

POB 27048 (Dept. ER)

Barrie Ont.

CANADA

L4M 6K4

(705) 735-0540

[ethnogarden@sympatico.ca](mailto:ethnogarden@sympatico.ca)

<http://store.yahoo.com/ethnogarden/index.html>

A new Canadian entheobotanical company that looks to be good. Note that all prices below are listed in Canadian dollars, and their site has a “currency converter” function that allows one to see what the charge would be in the currency of a variety of countries. Most of their products should now be in stock, although the one that may be of most interest to some folks—ibogaine hydrochloride for \$330.00 (about \$207.00 in USA dollars) per gram—won't be available until 2002. Alas, they don't ship this product, nor any of their *Tabernanthe iboga* products or their *Lophophora williamsii* seeds to the United States. However, they do ship these products to most (but not all) other countries; see their web page for restrictions. Other products of interest include seeds for

*Argyrea nervosa* (7 grams \$45.00); *Banisteriopsis caapi* (10 seeds \$18.00); *Diplopterys cabrerana* (10 seeds \$18.00); *Leonotis leonorus* (20 seeds \$17.00); *Lophophora williamsii* (10 seeds \$16.00); *Peganum harmala* (250 grams \$40.00); *Psychotria viridis* (10 seeds \$18.00); *T. iboga* (10 seeds \$25.00); *Trichocereus pachanoi* (100 seeds \$18.00); *Trichocereus peruvianus* (100 seeds \$19.00); and dried plant material from *L. leonorus* (flowers 25 grams \$48.00); *Salvia divinorum* (28 grams \$50.00); *T. iboga* (root-bark 5 grams \$65.00); and *T. peruvianus* (25 grams \$55.00).

Pure ibogaine has been a difficult-to-obtain and expensive item for a long time. It is not illegal in most countries, and my hope is that someone somewhere has *Tabernanthe iboga* under extensive cultivation to provide this potentially valuable chemical to those who desire it. I would be remiss not to mention, however, that one doctor knowledgeable about entheogens has mentioned to me that ibogaine may be fairly neurotoxic, and its use should be restricted to the “last resort” status for those opiate addicts who have found no other way to kick. The use of ibogaine is controversial even amongst proponents of entheogens!

## HYOSCAMUS—THE HENBANE PAGES

<http://hyoscyamus.yage.net>

Just what you'd expect from the name—a web site dedicated to the *Hyoscyamus* genus.

## ICAROS DNA & PEDRITO ARTS

Jiron Medina 323 (Dept. ER)

Callao 5

PERU

(51) (1) 989 03 81

<http://icarosdna.yage.net>

<http://www.galeon.com/icarodna/page/index.htm>

[icarosdna@yage.net](mailto:icarosdna@yage.net)

[icarosdna@yahoo.com](mailto:icarosdna@yahoo.com)

ICAROS DNA is a supplier of wildcrafted shamanic herbs from the rain forest and Andean highlands of Peru, that generally deals in bulk quantities. They offer a money back guarantee and claim to have excellent prices. (No prices are provided on their web site, so one must contact them via e-mail to see what their products cost.) PEDRITO ARTS sells traditional native handicrafts, textiles, jewelry, and pottery as a means to provide income for the Shipibo women, and to encourage them to continue producing these products. Payment can

be made via wire transfer or WESTERN UNION (but not via credit card). Orders can be paid 50% in advance and 50% upon delivery.

None of the dried herbal products are sold for consumption, but rather only for ethnobotanical research purposes. I have heard very little about this company, except from one friend who was quite impressed with 35 dry grams of *Trichocereus peruvianus* flesh (from Matucana) that he said was being marketed to and in Europe, and which originated from ICAROS DNA. They offer *Banisteriopsis caapi* (three different colors/varieties: yellow “Cielo,” red, and white), *Brugmansia suaveolens*, *Brunfelsia grandiflora*, *Bursera graveolens* (“Palo Santo,” a natural wood aromatic incense used for centuries by the Incas), *Bursera fagaroides* (copal resin incense), *Diplopterys cabrerana*, *Ilex guayusa*, *Nicotiana tabacum*, *Petiveria alliacea*, *Psychotria viridis*, *Tabebuia serratifolia*, and *Virola* bark.

### JAMISON ETHNOBOTANICALS

Jamison Schuetz

525 NW Monroe #110 (Dept. ER)

Corvallis, OR 97330

www.jamisoninc.com

Good prices on *Argyrea nervosa* (seeds: 1 gram \$2.00); *Banisteriopsis caapi* (wood powder: 15 grams \$10.00, 30 grams \$20.00); *Calea zacatechichi* (leaves: 7 grams \$10.00, 15 grams \$20.00); *Cola acuminata* (nut powder: 25 grams \$10.00, 50 grams \$20.00); *Coryanthe yohimbe* (bark: 20 grams \$10.00, 40 grams \$20.00); *Ephedra nevadensis* (seeds 1 gram \$2.00); *Heimia salicifolia* (foliage: 30 grams \$10.00); *Mimosa [tenuiflora = M. hostilis]* (root-bark from Brazil: 10 grams \$10.00); *Peganum harmala* (seeds 4 grams \$2.00); and *Psychotria viridis* (leaves: 15 grams \$15.00),

Prices include S/H. Payment must be via USA cash, check or money order made payable to JAMISON SCHUETZ. This looks like another reasonably low-priced source worth supporting.

### LADY SALVIA

www.ladysalvia.com

support@ladysalvia.cjb.net

The *Salvia divinorum* leaf sold by LADY SALVIA is said to be “guaranteed in potency to be 3–4.5 mg salvinorin A to 1 g leaf.” Without standardization of this leaf, I have to wonder how they can make such a guarantee? Perhaps they do tests

periodically, and any leaf material that isn’t at least 3 mg/g is chucked into a pile to be used as starter material for their extracts? While it is possible that they do this (though not necessarily probable), they still can’t reasonably make such a claim of potency unless they tested *all* of the leaf that they sell. 15 grams sell for \$20.00, 30 grams for \$37.00, and 100 grams for \$110.00. They also have a “Special-S Extract” for \$20.00 per gram, which is guaranteed to have 22–24 mg of salvinorin A. Strangely, they deposit the salvinorin A onto damiana (*Turnera diffusa*) leaves, claiming that this makes it an “ultra smooth smoke.” They also sell a non-standardized 5X extract for \$18.00 per gram, and a non-standardized 10X extract for \$28.00 per gram. Although I have not tried their *Salvia-on-Turnera* product myself, the following two comments were posted to a *S. divinorum* e-mailing list to which I subscribe:

I tried a Salvia product that was advertised to contain the same amount of salvinorin A per gram of leaf, deposited on damiana leaves, and it was absolute CRAP. Not even 2X, if even that. I don’t know if what you have is the same, since I got mine from a different seller, but what I tried wasn’t made by the seller I bought it from (he didn’t mention who he bought it from). It was weak crap. It had a nice smell to it, but one had to smoke 1/2 a gram or more to get anything with it.

And:

I tried the same thing from Lady Salvia, it was pure crap. Not worth a damn.

While perhaps unlikely, it is possible that more than one company is producing an extract of salvinorin A placed onto damiana, but if so, neither company producing this odd product is doing the best job of it. If a product *is* standardized, it definitely should produce effects for most people at a reasonable level.

Aside from *Salvia divinorum*, they sell *Calea zacatechichi* (30 grams for \$15.00, 100 grams for \$40.00); *Turnera diffusa* (30 grams for \$8.00, 100 grams for \$16.00); *Mimosa [tenuiflora = M. hostilis]* root-bark (30 grams for \$28.00, 100 grams for \$82.00); and Sinichuichi [*sic*] (presumably *Heimia salicifolia*, “sinicuiche” 30 grams for \$22.00, 100 grams for \$50.00).

Since this is a web-based company, I thought that it was interesting that they use a third-party billing-agency to handle their transactions. They state: “Lady Salvia will never see your billing information. Under no circumstances will we ever

release your name, address, email address, phone number, or any other personal information to anyone, EVER.” Of course, if they don’t see your billing information, there isn’t any way that they could release it! However, this doesn’t mean that the billing-agency that handles their accounts wouldn’t flip like a dime if pressured by a government agency. Hence this seems like a fairly hollow promise of security. And anyway, nothing that they are selling is illegal...

LADY SALVIA’s prices for all of their products are quite good, and the fact that they have branched out and offer products other than *S. divinorum* is admirable. Nevertheless, if they can’t nail their namesake and offer something substantial (and without making questionable claims), I have to wonder how long they will be around.

#### LILA

**vegetalismo@hotmail.com**  
**http://lila.yage.net**

*Lila* is an on-line magazine that focuses on topics such as transpersonal research and shamanism. They also have a discussion forum. Articles currently posted include: “Post-Modern Monk and Modern Shaman: The Theories of KEN WILBER and STAN GROF” by STEPHEN DINAN; “Green Dharma” by MARCUS and DAN; “The Shamanic Paradox” (quotes from the book *Shamans, Healers and Medicine Men* by HOLGER KALWEIT); “Provoked Life: An Essay On The Anthropology Of The Ego” by GOTTFRIED BENN (1886–1956); “Spirits of the Rainforest” by DEMETRI DIMAS EFTHYVOULOSIS; “Ketamine—Near Death and Near Birth Experiences” by KARL JANSEN; and “Entheotherapy—A Review of the work of MYRON J. STOLAROFF” by MARCUS, as well as many other writings. *Lila* also features the Non-Dual Gallery, a collection of art exploring the transpersonal or “non-dual” vision of human nature.

#### MYCOTOPIA

**www.mycotopia.net**

A mycology web site that hosts a community of “very helpful and intelligent people, who will be more than happy to help with any questions you may have.” They have discussion forums, live chat, techniques, links, and legal information about our fungal friends.

#### SALVIAMAN.COM

**webmaster@salviaman.com**  
**www.salviaman.com**

SALVIAMAN.COM sells Oaxacan *Salvia divinorum* and *S. divinorum* extracts. They have *S. divinorum* leaf (15 grams for \$20.00, 30 grams for \$30.00, 100 grams for \$100.00); 5X extract (1 gram for \$20.00, 2 grams for \$35.00, 5 grams for \$70.00). Other extracts are available, as are live cuttings of *S. divinorum* plants. Inquire about these via e-mail. They state that “At times we can have up to a two week back order,” which isn’t too bad but might indicate that they are slow to fill orders in general. They only accept payment on-line with PAYPAL.

#### SAMORINI NET

**www.samorini.net**

GIORGIO SAMORINI emerges on the web with high-quality information on entheogens. He plans to create a huge site, with a database of printable articles concerning psychoactive plants and drugs from the 800s through 2001 and beyond. (These are currently mostly in Italian but will expand to include other languages.)

#### SHAMANSHOP / KALYX

**POB 417 (Dept. ER)**  
**Camden, NY 13316**  
**www.shamanshop.net**  
**orders@shamanshop.net**

Your basic on-line headshop. Looks like they have some good products. They have a huge selection of links that is definitely worth checking out.

#### XENOPHARMACOPHILIA

**www.xenopharmacophilia.com**

Foreign drug love? This is a fun site created by “REVEREND MEO.” Plenty of the REVEREND’s own rants and drug experience files, as well as original interviews that he has done with folks like RICHARD GLEN BOIRE, UNCLE FESTER, KARL JANSEN, DENNIS MCKENNA, DOUGLAS RUSHKOFF, and others. (The UNCLE FESTER interview is truly great.)

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

Copyright © 2002 by *The Entheogen Review*. Nothing in this journal may be reproduced in any manner, either in whole or in part, without written permission of the editors. All rights reserved. All advertising and advertised products void where prohibited.

## JOHNNY APPLESEED SPEAKS...

JOHNNY APPLESEED was one of the original contributors to *The Entheogen Review*. He's been laying low of late, but surfaced recently at the CONSCIOUSNESS TECHNOLOGIES II conference, held in Sisters, Oregon, on July 19–22, 2001. We're happy to be able to provide some information related to his latest findings in this forum.

*What was your presentation at the CONSCIOUSNESS TECHNOLOGIES II conference about?*

I took people through a hands-on experience of making ayahuasca analogues in a field situation. We used an oil drum with the top cut off, and heated it using a propane burner. We had this about one-third full of water, acidified by the juice of about a dozen lemons. After this got to a rolling boil, we put in about five pounds of a new variety of dried *Phalaris* grass. This was tamped down so it was all covered by the water, and allowed to simmer for 15 minutes. At the end of that time, the grass was forked out and the water was kept simmering to reduce the liquid to about one gallon.

*Is this different from your usual method of producing ayahuasca analogues?*

Yes. For the past eight years or so I have been making ayahuasca analogues by simmering *Phalaris* grass all day. Then I allowed it to cool and extracted the alkaloid fraction using the acid-base method that I published in one of the early issues of *ER*. Basically this entails adding an organic solvent to the barrel of water extract and changing the pH. to basic. Since they are now in a basic environment, the alkaloids prefer to be soluble in the organic solvent layer and they will migrate into that layer. Periodically this organic solvent layer can be drained off and evaporated, leaving the mixed alkaloids as a tar-like substance.

I had been doing this for two reasons. One is that by prolonged simmering of *Phalaris* grass, one also extracts a somewhat toxic substance. Although there is some uncertainty as to just what this is, most people who have tried direct extracts of *Phalaris* have reported this toxic effect to some extent. By extracting just the alkaloid fraction with the acid-base method, one leaves these toxic effects behind. The second reason for extracting the alkaloids is that it removes most uncertainty about dosing. After a little practice one knows fairly precisely how much extracted alkaloids to use. For instance, I find that my old standby, the "Turkey red" strain of

*Phalaris arundinacea* gives a consistent experience at 75 mg of extracted alkaloids. Of course, carrying small caps of alkaloids also facilitates traveling when one is doing sessions.

*What is the reason for using the new methodology in your conference presentation?*

Ever since my work with *Phalaris* grass in the early '90s, one of my goals has been to embed new shamanic entheogenic traditions into the North American continent. One of the best ways to accomplish this is by using plants that can be naturalized, such as the *Phalaris* grass species, and by developing procedures that do not require solvents or extraction procedures not available to the ordinary practitioner. I am particularly thinking of North American Indian tribes, who would be the best communities to bring this to, as they have a history of such usage and are uniquely situated to carry this knowledge forward into an uncertain future.

Thus, when a research colleague reported to me that the 15 minute quick-simmer seemed to extract the tryptamine alkaloids, but leave behind the toxic elements in *Phalaris*, I realized that this was the breakthrough we had been looking for with *Phalaris*. I have spent the past eight years in breeding work trying to isolate the toxicity, but with no success.

There is another breakthrough in *Phalaris* management that I also learned of from a colleague this year. This involves the harvest of *Phalaris*. Previously I had been harvesting one or two times per year and making big batches. This new harvest technique promises to be much better. Basically it involves harvesting the grass every week. The new fresh growing tips apparently produce a much higher concentration of the active alkaloids. I have reports that one double handful of the fresh growing tips extracted in acid water for 15 minutes provides a reliable oral experience when potentiated with Syrian rue (*Peganum harmala*). Of course, the fresh cuttings could be dried and stored as well. Under this protocol, the harvesting is discontinued at about mid-July, as the toxic element seems to increase after this time.

*Are there any disadvantages to this new procedure?*

Yes, by directly extracting and drinking a water extract of *Phalaris*, one is now very uncertain about the dosage. Each year's production, the time of harvesting, soil, climate—all these variables now enter into the quantity of alkaloids that will be included in the half cup of extract one is drinking. Thus, each person will have to titrate the dosage of their *Phalaris* patch every year. When one extracts the alkaloids directly and uses a set amount, all these variables disappear. I expect both methods will continue to be used.

*How did you develop your Phalaris grass ayahuasca analogue?*

I started with several hundred seed sources of *Phalaris arundinacea*, and planted out about five seeds from each source, for about 1000 plants. Then I did thin layer chromatography (TLC) on them to determine their alkaloid profile. I found that most of the seed sources produced varied alkaloid profiles within the seed source, suggesting that the genetic determination of alkaloid production was not uniform within the population. I was lucky enough to discover the strain that became named as "Turkey red" produced a uniform alkaloid profile within all the seeds from the seed source, and that alkaloid profile had what I wanted—a concentrated source of 5-MeO-DMT.

There are about five other alkaloids present within the "Turkey red" strain as well. I do not know what most of them are. I have tried the experiment of separating out just the 5-MeO-DMT and taking that orally with a MAOI, and I do get an effect, comparable to using chemically-produced *pharmahuasca* from synthesized 5-MeO-DMT. However, it does not have the magical shamanic effect I like for my group use. I have about a thousand TLC plates of my tests, each with its own unique and different alkaloid mixture. This could keep graduate students busy for years elucidating the unique healing properties of these mixtures.

*What is the new Phalaris grass that you made available at the conference?*

This is my newest release that I have been working on for the last few years. I call it "Big Medicine." This is a tall fast-growing *Phalaris* species that contains DMT. It also spreads by runners—a necessary characteristic I select for so that it can be spread by root cuttings, and thus bypass the genetic rearrangement that could result from relying on seed dissemination.

My old standby, "Turkey red," was selected to produce 5-MeO-DMT because this is the alkaloid that I personally prefer for my own work and the work I do with groups around the country. I feel 5-MeO-DMT most closely mimics the natural enlightened state of a fully-functioning pineal gland. It does not distract one with visuals, but simply opens one's energy field and dissolves the energetic barriers between people. By taking about 75 mg of the "Turkey red" extract—equivalent to about 7.5 mg of 5-MeO-DMT—potentiated with a MAOI such as Syrian rue, one can experience much healing, and in the right group, a unification of consciousness within the group. I believe this medicine has a role to play in the next stage of evolution, which must involve some form of group consciousness. People might be interested in my paper on genetics, evolution, and entheogens, published in Winter 1997 issue of *The Resonance Project* magazine ([www.tripzine.com/articles.asp?id=genetics](http://www.tripzine.com/articles.asp?id=genetics)).

Anyway, this new cultivar, "Big Medicine" is a *Phalaris* species that contains a fairly pure source of DMT. Dosage will have to be experimented with but I would expect it to be in the range of one pound of dried material per dose. The exact species is unknown because of my breeding procedure, which is to plant out many varieties and species of *Phalaris* and let them cross randomly, and then to let climate and testing sort out the survivors. It will be available from HERBAL SHAMAN and also from ALLIES (POB 2422, Sebastopol, CA 95473).

*What is your current research interest?*

Well, we still need a good MAOI that can be naturalized over the whole of the Temperate Zone. Currently we have Syrian rue, but that only grows well in the warm dry areas of the country. There is also passion flower (*Passiflora* species), but that only grows naturally up into the middle of the country, and it is very weak. I am planning to collect seed of the most northern-growing cultivars and plant it further north to see if a few will survive to start a cold-hardy strain. The problem of the weak MAOI activity will be harder to deal with. Testing for harmine and harmaline is easy with simple thin layer chromatography, but MAOI activity either has to be bioassayed or involves very complex animal operation and testing procedures. If anyone knows of any good info in this area of better MAOI plants or testing procedures, I would encourage them to publish it in *The Entheogen Review*.

Thin layer chromatography is a great way for your readers to test new plants they may suspect of entheogenic activity. It is something anyone can do on their kitchen table with the

## THIN LAYER CHROMATOGRAPHY

Thin layer chromatography, or TLC, is a method of identifying specific compounds. By comparing colored spots of an unknown substance, to similar spots of known compounds—all of which have been wicked up a plate of silica gel by a solvent—one can get a good idea of what the unknown compounds are.

### MATERIALS

1. Chromatography Chamber: Rubbermaid 1.7 quart container or equivalent
2. Chromatography Solvent: methylene chloride:methanol:concentrated ammonia mixed in proportions of 80:15:1
3. Chromatography Plates: Alltech Polyram silica gel plastic 20 x 20 cm plates or equivalent
4. Ehrlich's Reagent: from Alltech
5. Xanthydro: from Sigma
6. Preval Paint Sprayer: from auto parts store
7. Micropipette Applicators: 25–30 microliter
8. Bottle of standard or known referent plant extract (see comments below)
9. U.V. Light

### PROCEDURE

Prepare the silica gel plates by cutting them into quarters so that you have 10 x 10 cm square plates. Draw a line across the plate with a soft lead pencil about one-half inch up from the bottom of one edge. This is your starting place for spotting your samples. Divide this line into channels or lanes for the samples. You can get a maximum of about seven channels per plate, leaving about an eighth-inch margin on the edges. Number the plate on top and record the info in your notebook.

*Use a new micropipette for each sample.* Using a micropipette, spot one sample each of the extracts in the middle of each channel on the penciled line. Extract your plant samples with either basified methylene chloride or alcohol. Put your standard in the middle lane. Standards can be made by extracting plants known to contain target alkaloids; these plants are widely available through mail order.

Use a micropipette and dip it into your sample solution. It will draw up a sample by capillary action. When spotting on to the plate, keep the spot as small as possible, touching the pipette to the plate briefly, blowing on the plate to dry the solvent, then touching the plate again, and so on until the pipette is empty. Spot anywhere from one to three pipettes of sample onto the plate depending on concentration. Keep the extract made from your known referent plant in a tightly closed container and free from contamination. It is a good idea to keep it refrigerated.

When your plate is prepared, add about a quarter inch of the Chromatography Solvent to the Chromatography Chamber. Then place the plate in the chamber with the row of spots on the bottom. Make sure that the row of spots is above the level of the solvent. Place the lid on upside-down so the solvent vapor pressure does not blow it off, and let it remain undisturbed.

The solvent will start to wick up the plate, taking various molecules up with it at different rates. It will take about 15–20 minutes for the solvent front to go about three-quarters of the way up the plate. At this point remove the plate. Using a pencil, mark the top of the wetted area, and dry the plate with a hair dryer (or in the field by air drying).

At this point, if testing for  $\beta$ -carbolines (harmine and harmaline) use a long-wave U.V. light and shine it on the plate in the dark. If using Syrian rue seed extract as a standard, you should see a spot about 25% up the wetted area of the plate that fluoresces a bright light green, and a spot about 60% up the plate that fluoresces blue.

If testing for tryptamine alkaloids, then take the Preval paint sprayer loaded with Ehrlich's solution and spray a fine mist onto the plate. If indoors, place the plate in a cardboard box turned on its side to catch the overspray. Allow for ventilation. Do not spray so much that the plate becomes saturated and the spots run. As you spray, the different compounds that have moved up the plate at different rates will start to appear as colored spots. DMT and 5-MeO-DMT will both be a spot about 35% up the plate that is purple/violet.

To differentiate DMT from 5-MeO-DMT, use Xanthydro reagent as your visualization spray. Xanthydro is very unstable and needs to be kept frozen. The Xanthydro reagent needs to be prepared fresh for each few days use. It is prepared by mixing 100 mg Xanthydro in 95 ml of 190 proof ethanol plus 5 ml concentrated hydrochloric acid. This mixture is sprayed as above. It will destroy the Preval paint sprayer with one use, so an air compressor and suction-type glass sprayer are useful. DMT will visualize as a violet spot under Xanthydro reagent, and 5-MeO-DMT will visualize as a blue spot, both in the same place. The size of the spot is roughly proportional to the concentration.

right access to a few inexpensive things from a good chemical supply house.

I also want to follow up on some info I got from ROB MONTGOMERY about DMT in *Eucalyptus* wood. One thin layer chromatography test I ran showed both the wood and bark of a common *Eucalyptus* as having a fairly pure DMT band. I would encourage others to follow that up as well. There is also the question of American admixture plants; I have heard of people using Indian snakeroot (*Rauwolfia serpentina*) and boneset (*Eupatorium perfoliatum*). Proceed with caution with these, especially the first!

Then there is the question of investigating the blackout technique (see sidebar). This is something I learned about at the conference. It is being tried out in a few places in Europe and Asia. It involves a technique to increase the endogenous production of DMT and 5-MeO-DMT in your own brain by being in a completely blacked out environment for two weeks. What people are doing is renting a house and sealing it up so no light can get in. They arrange for food to be brought in one room that they can access, and they just live there for two weeks. What is reported to happen is that there is an increased level of melatonin production, leading to the production of high levels of the alkaloids. Some very interesting things are reported to occur to one's vision.

I certainly have no lack of things to keep me busy, but my main activity these days is doing sessions with small groups of people. Finding the right group of people who are willing and capable of going to advanced states of connected consciousness together is the key to accessing this next level of evolution we are all seeking. ☉

## DARKROOM MEDITATION

Strange synchronicity—around just the same time that we received the interview with JOHNNY APPLESEED that mentions the “blackout technique,” we were also forwarded some information related to a teacher who provides such sessions. The data came from an *ER* subscriber who studied with this same teacher 12 years ago. This subscriber noted that he had heard that TERENCE MCKENNA was at one point researching Tibetan meditation and shamanic practices, but that he could not find any evidence of tryptamine-producing plants or animals. Perhaps such plants and animals weren't necessary, and it was proposed that “darkroom” style meditations—and the resultant endogenous tryptamines that they are said to produce—might be the original inspiration for the colorful *thangka* paintings of Gods and spirits...

Master MANTAK CHIA provides darkroom retreats within a Taoist context. The first of these retreats, held in Thailand, began on February 10, 2002. The following descriptions are given for brain activity during specific days of darkness:

DAYS 6–8: “At this stage the pineal gland also starts to produce the neurohormone 5-MeO-DMT. This psychoactive tryptamine is highly luminescent; it is also extremely phosphorescent due to the amount of phosphene that it transmits onto the visual cortex. The neurotransmitter 5-MeO-DMT (‘akashon’) is normally only active when we are in the womb and in the first months of our lives. It is now reactivated in the darkroom. 5-MeO-DMT switches on 40% more of the cerebral cortex and awakens the nervous system to become aware of itself; ‘beingness’ results. It is the empathogenic neurotransmitter that expands the emotional body between ‘infinity and zero.’ It gives rise to telepathy in the emotional and intuitive bodies. It engages the awakening of the ‘Flower Of Life,’ the spine, which begins to glow in a state of beingness and peace. 5-MeO-DMT discharges the darkness from the darkroom. A bright light will be activated. This Great White Light, the manifestation of the astral body, enables the self to project externally. Many exercises will be practiced during this period; compacting Chi, consciousness and awareness into the nervous system, working with the Silent Self and anchoring the Immortal Body.”

DAY 9–12: “There is now enough ‘Mono Amine Oxidase Inhibition’ triggered by the pinoline, to allow the pineal gland’s ‘serotonin to melatonin cycle’ to be intercepted by adrenaline and ephedrine activity and converted into a ‘serotonin – DMT pathway.’ When DMT levels reach more than 25 mg, one’s experience can become very visual. DMT is the visual third eye neurotransmitter. It enables the energy body and spirit to journey into hyperspace, beyond third dimensional realms of time and space. It is intensely energizing. At this stage of the Dark Room Retreat, the required amount of sleep tends to diminish dramatically. Although the day may last 24 hours, 3 hours of sleep can seem like 12.”

Clearly, there are a LOT of sketchy speculations above that are being presented as if they were known facts, but this shouldn't discount the possibility that some very strange mental states (possibly related to tryptamine levels) might be achievable through exposure to prolonged periods of no light. Costs for the retreats ran \$783.00 for one week, \$1,536.00 for two weeks, and \$2,253.00 for three weeks (food included). Information related to the darkroom technique and the retreats offered can be obtained on the web at [www.universal-tao.com](http://www.universal-tao.com). This site contains a downloadable version of the *Darkroom Enlightenment Technology Manual* and data related to preparations for the darkroom retreat and nutritional guidelines that are said to help increase the production of endogenous tryptamines. We see no reason why psychonauts with enough free time on their hands shouldn't be able to replicate such a darkroom environment in their own home, and we hope to hear from some *ER* subscribers who do just that (or perhaps who attend one of these retreats).

# Mind States JAMAICA

October 1-6, 2002

with presentations by

- RICHARD GLEN BOIRE
- EARTH EROWID
- FIRE EROWID
- ALEX GREY
- JON HANNA
- STEPHEN KENT
- JONATHAN OTT
- MARK PESCE
- ANN SHULGIN
- SASHA SHULGIN

[www.erowid.org/mindstates](http://www.erowid.org/mindstates)

**Join us in beautiful Negril Jamaica, for a 6-day consciousness expanding seminar like you've never experienced before!**

#### TICKETS

\$1000 (early bird, before August 1) or \$1,300 (from August 1–September 15).

Tuition includes admission to all lectures and events, accommodations (double-occupancy), delicious Jamaican food (vegetarian and vegan available), and all alcoholic beverages.

Airfare and transfer to the resort not included.

Payment can be made with a credit card through PayPal ([www.paypal.com](http://www.paypal.com))

by sending the money to the e-mail address [mindstates@prodigy.net](mailto:mindstates@prodigy.net),

or mail a check or money order to: Mind States, POB 19820 (Dept. ER), Sacramento, CA 95819

Jamaica is an island paradise, with beautiful white sand beaches, a turquoise sea, coral reefs, swaying palm trees, winding mountain rivers, and spectacular waterfalls. To paraquote one guidebook: "It is a 'far-out' setting where you can drool over sunsets of hallucinogenic intensity that have nothing to do with the 'magic' mushrooms that show up in omelettes and teas." Our seminar will be held in Negril, "a place where inhibitions are lost and pleasures of the flesh rule." Although strictly speaking, *Cannabis* is illegal in Jamaica, it is clearly tolerated to a larger degree than in the United States: "Herb is a part of daily life in Negril so don't be surprised if your first potential supplier is your hotel porter and you lose count of the men who hiss 'sensi' as you pass them in the street." Of course, Jamaica is also renowned for its 'world' music, particularly the reggae of Bob Marley and others. The attitude in Negril is laid-back and "hippie friendly."

**FOR MORE INFORMATION, SEE OUR WEB SITE AT [WWW.EROWID.ORG/MINDSTATES](http://WWW.EROWID.ORG/MINDSTATES)**

# SOME “HIGH” DESERT PLANTS

by LAZAR

My group and I have been examining a number of plants with psychoactive potential for several years. Of the dozen or more plants looked at, five seem to have some interesting properties when ingested either alone or blended in varying proportions. By share these findings with *The Entheogen Review*, we hope to eventually generate some feedback in this publication.

## METHODOLOGY

The harvested plant material was air-dried in the shade and when very dry reduced to a fine powder in a blender. We sharpen the blades with a file so there is more of a cutting action, which generates less heat than dull blades (which might thermally degrade the herb being pulverized). After blending a small batch for a short time it is screened through a 40 mesh sieve; the oversize is returned to the blender with more herb for further blending. If you do not have a 40 mesh sieve a piece of window screen will do, but the product will not be as fine and may be absorbed in the gut somewhat slower. The pulverized herb is stored in jars with tight-fitting covers in a dark, cool place.

We had access to a small pellet press and found that the powdered herbs could be pressed into tablets each containing about 250 milligrams. This made it easy to measure doses for bioassaying. Since most *ER* readers will not likely have access to such a press, it is easy to measure out the powdered herb with measuring spoons, mix the powder with some juice and drink it—a simple, low-tech approach. A ¼ level teaspoon of the powdered herbs described here will weigh between 480 and 535 milligrams.

In bioassaying these herbs, we followed those procedures described in “A Protocol for Psychoactive Drug Evaluation” (SHULGIN *et al.* 1986). One starts with low doses and works up in an incremental manner (1.5 to 2.0 times previous dose), with a three-day rest between trials. This is a safe way to test these things, and if you get a negative effect just stop testing that herb and record your findings. The above protocol should be followed in finding suitable levels of alteration for single plant species and for various mixtures. We have found a great deal of variability in response to these plants and mixtures among different individuals, so act accordingly;

plants from different sources could vary in potency. There have been reports of poisoning from overdoses of *Argemone glauca* and *A. mexicana* (PENDELL 1995), so approach these herbs carefully.

*Argemone glauca* (Hawaiian prickly poppy, *puakala*) is a member of the poppy family (*Papaveraceae*) native to Hawai'i, which grows on the dry side of the islands at sea level to 1000 feet. It can be grown from seed in warm dry areas of the Mainland. When the plant is in blossom (large white flowers), cut a few leaves from each plant. If the leaves are dusty, wash in water and dry in the sun to remove surface moisture, then dry in the shade for several days until crisp and brittle. Heavy leather gloves are recommended for handling.

EFFECTS: 500 mg gives a nice, easy going, modest alteration, which lasts 2–3 hours, and can be enjoyed while gardening, walking, sifting, *etc.* More—up to 2,000 mg—gives a laid-back contemplative state that is similar to smoking some *Cannabis*, which can also be used in combination with this poppy to heighten or modify the effects.

*Argemone mexicana* (Mexican prickly poppy) is another close relative (*Papaveraceae*) native to northern México and Southern Arizona and New Mexico (EMBODEN 1979). The flowers are bright yellow, whereas the other *Argemone* species are white. It can be grown successfully up to the 40th parallel and perhaps even further. In México it is a short-lived perennial, and to the north it is an annual as the roots do not survive over winter. To get good sized plants it is necessary to start them indoors in early spring and plant them out after frost danger passes. Collecting, cleaning, and drying are the same as for *A. glauca*, as are the basic effects and dosages.

*Argemone munita* sp. *rotundata* (prickly poppy). This is native to the northern part of the Great Basin. It ranges from 4,200 to over 6,000 feet in elevation, and is very often found along roadsides where it is considered a weed. It is a short-lived perennial (5–7 years) becoming larger each year. Harvesting and drying are the same as for *A. glauca*, as are the effects—with some subtle differences. It seems to be a little weaker than *A. glauca* or *A. mexicana*; perhaps it is just mellow?

A few other *Argemone* species—*A. grandiflora*, *A. polyanthemos*, and *A. plieacantha*—seem to be quite a bit weaker in active components and we were not impressed by the results.

## COMMENTS ON THE THREE ARGEMONE SPECIES

The bright yellow sap from the plants may be recovered by putting leaves and stems through a juicer and evaporating the strained juice. The result is a dark brown residue, which is scraped from the evaporating pan. It may be smoked or eaten with about the same result, but something seems to be missing when compared to the use of the dried powdered leaf.

With most subjects, all three of the *Argemone* species exhibit a nice mood elevator or antidepressant action, which is increased and modified with a little smoked *Cannabis*. Our favorite is *A. glauca* with a little *Cannabis*. This combination seems to greatly increase the pleasure and intensity of love making. All of the *Argemone* can be smoked, but it is a low-grade proposition and the digestive system is much better equipped to handle the amount of leaf involved. The alkaloids in the *Argemone* species are quickly converted to the soluble hydrochloride salts in the stomach and are absorbed there and in the intestine. Several alkaloids are present in these poppies and they vary in amounts in different species. Alkaloids present include: argemonene, berberine, protopine, artarine, cryptopine, allocryptopine, senguinarine, and stylophine. These are isoquinolines and there has been no comprehensive survey so far as we know of the quantities of each present in the several *Argemone* species. Some of these alkaloids are found in opium, but they are not thought to be addictive.

*Leonuris sibericus* (Siberian motherwort) is an interesting member of the mint family (*Labiata*) which grows from Siberia to the jungles of Malasia (OTT 1996A; PENDELL 1995). Some sources list it as a perennial, but we have found it to be a biennial. The first year it produces a basal rosette and a hardy root system; the second year results in a tall plant up to 7 feet, with many small lavender flowers at the branch ends. This is the time to harvest by cutting off the flowering tops and stripping the leaves. All this is dried on screens in the shade. The dried material is ground to a powder as described previously. Alkaloids present include: leonurine, leonuridine and homorunine (EMBODEN 1979) which account for the psychoactivity (LAZAR 1995).

**EFFECTS:** This material by itself provides a nice mellow altered state for 2 to 3 hours, which for some people doesn't have much character. However, it is useful to build on or modify with other things such as *Tagetes lucida* and/or some *Cannabis*. For many individuals a combination of the two really kicks it into gear.

*Tagetes lucida* (Mexican mint marigold) is an import from south of the border, that has been naturalized to some extent in the Southwest (EMBODEN 1979; OTT 1996A). The herb has aromatic leaves and yellow flowers. In the process of growing this plant one of our group discovered that by smelling the flowers, he got a nice mild alteration of consciousness that lasted 10 to 15 minutes.

YAGE.NET specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers.

We're also home to the largest collection of ayahuasca resources on the web.

We were not able to determine whether it was pollen or some vapor that caused this effect.

We found it best to germinate the seeds indoors in early spring, and transplant them to the garden in warm weather. Do not over-water them as you will get larger, lush, plants that do not have as much of the active components. (The same is true for the other plants mentioned in this report.)

This herb was one of the additives to the ritual *cacao* drink of MONTEZUMA (*sic*), and was used in other ceremonies as well (EMBODEN 1979). When made into a tea, it has a pleasant flavor but no psychoactive effects, probably because the active principles are oils and not very water soluble. We have found that when ingesting this herb it is necessary to eat something with it (*e.g.*, crackers, a cookie, *etc.*) so it will travel quickly to the intestine where it is absorbed. The flavor was reminiscent of anise, so we made some “Anisette” by extracting the active ingredient and flavor with grain alcohol, diluting and adding sugar. The result was good—both in taste and effects—but after the mixture was left standing a week or so, the effects were gone (except for those of the alcohol).

**EFFECTS:** This herb is quite variable among individuals, both relative to the quantity needed and to the direction of alteration. There were no bad experiences, just widely different ones. We have tested this herb up to 2,000 mg (by itself and in combination with other herbs) and most participants felt no need to increase the dosage further. A few did say they felt that amount was too much. It creates a “lucid” state which can be appreciated in a number of ways: listening to music, contemplating, grooving, introspection, communication, *etc.* Some of the effects noted are: clarity, alertness, closed-eye-visuals, body warmth, body tingles, feeling of well-being, and some time-distortion. The period of alteration lasted 2 to 3 hours in most cases and there was no interference with sleeping afterwards, although many reported increased dreaming (sometimes with weird content). We also evaluated *T. minuta* and found it had about the same properties as *T. lucida*. However, the plant was smaller so yields were low.

We made many bioassays of various blends of the foregoing herbs and found in most cases a synergistic effect. We haven’t finished testing all possible combinations and ratios of herbs within combinations, but we will give some generalizations. First, all five of these herbs mix well with *Cannabis* in varying proportions. We did not test mixtures of *Argemone* species with *L. sibericus*, since both tend to make one drowsy. Combinations that worked well were: *Argemone* and *Tagetes*, (both with and without *Cannabis*), and *Leonuris* and *Tagetes* (both with and without *Cannabis*). The ratio of the herbs that are eaten can vary from mostly one to mostly the other. During bioassaying if the subject felt sleepy a cup of coffee or a NoDoz® helped.

When ingested alone, none of the five herbs described here gave the user a really intense entheogenic experience. However, when combined many of the resulting blends did deliver a “pasted to the wall” experience, and there was a great deal of variability among individuals for any given blend.

## SOURCES

The following are places where some of the herbs discussed in this article can be obtained. The prices listed were current when the article was written, but that might not be the case at the moment—write for cost and availability information before ordering anything.

BOTANICAL PRESERVATION CORPS, Box 1368 Sebastopol, CA 95473. *Leonuris sibericus* for \$50.00 per pound plus \$8.00 shipping.

MOUNTAIN OAKS, POB 155, Doyle, CA 96109. *Argemone munita* sp. *rotundata* for \$70.00 per pound, and *Leonuris sibericus* for \$60.00 per pound. Prices are postpaid in the USA.

NATIVE SEEDS/SEARCH, 526 N. Fourth Street, Tucson, AZ 85705, [www.nativeseeds.org](http://www.nativeseeds.org). *Tagetes lucida*, sold as “Mt. Pima Wild Anise Tea,” catalog #FD2a, 1 ½ oz for \$2.00 plus shipping.

# COOKBOOKS AND CUBENSIS

by YACHAJ

"First effects felt at 10 minutes after eating the little devils. Shortly after that, the world erupted into patterns... Well! I wanted a really intense psychedelic experience to write about, and here it is... One and a half grams is quite enough to deal with." — ALICE'S voice, from *TIHKAL: The Continuation* (SHULGIN & SHULGIN 1997)

"The history of the solution of the teonanacatl mystery... is a very good example of how modern scientific research, in its effort to obtain novel compounds which are valuable in medicine, can revert to ancient knowledge of the miraculous powers hidden in the Plant Kingdom." — ALBERT HOFMANN, as quoted in *The Botany and Chemistry of Hallucinogens* (SCHULTES & HOFMANN 1980)

"[People] see very important visions, spiritual visions... The most popular [drug] for that is psilocybin. It's a more spiritual trip." — "JACOB," from *The Secret Chief: Conversations with a Pioneer of the Underground Psychedelic Therapy Movement* (STOLAROFF 1997)

"A real-life equivalent of Aldous Huxley's fictional moksha would be something like psilocybin, the drug that psychonauts prefer over all others." — RONALD SIEGEL, from *The 3-Pound Universe* (HOOPER & TERESI 1986, 1991)

"LSD and mescaline are generally thought to have more impact than psilocybin because of their longer duration; they are also perceived by many people as more coercive than psilocybin. The psilocybin experience seems to be warmer, not as forceful and less isolating. It tends to build connections between people, who are generally much more in communication than when they use LSD. [...] In contrast to most psychedelics, psilocybin mushrooms have also impressed many users with auditory effects." — PETER STAFFORD, from *Psychedelics Encyclopedia* (STAFFORD 1992)

## THE EARLY DAYS...

An entry in a cookbook 350 years ago eventually gave rise to industrial production of edible mushrooms in the Western hemisphere. Psilonauts scaled this down to a backpack-suited cultivation protocol. Now we return to a discussion of "cookbooks," for the recipe of a divine psilocybian treat: psilopunch.

The first recorded mushroom cultivators were Chinese Taoists. They didn't make a clear distinction between sacramental, food, and drug mushrooms; rather they viewed production and consumption procedures holistically. Their first mushroom cultivation techniques were published a thousand years ago, for the medicinal/gourmet mushroom *Lentinula edodes* (shiitake). These methods were not introduced to the English-speaking world until late in the 20th century. The delayed introduction of mushrooms as edible crop in Europe is often explained by the Anglo-Saxon "mycophobia," *i.e.*, associating mushrooms with poison, filth, and disease, rather than health and spiritual exploration.

## MYCOPHOBIA

The term "mycophobia" was coined by VALENTINA and R. GORDON WASSON, the two amateur mycologists who re-introduced the use of sacramental psilocybian mushroom consumption in Europe and the US through the publication of their 1957 book *Mushrooms Russia and History*. JONATHAN OTT, a pupil of R. GORDON WASSON, presented a possible explanation for mycophobia as cultural phenomenon in his 1997 book *Pharmacophilia or the Natural Paradises*. OTT tells us about the followers of the middle-eastern prophet ZARATHUSTRA (believed to have lived in the fifth to sixth centuries before the

Early underground "rock art" inspired this depiction of modern mycophobia; the police state representative attempts to efface the object of a psilonaut's inspiration. Drawing by Hans Vogt in 1996.

Christian year “zero”) who ingested *haoma* (*soma*), a brew some think was made from *Amanita muscaria*. According to OTT this tradition was followed up in the third century of our era by the Iranian prophet MANI and the Manichæans. As a religion that spread widely throughout Europe, Manichæism became one of the most powerful rivals to Catholicism. The influence and popularity of this Manichæan sect inspired Popes ALEXANDER III and INNOCENT III to decree the first internal crusade of Christendom. It is estimated that about a million people were killed between 1181 and 1201, effectively obliterating European Manichæism. The crusading Catholics effaced all details of the rival sect, and would have interred all traces of any fungal sacrament that may have existed.

Whether or not this history actually involved a fungal sacrament and contributed to mycophobia in western Europe is still debated by scholars, but fact is that since that time even non-psychoactive mushrooms have been taboo in Anglo-Saxon Europe. Mushrooms were only gradually re-introduced in the 17th century, and not as sacrament but as exotic ingredient in cooking. The introduction of gourmet mushrooms in Europe is an important stage in the history of mushrooms that ultimately led to production techniques for psilocybian mushrooms.

## RENAISSANCE COOKING

The western European history of edible mushrooms probably started with *Amanita caesaria*, the prized mushroom of the Romans, which never disappeared from the Italian cuisine. Italy has been called “The Mother of the Western Cuisines,” and perhaps its greatest contribution was its influence on French cooking during the Renaissance.

One crucial event was the arrival of CATHERINE DE MEDICI in France in the 16th century. Married to HENRY II (who later became the French king), she brought with her a retinue of cooks schooled in the subtleties of Florentine cooking. FRANCOIS LA VARENNE, the father of French Cuisine, learned to cook in DE MEDICI’S kitchens. In 1652, he published a revolutionary cookbook, *Le Cuisine François*. This was the first real kitchen chemistry (cooking) manual with recipes in alphabetical order. It included—for the first time—instructions for cooking vegetables. The white button mushroom *Agaricus bisporus*, “champignon” in French, gave food that exquisite touch that made it an essential part of the French cuisine.

## MELON GROWING, WITH CHAMPIGNONS

By the time LA VARENNE’S cookbook was published, French melon growers near Paris had discovered that the prized champignon of *Le Cuisine François* spontaneously emerged from the composted horse manure that was used to keep the growing melons warm. Soon they recognized a major cash crop in the mushrooms, when they realized that more mushrooms came up if the compost was sprayed with the water that had been used to wash the mushrooms. Now we know that this was caused by the mushroom spores and mycelial fragments that ended up in the water and germinated in the horse manure; the French melon growers essentially discovered the basics of the liquid inoculation techniques of today.

A grower whose name is only passed on as “Mr. MARCHAND” then developed mycelium transplantation, and the botanist JOSEPH PITTON DE TOURNEFORT (1656–1708) first wrote about mushroom cultivation in 1707. He also developed the casing method and helped to transfer the cultivation technology to the neighboring countries of Germany, the United Kingdom, and Italy. The Netherlands began *Agaricus* cultivation in 1825, and shortly thereafter the U.K. developed compressed horse manure brick spawn and exported it to Australia, Denmark, Germany, and the USA. In France, the PASTEUR RESEARCH CENTER brought about a technical innovation in mushroom cultivation in 1893, by developing a method to sterilize the compost and inoculate spawn.

The history from this point, and the impact of the classic techniques on the cultivation of psilocybian mushrooms, is discussed in detail in the WINTER SOLSTICE 2001 issue of *The Entheogen Review*. Mycelium transplantation techniques gave rise to industrial cultivation methods, which were eventually scaled down to a table-top format for home-cultivators. In less than 25 years *Psilocybe cubensis* emerged as the most popular home-cultivated mushroom in the world. The challenge of growing the right mushrooms in the right place (in a backpack if necessary), has now been solved. Now it is time to zero in on methods to get enough *P. cubensis* at the right moment, and to make a decoction of optimum potency.

## KEEP IT SMALL

Until recently it was a problem for many of us to have the right quantity of fresh mushrooms on hand at exactly the moment they were needed. Fast-growing mushrooms like *Psilocybe cubensis* are only in prime condition for about a day. After harvesting, they quickly lose moisture (and hence weight) when they are put in an open dish, which makes it

difficult to measure a correct dosage. If they are stored in a closed container they may rot.

The most obvious solution to this problem is to only grow a small amount of mushrooms at any given time, for instance by inoculating one *PSYLOCYBE FANATICUS* “tek” style half-pint container of substrate per week. (The *PF TEK* can be downloaded for free from [www.fanaticus.com](http://www.fanaticus.com).) Discard all mushrooms that are not used for spore-printing or experiments. In this way you will always have a fresh crop on hand or coming up.

### A FAST-GROWING PROBLEM...

Unfortunately, *Psilocybe cubensis* mushrooms can grow so fast that often they have matured beyond their prime condition by the time they are spotted by the grower. The baby mushrooms, “primordia,” of the early morning may be overripe and sporulating when the cultivator comes home from work. Since alkaloid concentration tends to drop sharply when the caps open and the spores mature, and since *P. cubensis* spores may induce strong allergic reactions in some people, it is not recommended to use sporulating *P. cubensis* mushrooms for other than ornamental or spore-collecting purposes.

Another problem emerges when an unexpected opportunity arises for a group experience, and there are not enough fresh mushrooms on hand for everybody. So how can one make sure that there are always enough fresh mushrooms available without the need to grow them in bulk?

### ...AND A HIP SOLUTION

HIPPIE’S “mycro-tek” provides an elegant solution to both problems (see *WINTER SOLSTICE 2001 ER*). It has been demonstrated that half-pint shot-glasses with mushrooms in exactly the right stage for consumption (*i.e.*, before the cap opens and the gills become visible) can be refrigerated and stored for at least three months without damaging the quality of the crop or the mycelium. At temperatures around 4° centigrade, *Psilocybe cubensis* mushrooms (as well as all the primordia), stop growing. The fungal enzymes that decompose psiloc(yb)in are barely active at these temperatures. Currently this “mycro” version of the *PF TEK* provides the best storage method for fresh mushrooms ever published.

The only necessary precaution is to protect the contents of the jar or shot-glass against dehydration (secure a tinfoil covering with a rubberband when it is refrigerated). It is also important to harvest all primordia and mushrooms within

48 hours after the glass/jar is returned to room temperature; they do not grow anymore and are rejected by the mycelium anyway. In harvesting each delectable fruit, remember that it is best to grasp the lower portion of the stem firmly and then twist the mushroom free from the mycelial network.

An efficient technique to clean a substrate cake from the many aborted pinheads, little primordia, *etc.*, is to use a sharp serrated knife. It doesn’t matter if you scrape off the outer surface—the mycelium will recover after a few days at room temperature. When the substrate cake is cleaned, put it back in the container, adjust the weight to what it was around the time of inoculation by means of adding drops of water in the vermiculite top layer, and cover it again with tinfoil. Keep everything at room temperature and the next crop will arrive in a week or two.

It never hurts to harvest mushrooms when they are young and potent. The total production in biomass per amount of substrate remains grossly the same, so when a primordium is harvested the mycelium will signal other pins to enlarge. The amount of pins that a mycelium makes is many times bigger than the amount of mushrooms it is able to support. To simultaneously get as many possible mushrooms as possible in exactly the right stage for consumption, remove the first volunteer primordia as soon as their tops are reddish. Do it with a flame-sterilized pair of tweezers and each primordium can be cloned on *MCALPINE*’s agar medium or immediately used to make a peroxidated mycelium slurry if desired.

Adjust the weight to what it was around the time of inoculation by means of adding drops of water in the vermiculite top layer.

Wait until at least half a dozen or even more reddish-topped primordia are visible on the substrate cake, put the glass/jar upside down if needed so that the mushrooms grow away from the opening of the container (mushrooms grow towards daylight). Then wait until the first mushroom of the group is *just* about to open its cap, put a rubber band around the tin-foil and refrigerate the substrate container at 4° centigrade.

In this way many containers of unharvested fresh mushrooms can be kept for months and are immediately on hand when an opportunity for a group session presents itself.

### FRESH VS. DRY

In the following protocols the “Hawaiian,” “Matías Romero” and “Stropharia”<sup>1</sup> varieties of *Psilocybe cubensis* are chosen because of the known and relatively stable alkaloid concentration when they are grown according to the *PF TEK*. Fresh mushrooms are not only preferred because they contain more alkaloids than dried ones but also because using them is more efficient (cold desiccation of mushrooms may take up to ten days).

Using boiled fruit juice serves two purposes: improving the effectiveness of the extraction and stimulating the fungal enzymes to convert the psilocybin into the faster acting psilocin.<sup>2</sup>

I should note that the only *documented* method for enzymatic dephosphorylation of psilocybin into psilocin via *P. cubensis* enzymes uses dilute acetic acid (vinegar) and a ten-minute boiling time (CASALE 1985). While even pure vinegar can be made drinkable when enough sweetener is added, I recommend fruit juice because of the better taste. Citric and other

organic acids are so closely related to acetic acid that I do not expect that it makes a difference. However, the described dephosphorylation method may not work with enzymes of psilocybins other than *Psilocybe cubensis*. The coffee press is chosen because it is designed to keep biomass submerged during the extraction. The tea sieve and funnel are optional. The vitamin C is meant to protect the fragile psilocin as much

as possible against oxidation. Psilopunch can be kept for a month in the refrigerator and even longer when it is frozen, but it is not recommended. (The potency may still decline very slowly due to enzymatic action, and any contaminating bacteria/water molds may do the same thing as fungal enzymes *and* can cause food poisoning. Especially when the punch is stored for many months in a freezer that doesn't work perfectly—thawing and re-freezing a tiny part of the juice every now and then, which frequently happens when the freezing compartment is inside the refrigerator and not a separate box.)

If one uses the *PF TEK* and the following recipe precisely, each 100 milliliter of thusly-produced

psilopunch equals ten grams of fresh (or one gram of dried) *Psilocybe cubensis* mushrooms, or about seven milligrams of alkaloids. This is slightly above the minimum detectable psychoactive dose for most people: normal waking consciousness is not more disturbed than it would be after consuming a moderate amount of wine on an empty stomach. I highly recommend that first-time psilonauts read the *Psychedelic Experience FAQ*, which can be viewed on any computer with a web connection—for instance at an Internet café or public library (see [www.erowid.org/psychoactives/faqs/psychedelic\\_experience\\_faq.shtml](http://www.erowid.org/psychoactives/faqs/psychedelic_experience_faq.shtml)).

Put the jar upside down if needed so that the mushrooms grow away from the opening of the container. Photo shows *Psilocybe cubensis* var. “Hawaiian” in microwave-proof PP plastic 500 ml jars, fruiting on PF Substrate.

## PSILOPULP

The first step in making a good psilopunch is to prepare the pulp. For each psilonaut cut 25 grams of fresh *Psilocybe cubensis* in small pieces and quickly place the mushroom pulp into a “French press” coffee extractor (as drawn on this page by HANS VOGT). Add one powdered vitamin C tablet and 100–150 milliliters of boiling fruit juice.

A more perfectionist approach (especially suited for cold extractions and/or dirty mushrooms) is to first wash the vermiculite and other debris from the mushrooms, then keep them submerged for a few minutes in a solution of at least one gram of vitamin C per liter of water. This treatment removes blue stains and raises the water content of the mushrooms to the maximum of 95%. Then put the mushrooms in the freezer; freezing fractures the cell membranes, making it easier to liberate the alkaloids. When the mushrooms are frozen solid, put them along with the 100–150 milliliters of fruit juice and a vitamin C tablet in a kitchen blender and make a fine pulp. If no blender is available the frozen mushrooms may be put in a paper (not plastic) bag and pounded to pulp with a shoe heel (not a hammer). Whatever method is used to make the pulp, the next step is to get it in the coffee press.

## PSILOPUNCH

Keep the pulp submerged below the juice line and allow it to stand for 12–24 hours at a low temperature (usually in the refrigerator, but a thermos flask can also be used). Pour the juice through a tea sieve, which is placed in a household funnel (to prevent spilling) in a measuring bottle (a baby bottle is perfect for this). Wash the remaining alkaloids out of the mushroom pulp by means of pouring more fruit juice in the coffee press and/or tea sieve and through the funnel in the bottle until the 250 ml mark is reached. Close the bottle and use the psilopunch within 24 hours.

## SHELF LIFE

Psilopunch can not be kept for very long at room temperature because water-soluble mushroom enzymes remain active and decompose the alkaloids over time. A possible method to overcome this problem is to boil the psilopunch for a short time at about 120° centigrade, a temperature at which most enzymes do not survive. In his 1977 book *Magic Mushroom Cultivation*, the late DR. STEVEN POLLOCK wrote about this possibility:

“Jars are next placed on a bottom rack in a pressure cooker and sterilized at 15 lbs pressure for an hour...If this is done, the broth should be canned along with the mushrooms. The canned mushroom soup that results should keep for many months and conceivably even for years. But canning is risky. If sterilization is not complete or the jars inadvertently later become contaminated, enthusiasts can acquire severe food poisoning.”

However, prolonged boiling may also damage the desired alkaloids. On page 27 in the 1999 edition of his book *Narrenschwämme*, the German researcher Dr. JOCHEN GARTZ writes that psilocybin starts to decompose at temperatures above 50° centigrade. As far as psilocin goes, I was unable to find any data

regarding its stability at higher temperatures in an acidic environment. Pages 65–67 of the manual *The Compleat (sic) Psilocybin Cultivator's Bible* (HONGERO PRESS, 1976) praises a 45-minute pressure cooking at 15 psi in quart Mason-jars for the final product, but recommends a dose of 50 grams of fresh *Psilocybe cubensis*—twice as high as in the recipe that I’ve presented here.

Since I have not been able to test the shelf life of pressure canned psilopunch before the deadline of this article, I can not present any information that might be useful for people who want to pursue it (except that if this process is used, then it is not thought to be necessary to use the punch the same day). Using the pressure canning technique for psilopunch *might* improve the digestibility of the punch for those psilonauts who are sensitive to certain mushroom proteins. However, the limited psychoactive tenability of cold processed psilopunch could actually be advantageous, if the liquid gets lost, seized, or stolen.

## DRY CUBENSIS PUNCH

In the described recipe a correct dose can only be determined from fresh harvested mushrooms. However, at the moment that the caps of *Psilocybe cubensis* are a shiny golden color and just not yet shriveling, they have already lost over 10% of their weight. A dosage of 25 grams of these mushrooms is more than 10% more powerful. Shriveling mushrooms may be up to ten times as powerful as fresh ones.

To ensure that the psilocybian experience develops without fearful moments, mushrooms are best used before they begin to shrivel. If this intention fails, then drying is the best option. The drying technique that I recommend is to place the mushrooms in a kitchen sieve and blow them until they are almost totally dry by means of a table fan. In the winter months the sieve can be placed above a “heat” source (a TV or computer monitor is fine), on the condition that the mushrooms are not heated to more than 30° centigrade.

After about 24 hours, when the mushrooms are almost dry but just pliant, they are placed in an open baggie. The baggie is put in a small screw-cap jar with a layer of drying agent on the bottom. The jar is closed airtight and preferably placed in the refrigerator for about a week (if necessary this step can also be performed at room temperature). Then the baggie is closed. Dried mushrooms are best stored in the freezer, but be aware that most baggies are not fully protective against moisture. In moist mushrooms, the enzymes are still at work and decompose the alkaloids over time. So if the dried mushrooms absolutely need to be stored, leave the baggie in the air-tight closed drying jar in the freezer. Do not forget to label the jar: species/variety, date collected, and—if they are mushrooms from the wild—where they were found.

There are many possible drying agents but the best I have come across is Drierite™, which is a mixture of calcium sulphate or gypsum and calcium chloride. Both salts can be made in a similar manner: by means of boiling powdered blackboard chalk in respectively sulfuric and hydrochloric

acid and baking the residue in an oven. In the majority of cases, Drierite™ is easier to be bought than made, although it sometimes needs to be baked dry first for optimum performance.

## PSILOPUNCH FROM CRACKER-DRY CUBENSIS

Fill a Ziploc™ baggie with 2.5 grams of cracker-dry mushrooms and one vitamin C tablet. Press the air out of the baggie, close it, and put it between a few layers of paper. Pound the contents to a fine dust with a shoe heel. The dust is fine enough when the contents of the baggie just fit in a standard coffee dosage spoon of 15 milliliters (this is useful knowledge when the punch needs to be prepared without a more sophisticated apparatus to measure the weight).

Put the dust in a tea-ball. Put the tea-ball in a drinking glass and pour boiling fruit juice on top of it until the contents of the tea egg are completely submerged. Put the glass in the refrigerator and leave it to stand and extract overnight. Place the tea-egg in a funnel and the funnel in a baby bottle (as shown in the illustration). Pour the juice over/

through the powder in the bottle until the 250 ml mark is reached. Now each 100 milliliter equals one gram of dried mushrooms (again, slightly above the minimum detectable dose).

## MAINTAINING QUALITY

In order to make a psilopunch of a constant, reliable quality, it is important to make sure that 100 ml is not more than slightly above the minimum detectable level. If this is pursued correctly then the potency of the mushrooms is no longer important—only the power of the punch counts. Dried *PF TEK*-grown *Psilocybe cubensis* normally contains 0.66–1.0% alkaloids; *P. mexicana* and *P. tampanensis* slightly less, *P. baeocystis*, *P. cyanescens* and *P. semilanceata*, and *Panaeolus [Copelandia] cyanescens* mushrooms slightly more, and *Psilocybe azurescens* can be up to twice as potent. But a correctly prepared psilopunch should always be produced in a consistent manner, where drinking less than half a wine

glass on an empty stomach produces no psychoactive effect at all. The first time that you consume psilocybin, do not drink more than a deciliter (*i.e.*, one wine glass) per hour on an empty stomach. Low doses enable one to survey one's own sensitivity, body discomfort, *etc.*, in a more relaxed mood.

## MEDICINAL QUALITIES

According to POLLOCK, "small doses may not induce colorful visual imagery but provide interesting and worthwhile experiences." Among the most worthwhile of those experiences may be the relief of difficult to treat conditions like obsessive compulsive disorder (OCD—a chronic and debilitating psychiatric condition) and cluster headaches, the most extreme form of migraine. It is beyond the scope of this article to discuss the medical applications of psilocybin (see [www.erowid.org/plants/mushrooms/mushrooms\\_medical1.shtml](http://www.erowid.org/plants/mushrooms/mushrooms_medical1.shtml) and [www.maps.org/news/1099news.html](http://www.maps.org/news/1099news.html) for further information), but I think it is appropriate to draw the conclusion that psilocybin falls within the holistic ideal of a fungal decoction with medicinal, spiritual, and savory qualities alike.

## ALTERNATIVES

One should not overestimate the culinary qualities of psilocybin mushrooms, however. For instance, while the psychoactive effects of *Psilocybe* species may be wonderfully synergistic with those of *Cannabis*, especially in the second hour after ingestion of the punch, this is not the case with their effect on the appetite. Many individuals' stomachs "shrink" tremendously when the mushroom alkaloids kick in, no matter if the stomach is filled or not. A clever psilocybin taker takes the punch when s/he is really hungry. In the beginning this may feel somewhat uneasy. But believe me, one hour into the experience it could feel much *more* uneasy if you have eaten. High-calorie mushroom milkshakes, omelets, pizzas, soups, and other dishes (despite being popularized by some in a similar way as is done for *Cannabis*), are *not* recommended—at least not by me.

A good alternative to psilocybin is to make a mushroom tea. A great recipe is given in PAUL STAMETS' book *Psilocybin Mushrooms of the World* (TEN SPEED PRESS, 1996), the most up-to-date monograph on psilocybin mushrooms currently available. On page 50, he mentions "Cruz's Brew," stating:

# AYAHUASCA HEALING RETREAT

in the Amazon rain forest of Manaus, Brazil

**JULY 22-31, 2002**

There will be lectures, ritual plant ceremonies with *ayahuasca* and *Salvia divinorum*, group sharing, creative artwork expression, biofeedback, regressions, and excursions. Spend ten days in the Amazon rain forest. Located 1.5 hours from Manaus, the lodge has excellent facilities: phone, Internet, air conditioning, swimming pool, and rooms with private bathrooms. \$1,600. Invited staff includes:

- ▼ ZOE SEVEN, techno-shaman
- ▼ ISABELA HARTZ, visionary artist
- ▼ PABLO AMARINGO, shaman/artist
- ▼ JON HANNA, psychedelic researcher
- ▼ FRANK ECHENHOFER, EEG researcher
- ▼ SILVIA POLIVOY, transpersonal psychologist

[www.ayahuasca-healing.net](http://www.ayahuasca-healing.net)

or contact SILVIA at:  
[silviap@house.com.ar](mailto:silviap@house.com.ar)  
 phone/fax in Argentina:  
 (5411) 4774-3892

“You will need two vessels. In one, add spiced, herbal tea—the best we have found uses a blend of orange peels, whole cloves, nutmeg, and cinnamon. Then add enough water to ensure the equivalent of one and a half cups per dose. Bring the water to a boil, then reduce the heat to simmer. Add the mushrooms in chopped or broken form into the bottom of the other empty vessel. Wrap the pot in a towel for insulation, then pour the hot tea through a strainer into the other pot. Stir occasionally. Allow to steep for an hour, and serve one cup per person per dose. After 10–20 minutes, cups of tea are distributed.<sup>3</sup> At 1 gram of dried mushrooms or 10 grams of fresh mushrooms per cup of tea, the dosage can be accurately disseminated. Any residual mushroom debris is also evenly distributed and consumed.”

The biggest advantage of a psilocybian tea compared to psilopunch is the rapid preparation of it. The main disadvantage is that the mushrooms need to be swallowed along with the tea, especially when other species than *Psilocybe cubensis* are used. For instance, *P. semilanceata* does not readily release its alkaloids to the tea. The reason for this is still unknown, but ignoring this knowledge may result in a tea that is of a much lower potency than the mushrooms—thusly producing a very uneven distribution of the alkaloids over a group of participants. The need to keep the mushrooms in the tea also adds to the risk of nausea because not everybody can stand chitine, the polysaccharide that makes up most of the dry mass of the mushrooms.

Yet another alternative is alcoholic “blue juice,” also described in *Psilocybin Mushrooms of the World*:

“...[S]oak crushed [dried] mushrooms in 75+% ethanol. After two to three days, the roughage can be filtered, leaving a dark-blue elixir that can be decanted accordingly. For every fresh 5 grams of mushrooms, 25–50 milliliters of alcohol is recommended. Psilocybin and psilocin dissolve into this solvent, and the alcohol also acts as a preservative.”

This extract has the advantages of being one tenth of the volume of psilopunch and the having the disinfecting and enzyme-immobilizing qualities of alcohol. While it is often recommended to avoid alcohol in combination with psilocybian mushrooms, it is usually not much of a problem to begin the experience with a few milliliters of it. It may help reduce the “stage-fright” emotion that often precedes the trip, and its effect wears off when the alkaloids start to really work.

Alcohol also ensures that the psilopunch is not confused with plain fruit juice. In the described protocol, all mushroom fragments are filtered from the punch, and the extracts have no alarming smells or weird tastes. While some intrepid psilonauts have successfully used this knowledge to smuggle their juices through concert gates, festival fences, and even Customs checkpoints,<sup>4</sup> it may be wise to add some table salt and a few drops of food dye to the juice as fair warning that this is not the kind of drink to start a working day with; protect your roommates against an unexpected punchline! ☹

## NOTES

1) PSYLOCYBE FANATICUS and I arrived at the description “Stropharia” for the mushroom called Slim Matías Romero (SMR) in the article “Mushroom Cultivation: From Falconer to Fanaticus and Beyond,” in *ER*, Vol. X, No. 4, p. 134.

2) Converting psilocybin into psilocin may not always be the best decision. In the forthcoming TROUT’S NOTES *Some Simple Tryptamines—A Brief Overview & Resource Compendium*, the authors mention that, compared to psilocin, psilocybin has half the blood-pressor activity, 82% less serotonin antagonism, and 97% less body temperature-raising activity (citing CERLETTI *et al.* 1968). This may especially be important when mushrooms are consumed along with MDMA. [See also pages 20–21 of this issue of *ER*, for a discussion of serotonin syndrome.] As well, from the point of chemical stability, psilocybin is again preferred (SHULGIN 1998). It may be better to extract the mushrooms in cold juice for 24 hours, but I have comparative no data to confirm that statement.

3) The timelines presented in this quote are confusing. First it says that the tea and mushroom mixture is supposed to steep for an hour, and then it says to wait 10–20 minutes to distribute the tea. Will people be drinking cold tea by this point? Most folks that we know steep the mushrooms about 15 minutes in hot tea and then drink (also consuming the dregs). And generally, tea from store-bought teabags itself only needs to steep for about 5 minutes.

4) This is mainly possible because mushroom alkaloids are not on the “Drugs of Concern” priority list of the DEA (see [www.usdoj.gov/dea/concern/concern.htm](http://www.usdoj.gov/dea/concern/concern.htm)). Among other things this means that they are not searched for during the standard luggage screening tests, which would signal other drugs if they were smuggled in this manner. Most blood, hair, and urine tests do not currently check for the metabolites of mushroom alkaloids either (see [www.erowid.org/plants/mushrooms/mushrooms\\_testing.shtml](http://www.erowid.org/plants/mushrooms/mushrooms_testing.shtml)).

## PARANOID RESPONSE #1

In response to JON HANNA's article titled "Pragmatic Paranoia" about international and U.S. terrorism; although I feel that this is a valuable area to address, it's probably also worth pointing out that in addition to the terrorism enacted by our government to people, businesses, and organizations that are involved with entheogens, there is also the issue of "terrorism" created by users, businesses, and organizations involved with entheogens *themselves*. I can say from first-hand experience that a few of the people and organizations that have graced the pages of the *ER* over the years, myself included, are to some degree also guilty of low-grade types of terrorism. The act of ignoring the genuine needs of others in order to gain prestige within a group is an example of this; a person's needs are ignored, causing feelings of grief, abandonment, and overall unhappiness, so that others can go off and be considered "big shots." This form of terrorism may not always be carried out on a collective scale, or have such dramatic impact as the destruction of the WORLD TRADE CENTER and the PENTAGON had. But in essence, it is nonetheless the same. Wars are nothing more than an individual's feeling of terrorism acted out on a collective scale.

Over the years, I've been terrorized by many people claiming profound religious faith, including members of the peyote churches and other entheogen users. And, sad as it is, I too have sometimes caused others some degree of terror (for which I have suffered, as do all who commit this outrage). The way I see it, it's important to undo our acts of terrorism as soon as we are able to recognize them for what they are. There are many ways to accomplish this, and each person must decide what the right way is for themselves. The Golden Rule simply states, "Do unto others as you [would] have them do unto you." Which says nothing about doing unto others as others have done to us. The essence of most of the great religious teachers is that peace on earth begins within us. So if we can't look honestly at the violence within our own soul, then to criticize the violence of everyone else is worthless. — PHILLIP HAMBLY, founder of WILDFLOWERS OF HEAVEN BOTANICALS

## PARANOID RESPONSE #2

It seems to be difficult for people to see that we have been at war all along; a war horrible beyond discernment. Each and every item sold in stores, manufactured for people's delight, whimsy, and easement, is just so much stuff taken from nature—consider the first law of thermodynamics. If that seems silly to you, consider the *scale* at which this is being done... it counts *now*. Push has come to shove, and one wonderful potential of psychedelics is to sensitize people's perceptions. My opinion is that we will need a lot of people asking very uncomfortable questions; people who are willing to change and who are ready to lose our culture's attachment to the *huge* "security blanket" of ignorance that we are currently wrapped tightly in. Psychedelics can really help people. (I, personally, am learning to laugh while rolling about in shit.) This so-called "war"... these ever-more stupid and hubric laws... they are spitting in the ocean, The real villain is still in the shadows. People *can't* live separate from nature *and* know/have/appreciate/study/love nature. And nature is the template for imagination—it's the damn apple cart. I'm not talking "exclusivity" here. I've had some wonderful trips in horrible jails. It's the venue of the heart that counts. If we can—and we easily can—stop the War on Nature, the situation will rapidly remedy itself. Hubris is the essence of modern brainwashing—and it works, it seems, like a disease; you catch it (or not)! It's a struggle. Does this war represent potential? Could the unthinkable happen—America loses, and loses badly—so the death-dealing economy falls away entirely? Would that be so bad?

Psychedelics can really help. We've got lost time to make up, don't ya think? Now, every nuance counts. Let the poor frightened ones shake in their narrow-minded boots, and let's begin to speak plainly about how to help the greater mind open, and how to make the best use through our best wisdom (thank you, psychedelics) of the opportunities that I hope will begin to arise soon. "The strong man revels in his strength and the weak man wonders how he got it." — L.B., Whaletown, B.C.

## MORE EFFECTS OF TERRORISM

With the recent problems related to terrorism, the U.S. POSTAL SERVICE is proposing and has begun irradiating mail in high-flow mail areas, in an attempt to kill any *Bacillus anthracis* that might be present. My question is, will this radiation that kills the spores which cause anthrax disease also kill our friendly spores from psilocybian mushrooms? Also, do you know if it might also harm our other friendly biologicals? — T.F., IL

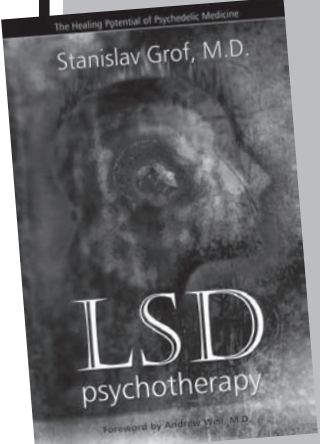

Although radiation sterilization (this is generally done using a strong gamma source) should not affect the activity of anything, if it is capable of killing anthrax spores then it would also be capable of

killing not just fungal spores but also the viability of any seed material and many living plants. Similarly, yeast or edible mushroom cultures shipped through the mail would suffer the same fate. This is something that needs looking into and should be of great concern to any company that markets seeds, live plants, or fungal spawns.

Considering that no more *Bacillus anthracis* is being found, this seems to be radical overkill done mainly for its PR value in assuring the public that their mail is safe. (Sadly, such a move towards "safety" may bring greater actual health risks due radiation itself; some postal workers have quit their jobs because of this new procedure, concerned about the effects of prolonged exposure to radiation in their workplace.) Besides, if some terrorist wanted to deliver *B. anthracis*, the obvious choice of a lead-lined parcel would be simple enough to create, further suggesting that radiation is not really a solution. Perhaps such lead-lined parcels may become required for the shipping of fungal spores. Lead sheet is available at any large plumbing

### BOOKS PUBLISHED BY MAPS

[www.maps.org](http://www.maps.org)

**\$12.95**

**\$14.95**

**\$10.95**

**LSD Psychotherapy** (2nd edition) by Stan Grof, M.D.  
40 color plates (8 new), introduction by Dr. Andrew Weil.

"I know of no work that so well incorporates the findings of Freud, Jung, and Rank... I do not doubt that others working in this field will find Dr. Grof's discoveries a basis for a whole new strategy of research."  
— Joseph Campbell, author of *The Hero With a Thousand Faces*

**Ketamine: Dreams and Realities** by Karl Jansen, M.D., Ph.D.

"...clearly written, well researched and documented... presents a balanced and objective view point... covers all the aspects of ketamine from pharmacology to its use in raves... interesting for clinicians and researchers as well as the general public."  
— Stan Grof, M.D., author of *Psychology of the Future*

**The Secret Chief** by Myron Stolaroff

"In the illegality of his time it was unthinkable to publish the excellent results of his therapy... today nine years after his death, a friend has undertaken the task of publishing the details of the therapeutic methodology of this intrepid Ph.D. psychologist..."  
— Albert Hofmann, Ph.D., author of *LSD: My Problem Child*

**— FREE WITH PURCHASE OF ANY BOOK! —**

**The MAPS Bulletin: "Creativity Issue"**

This issue breaks important ground for MAPS. We've moved into even more controversial territory than usual, since there is not yet a cultural consensus surrounding the approval of the use of psychedelics and marijuana to enhance creativity.

supplier by the foot. Required thickness can be readily calculated if the figure for the total rads they intend to use is available information. If not then the radiation used for standard food sterilization for storage or sterilization of surgical instrumentation could be used as a guideline. It is worth noting that at the J.L. HUDSON, SEEDSMAN web site they state: "According to the USPS, at present (January 12th), only mail to Washington, D.C. is being irradiated, and only letters—not packages. Your seeds should be safe in the mails." Safe as long as you don't live in Washington, D.C., that is... Should we hear any further news in this area, we will report on it in a future issue of *ER*. — K. TROUT

## I KILLED MY SCALE!

After reading the interview with JONATHAN OTT in the VERNAL EQUINOX 1999 issue of *ER*, I went out and purchased a scale like the one that he mentioned could be found for about \$150.00. I couldn't find it that cheap, nor even for the \$279.99 mentioned by the editors of *ER*. The least expensive place I could find it charged me \$295.00 (plus \$13.00 for shipping); yes, I spent \$308.00 on the TANITA 1210-100 CARAT SCALE, which weighs to  $\pm 2$  mg. Now, this scale is not something that I used with great frequency, but there were definitely times that it was necessary to save me from an overdose. Eyeballing certain very potent chemicals is not a good idea, and I felt that the money was well spent. That is, until I did something stupid. Normally I would have no reason to weigh anything that requires such large doses on this scale, but I was trying to see exactly how many grams of GHB powder fit into a level tablespoon. I weighed the dose and then shut off my scale when I was done. The next time I went to use my scale, it gave me an error message. Just "ERR," which was not one of the specific error messages that the scale's instructions give you pointers on how to fix. I called the manufacturer and spoke with a technician, who told me that I probably fried my circuit board, and that they don't even bother fixing these scales. (When they are under warranty, they just replace them with a new one. Of course, my warranty had expired long ago.) I suspect that what happened to my scale was that a small amount of GHB fell down into the crack beneath where the tray sits and onto the circuit board below. What with GHB being *extremely* hydrophilic, this likely condensed water from the air, and fried the board. (Simple corrosion also may have been a factor; a friend using plastic DEERING scales to weigh GHB found many large pits were dissolved in the weighing pan itself.) Why am I relating this story here? Well, merely as a cautionary tale. Don't weigh GHB or any other hydrophilic chemicals on these scales! There may have been some other reason that the scale crapped out on me, but this is the only thing that I could think of as being causative.

The story has a not-as-bad-as-it-could-be ending. TANITA has a policy that if you return one of these busted scales, you can have it replaced for \$145.00. So my replacement scale cost just less than half of what it would have cost me to buy another one brand new. Still, this was a pricey enough lesson that I figured it was worth hiping the readers of *ER* to. — R.K., AZ

## HYPE OR HEALTH RISK?

The cover of the January 31, 2002 issue of *Rolling Stone* magazine contained the headline that screamed “The New (Legal) Killer Drug,” in reference to 2,5-dimethoxy-4-(n)propylthio-phenethylamine, more commonly referred to as 2C-T-7. The article, by MARK BOAL, relates the information that three young adults have died from what are referred to as “T-7” overdoses, stating that “...T-7 is...highly dangerous in ways that are still not understood.” While these deaths are very sad, I am curious if they really were due to “overdoses?” Clearly the doses being consumed were too high; the two *known* doses were around 35 mg insufflated and the unknown swallowed dose was also “thought to have been heavy” (what with 4–6 milligrams or less being the suggested dose via the nose, and a disturbing description of a too-high dose of 15 mg via this route both having been presented in past issues of *ER*). Taking about six to nine times the correct dosage of some drugs definitely could produce problems, but it has been my understanding that the phenethylamines are pretty non-toxic from an “overdose” perspective. For example: mescaline is considered, based on the LD50 results in animal studies, to be about twice as toxic as aspirin, and it is said that the one and only *possible* death from mescaline overdose (claimed to have occurred in a military experiment

but lacking any confirmation or proper publication) resulted from the I.V. injection of 15 grams of the stuff, which would be a 30 to 60 times overdose based on a 250 mg to 500 mg *oral* dose (and it isn’t really correct to compare to an I.V. dose anyway, since the I.V. route would definitely require a much smaller amount than oral consumption). While nowhere *near* the same amount of people take 2C-T-7 as take aspirin, it may still be worth considering—from the point of view of “legal killer drugs” and public health risk issues—that about 2000 people per year kick-off related to aspirin overdoses. Also, it is quite reasonable to think that accidentally taking too much of a relatively potent compound (a small volume of material) such as 2C-T-7 would be a lot more likely than taking too much of a comparatively weak compound like mescaline (a large volume of material).

Still, when one reads the whole article in *Rolling Stone*, one finds that two of the young adults who died from “2C-T-7 overdoses” were also known to have been concurrently consuming other drugs. The article states that JOSH ROBBINS’ death was due to the combination of drugs “[putting] more pressure on his heart than it could bear.” Over the course of the evening, he had consumed an unknown amount of what may have been MDMA (a single “Ecstasy” pill), then inhaled nitrous oxide, then consumed 25 mg of ephedrine and 5 mg of guaifenesin, then insufflated about 35 mg of 2C-T-7. The person who died after oral consumption of what was an unknown and possibly heavy dose of 2C-T-7 had concurrently swallowed 200 milligrams of “Ecstasy” (again, due to the uncertain street market, it is impossible to say for sure that this was MDMA). There is no statement that the third person who died had consumed anything except the 35 mg intranasal dose of 2C-T-7, but this doesn’t necessarily mean that he *wasn’t* on some other drugs, nutritional supplements, or herbal products at the time, which may have interacted negatively with the 2C-T-7. Any thoughts on what really might be going on here? Should we be more leery of 2C-T-7 than we are of 2C-B (for example)? — J.H., CA

There is nothing in any description of the deaths that does not fit the symptomatology possible from serotonin syndrome. MDMA is thought to be associated with the production of serotonin syndrome in a few cases of adverse reactions. Symptoms can include agitation, coma, hypomania, convulsions, confusion, difficulty walking, increased sweating, diarrhea, heightened deep tendon reflexes and myoclonus (muscle jerks), poor control of heart rate and blood pressure, shivering and increased muscle tone and rigidity, which can lead to hyperthermia and death (see [www.uspharmacist.com](http://www.uspharmacist.com); STERNBACH 1991 and AMES & WIRSHING 1993, in HOLLAND 2001). Sedation and active cooling is the treatment for serotonin syndrome as with hyperthermia from over-activity (HOLLAND 2001).

ENTHEOS, POB 40023, SAN DIEGO, CA 92164  
— \$25.00 in the USA for a one-year subscription —

Until the advent of SSRI antidepressants, serotonin syndrome was not a very common problem and mainly affected people who had combined things such as some MAOI drugs and demerol. These days, as there is increasing use of 5-hydroxytryptophan (5-HTP) to alleviate the depression that can follow MDMA and other drugs, there is likely to be a much broader occurrence of serotonin syndrome than is presently recognized. I've heard of people *pre-dosing* with 5-HTP.

The problem arises from such things as serotonin precursors (5-HTP) or releasers (such as cocaine and MDMA) being followed with or combined with something else that acts as a serotonin agonist at the 5HT2a site. (Usually, the substances we normally discuss have mixed agonist/antagonist action at the 5HT2a site.)

Unfortunately, lack of recognition of the cause of the deaths related to 2C-T-7 ingestion may preclude effective emergency room treatment in the future. In one case recently of a bad reaction to 2C-T-7 following excessive cocaine use and followed by repeated MDMA ingestion (in this case the person *lived*), the EMS crew first shot him up with a narcotic antagonist and took other inappropriate steps prior to giving him Valium, which is likely what saved his life (Xanax would work too).

Calling these deaths from 2C-T-7 "overdoses" deaths is probably not correct, as they were likely due to drug interactions. Sure the doses were well over what is sane, but the term "overdose" is generally reserved for something life-threatening in-and-of itself. Calling it an overdose implies the 2C-T-7 was the primary culprit and generally leaves the impression with the listener that the issue was studied and understood. (I'll bet many people believe that JANIS JOPLIN died of a heroin overdose, due to that statement being made in print. While the coroner found evidence that heroin had been used some days earlier, she was actually determined to have died from a cerebral hemorrhage after getting excessively drunk and smacking her head on a bedpost while falling down.) My point is this issue should be one where the *study* of the 2C-T-7 deaths is conducted, rather than making blanket assumptions and likely inappropriate statements about 2C-T-7 overdose. Of course this "overdose" claim is so widespread at this point there is likely little that can be done to check its spread. Already similar sensationalistic articles, such as the piece "Highway to Die" (EDELSTEIN 2002) have begun to appear.

Study of the issue is what is really needed. Some people have concluded 2C-T-7 is terribly dangerous in and of itself. And while this conclusion may turn out to be true, it nevertheless could prevent the issue from being adequately studied by those people in a position to study it. No one is going to spend money studying something that is assumed to be cut-and-dried, even if the conclusion is later noted to have been erroneous (for example, the cause of *Phalaris* staggers). The losers will be those people who receive inappropriate emergency room treatment in the future. *Most* people can survive serotonin syndrome if it is treated promptly and correctly. *If* I am right in my assessment, this is an important issue for health care professionals to understand, as it is likely to show up with other "research chemicals" as well. (I shudder to think what will happen if and when the benzofuran derivatives hit the streets and reach the hands of people who recklessly combine multiple drugs...) K. TROUT

## TRICHOCEREUS DOSING

Over the years, I have become annoyed with all of the references to *Trichocereus* dosages by length of the fresh plant material. At some point a few years ago I began tracking basic stats on my San Pedro preparations. While I don't have enough data points for valid standard deviations or other statistics, I think these numbers offer some idea of what is "typical," and of the range of values encountered. I have tossed in a few numbers on non-pachanoids where available, but they are probably not representative samples.

One of the things I'd like to point out to those who measure by length is that it would not be surprising if *Trichocereus peruvianus* were to be four times as potent as *T. pachanoi* when measured on a footage basis, since a comparable length weighs about four times as much. This is not to suggest that there may not be *T. peruvianus* that are four times as potent by weight as well, although I haven't come across them. Those who measure their dosages only by length should be aware that such a hypothetical specimen would be about sixteen times as potent as *T. pachanoi* by length, which might offer a surprise to the unwary.

	TRICHOCEREUS PACHANOI			
	MEAN	MEDIAN	MIN.	MAX.
weight/length, wet				
pound/foot	2.0	1.8	1.4	3.2
grams/inch	77	68	54	123
% water (see #5)	94.3%	94.5%	90.9%	95.9%
% residue (see #6)	19.0%	15.4%	4.3%	40.8%
gross dry oz/foot	1.9	1.4	1.2	4.7
net dry oz/foot	1.5	1.2	1.1	3.5
net dry oz/wet lb	0.8	0.7	0.6	1.1
gross dry g/foot	53.5	38.8	34.2	134.1
net dry g/foot	43.6	34.6	30.1	100.4
net dry g/wet lb	21.4	19.5	17.7	30.9

MEAN VALUES FOR OTHERS*			
#1 BELOW	#2 BELOW	#3 BELOW	#4 BELOW
7.8	1.3	2.5	2.5
294	48	93	96
n/a	94.5%	94.5%	93.2%
n/a	21.1%	13.0%	22.2%
n/a	1.1	2.1	2.8
n/a	0.9	1.9	2.3
n/a	0.7	0.8	0.9
n/a	32.0	61.0	78.7
n/a	26.4	54.0	64.4
n/a	20.6	21.9	25.3

Rough rules of thumb for *T. pachanoi*: 1 foot = 2 pounds (wet) = 1.5 dry ounces (net); 1 pound (wet) =  $\frac{3}{4}$  dry ounce (net).

\* Data on non-pachanoids provided for comparison, but are based on only a handful of data points. The *T. pachanoi* data includes 15 samples from what seem to be 4 clones—not enough for full statistics, but enough to be indicative. The main differences between samples seemed to be more a function of age of specimen than clone source.

- 1) *T. peruvianus*: two TROPIC WORLD specimens, large, gray-blue, long-spined. Not dried.
- 2) *T. bridgesii*: based on two samples; long, slender specimens. Other *Trichocereus bridgesii* are often much stouter.
- 3) *Trichocereus* sp. SS03: two specimens from SACRED SUCCULENTS.
- 4) *Monstrose*: "melting candle" specimen from CALIFORNIA CACTUS CENTER. Sold by them as *T. peruvianus*, and it may well be a form of *T. peruvianus*, as the diameter of some specimens (not this one) exceed diameter of any *T. pachanoi* I have seen. It is said to have been started from seed in 1995, so is apparently not the same plant as the "melting-candle" *T. pachanoi* offered by many growers—it is stouter, branches more frequently, and the few spines it possesses are very long. This new clone is now becoming more common among cactus retailers in Southern California. No bioassay quite yet. (Soon.)
- 5) Based on ratio of gross weight after drying to crispness compared to fresh weight.
- 6) Percentage of gross dry yield that is "unsiftable" after double pulverization.

A few words about cultivation and preparation are relevant to interpreting the chart. First, although most of these clones were obtained from commercial sources at one point or another, all of them have been under my cultivation for a number of years, and have been exposed to essentially similar growing conditions; some of them are fourth- or fifth-generation clones within my own growing space. Second, after a number of years of experimenting with various means of consuming *Trichocereus* cacti, including eating peeled and cored cactus, making San Pedro lime tea, and a few more rarified means of extraction, I have settled on drying and powderizing as what works best for me. I section the cactus into stars  $\frac{1}{8}$  to  $\frac{1}{4}$  inch thick and either dry on wire mesh sheets in front of a fan, or put into a standard food dryer. When the stars are so dry that they snap like crackers, I pulverize them on "high" in a Vita-Mix—essentially an industrial-strength blender—highly recommended for the plant alchemist! I then sift the powder through a fine tea strainer using a pestle to force it through, setting aside the unsiftable material when it accumulates thickly. I then re-pulverize the unsiftable material and repeat the sifting. Anyone using regular blenders might want to use more than just two passes.

The material that does not make it through the strainer after a second pass is what is reported as "residue" on the accompanying table; I add this to the soil around my plants. As it seems to be composed mostly of fragments of spines, waxy outer coat, and corky inner stem, its mescaline content is probably minimal. The amount of dried material that I return to my plants averages 15–20% of the gross dry weight, but on a few really old stems it has run as high as 40%, because of the large volume of corky core and the frequent hardened or injured spots on the outer skin.

I have found the material to be very stable on long storage, but it should be protected from light, heat, and moisture. Just to be sure that nothing in the way of mold or bacteria decides that this would be a good home, I always store it in an airtight tupperware container and include a couple of teaspoons of silica gel desiccant to keep it dry. (I wrap the silica gel in two coffee filters and tape it shut—you don't want to spill it in your cactus powder!) Freezing it might be good for long-term storage, but make sure that you keep it dry.

I seem to have been lucky with the *Trichocereus pachanoi* in my collection. A dry ounce of material is a good solid dose, and 1.5 ounces has become my standard for a substantial entheogenic experience. If your plants are less generous, then your volume will go up accordingly. I get it down by mixing

it quickly with the minimum amount of water (to about milkshake consistency) and gulping it. This usually requires two or three gulps to get it all down. It is by no means pleasant, but it has proven reliable, and at least for my friends and me, has proven to be less nauseogenic than lime tea or direct consumption.

Three things should be noted about this approach, however. First, you need to get it down very soon after adding the water or it will start to rehydrate and swell (and also start to get slimy). Second, it may take a little longer to get to the peak of intensity by this route, though we have not found the peak to be at all diminished compared with other means of ingestion. Third, be prepared to move your bowels at some time during the journey (and maybe more than once), as you are consuming a lot of fiber here, seemingly comparable to a very large bowl of oatmeal or a good dose of bran cereal. Hey, it beats purging by the other possible route. — S. BEAR, CA

The table and comments are welcomed data which underscore the long-standing observations that weight is preferable to length when describing or measuring doses. It should also be remembered that both the state of health and the history of watering in prior months can significantly affect the weight of a given section within a single plant. The phrase "good solid dose" would be more meaningful if qualified in terms of mescaline equivalency. Some people consider 300 mg to be a "good solid dose," whereas others consider such a dose to be 500 mg or more.

I know of two bioassays of the CCC "melting candle" cactus you mention in your chart. Both reported it active but weak, with a dose of over a kilogram (fresh weight). I find it hard to believe that this material was started from seed in 1995, as this was the now defunct ethnobotanical company SHAMANISMO's wholesale supplier for "stout *Trichocereus peruvianus*" cuttings in 1998 and onward. A pho-

tograph of these cacti obtained during this period available at the CCC web site showed a *huge* specimen. Queries placed to CCC about this material in 1998 received the reply that this was the only *T. peruvianus* they had ever made available. Personally, I am convinced that this is *not* a *T. peruvianus*, but rather some sort of semi-monstrose hybrid. — K. TROUT

## PRIME POPPY PROCESSING?

The article “U of C Poppy Crop Seeds Opium Study,” by ROBIN SUMMERFIELD, which appeared in the 17 January 2002 issue of the *Calgary Herald* (MAP posted at [www.mapinc.org/drugnews/v02/n076/a05.html](http://www.mapinc.org/drugnews/v02/n076/a05.html)) discusses the research of PETER FACCHINI, Ph.D. (plant cell biologist, biochemist, geneticist, molecular biologist, phytochemist, and the first person to clone the gene involved with morphine biosynthesis), who is the keeper of a small garden of opium poppies in an

unmarked basement room at the UNIVERSITY OF CALGARY. FACCHINI is working on isolating the opium poppy’s enzyme-encoded genes, in order to understand the 18 or so metabolic stages from their beginning, to codeine, to morphine—and then alter that process. The idea is that, by blocking the synthesis of the molecule at certain stages, a plant could be produced that produces codeine directly. As codeine-containing plant, rather than a morphine-containing one, it would be much harder to synthesize heroin from the plant.

This brings to mind a critical question, which I hope the masterminds at *ER* (or perhaps the readership) can answer. In the thousands of years since mankind has grown poppies, have we advanced one whit from the tedious process of scoring the plump heads to extract their sweetness? I, for one, am interested in learning the latest method for a backyard gardener (so to speak) to get the goodies out of her poppies. I read once, somewhere, that simply plucking the pods and

## NEW INCENSES

*Nymphaea caerulea* (blue lotus): This little-known flower has been considered sacred for several thousand years, where it was used medicinally and ritually by the Egyptian priesthood. Its pleasing aroma is said to induce deep relaxation and a euphoric state of mind.

*Nelumbo nucifera* (sacred lotus): Another obscure sacred flower from the East, it is quickly becoming very popular with those who have been lucky enough to try it. This plant mixes well with other common burning herbs, but is also very much enjoyed by itself.

*Sceletium tortuosum* (*kanna*): A very rare succulent from the deserts of South Africa. The Bwiti culture uses this plant as an important part of their ritual life, and consider it to be an indispensable ally. We offer this plant in the manner dictated by tradition, fermented and finely powdered.

*Mimosa hostilis* (*jurema*): This thorny tree is used medicinally and spiritually by several Central and South American cultures. Wild-crafted in México for us by a well-known ethnobotanist, we offer fresh, dried whole chunks of both root-bark and stem-bark.

*Voacanga africana* root-bark: After years of searching we have finally procured a small supply of this exotic botanical. Used in the adolescent initiation ceremonies by East African shamans, this powerful teacher was treated as a divine spirit. Very limited supplies.

All incenses are sold strictly to adults as non-consumables and should not be ingested in any manner.

placing them in vodka, would extract the opium just fine. Is this true? Fundamentally, I ask: what is the most efficient manner of extracting opium from poppies, the limit being it must be doable without fancy machinery, or costly, or dangerous, or requiring sophisticated laboratory maneuvers? Do tell. — ORG B.

We asked Dr. FACCHINI about the manner in which poppies were commercially harvested for the pharmaceutical market, figuring that when money is involved, folks tend to try to be efficient. He replied:

"Generally, the traditional method of harvesting poppy (*i.e.*, lancing the seed capsules and collecting the exuding latex) is still used in several legal opium-producing countries such as India and Turkey. In more developed nations authorized to grow the plant, such as France and Australia, modern agricultural practices are applied throughout the entire cultivation and harvesting process. Basically, the seed capsule is collected mechanically, dried, and typically converted to raw pellets for export. In some cases, further processing is done at the point of origin depending on the requirements of the foreign market."

The traditional method is a more labor-intensive process than many home gardeners wish to undertake. Add to that the fact that lanced poppies in one's garden look a *lot* less "ornamental" to law enforce-

ment than non-lanced poppies, and it may indeed behoove one to use an alternate processing method. The easiest one is to simply grind up the dried pods, soak them in warm acidified water, and then strain and dry the tea into goo. This is what JIM HOGSHIRE recommends (*sans acid*), in his book *Opium for the Masses*. The traditional and tedious method of lancing the pods is used because one can extract *more* from the plant; while it is alive, it will continue to produce opium.

If you have a lot of pods, there probably is no good reason to waste the time with milking. A more purified extract of morphine is available via a simple kitchen chemistry procedure, mentioned in the book *Opium Poppy Garden: The Way of a Chinese Grower* (RONIN PUBLISHING, 1993) by WILLIAM GRIFFITH:

"To prepare morphine, raw opium is refluxed in 95% ethanol for six hours. This resultant water alcohol mother liquor is adjusted to a pH of 8.5 with ammonium hydroxide (15% solution). Most of the other alkaloids are insoluble and remain behind. The morphine is then in the solvent and can be evaporated down to the alkaloid extract."

But it is a simple enough matter to make a lemon- or lime-juice tea from the fresh pod or dried pods and consume this directly. This has the advantage of requiring that a person possess only intact pods, rather than isolated morphine or illicit residues. Care should be taken if grapefruit juice is used as the extraction vehicle, or consumed in conjunction with this tea, as it may cause some degree of an increase in effects per dose and a prolonged action, due to preventing

the metabolism of opiates.

For an excellent resource regarding proper fertilization, watering levels, and other environmental concerns to maximize opium content, we recommend that the interested reader pick up a copy of *Opium Poppy: Botany, Chemistry, and Pharmacology* by L.D. KAPOOR, Ph.D. (HAWORTH PRESS, 1995). A lot of study has been done on this plant with regard to what chemicals it contains, and *when* during harvest it may contain the most of each (and in what plant parts).

What I found to be an interesting data point is that the roots of seedlings have an extremely high morphine content, and the highest overall alkaloid content was found in 84-day-old seedlings (KAPOOR 1995). As the plant grows, morphine translocates from the roots to the leaves and then to the capsules (which, when they appear and as they grow, become more potent than the leaves and

roots). This means that one could harvest the plant while it was still very young and extract the roots rather than the pods. I have no idea why this isn't usually done, since it seems like a no-brainer. One would save time, since one doesn't have to wait for the plant to grow big, and one could sprout many more plants in a small space. And there is the added benefit of the plants in their young (pre-podding) form being less recognizable with regard to the specific species that they are. Of course, from the point of alkaloids versus biomass, the roots of seedlings ain't gonna be huge. But one certainly could grow a lot of them in a short period of time as a ground cover. Hell, hydroponics for seedling growing might not be a bad idea, for ease of cleaning off the roots.

From the point of view of a "whole-plant" basis, the greatest relative concentration of morphine was found in plants harvested 98 days after germination, whereas the greatest *amount* of morphine

## OM-CHI HERBS

*Nymphaea caerulea* (sacred blue lily of the Nile) flowers—\$300.00 kg

*Nymphaea alba* (white water lily) flowers—\$150.00 kg

*Nelumbo nucifera* (sacred lotus) flowers—\$90.00 kg

*Nymphaea lotus* (blue lotus) flowers—\$150.00 kg

*Sceletium tortuosum* powder—\$85.00 oz

Smaller quantities also available.

Also 5x concentrates of the above and many more.

\$2.00 print catalog from:

OM-CHI HERBS

POB 5352 (Dept. ER), Eugene, OR 97405

See our on-line catalog at:

[www.omchiherbs.com](http://www.omchiherbs.com)

was found in plants collected after 98–114 days (MIKA 1955, in KAPOOR 1995). Various workers reported an increased overall alkaloid content when a nitrogen (or nitrogen/phosphorus) fertilizer was used (SHEBERSTOV *et al.* 1972; NOWACKI *et al.* 1976; COSTES *et al.* 1976; KUZMINSKA 1973A, all in KAPOOR 1995), but the morphine content remained constant regardless (KINOSHITA *et al.* 1959, in KAPOOR 1995). Potassium slightly depressed morphine content, and the macronutrients magnesium and/or calcium increased both yield and morphine content (KUMINSKA 1973B, in KAPOOR 1995), and the application of salts like sodium chloride and sodium sulphate also increased morphine content (SPASENOVSKI 1980, in KAPOOR 1995). The best soil pH is considered to be pH7 (KAPOOR 1995).

Interestingly, while Dr. FACCHINI has been looking for a genetic solution, retired chemist and author OTTO SNOW, in his new book *Oxy* [2001, THOTH PRESS, POB 6081, Spring Hill, FL 34611, ISBN 0-9663128-2-1, \$31.95, 246 pages (containing both photos and illustrations)] may have come up with an easier solution, and one that is a great idea for the basement shaman who doesn't want to grow the specifically scheduled poppy, *Papaver somniferum*. Rather than growing opium for the sake of producing morphine, SNOW suggests that it may be found useful to grow *P. bracteatum* for its thebaine content and then convert this into oxycodone (or one of the higher-potency molecules like oripavines). At least one of the approaches included by SNOW for the conversion of thebaine into oxycodone requires only reagents such as sodium hydrosulfite, hydrogen peroxide, glacial acetic acid, ethanol, and ammonia. SNOW also stresses the known fluctuations in both the alkaloid content and actual alkaloid profile and the importance of the timing of harvest, should thebaine be the desired product.

Another interesting discussion presented by SNOW concerns the isolation of oripavine and thebaine from *Papaver somniferum*, should available quantities of plant material be great enough and actual isolation of active components be desired.

This book is highly recommended as resource material for anyone with an interest in this area. Featured material includes a nicely detailed and referenced section on the known pharmacology and physical properties for the major opium alkaloids, their isolation and purification, and—just as importantly—the various chemical means to accurately identify them once isolated. Preparation and purification of etorphine and related high-potency oripavines are also discussed in detail. SNOW covers not simply opium production and chemistry, but also the various species of poppies (including those both useful and useless), the known poppy chemistry (and the wealth of published analytical errors), and isolation or synthetic approaches for the main active molecules. In the process, SNOW has assembled a fascinating reference compendium of numerous government publications on the subjects of both opium and opiates via authorized and black-market sources.

The reader is cautioned to tread carefully within the text of those reproduced articles due to the presence of the errors that often characterize official publications but, despite this, SNOW's work will be found to be a treasure trove of information for those either with an interest in opiates or effective pain analgesia for chronic pain. *Oxy* is one of the best treatments of the topic we yet have encountered published in the English language. — Eps.

## SACRED SUCCULENTS

# EVENTS CALENDAR

## TOWARDS A SCIENCE OF CONSCIOUSNESS APRIL 8–12, 2002

The UNIVERSITY OF ARIZONA'S CENTER FOR CONSCIOUSNESS STUDIES presents their fifth biennial "Toward a Science of Consciousness," in Tucson, Arizona. Just a few areas of discussion include: the nature of reality, free will, neural correlates of consciousness, neuropsychology, anesthetic and psychoactive drugs, artificial intelligence, animal consciousness, quantum theory, religion and contemplative studies, anthropology, transpersonal psychology, hypnosis, and parapsychology. Speakers include: PAUL BACH-Y-RITA, PAT FLETCHER, PETER MEIJER, MRIGANKA SUR, ALVA NOË, CLAUS EMMECHE, DEAN RADIN, WILLIAM ROBINSON, ELKHONON GOLDBERG, RANULFO ROMO, MICHAEL SHADLEN, RODNEY BROOKS, RAY KURZWEIL, RALPH ADOLPHS, ALFRED KASZNIAK, SHENG HE, RANDOLPH BLAKE, ANDREW NEWBERG, RADIOLOGY, FRED TRAVIS, ANTOINE LUTZ, CARLOS SCHENCK, NICHOLAS SCHIFF, NANCY WOOLF, ANDREW DUGGINS, V.S. RAMACHANDRAN, SEMIR ZEKI, VITTORIO GALLESE, JEFFREY SCHALL, BARRY DAINTON, JONATHAN SHEAR, MICHAEL TYE, SUSAN BLACKMORE, and many others. Admission is \$325.00 per person (or \$165.00 for full time students). For more information contact JIM LAUKES, POB 210158 (Dept. ER), Tucson, AZ 85721, (520), 626-9062, [jlaukes@u.arizona.edu](mailto:jlaukes@u.arizona.edu), [www.consciousness.arizona.edu](http://www.consciousness.arizona.edu).

## THE DARK SIDE OF CONSCIOUSNESS APRIL 10–14, 2002

Sponsored by the SOCIETY FOR THE ANTHROPOLOGY OF CONSCIOUSNESS, "The Dark Side of Consciousness" will be held in Tucson, Arizona at the CLARION SANTA RITA HOTEL—call (520) 622-4000 for reservations and ask for the SAC conference discount rate. Topics include fear, pain, anger, terror, shamanism, techno culture, existentialist psychology, Iu-Mien healing practices, Judaism, Buddhism, the sub-erotic foundations of communal harmony in Tibetan monasteries, micro-nationalism, the politics of consciousness, shamanic drumming, the many faces of *Datura*, origins of religion,

child abuse, human evolution, a journey to the world's sacred sites (slide show), psychic phenomena, the multidimensional mind, collective consciousness, and more. Presenters include: GALINA LINDQUIST, LOURDES GIORDANI, RALPH ALLISON, MITRA C. EMAD, CLAUDIA WEINER, PAT RYAN, BRYAN RILL, ANDREI VINOGRADOV, MARK A. SCHROLL, JEFFERY L. MACDONALD, GILAH YELIN HIRSCH, E. RICHARD SORENSON, MIRA ZUSSMAN, AMY SMITH, ANNE MENNE, JOHN BAKER, JOHN MCCLOY, LESLIE M. MCQUADE, ROBERT GREGORY HAHN, JAMES MCCLENON, MICHAEL WINKELMAN, GERI-ANN GALANTI, MARTIN GRAY, STANLEY KRIPPNER, PAUL DEVEREUX, ADAM FISH, ETZEL CARDEÑA, MARK VAN OMMEREN, TIM LAVALLI, MARGARET WILLSON, ED MIKENAS, JEAN MILLAY, GEORGE WILLIAMS, DANIEL DESLAURIERS, and EUGENE HALTON. Admission is \$120.00 (general), \$100.00 (member), \$75.00 (student), and single-day passes are also available. Experiential workshops cost extra. Send registration payment to: KATHY ANO, AAA, 4350 N. Fairfax Drive, # 640 (Dept. ER), Arlington, VA 22203; or for more information contact [johnbaker@vcccd.net](mailto:johnbaker@vcccd.net).

## SCIENCE AND CONSCIOUSNESS APRIL 26 – MAY 1, 2002

Held in Albuquerque, New Mexico, the "Fourth International Conference on Science and Consciousness" touches on areas such as peak experiences, transcendent states, quantum theory, unity-consciousness, contemplation, intuition, dreams, creativity, meditation, synchronicity, altered states, intentionality, and chaos theory. Speakers include FRITJOF CAPRA, ELISABET SAHTOURIS, PETER RUSSELL, RUDOLPH BALLENTINE, ALONDRA OUBRÉ, BILL GUILLORY, PIERRE GRIMES, RUPERT SHELDRAKE, MATTHEW FOX, JOYCE HAWKES, LAWRENCE FAGG, GARY SCHWARTZ, WILLIAM TILLER, LINDA JEAN SHEPHERD, KONSTANTIN KOROTKOV, CAROL RITBERGER, JOHN DEMARTINI, TINA DE SOUZA, PAUL VON WARD, SAVELY SAVVA, MATTHEW CROSS, KELLY HOWELL, BERNARD AMADEI, CHRIS THOMSON, JOHN MILEWSKI, KAY GARDNER, KEN COX, JEANNETTE VOS, DON BECK, ONYE ONYEMAECHI, ELIZABETH TARG, BRUCE LIPTON, STEVEN VEDRO, NORMAN DON, TANIS HELLIWELL, CARLOS

WARTER, STEVE BHAERMAN, JEAN MILLAY, and LEONARD SHLAIN. Admission is \$745.00. For more information contact THE MESSAGE COMPANY, 4 Camino Azul (Dept. ER), Santa Fe, NM 87508, (505) 474-0998 or (505) 474-7604, [message@bizspirit.com](mailto:message@bizspirit.com), [www.bizspirit.com](http://www.bizspirit.com).

## POETS, MYSTICS, MAGICIANS JUNE 7–9, 2002

A PROPHETS CONFERENCE at the JAMES A. LITTLE THEATER in Santa Fe, New Mexico, this event “brings together a most inspiring faculty to facilitate our awareness, creativity, understanding, and transformative evolution. Encompassing art, science, and spirituality, these motivated and accomplished teachers bring us visions of universal unity. They point at the necessity for a new order of values; values immersed in a mystical union with the All. They call us into wider dimensions where love and compassion help make the world safe. They motivate us into activities of learning, giving, knowing, conceiving, usefulness, and gratitude.” Speakers include: BARBARA MARX HUBBARD, GREGG BRADEN, STANISLAV GROF, NORMAN SHEALY, BROOKE MEDICINE EAGLE, TOM ROBBINS, KRISHNA DAS, FRED ALAN WOLF, HOWARD MARTIN, LAURIE MONROE, RALPH METZNER, HANK WESSELMAN, ILONA SELKE, ROBERT VENOSA, MARTINA HOFFMANN, and KEVIN RYERSON. Cost is \$245.00 before April 7, \$295.00 from April 7–May 7, and \$345.00 after May 7. Mail payment to: MYSTERY SCHOOL, POB 567 (Dept. ER), Kula, HI 96790 USA. For more information: (888) 777-5981, [www.greatmystery.org](http://www.greatmystery.org).

## AYAHUASCA HEALING RETREAT JULY 22–31, 2002

Held in the Amazon rain forest of Brazil, this ten-day program includes theoretical lectures by top people in the field of entheogens, hands-on training with visionary and healing plant teachers (four ayahuasca sessions and two *Salvia divinorum* sessions), as well as practical work with brainwave technology to induce the appropriate mind-state, and the use of biofeedback devices that aid in determining if one is in an optimal state for healing. There will be lectures on entheobotany, transpersonal psychology, lucid dreaming, out-of-body experiences, meditative techniques, visionary art, and psycho-spiritual discovery, as well as group sharing,

creative artwork expression, regressions, psychotherapeutic sessions, and excursions. Located 1.5 hours from Manaus, the lodge has excellent facilities: phone, Internet, air conditioning, swimming pool, and rooms with private bathrooms. Presenters include: ZOE SEVEN, ISABELA HARTZ, PABLO AMARINGO, JON HANNA, FRANK ECHENHOFER, and SILVIA POLIVOY. Cost is \$1,600.00, which includes lodging (double occupancy), local transportation, and all meals. For more information see [www.ayahuasca-healing.net](http://www.ayahuasca-healing.net).

## PLANTS IN HUMAN AFFAIRS JULY 27—AUGUST 17, 2002

This program consists of two 3-credit courses and is offered as an academic collaboration between the KOHALA CENTER in Kameula, Hawai'i, and the CENTER FOR SPIRITUALITY AND HEALING at the UNIVERSITY OF MINNESOTA. For information about course registration, the instructors, and for a detailed topic outline, see [www.csh.umn.edu](http://www.csh.umn.edu) and click on the link that reads “Study in Hawaii” under the “What’s New” section. “Plants and Civilization,” is an introduction to the science of ethnobotany and the role of plants in the rise of civilizations, which will be taught by KATHLEEN HARRISON. “People, Plants, and Drugs: An Introduction to Ethnopharmacology,” will be taught by DENNIS MCKENNA. Lectures will be supplemented with frequent field trips, and guest presentations by distinguished authorities on Hawaiian and Polynesian ethnobotany will take maximum advantage of the unique learning opportunities offered on the Big Island. Enrollment is limited to 20 students, and you do not have to be a student at the UNIVERSITY OF MINNESOTA to register. Students at other schools can receive credit that can be transferred to their home institution. Non-degree students are also eligible, and can register through continuing education. The cost of \$2000.00 includes meals, transportation, and lodging (tuition and airfare not included). The registration deadline is May 31, 2002. For more information or to register, visit [www.csh.umn.edu](http://www.csh.umn.edu) or contact NANCY FEINTHEL at (612) 624-5166 or [feinthel@tc.umn.edu](mailto:feinthel@tc.umn.edu).

## WHIP IT GOOD

*LECHTERS kitchen supply will only sell me two boxes at a time, and they want to take down information from my driver's license. I feel like a pariah, while the girl behind the counter grins and sarcastically entertains me to "Have fun with your whipped cream." GOLDIES, a local porn store, is more relaxed, but the prices are too high and the people hanging out in the store give me the creeps. In San Francisco, there are a bounty of headshops offering various prices, but the best spot was a hole-in-the-wall liquor store on upper Haight, where—astonished by my volume purchase—the middle-eastern owner gave me a hefty price-break and free balloons as an encouragement to "come again." And then there is the gear: a black leather glove protects from the cold, tattered green army bag clink-clink-clinks as I walk, brass cracker clenched tight in a fist to ward off any potential gas thieves...*

I was thinking the other day how odd it was that while many (if not most) store-front headshops carry nitrous oxide "whipped cream" chargers, very few of the specialty mail order companies or web sites sell these. But when I started looking into this, I may have found the reason. The ability of the web to reach into any home and become an "instant access" point for ordering all manner of "questionable" products may be a good way to make more money. However, it can also be a good way for entrepreneurial headshop owners to get thrown in the pokey. Witness, for example, the case of LAWRENCE TEIMAN of Tempe, Arizona—owner of SHIRTS 'N' THINGS—who sold paraphernalia both in person and virtually on his web site BONGMART.COM. TEIMAN was sentenced to 15 months in prison and fined \$40,000 for selling N<sub>2</sub>O, after ANDREW MCCOY, a 20-year-old student at VIRGINIA POLYTECHNIC INSTITUTE, was found dead in 1999 from asphyxiation due to inhaling the N<sub>2</sub>O he had purchased from TEIMAN (MEADOWS 2001).

A bit of a sobering situation, both from the perspective of the user and the seller. Nevertheless, there are numerous users who "play it safe" (having friends handy to make sure that they don't croak). So where *can* responsible users buy nitrous on the web without much hassle?

I hopped on the Internet to see what I could find. Before searching "whipped cream chargers" at GOOGLE, I checked out the EROWID nitrous vaults, where I learned that the ISI brand ([www.isinorthamerica.com](http://www.isinorthamerica.com)) is generally considered the best quality, while the EZ-WHIP brand is not recommended due to its having been reported to contain oily residues. LELAND brand ([www.lelandltd.com](http://www.lelandltd.com)) has been reported by one person to be residue-free, and the other well-known brands, WHIP IT and KISAG, are not mentioned at all at the site. I have heard rumblings from people who are concerned about aluminum dust coming off of these chargers and being inhaled (thusly, I suppose, contributing to ALZHEIMER's disease, or lung problems, or easier tracking by alien overlords...). This is patent nonsense. The ISI brand specifically says that the cartridges are made from recyclable steel, and the LELAND and other empties that I found strewn about my office (why do I save these?) also stuck to a magnet, proving that they ain't made of aluminum. I've also seen it posted on the web that traces of lead are contained in these chargers; again, this seems highly doubtful in a product that is supposed to be "food grade."

For price comparison purposes, I have not listed the KISAG brand, as these need a special dispenser and they are probably incompatible with regular "cracker" devices. Many of these companies also sell whipped cream dispensers. Having recently upgraded my gear to include one of these, I have to say that if you are going to use cartridges, a dispenser is a must-have item. Spend the \$30.00 to \$40.00, for God's sake (or find one of these at a thrift store perhaps, for less).

Unless otherwise noted as a "10-pack," each box mentioned below contains 24 chargers. When brand names aren't presented, it is because the seller didn't say what they were selling. A "case" contains 25 boxes. Prices are listed from least expensive to most expensive, and headshop sellers are interspersed with more legitimate suppliers. The coffee and kitchen supply companies sometimes have warnings about not selling to minors, or forms that need to be filled out saying that the purchaser is legally able to buy/own nitrous oxide. FANTES, for example, says: "We will not knowingly sell N<sub>2</sub>O cartridges to minors, and we will limit purchases to 2 packs during any two week period, which should suffice in normal home kitchen use." Suffice my ass...

1 "10-pack" for \$8.99 (= \$21.58 for 24)

GRUENEWALD MANUFACTURING Co. ([www.whipcream.com](http://www.whipcream.com)) may be the answer that folks not wanting to freeze their hands cracking tiny cylinders are looking for. They sell a decent variety of different "industrial" whipped cream makers, along with a small tank-style charger, called the "M-5." This tank holds about 1000–1200 times the amount of gas as one of the tiny chargers (or 41–50 of the 24-pack boxes). Clearly, aside from the monetary savings, such a tank will be much more enjoyable to use from a labor perspective. It would probably be a good idea to also order GRUENEWALD's smallest "Refillo-whip Recharger System," so that they have no reason to believe that your constant tank purchases are for other than legitimate purposes. (Plus, you really *can* make whipped cream then...) Before one gets too excited about hitting the gas, I recommend reading the article "Nitrous Oxide Gnosis" by TOAD, which appears in the current (No. 7, Winter 2002) issue of *Trip* magazine. TOAD dispenses the sobering details regarding nerve damage, crapped-out DNA synthesis, and other disturbing physiological side-effects. TOAD points out the importance of mixing in pure oxygen with your gas (*not* mere air), and that single exposures of 25

minutes or less are probably within the safe range (leaving a 1–2 week interval between sessions). Consuming 4–8 grams of the amino acid methionine, plus a vitamin B12 tablet, and a folinic acid tablet prior to a heavy nitrous session is also recommended. But my summation is far from complete; read the article in *Trip* before you huff.

**ELEMENTAL SCIENTIFIC****POB 571****Appleton, WI 54912-0571****(920) 882-1277 PHONE & FAX****info@elementalscientific.net****www.elementalscientific.net**

HAGENOW LABORATORIES, a reliable source for chemicals and glassware that had been in business for over 47 years, has been bought up and is now in operation as ELEMENTAL SCIENTIFIC. Their catalog and 2001 catalog supplement are available on the web, or for \$2.00 from the address listed.

**COSMIC TRADING****info@dopetest.com****www.dopetest.com**

A web site offering testing kits for cocaine, LSD/psilocybin, and MDMA/amphetamine/2C-B. The site provides much less information than say, the DANCESAFE testing kit page. Still, it is a good thing that there are more of these companies popping up. Unfortunately, the Feds may consider these testing kits to be "drug paraphernalia." The wind blows sour of late, what with the arrest of CHRIS HILL, founder of the CHILLS pipe company. Recently charged with distributing drug paraphernalia, he may be facing up to 20 years in prison (ECKHART 2002). Should things become dicey for companies in the USA that sell test kits, the good thing about the COSMIC TRADING kits is that they are offered for sale from outside of the USA. Of course, they still have to cross Customs...

**EROWID EXTRACTS****POB 620939****Woodside, CA 94062****info@erowid.org****www.erowid.org**

Two issues of the "Psychoactive Plants and Chemicals Newsletter" *Erowid Extracts* have been produced to date. As might be assumed, this is the print vehicle of the EROWID web site;

a year's subscription (two issues?) is available for those who pay membership dues of \$25.00 or more. While the EROWID web site is a great resource for factual data, I don't often "surf" the web for pleasure and hate to be forced to read articles via my computer screen. I am much happier to read anything in a printed format, and am glad to see this recent move by EARTH and FIRE and the rest of the EROWID crew. A print newsletter allows the presentation of specific content, and the reader is less likely to become overwhelmed by feelings of being lost in a massive virtual database, randomly wandering about trying to score the kind nuggets of data. This second issue reflects on the deaths of ELIZABETH GIPS, JOHN LILLY, OSCAR JANIGAR, and KEN KESEY, discusses the etymology of "erowid," relates a *Cannabis*-induced psychosis, showcases the EROWID response to a letter in the *New England Journal of Medicine*, re-examines the reported duration of MDA, offers a 2C-I trip report, excerpts an interview of ANDREW WEIL from *Ecstasy: The Complete Guide*, debunks myths surrounding the mescaline content of *Trichocereus* species, shares data on a method of "mouth smoking" of *Cannabis*, and provides organizational updates for various businesses and groups working in the psychedelic arena.

Perhaps the most important part of this issue (and what prompted me to write this review), is the article "Do Antioxidants Protect Against MDMA Hangover, Tolerance, and Neurotoxicity?" by EARTH EROWID. Heavily referenced, this piece presents the idea that potential neurotoxic effects from MDMA (or other amphetamine) consumption due to "oxidative stress" may be avoided by taking moderately high doses of antioxidants such as vitamin C, alpha lipoic acid, and l-cysteine (and perhaps vitamin E), before, during, and after an MDMA session. It has also been shown in one study that very high doses of injected 5-HTP block MDMA neurotoxicity, and speculations on the method of action are presented, as are cautions that 5-HTP may contribute to an increased risk of serotonin syndrome (something that may be of real concern, considering that 5-HTP is being used increasingly following or in conjunction with MDMA, in an attempt to reduced the "crash" that can sometimes be associated with using this drug). Discussion of the prophylactic use of Prozac following MDMA is also noted, although the possibility of this contributing to serotonin syndrome is also warned of, and one is left with the feeling that antioxidants may be a better course of action. It is pointed out that rats on vitamins not only resisted the neurotoxic effects, but they also had reduced tolerance between doses. This article, and some similar comments made at the 2001 STATE OF ECSTASY conference in San Francisco, have made me wonder if the

nootropic drug Hydergine might provide a good degree of antioxidant protection and perhaps act as "potentiator" as well (although one possible concern might be that both MDMA and Hydergine cause increased blood-flow to the brain). Those who consume MDMA or any of the related analogue compounds should read this article *and* take their vitamins; perhaps mom was right after all?

### **INTERSPIRITUAL FELLOWSHIP OF MYSTIC EXPERIENCE**

**2501 East D Street, STE 201**

**Tacoma, WA 98421**

**(253) 830-0292**

**ifme@intothemystic.org**

**www.intothemystic.org**

The INTERSPIRITUAL FELLOWSHIP OF MYSTIC EXPERIENCE (IFME) is a non-profit organization "founded to foster dialog, understanding, and cooperation among people of all spiritual traditions through the common vehicle of direct spiritual experience." Founded by Reverend MIKEL OLSSON, Ph.D., the organization embraces all manner of mystical experiences, whether they be brought on through psychotherapy, various religious disciplines, or entheogenic plants and drugs. The IFME hosts a monthly entheogen study group for people interested in using entheogens as part of their spiritual path. Contact IFME for more details.

On March 30, 2002, the IFME will hold the "Plants of the Gods: A Practical Introduction to Entheology" event, in honor of the 40th anniversary of WALTER PANKE'S Good Friday Experiment. This is a one-day introduction to the historical and contemporary use of entheogens as an aid in spiritual development. There is a \$50.00 suggested donation, and all participants must be pre-registered. Although it seems unlikely that this column will reach many *ER* subscribers in the Tacoma area in time for them to attend this event, I'd love to hear details from anyone that might have made it.

### **KAK-TALL-A-TREE**

**3128 16th Street #225**

**San Francisco, CA 94103**

A relatively new company selling a small selection of cacti of interest to those wishing to grow tried-and-true strains. There are several clones available, some of which were described in detail in past issues of *ER* in K. TROUT'S series of articles on *Trichocerei* (these are the "RS00..." numbers).

KAK-TALL-A-TREE is a small company with a narrow focus on plants that will specifically be of value to those who plan on propagating and sharing cuttings. Cactus selection and propagation based on specific criteria is a relatively new area from the standpoint of commercial offerings, and such companies need the support of serious psychonauts and cactophiles. There have been significant gains in the arena of breeding *Cannabis*, for example—what with more potent varieties and specific plants like “Northern Lights,” “White Widow,” and “Blueberry” available. The diversity of mushroom spores has also increased in recent years, with “known” strains being shared. It’s about time that someone started using the same approach with cacti, and it is *possible* that cross-breeding good strains might result in better strains.

I have a few KAK-TALL-A-TREE plants in my own cactus collection, and—with regard to plants that I have purchased from different locations—the plants offered by KAK-TALL-A-TREE are some of the fattest, most robust specimens. The prices are more than you’d pay at TARGET or HOME DEPOT for the garden-variety of San Pedro, but you are getting a much bigger (and better) plant.

Of course, the plants offered by KAK-TALL-A-TREE are only sold for the purpose of cultivation and contemporary ethnographic study, not consumption. Write for current information regarding what clones are available and at what price. With a collection of plants from both KAK-TALL-A-TREE and my other favorite cacti vendor, SACRED SUCCULENTS, one’s garden should be in great shape.

### NACHTSCHATTEN VERLAG

Kronengasse 11,  
CH-4502 Solothurn  
SWITZERLAND  
0041 32 621 89 49  
0041 32 621 89 47 FAX  
info@nachtschatten.ch  
www.nachtschatten.ch

This Swiss publisher has been cranking out German translations of English drug books, as well as publishing originals in German. They’re doing a great job. (I don’t know why, but the covers of many of the translated books look better than the originals, and the book designs overall have a nicer aesthetic.) Some translated works include *Peyote und anderpsychoaktive Kakteen* by ADAM GOTTLIEB, *Der Haschischesser* by FITZ HUGH LUDLOW, *Cannabis Spiritualität* by STEPHEN GASKIN, *Der psychedelische Reiseführer* by D.M.

TURNER, and *Ecstasy und die Tanz-Kultur* by NICHOLAS SAUNDERS. Apparent new originals in German include *Schamanenpflanze Tabak and Schamanismus*, *Techno & Cyberspace* by CHRISTIAN RÄTSCH, and *Salvia divinorum—Die Wahrsagesalbei* by JOCHEN GARTZ (see review on page 35). Many other books are also available, as are a cartoonish set of *Cannabis*-oriented playing cards, and some beautiful post-cards of FRED WEIDMAN’s psychedelic-inspired art from the *Magic Mushroom Kalender 2000*. This is a publisher that is definitely worth checking if you speak German, particularly for their original publications.

### PACIFIC EXOTIC SPORA

POB 11611

Honolulu, HI 96828

www.mushroomspores.com

PACIFIC EXOTIC SPORA (P.E.S.) has been around for years as a reliable supplier of spores for psilocybian mushrooms. Recently, I was sent some literature related to a “new” strain that they began offering in 1998, and they currently have them on sale for \$85.00 per spore print, which seems pretty damn pricey for a spore print. And yet, their description intrigued me:

“Psilocybe Cubensis Azurescens...To our knowledge this is the only Cubensis strain to show high concentrations of Psilocybin, Psilocin and the desirable 4-phosphoroxymethyl (Baeocystin, (very enjoyable), the analogue of Psilocybin. It is truly a beautiful and memorable rush. P.E.S. obtained a fine specimen of the famous and potent Ps. Azurescens, from the Oregon coast. This Azurescens strain was genetically combined with a very powerful Ps. Cubensis. P.E.S. used genetic inclusion methods and was able to combine these two potent strains together. We named it Psilocybe Cubensis Azurescens. When the fruit bodies are bruised, it deeply blues to a black. Our strain contains many attributes that are relative to Ps. Azurescens. Our research is conclusive, Ps. Cub. Azurescens is one of the most potent species in the World today.”

It sounds too good to be true! And, perhaps it is. I asked a mycologist working in the area of genetics about this glowing description, and here’s what she had to say:

“Funny you mention P. E. S., as I have previously thought about their remarks regarding their ‘cubensis azurescens’ strain. I sincerely doubt any of their claims for no other reason than they have used incorrect terminology for the

process they describe that produced this novel strain. It's obvious they don't understand the actual process to create a hybrid species.

"I have never heard of the term 'genetic inclusion,' neither has anyone else in my mycology laboratory or my friend who received his Ph.D. in Plant Breeding a few years ago. It is not a real science/genetics term and will not be found in any college textbook. Guaranteed. I am current on all my genetics terms. However, their phrasing sounds similar to what would be considered an 'induced allopolyploid.' This is a real term. In easier wording, a 'hybrid species.'

"In plants and fungi, two different but closely related species can be combined but must be in haploid (1N) state during mating ('1N' means '1 nucleus'). This usually requires a chromosome-doubling phase to restore fertility (no fruiting will occur if strains aren't fertile). The only time a mushroom strain is haploid is during its mycelial state before karyogamy; *i.e.*, single spores will germinate and are haploid until they come in contact with another complementary germinated single-spore strain. Therefore only single-spored strains are haploid.

"If P.E.S. actually did what they say they did, they would have had to screen hundreds (if not thousands) of progeny to find a fertile hybrid, as most hybrids are sterile.

"Recombination does not usually occur between genomes that are distant. Such a technique is very difficult and successful recombination rates are less than 0.0001%. I'm not sure it would be possible to actually cross *Psilocybe cubensis* with *P. azurescens* because phylogenetically they aren't that closely related—they belong to different and distinct sections within the genus *Psilocybe*. There's enough genetic distance for incompatibility.

"Cytogenetically these combined genomes behave independently. And again, recombination does not usually occur between genomes that are distant.

"By using the term that they did, they make it sound like they did some sort of genetic modification or engineering via DNA. Ha-ha-ha. Not very much is understood about the genome of *Psilocybe* species besides the very limited number of regions that have been sequenced—none actually relating to alkaloid production. It would be very expensive to do such a task without much financial reimbursement by selling this strain. I can guarantee they did nothing of the sort. I suspect the only thing they did was grow spores of the two different species together in culture and then select out fast growing dikaryotic colonies.

"My friend that sells on the Holland market gave me this P.E.S. strain and I have it in culture as well. He seems to like the P.E.S. strain and it fruits well, but he gets no more money for fruit-bodies of this strain than any other *Psilocybe cubensis* strains that he sells.

"In culture and cultivation, I see no morphological or phenotypic differences between this strain and other *Psilocybe cubensis* strains. On a qualitative basis, I have found this P.E.S. strain to be no more potent than my favorite Gainesville and Thai *P. cubensis* strains. What I am saying is that they are simply selling a *P. cubensis* strain, rather than a hybrid species or cross like they claim. They have a nice advertising ploy, but it just doesn't hold up to science."

In a second P.E.S. flyer I noticed that they seemed to be making the claim that this strain contains baeocystin based solely on a blueing reaction that resembles that of *Psilocybe azurescens*, stating: "The light-blue coloring properties are attributed to the Baeocystin content of this genus. When bruised its sequence goes to very light-sky-blue, to caerulean and then indigo-black. These properties are indeed unique to only *Ps. Azurescens*."

Without actually having the mushroom tested chemically, it seems to me that it is a leap of faith to conclude that it contains *any* baeocystin, and I have been unable to locate any studies that have tied the "light-sky-blue" color to this chemical. I asked PAUL STAMETS about this, and he too was unaware of any such study (although he thought that such an investigation would be a "good idea, though" and "worth exploring"). Indeed, if this color were related, one might expect the other mushroom known to be high in baeocystin, *Psilocybe semilanceata*, to show a similar light-blue initial bruising, but again according to STAMETS, only "very rarely [do] any bluish tones show, and then only in the basal mycelium."

So what is going on with the P.E.S. claims? I have no idea. I have sent them a copy of this column, with the hope that they might respond to it; should this happen, I've no doubt that *ER* will publish their remarks. Strange claims (and high prices for this particular spore print) aside, I have never heard any complaints about the viability of P.E.S. products, nor grumbles about the potency of mushrooms produced, nor reports from people who were disgruntled due to bad service. Whatever it *is* that they are supplying, people who get it seem to like it.

# BOOK REVIEWS

*Salvia divinorum*—*Die Wahrsagesalbei* by JOCHEN GARTZ. Foreword by CHRISTIAN RÄTSCH. 2001. (NACHTSCHATTEN VERLAG, Kronengasse 11, CH-4502 Solothurn, Switzerland, www.nachtschatten.ch), ISBN 3-907080-28-9 [5.25" x 8" paperback, 9.70 Euros]. 73 pp., 1 line drawing, 1 chemical sketch, 1 black and white photo, 13 color photos, 6 additional pages of advertisement, with a bibliography and a suggested reading list. No index.

*Salvia divinorum*—*Die Wahrsagesalbei*, a new German book by JOCHEN GARTZ, kicks off with a foreword by CHRISTIAN RÄTSCH, who comments on the demonization and prohibition of psychoactive plants and drugs throughout history, relating that *S. divinorum* had escaped a large amount of publicity until recently. He notes the preponderance of web-based reports (unfortunately giving the wrong URL for the SALVIA DIVINORUM RESEARCH AND INFORMATION CENTER), and quickly summarizes salient chemical and pharmacological details related to salvinorin A. He laments that sensationalistic press may limit scientific discovery, and opines that prohibition causes more problems than it prevents. The book then moves into Chapter 1—a short introduction with a historical quote from MARÍA SABINA and a mention of the contemporary chemical isolation of salvinorin A in the 1980s.

Chapter 2 tells of early ethnobotanical investigations into the identity of *Salvia divinorum*. Within the context of the “discovery” of this plant by western science, GARTZ summarizes the experiences of R. GORDON WASSON, ALBERT HOFMANN, and ANITA HOFMANN with the *curanderas* CONSUELA [GARCIA] and MARÍA SABINA, and notes the unusual association of a “Shepherdess” in one of the common names for the plant (*hojas de la Pastora*), as well as the proposal that *S. divinorum* might have been the Aztec sacred plant *pipilzintzintli*.

Chapter 3 provides a botanical description of the plant and its natural habitat in the Sierra Mazatec, mentioning that it hasn’t been found anywhere outside this region despite the fact that the natives claim it came from elsewhere. GARTZ notes that the flower’s bell-shaped calyx is bluish or purplish in color, but the corolla is always white, and he correctly points out that: “Jonathan Ott zählte 1996 sechs Publikationen auf, die irrtümlicherweise bei den Farbzeichnungen der Pflanze blaue Kronblätter zeigten.” In

spite of these comments, GARTZ strangely includes a photograph of a plant in bloom with a corolla that turns purple and terminates in a double-bloom with petals that look nothing like a *Salvia divinorum* bloom! (Further, the leaves shown are clearly not *S. divinorum* leaves.) This picture appears in the center full-color section of the book, with the caption “Diverse Blütenstadien der *Salvia divinorum*” (“Diverse bloom-stages of *Salvia divinorum*”). When I asked DANIEL SIEBERT what he thought about this image, which was certainly *not* an example of the diversity of *S. divinorum* blossoms, Mr. SIEBERT identified it as being the double corolla of a horticultural variety of *Datura metel* blossom. Unfortunately, this image (also on the book’s back cover no less), will do little to clear up the confusion related to the color of this plant’s blooms. Furthermore, in the same section under “Frischpflanzen und getrocknete Salviablätter,” (“Fresh plants and dried *Salvia* leaves”) GARTZ shows another plant that is clearly *not* a *S. divinorum* plant, but rather some sort of Solanaceae (probably a *Brugmansia*). Since GARTZ didn’t take these photos himself—and as we’ll see from the description of the following chapter, he seemingly doesn’t have a lot of personal experience growing the plant to draw on—it is quite odd that he wouldn’t have asked for some input from better-informed colleagues as to *what* the plant looks like before publishing these photos. (Alas, this Solanaceous plant photo *also* appears again on the back cover of the book.)

Chapter 4 discusses cultivation of the plant, relying very heavily on the American book *Salvia divinorum Grower’s Guide* (*SDGG*). Indeed, the wording and topics are virtually identical—when translated—throughout this entire chapter of the book, including things like not recommending rooting hormone and suggesting that pussy willow can be used as a producer of auxin(e), providing a similar “optimum” temperature range for rooting the plants, providing the identical root-length transplant time, the exact same three suggested soil mixtures presented in the same order, the same pH range for the soil, and the similar phrasings of text, such as “Despite what many people believe, it *is* possible to grow *Salvia divinorum* outside a humidity-controlled environment...” (from *SDGG*) presented as “Entgegen mancher Meinug ist es jedoch möglich, die *Salvia divinorum* ausserhalb einer sehr feuchten Atmosphäre...” The chapter then con-

tinues to on to describe the exact same process of acclimatization over the same time frame that is presented in the *SDGG*, the exact same indoor lighting suggestions and cautions, the exact same hydroponic-growing instructions, the same theories regarding leaf-browning (stress and/or a virus that expresses itself due to excessive cloning), the same comments about nutrient needs, the same potential pests as well as the same methods of controlling them, including the same predator insects and the same tips on replacing copper “snail” tape after a year. Since this chapter of GARTZ’ book is predominantly just a German translation of the *SDGG*, I would hope that the publisher of the *SDGG* is receiving translation royalties!

Chapter 5 relates data regarding the chemical and pharmacological investigations of *Salvia divinorum*—history that has also been pretty well covered by two previous journal articles (OTT 1995, OTT 1996). Even chapter 6 on the psychoactive effects of *Salvia* extracts mainly presents “trip reports” that have appeared elsewhere, quoting from WASSON, VALDÉS, SCHULDES, and TURNER. Chapter 7, “Investigations with pure Salvinorum (*sic*) A” quotes from SIEBERT’s published “lab notes,” again relates a “trip report” found in TURNER’s book, and retells OTT’s experiments with the vaporized pure compound and sublingual acetone/DMSO mixtures. Chapters 6 and 7 offered—at most—only two or three “trip reports” that I hadn’t read already. GARTZ sums up the lack-of-binding to neuro-receptors found via the NOVASCREEN tests, and notes the high potency of salvinorin A. He points out that JONATHAN OTT had wondered why the traditional Mazatecs were unaware of what a potent plant they really had, and suggests that the answer to this question is that it was simply because they lacked the chemical knowledge and necessary solvents to extract the salvinorin A, and that they were probably better off for their ignorance. GARTZ states that he feels that the combination of pure salvinorin A with well-known tryptamines, phenethylamines, or LSD in higher doses (which has been published in some “trip reports”), is an irresponsible consumption behavior that stands in stark contrast to the traditionally moderated ritual use of plant preparations in México (for which there have been no reported problems). Although such an attitude appears at first blush to harken the romantic ideal of “native wisdom,” and can certainly be seen to be the situation in some cases (such as with the extraction of cocaine from *coca* leaves and the resultant addiction problems), it isn’t terribly accurate to imply that native drug-users as a rule didn’t mix-and-match psychoactive plants. Witness the use of *Brugmansia* and tobacco in some ayahuasca brews, or the same sorts of go-

ings-on with traditional San Pedro usage, and GARTZ may have missed that the Mazatec *have* been reported to concurrently use psilocybian mushrooms, *i.e.* “tryptamines,” with *Salvia divinorum* (EMBODEN 1979). While purified compounds need to be handled with respect, the combination of such for psychonautical exploration is no different in principle today than with the natives of old. Take care, or get your ass kicked (or worse); clearly there is a learning curve and the plants (or chemicals) will let you know when you are treading on thin ice.

Finally, GARTZ sums up the book in chapter 8, noting that there are still many mysteries surrounding this plant, that related plants may still be found which contain salvinorin A or similar compounds, and that new methods of studying the brain and its interaction with psychoactive chemicals—such as PET scans—may eventually result in the discovery of what areas of the brain are most closely connected to the visionary properties of salvinorin A.

This book does an excellent job of succinctly covering the history of *Salvia divinorum* up to the new millennium, pulling together the various aspects of ethnobotany, pharmacology, cultivation, chemistry, and contemporary use, into one place for the first time. Alas, it doesn’t present any *recent* information such as the simple, single-solvent extraction methods discussed via special interest e-mail groups, or the use of *S. divinorum* in religious meditations (SOUTAR & STRASSMAN 1999–2000), or as an antidepressant (HANES 2001). Nor does the author break any new ground by actually bioassaying the previously untried (and potentially potent) chemical salvinorin C (VALDÉS 2000; VALDÉS *et al.* 2001). To the best of my knowledge, in English, there are currently four books on *S. divinorum* (TURNER 1996; SOCIEDAD PARA LA PRESERVACIÓN DE LAS PLANTAS DEL MISTERIOS 1998; AARDVARK 1998–2001; SHAYAN 2001), as well as a shorter booklet (ANON. 1999), complete chapters in other books (HEFFREN 1974; FOSTER 1984; PENDELL 1995; RÄTSCH 1998), a web-based FAQ (SAGE STUDENT 2002) a *User’s Guide* (SAGE STUDENT 2000), numerous journal articles, and a *giant* web site with up-to-the-moment topical data ([www.sagewisdom.org](http://www.sagewisdom.org)). Which begs the question, I suppose, do we really *need* another book on *Salvia divinorum* at this point? The answer may be “yes,” but predominantly because this book *is* in German, and hence will reach an audience that might have a hard time reading the myriad of information that is already available in English. — DAVID AARDVARK

*Ibogaine: Proceedings of the First International Conference* by KENNETH R. ALPER and STALEY D. GLICK (Eds.) 2001. (ACADEMIC PRESS, 525 B Street, Suite 1900, San Diego, CA 92101-4495, www.academicpress.com), ISBN 0-12053-206-9 [6" x 9" softbound \$79.95], 333 pp., alkaloid index and general index.

I've had a long standing interest in *Tabernanthe iboga* and ibogaine studies ever since I published the GOUTAREL, GOLLNHOFER, and SILLANS summary, "Pharmacodynamics and Therapeutic Applications of Iboga and Ibogaine," in my *Psychedelic Monographs and Essays* Vol. 6. This article collected everything known in English in 1993 about ibogaine research. Dr. GOUTAREL was the scientist who originally helped isolate the ibogaine alkaloids in the early 1950s. Soon after this article was published, several books appeared including *The Ibogaine Project: Report on the Staten Island Project* by PAUL DE RIENZO and DANA BEAL (AUTONOMEDIA, 1997), and *Iboga* by AMON KNUT ML (MARIBOR, 1994). And papers continue to appear in academic and medical journals...

Along with this glut of publishing came many mystical and romantic notions of ibogaine as an "addiction cure" (now called an "addiction interrupter"). Ibogaine achieved—at least for a while—postmodern *soma* status. Soap opera camp—as publicized by the HOWARD LOTSOFF/DEBORAH MASH "wars" surrounding ibogaine patents—appeared as an aside. During this tug-of-war, science continued onward. Research has been collected and serious science has evolved regarding ibogaine. *Ibogaine: The Proceedings* celebrates 40 years of investigations and evolving therapy regimes.

As with *soma*, ibogaine is a subject that deserves the higher ground, and this new book is written by the best minds available, with funding and continued research as the goal. IBOGAINE: THE FIRST INTERNATIONAL CONFERENCE was held in New York City in 1999, and this book collects the proceedings, plus more. Adding to pharmaceutical and toxicology research is new information regarding therapies that use ibogaine, including traditional Bwiti therapies, various encounter and shock therapies, dream therapies—even amateur therapies using ibogaine in uncontrolled doses, based on self-help models.

What are the real issues here? One real issue is hard-core heroin and cocaine addiction and a hard-core shamanic cure—a dramatic cure that imparts psychic powers on the survivor. Another issue is talking to the dead. A further issue is talking to angels and demons during the *iboga* visions. Let's not forget the issue of time travel, commonly reported.

And the issues of heaven and hell, both of which open their gates—what about this? And, oh yes: somewhere in the midst of all this are issues of neurology and brain science.

Many of the chapters and papers in *Ibogaine: The Proceedings* are highly technical, and deal with aspects of ibogaine's pharmacological and toxicological actions. Such include neurotransmitter activities, effects on neuropeptides, metabolism, excretion, and locomotor activity. Of interest to me however were the psychological papers studying ibogaine's effects on learning, memory, and EEG. EMMANUEL NAIVE's chapter "Changes in Gene Expression and Signal Transduction Following Ibogaine Treatment" presents the startling fact that ibogaine can rewrite gene expression, which leads directly to voltage and electrical regulation through intracellular communication. Such cell cross-talk is connected to learning and the way information is gated or processed into memory—something that is claimed to be observable in real time by some ibogaine trippers.

The chapter "Returning to the Path: The Use of Iboga[ine] in an Equatorial African Ritual Context and the Binding of Time, Space and Social Relationship" by JAMES and RENATE FERNANDEZ is also important. JAMES wrote the seminal study *Bwiti: An Ethnography of the Religious Imagination in Africa* (PRINCETON UNIVERSITY PRESS, 1982). The Bwiti are the celebrated African tribe that originally used the *iboga* plant in its occult ceremonies. A cult within the Bwiti called the Fang is also mentioned. The Bwiti live partly in this world, and partly in a mythical land contacted by *iboga* initiates.

We also see reviews of LOTSOFF'S NDA INTERNATIONAL AND ICASH (International Coalition of Addiction Self-Help), a therapy based loosely on the work of ALDOUS HUXLEY and Dr. TIMOTHY LEARY. Dr. DEBORAH MASH and her ibogaine clinics in St. Kitts in the Caribbean are described. Dr. MASH is also famous at the UNIVERSITY OF MIAMI MEDICAL SCHOOL for performing a brain autopsy, seeking clues to ibogaine's inner workings.

ERIC TAUB'S ibogaine sessions are discussed. Here we see less therapy and more shamanic ritual (similar to the ideals of the Bwiti). MYRON STOLAROFF reports on west coast therapy scenes and regimens, and his book *The Secret Chief* is mentioned. From the Netherlands we hear about DASH/INTASH, THE CENTER FOR ADDICTION RESEARCH AT ERASMUS UNIVERSITY and the work of NICO ADRIAANS, a field researcher studying street addiction and therapeutic communities. From Slovenia we hear about the work of

MARKO RESINOVIC, who founded the SLOVENIAN IBOGAINÉ FOUNDATION in 1995. Worth noting is the pricing structure—\$200.00 for a gram of ibogaine hydrochloride with therapy, as opposed to several *thousand* dollars for the therapy of Dr. MASH or ERIC TAUB! Curious. The section on Denmark describes interesting scenes alleged to have existed within CHRISTIANA, the anarchist “village” near Copenhagen. A 44-kilogram supply of ibogaine hydrochloride connected to CHRISTIANA was mentioned, circa 1981. This stash was code named “Indra” and used to treat over 1000 advanced heroin junkies in CHRISTIANA village. We hear of a gram of ibogaine hydrochloride going for \$25.00 in CHRISTIANA... Netherlands therapists worked with this same “Indra” supply for years, pricing therapy at \$600.00 to \$1000.00. In the United Kingdom, thanks to sales of *The Ibogaine Story*, and a video sponsored by the group CURES NOT WARS and promoted by the GREENS political party, ibogaine therapy flourishes. In Italy, Dr. GIORGIO SAMORINI’S work is mentioned, as are his forays into Bwiti initiations. In the Czech Republic, it costs \$500.00 for treatment with ibogaine. In France an actual *Nganga*—a Bwiti ritual guide—officiated ibogaine therapy for \$1000.00. (I published a photo of a Bwiti *Nganga* sorcerer in my *PM & E* journal, replete with loincloth and bone pointing, once upon a time...)

In Africa, the home of the Bwiti and the *iboga* plant, we hear about DAN LIEBERMAN, an ethnobotanist who was involved in arranging Bwiti ceremonies in Gabon (before his death in 2000). This section of the book focuses on medical and

therapeutic subcultures—something of relevance to readers of *The Entheogen Review*, because we are just that—a subculture.

*Ibogaine: Proceedings* also shows time lines of ibogaine-related discoveries, and has a special index just for alkaloids titled “The Alkaloids, A Cumulative Index of titles, 1950–2001.” This includes references for syntheses of the active compounds in *qat*, *Ephedra*, ergot, and even rare amphibian-, spider-, and wasp-toxin alkaloids, as well as chemicals such as piperidine and morphine. This special index is an interesting addition to *iboga* alkaloid chemistry. A 10-page regular index rounds things off.

All in all, *Ibogaine: Proceedings Of the First International Conference* is a solid addition to the literature. The book is a welcome return to ibogaine science and resets ibogaine mythology with real world, modern practices—both within the clinic and the traditional Bwiti cults. This is a book that will serve the ibogaine community and psychedelic researchers for years to come. Unfortunately, the book is somewhat expensive, at about \$80.00 in soft-bound. However, owing to the tremendous resources, networks, and histories pulled together here, we have a winner worth the dough.

Dr. ALPER and Dr. GLICK, I toast you. The Bwiti thank you, the spirits of *iboga* thank you, and patients everywhere thank you. Amen and peace. — THOMAS LYTTLE

# ENTHEOBOTANICA

IS NOW OFFERING A LIMITED NUMBER OF AUTOGRAPHED HARDCOVER  
FIRST ENGLISH EDITIONS OF  
ALBERT HOFMANN'S  
CLASSIC WORK **LSD: MY PROBLEM CHILD**

Currently out-of-print in *any* edition,  
these special collector's copies of the 1980 McGraw-Hill edition  
have been signed by both Dr. Albert Hofmann and the book's translator, Jonathan Ott.

OFFERED BY ENTHEOBOTANICA, KRONENGASSE, 11 / 4502 SOLOTHURN, SWITZERLAND / TEL. 0041(0)32-621-8949

AVAILABLE FOR \$100.00, PLUS \$5.00 NAM, \$10.00 ELSEWHERE FOR S&H FROM

LEONARDO CRUZ / A.P. 13 BIS / COATEPEC, VERACRUZ / MÉXICO 91500, LEOCRUZ3@HOTMAIL.COM.

PLEASE MAKE CHECKS PAYABLE TO JONATHAN OTT.

*Plants of the Gods: Their Sacred, Healing, and Hallucinogenic Powers* (revised and expanded edition) by RICHARD EVANS SCHULTES, ALBERT HOFMANN, and CHRISTIAN RÄTSCH. 2001. (HEALING ARTS PRESS/INNER TRADITIONS, One Park Street, Rochester, VT 05767, www.innertraditions.com), ISBN 089281979-0 [7.5" x 10.5" paperback, \$29.95]. 208 pages, full-color illustrations throughout, 5-page bibliography, 5-page index.

It may be a rare thing for a second edition of a book to warrant its own review, but such is definitely the case with the new edition of the SCHULTES' and HOFMANN'S 1979 classic *Plants of the Gods*. The updated version was produced as a German translation in 1998 by CHRISTIAN RÄTSCH, and HEALING ARTS PRESS released the English translation of this in late 2001. It is a thing of beauty.

The primary and most dramatic improvement is the inclusion of numerous new photographs and art images. Although this second edition retains many of the same photos, it introduces a lot of new ones as well. In some cases, the item depicted—such as the statue of SHIVA with *Datura* flowers in his hair (p. 11)—has been revisited with a higher-quality photo. Frequently, black and white images have been replaced with a similar image in stunning full-color. While this works superbly in most cases, there are a few situations—such as the replacement color photo of an aerial view of the Kuluene river (p. 24)—where the original black and white photo was much better. New psychedelic art is featured throughout from the likes of PABLO AMARINGO, WALANGARI KARNTAWARRA JAKAMARRA, NANA NAUWALD, and DONNA TORRES. There are even some incredible watercolor paintings done by CHRISTIAN RÄTSCH himself (think *Codex Seraphinianus* on acid)—where can we see more of his art!? A beautiful mural of an ayahuasca ceremony that graces a wall at the CUZCO AIRPORT in Peru reminds us that some countries have a more enlightened attitude towards the use of psychotropic plants.

“Fourteen Major Hallucinogenic Plants” of the first edition has been altered to become “The Most Important Hallucinogenic Plants,” and expanded to include new sections on *Anadenanthera colubrina*, ayahuasca analogs, *Salvia divinorum*, and *Duboisia hopwoodii*. There have been numerous expansions on the old chapters as well, including many additional species of the genera discussed. Six new plants have been added to the “Plant Lexicon,” and this section has been vastly improved through the addition of color photographs. Previously, the majority of the plants described were depicted via illustrations, with only a few photo images; this

situation is now reversed, with only a few illustrations. (It is a shame that there are *any* drawings remaining, although I suspect in some cases it might be hard to obtain photographs of the plants in question. Still, in other cases it should not have been difficult—photos of *Banisteriopsis caapi*, *Lagochilus inebrians*, *Mandragora officinarum*, *Mimosa tenuiflora* [= *M. hostilis*], *Peucedanum japonicum*, *Scirpus atrovirens*, *Tabernanthe iboga*, and *Virola theiodora* are all available via the web). The map of “Native Use of Major Hallucinogens” has been expanded to include *Hyoscyamus* sp., *Duboisia* sp., and *A. colubrina*, and the depicted range of *Cannabis* use has been increased.

Some problems that the original book had are, alas, retained or, in a few cases, exaggerated. The gutter of the book is too tight, causing one to crack the spine to get a full view; this was the case in the earlier edition as well. New layout glitches include shaded backgrounds for text boxes being placed too close to the edge of the text (in some cases touching it), and headlines that sit too close to the images. The problem of citing alkaloid contents as fixed numbers is still present (although in a few cases ranges are presented). Those with little knowledge on the subject might actually believe that *all* dried *Trichocereus pachanoi* plants have a 2% mescaline content, while this is actually the peak of the range that can be determined through a survey of the scant few published isolation analyses (which dips down to 0.33%, and even lower in published HPLC analysis), and may not be typical. In new cases when ranges *are* presented, such as the case with *Mimosa tenuiflora* root-bark said to contain 0.57 to 1.0% DMT, the information may not be correct. (*M. tenuiflora* has been reported to contain 0.31 to 0.57% DMT with specific analyses available in the literature of GONÇALVES DE LIMA 1946 and PATCHER *et al.* 1959, and there have been unsubstantiated counter-culture claims of 1% to 11%, see *ER* Vol. X, No. 3, 2001 and OTT 2001). Both the new and the old editions of this book are riddled with statements about alkaloid contents that are presented as if they were fixed amounts, when in reality alkaloid content can be highly variable.

Some new errors are introduced with this edition. Spelling mistakes are peppered throughout (they've mis-spelled author HOFMANN'S name on the back cover!), and awkward phrasings are not uncommon in those sections that were translated from German. In some cases, plants are presented as containing specific alkaloids that they do not have. For example, it is remarked that “The Turkey Red variety of the grass *Phalaris arundinacea* contains liberal amounts of DMT.” This is in error, as this variety contains liberal

amounts of 5-MeO-DMT, not DMT. Also, photographs of four cacti—*Ariocarpus retusus*, *A. fissuratus*, *Astrophyton asterias*, and *Aztekium riterii*—known in México as “peyote” are depicted, with the statement “They primarily contain the substance mescaline and other psychoactive alkaloids.” This too is in error, as only *A. riterii* has been found to contain trace amounts of mescaline, and no mescaline has been found at all in the others. (It was interesting to see that RÄTSCH considers a heftier amount of mescaline, “0.5–0.8 gram” to be a

dose, compared to the SHULGINs’ more conservative 200–400 mg dose listed in *PIHKAL*; I tend to agree with RÄTSCH.)

Any and all criticism of this book should be viewed as minor, as it is truly a marvelous work. RÄTSCH has taken a great book and made it better. Especially if you own the first edition, you owe it to yourself to pick up this revamp. It is visual delight, a joy to read cover-to-cover, and it will no doubt be revisited repeatedly for years to come. — JON HANNA

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

# MUSHROOM MYTH AND IMAGERY IN HAWAII: EVIDENCE FOR AN INDIGENOUS CULT

by MARK HOFFMAN

*Ke ho'i a'e ka 'opua i Awalau*

(The rain clouds are returning to Awalau)

Hawaiian proverb, signifying a return to the source.

*He kukahi au, he wauke no Kuloli!*

*"Like the lone wauke plant of  
Kuloli, I stand alone in my  
battles!"*

When it comes to the question of indigenous<sup>1</sup> ethnomycological traditions in Hawai'i, the consensus of those mycologists and ethnobotanists who have considered the problem is clear—prior to the introduction of cattle, horses, and sheep in the 1790s, there simply *was no tradition* to be considered (POLLOCK 1974; ALLEN & MERLIN 1999; DESJARDIN 2002). To this day in Hawai'i, it is believed that there is no ethnomycological record whatsoever published for the period prior to contact. Despite scant additional investigation into this matter,<sup>2</sup> evidence for the indigenous use of sacred mushrooms has not surfaced in the literature, nor has even a single common name or word for "mushroom" been found. For these reasons, experts have come to believe that sacred mushrooms were not used.<sup>3</sup>

1.

Consider this drawing of a "mushroom helmet" rendered by ARAGO in 1819, as well as the other evidence that accompanies this article. As we search for traces of indigenous ethnomycological traditions, the essential question is simple: Do these motifs, myths, and other bits of evidence represent sacred mushrooms?

**"How strange it is..."**

wrote R. GORDON WASSON, "...that the most spectacular, the most potent, mushroom lacks a name in the English language" (WASSON 1968). In order to account for the puzzling lack of a common name for *Amanita muscaria* among the Indo-Germanic languages, WASSON went to great lengths to uncover and document cultural

and linguistic evidence illustrative of the spiritual origins of specific fly agaric traditions, and the process by which sacredness and tabu become interrelated (WASSON & WASSON 1957; WASSON 1968). By pursuing those candidates that possess an unusual *absence* of information, one may very well be on path of the most sacred—and therefore tabu—of cultural phenomena. The stranger or more unlikely this absence, given the availability of similar or related data, the more likely we are to find deep veneration and a subsequent "protected" (tabu) status within the cultural context.<sup>4</sup>

AUTHOR'S NOTE: This article is dedicated to R. GORDON WASSON, the father of ethnomycology, who inspired this research. A cited photocopy of Figure 1 was found during a visit to the WASSON ARCHIVE, HARVARD BOTANICAL MUSEUM LIBRARIES. The author would also like to thank JOHN ALLEN and Dr. DENNIS DEJARIDIN for their contributions to this research.

If one accepts the idea that indigenous Hawaiians lacked any knowledge, names, or interest in the exotic world of fungi, then one must also accept that they do so while venerating and sacramentally consuming other, more common and accessible flora—as if the mystery and novelty of fungi would go unnoticed by a shamanic people! Such an assumption seems unlikely.

Thus, we must look for a more satisfying explanation for the situation in Hawai'i—and we need not look far. In fact *huna* (secret)<sup>5</sup> is literally the name of a Hawaiian religion whose practitioners and functionaries are called *kahunas*. The concept of *tapu*, as the source and translation of our word “tabu,” is close in meaning to *mana*, which is an important concept in Polynesian religion that describes a spiritual power that can be transmitted via bloodlines, or which infuses sacred sites. The word *tapu* is similarly used, but describes more transitory “contagious” states such as shamanic ecstasy—or

“being under the influence of the Gods”—and the sacredness of the ceremonies whose main function it was to channel this divine “energy” where it was desired (ELIADE 1987). Because this energy is characterized by its motion, *tapu*-infused or “sacred” foods, objects, *etc.*, must be carefully managed to avoid accidental exposure to potentially dangerous spiritual influences. As such proscriptions are assigned “forbidden” status, special preparations and precautions are established for entering states of “divine possession.”

During the pre-contact period,<sup>6</sup> the rank and file of Hawaiian society must have been privy to *tapu* matters. Thus the existence of sacred traditions concerning mushrooms were probably not “secret,” nor would there have been a desire to have them be so by the chiefs and *kahunas* (such a futile effort being doomed from the start, what with wearing helmets *like that!*). Given the fact that native Hawaiian's seem to have avoided wild mushrooms as a regular food source,

## MUSHROOM HEADS AND HELMETS

“Mushroom heads” like those that accompany this article appear in many locations worldwide as petroglyphs and in other forms, including the altar-sized mushroom-stones of the Americas and China, and the “owl head” megaliths across Eurasia. These and similar designs represent a consubstantiality with the “divine spirits” of the entheogenic mushrooms. The “mushroom head” motif lived on in various parts of Eurasia, and is found upon the heads of Gods (such as KRISHNA) or kings—being popular among the Sassanian and other Persian royalty. One especially interesting Egyptian statute, which had been owned by KAHILIL GIBRAN and loaned to R. GORDON WASSON, sprouts a somewhat traditional-looking Egyptian multi-crown, but being slightly wider and rounder, looks remarkably like a flush of psilocybian mushrooms. Such mushroom helmets might be placed in a category along with the opium poppy headgear of ATTIS and various Old World Goddesses, as well as the lily-headed designs of Gods and shamans in both the Old and New Worlds.

While such images are revealing of entheogenic states, they also warn the observer of the tabu condition surrounding them. Considering this, I think it likely that such ritual headgear (including the crowns of divinely-appointed and power-conferred monarchs), evolved, at least in part, from the need to protect against accidental exposure to a contagious, *tapu*-like power. Such protection would be especially appropriate to the Hawaiian/Polynesian need to “manage” the divine allocation of royal *mana/tapu*.

Other examples of sacred plant-headed motifs abound, even in Hawai'i where we see the motif in petroglyphs. In FIGURE 6 we see one such occurrence, wearing the well-known streaming headdress (which is thought to have derived from the decoration of masks and helmets with the long, thin leaves of the sacred *Ti* plant during rituals). The presiding shaman would also integrate themselves with the sacred flora by creating ritual paraphernalia and even disposable garments from the leaves of holy plants as a protective measure, presumably serving to mediate the *tapu* created by the rituals for the safe management and release of this temporary (but very delicate and contagious) spiritual condition. Similarly such concern for ritual purity is the likely impetus of the *lei*-giving tradition.

it's likely that the *tapu* restrictions over time extended to all of the higher fungi, resulting in an "all out" ban on mushroom consumption. India's Santal language gives the unique attribute (within the vegetable kingdom) of "soul possessing" to their *pukita* mushroom (WASSON *et al.* 1986); it would be surprising if Hawaiians didn't also preserve a unique status for mushrooms in the natural order—considering them very powerful incarnations of *tapu* due to their unparalleled growth and special relationship to the sacred rain.

And yet, it is an interesting fact that there is no known native Hawaiian word for "mushroom," nor any specific varieties thereof. This puzzling situation has led to the acceptance of a very unlikely conclusion (what with the comparative wealth of other specific plant names): that pre-contact Hawaiians either didn't like or had no interest in mushrooms. Given what we know of historical food shortages and famine (CHOCK 1968), and keeping in mind the advanced herbal-pharmacological skill of specialist *kahunas* who study plant medicine starting as young as five years of age, this is an unacceptable conclusion.<sup>7</sup>

## FUNGAL FECALPHILISM

It would be a serious mistake to apply my wholesome American fecalphobia to native Hawaiians, and by so doing perpetuate the assumption that "horse dung" is viewed with any disdain. Exploring the Hawaiian *kava* customs I read in a traditional prayer: "...and produce for us excrement for your land which has stood orphaned. This is your kava, Male Ancestor..." (LEBOT *et al.* 1992).

Although I had realized that it would be prudent to check into the assumption that there was nothing "behind" the

post-contact term for "mushroom" that is in widespread use, *kukaelio* ("horse dung"),<sup>8</sup> I hadn't yet considered the idea of the potential sacredness of excrement. I came away from this reading with a new hope that the persistent problem of the non-native Hawaiian mushroom "horse shit" would soon be resolved to my satisfaction.

Checking Hawaiian dictionaries for this and related terms, I notice a very promising entry: "kukae'ua'u. A medicinal plant (no data)" (PUKUI & ELBERT 1971). This term seems to result from combining the root *kukae* (excrement) with *ua* (rain). The final "u," however, is not a standard connective (like the Hawaiian "o" or "a") allowing for the simple "excrement of rain." Rather, and very appropriately, the word ends with the characteristic "au" of the words "drug" and "heal" (*la'au* and *lapa'au*, respectively). The inclusion of the medical characteristic in the dictionary reinforces my interpretation that the "au" of "drug" is intended. (See further comments on the *la'au* herbs on page 45.)

Another similar fungal word is also present: "kukaela: Eggs deposited by flies, as in meat. *Lit.*, sun excrement." The presence of maggots and flies certainly conjures to mind the common image of rotting and maggot-infested fungi. In addition, the word "mite" in Hawaiian is *'ona*, which also means "intoxication." Flying insects were thought to cause possession, insanity, and intoxication in medieval Europe (WASSON & WASSON 1957), and the sun's inclusion here is consistent with its traditional Hawaiian role of sacred illuminator, with dung/fungus being a breeding ground for those small insects associated with intoxication.

The word "dung," *kukae* is often used to designate a fungus-like "excretion" and in fact is the root word of several types

4.

5.

6.

7.

of herbs and lower fungi, including “mildew” (*kukaeloli*). Of the fungi, a certain *kukae-akua* —“ghost excrement” or “god excrement”<sup>9</sup>—is considered an excreta of spiritual origin. This substance also goes by the name *huamai-lani*, or “fruit of (the) sky” (PUKUI & ELBERT 1971). This particularly appropriate description of fungi indicates that the same “dung of God,” was probably applied to various entheogenic species of edible “fruit” fungi, and intended in the same manner as the “*kava* excrement” is applied above.

In fact, there is even evidence that such “excrement” was eaten in a magico-religious context. There is a proverb involving an *'ai pilau* (eater of filth) who is said to practice malicious sorcery by this means. His God is called *akua'ai pilau* (PUKUI 1983). Notice that in this malicious context *kukae* is not used however, the “filth” instead going by *pilau*.

## DIVINE IDENTITIES?

If there *was* a native sacred mushroom tradition in pre-contact Hawai'i, then it is certainly possible that indications of the “missing” mushroom names may be found among the many Gods of the Hawaiian pantheon. Suggesting themselves immediately as candidates of a fungal avatar are the magical “little people” of the Hawaiian forests, the *menehune*. KANE, bringer and source of the “water of life,” is their God, and he is also God of the forest. Like the little people of enchanted European forests, these phallic “little men” are said to achieve amazing feats of “construction,”<sup>10</sup> usually during the night (KNIPE 1989). In one example these little people, night after night, replant a felled tree that is to be made into a canoe. One might speculate that the *menehune* “live” and “hide” in said tree, even “resurrecting” it on occasion as they fruit from the decomposing trunk.

The name *menehune*—who are often described as “magical” and “mysterious”—is certainly cognate with *mea huna*, meaning “secret.” Considering the curious fact that the important designations *menehune*, *huna*, and KANE all carry as a primary definition “minute particle, tiny” (as a means of indicating their “hidden” identity), it is again significant that *'ona*, the word for “mite” (or tiny flying insect) means “intoxicated” (PUKUI & ELBERT 1971).

The wind God MAKAI-KE-OE, endowed with the power of plant growth, took form as an intoxicating tree whose branch (*mana* in Hawaiian) was a potent but dangerous love potion, inducing visions and voices (BECKWORTH 1940). Entheogens and other psychoactives are often also considered aphrodisiacs (RÄTSCH 1997). Even more interesting for our mycological purposes is another version of this God, KAPUA'IAIA called the “wicked footprint” (PUKUI & ELBERT 1971).<sup>11</sup> This intoxicating God is found where we would expect to locate a mushroom—on the ground.

## ARAGO PAINTS US A PICTURE

That the unusual headgear of the Hawaiians was rendered naturalistically becomes obvious enough when considering the various helmet styles alongside very similar glyphs (MCBRIDE 1969). JACQUES ETIENNE VICTOR ARAGO, who provided a narrative of his 1817–1820 “voyage round the world,” drew the depiction of a mushroom helmet (FIG. 1) shown at the start of this article as well as several other examples of the same style (ARAGO 1823). Mushroom heads also appear as petroglyphs, as seen in figures 4–9, with one such glyph even showing tapu lines coming from the (mushroom) head (FIG. 5). The glyphs strengthen the argument because they are so different from the helmets, but are also clearly fungal.

8.

9.

10.

The distinctive helmets are also rendered in glyph form—these appear in print along with other helmeted figures, but their source is not cited (FEHER 1969). The idea that the petroglyphs were often involved in initiation rites has been proposed (MCBRIDE 1969), and that they are generally linked to sacred phenomena is widely accepted by researchers (LEE & STASACK 1999).

If we allow that these motifs do in fact refer to mushrooms, it comes as no surprise to us that, of the ubiquitous anthropomorphic figures that represent the majority of the glyphs, there are but a few styles that deviate from the simple round head form. Of these variations the vast majority can be identified as animal heads and/or known headdresses or helmets. Acknowledging and allowing for the importance of shamanic and visionary themes, it is safe to conclude that these anthropomorphic glyphs represent naturalistic phenomena. Such naturalistic depictions developed, over time, to include the characteristic triangular torso and muscular forms of Hawaiian glyphs. This conclusion is also consistent with the documented and widely-accepted idea that these glyphs were important objects of sympathetic magic (COX & STASACK 1970; FARLEY 1889). Thus, we might expect a bemushroomed individual to be represented as we find our examples. In fact naturalism is the central guiding principle in Hawaiian glyph art, which is obvious from the wide range of identifiable flora, fauna, and material culture represented (LEE & STASACK 1999).<sup>12</sup>

## HAWAIIAN SACRED PLANT TRADITIONS

*La'a*, meaning “sacred, holy, devoted, consecrated, set apart for sacred purposes, dedicated” is the root most often found in words that refer to medicinal herbs, and related treatments, and is also the root of “intoxicating drug” (*la'au 'ona*, “intoxicating plant or medicine”) and “narcotic” (*la'au ho'omalule kino*, “plant or medicine to bring peace to the body”). Also sharing the root *la'au*, are the words that designate psychoactive plants such as *Datura stramonium* (*la'au-hano*) and *Papaver somniferum* (PUKUI & ELBERT 1971). We know that a mythological and ritual complex, involving sacred and/or psychoactive plants, was an important part of Hawaiian religion. For instance, one finds many mythological references to *lohiahu* or “the water of life,” the great prize of the underworld that can revive the dead (BECKWORTH 1940). And there is a consecrated drink, for the princess HI'IAKA who—as sister of PELE and equal in power to her—is also able to revive the dead by means of “medicinal herbs” and drinking the “water of life.” Another sacred plant is an evergreen tree called *noni* (*Morinda citrifolia*), which was

brought by the earliest Polynesian settlers and is an important part of the native pharmacopeia. According to a Tongan myth, it was the leaves of this tree that revived the lifeless MAUI. And there are, of course, the famous 'awa (*kava* or *Piper methysticum*) drinking ceremonies, so central to (and symbolic of) the exercise of secular and sacred power. There is also a “potent liquor much like a clear brandy” called *okolehau* (or *oke*), which is distilled from the baked root of the *Ti* plant (*Cordyline terminalis*), a member of the lily family. This plant, sacred to the God and Goddess of the *hula*, is an emblem of “high rank and divine power.” As mentioned, the leaves of this plant were used as decorations on sacred masks and helmets, and it is thought that the feather *hahili* evolved from *Ti*-laden headgear (see [www.hawaii-nation.org/canoe/ki.html](http://www.hawaii-nation.org/canoe/ki.html)).

## CONCLUSION

Were the mushroom motifs extant among the native Hawaiians prior to European contact and the introduction of cattle and horses, which started in the 1790s? ARAGO's depiction—obviously representing mushrooms—was done in 1819. Due to the series of events that would have had to have taken place prior to this time in order for these helmets to appear, the improbability of their representing a post-contact motif speaks for itself.<sup>28</sup> The next important question has to do with how these traditions adapted to the new Western influences from that point. Continuing the assignment of the *kakae*-word cluster may suggest that linguistic and mythological analyses could make moot the need to establish the mushroomic art motif prior to contact. Considering that several very promising and suggestive terms have been preserved among the fungal group, and that careful attention was given even to the spiritual ontology of lower fungi (in the case of the *kukae-akua* —“ghost dung,” “god dung,” and *kudaeloli*—“mildew,” and their related traditions) it must be considered all but impossible that early Hawaiians didn't have additional entheo/ethnobotanical traditions, especially in the case of higher fungi.

I hope that the evidence presented here will stimulate additional discussion and research, contributing to a more satisfactory understanding of the early ethnomycology of native Hawai'i. Your comments and suggestions are encouraged. Aloha. ☉

MARK HOFFMAN is the editor of *Entheos: The Journal of Psychedelic Spirituality*. He can be reached at [entheos70@aol.com](mailto:entheos70@aol.com).

## ILLUSTRATIONS

1) ARAGO'S 1819 rendering. "Mushroom Ornamented Helmets... Such helmets apparently were not covered with feathers." Image scanned from FEHER 1969.

2) Mushroom helmet with two rows of "ornaments." Image scanned from FEHER 1969.

3) Mushroom helmet with a single row of "ornaments." Image scanned from FEHER 1969.

4) Mushroom head petroglyph from the Kaeo 1 site, Puako, Hawai'i Island. Scanned from LEE & STASAK 1999.

5) Petroglyph with *tapu* or *mana* lines from the Kaeo 10 site, Puako, Hawai'i Island. 76 x 43 cm. Scanned from LEE & STASAK 1999.

6) Petroglyph with ritual botanical headgear from the Ka'upulehu site, Hawai'i Island. 130 x 83 cm. "A finely pecked chiefly figure with muscles, elaborate headdress, and an unusual mushroom-shaped head." Scanned from LEE & STASAK 1999.

7) Petroglyph from the Ka'upulehu site, Hawai'i Island. "Two finely pecked muscle figures with oddly shaped heads...have been vandalized by gross pecking." Scanned from LEE & STASAK 1999.

8) Mushroom head from Ahupu Iki site 121G, Kaho'olawe Island. Scanned from LEE & STASAK 1999.

9) Detail (full glyph on back cover of this issue). Mushroom head from Kukui Point, Lana'i Island. Scanned from LEE & STASAK 1999.

10) An interesting comparison to the Hawaiian mushroom helmets; this image is *not* from Hawai'i, but rather it depicts a "Mexican goddess representing the spirit of *teonanácatl* mushrooms incarnate, from Mixtex *Codex Vindobonensis*, circa 1500 A.D. The mushrooms issuing from her head mirror a motif found in the Mexican *Lienzo de Zapatepec*, in first millennium B.C. petroglyphs from Siberia and in more ancient petroglyphs from Tassili, Algeria...Drawn by Martín Vinaver, México, April 1993." Scanned from OTT 1993.

## NOTES

1) Here "indigenous" is defined as that culture living on the

archipelago before contact with European cultures. Though the most geographically remote of all cultures, many of the sources of this unique civilization (as encountered by British explorer Captain JAMES COOK and those that followed) remain of unknown origin and probably reflect an eclectic mix of influences from several continents. Another unsettled matter has to do with the historical likelihood that Hawai'i was visited much earlier than previously believed (MCBRIDE 1969; LEE & STASAK 1999). The Spanish recorded an encounter with uncharted islands in this area and Hawai'i's native legends often mention early visitors. These "folk tales" are generally accepted as having a factual basis among the Polynesian "natives." Such Spanish contact is thought to have occurred as early as the 1550s, explaining the introduction of non-Polynesian objects such as the "helmet" headgear, long cloaks, and daggers (LEE & STASAK 1999), but we must not rule out the possibility of even earlier contact.

2) Evidence for pre-contact use of entheogenic mushrooms has been sought in the past—without any published result—by ANDIRJA PUHARICH the controversial parapsychologist and author of *The Sacred Mushroom*, together with DAVID BRAY, a well-known Hawaiian *kahuna*.

3) This conclusion is also based upon the fact that no native species of psychoactive mushroom is yet known, nor is one expected to be discovered (POLLOCK 1974; ALLEN & MERLIN 1999; DESJARDIN 2002). It is true, however, that several species designated "native" have not been bioassayed or otherwise analyzed, and these may yet prove psychoactive (DESJARDIN 2002).

4) As a general rule, the applicability of this principle increases proportionally to the sacredness of the plant. Thus entheobotany, focusing on what are traditionally the most sacred plants and fungi, must not be discouraged by situations like we find in Hawai'i. Rather, such a rare and remarkable case is bound to *reveal* the desired (forbidden) fruits.

5) *Huna*, compared to the terms *mana* and *tapu/kapu* has a much more limited range of meaning. Still, it should be noted that the first definition "minute particle, grain" indicates an inherent mystery or "difficulty of seeing" rather than the religious convention of "hiding" or "disguising" (*i.e.* "keeping secret") spiritual information, which is only the secondary meaning (PUKUI & ELBERT 1971).

6) Such secrecy usually results when the religion of an invading nation establishes oppressive and putative measures or

otherwise co-ops and decimates the competition. Certainly in Hawai'i—where conversion to Christianity was especially swift—this must have played an important role in pushing the “sorcerers” underground, where such traditions may yet be preserved.

7) In addition to possessing a sophisticated spiritual world view, *kahunas* were also “highly specialized experts with considerable skill in physical diagnosis and pharmacology,” according to Drs. F.L. TABRAH and B.M. EVELETH, from a report to the *Hawaii Medical Journal* on “The Effectiveness of Ancient Hawaiian Medicine.” (See [www.naturestruth.com/history\\_of\\_noni.htm](http://www.naturestruth.com/history_of_noni.htm).)

8) Clearly *kukaelio* (“horse dung”) was coined by native Hawaiian speakers *after* the introduction of horses, but using the older root *kukae*. Mushrooms also sometimes went by *mamalu*, meaning umbrella (DESJARDIN 2002).

9) Though for some reason not mentioned in this definition, *akua* carries the primary meaning “God.”

10) Though here extended to canoes, such “construction” can be understood in terms of “growth”—miraculous/non-ordinary/mushroomic growth, as in the present mythological example.

11) Literally “wind of the trailing whistling,” an apparent reference to the pursuing “voice” of the God’s alter ego.

12) Abstract or geometric designs are not uncommon, but they are not necessarily related to naturalistic glyphs. For this reason it would be a mistake to assume that a mushroom-headed glyph combines the human figure with an “abstract” symbol of unknown meaning. The abstract category is of course the most difficult to interpret (LEE & STASACK 1999), and it is probable that many of the “abstract” designs were intended as pictograms of everyday phenomena, which due to their simplicity, have yet to be identified.

13) Included among these preconditions are; the sufficient spread of cattle and horses, the incorporation of a the new mushroom entheogen into the spiritual life of Hawaiians, the incorporation of the motif into their sacred arts, the gradual replacement of previous (and venerable) helmet styles with the fungal design, the wide dispersion of this motif that ARAGO found, and the development of the motif to the high degree of skill to which his renderings attest. All of this would have had to taken place in about 25 years.

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus* ...  
*Epithelantha* ... *Pelecypora* ...  
 obscure *Trichocereus* species  
 including new hybrids  
 and cristate/monstrose  
 San Pedros and others ...  
*Turbinicarpus* ... *Aloe* ...  
*Bursera* (source of copal) ...  
*Delosperma* ... *Ipomoea* ...  
*Pedilanthus* ... *Sceletium* ...  
 and more!

We also offer an extensive guide to grafting cacti and other succulents.

Our catalog is fully illustrated, and loaded with ethnobotanical and horticultural information.

Please send \$2.00 to receive a catalog and additional rare plant & seed supplements throughout the year.

**Join us in beautiful Negril Jamaica, for a 6-day consciousness expanding seminar like you've never experienced before!**

#### TICKETS

\$1000 (early bird, before August 1) or \$1,300 (from August 1–September 15).

Tuition includes admission to all lectures and events, accommodations (double-occupancy), delicious Jamaican food (vegetarian and vegan available), and all alcoholic beverages.

Airfare and transfer to the resort not included.

Payment can be made with a credit card through PayPal ([www.paypal.com](http://www.paypal.com))

by sending the money to the e-mail address [mindstates@prodigy.net](mailto:mindstates@prodigy.net),

or mail a check or money order to: Mind States, POB 19820 (Dept. ER), Sacramento, CA 95819

Jamaica is an island paradise, with beautiful white sand beaches, a turquoise sea, coral reefs, swaying palm trees, winding mountain rivers, and spectacular waterfalls. To paraquote one guidebook: "It is a 'far-out' setting where you can drool over sunsets of hallucinogenic intensity that have nothing to do with the 'magic' mushrooms that show up in omelettes and teas." Our seminar will be held in Negril, "a place where inhibitions are lost and pleasures of the flesh rule." Although strictly speaking, *Cannabis* is illegal in Jamaica, it is clearly tolerated to a larger degree than in the United States: "Herb is a part of daily life in Negril so don't be surprised if your first potential supplier is your hotel porter and you lose count of the men who hiss 'sensi' as you pass them in the street." Of course, Jamaica is also renowned for its 'world' music, particularly the reggae of Bob Marley and others. The attitude in Negril is laid-back and "hippie friendly."

# POLYDAMNA'S DRUG: EGYPTIAN BEER AND THE KYKEON OF ELEUSIS

by THOMAS JENDEN RIEDLINGER

Of many so-called “mystery religions” in ancient Greece, the cult of the Goddess DEMETER at Eleusis was by far the most significant. For two thousand years, from the mid-1400s B.C.E. until 395 C.E., up to three thousand people a year took part in the cult’s secret rites in a temple in the city of Eleusis near Athens (see map, FIG. 1). Any person who spoke Greek and who had not committed murder could participate once in a lifetime. For most people once was enough to completely transform their metaphysical beliefs. “Thrice happy are those of mortals, who having seen those rites depart for Hades; for to them alone is granted to have a true life there,” wrote SOPHOCLES with obvious enthusiasm (RUCK in WASSON *et al.* 1978). According to the poet PINDAR, what they saw confirmed that life has a “divinely granted beginning” and some form of continuity beyond the grave (RUCK in WASSON *et al.* 1978). CICERO likewise reported that the rites had revealed to him life’s “true foundations” and convinced him “we can live with joy...and die with a better hope” (CICERO, *De legibus* 2.38.). This was not something that initiates were asked to take on faith. Instead it was experienced by them in such a way that even SOPHOCLES, PINDAR and CICERO declared themselves convinced. Other famous initiates not known to be gullible include EURIPIDES and the formidable Roman Emperors AUGUSTUS, HADRIAN, and MARCUS AURELIUS.

Exactly what transpired in the Mystery Rites of Eleusis is uncertain; all initiates agreed to keep that secret under pain

of death. However, some important clues are found in the *Homeric Hymn to Demeter*, an ancient Greek poem containing what scholars consider the “official story” of the cult’s traditions (MYLONAS 1969). Composed as an oral tradition in the second millennium B.C.E. by an unknown author—not HOMER—and first written down near the end of the seventh century B.C.E., it tells the story of DEMETER, the Goddess of agriculture, whose daughter PERSEPHONE is kidnapped from the surface of the earth by HADES, God of the underworld. Not knowing where PERSEPHONE has gone, DEMETER leaves her home on the island of Crete to find the girl. After months of fruitless searching she discovers PERSEPHONE’s fate and also learns that because ZEUS himself had authorized the kidnapping her daughter cannot be retrieved from HADES. DEMETER collapses in grief on a rock beside a well near the town of Eleusis. Some local women find her there, but since she has disguised herself as an old

woman they fail to recognize her as a Goddess. When she asks them to help her find work taking care of a newborn child, the women introduce her to queen METANEIRA, wife of CELEUS, king of Eleusis, whose infant son needs a nurse. For a while after taking this position the Goddess remains “mirthless, with a taste for neither food nor drink, wasting away because of her desire for her daughter” (STAPLES in WASSON *et al.* 1978), but eventually she is persuaded to accept nutrition. Refusing red wine as a sacrilege under the circumstances, she directs METANEIRA to make her a non-alcoholic potion of barley, water and *glechon* (mint). Accord-

of death. However, some important clues are found in the *Homeric Hymn to Demeter*, an ancient Greek poem containing what scholars consider the “official story” of the cult’s traditions (MYLONAS 1969). ing to the hymn this potion constitutes “the precedent for the Mystery” (STAPLES in WASSON *et al.* 1978). Thus alcohol was banned from the Rites of Eleusis and participants imbibed a sacramental potion, the *kykeon*, made with only barley, water and mint (MYLONAS 1969). DEMETER then launches an effort to transform the son of CELEUS and METANEIRA into a God by secretly dipping him into the hearth fire every night while his parents are sleeping. METANEIRA sees her doing this and cries out in horror, offending the Goddess, who says that she will not continue the process of making the child a deity. “I would have made this son ageless for all of time and I would have granted him undying honor,” explains DEMETER, “but now he can never escape the demons that bring his death” (STAPLES in WASSON *et al.* 1978). She promises, however, that because she has come to love the boy he will be remembered “in due course as the season returns” (STAPLES in WASSON *et al.* 1978)—a reference, apparently, to one of the themes later celebrated in the Eleusis cult’s ceremonies.

### ERGOT INFUSION: THE WASSON/HOFMANN/RUCK THEORY

How the *kykeon* was made remains unknown. Some, however, think its formulation almost certainly included a secret fourth ingredient. For in seeking to explain how so transformative a vision was revealed so consistently to so many people each year for twenty centuries without being described to outsiders, they suspect that initiates drank some kind of entheogenic substance which caused them to have an experience that could not be described. Modern users of entheogens have likewise reported that they have experienced visions and insights which cannot be explained in words and thus remain ineffable, especially at stronger dosage levels. Yet there seems to be no proof, as we have heard, that psychoactive substances of any kind were used in the *kykeon* of Eleusis: neither barley, water nor mint are mind-altering substances.

One possible solution is a theory proposed in the 1978 book *The Road to Eleusis* by R. GORDON WASSON, ALBERT HOFMANN and CARL A.P. RUCK. According to them, the *kykeon* almost certainly included ergot alkaloids. Ergot is the common name for *Claviceps*, a genus of pharmacologically active fungi that infect grain-bearing grasses. WASSON and his colleagues thought the ergot of Eleusis must have been either *Claviceps purpurea* on barley or *C. paspali* on a grass called *Paspalum distichum*. *C. purpurea* has the advantage of being closely linked with barley, the specified grain at Eleusis. Its chemical constituents, however, include a high percentage of potentially deadly peptide (non-water soluble) alkaloids, most notably ergotamine, in addition to entheogenic nonpeptide (water soluble) alkaloids such as ergonovine, a botanical source sometimes used as a starting material for LSD synthesis. *C. paspali* contains only entheogenic nonpeptide alkaloids but has the disadvantage that it seldom grows on barley. Furthermore, it is now believed that the host grass, *P. distichum*, was not native to Europe, but originated in America and was introduced into Europe only after COLUMBUS (FESTI & SAMORINI 1999).

Adding either of these ergots to DEMETER's sacred formula would seem to be, at best, a deviation and at worst a profane violation. However, one could argue that ergotized barley is not technically a fourth ingredient. WASSON and his colleagues therefore wondered if the priests who prepared the *kykeon* knew some secret way to neutralize or separate out peptide alkaloids from *Claviceps purpurea*. They surmised that this could have been done by soaking the fungus in water and filtering out the particulate matter that did not dissolve. Presumably this would have left only nonpeptide alkaloids such as ergonovine dissolved in a water solution that was safe to drink. However, ergonovine does not have the famous potency of pure LSD, a substance obtainable only by "semi-synthesis" of certain alkaloids using laboratory methods that were unknown to the ancient Greeks. In fact, it was not until 1938 that ALBERT HOFMANN first produced LSD from ergonovine in his laboratory at SANDOZ PHARMACEUTICALS in Switzerland. Pure LSD reportedly is twenty (WASSON *et al.* 1978) to two hundred (OTT & NEELEY 1980) times more psychoactive than an equal dose of ergonovine. So in order to approximate the potency of LSD the *kykeon* would have needed to contain a comparatively heavy concentration of this alkaloid. Even that may not have worked. When HOFMANN consumed pure ergonovine at about ten times the dosage that would have been optimal with LSD he found the effects to be physically uncomfortable and only somewhat entheogenic (WASSON *et al.* 1978). This, and additional research by others, suggests that ergonovine at high doses causes nausea, vertigo, lassitude and other unpleasant physical effects (OTT & NEELEY 1980).

Such research is compelling. But it does not prove conclusively that drinking a potion prepared via water infusion from ergotized barley would produce the same effects as a pure dose of ergonovine prepared in the laboratory. It may be that less sophisticated methods of extracting ergot alkaloids from *Claviceps purpurea*, for example, would achieve a different outcome since the relative percentages of alkaloids in ergot can vary within the same species over time and in different regions and depending on the host grain. Why, then, did WASSON and colleagues not test their own theory by making and drinking a water infusion of ergotized Grecian barley? I suspect—since they do not address this in their book—that they feared ergot poisoning. The problem is that processing ergotized barley by simple infusion is too primitive a method to ensure that all the toxic ergopeptides will be filtered out. No doubt they were especially concerned about the heavy concentrations of ergotamine in *C. purpurea*. Ingested in even small quantities this alkaloid causes "ergotism"—gangrene

and consequent limb loss from restricted blood flow (vasoconstriction), convulsions, a raging delirium and possibly even death. It therefore seems likely that healthy respect for ergotamine's deadly effects is an unstated reason that WASSON and colleagues endorsed *Claviceps paspali* over *C. purpurea* as a candidate for the *kykeon*, even though *C. purpurea* is more closely linked with barley and as such would seem to have the stronger claim.

## ERGOT DECOCTION: A NEW THEORY

In this context I would like to recommend a new hypothesis that possibly explains how *Claviceps purpurea* could have been processed with primitive methods to produce a safe yet potent concentration of entheogenic ergot alkaloids. Specifically, I am suggesting that it may have been prepared with a modified beer-brewing process using nothing but ergotized barley (*i.e.*, barley infested with *C. purpurea*) plus water and mint. If this process were stopped at a point just before fermentation the result would have been, I believe, a kind of non-alcoholic "near beer" having entheogenic properties that satisfies all of the strictures imposed by the *Homeric Hymn to Demeter*. The key to my hypothesis is that this potion's safety would not hinge exclusively on filtering out ergopeptides but also on making these alkaloids indigestible and therefore non-toxic if swallowed.

Imagine a formula starting with barley infected with *Claviceps purpurea*. The barley is ground in the husk without letting it "malt" (*i.e.*, germinate). Water then is added and the mixture is brought to a rolling boil for at least half an hour. After boiling, the water containing the ergotized barley is cooled, passed through a filter to eliminate most if not all of the chaff and then drunk almost immediately without adding any yeast, since yeast would produce fermentation which in turn creates alcohol. Such a method, called decoction, would produce a very different kind of potion than if ergotized barley had simply been soaked in water as WASSON, HOFMANN, and RUCK proposed. For grinding up the barley grains and boiling them in water would release substantial quantities of condensed tannins (proanthocyanidins) from the husks. (All references to tannins in this essay mean specifically condensed tannins as opposed to hydrolyzable tannins, which have different chemical properties. Grain husks contain concentrations of condensed, not hydrolyzable, tannins.) When these tannins are added to water the water becomes a colloidal solution that has a distinctive sharp "puckering" taste called astringency; red wine and tea are two common examples. In such solutions condensed tannins bind with alkaloids, and also with peptides and proteins that have pro-

line, an amino acid, in their chemical structures. Boiling enhances this binding process, driving compatible molecules together to form complexes. As the boiled solution cools these newly-formed complexes precipitate out as particles and clumps that can be filtered and discarded. Presumably this process would reduce the risk of ergotism even if the barley were infested with *C. purpurea*, since ergotamine's chemical structure includes proline. Furthermore, since tannin-alkaloid complexes are not digestible, the danger that some of them might be sufficiently small to slip through a filter would be neutralized as well, for if swallowed they would pass harmlessly through the digestive system. Entheogenic ergonovine and other non-peptide alkaloids of *C. purpurea* that dissolve in a water solution would survive all these steps as an active ingredient, with increased concentrations presumably boosting the entheogenic effect.

One drawback to this method is that the effects of ergot poisoning are too horrible to run the risk of using too little tannin. It therefore would be safer to flood the solution with more than enough to remove and/or neutralize all peptide ergot alkaloids. But in that case any tannins that failed to bind with ergopeptides would stay in solution. Depending on how much remained the solution's astringency could render it undrinkable. Worse, ingesting too much tannin also can be poisonous, causing nausea, abdominal pain, vomiting, liver damage, and perhaps even death from respiratory failure. Excess tannin clearly needs to be removed from the solution after all the ergopeptides have been filtered out or neutralized.

I believe there is a relatively simple way to do this without adding "unauthorized" extra ingredients. A quantity of barley free of ergot could be separately malted, dried, crushed and then soaked in cool or tepid water, producing by infusion a solution much richer in protein with substantially less tannin than the boiled solution of ergotized barley prepared by the decoction method. If these separate solutions then were blended and left standing for a while at room temperature, the excess tannin molecules from both of them would bind with certain proteins which, like ergot peptide alkaloids, have proline in their chemical structures. These tannin-protein complexes precipitate out of solution like the tannin-ergopeptide complexes and thus can be removed by filtration, achieving a significant reduction in the quantity of tannins still remaining in solution. *[While the mechanism being proposed is certainly sound, it is worth considering that since tannins are well-known for forming insoluble precipitates with alkaloids in general, it is possible that the desired non-peptide*

*alkaloid(s) may also end up as precipitates (and hence the theory might not work quite as suggested). This is a good reason why some enterprising graduate student should test the proposed theory prior to any bioassays being conducted. — Eds.]* The trace amounts of tannin that remained would not be harmful. However, there likely would be enough to make the potion mildly astringent and perhaps cause sensations of queasiness in people with delicate stomachs. In that case it makes perfect sense that mint was added to the *kykeon*, for mint both masks astringency (think of mouthwash) and helps suppress gastric distress.

## EGYPTIAN BEER

Let me emphasize again that this modified brewing process would have stopped short of fermentation, producing a solution free of alcohol. Other than that, its procedures conform with traditional beer-brewing methods. That is actually an understatement. The two-part decoction/infusion method I have just described is an unusual technique that has been traced to ancient Egypt between 1550 and 1307 B.C.E., a period that neatly overlaps the known beginning of the Mystery Rites at Eleusis in the 1400s B.C.E. According to fairly reliable records including the "Parian Chronicles" of ancient Greece, the cult of DEMETER was established at Eleusis sometime during the period 1462 to 1408 B.C.E. (MYLONAS 1969).

Until recently this ancient brewing method was effectively a secret, having been replaced by more familiar methods in the distant past and subsequently lost to human memory. On the basis of paintings in tombs and sketchy written information, archaeologists believed that the ancient Egyptians made beer from baked bread, not directly from grain, by mixing crumbled bread with water and then pressing it through a sieve. This produced a solution rich in nutrients and yeast for fermentation. But in the mid-1990s an analysis of residue in beer pots discovered at two different archaeological sites in Egypt—DEIR EL-MEDINA (1550–1307 B.C.E.) near the Valley of the Kings and Queens and AMARNA (ca. 1350 B.C.E.) in Middle Egypt—found something unexpected. The residue included trace amounts of both malted and unmalted wheat grains and two different kinds of starch granules. One kind is fairly intact and therefore typical of starch from grains that have not been processed with heat. The other kind is swollen and distorted in a way that indicates heat exposure. Scientists concluded that the beer stored in the pots had been brewed with a two-part process that combined unheated malt with either heated malt or heated unmalted grain (see FIG. 2); baked bread was not part of the

formula. Specifically, one batch of barley or wheat was processed by infusion using only cool water and an equal batch of the same grain by decoction with boiled water. The separately processed solutions then were combined, sieved to filter out chaff, and fermented for several days.

In her paper announcing these findings, DELWEN SAMUEL did not hazard an opinion as to why the Egyptians adopted a two-part brewing method (SAMUEL 1996). She and a colleague have elsewhere proposed that it probably helped regulate brewing temperatures (SAMUEL & BOLT 1995) in a region where excessive ambient heat can destroy enzymes needed to make sugars that are changed into alcohol during fermentation (FAIRLEY 1992). Another possibility is that this brewing method helped reduce the risk of side effects from

grains infested with ergot or other toxic fungi. In time this may also have led the Egyptians to discover ergot's entheogenic powers. That would not be inconsistent with historical accounts ascribing herbal expertise to the ancient Egyptians. For example, HOMER writes in a passage on HELEN OF TROY in *The Odyssey* (4: 216–232):

These drugs of subtle virtue the daughter of Zeus was given  
By an Egyptian woman, Polydamna, wife of Thon;  
For the rich earth of Egypt bears many herbs  
Which steeped in liquor have power to cure, or to kill  
(HERODOTUS 1972).

Did the ancient Egyptians discover in ergot a similar "POLYDAMNA'S drug" and harness its power for use in their

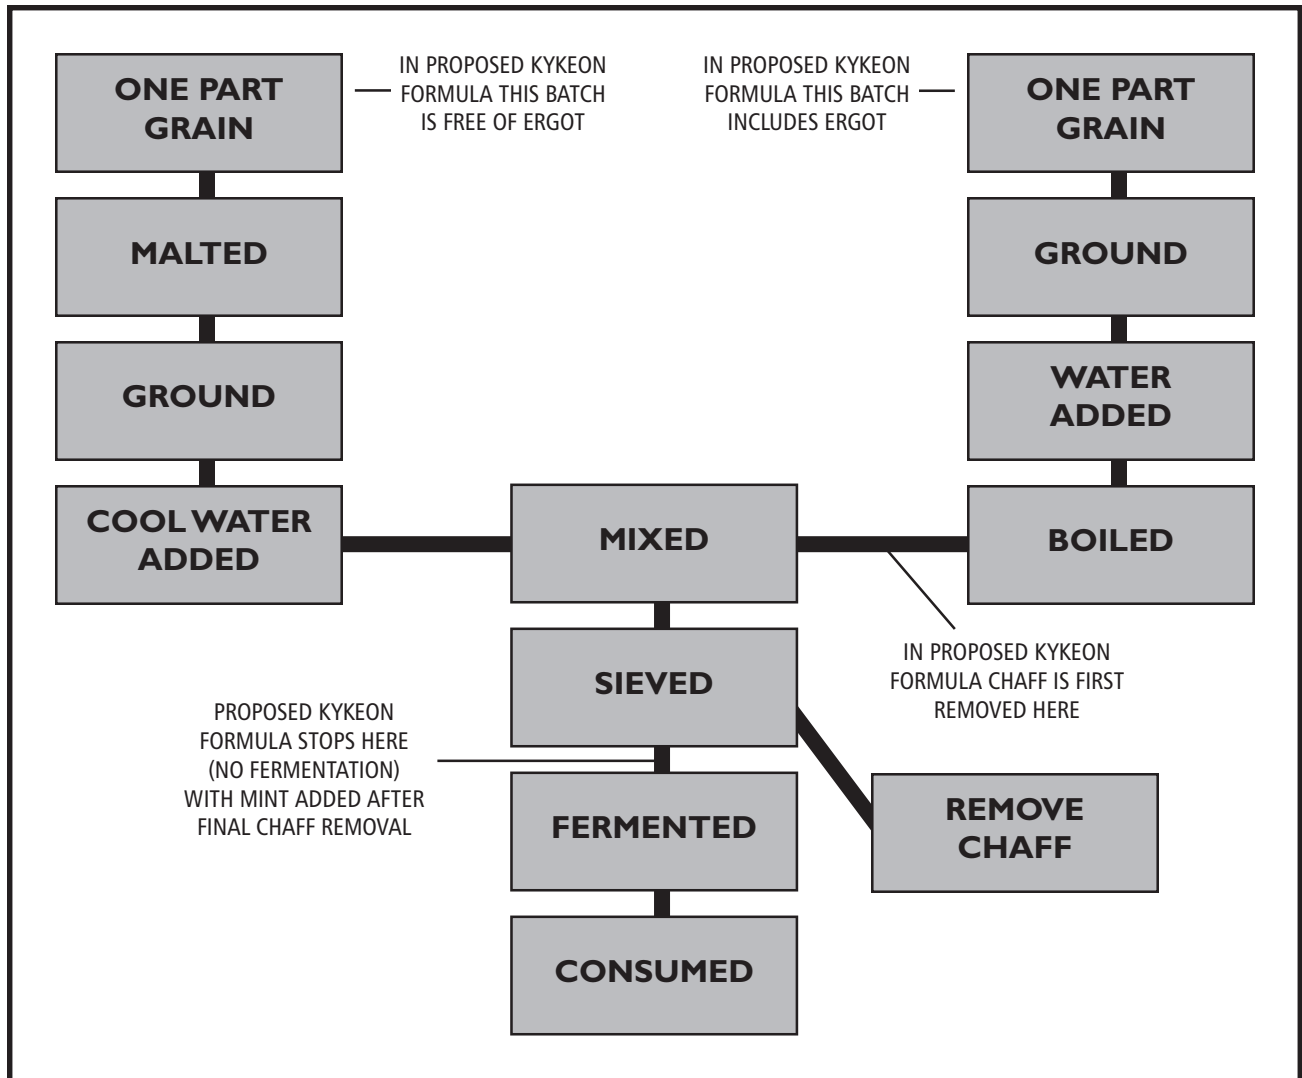

FIGURE 2: Diagram showing suggested reconstruction of beer brewing method used in ancient Egypt. Adapted from SAMUEL, D. and P. BOLT 1995. "Rediscovering Ancient Egyptian Beer," *Brewer's Guardian* 124(12): 26–31.

religious rites? Was this the original source of the *kykeon* imbibed at Eleusis? I am reminded that HERODOTUS, the ancient Greek “father of history,” believed that the Egyptians had “originated, and taught the Greeks to use, ceremonial meetings, processions, and liturgies,” including a “solemn assembly” in a temple devoted to ISIS, “the Egyptian equivalent of DEMETER” (HERODOTUS 1972). He himself had been present at one such assembly that honored OSIRIS, the brother and husband of ISIS. However, he would not reveal what he had experienced there, apparently because of its resemblance to the secret of Eleusis (HERODOTUS 1972).

It is worth noting at this juncture that the myth of OSIRIS and ISIS echoes several major themes also found in the myth of DEMETER and PERSEPHONE. Like DEMETER in her role as the Goddess of agriculture, OSIRIS was a deity who created “life from death in the depths of the earth, being thus the force that is inherent in sown grain and rising flood waters” (ALLEN 1997). And like DEMETER seeking PERSEPHONE, ISIS reportedly wandered the world in search of OSIRIS’s body after he was killed by SETH, a God who coveted her. At one point during her quest, the Goddess sits beside a fountain near the town of Byblos in the papyrus swamps of the Nile Delta, refusing to speak to anyone except the local queen’s handmaidens. Exactly like DEMETER at Eleusis, she has disguised her true identity; takes work as a nurse to the queen’s youngest son; dips the boy into fire each night to make him immortal; is seen doing this one evening by the queen, who shouts in horror; and resolves therefore, because she is offended, to deprive the young prince of “that immortality which would otherwise have been conferred upon him” (SPENCE 1990/1915).

HERODOTUS also reported that the “daughters of DANAUS,” a mythical king of the city of Argos in southeastern Greece, brought the “mysterious rites of DEMETER” to Greece from Egypt (HERODOTUS 1972). Modern scholars such as PAUL FOUART, JAMES FRAZER and LEWIS SPENCE likewise endorse a connection between Egypt and Eleusis. Persuaded by the writings of HERODOTUS and by the parallels between the myths of ISIS and DEMETER, FOUART believed that the DEMETER cult in Greece derived, at least in part, from the ISIS cult in Egypt (FOUART 1914). FRAZER argued in his landmark book, *The Golden Bough*, that the “kernel of the mysteries, the innermost secret revealed” to OSIRIS cult initiates in Egypt and DEMETER cult initiates at Eleusis was essentially the same, involving deities who personified the annual return of food crops (FRAZER 1950/1922). And according to SPENCE, the Greek mystery rites initially were practiced by

the earliest known inhabitants of the Greek peninsula before their land was invaded and conquered in the mid- to late second millennium B.C.E. These conquered peoples, who had “inherited a strong cultural influence from Egypt,” then “adopted the mystic attitude in order to shroud their religious ceremonies from the eyes of the invaders,” SPENCE claimed (SPENCE 1990/1915).

## THE CRETAN VECTOR

A major argument against all theories linking the Rites of Eleusis with a source in ancient Egypt is that “not a single object of Egyptian origin, or indicating Egyptian influence” and dating from the second millennium B.C.E. has been found at Eleusis (MYLONAS 1969). However, there may be an explanation for this absence of hard evidence. Though our primary source of information on the Mystery Rites of Eleusis, the *Homeric Hymn to Demeter*, does not mention Egypt it does identify the island nation of Crete as DEMETER’s homeland, where she was revered as the GREAT MOTHER (RUCK in WASSON *et al.* 1978). ARTHUR EVANS, the famed archeologist who supervised extensive excavations on Crete in the late 19th and early 20th century, observed that the Minoan culture which flourished there until the mid-1400s B.C.E. had “practically uninterrupted relations with Egypt” for about two thousand years (EVANS 1964). He called special attention to artifacts found at the site of the Temple of Knossos on Crete that date from the end of the Minoan culture around 1450 B.C.E. According to EVANS: “The reproduction of Nile scenes by Minoan artists is at times so accurate and detailed as to convey the impression that guilds of Cretan craftsmen were actually working at this time on Egyptian soil” (EVANS 1964). At about the same time, circa 1470 to 1450 B.C.E., Egyptian artists were embellishing a tomb at Karnak in Thebes with paintings that show visitors from Crete delivering gifts (LUCE 1969). The tomb is that of REKHMIRE (REKHMIRE), a vizier to the Pharaoh TUTHMOSIS III, whose name is found etched on a jar that EVANS unearthed from a Cretan warrior’s grave near Knossos (LUCE 1969). The warrior’s grave is located in Katsamba, a harbor town of Knossos. TUTHMOSIS III (also known as THUTMOSE III) reigned from about 1490 to 1436 B.C.E. REKHMIRE died and was buried circa 1450 B.C.E., by which time his tomb had been under construction for twenty years.

EVANS also mentioned with “great interest” a small, high-spouted jug about 6 inches tall, exhumed at Knossos, which was decorated with two molded triple sprays of barley. “Though the vessel is small we may perhaps infer that the liquor for which the vases were intended was not uncon-

nected with 'John Barleycorn,'" EVANS concluded. It seemed obvious to him that "some kind of beer was brewed in Crete" and that its use "preceded that of wine in the island" (EVANS 1964). But CARL KERÉNYI, an expert on ancient Greek mystery cults, later commented that the "small size of the vessels on which this view was based argues rather that they were used for that other barley drink—consumption of which was a requirement for the participants in the Mysteries of Eleusis—in ceremonies which allegedly were performed without secrecy at Knossos" (KERÉNYI 1976). The late TERENCE MCKENNA was likewise convinced that the Eleusinian Mysteries "were clearly connected to Minoan rites" on Crete (MCKENNA 1992). He also claimed, incorrectly, that WASSON and colleagues had argued that the *kykeon* was "an ergotized beer brewed from a strain of ergot fungus" (MCKENNA 1992), thus foreshadowing the theory I have laid out in this essay.

The foregoing facts and opinions suggest that public rites involving barley beer may have been transferred from Crete to Eleusis as a secret—*i.e.*, as a mystery for reasons such as SPENCE proposed—that still used a drink made from barley when Crete's Minoan culture collapsed around 1450 B.C.E. But because the *Homeric Hymn to Demeter* proscribes alcoholic beverages, scholars have tended to think that the *kykeon* could not have been beer<sup>1</sup> and therefore must have been different from the sacramental drink of Minoan Crete. Reinforcing this assumption is the fact that beer seldom was drunk by ancient Greeks, who favored wine. It is worth noting that the opposite was true in ancient Egypt, where beer was ubiquitous and wine comparatively rare. If the sacramental substance of the Eleusinian Mysteries originated there it more likely began as a beer product during the Old and Middle Kingdom periods from about 3100 to 1630 B.C.E., when barley was preferred by the Egyptians; only later did they favor wheat (SALLARES 1991). In that case, the Minoan Cretans may have used the same formula, learned from their commerce with Egypt, which later was adapted by the Eleusinian priests to eliminate alcohol.

I surmise that the cult at Eleusis began as a satellite community of Cretans, based there or in Athens, who found themselves cut off from their homeland when Crete was invaded and sacked circa 1450 B.C.E., apparently by Mycenaean soldiers from the Greek peninsula. Or perhaps the Eleusis cult founders were priests who fled Crete when the Palace of Knossos was torched by these invaders. In either case, the Cretans who founded the cult at Eleusis disguised their religion to hide its true provenance during this time of oppres-

sion, thus ensuring its survival as a mystery religion in the culture that evolved as Classical Greece. In this manner the former GREAT MOTHER OF CRETE, whose original name had been Isis in Egypt, became the Greek Goddess DEMETER; and her sacramental potion, which had once been an ergotized beer, became the ergotized *kykeon* using all the same ingredients but stopping short of fermentation.

It is not clear why alcohol would have been eliminated from the recipe and any conjecture on that point would clearly be only speculative. Most likely the priests of Eleusis dropped the fermentation stage for two basic reasons. It was not needed to make the potion psychoactive and eliminating alcohol disguised the potion's connection to Egyptian and/or Cretan beer. It also may have been a cultural preference, though probably not in reference to DIONYSIAN wine because that was a later development in ancient Greece. It should be kept in mind that the *Homeric Hymn to Demeter* most likely reflects an already established tradition (in other words, it is a retroactive explanation); the hymn probably does not precede the Rites of Eleusis.

So urgent an effort to hide the cult's Cretan connections may also explain what might be called the "Kyrnos problem." According to GEORGE MYLONAS, excavation of the earliest archeological strata at Eleusis turned up "not a single object" that indicates Cretan origin or influence (MYLONAS 1969). However, he goes on to say:

The sanctuaries of Demeter have yielded a special type of a vase known as the Kernos...It is very characteristic of our site and of the Eleusinian cult, and it was taken as evidence of Kretan [*var.* Cretan] or Minoan influence. In spite of differences, the Kernoi can be compared to Minoan multiple pots and as Nilsson remarks 'nobody denies the connexion [*sic*], although about a thousand years intervene between the Minoan and the Greek (Eleusinian) specimens.' This chronological difference, we believe, excludes Minoan influence; if it existed, we would expect to find such vessels in the early strata of the Sanctuary of Eleusis (MYLONAS 1969).

In my opinion, both the absence of Minoan Kernoi in the earliest archaeological strata of Eleusis and their prominent use by the cult so long after the culture of Minoan Crete had collapsed might well reflect a preservation strategy: No Kernoi are found in the earliest strata because their original use at Eleusis was limited to sacred objects kept from public view, a common practice in religions. Thus carefully preserved and passed in secret from one generation of priests to

another for hundreds of years, they eventually resurfaced as a cultic emblem. By then the Kernoi style was a Minoan anachronism paying faithful homage, it may be, to the cult's Cretan homeland.

## CONCLUSION

Like WASSON, HOFMANN and RUCK, I have not personally tested my *kykeon* theory using raw ingredients. That is because to ingest such a potion prepared with ergot alkaloids before it has been analyzed and certified nontoxic could be crippling, perhaps even fatal. One special problem in this case is that relatively minor alterations in the chemical structures of ergot alkaloids and polyphenols such as condensed tannins cause dramatic variations in their pharmacological effects. So the relative percentages of either substance left in a processed solution must be carefully determined using mass spectrometer analysis and other sophisticated laboratory methods. Only then would I feel confident drinking a potion prepared from an untested theory like mine or that of my predecessors. MCKENNA put it this way in a memorable turn of phrase regarding those who are tempted to prove by self-experimentation the WASSON/HOFMANN/RUCK theory: "There are old mycologists, and there are bold mycologists, but there are no old, bold mycologists" (MCKENNA 1992).

As for archeological proof of my theory, I do not expect it to come from Eleusis. There is room for reinterpreting the evidence already found there, but no further, unsuspected revelations will emerge from excavations at the site. This is poignantly expressed by GEORGE MYLONAS, a former director of excavations at Eleusis, in a passage from his book on the Eleusis cult:

For years, since my early youth, I have tried to find out what the facts were. Hope against hope was spent against the lack of monumental evidence; the belief that inscriptions would be found on which the Hierophants had recorded their ritual and its meaning has faded completely; the discovery of a subterranean room filled with the archives of the cult, which dominated my being in the days of my youth, is proved an unattainable dream since neither subterranean rooms nor archives of the cult exist at Eleusis; the last Hierophant carried with him to the grave the secrets which had been transmitted orally for untold generations, from the one high priest to the next (MYLONAS 1969).

It still is possible, however, to explore the vast archeological records of Minoan Crete and ancient Egypt in hope of find-

ing evidence that clarifies somewhat the origins of the Mystery Rites of Eleusis, with special emphasis on hitherto neglected botanical artifacts. The climate of mainland Greece is not very conducive to preserving botanical specimens. That of Crete is better, as evidenced by the discovery of large jars called *pithoi* at Knossos that still contained peas, barley and beans (WOOD 1985). But Egypt's arid climate is perfect for such preservation. Which is why beer residue in pots that had been buried for well over two thousand years could still be analyzed.

Egyptian mummies, too, have provided botanical evidence of possible commerce with Crete. BILL BAUMANN reports that the mummification process involved packing body cavities with the aromatic "sprout lichen" *Evernia furfuracea*, also known as "oak moss." Since *E. furfuracea* does not grow in Egypt, BAUMANN believes that it must have been imported from the "more moist Islands of the [Greek] Archipelago" (BAUMANN 1960), a reference to Crete, where it is common (LUCE 1969), and the Cyclades.

Another and more pertinent example of Egyptian archaeobotany involves a tomb in the foundation of a funerary temple near Abusir, Egypt, that was sealed and abandoned to the desert's shifting sands four thousand years ago (LINDAU 1904). The tomb was a later addition (ca. 2000 B.C.E.) to a funerary temple built for King NIUSERRE of the Fifth Dynasty (2450 to 2321 B.C.E.). When reopened at the start of the 20th century by German archeologists, its contents were found to include emmer wheat chaff mixed with "spikelets" of a weed called *Lolium temulentum*. The latter, more commonly known as darnel, caught the attention of a botanist in Germany named GUSTAV LINDAU who suspected that seeds in the spikelets were themselves a kind of tomb for what he called "des Pilzes des Taumellolchs" (the mushroom of the Taumellolchs), a German designation for darnel. By this he meant any of several fungi that commonly infect *L. temulentum*. Using only an optical microscope, LINDAU confirmed his hunch: all of the seeds had been infected with a fungus at the time of their interment. The fungus's identity remains an open question pending DNA analysis of LINDAU's samples, which likely no longer exist. According to some it probably was *Endoconidium temulentum*, a fungus especially fond of darnel (SALLARES 1991). But another, more intriguing possibility is *Claviceps purpurea*, which also commonly infects darnel. Both HOFMANN and RUCK in *The Road to Eleusis* suggest darnel as a possible source of the ergot used in making the *kykeon* (WASSON *et al.* 1978) and RUCK has noted, both alone and with STAPLES, that the

ancient Greeks considered darnel a "reverted" or primitive form of barley (RUCK in WASSON *et al.* 1978; RUCK & STAPLES 1994). It thus seems feasible that ergot-infested darnel or ergot harvested from darnel may have been the suspected secret fourth ingredient of the *kykeon*, acceptable as such because the weed was so closely identified with barley.

These examples, of course, do not prove a connection between ancient Egypt and Eleusis or even that *Claviceps purpurea* was extant in ancient Egypt. They do, however, represent the kind of neglected discoveries already in the record that may prove to have some bearing on the secrets of Eleusis and perhaps on the transmission of its mysteries. As WASSON succinctly observed in his book aptly titled *The Wondrous Mushroom: "New perspectives in ethnomycology are beckoning to us"* (WASSON 1980). ☉

## NOTES

1) One notable exception is an essay by CHARLES MUSÈS on "The Sacred Plant of Egypt" which appears in RÄTSCH, C. (Ed.) 1989. *Gateway to Inner Space: Sacred Plants, Mysticism and Psychotherapy*. PRISM PRESS, pp. 143–159. MUSÈS argues that the doctrines of the Mystery Rites of Eleusis can be traced to cults in Egypt that consumed the leaves of a treelike shrub called khat (qat)—*Catha edulis*. He briefly mentions that his friend, the Egyptologist JEAN-CLAUDE GOYON, once proposed in a letter to him dated 18 February 1985 that the ancient Egyptians "perhaps also knew of ergotized grass." GOYON credibly surmised that this is possibly reflected in the curious myth of an Egyptian Goddess, HATHOR, who got drunk on barley beer containing mandrake and some of the blood of human beings she had killed. MUSÈS brushes off his friend's suggestion on the grounds that "it is not a grass (much less a mushroom) to which the ancient hieroglyphic and hieratic texts [of ancient Egypt] refer...when they speak of the divine plant that can manifest the gods." According to MUSÈS, this plant undoubtedly was *Catha edulis*.

# TCHAI

by R. STUART

BOB WALLACE'S PROMIND FOUNDATION provided a grant through the MULTIDISCIPLINARY ASSOCIATION FOR PSYCHEDELIC STUDIES to sponsor this investigation into the ethnobotanical mystery of a putative hallucinogen called "tchai."

In a 1965 paper presented at an AMERICAN ANTHROPOLOGICAL ASSOCIATION meeting, MICHAEL HARNER discussed an ayahuasca admixture plant called *cha'i*:

Carneiro (1964:8) also reports that the Amahuaca may add as many as two plants other than *Banisteriopsis* to the brew. Native names for two plants besides kawa which may be added for strength are "chuchupawa", "cha'i" and "chuchupano" ("tow'i" in Spanish) (Carneiro, unpublished field notes). Cha'i is sometimes drunk first, before taking ayahuasca, to increase the hallucinations (HARNER 1965).

HARNER noted that anthropologist ROBERT CARNEIRO's published report mentioned two admixture plants (CARNEIRO 1964). However, CARNEIRO's Amahuaca field notes also listed the names of two additional herbs, so there were a total of four admixture plants. The preceding passage by HARNER has confusing wording; it miscounted these four distinct plants as being only two, and misspelled the last letter of what CARNEIRO's field notes listed as *chuchupana*. To assist with my investigation, CARNEIRO recently searched through several books on Peruvian Amazon flora, but could not find Latin binomials for those two that he spelled *chuchupana* and *chuchupawa*, which perhaps might contain DMT. The herb *toé* (*tow'i*) is *Brugmansia suaveolens*. CARNEIRO's Amahuaca informant stated that *toé* was called *canachiari* by the Shipibo, who today also recognize the name *toé*. CARNEIRO's Amahuaca field notes say that a *nopal* (*Opuntia*) cactus called *cha'i* is sometimes mixed with ayahuasca (CARNEIRO 2002).

Later authors called this cactus *tchai*. The Sharanahua, who live immediately east of the Amahuaca, use the name *tchai del monte* for another ayahuasca admixture, the leaves of the fern *Lygodium venustum* (PINKLEY 1969), and the *tchai* cactus should not be confused with this.

*Tchai* plant,  
possibly *Brasiliopuntia brasiliensis*.

A 1972 article written by LAURENT RIVIER and JAN-ERIK LINDGREN refers to two unidentified cacti used as ayahuasca admixtures. One was an *Epiphyllum* and the other an *Opuntia*. The *Opuntia*, for which there were no voucher specimens, was called *Tchai* in Sharanahua. The article stated:

This cultivated cactus is considered by the Sharanahua to be hallucinogenic. It was brought to Marcos from the Amahuaca living on the Inuya River. The mixture of Ayahuasca and *Tchai* is very strong and is never used medically (cf.36) (RIVIER & LINDGREN 1972).

[Note that the reference "cf.36" erroneously cited an 1888 article on peyote that does not mention *tchai*. K. TROUT notes that this paper mentions some sort of *Epiphyllum*

as containing an unidentified alkaloid, so he suspects that RIVIER & LINDGREN put cf.36 on the wrong line. The "36" may also be a typo for reference 35, an ayahuasca article that, however, also does not mention *tchai*. Reference 36 is: LEWIN, L. 1888. "Ueber *Anhalonium Lewinii*," *Archiv für Experimentelle Pathologie und Pharmakologie* 24: 401–411, and reference 35 is: LEWIN, L. 1928. "Untersuchungen über *Banisteria Caapi* Spr. (Ein Sudamerikanisches Rauschmittel)." *Naunyn-Schmiedebergs Archiv für Experimentelle Pathologie und Pharmakologie* 129: 133–149.]

This information related to a psychoactive *Opuntia* has been repeated in the ethnobotanical literature many times.

SCHULTES 1986; SCHULTES & RAFFAUF 1990; OTT 1993; OTT 1994; OTT 1995; OTT 1996; TROUT 1997/1998; TROUT 1999; SMITH 2000). In 1993, ANTONIO BIANCHI and GIORGIO SAMORINI provided new observations:

Amongst the Shipibo shamans, for example, our informant (Don Guillermo A.) has related how he still uses today, for hallucinogenic purpose, *tchai*, a cactus that, as it probably belongs to the *Opuntia* genus, may be hypothesized as containing molecules of a phenylethyl-aminic nature. Neither he nor any of the shamans that he knows added it any longer to ayahuasca, considering that the experience is too intense. If the presence of mescaline alkaloids in the cactus were proved, it would be the [demonstration] of how the knowledge linked to the interaction of b-carbolin-mescaline is completely disappearing (BIANCHI & SAMORINI 1993).

Their paper also included a photograph of a *tchai* plant that bore the caption “Hallucinogenic cactus, the use of which as an additive to ayahuasca has been documented in the past by Rivier and Lindgren (44); today some Shipibo and Amahuaca shamans use its raw juice.” Upon later becoming familiar with each of the *tchai* plants growing in GUILLERMO’S yard, I recognized that the plant in this photograph was the one that has small branches sprouting from the stump of a large tree that died several years ago from the ground up. The picture gives an impression that *tchai* is a small bush, when actually mature aborescent specimens have a trunk that is 4.5 inches wide and at least 9 feet tall.

Cactophile and author M.S. SMITH noted:

Six *Opuntia* species have been found to contain mescaline, the highest amount being 0.01% within dry material of *O. acanthocarpa* and *O. basilaris*.

*Opuntia* species have a large number of traditional uses in traditional Native American medicine, including treatment for earaches, rheumatism, asthma, and hemorrhoids. A poultice can also be made of the viscous flesh that can be used on bites, burns, abrasions, rashes, etc. (SMITH 2000).

A 1986 chart of ayahuasca admixture plants listed “*Opuntia* sp. Mill.” with the vernacular name “Tchai” as containing “N-Me-Tyramina, mescalina” (N-Me-tyramine, mescaline) (MCKENNA *et al.* 1986; MCKENNA *et al.* in SCHULTES 1995). Two of the citations for this incorrect statement refer to chemical analyses of North American *Opuntias* whose range does not extend into South America (PARDANANI *et al.* 1978; VANDERVEEN *et al.* 1974). The third citation is the 1972 RIVIER & LINDGREN report, which does not mention any analysis of *tchai*.

BELOW: Perfume used in blessings by shaman; perfume and tobacco smoke are blown on participants during *tchai* and ayahuasca ceremonies.

Despite the presence of *trace* amounts of mescaline in various *Opuntia*, none of these have yet been identified as possessing a usable potency. There have been unconfirmed rumors about traditional sacramental use of *Submatucana madisoniorum* (originally in the genus *Borzicactus*, and later in *Matucana*), however my own bioassay with two old cultivated specimens (weight: 0.42 lbs) was negative. *Armatocereus laetus*, another putative sacrament, has not been chemically analyzed (DAVIS 2002), but my own bioassay with the related *A. arboreus* was negative. To date, no visionary cacti have been positively identified in South America outside the widely documented genus *Trichocereus*.

There seems to be only one other possible reference to a *cactahuasca* mixture. A *Peireskia* cactus (a.k.a. *Pereskia*) was presented as apparently being a previously unknown psychotropic plant used by natives in Paraguay. The article stated, “The palmaceas are also frequently used, most commonly in infusions; and, among them, the major psychoactive action they develop are the *Passiflora edules* (*mburucuyá*) and the *Peireskia sandents* (*ysypóvori*)” (COSTANTINI in DÍAZ 1975). This passage is confusing. It implies that the passionflower and the cactus are species of palm. Nevertheless, the use of a semicolon to separate “*Palmaceas*” from “*Passiflora*” and “*Peireskia*” indicate that the latter two are being considered together, separate from the former. Because the latter two plants do not even have a comma between them, perhaps the author of this poorly-worded passage is conveying that the *Passiflora* and the cactus are consumed in combination. Probably “*sandents*” is a misspelling of “*scandens*.” The *Passiflora* species might contain a MAO-inhibitor such as harman that would interact with whatever might be in the *P. scandens* (possibly tyramine or similar molecules like 3-MeO-tyramine).

## THE SEARCH FOR A VISIONARY *OPUNTIA*?

The prospect of finding a visionary *Opuntia*, particularly one whose potency was “too strong,” seemed like an important lead to investigate. BIANCHI kindly directed me to the home of GUILLERMO ARÉVALO, who lives in Yarina, Peru. In November 2001, I took *tchai* in four ceremonies conducted by GUILLERMO’s father BENITO, while other participants imbibed ayahuasca. I did not experience any consciousness alteration other than what might be expected from lying in darkness while listening to chants for several hours.

Four other Shipibo herbalists familiar with the psychoactive and medicinal plants in the Ucayali region recognized *tchai* and all other Opuntoid cactus as having formerly been applied topically to prevent infection of wounds, and one told me that it had also been prepared as a beverage and drunk to treat rheumatism, diarrhea, stomach ache, and body aches. However, none of these other herbalists had ever heard that any *Opuntia* was psychoactive.

Later I conducted another bioassay on the *tchai* leaves from BENITO’s garden. After fasting for 24 hours, I ingested 18 mashed *tchai* leaves weighing 0.17 lbs. While this was not a massive quantity of material, all of the leaves were 100% green “meat,” which is usually believed to be the most potent part of a cactus such as *Trichocereus*. Therefore, I would expect this amount to induce some reaction if *tchai* possessed central activity, particularly since this was more than twice what I

took under BENITO's supervision. In case *tchai* had constituents that would only be active in the presence of  $\beta$ -carbolines, I simultaneously consumed 0.75 teaspoon of pulverized *Peganum harmala* seeds, even though 0.5 teaspoon is all I need for MAO-inhibition. This test did not induce any mind-expansion, and I did not experience nausea or other side-effects.

ALEXANDER SHULGIN performed GC/MS analysis on my *tchai* sample and reported, "There was only one compound that fell in the rational area for alkaloids, and it had a molecular weight of 222. If it was an alkaloid, it would have to have two nitrogens in it and it didn't resemble any of the  $\beta$ -carbolines. But that molecular weight could have also been  $C_{15}H_{26}O$ , or a hydroxy-sesquiterpene, which are widespread in the plant kingdom" (SHULGIN 2002).

Based on my personal experience and the fact that SHULGIN could not detect any known hallucinogenic constituents, I conclude that any psychoactive effect which the natives experience from ingesting *tchai* is based solely on the ritual context and suggestibility induced by the shaman.

K. TROUT identified the *tchai* cactus as a *Brasiliopuntia*, a genus of tropical *Opuntia* with 5 species (TROUT 2001). I believe it is *Brasiliopuntia brasiliensis* (WILLDENOW) BERGER, a.k.a. *Opuntia brasiliensis* (WILLDENOW) HAWORTH (HUNT 1999). The habitat of wild *B. brasiliensis* extends into eastern Peru, and it is so widely cultivated as an ornamental that I even found one growing in my hotel in Lima. ☉

Shipibo magic charms. The plant juice in vial on the left is applied around a man's eyes so he can obtain valuable objects and girlfriends. The vial on the right contains five pulverized plants that are mixed with perfume and applied to a traveler to protect against being bullied by the police.

## AYAHUASCA HEALING RETREAT

in the Amazon rain forest of Brazil

**JULY 22-31, 2002**

There will be lectures, ritual plant ceremonies with *ayahuasca* and *Salvia divinorum*, group sharing, creative artwork expression, biofeedback, regressions, and excursions. Spend ten days in the Amazon rain forest. Located 1.5 hours from Manaus, the lodge has excellent facilities: phone, Internet, air conditioning, swimming pool, and rooms with private bathrooms. \$1,600. Invited staff includes:

- ▼ ZOE SEVEN, techno-shaman
- ▼ ISABELA HARTZ, visionary artist
- ▼ PABLO AMARINGO, shaman/artist
- ▼ JON HANNA, psychedelic researcher
- ▼ FRANK ECHENHOFER, EEG researcher
- ▼ SILVIA POLIVOY, transpersonal psychologist

# STORE REVIEW

by GWYLLM LLWYDD

It is always pleasant to be surprised and deeply engaged with something new and unique. This doesn't happen frequently enough, so it should be savored and shared. Having survived the last 36 plus years of the psychedelic revival, it is nice to see something whose time has come in a most relevant way. What am I talking about? A bookstore. But something more than that. A coffee shop, a video viewing center, an outpost of cognitive liberty...

How many bookstores can you walk into and have a conversation that starts out with H.R. GIGER's art and psychological mind set, moves through WILLIAM GIBSON's prescient vision of the Internet, the possible emerging cyber tools for surfing the net in VR, and the parallels of the DMT guardians and how they resemble certain aspects of the unconscious culture we are emerging from, then end up discussing how memes move through our collective consciousness and inform us about the shifts in the body politic?

In the paraphrased words of PSYCHONAUTICAL SUPPLY's founder and owner, WILLIAM WILLARD: "I wanted to open a bookstore for many years, in fact it has been in the works for six years. I wanted to address the dearth of philosophical discussion on these subjects, to move beyond the dialog that saw entheogens in an 'either or' light, or as something to party with. I envisioned someone coming in to PSYCHONAUTICAL SUPPLY and feeling free enough to have a discussion about freeing the mind; I wanted a place of intelligent discourse, where people would be free to speak and to have honest dialog..."

WILLIAM has achieved just that. PSYCHONAUTICAL SUPPLY reminds me greatly of ATLANTIS BOOKSTORE in London, or THE BODHI TREE in Los Angeles. You walk in and find yourself in a place of great comfort, nicely apportioned, painted in warm colors, a small fire burning in the fireplace, quiet trance music, and books everywhere. The counter tops have blotter paper art from the 1994 exhibit in San Francisco. There are illustrations and photos on the walls of the SHULGINS, ALBERT HOFMANN, TIM LEARY, WILLIAM S. BURROUGHS and other pioneers of the new culture. Not only do they seem to carry every book you could want on psychedelics and entheogens, but there are sections on

music, popular culture, cyber culture, the Beats and more. There is a wide selection of art books in various permutations as well; everything from ROBERT WILLIAMS and ALEX GREY, to ayahuasca paintings and Huichol yarn art.

The sheer number of books offered on the topic of psychoactives is boggling. From TROUT's NOTES and KARL JANSEN's ketamine book to all the currently in print works by the eloquent JONATHAN OTT, it is indeed humbling to find out what you don't have in your library—yet! The magazine section carries *The Entheogen Review* (which looks good on display) the *MAPS Bulletin* (one of WILLIAM's favorites) old copies of *The Resonance Project*, and other magazines in this genre, with about 15–20 titles that I was not familiar with, including the no longer published rag *Psychedelic Illuminations* (while they last). They also carry magazines like *Gothic Beauty*, which appeals to the large Goth culture that has developed over the years in Portland, the provocative *Ad-Busters*, which deals with how we are manipulated by the media through advertisement, cyber-culture magazines, and a host of others. Many of these periodicals are not readily available in most magazine or bookstores, which makes it even more delightful. As well, they carry a wide line of audiotapes, offering selections by TERENCE MCKENNA, SASHA SHULGIN, COLIN WILSON and others. There is a large selection of video tapes, with what seems to be every commercially-produced TERENCE MCKENNA video, including *The Experiment at Petaluma*—one of my favorites. "Video Nights" are being considered at this time, where it looks as if there will be showings of many of the tapes that are available at the store. Hook-ups for video are present in every room of the store, enabling many people to participate in these events. Speaking of hook-ups, they also provide free computer use and Internet access via DSL!

Last, but not least, PSYCHONAUTICAL SUPPLY is a coffee shop, serving the best in local coffees, teas, and desserts. All are fresh and served up promptly. So if you want to peruse a book about analogue synthesis, have a cup of good espresso, and eat a biscotti while relaxing in a comfortable armchair in front of a friendly fire, you have found the right place. ☉

PSYCHONAUTICAL SUPPLY, 2511 SE Belmont, Portland, OR 97214

# NETWORK FEEDBACK

## DOMESTIC TERRORISM UPDATE?

I hope that *The Entheogen Review* reports on the JLF bust, and what's going on there. Have all vendors that sell stuff like DXM shut down? Maybe *ER* could clarify some of these issues? Thank you. — I.S., IL

No, all vendors that sell DXM have not shut down; and, for that matter, DXM is still easily available in over-the-counter medications. However, some of the companies selling other research chemicals such as 2C-T-7, MBDB, and 4-Acetoxy-DET have either quietly withdrawn from the marketplace or they are non-responsive to attempts at contact. MBE TECH, which did close, has reopened in England. However, the rumor is that the people running it are not the same folks as those who started the business, and anyway it is quite odd that this company would relocate to England considering that most of the items that they list as being available were scheduled in England as of February 1, 2002. We have heard that the new version of this company is a rip-off. We've also heard that the new company at [www.e-chemicalsupplier.com](http://www.e-chemicalsupplier.com) is likewise a scam. It would seem as though they have just hoovered the product list from MBE TECH, and passed this off as their own. It is reasonable to think that such an approach might become more common with rip-off artists preying on those who search the web for spots to order research chemicals from. WESTERN BIOSYNTHESIS appears to still be in operation, but we have not heard anything either good or bad about them. While there are still a few low-key suppliers for research chemicals that may be reliable, none of them particularly wanted to have a spotlight shown on them in the pages of *ER*. DXM may be easier to find on the web (a search on GOOGLE turned up [www.chicochemical.com](http://www.chicochemical.com), and [www.ltkresearchproducts.com](http://www.ltkresearchproducts.com)), but such a search will also turn up a preponderance of articles about sellers who have been arrested, and the controversy over sales via E-BAY.

As far as the JLF bust goes, the court date was continued until May 20, and this issue of *ER* went to the printer prior to this, hence we don't have the latest scoop on how the trial is going (if it hasn't been continued again). Visiting [www.jlfcatalog.com](http://www.jlfcatalog.com) might provide one with an update. When last we visited the JLF web page, a version of the following text was posted:

“Attention All Experimenters, Researchers, Scientists, Hobbyists, Artists, Collectors, Religionists, *etc.*: We have your much-needed raw-materials of great controversy!

“You may have read about us in the LIBERTARIAN PARTY article ([www.lp.org/lpnews/0202/drugraid.html](http://www.lp.org/lpnews/0202/drugraid.html)), in *Rolling Stone* (Jan 31, 2002), or ALTERNET ([www.alternet.org/story.html?StoryID=12393](http://www.alternet.org/story.html?StoryID=12393)). We are JLF POISONOUS NON-

CONSUMABLES (POB 184, Elizabethtown, IN 47232, [www.jlfcatalog.com](http://www.jlfcatalog.com), 812-379-2508). Recently the Drug War came knocking at our door. At least two Federal Agencies do NOT want us selling many of these things, and do NOT want you possessing them; even though they are all legal! The FDA (FOOD AND DRUG ADMINISTRATION), DEA (DRUG ENFORCEMENT ADMINISTRATION), and INDIANA STATE POLICE have tried to shut us down twice recently. In early September of 2001, our business was raided and much inventory, assets and moneys seized. And I, the proprietor, have just been charged (1/28/02) with a 10-count offense (+ forfeitures-clause) for some of the catalog products. The long and complicated counts use wording like ‘controlled substance analogues,’ ‘prescription drugs,’ and ‘misbranded.’ No matter that we do not sell a single food or drug, the FDA and DEA prefers to say that we do among many other untruths. No matter that I legally purchased all my products on the open market without any special licenses, and still could today; no matter that most of my sources are still in operation and still sell those same items and to my knowledge have not been approached by the Feds (I am being treated like a drug criminal—urine-tests and all—yet I was not once asked to divulge ANY of my sources): I have been forced by the prosecutor to stop sales of 13+ catalog products (in order to stay out of jail until the trial), which were completely legal and were represented by us in the most responsible fashion possible. Because of this recent indictment, we were just smeared badly by a local paper and TV station.

“Please check out our catalog to see what the big deal is all about. Yes, miraculously, we are still in business, and despite the efforts of our government, we still have an interesting collection of products for sale. We do not have a special defense fund and are not asking for donations\*, just that you buy something from us. As a capitalist enterprise, JLF will hold true to form and try to capitalize on our government-induced misfortune. Please help us do that. By doing business with us and/or helping us distribute this article/advertisement, you will both make a statement and support our defense efforts. Please help us exploit all this press and employ it as free advertising that we could not otherwise afford. Defend your right to material freedom and my right to free enterprise by engaging in activism through free trade. In

“\*We will accept donations in the form of *pro bono* legal help or representation to aid or team up with my current attorney, who is a very busy man.”

It will definitely be interesting to see how this case progresses, and we wish the best for Mr. NIEMOELLER and JLF, who have been around selling dried *Amanita muscaria* and other interesting poisonous non-consumables since before *ER* began. We will keep *ER* readers posted about this case, and we encourage anyone who has experiences with companies selling “research chemicals” to write and let us know which companies are reliable, and which ones are not. — DAVID AARDVARK

## LANTERN PIPE

*ER* has mentioned various approaches to smoking free-base alkaloids. I wanted to mention that a standard lantern globe could also be used. The sample is placed inside on the bulging part with both ends being covered by hands while heating. A candle can be used to heat the alkaloid from below. The tube fills with smoke, which can then be inhaled by removing the hands from the ends. It works great! — N.L., CO

There are no doubt many such effective approaches, probably limited only by the range of our readers’ imaginations and creativity. The approach you describe sounds very effective—rather like an “alkaloid bong” of sorts. Another interesting one we have heard about is the use of the small (10 ml) glass vials that ginseng extract comes in, along with a paper straw. In this version of an alkaloid volatizer, the sample is placed inside of a clean and dry vial, heated from underneath, with a small bit of wire wrapped around the neck serving as a handle. The smoke sucked up using the paper straw. This device also has the advantages of being cheap, readily available, and disposable. — K. TROUT

## PATIENTS’ RIGHTS AND POPPY FIELDS

There are no patient rights in this nation. Over 100,000 patients are killed each year as a result of butchers being allowed to “practice” on patients. In many states, such as Florida, a dying patient has no right to adequate pain relief. Congress and the Florida legislature have long turned their backs on any adequate and comprehensive patients rights

bill. After witnessing a patient being treated with codeine and Tylenol for a terminal spinal tumor, I decided to compile a book for the American patient. There are no guarantees that a patient in severe pain will be treated appropriately. Should there be a terrorist attack (biological or nuclear) or meteor strike, millions of Americans will perish. *US narcotic stockpiles will vanish in a matter of days.* Small towns and families will have no relief from pain unless they can make narcotics themselves.

Currently in America, the commercial cultivation of *Papaver somniferum*, the opium poppy, is illegal. The few opium poppies growing in gardens for bread seed will not provide the relief needed in emergency situations. In Australia, a new breed of *P. somniferum* has been genetically engineered. It

produces a mixture of morphine and thebaine; however, the latex from this plant is toxic. The plant maybe also be illegal to grow. Last year I noticed that it may be that this variety is now being sold in America—possibly further weakening the meager gene pool of poppies capable of producing opium.

The “scarlet poppy,” *Papaver bracteatum*, produces high levels of thebaine, which can be extracted from straw and transformed into narcotics. In the interests of national security (long term survivability of the democracy/human species), the US must become independent or have the capability to produce narcotics on site, should it be necessary.

I strongly advocate growing scarlet poppies as a stock reserve for use only in the case of national emergency. They are

beautiful perennial flowers, with stalks as high as four feet with flowers reaching five inches in diameter. The selective breeding of these plants to produce larger pods will guarantee that in the case of war, natural disaster, or biological attack, Americans will have the ability to help themselves and patients. A copy of my book *OXY* in a hope chest passed down from generation to generation, may allow our descendents the knowledge to produce narcotics. The small patch of scarlet poppies growing in your garden may determine which families/towns will survive, and which will perish. God Bless America. — OTTO SNOW

I am offering 200 seeds and instructions, postage paid for \$5.00. Plants need cold winter to flower (zones 5–8). Anyone who wants them can send checks to: THOTH PRESS, POB 6081, Spring Hill, FL 34611.

## MORE SCORPION TALES?

I would like to relate my own experience, with regard to the news article and commentary on “Smoked Scorpion?” in *The Entheogen Review*, Vol. X, No. 4.

During the summer of 1986, I lived in Cañon City, Colorado; the high-desert ecosystem there includes scorpions and tarantulas. One evening, as I was reading in bed, one of the tan *Centruroides* scorpions crawled up between the wall and the bed and stung me in the palm of my hand where it lay against the wall. The experience was like having a small nail driven through my hand, but I iced the sting and eventually was able to fall asleep.

My mood was low that summer, because I had recently lost my job, and my wife and I were trying to get by on unemployment insurance, freelancing, and part-time work. But the morning after the scorpion sting, I felt great! I was almost euphoric, and I figured that something about the venom was a sort of stimulant—perhaps it was the serotonin boost, as your commentary suggests. (Still, the next time I saw a scorpion dance across the living room, I took it outside without inviting it to sting me.) The idea of smoking scorpion stingers did not occur to me then, but I can attest to the psychoactive component in the venom. Best wishes. — C.S.C., CO

## SIZE MATTERS

Just how large are those DMT crystals depicted on the front and back covers of the last issue of *ER*? —J.S., OR

Ah yes... we expect that the enlarged photo on the cover may have given some people fuel to drool and dream. We asked the chemist who created this rock to fill us in on the actual size, and he noted:

The crystal is approximately 1 ½" by ¾" to the best of my memory. I have also grown DMT crystals under different conditions, occasionally resulting in remarkable formations. One was a massive single crystal shaped like a pyramid with its top cut squarely off. When viewed from the top, one could see how the crystal lattice was formed.

So there you go. Not nearly as big as we depicted on the front cover, and about 60% of the size that we depicted on the back cover. (Had we thought of it, we would have made it life-sized on the back cover... ah well.) — Eds.

## BAD SCIENCE

The validity of PET scans purporting to show that MDMA users have lower serotonin levels, which have been dragged out on popular TV programs such as *The Oprah Show* and claimed to show “holes in the brain” due to Ecstasy use, has recently been called into question, due to an article published in *New Scientist*. “[T]he scans, though published in a respected journal, are based on experiments so fundamentally flawed they risk undermining the credibility of attempts to educate people about the risks of drug,” noted the article (CONCAR & AINSWORTH 2002). This “evidence,” funded by NATIONAL INSTITUTE ON DRUG ABUSE (NIDA) with the goal of *finding* damage that the drug may produce, suggests that one should always question where the money is coming from with such studies, and who benefits from the reporting of the data. In the same way that the “LSD breaks chromosomes” scare got headlines in 1967, while the fact that these studies were flawed received little notice, the “MDMA causes holes in your brain” threat received a lot of hype, while the fact that the experimental design was bad certainly isn’t likely to be showcased on *Oprah*, nor is the point that the frenzy of a political climate that demonizes some drug use may influence or taint the “scientific” findings that are reported. It may very well be true that MDMA causes brain changes that are *not* beneficial, and such data may someday be presented. The problem is that the government hacks cry wolf so much, that

their credibility is shot. Important warnings of health risks may go unheeded, in the same way that kids who know they have been lied to about *Cannabis* may go on to try more dangerous drugs—believing that all cautionary advice is bogus. — J.H., CA

## BREEDING MORNING GLORIES

Why aren't more people working on developing hybrids of morning glories? Some of the hybrids of "heavenly blues" and "pearly gates"—like "flying saucers"—are gorgeous and said to be active. — ZERO M., TN

One problem is no doubt the lack of interest in their use for drug purposes by most people who have already experienced them. Another is the difficulty in creating hybrids between the various morning glory species and the lack of consistency for the offspring of hybrids created between forms within a given species. The idea that "flying saucers" is a hybrid between "heavenly blues" and "pearly gates" is a quite common but erroneous one.

A short history for some of the available forms of this species may be in order (see [www.exoticplants.org.uk/lpomoea\\_tricolor.html](http://www.exoticplants.org.uk/lpomoea_tricolor.html)). "Heavenly blue" has apparently been in cultivation for over 100 years now. White mutations of this flower are known, and it was one of these mutants that was selected for the development of "pearly gates." Many white mutants show blue streaking but this one was found to be consistently white and was first offered to the public in 1942. "Blue star"—a form with dark blue stars on a light blue background and white to butterscotch colored seeds—was a mutant noticed in CLARKE'S EARLY FLOWERING strain of "heavenly blues," and developed by D. DENHOLM in California. Another "blue star" was apparently developed independently around the same time by at least one other grower in Holland, after a white-seeded mutant producing sky-blue flowers with a white star were encountered in the same "heavenly blues" strain in the 1930s. K. TROUT has encountered 3 forms sold under the name "blue star" (one with blue stars on a white background and black seeds in addition to the two mentioned above). We have DAROLD DECKER to thank for an additional 2 beautiful and active morning glory forms. DECKER introduced "flying saucers" in 1960 after choosing the best of several variegated mutations he had selected out of "pearly gates." He claims it was a "one in thousands!" selection. "Wedding bells" was also selected by DECKER and released in 1962. DECKER commented that this rose-

lavender colored mutant was the *only* lavender individual he had ever observed in the many acres of heavenly blues that he had grown. No doubt more wonderful selections could be developed through the careful selection of such mutants. While the editors have no plans to ever ingest this species again, we would applaud any efforts to create more beautiful flowers from this spectacular plant. — Ebs.

## ACTIVE ASTROPHYTUMS?

Does anyone have info on *Astrophytums*? In the 1980s, I would purchase small specimens of *Astrophytum myriostigma* at a local nursery for 50¢ each. One and a half of these would be quite noticeable, and two was definitely trippy. They tasted like tender cucumbers. However, I purchased a tray of larger specimens (3 inches across), but these were fibrous and sat very heavily in my stomach without any noticeable effects. More recently, I purchased five 1-inch buttons from WILDFLOWERS OF HEAVEN and ate them with a friend. Although it was definitely a low dose, we felt something. The ones I used to purchase came from a large retailer; could it have merely been a reaction to systemic poisons added during cultivation, or are they good as I suspect? I have recently planted seeds, but if anyone knows where I can get some young 1.5 to 2-inch specimens at a reasonable price, I'd love to know. — R.D., MO

The on-line CACTUS & SUCCULENT PLANT MALL ([www.cactus-mall.com](http://www.cactus-mall.com)) is a good place to look for these cacti, although many people offer them. SACRED SUCCULENTS is another good choice, particularly since they grow-out their plants under organic conditions. The size you want is possible within 5 years from seed under good conditions. It's a good question about insecticides in commercial cacti but I don't know the answer. As far as psychoactivity goes, the entire genus is a curious omission from the analytical literature. Very few references to any *Astrophytum* have thus far been encountered. There are the comments made by a reader concerning jackrabbits liking *A. myriostigma* and becoming visibly inebriated by their consumption (B.K. 1998) and that same species has appeared listed as containing unidentified alkaloids but unaccompanied by any meaningful reference. More recently M.S. SMITH commented that *A. asterias*, *A. capricorne* and *A. myriostigma* have been claimed to be known as

medicinal "peyotes" (SMITH 2000), and SASHA SHULGIN observed a positive reaction in an unpublished alkaloid test in *A. myriostigma* (SMITH 2000, citing a personal communication). Clearly the genus is begging for analysis. — K. TROUT

## TMA-2

Why isn't TMA-2 more readily available? —D.L. CA

Part of this probably has to do with precursor availability (or lack thereof) for this compound. Its expense probably plays a role as well. While its Schedule I status no doubt also poses some problems, another part may have to do with the material itself. One friend described her experience with it as "rather unimpressive."

After several decades of wanting to try it, JUSTIN CASE obtained 25 mg of TMA-2 from a reliable source. His results were summed up as "interesting but rather disappointing." (Perhaps not surprising, after such a long period of anticipation.) The material was reported by

CASE to be "similar to mescaline in a number of ways, but with more of a liquid wave-like motion to stationary objects, rather than the 'crawling-in-place' movements that mescaline produces for me. The taste was more amphetamine-like than mescaline-like and the material had a distinctly ether-like smell to it. Onset was slow, taking well over 2 hours to reach a solid level despite starting to become noticeable at around 20 minutes. The effects were mild, rather like the level that would be expected should I have eaten maybe 200 mg of mescaline. Duration of the peak and effects were slightly shorter than mescaline (sleep was possible less than 12 hours after ingestion)." CASE also suggested that should he ever obtain more, 40 mg would be the next dose chosen for evaluation, but that many other substances would no doubt be evaluated ahead of it (CASE 2002). We'd love to hear more from our readers concerning their experiences with this substance. — EDS.

## 5-MeO-DMT AND TOLERANCE

Questions often come up concerning tolerance to psychedelics. Most of our readers have no doubt experienced

# NEW INCENSES

*Nymphaea caerulea* (blue lotus): This little known flower has been considered sacred for several thousand years, where it was used medicinally and ritually by the Egyptian priesthood. Its pleasing aroma is said to induce deep relaxation and a euphoric state of mind.

*Nelumbo nucifera* (sacred lotus): Another obscure sacred flower from the East, it is quickly becoming very popular with those who have been lucky enough to try it. This plant mixes well with other common burning herbs, but is also very much enjoyed by itself.

*Sceletium tortuosum* (*kanna*): A very rare succulent from the deserts of South Africa. The Bwiti culture uses this plant as an important part of their ritual life, and consider it to be an indispensable ally. We offer this plant in the manner dictated by tradition, fermented and finely powdered.

*Mimosa hostilis* (*jurema*): This thorny tree is used medicinally and spiritually by several Central and South American cultures. Wild-crafted in México for us by a well-known ethnobotanist, we offer fresh, dried whole chunks of both root-bark and stem-bark.

*Voacanga africana* root-bark: After years of searching we have finally procured a small supply of this exotic botanical. Used in the adolescent initiation ceremonies by East African shamans, this powerful teacher was treated as a divine spirit. Very limited supplies.

All incenses are sold strictly to adults as non-consumables

this first hand with materials such as LSD or psilocybian mushrooms. Some substances though, such as DMT, appear to produce minimal, if any, true drug tolerance in the classical sense. RICK STRASSMAN reported *no* tolerance development to IV injections spaced 15 minutes apart (STRASSMAN 2001). Minimal cross-tolerance with LSD has also been reported in LSD-tolerant humans (ROSENBERG *et al.* 1964). Efforts to explore this issue with regard to 5-MeO-DMT, conducted in the course of the last couple of months by JUSTIN CASE, were unable to demonstrate *any* development of tolerance to dosages readministered multiple times in a row—up to 10 times spaced 2–10 minutes apart, with this approach being repeated for a period of a few days (CASE 2002). REV ME O reported a similar experience with repeated daily dosages for 2 months and commented that, if anything, a greater sensitivity was experienced (REV. ME O 2002)! REV. ME O experienced significant mental aberrations persisting well after his period of intensive use. CASE also made a comment about feeling “goofy” for some time afterwards. Interestingly, in the course of their evaluations, both CASE and REV. ME O independently reached the conclusion that their favored approach to administration of the drug was to use small amounts (3+ mg), repeated rapidly until reaching a desired level, rather than taking 10–20 mg all at once, as is more commonly practiced. When the peak effects began to fade, this was found to be repeatable; allowing a more lengthy experience than usual to be maintained (with 20 or more mg being consumed per session). I’d love to hear more feedback from *ER* readers concerning the issue of tolerance development with either DMT or 5-MeO-DMT. — K. TROUT

## A FEW ERRATA...

We sometimes make mistakes here at *ER*, but we try to clean up our messes. Here’s a few to note:

**ADDRESS CORRECTION #1:** In the article “Some High Desert Plants” (Vernal EQUINOX 2002), we listed the address for NATIVE SEEDS/SEARCH as 526 N. Fourth Street, Tucson AZ 85705. Rather than “Street,” this should have been “Avenue,” which was realized after a recent visit to their store, where they sell beautiful wooden bowls handmade by Tarahumara Indians at great prices, as well as peyote gourds.

**ADDRESS CORRECTION #2:** In the ENTHEOBOTANICA advert in the last issue, we provided the address for this book company in Switzerland, along with an address in México, as the places where one could order an autographed first Ameri-

can edition of ALBERT HOFMANN’S *LSD: My Problem Child*. We have since been told that the address in México is not handling sales of this book; orders should be sent to the Swiss address, and postage rates can be obtained by e-mailing [versand@nachtschatten.ch](mailto:versand@nachtschatten.ch).

**ANADENANTHERA SNUFF:** At *ER* we generally feel that people should experience things first-hand before passing along what may or may not prove to be true. Recently we made a comment about *Anadenanthera colubrina* seed snuff lacking activity unless a base was added, without directly comparing both of the preparations firsthand. Since then, we have heard—in no uncertain terms—from a number of readers who have reported successful snuff forays without adding baking soda or another alkali source. The opinion appears to be that the alkali may contribute to keeping it dry in tropical environments and as an aid in creating a fine powder, but in “real world” terms makes the snuff burn more intensely and is apparently not required. We stand corrected, thought our readership would like to know, and would like to apologize for having mentioned such a claim without actually conducting a subjective comparative bioassay ourselves. And of course, thanks to our sharp-eyed readers for correcting us. As one T-shirt recently proclaimed, “So many drugs, so little time!” — EDS.

# EVENTS CALENDAR

## WASIWASKA AUGUST 4–13, 2002

An experiential and theoretical symposium featuring ayahuasca sessions, Holotropic Breathwork™, psychopharmacological lectures, and consciousness studies, held in Manaus, Brazil. Speakers include: LEOPOLDO CABREIRA, ANDERSON DEBERNARDI, IVANIA HASSLER, DIANE HAUG, FRANCIS HUXLEY, LUIS EDUARDO LUNA, and JEREMY NARBY. Price is \$1,600.00 to \$1,750.00. For more info, contact LUNA at [luna@wasiwaska.org](mailto:luna@wasiwaska.org), or see [www.wasiwaska.org](http://www.wasiwaska.org).

## THE PROPHETS AUGUST 9–11, 2002

Another PROPHETS CONFERENCE, this time in Oxford England. Speakers include: PIR VILAYAT INAYAT KHAN, JAMES REDFIELD, ERVIN LASZLO, EDGAR MITCHELL, JAMES TWYMAN, STARHAWK, TONY PARSONS, MICHIO KAKU, BROOKE MEDICINE EAGLE, PETER RUSSELL, MAYAN ELDER HUNBATZ MEN, SERGE KAHILI KING, COLIN WILSON, PAUL DEVEREUX, SALLE MERRILL REDFIELD, RICHARD METZGER, and MARIA SAGI. Cost for the week-long conference package is \$1,445.00; the conference and sacred sites only is \$525.00; and the conference only is \$345.00; individual presentation tickets are \$25.00. For more information: (888) 777-5981 (USA) or (44) 020 7692 0670 (United Kingdom), or [prophets@greatmystery.org](mailto:prophets@greatmystery.org), [www.greatmystery.org](http://www.greatmystery.org).

## BOOM FESTIVAL AUGUST 21–24, 2002

The BOOM FESTIVAL is an open-air psychedelic trance festival featuring top international live electronic acts and DJs. The event takes place in a magical forested countryside area of Portugal. There will be three dance areas, a chill-out area, and a large camping space where basic facilities like showers and toilets will be available. There will also be a flea market

where people can rent space to sell goods as well as a large selection of food vendors to keep an estimated 13,000 fed over the four days of the festival. A separate zone dedicated to lectures and workshops will host an engaging group of speakers who will be presenting upon the following topics; spiritual ecology, medicine culture, *Salvia divinorum's* history and use, techno-shamanism, plant/human symbiosis, neo-shamanism, altered states, visionary art, trance-dance, psychedelics and politics, community and cultural evolution. Speakers include WILBERT ALIX, MORGAN BRENT, ALEX GREY, JON HANNA, CHARLES HAYES, ZOE SEVEN, SIJAY, DELVIN, and others TBA. The BOOM FESTIVAL is similar to BURNING MAN, yet mellower with more creature comforts. Tickets are \$55.00. E-mail [info@boomfestival2002.com](mailto:info@boomfestival2002.com) or see [www.boomfestival2002.com](http://www.boomfestival2002.com) for more details.

## TELLURIDE MUSHROOM FEST AUGUST 22–25, 2002

The TELLURIDE MUSHROOM CONFERENCE is designed for persons interested in expanding their knowledge of edible, poisonous and psychoactive wild mushrooms. Consideration will be given to the cultivation of diverse mushroom species, emphasizing practical principles and techniques. Daily forays will be held in the surrounding mountains to collect edible and poisonous species and study their field characteristics. Conference facilities include appropriate meeting rooms and campsites. More elaborate accommodations are available locally. Meat and non-meat nutritious meals will be served. Presenters include: BILL ADAMS, JOHN CORBIN, TONY CORBIN, LEE GILLMAN, LINNEA GILLMAN, ART GOODTIMES, DAVID GRINSPOON, JOHN L. KANE, JR., GARY LINCOFF, LYNN MARGULIS, MARK MCCOIN, RITA ROSENBERG, EMANUEL SALZMAN, JASON SALZMAN, JOHN SIR JESSE, PAUL STAMETS, MICHAEL STANWOOD, and ANDREW WEIL. Cost is \$315.00 with meals or \$265.00 without meals. For more information see [www.telluride.com/mushroom.html](http://www.telluride.com/mushroom.html), or contact FUNGOPHILE, POB 480503, Denver, CO 80248-0503, (303) 296-9359, [jason@causecommunications.com](mailto:jason@causecommunications.com).

**www.e-chemicalsupplier.com**

A new company that claims to supply various desirable nutrients, amino acids, OTC drugs, and research chemicals. They list: 1,4-butanediol (1 pint \$45.00; 1 quart \$85.00), 1-(3chlorophenyl)-piperazine (2 grams \$50.00; 5 grams \$80.00), 1-(4-methoxyphenyl)-piperazine (2 grams \$50.00; grams \$90.00), 1-benzylpiperazine (55 grams \$75.00), 2,5-dimethoxy-4-ethylthiophene (500 mg \$210.00), 2,5-dimethoxy-4-(n)-propylthiophenethylamine "2C-T-7" (250 mg \$125.00; 500 mg \$245.00; 1 gram \$415.00), 2,5-dimethoxy-4-ethylthiophenethylamine "2C-T-2" (250 mg \$125.00; 500 mg \$245.00; 1 gram \$415.00), 2,5-dimethoxybenzaldehyde (100 grams \$105.00), 3,4,5-trimethoxybenzaldehyde (100 grams \$105.00), 5,7 dihydroxyflavone "chrysin" (25 grams \$140.00), 5-methoxyindole (1 gram \$45.00), 5-methoxyindole-3-carboxaldehyde (1 gram \$100.00), adenosine-5-triphosphate, "ATP" (5 grams \$55.00; 25 grams \$175.00), alpha-chloralose (10 grams \$65.00; 25 grams \$125.00), alpha-methyltryptamine "IT-290" (500 mg \$75.00; 1 gram \$125.00), ascorbic acid (1 gallon \$550.00), caffeine (125 grams \$65.00; 500 grams \$150.00), clenbuterol (500 mg \$70.00; 1 gram \$110.00; 10 grams \$650.00), dehydroepiandrosterone "DHEA" (5 grams \$70.00; 25 grams \$200.00), dextromethorphan "DXM" (100 grams \$122.00; 500 grams \$500.00), dipropyltryptamine (500 mg \$70.00; 1 gram \$110.00), dopamine (5 grams \$20.00; 25 grams \$95.00), erythromycin (50 grams \$160.00), harmine (1 gram \$65.00), indole (100 grams \$85.00), L-carnitine (25 grams \$55.00; 100 grams \$150.00), L-dopa (5 grams \$55.00), L-lysine (100 grams \$40.00), L-tryptophan (100 grams \$45.00; 500 grams \$185.00), L-tyrosine (50 grams \$50.00; 100 grams \$75.00; 1000 grams \$850.00), lidocaine (25 grams \$70.00; 100 grams \$170.00), N,N-diisopropyl-5-methoxytryptamine "5-MeO-DIPT" (250 mg \$95.00; 500 mg \$165.00; 1 gram \$265.00), N,N-diisopropyltryptamine "DIPT" (250 mg \$75.00; 500 mg \$110.00; 1 gram \$200.00), scopolamine (1 gram \$125.00), tryptamine (2 grams \$55.00; 5 grams \$95.00; 10 grams \$155.00), tyrosine (100 grams \$110.00), and yohimbine (10 grams \$110.00; 100 grams \$700.00).

Strangely, at one point they also list 1-benzylpiperazine (55 grams \$75.00), and later they list benzylpiperazine hcl (5 grams \$55.00; 10 grams \$90.00). And they also list dimethyl-5-methoxytryptamine (1 gram \$235.00) and later they list (N,N 5-methoxydimethyltryptamine "5MEO" (250 mg \$95.00; 500 mg \$165.00; 1 gram \$275.00). The fact that they are listing the same chemicals in slightly different ways and charging different amounts for them doesn't provide me with a whole lot of confidence that they know what it is that they are dealing with! I have heard a vague caution related to this company, and a second warning that they are a rip-off. It is also worth noting that at least a couple of the items they claim to provide are specifically included on the watched drug manufacturing precursor list. I don't know anyone who has done business with them, and I really know nothing at all about them. They carry a *very* similar line of products as MBE TECH claims to offer, and I have to wonder if they aren't actually the same people, relocating and operating under a new name after getting some bad press on the web? Or perhaps are just a scam that has hoovered the MBE TECH product list in an attempt to bilk unwitting web surfers out of their dough. They did not respond at all to my e-mail asking them about the strange coincidence that their product list was so similar to MBE TECH's.

### ETHNOBOTANICALS ORG

1936 Eastview Avenue  
Louisville, KY 40205  
(888) 274-6824 ORDERS  
(502) 459-7401  
(502) 479-8954 FAX  
mike\_ky@webtv.net  
<http://ethnobotanicals.org>

Seeds, barks, and cut & sifted (c/s) herbs of interest, including: *Acorus calamus*, *Alchornea castaneifolia*, *Anadenanthera colubrina* (seed, leaf, and bark), *Areca catechu* (dried sliced nuts), *Argemone mexicana* (c/s), *Argyrea nervosa*, *Bacopa monniera*, *Banisteriopsis caapi*, *Brunfelsia grandiflora*, *Calea zacatechichi*, *Celastrus paniculatus* (seed oil), *Cola acuminata* (nut-powder), *Cystis scoparia*, *Desmanthus illinoensis* (seed), *Desmodium gangeticum* (c/s), *Diplopterys cabrerana* = *Banisteriopsis rusbyana* (whole leaf), *Ephedra* sp. (powdered extract, 8% ephedrine), *Erythrina mulungu*, *Ficus insipida*, *Heimia salicifolia*, *Humulus lupulus*, *Hymenaea courbaril*, *Ipomoea carnea* (leaf), *I. purpurea* (seed), *Jasminum officinalis*, *Jatropha curcas*, *Kaempferia galanga* (root-powder), *Leonotis leonurus* (c/s), *Leonurus sibiricus* (c/s), *Lespedeza bicolor* (seed),

*Lobelia inflata* (c/s), *Lycopus virginicus* (c/s), *Mandragora* sp. (root c/s), *Mimosa tenuiflora* (root-bark), *Nepeta cataria*, *Nicotiana glauca*, *N. rustica*, *Nymphaea caerulea*, *Paullinia sorbilis* (seed powder), *Peganum harmala* (4X seed extract), *Phalaris arundinacea*, *Phoradendron flavescens* (leaf), *Phragmites australis*, *Phthirusa pyrifolia*, *Piper methysticum* (root-powder), *Salvia apiana*, *S. chinensis*, *S. divinorm* (leaf, plus 4X and 6X extracts), *S. splendens*, *Scutellaria nana* (c/s), *Scoparia dulcis* (leaf-powder), *Scrophularia nodosa* (c/s), *Serjania triqeta*, *Solanum dulcamara* (c/s), *Tagetes lucida*, *Tilia americana*, *Turnera afrodisiaca* (c/s), *Verbena hastata*, and *Voacanga africana* (seed and root-bark), along with a few plant preparations. Prices look good to great.

### ETHNOBOTANYSOURCE.COM

2304 Balsam Drive #E-301  
Arlington, TX 76006  
race@ethnobotanysource.com  
[www.ethnobotanysource.com](http://www.ethnobotanysource.com)

The selection that ETHNOBOTANYSOURCE.COM currently offers is rather small, and some items appear to be frequently out-of-stock. Strangely, they sell baby Hawaiian woodrose seeds that came from Africa, and *Salvia divinorum* leaves that are said to have come from Peru! (Is someone in Peru really cultivating *S. divinorum*?) Other products include *Banisteriopsis caapi*, *Leonotis leonurus*, *Psychotria viridis*, Rooibos tea, *S. divinorum* leaf extracts (in 5X, 10X, and 15X), and white tea. Perhaps more interesting than their products is the fact that they offer extraction services for other botanical companies. (I'd love to see someone take full advantage of this, and produce a standardized extract of the Turkey red strain of *Phalaris arundinacea*, for example...) They also seem to be doing some degree of research into cancer-fighting botanicals, although exactly what it is that they are doing isn't too clear from their web site.

### FREE SPORE RING

RALPH  
POB 1667  
Nampa, ID 83653-1667  
ralphrw@cableone.net  
[www.geocities.com/ralph1956\\_2000/ralphster44\\_FSR.html?988942758830](http://www.geocities.com/ralph1956_2000/ralphster44_FSR.html?988942758830)

A great idea for a site, RALPH at the FREE SPORE RING will a send "free" psilocybian mushroom spore print for \$1.00 (to cover postage and handling) to any state except CA or GA,

due to the restrictive laws in these states. What spore print is sent is at his discretion, and varies according to what is available. RALPH asks that prints are donated in return when the newbie mycologist has a successful harvest (this keeps the whole show running on the cheap). He also has good prices (\$10.00 to \$15.00) on a large variety of specific strains as prints and in syringes depending on which strain is ordered.

### THE GENESIS OF EDEN

[www.dhushara.com](http://www.dhushara.com)

Mathematician CHRIS KING's odd rants on biocosmology, consciousness, evolution, biodiversity, gene tech, deadly conflict, sociobiology, shamanism, social ecology, fertility spirituality, and more. "The Genesis of Eden is a cross-cultural synthesis of scientific innovation with spiritual tradition in its deeper cultural origins in the stream of consciousness, an essential step in placing spirituality within the context of the fertility from which the paradise of Eden originated, and in healing humanity in the natural restoration of planet Earth." The site's "shamanism" pages "develop the area of medicinal plants, shamanism, and natural spirituality," and are definitely worth checking out. The site is available on CD, as are several other music, video, and informational CDs.

### GREEN EARTH ETHNOBOTANICALS

POB 16602

Rochester, NY 14616

[orders@greenearth-ethnobotanicals.com](mailto:orders@greenearth-ethnobotanicals.com)

[www.greenearth-ethnobotanicals.com](http://www.greenearth-ethnobotanicals.com)

GREEN EARTH ETHNOBOTANICALS offers a number of species of interest, including: *Amanita muscaria* (dried mushroom), *Argyria nervosa* (seed), *Banisteriopsis caapi* (dried vine), *Datura metel* (seed), *D. stramonium* (seed, thorn apple w/ seeds and root chunks), *Ilex paraguayensis* (herb), *Ipomoea violacea* (seed), *Leonotis leonurus* (herb), *Mimosa tenuiflora* (ground root-bark), *Nicotiana rustica* (seeds), *Papaver somniferum* (seed), *Peganum harmala* (seed), *Piper methysticum* (ground root), *Psychotria viridis* (dried and fresh Hawaiian grown leaves and seed), and *Salvia divinorum* (live plants, dried leaf, as well as 5X and 10X extracts). This is the only company that I am currently aware of who currently offers fresh leaf for *P. viridis*. Overall their prices are quite good. They offer a free snail mail catalog, or check them out on the web at the URL listed.

### GREEN MAN'S SEEDBANK UPDATE

[www.seedbankupdate.com](http://www.seedbankupdate.com)

Provides a weekly update with the latest reviews of *Cannabis* seed companies; offers a list of *Cannabis* strains with descriptions; showcases plans for a home built ozone generator to combat odors; presents ways to cure your crop and give flavors; provides links for horticultural information and pot friendly businesses; lists new and unrated seedbanks; gives instructions for a cheap do-it-yourself aerocloner; and more. At the time that I wrote this, the following companies were leading the pack as the best seedbanks: TAMBU (4 stars); LEGENDS (4 stars); HD SEEDS (4.5 stars); HEAVEN'S STAIRWAY CANADA/HEAVEN'S STAIRWAY ENGLAND (5 stars); SEEDS DIRECT (5 stars); and HEMPSEED CYBERSHOP (5 stars).

### HERBAL MEDICINE BAG

POB 1203

Webster, NY, 14580

[herbs@herbalmedicinebag.com](mailto:herbs@herbalmedicinebag.com)

[www.herbalmedicinebag.com](http://www.herbalmedicinebag.com)

HERBAL MEDICINE BAG sells: *Amanita muscaria*, *Anadenanthera* sp., *Argemone polyanthemus*, *Argyria nervosa*, *Ariocarpus retusus*, *Artemisia absinthium*, *A. vulgaris*, *Astrophytum myriostigma*, *Atropa belladonna*, *Aztekium ritterii*, *Acorus calamus*, *Banisteriopsis caapi*, *Brugmansia* sp., *Calea zacatechichi*, *Coffea arabica*, *Coryphantha macromeris*, *Datura innoxia*, *D. metel*, *D. meteloides*, *D. stramonium*, *Desmanthus illinoensis*, *Desmodium gangeticum*, *Diplopterys cabrerana*, *Ephedra minima*, *E. nevadensis*, *E. sinensis*, *Epithelantha micromeris*, *Glycyrrhiza lepidota*, *Heimia myrtifolia* (*salicifolia*), *Humulus lupulus*, *Hyoscyamus niger*, *Ilex paraguayensis*, *Ipomoea violacea*, *Lactuca virosa*, *Leonotis leonuris*, *Leonurus sibiricus*, *Lobelia inflata*, *Mandragora officinarum*, *Matucana madisoniorum*, *Mimosa tenuiflora*, *Myristica fragrans*, *Nicotiana rustica*, *N. tabacum*, *Noctiflora* sp., *Pachycereus pecten-arboriginum*, *Papaver somniferum*, *Passiflora incarnata*, *Paullinia cupana*, *Pausinystalia johimbe*, *Phalaris arundinacea*, *P. aquatica*, *Peganum harmala*, *Piper methysticum*, *Psychotria viridis*, *Rivea corymbosa*, *Salvia divinorum*, *Sarothamnus scoparius*, *Silybum marianum*, *Stipa robusta*, *Trichocereus bridgesii* KK919, *T. bridgesii* var. *monstroze*, *T. cuzcoensis*, *T. pachanoi*, *T. pachanoi* KK339, *T. peruvianus*, *T. peruvianus* var. *matucana*, *T. santiaguensis*, *T. terscheckii*, *T. werdermannianus* KK917, *Valeriana officinalis*, *Verbascum thapsus*, *Voacanga africana*, and more. They also have a variety of attractive traditional preparation utensils for making *kava*.

**HERBAL MERCHANTS RATING PAGE****[www.gliderspen.net/cgi-bin/rate/merchantR.cgi](http://www.gliderspen.net/cgi-bin/rate/merchantR.cgi)**

I immediately liked this site because the first thing that it listed is *other* sites that also rate botanical vendors. Nice to see that they feel people can get the most well-rounded data by visiting more than one review site. Their interface is easy to read, and one can sort the companies by name, rating, total votes, and click throughs (as well as reversing the order). This allows one to get a great sense of the data from a variety of angles. The site also provides links to the companies web sites, and lets one read the comments that have been made. Kudos to the site owner GLIDER for providing such a valuable service that is sure to just keep getting better as more people are hipped to it and more companies are rated.

**JAMES ARTHUR ON-LINE****[www.jamesarthur.net](http://www.jamesarthur.net)**

JAMES ARTHUR is an entheomycologist with the fervor of a born-again Christian, who has written the book *Mushrooms and Mankind: The Impact of Mushrooms on Human Consciousness and Religion*. His site also offers a number of video tapes of talks that he has given, and relates details of where he has spoken in the past. Scrolling down his list of appearances may eventually lead one to the conclusion that ARTHUR is not only obsessed with mushrooms, but with himself as well. Indeed, ARTHUR's posted "Brief Bio" (*sic*) is pretty funny in its pomposity and name dropping. A couple of examples:

"In 1976 R. Gordon Wasson told James, in his opinion, James was the world's leading expert in the field of Ethno-Mycolgy, as it pertains to Christianity. He also referred to James as his dear friend."

And:

"James is/has been friends, acquaintances, conversants, and/or is associated through common friends with: R. Gordon Wasson, Terence McKenna, Sasha Shulgin, Jonathan Ott, William Bramley, Stan Tennen, Jordan Maxwell, Zechariah Sitchin, Neil Slade, Clark Heinrich, John Allegro, Amado Crowley, David Aurora, Paul Stamets, Wade Davis, Robert Forte, Peter Furst, Jace Callaway, Jochen Gartz, Giorgio Samorini, Lloyd Pye, Christopher Dunn, Alan Alford, Karena Bryan, Abd el' Hakim Awayan, Stephen Mehler, Robert Eisenmann, John Allen, Paul Kroeger, Dale Pendell, Ann Shulgin, Andrew Weil, Manny Salzman, Wade Davis, Bo

Holmstedt, Gary Lincoff, Dennis McKenna, Taylor Lockwood and many others..."

That "associated through common friends" bit is the best... you know, I'm directly associated through common friends with JASON ALEXANDER, BECK, RAY BRADBURY, BEAU BRIDGES, JERRY BROWN, SEAN CASSIDY, SALVADOR DALI, THOMAS DOLBY, PATRICK DUFFY, BILL GATES, H.R. GIGER, ELIZABETH MONTGOMERY, PETER O'TOOLE, JOHN RENOIR (both the painter and the film-maker), SAM RAIMI, ANN RICE, WINONA RYDER, BRITNEY SPEARS, GEORGE TAKEI, and JOHN TRAVOLTA—although I've never actually *met* any of them—and nearly everyone on ARTHUR's list too! This approach exemplifies an attitude that I refer to as "cool by the transitive property," as if the people that one knows somehow make that person more interesting. I was discussing this the other day with NEILS BOHR over espresso, when STEPHEN HAWKIN and ROBERT DiNIRO joined us and agreed that it's a pretty ridiculous way to bolster one's biography.

All kidding aside, ARTHUR has some useful information at his site, and a fun correspondence with *Amanita muscaria* and Christmas, titled "The Hidden Meanings of Christmas." The site has many great art images posted, and I expect that it would be quite enjoyable to see ARTHUR give a slide presentation on the topic of *Amanitas*. His site also has a good selection of links.

**LIFE ENHANCEMENT PHARMACEUTICALS****SDI LABS****9835-16 Lake Worth Road, STE. 227****Lake Worth, FL 33467****(561) 335-6785****(888) 335-6785****[samson@sdi-marketing.com](mailto:samson@sdi-marketing.com)****[www.lifetechlabs.com](http://www.lifetechlabs.com)**

Somehow I have ended up on a spam e-mail list that sends out notices related to companies that will sell me GHB, Viagra®, HGH, and testosterone. I finally decided to look into such a mailing from LIFE ENHANCEMENT PHARMACEUTICALS. They have the snake-oil hype thing down: "Build muscle without exercise! Lose fat without dieting! Increase sexual pleasure and performance! Remove Wrinkles and Cellulite! Lower Blood Pressure and improve Cholesterol Profile! Improve Sleep, Vision and Memory! Strengthen the Immune System! Increase Energy and Cardiac Output!" Goodness. And amazingly they state that their products are "100% legal

for use in the United States!” Well, I happen to *know* that GHB is scheduled in the USA, and Viagra® is a prescription drug. How can they be making these claims? In looking through their products list, despite the fact that Viagra® was mentioned prominently in the subject line of their spam, there is no mention of it anywhere on their web site. One down to false advertising. Their site notes that: “Due to distribution limitations and mail order policies for personal import of pharmaceuticals, all orders must be placed through this website only.” Utter nonsense geared towards keeping a customer hooked on them as a sole supplier.

When I looked closer at their claim of selling GHB, it is explained that what they are selling as GHB actually “does not contain” gamma hydroxy butyrate (*i.e.*, GHB), furanone, gamma butyrolactone, or butanediol (presumably 1,4-butanediol). The name “GHB” is “a pending Trademark of SDI-LABS.” Outrageous! They’ve actually trademarked the initials of an illicit street drug and are passing off their herbal/nutrient formula under this name. Not that this hasn’t been done for years—hell, I recall hearing stories of tobacco companies trademarking the names for varieties of *Cannabis*, such as Acapulco gold (although it was thought that they were doing this based on the idea that *Cannabis* would someday be legalized). Similarly, there are all of the various useless herbal *Cannabis* substitutes that are sold via misleading names. What LIFETECH LABS is *actually* selling is a product that contains 4-androstenediol and yohimbine HCL. Of course their “HGH” product is not really human growth hormone either, but rather a blend of L-dopa, GABA, and niacinamide. And the “testosterone” that they offer is actually a transdermal testosterone *enhancement* (yes, the only testosterone present is that which your body makes), composed of 4-androstenediol and 19-norandrostenedione. Prices for their products range from about \$80.00 to about \$110.00 (plus \$8.00 to \$24.00 for shipping). The chemical components of these products can be found for substantially less, sans hype, at a local health food store. The products offered by LIFE ENHANCEMENT PHARMACEUTICALS may actually have some sort of positive effect, but they are grossly overpriced.

As they process orders via the web, they have the following notice: “Warning: Zero Fraud Tolerance. Your ISP customer specific IP address will be logged when submitting an order. All fraud will be turned over to the proper authorities.” Pretty fucking ironic that *they* are concerned about fraud, when their whole business is set up to lure people in through misleading advertising. I’d be surprised if people weren’t already calling these fuckers up on their toll free line, asking a lot of

questions about their products and running up a phone bill for them, without ordering anything.

#### **LIGHTNING POWDER COMPANY, INC.**

**13386 International Parkway**

**Jacksonville, FL 32218**

**(800) 852-0300**

**(904) 741-5400**

**(800) 588-0399 TOLL FREE FAX**

**info@redwop.com**

**www.redwop.com**

A distributor and manufacturer of crime scene investigation equipment, these guys are a good place to check out to see the latest ways that “the man” can keep you down. Or just to learn about various new products used in crime fighting, such as the “Carry-on Odor Perception Inhibitor.” In their own words: “The smells from some crime scenes with dead bodies can be very offensive. Even done in an air conditioned morgue, autopsies of decomposing bodies can have very strong odors. The most hardened investigator can be adversely affected by these smells. Carry-On Odor Perception Inhibitor is a cream that is rubbed directly under the nose, tricking your olfactory sensors into not registering the offensive odors of putrefaction, while allowing you to experience the full gamut of additional scents around you.” But I digress...

Their “Drug Recognition Card and Pupillometer” (\$9.95) is a 3" X 5" translucent plastic card with a chart that lists the reactions to various classes of drugs, and includes a “pupil gauge” along the bottom that ranges from 1.0 mm to 9.0 mm (in 0.5 mm increments). I guess this may be useful to see exactly *how* dilated one’s pupils are after that sixth hit of acid...

For those who purchase street drugs, they have the whole line of NIK drug testing kits, ranging in price from about \$10.00 to nearly \$300.00. Boxes of ten color-changing tests for specific drugs such as opium/opiates, barbiturates, LSD, *Cannabis*, cocaine/crack, methadone, PCP, brown heroin/MDMA, methaqualone, pentazocine, propoxyphene, ephedrine, diazepam, and methamphetamine are available for between about \$14.00 and \$23.00. They even have cocaine swabs to test for traces amounts of dust that might have been left on a mirror. The latest test product are the NIK STICKS—a tube-type configuration, rather than a pouch (the benefit is a lower-priced test). These are available in boxes of ten tests for \$11.95 per box, and they offer: Mayer’s Reagent (narcotic

alkaloids), Marquis Reagent (opium alkaloids/heroin); Nitric Acid (differentiates heroin from morphine), Cobalt Thiocyanate Reagent (cocaine, procaine, tetracaine, and methadone), Dille-Koppanyi Reagent (barbiturates), Mandelin Reagent (amphetamines), Modified Ehrlich's Reagent (LSD, hallucinogens), Duquenois Reagent (THC), KN Reagent (THC), Cocaine Free-Base Reagent (crack/cocaine base), Methaqualone Reagent (methaqualone, PCP), Meth Test (methamphetamines), Mecke's Modified (confirming test for all forms of heroin), Diazepam/Valium Reagent (Valium, Rohypnol), Talwin (pentazocine), and Ephedrine (ephedrine).

Other companies that carry these sorts of tests can be found on the web at:

[www.safetyleague.com](http://www.safetyleague.com)

[www.securitycosmos.com](http://www.securitycosmos.com)

[www.tritechusa.com](http://www.tritechusa.com)

[www.armorholdings.com](http://www.armorholdings.com)

[www.crackdown-drugtesting.ltd.uk](http://www.crackdown-drugtesting.ltd.uk)

[www.faurotinc.com](http://www.faurotinc.com)

[www.red-diamond-unif.com](http://www.red-diamond-unif.com)

And undoubtedly many others. Interestingly, a company called FORENSIC PRODUCTS & SERVICES (1007 Candytuft Blvd, Pueblo, CO 81001, [www.cripkit.com](http://www.cripkit.com)), offers a product called "Shroom Juice," used to determine if mushrooms contain psilocybin/psilocin. "The test is a simple, two step color test that can be ran on both the cap and stem material from suspected psilocin mushrooms. The first color obtained is red, which changes to blue with the addition of a second reagent." I expect that some mushroom hunters might find such a test valuable...

Links to the web sites of many companies that carry law enforcement products that could be of use to freedom-loving individuals can be found at the web site [www.officer.com](http://www.officer.com). There's no reason that such technology should be in the hands of the police only.

## LOTUSTECH

**33 University Square #256  
Madison, WI 53715  
[info@lotustech.org](mailto:info@lotustech.org)  
[brogers101@charter.net](mailto:brogers101@charter.net)  
[www.lotustech.org](http://www.lotustech.org)**

LOTUS TECH has some unique offerings, along with more standard botanicals that one might expect. Products include: "Afro-blend" (wilde dagga 10X, kanna, blue lily 5X) 3 grams \$20.00, 7 grams \$40.00, 14 grams \$70.00, ounce \$120.00; *Amanita muscaria* 10X (on *damiana*) gram \$10.00, 3 grams \$25.00, 7 grams \$50.00, 14 grams \$80.00, ounce \$150.00; *Calea zacatechichi* 10X 3 grams \$20.00, 7 grams \$40.00, 14 grams \$70.00, ounce \$120.00; *Diplopterys cabrerana* foliage ounce \$20.00, 4 ounces \$60.00; *Eschscholzia californica* 6X ounce \$30.00; harmaline/harmine isolate gram \$30.00; *Leonotus leonurus* 10X 7 grams \$25.00, ounce \$75.00; *Mimosa tenuiflora* root-bark ounce \$20.00, 4 ounces \$60.00, pound \$200.00, *Nelumbo nucifera* 30X gram \$20.00, 3 grams \$50.00, 7 grams \$100.00, 14 grams \$175.00, ounce \$300.00, *Nymphaea caerulea* 5X 3 grams \$20.00, 7 grams \$50.00, 14 grams \$80.00, ounce \$150.00, 4 ounces \$500.00; *Papaver giganteum* bouquets 100 pods \$50.00; *Salvia divinorum* dried leaf ounce \$30.00, 4 ounces \$100.00, pound \$300.00; *S. divinorum* 10X gram \$30.00; 7 grams \$125.00, ounce \$400.00; *S. divinorum* (black wax) gram \$50.00, 7 grams \$250.00; *S. divinorum* tincture 30 ml \$100.00; *Scelletium tortuosum* 3 grams \$20.00, 7 grams \$35.00, 14 grams \$60.00, ounce \$100.00; *Virola* resin/incense gram \$30.00.

## MJB BOTANICALS

**POB 22  
Walworth, WI 53184  
[marbr@ziplip.com](mailto:marbr@ziplip.com)  
<http://mjb.4mg.com>**

MJB BOTANICALS sells a variety of the more desirable plants and herbs, and they also offer custom herbal extractions. They have: *Desmanthus illinoensis* roots (60 grams \$10.00), *Diplopterys cabrerana* (30 grams \$20.00), *Ipomoea violacea* (seeds 4 ounces \$10.00), *Mimosa tenuiflora* root-bark (Brazilian 30 grams \$20.00), *Peganum harmala* seeds (90 grams \$10.00), *Phalaris* grass var. Yugoslavian red [*not to be confused with Yugoslavian fresh cut or Turkey red*] (30 grams \$5.00; seeds 1 gram \$5.00), and *Salvia divinorum* (unrooted cutting: \$15.00; 2/\$25.00, rooted cutting \$20.00; 2/\$35.00; leaf 30 grams \$20.00; 10X extract 1 gram \$20.00, 5 grams \$50.00; standardized tincture available on request). Their web site

also stated that they carry “many research chemicals,” and that one should e-mail for a list of what is available at what price. I did just that, and found out that they offer a great selection at reasonable prices; definitely worth checking into.

### **MUSICGODS.COM SHOPS**

[www.musicgods.com/shops](http://www.musicgods.com/shops)

A “Hippie, Head, Music, Hemp Shops’, Vendors’, and Wholesalers’ Directory.” A nice way to find one of these sort of storefronts near you. I have always thought that it would be a good idea if someone mapped these stores out all across the USA. And someone has.

### **RXMARIJUANA.COM**

[www.rxmarijuana.com](http://www.rxmarijuana.com)

Run by LESTER GRINSPOON, M.D., Associate Professor of Psychiatry at HARVARD MEDICAL SCHOOL and JAMES BAKALAR, J.D., leading experts on medical *Cannabis*, this site has the data you will need. Alas, it is one of those “black background, small font, hard-to-read sites” (the white font isn’t as bad as the red, which is nearly illegible). There’s a FAQ, an “Ask Dr. GRINSPOON” section, and posted submissions from visitors to the site, as well as excerpts from the virtual hosts’ books.

### **SALVIA SPACE**

2619 Parker St.

Berkeley, CA 94704

[info@salviaspace.com](mailto:info@salviaspace.com)

[www.salviaspace.com](http://www.salviaspace.com)

With an attractive web site design, SALVIA SPACE claims to have the lowest prices on *Salvia divinorum* leaf and extracts, and they offer a somewhat useful price comparison of their competition (29 sites) with direct links to these web pages (a nice touch) so that one can check it out for him- or herself. While, their prices on *S. divinorum* related products are among the lowest of any retailer that I am aware of, they aren’t the rock-bottom lowest, as they claim to be. They offer their price comparison on some of their other products as well, again claiming the lowest price, but they don’t provide nearly as many companies that they compare with on these other products. If one goes fishing on one’s own, it is easy enough to find lower prices on these items too. For example, OM-CHI HERBS has *Nelumbo nucifera* flowers, *Nymphaea caerulea*, and

*Sceletium tortuosum* at substantially lower prices, *Amanita muscaria* can be found at lower prices at ETHNOPLANET and MAYA ETHNOBOTANICALS, and RIVER’S SOURCE charges about half as much for *Lactuca virosa*.

But let me discuss their namesake for a moment. While SALVIA SPACE sells 25 grams of dried *Salvia divinorum* leaf for \$21.00, MJB BOTANICALS sells 30 grams of dried leaf for \$20.00, making them the company that *actually* offers the lowest price on *S. divinorum* that I am aware of (at only about 67¢ per gram, plus shipping—which at \$5.00 is also lower than the \$7.00 that SALVIA SPACE charges.). That \$7.00 S/H that SALVIA SPACE charges is worth taking into account when comparing prices too. Consider, for example, that SALVIA SPACE sells 25 grams of *S. divinorum* for \$21.00 + \$7.00 (\$28.00, or \$1.12 per gram). ETHNOBOTANYSOURCE.COM, on the other hand, has a \$1.75 S/H charge and sells Mazatec *S. divinorum* leaves at the price of \$30.00 for 30 grams + \$1.75 (\$31.75, or about \$1.06 per gram) and Peruvian leaves for \$24.00 for 30 grams + \$1.75 (\$25.75, or about 86¢ per gram). So even though their listed price for either of these leaves appears higher than that of SALVIA SPACE, the end price is lower. (And in fact, on a gram-per-gram basis, their listed price for Peruvian leaves is actually slightly lower.) I doubt that I would have been so uptight about checking into the availability of lower prices for these products, if it wasn’t for their claim “Nobody Beats Our Prices!” They actually *do* have decent prices overall, even if they aren’t the rock-bottom lowest available. I pointed out that other companies do beat their prices, and asked them if—when shown such companies—they would be willing to come down on their prices; they did not respond to my e-mail.

As well as the above-mentioned products, they also offer “Red Rock” (*Daemonorops draco*), which was being misrepresented on the “street” as some form of opium. (See [www.erowid.org/chemicals/opiates/opiates\\_myth1.shtml](http://www.erowid.org/chemicals/opiates/opiates_myth1.shtml).) This is the first time that I have seen a straightforward presentation of this product, which—despite the fact that it is not any sort of opium derivative—may possibly be psychoactive in some manner.

# BOOK REVIEW

---

*Conspirator* by FLOYD DAVIS. 2001. (PSYCHEDELIA AUSTRALIS PUBLISHING, POB 620 AUST 2482, Mullumbimby, Australia, magikal@mullum.com.au), ISBN 0-9579747-1-X [5.88" x 8.25" paperback, \$24.95]. 316 pp.

In his first novel, Australian FLOYD DAVIS takes readers on a wild joyride through the soft underbelly of a control-oriented future society and the various factions of resistance that have rejected it. DAVIS populates his world with a cast of fascinating characters mirroring the personalities of many of those who today form both sides of the picture.

*Conspirator* proved to be one of those rare books that this reviewer was unable to set down until finished. It was inhaled nearly as readily and rapidly as its central characters burned dope. I say *nearly*, as I seemingly can't read quite as fast as the bud was being burned in the tale. Rarely did an event occur for the central characters unaccompanied by the smoking of sweet herb.

Scarcely pausing for a breath (except perhaps to inhale), DAVIS guides readers through a post-apocalyptic world where humanity is governed by a central computer intelligence, pretending to solve mankind's problems via implanted computer technology permitting it to directly communication with citizens.

Despite the computer interface being presented as the perfect solution to the problems of the human race, it soon finds itself undercut due to hardware failures of the very technology promoted as salvation. (Leading to a need for fresh blood; with the outcasts being deemed the appropriate pool to harvest it from, of course).

These deliberate fringe elements are as disparate as revolutionary: techno-warriors with death wishes and exceptional luck, indoor and outdoor guerilla *Cannabis* cultivators, bare-foot witches creating an idyllic utopian society protected by the minds of children, magicians drinking psychedelic brews to do battle in the astral realms, and drunken Mad-Maxioid junk collectors.

We are treated to a fast-paced tour through the various worlds of these misfits, tax-dodgers, and outcasts-by-choice, living beyond the edges of the civilized world. This intriguing set of characters finds themselves drawn together only by the crisis threatening their existence. The need for unity is compounded by the familiar problem of the most suitable leaders rarely being the same ones who are the first to actually want the job. While peppered with moralistic lessons and observations, DAVIS keeps them running as a current beneath the action-packed surface, stimulating thought while not leaving the reader feeling preached at.

A few readers may find themselves discovering their inner cynic when encountering DAVIS' solution for the world's problems as being (simply put), "All we need is more love" and "A real solution involves everyone," but there is much to reflect on in his treatment of the resolution to the conflicts running through the rest of the book.

The only complaint I have about this book was feeling that a few more pages would have been a welcome addition. There were spots toward the end that I found myself wishing that events had been described in greater detail, or that some of the transition in the complex chain of events had been explained better. On occasion I was left scratching my head, wondering how the story jumped from one point to the next, or puzzling over the occasionally inexplicable motivations of the normally solid characters. But this was only a minor distraction.

Most fascinating was the central premise that the only viable outcome is one where those involved on all sides of the conflict need to be winning participants in the resolution of the human drama into which we are seemingly hurtling headlong. *Conspirator* proved to be a greatly entertaining piece of thought-provoking escapist fiction, and I look forward to seeing more works from DAVIS' pen. — K. TROUT

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See [www.entheogenreview.com](http://www.entheogenreview.com) for descriptions and prices.

Copyright © 2002 by *The Entheogen Review*. Nothing in this journal may be reproduced in any manner, either in whole or in part, without written permission of the editors. All rights reserved. All advertising and advertised products void where prohibited.

# JUST MY OPINION...

## Remembering BOB WALLACE (1949–2002)

I first met BOB WALLACE at a party, although we had conversed for some time prior to this meeting via e-mail. BOB had plans to open up MIND BOOKS—a specialty book vending business geared towards psychedelics—an idea that was suggested to him by JONATHAN OTT at one of the now legendary BOTANICAL PRESERVATION CORPS seminars that were held in Palenque for many years. BOB had not yet opened this business, but as I was at the time working on the first edition of my book *Psychedelic Resource List*, it seemed like he was someone whom I should get to know.

We later partied together on the playa at BURNING MAN. I loved to talk with BOB about these gatherings, and hear him excitedly describe his latest thoughts on flaming whips, shade structures, flame throwers, or the transportation art that he was cooking up. (In searching for a photo to use for this remembrance, I came across several that had been taken of BOB over the years at BURNING MAN, scantily-clad in various costumes that seemed perhaps less than appropriate. I finally located the sole fully-clothed picture that I snapped in México of BOB peaking through the jungle foliage, and recalled the time there that we spent smoking too much *Cannabis* into the wee hours of the night, discussing plans for the 1997 MIND STATES conference.)

BURNING MAN became increasingly important to BOB over the years, as did many aspects of the psychedelic community. BOB recently started hosting the monthly Friday Night Dinners in the Bay Area. His new digs were the perfect spot for such gatherings, where folks in attendance could feed their heads in his extensive library, or their hedonism in his large pool that he had heated to 100° for night-time naked swimming. As well as such “flesh meets,” BOB was very active in the online community. While sometimes I don’t read all of the e-mailing lists that I belong to, due to lack of time, I would eagerly crack into a thread at the point when I noticed that BOB had chimed in. (I suspect that I am not the only busy person who did this.) BOB’s comments always reflected his thoughtful nature and intelligence. His frequently was the voice of reason that calmed flame wars. He even began to sign off his e-mails with the line “just my opinion”—a quip to deflate any conception that he was attempting to provide *the* authoritative voice on a given subject.

BOB was hugely supportive of my own projects, and I always appreciated his ideas about these. At the 2001 MIND STATES conference that I produced, BOB stated that he felt that it was the best such event that he had ever attended—high praise, since I knew that he went to most of these sort of gatherings. He backed up these words by actually paying me *more* than

the agreed-upon booth-rental fee for his book vending table, because he had had such a good time. This was typical of his generous spirit, and he later helped me out financially with some other psychedelic projects. He was a source of funding for MAPS, the CENTER FOR COGNITIVE LIBERTY, the HEFFTER RESEARCH INSTITUTE, EROWID, and other worthy organizations. (See [www.promind.org](http://www.promind.org) for recent donations.) One of BOB’s main concerns was harm reduction in the psychedelic community, and he was the primary funder for the pill testing project at [www.ecstasydata.org](http://www.ecstasydata.org).

BOB planned on attending the MIND STATES JAMAICA conference that I just produced. He would have had a blast. At the event, his friends EARTH and FIRE EROWID led a remembrance for him. A group of us—some of whom I had only recently met at BOB’s house—joined hands in a squashed oval, stepping slowly to the left so that each of us for a moment faced

each other. BOB had developed this ritual as an opening ceremony for the trance-dance parties that he frequented, and for the first time it sunk in how meaningful this ceremony can be and the care that BOB had taken in creating something simple yet powerful.

Apparently stricken with pneumonia, BOB died in his home on September 20. Mainstream press obituaries noted that he was a computer programmer, an early MICROSOFT employee, one of the first to make “shareware” software commercially available, and that his fortune was largely gained through the stock he retained upon leaving MICROSOFT to start his own business. Yet none of this bespeaks the riches that he offered the psychedelic community that he loved. While his financial generosity was great, his generosity of mind and spirit was greater. BOB had the heart of a little boy and the wisdom of an elder. He was largely soft-spoken (occasionally not so), had keen insight, a great sense of humor, and the determination that it takes to bring dreams into reality. We’ll miss you BOB.

— JON HANNA

## JAY C. FIKES SPEAKS...

interviewed by THOMAS LYTTLE

Dr. JAY C. FIKES is an anthropologist who has published extensively on Native American shamanism and entheogenic ceremonies. He has lectured and taught at several universities, and his books include *Step Inside the Sacred Circle*, co-authored with NELLEKE NIX (WYNDHAM HALL PRESS, 1989), *Carlos Castaneda: Academic Opportunism and the Psychedelic Sixties* (MILLENNIA PRESS, 1993), *Reuben Snake, Your Humble Serpent* (CLEAR LIGHT, 1996), and *Huichol Mythology* (a collection of ROBERT ZINGG'S myths, in press 2003 for the UNIVERSITY OF ARIZONA). He exploded onto the psychedelic landscape with research claiming that several scholars—including CARLOS CASTANEDA—faked data about the Huichol Indians (and other tribes) and misled the American public about psychedelic rituals, especially peyote rituals. An impeccable scholar, Dr. FIKES' search for truth in anthropology led him to record never-before-seen shamanic rituals, and print narratives relating to the "nagual," a were-body inhabited by Indian shamans and sorcerers. Dr. FIKES and I spoke in Spring of 2002, when he took time from his teaching position in Turkey.

*THOMAS LYTTLE: Dr. FIKES, can you tell us a little about your childhood? What were your first exposures to Native American culture?*

JAY FIKES: I grew up near the JOHN WAYNE AIRPORT in Orange County, CA. I played baseball with my friends and did well in school. Most of all I loved roaming the fields of the vast Irvine Ranch in search of snakes and the animals necessary to feed them. I kept several species of snakes as pets. My mother did not mind my having them around the house because she had worked during her college years in Kansas for Dr. BURT, who shipped snakes and other animals to schools and collectors. As a boy I was surprised that people other than my mother and my friends—who also had snakes as pets—were scared of snakes. Didn't they know the difference between harmless and poisonous species? My friends, my mother, and I did.

When I turned ten years old my parents gave me a .22 rifle. From then until 1975 I frequently hunted quail, mourning doves, and rabbits. I often hunted alone and I believe that my 14 years of experience as a hunter gave me a profound emotional connection to the Huichol and other traditional Native Americans. I remember being around eleven years old and having a rattler strike at me (but miss) when I was on a hike with other boys. I remember shooting as many as ten rattlesnakes during my many years of hunting. I ate the last rattlesnake I shot and kept its skin in my freezer, thinking I might make a belt or something with it. But I began having nightmares. Rattlers were attacking me. Perhaps two years passed before I finally decided to take the skin back to the same place where I had shot that particular rattler in 1975. After I took it back, my nightmares stopped—and I stopped hunting rattlers.

*TL: These dreams bothered you enough to talk to shamans about it, later on in your life.*

JF: There is more to tell about my hunting experiences, but suffice it to say that after talking with Huichol shamans about the specifics of my nightmares I realized that snakes and other animals have spirits. This insight, one that I gained from first-hand experience, is fundamental to American Indian hunting rituals. Performing those rituals shows proper respect for the animal's spirit and thereby prevents hunters and their families from illness sent by angered spirits (see my interpretation of Huichol deer hunting in my 1985 doctoral dissertation). Orthodox anthropologists evidently don't know, or don't want to admit, that there is a spirit world.

*TL: Your teaching and writing focuses on truth and the search for truth in anthropology. Where did this come from?*

JF: I should probably mention receiving “corporeal punishment” as a child. I remember being spanked twice as a punishment by my father and twice—I think—by my junior and senior high school coach, Mr. JOHN BLAIR, who was a Mormon. The first spanking I can remember happened when I was five or six years old. My father spanked me for lying about stealing some pop bottles in concert with another boy. What a vivid memory. I suspect the condemnation of misrepresentation and fraud expressed in *Carlos Castaneda, Academic Opportunism and the Psychedelic Sixties* is, in part, based on my being punished the first time I lied. My criticism is also consistent with the fact that I respect Indian spirituality more than anthropological theories. Although my parents were strict they also allowed me great freedom. They praised and rewarded me for reading books and getting good grades. More importantly, my father used to drop me off at road’s end to hunt by myself for hours, once or twice every weekend during my high school years.

*TL: Did you see Native American Indians on TV when you were a kid? Did that influence you?*

JF: My earliest memory of American Indians was derived from television. At five or six years of age I was playing “COCHISE” with my best friend, JAMES DAVID. In 1956 or 1957 we were keen on imitating the heroes of the television series *Broken Arrow*. JAMES and I decided to become blood-brothers, just like THOMAS JEFFORDS, the mail superintendent who became an Indian agent, and COCHISE, the Chiricahua Apache “chief.” In real life the friendship between COCHISE and JEFFORDS was truly instrumental in establishing peace between Anglos and Apaches in southern Arizona in the early 1870s. I probably remember becoming blood-brothers because my mother and grandmother continued to mention this incident, expressing amazement that we used

rose bush thorns to draw blood so we could smear our bloody fingers together.

*TL: When did you actually meet real Indians?*

JF: My first contacts with real American Indians came when I was a teenager. That summer when I was 13 years old my family took a vacation trip through a few southwestern states. Somewhere along the highway north of Santa Fe, New Mexico, our car broke down or had a flat tire. A Native American man kindly repaired it

and we took him to Santa Fe. I clearly remember having dinner with him at a Santa Fe restaurant. When I was in high school my father began working with a Lakota named Captain FLYNN. He came to our house a few times and made a positive impression on me.

*TL: Tell us about your first shamanic journey on psychedelics.*

JF: In the summer of 1970, I journeyed to a small village in southern México in search of entheogenic mushrooms. Reading CASTANEDA’S first book had inspired me to seek the kind of mystical experiences he had described. I bought some fresh mushrooms from an elderly Indian woman. My first experience with mushrooms was awesome. I

stayed up all night strolling through forests. I saw a black jaguar, had an experience of “magical flight” and “magical heat,” and left this mountain village the next morning after breakfast. I remember meeting many Indians in Oaxaca and San Cristobal de las Casas that summer.

*TL: “Wounded Knee” and the American Indian Movement (AIM) also was protesting during this period and was in the news a lot. This was the late 1960s and early 1970s.*

FIGURE 1: My adopted grandfather, the premier ritual orator at Santa Catarina, circa 1981.

JF: By the time the confrontation at Wounded Knee happened in 1973, I was very pro-Indian. By then I had read a few books besides CASTANEDA on American Indians for my college classes. It bothered me to see on television that they were having to fight for their rights. I tutored American Indians at the Pala Indian reservation in California in the summer of 1974, and briefly visited the Seri Indians of Sonora. The Seri seemed too removed from their aboriginal life-style so I decided to do my fieldwork with the Huichol. In 1975, I taught anthropology classes on VANDENBURG AIR FORCE BASE and became friendly with JUANITA CENTENO, a Chumash Indian. Once I became a graduate student at the UNIVERSITY OF MICHIGAN, I began “hanging out” with Indians. I started my research with Huichols of Santa Catarina in 1976.

*TL: What religion were you raised with?*

JF: My parents had me baptized in the Methodist Church. They took me to Sunday school regularly until I was about 14 years old. After that I rarely went to church. My father always hinted that his ancestors were Jewish. He eventually told me that his maternal grandfather, EDMOND ORANGE WISE, was a Jew who converted to Christianity. So I grew up with many Jewish friends and what was probably a slightly unorthodox perspective on Christianity. I remember as a teenager, my mother spoke about Bishop PIKE in a way that showed me she believed in the spirit world. For many years I questioned the relevance of Christianity, citing its lamentable historical record.

I was planning to claim conscientious objector status during the Vietnam War. President NIXON’s establishment of the lottery system made that unnecessary because my birth date corresponded to number 363 in the first lottery. In the mid-1970s, while I was a graduate student in anthropology in Ann Arbor, Michigan, I began attending FRIENDS (Quaker) meetings. I became an official member of the RELIGIOUS SOCIETY OF FRIENDS in 1982. I am still a member although I do not agree with certain of their political positions: I support our “war against terrorism” and the death penalty.

Reflecting on my 25 years of experience, observation, and study of Huichol Indian rituals and sacred sites, as well as several years of participation in some 30 NAC meetings, I find that I agree wholeheartedly with REUBEN SNAKE that Christian and American Indian religious beliefs and practices can be complementary. Let me address this issue, of syncretism, in both a personal and scholarly way. I have concluded that people who find significant similarities between beliefs

and practices in Christian and indigenous American religions are adapting to being bicultural (having a dual religious allegiance or wanting to belong to two distinct cultures). In light of geneticists lauding hybrid vigor, it seems to me that becoming a religious hybrid or eclectic should be perfectly acceptable. Yet critics of bicultural religious identity seem to outnumber advocates. Detractors of syncretism are typically religious fundamentalists, native militants, and cultural anthropologists. I am not at all interested in systematically rebutting their position. Suffice it to say that I suspect most critics of syncretism are either very comfortable being monocultural or perhaps they have not yet perceived the value of having a hybrid or eclectic religious identity. My training at the UNIVERSITY OF MICHIGAN, and subsequent contact with academic anthropologists, has convinced me that most anthropologists have emphasized identifying and interpreting the meaning of non-European aspects of American Indian religions. If pursued with a blind eye toward clear evidence of religious acculturation to Christianity, this orthodox bias in anthropology will produce an incomplete and possibly misleading view of individuals and cultures. Sometimes, as in the case of BLACK ELK, who was both an Oglala holy man and a Catholic catechist (see MICHAEL STELTENKAMP’s book *Black Elk: Holy Man of the Oglala* and PAUL STEINMETZ’S book *Pipe, Bible and Peyote among the Oglala Lakota*), this anthropological bias can involve a deliberate neglect of the Christian component of an American Indian’s personality. Such neglect of Christian influence on aboriginal American religions is also a serious problem in Huichol studies and the New Age tours they inspire (see my 1999 essay “Examining Ethics, Benefits and Perils of Tours to Mexico” in the *International Conference on Heritage, Multicultural Attractions and Tourism, Conference Proceedings* Vol. I, pp. 407–422. Edited by MERAL KORZAY *et al.*, BOSPHORUS UNIVERSITY). The problem is not simply that syncretism is understudied, or that some anthropologists may succumb to the so-called imperialist nostalgia syndrome defined by RENATO ROSALDO, in his book *Culture and Truth*. To respect the totality of somebody’s religious identity may mean recognizing that the recurrent anthropological bias—having high regard for native religions coupled with low regard for Christianity—is not an attribute of objectivity but is merely an ideological stance or perhaps a personal choice. This anthropological bias privileges one of three possible choices—which I define below as choice # 2—that are made whenever there is an obvious conflict between cultures. Most American Indians select one of these three positions: 1) Having high regard for Christian religion/low regard for native religion; 2) Having low regard for Christian religion/high re-

gard for native religion; or 3) Having high regard for both Christian and native religion. A fourth possibility, being neutral or negative about both Christian and native religion, is rarely selected by Indians. I would like to see anthropologists better prepared to understand each of these three positions. If they want to achieve a more complete and accurate understanding of a particular person (e.g., BLACK ELK or REUBEN SNAKE), or culture (e.g., Lakota or Huichol), they must try to examine impartially the kind of choices various members of a particular culture make. To respectfully explain the choices made by religious leaders in other cultures may require that we become more candid about our own religious preferences.

Like REUBEN SNAKE, I value syncretism and admire his attempt to combine valuable elements from both Christian and American Indian religions. I find syncretism a more satisfying choice than either rejecting or accepting all elements of any one religion. My participation in NAC rituals and research with Huichol shamans, including my pilgrimage to the plant entheogen called *kiéri* (see *Entheos* 1(2): 38–42), has enabled me to combine elements of Judeo-Christian and American Indian religions. Acculturation into American Indian religions has reinforced my childhood belief that snakes are not Satanic, and forced me to discard or modify certain Judeo-Christian doctrines. My preference for religious eclecticism allows me to discard elements of both tribal and Judeo-Christian dogma. I do not need to believe that JESUS CHRIST is the only begotten son of God to retain him as my role-model. I can believe in an afterlife or spirit-world without subscribing to the orthodox Christian view of heaven and hell. I do not need to believe, as traditional Huichols do, that the Sun-Father must regularly be given human (deer or cattle) blood to survive. Yet I learned from them to value the sun as a source of terrestrial life. I also learned from them that animals and people have spirits that *do* communicate with us even after death, and that peyote and *kiéri* are entheogens (plants that have intelligence and divinity). Unlike most Huichols, I take JESUS CHRIST as my role-model (my personal Lord and Savior—to use religious terms). Almost daily I pray to WAKONDA (the Winnebago name for the Great Mystery or God), to our celestial Mother and Father and to Grandfather-Fire (addressing them with their Huichol names), and offering them all cedar and tobacco, which I grow myself. I also make my prayers in JESUS CHRIST'S name, sometimes even addressing him. It has taken considerable effort for me to feel comfortable having this sort of hybrid religious identity. Probably the most important corollary of my personal transformation is that I abhor dogma, of whatever kind.

*TL: Can you speak about your academic training? What prompted Huichol Indian Identity and Adaptation, your Ph.D. dissertation?*

JF: I remember vividly arriving for the first time in Ann Arbor, Michigan, in January 1975 to begin my training as a cultural anthropologist. It was the middle of winter and snow blanketed the ground. At the base of the Corinthian-style columns of ANGELL HALL, where the anthropology department was located then, was written ANARCHY! in red paint. As an undergraduate at the UNIVERSITY OF CALIFORNIA AT SAN DIEGO, and later at IRVINE, I had learned a considerable amount about Marxism and anarchism so I felt I was at the “right place at the right time.” At that time the UNIVERSITY OF MICHIGAN'S anthropology department was rated first in the nation. The professors who had the greatest impact on me at the UNIVERSITY OF MICHIGAN were MICHAEL TAUSSIG, ROY RAPPAPORT, CONRAD KOTTAK, and GARY WITHERSPOON. I truly enjoyed being a teaching assistant for four semesters for CONRAD KOTTAK. He was friendly and had an encyclopedia-like grasp of anthropology as an academic discipline. I remain in touch with KOTTAK, who is one of the few cultural anthropologists I still admire. My mentor and academic advisor, ROY RAPPAPORT, died several years ago. RAPPAPORT was considered one of the world's foremost authorities on ritual and he had a profound influence on the ecological perspective on ritual evident in my dissertation, *Huichol Indian Identity and Adaptation*. GARY WITHERSPOON was a Mormon missionary to the Navajo when he met the Navajo woman who became his wife. His emphasis on understanding native cosmology and language—illustrated by his own work among the Navajo—continues to inspire me. MICK TAUSSIG was like an elder brother to me. He was also interested in shamanism and radical politics so it was natural that we would be close. I feel some regret at having lost contact with him. He reinforced my own inclination to pay careful attention to the history and structuring of economic relations in whatever culture I intend to interpret.

My doctoral dissertation chairperson, JOYCE MARCUS, was a Mayan specialist. She was interested in cosmology and ritual and was instrumental in guiding me through the difficulties inherent in dissertation writing. At the end of 1981, in my review of literature previous scholars had published about the Huichol, I expressed skepticism about the veracity of some of Dr. PETER FURST'S statements—especially about Huichol waterfall jumping being illustrative of shamanic balance. MARCUS immediately restrained my criticism of Dr. FURST, while neglecting to tell me—in her letter dated 23

March, 1982—that she was a friend of Dr. FURST. We discovered that later, during the course of my lawsuit against Dr. FURST. In that 1982 letter she warned me that my “attack will be responded to, and defenders of Furst and Myerhoff will come to their defense; everyone will overlook the original contributions to Huichol studies that you can make.” Just before I defended my dissertation—in autumn of 1984—MARCUS removed Dr. PHIL WEIGAND from my dissertation committee. I was upset about her decision because at that time I regarded WEIGAND as the foremost authority on the Huichol. WEIGAND was also critical of many aspects of the work FURST and MYERHOFF had published on the Huichol. With reference to my criticism of FURST and MYERHOFF, MARCUS was *right* in stating in 1982 that: “The field of Mesoamerican ethnology and particularly that of Huichol studies to boot is so small that you will damage your reputation before you ever get underway.” She supported her friend, Dr. FURST, and discarded my mentor, Dr. WEIGAND. She abandoned me around 1989, at the time I began asking Dr. FURST for his field notes concerning waterfall jumping.

I am not sure if it would be accurate to attribute my ability to recognize anomalies in ethnographic data to my training at the UNIVERSITY OF MICHIGAN. But then again, where else could I have developed that skill? Exercising that ability was central to my debunking of spurious elements in CASTANEDA’s portrait of Mexican Indian shamans. In my book, *Carlos Castaneda, Academic Opportunism and the Psychedelic Sixties*, I noted that neither CASTANEDA nor BARBARA MYERHOFF had field notes to support claims they made about waterfall jumping. I also mentioned that Dr. FURST had refused to produce any field notes about waterfall jumping in response to my requests to see them. I feel that my condemnation of CASTANEDA is strengthened by the fact that Dr. FURST admitted in his deposition testimony of December 19, 1996, that he *has* no field notes to support his interpretation of RAMON MEDINA SILVA’s stunts at the waterfall near Guadalajara. On page 219 of that deposition Dr. FURST stated: “There are no field notes on the waterfall incident. My photographs are my field notes. Thirty or 40 or 50 photographs that I took. It wasn’t an occasion on which you write things down.” So we have three people (FURST, MYERHOFF, and CASTANEDA) who have no field notes to help elucidate their strikingly similar accounts of Mexican Indians doing amazing acrobatic displays at waterfalls.

Being a native of southern California, I hated Michigan’s long, cold winters. I made some wonderful friends in Ann Arbor, including my dear friend, DAVID ROBBINS. My academic

training in Michigan was surely as good as it would have been anywhere else. In addition to obtaining my doctorate from the top rated anthropology department in America, living in Ann Arbor provided me with an unexpected bonus, meeting LEBRIZ TOSUNER, the woman who has been my wife since 1979. LEBRIZ and I were both enrolled in a required ethnology class taught by Professor ARAM YENGOYAN. The next year we were both teaching assistants in CONRAD KOTTAK’s American culture class. When I first noticed her, at a drinking fountain in ANGELL HALL, I thought she looked like a Latin American. I started speaking to her in Spanish but she replied in English that she didn’t speak it. Then I asked her if she was Jewish, since the vast majority of my girlfriends had been. She declared she was Turkish. I replied, “Then you must be a Sephardic (Jew).” I knew almost nothing then about Turkey. Telling the rest of the story about my years living and teaching in Turkey will fill a book.

I have not yet published my doctoral dissertation. Waiting this long to rewrite it has some advantages. I have obtained much more data on Huichol ritual and shamanism and have gradually arrived at a different perspective on Huichol ritual than the ecologically oriented one I used in my dissertation. I now believe that prior to Spanish conquest Huichol were subservient to the Cora, a more powerful tribe living to their west. In addition to being an entheogen essential to Huichol shamanism, peyote was probably supplied to the Cora by the Huichol. Because *kiéri* is a powerful entheogen native to the territory Huichols have inhabited for at least the past 1,800 years, the question I must answer in rewriting my dissertation is, “Who and what induced the Huichols to make those arduous annual pilgrimages to collect peyote?” The elaborate rituals I saw performed at aboriginal Huichol temples have a long history, one that involved Huichols making peyote pilgrimages not merely to acquire shamanic skills but also to give peyote in tribute to the Cora. My mentor, PHIL WEIGAND, shares this understanding of Huichol history.

*TL: Your first book, written with NELLEKE NIX, is Step Inside the Sacred Circle. This book contains the chapter, “A Shaman Called Fool.” Can you tell us about this chapter?*

*JF: As I reflect on Step Inside the Sacred Circle, I see it as the beginning of my moving outside the mainstream of anthropology. In that book, I defined civilization as problematic, and I tended to romanticize American Indians. Among the narratives contained in that book, “A Shaman Called Fool” is most important because it offers an authentic first-person*

account of how one becomes a shaman (set in Kwakiutl culture of the 1870s), and because it illustrates the esteem in which wolves are held throughout North America. I wanted to popularize this story, recorded by FRANZ BOAS, of how one Kwakiutl man acquired extraordinary ability in hunting and healing as a result of his act of kindness to an injured wolf.

*TL: As an anthropologist, you were interested in myths and theories surrounding shamanic powers—are they real?*

JF: I had noticed that there were not enough readable and accurate first-person narratives that clarified how shamanic power—to enable success in hunting, healing, warfare, divination, and sometimes in sorcery or witchcraft—is acquired. Some well-known narratives about becoming a shaman, such as the account of QUESALID recorded by FRANZ BOAS and popularized by the famous French anthropologist LEVI-STRAUSS, suggest that shamanism works because of the “pla-

cebo effect,” *i.e.*, the patient’s faith in the efficacy of the shaman’s symbols is what makes the patient well. The way in which LEVI-STRAUSS presents QUESALID’s adventures in becoming a shaman raises certain ethical questions such as, “Is deceit justified in treating a patient, if indeed that patient recovers?” While some shamans may know, or suspect, that their healing ability depends primarily on the faith their patients have in them, I am convinced that there is—sometimes at least—more to shamanism than that. “A Shaman Called Fool” makes it clear that it is the wolf spirit communicating with the shaman that makes his hunting and healing efficacious. “A Shaman Called Fool” illustrates primordial or authentic shamanism, a phenomenon in which special human ability (*e.g.*, in healing) is attributed to receiving aid from one’s ancestors, from sacred plants (entheogens), or from esteemed animal spirits. I am still fascinated by authentic first-person accounts of shamanism.

*TL: What have other anthropologists said in this regard?*

FIGURE 2: The Huichol shaman CATARINO sings and plays his instrument at a California library.

JF: Let me mention three other narratives that I believe exemplify authentic shamanism. "How Aua Became a Shaman" (see pages 64–69 in *Native American Autobiography*, edited by ARNOLD KRUPAT for UNIVERSITY OF WISCONSIN PRESS, 1994) is a first-person narrative that describes how this Inuit (Eskimo) man, born in 1870, obtains shamanic power from his first two tutelary spirits: a female seashore spirit (his namesake, AUA) and a shark. AUA's report is filled with references to nuances of Inuit culture. AUA interprets his birth, life, and attaining enlightenment (*i.e.*, gaining helping spirits as well as extrasensory perception or divinatory power) from within that context. It seems worth mentioning that KNUD RASMUSSEN—the man who recorded AUA's remarkable story—was, like BOAS, devoted to systematically studying one culture.

"The Man Who Ate Honey: Kiéri and the Calling of a Huichol Shaman" (*Entheos* 1(2): 38–42, 2002) is a first-person story that describes how, around 1930, a powerful plant entheogen, *kiéri*, selected my Huichol friend, CATARINO, to serve as a shaman. I believe my knowledge of Huichol religion was obvious to CATARINO and that he confided the story of his life-altering transformation, triggered on a material level by eating honey containing *kiéri* pollen, because he trusted that I would understand and accurately interpret his personal experiences, as uncanny as they might seem. So I suppose this sounds like I am putting myself in the same league with BOAS and RASMUSSEN. If it does, I ask readers to pardon my lack of humility and please read CATARINO's story anyway.

Finally I want to revive interest in the adventures of a teenager captured in 1907 by Amazonian Indians, as told in F. BRUCE LAMB's book, *Wizard of the Upper Amazon*. I had the pleasure of meeting LAMB at his home in Santa Fe, New Mexico, in 1988. At that meeting LAMB helped dispel doubts that I had about the authenticity of his book, *Wizard*. My doubts were prompted by having read anthropologist ROBERT CARNEIRO's attack, "Chimera of the Upper Amazon" (see pages 94–98 in RICHARD DEMILLE's *The Don Juan Papers*, 1980, ROSS-ERIKSON PUBLISHERS). LAMB kindly gave me a copy of his rebuttal to CARNEIRO (see "Wizard of the Upper Amazon as Ethnography," *Current Anthropology* 22(5): 577–580, October 1981) and his book, *Rio Tigre and Beyond* (NORTH ATLANTIC BOOKS, 1985). *Rio Tigre* complements and updates the life of the *mestizo* shaman, MANUEL CÓRDOVA RIOS, whose account of his several years of life spent among an Amazonian Indian tribe is presented in *Wizard*. Most notably, *Rio Tigre* provides many examples of successful healings done by RIOS. RIOS, whose amazing diagnostic ability seems

to have been nurtured by numerous sessions with the entheogen known as ayahuasca, had his own unique method for diagnosing and treating his patients, often with medicinal plants. I heartily recommend both books. LAMB's focus on CORDOVA RIOS' life among the Indians (the subject in *Wizard*) and after RIOS had returned to Iquitos (the focus of *Rio Tigre*) is clearly aided by his considerable knowledge of tropical eco-systems and his familiarity with published ethnographies of Amazonian tribes (but not by having done fieldwork in them). I am hoping to find similar first-person narratives that interpret clearly how people in Central Asia become shamans. I invite readers of *The Entheogen Review* to let me know about such reports.

*TL: Tell us more about the shamanic "Wolf Nagual" and the Wolf-Shrines you visited.*

JF: Another reason that "A Shaman Called Fool" attracted my attention was based on my own experiences among the Huichol. During my research in Santa Catarina I had visited wolf-shrines, recorded myths depicting wolves as tutelary spirits in deer, rabbit, and peyote hunting, and recorded esoteric information that explained how a few elite Huichol learned to take the wolf's form (see my 1985 dissertation). One day as I was leaving the Huichol homeland to return to "civilization," I was given some peyote to give me stamina. As we walked through a pine forest I sensed (heard and felt) wolves calling me. When I asked my compadre about it he replied nonchalantly that my experience was consistent with experiences that peyote-hunters have when they travel some 350 kilometers (one-way) to collect their sacrament. They say that the spirit of the wolf is their guide and companion. Eventually, no doubt as a result of my "blessing" by a wolf-shaman

and my visits to their wolf-shrines, I had a memorable dream in which I inhaled the breath of a wolf. Despite the significance of this dream, I do not pretend to be a shaman. I claim only to understand what they tell me about how they have become shamans.

*TL: Your article about the Huichol shaman who received a blessing after eating honey that contained pollen from the sacred plant, kiéri, is outstanding. Please tell us more.*

FIGURE 3: At age seven, CATARINO learned songs after ingesting honey containing *kiéri* pollen.

JF: We can simply excerpt some of what is published in my article, mentioned earlier:

As we crossed the stream there were plants called Kutamé (snake's tooth). When we came to these plants there was a honeycomb made by wasps (called huariches in Spanish and rumaste in Huichol). ...As we ate the honey we suddenly started vomiting. Our vomit was a very yellow color. ...I turned and looked up and saw a huge rock sliding down. That rock was sliding down towards us (but it was only a hallucination). The rocks were breaking apart at the same time and I saw two paths dividing. ...My cousin shouted at me, "Where are you going?" ...I continued climbing up the mountain. When I looked up at the summit I saw a boy who spoke to me: "Come on, come on." ...I followed him until we came to a hill covered with god-houses (sherikite). ...Then he gave me tacuatzi (an oblong basket containing the shaman's sacred paraphernalia) placing it on the ground in front of me. He opened the tacuatzi and everybody could see the prayer feathers. He began singing the song of húahue [T.N.: This song is used in several ceremonies such as parching of the corn, and for the bull, and when the cornfield is cleared for planting].

"Listen well," he told me.... "I am only going to give you these five verses. I am never going to give you a rope, nor a bow, nor an arrow [T.N.: "Not having a rope" means that he will never be able to grab a cacaoyari (male ancestor), not having a bow means that he will not be able to shoot an itaoqui (the spirit of a deceased shaman that appears in non-human form), not having an arrow means that he will not be an evil-doer using witchcraft]. ...I came to my senses and began to look around in every direction. ...I was completely alone, sitting with my back against a boulder. Almost all of my body was numb. After I recovered my normal consciousness I spent almost all day laying down there, overcoming my numbness.

CATARINO's experiences were life-altering. My own experiences, as well as Huichol doctrine, have convinced me that this is one powerful plant. As I mentioned in that essay, "Huichols have warned me never to eat *Kiéri*. I feel compelled to emphasize that eating any part of this plant may well be hazardous to one's health. ...*Kiéri* can punish, with serious illness or death, all those who fail to abide by their vows. When transgressions against *Kiéri* are committed, forgiveness or atonement is virtually impossible."

*TL: You often mention the "Boasian Essence" in anthropology. What is this and why do you hope to revive it? How has this influenced your work?*

TL: I hesitate to answer this question because I am rethinking the value of FRANZ BOAS' methods of collecting data from American Indians in light of ethical standards that have been emerging. On the positive side, BOAS recommended certain guidelines for doing anthropological research that I believe are sound. In contrast to "armchair theorists," many of whom advocated uni-linear cultural evolution, BOAS emphasized the need to do fieldwork focused on a particular culture and its geographical neighbors. This is precisely what I have been doing with the Huichol. In collecting information about another culture BOAS realized that speaking the native language was essential. Although I have learned some Huichol I am not fluent. To compensate for my deficiency, I recorded songs and sacred texts ("myths") in the Huichol language and had bilingual Huichols translate them into Spanish (a language I speak fluently). BOAS believed that obtaining an accurate interpretation of the meaning of such data entailed grasping the native perspective. If the meaning of a myth or ritual practice was unclear after it had been translated into Spanish, I always asked my translators to ask the shamans to explain more, until I understood what it meant to them.

*TL: Your investigations went beyond those of BOAS, however. You actually entered the world of the shaman, and tried to become a shaman?*

JF: Unlike BOAS, I attempted to understand certain esoteric Huichol beliefs by going to their sacred sites, participating in rituals and eating their sacrament, peyote. I view this approach as a corollary of his recommendation that anthropologists understand meaning from the native perspective. BOAS, with the help of a Kwakiutl named GEORGE HUNT, studied Kwakiutl culture and language for decades. Doing research within a single culture for an extended period of time is precisely what I have been doing, since 1976, with the Huichol. BOAS felt and acted with a sense of urgency about preserving aboriginal American culture. Given our federal government's ethnocentric policy of suppressing native religions, enforced from the mid-1880s until 1934, there was every reason to believe that much cultural knowledge would be lost, and it was. The Huichol and other Mexican tribes have experienced similar problems. Certain Huichol rituals, such as rabbit hunting, are only preserved on tape and in my translations.

*TL: Is there anything about FRANZ BOAS that you want to criticize?*

JF: Some of what BOAS did, as a part of his research among American Indians, can and should be criticized. I am particularly disturbed, given my firm belief in the spirit world, that BOAS stole many American Indian skulls and skeletons and encouraged others to do so. He also purchased human remains to sell to museums such as the SMITHSONIAN. A careful reading of his diaries and letters (see *The Ethnography of Franz Boas* by RONALD ROHNER, UNIVERSITY OF CHICAGO PRESS, 1969) reveals other questionable activities.

*TL: Your 1996 book Reuben Snake: Your Humble Serpant is the biography of AIM (American Indian Movement) and Native American Church elder Reuben Snake. This book is filled with "Winnebago Wisdom," as you say. Tell us how you came to write this book.*

JF: In April of 1990, when I was working as a lobbyist for the FRIENDS COMMITTEE ON NATIONAL LEGISLATION in Washington, D.C., I called REUBEN SNAKE to offer to help him persuade Congress to pass legislation to protect the religious freedom of peyotists whose way of worship had just been threatened by the Supreme Court's tragic decision in *Employment Division of Oregon v. Smith*. In late May of 1993, just

after Senator DANIEL INOUE had introduced legislation to protect the NATIVE AMERICAN CHURCH (NAC), I decided that I would go to Winnebago, Nebraska to interview REUBEN SNAKE. What prompted me to go to Winnebago was a dream I had. In it a voice told me not to go underground. I understood that message to mean that I should not go to the Huichol peyote dance, which is held at the end of May to initiate the rainy season.

The dream occurred just as I had been thinking about whether to interview REUBEN SNAKE, or to go instead to the Huichol peyote dance, which for me is full of symbolism about entering the rainy season, darkness, and the primordial underworld (Pacific Ocean). Today I see another meaning to the warning about my not going underground: it meant that I should remain publicly active during the campaign to pass what became PUBLIC LAW 103-344 (see *One Nation Under God: The Triumph of the Native American Church*). I obeyed my dream, wrote REUBEN SNAKE's biography, and helped pass P.L. 103-344, in part by doing over 20 radio interviews nationwide. The interviews I did with REUBEN SNAKE on the Winnebago reservation in late

May and early June of 1993 were all tape-recorded. Instead of explaining here the mechanics of how I edited and interpreted what REUBEN SNAKE said on those tapes I prefer to emerge from the closet—or perhaps the underground—and explain something about my belief in the reality of the spirit world.

*TL: Tell us about the last days of REUBEN SNAKE and your visits with him.*

JF: The last day I saw REUBEN—about two weeks before he died, on June 28, 1993—he was talking to a college class on the Winnebago reservation about the need for museums, collectors, and anthropologists to divest themselves of skel-

etons of American Indians. We did not discuss that issue, of repatriation of bones and sacred artifacts, in the book, but we had certainly talked about the spirit world. Shortly before participating in my first NAC meeting, in June of 1990, I told REUBEN about some of my “paranormal” experiences. He warned me not to discuss them publicly because few Anglos would understand. We agreed that revealing such experiences—thereby announcing my belief in spirits—before

we had passed legislation to protect the NAC might be detrimental to our cause. I have honored his request to stay underground—in the closet on this issue—until now.

*TL: Tell us about your visions and the paranormal, please. This will help people partly understand what happens on psychedelics.*

JF: I want to briefly describe two experiences, which happened without my having eaten any peyote, that increased my faith in the spirit world that REUBEN often talked about. About four a.m. one morning I was writing the Epilogue to the *Reuben Snake* book, pondering what REUBEN meant by declaring that the spirit of the eagle was his lawyer and

that, “The eagle is the one bird that can fly up into the face of God. He carries our message up to God.” Suddenly I was amazed that my doorbell rang, but from inside the house, just above the piano in my hallway.

At that moment I knew REUBEN's spirit was present, teaching me that it is indeed the eagle's spirit that carries our prayers up to God. I understood that the eagle-bone whistle I heard him blow in NAC meetings was like my doorbell ringing—a way of making God aware of people's prayers. One afternoon, some days later, I was writing an explanation of the significance of thunder in REUBEN SNAKE's life. His first memory was of his grandmother, a member of the Winnebago Thunder Clan, praying with tobacco to the first

FIGURE 4: REUBEN SNAKE at the Ho-chunk (Winnebago) pow-wow.

thunder that brings the life-giving rain back again each spring. His final experience on this earth was when the thunder-beings struck the earth behind his house just as he and his family completed their singing and praying. As I was writing down a quotation explaining what the anthropologist PAUL RADIN had discovered about Thunder Clan members: that they called themselves “thunderbirds because they, like the true thunderbirds, caused a drizzling rain and fog when they went about” (see FIKES 1996: 256) it began drizzling above and around my house. A few minutes later my mother arrived and immediately remarked to me how strange it was that it was drizzling at my house but it was clear everywhere else. By communicating with me, after his death, REUBEN deepened my conviction that our “deceased” relatives may help heal us and may meet us as we journey into the spirit world. REUBEN’S benevolent presence has made my life more marvelous. For that and more, I thank you brother. Given these and other experiences I have had with spirits of the “deceased,” I feel compelled to emphasize what REUBEN and others have told me about the importance of putting the bodily remains of American Indians back underground. That is where they belong. Believers in the spirit world are distressed, as I am, by the fact that so many skeletons are still trapped in museums such as the SMITHSONIAN. This is one reason that I call myself a “recovering anthropologist.”

*TL: Do you think the introduction of psychedelics into American culture is a good thing? Do you feel psychedelics should be legal?*

JF: Although I do not personally use marijuana I believe it should be legalized, with appropriate restrictions on driving and performing other dangerous tasks while under its influence. If I remember correctly marijuana is still classified as a Schedule I controlled substance. Both medical and recreational users of marijuana attest to its benefits and I have concluded that those benefits outweigh the harm that comes from keeping it illegal. Many Americans are not aware of certain problems associated with growing marijuana outside our country’s borders. I am particularly bothered by the harm to Huichols that continues to result from the treatment of marijuana as an illegal substance. On the one hand the Mexican army has invaded Huichol territory, sprayed Huichol cornfields where no marijuana was being grown and hassled people who were not involved in its cultivation. On the other hand, Huichol marijuana growers and their Mexican distributors are believed to have murdered rivals and those they fear might report their illegal activities. Huichols have warned me not to travel to certain areas. Some of them

believe that the journalist PHIL TRUE was killed in 1998 in Huichol territory because he stumbled onto a marijuana field. In 1986, my pilgrimage to a specific *kiéri* was considered somewhat dangerous because of its proximity to marijuana growers. Legalizing marijuana should eliminate these and other problems. Making it a legal “cash crop” would bring real benefits to many Huichol families who badly need extra income to survive—but who don’t want to take the risks entailed by illegal cultivation.

*TL: Do you teach and lecture? Describe a college class with Dr. JAY FIKES.*

JF: I am preparing a lecture for upper division anthropology students. I will briefly summarize several cases of fraud and invite them to comment on each of them. The first example of fraud comes from an essay in *Native American Voices, A Reader* by SUSAN LOBO and STEVE TALBOT (ADDISON WESLEY LONGMAN EDUCATIONAL PUBLISHERS, 1998). The authors of “Ethnic Fraud, Native Peoples and Higher Education” cite two studies of ethnic fraud, one in 1991–1992 at the UNIVERSITY OF MICHIGAN and one in 1988–1989 at the UNIVERSITY OF CALIFORNIA, LOS ANGELES. Only about twenty percent of all students claiming to be American Indians or Alaska natives could produce documentation proving that they were in fact members of a federally recognized tribe. I tell my students that somebody I knew in 1976–1978 at the UNIVERSITY OF MICHIGAN encouraged me to falsely claim, as he or she had done, that I was an Indian. Of course I did not make such a false claim.

*TL: So you emphasize integrity and keeping to the facts in a scientific manner, and recording narratives without emphasis. And to avoid fraud or the appearance of fraud. A “sacred trust with history,” you try to impart this attitude in your students, right?*

JF: Yes I do, and I am still disturbed that fraud-tolerance is so widespread in academia. Another study of ethnic fraud, a 1993 survey of UCLA students, showed that only about 15% could prove they were enrolled in a federally recognized Indian tribe. I encourage my students to think about what difference this magnitude of fraud in “higher education” might have on bona fide Indian students, and why non-Indians would misrepresent themselves (basically to get grant and scholarship money set aside for Indians), and what should be done about it (proof of state or federal tribal enrollment should be required to qualify for college admission or funds). I also have students discuss the motive and consequences associated with FRANZ BOAS having misrepresented himself

as a “chief” in 1886; at the first isolated Kwakiutl settlement he visited. BOAS used such self-aggrandizement to receive more favorable treatment from people who did not know or trust him. I ask them to discuss the pros and cons of this “white” lie.

*TL: Wasn't the famous anthropologist MARGARET MEAD accused of fraud?*

JF: She did misrepresent herself and she was fooled by two Samoan hoaxers she relied upon as “informants.” She became BOAS’ most famous student, and I tell my students to read what I said about her in my interview with SANDY McINTOSH ([www.sustainedaction.org](http://www.sustainedaction.org)). In that interview I endorse DEREK FREEMAN’s debunking of MARGARET MEAD’s globally celebrated conclusion—that a stress-free adolescence facilitated by “free love” existed in Samoa in the 1920s. I cite the hostile reception FREEMAN was given by anthropologists who united behind MEAD and attacked him. I explain that his research proved conclusively that two of MEAD’s adolescent female “informants” conspired to mislead her about Samoan sexual practices—see page 161 of MARGARET MEAD’s book *Blackberry Winter* (POCKET BOOKS, 1975) and page 67 of DEREK FREEMAN’s book *Margaret Mead and the Heretic* (PENGUIN BOOKS, 1996). I tell them that MEAD purposely concealed/lied about the fact that she was married. I ask them: did she do this in order to establish rapport with the adolescent females she relied upon for information about Samoan pre-marital sexual practices? Was her deceit repaid by theirs toward her? What were the pros/cons of MEAD misrepresenting herself? Should they follow the example of BOAS and MEAD when they do fieldwork? How important are trust

and rapport in doing fieldwork? This discussion sets the stage for evaluation of CARLOS CASTANEDA. What were the motives and the consequences for him falsely claiming to have become a sorcerer’s apprentice? Should anthropologists condemn CASTANEDA’s hoaxing and his “research” methods and conclusions? Should anthropologists retract their denunciation of DEREK FREEMAN’s well-documented expose of MEAD?

FIGURE 5: Huichol shaman sucked out the object causing a patient’s illness.

*TL: What are the basic issues here?*

JF: The basic ethical question is under what circumstances and for what reasons is any misrepresentation of self ever justified? Which goals are “noble” enough to exonerate people who use fraud? Another question I ask them to consider is this: given the fact that professional anthropologists do not or can not enforce any ethical standards—I remind my students that the Ethics Committee of the AMERICAN ANTHROPOLOGICAL ASSOCIATION was disbanded several years ago—then for what reasons should anybody take *any* of their publications seriously? I remind my Turkish students that they have a special tense in their language, that clearly distinguishes first-hand observation and experience from hearsay.

What safeguards or rules do American anthropologists currently use in order to differentiate accurate research from hearsay—which may well include fraud and undocumented ethnographic anomalies. Citing as an analogy adopting a policy of having college students submit proof of their ethnic identity (as advocated by the authors of “Ethnic Fraud, Native Peoples and Higher Education”), I ask them if there is a need to adopt a policy requiring that field notes or recordings be produced to support claims about data presented in doctoral dissertations, or to authenticate publications where anomalous data (such

as the sensational waterfall jumping described by FURST, MYERHOFF, and CASTANEDA) are presented. Speaking of field notes, I tell them what I wrote earlier (FIKES 1993: 57), that when UCLA's resident expert on Yaqui Indians, Professor RALPH BEALS, asked CASTANEDA to see his field notes, describing his conversations and observations of don JUAN, CASTANEDA never came back. Just imagine how different our world would be if there had been a UCLA departmental policy requiring that field notes be produced prior to granting an anthropology doctorate.

*TL: You have just cited what is your most famous and controversial book, Carlos Castaneda: Academic Opportunism and the Psychedelic Sixties. This book accuses FURST, MYERHOFF, and CASTANEDA of academic fraud. A lawsuit resulted, with you suing FURST for defamation of character and for tortious interference with your book.*

JF: This is a complicated issue. I'd prefer that interested parties write to me to obtain a copy of the legal brief surrounding this case, as prepared by my legal team: MODRALL, SPERLING, ROEHL, HARRIS, and SISK. The title of the brief is *The State of New Mexico Court of Appeals, No. 20,717 : Jay Courtney Fikes, Ph.D. [Plaintiff] vs. Peter T. Furst, Ph.D. [Defendant]*. People requesting that brief should write to JAY FIKES, POB 517 Carlsbad, CA 92018-0517, and include a check for \$5.00 to cover my costs of copying and postage.

*TL: There are a lot of rumors surrounding this lawsuit, which directly pertains to your book on CARLOS CASTANEDA. I'd like to quote "The Summary of Facts" from your brief. Is this okay?*

JF: Yes, go ahead with the quote.

*TL: Quoting from page 2 of your legal brief under the title "Summary of the Facts" we read:*

From 1976 to 1982, Dr. Fikes intensely studied and lived among the Huichol and discovered that many of Dr. Furst's earlier representations concerning the Huichol, including those representations relating to peyote enemas and waterfall jumping, could not be verified. (R.P. 356-57) [*Refers to official court record of documents relevant to FIKES' appeal.*]. After Dr. Furst denied several requests to produce field-notes, Dr. Fikes took steps to publish his observations and correct Dr. Furst's earlier observations (R.P. 358-61). These observations were set forth in a manuscript titled *Carlos Castaneda: Academic Opportunism and the Psychedelic Sixties*, which Dr. Fikes sought to publish with Madison Books (R.P. 361-62).

This present lawsuit is the end result of Dr. Furst's relentless efforts to prevent Dr. Fikes from correcting the record concerning the Huichol and to destroy Dr. Fikes anthropological career.

*It is a sad day when two distinguished scholars have to face off in court, over religious anthropology.*

JF: I don't mind admitting that I have suffered a lot from the many defamatory statements Dr. FURST has made about me. I feel strongly that my reputation, as well as the righteousness of bona fide Huichol shamans, will be vindicated as the truth emerges through this lawsuit.

*TL: Thank you Dr. FIKES. This has been a very enjoyable chat. God bless you.*

JF: I've enjoyed it. I hope the Creator blesses you and the readers of *The Entheogen Review*. ☉

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus*,  
*Epithelantha*, *Pelecyphora*,  
obscure *Trichocereus* species  
including new hybrids and  
crustate/monstrose San Pedros and others,  
*Turbinicarpus*, *Aloe*, *Bursera* (source of copal),  
*Delosperma*, *Ipomoea*, *Pedilanthus*, *Scelotium*,  
and more!

We also offer an extensive guide  
to grafting cacti and other succulents.  
Our catalog is fully illustrated, and loaded with  
ethnobotanical and horticultural information.  
Please send \$2.00 to receive a catalog  
and additional rare plant & seed  
supplements throughout the year.

# LILLY AND LOTUS

by TAO JONES

I am going to touch on the botanical and pharmacological side of the plants in question and also delve into the metaphysical aspects of their use.

...It is necessary to distinguish clearly the genus *Nymphaea* from *Nelumbo* as the term “lotus” has been used in a general sense to denote both genera. The genus *Nelumbo* (syn. *Nelumbium*) was unknown in ancient Egypt and was never found as a part of ancient monuments or of any art. *Nelumbo* was introduced by the Persians and was present only as a cultivated plant... The large flowers of *Nelumbo* are borne a meter above the water and at maturity the petals are shed revealing a large funnel-form seed pod. Likewise the leaves are often a meter across and are peltate. They are always held above the surface of the water. These characteristics are not found together in any of the water lilies.

*Nymphaea nouchali* var. *caerulea*.

*Nymphaea* lotus does not refer to the lotus of common parlance, but to a white flowered night blooming species of *Nymphaea* also common to the Nile delta at a very early date (EMBODEN 1981).

The plant parts in question—flowers of *Nelumbo nucifera* (sacred lotus), *Nymphaea nouchali* var. *caerulea* (sacred blue lily of the Nile), *Nymphaea alba* and *Nymphaea lotus*—all have suggestion of entheogenic applications in the ancient cultures who used them reverently, although for the most part how they were utilized is still uncertain. My experiences with these plants have convinced me that they were—at least in the Egyptian culture—responsible for entheogenic beliefs and practices. I have tried the flowers of all the above mentioned plants by either smoking them (or an extract thereof), soaking them in wine (7 grams of flowers per bottle) and drinking the wine thereafter, and by soaking extracts in cranberry

juice (1 gram of 5X per cup of juice) and drinking the juice, or smoking the flowers mixed with *Cannabis*.

While alcohol infusions produced the most noticeable effects, the juice infusion left me completely incapacitated and in the “it can wait until later” mode I mentioned in my previous paper, “The Land of the Lotus Smokers” (*ER* Vol. X, No. 4, 2001: 125)

A decoction of 3–10 unopened flower buds [of *N. caerulea*] has narcotic, anaphrodisiac, mildly euphoric and antitussive effects (VOOGELBREINDER 2002).

Smoking the flowers, no matter which species, had a more pronounced and immediate effect, which required some familiarity to fully appreciate. In my opinion, the “dreaminess” of the plant is more manifest when smoked. While flowers from all three *Nymphaea* species assayed—as well as those from *Nelumbo nucifera*—had psychoactivity, all were different in potency. *N. nouchali* var. *caerulea* had the highest percentage of dissolved solids when prepared as a 5X concentrate powder. Next was *N. alba*, followed by *N. nucifera*, and *N. lotus*. When just the flowers were smoked, *N. lotus* seemed to be least effective. However, as this is the species with which I have worked the least, there is a good possibility I have just not yet become familiar with its range of effects.

It is the euphoric and lasting sense that “nothing matters and all is perfect,” which the herb produces, that is the main objection I have to continued use of the plant. I find myself letting my affairs in the real world slide, something I cannot afford to do on a regular basis. When I first started using *Nymphaea* species I was not obtaining the effects I now

experience. It took a period of becoming acquainted with the effects in order to let the herb show me what it does before I understood the amazing power and beauty of the experience. Indeed, a week after my last experience—a hard week, mind you—the first thing my body and mind wanted was to experience the blissful letting go into infinite oblivion that I had experienced previously. However, as it had taken me four days to return to “normal” after trying the herb for two days in a row, I could not spare that large a block of time from my professional life to head out for another such excursion. It is easy to see that HOMER had obtained his description of the effects of eating lotus flowers from either first-hand experience or first-hand observation.

In instances of divination, one sometimes does not obtain an answer immediately upon asking the question. Sometimes one does not get an answer. Sometimes an answer is not recognized for what it is until much later, long after the necessity for asking the original question has passed. Sometimes one does not recognize the answer until years later, and then, only by the grace of memory recall of the question asked so long ago. Sometimes one is not aware of having asked a question.

I was in lily dreamland, a disincarnate intelligence traveling with another of the same. We came upon a metaphysical knot in the path—one I had encountered before and for which I could see no solution. I remarked to my “companion” that it seemed unlikely this could be resolved in this lifetime. I was immediately given a vision (within the dream) of myself in the future, young again and in the fullness of health in a beautiful garden surrounded by friends and lovers; the obstacle—and all others—had been overcome and the scene was of youth and perfection. This lasted only a second, and to myself at the time it seemed to be a different type of reincarnation vision. Rather than visions of past lifetimes, this was of a future life. I noted the oddity of this and proceeded with the dream.

Later that evening as I was going to visit friends I recalled that the Egyptians did not have the conception of previous lifetimes in their cosmology, but rather the promise of an afterlife of perfection with the gods. My own mind, geared toward oriental mysticism, had unsuccessfully attempted to supply an explanation from the Hindu system of belief instead of an Egyptian mythology-based explanation. When I realized that this plant gave visions of an afterlife as described by the Egyptian priests in the *Book of the Dead*, the origin of their cosmology began to make a great deal of sense.

We must consider that the legends that became the history of Egyptian dynastic belief are founded upon a water lily as having arisen from chaos (nun) to produce the first god, Ra or Atum. This was to have happened before the birth of the sun and it is the substance of three of the four cosmogonies of ancient Egypt.

...An overview of these cosmogonies, which have numerous variant versions, shows the influence of the blue water lily in conceptions of the origins of the universe (EMBODEN 1981).

YAGE.NET specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers. We're also home to the largest collection of ayahuasca resources on the web.

Blue lily flowers were found in the tombs of the Pharaohs and unguent bottles in the shape of the blue lily flower were buried with the bodies. EMBODEN proposes these to have contained a powerful extract made from the blue lily to help the deceased in their trip to the realm of the afterlife.

*N. caerulea* was a symbol of death and rebirth to the Egyptians and was held sacred to Osiris, who was said to have been reincarnated as a blue water lily after his murder by Set. A text called “Transformation into the Blue Water Lily” [or alternately, Lotus] from the *Egyptian Book of the Dead* makes reference to a blue water lily associated with Ra and Hathor and the pure light of the sun. The incantation discusses the desire of Ani to “transform himself into the sacred blue water lily so that his body might have new birth and ascend daily into heaven” (VOOGELBREINDER 2002).

That this plant was responsible for the origin of the concept of and belief in an afterlife can never be proven definitively, but my experience has shown that it is indeed to be classed as a narcotic entheogen, capable of producing ecstatic and wondrous visions. It can dissolve the boundaries between the self and the universe. Infinity and ecstasy are recognized as realities rather than concepts. The experience is of a subtle energy, until one learns to tune in and let it take one where it will. My latest experience lasted for four days and I found myself at times coexisting in two complete and separate worlds simultaneously.

On this particular journey I had smoked one small cigarette of a cultivar of an *N. nouchali* species (“pink”), followed the next day with a cigarette of *N. alba* flowers. As noted before, when I take these herbs for more than one day (or use them more than once in a day), the effects become cumulative. By the third day, I am in a place that is almost impossible to describe. It is truly a magical world of extreme physical joy and mental and spiritual amazement. I can coexist in this world while also being present in the normal world in which we live. The worlds overlap in such a way that I can have awareness of living two completely different lives at the same time. I coexists in both, in a kind of dream state.

I should mention at this juncture that it took me over a year of sporadic use—perhaps 8–10 usages—before I fell into the state described above, and it was only due the fact that I finally used the plant alone and not in a social situation with others, which would leave me externally oriented as opposed to being inwardly focused. It is only when I find the inward focus that I experience these effects.

The effects of flowers from the *Nymphaea* species appear very similar to that of the *Nelumbo* flowers, varying only in proportions of aporphinic alkaloids present from species to species. While searching for data on *Nymphaea* and *Nelumbo* species alkaloids, I came across the following: EMBODEN mentions *Nymphaea* species contain nuciferine, nornuciferine, nupharine, and also apomorphine:

...apomorphine is one kind of aporphine and is capable of producing profound neurochemical alterations. While it is listed in most pharmacopoeias as a non-narcotic emetic, we have evidence from Diaz that it acts much as ergotamine in *Rivea corymbosa* and *Ipomoea violacea*; that is to say, it acts directly upon the dopaminergic receptors to produce a compulsive stereotyped behavior in diverse species of animals... Large doses (in humans) mimic psychoses which would be considered typical shamanic behavior (EMBODEN 1981).

*Nelumbo nucifera* contains the following alkaloids as listed on the *Nelumbo* pages of *Garden of Eden, Vol II*:

Seeds of *N. nucifera* are + narcotic (Ott 1993), and yield a variety of isoquinoline-type alkaloids—nuciferine, nornuciferine, pronuciferine, 0.01% armepavine, dl-armepavine oxalate, 0.02% nererine (antihypertensive), lotusine, liensinine (antihypertensive), 0.01% isoliensinine, roemerine, anonanine, demethylcoclaurine, 4-methyl-N-methyl-coclaurine, methylcorypalline and 5-MeO-6-OH-aporphine (VOOGELBREINDER 2002).

The seeds are used as an antipsychotic, antihypertensive, tranquilizing, tonic, aphrodisiac, nervine, antifebrile, antipyretic heart tonic with an affinity for the spleen, kidneys and heart. (Bremness 1994; Huang 1993; Nishibe *et al.* 1986; Reid 1995) (VOOGELBREINDER 2002).

I could find no information on the chemical constituents of *Nelumbo* flowers, although there is copious information available on every other part of the plant.

In China the leaves have been smoked with tobacco... the rhizome fiber is used to restore the health of those with nervous exhaustion (see *Nicotiana*, Cooke 1860).

...A methanol extract was shown to have CNS-depressant or narcotic and muscle relaxant activity in mice. (Mukherjee *et al.* 1996) (VOOGELBREINDER 2002).

While I believe that nuciferine is the prominent alkaloid in *N. caerulea* flowers (aporphine is a powerful emetic and I experienced no nausea or emesis at any time while using these

plants except for a slight dizziness the first few time I smoked *N. caerulea* flowers), there may well be other alkaloids present that could account for some or the majority of the perceived effects. At least it seems that way to me.

This is certainly an area that is far from being fully explored and understood, and I have been experimenting with other *Nymphaea* species flowers to determine if the effects are ubiquitous throughout the genus. So far I have had success with a number of different species and cultivars, information about which will be forthcoming when I have had time to more fully assess and evaluate these plants. There are also species listed in botanical literature as having no alkaloid content and I am attempting to locate these as well and assay them for comparison.

A personal communication from THEOBROMUS mentions activity in *Nuphar* species. While I have not had the opportunity to assay these plants for myself as yet, I am confident in his findings.

In conclusion, this field has barely been touched and is wide open for further exploration and discovery. I feel certain that experiments with parts of *Nelumbo* species other than the flowers will provide results similar to those of the flowers, and have strong suspicions that the same holds true for the other parts of various *Nymphaea* species. ☉

# JOURNEY INTO THE REALM OF IBOGAINÉ

by INFINITE EYES

---

Back in 1964, when psychedelic exploration was still legal, I obtained three doses of ibogaine. I had previously been doing extensive exploration with LSD, peyote, DMT, and mescaline, both in my laboratory as chief alchemist for the LEAGUE OF SPIRITUAL DISCOVERY, and internally on my own quest for illumination. Always on the lookout for new and effective ways to access God-consciousness, I was eager to try ibogaine. I had heard fascinating stories about ibogaine from the older friends who had turned me on to my first psychedelic experience with mescaline. One told of a parade of cosmic proportions. Another described a pageant of incredible detail and completely realistic visions, like watching a movie. These were some of the tantalizing descriptions presented to me about ibogaine.

LSD tends to magnify, intensify and empower the vision of a timeless moment. DMT, on the other end of the tryptamine spectrum, tends to transport one into a totally “other” realm, replete with elaborate and intensely colorful designs, strange guardian creatures, and visitations from divine messengers. Having retrieved rich treasures of spiritual secrets from the DMT realms, I was intrigued by the descriptions of ibogaine.

Looking through my anthropology books, I found passages describing members of the Bwiti cult in central Africa using *Tabernanthe iboga*, a traditional plant source for ibogaine, in ceremonies to visit their ancestors and receive instructions. In lower doses, ibogaine was said to give hunters the ability to stay motionless for many hours while they became one with the jungle.

My two intrepid cosmic companions, ALAN and RAYMOND, and myself were all enthusiastic about trying it. We decided to take it at their flat in Brooklyn Heights—a brownstone building that had fallen into disrepair—that lay on the boundary between the black and Puerto Rican neighborhoods. They had fixed the fireplace and transformed the flat into a psychedelic temple. Now assembled, we discussed the preparations. We had fasted for two days and spent the day before quietly reading, meditating, and doing yoga to ensure the best possible experience. We disconnected the phone and put a “do not disturb, meditation in progress” sign up on the door.

We each took about 800 mg of ibogaine hydrochloride, a chalky white powder with a bitter, earthy taste. We sat on mattresses arranged on a carpet around the fire. We waited one, two, three hours, and nothing happened. The fire burned low, but no one moved to build it up. The shadows grew long and night fell. Simultaneously, we all lay down, as the lethargy that had subtly been coming on grew more intense. I had no desire to move. Everything became silent and still. I felt that I was in a soft, humming, electric cocoon that gave me little “funny bone” shocks if I touched it.

I was in the middle, centered between euphoria and depression. I felt balanced. My sense perceptions were heightened. The little glow from the fire brightened the whole room. My eyes focused in a different way—clear, but taking everything in. And then the room started to spin. It was similar to an alcohol drunkenness, but with no feeling of vertigo or nausea at all. I was glad that I had fasted! The whirling increased and I felt like I was in the center of a pinwheel. Faster and faster it spun and then I was rising like a projectile through the room—great chunks of wall and brick peeling back and falling away in slow motion. I shot up into the stars: a pair of disembodied eyes wandering, searching. I was an essence—a solo awareness flying through the universe, exploring and seeking.

After an immense journey, I came to a planet. It was a sandy yellow color. I was able to project my vision down to it, and I looked around the surface of the planet. It was an inhospitable looking place; with winds strong enough to blow rocks and sand past me. It looked lethally hot and dry. I moved on. Next, I came to a dark green planet. No clouds. No seas. No mountains. It looked as though it were covered with a poisonous mold. I did not want to go any closer. I continued on through the galaxies until I arrived above a whirling vortex that was coalescing into a solar system. I watched a sun and its planets form, and came closer to observe. I was drawn to one of the middle planets. The fiery liquid surface was cooling and turning from yellow and red to black solids broken by red rivers of lava emitting flames. Slowly, the planet cooled until fumes and vapors veiled the entire surface. As I circled the planet, I sensed a long epoch of torrential rains, as water vapor formed and condensed in the upper atmo-

sphere and fell toward the burning surface, only to evaporate again long before reaching the ground. Eventually, the planet cooled and the rains arrived on the lands below. After what seemed like a long time, the clouds began to clear. I skimmed the planet now, seeing and being everything that I came across. I watched mountain chains rise and volcanoes burst, and everything subside again and again into flat plains and meandering rivers. Time and time again, mountains rose and dissolved and continents appeared and disappeared. Then this slowed down and I watched the seas and plains. All was sterile—a tan land with smoking volcanoes and no life, yet fecund and ready.

As I watched, I then saw life appear. I observed spots of green forming along the seashores. They shot along the banks, forming a green margin and then running up the rivers and tributaries like the veins in a leaf. The barren spaces between these branches of life filled with proliferating plant life. The oceans seemed to be teeming with life and then the first bug-like creatures started to crawl out on land. They spread all over, rapidly changing into a variety of insects and strange lobster-like creatures. Fern-like plants appeared. Vast varieties of life appeared and then disappeared. Elaborate life experiments succeeded one another with awesome complexity.

Then suddenly I was in a steaming swamp-like environment that looked familiar. With a sense of awe and amazement, I realized that I was watching the age of the dinosaur, and it slowly dawned on me that I was witness to the history of life evolving on the planet Earth! With a speed that defies accurate recall, life forms changed again and again, spreading and multiplying in a dizzying array of shapes and colors. Humanoid creatures appeared and soon after were hunting and then farming and building. Civilizations bloomed, spread, and subsided, like bubbles on a fermenting pond. Ages of war and conquest expressed the speed of civilization and technology. I witnessed slaughter and mayhem, torture and mutilation, rape and castration. Man's inhumanity to man was illustrated in myriad forms. I was there "in" it, feeling it as both the doer and the done to. For what seemed an interminably long time civilization rose and fell in inter-folding waves of creation and brilliant innovations in arts and sciences, only to fall in smoking ruins followed by ages of darkness.

Then, points of light appeared in the dark, interconnecting again in new waves of discovery and renaissance. Undulating waves of humanity were crashing and washing over the

planet in a succession of expansion and contraction. As I lived through this flux and change, there arose in me an awareness of the noble and brave potential of humanity and its duty as the intelligent species to protect the forests and life forms and water of the planet. I was experiencing a feeling of the sacred unity with all life. I saw the whole planet's surface as one organism inhabited by one spirit growing its forests to protect its surface and provide even moisture and temperature for all its creatures. I saw one species, humanity, as the natural intelligent guardian of all life. I realized that it was humanity's intelligence that must understand, preserve, and care for the earth's surface—and life that is its nutrient substrate, its womb, and its mother. I felt how all life was precious, interconnecting, and supportive of all other life. I dedicated my spirit not to destroy any part of this puzzle of divine mystery that is the milk of creation. Throughout, there was this balance and acknowledgment of the intertwining of opposites, the negative and positive, the base and noble. This feeling went through me as a dual aspect of one energy—total, deep, and sweeping me away on this immense journey of life's history. It was like falling in love, so entrancing was this vision.

Hours had gone by. The fire was long gone, yet this movie continued with fantastic detail, one pageant coming on the heels of another. An example of the incredible detail that *ibogaine* shows: through my constantly available "zoom lens," I was observing a French king and his retinue during a formal promenade in the gardens of Versailles. Of this large group of people in courtly splendor, one woman's dress caught my eye. I could see at great distance the hem of her dress, an intricate and tiny embroidery of inter-linked fleur-de-lis. Simultaneously, I could see both immense and complicated scenes and vistas as well as small details with great precision. On and on it went, and I never moved. This peak experience went on for at least 14 hours. I was watching scenes from the industrial revolution when the sun shown in the window. The movie continued in stronger and weaker waves, dimming in the light and finally fading out, although I know it was still going on at some internal level. Although I could move around now, I was still high and it was still going on 24 hours later. This was a long trip!

By afternoon, we were all getting pretty hungry. I decided to brave the world and pick up some food at the corner store. I exited the house, which was located on the black side of the street, and headed for a Puerto Rican store on the opposite corner. This was New York, a place where people don't usually greet strangers on the street. I walked past this old man

who glanced up and said, “Hello.” Down at the corner I met a black woman; we also greeted each other and smiled. I crossed the street and entered the store. Pretty soon I was chatting and joking with the owners, and they were putting extra fruit in my bag as gifts. As I exited the store and crossed the street upon my return I had to pass through a group of young black gang members who had just arrived. To my surprise they let me pass with no incident. What was going on? As I walked back it hit me. I knew where we all came from. We all came from the same source—the same mother. There was no difference between us. I saw it, I felt it, and I “was” it. And it was recognizable instantly by others. I had been transformed into a being at one with all other life. Racism and prejudice became incomprehensible to me after that. I knew where we all came from. We all came from the same universe: we were all one.

What I learned from this trip is that there is a new paradigm arising for humankind. Transcending mind, one finds the spirit or soul. Rejecting the bias of politics and the destructiveness of fear, one finds that life and unity and harmony are served by love. Humanity’s role as guardian of the planet becomes all too urgent as we go beyond the carrying capacity of the planet’s surface. This is the dream we must realize: to bring back the health of life and nature on this planet. Protect the womb that has borne us and still serves us. Bring back the forests, let the waters run clean, and live in love and harmony with each other. It is time to understand the roots of fear and deal with them. Let us join in a dance to celebrate life and love and rediscover the beauty of inner sacredness.

What is this stuff called ibogaine that tastes like earth and lets you see your ancestors? Is it a DNA-designed communication link to our origins? How far back are these origins? Are we visitors from space, planted here on the wings of the God-DNA? Is this cosmic panorama it reveals created to give humanity a real look at our history to understand who we are and how we are connected to the universe? One thing is certain: ibogaine is one of the true, deep psychedelics. It is flesh of the Gods. Use it with preparation, respect, and care, and you may grant yourself a taste of truth, a vision into the nature of reality and an inspiration to enter into the path of unity and knowing.

## AFTER-THOUGHTS

One of richest uses of psychedelics is giving them enough time and attention to allow the sacred messages to filter through and become meaningful. A day before for preparation and one afterwards for contemplation is ideal. The peyote people would spend the morning after, for a traditional breakfast and sharing the visions they had had and finding meanings in these messages from beyond. In like manner, we can also find new meanings for these visions as the years deepen our perspectives.

So as time passed, I wondered who it could have been that was seeing the evolution of life on our planet. Was this some mystery that would just have to be accepted as is? Many years later I came across two ideas that gave new meaning and depth to these ibogaine visions. The first idea came when I read about an explorer in the Amazon questioning the chief of the Mayoruna about the purpose of all the intense psychedelic journeys that the entire tribe participated in. He said that the purpose was to go back to the beginning. The second idea came after reading JEREMY NARBY’S book *The Cosmic Serpent*. I realized that it was quite possible that the DNA molecule had an extraterrestrial origin. In fact, due to the complexity of this life-evolving molecule and the relatively short window it had in which to evolve on this earth it seems that DNA’s evolution here on planet earth may just be another geocentric earthling myth.

Putting these two ideas together started a process that gave a whole new meaning to my ibogaine vision. I was going back to the beginning. Going back to the beginning of life on this planet. Certainly, it was not my persona that was going back. Then what or who was going back? What was the common denominator of all living things? Who was the “I” that was observing and so intensely participating in all these lives and journeys? Suddenly I realized that the common denominator and the origin of life was the DNA that we all carry, whether it be the simplest bacteria or modern man. Now my vision took on a whole new meaning. Our consciousness predates this solar system. I had gone back to the beginning when I (and all of us) had been space-borne DNA looking for a new home in which to create life. I had been seeking through one solar system after another until I came to the nascent solar system we now call our home. Now I rushed down to the surface after waiting for eons for the conditions to be right for the formation of life. Then down I went, creating new life, evolving from the beginning into the vast mystery. ☉

# NETWORK FEEDBACK

## KAEMPFERIA GALANGA MAOI ASSAY, MIRABILIS MULTIFLORA...

In the VERNAL EQUINOX 2002 issue of *ER*, JOHNNY APPLESEED states the need for MAOI testing procedures. I have come across a type of MAOI assay while researching *Kaempferia galanga* use. In the article NORO, T. *et al.* 1983, "Monamine Oxidase Inhibitor from the Rhizomes of *Kaempferia galanga* L.," *Chem. Pharm. Bull.*, 31(8): 2708–2711, they use benzylamine as a substrate to test for the binding of MAO in the presence of other compounds. The benzylamine can then be tested spectrophotometrically at 250 nm to see how much inhibition there has been of the MAO binding. This testing method is presented in a 1954 article by TABOR, C.W., H. TABOR & S. M. ROSENTHAL in the *J. Biol. Chem.* 208: 645.

The claim is made that the compound ethyl *p*-methoxy-*trans*-cinnamate has the most powerful MAOI effect of all the compounds found in *Kaempferia galanga*, but *no* MAOI effect was found from *p*-methoxy-*trans*-cinnamic acid. *K. galanga* being a mild MAOI seems to fit with my experiences with this plant, where I put up to 500 grams of the rhizome (fresh or frozen from an Asian grocery store) in a blender with lecithin (as an emulsifier since the MAOI came out in the non-polar benzene fraction in the above paper), ginger (to avoid stomach complaints), water, and some coconut milk (as a fat to absorb some of the non-polar compound). After blending this for 5 minutes or so and straining and drinking the potent-tasting liquid, I usually feel a mild euphoria, mellowing, and aphrodisiac effect after an hour or so. I am still playing with the extraction method as I get slightly different effects each time I use it, and I am still trying to determine if the species sold as "galanga" in the Asian grocery store is *Kaempferia galanga* or *Alpinia galanga*, (both in the Zingiberaceae, or ginger, family). I am growing out one of the roots so as to be able to identify the plant in the NEW YORK BOTANICAL GARDEN herbarium, where I work. Do you know anyone else who has experimented with this plant?

We don't personally know anyone who has experimented with *Kaempferia galanga* but the information you present above certainly does pique our interest. *K. galanga* has been reported as a "very

mild but real hallucinogen," with a dose being described as "approximately 3 inches [of whole root] per person" (MILLER 1983). There are a few reports of "galanga" trips posted to [www.erowid.org](http://www.erowid.org), and effects are presented as ranging from none at all, to mainly side-effects, to mild *Cannabis*-like effects, to mild LSD-like effects. One person, who smoked an extract, had fairly decent results. Nevertheless, it is important to remember a couple of points.

First, it should be stressed that there are several distinct plants sold as "galanga," and these are not synonymous in appearance, taste, botany, or chemistry. *Alpinia galanga* (greater galanga) forms very stout whitish rhizomes, whereas the *Kaempferia galanga* takes a branching form of long finger-like rhizomes. *K. galanga* is also used for its medicinal stem in China Like the Indonesian *A. galanga*, it is said to be found dried and sliced in the West. There is also *A. officinarum* (lesser galanga), found in China. It is smaller and more compact. While the editors have not yet used either in conjunction with anything that would benefit from MAO inhibition, K. TROUT has gotten little effect from the *A. galanga* beyond a pleasant mild sense of well-being, similar to that resulting from ginger, despite eating fairly large amounts of the commercially available roots (fresh and also dried). While *K. galanga* is said to be commercially available, neither TROUT nor AARDVARK has encountered it yet. Large Asian markets and Traditional Chinese Medicine (TCM) herb suppliers would probably be good places to look for this species.

Second, not all MAOI drugs are equal, and only some will work to activate tryptamines. There are still a number of loose ends to be tied up concerning the pharmacology of this interaction, despite the effect of the combination being well-known and studied. This pharmacology should be explored further, particularly if it turns out that *Kaempferia galanga* proves to be a decent MAO-A inhibitor.

Another plant I've been recently interested in is *so'ksi*, or *Mirabilis multiflora*, which is used as a psychoactive by Hopi Indian medicine men, as reported in ALFRED F. WHITING'S *The Ethnobotany of the Hopi* (MUSEUM OF NORTHERN ARIZONA ©1966, originally published 1939). It is listed under the genus *Quamoclidion* (or something like that) in this book. This plant is in the *Nyctaginaceae* family and is closely related to the ornamental garden plant four o'clocks (*Mirabilis japonica*), but the ornamental is a powerful purgative. WHITING reports only that the medicine men chew the root of this plant to reach an altered state. All other references to this plant seem to refer back only to WHITING'S account. It is listed in a few places at [www.erowid.org](http://www.erowid.org), but these are not dependable sources. A friend who recently visited with the Hopi near Flagstaff reported to me that *so'ksi* is still used there but did not witness its use. Have you heard of any work with

this plant? HOFMANN and SCHULTES do not even mention any plants in this family, let alone this genus as being psychoactive in their treatise *The Botany and Chemistry of Hallucinogens*, so the study of this plant is quite interesting because it expands the range of hallucinogenic plants in flowering plant taxonomy. Thank you for your help. — N.B., NEW YORK BOTANICAL GARDEN

Alas, *Mirabilis multiflora* is still an under-explored plant. We published an article on this plant in Vol. IX, No. 2 of *The Entheogen Review*, p.100. Despite it being reported as a "hallucinogen" in some texts, the one psychonaut has described the effects as being "GHB-like." We'd like to hear more from anyone who has first-hand experience with this plant. — Eds.

## ANADENANTHERA & MIMOSA

I had some extra *Anadenanthera colubrina* and *Mimosa scabrella* seeds, which I got from South America, so I figured that I would send them to you folks at *ER*. [Thanks! — Eds.] The *M. scabrella* germinate well by pouring boiling water over them and letting them soak for 24 hours. I've had no luck yet with starting the *A. colubrina* seeds; any suggestions would be a great help.

It has been said that *Mimosa scabrella* is "very similar" to *M. hostilis* [now considered synonymous with and correctly referred to as *M. tenuiflora*, due to the latter having been described first (BARNEBY 1991) — Eds.], and is used in its place as basically an "equal." Do you know if this is at all true?

Also, do you know why *Mimosa [tenuiflora]* seeds are so difficult to find? Previously only JLF and L.E.R. had seeds, and NATIVE HABITAT had plants. The seeds from JLF must have been old, as none germinated even with many attempts. L.E.R. no longer has seeds, and NATIVE HABITAT seems to have given up on offering live plants. If this is one of the more desirable plants, why aren't seeds being offered? I would really like to know if *M. scabrella* could replace it.

Thanks for any answers you can provide and for keeping up the good work! — ANONYMOUS, WI

*Anadenanthera* seed germination results that we have experienced ourselves and heard about from others range from excellent to not at all. The major factor may be the age of the seeds, as fresh seeds generally show phenomenal germination (in terms of being very fast and having a high percentage of sprouting seeds). TROUT's results thus far have been only at both ends of the spectrum; either a rapid germination (from 1 to several days), or—in other cases—none at all have germinated, and the seeds turned to a pasty material. AARDVARK only saw the latter disappointing results. A warm water soak until swollen may prove of benefit but many people report success simply planting them halfway buried edge-wise into the soil with the hilum (the seed eye) being placed at about soil level. Some have suggested that partial burning or roasting of the seeds is important and they are occasionally made available in this state but we have not found this essential. A heating mat is recommended though.

Some *Anadenanthera* species form elongated storage organs in their root system and care must be taken to maintain the intactness of the root system during transplanting. Preliminary efforts to stimulate root suckering in our container grown plants have not yet been successful.

**SUBSCRIBE TO TRIP MAGAZINE!**  
[www.tripzine.com](http://www.tripzine.com)

Filtered light with a bit of full sun has given excellent results. *Anadenanthera colubrina* is frost tolerant but how freeze hardy it is remains to be seen. It occurs over quite a wide range and it is likely that some quite cold tolerant strains can be brought into cultivation. Bark and root-bark of this species (and its *cébil* variety) should be examined in greater detail. The root-bark of *A. peregrina* can at least sometimes be quite high in 5-MeO-DMT (SCHULTES *et al.* 1977 reported one tree with 39 mg of 5-MeO-DMT per 10 grams of dried stem-bark and nearly 64 mg in the same amount of dried root-bark).

As far as *Mimosa tenuiflora* goes, we had a few old seeds that were obtained from the defunct botanical business ...OF THE JUNGLE. As they went out of business in 1996, these seeds must have been at least seven years old, and probably eight or nine years old. (Oddly, we can't find this offering listed in any of the old catalogs that we have for them, but the seed packet that we had clearly came from their company, and was marked "*Mimosa hostilis*," so we assume it was one of many limited items that never made it into a catalog.) Only one of the few that we planted germinated. Another cause for non-viable *M. tenuiflora* seeds that we have recently seen is that the seeds were not fully mature.

We agree that active growing of this plant could be useful, especially to check out the potential use of the foliage, despite the likelihood of its usefulness being low. Why *Mimosa tenuiflora* seeds are not more readily available is a truly good question. Seeds *should* be far more widely available than they appear to have been. We've no idea why these seeds seem to have vanished or been largely unavailable from the specialty market. GNOSTIC GARDEN used to carry them, but apparently they have been discontinued. ETHNOGARDEN BOTANICALS has these seeds listed as "forthcoming," so one might periodically check their web site (<http://ethnogarden.yage.net>).

The only two sources that we have been able to locate are: BOTANIC ART, Hoogstraat 116, 3131 BP Vlaardingem, The Netherlands, [www.botanic-art.com](http://www.botanic-art.com) (8 seeds for 5.70 euros); and PJT BOTANICALS, POB 49, Bridgewater, MA 02324-1630, [www.pjtbotanicals.com](http://www.pjtbotanicals.com) ("packet" for \$5.00).

The seeds we obtained from JLF showed poor germination but more importantly those few that *did* germinate proved to *not* be *Mimosa tenuiflora*, but are rather a presently unidentified *Mimosa* species. Analysis of this material is currently lacking. *Mimosa* seeds sometimes rapidly lose viability but often can benefit from nicking and a soak in warm water prior to sowing. Use of a heating mat is also suggested. One commercial vendor of *M. tenuiflora* root-bark commented that when harvesting from trees in the wilds of Chiapas, he noticed that those trees that had previously been harvested for their root-bark went on to form a ring of new trees, sprouting from the periphery of root fragments remaining in the soil (MONTGOMERY 2002). This suggests both that harvesting can be done sustainably and that deliberate stimulation of root suckering (such as planting on berms and dividing the root system periodically) may prove to be a powerful propagation technique for the species.

So far as we can tell, *Mimosa scabrella* has not yet been reported in any traditional *jurema* preparations, unlike *Mimosa hostilis* (GONÇALVES DE LIMA 1946), *M. verrucosa* (SILVEIRA BARBOSA 1998) and *M. ophthalmocentra* (BATISTA *et al.* 1997; 1999). However, *M. scabrella*

may indeed prove to be a valuable source for DMT, if extrapolations from the literature hold true. The sole published analysis of *M. scabrella* stem-bark placed the DMT content at less than 0.0357% by dry weight (DE MORAES *et al.* 1990). Compare this to an analysis of the stem-bark of *M. tenuiflora*, which reported a yield of about 0.03% (MECKES-LOZOYA *et al.* 1990), and it seems as though the stem-bark of *M. scabrella* may be comparable to that of *M. tenuiflora* in DMT content. While *neither* reported stem-bark contents of DMT is particularly high or useful—a quarter pound or more of stem-bark being needed for a single dose—it is well-known that the root-bark of *M. tenuiflora* is much more potent, ranging from 0.5% or less (GONÇALVES DE LIMA 1946; PACTER *et al.* 1959) to over 10% by one account (OTT 2002). We are unaware of any published analysis of the root-bark of *M. scabrella*, yet if it can be extrapolated that *M. scabrella* follows a similar trend (which, of course, it may not), then this plant could be a more easily available source than *M. tenuiflora* seems to be—at least for those who want to grow their own plants. And *M. scabrella* has the added advantage of reportedly being hardy in cooler climates. We've heard of one grower in the North of England who successfully raises these plants (GIBSON 2002). Clearly this plant needs closer analysis. — EDS.

## DESTRUCTIVE DISTILLATION, CACTUSTEA SUCCESS

I have occasionally sought advice about what to do to refine 5-MeO-DMT "beer," a weak extraction of *Phalaris* grass that gives a pleasant buzz but fails to fully open the door to the other world. I don't know why it took me so long to put this together, but when I smoke it I use a vaporizer, and some of the crystals cool enough to precipitate in the pipe. And, I've known for some time that this precipitate is stronger than the original material. So why not do this on purpose?

I tried doing this in a glass crockpot, thinking that I would get precipitate on the lid. The material in the pot, with a very low gas flame under it, boiled in an encouraging manner and filled the house with lovely fumes, but no precipitate was left on the lid of the pot.

I believe there is some piece of laboratory glassware available for performing the operation I would like to, but I'm not sure what it's called. It looks something like this:

Can you tell me what the name of this item is, appropriate specifications, where to find it, and the approximate cost? I think that this item would really further my research.

An alchemical alembic.

This image was taken from a posted scan at [www.levity.com/alchemy/libav02.html](http://www.levity.com/alchemy/libav02.html) obtained from the book by JOHN FRENCH titled *The Art of Distillation. Or, A Treatise of the Choicest Spagyric Preparations Performed by Way of Distillation, Being Partly Taken Out of the Most Select Chemical Authors of the Diverse Languages and Partly Out of the Author's Manual Experience together with, The Description of the Chiefest Furnaces and Vessels Used by Ancient and Modern Chemists also A Discourse on Diverse Spagyric Experiments and Curiosities, and of the Anatomy of Gold and Silver, with The Chiefest Preparations and Curiosities Thereof, and Virtues of Them All. All Which Are Contained In Six Books Composed By John French, Dr. of Physick London. Printed by Richard Cotes and sold by Thomas Williams at the Bible in Little-Britain without Aldersgate, 1651.*

On another subject, I took an *ER* correspondent's advice and made a cup of tea from two kilos of *Trichocereus pachanoi* stalk. After initial nausea, my partner and I found ourselves quite unmistakably on the other side of the "door," being the "ones" who animate us, rather than our ordinary selves. This was accompanied by some visual phenomena that involved seeing each other's alternate identities. The lifting of the veil lasted all night from about 6:00 pm on the Summer Solstice, with a distinct difference in perspective remaining until about 6:00 pm the next evening. Thank you very much for encouraging me in this direction. — M.H., TN

I'm glad that you found the *ER* correspondent's cactus advice to be of use. Before I begin with your question about glassware, I should clarify some terminology. A *precipitate* is an insoluble material that deposits from out of a solution. The material you were hoping to find deposited on the lid of your device (and which you witnessed inside your free-base pipe) is more correctly referred to as a *condensate* or *distillate*. As to the piece of glassware that you refer to, this is not really a piece of chemical lab-ware; it is actually a piece of alchemical glassware. The particular piece depicted is known as the "head" of a primitive distillation apparatus called an alembic. (If it were closed on the bottom it would be a related device known as a retort.) The drawing to the left illustrates one such simple distillation apparatus. These are not used in modern chemistry so far as I know. I suspect the only source for one would be to have it made by a glassworker. This approach can certainly work as evidenced by the condensations within a free-base pipe but it has a couple of major drawbacks. One drawback is its inefficiency; using a longer column and water or some other cooling mechanism for inducing the condensation would be a better choice. The other drawback is destructiveness. A substantial amount of the product will be either damaged or destroyed during such high temperature distillations. (Observe how an excess of DMT left in the bottom of a glass pipe darkens steadily as reheated.) Vacuum distillation or even simple extraction would be strongly suggested instead. If you do decide to explore the path you alluded to, please let *ER* know of your results! — K. TROUT

## MEDICAL MAOI, IBOGAININE EXTRACT

I've got a couple of questions for you. First off, how much moclobemide should one consume with an extract of *Mimosa tenuiflora*, or *Psychotria viridis*, or *Trichocereus* species for tryptamine activation or phenethylamine potentiation?

Second, I have some *Tabernanthe iboga* extract (crude ibogaine) that I obtained from INDRA SHAMANIC PRODUCTS. The dose that they recommend is 1 to 6 grams. Is the high end of this range within a safe amount to take? I am hesitant to consume it after reading *Ibogaine: Proceedings of the First International Conference*, where the deaths of a few individuals were reported. One of them, a 40-year-old heroin addict, was reported to have died after having allegedly taken 5 grams of *T. iboga* alkaloid extract 40 hours prior to his death (p. 27). How much of the extract that I have can be consumed to be on the safe side and not embark on a one-way journey?

On another note, I ordered 10 grams of *Amanita pantherina* and some extracts from PURE LAND ETHNOBOTANICALS in October 2001. They were quick to charge my credit card, but I have still not received any products nearly a year later. I have e-mailed them several times and they only responded after I threatened to publish my "story," and they told me that they would look into the matter. Nothing happened. What particularly annoys me is that they didn't even tell me whether

or not they *sent* the stuff (*i.e.*, did it get lost in the mail?). Since that time, there has been a total lack of response to inquiries. I would advise other psychonauts not to do business with this company.

Thank you for an excellent magazine. — O.H., Sweden

As far as a dose of moclobemide goes, we have heard of people taking from 75 mg to 150 mg, and getting good results in activating and/or potentiating tryptamines and phenethylamines. Since the pills frequently come as scored tablets in 150 mg doses, we have heard of people who will break them in half and take 75 mg about 15–20 minutes before they consume the tryptamine or phenethylamine, and then a second 75 mg concurrently with the entheogen. It bears repeating again that we do not recommend that people mix moclobemide or other MAOI drugs and MDMA, as such mixtures may have the potential to induce a hypertensive crisis.

With regard to the crude “ibogaine” extract that you describe, unfortunately there is no way to know exactly how much ibogaine it contains without quantitative laboratory analysis. Hence, guessing about doses (and potentially lethal overdoses) is problematic. Also, it seems quite likely that the state of health of the individual consuming the extract could have something to do (or even a *lot* to do) with whether or not he or she ends up taking a dirt nap after sucking down their dose. So far as pure ibogaine goes, OTT gives the “dose” of “entheogenic above 1 mg/kg,” which would seem to place the threshold dose for a 150 pound person at about 68 mg, and yet he also stated that the threshold dose for straight root-bark of *Tabernanthe iboga* was 20 grams, saying that this amount was thought to contain “about 75–125 mg of ibogaine,” and he supposed that the initiation dose (said to “break open the head”) might contain as much as 6.25 grams of ibogaine, but he is quick to point out that such massive doses have resulted in deaths (OTT 1993). (Note that the figures OTT gives for root-bark might not translate to extracts made from the whole root, as it is possible that the bark of the root is more potent.) The “Secret Chief” relates that the ibogaine doses he administered were between 225 and 300 mg (STOLAROFF 1997). *TIHKAL* places an ibogaine dose at “from hundreds of milligrams up to a gram or more, orally” (SHULGIN & SHULGIN 1997). A report in this issue of *ER* (see page 98) discusses the effects of 800 mg. The crude extract sold by INDRA SHAMANIC PRODUCTS ([www.indra.dk](http://www.indra.dk)) that you mention is said to be a “5X” extract. So, if one can extrapolate from the ibogaine-content figures presented by OTT for the straight root-bark (which it may not be safe to do, since natural products can be highly variable in their alkaloid content), this would mean that a 4 gram dose of “5X” extract should contain about the same amount of ibogaine as a 20 gram dose of straight root-bark: 75–150 mg, or the “threshold dose,” and a 6 gram dose of the extract would contain closer to 113–225 mg. This dose range is up to the low end of that presented by the “Secret Chief” and nowhere near as high as that consumed by INFINITE EYES (reported on page 98). All of this number crunching could be totally off, and the bottom line is that we don’t feel comfortable giving the “green light” for any particular dose of crude extract, without knowing better what exactly the extract contains. Crude extracts are also likely to contain other alkaloids that may not be safe to take in overly high doses.

So far as your situation with PURE LAND ETHNOBOTANICALS goes, it is unfortunate. We have ordered from them ourselves, and the order was sent promptly and completely. It is hard to say what is up with them, but it is totally lame that they have ignored your attempts to get the situation resolved. With regard to entheobotanical companies, there are several on-line vendor rating systems, and we feel that these can be useful when people use them to report both good and bad experiences. One such site (for complaints only, and a bit sparse at the moment, but with the benefit of being run by the Erowid web site) is at [www.erowid.org/vendors/vendors\\_complaints.shtml](http://www.erowid.org/vendors/vendors_complaints.shtml), and we encourage you to post your situation at that site. We will also forward a copy of this issue of *ER* to the folks at PURE LAND, with the hope that it might spark some response and resolution to your situation. Contact them again after you get this issue of *ER*, and see what happens. Another recent example of a rip-off that *ER* received:

A \$250.00 order was sent to the “new” M.B.E. TECH in the United Kingdom ([www.mbetech.com](http://www.mbetech.com)). No product was ever provided, e-mailed complaints only met with an auto-response saying that people wishing to correspond needed to do so via snail mail, and snail mailed complaints met with no response at all.

We reported in a past issue of *ER* that we felt that it seemed likely that the new M.B.E. TECH was a scam, and this would appear to confirm that report. Sadly, there are pirates surfing the waters of the web these days too. — Eds.

## STORAGE, SHELF-LIFE, MAOI ACTIVITY, TOLERANCE, TMA-2

As a new subscriber I have to say that your magazine is excellent, and much more in-depth than most sources. Please release me from my ignorance and print a few questions I can’t seem to get answered elsewhere:

I am interested to know about the “shelf life” of various entheogens under the following conditions—cool, dark, and reasonably air tight. I’ve read that phenethylamines are fairly stable, and that 2C-T-2 and 2C-T-7 should last 20+ years. Can I assume that 2C-I and TMA-2 have a similar longevity? I also read that most tryptamines are much less stable, especially 4-Acetoxy-DET and AMT, although *TIHKAL* mentions that MIPT is much more durable. Harmine is listed as “more stable” than harmaline. Could anyone please give me *any* info on the shelf-life of tryptamines such as 5-MeO-AMT, 5-MeO-DMT, 5-MeO-DIPT, 4-Acetoxy-DIPT, and DPT? Psilocybin is supposed to be stable as fungal material (*P. semilanceta*), but I have seen it become worthless in about four years. (No idea why I kept it that long.)

Does anyone have any idea if 5-MeO-AMT is *really* a MAOI or not? There is certainly a serotonergic feel to it. I've read that it is "possibly" a MAOI, which is vague and I would like to know if it might be problematic to someone on a SSRI drug. Also, I did do some experiments with it but haven't for the moment gone above 4.5 mg; at the peak of such a dose, there would be some suggestions of something possibly physically problematic that led me to conclude that I should move up very carefully with it. Has anyone had problems or other comments on this compound? I suspect that it could be really weird at a high dose if the body load is tolerable.

Since you are discussing a number of compounds that were created by ALEXANDER SHULGIN, we figured that it would be prudent to pose your questions to him. He responded:

Regarding 5-MeO-AMT (alpha,O-DMS). As to the shelf life, I can only offer the apparent present appearance of my original discovery sample. I dug it out of my refer-

ence collection. It was stored (as have been all my synthetic retainers) in a glass vial, stoppered with a cork, in a box that is dark inside. No special effort is made as to air or moisture or heat. In this tryptamine box, looking at few samples at random, the present appearances range from loose white solids to black gums! The 5-MeO-AMT sample was the hydrochloride salt, dated early 1976 (therefore over 25 years old) and was a light brown crystalline solid. So it seems to be pretty stable.

The three points that you mention, temperature, light and oxygen, are the major factors defining stability. But original purity, dryness, and the chemical nature of the contained impurities can affect changes. Another subtlety is just how one can determine the loss of potency? What if the decomposition product is psychoactive? What if you have become tolerant to the action of the drug? What if you subconsciously believe that any discoloration is a move towards loss of activity? A dear friend of mine, a Professor of Chemistry, contributed his

## HERBAL-SHAMAN

# NEW INCENSES

*Nymphaea caerulea* (blue lotus): This little known flower has been considered sacred for several thousand years, where it was used medicinally and ritually by the Egyptian priesthood. Its pleasing aroma is said to induce deep relaxation and a euphoric state of mind.

*Nelumbo nucifera* (sacred lotus): Another obscure sacred flower from the East, it is quickly becoming very popular with those who have been lucky enough to try it. This plant mixes well with other common burning herbs, but is also very much enjoyed by itself.

*Sceletium tortuosum* (*kanna*): A very rare succulent from the deserts of South Africa. The Bwiti culture uses this plant as an important part of their ritual life, and consider it to be an indispensable ally. We offer this plant in the manner dictated by tradition, fermented and finely powdered.

*Mimosa hostilis* (*jurema*): This thorny tree is used medicinally and spiritually by several Central and South American cultures. Wild-crafted in México for us by a well-known ethnobotanist, we offer fresh, dried whole chunks of both root-bark and stem-bark.

*Voacanga africana* root-bark: After years of searching we have finally procured a small supply of this exotic botanical. Used in the adolescent initiation ceremonies by East African shamans, this powerful teacher was treated as a divine spirit. Very limited supplies.

All incenses are sold strictly to adults as non-consumables

own thoughts with the phrase, “A little bit of color goes a long way.”

As to MAOI activity, I have no idea. I am reasonably sure that the compound is not an agonist as it has that famous alpha-methyl group. In fact the original molecule was designed just that way to increase the odds of its getting to the brain without decomposition. Similarly, the covering of the serotonin hydroxy group was a move to increase the probability of its getting across the blood-brain barrier. These two additions were built into my original name for it, alpha,O-dimethylserotonin, or A,O-DMS. However, the 5-MeO-AMT name doesn't require the user to know the structure of serotonin. — SASHA

To add to SASHA's thoughts; while “dark” is easy to do, “cool” and “air-tight” are a bit more problematic, but also doable. Hell, *cold* would no doubt be better than merely cool. It strikes us that the best way to store *any* entheogens would be in a light-tight, air-tight, sealed container in a freezer. (As “anal” as it may sound, we know many people who even go to these lengths to store their *Cannabis*.) The inclusion of some desiccant to keep the stored product dry would likely be beneficial in most cases, as would either sucking out the air from the container (with some “seal-a-meal” type device that can be used with the metal lids on glass canning jars) or replacing the air with an inert gas that contains no oxygen. While this won't take care of all of the variables that SASHA mentioned, nor answer all of his questions about these variables, it is still probably the best that one can hope to do within reasonable means, and will no doubt increase the shelf-life of most compounds above that which would be had by simply placing them in a box in a cupboard of your house.

Also, as an extension on the article on 5-MeO-DMT and DMT not causing tolerance, I am hopeful that perhaps *ER* subscribers will write in with *any* information on varying degrees of tolerance and cross-tolerance with and between various compounds.

I also have a few comments on TMA-2, with reference to the remarks made in *ER* Vol. XI, No. 2. For the record, I weigh 112 pounds, although I'm not convinced as to how relevant weight is with regard to dosage of this compound.

I have taken TMA-2 twice. My first dose was 37.5 mg. Effects started at about the half-hour point, and took maybe 2–3 hours to reach the full effects. On this occasion, I had a lot of discomfort while coming on (too much of a body load, compared to the mental effects). In retrospect, I believe that this discomfort was partly psychological in origin, as I may have been projecting a lot of negative energy due to ingesting a virtually untested synthetic drug. I am afraid that I have never had the opportunity to take mescaline, so I can't make a comparison. Certainly, there was much of the feel of an organic

psychedelic, with earthy colors, but not overwhelming visuals. My mental state was one of gentle clarity. Communication was good, as was appreciation of music. At about five hours, we went to the forest and bonded with nature. At several points during the day, there was some “edge” or lack of complete ease, but overall I found it a good and complete psychedelic, although perhaps not an outstanding one. My second trial was at 35 mg, and again the come up was hard due to the compound's uncomfortably sharp “glass like” stimulation, which produced a restlessness that initially tied me to my body. However, this time—knowing better the language of the material—I was able to break through earlier on, and there were delightful rushes to hyperacuity; the day was glorious and healing. The next time I think I would take 40 mg. It was not overwhelming (mentally), but I'm not sure that I would take it above 40 mg yet. (Were it mescaline, I would have tried 600 mg next.) It isn't in the LSD/ayahuasca league perhaps, but it's still pretty damn good stuff and an ally. I was near base-line at 12 hours and sleep was not too difficult after this point. — B.N.

P.S. Does anyone know of a supplier of dried *Mitragyna speciosa*?

Alas, we can't help you out with any suppliers of dried *Mitragyna speciosa*. Perhaps our subscribers can? Live plants are currently available from THE BASEMENT SHAMAN ([www.basementshaman.com](http://www.basementshaman.com)), but one might have to hit the underground market in Thailand in order to score the dried leaves. Perhaps some brave and enterprising botanical company will send a collector there to gather up enough to sell in the USA? Keep in mind that while the plant is totally legal in the USA, it is scheduled in its native Thailand, with severe penalties for possession and sale; no doubt this is the reason that it is not yet widely available in the USA. — Eds.

## EVEN MORE SCORPION TALES

The “More Scorpion Tales” article in a recent issue of *ER* reminded me of my own scorpion experience many years ago in Hawai'i. I was living on a beach in Maui and had been hearing horror stories about the centipedes and scorpions there. I had actually developed a bit of a scorpion phobia from these tales (none of which, by the way, were anyone's first-hand experiences with scorpion stings or centipede bites—it was always “this friend of mine...” or “my sister's boyfriend...”). Anyway, one day I was sitting in my truck and felt something on my leg. Without looking to see what it was, I brushed it off with my hand and was stung on my finger. I looked down to see what had just stung me and I saw that it

was a scorpion. The stinging sensation only lasted about 15 minutes and was relatively mild. However, for the rest of the day I felt wonderful. I felt great nearly every day during that period of time anyway, because of my stress-free, immersed-in-nature, simple and freely creative beach-camping life-style. But the day I was stung by the scorpion, I was much more euphoric than usual. I've always wondered if that blissful day was due to the scorpion venom, or due to the release of all the "fear energy" I had invested in my scorpion phobia. Or perhaps both things played a part? Like C.S.C. in Colorado, I haven't chosen to get stung again. — R.G., WA

Reports of feeling mildly mind-altered to euphoric appear to be common among those experiencing non-lethal scorpion stings. It certainly was the experience of K. TROUT, although the throbbing pain of the sting itself would suggest that it is not likely to ever become a popular area of experimentation. — Eds.

## GROWING PEGANUM HARMALA

Regarding JOHNNY APPLESEED'S comment in the interview with him that appeared in the VERNAL EQUINOX 2002 issue of *ER*; his remark that *Peganum harmala* will only grow in warm, dry areas is—in my opinion—only partially true. *P. harmala* will definitely grow in areas where it gets very cold. I've successfully grown it at above 8,500 feet elevation, where winter temperatures normally drop below minus 10° F. I've never been in a geographical area that would permit me to test my theory, but I would predict that *P. harmala* could be cultivated much like alfalfa. In those geographical areas where soil pH levels are naturally low, such as in costal regions, farmers will raise the pH in order to grow alfalfa. In areas where the pH levels are naturally high, farmers don't adjust it at all. Of course, in areas that receive high amounts of rain, it would be more difficult and costly to maintain the higher pH levels due to the leaching effect of the water. *P. harmala* may be one of the many species that doesn't thrive in wetter conditions. So, it's my theory that to say *P. harmala* will grow well in warm soil types is more true than saying it grows only in warmer areas. This is also an area of research that it would be interesting to hear more about from those *ER* subscribers inclined to experiment. — P.H., NM

## MORE ON MUSHROOMS

Congratulations on your recent mushroom cultivation articles. I believe the advances in cultivation techniques de-

scribed are the most important development in psychedelia in decades. Therefore, I wish that you would follow up this article with a reprint of growing instructions from the Internet, perhaps revised by you. Every step should be described in minute detail and the most concrete terms. Not everyone has Internet access, and even if they did, it would be good for you to print a hard-copy version for the sake of the record. For example, things that I am curious about are whether there is a single source for supplies like syringes, glasses, where one obtains (or how one makes) brown rice powder, *etc.* — R.K., WA

The sort of detailed instructions that you request we publish would be lengthy enough to fill a book. And while it would perhaps be possible for us to run a series of articles that cover this topic in installments over the course of several issues, such an approach might not be the best use of our space, considering that this basic information is available for free on the Internet ([www.fanaticus.com](http://www.fanaticus.com)), as well as being available for purchase (in a nicely bound and illustrated form) for \$10.00 from PSYLOCYBE FANATICUS, POB F, Amanda Park, WA 98526. As far as supplies go, one good company that offers a free catalog is MAGIC, POB 39, Prospect Heights, IL 60070, [www.mushroommagic.com](http://www.mushroommagic.com), but there are numerous other such companies around too (the *Psychedelic Resource List* is a good reference book for these sort of companies). We might also add that if you have access to a public library or a cyber café, Internet access is available even if you don't own a computer. This is true not just in the USA but in most countries. On a recent trip to Belize for example, it was a rare town that did *not* have several affordable cyber cafés. — Eds.

## FOREIGN DATA

*The Entheogen Review* occasionally gets questions regarding the legality of plants and drugs in other countries, and we felt that it might be a good service to include some information related to this in a future issue. *ER* has subscribers worldwide in Argentina, Australia, Austria, Belgium, Brazil, Canada, Columbia, Costa Rica, England, Finland, France, Germany, Ireland, Italy, Japan, México, the Netherlands, New Zealand, Norway, Peru, Portugal, Scotland, Slovenia, South Africa, Spain, Sweden, Switzerland, and Taiwan. If you live in one of these countries, or somewhere other than the USA, please let us know what the legal situation is like in your part of the world. Which entheogens aren't prohibited? Which are? Where is documentation of these laws available? What is the availability of entheogens in your area? Does the political climate seem to be getting better or worse? — Eds.

# EVENTS CALENDAR

## ALTERED STATES OCTOBER 25–29, 2002

The INTERNATIONAL CONFERENCE ON ALTERED STATES OF CONSCIOUSNESS will be held October 25–29, 2002, and will cover the topics of “Shamanism, Healing, Enlightenment, and Peak Experiences.” Presenters include WILBERT ALIX, BROOKE MEDICINE EAGLE, KEN EAGLE FEATHER, PETER GORMAN, WARREN GROSSMAN, KRISTIN MADDEN, RALPH METZNER, DEBORAH MILTON, VICTOR SANCHEZ, HANK WESSELMAN, and many others. Registration is \$695.00, which doesn't include food or lodging. For more info contact THE MESSAGE COMPANY, 4 Camino Azul, Santa Fe, NM 87508, (505) 474-0998, (505) 474-7604, (505) 471-2584 FAX, [message@bizspirit.com](mailto:message@bizspirit.com), [www.bizspirit.com](http://www.bizspirit.com).

## PSYCHOACTIVITY III NOVEMBER 22–24, 2002

PSYCHOACTIVITY III, held November 22–24, 2002, will focus on ayahuasca. Presenters include ARNO ADELAARS, HANS BOGERS, JACE CALLAWAY, HILARIO CHIRIAP, PIERS GIBBON, LUIS EDUARDO LUNA, CLAUDIA MÜLLER-EBELING, JEREMY NARBY, CHRISTIAN RÄTSCH, BENNY SHANON, YATRA W.M. DA SILVEIRA BARBOSA, KAJUYALI TSAMANI, and ADÉLE VAN DER PLAS. Films will also be shown: *Fear and Loathing* by GAVIN SEARLE, *Night of the Liana* by GLENN SWITKES, *Shamans of the Amazon* by DEAN JEFFRYS, and *Ayahuasca Tourism* by JOSH COLLIER. Meet traditional shamans and people involved in the Dutch ayahuasca scene. Cost is ₣ 255.00 (about \$247.00). For more info see [www.psychoactivity.org](http://www.psychoactivity.org).

## AYAHUASCA HEALING RETREAT

*Drifts Angel* by Robert Venosa

**JANUARY 9–18, 2003**  
**JANUARY 20–30, 2003**

There will be lectures, four ceremonies with *ayahuasca* and two with *Salvia divinorum*, group sharing, artwork expression, transpersonal exercises, and excursions. Spend ten days in the Amazon forest. Located 1.5 hours from Manaus, Brazil, the lodge has excellent facilities, phone, Internet, air conditioning, a swimming pool, and rooms with private bathrooms. Contact: [silviap@house.com.ar](mailto:silviap@house.com.ar).

### JANUARY 9–18, 2003 STAFF:

- \* Rick Doblin, psychedelic researcher
- \* Robert Venosa, visionary artist
- \* Martina Hoffmann, visionary artist
- \* Jonathan Ott, ethnobotanist
- \* Zoe Seven, techno shaman
- \* Silvia Polivoy, transpersonal psychologist
- \* Isabela Hartz, visionary artist

### JANUARY 20–30, 2003 STAFF:

- \* David Icke, author and lecturer
- \* Zoe Seven, techno-shaman
- \* Silvia Polivoy, transpersonal psychologist
- \* Isabela Hartz, visionary artist

**San Francisco, CA 94122-5265**  
**dopeddealer@adopedealer.com**  
**www.adopedealer.com**

*Confessions of a Dope Dealer* is a whirlwind ride through the life of SHELDON NORBERG, during his years as a professional drug dealer. From his teen-aged introduction to *Cannabis* and LSD, to high school hijinks, GRATEFUL DEAD concerts, getting busted by his parents, college party daze, and his eventual stint as an outdoor *Cannabis* farmer, this was an enjoyable book from cover to cover. At times SHELDON seems neurotic, at other times he comes off as a bit of an asshole, but throughout he remains an eminently likeable anti-hero. The book is \$24.00 postpaid (CA residents add applicable sales tax), and the web site offers a variety of t-shirts as well.

SHELDON has taken the book and turned it into a one-man play. At first I was a bit skeptical, but when I saw the production at a packed house on a closing night of one of its several runs at different locations in the Bay Area, I was blown away. Simple-yet-powerful sound and lighting effects are seamlessly incorporated into SHELDON's emotive and frequently humorous description of his own life's adventures. When it was over, I was left wanting more. Shows are forthcoming on November 2, 2002 in Davis, CA at the VARSITY THEATER, and from November 20–24, 2002 in Walnut Creek at the LESHER CENTER. Check his web site for details about these showings; if one is happening near you, it is definitely worth sparking a bowl and heading over.

## Wildcrafters Wanted!

Especially seeking harvesters of *Desmanthus* root-bark.  
Will pay competitively. Contact:

A United Kingdom supplier of *Acorus calamus*, *Areca catechu*, *Banisteriopsis caapi*, *Calea zacatechichi*, *Cannabis* seed (DUTCH PASSION brand), *Corynanthe yohimbe*, *Datura stramonium*, *Diplopterys cabrerana*, *Ephedra sinica*, *Ginkgo biloba*, *Ipomoea tricolor*, *I. violacea*, *Lactuca virosa*, *Mandragora officinarum*, *Mimosa tenuiflora*, *Oleoresin lupulinae*, *Paullinia cupana*, *Peganum harmala*, *Piper methysticum*, *Psychotria viridis*, *Ptychopetalum olacoides*, *Salvia divinorum* dried leaf and extracts, *Sceletium tortuosum*, *Scutellaria laterifoli*, *Serenoa serulata*, *Trichocereus peruvianus* (dried), and *Valeriana officinalis*. They also offer a variety of traditional incenses, charcoal disks, smudge sticks, a digital scale, a capsule filler, an herb grinder, and a few books. Their prices seem low to middle of the road.

**DRUGS.COM**  
**www.drugs.com**

“The Internet’s Drug Information Resource.” All manner of pharmaceutical drug-related information, as you might expect. One cool thing about this site is their “Pill Identifier Wizard,” where you may be able to ID a pill by describing it via a series of prompts. Without even *noting* the marking on the pill, this program got a correct hit right away when I typed in the specs for a Marinol pill. (Of course, there aren’t *that* many round capsules...) It actually shows oversized pictures of the pills that it thinks you might be describing, so that you can pick the right one. When I described a Prozac, it also kicked out the goods. This could be a valuable service, although I don’t know if it would deliver on generics...

**ENTHEOGENE BLÄTTER**

**info@entheogene.de**  
**www.entehogne.de**

Some years ago, BERT MARCO SCHULDES created a German-language version of some of JIM DEKORNE's issues of *The Entheogen Review*; this was published for about six issues and then the project was abandoned. Recently, a similar approach has been taken by publisher/editor HARTWIN ROHDE, and since the last issue of *ER* came out, two issues of this new publication—*Entheogene Blätter*—have already appeared. ROHDE is making a go at producing a monthly version of *ER* in German, and appears to be succeeding. The journal is 5.75" X 8.25", 52 pages, with a color cover and an attractive layout. Although much of the bulk of this journal is made up of articles that appeared in past issues of *ER*, there is also quite a bit of new material; the first issue contained original articles on *Acacia complanata*, *Acorus calamus*, *Alternanthera lehmanii*, *Argemone species*, *Argyria nervosa*, *Arundo donax*, *Atropa belladonna*, *Banisteriopsis caapi*, *Brugmansia*, *Brunfelsia*, *Convallaria majalis*, *Corynanthe pachyceras*, *Galium odoratum*, and more. An original article in the second issue focuses on psilocin as medicine. I am glad to see that *ER* is reaching a larger audience in this manner, and it is quite a trip to see my own "Sources" column translated into another language. Definitely recommended for those who understand German.

**THE FREEDOM BOOK COMPANY**

**Southsea**  
**Hampshire**  
**PO4 0DB**  
**UNITED KINGDOM**  
**+44 023 9278 0600**  
**+44 023 9278 0444 FAX**  
**info@freedombooks.co.uk**  
**www.freedombooks.co.uk**

A British book seller that specializes in drug and counter-culture books. Categories include "Magazines" (with a bunch of novel *Cannabis* rags); "*Cannabis*"; "Psychoactives" (magic mushrooms, traditional and tribal brews, Ecstasy and

beyond); "Sex, Magic & More;" and "Underground." Most of the books that they carry are standards that can be obtained via pretty much any psychedelic book vendor, but they do have a few unique British titles that I hadn't seen before. (I did cringe when I saw that they are still hawking my friend WILL BEIFUSS' horribly out-of-date 1996 *Psychedelic Sourcebook*.) Check them out on the web.

**HEADS**

**World Wide Heads, Inc.**  
**POB 1319**  
**Hudson**  
**Quebec, J0P 1H0**  
**CANADA**  
**(450) 458-0605**  
**(450) 458-2977 FAX**  
**editor@headsmagazine.com**  
**www.headsmagazine.com**

A fairly new rag out of Canada, *Heads* focuses largely on *Cannabis*-related topics, but also covers extreme sports, music, and personalities. Edited by PAUL DIRIENZO (who co-authored *The Ibogaine Story* with DANA BEAL and had a short stint as a *High Times* editor) and ANGELA FINLEY, *Heads* features writings from such folks as CHARLES HAYES, THOMAS LYTTLE, MARTIN LEE, and others. A one-year (6 issue) subscription in the USA is \$17.77 (in U.S. dollars). Contact them about available back-issues.

**HERBAL EXPLORATIONS**

**POB 5637**  
**Kingwood, TX 77325**  
**(832) 746-7668**  
**info@herbalexplorations.com**  
**www.herbalexplorations.com**

A small selection of shamanic herbs, including: *Argemone chicolote*, *Banisteriopsis caapi*, *Corynanthe yohimbe*, *Diplopterys cabrerana*, *Mimosa tenuiflora*, *Nicotiana rustica*, *Peganum harmala*, *Psychotria viridis*, *Trichocereus peruvianus*, and *Virola* sp. Prices appear to be pretty good overall. They also offer resin and wood incenses, smudge sticks and special blends, and have plans to sell traditional Peruvian and Mexican jewelry and textiles.

**IAMSHAMAN.COM**  
 admin@iamshaman.com  
 www.iamshaman.com

Geared mainly geared toward *Salvia divinorum*. They have a reports section, an on-line store that sells leaf and extracts at good prices, a links section, and a chat section. They do have a merchant rating link, which may eventually become a good way to get the skinny on those companies that are good and those that are rip-offs, although there is always the possibility that a site that makes money from the sales of plant products might not be totally unbiased with its ratings. But overall this site has a good feel about it.

**LIL' SHOP OF SPORES**  
 RVF  
 POB 32  
 Sherrill, IA 52073  
 blushroom@lilshopofspores.com  
 www.lilshopofspores.com

Many varieties of *Psilocybe cubensis* spore prints and spore syringes for sale, plus technical advice, photos, and links. Prices for spore prints run about \$20.00, and for syringes about \$15.00, with a \$5.00 S/H charge applicable for syringes only. Send payment or inquiries to "RVF," not "Lil' Shop of Spores."

**MICRON MAJICK MYCOLOGY MARKET**  
 A.I.W.D.  
 6066 Shingle Creek Pkwy #209  
 Brooklyn Center, MN 55430  
 admin@micronmagick.com  
 www.micronmagick.com

Selling mycological supplies, their main unique offering is a synthetic disc that is electrostatically charged to ensure that it filters 99.97% of the air-borne particles down to 0.3 microns. These filters fit any size jar used in home or commercial mushroom cultivation. The discs are placed on top of the spawn jar and take the place of the metal lid in the traditional band and lid set up, allowing air exchange but preventing the passage of contaminants. They are sterilized and reusable. A pack of 25 is \$5.00 and a pack of 100 is \$15.00. A few other products are available too, such as *Psilocybe cubensis* spore syringes, various substrate material, and pressure cookers; check their web page, which also provides technical details and a few links.

**OPD CHEMICAL BUYERS DIRECTORY**  
 www.chemexpo.com

An interesting web site that will find sources for chemicals via their search engine. When I first dicked around with this, I couldn't get it to pony up any of the goods. However, I eventually realized that one needs to be fairly vague in one's requests, due to variations in chemical nomenclature. For example, a search for the abbreviated "5-MeO-DMT" turned up nothing, while a more general search for "tryptamine" turned up a company that purportedly sells 5-methoxy-N,N-dimethyl-tryptamine (however, when I went to this company's web site, I couldn't locate any mention of this chemical). This locator clearly won't be too useful for finding chemicals that have end uses as consumables, but it could be a good way to find sources for solvents or other chemicals that might be of use for the home experimentalist.

**THE THRESHER**  
 331 W 57th St. #153  
 New York, NY 10019  
 david@thethresher.com  
 www.thethresher.com

*The Thresher* calls itself a "political journal," remarking:

"Everybody knows that the next political paradigm is post-ideological, an unpredictable hybrid of all the influences on human thought and behavior. The smartest among us are looking for interesting ways to crossbreed left, right and center; mainstream and subculture; individual liberty and community; straight and queer; spirituality and critical intelligence; high technology and zero emissions; speed and permanence; rebellion and problem-solving; Caucasian and everybody else; ad infinitum. We're not talking dialectics. We're talking complexity. *The Thresher* will attempt to navigate its way through the tangled mess that is early 21st Century politics."

While the rest of us attempt to navigate our way through the above tangled mess of a magazine description, I can perhaps offer a few more salient details. Each issue is about 200 pages in length. The first issue, released in September of 2001, featured articles on national security, environmental ideas, energy resources, and quite a few pieces on drug policy issues. Of more pointed interest to psychedelists were the articles "Making Media War on MDMA" by STEVE ROBLES, "The FDA Trip" interview with RICK DOBLIN, and a book excerpt from

*DMT: Spirit Molecule* by RICK STRASSMAN. Issue number two is recently out, and is geared toward control culture politics, with a great interview of former LAPD narcotics investigator MICHAEL C. RUPPERT (see [www.copvcia.com](http://www.copvcia.com)), amongst offerings by DOUGLAS RUSHKOFF, ROBERT ANTON WILSON, TODD BRENDAN FAHEY, and more. *The Thresher* is edited by R.U. SIRIUS, former front-man for the highly lauded tech/drugs magazine *Mondo 2000*.

A six-issue subscription is \$29.99, and single issues are \$6.99. Although the publishing schedule for this puppy doesn't seem to be too terribly regular ('twas nearly a year between the first and second issues), it is an all-around interesting rag and I encourage folks to subscribe.

**TINGLE LEAF IMPORTS**  
**3900 W. Brown Deer Road, STE. A125**  
**Milwaukee, WI 53209**  
**(603) 507-8132**  
**info@TingleLeaf.com**  
**www.tingleleaf.com**

A new company retailing and wholesaling dried *Salvia divinorum* leaves. At \$25.00 per 30 grams, their retail prices are comparable to some of the lowest available. However, at \$550.00 per kilogram, their wholesale prices (while substantially cheaper than retail), aren't any great bargain considering that—if one shops around—dried leaves can be imported from Mexico for about \$200.00 per kilo. Nevertheless, this may be a good place for the end-user to shop—particularly the novice who merely wants a small amount to try out, as they sell a 10 gram trial size for \$10.00.

## ERRATA

In the WINTER SOLSTICE 2001 issue of this column, I reviewed a company called ETHNOGARDEN ([www.ethnogarden.com](http://www.ethnogarden.com)). Apparently I listed their URL incorrectly, and the one listed above is the correct site. I also stated that they offered *Banisteriopsis caapi* seeds and *Diplopterys cabrerana* seeds; this too is incorrect, as they have been unable to secure a source for these seeds. However, they have expanded their offerings on the *Tabernanthe iboga* front, and they also offer *Mimosa tenuiflora* in large amounts at wholesale prices.

In my last column I reviewed the company SALVIA SPACE ([www.salviaspace.com](http://www.salviaspace.com)), and gave them a bit of a hard time

due to their seemingly inaccurate claim “Nobody Beats Our Prices!” I remarked that I had asked them via e-mail whether or not they would be willing to come down on their prices if they were shown those companies that currently offered lower prices, and noted that they had not responded to my query. This is incorrect. They did respond to my query, but because the date was somehow wrong on the e-mail, this response went to the bottom of my cue and remained unnoticed by me until a routine cleaning of my files. They said that the absolutely *would* be willing to beat any legitimate competitor's prices. My apologies for the error.

## R.I.P.

*ER* subscriber B.H., IL recently wrote in to hip me to some companies that were no longer in business. And since I have been working like crazy on the *massively* updated fourth edition of my book *Psychedelic Resource List* (available soon, I promise!), I have come across some additional companies that it is worth pointing out are no longer around. Of course, if you are aware that any of these companies *are* still around, and just at new digs, please let me know.

# BOOK REVIEW

*Shaman, Jhankri and Nele Music Healers of Indigenous Cultures* by PAT MOFFITT COOK. 1997. Foreword by JULIAN BURGER, Ph.D. (EL-LIPSIS ARTS, 360 Interlocken Blvd., Ste. 300, Broomfield, CO 80021, 800-788-6670), ISBN 1-55961-456-0 [7.5" x 11" paperback]. 96 pp., plus CD, ISBN 1-55961-456-0 [60 minutes]. \$30.00.

*Shaman, Jhankri and Nele* is a well-crafted mix of song:

In the following chapters you will meet an *ojha*, *maestro*, *nele*, *manbo*, *phawo*, *jhankri*, *ayahuascero*, *kangsinmu*, shamans and other musical doctors. After reading their stories, the accompanying CD will provide a listening experience of the actual healing music. Each recording has its own unique quality and purpose. It is important to keep in mind that this music was not created to entertain but to stimulate an effect in their patients. Most recordings were made in the last six years with the exception of the Huichol mara'akame that was recorded in the Sierra Madre mountains in 1940 (*SJN*, p. 7).

story:

I owned a small shop on the main street. Baba, the old healer, wanted to teach me secret songs and how to prepare medicine. He said I was an *ojha*.

I prayed to the goddess for direction. She came upon me, "Close your shop and build a temple in this field. Fly a red flag from the roof. You will become an *ojha*. Do not worry about money or your family's needs" (BABAJI in *SJN*, p. 8).

Sitla came upon me. My eyes were closed. When they opened I saw strange things. Songs and words pounded in my head. For seven days and six nights the goddess lived in me. I stayed inside her temple. No one could touch me or I would scream. When Sitla left me I knew I was a healer. That was long ago. Now, with song I invite the goddess to come to my healing hut, to come upon me. Through her grace and power I heal people with jaundice and small pox and babies with fevers (KOSHALYA in *SJN*, p. 12).

fact:

"These ways will be finished by the year 2000," predicts the maestro. "Already, there is no one who can sing the

pictures. I had two students for a while but they do not come often. To be a maestro takes time and patience. They are more interested in travelling to the mainland and finding work. I know the songs will disappear. That is why I am willing to sing for you [MOFFITT-COOK]" (MAESTRO DEMOSDENES RAMIREZ HURTAS in *SJN*, p. 36).

lore:

Long ago, when the world was in great danger from drought and fire, a tree sprang forth from the loins of a woman of great purity. All the animals and human beings climbed into its branches and saved themselves from destruction. This tree was called the Huanaymey Tree (*SJN*, p. 41).

And, of course, healing:

First we gave her marsh tea. I told her to drink a gallon of it in one day. When she was done we had a meeting. We rolled her over on her left side and started drumming there. After the drumming we begin to sing...then rattle. We are exposing the kidney to the healing vibrations of our instruments and voices. Soon that drum produces a certain tone and the beat takes on a certain cadence. Then I know it's beginning to work. We are affecting the patient. Now the sound will help break loose all that poison that's in there. That woman got well (STEVE OLD COYOTE in *SJN*, p. 82).

The accompanying CD consists of 18 representative songs that each particular shaman uses. So that you have a complete outline of this book what follows is a listing of the 18 chapters: BABAJI (North Indian Ojha), KOSHALYA (Hindu Village Healer), RAM TMAPA and SUNI RAM (Jhankri of Nepal), DON AGUSTIN RIVAS-VASQUEZ (Peruvian Ayahuasca Shaman), MICHELINE FORESTAL (Haitian Vodou Manho), KANUCAS LITTLEFISH (Native American Anishnabe Medicine Man), Maestro DEMOSDENES RAMIREZ HURTAS (Kuna Indian Song Healer of the San Blas Islands), DARKIKING DON ALEJANDRO (Amazon Medicine Man), ALEXANDER TAVAKAY (Tuvan Shaman), POINTING FATHER (Spiritual Baptist Immigrants from Saint Vincent Island), MARA'AKAME (Huichol Peyote Shaman from Mexico), JORGE K'IN (Lacandon Mayan Healer), NELE BUNA INAYENIKIDILI (Kuna Indian Seer of the San Blas Islands), ANSELMO PALMA CRUZ (Tarahumara

Owiruame from the Sierra Madres), KANGSINMU (Spirit-Possessed Shaman of Korea), STEVE OLD COYOTE ("Road Man" of the Native American Church), SIMON ELIET (Inatulele from Panama), and PHAWO NYIDHON (Tibetan Oracle).

You will no doubt refer to this book and CD time and time again. Frequently I find myself sitting down to play three or four favorite tracks. Thoughts stir, I make some notes, re-read passages and call or e-mail a friend about feelings and ideas. Using the CD to inspire such contemplation has provided added pleasure and insight. Whenever I pick up the colorful book I find pleasure thumbing through it, reading a bit and enjoying the photos. For instance, I recently revisited Chapter 9: "ALEXANDER TAVAKAY: Tuvan Shaman" and Track 9: "Calling Animal Helpers," sung by TAVAKAY. In this song, which is usually used to heal children, he summons "...the cuckoo, raven, and the owl while shaking the sound markers attached to his costume and beating his drum." The text describes geography, ethnography, history, the 1991 shamanic conference sponsored by MICHAEL HARNER'S group, FOUNDATION FOR SHAMANIC STUDIES, and the Tuvan government (held in Kyzel, the capital city), and TAVAKAY as the Tuvan shaman and participant in that congress. This is all accomplished concisely in three pages, so as not to overwhelm (if you want detail find a more scholarly text). The background that MOFFITT-COOK provides is "just enough," and one can listen to the musical track without feeling mentally overloaded or taxed.

Though the book is sewn and wrapped, the pages do tend to pull away from the binding. This is unfortunate and will limit the life of this volume. The font chosen for the text is readable though perhaps overly "stylish," and a better

choice could have been made. Each chapter contains a listing of references, but a general bibliography has been omitted. There is no index. Nevertheless, I would definitely recommend this book and CD pairing. MOFFITT-COOK herself sums it up well:

It is with great skepticism, hope and ultimately trust in the Divine that the indigenous healers represented in this book, share their knowledge, lives and healing music with you. It is my hope that this tremendous act of trust on their behalf helps to quicken the process of preservation and increases public awareness and respect for the indigenous peoples of the earth (MOFFITT-COOK in *S/N*, p. 7).

Despite the minor production problems mentioned, PAT MOFFITT-COOK has produced a wonderful compendium of song, didactic and visual beauty accessible to all. She should feel proud. — JAY YASGUR, RPh., MSc.

Mr. YASGUR, whose formal education was in pharmacy, is an author and healer specializing in homeopathy, massage, holistic health-care counseling, and plant spirit healing. His first book, *Yasgur's Homeopathic Dictionary and Holistic Health Reference* 4th Ed. (1998), is a standard reference in the field. His forthcoming work, *111 Great Homeopaths*, deals with the lives of many of the world's great homeopaths and will be translated into six languages. He may be contacted c/o, VAN HOY PUBLISHERS, POB 636, Greenville, PA 16125, (724) 347-1580, yasgur@juno.com, and www.yasgur.net.

Bulletin of the Multidisciplinary Association for Psychedelic Studies • Volume XXI, Number 2

From celebration to frustration, and back again. MAPS major accomplishments at the end of last year led me to believe that our goal of developing psychodisks and marijuana into FDA-approved prescription medicines was moving from distant vision to reality possibility. Yet, immediately after celebrating our achievements, new resistance blocked further progress and for a time our initial excitement was replaced by frustration. Now, after more than half a year of difficult, slow work, we're making significant progress, reuniting some old friends, and have energetically responded to others.

On November 2, 2002, after three years of struggle, FDA approved a MAPS-funded MDMA application (therapy protocol, specifically Dr. Michael Mithoff's) study of MDMA-assisted psychotherapy to the treatment of post-traumatic stress disorder (PTSD) (p.4). By November 7, however, some administrators at the Medical University of South Carolina (MUSC), where we expected to conduct the study, reacted with alarm to the media attention generated by FDA approval of the protocol ([www.musc.edu/health/](http://www.musc.edu/health/)). We had five months to address their fears and concerns, but were unable to obtain permission to submit the protocol for review to the MUSC's Institutional Review Board (IRB). We then started negotiating with FDA to move the study to a new location. On June 14, FDA informed us that our request was approved. We're now in the midst of an 18-month IRB review, and with luck will be able to begin the study in several months.

#### Letter from Rick Doblin, Ph.D., MAPS President

We also experienced a major obstacle near to our four-year effort to obtain a license to produce our university of FDA-approved marijuana, necessary in order to proceed to a professional manner with a medical marijuana research program. MAPS has partnered with Prof. Paul Otten, (Office Assistant, Dept. of Plant and Soil Science, and has pledged a grant to fund all production expenses (p. 2). On December 1, 2002, after receiving our application for licensure, the Massachusetts Department of Public Health informed us that it had no responsibility for licensure for the Otten Research facility, as long as the Drug Enforcement Administration (DEA) first approved the project. This major milestone moved the application to the Federal review process (see sidebar). On December 5, DEA informed us that it had lost our application, which we had submitted six months before. We subsequently filed a copy to DEA, waited over a month and then were told the application was approved because it only had a 60-day review period (DEA had lost the application with the original signature). Realizing that we were in for a major struggle, we decided to seek outside support before resubmitting. These last six months have been focused on obtaining the supporting documents, a letter to DEA Administrator Ann Hutchinson from several Congressional Representatives endorsing the licensing of private facilities to produce marijuana for medical research (see back cover), and a legal analysis by the American Civil Liberties Union and Congdon & Bunting explaining why US international treaty obligations do not prevent DEA from licensing the facility. The articles bring our assistance to early July.

In December 2002, as a result of a generous grant from a new donor, MAPS and LANTRON were able to start planning for a new round of marijuana research. Our intent is to have a research approved by FDA for use in clinical trials. Following the recommendation of the Institute of Medicine for the development of a new medical delivery device, informally, we are searching the universities that had a reasonable chance of being approved by the FDA instead of taking longer than anticipated. We've recently chosen two promising models, the Indiana University research model, and the Utah (Utah State) model, and have finally started a new \$30,000 marijuana research program, with results to be reported in the next Bulletin.

During these difficult times, I've been encouraged by the stories I've been reading to my left, particularly about the tortoise and the hare. If anything characterizes MAPS, it's our need, it's time and steady with your continued support. I'm confident we can win the race, *www.maps.org* Rick Doblin, Ph.D., MAPS President

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See [www.entheogenreview.com](http://www.entheogenreview.com) for descriptions and prices.

# A YEAR OF TRIPS & TRIPPING...

by JON HANNA

Various offers to speak at psychedelic-related gatherings, as well as the MIND STATES III conference that I produced in Jamaica, kept me trotting the globe at a more rapid pace than I am used to. Due to this, I got a first-hand look at the “new” security measures in place at various airports in the USA. I suppose that I tend to fit the stereotype of a drug user, more so than a terrorist. From the number of times that I was searched, I am beginning to think that I might as well wear a T-shirt that says “profile me” on it whenever I travel by air. (Come to think of it, maybe *everyone* should wear these shirts when hitching a ride on an airplane.) On my first voyage to Jamaica, when leaving from the Sacramento International Airport, they searched through all of my bags and made me take off my shoes. No problem. Then they did the whole process a second time, right before I was about to board the plane. Amazingly, it was the same woman who took my shoes the second time, and I remarked, “What, did you do a shoddy job before?” This time, they found a \$50.00 microtorch lighter in my carry-on bag, which they confiscated. I guess that they thought I was gonna hijack the plane with a tiny flame. (Oddly, they let regular butane lighters on without any problem, so I guess that in order to be a threat, you’ve gotta have a *very hot* tiny flame.) On the way back from Jamaica, there was a really long escalator down to the baggage claim area, with a cop and drug-sniffing dog at the bottom. I guess they want to give someone a lot of time for the bullets of sweat to bead up on his or her forehead. Since I wasn’t carrying anything illegal, I gave the dog some friendly pats on the head, and the cop quickly ushered me past.

Outside the USA, airport security was much less uptight about it all, again showing how ironic it is that America claims to be the “land of the free.”

## ARIZONA

**Destination:** the TOWARD A SCIENCE OF CONSCIOUSNESS (TSC) conference, held every other year in Tucson, Arizona, and the concurrent annual meeting of the SOCIETY FOR THE ANTHROPOLOGY OF CONSCIOUSNESS (SAC). Amongst consciousness studies aficionados, there is a sizable undercurrent of folks who are clearly interested in firsthand psychonautical explorations. And, as is usually the case at such events, the most fun was in meeting and hanging out with others in attendance. Whether it was discussing psychopharmacology over drinks at the hotel bar, or sampling *Datura* smoking blends under a warm summer night’s sky at the “End of Consciousness” party, it is the interaction that makes these events great. Of course, there were numerous presenters who shone as well. At TSC, SUSAN BLACKMORE’s riffing on the “contents of consciousness” was particularly enjoyable, as was a dinner discussion with her about her disillusionment with parapsychology research. BLACKMORE, author of *The Meme Machine* (see [www.susanblackmore.co.uk](http://www.susanblackmore.co.uk)), was a firecracker whom I am happy to say agreed to be the M.C. for the MIND STATES IV conference in Berkeley, May 23–25, 2003. Other stand-outs were RODNEY BROOKS on robotics, RAY KURZWEIL on artificial intelligence, and V.S. RAMACHANDRAN on the neurology of aesthetics. My own presentation, which was to be a slide-show on psychedelic art, was marred by the fact that event organizers failed to provide a slide projector! Nevertheless, the talk went over well to a packed house.

At SAC—which focused on “the Dark Side of Consciousness”—highlights included individual presentations and a panel discussion on *Datura*, featuring JOHN BAKER, JOHN MCCLOY, LESLIE M. McQUADE, and ROBERT “Rio” HAHN, as well as a wonderful slide-show of sacred sites by STANLEY KRIPPNER and ADAM FISH, and a humorous presentation related to first-person encounters with the psychic Reverend CARRIE, as told by TIM LAVALLI.

I can heartily recommend that one attend both the TSC and SAC events.

## JAMAICA

While planning the MIND STATES JAMAICA seminar, I heard the oft-repeated rumor that Jamaica was “too dangerous” of a destination to hold such an event. (In many cases, when asked, the person offering cautionary advice had never actually *been* to Jamaica, but was merely repeating the same story that was “making the rounds.”) Of course, it seemed most reasonable to actually take a scouting mission to the island and see for myself.

After arriving at Montego Bay, the picturesque drive to Negril was about 1.5 hours. And, as I expected, the island was gorgeous. There were many dilapidated shacks along the drive, where nature was in the process of reclaiming that which man

had built. Cows and goats occasionally roamed free and crossed the road in front of traffic. There appeared to be no laws against having open containers of alcohol in vehicles, and I enjoyed a couple of cold beers on the way to the resort. (Beer choices seemed to be limited to the Jamaican RED STRIPE and RED STRIPE LITE, along with HEINEKEN and GUINNESS.) The driver was very friendly, shouting out to numerous people that we passed.

The resort where the seminar was to be held is just past Lucea at the start of Negril on Bloody Bay—a bit removed from the center of town. The place was beautiful: huts on stilts, lush vegetation, lizards, mongooses, a pool with a swim-up bar to serve various tasty mixed drinks, mango trees, palms, the beach access across the street with white sand, very warm blue water, and a grill and bar for lunch. For people who have been to the Palenque ENTHEOBOTANY seminars and to the Hawaiian ALLCHEMICAL ARTS seminar, this location captured an atmosphere that combined the best of both of these other locales.

On the way into town, jerk chicken stands peppered the roads. At Ms. BROWN'S, JENNY'S CAFE, and TEDD'S toward the west end, I noted that "space cake" and/or mushroom tea was available. (TEDD'S seemed to garner the most praise from the locals.) While cruising the beach, a couple of friendly entrepreneurs approached me to see if I might be interested in purchasing any of their mind-altering wares. There certainly appeared to be plenty of *Cannabis* and hash available. During my short stay on the island, three people I met offered to take me on tours of their ganja gardens. In the evenings, I caught some reggae bands performing on the beach.

I didn't get any sort of vibe that Negril was particularly dangerous; on the contrary, it seemed highly geared toward tourism. The only time I experienced a strong sense of paranoia was while riding in a cab that was going *way* too fast for the road it was on. (Add to this that they drive on the left of the road there and that I had smoked a lot of dope that day, and I was quite glad to finally have my feet back on the ground at the resort.) It is true that a lot of hustlers tried to sell me drugs, jewelry, hair-braiding, blow jobs, massages, and anything else they could think of. It is a poor country, and the tourists are frequent marks for this sort of activity. But the location was beautiful and seemed quite appropriate for the event; I decided to go ahead with the MIND STATES III conference there, and was looking forward to returning.

SILVIA POLIVOY, ZOE SEVEN, and PABLO AMARINGO  
at the AYAHUASCA HEALING RETREAT in Brazil

## BRAZIL

I was pleased to be one of the presenters at an AYAHUASCA HEALING RETREAT ([www.ayahuasca-healing.net](http://www.ayahuasca-healing.net)) seminar near Manaus. At the event I gave a talk on art, as well as a talk on *Salvia divinorum*. I also lead several group sessions with this plant, using an oral tincture and/or a 10X standardized extract. The sessions were set up in the evenings, and the following day there was group sharing. While some people did not have very strong effects, I was a bit surprised to learn that some of the people who had taken the tincture and were having very strong and *unpleasant* effects, still asked for some of the 10X extract to smoke on top of this! One woman had a very touching experience of reliving a childhood trauma from the perspective of her brother. Another woman was ecstatic that she finally had some visions, which the ayahuasca hadn't been providing her. One man felt as though he was repeatedly being crushed under a steamroller.

One of the three monkeys that kept us company at the resort.

The ayahuasca sessions were tough on me physically, with flu-like symptoms, overheating, nausea, vomiting, and generally feeling crappy. At least for myself, traditional ayahuasca feels much more toxic than those analogues that I have done and enjoyed. After two of the four sessions, I had had enough. However, this allowed me to act as a sitter outdoors, for those who wanted to momentarily escape the circle and get some fresh air or enjoy the amazing star-filled night sky. We were blessed at the final ayahuasca voyage to have former shaman PABLO AMARINGO present, and he sung *icaros* throughout the session—something that he hasn't done for perhaps 20 years! I felt very lucky to have been able to spend this time with PABLO, who also provided art instruction during the days.

The Amazon in Brazil is incredible. A guide led us through the forest and taught us about various medicinal plants. At night we took a boat ride through the trees (at this time of year, the river is so high that it floods the jungle), and the guide jumped from the boat, caught an alligator, and wrestled it on board! Some of the attendees went fishing for piranhas, pulling fish out as fast as they could hook the lines with fresh chunks of meat. Due to the ayahuasca diet, our meals were not particularly spicy, but there was a bounty of freshly caught fish every day to eat.

Event organizer and psychotherapist SILVIA POLIVOY, who is convinced of the healing power of ayahuasca, made herself available throughout the week for anyone who felt the need to speak privately about his or her session. Other presenters included the artist ISABELLA HARTZ, EEG researcher FRANK ECHENHOFER, and techno-shaman ZOE SEVEN. I'd definitely recommend these seminars to people with an interest in ayahuasca or in visiting the Amazon.

A view from our transport boat. At other times of the year, the water level is lower, and this area is a footpath.

## ENGLAND

While in Brazil, I was fortunate to befriend an Australian living in London, who offered a place for my wife and me to stay when we stopped over there on our way to Portugal. I had heard before leaving for England that they had recently decriminalized *Cannabis* there, and there were rumors that “coffeeshops” similar to those in Amsterdam were popping

Stopped in front of the AMSTERDAM OF LONDON headshop/coffeeshop at 244 Camden High Street. The makeshift cardboard sign above my head advertised “*Cannabis* Tea” and “Mushroom Tea.”

up. I wasn’t able to locate any hard data before leaving regarding exactly *where* I could find such shops, but I did get some tips on where to score on the street from e-mail pals that live in the area. On arrival, I learned that *Cannabis* had *not* yet been rescheduled to “Class C” (this will occur in July 2003). The change in the law will mean that police will no longer *have* to arrest someone who is smoking a joint, but rather they can confiscate the drug and issue a warning or perhaps a summons to court. (They still *can* make an arrest, if they feel that the situation warrants it.) Nevertheless, the word we got from friends was that some liquor stores were selling *Cannabis* “under the counter,” if you knew to ask. Clearly there is a much more relaxed attitude, knowing that personal use will not be punished harshly in the future. Indeed, when we went to Camden Street—a hipster spot to shop—we stumbled onto a shop where a cardboard sign above the door offered “*Cannabis* Tea” and “Mushroom Tea.” When we squeezed into the packed headshop, folks were lighting up joints around a tiny table while drinking their tea. I asked how “strong” the mushroom tea was, and the guy behind the counter responded, “How strong do you want it?” (They would make it as strong as I liked, but the price went up commensurately.) We instead opted for a couple of cups of *Cannabis* tea. There was plenty of shake prepackaged in teabags for sale. But the real score was dime-bags in Ziploc™ baggies. £10.00 got us what appeared to be around a gram of very high-quality green bud. They were obviously selling a lot of these, as the counter was constantly buzzing with traffic. We sat down to enjoy our tea and I rolled a couple of fatties, marveling at the civility of it all. Later on the street, I spotted some teenagers drinking beers without getting hassled. Not only are there no laws against having open containers of alcohol in public outdoors, but the drinking age would appear to be 16 years old. (At least, at one pub we visited, there was a sign up saying that they wouldn’t serve anyone under 16.) The absurdity of the Amerikan slogan “land of the free” certainly hits home when one travels to other countries. And then we were off again...

## PORTUGAL

BOOM! BOOM! BOOM! BOOM! Into the belly of the beast. Ground-zero, center of the floor, lights flickering behind closed eyes, bodies moving as one organism to the music blasting from stacked speakers... When in that space, can anyone *question* whether or not dance can be a primary religious experience? The BOOM FESTIVAL, like similar gatherings worldwide, acts as the container—a sacred meeting

ALEX GREY sketches ERIK DAVIS as we wait for our planes.

ground for a new breed of spiritual converts hooking into the group consciousness of shared God-mind. But it ain't *all* about the dancing...

Nestled in the hills of Portugal near the Spanish border, a magical tent city is built for a few days every two years. It's hard to avoid comparisons to BURNING MAN—in some ways it seems better, in others worse. While the MAN is about “radical self-expression,” the BOOM seems more unified. The Portuguese attendees are physically beautiful people. And while frequently scantily-clad, they primarily *are* wearing clothes, unlike at the MAN. This lends itself toward a cohesive style of dress, typified by brand names such as SPACE TRIBE, with fractal mushrooms, spin-offs on religious symbols, Celtic knots, *etc.* The fashion and art of the psy-trance movement is similar in structure to what was attempted by the GRATEFUL DEAD's artists: gather archetypal symbols from the world's religions and squash them all together. And yet somehow it works better with the trance scene. While these “new” symbols are clearly rooted in the past, they seem to have been better channeled via direct experiences with the hallucinatory overmind—*logos* manifest in colorful clothing form.

While self-reliance rules at the MAN, BOOMers are treated to beer booths and food vendors. I have to admit the guilty pleasure of consumerism—purchasing hot food that I didn't have to make myself was a definite plus. The MAN has the “ice thing” down better though—trying to score ice for a beverage at the BOOM was impossible. The down side to having such vendors was the fact that recycling or even throwing away one's garbage in the ample trash cans was a concept totally lost on many BOOMers. There was a constant blanket of litter in this area, and as I frequently picked up

other people's garbage when throwing out my own, I thought of how desperately this festival needs to embrace the MAN's “leave no trace” policy. On the flip side, encouraging vending allowed for a long row of booths offering art, massage, *Cannabis* seeds, smart drinks, clothing, jewelry, pipes, and sundry handmade crafts.

The BOOM has a much better grasp on organized information exchange than the MAN. Speakers such as myself, MORGAN BRENT, ERIK DAVIS, ALEX GREY, CHARLES HAYES, ZOE SEVEN, and others, presented in the Dynamic Mythologies Tent—a place where one could learn more about experiential aspects of the psy-trance culture, including the visionary sacraments that inspire some of us. (Personal-use quantities of drugs are tolerated in Portugal, making this a good location for such a festival.) MAPS had a tent nearby, to help out those who might be having difficult trips. And in the evening, psychedelic animation and films were shown by Dr. SPOOK and the LIQUID CRYSTAL VISION crew. I was a bit surprised by the festival attendees' lack of knowledge regarding those

ERIK DAVIS enjoying a cold European soda.

drugs that were making the rounds. Several people told me about the blotter or micro-dot “mescaline” that they had been sold (which clearly *wasn't* mescaline). But the BOOMers seemed quite eager to learn, and obviously were pleased that the Tent had been made available for them. All in all, the BOOM was a blast, and I definitely hope to make it back to the next one.

Scrambling around the town of Lisbon, the architecture was incredible—castles, churches, cobblestone roads. We hit an open-air market, where artisans were selling their crafts, and I was immediately entreated to purchase a large bag of green bud or a sizable chunk of hash for 20.00 euros each. When I explained that I had to take a plane the next day, and couldn't possibly smoke through it all, the man trying to sell it to me didn't like my excuse and kept hassling me. It was heartbreaking to turn him down, since it was about four times as much as one could have purchased for the same money in the USA. And he was doggedly persistent—much more so than anyone I ran into in Jamaica. When he finally took “no” for an answer, it wasn't 60 seconds before another gentleman tried to sell me an even bigger chunk of hash—a fucking *huge* chunk of hash—the biggest I have ever seen. He similarly didn't want to hear my excuse as to why I wouldn't be buying it, and kept harassing me to purchase incrementally smaller amounts of it. After several minutes he finally gave up on me. Believe me, I wish that I *could* have bought some...

## NEW YORK

I figured that I'd head to New York City, to help my brother build a house in the woods. While there, I got the opportunity to go to an opening for an ALEX GREY art show at the TIBET HOUSE. (The show is running through January 3, 2003; see [www.tibethouse.org](http://www.tibethouse.org) for more details.) The size of ALEX's work always blows me away. I got the chance to meet JULIE HOLLAND, author of *Ecstasy: The Complete Guide*, who was also in attendance. And then I hooked up with CHARLES HAYES, author of *Tripping*, and we headed down to a beer bar where we discussed psychedelics with a couple that we had met at the opening. Overall it was a nice diversion from hectic planning for the MIND STATES JAMAICA event that was just around the corner.

A good spot to score 'shrooms. Photo by [WWW.EROWID.ORG](http://WWW.EROWID.ORG)

## JAMAICA AGAIN

The MIND STATES III conference was enjoyable from many more perspectives than I have space to get into here. Let me conclude this travelog with a couple of stories related to two of the speakers at this event.

JONATHAN OTT: Recently traveling from Spain to Germany, JONATHAN got held up at Customs. It seems as though they were curious about his slide carousel (he had been presenting a talk about *coca* and cocaine), and they noticed that a number of slides that have pictures of crack rocks on them or something similar.

AGENT: “What are these pictures of?”

JONATHAN OTT: “Cocaine and *coca* plants.”

AGENT: “Are you involved with drugs?”

JONATHAN OTT: “Yes.”

AGENT: “Are you currently on any narcotics?”

JONATHAN OTT: “Yes. I took some painkillers for a tooth problem.”

With that answer, the officials made it clear that JONATHAN needed to submit to a full-body X-ray, and if he didn't agree to this, things would not go so well for him. Since he wasn't a mule, the X-ray went off fine and they had to begrudgingly let him go.

RICHARD GLEN BOIRE: A guy had contacted me via e-mail asking if he could purchase a ticket for a single talk—one that RICHARD was giving—at the MIND STATES JAMAICA conference. Since a couple of other people had asked me about possibly buying single talk tickets to ALEX GREY's presentation, this request didn't seem *that* odd. However, when this guy showed up with a buddy, they had "narc" written all over them. The talk that they bought tickets for was titled "Rastafarians: Friendly 'Pot heads' or The Next Al Quada?" Perhaps two-thirds of the way into the talk, someone asked, "Um... what does any of this have to do with the Al Quada?" and RICHARD responded that his title was a joke, and that he had thought that as the event producer, I would have retitled his talk. (Not *getting* his joke, I left the title as he proposed it.) His talk had nothing to do with terrorism. At this point, one of the two guys who had paid specifically for his talk was heard to exclaim, "I fucking came all the way from the USA for this shit!" At which point they both got up and left. While no one can say for certain why these guys were at RICHARD's talk, it would certainly *seem* as though the US government must be scanning the web for any mention of "Al Quada" and then sending agents to check things out. ☉

RICHARD and FINN BOIRE watching the sun set from a glass-bottomed boat ride.

JONATHAN OTT explains the neuroprotective and nootropic effects of nicotine.

# YEAR OF JUBILEE

by MARK PESCE for JAMES KENT and DANIEL PINCHBECK

*And ye shall hallow the fiftieth year, and proclaim liberty throughout all the land unto all the inhabitants thereof: it shall be a jubilee unto you; and ye shall return every man unto his possession, and ye shall return every man unto his family. Leviticus XXV:10*

or it's not, which means everything I've ever thought or believed for the last 30 years has been some sort of joke, the kind of practical joke that leaves you, broke & high dancing naked at the foot of a Mayan pyramid on the Winter Solstice of 2012, expecting that moment of perfect alignment when the cosmic ray will sweep down and brush it all away, sans teeth, sans eyes, sans truth, sans everything. A second childhood's end.

I go too fast—probably the drugs coming on—so let me step back and walk into this territory: gently, slowly cherishing the burning embers and broken glass, the clasped hands and lover's looks, the simple and increasingly the complex, and get some understanding which will, for now, have to stand in for wisdom.

And give it to you in pieces, thought-bites, images plus time: there is no essential sequence; one before another, one follows another, like pearls on a string, each complete, beautiful, identical, and only time to separate one from another, but nothing about them, (nothing important anyway), says anything but one thing, an arrow drawn tight in its bow, pointed perfectly upward along the tangent ray infinity.

The same place where, in a moment, I believe, the *Summum Bonum*, Elixir of the Metals, and true Philosopher's Stone will pound down to Earth. And put this way, I can relate the strange eventful history of my 50 years as a series of lightning strikes in a roiling darkness, seeming to come ever closer to the mark.

The last of these—the Blast to Please—entirely holy fire, divine current a carrier wave for a more universal symbol than the stuttered phonemes issuing from sunburned & blistered lips, more meaningful than answered prayers which if thoughtfully obeyed would leave one world and the second and the third wiped out in an orgasm of hatred, more timely

than sperm meeting egg, the perfect and logical conclusion to the Birth of Form, the arc stretching up across 12 billion years, from bang to burst.

Or so I keep telling myself. And I know, having been informed in college long ago (one of the only things I learned there) that true is only true if it remains true after you've stopped telling yourself what true is.

Listen: there's but a few moments left. No time for transcendence no time like the present. After which there'll be no more time.

And here, in the bandgap between chaos and eternity, in this dense and active zone, everything has become so overloaded that even the simplest words have wriggled free from their moorings in the safe port of meaning, and every story so transmitted tells a universal tale.

Stately, plump, buck naked, I was from my mother's womb untimely rip'd, an ill-starred child who kills his mother, and I did the doctor's work, gutting myself into orphanage with a hideous episiotomy, rent a central artery and exsanguinated, slipping away before I had ever been lifted to breast. Life is death, life is pain, and if I could never quite feel the guilt of my own impertinence, neither would I bask in her unconditional love.

Passed hand-to-handed off through a small forest of relatives, each who gave me a little something: lemon cookies, a whispered prayer, and a swift backhand. Faint praise and a big party to celebrate my exodus.

To Carthage then I came—*Delenda est Carthago*—the city set on a hill as an example for all others to see. Look upon us, it cried, with the voice of vainglory, for we are important. We are all importance: that not contained within us is not worth knowing. Everywhere the center, all and everything.

Here the Academy with its bright lights, the hallowed halls of the Big City. I sat down at a table with all manner of delights spread before me, sweet confections and hearty meats, and with an engulfing appetite I ate it all, took it within me,

and from the first bite began to forget a world beyond these halls, a place outside the City. My food filled me utterly, and if I gave no thought to an existence apart from this self-evident center of the human world, what did that matter? I had arrived, received the truth, and been accepted into the mysteries. Worship of the neon night supplanted dedication to the evening star, and the ways of Man seemed fairer and more beautiful than the logic of nature.

To Carthage then I came, tasted joy in diesel and might, and if not for the light cast from my shadow, might have remained forever trapped in the Bardo of the Gods, utterly destroyed in an instant of fire. But this would not be. I woke up from a fitful sleep and gazed upon the objects of possession, the chains and keys, leash and collar, and understood I had gloried in the light reflected from a false Sun, projected through scaffolding and scrim, a stage play of the real.

And vomited all of it up, venting the poison as if touched by the Vine, replaced nothing with nothing, and the empty space like an open sore, ready, waiting, willing to give up to any sort of infection.

And so I passed through refiner's fire, and came to know the One. Dross burned away, the remainder quenched in a baptism of fire, I received the good news with an open heart and in a moment the world changed, its shifting forms a landscape of light and shadow, black and white. It only required faith in the One, and from this all else followed, my foolscap and sackcloth, my crown of thorns and rosy cross—by His stripes I was healed, made complete in a way the City could not offer. And thus the One became One point, One thought, One duty, as evident as truth and conspicuous as air. This I grasped, and was grasped by it, fitted out as a puppet suits its master, for my mouth became a mouthpiece for the One, my hands His hands, my mind His mind, a slave to him, honestly and utterly, with the promise of rich reward after a lifetime of good stewardship.

But though I loved the One, and spoke the words, and did His bidding, beneath my gut a voice cried out in a language nearly forgotten and wholly recognizable: the sound of my soul. Which at first began with the plaintive call of a longing for appetites unfulfilled, the demon and terror I had put aside when the One burned through me. Which grew in time to a cry that this was not enough, or would be only in a complete castration, cock and balls nailed neatly to the cross, each perfectly at war with the other, and in this delicate balance the rarest of opportunities: to act, for one moment, from myself, respecting appetite and adoration, Eros and Agape.

And there could have stalled forever, in the outer chambers of the Temple, but a stiff prick knows no conscience, has no allegiance to the One, seeking to stab and stab and stab the wound that bleeds and heals. A moment of heat, and the fire was gone. I had cut myself off in the spirit only to recover my body, and years passed before I wondered why not the cross and the cock, thorn and pricks?

I still have no answer.

Because I could not believe the One, instead I fell to All, crash-landed Pleiadians with light bodies Gnostic & perfect, teasing the subtle from the rough clay which binds us, spirit and soul, to the doomed decaying wreck of Earth, invaded by an army of Martian Greys, Zeta Reticulans, cattle mutilators and anal probes, black helicopters and a lie so Big none dare speak its Name.

Light as air, blown back and forth from PYTHAGORAS, PLATO, HERMES TRISMEGISTOS, DEE and BLAKE, CROWLEY and GURDJIEFF, DRUNVALO MELCHIZEDEK and Zen Master RAMA, driven hither and yon across a seemingly endless sea of perfect equanimity, all points equal and superlative, seductive in the apparitions of Angels from the next dimensional plane of existence who needed my help in combating the Archons of the Demiurge, who needed, like TINKERBELL, a handclap at the right moment in time to rescue us from the thunderous approach to the abyss. My eyes, like candy, looked sweetly upon the Testimony of Sages and Wisdom of the Prophets.

It was all true, all of it. All of it made up, and perfectly true. But even so, ridiculous. Closing my mind to the All made the universe a less interesting place, but with the fog of a trillion truths gone, I knew what I must do: simplify, bring myself back to unadorned essence.

And so I scraped a hovel from hard land, felled the trees and built a home, everything absolutely direct: food from my hands to my mouth, heat from the wood I had cut, and an absolute conviction that confusion arose as the consequence of connection, and that, in excepting myself from the bounds of community I would become calm, my perfect nature revealed in unalloyed solitude.

And thus went mad, or nearly, for when the whine outside diminished, the voices from the inner world overwhelmed, amplifying every fear into panic, appetite into unquenchable hunger, and disappointment into blind fury. My own mind, companion in my hermitage, at last burst forth in a dark hallucinatory creativity wherein the very fabric of existence breathed against my presence in it. And in my darkest hour, crouched in a fetal ball, she came to me.

What can I say of a daughter of the Gods? That she was fair and bright as the Sun, dark and brooding as the Seas, quick as silver and great in battle? Even these do not touch it, for in her I understood the first and greatest of the mysteries: we are alone, yet we are with others. To hear her voice, after so

much silence, was like rain in the desert, and brought forth a life in me I had not suspected: that I could, through another, be complete.

She took me to her palace, and bade me eat, and from the moment I tasted her food, time moved away, neither forward nor backward, now or later, but an endless present of feasting and merry.

Time forgotten and ten years past, she the same ever-pleasing form, while I grew older and more imbecilic in a Neverland of pleasures which delight the body and never touch the soul. Life is suffering and I, quite clearly, was not alive.

The moment of this thought the spell broke. All faded into the fantastic mist from whence she conjured, and she stood before me smiling.

You have chosen wisely. But more must come, and more must pass, before you find your home.

Because of her I could anticipate a world of seductive voices which promised perfect peace and endless love, stopped my ears up against the impossible and absolutely believable lies of perpetual rising, and found somewhere within myself the power to resist the offering tailor-made to be absolutely irresistible, cursed my appetites and damned the Fates, until, after a crucifying interval, their chants changed from promises to pleas, from pleas to whispered hopes, and then, thankfully, to silence.

But this was not the half of it. The world had more to offer me, and made itself plainly heard: these I give you freely—Wisdom and wonder, comfort and power. But one or the other. Choose! Thus was I torn, as my mind wanted one, my heart another, and each would have gone their separate ways, ripping me asunder, if I had not recalled her stern advice: Both choices true, both choices false, both choices wrong, both choices right. How then but the Middle Path? I wanted both—how I wanted both!—and settled for neither, none the richer, and none the wiser, but more myself.

And now I found myself before a great tree, its root the Earth itself and branches threading upward to infinity. This tree contained one fruit, red as sin with spots of pure light, guarded by a dove and serpent. The dove forbade me eat but the serpent countered, arguing any price be worth the taste of such magical food. And I, the perfect fool, swayed by his

words, did take the fruit and eat. It was sweet in my mouth, but in my belly it did sour. Then the thunder spoke:

Thou shalt not look upon the face of the Lord and live. Thou shalt not. And so I died.

Death felt like the ultimate recognition. Here again, as if I'd never been gone at all. And the moment of pure light, when the Great Liberation is offered up in the opening to Nirvana, in that moment I understood all this had happened before, I had already stopped the wheel of time, experienced each of my past lives, first as a Tibetan monk shot by invading Chinese in the spring of 1962, whose last thoughts of anger and regret he put aside in favor of a renunciation of anger and regret, and so passed the wrathful demons and stopped the wheel of time. And before that a German Jew, an engineer building the delicate clockwork control systems of VON BRAUN'S flying bombs, and killed in the Allied raid on Peenemunde, whispering the Shema as the walls caved in with fire, and before, a Spanish child consumed with influenza during the great epidemic that followed the Great War, and before and before and before and before, the endless succession of beings and becomings a cosmic joke, perfectly executed to bring forth a laugh at just the right moment, this moment, when I recognized myself as a lesser bodhisattva, not messiah nor prophet but witness and clerk, keeping some celestial record of events too strange to be uttered or known or even seen before. God had fashioned him an Eye, made it perfect, and bade him see.

Naked and revealed, cast up on Ithaca's shores, returned to the universe of Form, I remember myself, a man in the complex and terrifying world that offers gory glories and painful beauties, and everything increasingly confused, as if some human act had pierced the fabric of reality, and all that lay beyond come rushing in.

But this mattered little, this was all according to plan, and against this I had been given sun and moon, wife and daughter, each an emanation of divine love, visible in their eyes, spoken in their voices, felt in their touch. These I had against the coming tide, these the pillars to which I'd lash myself as I faced a rising sea of troubles: many comings and goings, great earthquakes, wars and rumors of wars. I read the end stories, each and every one, and knew these too would come to pass.

But how could I escape the attachments of love? Life is death, life is pain. And so I saw four horsemen in the sky, and the

last of these, a rider on a pale horse, and his name was Death. And he brought great pestilence into the world, and a quarter of mankind died.

It was quick, mercifully quick, I'll grant Him that. No long, drawn out leave-taking, just high fever and endless sleep. Would that I could sleep. Instead I watch wife and mother, child and daughter, lay down, never to rise again. And the world is plunged into darkness. There is no sleep, there are no dreams. How could, on the threshold of something completely unexpected, we be overrun by something so small? Is this the end I am to witness, nothing but the stupidity of death, repeated a billion upon billion times? Are we meant to exhaust the sea of compassion?

I knew I endured the pain of my attachments, and resented that I must release my love to release my hatred to release a miracle.

And so, so slowly, I come to realize that this is the appointed task, the appointed hour. Without the shock of loss, it could not possibly be real. The universe risks everything on a single throw of the dice, sacrificing whatever might be required to guarantee the bet. We are powerless, perhaps, but not hopeless, and I have a promise to fulfill, even as the promise is fulfilled.

Or so I keep telling myself.

Moments left. Moments. And I wonder what completion means, and as the sun rises I start to understand that I too am the universe, and I too seek escape from the endless, ridiculous cycle of birth and death and rebirth, the mechanical movement of souls into and out of form, difficult but necessary to translate this universe to different stuff, lifting each part into the whole, with all voices united, mine and hers and she asks can you hear it? and yes I say yes ☉

# PHARMACO PROHIBITA

by RICHARD GLEN BOIRE

Control culture seems to be taking a renewed interest in esoteric visionary plants, with several recent cases foreshadowing potentially darker times to come.

In August 2002, members of the ayahuasca-using religious group known as the *União do Vegetal (UDV)* won a major legal victory when a federal court ruled that the group's use of ayahuasca was likely protected under the RELIGIOUS FREEDOM RESTORATION ACT (RFRA). While this was wonderful news, some of the underlying reasoning in the case was unsound, and has already been used to detrimental effect in another US case involving an Atlanta man who imported dried *Psychotria viridis* and *Banisteriopsis caapi* vines. Additionally, *Salvia divinorum* and its active principle salvinorin A are being targeted by a bill (HR 5607) in the US Congress, which seeks to place them both into Schedule I. Finally, in November, the Supreme Court of Holland, ruled that while living and wet psilocybian mushrooms are legal, dried mushrooms are illegal.

The *UDV* case arose after US Customs agents seized several bottles of ayahuasca imported from Brazil for use by members of a US-based branch of the *UDV*. Although the government did not file criminal charges, it warned the *UDV* that if they imported any more ayahuasca the government would treat the action as a federal drug offense. The *UDV* filed a lawsuit alleging that ayahuasca was not a scheduled substance under US law, and that even if it were considered a scheduled substance, *UDV's* use of it was protected by the First Amendment's Free Exercise Clause and by the Religious Freedom Restoration Act (RFRA).

In a 61-page ruling, Judge JAMES PARKER of the United States District Court for the District of New Mexico, found that although the government's actions did not violate the *UDV's* free exercise rights under the First Amendment, the seizure of the church's sacrament appears to have been in violation of the RFRA. The RFRA is a federal law passed by Congress in 1993 for the purpose of providing greater protection to religious free exercise than even the First Amendment, which had been significantly watered-down by a 1990 United States Supreme Court decision. (See *Employment Division, Dept. of Human Resources of Oregon v. Smith*, 494 US 872 [1990].) Judge PARKER found:

[The] Government has not shown that applying the [Controlled Substance Act's] prohibition on DMT to the *UDV's* use of hoasca furthers a compelling interest. This Court cannot find, based on the evidence presented by the parties, that the government has proven that hoasca poses a serious health risk to members of the *UDV* who drink the tea in a ceremonial setting. Further, the Government has not shown that permitting members of the *UDV* to consume hoasca would lead to significant diversion of the substance to non-religious use (*União do Vegetal v. John Ashcroft*, 1647 JF/RLF [2002] Opinion, p. 32).

The problem with the ruling was Judge PARKER's finding that ayahuasca was indeed a controlled substance. This is the first time a court has expressly held that ayahuasca is indeed a "material, compound, mixture, or preparation that contains DMT" and is thus within Schedule I. The *UDV* argued that such an expansive reading of the "material, compound, mixture..." phrase would lead to absurd results, like outlawing our own brains, which endogenously contain DMT, and outlawing a host of plants that are generally considered legal. One way to make sense of the phrase, argued the *UDV*, was to interpret it as only applying to synthesized DMT, and not to DMT that occurs naturally. The legislative history of DMT's scheduling supports this reading. (Every time that DMT was discussed, it was in reference to synthetic DMT.) Judge PARKER called these "interesting arguments," but he rejected them. Speaking about DMT-containing *Phalaris* grass, Judge PARKER explained:

During the hearing, the Plaintiffs presented evidence showing that certain plants growing in this country, including phalaris grass, contain DMT. The Plaintiffs' evidence included a document showing that the United States Department of Agriculture even recommends using one kind of phalaris for erosion control. The Plaintiffs appear to argue that if people are allowed to grow phalaris grass for nonreligious reasons, while the *UDV's* supply of hoasca is confiscated, this Court should conclude that the federal government must be discriminating against the Plaintiffs on the basis of religion. The Court does not believe that the evidence about phalaris would necessarily lead to that conclusion. Individuals with phalaris grass in their lawns may possess DMT in some sense. However, if there are no indications that the

people with phalaris lawns are consuming the grass, law enforcement might legitimately choose not to prosecute, for reasons other than that the grass is being used for the secular purpose of having a lawn. Federal law enforcement entities might prioritize focusing on the UDV's hoasca use not because the use is religious, but instead because UDV members make much more extensive use of hoasca by personally ingesting it than a person with a phalaris lawn makes the grass. Before their tea was confiscated, UDV officials regularly distributed the tea to church members for consumption.

Some evidence presented at the hearing suggested that non-religious consumption of plants containing DMT does take place in the United States. This evidence included materials taken from the Internet—advertisements for plants containing DMT and testimonials from people claiming to have used teas similar to hoasca.

With respect to DMT naturally occurring in the human brain, Judge PARKER was of the opinion that this was insufficient to make the law absurd when applied to non-synthetic DMT found outside of the brain:

The Plaintiffs observe that many plants and animals, including humans, contain DMT; and the Plaintiffs imply that because the CSA cannot be read to ban humans, that the statute must apply only to synthetic DMT. [But,] simply because banning humans would be absurd does not mean that banning any non-synthetic DMT found elsewhere would be absurd.

Although the *UDV* ruling concerned ayahuasca—the liquid tea—and not the ingredient plants in their living or dried form, Judge PARKER's language has already been read by at least one federal court judge to apply to plants that naturally contain DMT such as *Psychotria viridis*.

Earlier this year, a federal grand jury in Atlanta indicted a man on charges of illegal importation and possession of DMT after US Customs confiscated an inbound shipment of almost 1000 pounds of dried *Psychotria viridis* and *Banisteriopsis caapi*. This was not an extract, or a combined potion of the two plants. It was simply dried plant material. When the man correctly moved to dismiss the case on the ground that neither plant was a controlled substance, his motion was denied, largely because the judge in the case misread the *UDV* ruling as applying not only to prepared ayahuasca, but also to the bare plants themselves.

## Help Us Defend *Salvia divinorum*...

...and other entheogens as tools for enhancing the mind. We're currently coordinating effective opposition to H.R. 5607, the bill to schedule *Salvia divinorum* and salvinorin A. We're also:

- ◆ Presenting cognitive liberty arguments in a forced-drugging case before the US Supreme Court
- ◆ Offering accurate, up-to-date entheogen information as part of our "Ask Dr. Shulgin" on-line service
- ◆ Publishing the groundbreaking *Journal of Cognitive Liberties* (free to our members)
- ◆ Designing and disseminating a cognitive liberty curriculum exploring social issues that affect freedom of thought and mental autonomy

[www.cognitiveliberty.org](http://www.cognitiveliberty.org)

While both the *UDV* ruling and the Atlanta ruling were from low-level federal district courts, and hence have little binding precedence value, they are important rulings because subsequent courts facing similar issues will likely treat these cases as informative. They could be the first legal footholds to shutting down commerce in visionary plants that have heretofore been considered legal. Applying the US drug law to plants that endogenously produce “scheduled” phytochemicals would result in hundreds, if not thousands, of plant species being considered illegal. If the Controlled Substance Act schedules were intended to apply to plants that naturally produce psychoactive principles, why would mescaline, and peyote both be listed? Why would THC, and *Cannabis* both be listed? Why would cocaine and opium as well as their plant sources both be listed? Clearly, when the Controlled Substance Act has intended to outlaw a specific plant it has done so by name, and for good reason. A rule like that applied in the Atlanta case would require everyone to become expert phytochemists under threat of criminal imprisonment.

The Atlanta case will play out over the next few months, and the JLF “poisonous non-consumables” case (which involves some similar charges and issues) is set for trial in January, and could likewise result in adverse case law concerning visionary plants.

Finally, even in Holland, where we have traditionally looked for tolerance and sophistication when it comes to visionary plants, HANS VAN DEN HURK, the owner of the CONSCIOUS DREAMS smartshop, lost his final appeal before the Dutch Supreme Court. In November, the Court let stand an earlier ruling holding that just about any human “preparation” of a psilocybian mushroom (including drying or mixing into honey or syrup) transforms the mushroom into an illegal drug. Only fresh mushrooms remain legal, which could lead to a much lower supply and a much higher price in the Dutch smartshops. On the upside, freshness should be guaranteed.

# NETWORK FEEDBACK

## EXTRACTION DEVICES

Have you ever done a review of the soxhlet extraction apparatus sold by the BOTANICAL PRESERVATION CORPS or the one called COLDFINGER HERBAL EXTRACTOR sold by the BASEMENT SHAMAN? Also, I am curious to know what would be the least complicated or most efficient method of DMT extraction from *Arundo donax* or *Desmanthus* sp. to yield a smokable product? — L.E.G., NH

It first is worth pointing out that the BPC is no longer offering these units for sale. However, what they were offering was a standard soxhlet extractor, which can be obtained from other sources (and generally speaking, at substantially lower prices). ELEMENTAL SCIENTIFIC [POB 571, Appleton, WI 54912-0571, (920) 882-1277, www.elementalscientific.net] is one place that offers such a device for about half the cost that the BPC used to charge. Basically, this device is a reflux extractor (see cover photos on this issue of ER).

The COLDFINGER HERBAL EXTRACTOR (produced by EDEN LABS, see www.edenlabs.org) may appear different on the surface but it too is also essentially a modified reflux extractor. It is similar to the old Iso-II extractor, but uses a different condenser arrangement and is constructed of different materials. As well, the Iso-II had its own heat source (a light bulb), whereas with most of the COLDFINGER devices, one must provide an additional electric heat source. There are several different COLDFINGER HERBAL EXTRACTOR models, that will extract different amounts of dried material. EDEN LABS makes the claim that their lowest-priced model (\$300.00) can extract 2–4 ounces of material; the “high end” of this claim is exaggerated, and it can only do about 2 ounces or so.

It has been rumored that people who have purchased products in the past from EDEN LABS (formerly known under the names of TECH ENTERPRISES, HEALTH TECH, and SEED TECH) have been investigated by the DEA, which evidently obtained the company's customer list. While we have no way of knowing for certain if this did indeed happen, these sort of rumors lead us to the suggestion that in some cases it may be better to deal with a retailer of products, rather than the manufacturer. In this case, for example, one interested in these devices might be better off purchasing one from a retailer (such as the BASEMENT SHAMAN, that you mentioned).

Contrary to the company literature, the COLDFINGER condenser arrangement is not novel but is a rather old idea. The reader might ask him- or herself whether a high-priced piece of glassware is a good investment. For ease of producing herbal elixirs, such a device can prove a great boon, but it is also important to remember that most of the entheogens extract just fine with a simmering or even a room temperature soak for a week. The latter can provide results

every bit as good as a soxhlet, and it does not limit a person to amounts small enough to fit in the extraction devices asked about. Another important issue is heat. Direct comparison of soxhlet extractions on psilocybian mushrooms (BEUG & BIGWOOD 1981) has shown that substantial losses can arise during the lengthy heating involved in soxhlet extraction as opposed to something shorter, gentler, and low-tech. The biggest problem with an approach such as is used by both a soxhlet and the COLDFINGER is that once the plant material starts to extract into solution, the solvent is steadily evaporated by heat and recondensed by cold to cyclically extract the plant material with freshly distilled solvent. This is a good thing in itself; however, in order to work, it also requires heating the entire volume of the resulting extract and keeping it at the boiling temperature for the solvent chosen. This heating must be maintained for the duration of the entire extraction process since this is what powers the refluxing of solvent.

Soaking at room temperature, in an airtight jar kept in a dark place, works great for many alkaloids, especially tryptamines. Always, be sure to initially add enough solvent, with stirring or shaking, to fully saturate all dried material *before* adding the bulk of the solvent to a jar full of dry powder. This thorough saturation should be done initially even if intending to simmer a dried powder/solvent mix in a pan.

A soxhlet or COLDFINGER can be handy, and makes for a nifty kitchen gadget (albeit one of potentially dubious legality depending on what is used in it), but it's our opinion that for most people, a simpler and less costly approach will prove satisfactory. A stainless steel pressure cooker, for instance would prove a far better investment to aid in those extractions that require heating. A basic crockpot with some water in it can also provide a nice heating bath for a vessel containing the extraction slurry. These are safe to use and are available at low cost, although we would suggest obtaining one with a variable temperature-selection dial rather than one or two preset temperatures. Or, place a dimmer switch in the line and check the temperature using a kitchen thermometer. For a dilute aqueous acid solution, the extraction can be performed right in the crockpot.

As far as the “least complicated or most efficient method of DMT extraction from *Arundo donax* or *Desmanthus* sp. to yield a smokable product” goes, our first and most significantly productive suggestion would be to choose some plant other than *A. donax*. This species has never panned out into a functional plant, at least not here in the US. Although DMT was reported as being recovered from plants growing in India (GHOSAL *et al.* 1969), JOHNNY APPLESEED WAS unable to detect it in all but one sample collected from various individuals in the US (APPLESEED 1993–1995). It is worth commenting on the DMT recovered to date: in one case 700 grams of rhizome gave 40 mg of DMT along with over a gram of mixed indoles (GHOSAL *et al.* 1969) and in another case 20 mg was recovered from 200 grams of “dried plant,” which also yielded 520 mg of gramine (DUTTA & GHOSAL 1967). Some *Desmanthus illinoensis* and *D. leptolobus* strains

are worthless, while others are functional (THOMPSON *et al.* 1987; APPLESEED 1993), but they are all a lot of work to harvest and process ('though for a person in the Midwest who has no other DMT source they could be a blessing).

When approaching an extraction, "least complicated" and "most efficient" are frequently directly conflicting goals. The least complicated route would be to soak the dried powdered roots in an organic solvent then evaporate it. This will leave lots of unwanted gunk in the residue. The most efficient method, in general, would be the most labor intensive and complicated. For most plants and most alkaloids that our readers are interested in, the most efficient route is to start out by simmering in a stainless steel pressure cooker with an aqueous acid (we'd recommend citric acid, due to its safety, ease of handling, and ready availability), and then take it through standard acid-base partitioning with an appropriate choice of an organic solvent, ending up with a free-base. This process has been described in numerous past issues of *The Entheogen Review*, with specific plants, alkaloids, and solvents. Whether one is looking for an easy crude extraction, or a more labor-intensive purified compound, the key is to start with plants that are known to generally contain high quantities of the target alkaloids. Growing out known potent strains is always a good idea. For DMT sources, we would recommend *Diplopterys cabrerana*, *Mimosa tenuiflora*, and *Psychotria viridis*. — Eds.

## AMANITA STRENGTH AND CULTIVATION

Contrary to published literature, I have found that—for at least myself—fresh *Amanita muscaria* var. *formosa* is more potent than dried mushrooms of the same harvest. I'm hoping to start cultivating *A. muscaria*. Where can I find information about growing this entheogen? — L.E.G., NH

All the literature we have encountered describes the fresh caps as stronger *and* less pleasant than the dried material. Both appear active (at least in some people some of the time) but ibotenic acid also causes pronounced side-effects such as sweating. As far as we understand it, the drying and/or heating (converting ibotenic acid to muscimol in the process) is not done to make the mushrooms stronger but is performed to lessen these unwanted side-effects.

*Amanita muscaria* requires a living host tree, so it can't be cultivated in a lab or closet. However, in the recently released book *Magic Mushrooms in Religion and Alchemy* (the first US edition of *Strange Fruit: Alchemy, Religion and Magical Foods* by CLARK HEINRICH), it has been noted that it is possible to inoculate the roots of an appropriate tree species, such as Monterey pine (*Pinus radiata*), with fungal spores and create cultures outdoors, assuming a healthy, living host and hospitable climate is available. The company JLF: POISONOUS NON-CONSUMABLES was at one time selling treelets that had been inoculated in this manner. — Eds.

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus*,  
*Epithelantha*, *Pelecypora*,  
obscure *Trichocereus* species  
including new hybrids and  
cristate/monstrose San Pedros and others,  
*Turbinicarpus*, *Aloe*, *Bursera* (source of copal),  
*Delosperma*, *Ipomoea*, *Pedilanthus*, *Sceletium*,  
and more!

We also offer an extensive guide  
to grafting cacti and other succulents.  
Our catalog is fully illustrated, and loaded with  
ethnobotanical and horticultural information.

Please send \$2.00 to receive a catalog  
and additional rare plant & seed  
supplements throughout the year.

Sacred Succulents  
POB 781 (Dept. ER)  
Sebastopol, CA 95473

## SEARCHING FOR BOOKS

Does anyone have a copy of the 1996 book *Selection, Preparation and Pharmacological Evaluation of Plant Material* by WILLIAMSON, OKPAKO, and EVANS? I'm also looking for a copy of the 1995 book *The Illustrated Encyclopedia of Essential Oils* by JULIA LAWLESS, and a copy of the second edition of *Passion Flowers* by JOHN VANDERPLANK. I can pay cash or trade (*Anadenanthera colubrina*, *Argyreia nervosa*, *Peganum harmala*, or *Salvia divinorum*). Please contact me via ER. — L.E.G., NH

Those looking to purchase new and used books may find good deals on-line. While a paperback copy of the WILLIAMSON, OKPAKO, and EVANS book retails for \$81.95, we were able to locate a new copy via [www.amazon.com](http://www.amazon.com) for \$67.32. Better deals are frequently available at [www.half.com](http://www.half.com). Although we could not find the first title listed above at [www.half.com](http://www.half.com), we did spot several copies of the book by LAWLESS (\$15.72 best price; retails at \$24.95), and several copies of the VANDERPLANK book (\$14.98 best price; retails at \$29.95). — Eds.

## DARKROOM MEDITATION

In the VERNAL EQUINOX 2002 issue of *ER* you solicited comments from readers who are familiar with the darkroom meditation as promoted by MANTAK CHIA. I was a student of MANTAK's eight years ago, when he toured the USA, giving seminars for his HEALING TAO CENTER. I attended six or seven levels, so I am pretty familiar with his stuff. In 2000 I returned to using entheogens and devoured all the information I could find on the web. I soon came across ANANDA's materials, and it was here I first learned of the darkroom meditations, which he had been administering for some years. MANTAK CHIA met ANANDA in Europe, and it is there that I believe that CHIA first learned of the darkroom (despite statements that it is an ancient Taoist technique, which it no doubt is). I have friends in his HEALING TAO and from what I know of his techniques, he knew little or nothing of the darkroom meditation before this.

In November 2001, I created my own darkroom and sealed myself up for 12 days. I kept extensive notes on audio tape, and I hope to write up a more detailed account for a future issue of *ER*. I'd say that the main benefit from this technique is that it allows one to stay in a modified state for a period of time much longer than the usual trip. The greatest advantage came from the sustained release of pinoline (the "eye of understanding"). Effects from endogenous 5-MeO-DMT were brief, and those from DMT (the "eye of vision") were limited but cool, although there were no closed-eye visuals or open-eye visuals (which in this situation would be the same). I also know that ANANDA will supply an herbal booster after the eighth day or so, when the DMT turns on. This seems like a good idea to me now, after having done it without. — THEODORE GENISIS (ntheogen@hotmail.com)

We would be curious to know what exactly is in the "herbal booster" you mention? Is this a smoke of *Cannabis* or some other psychoactive plant? Or is this some manner of nutritional supplement?

It is important to understand that the claims for various proposed neurochemicals directly causing the effects described are presently supposition, *not* known fact. We're not saying that these darkroom meditations might not produce interesting and potentially valuable neurochemical changes. However, the manner in which these meditations are being "sold" contains too much faux science—replete with untold details and sans any sort of references—for us to feel comfortable about the neurochemical claims that are being made. (In one account sent by a friend some months ago, he cited Rick STRASSMAN as his reference proving DMT was the responsible chemical. To date, STRASSMAN has done no research that would prove this claim.)

Attendees of MANTAK CHIA's seminars, who have been *told* that the effects they experienced resulted from these three chemicals, may indeed now equate particular portions of the experiences with these chemicals as the cause. But that doesn't mean that there actually is any such causal relationship. We'd be interested to know what sort of experience the people describing darkroom-induced "DMT," "5-MeO-DMT," and "pinoline" effects have had, in terms of actually bioassaying these three chemicals in pure form. It is hard to imagine the effects that you attribute to DMT above were indeed related to DMT, since you say you had no visuals of any sort. All DMT experiences that we've had, whether with eyes open or closed, have had a highly visual component to them. Which makes us wonder what about this part of your experience seemed in any way like DMT?

The darkroom technique is interesting, but the pseudo-science packaging is distracting and the presentations/discussions we've read thus far provide mere supposition as proven biochemistry. (Such a looseness of factual accuracy is never a good sign when encountering something new.) Perhaps it *will* all eventually turn out to be the case exactly as described, but at the moment it is merely speculation and hype.

We look forward to reading much more on this fascinating subject, but it is our hope that future researchers and authors writing on the topic will present facts and hypothetical packaging in a manner where the two are clearly distinguished. We don't want our "bone of contention" to discourage people from experimenting with and reporting on these darkroom meditations, and we look forward to any future first-person descriptions. — Eds.

## ACACIA RIGIDULA?

In *Phytochemistry* 49(5): 1377–1380, there is an article titled "Toxic Amines and Alkaloids from *Acacia rigidula*," wherein 44 alkaloids and amines were isolated and identified by GC/MS, including nicotine, DMT, mescaline, several tetrahydroisoquinolines, and four amphetamines—including methamphetamine. This plant's makeup blew me away! I am pretty sure that I have never seen it listed in any of my ethnobotanical books, but then I suspect this plant most likely hasn't been used in the past as an inebriant—I realize that it could very well be a death sentence if imbibed. But for the right chemist in the right place, it might represent a novel challenge for compound isolation. Although my math approximates come up with mere milligrams per pound for mescaline, there are other phenethylamines as well as isoquinolines in larger amounts, and the tryptamines are present in the 100s of milligrams per kilogram.

It would be interesting to find out more about the "guajillo wobbles"—a locomotor ataxia that afflicts sheep and goats who graze on the related species *Acacia berlandieri*, which is reported on in this paper. Does this plant kill stock animals?

If so, what percentage? As with *Phalaris* grasses and *Stipa robusta*, the interdisciplines of veterinary studies, ethnobotany, and organic chemistry turn up an interesting plant.

I have a few questions related to this paper. Have mescaline and the other peyote alkaloids that occur here been previously found in any plants other than cacti? The plant grows in Texas and northern Mexico; is it found growing in the same area as peyote? Are there any botanical companies selling seed or plants of this species? Could the reported 2-Cyclohexylethylamine and/or N-2-Cyclohexylethyl-N-methylamine be considered PCP precursors?

This plant has got my imagination going. — C.E.G., ID

There are many questions surrounding this paper. Sadly, the first is determining its veracity. Over the course of about a year, the authors have not responded to anyone we know of who has attempted to contact them concerning the assorted inconsistencies in this paper. They claim that “available” reference standards were used for identification of the materials. However, some of the compounds they claim to have found were not only never before noted in the literature as plant alkaloids, but at least one of them appears to have never been reported in the chemical literature as having been synthesized. Until Dr. CLEMENT can be contacted or these questions otherwise answered, we suggest viewing the results of this paper with a grain of salt.

Mescaline has been reported in *Acacia berlandieri*, mentioned in another earlier paper by the same lead author, which is plagued with similar unanswered questions (CLEMENT *et al.* 1997). As well, N-Methyl-mescaline has been isolated in tiny amounts from another Leguminous plant, *Alhagi pseudalhagi* (GHOSAL & SRIVASTAVA 1973; GHOSAL *et al.* 1974).

“Guajillo wobbles” and “*Phalaris* staggers” have little if anything in common so far as we can tell. The two Acacias we’ve discussed can kill livestock but they do not appear to do so directly. Instead the animals develop a wobbly gait, stop eating and drinking, and later become prostrate. They can eventually die from this bad summer-time combination. Most of the year these plants are considered nutritious and healthy to consume. The problem arises when they become the predominate vegetation during times of prolonged drought, as they then form the bulk or entirety of the animals’ diets. During this time of year losses can be quite high (due to the animals failure to ingest adequate food and water to survive the heat of summer). It’s believed that N-methyl-phenethylamine, the main alkaloid present, is the responsible agent, as it has been used to experimentally induce the syndrome. Strangely, this was disputed by CLEMENT who noted that well-fed animals given this alkaloid had no problems, while ignoring the well-known fact that well-fed animals have no problem when grazing the Acacias either!

Interestingly, the growth range for these Acacias does indeed overlap with peyote land.

We are not aware that any of the specialty entheobotanical companies are yet carrying seed or plants of these particular Acacias, although they do appear to be available from some nurseries that specialize in plants of that area. Possible sources include CIVANO NURSERY on the web at [www.civanoonuser.com](http://www.civanoonuser.com) and McNEAL GROWERS on the web at [www.mcnealgrowers.com](http://www.mcnealgrowers.com).

As far as the cyclohexyl[m]ethylamines potentially being precursors for PCP production goes, it may be possible to use these as a precursor source (we aren’t certain), but it is unlikely that they will be viewed as a precursor source by the government at least. — Eds.

## CATHA EDULIS, CATHINONE, AND METHCATHINONE

I was introduced to *mira* (*Catha edulis*) while I was in Kenya, where I was taught by fellow travelers and locals to chew the red stems with gum. It took one or two hefty bundles to get a buzz, but once it set in it was quite powerful. Not a wiry shaky stimulation, but a slow deep-breathing sense of power and magnitude. I actually felt like a larger human being. The effects lasted only as long as you chewed it, but security guards I met claimed to stay awake for close to a week at a time. Nobody bothered to chew the leaves—only the red stems from fresh plants were chewed.

Back in the United States, I learned that Kenyan *mira* is considered the world’s strongest. I obtained a rooted cutting and waited three or four years for it to reach a size where I could harvest it. My mistake was planting it in far too large a pot, so it spent several years filling its container. It took six years before flowering, and then produced only a few flowers with very few seeds. It is an easy plant to grow though, and is indistinguishable from many ordinary hedges. During the summers I would boil Swiss chard and pour the cooled broth onto the *mira*. The result was a doubling in size over a few days. This can be repeated one or two more times over the course of the summer.

My first harvest was disappointing. I chewed both leaves and bark and received only a mild buzz and a great deal of heart stimulation. The increase in heart rate and what felt like an increase in blood pressure (with veins sticking out on my forehead and tension in my chest) were serious drawbacks.

My first extraction of the plant used dichloromethane, which resulted in a solid black resin that produced effects that were indistinguishable from the plant. Subsequent extractions were done with methanol and included heating the plant/

solvent mixture in a water bath to the near boiling point of the methanol. I've also let the mixture sit in a warm dark place for three months as an alternate extraction method. Boiling seems much more effective. The methanol extract was evaporated off. During this evaporation, an insoluble gunk fell out of solution and this was filtered away. Eventually the residue hardened into a clear red lacquer, which was scraped off the plate and squeezed into a solid ball. Again, the effects were no different from the plant itself. It made me jittery, sweaty, my heart raced, and the veins on my forehead stuck out.

I synthesized cathinone from phenylpropanolamine, and methcathinone from pseudoephedrine, in order to experience firsthand the difference between these molecules, their precursors, their corresponding amphetamines, and the natural plant. Pills were extracted to obtain the precursor. The difficulty involved in separating phenylpropanolamine from the pill binders cannot be exaggerated. With a theoretical yield of over 20 grams, I was only able to obtain 1.5 grams. My hat goes off to whatever chemist designed those pills to balk folks like me. Pseudoephedrine was easier to obtain (although still laborious to extract) from decongestant tablets. *[It is worth pointing out that some states require stores to report any purchases of pseudoephedrine over a box or two. If you are buying any quantity of cold pills to extract the pseudoephedrine, you would be wise to check into the laws in your area and perhaps purchase small amounts from several stores. — Eds.]* For successful oxidation, pseudoephedrine must be racemized by heating with 14% HCl for 72 hours in a crockpot (steam bath). *[We're not clear what this means. Was it done in a crockpot or using a steam bath? This makes a difference, since a steam bath is hotter than a crockpot. — Eds.]* Oxidation was then achieved via chromium trioxide with acetone as the solvent. *[This process is potentially toxic if not cleaned up adequately, and would not be a great choice for those with little experience handling and disposing of such chemicals. — Eds.]* Yields were more satisfactory, but still on the low side.

Comparing the effects of these two substances with their plant relative yielded useful insights. Good comparisons between methcathinone and methamphetamine can be found on the web, so I won't get into that here. Suffice it to say that my experience substantiates the generally held view that methcathinone is weaker and shorter acting (which is a good attribute, in my opinion), and it causes and increase in blood pressure.

Synthetic cathinone produced intense euphoria at 300 mg. Admittedly, that's a large dose, but it was worth it. The on-

set was speedy, and the effects brief, with a peak after 45 minutes not lasting longer than 30 minutes, and all effects were gone after two hours. It was similar to the effect of the plant itself.

I returned to my ball of red lacquer and my associate who had taken half of the lacquer for private investigation. He had consumed the entire half-ball at once (something to be expected from this individual), and reported relatively intense stimulation that was well tolerated. I took my half of the ball of red lacquer and dissolved it in acetone and added a few drops of concentrated HCl, and to my amazement fluffy purple-white crystals appeared. They weighed 440 mg. I consumed this 440 mg in two doses separated by 30 minutes. The effects were similar but not identical to the chemically-synthesized cathinone.

Ultimately, I think that *Catha edulis* is a superior source for cathinone. A small investment today may produce great rewards in 6 to 10 years. — E.N., CA

We're curious about the comment about this contributor's plants "doubling in size over a few days," which seems pretty unlikely. Perhaps possible if starting with a small enough given size but this can't be a reliable outcome for larger plants. Maybe we have a different idea of what "a few" means?

We wonder whether there is a large difference in an individual's sensitivity to this plant and/or if the alkaloid content from plant to plant is highly variable. The *ER* editors have tried *Catha edulis* on several occasions; both red- and green-stemmed versions. We found these bioassays to range from totally inactive to moderately boring. Evidently plenty of people respond differently than we do. Perhaps it is due to our failure to ingest 1–2 hefty bundles? We've heard of people in the US getting strong effects from reasonable amounts, but one editor's ingestion of 66 grams of fresh picked leaf "felt like a weak cup of *Ephedra* tea and left me not wanting to try it again." And the other editor feels that *C. edulis* is one of the most foul-tasting plants that he has had the displeasure to chew, and despite repeated attempts he has gotten nary a buzz from the plant.

This brings up the example again that it is important to include specific weights when presenting dosage reports (whether leaf or extract); this can make a *big* difference in how valuable the information presented might be for others.

We were also under the impression that cathinone is a fairly unstable chemical, and as such we would not have expected it to survive the isolations described above. Although we found the above report to be of interest, it provides us with more questions than answers. — Eds.

## STEAM DISTILLATION, ENEMAS, AND MORNING GLORY PREP.

Considering the potent effects when creating absinthe, would it be worth it to steam distill mescaline-containing cacti, *Salvia divinorum*, morning glory seeds, or *Cannabis*?

One of my own biggest hesitations on trying out new things is the taste factor. So something caught my eye in the ROSETTA catalog—the paper titled “A Multidisciplinary Overview of Intoxicating Enema Rituals in the Western Hemisphere.” However, this article pretty much told me nothing of value, so I took it upon myself to grind up 20 or so baby Hawaiian woodrose seeds, soaked the powder in water for a full day, and then using a FLEET disposable enema bottle, inserted it anally and held it in for 10–15 minutes. Nothing happened, and I haven’t repeated it since, although I have plans on soaking it in wine and retrying it, as I guess according to the article, alcohol does readily absorb rectally.

I would like to see a *good* kitchen extraction of lysergic acid amide (ergine). Damn it, one that works. No more water extracts or bogus alcohol ones. I *know* that baby Hawaiian woodrose seeds work, but I have never been successful with an alcohol extract or defatting these same extractions, so please help. — ANONYMOUS

It would not be worth the effort to steam distill any of the herbs or seeds you mentioned. Steam distillation should be used for materials such as essential oils (*i.e.*, terpenes and simple aromatic compounds) or some alkaloids with low boiling points (such as phenethylamine or nicotine). *Cannabis* might yield an interesting essential oil blend but this is really only a good approach for materials with both good volatility and stable components. It *might* be a good way to capture an essential oil fraction of *Cannabis* that could prove interesting in perfumery, incense making, aromatherapy, or other essential oil works. However, I suspect that steam distillation of THC would probably give disappointing results.

*ER* currently has some researchers working on an article related to enemas as an ingestion method, which should appear in a future issue. Of course, I would love to hear from any of our subscribers who have tried this method, whether or not it was successful. The 10–15 minutes retention time that you mentioned seems too short. I’d suggest at least an hour, if not two or more. (Or at the very least until full effects are clearly perceptible.) Keeping the volume of liquid to the least amount reasonably possible should help accomplish this. That said, I’ve heard anecdotal accounts of morning glory seed enemas and of an enema using the methanolic isolate of morning glory seeds similarly being inactive rectally. Straying farther afield, DMT bioxalate has been reported inactive rectally (DESMET 1983), and an unpublished bioassay by JUSTIN CASE using 185 mg of DMT ascorbate found the same result (CASE 2002). There are also anecdotal

accounts of psilocybian mushrooms being inactive as an enema, so perhaps indoles are not effective via this route without a MAOI?

So far as a ergine extraction goes, perhaps the problem is not with the isolation method but with the material? There is some evidence to suggest that ergine is *not* particularly psychoptic (see *ER* Vol. 8, No. 4, p. 136), and that those visionary results that arise from the ingestion of *some* morning glories may instead be the result of another component. For isolation of ergine, methanol works fine. For isolation of the alkaloids in morning glory seeds, water works fine. However, not all morning glory or woodrose are necessarily psychoactive or produce the desired psychoptic effects. While this author has ingested them several dozen times, the most common result resembled those reported by ALBERT HOFMANN, with his own bioassay of the pure compound ergine: “a sensation of mental emptiness and the unreality and meaninglessness of the outer world, [...] and [...] a not unpleasant physical lassitude, which ultimately led to sleep” (HOFMANN 1980). In a lesser number of cases (true with both morning glory seed ingestion and extracts) an LSD-like effect resulted. Baby Hawaiian woodrose seeds are more effective and reliable than morning glory seeds overall, but this activity can in fact be harmed or lost during the isolation and solvent removal to yield of a gummy residue. I suspect two things: First, that the true psychoptic agent is not present in all “active” morning glory seeds; and second, it is an unstable compound and therefore subject to degradation during extractions and evaporations. Defatting does not seem to be at all important if direct ingestion of the resulting gum is desired, and it may actually introduce a step where a nonchemist can screw up his or her product during the process of drying the material after petrochemical extraction (in preparation for the actual extraction of the ergine). — K. TROUT

## MIND MACHINES

Back in 1988, *Reality Hackers* magazine described various “mind machines” and made them sound interesting. Where can one get these sort of machines, and has anyone used them with entheogens? Thanks for any help you can provide. — ANONYMOUS

One source for the “mind machines” that you mention is TOOLS FOR WELLNESS ([www.toolsforwellness.com](http://www.toolsforwellness.com)). They carry several different devices, but be forewarned that their catalog is a prime example of New Age hucksterism. Shop around though, to compare prices and different models, as these machines tend to be expensive.

When “straight,” mind machines can be useful for a number of purposes, including study and relaxation. A great source for information related to what these machines do and how they can be used in conjunction with entheogens is the book *Into the Void: Exploring Consciousness, Hyperspace and Beyond Using Brain Technology, Psychedelics and Altered Mind-States* by ZOE SEVEN. Descriptions of the functions of many of these machines can be found at [www.zoe7.com](http://www.zoe7.com), as can details on how to order the book. Despite the fact that this book has some pretty “out there” philosophical

speculations, the data presented on mind machines is solid, and the author's first-person reports of various combinations of these with entheogens is fascinating and well worth checking out.

Combined with psychoptic drugs, mind machines can help to create experiences that are amazing in richness and depth. However, the use of a SYNETHIC DSL mind machine left K. TROUT feeling a bit overloaded and washed out after the fact. As well, he noticed that after a year or two of fascination he used the machine much less frequently, due to a learned ability to attain those mind states on the natch that it initially helped to generate. — EDS.

## AYAHUASCA SNUFF DOCUMENTED

After years of odd reports suggesting that *Banisteriopsis* was incorporated into some snuffs, an aspiring anthropology doctoral candidate named ROBIN RODD recently reported both observing and bioassaying Piaroa Venezuelan *Anadenanthera peregrina* snuff prepared from seeds pounded to a paste with fresh shoots of *B. caapi* before kneading with ash and heating to dryness (RODD 2002). Resulting bioassays confirmed earlier reports of an enhanced and prolonged action from tryptamine snuffs when including small amounts of a MAOI (OTT 2001). We look forward to more work in this exciting area. — EDS.

## HOMEGROWN IN BRITAIN?

Magic mushrooms are my favorite. Are there any sources for psilocybian mushroom spores in Great Britain? — P.G., Kent

Yes, although oddly there don't seem to be a lot of vendors there for such. However, you should be able to get spores and related growing equipment from KING BONG (POB 4042, Bournemouth, BH3 7YL, United Kingdom, info@kingbong.com, www.kingbong.com). It is quite possible that other "mom and pop" headshops may also carry such products there as well. — DAVID AARDVARK

## SACRED MUSHROOMS IN THE USA?

We know that there was psilocybian mushroom use in Mexico, but I haven't heard anything about such use in America. Any ideas on whether or not this was going on in the Precolumbian USA? — ANONYMOUS

Images strongly suggesting some sort of mushrooms have been found in burial sites, mounds, and other archaeological excavations in the USA. Various made of stone, copper, or fashioned of wood overlaid with copper, they are generally cataloged as ceremonial items, fetishes or pendants. Their existence raises many questions. A couple of examples found in a cemetery at the mouth of the Wabash (taken from MOOREHEAD 1910) are presented below.

I'd love to see more work done on the association of the coprophilic *Psilocybe* species with ruminants other than cows. Photographs exist on the web at [www.mushroomjohn.com](http://www.mushroomjohn.com) that show several growing on water buffalo dung in Thailand. Reliable reports of their occurrence on horse manure beds in the absence of cattle or cattle manure—from both Victoria and Lubbock, Texas—suggests this is a question begging for some attention. STAFFORD (1992) commented on the failure of attempts to cultivate *P. cubensis* on deer dung. It should be remembered though that deer are not grazers of grassy pastures; they browse on new growth and tender vegetation. In talks, TERENCE MCKENNA claimed that psilocybian mushrooms would only grow on *Bos indicus* dung but it's quite clear that *Bos taurus* also produces dung capable of serving these mushrooms' needs. Preliminary observations in Texas suggest that shredding fields or otherwise adding a layer of grassy material to the mycelial-hopeful matrix (such as feeding herds with hay during winter) may be what enables coprophilic psilocybian mushrooms to spring forth more abundantly than those relying entirely on the scattered microhabitat normally present. This may hold a key to understanding why some fields can be productive while others nearby are not. The hay or grass would provide partially decomposed dung a microhabitat with adequate moisture for a period of several days. (Thanks to MT for bringing this to our attention.) It would be worthwhile to conduct a study at an American bison (*Bison bison*) ranch to learn if its dung is *Psilocybe*-worthy. (Grasses would have been both eaten and trampled by the migrating herds.) If so, the existence of these psilocybian mushrooms prior to the introduction of cattle would become at least plausible.

Or, it could be that the mushroom representations are not of coprophilic species. Either way, they provide tantalizing clues suggesting an overlooked area of Precolumbian study of North America. — K. TROUT

# EVENTS CALENDAR

## EXODUS JANUARY 12–19, 2003

The EXODUS ART, MUSIC, AND CIRCUS FESTIVAL is a psychedelic journey set in the highland forests of Australia. The event includes a healing village, circus performances, movies, videos, a local aboriginal camp, ethnobotanical exhibition and conference, an alternative youth space, kids activities, chill spaces, workshops, RAVESAFE and first aid spaces, markets, and food stalls. Focused on entheogens is the Intra Cortex Psychedelic Circus, with panel discussions on "Australia—Entheogenic Wonderland," "Psychedelic Deep Ecology," "The Initiatory Path," "Doof Culture," and "Safe Models and Spaces." Tickets are \$130.00 AUS. For more information, see [www.happypeopleproductions.com/Exodus](http://www.happypeopleproductions.com/Exodus).

## WASIWASKA FEBRUARY 9–18, 2003

WASIWASKA RESEARCH CENTER FOR THE STUDY OF PSYCHOINTEGRATOR PLANTS, VISIONARY ART, AND CONSCIOUSNESS presents Experiential and Theoretical International Symposia in the Brazilian Amazon. Featuring four ayahuasca and two breathwork sessions; literary, artistic, and musical expressions of inner experiences (workshops); body work, yoga, and excursions into the rain forest; and lectures by RICK HARLOW, LUIS EDUARDO LUNA, DENNIS MCKENNA, STEVEN WHITE, and MICHAEL WINKELMAN. For more information, see [www.wasiwaska.org](http://www.wasiwaska.org).

## AYAHUASCA HEALING RETREAT

*Drifts Angel* by Robert Venosa

JANUARY 20–30, 2003

There will be lectures, four ceremonies with *ayahuasca* and two with *Salvia divinorum*, group sharing, artwork expression, transpersonal exercises, and excursions. Spend ten days in the Amazon forest. Located 1.5 hours from Manaus, Brazil, the lodge has excellent facilities, phone, Internet, air conditioning, a swimming pool, and rooms with private bathrooms. Contact: [silviap@house.com.ar](mailto:silviap@house.com.ar).

### STAFF:

- ✧ David Icke, author and lecturer
- ✧ Zoe Seven, techno-shaman
- ✧ Silvia Polivoy, transpersonal psychologist
- ✧ Isabela Hartz, visionary artist

**http://acetech.netfirms.com**

ACE TECH sells a "Magic Mushroom Test Kit" (\$45.00), which can be used to check for the presence of tryptamines in plant, animal, and fungal matter. Psilocybin, psilocin, DMT, lysergic acid molecules, auxins, and any other molecule that contains the indole ring will test as "positive" if they are present. Unfortunately, it can't specifically note what indoles are present, and other indoles that might not be too interesting such as serotonin would also test positive. So this might be useful as a general field test—presuming that it can be used as a field test—when mushroom hunting in the wild, but other identification methods should be used in conjunction with it. There is no indication that I could see on their web site as to how many tests it can perform per kit. There was also a curious lack of information in other areas. For instance, there appeared to be no indication of what specific test is being used or how it is to be performed—neither is a small omission. Many indole-sensitive reagents cross-react with a wide variety of compounds including non-indolics, which can lead to false positives. While I applaud the commercial availability of test kits, I feel that customers should be provided with more information about what the kits actually do. Only rarely can such test kits be performed without potential exposure to strong acids or other chemicals. Tests such as those used by professionals in field testing are often unsuited for amateur use. While the convenience of a prepared test for indoles would be great, I suspect that all customers would want to know what they are buying. ACE TECH didn't respond to an e-mail asking about their tests.

ACE TECH also sells: herb dryers/desiccators (a small one is \$10.00, a medium one is \$20.00, and a large one is \$30.00), spore prints for *Psilocybe azurescens* (\$45.00) and *P. cubensis* (\$30.00), *Papaver somniferum* seeds (\$10.00/100 grams), safrole (\$50.00/100 ml), and red phosphorus (\$100.00/10 grams). Add \$6.00 to any order for S&H charges.

Chemicals such as safrole and red phosphorus are used in the production of MDMA and/or methamphetamine. It seems a little bit dicey that they are being offered through a company such as this, alongside opium poppy seeds and mushroom spores. I think that I would steer clear of this company altogether, despite their possibly useful test kit.

**ALKEMISTS PHARMACEUTICALS, INC.**  
**1260 Logan Avenue, B-3**  
**Costa Mesa, CA 92626**  
**(714) 754-4372**  
**(714) 668-9972**  
**phytolab@alkemist.com**  
**www.alkemist.com**

"Alkemists Pharmaceuticals offers a unique analytical approach that combines Microscopy with Digital Photo-Documentation and analytical chemistry techniques, depending upon the sample being analyzed for the proper identification, characterization and/or content determination of botanical samples. Our specialty is the systematic identification and evaluation of botanicals and their marker compounds for quality control, utilizing Digital Photo-Microscopy (DPM) and High Performance Thin-Layer Chromatography (HPTLC) and/or High Performance Liquid Chromatography (HPLC)."

It is a goal of ALKEMISTS PHARMACEUTICALS to compile a detailed reference compendium of ethnobotanicals. They have been working with BOTANICAL DIMENSIONS and other interested parties, and hope to in the future publish an ethnobotanical monograph that presents some of their findings. They are looking for "novel, usual, or unusual plant suspects that are either known or suspected to be of ethnobotanic significance, that [they] can analyze and catalog microscopically as well as chromatographically 'fingerprint' and/or quantify for some known active constituent." They need a dry sample anywhere from 1 gram to 10 grams minimum, and 25 to 50 grams is ideal. (If sending a fresh sample, it must be sent in such a manner that allows it to arrive without rotting.) They ask to be notified before a sample is sent, so that they will be

sure (when possible) to have an authentic sample on hand for comparison purposes.

For individuals or companies who wish to discover just what some plant they have contains and how much it contains, prices for quantitative analysis by HPTLC with scanning densitometry are \$200.00 (one sample), \$185.00 each (2–5 samples), \$175.00 each (6–10 samples), and \$150.00 each (11+ samples). Or if you are interested in finding out if you have the plant you think you have, then simply doing a qualitative analysis with either microscopy or HPTLC could be your guarantee you have the right plant or extract. The prices for these analyses are \$125.00 (one sample), \$120.00 each (2–5 samples), \$110.00 each (6–10 samples), and \$100.00 each (11+ samples). It strikes me that working with ALKEMISTS PHARMACEUTICALS may be a good way to gather some data on lesser-known plants where legally possible, particularly those of obscure chemistry.

**artvisionary@optusnet.com.au**

**www.artvisionary.com**

A sporadically-produced art magazine that occasionally deals with artists influenced by psychedelics. A limited number of the first two issues are available from the address listed. The third issue is recently on the newsstands for \$10.50 (USA), and it features art from ERNST FUCHS, ALEX GREY, PHILIP RUBINOV-JACOBSON, and others. A two-issue subscription is available direct; postpaid rates in Australian dollars are \$18.00 in Australia or \$27.00 from any other country. Funds must be paid in Australian currency. Definitely get a subscription to this.

#### **BLUELIGHT**

**www.bluelight.nu**

A drug information and harm reduction web site. With a focus on MDMA/Ecstasy, BLUELIGHT claims to offer “a middle road between the myths and rumours of street level drug culture, and the often impenetrable jargon of more scientifically rigorous sites.” Strangely, their catch phrase is:

“THERE IS NO SUCH THING AS ‘SAFE’ DRUG USE!” (Yes, in all caps.) This is a totally absurd remark, which certainly doesn’t reflect a middle-of-the-road attitude. People use licit and illicit drugs on a daily basis in safe and effective ways.

Clicking on the FAQs link in their “Forums” box, the first post to the site that I checked out was a document on MDMA titled *A Rough Guide to Ecstasy*. It states that “Hallucinating whilst on MDMA is not uncommon especially with higher doses, this can include open eye visuals (oev’s) and closed eye visuals (cev’s).” While MDMA does cause some perceptual changes, I have never heard of anyone aside from the misinformed mass media who would term these changes “hallucinations.” Also in this document, when discussing the possibility that street Ecstasy is tainted with heroin or cocaine, they state “neither heroin or cocaine are orally active in the amounts that you would find in pills,” which is also absurd, since 100 mg of heroin taken orally would have an effect similar to 500 mg of codeine, and cocaine taken orally at 100 mg would also certainly be active. 100 mg would easily fit in a pill—hell, the ibuprofen pills in my medicine cabinet contain 800 mg! This *Guide* states that MDA is “more speedy” than MDMA, another comment that hardly seems right.

While one certainly can’t judge a whole web site on the content of one document posted to it, and while the above-described *Guide* does indeed have some good information in it, it also exemplifies the fact that entirely reliable information can be quite difficult to come by on the web. BLUELIGHT seems to be largely made up of forums, where the people asking and answering questions really don’t have a great deal of knowledge on the topics that they are discussing. For this reason, the effectiveness of this site to impart truly useful harm reduction data seems to be a bit limited. The site is not entirely useless though; it provides a good—albeit somewhat scary—sense of the generally low knowledge level of some of the people who use illicit drugs. And BLUELIGHT’s home page frequently has links to the latest mainstream media articles on the topic of illicit drugs (which also may be riddled with errors, of course).

**FRESH HEADIES****POB 474****Lions Bay****B.C., V0N-2E0****CANADA****(866) 635-8464****freshheadies@hotmail.com****www.bubblebag.com**

Producers of the ice-water hash preparation system called the “bubblebag.” This system allows one to produce a high-grade hash from a low-grade or non-saleable leaf and bud. It uses ice and ice-cold water to harden and detach the trichomes from the leaf, and then a system of bag screens to create different grades of hash with the highest grade being pure trichomes. The process is relatively simple and only takes just over an hour to complete, so it is much more efficient than using screen boxes, particularly if large quantities are being prepared. They sell a 1-gallon six-bag kit for \$110.00, a 5-gallon three-bag kit for \$15.00, a 5-gallon six-bag kit for \$220.00, a 20-gallon four-bag kit for \$380.00 and a 20-gallon six-bag kit for \$460.00. (The more bags used, the higher quality of product that can be obtained.) I suspect that the bubblebag will become a standard contraption in the future used by most commercial and personal growers, to produce quality from quantity.

**JUXTAPOZ****POB 884570****San Francisco, CA 94188-4570****(888) 520-9099****anna@hsproductions.com****www.juxtapoz.com**

My absolute all-time favorite magazine, *Juxtapoz* contains articles, interviews, and tons of cutting edge art. “Low Brow” is the self-described style (tattoos, tikis, hot-rods, mud-flap chicks), but there is a lot of variety and non-mainstream art contained herein (chalk art/fantastic realism, for example, in one recent issue), and they occasionally dabble in psychedelia with artists like ALEX GREY, MATI KLARWEIN, STANLEY MOUSE, and others featured.

Edited by ROBERT WILLIAMS, *Juxtapoz* comes out six times a year and is a mere \$13.95 via crappy mail (which means that your issue is likely to arrive having been thumbed by every postal employee whose hands it passes through, with bent pages and wrinkled covers) or \$27.00 sent in a first-class envelope. Having been too cheap to splurge on the more

expensive mailing cost, I now find myself wanting to reorder every issue that I have gotten, to have some pristine “back up” copies of this inspiring publication. Canadians should send \$25.00, and folks from other foreign countries should send them \$30.00 (in USA funds only). I’d recommend ordering this via the phone rather than their web site, which seems a bit glitchy—when I recently attempted to place a gift order for one year sent first-class, the interface wouldn’t allow me to enter in a separate shipping address and for God knows what reason it charged me \$40.81! (They made things right when I griped though.) Crappy web interface aside, the rag rocks. When *Juxtapoz* comes in the mail, I always stop whatever I’m doing and crack it open immediately; it’s drugs for your eyes, baby.

**HYDROFLOW****3649 SE Yamhill Street****Portland, OR 97214****(866) 862-GROW****(503) 230-0899****info@hydroflow8000.com****www.hydroflow8000.com**

“Hydroflow digital timers make it possible for you to explore the numerous combinations of light/dark cycles that are not feasible with traditional 24 hour timers. Making adjustments to the number of hours in your plants’ day can lend to amazing results. By breaking away from the standard 12 on/12 off boundaries, you can be free to experiment with any multitude of light/dark cycles without being restricted to a 24 hour day. You can blast your plants with 18 hours of light and 12 hours of dark to increase harvest by up to 20%, or shorten the cycle to 6 on 12 off and harvest up to 25% faster with 50% less electricity use. Go with the model that best fits your needs—2000, 4000, or even 8000 watts, all controlled by one unit. And now all models come equipped with two auxiliary outlets that will automatically turn on when the lights turn off. This means you can run fans, air conditioning, or whatever you need on when the lights are off.”

Although I don’t know anyone who has used these timers, the idea of increasing one’s daylight hours to 18, while keeping the night hours at 12, strikes me as a brilliant way to increase one’s yield by making bigger flowers. Kudos to the folks at HYDROFLOW for coming up with this device. Prices for 120 VAC timers are \$165.95 for the 2000 watt version, \$191.95 for the 4000 watt version, and \$245.00 for the dual 4000 watt version. The 4000 watt and dual 4000 watt models are also

available in 240 VAC versions, at slightly higher prices. I suspect that these timers would be a wise investment.

#### **LSD BLOTTER ART**

**438 East 1700 South #3  
Salt Lake City, UT 84115  
lsdblotterart@hotmail.com  
www.lsdblotterart.com**

A vendor of contemporary blotter acid art. Although they don't sell vintage blotter, they do sometimes offer reprints of vintage stuff and they can also put serious collectors in touch with sellers of the old hits. Their web site has galleries for TIMOTHY LEARY, the GRATEFUL DEAD, ALEX GREY, and miscellaneous others (including some prints signed by the artists or by psychedelic noteworthies). They also have a couple of "contributor showcases" where one can view blotter art that is in private collections and not for sale through the site. And they even offer some smaller sized prints, for the budget collector. Prices range from a mere \$6.00 for the smaller prints (3 7/8 inches square) to \$300.00 for the *Alice in Wonderland* "Mad Hatter" design signed by KEN KESEY. Quite a number of full-sized sheets sell for around \$20.00 to \$35.00, and it strikes me that these might be good for a collector of such ephemera to take to some future conference where members of the psychedelic illuminati might be speaking and get them signed, since this clearly increases their value dramatically.

#### **PEACE ROCK POSTERS**

**PMB 25C  
6346-65 Lantana Road  
Lake Worth FL 33463

info@peacerock.com  
www.peacerock.com**

PEACE ROCK offers a large selection of rock posters and handbills from the 1960s and 1970s. They sell only original vintage items—FILLMORE posters, FAMILY DOG posters, black light posters, handbills, various ephemera, and more. Prices range from \$25.00 for a mint-condition 1967 *Berkeley Bonaparte Acid Man* poster, to \$6000.00 for a reprint *Acid Test* poster, hand-colored and designed by KEN KESEY and other members of the original MERRY PRANKSTERS.

#### **POLLINATOR COMPANY**

**Nieuwe Herengracht 25  
1011 RL  
AMSTERDAM  
00 31 20 4708889  
00 31 20 4715242 FAX  
info@pollinator.nl  
www.pollinator.nl**

Another vendor of ice-water hash-making bags, these guys sell the "Ice-O-Lator" in various sized models, ranging in price from 40.00 to 180.00 euros. They also offer hash presses, smoking accessories, *Cannabis* seeds, grow supplies, manicuring tools, books, psilocybian mushroom kits, spore syringes/prints, and more.

#### **QUALITY HEALTH, INC.**

**401 Langham House  
29-30 Margaret Street

sales@qhi.co.uk  
www.qhi.co.uk**

QUALITY HEALTH, INC. is a supplier of smart drugs, anti-aging drugs, hormones, amino acids, herbal and other supplements, and other pharmaceuticals. Products offered include: Ampamet (aniracetam), cat's claw, choline, chromium picolinate, Desmopressin (DDAVP), DHEA, Diphantoine (phenytoin), Ester-C formula, GH3 (Original Aslan Formula), ginkgo biloba extract, Glucophage (metformin hydrochloride), glucosamine sulfate, grape seed extract, Hydergine (ergoloid mesylates), Hydergine FAS, Inderal (propranolol), Intellectol (vinpocetine), Jumex (deprenyl), kava-kava complex, L-arginine, lecithin (61% phosphatides), L-glutamine, L-lysine, Loniten (oral minoxidil), L-tryptophan, melatonin, Mnesis (idebenone), Neupramir (pramiracetam), Olmifon (adrafinil), Parlodel (bromocriptine), Premarin (conjugated estrogens), Pro-gynova (estradiol valerate), Proscar (finasteride), Provigil (modafinil), Reminyl (galantamine), Retin A Cream, SAMYR (pharmaceutical SAMe), saw palmetto extract, selenium, Sermion (nicergoline), St. John's wort, UCB Nootropil (piracetam), yohimbine hydrochloride, and zinc picolinate.

**RAC RESEARCH, INC.**  
**POB 630306**  
**Bronx, NY 10463**  
**contactus@racresearch.com**  
**www.racresearch.com**

A relatively new research chemical supply company. Although similar companies largely seem to be scam operations these days, I have actually heard from one correspondent who has placed and received three orders from RAC RESEARCH, and been happy about this company's service and product quality. Their products are sold in gram quantities, and they carry 5-MeO-DIPT (\$185.00), 5-MeO-DMT (\$210.00), AMT (\$120.00), 5-MeO-AMT (\$270.00), DPT (\$185.00), and dextromethorphan (\$20.00). I'd be interested in hearing any more feedback from folks who might place orders through RAC RESEARCH.

**RALPHSTER'S SPORES**  
**POB 1667**  
**Nampa, ID 83653-1667**  
**ralphrw@cableone.net**  
**http://RalphstersSpores.com**

A new company selling spore prints and spore syringes for *Psilocybe cubensis*, *P. cyanescens*, *P. samuiensis*, and *Panaeolus cambodiginiensis*. Their prices look competitive. They also sell various substrates and a mushroom grow system called the HYDRA-POD™, which looks like a great product for small-scale growers.

**RED ANGELS**  
**Mars Antrim**  
**POB 951**  
**Lakeport, CA 95453-951**  
**redangels@mail.com**  
**http://fly.to/redangels**

Producers of the *Secrets of Soma* (\$29.95) video documentary of an *Amanita muscaria* picking and preparation session, the husband and wife team of REX and VENUS has been using *A. muscaria* mushrooms for over 20 years, frequently on a daily basis. REX stated that he stopped counting after 5000 ingestions.

Although the video is an amateur production, it does a good job depicting the fact that the couple is dedicated and sincere in their devotion to *Amanita muscaria*. It kicks off with

REX chewing big bites from a huge *A. muscaria*, and there are numerous scenes throughout of him eating more. They mention that it is good to consume doses gradually over a period of time. They explain the preparation of a "stew/tea," and provide tips on freezing, drying, and storing mushrooms. They relate the fact that their kids were born while VENUS was on *A. muscaria*, which she states "eases the pain in childbirth." REX opines that the belief that one must fast before consumption is a myth, although such behavior will cause the mushrooms to come on a bit quicker and stronger. He also claims that the mushrooms have an appetite suppressant quality. There is the presentation that "all dried mushrooms represent a lessened potency," and they note that dehydrating can cut the potency by 60% to 80%, while "solar dried" mushrooms might be cut in potency by 40%. Nowhere is the idea mentioned that drying or cooking the mushrooms might decarboxylate ibotenic acid to muscimol (possibly reducing side-effects). Indeed, there is no mention made at all of the negative effects that many people get from eating these mushrooms. On the practice of drinking urine, VENUS states: "Once recycled through the body, it becomes a waste by-product and takes on an impure vibration. We do not recommend using *soma* in this manner, because it negates the spiritual essence of God. This method is SATAN's sacrament, the Devil's brew."

Although they caution that one shouldn't eat white, yellow, or brown Amanitas unless an expert has identified them, they go on to mention that REX did consume a white *Amanita* that his son had found for him. They then state that non-red Amanitas can produce a visionary/spiritual effect where it seems as though one is operating at "higher speeds." There is unfortunately no explicit discussion of the fact that some Amanitas, such as the white or greenish *Amanita phalloides*, are deadly due to completely different chemistry.

The video is peppered with spiritual ramblings and references to the *Rig Veda*. REX waxes enthusiastic about the experience of God-energy that *Amanita muscaria* can produce. Overall, while it was interesting to see folks who have such a strong allegiance to the use of this mushroom, I was disappointed that they didn't include more specific descriptions of the effects that they got from their use. The video could have presented more hard data and it would have benefited from a section where the couple was interviewed by someone knowledgeable in the fields of ethnomycology and entheobotany, in order to tease out more detailed information about how the mushroom had enhanced their lives.

**SHAMANS OF THE AMAZON****POB 111****Suffolk Park, 2481, NSW****AUSTRALIA****dean@shamansoftheamazon.com****www.shamansoftheamazon.com**

*Shamans of the Amazon* is a documentary by independent Australian filmmaker DEAN JEFFERYS. The movie features one of the final interviews conducted with TERENCE MCKENNA before his death, as well as an interview with YATRA DE SILVEIRA BARBOSA regarding the legal situation surrounding ayahuasca use in the Netherlands. Also featured are two shamans from Ecuador, ENRIQUE and RAPHAEL, as well as the art of PABLO AMARINGO and ALEX GREY. JEFFERYS' film is a personal account of his return to the Amazon with his pregnant partner and their one-year-old daughter. (As a relatively new parent myself, it seemed quite bold that JEFFERYS brought his young child into the somewhat harsh conditions of the Amazon, until I considered that children have been growing up there for years.) Of course, the ayahuasca ceremony is part of what is covered, and one ayahuasca shaman had some interesting and on-target medical advice for JEFFERYS and his partner. One thing that struck me was how angry a young shaman was with the affect that the USA and corporate interests were having on his native land. Truly we have to be more aware of what is going on in the name of big business/government, and JEFFERYS' film does an excellent job of helping the viewer to comprehend this reality.

There is a QUICKTIME preview of the movie available at the web site, and you can purchase the video for \$25.00. JEFFERYS also produced the film *Amazon: The Invisible People*, which is available in video format from the web site for \$15.00, (or order both for \$35.00). Add \$15.00 (Australian) for S&H (international). JEFFERYS hosts an e-mail list, and a newsletter about ayahuasca, DMT, and neo-shamanism. You can also read about his tours, coming events, and some reviews at his web site, as well as check out a few links.

**SPEAKING PLANTS BOTANICALS****POB 36084****Dallas, TX 75235-1084****sales@speakingplants.com****www.speakingplants.com**

SPEAKING PLANTS BOTANICALS is a fairly new botanical supply company that has a good variety of offerings. Due to a recent court case against another such vendor—ALAN SHOEMAKER

of <http://chinchilejo.yage.net>—who was busted for importing a dried herb that contains DMT (see pages 130–132 of this *ER* for details)—SPEAKING PLANTS has indefinitely discontinued their sale of *Anadenanthera colubrina*, *Desmanthus illinoensis*, *D. leptolobus*, *Diplopterys cabrerana*, *Mimosa tenuiflora*, *Psychotria viridis*, and *Virola* sp. This is interesting from the point of view that a specialty botanical company has voluntarily stopped selling dried herbs that are not specifically scheduled and hence would seem to be legal. The case against SHOEMAKER clearly has them concerned that the law against “mixtures” that contain scheduled compounds could be interpreted to include natural plants that are not currently scheduled. And it is obvious that SHOEMAKER has to go through the hassle, expense, and stress of a trial (which in itself may be enough to cause one to avoid selling these herbs until some more concrete decision is reached related to this law). Nevertheless, it seems odd that SPEAKING PLANTS would have only discontinued their DMT-containing herbs, and not discontinued the herbs that they sell which contain other scheduled compounds (such as ergine, cathinone/cathine, and mescaline). Surely if SHOEMAKER is convicted for importing a dried herb that is not specifically scheduled but which contains a scheduled compound, this ruling could be applied across the board to *any* dried herb that contains a scheduled compound. One might still be able to argue that any such live plant that contains a scheduled compound is being grown solely for ornamental/horticultural purposes. But the days of easy access via numerous entheobotanical vendors may be numbered, particularly if they on their own become concerned enough about potential legal ramifications to stop selling those plants that contain controlled substances.

SPEAKING PLANTS carries: *Acorus calamus*, *Agave lilieaceae*, *Amanita muscaria*, *Argemone chicolote*, *A. mexicana*, *A. polyanthemus*, *Areca catechu*, *Argyrea nervosa*, *Ariocarpus fissuratus*, *Artemisia absinthium*, *A. compositeae*, *Arundo donax*, *Banisteriopsis caapi*, *Brugmansia arborea*, *Calea zacatechichi*, *Carnegia gigantea*, *Catha edulis*, *Coffea arabica*, *Cola nitida*, *Coryphantha macromeris*, *C. vivipara*, *Datura inoxia*, *Echinocereus coccineus*, *E. neomexicanus*, *E. triglochidiatus*, *Ephedra equisetina*, *E. sinica*, *Eschscholzia californica*, *Heimia salicifolia*, *Humulus lupulus*, *Ipomoea tricolor*, *I. violacea*, *Lactuca virosa*, *Leonotis leonurus*, *Leonurus sibiricus*, *Lophophora decipiens*, *Marrubium vulgare*, *Mimosa pudica*, *Mirabilis multiflora*, *Nepeta cataria*, *Nymphaea caerulea*, *Papaver nudicaule*, *P. somniferum*, *Paullinia cupana*, *Pausinystalia yohimbe*, *Peganum harmala*, *Piper methysticum*, *Sassafras albidium*, *Scelletium tortuosum*, *Stipa robusta*, *Trichocereus*

*pachanoi*, *T. peruvianus*, *T. terscheckii*, *Turnera diffusa*, *Verbascum thapsus*, *Voacanga africana*, and a number of other plants and plant products. They also offer books, journals, videos, incense, smoking blends, psilocybian mushroom spore syringes, and more.

SPEAKING PLANTS sell a kilo of *Salvia divinorum* for \$250.00, which is among the lowest prices that I have seen offered. For those who are unaware, federal bill HR 5607, introduced on October 10, 2001, seeks to schedule *S. divinorum* and salvinorin A. People looking to stock up on this plant while it is still legal may wish to order from SPEAKING PLANTS.

### WEED WORLD

POB 1332

www.weedworld.co.uk

*Weed World* is the United Kingdom's answer to *High Times*. Although a professionally-produced full-color glossy rag, it has a more laid-back attitude than *HT* does. Casual first person yarns weave through the pages, along with news (both local and worldwide), product reviews, recipes, legal updates, reader letters, comics, music reviews, grow tips, interviews, and more. I like to occasionally check in with *Weed World* to see what the state of affairs is in England and other parts of Europe. The most recent copy I picked up was issue #40, which caused me to realize that they have been publishing for quite a few years now. I decided to try and dig up the first copy of this that I had seen, and couldn't find it—so I thought. What I found was titled *A World of Drugs* No. 2, and yet it looked suspiciously similar. Not full color, but there was that word "world," and it was produced in the UK... Checking their web site, I learned that *A World of Drugs* was their predecessor, first published in 1991.

In issue #40 of *Weed World* I noticed a couple of photos of buds with the fan leaves drying but not yet trimmed—something that one would never see these days in the highly manicured pages of *High Times*! And it reminded me of the old days, when *HT* actually did show naturalistic shots such as this, which weren't pumped with glowing blue backlighting or scantily clad smoker-models. Yes, *Weed World* is a little more relaxed... something that bespeaks the topic at hand.

*Weed World* comes out six times a year, and it runs about \$6.00 at the newsstands in the USA. One can subscribe in the UK for a year by sending them £18.00, or in Europe for £22.00, or in the USA for \$32.35 (USA funds) or in Canada for \$43.15 (Canadian funds). For UK or European subscriptions, send payment to the address listed above. For USA subscriptions, send payment to: DIRECTMAG, POB 2165, Williamsville, NY 14231. For Canadian subscriptions, send payment to: DIRECTMAG, 695 Westney Road South, STE. 14, Ajax, Ontario, L1S 6M9. North American orders can also pay with a credit card via the toll free number listed above.

## KRATOM

I've frequently gotten questions asking where people can purchase *Mitragyna speciosa* (*kratom*). In the past, I was only aware of SHAMAN AUSTRALIS selling tissue-cultures, and BASEMENT SHAMAN selling plants. However, the situation is slowly improving. For live plants, we can now add NATIVE HABITAT [POB 644023, Vero Beach, FL 32964, (561) 778-8361, Lee@NativeHabitat.com, www.nativehabitat.com] into the fray. They have plants for \$45.00, dried leaf for \$40.00 per ounce, and fresh leaves for \$25.00 per ounce. Interestingly, while the plant is traditionally used for its stimulant/opiate-like effects, the NATIVE HABITAT web site remarks, "It does nothing for us...can somebody tell me what we are doing wrong?" I have heard from others who have tried the dried leaves of the plant from various sources and gotten only mild or no effects, and I have also heard from one person who used to get effects from a batch of these leaves but they simply stopped working for him at one point, to his dismay. It's hard to say what is going on. New vendors of dried leaves include PURE LAND ETHNOBOTANICALS [2701 University Avenue, PMB 463, Madison, WI 53705-3700, info@ethnobotanicals.com, www.ethnobotanicals.com], who offer 10 grams for \$25.00, 25 grams for \$52.00, and 100 grams for \$160.00, and ETHNOGARDEN [POB 27048, Barrie Ont., L4M 6K4, Canada, ethnogarden@sympatico.ca, http://ethnogarden.com] who offer (in Canadian dollars) 28 grams for \$47.00 (about US \$30.00), 56 grams for \$86.00 (about US \$55.00), 112 grams for \$160.00 (about US \$102.00), and 455 grams for \$575.00 (about US \$365.00), and also sell packets of about 100 seeds (of unknown viability) for \$15.00 (about US \$9.50). I've heard that they have plans to stock a full-spectrum alkaloid free-base of *kratom* as well. HERBAL-SHAMAN [POB 8892, Wichita, KS 67208, (877) 685-9199, www.herbal-shaman.com] will soon also be stocking dried leaf.

# BOOK REVIEWS

*Pharmako/Dynamis: Stimulating Plants, Potions & Herbcraft—Excitantia and Empathogenica* by DALE PENDELL. 2002. (MERCURY HOUSE, POB 192850, San Francisco, CA 94119-8250, www.mercuryhouse.org), ISBN 1-56279-125-7 [7" X 9.25" paperback, \$21.95]. 294 pp., black-and-white illustrations throughout, with index.

I'm a sucker for the "references" section in a book of scholarly design; I thrive on information—the more relevant, the better. If it moves further into the realm of cross-references, I am on my knees with delight. There are enough cross-references in *Pharmako/Dynamis* to enthral me. The book is a cornucopia of arcane his/herstories of plants and their effects on human civilization. Information swims through these pages—information untold and unrevealed, except for the most curious amongst the connoisseurs of plant inebriants. Information to get lost in... information to find yourself in... information that reveals secrets... information to set a course for distant shores with...

You can literally open up this book's pages anywhere and be on your feet with the text. I did not read it in the traditional sense the first time around, but scouted through the references, scooted over to the relevant chapter, read a bit here, read a bit there, then delved into the chapter in toto. Mr. PENDELL suggests that you read it in any manner that you like, and I found my "random access" approach to be a rewarding exercise.

**EXCITANTIA:** The book starts out with some of the more familiar inebriants—coffee, tea, and chocolate. PENDELL traces the history of each from their regional points of origin, and then delineates the preparation, the chemical constituents, and the social impact, from native populations to the world at large. Along the way you discover that these plants aren't so familiar as one assumes. As one's knowledge of the plants' history grows, the attraction to use them becomes all the

more engaging. (Or are *they* using us in their agenda?) This section includes other less known plants and one infamous alchemical concoction: *betel*, *guarana*, *kola*, Ma Huang (*Ephedra sinica*), *qat*, *coca*, and even amphetamines are covered. The information on these runs from short to quite extensive.

I especially appreciated the chapter on guarana, which I used extensively in the early- and mid-'90s. Because of this familiarity, I felt that the chapter devoted to it could have been longer, but I loved what was there.

The chapter on *Erythroxylum coca* is also well presented. Even though I was more familiar with this subject—due to the massive amounts of press it has received over the years—what made this chapter work for me was the poetic approach and reverential feel to the phrasings and pacing found there. It is a beautiful piece of work that restored the respect *coca* had lost in my personal pantheon of plants.

The Ma Huang chapter is absolutely fascinating, presenting elements of history and myth to suggest that *Ephedra sinica* may be the source of the *soma* of the *Rig Veda*. While this theory is in direct contention with R. GORDON WASSON's popular proposition that *soma* was *Amanita muscaria*, whether or not you end up agreeing isn't the issue here. Rather, the ride that PENDELL takes one on while tracing this subject is a delight unto itself.

**EMPATHOGENICA:** This section covers nutmeg (*Myristica fragrans*), MDMA, and GHB. The section on nutmeg brought me back to an earlier part of my life—a time when "tripping" took on some interesting forms. Known for its use in correctional institutions and by kids who couldn't score, I never tried nutmeg myself, but I knew many who did. It sounded like an intense body load fraught with some peril, but nonetheless it was there for those who needed it. This chapter covers some of the spice wars history: from the Arabs

importing to the Venetians (who ran the whole ball of wax through the Renaissance until the Portuguese sailed into the picture), to the Dutch and English tangling over control of spices coming from the far east and the spice islands into Europe.

The MDMA chapter is exhilarating and exciting. The accompanying whirlwind of images pulses through it at 180 bpm. PENDELL ends this section with a paean of devotion.

One of the main elements that attracts me to PENDELL's writing is his mastery of the poetic aside. Nuanced yet explicit, he evokes the muse so well that one finds it entangled in all of his writing, even the technical aspects. Yet for myself, the most satisfying parts are the explicitly poetic—those that captivate with the small flip of a word, placed just so. Poetry is an ancient key to deeper realms; PENDELL knows this and exploits it to everyone's benefit. He has honed his craft well, to the delight of this reader. If you pick *Pharmako/Dynamis* up in a store, go to these sections first. Of special note are the "Wandering and the Vision Quest" and "Dream Stutters" chapters, as well as the shorter pieces entitled "Hecate's Garden" and "Nigredo: A Turn of Darkening." These are worth the price of admission. I have read them repeatedly, and gained from doing so.

Though the layout of *Pharmako/Dynamis* is similar to its predecessor *Pharmako/Poeia*, they are truly separate works. Yes, the theme is carried on, but the impact and much of the transmission is different. Both books stand firmly on their own. The impact of *Pharmako/Dynamis* is very much in league with *The Botany of Desire* by MICHAEL POLLAN, but with added gifts. After reading these works, you begin to look at plants in a far different way. We are inculcated to think that we have dominion over the flora and fauna, but do we? After reading POLLAN and PENDELL, I am not so certain. If you follow the underlying logic of both books, you may come to the conclusion that we have been doing the bidding of the plant world, albeit unconsciously. *Pharmako/Dynamis* a welcome edition to my library. I believe that most readers of *The Entheogen Review* would share in this assessment.

— GWYLLM LLWYDD

*Shamanic Snuffs or Entheogenic Errhines* by JONATHAN OTT. 2001. (ENTHEOBOTANICA, Kronengasse 11, CH-4502 Solothurn, Switzerland, info@nachtschatten.ch, www.nachtschatten.ch), ISBN 1-888755-02-4 [6.25" X 9.25" limited edition of 1026 copies, hand-bound in leather, with cloth-bound slipcase, signed and numbered, \$100.00]. 160 pp., 1 color and 11 black-and-white illustrations, with index.

My first impression of this book was the smell of its leather cover—gorgeous, and quite appropriate that a book on snuffs would engage the reader in such a manner. Indeed, the slipcase, the binding, the luxurious paper (which contributed its own crisp smell), the line drawings by ELMER W. SMITH, the excellent typography, and even a woven burgundy place-holding ribbon, all make this offering a class act and the most beautifully-produced book that OTT has published to date. Indeed, I suspect that it is the most beautifully-produced book in my entire library. Although the price is high, this limited edition is certainly a quality presentation.

The book's introduction—nay "Inspiration"—kicks off with a description of snuff use from COLUMBUS and explains that, while current fashion is to smoke tobacco, in the past, snuffing it was more prevalent. OTT points out in the context of visionary tryptamines, that it was the snuffs that *led* to an understanding of the proposed "ayahuasca effect"—something that has been given much more focus in recent years. As well, he notes: "[I]t would scarcely be fair of me to approach the subject of the shamanic snuffs whilst religiously keeping my nose clean, so to speak. Accordingly, punctuated by sniting and perfunctory emunctories, I have placed my proboscis at the service of pharmacology, exploiting one area of my anatomy at least, in which I can justifiably claim to be better-endowed than most! The long and the short of it is that I've embarked yet again upon an ambitious program of psychonautic bioassays..." And it just gets better and better from that point, with OTT's unique brand of humorous prose shining a piercingly clear light through the darkness, like RUDOLPH'S nose on Christmas Eve.

The first three chapters of *Snuffs* are historical accounts, relating the traditional ethnobotany and the chemistry of *Anadenanthera* snuffs, *Virola* snuffs, and *Nicotiana* snuffs, over hundreds of years of use. The proliferation of ethnographic terms and data-dense writing style can make these chapters a bit hard to read. Nevertheless, they are goldmines of information, relating countless specifics regarding the active plants, sundry additives to the snuffs, who took them, how they took them, when they took them, and more.

Easier reading is found within the fourth chapter, “Lesser-Known Snuff Sources,” which provides quick glimpses into numerous other plants that have at one time or another been consumed through the nose. Tidbits are presented related to *Acoanthera oppositifolia*, *Acorus calamus*, *Anacyclus pyrethrum*, *Annona senegalensis*, *Arctostaphylos uva-ursi*, *Artemisia* sp., *Asparagus africanus*, *Banisteriopsis caapi*, *Cannabis* sp., *Capsicum* sp., *Datura* sp., *Dimorphandra parviflora*, *Erythroxylum coca*, *Fomes fomentarius*, *Ilex guayusa*, *Ipomoea* sp., *Justica pectoralis*, *Maquira sclerophylla*, *Pagamea macrophylla*, *Piper* sp., *Salvia* sp., *Securidaca longipedunculata*, *Senecio* sp., *Suaeda aegyptiaca*, *Tagetes* sp., *Tanacetium nocturnum*, *Terminalia splendida*, *Tinospora bakis*, *Trichocereus pachanoi*, *Tricholine* sp., *Veratrum californicum*, and *Zanthoxylum zanthoxyloides*. OTT also describes plants that have been traditionally used as hound- and horse-snuffs—a “visionary veterinary vademecum.”

I suspect that the primary reason that most contemporary psychonauts will want to obtain this book, however, is to glean the practical-use data that are provided in chapter five, “Shamanic-Snuff Psychonautica.” It is herein that OTT provides the highly valuable details from his own rigorous experiments with 5-MeO-DMT, *Virola* resin, bufotenine, nicotine, and the concurrent administration of harmine and/or harmaline in some cases (compounds that appear to dramatically increase the potency of 5-MeO-DMT and bufotenine, even when taken intranasally or sublingually).

With each of the experiments reported on, OTT abbreviates the compounds: 5-MeO-DMT becomes “M,” bufotenine becomes “B,” and nicotine becomes “N,” with the corresponding “N” [intranasal], “S” [sublingual], “O” [oral], “V” [vaporized], and “R” [intrarectal] being used to denote the method of consumption. (As “M” is street vernacular for both mescaline and MDMA, hopefully its use here to denote 5-MeO-DMT won’t add another such confusing term into common use.) OTT also includes a description of the isolation and purification procedure that he used on *Anadenanthera*

*colubrina* var. *Cebil* seeds to obtain bufotenine, a procedure that doesn’t appear to be overly complicated—something that a kitchen chemist with access to some labware and solvents might be able to perform.

The main “bombshell” of this book—if it can be described as such, since the information has been floating around for some years now—is that bufotenine is indeed visionary. OTT redacted his own previous comment in *Pharmactheon* (based on the literature rather than first-hand experience) where he had stated “bufotenine is not active orally at 100 mg doses.” He now reports that this dose orally is “most decidedly active, albeit mild.” Intranasal doses are more active than oral doses, and OTT found bufotenine to be even more potent via vaporization, particularly when inhaled through the nose. Despite the fact that OTT admits to his own mis-characterization of bufotenine’s activity in a couple of his past books, he nevertheless takes aim at one particular article by others that made the same mistake that he did, in what OTT clearly feels was a grander fashion. However, as OTT earlier remarked in *Pharmactheon*, “Since the symptoms of cardiopulmonary distress described following the administration of bufotenine can hardly be pleasurable, and few among us would wish to see our faces the livid color of an eggplant, it is doubtful anyone would intentionally administer this drug,” and as the folks who wrote the article that OTT criticizes cite *Pharmactheon* as one of their sources, it shouldn’t seem too surprising if they would have shied away from personal bioassays after reading what OTT had to say! Indeed, it seems highly doubtful that OTT himself would have ventured into the realm of bufotenine bioassay, if it wasn’t for the fact that some *Anadenanthera* seeds that had traditionally been used for snuff—and which OTT himself found to be visionary—tested out as having virtually nothing *but* bufotenine in them. It is quite understandable that the authors whom OTT takes to task would not have similarly stumbled onto this finding via bioassay, since their primary interest was toad secretions, which contain numerous more deadly bufotoxins, along with the bufotenine. Nevertheless, OTT is to be commended for his further investigations into an area that many would not have trod, due to the preponderance of evidence from past studies of bufotenine’s activity seeming to indicate that it might be a dangerous path to walk.

During his psychonautical exploration, OTT also discovered that a previous report in the SHULGINS’ book *TIIKAL* of 5-MeO-DMT being inactive orally (based on a sole bioassay of 35 mg), may have been due to that individual’s biochemistry, rather than an inherent lack of oral activity for the

compound. OTT found 30 mg of the free-base (encapsulated) to indeed be active—on a similar level to 10 mg taken intranasally or sublingually.

I was a little disappointed that this book didn't cover the pharmacology of DMT via sublingual or intranasal ingestion. I've heard a few reports related to DMT ingested in this manner, but seen nothing published anywhere. JONATHAN pointed out to me that his was a book that focuses on shamanic snuffs and not general tryptamine pharmacology, and that DMT does not figure in the composition of the traditional snuffs, except as an occasional trace or minor secondary product. While this is true, I suspect that an aside which detailed DMT pharmacology would have been welcomed by most readers.

In the pharmacology data that was presented on those tryptamines that do figure heavily as active components in traditional snuffs, threshold doses were found via sublingual and intranasal ingestion. But there wasn't any mention of "fully active" doses without the addition of a MAOI. Following the publication of this book, I heard about people who dramatically increased the threshold sublingual doses that OTT mentioned for 5-MeO-DMT, and who were unable to obtain what they considered to be "fully active doses." They did get some noticeable effects, but nothing at all like those from smoking or oral ingestion with a MAOI. There would be, no doubt, more debate surrounding what constitutes a "fully active" dose than there would be surrounding what constitutes a "threshold dose" for any given compound. Still, it is reasonable to think that even a *threshold dose* for one individual may be quite different in milligram amounts than it would be for another individual (as exemplified by the report of no oral activity for 35 mg of 5-MeO-DMT that was put forth in *TIHKAL* being challenged by OTT's own report of activity at 30 mg). Hence, OTT's threshold doses should only be seen as guidelines—amounts that worked for him (though it should be noted that he claims to have a relatively high tolerance to tryptamines, before one jumps headlong to any conclusions based on the *TIHKAL*/5-MeO-DMT dose comparison). But it is also worth noting that just because a "visionary threshold dose" is reached, this doesn't necessarily mean that larger sublingual or intranasal doses will be "fully active" in the same manner as via smoking or oral consumption concurrent with a MAOI. Obviously more data points are needed on this topic. Those who chose to enter into the fray are encouraged to follow the strict methodology that OTT describes in his book to ensure that the material remains under one's tongue: dry the mouth before

applying the crystals, then recline with one's head propped up and the tongue elevated to block the throat, and keep any saliva in the mouth for about 45 minutes. Who said taking drugs wasn't hard work?!

The book ends with a poem, "Arboreal Afflatus Taíno Talking Tree," and contains a comprehensive bibliography and detailed index. I heartily recommend *Snuffs* as a valuable reference book for anyone interested in the history and pharmacology of the traditional snuffs. It is a beautiful, well-written, and informative compendium, and an inspiration for those choosing to pursue further psychonautical investigations. A German version of this book is planned as well. Contact ENTHEOBOTANICA directly regarding shipping and handling charges for your country of origin before placing any orders. — JON HANNA

## RS Botanicals

HCR 74 21614, El Prado, NM 87529 USA

— Offering hard-to-find botanicals at all time low prices. —

*Argyrea nervosa*  
seeds 15 grams/\$25.00

*Ephedra nebrodensis*  
seeds 100/\$4.00

*Desmanthus leptolobus*  
seeds 100/\$5.00

*Lophophora* species  
seeds 50/\$10.00

*Mirabilis multiflora*  
seeds 100/\$5.00

*Trichocereus peruvianus*  
seedling plants \$18.00 each

*Stipa robusta*  
seeds (the narcotic strain) 100/\$5.00

### FREE SHIPPING:

Mention this advertisement through June 1st, 2003 and get free shipping. But include \$3.00 for each order under \$100.00, to cover insurance cost. Over \$100.00 include \$4.50. For a complete list of about 100 different botanicals we offer, visit us on-line at:

<http://RiversSource.yage.net>

A new paper catalog will be available in March, 2003. Send \$4.00 to our mailing address above to receive this. If you've requested one but have not yet received it, a new catalog will be sent out to you in our March mailing.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check, or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See [www.entheogenreview.com](http://www.entheogenreview.com) for descriptions and prices.

Copyright © 2003 by *The Entheogen Review*. Nothing in this journal may be reproduced in any manner, either in whole or in part, without written permission of the editors. All rights reserved. All advertising and advertised products void where prohibited.

# HIGH ON AVAM

by THE RAINBOW BEND COLLECTIVE

No, AVAM isn't the newest creation of our favorite organic chemist, but the acronym of the AMERICAN VISIONARY ART MUSEUM, located on Baltimore's Inner Harbor. *High on Life: Transcending Addiction* is the title of AVAM's current, amazing show of art works that manifest the complete range of drug experiences from hardcore heroin addiction, depicted in dark, angry works by WILLIAM S. BURROUGHS and others, to the luminous LSD visions of ALEX GREY.

The show is so interesting, so compelling, so involving, that we have made multiple trips to Baltimore to take in every work and to read every word of the inspired gallery text, of the informative captions beside the works, and of the works themselves—some of which are extremely wordy, as though created by a schizophrenic frame of mind. After each visit—one of which was in an entheogenic state of consciousness—we have come away filled with wonder at this incredible assemblage of works inspired by America's many drug cultures. Without any exaggeration at all, we can say this is the finest, most interesting show of art we have seen anywhere. But then we approach it from a minority perspective, albeit one that is shared by the readers of *The Entheogen Review*.

Rather than use this space to display our own erudition of art (which is great) or our knowledge of altered states (which is extensive), we have chosen—with the AVAM's permission—to let *High on Life* largely speak for itself through the writings that accompany the show. At the entrance to the exhibit, for example, the visitor finds the following:

As human beings, we are hardwired to experience ecstasy, epiphany, laughter, and bliss. Little children twirling in the summer sun to experience the altered state of becoming falling-down-dizzy are not very far removed from whirling dervishes seeking spiritual attunement with the harmonious spin of the planet. If the pull upward into ecstasy is mighty, human frailties dictate that the ascent will be an imperfect one, with use sometimes leading to the hell of abuse. The National Institutes of Health put the total cost of alcohol and drug abuse at \$245 billion in 1992, up 50 percent over 1985. The human toll is incalculable.

Because the urge is biological, and because the distinction between licit and illicit drugs is not based on harm, legal attempts at prohibition seem doomed to failure. Albert Einstein's 1921 words on Prohibition ring as true of the "War on Drugs" as they did the War on Alcohol: "The prestige of government has undoubtedly been lowered considerably by the Prohibition law. For nothing is more destructive of respect for the government and the law of the land than passing laws which cannot be enforced. It is an open secret that the dangerous increase of crime in this country is closely connected with this." The War on Drugs is a war that does not go away, is not won, and does not end. It is a war with an economic and emotional price tag that exceeds the costs of all the wars in which Americans have fought and died. In a new millennium with age-old problems escalating exponentially, taking a compassionate and searingly honest look at humankind's long history of addiction and self-medication, along with positive efforts toward spiritual transformation, is the only way to formulate enlightened actions and compassionate responses. If human beings are intrinsically flawed, they are also endlessly transcendent. Addiction is a spectrum in which we all participate, whether our drug of choice is caffeine, nicotine, morphine, sugar or shopping. To paraphrase Pogo, "We have met the addict and he is us."

Spread over three floors of AVAM's architecturally brilliant main building, the show is divided into seven sections: *Temptation*, *Descent*, *Constant Craving*, *Dispensation*, *Just Say Know*, *Plants of the Gods*, and *The Third Eye*. The works in the early sections "illustrate the powerful allure that certain drugs, habits, and compulsive behavior patterns exert." As you would probably guess, these include the opiates, products of the *coca* leaf, and the legal substances alcohol, nicotine, caffeine, sugar. The displayed works tend toward the dark, the obsessive, the paranoid, the escapist. The gallery text that introduces the first section begins humorously with a quote from OSCAR WILDE: "I can resist everything except temptation." The text notes how our "natural desire to feel good...renders us ever-receptive to anything that promises to improve our sense of well-being, no matter how temporarily, and in many cases regardless of the cost." As many of the works illustrate, and as the individual lives of many of the artists show, the cost can be great.

Not all of the works are framed pieces of art. There is MAT JAMES' wild and crazy *Chair for William Burroughs*. There is BRION GYSIN's legendary *Dreamachine*, fabricated 40 years ago as a "drugless turn-on." And early in the show, the viewer encounters JOHN LAWSON's *Garden of Earthly Delights*, a 53-foot-long bar top from New Orleans' AUDUBON HOTEL, whose 24-hour bar was a popular late-night gathering spot for artists, musicians, drug-users, prostitutes, and other colorful inhabitants of the city's underworld. A Brit who has lived in New Orleans since 1991, LAWSON uses as his artistic medium the multicolored plastic beads that abound in the city during Mardi Gras. While living at the AUDUBON HOTEL, and in part payment of his rent, he glued beads to the bar top to create an intricate and lush beaded-mosaic imagery. New Orleans' wild nightlife is depicted in another of his beaded creations, *Temptation*, a piano salvaged from an old New Orleans brothel and covered with beaded images that allude to the temptations of the flesh for which New Orleans is famous. After overdosing on speedballs, LAWSON has reevaluated his life and embraced a more Buddhist lifestyle in which he abstains from all drugs, including alcohol and nicotine.

The disturbing works in *Descent* reflect the "hellish," "nightmarish" aspects of drug experiences and of human experience in general. We especially liked LORI JAE REICH's powerful *Ignorance Rampant*, shown here, which depicts the ravages on the individual caused by the commercialization of tobacco and alcohol. From the painting's caption, we learn that:

Ignorance Rampant by LORI JAE REICH, see <http://lorijreich.com>

Lori Jae Reich was born in Chicago and raised in nearby Skokie, Illinois. She was a hair-dresser until 1979, when the small plane she was flying in crashed, killing two people. The crash left her with ongoing physical and severe psychological problems, including post-traumatic stress disorder (PTSD), agoraphobia, panic and anxiety disorder, depression, and fibromyalgia. During the 1980s, these experiences lead her to become an advocate for mental health issues. In 1991, Reich began reading how-to-books on art. For three years she explored abstraction, but in 1995, she began to work with representational imagery in painting about the psychological impact of her plane crash. From that point, she devoted all her artistic energies to making figural paintings that reflect her opposition to war and her embrace of the Buddhist values of mutual respect and compassion for all beings.

*Constant Craving* explores the nature of addiction. The gallery text begins with a quote from BURROUGHS: "Junk is the ideal product...the ultimate merchandise. No sales talk necessary. The client will crawl through a sewer and beg to buy..." It ends with ROBERT DOWNEY JR. describing his addiction to a judge during a 1999 hearing: "It's like I've got a shotgun in my mouth, with my finger on the trigger, and I like the taste of the gun metal." The works of ROY FERDINAND are standouts in this section of *High on Life*. About him and his work, we are told:

Roy Ferdinand was born in New Orleans to a father who worked as a maintenance engineer and a mother who worked as a cook. With the exception of an Army stint in his late teens, he has spent his entire life in New Orleans. He dropped out of high school at 17, and with the exception of art classes he took for a few weeks in junior high school, he's entirely self-taught. Since 1986, Ferdinand has created a substantial ongoing body of drawings that provide an unflinching, close-up view of street life in that city's predominantly black neighborhoods. His works chronicle the violence, police brutality, prostitution, illicit drug commerce, and economic desperation that plague these areas and others like them throughout the urban United States. Using simple materials—posterboard, marker pens, color pencils, and watercolors—he composes vividly detailed, evocatively shaded, brutally realistic scenes that are sometimes heartbreaking, often highly disturbing. Images of guns and drugs abound, while

evidence of compassion, mercy, and justice is conspicuously absent, providing a stark picture of the squalor and desperation from which so many denizens of poor urban neighborhoods seek relief and escape through the use of drugs. Ferdinand illustrates the furtive transactions, tough come-ons, hostile pedestrian interactions, and frequent carnage that characterize the intertwined worlds of street-level drug commerce and prostitution. He compares his project to that of a battlefield sketch artist, saying “We’re involved in a war now.”

Ferdinand says that much of what he draws reflects his feeling that residents of neighborhoods such as the ones he portrays are “practicing a kind of intra-racial prejudice that is aggravated by false machismo and pride, as well as greed and self-righteousness,” a situation further complicated by the widespread use of legal and illegal drugs in these neighborhoods.

TOM FRUIN’s *Treasure Map* is another work in the *Constant Craving* part of the show that we think deserves special mention here. A large, multicolored wall-hanging composed of stitched-together small squares of plastic, the work has a hidden meaning, as explained in the following caption, and proves art can be made of anything:

Tom Fruin was born and raised in Los Angeles, where his childhood art activities included making figural sculptures from telephone wire. In 1996, he earned a bachelor’s degree in studio art from the University of California at Santa Barbara. He moved to New York that same year and he began collecting the small zip-lock bags in which illicit drugs are sold—castoffs that are ubiquitous in certain parks and neighborhoods. Within 18 months, he had collected 3,000 bags of various sizes, colors, and designs, and he sewed them together in a grid to create a kind of tapestry or quilt. Because the pieces incorporate specific references to the places where their components were found, Fruin refers to them as flags or maps. “I’m cataloging them the way I found them,” he says, “according to the kinds of drugs being consumed in each area.” To him, the works provide “a way of understanding people and places by the litter left behind.” As he has become known for these works, friends and acquaintances have begun to give him their own used drug bags, from which he creates works that are essentially portraits of individual drug users.

One artist, RAY MATERSON, rates an entire gallery all to himself. His stitched works of art are so small and intricate—1,000 to 1,500 stitches per square-inch—that AVAM provides the viewers with magnifying glasses to examine them. Here is his story:

Ray Materson grew up in the Midwest and earned a bachelor’s degree in philosophy and performing arts from Grand Valley State University in Allendale, Michigan. While studying there, he also developed the cocaine addiction that later led him to use a toy gun in a parking-lot holdup. He was tried and sentenced to 25 years in prison. Fairly early on in his sentence, Materson thought about his grandmother and her habit of sitting for hours while sewing needle-point designs on an embroidery hoop. He improvised a similar hoop from the top of a plastic food container and clandestinely acquired a sewing needle. Using threads from unraveled socks, he began by sewing sports patches for himself and other inmates. As Materson developed his skills, he began to sew pictures drawn from his life experiences. Some were raw images of his days of

reckless abandon and chronic drug addiction, while others were inspired by his former involvement with theater, his sports heroes, or his dreams and aspirations. All were rendered in the fine nylon thread that he salvaged from colored socks. In creating art, Materson says, he found hope and salvation. He was released from prison in 1995 and today lives with his wife Melanie and his three children in New York, where he makes art and counsels troubled youth. With his wife, Melanie, he has written his autobiography, *Sins and Needles: A Story of Spiritual Mending*.

*Dispensation*, the show's middle section, bridges the gap between what we think of as the constrictive, addictive substances and the expansive, nonaddictive entheogens. The gallery text begins with a quote from STEPHEN JAY GOULD: "[H]ow can we possibly defend our current policy based on a dichotomy that encourages us to view one class of substances as a preeminent scourge while the two most dangerous and life-destroying substances by far, alcohol and tobacco, form a second class advertised in neon on every street corner in America." The text continues, in part:

From the standpoint of the legal system, there are only two classes of drugs—legal and illegal. Classification is not based on harm but on history, custom, and economics, and the lines shift like sand from place to place and across time. After coffee was banned in Egypt in the 16th century, dealers were punished and stocks were burned. In 1777, Frederick the Great of Prussia banned coffee roasting except in official government establishments, saying, "Many battles have been fought and won by soldiers nourished on beer, and the King does not believe that coffee-drinking soldiers can be relied upon to endure hardships in case of another war."

In colonial America, liquor was "food, medicine, and social lubricant." Laudanum, an opium derivative, was widely used throughout the eighteenth century, for everything from soothing a teething baby to easing the arthritic aches and pains of the elderly... Nineteenth-century America has been described as a "dope fiend's paradise," where opium, morphine, and heroin were all as legal and accessible as aspirin.

In the early years of the twentieth century, members of the Women's Christian Temperance Union railed against the dangers of alcohol but consumed quantities of opium-laced patent medicines like Mrs. Winslow's Soothing Syrup or McMunn's Elixir of Opium at their temperance meetings. Today, marijuana is illegal in the United States, but in the European Union and Canada, authorities are moving to decriminalize or legalize it and medical uses are already permitted in many of those countries.

The artworks in *Dispensation* deal with the wide range of substances whose use is legal and socially sanctioned for medicinal or recreational use in the United States. They include sugar, nicotine, alcohol, and prescription drugs, as well as other legal, socially sanctioned substances and activities, such as food and shopping, often associated with addictive behavior.

Thus does this section of AVAM's *High on Life* brilliantly cut through what the authors of this piece like to think of as the "official truth" about drugs, which underlies our government's war on certain substances, to get to the *real* truth,

that our drug laws are based not on reason but on emotion, on hysteria, and on a rather complete misunderstanding of the influence of substances on human behavior, health, emotion, and spiritual awareness. “The American people,” to borrow an obnoxious phrase from U.S. politicians, have been brainwashed for so long by the official truth that is used to justify the War on Certain Drugs, that they are deeply ignorant of the real truths about drugs, even the drugs they themselves are using. ERIC WHITE’S *Intermezzo* (shown below), brilliantly captures the influence of sugar, alcohol, and nicotine on the American way of life. His *Divine Mother of Guilt* (shown on the cover of this issue of *The Entheogen Review*) turned into one of the trippiest works in the show when we saw *High on Life* while high. ERIC WHITE, we think, is that rare artist who can satisfactorily create from the perspective of more than one state of consciousness.

*Just Say Know*, the next section of the show, doesn’t pull its punches in its criticism of the official truth that underlies the War on Drugs:

“If there is a war on drugs, then many of our family members are the enemy. And I don’t know how you wage war on your own family.” — Michael Douglas as the newly appointed Drug Czar Robert Wakefield in *Traffic*

Former Baltimore Mayor Kurt Schmoke called the war on drugs “our domestic Vietnam.” Like the Vietnam War, Schmoke said, the War on Drugs has “lasted too long and cost too many lives... It’s time to bring this enervat-

ing war to an end. It’s time for peace.”

Few topics of public discourse since the Vietnam War have proven more contentious than drugs. Several U.S. Presidents in a row have supported the heavily financed, highly publicized war, with results that have been, in the most generous estimation, dubious. The phrase most often associates with the endeavor is the slogan coined by former First Lady Nancy Reagan to discourage young people from using illegal drugs: “Just say no.” However, when it comes to drugs, as with sex, young people tend to be curious, inquisitive, unwilling to settle for oversimplified answers, and suspicious of the advice offered by their elders. As Ogden Nash put it: “Oh, what a tangled web do parents weave/When they think that their children are naive.” The millions of young people and adults who regularly consume illegal drugs aren’t the only ones who have rejected the “Just say no” approach and questioned the wisdom of the War on Drugs. Increasing numbers of ordinary, non-using citizens, as well as respected leaders from across the political spectrum have urged rethinking our society’s punishment-oriented approach to drugs in favor of a “harm reduction” approach that acknowledges that there is no ultimate solution to the problem of drugs in a free society, and advocates lessening the harm of drugs through education, prevention, and treatment.

The works in *Just say Know* embody with imagery and texts just a few of the many arguments that have been offered to support various positions in this ongoing societal debate.

Intermezzo by ERIC WHITE, see [www.ewhite.com](http://www.ewhite.com)

For every complex problem, there is a solution that is simple, neat, and wrong. — H.L. Mencken

Every time we reach this part of the show, with its interesting works by WILLIAM S. BURROUGHS, LORI JAE REICH, and others, our eye is attracted to the next gallery, which contains *Plants of the Gods*, the beginning of which can be glimpsed ahead, and which offers a marked contrast to most of what has preceded. Behind us are the dark works of addiction and contraction, ahead the brilliant, spiritual works of artists inspired by the entheogens. Appropriately enough, the gallery text for *Plants of the Gods* begins with a quote from TERENCE MCKENNA:

“The shamanic plants and the worlds that they reveal are the worlds from which we imagine that we came long ago, worlds of light and power and beauty that in some form or another lie behind the eschatological visions of all of the world’s great religions... Nature is ourselves, to be cherished and explored. Shamanism has always known this and...taught that the path required allies. These allies are the hallucinogenic plants and the mysterious teaching entities, luminous and transcendental, that reside in the nearby dimension of ecstatic beauty and understanding that we have denied until it now nearly too late.” — Terence McKenna, *Food of the Gods: The Search for the Original Tree of Knowledge* (1992)

Shamanic use of plant-based hallucinogens—including cannabis, mushrooms, peyote, and ayahuasca—was central to the religious lives of people in parts of Africa, China, India, Tibet, Siberia, Mediterranean Europe, and the Americas. To the shaman with expertise in their use, the experience that rational science interprets as hallucination is an interdimensional interaction with supernatural beings and visible, sometimes audible energy forms—in other words, nothing short of a direct encounter with God or gods. For this reason, some modern students of these drugs have termed them “entheogens”—activators of inner divinity.

The widespread ritual use of these substances was demonized in Europe and in other parts of the world with the rise of the monotheistic religions and dominator cultures whose prevailing drugs of choice were alcoholic. European explorers and the missionary clergymen who

accompanied them to the Americas—home to the widest variety of plant hallucinogens in the world—continued the campaign of suppression. They were so successful that the existence of most of these naturally occurring drugs—cannabis being a notable exception—remained virtually unknown to the modern Western world until their rediscovery in the mid-twentieth century.

This rediscovery took place first in the scientific and therapeutic communities, then spread quickly during the 1960s into the popular arena. The suddenly widespread, indiscriminate use of plant-based hallucinogens and their synthetically produced chemical derivatives... resulted in occasional public incidents and innumerable “bad trips.” The ensuing sensationalizing by the mass media prompted a fierce legal and political backlash, resulting in the blanket legal prohibition of them all by the end of that turbulent decade. As with the prohibition of alcohol in this country earlier in the twentieth century, prohibition didn’t dampen the public fascination with and inclination to use them. While the U.S. government put an end to virtually all legitimate experimental tests of these drugs, they continue to be used for private recreational, psychotherapeutic, and spiritual purposes, as reflected in the contemporary artworks that dominate this gallery.

Of special interest to the readers of *The Entheogen Review*, this shimmering section showcases 59 separate works directly inspired by the entheogenic experience, including six works by Huichol Indians of Mexico and two by PABLO AMARINGO. ALEX GREY is represented by six impressive works, ranging in size from the large *Adam and Eve* to the small *Glimpsing the Empyrean*. Seeing his works in the original rather than as reproductions was a real treat for us. The works of MAURA HOLDEN, a Vermont artist previously unknown to us, were a revelation. She deserves more exposure. We felt this section of the show alone makes the trip to AVAM a worthwhile experience.

And then comes the final section, *The Third Eye*, whose 14 works provide a fitting capstone to *High on Life*, reminding us of the eye atop the pyramid on the back of the U.S. dollar bill. Once again, the gallery text illuminates:

**WWW.AVAM.ORG**

Drugs precipitate changes in brain chemistry. Such changes have also been associated with visionary states of consciousness achieved solely through mystical disciplines, without the aid of drugs. For many centuries adepts in spiritual disciplines ranging across virtually all religions have spoken of the transcendent, ecstatic states of consciousness achieved through the dedicated pursuit of meditation, fasting, dancing, and other arduous spiritual practices.

The enlightenment or divine illumination experience is perhaps most poetically characterized in the image of the newly opened “third eye”—a metaphor rooted in the pre-Ayurvedic oral and visual traditions of India, typically illustrated by an image of an eye positioned in the central forehead. This is the Ajna-Chakra of Tantric yoga, which teaches that this chakra, or energy center, forms the boundary between human and divine consciousness. Its actual location is within the brain, at the upper center of the skull, anatomically corresponding to the pineal gland, directly above one of the crucial byways for cerebrospinal fluid and in close proximity to the crucial emotional and sensory brain centers. Recent neurochemical theories have suggested a correspondence between the mystical enlightenment experience and the spontaneous release of the hallucinogen DMT, or N,N-dimethyltryptamine, within the pineal gland, and have also connected such endogenous DMT production with the spirit’s departure from the body at the moment of physical death.

The works in this gallery allude to the precipitation of changes in brain chemistry in the absence of drugs,

and point to the possibility that each of us has the innate capacity to self-regulate our brain chemistry in order to produce such changes and gain regular access to visionary consciousness or divine wisdom.

In this section of the show, we were particularly taken—especially during our heightened visit—with *Chakra Projections*, a large, inspiring acrylic-on-wood work by PHOENIX and ARABETH depicting the chakras of a naked male meditator, and ALLYSON RYMLAND GREY’s meticulous *Jewel Net of Indra* (shown below, left), an even larger, abstract work in oil on wood panel. These two works flank the “Third Eye” text panel extolling non-drug paths to enlightenment, perhaps ironically in GREY’s case. This is what we learn from the caption that accompanies GREY’s engrossing painting:

Allyson Rymland Grey was born in Baltimore and received both bachelor’s and master’s degrees in fine arts from Tufts University. Having observed the polarizing conflicts that can result from the sacred writings of different faiths, she has spent the last 25 years creating a “secret language” that is incapable of causing such divisions by virtue of its having no interpretable meaning. A formative influence on her work was an experience she shared with her husband, artist Alex Grey, after they had ingested LSD together and saw what she describes as “the grid upon which the fabric of our material reality is draped.” Later, she read about Indra, the Hindu god of space, whose domain is described as a net marked with “a jewel so highly polished and perfect that it reflects every other jewel in the net.” This concept—overtly treated in her painting, *Jewel Net of Indra*—resonated powerfully with what she and her husband had envisioned under the influence of LSD, and she has attempted to point to this experience in all of her subsequent artwork. Grey envisions her work as a journey, in which each painting leads to ideas that generate the next painting. In addition to pursuing her own artwork, she collaborates on projects with her husband, Alex Grey, and their daughter, actress Zena Lotus. They live in Brooklyn, New York.

Our gratitude and congratulations go to TOM PATTERSON for putting together this brilliant show. See it if you possibly can. It deserves our support. Added attractions are AVAM’s gift shop, which sells cool things by visionary artists, and its top-floor Joy America Cafe where you can enjoy an elegant lunch or dinner with a stunning view of Baltimore and the Inner Harbor at a moderate price. *High on Life* closes on September 2, 2003. Visit the museum on-line at [www.avam.org](http://www.avam.org). ☉

Continuing Perspectives on Altered Consciousness

**MAY 23–25, 2003**

Celebrating the 60th anniversary of the discovery of the psychoactive effects of LSD.

Held at the International House in Berkeley, California, presenters include:

Pablo Amaringo • Anton Barbeau • Susan Blackmore • Richard Glen Boire • Erik Davis • Earth Erowid  
 Fire Erowid • John Gilmore • Alex Grey • Allyson Grey • Stanislav Grof • Lorenzo Hagerty • Mark Henson  
 Martina Hoffmann • Mark McCloud • Ralph Metzner • Naaskow • David E. Nichols • Sheldon Norberg • Mark Pesce  
 Stevee Postman • V.S. Ramachandran (tentative) • Nicholas Sand • Wrye Sententia • Zoe Seven • Ann Shulgin  
 Sasha Shulgin • R.U. Sirius • Myron Stolaroff • Fred Tomaselli • Robert Venosa

Tickets are \$225.00 by May 15, and \$250.00 from May 16 until the event.

**BUY YOUR TICKETS EARLY!** Our last conference in Berkeley sold out. Checks made out to "Mind States" can be sent to: Mind States, POB 19820 (Dept. ER), Sacramento, CA 95819. Payment can be made with a credit card via our web site.

— [www.mindstates.org](http://www.mindstates.org) —

# SWAMI'S SACRED PLANT

## A REPORT OF UNPRECEDENTED *Datura* USE IN NEPAL

by ROBERT "RIO" HAHN, FRGS, FN'86

The kingdom of Nepal is home to some of the world's richest landscapes and cultures. Contained within its 56,827 square miles are eight of the world's ten highest peaks and an incredible variety of ecosystems. Nepal is less than 560 miles long from east to west and only 94 to 125 miles wide north to south. It can be roughly divided into three geographic regions: the hot lowland Terai, the rugged deep valleys and terraced ridges of the Hills, and the towering Himalaya Mountains (MORAN 1996).

Nepal's rugged terrain has preserved a kaleidoscope of linguistic and cultural traditions that include an estimated 100 different ethnic groups, speaking some 70 different languages (MORAN 1996). The Kathmandu Valley, a fertile basin set in the heart of the Himalayan foothills, is an unparalleled living museum of ancient religious practice and extraordinary art and architecture.

Most of Nepal's estimated 22 million people practice some type of daily religious devotion at the thousands of shrines, statues, altars, and temples that adorn the cities and countryside of this magical kingdom.

Associated with many of the religious practices in Nepal and India, are a number of sacred plants. Among them are *Canabis sativa* (known as *ganja*) and *Datura*, both of which are considered sacred to SHIVA, Lord of the Yogis. In order to aid his meditation, SHIVA is reputed to consume prodigious amounts of *ganja*. On the festival of SHIVA Ratri, hundreds of Hindu *sadhu* (holy men) gather at the Pashupatinath Temple in Kathmandu to pay homage to SHIVA with prayer, singing, and austerities, all fueled by massive doses of *ganja* (MORAN 1996). Traditionally on the subcontinent, *ganja* and *Datura* are mixed together (SCHULTES & HOFMANN 1980) by the yogis and smoked in a *chillum* or clay pipe.

Also associated with many religious rituals, though rarely a focus of them, is the practice of *betel* chewing. MARCO POLO, during his travels through India in the thirteenth century, first reported to Europeans on the practice (ROONEY 1993, in BEE 2000), and the first archaeological evidence of *betel* chewing in India appears in the early Christian era. *Betel* chewing has probably been common in areas of Southeast Asia and Indonesia for thousands of years (BEE 2000), and tradition relates its beginnings to mythical origins, as is the case with many eastern religious practices. As much as ten percent of the world's population is estimated to chew *betel* for social, medicinal, and religious reasons (BEE 2000). There are several reported constituents of the *betel* chew, however *Datura* is not usually one of them, nor has it been reported as a constituent in some of the recent literature on *betel* chewing.

### **DATURA: A BRIEF HISTORY**

Revered and feared throughout the world, *Datura* is considered one of the most mysterious and frighteningly powerful sacred plants. Traditional cultures have treated *Datura* with cautious respect, and *Datura* has often been associated with the practice of sorcery and witchcraft (DAVIS 1988). *Datura* is reputed to have been a major component of the salve European witches used to anoint their broomsticks, an effective means for women to self-administer the drug through the moist tissue of the vagina (DAVIS 1988). The popular image of the flying witch is no doubt one of mystical flight, an out-of-the-body sensation (EMBODEN 1979, 1981, in SCHULTES & REIS 1995) in which the journey is not through space but across the hallucinatory landscape of the witches' own mind (HARNER 1973; HANSEN 1978, in DAVIS 1988). Today, *Datura*'s most important psychoactive alkaloid, scopolamine, is used in modern medicine for

motion sickness, as a bronchodilator for asthma relief, and in many cold medicines to dry out the mucous membranes (McCLOY 1999).

*Datura*, commonly known as thorn apple, jimson weed, locoweed, and devil's weed, is a member of the Solanaceae family, which also includes well-known common plants such as tomatoes, potatoes, eggplants, peppers, and tobacco. The Solanaceae family also includes the so-called hexing herbs, including deadly nightshade (*Atropa belladonna*), mandrake (*Mandragora officinarum*), and henbane (*Hyoscyamus niger*). Belladonna, henbane and *Datura* were staples in poison potions and witches' brews (KREIG 1964).

The genus *Datura* contains 15 to 20 species, which are usually divided into four subgenera (SCHULTES & HOFMANN 1980), although there is still debate among taxonomists as to the classification of all the species. The *Daturas* are herbaceous plants, some perennial and some annual, with fragrant trumpet-shaped flowers and usually spiny seedpods.

Most species, and records of widespread use, are found in the New World, with only two species native to the Old World. *Datura metel* and *Datura ferox* have been known and used on the Indian subcontinent since ancient times (SCHULTES & HOFMANN 1979, 1980).

Knowledge of *Datura*'s intoxicating effects dates back to pre-history and accounts of its use can be found in the earliest Sanskrit and Chinese texts (SCHULTES & HOFMANN 1980). Reference to *Datura* may also have been found in Egyptian iconography in the depiction of "Lady TUTH-SHENA" on a stela standing in awe before the god HORUS (shown below). Emanating from the sun disc on HORUS's head are five "rays" of tubular flowers that strongly resemble the distinctive trumpet-shaped flowers of *Datura* (EMBODEN 1979, 1981, in SCHULTES & REIS 1995).

The name may be derived from its use in ancient India by the *datureas*, bands of thieves who used the plant to drug their intended victims (FLUCKIGER & HANBURY 1879;

SAFFORD 1920, in DAVIS 1988). The formal botanical name, *Datura*, was adapted to Latin by LINNAEUS from the vernacular name *dhatura* or *dutra* in India (SCHULTES & HOFMANN 1980), which is related to the Sanskrit name *Dhustura* (BENNET et al. 1992).

*Datura* is highly psychoactive and has been described as an intoxicant or a hallucinogen, but calling it a deliriant is probably most accurate (BERNHARD-SMITH 1996). Ingestion of *Datura* causes symptoms of spectral illusions, delirium, dilated pupils, thirst, dryness of the mouth and muscular incoordination (BERNHARD-SMITH 1996). The pharmacological activities of the *Daturas* are due to the presence of tropane alkaloids, the most active being scopolamine (hyoscyamine). Depending on the specific species and plant part, hyoscyamine (atropine), norhyoscyamine, and tropine, among many others, may be present (McCLOY 1999).

The tropane alkaloids block neurotransmission in the parasympathetic nervous system, specifically across the muscarinic cholinergic receptors. This causes anticholinergic syndrome characterized by fever, flushing or rashes, hypertension, tachycardia, bronchodilation, delirium, hallucinations (audio, visual, and tactile), blurred vision, dizziness or vertigo, sedation, agitation, and persistent memory disturbances that can lead to amnesia. Users report that time appears to slow down and their perceptions are disoriented; effects which can be so subtle as to be difficult to notice without the assistance of a sober attendant (McCLOY 1999).

During the Sanskritic period, Indian medicine valued the Old World species of *Datura metel* for treating mental disorders, various fevers, tumors, breast inflammations, skin diseases, and diarrhea (SCHULTES & HOFMANN 1979). In 1578, the Portuguese explorer CHRISTOVAL ACOSTA noted its use as an aphrodisiac in the East Indies, stating that "...he who partakes of it is deprived of his reason for a long time, laughing or weeping or sleeping...at times he appears to be in his right mind, but really being out of it..." (SCHULTES & HOFMANN 1980). In 1797, SAMUEL COOPER wrote his dissertation on the properties and effects of *Datura stramonium* for his degree in medicine from the UNIVERSITY OF PENNSYLVANIA. From his studies of *Datura's* effects he commented, "Should we not be induced to attempt the discovery of other articles which affect the mind? May not articles exist which [are] capable of affecting all its different faculties?" (COOPER 1797).

According to the ancient Sanskrit text *Vamana Purana*, which traces the origin of plants and plant groups to different gods (BENNET et al. 1992), *Datura metel* is said to have originated from the heart of MAHESVARA—the god SHIVA in the form of the Great Lord (SENSARMA 1989, in BENNET et al. 1992). The *Purana* purports that the gods like particular flowers, and adepts gain a particular god's favor through the offering of the appropriate flower (BENNET et al. 1992). *Datura* is traditionally associated with the worship of SHIVA (MAJUPURIA, revised by JOSHI 1989), the Indian god of creation and destruction. Devotees place the flowers and fruits of *Datura* on SHIVA altars during their devotional ceremonies. Revered for their aphrodisiac properties, *Datura* flowers are usually laid upon a SHIVA-lingum—an image of the phallic incarnation of SHIVA (SCHULTES & HOFMANN 1979)—while mantras are recited.

In India and Nepal, religious plants are of such importance that several towns have been named after them (MAJUPURIA, revised by JOSHI 1989), and the literature abounds with stories of their use. ACOSTA reported that Hindu prostitutes were so skilled in the use of *Datura* seeds that they could administer doses corresponding to the number of hours they wished their victims to remain unconscious (TAYLOR 1965, in DAVIS 1988). The Thugees, forerunners of the famous Dacoit bandits of Phoolan Devi fame, used *Datura metel* to stupefy their victims before raping, robbing, and even killing them—their form of ritual worship to the goddess KALI (HANSEN 1978, in DAVIS 1988).

In the fifth century B.C. in China, where *Datura* was considered a sacred plant, legend has it that when Buddha preached, dew or raindrops fell from heaven on the plant (SCHULTES & HOFMANN 1979). The Arabian doctor AVICENNA reported use of *Datura metel* in the eleventh century under the name *Jouzmatal* ("metel nut"), and its use has also been mentioned in the writings of DIOSCORIDES (SCHULTES & HOFMANN 1979).

In many New World Amerindian cultures, *Datura* is used during puberty initiation rituals and as an aid in acquiring an ally. North American Indians who drink *toloache* (a *Datura* concoction) have an injunction against partaking of the plant more than once in a lifetime, probably due to its dangerous and unpredictable character (RIPINSKY-NAXON 1993).

## SWAMI DHARMJYOTI'S USE OF *DATURA*

In the late 1970s, on one of my initial expeditions to Nepal, I became acquainted with SWAMI DHARMJYOTI. SWAMI, as he is affectionately known, is an 85 year-old Hindu yogi and Sanskrit scholar. As we became better acquainted, SWAMI invited me to accompany him to local religious rituals. Usually, I was the only Westerner present, and through him, I was often permitted to film the ceremonies.

We frequently met daily for long discussions on a wide range of eastern religious topics, which eventually led to discussions of his *betel* chew. In time, as his confidence in me developed, he revealed to me the nature of his *Datura* practice.

We have continued to develop our relationship, which now stretches more than two decades, on each of my visits to Kathmandu. These visits include two EXPLORER'S CLUB Flag expeditions—Flag No. 189 in 1999, and Flag No. 60 in 2001—during which, with the participation of TERESA FISKE, we were able to photograph and film in detail his *betel* chew preparation.

As a boy in his native India, yogis recognized young SWAMI as having an aptitude for yogic practice, and according to ancient tradition, his family sent him at the age of six to live with the yogis and begin his training. During the course of his yogic studies, SWAMI was slowly introduced to *Datura*, possibly enabling him to develop a tolerance for its potentially deadly effects. Finally, at the age of sixteen he was fully initiated in the daily ritual use of *Datura*. However, unlike the American Indians who use *Datura* once in a lifetime, SWAMI has continued to use *Datura* throughout his entire life.

By his own report, supported in part by my direct observation, SWAMI regularly takes at least eight daily doses of *Datura* in the form of the *betel* chew. Typically, he ingests the *betel* chew in the morning at 7:00 am, 8:00 am, and 9:00 am, then again in the afternoon at 2:00 pm and 3:00 pm (or 3:00 pm and 4:00 pm), and then at night at 7:00 pm, 8:00 pm, and 9:00 pm (or 8:00 pm, 9:00 pm, and 10:00 pm), usually taking none after 10:00 pm.

Not only does this constitute ingestion of what may be an extraordinary amount of *Datura*, it also appears to be a completely unique example of sustained daily usage of *Datura*. Based on *Datura's* classification as a deliriant, one would expect such a dosage level to render SWAMI confused, disoriented, unable to think clearly, and incapable of remembering almost anything.

In SWAMI's case, just the opposite appears to be true. SWAMI reports that without his daily regime of *Datura*, he is unable to remember the vast number of books he has read and Sanskrit writings he has studied, nor is he able to attain the level of mentation to which he is accustomed. Indeed, during the course of a conversation with SWAMI, he will pause to ingest his *betel* chew, and then continue to speak and act in the same manner as he did before.

SWAMI exists on a sparse diet composed mainly of rice, an effect consistent with the reduction in appetite caused by arecoline (CHARPENTIER 1977, in BEE 2000), the primary active ingredient of the areca nut (*Areca catechu*), a member of the Palmae family and one of the constituents of the *betel* chew. He reports that his *betel* chew with *Datura* produces such wonderfully sound sleep that only by pinching can he be awakened.

As with most *betel* chew preparations, SWAMI begins by choosing and cleaning a leaf of the *betel* pepper vine (*Piper betle*). The leaf, which will later be folded and rolled into a chewable quid with the other constituents inside, is rich in essential oils, especially eugenol, and has an antiseptic quality (ROONEY 1993, in BEE 2000). It comes from the Piperaceae family, which includes kava kava (*Piper methysticum*) and common table pepper (*Piper nigrum*).

Next, SWAMI applies a coating of slaked lime to the leaf, a practice that is common to almost all *betel* preparations. Slaked lime is lime (CaO) that has absorbed water to produce calcium hydroxide (Ca(OH)<sub>2</sub>), a more alkaline form of lime. The slaked lime reacts in the quid with the chemical arecoline from the areca nut to produce arecaidine, a stimulant to the central nervous system with nicotine-like properties (RUDGLEY 1993, in BEE 2000). The slaked lime also irritates the membranes of the cheek, increasing blood flow to the area, which aids in the absorption of the tropane alkaloids contained in *Datura* (McCLOY 2002).

SWAMI slices the areca nut (*Areca catechu*) for his *betel* chew.

SWAMI next adds a mixture of tobacco and *Datura* seeds. This tobacco is much more potent and less tainted with chemical additives than tobacco found in the West. The *Datura* seeds are boiled in milk and then dried in the shade. The tobacco and *Datura* are then fried together and dried, resulting in a crystalline looking preparation. The tobacco contains nicotine, which is a stimulant and may also help to counteract the sleep-inducing aspect of the *Datura*. *Cannabis sativa*, as well as tobacco, is often used as an admixture to this preparation.

Next SWAMI adds pieces of white hard *Katha* or *Cutch* from *Acacia catechu* (McCLOY 2002), a member of the Leguminosae family. The bark of the tree is crushed and boiled producing the hard white *Katha*, which is cut into small pieces for use in the quid.

Pieces of the areca nut are then cut and added to the quid. The primary active alkaloid of the areca nut, arecoline, stimulates the parasympathetic nervous system, increasing the flow of saliva, tears, and sweat, dilating the blood vessels, and increasing the tone and contractility of smooth muscle. Overall there is an increase in breathing and perspiration while maintaining a steady heartbeat (BEE 2000).

Additionally, for taste, SWAMI may add cardamom to the quid. When chewed with the areca nut and lime, the *Piper betle* leaf produces copious amounts of red saliva, which is periodically spit on the ground or in spittoons (BEE 2000). For a more potent mixture, SWAMI adds a relatively pure extract of *Datura* seeds to the quid, prepared in the form of a black paste, which is spread on the leaf to about an inch in length by 1/4 inch wide and 1/16 inch thick.

## DATURA: A PERSONAL EXPERIMENT

As we documented SWAMI's *Datura* quid preparation and use, he agreed to initiate me into the practice itself and let us film the process. SWAMI prepared for me a quid identical to those I have watched him prepare for himself, including the addition of the *Datura* paste. SWAMI cautioned me against swallowing the potent mixture, and constantly monitored my physical and mental state as the *Datura* took effect.

At first, I found myself entering a state of vertigo and became dizzy, which was stabilized by sitting down. I reported a feeling of lightness in the head, and a sensation like that of an electric current running throughout my body. I spit the red mixture out on the ground as its effects continued to

increase in intensity. Finally, I lay down to rest and enjoy the *Datura* experience.

After some time, SWAMI became concerned and insisted on administering his “antidote” to me. His concern appeared overstated to me, but he insisted saying he didn’t want the death of a Westerner on his hands as it would cause problems for him with the local authorities! For my part, I became interested in the nature of his antidote, never having heard of a local one. His antidote consisted of a mixture of yogurt, water, and a large quantity of sugar. The recognized medical antidote for *Datura* poisoning is physostigmine, a drug first isolated from the Calabar bean (*Physostigma venenosum*), a climbing liana that grows in the swampy coastal areas of West Africa (GOODMAN & GILMAN 1970, in DAVIS 1988). However, it is worth noting that physostigmine was unable to be demonstrated antidotal in normal humans (DRACHMAN 1977), and it was reported to show an improvement in memory in only one solitary psychotic (SITRAM et al. 1978, in PETERS & LEVIN 1977). It is unlikely that SWAMI’s antidote works through chemical counteraction of the scopolamine; its primary benefit is probably psychological. Taking the antidote did not stop the effects I was experiencing.

The effects of my *Datura* experience lasted for the next 24 to 36 hours, slowly decreasing in intensity. During this time I experienced an “elevated state” of mind and exhibited, according to external observation, a euphoric disposition.

It may be difficult to extrapolate SWAMI’s regime of *Datura* use to wider application, since he began as a young boy and may have developed a tolerance for *Datura* not previously recognized. It has also been postulated that SWAMI’s insistence that he requires his daily dosage of *Datura* in order to recall his vast learning and studies is an example of the “state specific knowledge” phenomena in which material absorbed at a certain state of consciousness can only be recalled in a similar state of consciousness (TART 1972), and therefore not necessarily a specific result of his *Datura* practice.

Regardless of our theories concerning his *Datura* usage, SWAMI’s practice does stand as a unique example of *Datura* ingestion, and should provide the impetus for further study, including the search for others with a similar *Datura* practice. Unfortunately, modern custom has made it almost impossible for young persons with the potential for yogic practice to leave their families and follow the yogi path, apparently leaving SWAMI with no apprentice to follow in his footsteps. We may therefore be left with this unique report of *Datura* consumed in the way it is used by SWAMI as one of our few keys to understanding the effects of one of nature’s most fascinating and powerful sacred plants. ☉

Arecoline from areca nut is a proven cholinergic agonist in contrast to the antagonistic action of scopolamine—its action on memory is the direct reverse of scopolamine (SITARAM et al. 1978), and it has been shown in laboratory animals to specifically reverse memory deficit caused by scopolamine administration. Since scopolamine has a much longer duration, re-administration of the arecoline/nicotine chew may be requisite. — Eds.

Robert “Rio” Hahn is a practitioner of “necessary adventure.” A recognized explorer, his many expeditions include serving as scientific chief for a two-year expedition 2000 miles up the Amazon River investigating medicinal and psychoactive plants used by shaman of the northwest Amazon, and as expedition chief for a three-year around-the-world investigation of the tropic world. He has been elected a Fellow of both the Royal Geographical Society and The Explorers Club, where he currently serves as a member of the Board of Directors. Robert can be contacted at [RioHahn@adventure.org](mailto:RioHahn@adventure.org).

**NOTE:** *Datura* can be a dangerous plant; this article should not be viewed as recommending its use.

# NETWORK FEEDBACK

## ACORUS CALAMUS

Inspired by S. BEAR's glowing report of *Acorus calamus* experiments in *The Entheogen Review* 10(2): 68–70, I obtained several ounces of "high grade American *A. calamus* root" from a supplier who advertises in the *ER*. The root was certainly fresh enough to exude its *unique* odor onto everything in the package. When a small piece was chewed, I felt the same buzzing in my mouth that S. BEAR had described. I include this detail to establish that—as far as I can tell—my supplier was accurately describing the product he sent to me. My first bioassay was with 3 grams, ground up and ingested in water. I attended a party that day and felt slight but nonetheless very pleasant stimulation and some euphoria for several hours. Encouraged by the results of this experiment, I decided to try a higher dose, in a stunningly gorgeous location in the Sonoran desert. This location was a two-hour hike away from anything resembling civilization. I had ground up 10 grams, but for some reason, my "stay-on-the-safe-side" guardian angel told me to take 6. So I ingested 6 grams (in 12 ounces of water), on an empty stomach in the morning, before my companion and I hiked to our destination—a riparian area in a completely wild canyon.

An hour or so into the hike, I felt slightly nauseated, but I am used to a bit of this during bioassays, and shrugged it off, remembering S. BEAR's comment about *Acorus calamus* "settling the stomach," and figured it would pass. It didn't. Finally we reached our destination and I was feeling very nauseated indeed. I sat down on a rock and surveyed the scene... red rock canyon walls, the sound of a trickling creek, wildlife all around. I should have been at play in the fields of the Lord, but finally the nausea became too much, and I remembered (synchronistically) a line from *The Yoga of Herbs*, that *A. calamus* in "high doses [was] an emetic." The word "emetic" would echo itself into my consciousness for the following hours, as I began to vomit in an excruciating fashion everything in my stomach (which wasn't much, mostly water).

That was all fine and well, sort of, but I found soon thereafter that I couldn't even keep a capful of water down. Even the tiniest bit of water would cause my stomach to contract and, I'm sorry, but I must give a few grisly details of the

vomiting. I've vomited on many substances before—opium, peyote, and even some kinds of psilocybian mushrooms. The vomiting from *Acorus calamus* was unlike any of these. Instead of bringing any relief, it felt like a huge hand was squeezing my stomach, wringing like a sponge every drop of moisture from it. If that weren't bad enough, the vomit itself was the consistency of foamy saliva, making it necessary to spit out every last bit to keep from choking on it. It was hard enough to *think* in a situation like this, vomiting every few minutes, not to mention the fact that we were miles from civilization, much less a toilet, with the only way out being on foot.

Somehow I managed, with the generous help of my companion, to hike the several miles out of the canyon in record time, sipping liquid to keep from dehydrating, and vomiting every few minutes as I walked—quite a unique experience. I was very lucky that we did this hike in the cool winter, for if it had been the middle of summer, I could have been in serious trouble.

Back at our car, we still had to drive ten miles or so to reach a place where I could lie down. I was vomiting every few minutes. I have a new and profound respect for the agonies of chemotherapy patients, and can state that not being able to stop vomiting brought on some of the deepest despair I've experienced. Thank the gods that I had some *Cannabis* in the car, which I immediately sparked up—it quickly and miraculously mellowed the nausea and I was okay to drive the few miles to shelter. Once at the shelter, I started throwing up again, but at least with the *Cannabis* it was more manageable, and I knew that I would be okay. A cup of ginger tea also helped keep the nausea at bay. Nevertheless, I continued to throw up and was unable to keep anything more than a cup of water down for the next *ten hours*.

During this time, there was a quite noticeable psychoactive effect—MDMA-like, perhaps. But this was more of a nuisance than interesting, as I was in no condition to enjoy it.

I blame no one but myself—I know it's dumb to experiment in the wild with plants one knows hardly at all, and I shall never make that mistake again. I can't say that I didn't learn

anything—I certainly proved to myself the value of *Cannabis* and ginger as anti-emetics, and I'll never hear the words "medical marijuana" in the same way again! But I think we should be careful before jumping to conclusions about "stale calamus" being responsible for the effects experienced by myself and Dr. M.P. in *ER* 10(4): 149, or about *Acorus calamus*—even really good American *A. calamus*—as being an appropriate pleasure drug for everybody. Perhaps it's down to individual constitutions, perhaps this plant just doesn't like certain people (I'm very *pitta*, ayurvedically, if that explains anything). I would love to hear speculations that anyone might have on why this occurred, but I'm surprised, given the intensity of negative side effects (lasting ten hours) that it hasn't popped up in the literature more often.

Upon returning home, I unceremoniously dumped my several ounces of *Acorus calamus* root, as I will be unable to abide the smell of that plant again in this lifetime. However, I think that *A. calamus* has at least one positive effect that could be employed by traffickers in certain stinky substances. I have some weeks-old *kratom* that *still* stinks from being in the same package. Perhaps *A. calamus* could be used to confuse drug-sniffing dogs. Just a thought. — TALBY

## NUTMEG

A recent issue of the *ER* contained yet another reference to the psychotropic properties of nutmeg. I would like to add my own experience.

I lived in New Zealand for a number of years, during the NIXON regime. It was the same old story—a very active drug squad, nary a joint to be found, but heroin relatively easily accessible. This situation led mates and me to each ingest three heaping teaspoons of *Myristica fragrans*. It wasn't until a full four hours later that things began to feel a bit strange. By then, I had forgotten all about having taken the nutmeg, so I was surprised indeed! I found the effects to be very similar to those of *Cannabis*, with pronounced components of both euphoria and "mind tripping"—the ability to see a seemingly endless number of perspectives around a single event. Some "spacing out" was evident, eyes became very bloodshot, and cottonmouth was prominent. The muchies were absolutely merciless! I recall one of my mates, that first time, laughing so hard that he fell off the end of the couch and continued in paroxysms of laughter on the floor. Unfortunately, nutmeg is not easy to swallow and it gets

## PSYCHEDELIC RESOURCE LIST — FINALLY AVAILABLE!

Massively Expanded and Updated Fourth Edition

New Art Chapter • New Cannabis Seed Chapter • Many New Botanical Suppliers

Provides Sources For:

INFO: Books, periodicals, web pages.

GATHERINGS: Festivals, conferences, seminars.

PEYOTE: Seeds, live plants, and other psychoactive cacti.

ORGANIZATIONS: Religious, non-profit, and professional groups.

PSILOCYBES: Spore prints, syringes, dried mushrooms, grow supplies.

TABERNANTHE IBOGA: Seeds, roots, full-spectrum extracts, and ibogaine.

GARDENING SUPPLIES: Hydroponics, lights, timers, nutrients, predator insects.

RESEARCH CHEMICALS: Tryptamines, phenethylamines, GHB analogs, & more.

SMART DRUGS & OTHER PHARMACEUTICALS: Overseas medication suppliers.

CANNABIS: Viable seeds for countless strains and suppliers of dried herb.

SALVIA DIVINORUM: Plants, leaves, seeds, extracts, and salvinorin A.

PARAPHERNALIA: Vaporizers, pipes, and sundry smoking supplies.

LAB SUPPLIES: Glassware, solvents, chemical sources, etc.

AYAHUASCA: Traditional and analog dried herbs.

OPIUM POPPIES: seeds and dried pods.

AND MUCH MORE!

8.5" X 11", 207 pages, illustrated, with over 650 reviews.

\$20.00 plus \$4.00 (USA), \$9.00 (foreign) for S&H.

CA residents add \$1.60 for sales tax. Available from:

Soma Graphics, POB 19820 (Dept. ER), Sacramento, CA 95819

progressively more difficult the more times on does it, hence the reason that I have only done it perhaps a half-dozen times. The most I ever took was five heaping teaspoons—more than necessary. That time, I thought that I would take a spin on my motorcycle—I didn't even get two blocks away before I had to pull over and push the bike back home—every part of my body that was in contact with the bike was “merging” with it, so that I was unable to maintain a sense of balance. The effects of nutmeg usually lasted for the better part of two days; it was nice to know that when I awoke after a good night's sleep, I would still be pleasantly stoned (unlike with *Cannabis*, where a nap wipes the slate clean). I never experienced or heard of anyone experiencing negative effects of any kind, though I did read somewhere that excessive use of nutmeg may damage the liver. Upon my return to the States, I was told that there had been a run on nutmeg and that the stores couldn't keep it on the shelves. I tried it once again, but with no apparent effect. I suspect that perhaps by heating it or by some other means the psychoactivity had been neutralized. It would be nice if someone could come up with a kitchen extraction method (I tried several solvents to no avail). I would very much like to see the powers of evil try to subvert the use of something so ubiquitous as nutmeg!

— ANONYMOUS

## MYRISTICIN, MISTLETOE, AND ADRENOCHROME

On page 447 of *Pharmactheon*, JONATHAN OTT says that myristicin is psychotropic at a 400 mg dose and was isolated from *Myristica fragrans*. The spices nutmeg and mace are both made from this plant, and they both contain myristicin. They are legal and can be found in every town and the stuff to extract the myristicin can be obtained from any hardware store. Someone should run a crude extraction for this, and report back on their experiences ingesting it! On another note, I've heard that mistletoe is hallucinogenic. Is it? Finally, I'm not asking just because it was mentioned in *Fear and Loathing in Las Vegas*, as I first read about it in *Storming Heaven* by JAY STEVENS... But anyway, is adrenochrome real? Does it work? I found this recipe on the Internet at [www.lycaenum.org](http://www.lycaenum.org): 2 grams of adrenaline in 70 ml of water, add muriatic acid dropwise with shaking until clear, then add 8 grams of silver oxide and shake 5 minutes. Then filter. Thanks for any help you can provide. — ANONYMOUS

Regarding your suggestion that someone extract and consume *Myristica fragrans*, our initial question is, “Why?” And our next question, “Why not you?” The “high” overall is reported by many people to be rough (although the *ER* subscriber above seemed to enjoy it), and this is not likely to change if the active component is concentrated—although it would make it easier to consume. It often leaves one feeling lethargic and mildly poisoned for a rather long time afterwards. There are far better drugs than nutmeg around. Despite what OTT says, it is presently still argued whether myristicin is even actually active; it may be that it is the presence of elemicin which is required for nutmeg to produce its effects. Isolation of an essential oil of nutmeg is not complicated. Steam distillation and column fractionation should work fine. For a “crude extraction,” soak it in 70% ethanol for a few days, and evaporate it after filtering. One of the editors attempted to use nutmeg to get high from as a kid; the result from consuming a tablespoon of dried powder was merely a life-long aversion to the taste of nutmeg, with no psychoactive effects at all. The other editor found nutmeg interesting initially when swallowing a few heaping tablespoonfuls, but the body load and extreme persistence of aftereffects rapidly led him to abandon all interest.

Mistletoe does not appear to produce visions. However, it is important to remember that “mistletoe” is not a species of plant but rather a number of different plants with similar parasitic habits. Their chemistry is often quite different from one to the next. At least one species contains a substituted tryptamine of unknown human pharmacology (mentioned in passing in *TIHKAL*) but we can locate no pharmacological work. Most accounts describe mistletoe ingestion as mildly mind-altering or stimulating and not psychoactive. In fact, we have thus far never encountered a claim for visionary effects from mistletoe by anyone who bioassayed it. It is probable that the claims that it is a “hallucinogen” may stem from assumptions revolving around its sacred status and the common misconception that if a plant is considered to be sacred this indicates something that produces a visionary experience.

Adrenochrome is indeed an oxidation product of adrenaline (epinephrine). It is available from some mainstream chemical supply companies, and it has occasionally been seen listed among the offerings of those who provide psychoactive “research chemicals.” Many publications present it as a “psychotomimetic,” and it has been investigated as possibly playing a role in schizophrenia. Despite its frequently being presented as causing stimulation and/or hallucination, we are unaware of anyone who has reported any psychoactive effects from bioassaying adrenochrome, and the general consensus about this chemical is that reports of its use as a recreational drug are probably fictional. The book *Legal Highs* (a notoriously unreliable source) comments that 100 mg of adrenochrome semicarbazone can be dissolved in alcohol or fat (to aid absorption), and it produces “stimulation, [a] feeling of well-being, [and a] slight reduction in thought processes” (GOTTLIEB 1973). It also remarks that “Adrenochrome causes chemically induced schizophrenia. Its semicarbazone does not.” The Erowid Adrenochrome Vault notes that “adrenochrome monosemicarbazone, a derivative of adrenochrome, is marketed in some countries for the prevention of certain types of bleeding, both IM and in tablets” ([www.erowid.org/chemicals/adrenochrome/adrenochrome\\_basics.shtml](http://www.erowid.org/chemicals/adrenochrome/adrenochrome_basics.shtml)). — Eds.

## WORLD REPORT: JAPAN

I live in Sapporo, on the northern island of Hokkaido, which is pretty far from the action in Tokyo. Recently, psilocybian mushrooms were made illegal in Japan, but prior to that I could get them from Tokyo in bulk for about \$2.00 per gram. There have been some arrests for mushrooms in the area that I live in, but mostly it is just high school kids bragging and then getting busted. Here in Japan, everything from *Cannabis* on up is equated with heroin. And recently cocaine has been identified as coming through North Korea, adding to the bogeyman image of all drugs. Japan is a funny country, and fun, but drugs are most definitely taboo. Now there are several places selling MBDB and other things, but they are available in Japan only (via the Internet). Do you suppose it is safe to forward such research chemicals to the United States? The best price is at [www.winpal.net/~chemical/shop/buy.html](http://www.winpal.net/~chemical/shop/buy.html), but other places that sell in Japan include [www2.newweb.ne.jp/wd/mushroom/sub3.htm](http://www2.newweb.ne.jp/wd/mushroom/sub3.htm) and [www.drug.bird.to/chem.html](http://www.drug.bird.to/chem.html). In the United States there is [www.harulabo.com/tama1.html](http://www.harulabo.com/tama1.html) (although based in the USA, they will only sell to Japan). They sold 5-MeO-DIPT and AMT, although with the proposed scheduling of these substances in the States, I don't know if they still offer them. They also had 5-MeO-DMT. I haven't ordered from the Japanese sites, but I will. I've heard of a friend ordering from China, and I will find out more about this. I did order some 2C-I from the U.S. company that sells to Japan, and it arrived, but I haven't yet tried it. I'm really more of an archivist and collector than a jumbo petri dish. I just want a well-stocked medicine cabinet while these things are still available. I understand that safety is an issue best addressed through long-term research, but is there any info at least on the *quality* from these and other research chemical supply companies? Perhaps an informal survey? Is there a marked difference between various companies selling the same item? I intend to try the things that I have bought, I'm just not sure when. As MARK TWAIN said, "One of my strengths of character is that I'm always intending to do something." The problem is that the first one I tried was 5-MeO-DMT, and it scared the shit out of me. 2C-I, 4-Acetoxy-DET, and MBDB all sound a little milder. — G.N., Hokkaido, Japan

Thanks for the international scene report. You pose a good question: how does one know what the quality is of the chemicals that come from various research chemical suppliers? Other concerns are whether or not the company is a rip-off scam, whether or not the company is being watched via mail cover operations or web site surveying, and whether or not the company might in fact simply be a DEA sting operation. Unfortunately, it can be hard to get solid

answers. We were recently made aware of an underground weekly e-mailing list that provides updates on companies selling research chemicals.

The listing/review that we were forwarded described companies in the United States and various foreign countries, and some of the foreign companies were listed as selling chemicals that are specifically scheduled in the USA. A complete list of the chemicals that were currently noted as being offered from all of the companies combined included: 2-amino-Indan, 2C-B, 2C-C, 2C-E, 2C-H, 2C-I, 2C-T-2, 2C-T-4, 2C-T-7, 4-ACO-DET, 4-ACO-DIPT, 4-ACO-DMT, 4-ACO-DPT, 4-ACO-EPT, 4-ACO-EIPT, 4-ACO-MET, 4-FMP, 4-HO-DIPT, 5-MeO-AMT, 5-MeO-DET, 5-MeO-DIPT, 5-MeO-DMT, 5-MeO-DPT, 5-MeO-EIPT, 5-MeO-MET, 5-MeO-MIPT, adrenochrome, AMT, BZP, CHB, crotono-GBL, DIPT, DXM, DPT, EIPT, harmaline, harmine, MET, mCPP, mMPP, pMPP, PIPT, salvinorin crystals, TFMPP, and TMA-2. Although we didn't see it mentioned in this list, we know that one of the companies will provide MBDB, and there was even the suggestion that a different company in China might be willing to provide MDMA and mescaline (although it no longer listed them on its web site, it apparently *did* list them at one time). Most of the companies reviewed in this e-list had web sites; it seems like a carefully-worded web search might turn up some of them.

The copy of this e-list that we saw noted the same three companies that we have pointed out in past issues of *ER* as most likely being rip-offs under their "scam alert" section: TIMBERWOLF GARDENS, E-CHEMICAL SUPPLIER, and MBE TECH. For those companies that do not appear to be scams, the e-list rates them based on price, quality, customer service, and variety. The list requests that those receiving it do not forward it. Since obviously this was not the case when we got a hold of it, it seems possible that the folks running this list might be at risk—as might be those who subscribe to the list—of investigation by the government. Not that providing such a list in-and-of-itself is breaking any laws, but with the gung-ho manner in which the current U.S. government is trashing the Constitution, it seems prudent to not pass along any specific details about this list in *ER*. It is sad that such measures need to be taken to protect the privacy of people who are trying to provide a useful service (as well as the people who want to use that service), but such is the environment that we are living in these days. — Eds.

## FAREWELL TO LEGAL 5-MeO-DIPT AND AMT

Alas, it is time to bid farewell to (legal) 5-MeO-DIPT ("foxy methoxy") and AMT, two more entheogens that the U.S. government has seen fit to ban. As I'm sure most of us are aware—the DEA filed for emergency scheduling of these two research chemicals on January 28, 2003. [*For those willing to risk a visit to the DEA web page, surf to [www.dea.gov/pubs/intel/02052/02052.html](http://www.dea.gov/pubs/intel/02052/02052.html) for more details.* — Eds.]

Among other things, I consider myself a cognitive researcher and techno-shaman. I've been using 5-MeO-DIPT to enhance

both my chakra and *chi* exercises, with excellent results. The natural energy inherent in 5-MeO-DIPT experiences lends itself well to this type of work (as do several other entheogens—which, for the time being, at least—mitigates the loss). Fortunately, the true measure of the success of this work has been that lately, I've been able to achieve advanced results when doing this work outside the context of the 5-MeO-DIPT experience, while sober. In other words, it seems as though the 5-MeO-DIPT has done the job that I wanted it to do. My experiences with 5-MeO-DIPT have all been positive, but my work is still in the early stages (compared with, say, LSD, for example) and now it seems likely that I will not be able to see what else I may have been able to learn from 5-MeO-DIPT—or, at the very least, that my efforts will be hindered.

Why has the DEA selected these two tryptamines to focus their attention and resources upon when there are so many others? I'm not sure, but I'm willing to indulge in a little speculation. 5-MeO-DIPT and AMT are, generally speaking, more easily tolerated by the general public than are some of the other available research chemicals. While many people can "party" while under the influence of these, a,O-DMS and 5-MeO-DMT, in contrast, have been less likely to show up on the "party scene." Because of this, 5-MeO-DIPT and AMT have unfortunately become more visible—increasingly used on the club scene and at raves—so their blips on the government's "radar" became so large that they became easy targets.

The issue is probably more complex than that, but my bet is that this is at least a major component of the story behind this emergency scheduling. If I'm correct, then what? Here's what: those of us who use such compounds for entheogenic purposes should probably do our part to keep the remaining research chemical blips as small as possible—I know I will. I'm not talking about being selfish—spread the word. But I am talking about being selective; entheogens aren't for everyone, everywhere, all the time. There is a time and a place for all things. Let's do our part to choose our own actions wisely.

Speaking of 5-MeO-DIPT, I recently conducted a series of cross-tolerance tests concerning 5-MeO-DIPT and a,O-DMS. Past experience had suggested that there would indeed be a cross tolerance between the two, but I decided to formalize the result with an extended series of alternating bioassays, taking a dose of 5-MeO-DIPT one day, a dose of a,O-DMS the next, followed by a dose of 5-MeO-DIPT on the following day, and so on, until four cycles (5-MeO-DIPT → a,O-

[books@troutsnotes.com](mailto:books@troutsnotes.com)

DMS = one cycle) had been completed. Based on previous experience, I increased the dosages of each entheogen for each succeeding day in an effort to approximate the same “level” of intensity. I began the series with a dose of approximately 20 mg of 5-MeO-DIPT, followed with a beginning dose of a,O-DMS of approximately 10 mg. I increased each succeeding dose by about 5 mg for doses of 5-MeO-DIPT and about 2–3 mg for doses of a,O-DMS. I ended the series with a dose of about 35 mg (5-MeO-DIPT), and an a,O-DMS dose of about 16–19 mg—with the final doses of each being higher than was necessary to achieve the desired level of intensity. This was a rather rigorous dosing regimen. I’m currently in the process of inserting “sober” days between uses of 5-MeO-DIPT and a,O-DMS in a similar series. However, I think that I can say that the results are, for the most part, already obvious, especially comparing current observations with past experiences of this sort. So, here are the results:

5-MeO-DIPT and a,O-DMS do indeed cause a tolerance for each other. If one simply must “try” for an extended period, this tolerance can be, at least partially, overcome by increasing succeeding dosage levels. The amount you need to increase the dose is not necessarily the same amount that you increased the dose the last time. And, even if you do manage to reach the same or an even higher level of intensity, you are still likely to suffer “duration penalties,” i.e., your trip may be just as, or even more, intense than your previous trip, but it will probably not last as long (even taking into account that 5-MeO-DIPT and a,O-DMS trips have different typical durations). Of course, a “mega-dose” could still result in a trip of both increased intensity and duration. This is pretty dry stuff, and I feel as though most of this type of information should be part of “common knowledge” somehow, but I’m not sure I’ve read it anywhere else.

Inserting “sober” days between trips decreases tolerance. For me this is quite dramatic. However, I am a regular user of tryptamines, and it may be that this has conditioned my body to metabolize tryptamines more quickly than an occasional tryptamine user. Years ago I read somewhere (*High Times*, perhaps) that regular users of THC metabolize THC at a faster rate than occasional users. My experience suggests that this is true of metabolizing tryptamines, as well.

Although chronic *Cannabis* smokers do indeed metabolize delta-9-THC about twice as fast as non-users (LEMBERGER et al. 1971), extrapolation of such differences cannot be applied to alkaloid ingestion since the routes of metabolism are quite different. While I obviously can not state that what was reported was not the experience of the reader since it is what s/he reported experiencing, this has not

been my experience when exploring repeat administrations. It is also important to remain aware that not all tryptamines are created equal. Some, such as psilocybin, lead to rapid development of tolerance while others such as DMT or 5-MeO-DMT can be repeated with surprising frequency and will show the development of an increased sensitivity to the effects with only an hour or two between doses. Cross-tolerances between the various tryptamines seem to be all over the board. A meaningful cross-tolerance study between particular compounds would not alternate back and forth between the two, but instead would use one substance enough to first create the development of tolerance and then would apply the other to determine whether an ameliorated, unchanged, or exaggerated response resulted. — K. TROUT

For me, a two day “sober” period seems to completely “reset” my ability to trip, and a one day period seems to do almost as well. (A “one day” “sober” period between trips actually amounts to about 48 hours between the *dosing* times; so if one were to dose at 6:00 pm on Monday, then the next dose would be at 6:00 pm on Wednesday, with Tuesday being the inserted “sober day.” Obviously the actual amount of time spent “sober” depends on the duration of the compound(s) that one is working with.)

Past personal tolerance (but not cross-tolerance) studies conducted on both 5-MeO-DIPT and a,O-DMS have yielded the result that use of both 5-MeO-DIPT and a,O-DMS does result in a tolerance for the same substance if used on the following day. Again, in both of these cases, I believe that regular users will lose their tolerance at a higher rate than non-regular users.

This conjecture regarding a faster rate of lost tolerance by regular users is not supported by anything in my own experience—not with DMT, 5-MeO-DMT, LSD, DPT, 4-Acetoxy-DET, 4-Acetoxy-DIPT, PIPT, or anything else. It may be an idiosyncratic result. — K. TROUT

While I’m on the subject on 5-MeO-DIPT and a,O-DMS, I might as well relate an interesting experience from last year involving a combination of 5-MeO-DIPT and a,O-DMS with several other entheogens administered over a three-day period, and combined with dreaming and meditation techniques.

One Saturday in late November 2002, the planets aligned properly and an interesting chain of events unfolded. It was early afternoon. I had been expecting a delivery of 5-MeO-DMT and 5-MeO-DIPT that morning, but it was not delivered, to my dismay. I was still determined to trip that day—so I measured out 12 mg of the a,O-DMS that I had on hand and proceeded to consume the dose in a shot of orange juice. My buddy “B” had stopped by for a *Cannabis* smoking ses-

sion. For me, *Cannabis* always goes well with a,O-DMS, and is sometimes mandatory. We were enjoying what the afternoon had to offer, when the knock came at the door. It was the later-than-usual delivery of the 5-MeO-DMT and 5-MeO-DIPT that I had been expecting that morning. Now I had a dilemma. I had really been anticipating the arrival of the 5-MeO-DMT because it had been a while since I had any of it in my possession and it is one of my personal favorites. But I had already dosed on the a,O-DMS. I had been warned by a label on a static-free bag of a,O-DMS that “by no means should ‘a,O-DMS’ ever be combined with 5-MeO-DMT,” so you see my problem. I had had every intention of combining the two before I read this warning. I searched for information for months about this combination, but found nothing. I wrote people “in the know” with no results. I talked about the topic and speculated with friends. There just didn’t seem to be anything out there to support, or refute, the warning. “B” had previously suggested that the warning may just have been because 5-MeO-DMT and a,O-DMS are both such powerful substances all by themselves that the supplier may have been of the opinion that only an idiot would even think about combining them. Or, perhaps they personally knew someone who “freaked out” on the combo...

So, I decided to “go for it.” I felt healthy as a horse and “B” was present to act as a “sitter” in case anything went drastically wrong. I loaded up about 12 mg of the 5-MeO-DMT and vaporized it in my bowl, and it was fabulous—no problems, just increased power and length to the experience with increased psychedelia. While this combo may not be suitable for the beginning psychonaut, it is nothing to fear for the more experienced.

A friend of mine from northern California arrived unexpectedly with his latest batch of mushrooms, and I consumed 4 grams of his fine Ecuadorian *Psilocybe cubensis*. After the mushrooms kicked in I dosed on about 10 mg of 5-MeO-DIPT, figuring, “What the hell.” It was a very intense trip, but was only a prelude. Throughout the trip I continued to periodically visit the void via ever-increasing doses of 5-MeO-DMT—dosing 10 times before going to bed.

We are puzzled by this account. Starting with 12 mg of 5-MeO-DMT (following the ingestion of 12 mg a,O-DMS and *Cannabis*), this correspondent consumes 4 grams of mushrooms, 10 mg of 5-MeO-DIPT, and then smokes 10 additional “ever-increasing doses of 5-MeO-DMT.” Even if these doses were only increased by 1 mg each time, this would be  $12 + 13 + 14 + 15 + 16 + 17 + 18 + 19 + 20 + 21 + 22 = 187$  mg of 5-MeO-DMT. Either this person is 1) a hard-head, 2) insensitive for some reason (there could be many, such

as the use of various antidepressants), 3) bullshitting, 4) likes it more extreme than most, or 4) dosed so close together that he had a diminished response due to receptor saturation. Whatever the case, we don’t recommend that readers take any actions based on the information presented in this account with the presumption that similar doses would produce similar effects in them. — Eds.

Prior to going to “sleep” I meditated and set my intent to dream lucidly—and to dream a dream “worth dreaming.” And I most certainly did. Upon commencing my dreaming, I entered a state of being that is best described as a trance. Words are about to become inadequate.

I was aware, lucid, brimming with energy. My awareness bloomed—like a liquid flower. My perception expanded ever outwards. I became embedded in the center of causality. I became the tip of a space/time worm in motion, plowing through, burrowing through, everything. Plowing my own furrow in the field of time. The bubble-waves of causality rippled out, expanding in all directions from the tip of the worm, and along its body. North, south, east, west, up, down, past, present, future, and elsewhere... and elsewhere... And I saw that I was connected to everything the waves touched.

Over the next several days I continued periodic dosing (decreasing the number of doses of 5-MeO-DMT to 5 and adding a booster dose of 5-MeO-DIPT on day two; increasing the number of 5-MeO-DMT doses to 12 on day three). Prior to “sleep” each day, I meditated and set my dreaming intent; the dreaming trance dance at the center of causality continued each night for three nights in a row:

As I slipped into the dream, I moved into the causal nexus once again, taking up the syncopated dance of my intermittent trance. The visions were multi-dimensional, vivid, intense, and informative. — MoDu

## TOBACCO MORPHINE, ISOQUINOLINES, ANADENANTHERA & LIME

In the phytochemistry section of the local university library, I was reading a book published in the 1960s on plant alkaloid production. (Alas, the name of the book escapes me.) Anyway, it seems as though it is possible to “coax” tobacco plants to produce morphine if fed thebaine in some sort of supplemental plant food. Perhaps a compost mixture of *Papaver bracteum* material would provide enough thebaine?

Would this process actually produce any useful amounts of morphine? We don't know. If used as a compost, it seems possible that the composting bacteria might degrade the thebaine. If you were able to locate the book again, it would be interesting to know the quantity of thebaine that was added into the plant food. This could then be compared to the quantity of thebaine that is naturally found in *Papaver bracteum*, and if the later was too low, perhaps an extraction could be made to add at feeding times. The question would remain how one would go about dealing with all of the normal *Nicotiana* products, including nicotine, that would also be produced along with the morphine; but perhaps you are simply looking for some slight morphine effect while smoking the tobacco for its other effects? — Eds.

After consuming blue lily flowers a few times, I decided to investigate the literature. Subsequently, I learned of the shared chemistry of these flowers and *Nelumbo nucifera*, and *Ziziphus jujuba* (Chinese dates), *Corydalis* species, and scores of other plants that contain isoquinolines/aporphines. The new book *The Simple Plant Isoquinolines* by ALEXANDER T. SHULGIN and WENDY PERRY brought a huge array of plants to my attention. *Corydalis* extracts and *Z. jujuba* extracts are available at very reasonable prices from OM-CHI HERBS, and next to poppy seeds, *Corydalis* and *Z. jujuba* are my favorite source of these sedative/stimulant/analgesic/hypnotic/antitussive/immunostimulating/etc. alkaloids.

It is not correct to lump the isoquinolines together as if they were somehow a single active group with shared pharmacology. They have a wide and disparate palette of activities or lack of activities, in the same way that indoles, betacarbolines, and phenethylamines all are classes of compounds with a wide range of activities or lack of activities. The important thing to remember about any of these classes, and this is especially true of the isoquinolines, is that most of them show no interesting psychoactivity.

In regard to the SUMMER SOLSTICE 2002 issue of the *ER*, page 69, with reference to the editor's comments on *Anadenanthera* snuff: I found that without lime paste, the snuff was very mild, large amounts were needed, and my nasal passages swelled until they were almost closed by the second line of snuff. At this point, I can understand the need to have the powder "blasted" into the nasal cavity by a helper through a blowgun-style snuff tube. My first experience left me skeptical about pursuing these snuffs. Recently, however, I tried again, after reading an exuberant bioassay report in EROWID's vaults as my tip-off to the importance of lime paste. Ten grams of fresh seeds ground with 2 grams "wet" lime paste released a potent cloud of ammonia—anyone understand the mechanics of this? The wet mixture was dried, creating 8.5 grams of snuff. At least to *this* person, the resultant snuff is much stronger, with threshold effects from as little as 25

mg. A half-gram of this snuff insufflated in one sitting brought on a narcoleptic blackout in one person for about an hour. This person was unconscious, having a "near death" crisis in the beginning of the experience with very "real" hallucinations of police, ambulances, etc., in the beginning, and then nothing. Recovery was quick (two hours). This person's first experience with *yopo* remains an "important" event in his life, he says.

Personally, I like the low-dose potential of this snuff. 50–100 mg produces a warming excitable stage followed by a sometimes pleasant sedation. Sometimes I wonder if melatonin is being produced/released as a metabolic product of consuming this tryptamine mixture? Tobacco snuff, or chewed *coca* leaf on a few occasions, seemed to lessen some of the uncomfortable side-effects, such as nausea and head pressure. — C.G., ID

## PSILOCYBE CYANOFIBRILLOSA

This past fall my friend T.F. "discovered" several mushroom patches in his neighborhood. Specifically, at the SUNNYVALE LIBRARY and POLICE STATION complex, right next to stinky ol' El Camino Road. He said that it was fascinating to witness the slow and steady emergence of mushroom patches all over the grounds anywhere and everywhere woodchips were laid beneath hedges and shrubbery. T.F. originally found what would turn out to be *Psilocybe cyanofibrillosa* outside the library one day. It was bruised blue and olive on the caps of some, and had fine blue hairs near the base of the stem. A spore print yielded nice purplish-brown spores. Those criteria certainly sound like a *Psilocybe* to the rest of us, but T.F. was so determined to rule out the poisonous look-alike *Galerina autumnalis*, that he then set out to find this mushroom too, before he would consider eating the suspected *P. cyanofibrillosa*. Good things come to those who wait, T.F. always said, and once he found the deadly *Galerina* and confirmed that it looked nothing like the *Psilocybe*, he sautéed 75 grams of fresh-picked, cleaned mushrooms in melted butter for about ten minutes, before enjoying their pleasant nutty flavor. This was truly a life-changing discovery for T.F., and a life-confirming experience for others he turned on. While this may seem like a large meal for some, T.F.'s rationale was that the mushrooms were fully mature, and—according to PAUL STAMETS—*P. cyanofibrillosa* contains low levels of psilocybin. T.F. has since pointed out that STAMETS' study on this mushroom was conducted on dried specimens, and it may have been unable to adequately test for the pres-

ence of psilocin—and that fresh specimens could contain higher levels than originally thought.

It is T.F.'s belief that *Psilocybe cyanofibrillosa* is a more common *Psilocybe* than reported, and is even mis-identified as *P. cyanescens*. T.F. has found *P. cyanofibrillosa* in parks in the south Bay Area, as well as GOLDEN GATE PARK in San Francisco. T.F. has been amazed that he has not heard or read more about this mushroom. It is definitely psychoactive, grows outdoors in the Pacific Northwest, and what it lacks in alkaloid content it makes up for in prolific fruiting. Clearly, *P. cyanofibrillosa* is deserving of further cultivation and experimentation. — A.S., CA

## TRANSDERMAL GEL

I subscribe to some anti-aging e-lists. The subject of PLO gel recently came up on one of these lists. PLO stands for Pluronic Lecithin Organogel. It is much like DMSO in that it is used as a transdermal carrier for pharmaceuticals. A list of drugs used medicinally with PLO gel includes scopolamine, ketamine, and morphine. Here are more details:

“Pluronic gel is a stable compound and has not shown any harmful effects when applied to the skin for prolonged periods. Pluronic gel is an aqueous solution and typically contains 20–30% Pluronic F-127. The gel has good solubilizing capacity that makes it a good medium for topical drug delivery systems. Pluronic [Lecithin] Organogel is a versatile transdermal delivery system because both hydrophobic and hydrophilic drugs can be incorporated into the gel. Oil-soluble drugs are miscible with the lecithin phase, while water-soluble drugs are miscible with the aqueous phase. Once the drug is incorporated into its respective phase, both phases are mixed together to form a gel that is rapidly absorbed by the skin. The topical application of drug results in a local effect as well as systemic effect. Drugs incorporated in PLO are absorbed directly into the blood stream, thus avoiding both hepatic first-pass effect and degradation by the stomach” ([www.reedsrx.com/compounding/gels.htm](http://www.reedsrx.com/compounding/gels.htm)).

See [www.maximapharmaceuticals.com](http://www.maximapharmaceuticals.com) for sources. I haven't ordered any yet, but I feel it might be worth a try for those drugs that people find to be unpalatable, indigestible, unisufflatable, or unsmokable. — A.K., TX

# NEW BOTANICALS

*Amanita muscaria*  
*Voacanga africana* root-bark  
Plus many new species of seeds  
and a bounty of shamanic accessories.

HERBAL-SHAMAN

POB 8892 (Dept. ER)

Wichita, KS 67208, USA

Orders, Toll Free: (877) 685-9199

Questions & Tracking: (316) 685-9199

## WELCOME TO THE MACHINE

A problem for some *true* DMT aficionados is the difficulty involved in effectively delivering large doses—ideally without leaving one's lungs feeling like they've been coated with caustic residue. For those who really want to get a 50 mg dose or more, rather than just burning that much, there is finally a solution. "The Machine" is an amazingly effective drug delivery device that I recently test-drove. It is capable of holding one or many doses, for one person's repeated use or multiple users. I was introduced to The Machine by an Australian friend who, at the 2002 BURNING MAN, also taught me about the benefits that can be derived by using mullein when smoking tryptamines. The expectorant properties of mullein help clear out the lungs after smoking, and it also permits deeper inhalations without coughing during smoking. Mullein is also useful for using 5-MeO-DMT due to additionally permitting easier eye-balling of doses, via standardization.

# AYAHUASCA HEALING RETREAT

art by Pablo Amaringo  
see [www.pabloamaringo.com](http://www.pabloamaringo.com)

There will be lectures, four ceremonies with *ayahuasca* and two with *Salvia divinorum*, group sharing, artwork expression, transpersonal exercises, and excursions. Spend ten days in the Amazon forest. Located 1.5 hours from Manaus, Brazil, the lodge has excellent facilities, phone, Internet, air conditioning, a swimming pool, and rooms with private bathrooms. Contact: [silviap@house.com.ar](mailto:silviap@house.com.ar).

### STAFF:

- ✧ Pablo Amaringo, shaman and artist
- ✧ Richard Glen Boire, Esq., entheogen law
- ✧ Stuart Hameroff, M.D., neuroscientist
- ✧ Silvia Polivoy, transpersonal psychologist
- ✧ Zoe Seven, consciousness researcher

**JULY 20-29, 2003**

**[www.ayahuasca-healing.net](http://www.ayahuasca-healing.net)**

The only materials needed to fashion The Machine are a small glass bottle and a bit of extremely coarse steel wool, as is used for scrubbing pans. For the bottle, a single-serving Hennessy Cognac bottle works great, due to its long neck coupled with a handy pre-formed weak spot in the bottom. After breaking or drilling a small hole in the bottom of the bottle, a bit of steel wool is rolled into a plug and then pushed into the neck. Any loose bits inside can be compacted gently by using a probe inserted through the hole broken in the bottom. This is the finished device ready to be charged.

To charge The Machine, enough for one or more good doses (the more the better) is directly applied to the surface of the steel wool at the mouth of the bottle. The neck of the bottle is then gently heated just enough to cause the alkaloid to melt *into* the steel wool plug. If not intended for immediate use or if intermittent use is desired the cap can be replaced over the charge to protect it. Freshly applied DMT resin can be prevented from contacting the cap by placing a small piece of paper between it and the cap (rolling paper works well for this). The Machine can also be charged for multiple users by placing a much larger quantity on the inside of the plug by dropping it through the broken hole. Charging is done the same way, by gently heating the neck until the plug absorbs the alkaloid.

To use The Machine, simply point the neck downwards and heat the steel wool plug from below with a lighter, while slowly inhaling through the hole made in the bottom. (Take care not to overheat and ignite the steel wool.) Rotating the bottle while heating will help it volatilize evenly. The high surface area and heat distribution of the steel wool traps the liquid alkaloid, both retaining it and driving it into vapor. This trapping effect also permits the pipe to be simply set down, then picked up and reheated, as needed.

There is little to no loss with The Machine and for some unknown reason we have reliably found this pipe to be smoother on the lungs than many far less efficient devices—particularly the glass “crack” pipes. The amount of alkaloid that this device is capable of delivering must be experienced to be believed. The bottle can be reused but the steel wool should be replaced regularly. While The Machine works with many materials, extracted *Acacia* alkaloid is highly recommended. —JUSTIN CASE

Note: Having recently tested The Machine, I give it my highest endorsement. Previously the “burned plastic” taste and seared lung feelings from smoking a regular DMT pipe had caused me to abandon smoking as an approach to ingesting DMT. It was simply too painful and I never got a big enough hit to experience much effect, frequently coughing out too soon the hit that I did get. For whatever reason, vapor produced by The Machine wasn’t nearly as rough as that smoked through a normal DMT pipe. And man, does this pipe deliver a punch!

— DAVID AARDVARK

# BOGUS *KRATOM* MARKET EXPOSED

by JON HANNA

An increasing number of sources have been selling what they claim is dried leaf of *Mitragyna speciosa*, known by the common name *kratom*. Much of this material originated from BRUNO PHILLIPS, of EBOTASHOP (4 rés. le Clos des Charmes, rue Emile Zola, 5000 La Roche sur Yon, FRANCE, www.ebotashop.org, e\_bota@hotmail.com), who says that it was sourced from Myanmar, Burma. PHILLIPS and an individual who goes by the name of FARMER HANK were approaching numerous retailers of specialty ethnobotanicals and persuading them to carry this product. The material is being made into extract in the United States, described by different companies as “*kratom* acetate,” “mitragynine acetate,” and “full-spectrum alkaloid free-base of *kratom*.” One of the people to whom PHILLIPS pitched the dried leaf material for resale was DANIEL SIEBERT. SIEBERT astutely noticed that this leaf does not match the published description for the plant—the venation pattern on the leaves was not right and the underside of the leaves was entirely covered in trichomes, giving the leaf a hairy appearance. According to the published botanical description for the leaf of this plant, the top is supposed to be glabrous (smooth), and the bottom has no trichomes present on the interneural parts of the lamina (SHELLARD & LEES 1965; SIEBERT 2003). SIEBERT suggested that it would be a good idea if I notified *ER* readers of this misidentified leaf material. It has been suggested that there over 100 kilos of this mystery herb may have been distributed by PHILLIPS worldwide at prices ranging from \$200.00 to \$600.00 per kilo (SHAMAN AUSTRALIS 2003); if this true, there is a *lot* of bad material on the market.

Strangely, some people claim that this material is psychoactive in a manner similar to *kratom*. Others notice no activity at all. It has now been shown that this material is not *kratom*, both due to its incompatible botany and due to it not containing mitragynine, a target alkaloid unique to *Mitragyna speciosa*. It would be interesting to know whether or not those who claim that this material has “*kratom*-like” effects have ever *tried* properly identified *kratom*. One person who has tried both, commented to me that the bogus material “had some sort of effect, though when comparing it to a small stash of *kratom* from Thailand I found in my freezer, it had none of the pleasant euphoria and mild rapture of attention, just a sort of beside myself disconnected state” (B.K. 2003). A sec-

ond person familiar with the effects produced from real *kratom* commented on the bogus material, stating: “We were sent samples a while back and were thoroughly unimpressed and questioned the validity of the sample” (A.C. 2003).

In order to help confirm that the material on the market was not actually *kratom*, I obtained a quantity of mitragynine ethane disulphonate from DENNIS MCKENNA to use as a reference standard for chemical analysis. There was concern that this material might have degraded, as it was around 14 years old. As an aside, it has been mentioned elsewhere that this reference standard was “obtained from [a] specialty chemical supplier,” which is not the case, and I have also seen it posted to an on-line forum that this material was synthetically produced, which is incorrect. HITOMITSU TAKAYAMA at the CHIBA UNIVERSITY in Japan was one of the first people to synthesize mitragynine in 1995 (SHULGIN 2003), which was only eight years ago (clearly the 14-year-old sample could not have been produced by synthesis). Just after I received the mitragynine ethane disulphonate, I was informed of a chemical supply company, APIN CHEMICALS, that offered a reference standard of mitragynine picrate (SHULGIN 2003). So I also purchased 10 mg of mitragynine picrate from them for the hefty price of \$250.00. Both forms of mitragynine were then distributed to several individuals who had an interest in analyzing the commercially available material.

The first results came in from SIEBERT, who performed thin layer chromatography on several samples of known *kratom*, putative *kratom*, and the mitragynine reference standards. He noted:

The mitragynine picrate and mitragynine ethane disulphonate both reacted with ERLICH’s reagent to produce pale purple spots on my TLC plates. Neither of these compounds [is] entirely pure. The TLC profiles of both samples were almost identical. Both produced two matching spots: one prominent spot (presumably mitragynine) and one smaller spot. The mitragynine ethane disulphonate also produced a third clear spot that was smaller than the other two and several additional very faint spots. I was also able to visualize the compounds using UV light. The larger spot absorbs short wave UV light. The smaller spots fluoresce bright yellow

under long wave UV light. Apparently mitragynine is reasonably stable, since the profile of the fourteen-year-old mitragynine ethane disulphonate was not substantially different than that of the recently procured mitragynine picrate.

I also examined “kratom acetate” sold by ETHNOGARDEN and leaves sent to me from France by BRUNO. These leaves are allegedly from Myanmar (Burma). The “kratom acetate” was supposedly isolated from leaves obtained from the [Burmese] source. Neither of these produced any visible indole spots on the plates when sprayed with ERLICH’s reagent. And when exposed to UV light, there were no spots corresponding to those in the reference standards. It is very clear that these do not contain mitragynine. This is not particularly surprising since the morphology of the leaves indicates that they are not *Mitragyna speciosa*.

I also analyzed leaves grown by [NATIVE HABITAT, SHAMAN AUSTRALIS, and J.B.]. And also leaves obtained from...Thailand, and some leaves from an “unknown source” that were sent to me by WILL BEIFUSS (probably [also from Thailand]). All of these produced spots that appear identical to the reference standards. In the case of the relatively fresh leaves obtained from [NATIVE HABITAT, SHAMAN AUSTRALIS, and J.B.], a green chlorophyll spot largely obscures the mitragynine spot, making it difficult to see. I was not able to see this clearly until I examined the chromatograms under UV light and compared them with the reference standards.

Additional results, this time from HPLC analysis, came in from MJB BOTANICALS, the U.S. company that had been producing the “kratom acetate” extract from the bogus leaves, that was sold via them, ETHNOGARDEN, and probably other vendors as well. They stated:

Solvent: 95% MeOH 5 % H<sub>2</sub>O; Pressure: 1000 psi; Flow: 1.5 ml/min; Column YMC-Pack ODS-AQ; S-5 Micron 250 x 4.6 mm ID; 5 runs per sample; Run time 12 minutes; Alkaloid salts were converted to free-base forms with ammonia

The mitragynine ethane disulphonate was very contaminated, with an average of 7 peaks, with the biggest always being approximately 5.7 minutes. This product is too contaminated or degraded to use as a true reference sample.

The mitragynine picrate had 1 peak average, retention time of 1.6 minutes, with slight trailings being possible contaminates.

The “kratom acetate” had 3 peaks, with the largest being 2.3 minutes, and the others at 1.9 and 2.5 respectively, with no trailings.

Yohimbe had 1 peak average, with retention time of 2.4 minutes, with no trailings.

Melatonin (a tryptamine) had an average retention time of 3.8 minutes, with no trailings.

So I can say that that the “kratom acetate” does not contain mitragynine picrate or the other mitragynine compound. With the retention time being within 0.1 min of yohimbe, I would think that the active alkaloid might be a related compound or chemically similar.

Many companies that were known to have been offering the bogus leaf material or extract have been informed of these test results. Some companies have not at the time of this writing made any change in the manner in which they are selling the bogus material. Other companies are continuing to offer it (some under the name “Mellow Gold”), noting that the identity of the material is actually unknown, but stating that it has “kratom-like” effects. Based only on the few bioassays that I am aware of which were performed by people who have experienced the effects of real *kratom*, I would suggest here that to call the effects produced by this unknown material “kratom-like” is inaccurate. In addition, although there have been no known or reported side-effects from consuming the mystery herb or the extract made of it, it strikes me that it is irresponsible to continue marketing an herb that has not been identified—it could have chemicals in it that are carcinogenic or that cause liver damage, and the negative effects from ingesting these chemicals might not be apparent for some time. One company, CANNAPEE ([www.cannapee.ch](http://www.cannapee.ch)), appears to be claiming that the bogus material *is* some species of *Mitragyna* (which it may not be, and certainly isn’t *known* to be), although they have stopped selling it as *M. speciosa*.

To add to the confusion, some people growing properly identified *kratom* plants have obtained no activity from the leaves whatsoever. Others growing clones of the same plant have pointed out that the potency can be quite variable.

I have arranged for HPLC analysis and GC/MS analysis to be done on various plant samples, to determine whether or not they contain mitragynine, and if so, how much is there. This testing will be reported on in a future issue of *The Entheogen Review*. (Not all of the companies that provided me

with samples have had their material tested yet.) As well, microscopy work will be done on known *kratom* leaves, to create a database that will aid in proper identification of material that is offered commercially, hopefully helping to prevent scams in the future.

I should state that I do not believe that any of the retailers selling the bogus material were aware that it was not authentic. The blame for this scam lies with PHILLIPS/EBOTASHOP, the wholesaler who approached various retail companies with his so-called “*kratom*.” It has been said that he has refused to provide any refunds for those people to whom he sold the bogus material (SHAMAN AUSTRALIS 2003). As well, it is known that he is still selling the bogus material even after he was informed that it is not correctly identified. So, even if he was originally selling it by error himself (not knowing that it was misidentified), this can no longer be stated. It is still listed as being available at the EBOTASHOP web page. Some sales of PHILLIPS’ material were originally being brokered through SEBASTIAN TORRES (KITZU BOTANICALS). However, TORRES stopped facilitating such sales when he learned that the material was incorrectly identified, and FARMER HANK has also stopped selling the bogus material.

Those companies that are selling properly identified *Mitragyna speciosa* plants include SHAMAN AUSTRALIS, THE BASEMENT SHAMAN, THEATRUM BOTANICUM, and NATIVE HABITAT. This does not necessarily mean that all of these companies are selling plants that are potent or even active—NATIVE HABITAT has previously commented on the inactivity of the plants that they have. It is currently thought that climate may have an affect on the plant’s chemistry, and perhaps a change in climate may increase the potency of their plants. At this time I can not recommend purchasing *kratom* from any business other than those mentioned directly above. In the future I will provide names of any additional companies that are known to be selling dried *kratom* that tests positive for mitragynine.

So far as I am aware, there has been no definitive study in *humans* that shows that mitragynine is the primary active chemical in *Mitragyna speciosa*, although there have been studies with mice which seem to indicate that it might be (IDID et al. 1998). The sole known oral bioassay of 100 mg mitragynine produced no effects (WOGG 2000). In the 1960s, over 22 alkaloids were reported isolated from *Mitragyna speciosa* (JANSEN & PRAST 1988). A few of the alkaloids found therein include speciogynine, speciociliatine, paynantheine, mitragynaline, 7-hydroxymitragynine, corynantheidaline, 3-

dehydromitragynine, tetrahydromitragynine, mitralactonal, mitrasulgyline, mitralactonine, and 9-methoxymitralactonine—the last five of these are new as of 1998, and the last two are from young leaves (SHULGIN 2003). Clearly more work needs to be done with the plant; the isolation and quantification of chemicals from plants *that are known to be potent* would be a good first step. Bioassaying each of these compounds individually in amounts that are found in a comparable amount of a “dose” of active leaf would get us a lot closer to understanding what is going on. Hopefully someone with access to some quantity of potent leaf and the means to extract and isolate the compounds therein will employ the “HEFFTER technique” in the near future.

There has been some small amount of noise (mainly repeated by vendors of *kratom* or the bogus material) that in Thailand where *Mitragyna speciosa* grows, and where it is illegal, the government has had a change of heart and is planning to make it legal in order to treat addictions. I have been unable to locate any reliable source of data for this claim. Also I have heard that the AUSTRALIAN THERAPEUTIC GOODS ADMINISTRATION (their version of the FDA) is planning on placing the chemical mitragynine into their “Schedule 4.” This schedule would mean that the plant and dried herb are still legal, so long as they are not being consumed or sold for consumption (SHAMAN AUSTRALIS 2003). Frankly, it is mind-boggling that a government agency in Australia has set its sights on this chemical, which may not even be psychoactive in humans, which has never been available in pure form to the masses, and hence which can not reasonably be considered a “drug of abuse” in any realistic sense. As well, it has been reported that the MALAYSIAN NATIONAL NARCOTICS AGENCY engaged a botanist last year to conduct a study to determine if *kratom* should be classified there as a dangerous drug (YAHYA 2002).

I would like to thank all of the vendors and individuals who supplied me with leaf material for analysis, including SHAMAN AUSTRALIS, NATIVE HABITAT, THE BASEMENT SHAMAN, HERBAL-SHAMAN, B.K. & RICK, CRAIG, and PURE LAND ETHNOBOTANICALS. Thanks also to DENNIS MCKENNA and SASHA SHULGIN for their help with this project, to MJB BOTANICALS for providing material and sharing their test results, to WILL BEIFUSS who supplied initial funds to purchase the second reference standard and shared material for testing, and many thanks to DANIEL SIEBERT for bringing this scam to my attention in the first place, for providing material for testing, and for sharing his test results. ☉

# THE SAN FRANCISCO IBOGAINE FORUM

by R. STUART

This day-long educational event in November 2002, set in the FIRST UNITARIAN UNIVERSALIST CHURCH & CENTER, was one of a series of ibogaine forums being held in various U.S. cities and in London and Paris. These events discuss the use of ibogaine to eliminate withdrawal from opiates, cocaine, alcohol, and tobacco. (It does not work for benzodiazepine addiction.) Although ibogaine is a Schedule I controlled substance in the United States, the treatment is legally available at clinics in other countries.

The forum was sparsely attended. The morning's audience of four attendees gradually increased throughout the day to a peak of twenty people. Only in late afternoon were there more audience members than there were lecturers. Other forums in this series have also had very low turnouts, despite considerable advertising targeted toward the staff of substance abuse treatment centers. Nobody from the addiction treatment field deigned to attend the conference in San Francisco. Substance abuse treatment professionals are often in recovery themselves, and the 12-step movement stigmatizes all "mood altering substances"—except of course tobacco, caffeine, and sugar. A more appropriate taboo would be directed toward all "toxic and addictive substances," thus permitting the responsible use of psychedelics in curing addiction. Unfortunately, the rigid narrow-mindedness of many ex-addicts over this sort of distinction has contributed to the chronic stagnation of the addiction treatment industry.

Three *Cannabis* activists lectured on how general drug war politics discourage the development of ibogaine treatment for addiction. ED ROSENTHAL discussed how the prison-industrial complex profiteers off of maintaining heroin addiction. DANA BEAL recounted how ibogaine treatment has lagged behind the medical marijuana movement in the vanguard of drug legalization. CHRIS CONRAD talked about how prohibitionists use a pseudo-morality to stigmatize drug use. He suggested that the drug peace activists need to speak on Christian radio networks about the true immorality of persecuting addicts. NELSON COMERCI explained the use of acupuncture to reduce side-effects during ibogaine sessions. JULIAN ISAACS presented brain-imaging data on ibogaine subjects. EUGENE SCHOENFELD discussed his participation in *Tabernanthe iboga* rituals while visiting Gabon in the early 1960s. PATRICK KROUPA described his attempts at treating

his addiction, including his experience at the addiction treatment program at the Thai monastery of TUM KRABOK (a.k.a. THAM KRABOK). He said that the monastery's spiritually-based program was more successful at curing addiction thirty years ago because today's young people have less faith in Buddhism. He claimed that an entheogenic potion is dispensed at TUM KRABOK. All previous publications about TUM KRABOK describe the potion of secret herbs as being an emetic that produces vomiting without psychoactive effects. KROUPA, upon further questioning, repeated that the TUM KRABOK potion is "entheogenic." He said, "We had samples analyzed and they contained an indigenous ayahuasca and *Mitragyna*—which elsewhere in Thailand is punishable by death." He was not eager to provide further details. While the use of *Mitragyna (kratom)* in opiate detoxification has been previously reported, the existence of Asian ayahuasca analogue plants, if true, merits further investigation. KROUPA finally recounted how three ibogaine sessions cured him of a 14-year heroin addiction that had been refractory to conventional treatments. His profanity-filled lecture ended with a racist epithet that caused the only black member of the audience to leave the forum.

DEBORAH MASH, Ph.D., runs HEALING VISIONS, located at St. Kitts, West Indies. She announced at the forum that she would close this ibogaine treatment and research facility by the end of 2002, however it is still open in 2003. HEALING VISIONS charges about \$10,000 for its two-week program, as opposed to the \$3,000 fee for the clinics in Vancouver and outside of Tijuana. The higher cost is partially due to extensive medical supervision throughout the process. At the forum, MASH claimed that HEALING VISIONS never made any profit either for the organization or for its administrators. Nevertheless, one of the investors in HEALING VISIONS has revealed that he earned profit from the clinic, although he could not disclose the amount due to a confidentiality agreement. MASH supports herself by genotyping addicts for private industry, and in conjunction with this research she has amassed the world's largest collection of brains of deceased addicts. She believes that medical supervision is important, as there have been some deaths when ibogaine was administered in underground settings. Complications can even occur in patients who pass a heart exam and liver panel. MASH noted that addicts often lie on intake interviews, and must

be tested to ensure they do not have medications in their bloodstream that would prompt an adverse interaction.

MASH recounted that she is frequently told that she has lost professional credibility by being associated with a controversial medical treatment. She is never allowed to deliver a speech at addiction conferences, and she is snubbed by methadone advocates and 12-steppers who grimace at her educational posters. Although addiction personnel rebuff ibogaine, the treatment has a following even among some conservative government employees who have used it to overcome their addictions. NOELLE BUSH, daughter of the Florida governor and niece of the U.S. president, was accepted for treatment at HEALING VISIONS but could not attend because her parole prevented her from leaving Florida. MASH believes that ibogaine will become widely available for addicts only when there is a demand by treatment professionals, and by consumers who currently have largely ineffective treatments. She said, "Abortion was always available to the wealthy when it was illegal, and today the rich addicts can always get ibogaine in Mexico, or Canada, or St. Kitts. However, the poor inner-city addicts are never going to find their way to off-shore treatment centers, and they are the population in most desperate need of what we have to offer."

MASH, a former politician, is very diplomatic in discussing her opponents. Her research was delayed by MARK MOLLIVER's study showing ibogaine-induced neurotoxicity in rodents. While explaining that ibogaine has never been shown to be neurotoxic in primates and insisting that the moderate doses used in addiction treatment are absolutely not neurotoxic in humans, she effusively lauded MOLLIVER as "a brilliant scientist." She repeatedly praised HOWARD LOTSOFF for being the person who discovered that ibogaine has value in detoxing addicts. Only in response to pointed questions from the audience did she acknowledge that eight years of the twenty-year patent for ibogaine addiction treatment were wasted on a series of lawsuits initiated by LOTSOFF over who owned the rights to use "noribogaine" for addiction treatment. MASH says the FDA is being very helpful with her research, the DEA has always been friendly while monitoring her project, and the main obstacle she has had is getting funding from NIDA or other sources. She told the forum audience that she presently needs \$100,000 to complete her Phase I safety studies. Once this work is finished, anybody will be able to do Phase II clinical trials referencing her data.

The brain and liver form the ibogaine metabolite 12-OH-ibogaine, commonly referred to by the misnomer "noribogaine" rather than by its correct name decmethylobogaine. MASH believes that 12-OH-ibogaine has anti-addictive properties without visionary effects. She wants to get approval to test this metabolite for addiction treatment. It is likely that either 12-OH-ibogaine or a similar analog would be more "acceptable" than ibogaine itself due to the official bias against psychedelics. Nevertheless, the visionary properties of ibogaine are useful for the spiritual aspects of recovery, despite the stigma of psychoactivity. Ibogaine visions among Western addicts sometimes include a life review, visions of the dead, and encounters with a light-skinned black person who acts as a spirit guide. This stereotypical imagery is derived from the well-known iconography of African ancestor worship cults where *Tabernanthe iboga* is expected to produce communication with deceased relatives who have white skin because they are ghosts. Ibogaine was also said to produce a sensation of purification. For example, one addict reportedly saw sex toys ejected out of her third eye, enabling her to dispel some of the low self-esteem she had around her job as a prostitute.

Ibogaine is currently available as a hydrochloride or as the "Indra extract." The latter is the brand name for a large batch of total alkaloid extraction that has been circulating for years and which was manufactured in such a large supply that it will apparently be available for years to come. Ibogaine hydrochloride is said to have a more rapid onset and finish more abruptly than the total alkaloid extract. Nobody at the forum seemed interested in using unprocessed ibogaine root bark, and the lecturers stated that domestic cultivation of *Tabernanthe iboga* was an impractical source of *iboga* alkaloids for use in the United States. An article distributed at the table of free literature described how Africans could easily produce an inexpensive preparation for export to undeveloped countries where doctors can not afford synthetic medicines. This process extracts *iboga* alkaloids using only vinegar and ammonia. [JENKS, C.W. 2001 "Extraction studies of *Tabernanthe iboga* and *Voacanga africana*," *Natural Products Letters* 16 (1): 71-76.]

At the end of the day, CHRIS CONRAD distributed a petition requesting that the S.F. Board of Supervisors support the development of ibogaine as an addiction treatment. He noted that such resolutions are easy to get passed, but the follow through is difficult. If *ER* readers have ideas on how to initiate a budget-conscious municipal program using ibogaine for addiction detox, please send in your suggestions. ☉

# EVENTS CALENDAR

## SCIENCE & CONSCIOUSNESS APRIL 25–30, 2003

The FIFTH INTERNATIONAL CONFERENCE ON SCIENCE AND CONSCIOUSNESS will be held April 25–30, in Albuquerque, New Mexico. Billed as “Consciousness Exploring Itself,” this event features presentations from RALPH ABRAHAM, DON BECK, GREGG BRADEN, ANGELA BROWNE-MILLER, DON CAMPBELL, TONY COCILOVO, MATTHEW CROSS, DAVID CUMES, KATHRYN DARLING, JOHN DELUCA, JOHN DEMARTINI, LARRY DOSSEY, DONNA EDEN, DAVID FEINSTEIN, ROBERT FRIEDMAN, KAY GARDNER, DANA GAYNOR, PETER GORMAN, AMIT GOSWAMI, STANISLAV GROF, JOHN HAGELIN, MICHIO KAKU, DANIEL KINDERLEHRER, UMA KRISHNAMURTHY, VASANT LAD, TERI MAHANEY, SUZANNE MAXWELL, RALPH METZNER, ARNOLD MINDELL, STORY MUSGRAVE, ONYE ONYEMAECHE, SHARON PORTER, JOSEPH RAE, DEBBIE ROSAS, ILANA RUBENFELD, PETER RUSSELL, ALEXANDER SHULGIN, ANN SHULGIN, GREG TAMBLYN, WILLIAM TILLER, and CRAIG WEBB. Tickets are \$745.00 (which does not include food or lodging). For more information, see [www.bizspirit.com](http://www.bizspirit.com).

## IBOGA & IBOGAINE MAY 4–5, 2003

NEW YORK CITY CONFERENCE AND TELECAST ON IBOGA AND IBOGAINE will be held May 4–5, in New York. Presenters include KENNETH R. ALPER, CARL M. ANDERSON, DANA BEAL, RICK DOBLIN, SARA GLATT, STANLEY GLICK, VIC HERNANDEZ, AWOLOWO JOHNSON, CHARLES KATER, PATRICK KROUPA, HOWARD LOTSOFF, MARENDI, DEBORAH C. MASH, FRANK MORALES, EMMANUEL ONAIVI, DANIEL PINCHBECK, MARCO RESINOVIK, LAURENT SAZY, BOB SISKI, ERIC TAUB, and SAMUEL WAIZMANN. For more information, contact DANA BEAL at [dana@cures-not-wars.org](mailto:dana@cures-not-wars.org).

## GHB CONFERENCE MAY 9–11, 2003

The FIRST NATIONAL CONFERENCE ON GHB will take place May 9–11, 2003 in Orlando, Florida. This event is billed as “A comprehensive multi-disciplinary conference on GHB” that features: “GHB overdose, addiction, rape and death” for medical personnel; “GHB symptoms, addiction, sexual assault, death/murder, detection, testing and prosecution” for law enforcement personnel; and “GHB prevention and response” for school, parent, and community resources. Speakers include JO ELLEN DYER, MARC LEBEAU, KAREN MIOTTO, TRINKA PORRATA, STEPHEN W. SMITH, WALLACE WINTERS, and DEBORAH L. ZVOSEC. For more information see [www.projectghb.org/registration.htm](http://www.projectghb.org/registration.htm).

## MIND STATES IV MAY 23–25, 2003

The Spring of 2003 celebrates the 60th anniversary of the discovery of the psychoactive effects of LSD, and the MIND STATES IV conference will have a panel of experts discussing this world-changing molecule. They will also be showcasing a documentary film on early LSD research titled *Hofmann's Potion*. Other panels will be held on the topic of visionary art, and on the topic of control culture. Presenters include PABLO AMARINGO, ANTON BARBEAU, SUSAN BLACKMORE, RICHARD GLEN BOIRE, ERIK DAVIS, EARTH EROWID, FIRE EROWID, JOHN GILMORE, ALEX GREY, ALLYSON GREY, LORENZO HAGERTY, MARK HENSON, MARTINA HOFFMANN, MARK MCCLOUD, RALPH METZNER, NAASKOW, DAVID E. NICHOLS, SHELDON NORBERG, MARK PESCE, STEVEE POSTMAN, V.S. RAMACHANDRAN (tentative), NICHOLAS SAND, WRYE SENTENTIA, ZOE SEVEN, ANN SHULGIN, SASHA SHULGIN, R.U. SIRIUS, MYRON STOLAROFF, FRED TOMASELLI, and ROBERT VENOSA. Tickets are \$225.00 by May 15, and \$250.00 from May 16th until the event, from: MIND STATES, POB 19820 (Dept. ER), Sacramento, CA 95819. For more information e-mail [mindstates@prodigy.net](mailto:mindstates@prodigy.net) or see [www.mindstates.org](http://www.mindstates.org).

# SOURCES

by JON HANNA

On February 18, 2003, the DEA busted the psilocybian mushroom spore syringe vendor PSYLOCYBE FANATICUS on “conspiracy” charges, as the culmination of three years of surveillance. (As a reaction to this bust, one of the oldest mushroom kit companies, HOMESTEAD BOOKS, stopped selling their kits.) Recently in Ohio, a bill seeking to outlaw mushroom spores and mycelium that produce psilocin and/or psilocybin has been proposed (see [www.cognitiveliberty.org/dll/ohio\\_hb80.html](http://www.cognitiveliberty.org/dll/ohio_hb80.html)), and it seems at least possible that the government might see fit to encourage such regulation by distributing model anti-spore legislation to allied state legislators. On February 24, the DEA announced that 50 people involved in selling pipes and “paraphernalia”—primarily via the Internet and in conflict with federal law—were indicted in two DEA operations, “Head Hunter” and “Pipe Dreams.” It stands to reason that if these companies kept customer records, the DEA now has this information. As well, the DEA has commandeered many of these companies’ web sites (visit these URLs, and you are now told that the DEA shut the businesses down). It seems easy to believe that these sites could be tracking hits, or that they could “opened for business” again in the future, but actually be info-ops that lead to sting busts. The FDA has recently again threatened companies that sell alternatives to “street drugs” (see [www.fda.gov/bbs/topics/news/2003/new00889.html](http://www.fda.gov/bbs/topics/news/2003/new00889.html)), specifically including *Salvia divinorum* in the listed “unlawfully-marketed” products, as I predicted might occur in my “Pragmatic Paranoia” article (*ER* Vol. X, No. 3: 84). Recent reports have noted that the company E-BAY (and, by association, those companies that they own, such as PAYPAL and HALF.COM) will fax records of their customers’ purchases and on-line activity to any law enforcement agency that asks—no warrant required. It is becoming increasingly clear that the government is gunning for entheogen-related companies (particularly those with a web presence), and that “privacy” on the web doesn’t exist in most cases. The fact that the feds spent three years investigating PSYLOCYBE FANATICUS before the bust happened suggests that they are quite serious about such things. I strongly suspect that the hammer may fall next on research chemical companies, *Cannabis* seed vendors, and those selling *Salvia divinorum* (despite its current non-scheduled

status). Now, more than ever, my advice is to obtain a mail drop and use this with an alias, even if you are not breaking any laws.

Lifting my middle finger to the recent federal government’s actions against vendors of paraphernalia, I have included reviews of a number of companies that are selling *Cannabis* vaporizers in this issue, along with other assorted tidbits. The days of easy access to high-quality pipes, bongs, and vaporizers may be numbered, as the feds shut some businesses down and other people close up shop—quite reasonably scared of the potential legal ramifications of staying in business. As an example, the company SOLARIA at [www.lightwell.com](http://www.lightwell.com), which sells one of my favorite vaporizers, the Eterra, has recently restricted their sales to only those in California or in foreign countries.

## AROMAZAP

Offered through the Basement Shaman

POB 1165

Woodstock, IL 60098

(815) 337-3123

(815) 337-3445 FAX

[bshaman@interaccess.com](mailto:bshaman@interaccess.com)

[www.basementshaman.com](http://www.basementshaman.com)

At \$92.00, the Aromazap vaporizer has the benefit of being relatively inexpensive, compared to many models on the market. It is easy to use, works great, and is very efficient. Its main drawback is that it is basically a “one hitter,” so one spends more time reloading it than with other units. Hence it is better for solo voyages than for big groups of people.

The design of the Aromazap is nearly a direct copy of one of my favorite vaporizers, the Eterra (mentioned above). However, the Aromazap has the added bonus of coming with a bowl and essential oils for use in aromatherapy or just to make your house smell swell.

The units are made out of recycled woods; it is nice that rare hardwood trees from the Amazon aren’t being cut down to

create these. For those into aesthetics, the blocky design of the Aromazap isn't quite as attractive as the Eterra and the woodworking itself isn't as well done. But nevertheless it is still a very attractive unit, and much better looking than most of the other products on the market. The fact that it is about  $\frac{1}{2}$  the cost of the Eterra will probably make up for the slightly lower aesthetics in most folks' minds. And, with the Aromazap, one has the benefit of being able to choose between several different stained colors: ebony, mahogany, walnut, blue pine, and natural.

So far as how well the unit performs, it appears to perform just as well as the Eterra. The stem holds about 20 mg, the same as the regular Eterra stem. These things kick ass for someone who wants to get the best effects possible off of the smallest amount of herb. I have never burned any herb using the classic Eterra or the Aromazap, although this might be possible if the stem was left in too long. With the low air/volume ratio, these things actually allow one to "taste" the vapor, which provides a wonderful hint of minty/citrus flavor that my herb had. This is not a taste of smoke, but a delightful spritz of pure essence. Some people I know don't like this taste, preferring the thicker-bodied heavy smoke flavor. To each her own. The Aromazap needs to warm up for at least 30 minutes before use, and after that it can be left on 24/7, but the manufacturers recommend using a standard light timer to turn it off during periods when it is unlikely to be in use. This seems like a good idea. Although it doesn't draw much power, it seems like a potential fire hazard to leave it on all the time. Also, since it is made of wood, the internal part of the machine that is in contact with the wood may over time—particularly if it is left on constantly—end up charring a bit. (This charring was said to be one reason that the folks making the original Eterra moved on to ceramic and stopped using wood.) Obviously, inhaling the fumes from charring wood ain't a good idea. My recommendation with any unit is that it is left off, excepting when you plan on using it. If you need to use it several times at regular intervals during the day, for medical purposes, you can set a timer as Aromazap suggests, to come on and off at specific points during the day. Glancing over occasionally to see if the green light is on may help remind you that it is time to take your medicine. The bottom line is that this unit will save you money, simply because of the time that it takes to reload the one-hitter. By the time you have had one or two hits, you'll realize that you are already quite stoned and don't need to smoke any more.

### **B.C. VAPORIZER**

**2080-B St-Denis Street  
Montreal, Quebec H2X 3K7  
CANADA  
(514) 842-7438  
(514) 842-4544  
(800) 330-4367  
info@cannabis-shop.com  
www.funkyleaf.com**

B.C. Vaporizer has been making vaporizers for several years, and they are one of the few companies that still offer a "glass dome" style vaporizer, with a modified soldering iron as a heat source. In the past, similar units were offered by numerous companies. The main drawback with most of these is that there is a relatively large amount of air that needs to be sucked through them in order to clear the hit. (For those hoping to get a dual purpose use from such a vaporizer and smoke DMT from it will be disappointed. So much air has to be cleared that by the time you suck down the full dose, tolerance has built up and you can't get very high, even off of a hefty dose.) The larger air ratio just means that you have to take more hits to clear out all of the vapor. Not too big of a deal for *Cannabis*, unless you hyperventilate and get a unwanted head-rush. A secondary drawback is that there is a good deal of surface area on the inside of the dome that vapors can condense and collect on. It is true that this material can eventually be cleaned off and reused, but I suspect that it suffers from degradation due to oxidization over time.

They have two units available that are slightly different designs, the "standard" (\$84.95 plus S&H) and the "deluxe" (\$89.95 plus S&H). As their "dome" chambers, both have cheesy overturned glass jars that look as if they might have previously been used for dijon mustard. The "standard" has a 212 ml overturned jar, which will allow for a better air/volume ratio. The "deluxe" has a 314 ml jar, which is worse for the air/volume ration. However, the deluxe seems to have less of a problem of the stem tube falling out of it while using the device. Both have the same size bowl, which means that there is a similar maximum amount of smoking material that you can place in them. A truly deluxe model might have a smaller dome and a bigger bowl.

Both of these units seem to be dialed in to a good temperature for vaporizing herb effectively without burning it. It is possible that other strains, or different manner of material such as tobacco or herbal smoking blends, would not as effectively have their active chemicals volatilized (different

chemicals have different vaporization temperatures). These units might benefit from a temperature control dial, which would allow one to do some fine-tuning as to have a bit more flexibility. In an ideal world, the unit would also have a timer on it that shut the machine off automatically after 20 minutes, which is the maximum time that one is supposed to leave it on for continually. A timer could be added onto the unit aftermarket, and this would be helpful too for those who get so stoned that they forget to unplug it.

After a normal use period, the glass jar dome can get hot enough that you may well want to use a glove when removing it. And remember that the bowl itself will still be hot enough to burn you for some time after unplugging the unit.

Overall, I give the B.C. Vaporizers a high mark; they aren't too terribly expensive, they are very easy to use, and they work. You can see why they have been around as long as they have.

## **BLOTTER ART**

**[www.blotterart.net](http://www.blotterart.net)**

A blotter art gallery that features both vintage and current prints. The goal of this gallery is to eventually become the largest repository of such images on the web. A nice site for the newbie collector to view and drool.

## **CHEAP VAPORIZER**

**Aaron Jackson**

**Box 36079-5675 Spring Garden Road**

**Halifax, NS B3J 2S9**

**CANADA**

**[sales@cheapvaporizer.com](mailto:sales@cheapvaporizer.com)**

**[www.cheapvaporizer.com](http://www.cheapvaporizer.com)**

The “cheap vaporizer” is a small glass “test tube” (about 3 inches long with a  $\frac{3}{8}$  inch diameter), with a second smaller glass “test tube” (about 2 inches long and  $\frac{3}{16}$  inch diameter) that is inserted into the bigger tube. There is a plastic tube “cuff” on the smaller tube that allows the two to fit snugly together, and which works somewhat as insulation for your lips against the glass, should it warm up too much. Both tubes have three tiny holes in them at their rounded ends (what would be the bottom of a test tube). Screened bud is placed into the larger tube (perhaps 35–40 mg or so), and the smaller tube is inserted. The rounded end is tilted up a bit,

and the herb is tapped back so that it comes in contact with the smaller tube inside. Then, theoretically, just the tip of the glass is heated with a lighter held with the tip of the flame about 2–3 cm from the end of the tube. One draws on the tube, bringing the hot air into contact with the herb.

You have to have more patience than I do to hold the flame that far away from the tip and wait until enough hot air vaporizes the good stuff in the herb. The tip of the glass gets pretty black while you are waiting. But there is an easier way, which takes some practice: heat the glass tube directly under the herb itself, with the flame licking around the tube, not held far away from it. Of course, you can overdo it and burn the herb if you are not careful. It is a bit tricky to get just the right amount of heat to vaporize the herb and not burn it.

The great thing about this vaporizer is that the holes are so damn small (although you might occasionally get a tiny speck of screened bud that pops through into your mouth). This means that there is not likely to be very much loss due to slip-stream vapor escaping. Even if one is using pure trichome resin in this vaporizer, and the resin accidentally gets too hot and catches on fire, no problem. The tube fills with smoke, a tiny bit escapes from the holes, and the rest is trapped in the chamber ready to hit. Since pure resin burns so steadily, this vaporizer is actually an excellent choice for smoking resin (although with care it can be vaporized without burning).

When I first saw this unit, I thought that it could be improved by having a bubble in the outer stem, which could hold the material. This is really not necessary for use with screened bud, but would certainly make the unit more usable for smoking compounds that might liquefy first. A bubble design would allow the pipe to be used for opiates, tryptamines, crack... virtually anything. I would love to see a “sister” unit like this made that has such a bubble.

One drawback of this vaporizer is that it can be hard to clean. In attempting to clean it with a folded-over pipe cleaner, I ended up snapping the mouthpiece end of the smaller glass tube. I slipped the plastic tubing over it, and it still works, but I can see how it could have easily broken in a manner that would have been worse. I then tried soaking the thing in acetone, figuring that this would clean it up, not thinking about the plastic tube on the end of it (which sorta dissolved a bit in the acetone, heh...). If the manufacturer sold a couple of correctly-sized test-tube brushes, this would go a *long* way to making clean-up easier.

But hell, at \$15.00 plus \$6.00 S&H (cash or international money order only) they are so cheap, buy a few of them. They are incredibly portable, with a little practice they can work like a charm, and they are quite parsimonious with smoking material.

### CHURCH OF THE DIVINE SAGE

[admin@sagechurch.org](mailto:admin@sagechurch.org)

[www.sagechurch.org](http://www.sagechurch.org)

The CHURCH OF THE DIVINE SAGE says it was founded as a Nonprofit Religious Corporation in Illinois in early 2001, when its founder (whose name doesn't seem to be posted at their web page) claims to have contacted "the Divine" through his or her use of *Salvia divinorum*. The CHURCH, which says that they hold bi-weekly meetings, is apparently not looking to expand their membership, but their web page states that they are "always open to responsible adults over the age of 21, who agree to both our Purpose and our Creed stated in the Bylaws, and who are an active, contributing member of society." It seems pretty strange to me that someone would have to be a certain age to join a religion.

The CHURCH has published six issues of their newsletter, *Church of the Divine Sage Times*, however the links to all but issue No. 5 are dead at their site. Their "Bylaws and Rules" state that, "Members and applicants cannot use any synthetic, recreational, or illegal drugs at any time for any reason." This restriction seemed curious to me, since many people who find *Salvia divinorum* to be spiritually valuable also find similar value in the use of other plants, some of which may be illegal depending on where they live. Further in their bylaws, they state that, "no agency less than God has the power to suspend or set aside our rights, overtly or covertly." There is the possibility that *S. divinorum* may be made illegal in the United States, and yet it appears as though they are saying that their rights as a church to use their sacrament can not be taken away by the government. And yet their rights to use *S. divinorum* would be taken away by their own bylaws, should *S. divinorum* become scheduled, since they don't allow church members to use illegal drugs.

This "no illegal drugs" restriction on membership in their CHURCH seems quite odd, considering the fact that they do find *Salvia divinorum* to be of spiritual value. Yet somehow the use of any other similar sacramental plant is banished based on man's laws, which it would appear they are stating hold no real power over their own use of *S. divinorum*?

It becomes even more confusing, since they state that they are non-denominational, and clearly by reading their web site one can see that they embrace teachings from various religions. Yet someone who used peyote for spiritual reasons could not join this church, even if s/he believed that *Salvia divinorum* was also a sacrament. This approach doesn't seem to embrace a non-denominational attitude.

Finally, it seems quite odd that any restriction on membership would be based on the use of some other "illegal" plant, because I could use that plant and be a member of this church so long as I was using it in a country where its use was legal. For example, if my use of ayahuasca was confined to Brazil where it is legal, I could be a member of the CHURCH OF THE DIVINE SAGE; but if I took ayahuasca in the United States, my membership would be denied.

If—to paraphrase their bylaws—"no agency less than God has the power to suspend or set aside [the] right [to use a plant that I find to be sacred]," why then, would it make sense to join or support a church that is basically acting as an agency that suspends my right to worship as I see fit, because only their one sacrament—*Salvia divinorum*—is worthy?

I e-mailed the CHURCH and posed the above questions to them, but they didn't respond at all. After waiting about a month, I resent the e-mail—considering that it could have gotten lost in cyberspace somewhere. I have still not heard back after several months. I would have tried sending them a letter, but they don't appear to list a physical contact address anywhere on their site, which is another thing that seems a bit hinky.

I don't know what to think about this CHURCH. It seems like the founder is sincere in his or her beliefs, and yet the lack of response to my inquiry makes me wonder if this CHURCH even exists anymore, aside from its presence as a web page with some dead links on it.

**INAVAP**  
**POB 13171**  
**Minneapolis, MN 55414**  
**info@inavap.com**  
**www.inavap.com**

The Inavap vaporizer appears to be a modification of the Eterra design, and at \$99.00 plus \$13.00 for S&H—like the Aromazap—it is less expensive than the Eterra. It needs to be plugged in for 45 minutes to warm up, and after that the manufacturers say that it can be left on 24/7. I wouldn't leave it on for extended periods myself, but I am paranoid about starting accidental fires. Unlike the Eterra, where a small stem is inserted into the hot guts of the machine, and heated from the outside as well as having hot air drawn over the herbal material, the Inavap has a larger bowl in its stem where the material is placed. The base of the unit—a nine-inch-tall plastic construction shaped like a decanter—is flipped upside-down and the stem and bowl are screwed into a metal fitting. While holding the unit horizontally, one then draws slowly through the wooden stem attached to the metal bowl.

The unit's plastic base gets warm, although not uncomfortably so. One might be concerned that some sort of plastic fumes could eventually start coming off of this thing, but it didn't smell funny at all the short time that I had it on prior to using it, which might have been a couple of hours at most.

The nice thing about the Inavap, as compared to the Eterra or the Aromazap, is that it can hold a lot more material in its bowl, and hence one should be able to get more hits before having to reload.

Although one can get a number of decent hits off of the Inavap, the air coming through it quickly gets pretty hot. Indeed, the wooden stem itself heats to an *uncomfortably* warm point, particularly at the rounded end. One can use this as a sort of gauge; when it gets too hot for the lips, stop hitting. Or, if you want to hit it more, you can move your lips to the outer part of the stem, which doesn't get so hot. (However, if you hit from it in this position, you may end up getting a hit that is too hot for your throat and lungs.) At a certain point while hitting from this stem, it quickly got too hot to continue. The metal bowl inside the wooden stem simply heats too hot for it to be comfortable. Of course, by this time the material inside the stem may be spent anyway, and you may be high enough to stop. Still, the unit could be improved by using a longer stem that didn't transfer the heat from the metal bowl inside it so quickly.

After I felt as though I had probably spent the material in the bowl (and since I didn't want to trash my throat and lungs from the increasingly hot air coming through the unit), I decided to unscrew the stem and see what the material inside looked like. It was at this point that the stem completely detached from the metal bowl inside it. Heat must have softened the glue used to attach the bowl to the wood stem, and a goopy yellow crystalline glue was left in the stem, with the bowl still screwed to the unit. Obviously I would have to wait until the whole thing had cooled down again before trying to separate the two, unless I wanted to burn my hands on the metal bowl. Keep in mind that the unit broke in this manner after the first use. Not great. I suspect that this problem of detachment could have been avoided by having the two ends of the metal bowl thread in opposite directions, so that one wasn't turning to release the stem in the same direction as the stem was screwed into the wood itself. I stuck the wood stem back onto the metal bowl and let the whole thing cool down. Once it was back to room temperature, the stem remained glued to the wooden bowl, and I could detach the two parts and take a gander at the herbal material, which was toasty brown but not burned. The Inavap has some kinks that need to be worked out before I could recommend it. I really like the idea of the stem screwing into the base, and I like the fact that it holds a decent amount of material. But burning lips and the lack of ability to reload the thing while hot due to the stem falling apart are serious drawbacks.

#### **JUST SAY ONCE**

**<http://justsayonce.g2gm.com>**

A guy named TIM had a life-changing experience with *Salvia divinorum* and set up this web page so that anyone who wanted to could try the plant. Contact him and he will send you a sample of enough *S. divinorum* to "just say once" twice. Of course, he doesn't mind getting donations in return. But money isn't what this site is about; TIM is on a mission.

#### **KUNSTBAR**

**[www.whitehouseanimationinc.com/kunstbar.htm](http://www.whitehouseanimationinc.com/kunstbar.htm)**

STEVE WHITEHOUSE'S fabulous animation short *Kunstbar* won the Jury Award at FLASH AWARD 2002. Spilling over with modern art references, each drink from the bar menu takes the protagonist through a visionary trip. Quite psychedelic, and lots of fun, particularly if you get all the references.

**RELEASE THE REALITY****www.releasethereality.com**

Connecting to this web page might make you panic a bit at first, if you don't know to expect your browser window to jerk downward to the left as if it is being rapidly wiped from your screen. (Cool trick.)

Calling itself "The Nexus Of Psychoactive Entertainment," *Release the Reality* is a monthly virtual magazine with writings on the topic of psychedelics and other drugs. This site is a blast to check out; hours of frenetic surfing can be done here. Including writings on politics, art, music, news, discussion forums, interviews, free audio downloads from conference lectures, and more, *Release the Reality* has original material and it also acts as an instant portal to other areas of interest on the web. I found out about quite a few international magazines that discuss entheogens which I was totally unaware of before visiting this site.

You can check out all the previous issues of *Release the Reality* at the site's archives, and the magazine can be translated into a variety of languages at the site too, by clicking a button. They thoughtfully include a "tool box" of links to downloadable software that might be needed to use some of the links on their page (such as Acrobat Reader, QuickTime, Shockwave, RealPlayer, etc.), and the site has its own search engine. They do a great job of reviewing gatherings that have happened, and letting you know what's coming up.

There are quite a few banner adverts at the site, and it can get a bit confusing what is content and what is commercial. Nevertheless, the adverts aren't bothersome at all to me. Rather, it is intriguing to see what's happening on the business side of psychedelics, and as the site is set up so that the adverts open in a new window, they can be disposed of quickly enough if one isn't interested in them. I highly recommend viewing this site, which is a new favorite of mine. It's sorta what you might expect if a ton of content from *Trip* magazine and *Mondo 2000* was on-line, but with more of an international focus to it.

**SALVIA DIVINORUM CORPS****POB 650143****Potomac Falls, VA 20165****(703) 203-1463****webmaster@salviadivinorumcorps.org****www.salviadivinorumcorps.org**

A relatively new organization that operates a "buyer's club" for *Salvia divinorum*, in order to make it available at very low prices. They purchase *S. divinorum* directly from a Mexican supplier and sell it to the members of their buyer's club for \$5.00 to \$10.00 per ounce, and they offer a 5X extract for \$6.00 per gram. As always when mentioning *S. divinorum* prices, I like to point out that it is available at lower prices for larger quantities if one looks around. A kilo from Mexico can currently be had for \$125.00. That's about \$3.50 per ounce, which suggests that the buyers club is a pretty damn cheap way to go if one doesn't want to have to buy a kilo of the stuff.

The CORPS web site has posted trip reports and other discussion of this plant. They also produce a quarterly magazine called *Salvia Divinorum*. There are numerous photographs sprinkled throughout their first issue, some in color others in black and white, and usually of high quality. The art throughout is a bit less exciting, and the text layout is hard to read, suffering from too little white space in the margins and gutters. As far as content goes, the first issue was largely a compilation of information that is already available on the web or which has appeared in print previously. Articles from the usual suspects, VALDÉS, SIEBERT, HOFMANN, REISFIELD, and others. Strangely there are excerpts from STRASSMAN's book *DMT: The Spirit Molecule* (which have nothing really to do with *S. divinorum*). However, the 'zine also comes with a modified version of STRASSMAN's "Hallucinogen Rating Scale"—geared toward *S. divinorum* experiences—inserted into the publication, so perhaps that is the tie-in.

It isn't all reprints however; there is some new content. An excellent article titled "The Prohibition of Diviner's Sage" by THOMAS MUNRO provides a fascinating look at the scheduling of *Salvia divinorum* and salvinorin A in Australia, pointing out that the chemical name for salvinorin A that is cited in the law is wrong in several ways. MUNRO asks the pointed questions, "How is it that these errors went unnoticed by the committee's four 'technical experts'? Were they not paying attention, or do they not understand chemical nomenclature? ... If the technical experts didn't know what this com-

pound was, the rest of the committee certainly didn't. How can you prohibit something if you don't know what it is?" He goes on to explain that the people involved didn't even write a bad law, so much as they plagiarized (incorrect) speculation on the chemical structure from WILLIAM E. WHITE'S 1995 article "All about *Salvia Divinorum*." Furthermore, MUNRO proposes that the folks who created the ban in Australia had to break the law in order to access WHITE'S document, since it was posted to a forum that is banned in Australia—alt.drugs. This article alone is worth the purchase price of the 'zine. A short article titled "*Salvia Divinorum* in US legislature" by the 'zine's publisher SLAVA OLCHEVSKI was also an interesting look at bill HR5607 proposed by JOE BACA to control *S. divinorum* and salvinorin A in the USA. OLCHEVSKI provided a list of reasonable questions that, unfortunately, received no answer from BACA.

Alas, some of the newer content is pretty spotty as far as quality goes—the "*Salvia Quiz*" is fairly pointless, an article on the confluence of *S. divinorum* and Christianity was a throw-away, and the various trip reports included—running along the bottom of the issue (another poor layout choice)—were inconsistent: some bad, others better. An article about Buddhism didn't hold my attention, and a well-meaning article geared towards telling parents how they should handle it if their teenagers ask about *S. divinorum* had some good suggestions (such as surfing the web *with* your kid to discover and discuss information together) but the overall message strictly stuck to "abstinence is the best policy," which may be a bit unrealistic.

Overall this publication is a good first effort. I do wonder how long it will last, though—how much can one have to say about *Salvia divinorum*? I can't think of any similar quarterly 'zines written about psilocybian mushrooms, or LSD, or MDMA, or *Tabernanthe iboga*, yada yada. On the other hand, there are a whole lot of rags dedicated to *Cannabis*, many of which have stayed the test of time. Despite the sometimes inconsistent quality of this publication, I highly recommend picking up a copy—sure to be a collector's item. A single copy of the first issue is \$9.00 (USA), postpaid. A four-issue subscription is \$26.00 (USA), \$29.00 (Canada), and \$32.00 (other foreign), postpaid.

## TRIPATOURIUM

891 Main Street  
Reading, MA 01867  
(781) 779-1973  
random@tripatourium.com  
www.tripatourium.com

TRIPATOURIUM offers signed and unsigned blotter art from FRANK KOZIK, AIDAN BRUTE HUGHES, REV. SAMUEL, DANNY GOMEZ, TREVOR BROWN, JASON COOPER, NAOTO HATTORI, JAMES RYMAN, J.G. THIRWELL, and DARCY J. WATT. This blotter art seems a bit odd, in that the printed and perforated image is listed as being 8" X 8", and this is placed onto a 10" X 14" piece of blotter. (The "standard" for street blotter is generally 7.5" X 7.5", perforated at 1/4 inch, to make 900 hits.) It is unfortunate that the TRIPATOURIUM URL is listed on the side of this blotter, as it adds a commercial element of advertising that detracts from the art. Yet this could be matted out when framed. And these sheets are of very high quality—the printing, perfining, and paper (100# archival coverstock), are all excellent. As well, these pieces are being sold at pretty good prices. Signed (in editions of 50 to 250, depending on the sheet), they are \$35.00 to \$45.00, unsigned they are \$25.00. However, I was first hipped to this site due to a search for blotter art on E-BAY, where these sheets were selling at a mere \$10.00 to promote the TRIPATOURIUM web page. I've no idea if they will hold similar promotions in the future, but they do have a link for E-BAY auctions at their web site, so it is worth clicking on this first, to see what sort of savings might be possible. The site also features sculptures and paintings by DANNY GOMEZ. And it has the fabulous animation by GOMEZ titled *Flashback*, which everyone should check out. More of GOMEZ'S art can be found at <http://webzone.k3.mah.se/kit01051>.

## MIMOSA HOSTILIS AVAILABLE

A subscriber recently obtained a large quantity of *Mimosa hostilis* [= *M. tenuiflora*] root-bark, and is making it available to other ER readers. The material was harvested in Brazil and looks to be top-notch. The cost is \$160.00 per kilogram plus shipping. Any amount can be ordered and the price is the same (i.e., 100 grams would be \$16.00, 25 grams would be \$4.00). Shipping by Priority Mail is \$5.00 for up to 500 grams or \$10.00 for 501 grams to one kilogram. Pay by cash or by money order with "pay to" space left blank, sent to: ERIC, POB 370541, Milwaukee, WI 53237 or pay electronically via [www.paypal.com](http://www.paypal.com) to MHRB@earthlink.net.

# BOOK REVIEW

*Breaking Open the Head: A Psychedelic Journey into the Heart of Contemporary Shamanism* by DANIEL PINCHBECK. 2002. (BROADWAY BOOKS: [www.randomhouse.com/broadway/index\\_home.html](http://www.randomhouse.com/broadway/index_home.html).) Trade paperback 0-7679-0743-4 (2003) \$14.00, hardcover 0-7679-0742-6 \$24.95, e-book 0-7679-1152-0 \$17.50. [1.07" x 8.52" X 5.86"], 272 pp.

*Breaking Open the Head* is a “must read” for anyone even remotely involved with psychedelics in the new millennium. In this terrifically written autobiography, DANIEL PINCHBECK describes his transformation from a disillusioned and world-weary KAFKA-esque cynic into a spiritually rejuvenated (and more self-aware) human being via the path of psychedelic shamanism. He employs an endearing self-deprecating presentation to his story, while describing all the pitfalls, mistakes, and psychic ass-kickings—as well as the high points and insights—along the way.

The book’s title refers to the tradition of certain Gabonese tribes of striking the skull of a *Tabernanthe iboga* initiate three times with a hammer. While most tribes don’t go to these extremes, the idea behind this ritual is used by PINCHBECK as a metaphor for opening one’s head—increasing perception in order to become aware of the shamanic dimension and other transpersonal realms. PINCHBECK’S account of how he and another Westerner traveled to Africa to partake of the *T. iboga* ceremony is priceless. He has profound visions, but must deal with ingesting “the most bitter substance I have ever put in my mouth,” as well as the chief of the tribe mercilessly trying to extort them both before and after the ceremony.

Overall, this book serves as an incredible index, overview, and synthesis of past and contemporary shamanic, cultural, and spiritual concepts and pioneers. I’ve been reading *The Entheogen Review* since 1995, and this book dazzlingly reflects

all the other research and reading that I have done, since first happening upon JIM DEKORNE’S book *Psychedelic Shamanism* that same year. PINCHBECK covers (take a deep breath now) 20th century philosopher WALTER BENJAMIN, as well as MIRCEA ELIADE, CARL JUNG, GEORGE IVANOVITCH GURDJIEFF, ALEISTER CROWLEY, ALDOUS HUXLEY, TIMOTHY LEARY, and RICHARD ALPERT; he covers shamanic research pioneers such as MICHAEL HARNER, CARLOS CASTANEDA, and JIM DEKORNE; entheobotanists like RICHARD EVANS SCHULTES, R. GORDON WASSON, TERENCE MCKENNA, JONATHAN OTT, and WADE DAVIS; chemical researchers like ALBERT HOFMANN, ALEXANDER T. SHULGIN, and RICK STRASSMAN; Dadaist ANTONIN ARTAUD’S pursuit of peyote... wait! There’s more. He covers psychoactive mushrooms, *Salvia divinorum*, ayahuasca, visionary cacti, LSD, DMT, 2C-B, MDMA, DPT, and others. He describes first-hand his experiences at the 21st century cultural phenomenon of the BURNING MAN FESTIVAL. (Hey, I was there when he was too!)

This is not to say that the book is a dry listing of all these subjects—quite the contrary. It is a very heartfelt and enjoyable story. We follow the author through his trials, tribulations, and investigations into the psychedelic path—and the empathetic awareness of the state of our planet and our culture that the use of entheogens can evoke. Especially interesting were the accounts of his explorations with DPT, which he found to mirror, for all intents and purposes, a demonic side of our society—one that expresses itself in corporate logos and advertising!

I highly recommend this book. It was my favorite of the past year. If you enjoy reading *The Entheogen Review*, then this book is definitely up your alley. PINCHBECK lays out scores of paths and philosophies that one can pursue on the entheogenic path, and he expresses himself with humility and humor. Some of his subject material I have run across many times before, but this book puts it all together in a wonderful context. I’d buy a copy of this book for all my friends if I could afford it. So hey kids, log on-line now and grab it up.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See www.entheogenreview.com for descriptions and prices.

# DISEMBODIED EYES AND DIVINE VISION

by JON HANNA

*In my youth, I remember having been told that the psychedelic swirling puddle of oil on asphalt after it rained was called a “God’s eye.”*

It has been “proposed that the ‘disembodied eyes’ [carved onto columns at Teotihuacan in Mexico] represent the visionary sight of the shaman or participant in an agape involving ingestion of a potion compounded of entheogenic mushrooms, morning glory seeds, or other plants with allied effects. This interpretation is based on the occurrence of mushrooms, flowers, and seeds in juxtaposition with the ‘disembodied eyes’...” (OTT & WASSON 1983). The same article, perhaps less convincingly, presents a similar interpretation for the depiction of a disembodied eye on a gold ring from Crete (circa 1500 B.C.), by speculating that the Minoans might have had entheogenic rituals similar to those practiced by the Greeks. Artistic depictions of disembodied eyes have largely been considered to represent the “eye of God.” Such vision may indeed be closely related to the experience produced by entheogenic plants, which can allow one to seem to be viewing the world through the eyes of God. This vantage point has been described—with psychedelic overtones—in Chapter 11 of the *Bhagvad Gita*, when KRISHNA allowed ARJUNA to see the world through his divine eye (see side-bar).

## A CONTEMPORARY SYMBOL OF GOD’S EYE

Such a disembodied eye—referred to as “the eye of providence”—is included in the Great Seal of the United States. Created between 1776 and 1782, this symbol has the Latin phrase *Annuit Coeptis* above it, which has been translated to mean “It has favored our undertakings.” The “It” referred to is symbolized by the eye, which is quite clearly the eye of God. At [www.greatseal.com](http://www.greatseal.com) it is pointed out that the “[u]se of the eye in art forms as a natural symbol for an omniscient and ubiquitous deity was a well-established artistic convention in the eighteenth century (quite apart from the symbolism of any particular group).”

The DEFENSE ADVANCED RESEARCH PROJECTS AGENCY’s Information Awareness Office—an Orwellian project of the U.S. government that spies on citizens under the guise of protecting us from terrorists—recently adapted the Great Seal in a disturbing manner. The eye, now casting a probing beam across the entire planet, is transformed from the eye of God into the eye of a snooping government. Below this is found the Latin phrase *Scientia est potentia* (knowledge is power). Big Brother is watching. After critics lambasted this oppressive logo, DARPA removed it from their web site.

## ARJUNA SEES WITH THE DIVINE EYE

Excerpted from *Bhagvad Gita*  
Chapter XI: The Yoga of the  
Universal Form

[...S]urely you cannot see Me with these gross eyes of yours; therefore I vouchsafe to you the divine eye. With this you behold My divine power of Yoga. ...Sri Krishna, the supreme Master of Yoga, having said thus, then revealed to Arjuna His supreme divine Form. Arjuna saw the supreme Deity possessing many mouths and eyes, presenting many a wonderful sight, decked with many divine ornaments, wielding many uplifted divine weapons, wearing divine garlands and clothes, besmeared all over with divine sandal pastes, full of wonders, infinite and having faces on all sides. If there be the effulgence of a thousand suns bursting forth all at once in the heavens, even that would hardly approach the splendor of the mighty Lord. Arjuna, then, saw in the person of that supreme Deity, comprised in one limb, the whole universe with its manifold divisions. Then, Arjuna, full of wonder and with the hairs standing on end, bowed his head to the divine Lord and with joined palms addressed Him...

## THE FLIGHT OF DISEMBODED SIGHT

Artist and mechanic KENNY "VON DUTCH" HOWARD, who pin-striped cars and motorcycles in the 1950s, is widely credited for introducing the "flying eyeball" into American art. According to VON DUTCH: "The flying eyeball originated with the Macedonian and Egyptian cultures about 5000 years ago. It was a symbol meaning 'the eye in the sky knows all and sees all.' I have always believed in reincarnation, and the eyeball was tied to that." (HAGERTY 2001). The symbol remains an icon of the 1950s and 1960s hot rod crowd. It has appeared in countless versions since then, reincarnated in the now infamous 1968 rock poster painted by RICK GRIFFIN for THE JIMI HENDRIX EXPERIENCE performing at the Fillmore, and later used as a T-shirt logo for the absurd theatrical metal band GWAR, to name a couple of places that it has turned up.

Photographer ROBIN EDGAR believes that the "winged eye" is a composite that combines the "eye of God" symbol (said to represent solar eclipses) with the "winged disk" symbol (said to represent the streamers of the sun's corona that can appear during particular eclipses). EDGAR notes that the Egyptians, Mayans, Aztecs, and other ancient cultures all developed their own versions of the "winged eye" symbol (EDGAR 2003).

*My whole body is covered with eyes:*

*Behold it!*

*Be without fear!*

*I see all around.*

— Eskimo poem

## PSYCHEDELIC EYE-SIGHT

There is no arguing that the entheogenic mind state can sometimes cause a psychonaut to feel as though he or she has the vantage point of a disembodied eye. R. GORDON WASSON remarked of the bemushroomed state:

"What I was seeing was more clearly seen than anything I had seen before. At last I was seeing with the eyes of the soul, not through the coarse lenses of my natural eyes. ...It is a curious sensation: with the speed of thought you are translated wherever you desire to be, and you are there, a disembodied eye, poised in space, seeing, not seen, invisible, incorporeal" (WASSON 1980).

And a 19-year-old psychonaut commented:

I got stoned on grass, and as I was about to go to sleep, I came completely awake and aware of my surroundings ...I felt as if my body were covered with eyes and I could see in all directions (TART 1971).

This writer goes on to describe what might be characterized as an out-of-body experience, with the deity-like vision of a disembodied eye floating away from the planet, out into the universe, and beyond. With regard to this state of mind, ketamine researcher KARL JANSEN has remarked:

[...]Some physical boundaries are arbitrary. One explanation is Bell's theorem which involves a hyper-space where all realities exist at a single point. If entry can be gained to the quantum sea, a person's awareness—the 'disembodied eye'—might travel through different 'realities' without the body itself going anywhere (JANSEN 1999).

The disembodied eye (or flying eye) has appeared repeatedly in modern psychedelic artists' works, including the art of JOHN W. ALLEN, L.J. ALTVATER, GOODVISION, ALEX GREY, NAOTO HATTORI, MARTINA HOFFMANN, MATI KLARWEIN, CAROLYN KLEEFELD, STEVEE POSTMAN, BRIAN MORIARTY, FREDERIC PARDO, and many others. The disembodied eye is not always depicted hovering in the sky (with or without wings). It has also been frequently shown with flames surrounding it, and less commonly floating in water. In whatever form it appears, it is clearly a prevalent symbol. But how often is the actual image of a disembodied eye seen while one is on a psychedelic, and what are the reasons that this might appear?

There has been some degree of study related to the common structures of geometric patterns that appear while one is under the influence of a psychedelic (KLÜVER 1966; FISCHER 1969; OSTER 1966). However, there hasn't been much published that categorizes and discusses specific complex symbols—like the eye—that may be common to psychoptic visions. Some investigation on the prevalence of eyes in such visions turned up a few accounts:

I've seen an eye in a pyramid, an eye in an open book, and eyes in fire—that sort of thing—all of which lacked apparent bodies. But I've never seen *just* a disembodied eye. — K. TROUT

I had an experience years ago on ayahuasca that involved a disembodied eye. It was during an early evening experience...I felt the vibration of the huasca rising in my

body and looked outside...in the sky to see in-between the clouds a roving eye looking for something. I knew that this was the eye of providence at the time and the eye was looking for me. It made me feel special to be allowed to be in that experience at that time in my life. — C.J. BARNABY

"We have all heard

that the eye is a  
window to the soul.

This is true. The open eye  
is a symbol of awareness  
or consciousness.

If it is repeated

endlessly,

you have

a symbol of

infinite awareness...

When you are in

the visionary world,

anything can grow an eye,

from the sky to the

stones at your feet.

This symbolizes the

recognition of our

presence by the greater

field of presence, which is

nature and cosmos,

inner and outer space."

— Alex Grey

I was spiraling in toward a white light. Although I [was] focused primarily on the light, swirling around me was a distinct pattern made of nothing but eyeballs—seemingly an infinite number of them. — D.M.

Something lives in matter, or so says 2C-B. It has eyes, and a very Aztec-like pattern about it. I saw eyes everywhere, somewhat unsettling. They were always rolling back, but they were there. — A PSYCHONAUT

In some cases, although the eyes perceived are definite "other" in nature, they aren't necessarily representative of the eyes of God. Rather, they are part of some other discarnate entity:

I noticed something new to my experience of 2C-B [combined with MDMA] on this trip—entities! I was presented with closed-eye visions of strange creatures that looked like a cross between the type of animals that inhabit the deepest, darkest regions of the ocean floor (jellyfish, luminescent eel-like creatures, strange octopoids, etc.) and sci-fi style aliens, plus beings that looked remarkably like disembodied eyes. These beings did not seem to have the same sort of urgent sense of presence associated with them that I normally experience during tryptamine-mediated entity contact, however. I also perceived a scene rendered in Egyptian motifs in which several humanoid beings that were apparently priests or shamans performed some sort of sacred ritual around a highly elaborate, ornate altar. Egyptian style symbology is something that I often encounter on 2C-B; the bees often send visions of ankhs, pyramids, eyes of Horus, and such dancing across the insides of my eyelids. — TREY

[On DMT] I noticed what seemed to be an opening into a large space, like looking through a cave opening to a starry sky. As I approached this I saw that resting in the opening was a large creature, with many arms, somewhat like an octopus, and all over the arms were eyes, mostly closed, as if the creature were asleep or slumbering. As I approached it the eyes opened and it/they became aware of me. It did not seem especially well-disposed towards me, as if it did not wish to be bothered by a mere human, and had the impression I wasn't going to get past it, so I did not try (MEYER 1993).

### ART IMITATES LIFE OR LIFE IMITATES ART?

Why do disembodied eyes—or other common visions—appear while under the influence of a psychedelic? R. GORDON WASSON has conjectured that ancient Mexican art could have been influenced by visionary images seen while under the influence of entheogens (HOFMANN 1980). Yet might it not also be the other way around? From being in the environment of Mexico and viewing the local textiles before he consumed any psilocybin-containing mushrooms, perhaps WASSON's mind was “primed” to produce patterns similar to those that appeared on local rugs, cloth, and pottery. The

“imprinting” of certain symbols on one's mind is commonly reported by people who eat blotter art that has been decorated in a particular manner, who then see similar imagery when they are under the influence of the dose. Perhaps images of jaguars and snakes on ayahuasca occur because people have *heard* that ayahuasca causes these sorts of visions? The arena of mind that we enter while on psychedelics is of course influenced by what we have seen or heard prior to entering that state, and it is reasonable to think that those who view psychedelic art depicting disembodied eyes may be more likely to see such imagery in their own visions. And yet it is also possible that there is some archetypal imagery unique to certain visionary mind states that does not originate from an individual's personal memory. For myself, the sort of visions that springs forth following a smoked dose of DMT is totally “other.” There is nothing that I am aware of in my memory that could produce this imagery. Teasing out what is memory and what is local to a particularly induced mind state could well be an impossible task. But cataloguing the specific symbols that appear may be useful nonetheless, to provide a yardstick of contemporary culture's inner visions. ⊕

# ESTABLISHING IDENTIFICATION METHODS FOR ETHNOBOTANICAL MEDICINES

by SIDNEY SUDBERG and ELAN M. SUDBERG

What a long strange trip it's been. After all these years there is now a growing interest in the quality control of plant medicines. In the "early" days when there wasn't too much in the way of choice of plant medicine available to the consumer, concern for the quality of your herb of choice was minimal. Now, there seems to be a glut of product available and unless you know how to identify or distinguish good quality vs. poor quality by the age-old, time-tested organoleptic methods of taste, smell, and appearance of the plant, then you are dependent upon the reliability of your source or your own bioassay methods. If you are purchasing a plant medicine in any form other than the whole or cut-and-sifted form, then it becomes even more difficult to identify what plant you are buying or whether it is mixed with anything other than the plant you want.

## LESSER-KNOWN PLANTS

With the introduction of a number of lesser-known plant medicines from other cultures and parts of the world to the United States and Europe in the last two decades, the need for accurate identification is increasing. A plant species is unlike a pure chemical substance in many ways since very precise criteria such as melting point, spectral characteristics, and a chromatographic comparison with reference substances can be used to establish the identity of a single chemical entity. In the case of plant material, the standards for comparison cannot usually be so precise. Ideally the material to be identified should be compared with authentic specimens of good quality, either in the preserved or living state. This not being practicable, one usually has to rely on comparison against a written description, possibly supplemented with some type of picture of the product.

As the number of plant specimens increases or their usage profile broadens, the likelihood of "adulteration" or even substitution increases. Methods to identify a plant are described in monographs for many plants, but with the lesser-known or more novel plants appearing in commerce today, these are generally not available. Monographs for botanicals usually consist of a description of the distinctive and characteristic macroscopic and microscopic features of the plant in question together with simple descriptions of its organolep-

tic characters. Many monographs also include some type of test to ensure that the correct chemical ingredients are present whether via a "wet" chemical test resulting in the formation of a color or precipitate, or by chromatographic examination. Literature searches may provide additional chemical information. In the case of so many of the visionary plants, a single chemical compound is the defining factor for the quality and/or identity of the plant in question.

## CATEGORIES OF IDENTIFICATION

The criteria used for the identification can be divided into four major categories:

- 1) Macroscopic appearance
- 2) Organoleptic characters
- 3) Microscopic appearance
- 4) Presence and absence of chemical substances

Very rarely is identification made on the basis of only one feature. More frequently it is a combination of features that are all consistent with the plant in question. In the examples below, we show how these simple but powerful techniques are useful for plant identification and gauging or determining overall quality.

1) Macroscopic appearance is useful when the botanical is in pieces greater than 2 cm in diameter. Those features which can be seen with the naked eye or with a hand lens are used for identification. The macroscopic criteria most frequently used for identification are shape, size, color, and appearance of all surfaces. But, when there is only a powdered sample, the task of identification is more complex and one must rely on other procedures.

2) Organoleptic characteristics can help identify a large number of botanicals by their odor, appearance, texture, and taste. A classic example of the feature of odor would be *Cannabis sativa*.

3) Microscopic appearance brings us to the world of botanical anatomy. Here is where it gets interesting and where we

can make plant identification a fun and artistic science. Many plants have such unique characteristic cellular structures that there is no mistake as to the identification of the plant. An example might be the analogy to the obvious difference between a rose and a tulip or many other plants for that matter, macroscopically. Most of us can make this distinction by gross appearance and/or smell and even if the specimen cut up, you would still be able to distinguish them from one another, to an extent. Similarly, there are obvious *microscopic* characteristics that make plants distinguishable to the trained eye just like the rose is to most of us with the naked eye. In the pictures accompanying this article you will observe the microscopic and chromatographic differences between the leaves of *Salvia divinorum* and *Mitragyna speciosa*. If we look at the macroscopic features of the two leaves side by side, there would be a clear difference. If the leaves were powdered, you could perform a bioassay to distinguish the two or you could look at them chemically.

4) Chemical constituent profiles or fingerprints of the secondary metabolites of the plant are unique to each plant. Most “wet” tests are not very specific and detect only certain classes of compounds. The advent of chromatography, particularly high performance thin-layer chromatography (HPTLC), brought a whole new dimension to the use of chemical constituents for botanical identification. The other major techniques are gas chromatography (GC) for the investigation of essential oils, and high performance liquid chromatography (HPLC), which can be used for almost any type of constituent but which has the disadvantage of being comparatively costly and less environmentally friendly compared with HPTLC.

## COMBINING TECHNIQUES

Some examples of these combined techniques can demonstrate their utility. We recently had the opportunity to analyze, identify and characterize a plant we weren't familiar with, *Mitragyna speciosa* (*kratom*). There were no references for it that we were able to get and we only had some TLC procedures used for identification given to us for the analysis. We were given about 14 different samples and only a few of them were considered reliable or authentic. Of the 14, only seven of them were actually the right plant as determined by the pictures that follow. Our first step was to look at the powdered sample for any characteristic cellular structures that could be used for identification.

In Figure 1 and Figure 2 you are looking at the microscopic image of the surface of the leaf from a powdered sample of *Mitragyna speciosa*. The pointed structures are trichomes or hairs on the leaf midrib. The sample used for these pictures was a reliable sample and therefore can be considered a standard for the identification of future samples.

In order to further enhance this process, we ran a series of HPTLC plates to characterize the chemical profiles (Figures 3–6, to the right). We were supplied a chemical reference standard—the alkaloid mitragynine picrate (which is unique to *kratom*)—that would allow us to further confirm its identification. By use of these “fingerprints” you can get an idea of the predictable nature of the chemical constituents and the presence of the reference standard used to characterize it. Lanes 1–7 are the different samples and lane 8 is the reference standard mitragynine picrate. In Figures #3 and #4 we used the same chromatographic conditions and see one fin-

Figure 1: *Mitragyna speciosa*. Sample Findings: unicellular bristle-like trichome found on the mid rib showing warted exine. Magnification: 400X. Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 2: *Mitragyna speciosa*. Sample Findings: unicellular bristle-like trichomes found on the mid rib showing warted exine. Magnification: 400X. Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 3: *Mitragnyna speciosa*.  
Stationary Phase: silica gel 60, F254, 10 x 10 cm HPTLC plates.  
Mobile Phase : toluene : ethyl acetate : diethylamine [7.0/2.0/1.0].  
Detection: UV 365 nm.

Figure 4: *Mitragnyna speciosa*.  
Stationary Phase: silica gel 60, F254, 10 x 10 cm HPTLC plates.  
Mobile Phase : toluene : ethyl acetate : diethylamine [7.0/2.0/1.0].  
Detection: Van Urk's spray reagent → UV 365 nm.

Figure 7: *Psychotria viridis*. Sample Findings: upper epidermis with thick blotchy cuticle. Magnification: 1000X. Chemical Reagents: acidified chloral hydrate glycerol solution.

gerprint and when using a different set of chromatographic conditions in Figures #5 and #6 we see a different fingerprint but the patterns are the same, thus adding an element of multi-dimensionality to the characterization of this plant for future reference. If we were to try to draw any conclusions from this study, we could say that by comparison among all these samples, that if we look at lanes 4 in images 3–6, we could easily conclude that this sample of *kratom* has the highest concentration of its constituents including the apparent active principle mitragynine which is in lane 8 in all 4 images. Between the microscopic images of this plant and the HPTLC fingerprints, there would be very little difficulty identifying or distinguishing it from any substitute.

### **PSYCHOTRIA VIRIDIS**

Now for some images of some of the better known plant medicines that we all know and love. In Figure 7 and Figure 8 (below) we see *Psychotria viridis*. These are microscopic images that are not unique to *P. viridis* (as they are common structures in all plants) but they are characteristic of this plant and can be used to exclude other possible plants as substitutes.

Figure 5: *Mitragnyna speciosa*.  
Stationary Phase: silica gel 60, F254, 10 x 10 cm HPTLC plates.  
Mobile Phase: n-propanol : 1.5% NH4OH [9.0/2.0].  
Detection: UV 365 nm.

Figure 6: *Mitragnyna speciosa*.  
Stationary Phase: silica gel 60, F254, 10 x 10 cm HPTLC plates.  
Mobile Phase: n-propanol : 1.5% NH4OH [9.0/2.0].  
Detection: Van Urk's spray reagent → UV 365 nm.

Figure 8: *Psychotria viridis*. Sample Findings: lower epidermis with beaded cell walls & stomate. Magnification: 1000X. Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 9: *Banisteriopsis caapi*.  
Sample Findings: a bundle of lignified fibers.  
Magnification: 400X.  
Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 10: *Banisteriopsis caapi*.  
Sample Findings: fibers with inlaid prisms of calcium oxalate.  
Magnification: 400X.  
Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 11: *Banisteriopsis caapi*  
Stationary Phase: silica gel 60, F254, 10 x 10 cm HPTLC plates.  
Mobile Phase: CH<sub>3</sub>OH:CHCl<sub>3</sub>:acetic acid [7.5/2.5/1.5].  
Detection: UV 365 nm.

## BANISTERIOPSIS CAAPI

[Left:] Figures 9 and 10 show some of the microscopic features that help make the identification of this plant. Figure 11 is a HPTLC fingerprint showing the presence of harmine in *B. caapi*.

## SALVIA DIVINORUM

[Right:] Figures 12 and 13 are images of cellular structures of the leaf surface showing a top view of one of the glandular hairs and the characteristic trichomes. Figure 14 shows a typical HPTLC profile for *S. divinorum* in the four lanes in the middle of the picture with the reference standard salvinorin A in the first and last two lanes. The volumes used to create those bands listed on top of the lanes.

Microscopic pictures in combination with the HPTLC fingerprints are an important tool in pharmacognosy and have been used for many years for quality control in herbs of commerce. Although most of the plants pictured are unlikely to be considered major herbs of commerce in the near future, should the question arise as to the identity of some entheobotanical, whether for personal or commercial purposes, it is reassuring to know that there is a way to monitor the quality of these plant medicines. It is our goal to eventually produce a compendium or reference library of as many of the psychoactive ethnobotanicals as possible in a manual of identification using macroscopy/microscopy and HPTLC. A project of this sort will require that we first have vouchered or authenticated samples of any plants we analyze. If any interested parties who would like to participate in a project of this sort can contribute vouchered specimens of unusual ethnobotanical plants, please contact us via our web site at [www.alkemist.com](http://www.alkemist.com). ☉

Figure 12: *Salvia divinorum*.  
Sample Findings: large multicellular trichome with warty exine.  
Magnification: 1000X.  
Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 13: *Salvia divinorum*.  
Sample Findings: glandular trichome showing four individual cells.  
Magnification: 400X.  
Chemical Reagents: acidified chloral hydrate glycerol solution.

Figure 14: *Salvia divinorum*.  
Stationary Phase: RP-18W/UV254, 10 x 10 cm HPTLC plates.  
Mobile Phase: ethyl acetate : hexanes [5.0/5.0].  
Detection: Vanillin – H<sub>3</sub>PO<sub>4</sub> spray reagent.

# TRIFLUOROMETHYLPHENYLPIPERAZINE (TFMPP)

## AN ENTHEOGENIC ENTACTOGEN

by MARKUS BERGER • Translated by CHRISTINE BANDOW

*The following article has been adapted from a piece that appeared in the October 2002 issue of *Entheogene Blätter*—the German version of *The Entheogen Review*. Although the few psychonautical reports included in this article present predominantly positive accounts of the effects of TFMPP, in the past we presented largely negative reports in a discussion of the piperazine compounds, and a general survey of the web shows mixed opinions. — Eds.*

The fact that nearly every day new psychoactive substances are being synthesized really isn't anything new. So-called "designer drugs" are developed regularly. Phenethylamines and tryptamines have been the primary players in this arena, but for a few years now piperazines (also known as diethylendiamines) have been gaining status. How important are piperazines to the psychonautical scene, and what manner of effects do they have?

Consider the hip new drug trifluoromethylphenylpiperazine (TFMPP). Surprisingly, it has been reported by some to produce effects that are similar to those caused by entactogens such as MDMA. 1-(3-trifluoromethylphenyl)piperazine is also known by the names N-(alpha,alpha,alpha-trifluoromethyl)piperazine, m-trifluoromethylphenylpiperazine, TFMPP, TFMPP, and Molly. Its chemical formula is  $C_{11}H_{13}F_3N_2$ , and its CAS number is 15532-75-9. For storage purposes, it should be kept in a closed and dark place at a temperature of 15–30°C. Piperazines are hygroscopic (attract water) and heterocyclic (contain other atoms in their cycles of carbon) compounds that have antibiotic effects. They are primarily used in veterinary medicine. Piperazines are given to chicken and pigs to control parasites such as worms (VERORDNUNG 1990).

Pharmacologically, trifluoromethylphenylpiperazine behaves in a similar manner to phenethylamines (MDMA, mescaline, 2C-B, etc.)—it interacts with several serotonin receptors (SCHECHTER 1988; KŁODZINSKA et al. 1989;

STAAK et al. 2001a; STAAK et al. 2001b; HULSIK 2002; GLENNON n.d.). TFMPP's effects are sometimes described as lying somewhere between empathogens, such as MDMA, and entheogens, such as LSD. With closed eyes, psychoptic effects in most cases involve partly colored visions and patterns similar to those caused by mescaline. One's emotions may feel exposed, more intense, more understandable, and almost touchable.

What is considered "an active dose" of TFMPP can depend on the kind of effect desired. Slight empathogenic effects can be expected by taking a dose of approximately 25 mg. For a more visionary experience, one needs to take 75–105 mg. Unwanted side effects may include skin reactions, diarrhea or soft stool, hyperthermia (increased temperature of the body), tachycardia (increased number of heart beats), nausea, and vomiting.

The Internet newsgroup alt.drugs.chemistry contains some early psychonautical reports of experiences with this interesting piperazine. There is the 1997 example of TOM KASPER who owned CHEMICAL RESALE OF SANTA BARBARA—a no longer extant company that sold psychoactive "research chemicals." [KASPER eventually did some time in jail and may still be imprisoned for all we know.—Eds.] By "accident," KASPER poured about 100 mg of TFMPP hydrochloride onto a piece of chicken that was supposed to be his dinner:

[...W]hen I bit down on that chicken leg, I tasted the bitter taste, but too late. I had already swallowed...This was Tuesday afternoon at about 5:00 pm, and I was scheduled to go to the Carlos Santana concert at the Santa Barbara County Bowl at 6:30 pm. What to do, what to do? Well, I couldn't disappoint my beautiful date...I decided not to say anything. I stopped wedging on the chicken and left it out on the workbench (a mistake). When my beautiful date arrived, she saw the chicken and decided to have a bite. She too accidentally ingested a little [TFMPP], which must have accidentally spilled on

another piece of chicken. Oh well...We arrived at the S.B.C.B. for the concert feeling no effect from the ingestion at about 6:30 pm. By the time Santana started playing however, we were feeling the effect of the accidental ingestion of chemical TFMPP...In my estimation, it was similar to, but *more* euphoriant than MDMA, which I had accidentally ingested some years back when it was still legal. The toxic symptoms of ingestion included:

- 1) Increased sociability.
- 2) Increased desire to touch and love.
- 3) Enhanced tactile sensations (it felt good to touch things).
- 4) A feeling of “oneness” with the crowd, and with my date.
- 5) A desire to be very close and to share love with my date (KASPER 1997).

The effects described in this report are very similar to those of a substance that would be classified as typically entactogen. [*Keep in mind that this largely positive bioassay was reported by someone who at that time earned his living by selling the compound that he was describing effects for, among other similar compounds. — Eds.*] There wasn't any visionary component reported; perhaps the actual dose consumed was too small to produce such effects. Unfortunately, the report isn't crystal clear on exactly what amount of the chemical was consumed. Due to this vagueness, below I have quoted another report of a trip that was posted in the same newsgroup; this time there are precise details about the dose.

I ate 100 mg in a gel-cap. I started to feel trippy effects a little before the one hour point, and effects reached full intensity by around 2.5 hours. The comedown began at the 5 or 6 hour point and I was not completely back to normal until [after] 11 or 12 hours. Quite simply, it was not MDMA. There were some skin sensations that seemed like they could be MDMA-like, but there was none of the incredible emotional release of MDMA. However, there was no question that I was tripping. My thought patterns were trippy, things would breathe slightly if I looked very carefully for it, and music had a trippy edge. A little marijuana seemed to enhance the effects some. My pupils were dilated, my jaw was clenched just a little towards the end of the trip, and I was quite thirsty—at least the physical effects were similar to MDMA (PARADIGM SHIFT 1997).

Referring to risks and dangers, the quote below reports on a problem that arose due to the method of ingestion. The author prepared a sugar lump with about 102 milligrams of TFMPP hydrochloride and let it dissolve under the tongue:

I made the mistake of taking the “sublingual” stance too literally and held the cube in my mouth for a minute or two—for twenty minutes or so afterward my mouth was essentially numb. The substance seems highly caustic and swallowing it in a gel-cap with a glass of water probably would have been a cleverer way of ingestion (ANONYMOUS 1997).

Before I describe my own experiences, I'd like to share a trip report that was written by an anonymous friend, which gives another impression of the effects of TFMPP. The report was written by a 23-year-old male who weighed 120 lbs, who took 60 mg at 3:15 pm. About eight hours later, he wrote down remarks about his experience:

I'm at the level where I could sleep if I wanted to right now. I have to stay awake for “J” to come over and we'll hang out for an hour or so, but I'm sure the part of this experience that would have made sleep impossible is long gone. My pupils are still dilated and I am still feeling little waves of some perceptual shift, but the waves are becoming fewer and further between...also less intense. I think that a mood elevation was definitely one of the more primary effects. It was very [subtle] and mild in terms of visual trippiness or any kind of “trippy headspace.” It seemed to soften the trademark “self-conscious” effect that kills the buzz for so many other psychedelics. One note on the visuals: the first and last of the noticeable visuals seem to be a “dimming” of light and of visual clarity. Things get a little dim, like the power is waning or something, and then things get brighter again, but my vision also seems to go in and out of some kind of liquid blurriness.

I am definitely able to pick out the effects of TFMPP, and it is really nothing like BZP [*N*-benzylpiperazine] except for the mood elevation. The CNS stimulation was barely evident... and I think it probably was a side effect of the mood elevation and anticipation. There also is no parallel between the TFMPP and anything anywhere near MDMA. I would place it more like a small but perceivable amount of LSD, without the self conscious feeling and clenching, etc.

It's 11:03 now, and I'm sure the effects are diminished to a slight afterglow. The slow nature of the drug would have me thinking it will continue to decline in effect for another two hours or so until it isn't noticeable any more. I guess I consider this a positive experience, it was very entertaining. Any more would be overboard, the appetite issues and stomach uncertainty would probably increase with dosage. A Ralph Nader type of political protest would really hit the spot.

## PERSONAL BIOASSAYS

I took TFMPP three times. My first cautious (perhaps timid) experiment—due to concern about a possible allergic reaction or other trouble—with only 25 mg of this compound was a disappointment, without any effect. I felt only a little weary.

My second experiment was with 80 mg. Within two hours, this dose induced soft empathogenic feelings combined with mild and pleasant optical effects that I know from substances like 2C-B. Some objects appeared lightened with a 3-D picture-like contour in red, green, and yellow. My feelings were agreeable and I was in a very good mood but my mind wasn't satisfied. So I began to smoke a lot of hashish, and after half an hour I took some LSD. TFMPP at a dosage of 80 mg was a nice, short experience, and nothing more.

My third experiment was with 130 mg, which I took at 6:00 pm. At approximately 7:30 pm, I felt the same soft feelings as I had with the previous voyage, but with more visual effects. The skin around my eyes was very tight, my pupils were dilated and shaky (nystagmus), and my thinking was much clearer and very deep, but harder to sort out. At 8:00 pm the trip peaked. By 12:20 am or so, the effects declined slowly, and at 1:00 am I went to bed and slept deeply until the late morning. The chief characteristic of this trip that impressed me was the visual component, which was extra-ordinary. Physically effects included a kind of hyperthermia (I felt a little fevered) and tachycardia, sometimes with more than 140 heartbeats per minute!

TFMPP's primary effect cannot really be compared to other entheogens/empathogens in my opinion. If I were *forced* to do so, I would say it's somewhat like a mixture of 2C-B and MDA. Sometimes I felt as though I was losing control for a while. The experience is hard to describe. At the highest dose, it was visually colorful, yet it acted on a more subconscious level, rather than being a consciously reflective trip. I expect that I will probably have some more experiences with this substance in the future.

## AND THEN IT WAS SCHEDULED...

TFMPP began to gain notoriety among the rave community, and in the USA the DEA eventually scheduled the substance on September 20, 2002 (DEA 2002a). As with most cases when one drug is repressed, a new one pops up to take its place. In this case, 1-(3-chlorophenyl)piperazine or 3-CP, a close relative of TFMPP, has appeared on the market. It is

not scheduled by name, although it may be considered illegal under the Controlled Substance Analog laws if it was possessed with an intention to consume. 3-CP has milder effects, and it is believed that it will soon be available on the European market.

Since American "drug warriors" have scheduled the compound, it is now being synthesized in underground laboratories for the black market. It is offered in powder, liquid, and/or colored pills with symbols on it, and it is either marketed straightforwardly as TFMPP or misrepresented as MDMA (DEA 2001a; DEA 2001b). According to the DEA there has been one death related to consumption of TFMPP: a young woman from Zürich is said to have died from a combination of a piperazine derivative and MDMA (DEA 2002b). However, there is no source cited for this data, so this report is suspect.

TFMPP is still being sold via the Internet, marketed as a substitute for MDMA. It is legally produced in India and can be ordered from all over the world in amounts from 5 to 25 grams. The pure substance is also available in Germany. Mail order sources for this chemical includes SYN-CHEM OHG in Kassel, LM CHEMICAL TRADE & CONSULTING GMBH in Prisdorf, MERCK KGAA in Darmstadt, and CHESS GMBH in Mannheim, who offers the best price: 80 euros for 25 grams (another business charges 114 euros for 10 grams). Although at the moment TFMPP is legal outside of the USA, it is impossible to say for how long this will continue.

On March 21, 2003 the DEA published the following:

### Safety Advisory Regarding New Club Drug "Molly"

Detroit, MI—Special Agents of the U.S. Drug Enforcement Administration (DEA) working with the Michigan State Police and local law enforcement agencies have recently discovered the presence of a new club drug that is being sold to high school and college age students at "Rave" parties throughout the Detroit and Ann Arbor areas. This substance is known on the street as "Molly," which is 1-(3-Trifluoromethylphenyl) piperazine (TFMPP). This is an extremely dangerous drug, which is clandestinely manufactured and marketed in "Rave Clubs" as a more intense form of Ecstasy. This drug is an off-white powder generally sold in a gelatin capsule. TFMPP and Benzylpiperazine (BZP) were both given emergency controlled substance scheduling by the U.S. Drug Enforcement Administration in September 2002. TFMPP was given Schedule I status, meaning it has a high

potential for abuse and no accepted medical use. This drug first appeared on the West Coast of the United States and these recent seizures in Michigan are the first indication of its presence in the metropolitan Detroit area. TFMPP also goes by the names "legal E," "legal X" or "A2." TFMPP can cause increased heart rate, blood pressure and body temperature.

"Molly" has properties similar to the stimulant effects of Ecstasy, but taken in larger doses it promotes hallucinogenic reactions. This poses an even greater risk to young adults who have taken Ecstasy previously and accidentally overdose by trying to achieve the hallucinogenic effects. DEA is currently conducting "Operation X-Out," which is a nationwide initiative to increase education and enforcement operations involving club and predatory drugs. Drug distributors have invaded the Internet with misinformation regarding the dangers of club and "date rape" drugs that are marketed toward young people. Effective information campaigns are essential to inform young Americans about club drugs such as GHB, Ecstasy, Ketamine and TFMPP, which are promoted by individuals who disguise their deadly effects.

"This is another example of individuals exploiting our young people with dangerous mixtures of chemicals that have the potential for deadly consequences. The DEA working closely with state and local law enforcement agencies, will do everything in our power to protect our children," said Michael A. Braun, Special Agent in Charge of the DEA Detroit Field Division (DEA 2003).

*[This is the first instance we have seen of the term "predatory drugs," and we wonder if this will become a new catch-phrase for Drug War propagandists. — Eds.]* Note that there is a mistake in the text above. The synonym "A2" is not a name for TFMPP but for "BZP" (*N*-benzylpiperazine or 1-benzyl-1,4-diazacyclohexanedi hydrochloride). Its formula is  $C_{11}H_{16}N_2$ . It was synthesized in 1944 for use in veterinary medicine. Some have reported that it causes an effect similar to methamphetamine. The usual dose is between 150 and 500 milligrams, and the effects last for 6 to 10 hours.

## PIPERAZINE CANDYFLIPPING

A mixture of TFMPP and BZP called "Combo" or "Exodus" is now being sold on the black market. The BZP is thought to add an MDMA-like acceleration to the trippy effects of TFMPP. The BZP is also said to improve the effects of TFMPP on emotions, but I cannot confirm this. TFMPP alone stimulates the universe of emotions on a large scale. The effect of TFMPP and BZP at a dose of 150–200 mg tends to be similar to the effect of amphetamines. Both substances are currently legal everywhere except in the USA, and as far as I am aware there have been no adverse reactions reported from the combination of the two substances taken together. For more reports on the effects piperazines, see *The Entheogen Review* IX (3): 143–145. Additional reports on TFMPP taken in combination with some other substances can be found on the web at <http://leda.lycaeam.org/?ID=416>. ☉

# SOME EXPERIENCES WITH *ANADENANTHERA COLUBRINA*

## FINALLY, I TASTE THE SEED

I'd been thinking about *Anadenanthera* for several years. I first researched it back in ancient times—the 1980s—when it was as rare as rare could be. Along with *Virola*, it was a great mystery. I had seen a film that showed it being used, and it looked very painful. I am not drawn to pain, especially in the nasal passages, so I gave it a pass for a long time (even though the reports that I heard from many people were positive). It showed up in my consciousness again about two years ago. I saw my first trees—albeit baby ones—in the hills of Oakland. Then, all of a sudden, seeds were available on the market. The carrier wave kicked in, and I started asking questions again. But changes in my life occurred and my interest was taken in other directions, so I let it go.

Earlier this year, I received the new copy of *Plants of the Gods*, by SCHULTES and HOFMANN, with additions and revisions by CHRISTIAN RÄTSCH. This lovely book has been greatly expanded and has RÄTSCH's influence all over it. I read through it off and on for a couple of months until I stumbled on a chapter I had never seen before on *Anadenanthera colubrina* (*cebil*), which complemented the chapter on *Anadenanthera peregrina* (*yopo*) that appeared in earlier versions of the book. I had previously thought that *cebil* was just another name for *yopo*; but no, they are different. I read the chapters repeatedly, and discovered that there are some basic differences in the chemistry of these plants' seeds. *Yopo* seems to have a strong representation of DMT and bufotenine, as well as ringed tryptamine derivatives such as 2-methyl- and 1,2-dimethyl-6-methoxytetrahydro- $\beta$ -carboline. Some varieties of *cebil* have only bufotenine, while others may also contain 5-MeO-MMT, DMT, DMT-*N*-oxide, and/or 5-OH-DMT-*N*-oxide. Intriguing stuff; some of these compounds I knew little or nothing about.

Based on evidence from archaeological investigations, it appears that *Anadenanthera colubrina* could be the psychedelic that has been in use for the longest period of time in South America. Seeds, snuff kits, and pipes with burnt seeds have

been found buried with mummies that are at least 4,500 years old. I have an affinity for smoking, and the fact that this was one of the early methods of consumption once again got me excited about possibly “tasting” these seeds. I made enquiries. A friend gave me ten seeds with a caution: “It can be very uncomfortable, watch your dosage.” I am cautious, and I did nothing but physically examine them for several weeks. Then I headed off to the MIND STATES IV conference in Berkeley.

While I am visiting in California, I come across some more seeds. Obviously, this was meant to be. I obtain them, and ask acquaintances about dosage and experiences. Some are positive and others not. Some say two-plus seeds, others caution that such a dose could be very uncomfortable. One friend reports back that one seed smoked drove him to suicidal thoughts for the length of the voyage. Obviously, a plant not to be taken lightly. When following this line of enquiry I found people were also using it a third way: doing it sublingually combined with the same lime used for *betel* chewing. This method is said to bring it on slowly. Although it sounds like a sensible approach, I settle on smoking.

Summoning my courage, I toast two seeds until they make a popping sound. I take off the outer shell and grind the seed meat to a powder. Then I gently toast the powder again. I clean out my favorite pipe, and—as is my habit—wait for midnight. I load the pipe with the seed powder, settle back in darkness, fire up and take a small hit. I close my eyes, put the pipe down, and I drift.

At first, I feel like I have had a large dose of niacin. My face becomes quite warm. My heart seems to be swelling in my chest, just beating a regular tattoo. I drift a bit, and everything shifts ever so slightly. I fire up again, and then again. Something is taking form in front of me. Then the realization comes that the boundaries have gone. All that is, is this place, this moment. All that I was concerned about was for naught. In the inky blackness, red swirls pulsate, and slowly a form begins to emerge through the patterns. It is a black

multi-faceted jewel, the facets delineated by pulsing silver lines, and white pooling globules. It is beautiful, floating starkly alone. My mind reaches out to it and something occurs. From behind the gem emerges an ancient Indian woman. Bent with age she excitedly hobbles up to me. She smiles, and says in some language (not English nor Spanish), “You are here! You have arrived!” She is beside herself with excitement. More forms emerge around the jewel. It seems the whole village is there. They gesture, reach out, touch and converse with me, and amongst themselves. Great excitement fills the air. I look beyond the slowly disappearing jewel. I see rolling hills, a village, and *cebil* trees, swaying in the hot breeze. All seems achingly familiar, then I slowly drift off to sleep as the visions fall from me like dust. Little snakes of color remain, guarding where the jewel once hung, suspended in consciousness.

I wake the next morning, totally refreshed. I am very happy, and feel that something momentous has happened. Life, usually good, is even better. I am excited for the coming evening, as I am going back in. I want to see that landscape and to behold the jewel.

Midnight again. I settle back and take a large hit. As my head hits the pillow I can feel a great pressure beginning to bear down on me. My heartbeat increases and my face begins to feel hot. The pressure grows. I sit up, feeling like I have taken about 4–6 mg of 5-MeO-DMT. The universe is pressing against me with great urgency. I surrender to it. I feel the tryptamine carrier-wave vibrating and sounding through my being, all beings, throughout creation. The feeling recedes. Another hit, and in I go. Fractals, spiral nebulae, and the presence.

Out of the void, the jewel returns. I smile inwardly, I have been awaiting this. The jewel, pulsing with its blackness and expanding facets, fills the inner sky. I reach for the pipe once more. The jewel grows in detail and presence. It is everything. The pressure I had been feeling was coming from this source. Everything I was searching for would be answered in this place. The tryptamine carrier-wave grows louder. Out of the jewel comes a jaguar, its head thrashing about. The vision moves in a stuttering motion, and as it stutters, the jaguar’s head becomes a dragon’s, then back again to the jaguar. It starts snapping its jaws together, flailing its head(s) back and forth. It sees me and lunges—grabs me by the chest, deep into my heart—and shakes me like a puppet. It goes on and on. I feel like it is feeding on me, and yet I feel detached, like an observer to all of this. The vision recedes back into the

jewel. I lay there exhausted. The sky is pulsing with color, and the jewel’s presence is now a brooding one. I hear a noise and feel a vibration. My eyes open, and out of the jewel and sky, a giant dancing figure comes forth. It is an Eastern North American Indian with a mohawk. He dances from foot to foot, shaking the earth. His head reaches into the sky, fading into stars. He perceives my form lying there, hesitates for a moment, then jumps into my chest and sinks into my being. He is chanting the whole time. He jumps out of me and then grabs me again, and we merge and become one. The carrier wave is now screamingly loud. I start to fade and then lose consciousness altogether.

I wake up two hours later. Colors are swimming, and my sense of self is morphing, flowing from object to object, into the walls, the trees, then back into the house again. I feel like I am going mad. I walk out into the living room, and gather my thoughts slowly as I look out the window into the darkness. The panic subsides. By the time I get up and head to bed, all parts of my being have reassembled and are whole again. I fall asleep, smiling.

The morning comes with all its beauty, and I decide to give *cebil* a rest for awhile. What I have harvested from these excursions will keep me busy for several weeks, examining all parts of the experiences. Even just sitting with eyes closed, I can feel the warmth on my face and see the rolling hills with the *cebil* trees. A place of complete calm, fraught with unfolding myth and mystery. — GWYLLM LWYDD

## POTENTIATION

In a past issue of *The Entheogen Review*, I read where a snuff was prepared from the powdered stem-bark of *Banisteriopsis caapi* combined with *A. peregrina* and an alkaline base of some sort. But nowhere have I heard any actual bioassay reports that used the combination of a MAOI and bufotenine.

When I got my *Anadenanthera colubrina* seeds, I asked the vendor if he knew the percentage of bufotenine in them. He said that he had no idea, but he did know that the seeds from his latest batch were very active when smoked. He sent me six pods, each full of seeds. They averaged about 12 seeds per pod. The seeds were extremely thin and around 13–16 mm in wide. The black outer shell harbored a white-meat interior. This shell is so thin that it seemed to me to be a waste of time to attempt to bother with removing it. I was told that people using the seeds were breaking them up,

drying them out in a warm place, and then smoking them. Some people apparently also make a snuff out of the seeds, but I wasn't interested in doing that.

I decided that since the outer shell is practically insignificant, and the seed itself is so thin, that I would just break it up and smoke it directly, without any drying. I did this with one seed and it put me into a fairly strong journey with strange but very clear, rapidly-moving patterns. This lasted about five minutes, with a particularly beautiful afterglow. The material was potent, but I never felt the slightest amount of fear as I do when I smoke DMT. The body sensation was mostly neutral, but perhaps slightly pleasant.

About five hours later, I broke up another fresh seed and threw it in my pipe with a pinch of crushed *Peganum harmala* seeds, which couldn't have been more than 150 milligrams (although I didn't actually weigh it). I smoked this mix and noticed that it was an odd tasting but mild smoke, with virtually no irritation on the throat and lungs. When I finished the pipeload, I realized that the body sensation was very powerful, although the closed-eye visuals were mild. I felt no desire to smoke more. Over the next five minutes, the closed-eye visuals became fantastically beautiful—strong, clear, and quite colorful. They seemed to have a central overall pattern/design theme, in spite of the rapidly moving motifs. After a couple of minutes, the “theme” would instantly and dramatically change into something totally different, which would again last a few minutes or so until the next radical change. I found this to be novel and a lot of fun, because the changes were so surprising. The visuals had an amazing 3-D depth to them. As striking and colorful as the visual patterns were, they could only be experienced with my eyes closed. With eyes open, I merely felt very stoned with a mild nondescript visual alteration. There also was a slow, rhythmic body sensation that was so regular I thought that maybe it was in synch with my heartbeat. But when I took my pulse, I realized that the wave-like ebb and flow was somewhat slower than my heartbeat.

The seed smoked alone lasted around seven minutes. The seed smoked with the crushed *Peganum harmala* took five minutes to peak and stayed there for 15 minutes, with an additional slow 25-minute comedown. The added *P. harmala* produced an obvious quantum-leap potentiation in both strength and duration, not to mention a greatly improved quality in the feelings and visions. For me, this combo is an absolute winner, and comes in a very close second to my favorite, which is DMT-based ayahuasca. The next step is to

boil a crushed seed with *P. harmala* and drink it; I don't think that anyone has done that yet. [Note: JONATHAN OTT has discussed his bioassays of bufotenine free-base combined with harmaline in his book *Shamanic Snuffs or Entheogenic Errhines*. He tried this combination intranasally, sublingually, orally, and rectally, and found there to be definite potentiation in all cases. Strangely, he didn't report on any vaporization experiments, and yours is the first that we have seen regarding this.—Eds.]

As an aside, those who are habituated to opiates will not get off well on ayahuasca. Any kind of opiate, including codeine, hydrocodone, oxycodone, and even natural opium, are my drugs of choice when I am in an “ayahuasca overdose” situation. It renders the emotional, sensorial, and “alien contact” aspects of the journey virtually non-existent, leaving only a few mild visuals that have no emotional impact on me. I have tested this extensively, both on myself and with others, and the results are entirely predictable. In my opinion, those who regularly use opiates will *never* have a genuine ayahuasca experience. Interestingly, the use of tobacco can also be a powerful inhibitor of the effects of ayahuasca. — B. GREEN

## NO VISUALS

I smoked one seed of *Anadenanthera colubrina*, which weighed 230 mg. I didn't bother removing the seed-coat or toasting it; I just chopped up the seed and stuck it into my pipe. It took me about 8–10 big hits to dust the bowl, holding in the smoke about 25 seconds per hit. I felt a pins and needles sensation at first, and then some pressure in my head and a bit of general warmth, but no other effects aside from a mild cloud-headed feeling. About 15 minutes later, I still had some pressure in my head and the cloudy feeling, but I gave up on getting any closed-eye or open-eye visuals. I know people who have gotten strong effects from one seed, but obviously that is not the case with the seed that I smoked. Yields of bufotenine from *Anadenanthera colubrina* var. *cebil* have been reported from 0.5% (RENDÓN & WILLY 1985) to 12.4% (TORRES & REPKE 1996). If the seed that I smoked was somewhere in this range, this would place its bufotenine content at 1.15 mg to 28.52 mg. The range of activity for vaporized free-base bufotenine is said to be 2–8 mg (OTT 2001). This would appear to indicate that I either have fairly impotent *A. colubrina* seeds, that I am a “hard head” when it comes to bufotenine, or perhaps both. In the future, I may make a crude ethanol-based extraction of the seeds to smoke instead of smoking them directly. — FORK

# SHARED EXPERIENCES AND FIELDS OF CONSCIOUSNESS

by MoDu

Shared states of consciousness can be aided or induced by the consumption of entheogens (although entheogens need not be present in all cases for these experiences to occur). Below I have presented several examples of this sort of experience, as well as a theory that such states of consciousness might come about as a result of fields of consciousness that we each possess.

## A GLIMPSE INTO THE FUTURE

I was at the house of my friend and psychonautical companion, “BOB,” for an afternoon of exploration. Before getting down to the business of the planned entheogenic voyage, BOB and I shared a bowl of tasty buds. After this, as is my frequent custom prior to “launching,” I meditated briefly, did a few rapid deep-breathing exercises to hyper-oxygenate, and sat down cross-legged on the floor. I inhaled my “double” N<sub>2</sub>O balloon and then hit my pre-prepared bowl that contained 30 mg of 5-MeO-DMT. As I liquefied the crystals and inhaled their vapors, the rush began to spread throughout my body and my consciousness became single-pointed. I exhaled and the vision/experience began for me.

I was in the center of a causal node. In this place, I simultaneously perceived a number of multiple realities across various places and times. It was as though I had been dropped into a pond of causal potentiality and created these ripples of probability spreading across the surface of potential realities. There were junctions at various locations where my ripples intersected with other ripples: these were the locations of the perceived multiple realities, and there were a lot of them. Of course, it was nothing like this at all, but these words are all I have to describe it, and the best that I can do.

BOB waited until I was up and walking around—back from the void, so to speak—before he did his own double hit of N<sub>2</sub>O. He had decided not to partake of any 5-MeO-DMT. Then the vision/experience began for him.

He was in the center of a causal node. In this place, he simultaneously perceived a number of multiple realities across various places and times. It was as though he had been dropped into a pond of causal potentiality and created these ripples of probability spreading across the surface of potential reali-

ties. There were junctions at various locations where his ripples intersected with other ripples: these were the locations of the perceived multiple realities, and there were a lot of them. Of course, it was nothing like this at all...

When BOB was “back,” he uttered words to the effect of: “Whoa, that was wild! That’s *way* more than I usually get on just nitrous. I felt like I had done a hit of 5-MeO-DMT with you, or something!”

At about that time, I was feeling somewhat confused myself. I was trying to “unpack” some of the visions that I had experienced, and sort through a “memory” of our friend “NATHAN” that I kept accessing. I could have sworn that NATHAN had just stopped by, partied with BOB and me, and then left. So I asked, “Was NATHAN just here? Did we party with him?” BOB had the exact same recollection of being with NATHAN that I did. We began to discuss our visions, and quickly realized that we had shared the same experience and NATHAN was in one of our shared visions, wearing his orange jacket.

A few moments later, NATHAN showed up at BOB’s door, wearing his orange jacket! And we partied with him, just like we had already done that day in our visions.

If I were to speculate on why the visions we shared occurred in the way that they did, I would have to say that this situation happened because the act of partying with NATHAN was the nearest node of convergent probability waves that each of us perceived—hence, both BOB and I had recall of this near-future event wherein NATHAN was partying with us. It was the nearest node that manifested itself in actual space and time.

The “ripples” that we perceived may have been our entheogenically-altered perception of the probability waves of our own causality and the waves of at least some of our “significant others,” as these waves spread through possible (and perhaps even actual) future realities. “Significant others” might be thought of as the people/entities with whom we are causally connected. The various nodes could be places where some of these causal waves intersected. It might be that we perceived events at these nodes because these were

the “times and places” where our causal waves intersected with other causal waves in such a way that events of some kind actually (or perhaps probably) occurred. As to why there was a “shared” experience, it may have been because our states of consciousness were similar enough that there was a confluence of perception. What does it mean to say that two (or more) states of consciousness are similar enough to allow a sharing of this type? Perhaps it means that they are occurring on a similar “frequency.” Perhaps consciousness is the result of some type of quantum field phenomenon, such as the type of phenomenon that occurs among electrons in a superconductor, when individual electrons begin to act as though they are all the same electron. Perhaps one field of consciousness can become strong enough that it encompasses the other field of consciousness, resulting in a frequency “alignment” (the way that two clocks pendulums will become in synch when placed next to each other), so that two minds perceive as one mind or have extremely similar sets of perceptions. I would be interested in hearing any theories about why this seems to occur.

## CONTACT TRIPPING

Much like its more famous cousin, the “contact high” (well known throughout the *Cannabis* culture), there is an associated phenomenon that I refer to as “contact tripping.” Individuals are thought to contract a contact high from being in the presence of others who are stoned. Until recently, I’ve assumed that contact highs were either a product of inhaled secondhand smoke (quite possible in some of the hazy bubbles I’ve been enclosed in), or were a psychological reaction to being in the presence of others who were acting stoned (also a distinct possibility, given how easily influenced the human mind seems to be). However, myself and my fellow psychonauts have been increasingly reporting “contact tripping,” even in cases when they had no direct knowledge that someone nearby was tripping. In one case, two individuals were both tripping, and one individual reported that increased proximity to the other “tripper” increased the intensity of his own trip, while decreased proximity lessened the intensity. This individual’s tripping partner was on a much larger dose, and was also doing multiple psychedelics. The theory of shared experiences expounded above could easily be adapted to cover this phenomenon of contact tripping, and it provides a third alternative explanation for the phenomenon of contact highs as well.

If consciousness is a field, and every conscious being has such a field of consciousness (FOC), then these fields can interact and influence each other. An individual whose FOC is gener-

ating enough energy can cause the other individual’s state of consciousness to change—causing the effected individual’s state of consciousness to “harmonize” with the state of consciousness of the influencing person’s FOC. Someone who is tripping can cause another person’s state of consciousness to change from “normal” to “tripping” by influencing the other person’s individual FOC. This might also explain why states of mood can be contagious. When someone extremely happy walks into a room, the whole “vibe” of the room can change. The mentality of mobs could also be explained by the FOC theory.

## 5-MEO-DMT SHARED EXPERIENCE

My friend NATHAN borrowed a one-hitter pipe of mine for use on a road trip to smoke *Cannabis* out of. His hit resulted in him being launched into 5-MeO-DMT hyperspace. He called me immediately upon his “return” and asked if I had been using that hitter to smoke 5-MeO-DMT out of, which I hadn’t. However, NATHAN and I have had some shared experiences in the past, and it just so happened that at the exact time that he was taking his *Cannabis* hit, I had just gone to and returned from hyperspace, via my own ingestion of 5-MeO-DMT. Was this contact tripping? We think it was, although the interesting thing about this experience was that we weren’t actually in close contact—we weren’t even in the same state when it happened. This seems to imply that some fields of consciousness can influence states of consciousness even over a distance if the conditions are right. In this case, NATHAN and I have had shared experiences before. It seems as though we may be connected in some “deep” way, at least when it comes to our states of consciousness.

## 5-MEO-AMT SHARED EXPERIENCE

While I was tripping on 5-MeO-AMT, I visited a friend of mine who was DJing at a local club. I spent some time in the booth with her and then left the club. After I left, she told BOB that while I was in the booth she started “tripping her ass off.” She said that it started when I entered the booth and stopped immediately when I departed. She has been “influenced” by my field of consciousness on several other occasions. Unlike the experience related above with NATHAN, this time it seemed to be entirely related to my proximity to the person.

Reports of this type are becoming so numerous amongst my friends that they are approaching the realm of “common occurrence.” Animals seem especially sensitive; if only they would speak up!

[A recent book that touches on some of the issues brought up by MoDu in his article (although not specifically drug-related) is RUPERT SHELDRAKE's *The Sense of Being Stared At and Other Aspects of the Extended Mind* (CROWN PUBLISHERS 2003). SHELDRAKE is perhaps best known for his theory of morphogenetic fields, which overlaps somewhat with the idea of fields of consciousness presented above. This latest book of his deals with aspects of what is commonly referred to as extra sensory perception, both in humans and in animals. In keeping with the theme of MoDu's article, we have included an additional submission below that is an example of this sort of experience. — Eds.]

## THE COMMUNITY K-HOLE

Some friends and I had spent the day smoking *Acacia* resin. Later that night, five of us decided to do some ketamine. It started normally enough. Then amidst the usual noise and frenetic visual movement I began to experience myself and the others through the filter of one friend's mind. Before I had time to even ponder this, I felt my perception shift, flowing first from one friend then to another, perceiving myself and the rest of us as experienced through the minds of each other. Suddenly the whole thing sucked together in a washing machine motion of ecstatic chaos. It was a wonderfully delirious sensation. I was no longer myself but rather a melange of minds. Beyond simply being in telepathic union with each other, as has happened on numerous psychedelics, it was rather as though we had merged into one single mind. I felt as if I was experiencing my true consciousness as it exists prior to being split off into "individual" consciousness.

Another friend, unaware that we had done ketamine, walked into the room just as after we had begun our reemergence into "normalcy." Immediately prior to his entry, a cannister of N<sub>2</sub>O was circulated between us. Our friend found us in a noisy ecstatic heap, and decided to smoke a large hit of *Acacia* resin. We were completely unaware that he walked into the room, until he was suddenly there *with us* in the shared mental state.

Interestingly, he was expecting a simple DMT trip, but instead found himself merged in beingness with us, immersed in the washing machine-like movement of consciousness we were experiencing. Much of what he later described resembled ketamine far more than DMT; a feature which initially confused him substantially (as he had never taken ketamine). Like us he became joyous about the merger and excited about what had transpired. He had no clue that we were already "there" when he walked into the room, and he perceived that it was his own trip that had catalyzed our

reunification, which of course excited him greatly, thinking we had just changed the way the human mind perceives itself. Sadly we all came down and back into our differentiated selves. Since then I have learned that this sort of consciousness-puddling event may not always be the norm with ketamine, but it or something similar has been experienced by a surprising number of people I have talked with.

It furthers my belief that a much larger reunification event is in all of our not-too-distant futures. In fact, reunification of the fragmented consciousness and healing of the larger organism is a core feature in what I am being taught by the *Acacia*. This has been substantially bolstered by a series of events in the months which followed that wonderfully chaotic event. I felt as if I had returned to sacred chaos—to that wondrous pre-differentiated state of beingness from which I emerged, before being split off into this compartmentalized thing I call "me." The only down side is that it makes it a little harder to simply be me since I now know a small taste of the potential of what we all are. — JUSTIN CASE ☉

## SACRED SUCCULENTS

### Plants and Seeds

Various *Ariocarpus*,  
*Epithelantha*, *Pelecypora*,  
obscure *Trichocereus* species  
including new hybrids and  
crisate/monstrose San Pedros and others,  
*Turbincarpus*, *Aloe*, *Bursera* (source of *copal*),  
*Delosperma*, *Ipomoea*, *Pedilanthus*,  
*Sceletium*, and more!

We also offer an extensive guide  
to grafting cacti and other succulents.  
Our catalog is fully illustrated, and loaded with  
ethnobotanical and horticultural information.  
Please send \$2.00 to receive a catalog  
and additional rare plant & seed  
supplements throughout the year.

Sacred Succulents

## MORPHINE DREAMS

In the last issue of *ER*, I commented on the subject of thebaine conversion to morphine in tobacco plants, but failed to pony up any references. Since then, I located the book that was my source for this data: *The Biochemistry of Alkaloids* by TREVOR ROBINSON mentions this on page 67. Also noted is the conversion of thebaine to morphine by the wood-rotting fungus *Trametes sanguinea*, which is discussed on page 122. The citation regarding the tobacco research is MOTHES, K. 1966. *Naturwissenschaften* 53: 317–323. Little else besides the possibilities are discussed, and there is no other information pertaining to thebaine-to-morphine biosynthesis by plants that I could find therein.

I did find more on this subject in the book *Alkaloid Biology and Metabolism in Plants* by GEORGE R. WALKER and EDMUND K. NOWACK. These authors cite researchers GRUETZMANN and SHROETERR as having had success with a tissue culture of *Nicotiana allata*, wherein the o-demethylation of thebaine yielded codeine and morphine. On page 204, the authors state, “no details have been published, probably because of the practical value of the procedure.” It occurred to me that using a low-nicotine producing variety of tobacco, such as *Nicotiana allata*, would allow for greater amounts of material to be ingested—preferably inhaled after pyrolyzing. As morphine stays in the system for up to 12 hours, the levels could be built up over several hours, depending of course on the concentration of morphine in the tobacco in the first place.

On a long shot, if at all possible, maybe a successful grafting of tobacco to *Papaver bracteum* would yield the same results as a fortified thebaine-containing feed. This is all just fantasy foreplay for me really, as I highly doubt the grafting of these two different species would be possible. The metabolic pathways in plants have been shown to convert chemicals like tryptamine, dopamine, etc., to chemicals not normally contained within the plants. I guess the whole point for me in bringing up this information is just to share my amazement at all the intriguing possibilities concerning such procedures. Perhaps someday we will be able to imbibe a mushroom that is not normally psychoactive which has been manipulated

to contain DPT or some other synthetic entheogens. Researchers using these manipulative techniques can then use the data to pinpoint exactly where alkaloid conversion/synthesis is occurring in a plant; this is discussed on page 202 of the book mentioned.

As for my generalizations and inaccuracies on the subject of isoquinolines, thanks for pointing them out. I guess what I was trying to impart to the readers of *ER* is the existence of these herbs like *Corydalis*, jujube dates, and poppy seeds, that most likely rely on isoquinolines as their active chemicals. It is true that a lot of isoquinolines and the herbs/plants that contain them aren't that interesting. But for sedative effects, the blue lotus and *Corydalis* are pretty good—I get something from them, anyway.

I recently had the cool experience of going to the MIND STATES IV conference, and I was very interested when I heard SASHA SHULGIN's comments about the possibility of a “cactahuasca” type effect with the cactus *Pachycereus pringlei*. Maybe there is some potentiation effect with the isoquinolines contained in this plant, or maybe there are compounds that lack activity on their own, but which are activated when combined. At any rate, I plan on buying one of these from SACRED SUCCULENTS and giving it a home for a while until something more is printed or discussed about the activity of this cactus.

I am looking forward to reading the SHULGINS' new book when it comes out; SASHA's recent book *The Simple Plant Isoquinolines*, which was supposed to be an appendix for the SHULGINS' *Book Three*, has a lot of seemingly interesting compounds listed. So many have the basic structures of opioids, phenethylamines, and tryptamines contained within them. I wonder what the liver might do with a lot of them—perhaps some become more active after being metabolized into something that we would recognize. Looking at salutaridine, for example, could it possibly metabolize into morphine in vitro? If so, there are plenty of legal plant sources for it out there. Some of these salutaridine-containing species are used as analgesics—maybe this isoquinoline has something to do with such use?

A while back I purchased a tincture of *Laurelia novae-zelandiae* from New Zealand after reading a paper by PHIL RASMUSSEN titled “A Role for Phytotherapy in the Treatment of Benzodiazepine and Opiate Drug Withdrawal.” This plant is called pukatea, and is supposed to be a potent analgesic. The active compound is called pukateine, an isoquinoline purported to be similar to morphine in action. There are other compounds present in the plant, a lot of which are also isoquinolines. Holding the tincture sublingually does produce analgesia in the face. For me, consuming the tincture internally produces mellow effects, creating a relaxed state that is very clear and clean feeling. I have had some weird effects in high doses—that being 6 ml of a 1:2 tincture. I may be figuring this wrong, but I think that 1 ml of the tincture would contain about a 1/2 gram’s worth of bark in it. The effect was pretty strong tightness in the chest and a state of anxiety that lasted for 20 minutes. On occasions with less consumed, and on one occasion with the vaporization of 2 ml worth of dried extract, I have felt a positive mood and visual enhancement of texture and color, and an enhanced appreciation for the quality of space. The effect is mild, and it is worth considering that I frequently have been smoking *Cannabis* during these experiences.

I recently read a report on the dopaminergic action of pukateine. This caught my attention as I have been able to find very little on the physiological action of the plant or of isolated pukateine. I would have suspected that it acts on opioid receptors, and perhaps it does to some extent. Nevertheless, the effects that I perceive could be dopamine related, especially as this stuff makes me feel good and clearheaded, without producing the opiate-like mental doping that I was hoping for. It just doesn’t have a real sedative effect, although it does produce a relaxed state. Also, it is worth noting that I am not a very good person for reporting valuable bioassay data reports on this subject as I consume about 100 grams of poppy seeds on a daily basis. I do this as an opiate maintenance program. The pukatea could possibly be covered up by this, or potentiated, etc. I would be interested in hearing anyone else’s reports on this plant. The search for authentic *Mitragyna speciosa* specimens that are active is hard enough, even if one does get the real stuff. I have consumed the real thing, and I think that perhaps pukatea may have a similar use.

I’ve read a few research papers that hint at opiate-like action from plants such as *Bacopa monniera*, *Withania somnifera*, the “Chaste” tree, and perhaps *Corydalis*. I’ve heard that *Picraulima nitida* has a potent opioid in it. I’ve read in a couple

of sources about certain species of *Papaver* that contain the very potent etorphine opiate oripavine. Whether or not an herb can be used for analgesic effects because of its opioid content depends on many variables like toxicity, percentage of active compound, bioavailability, etc., but it is interesting to me to explore this topic. I am starting an Internet forum at [www.opiophile.org/com](http://www.opiophile.org/com); there’s not much up there at the moment, but check back to see the site’s expansion. (As an aside, naltrexone and naloxone have been used to combat “chocoholics,” as stupid as that sounds.)

On a somewhat related subject, I consumed eight grams (in two doses of 4 grams each) of *Voacanga africana* seeds recently. [NOTE: This is a substantially higher dose than any other reports we are aware of. K. TROUT reported on a dose of seven seeds in Vol. VII, No. 2 of ER. — Eds.] The doses were spaced about 45 minutes apart from one another. I didn’t notice any mental effects other than a slight stimulant action. I was prepared for some strange dreams, but didn’t notice any. In the morning, I awoke in a good mood, but feeling a little goofy. My partner and I prepared for a day in the mountains, and as we did that, I started noticing a pain between my shoulder blades. I took a vicodin for this pain and we left.

Shortly after this, I became pretty fucked up. Thankfully, I wasn’t driving, as I had a hard time staying awake—basically nodding off a lot of the day. The pain got increasingly worse and I also started to have pain in my solar plexus area. As this feeling grew and grew, I started to worry. We headed home, and by the time we got there I was miserable. I felt slightly feverish and had horrible muscle contraction-like pains all over my back and stomach. The back pains were focused between the shoulders. I thought about going to the hospital, but just lay in bed trying to ride it out. I had strange thoughts running through my head, and the mere existence of thought itself seemed painful. The experience was similar to cotton fever. After 3–4 hours of moaning in bed, I felt a little better. The recovery from my symptoms took a full three days and was somewhat similar to crawling out from an overdose of Indian snakeroot (*Rauwolfia serpentina*). I had these *Voacanga* seeds for almost a year and took these doses for want of a greater effect than the few reports I had been able to source. I will never take these seeds again. I may experiment with the root-bark of the plant, although I will definitely be more cautious. I have basically no information on the use of any part of *V. africana*.

Recently *V. africana* “isolates” have become available and are being offered through several web sites. I have been keeping my eyes open for any trip reports on the 'net, but so far haven't seen anything. You would think that someone would write about any free-base extract experiments that they have had, wouldn't you? Anyway, thanks for occasionally including information on opiates in *ER*. — C.E.G., ID

## A REPLY TO EDITORIAL COMMENTS IN “FAREWELL TO LEGAL 5-MEO-DIPT AND AMT”

On the topic of chronic tryptamine users metabolizing tryptamines faster and getting over tolerance faster than occasional users (see pages 18–21 of the Vernal Equinox 2003 issue of *ER*), I'm only suggesting that it *may* be true. It has been my experience that during periods of chronic tryptamine use, my ability to recover from tolerance is improved over my needed recovery period during times of non-chronic use. I will try to pay more attention to the phenomenon and will submit further observations on the subject in the future. My results being idiosyncratic would not surprise me—I've been told that I defied medical science on two separate occasions recently. I'd guess that it is medical science that needs the re-look in both cases, but who knows, maybe it's me.

Regarding your comments on my “cross tolerance” study between 5-MeO-DIPT and a,O-DMS, my bad. I'll try to do better science in the future. Sorry about that!

Concerning your puzzlement over my account of the experience enhanced by the consumption of *Cannabis*, a,O-DMS, mushrooms, 5-MeO-DIPT, and 5-MeO-DMT: I am not on any medications whatsoever and I'm not bullshitting about anything. And, your calculations on the 5-MeO-DMT were a bit low, as I ended up vaporizing over 200 mg of it during the initial day of this rather lengthy experience. This is not a record for one day's consumption of 5-MeO-DMT on my part; however, in conjunction with all of the other mentioned entheogens, it was a “personal best,” so to speak. I suppose that I am a bit of a hardhead who likes it more extreme than most, and I'm betting that I was probably experiencing receptor saturation as well. It was quite a trip.

I do agree with your observation/assertion that others should not expect the same type of results from a similar dosing session. We must remember that entheogens are just tools. I've

been using them for some 40+ years now, so my experience level is higher than that of many other psychonauts, and my 30+ years of experience with meditation and dreaming practices no doubt played a major role in the reported experience. — MoDu

In my own experience, when I have used 5-MeO-DMT at the frequency as you have described, a point of neurological saturation is generally reached by the time I have ingested a total of 60–100 mg, taken in a lengthy session of repeat doses. What transpires from that point forward is only very slight effects from the 5-MeO-DMT, unless I take an hour off. A similar “saturation” with diminished effects has been reported by a handful of other people smoking 5-MeO-DMT at this frequency of repeats, and it has also been reported with DMT. It may not be *true* tolerance, but whatever it is, it is easily experienced and can be undone by waiting an hour or two between doses. — K. TROUT

## THE BAD...

Every now and then I see references to LEGENDARY ETHNOBOTANICAL RESOURCES (L.E.R.) as if they are a real company. At one time they were, but I have become convinced that these days they are just another rip-off. They seem to average about a year and a half to fill a friggins' order. On 9/3/02 I sent a money order for \$22.00 for *Avena sativa*, along with some other products. After several letters of complaint, I have yet to receive a response. The last order prior to that one was for blue gelatin capsules. After several letters and phone calls regarding *that* non-filled order, and after a year and a half, I finally received *clear* capsules, with a note stating that the colored capsules had been discontinued. Any idea what the problem may be with these guys?

*The Entheogen Review* first reported a complaint about L.E.R.'s service (or lack thereof) in our Summer Solstice 1995 issue. At that time, JIM DEKORNE wrote to L.E.R. to get “their side of the story,” but they failed to respond to his letter. Over the years since then, we have heard countless complaints about this company: diseased plants, incorrectly-filled orders, and an inability to deliver the goods. Based on their track record, we can not recommend that anyone order from this company. — Eds.

On May 2 of this year I sent an international money order for \$22.25 to GREEN RHINO BOTANICALS, POB 484, Station Beaconsfield, QC, Canada, H3W 5V1. Near the end of July, nothing had been delivered. I've written to them, but have not heard back. Does anyone know anything about this company? — V.G., NH

We've never heard of this company, and were unable to locate any mention of them on the web. It could be that they are simply a small business run by one person, and slow to respond to orders. But a three-month's wait certainly seems long enough! You might try writing again; sometimes the squeaky wheel gets the grease. Your experience sounds like a warning that others should avoid this company. — Eds.

## ...AND THE GOOD

I ordered a small amount of products from each of the following companies, with good results: GREEN EARTH (NY), RIVERS SOURCE BOTANICALS (NM), O.M.U. (Canada), QUALITY HEALTH (England), P.E.S. (Hawaii), BOUNCING BEAR BOTANICALS (KS), COMPANION PLANTS (OH), P.J.T. BOTANICALS (MA), and THE BASEMENT SHAMAN (IL). I'm getting ready to send out for some more catalogs and make some more orders. I'll forward my results to *ER*. — B.H., IL

## SHELF LIFE AND IDENTIFICATION

What is the shelf-life of *Peganum harmala* seeds and *Mimosa tenuiflora* root-bark? Does *Psychotria viridis* lose much potency when it is dried and what is the shelf-life of the dried material? Could you publish some photos or illustrations of *Diplopterys cabrerana*? I obtained a plant a while back, but there is some doubt of its identity. The plant that I have has a milky stain down the central leaf rib. Thanks. — S.D., HI

*Diplopterys cabrerana* should have reddish veins and golden bark. Photos of the plant are shown to the left and below. [Thanks to LEE from NATIVE HABITAT for providing these.] For color photos see AYAHUASCA SPIRITQUEST's "Oco Yajé" web page, which provides some that might be of help. See [www.biopark.org/peru/oco-yage.html](http://www.biopark.org/peru/oco-yage.html).

Whether isolated or in dried plant form, harmala alkaloids and DMT stored in a reasonable manner should stay fairly potent for a long time. 30-year-old DMT has been smoked that was plenty effective.

Analysis of hundred-year-old harmala alkaloids has also been conducted with good results. Keeping your material dry, cool and out of light (and away from oxygen if you can) are the most important factors. See the article on desiccants on pages 68–69 of this issue for information about some products and techniques that can be of benefit when storing your entheogens.

## AMT SHELF-LIFE

A while back, someone said that AMT deteriorates relatively quickly. How quickly? What is left after it deteriorates? I was hoping to save my supply until better times, but now I wonder if maybe I should use it up quicker.

I'm ambivalent about AMT. So far, I've had it six times and every time I have said, "I'll never take this again!" Heh... But it is here and it does have some good points. For instance, I feel great the day it wears off. And for me, the first seven or eight hours feel just like LSD. But then the weirdness really sets in, and I have maybe 10–12 hours left to go! Believe it or not, I get off like this on only 2–3 mg. I must be a wimp, or else just majorly sensitive to this drug. My first trip with AMT was with 5 mg, and it was way too heavy. I cannot imagine doing 20 mg, good God. — M.B., IN

Might you have 5-MeO-AMT and not AMT? The doses that you refer to are much more consistent with the former than the later. Confusion between these two is so common that Erowid has a prominent warning about this on their AMT page ([www.erowid.org/chemicals/amt](http://www.erowid.org/chemicals/amt)). For myself, AMT does not get much stronger with higher amounts. I can discern little difference between 20 mg and 50. I find the effects of AMT to be fairly boring—a mildly dreamy weak stimulant. Before it was scheduled, I tried it multiple times at a wide range of doses, alone and in combination with other things, hoping it would actually do something interesting. It never did. Many substances don't have a great shelf life. It's not always that they become totally inactive though. I have noticed that some of the tryptamines are discernibly more intense when freshly manufactured and less so but still potent a couple of years later. — K. TROUT

My own single experience with AMT was a bust; I don't see any reason to take it again. I was left with a general crappy feeling (some nausea), and very little visual effect (like a mild dose of LSD perhaps). So far as the shelf life of compounds goes, whether in pure chemical form or in dried plants, we would love to see some systematic study done in this area. One approach would be to create three stable environments: 1) a container kept at room temperature, 2) an air-/water-tight container with desiccant and oxygen absorbers buried in the ground, and 3) a similar container that was kept frozen. Each container would hold sets of standardized samples that had been quantified prior to being stored. The containers would be opened at regular intervals (every 6 months perhaps), and the material would be retested, over a period of 5–10 years. Such an experiment would be simple enough to set up, provided that one

could secure someone who would be willing to do the analytic work involved, which could be quite tricky. Hopefully, someone out there reading *ER* will have the means and initiative to do such an experiment, and report back on it, since we seem to frequently get questions regarding the shelf-life of various things. — DAVID AARDVARK

## PSILOCYBE TRIGGERED HYPNOGOGIC IMAGE

Around 1996, I grew some mycelium of *Psilocybe tampanensis* on agar culture in covered petri dishes. When the agar was fully covered with mycelium, a sclerotia started to grow on top of it. I didn't know what it was at first, as I was new to mushroom cultivation. I looked at the pictures in STAMETS' book *The Mushroom Cultivator*, to see if it was a contaminant, but none of the contaminants depicted in that book looked like what was growing in my dish. It was the size of a shelled peanut, no bigger. It had a special quality and look to it, so I cut it out of the agar and sliced it in half to see the inside. It was solid throughout and turned blue after I cut it. I chewed and swallowed it, and got the telltale bitter taste of a *Psilocybe* mushroom, which lingered in my mouth.

I had a "plus-two" experience that was very pleasant. It came on quick for me, and lasted about three hours. I had taken it around noon, so I was pretty much back to base-line at when I went to bed at 9:00 pm, although I could still feel a slight pleasantness at bedtime.

At 11:30 pm, I awoke to a hypnogogic image at the foot of my bed. It was as if a large 4' X 4' screen for a movie projector was at the end of my bed. An image was projected on that screen of a human family: children, adults, and old people around a baby in a manger. They seemed to be in a desert, barren landscape, that did not look like anyplace on Earth. The clothes that they wore were such that I had never seen before: long metallic coverings that looked like something that monks might wear. The people did not smile. They seemed to be posing for a portrait, but they did not appear to be happy.

I leaned out of bed, opened my bedroom door, and called out to my roommate. I told her to come quick—that she needed to see what I was seeing. I turned back to my left to look at the clock, and then looked back at the image again. It was still there. I made eye contact with an older man in the image and then the whole thing disappeared as if a switch had been turned off; it was gone.

TERENCE MCKENNA once pondered the idea that *Psilocybe* mushrooms are of extraterrestrial origin. Perhaps the image I viewed was from another planet, but was carried through or accessed through the mushroom DNA/RNA. I may have been in a theta brainwave state as the image formed, as I was coming from a sleeping to a waking state when this occurred. (Although I was definitely awake; I have no doubt about that.) Perhaps the pineal gland was involved somehow, and the effects resulted from a combination of three components: pineal secretions, residual psilocybin effects, and the theta brainwave state.

I'd like to suggest that readers of *ER* explore the combination of psilocybin-containing mushrooms and the theta brainwave state. Theta brainwaves can be attained from two directions: one is via a slowing down of brainwaves until the theta state is reached; the other is via waking up from a deep sleep into the theta state. Using biofeedback devices can help to generate a theta state, and binaural beats might be useful in helping to maintain such a state and induce hypnogogic imagery. It is possible that the effects from psilocybin would be increased or somehow modified and different than they are when one takes mushrooms in normal waking consciousness. The theta brainwaves state might open the door for the psilocybin to go to town, or maybe the psilocybin will increase the theta brainwaves, or perhaps both.

— ONEGREENDAY

## MORE MORNING GLORY, NO LUCK WITH DATURA

This is a response to the letter titled “Steam Distillation, Enemas, and Morning Glory Prep” from Vol. XI, No. 4 of *ER*. My own experience with morning glory seeds was interesting, and for my purposes a success. I bought the seeds at a local grocery store. I think that they were the “heavenly blue” variety. I ground up the seeds in a coffee grinder until they were powder. Ten packets of these seeds were a dose—between 200 and 300 seeds. I mixed the powdered seeds with milk and drank this, which didn't taste bad. It took about 20 minutes to notice the effects, beginning with a speedy quality, followed by brighter colors and the walls and the floor “breathing.” I had some psychedelic mentation that was similar to LSD, but not quite the same. The biggest drawback that I can think of is that it makes you feel uncomfortably full (so I don't eat anything prior to taking them). Gas-X pills seem to provide some relief. The effects usually last between

five to eight hours for me, with no “hangover” at all the next day. The only reason that I tried the seeds in the first place is because I couldn't (and still can't) find any actual LSD. If the real thing isn't available, morning glory seeds are an okay substitute. I haven't tried it in an enema, nor do I want to try it this way, but if someone does, I'd like to hear about it.

I do have a question: what's the deal with Jimson weed seeds? Every year I hear about some poor high school student going nuts, seeing things, and what-have-you, after consuming some of these seeds. I have experimented as much as I want to with these—doing extractions, eating seeds, eating foliage—and all I get is massive cotton mouth that is extremely uncomfortable. No visions. Nothing positive to speak of. I've grown my own plants and ordered seeds from several different companies, but had no luck getting any of the desired effects from this plant. They do have nice flowers at least. Any suggestions? Thanks. — T.F., IL

Any suggestions? Yeah, avoid them. If people feel like they must experiment with *Datura* they should read everything they can before starting, and toss out the overly romanticized accounts. Then start low and have at least two experienced sitters as companions who are willing to commit to being there for the whole time. While one may have no clue where one actually are during the trip, one's body will probably still be intermittently quite mobile.

Some people who do get effects lack any memory of them. Many people who take *Datura* have little to no recollection of much of the experience. While total amnesia can occur, it is not the norm. However, amnesia for the majority of the experience does seem to be common. K. TROUT comments of his experiments with this plant: “I have some intensely vivid memories with incredible detail—so much in some cases that I can still it see in my head when I think about it. However these memorable vignettes are only a small fraction of the time I was there.” The reason for such memory loss in people of normal biochemistry is that *Datura* interferes with or can even block acetylcholine transmission. Acetylcholine is a critical chemical involved in the formation of memory. It is also worth being aware that when people talk about the discussions that *Datura* users have with imaginary people, it is usually the observers reporting this and not the person who ingested the *Datura*. Even when used for prognostication in traditional applications, the user is asked the questions, but someone else writes down the answers. While there no doubt are individuals who can recall some of what happens to them in great detail, our belief is that at least some of the intricately-detailed *Datura* accounts are likely to include a bit of poetic license, so far as an accurate retelling of events goes. On the other hand, amnesia is often not so much of an issue with lower doses.

High doses do in fact kill people. Another report of kids messing with these seeds, found on the Berkeley campus, was just on the news a few nights ago. (The kids were hospitalized for days.) The response on campus was to have someone kill the plants that the seeds came from. A high degree of variability in alkaloid content may be why they sometimes even kill people with extensive experi-

ence and who consider them their ally. It sounds like you may not have done a high enough dose, but bear in mind that the safety margin for atropine is far smaller than with scopolamine. Also realize that if you do take enough to "trip" it will be a deliriant experience that is totally unlike psychedelics in quality. *Datura* is not a replacement for psilocybin-containing mushrooms, mescaline, LSD, or any of your other standard fare; it is a completely different experience. — Eps.

## MUSHROOM MATTERS

Are there any reliable suppliers of spore syringes still in business? If using plastic containers for the mycro-tech method—mentioned in *ER* Vol. X, No. 4—how do you sterilize containers of brown rice medium? How long in the microwave at what setting? Thanks. — V.G., NH

We asked YACHAJ, who wrote the mycro-tech articles for *ER*, to field this question. He responded:

I suppose you mean a reliable vendor of spore syringes for customers in the U.S.? It's difficult to say. Buy only from vendors who guarantee the quality of their product and will replace it or refund your money if it is contaminated. The [www.mycotopia.net](http://www.mycotopia.net) forum is a close community and if vendors do not deliver quality, it is easily exposed through this venue. However, we may be in the last months that spore syringes are available in the U.S. The prosecutor in the *PSYLOCYBE FANATICUS* case wants to have these declared as "paraphernalia." Even worse than this, the prosecutor wants to declare the *PF TEK* instruction manual as "paraphernalia" too! The paraphernalia law could end up being stretched quite far. It may only be possible to stop such an approach based on defenses that argue for First Amendment rights. If this case sets a bad precedent, all "How To" texts that describe illegal activities may end up being banned. The ACLU has been informed about the approach of the prosecutor and they have been in contact with the McPHERSONS, but at this moment nothing is certain. If I lived in the U.S., I'd collect as many spores and seeds while possible.

## NEW BOTANICALS

*Amanita muscaria*

*Mitragyna speciosa*

*Voacanga africana* root-bark

Plus many new species of seeds  
and a bounty  
of shamanic accessories.

---

HERBAL-SHAMAN

Questions & Tracking: (316) 685-9199

As far as sterilization of brown rice containers goes, personally, I prefer glass containers (whiskey glasses) over plastic, because heat tolerant plastic (polypropylene) is not fully transparent. Polycarbonate plastic is transparent, but it is expensive and rare. You should avoid microwave ovens anyway (particularly with plastics, as it has been shown that cooking some plastics in a microwave puts off carcinogenic chemicals). Nothing beats steam sterilization. Half-pint containers of PF substrate can be sterilized in a normal milk-pan on a gas stove or campfire. — YACHAJ

## POPPY GROWING: LEGALITY & SOURCES

I presently have several sources for the seed of *Papaver somniferum*. There are varieties of every color and petal configuration. *P. somniferum* is legal to grow as an ornamental flower, and I am currently growing several types of these flowers in my garden. Another species, *P. bracteatum*, is not listed as a controlled substance at all. I would really like to grow *P. bracteatum*, but I am completely at a loss when it comes to locating a source for the seeds. Any suggestions? — L.E.G., NH

First off, it is important that we make it clear that you are operating under a misconception. It absolutely is *not* legal to grow *Papaver somniferum* for any purpose in the United States—ornamental or otherwise. Even though this is the case, there are many people who do grow it for ornamental purposes, and the huge majority of them will never be busted for this. Nevertheless, the DEA sent letters out a few years ago to seed companies that offered these seeds for cultivation in ornamental gardens, telling them that it was illegal to do so. They actually seem to have persuaded at least one major company, THOMPSON AND MORGAN, to discontinue selling these seeds in the USA. (THOMPSON AND MORGAN still lists the seeds in their catalog, but only sell them outside of the USA.) The chances of being busted for having a small opium poppy garden seem pretty slim, particularly if they are mixed in with other ornamental flowers, have not been obviously scored/milked, and you have done nothing else to attract the attention of the law.

The ironic thing about the DEA targeting horticulture companies is that anyone can go to their local grocery store and get these seeds. For the price of a packet of a couple hundred seeds from a seed vendor, one can get a spice jar filled with thousands of seeds. Even if the viability is a bit lower—as it sometimes can be—it is quite easy to buy these seeds mere minutes from most homes in America. Yet the DEA seems to absurdly think that harassing ornamental seed vendors is going to “curb the problem” of opiates in America.

*Papaver bracteatum*, also known by the synonym *P. orientale* var. *bracteatum*, was mentioned as a thebaine-containing plant in “Patients’ Rights and Poppy Fields” in Vol. XI, No. 2 issue of *ER*, and a

source for the seeds was presented in that issue. The conversion of thebaine to oxycodone was briefly touched upon in a book review of OTTO SNOW’s work *Oxy*, which appeared as part of an editorial remark in “Prime Poppy Processing?” from the Vol. XI, No. 1 issue of *ER*. Another source for these seeds is ALCHEMY WORKS SEEDS & HERBS [3074 Lake Road, Horseheads, NY 14845-3102, (607) 737-9250, www.alchemy-works.com]: \$4.00 for a packet of about 200 seeds. This company also sells regular “poppy seeds” (no doubt *Papaver somniferum*) for \$6.00 a pound, which is a good price. Although *P. bracteatum* is entirely legal to grow, it is worth noting that it can hybridize with *P. somniferum*; the two should not be grown in the same location, unless you don’t mind possibly producing seed for future plants that may be of “questionable” legality. It is also worth noting that thebaine itself is a Schedule II controlled substance, so while the *P. bracteatum* plant is legal, extracting it is not. — DAVID AARDVARK

## CALLIANDRA CHEMISTRY?

Has anyone come up with analysis for any *Calliandra* species to see if they are in fact DMT-containing? In OTT’s *Shamanic Snuffs or Entheogenic Errhines*, he mentions that this is used as a direct replacement for *Diplopterys carbrerana* in ayahuasca preparation. OTT strongly suggests that this genus may have some DMT containing species. — J.S., OR

The one analysis that we have seen mentioned comes from the SHULGINS’ book *TIHKAL* in listing #54 on tetrahydroharmine (THH), wherein SASHA states:

There are a number of other plants that are known to contain tetrahydroharmine and to have been used in various native preparations. I have recently learned of analysis of an Ayahuasca brew that had used the plant *Calliandra pentandra* as a component, instead of the usual *Psychotria viridis*. Ott’s magnificent compendium *Pharmactheon* makes mention of a *Calliandra augustifolia* as a component of ayahuasca, but there is no mention of this *pentandra* species. The preliminary analysis that I have been given of this decoction is that a component that had initially appeared to be DMT by HPLC analysis had proven to be tetrahydroharmine when assayed by GCMS. There was no detectable DMT present. And yet the material appears to have psychopharmacological activity.

More studies on tetrahydroharmine are absolutely imperative.

We had previously noticed some remarks regarding the activity of THH made by chemist Jace Callaway (Callaway 1995), so we asked him for his thoughts:

The picture is not at all clear on this one. THH is a weak SRI (serotonin reuptake inhibitor), like the other 1-me-

thyl-THBCs, so one can expect it to have about as much psychoactivity as a SSRI (i.e., little to none). In combination with MAOI, it acts to promote serotonergic activity by blocking 5-HT reuptake. Clearly, it is not a potentially lethal combination, as with harmine and Prozac for example, and I suppose that serotonin will compete with THH for the uptake site once serotonin concentrations have reached sufficient levels (pure speculation; those experiments have not been done, to my knowledge).

However, in a broad (as yet unpublished) survey of *Banisteriopsis caapi*, *Psychotria viridis* and subsequent teas, which included phytochemical analyses of all, plus subjective ratings of the teas, a strong correlation was found with teas that contained high amounts of THH and not DMT! This rating was from a large body of experienced users (regular União do Vegetal members who had consumed ayahuasca for 10+ years). In short, yes, there seems to be important activity from THH, but likely not the sort of activity that currently seems valuable to the lay user in the U.S. or E.U.; e.g., more temporal, than whirly/swirly, if you know what I mean.

I have tried THH, alone and in combination with MAOI, and there is a twinkling of sorts, but one might get a substantially similar reaction from Prozac. Also, there are two isomers possible from THH (+ and -, or d and l). I would suppose that one is more active than the other. Simply heating in boiling water will convert one to the other, so most teas will have both. the "d" form is the one reported to be found in the plant (d-leptafluorine), and I have often wondered about tales from the rainforests, where the tea is sometimes prepared just from soaking the macerated vine overnight (no heating, no admixtures), with visions resulting. Note: I suppose the desired vine should be a chemovare having high levels of THH.

*Calliandra pentandra* has good amounts of THH in the leaves, and it is used as an add mixture by some groups like the Shuar in Equador, and visions have been reported by reliable western folk from this and *Banisteriopsis caapi*. so, there still may be something there to look at more closely.

I am not aware of any other analyses on this plant species, aside from my own investigations (which are what SASHA refers to in *TIHKAL*). From my limited perspective, *C. pentandra* does not contain any DMT, and THH was the major component that showed up in my analysis. These two compounds have quite similar chromatographic characteristics; without mass spectral detection, I would have to doubt any claims that lack such specificity. — JACE CALLAWAY, Ph.D.

## UNIQUE COLOR REACTIONS?

Author K. GENEST in the 1965 *Journal of Chromatography* 19: 535 mid-page states: "Pemiclavine, which gives a greenish color with DMBA-spray, can be distinguished from the other related alkaloids... etc." Since there are a host of ergoline alkaloids, do any of the others—such as chanoclavine, ergometrine, elymoclavine, etc.—produce an other characteristic colors that distinguish them and set them apart when sprayed with DMBA-spray? If so, what colors correspond with which alkaloid when sprayed with DMBA and what journal references cite this data? — J.D., IL

The usual color expected with *p*-dimethylaminobenzaldehyde (DMBA) would be blue, but this is common, so it alone is not diagnostic. In this case, what is being referred to as important is the green color being diagnostic for this alkaloid. It's also important to remember that only rarely will a person have to be telling many alkaloids apart at once, and simply knowing that one alkaloid is penniclavine and the other is actually what you want is enough information.

It is worth remembering that only sometimes do colorimetric reagents provide unique color or reactions capable of positive ID. They are far more useful for: 1) Localizing the spots on a thin layer chromatography sheet where they are often otherwise invisible, and: 2) establishing that something is *not* what is wanted by its *lacking* said reaction. This is because many color reactions are shared. For example, many simple indoles produce a similar blue color when reacting with DMBA spray. It should also be remembered that additional identification means are necessary for positive identification in addition to colorimetric reactions. — K. TROUT

# DESICCANTS AND THE STORAGE OF CHEMICALS

by FIRE EROWID

Most chemicals that are in powder, crystal, or tablet form are best stored as dry as possible, whether for short or long-term storage. Unfortunately, many factors can make dry storage difficult. Dark and cool locations that are otherwise ideal for chemical storage tend to be damp. As containers are opened and closed or as seals age and leak, humidity can creep into a container, increasing the speed of degradation of materials stored inside. Many plastic containers are made from material that is permeable to water vapor over time. As temperatures go down, humidity trapped in a container may reach its dew point and precipitate out, potentially ruining the material.

One solution to this storage problem is the use of desiccant. A desiccant can be any material that is hygroscopic—meaning it will absorb water from the air. Desiccants can be purchased as loose powder, pellets or small sealed pouches of various sizes. These pouches—often made of uncoated Tyvek—contain the powder or pellets while still allowing air flow.

There are a number of desiccant products designed for different purposes. Some people use desiccant to keep delicate electronics dry. Gun collectors use it to keep their weapons from rusting. Pharmaceutical companies include desiccant packs inside medicine bottles, and shoe companies use it to keep leather dry. Home supply stores or craft stores often sell it for drying flowers.

Certain products are marketed specifically for the purpose of drying foods for long-term storage. These have the advantage of being approved for use with items that will be ingested. The most common commercially available desiccants are silica gel and clay.

Silica gel can absorb water from below freezing to past the boiling point, but functions best at room temperature. There are some varieties of silica gel that are approved by the FDA for use with food.

Indicating silica gel, which is normal silica gel with some of its granules coated with cobalt chloride, changes color as it becomes saturated with water. Cobalt chloride is a heavy metal that is *not* food-safe and should not come into contact with anything that will be ingested. Indicator silica gel is more

expensive, but is very useful for determining when the desiccant has reached its saturation point and lost its effectiveness. It is often available at chemical supply stores.

Once they have absorbed humidity, both types of silica gel can be reactivated (re-dried for future use) by spreading them in the bottom of a baking dish and drying them in an oven at 220–250° F for about three hours. Lower temperatures

will not dry the gel and higher temperatures can damage it. Silica gel packaged in Tyvek packets can be dried the same way.

Clay desiccants are less common than silica gel, but can also be less expensive. They work well at lower temperatures, but begin to release water at 120° F. This can be a problem for items stored in hot areas, but also makes it easier to reactivate them in the oven.

Calcium oxide is a caustic material, and inhalation or exposure to the eyes or skin should be avoided. Unlike silica gel or clay desiccant, calcium oxide expands as it absorbs water. It is slower than other desiccants, but can achieve lower humidity. When exposed to water or high humidity, it can release quite a bit of heat.

Calcium sulfate, also known as gypsum, is sold commercially under the name Drierite. It is relatively common and is available in an indicator variety, but is less efficient than most other commercial desiccants. Calcium sulfate can be reactivated by heating in an oven for one hour at 210–425° F.

There are a number of ways that desiccants can be used to help keep stored materials dry. The simplest is to put food-safe desiccant packs alongside the stored material inside a sealed container.

A second method is to put a layer of desiccant or desiccant packs in the bottom of a sealable container such as a glass canning jar or plastic box. The material to be stored is set into a separate and smaller sealed container. This smaller container is set on top of the desiccant in the first container, which is then sealed.

A third method is the do-it-yourself desiccant pack. A small glass jar can be half filled with desiccant pellets and then the top of the jar “sealed” with a piece of air-permeable fabric or two layers of coffee filter secured with string or a rubber band. This jar containing desiccant is then placed into a larger sealable container with the material or chemical being stored.

Other dry materials such as wood can also be used as a makeshift desiccant. A small piece of wood, dried in the oven until it becomes bone dry, can be placed in a container where it will suck moisture out of the air. While less effective than commercial desiccants, this method is also less expensive and can be done from materials found at home.

Most desiccant is fairly inexpensive, can be reused for years, and helps maintain the quality of materials stored over long periods of time. The key is to keep any non-food-safe desiccant separated from materials that might be ingested, while still allowing the desiccant access to the air that surrounds the stored materials. ☉

# EVENTS CALENDAR

## CONSCIOUSNESS AND THE SPIRITS OF NATURE SEPT. 9–11 • SEPT. 19–26, 2003

Located in an extraordinarily beautiful setting along the coast of Bahia, approximately 700 miles north of Rio de Janeiro, Brazil. Each week we will be hosting ayahuasca sessions and providing information on this plant medicine, its history, and healing properties. Ayahuasca and the heart opening process work together synergistically, allowing us to very quickly move past our self imposed limitations. Staff includes CLYDETTE CLAYTON, ANNA McCUSKER, MIREILLE MENDES, RALPH MILLER, SILVIA POLIVOVY, PETER RICHARDSON, and ZOE SEVEN. Cost is \$2,100 for each one week-long event, which includes a shared room at a private, beautiful and comfortable beach-front property, all meals, four evenings of ayahuasca ceremony plus lectures and group sharing sessions, and local transportation provided by shared van. For more information see [www.heartoftheinitiate.com](http://www.heartoftheinitiate.com).

## PSYCHEDELIC PSYCHOTHERAPY SEPTEMBER 19, 2003

NEAL M. GOLDSMITH presents an interactive sketch of the context for the use of psychedelics in psychotherapy through the tradition of shamanic practices reaching back millennia. He will also discuss the explosion of interest and research that occurred in the West from 1947 through 1976, during which time thousands of peer-reviewed research papers were published. Since 1990, the FDA and NIDA have resumed approving human-subject research with "hallucinogens" and findings from the contemporary clinical research will be reviewed. Over the past 50+ years, western researchers have systematically "reinvented the wheel" of ancient practice in roughing out the contours of safe and effective psychedelic psychotherapy. These "best practices" will be described and explained, and brief review of the prospects for the future will be presented. Held at 8:00 pm at the NATIONAL INSTITUTE OF THE PSYCHOTHERAPIES, 330 West 58th Street (between 8th & 9th Avenues), Suite 204, New York, NY. \$10.00.

## WASIWASKA AYAHUASCA OCTOBER 5–25, 2003

Ayahuasca sessions held every other night in Florianópolis, Brazil. Lectures on psychointegrator plants, visionary art, Brazilian culture, permaculture, yoga, Tai Chi, Capoeira, Portuguese lessons, gardening, and more. \$1,000 per week, with everything but airfare included. For a maximum of eleven persons. See [www.wasiwaska.org](http://www.wasiwaska.org), or contact LUIS EDUARDO LUNA by e-mail at [luna@wasiwaska.org](mailto:luna@wasiwaska.org).

## INSIGHT & OPENING OCTOBER 25–31, 2003

Join STAN GROF, JACK KORNFELD, and WES NISKER for a retreat to discover the power of breath and meditation. Ancient spiritual practices will be integrated with western psychology and modern consciousness research, through lecture and direct experience. Held in the high desert of Yucca Valley. \$1185 includes room and board. For more information, contact EastWest Teachings, 5935 Jordan Avenue, El Cerrito, CA 94530 (877) 208-4975, [eastwestteachings@earthlink.net](mailto:eastwestteachings@earthlink.net).

## TOUR OF EGYPT OCT. 21—NOV. 4, 2003

Join RALPH METZNER for the experience of a lifetime! Explore the cosmic mysteries encoded in the tombs and temples of this ancient civilization and practice remembrance divination, attuning with the gods and goddesses who still guide and inspire us. Tour cost of \$4,280 includes round trip airfare (New York to Cairo); all transportation in Egypt; all teachings and ceremonies; boat docks and hotels; entrance fees to sites; overnight and buffet breakfast at 5-star hotels in Giza, Aswan, and Luxor; 4 nights (three meals per day) on luxury Sonesta Nile cruise ship; private entrance at Great Pyramid; and three meals in Cairo and Soqqara. Cost is based on double-occupancy rooms; a single room is \$650 more. For more information see [www.rmetzner-greenearth.org](http://www.rmetzner-greenearth.org).

## RECOVERY ESSENTIALS

1005 Terminal Way, STE 110

Reno, NV 89502

(775) 326-5741

(775) 324-6788 FAX

info@recoveryessentials.com

www.recoveryessentials.com

Although my review below may seem critical in places, I want to note from the outset that I am a huge fan of the particular harm reduction approach that is promoted through the company RECOVERY ESSENTIALS. The idea this company embraces is that there are specific nutritional supplements which can be taken by those who use drugs that will help to reduce or eliminate the harm that drugs can inflict on one's body. Being in the best possible physical shape, and taking the appropriate nutritional supplements, will definitely help people recover from those times when they choose to indulge in legal or illegal drugs. Although it is a bit dated, I highly recommend the 1982 book *Life Extension: a Practical Approach* by DURK PEARSON and SANDY SHAW. A couple of research scientists hugely ahead of their time with regard to nutrition issues, PEARSON and SHAW actually developed the first "harm reduction" nutritional supplement that I am aware of, called "Party Pill™" (now available as the improved Party Pill II™), which I will discuss in more detail later.

RECOVERY ESSENTIALS' blends of supplements targeted for use with specific recreational drugs sometimes come with additional advice on healthier approaches toward using the drug in question. Such is the case with their "ALC-kit Sober Up™," for use in conjunction with booze. Some folks may feel that the first bit of advice presented in this product's "hangover prevention plan" is common knowledge: "Avoid drinking on an empty stomach. Food in the stomach slows absorption of alcohol into the blood stream." While this advice may seem good at first blush, it is actually the exact *opposite* of what one wants to do to avoid a hangover. If you want to avoid a hangover, you *should* drink on an empty stomach, or at least wait 3–5 hours since your last meal before drinking. According to nutritionist FRED BEYERLEIN, author of *Drink as Much as You Want and Live Longer*: "Drinking on

an empty stomach allows faster neutralization of alcohol, especially if you drink hard liquor. Higher concentrations of alcohol activate the stomach's neutralizing enzymes that catch alcohol before it sneaks under the stomach lining, and heads for the brain. Food dilutes the concentration of alcohol to a level that does not adequately stimulate these enzymes. Therefore, if you eat right before or during drinking it only serves to slow the rate and not the amount of alcohol to the brain. Drinking on an empty stomach may initially cause alcohol to travel to the brain faster, but the overall amount will be less because more of the alcohol will be neutralized." BEYERLEIN does note that these enzymes are not activated in the same fashion from drinking beer, wine, or diluted mixed drinks. Nevertheless, there are other benefits from drinking on an empty stomach. Drinking with a full gut can cause foods to ferment or rot in one's stomach while they are waiting to be digested, which will contribute greatly to the likelihood of vomiting and hangovers. As well, when one drinks on an empty stomach, one feels the effects of the alcohol more rapidly, so one can drink less to achieve the desired "buzz" level. Drinking less and getting more effects should be a hallmark of harm reduction, yet it seems to have been missed by the folks at RECOVERY ESSENTIALS. The other advice on their "hangover prevention plan," however, is relatively sound: favor clear distilled alcohols, alternate alcoholic beverages with water, drink less than one drink per hour.

The supplements in ALC-kit Sober Up™ are almost 50% vitamin C (900 mg) and either thiamine or vitamin B2 (100 mg). I say "either" because they strangely list thiamine as "vitamin B2," which it isn't—it's vitamin B1 (B2 is riboflavin). I suspect that they *mean* B1 in this case, since B1 is one specific vitamin that has been used in rat tests to combat the toxic effects of alcohol's metabolite acetaldehyde. The remaining 1375 mg of ingredients includes a proprietary blend of flavoglycosides (kudzu root extract), curcumin (turmeric rhizome extract), *N*-acetyl cysteine, *L*-cysteine, silymarin (milk thistle seed extract), sesquiterpene lactones (dandelion root extract), and *R*-lipoic acid. Unfortunately, they don't list how much of each of these ingredients that the pills contain, which makes it difficult to determine how helpful this amalgamation might actually be.

Comparing the ingredients in RECOVERY ESSENTIALS' ALC-kit Sober Up™ to DURK PEARSON and SANDY SHAW's Party Pill II™ is interesting. It should be noted that Party Pill II™ was designed as a harm reduction nutritional supplement to combat the negative effects of both tobacco smoke and alcohol. (RECOVERY ESSENTIALS has a separate product that targets tobacco use.) Party Pill II™ contains: vitamin C (831 mg), vitamin D (133 iu), vitamin E (133 iu), vitamin A from beta carotene (2,500 iu), thiamine/B1 (21 mg), riboflavin/B2 (83 mg), B6 (22 mg), folic acid (400 mcg), B12 (33 mcg), biotin (67 mcg), pantothenic acid/B5 (123 mg), calcium (77 mg), zinc (27 mg), selenium (67 mg), copper (1 mg), chromium (200 mcg), L-cysteine (600 mg), quercetin (67 mg), and hesperidin (67 mg).

The addition of pantothenic acid/B5 in Party Pill II™ is a plus, as this vitamin also helps the body to detoxify the acetaldehyde formed from the metabolization of alcohol. On the other hand, ALC-kit Sober Up™ benefits from including phytonutrients that may help repair liver function: curcumin, silymarin, and the sesquiterpene lactones from dandelion root. As well, the flavoglycosides that it contains from kudzu (*Pueraria lobata*) extract should have among them daidzin, which lowers blood alcohol levels.

Both formulas might benefit from the addition of potassium and magnesium, which are depleted more rapidly from the body during alcohol consumption. Also, the amino acid taurine could be added; while the liver makes taurine from cysteine, when alcohol is in one's system, the cysteine could be primarily tied up detoxifying the acetaldehyde. Taurine has brain-protective antioxidant properties. Rather than isolated beta carotene, which has actually been shown to be problematic—increasing the chance of various cancers and heart disease—Party Pill II™ (and the ALC-kit Sober Up™) would benefit from full-spectrum plant-derived carotenoids, which have not been shown to create the problems that isolated vitamin A and/or beta carotene have. (Alcoholics have been shown to have low levels of carotenoids in their blood.) Supplemental gamma linolenic acid (GLA) and docosahexaenoic Acid (DHA) might also be a good addition, to protect nervous system functioning in the presence of alcohol. The amino acid GABA could be added to keep nerve cells from over-firing and calm hypersensitivity that can be associated with a hangover. Another prophylactic measure for those who drink alcohol would be the consumption of Hydergine, which protects both the liver and the brain from damage. (My thoughts on creating a "better" nutritional harm reduction pill for use with alcohol were largely inspired by the ar-

ticle "Your Brain on Alcohol: Getting Over A Millennium Hangover," posted at [www.brain.com](http://www.brain.com).)

Another relatively new alcohol protection nutrient combo is SOURCE NATURALS' "Hangover Formula™." This formula contains: vitamin C (900 mg), vitamin B1 (300 mg), vitamin B2 (15 mg), niacinamide (50 mg) niacin (25 mg), vitamin B5 (25 mg), vitamin B6 (30 mg), vitamin B12 (30 mcg), biotin (50 mcg), folic acid (300 mcg), vitamin E (30 IU), calcium (90 mg), magnesium (200 mg), manganese (4 mg), N-acetyl cysteine (150 mg), silymarin (150 mg), L-cysteine (100 mg), feverfew extract (100 mg), choline (100 mg), chlorella (50 mg), lecithin (25 mg), inositol (25 mg), DMAE (25 mg), and 1327 mg of a "Chinese and Western Herb Blend" containing ueraria flower, magnolia bark, germinated rice, mint, chrysanthemum flower, marshmallow root, gravel root, slippery elm, gastrodia root, clove, fennel seed, and peach leaf. While I admit to not knowing why any of the ingredients of the herb blend are included, this formula otherwise appears to be fairly similar to Party Pill II™.

Each of these products contains some ingredients that the other does not, as well as slightly different dose levels of the common ingredients in most case, and fairly large differences in dose levels of the common ingredients in a few cases. I am not a nutritionist, and I have not researched the scientific literature regarding potentially optimum levels of each of the ingredients. It is hard to say which product might be the most useful; it is easier to say which product is the most expensive. Unfortunately, it is RECOVERY ESSENTIALS' ALC-kit Sober Up™, which costs \$4.50 per dose. 20 doses of Party Pill II™ sell for about \$28.00, or about \$1.40 per dose, from [www.life-enhancement.com](http://www.life-enhancement.com). Hangover Formula™ is the low-price winner, with 20 doses selling for \$12.15, or about 60¢ each, from [www.webvitamins.com](http://www.webvitamins.com).

RECOVERY ESSENTIALS also makes a packet for use with MDMA: the "e-Kit™." This supplement contains a bevy of antioxidants that may help protect the brain from the potential neurotoxic side effects of MDMA. It also provides calcium and magnesium, which are believed to help combat jaw clenching, and 5-hydroxytryptophan, which is thought to help replenish serotonin. Finally there are pills for use the day after one takes the MDMA, which provide "stimulating" nutrients and phytochemicals to help combat any fatigue that may have been induced from the earlier partying.

Even though I applaud this formula in general, I have two criticisms. First, the dose of vitamin C provided may be too

low. Data based on rat studies that showed protective effects from vitamin C used doses of the vitamin that were ten times higher than the dose of the MDMA (SHANKARAN et al. 2001). For a variety of reasons it may not be reasonable to extrapolate from this rat data for application with humans, but with a human who took 125 mg of MDMA, this would place the vitamin C dose at 12.5 grams. One would *not* want to take such a dose all at once! Nevertheless, I don't think that it can hurt to take extra C with your Ecstasy. Even on their own web site, RECOVERY ESSENTIALS states that "a quantity of 2 grams of vitamin C may protect users of MDMA from oxidative stress" and the site also notes that it may be better to take an "acute [dose of up] to 10 [grams...] during MDMA usage." So I wonder why they only put 400 mg in their e-Kit™? MDMA can cause oxidative stress for more than 24 hours (EROWID 2001), and vitamin C is rapidly excreted and must be taken repeatedly in order to maintain high serum levels (dosing with vitamin C every four hours or so is probably best). My own bias is that I think everyone should be taking a minimum of three grams of vitamin C daily anyhow for general health, and probably more than this—particularly when one is consuming drugs. Vitamin C can cause stomach upset and diarrhea when too much is taken too quickly, so one must gradually scale up the doses.

My second complaint with the e-Kit™ can't be avoided. That is that it is divided into four pill sets that need to be taken at different times. This is entirely reasonable, due to the nature of what each of the sets of pills is attempting to "fix" (although I encourage them to put vitamin C into *all* of these sets, as they have only included it in the first one). In theory, there is nothing wrong with taking multiple pills at different times; indeed it is beneficial to do so. In practice, however, particularly when one is high on MDMA, it can be hard to remember to take your pills at the right time. The first set is easy, but after that all bets are off. The one time I tried to use this kit, I ended up both forgetting about and losing the last two sets of pills. Since most of RECOVERY ESSENTIALS harm reduction nutrient packs come divided into four pill sets that are taken at different times, a good argument can be made for the inclusion of a wristwatch with an alarm as standard tripping gear. After all, the pills can only help if you remember to take them. The e-Kit™ is \$5.00 per packet (one "dose").

Other products sold by RECOVERY ESSENTIALS include nutritional supplements for use with cocaine, amphetamine, psychedelics, *Cannabis*, opiates, and tobacco. They also sell the nutritional supplements 2-aminoethanol phosphate, 5-hydroxytryptophan, ginkgo biloba extract, idebenone,

melatonin, *N*-acetylcysteine, *R*-lipoic acid, selenium, and vinpocetine, as well as a pill called Neuroguard, that can be taken along with their specifically targeted harm reduction products, which contains additional antioxidants that would probably be beneficial. Alas, it too is quite pricey, at \$48.50 for a 15–30 day supply. Strangely, I was unable to find a listing of the quantity of ingredients contained in Neuroguard on their site and an e-mail query about this went unanswered. They also offer the RAD Test™ for \$12.00, a useful product that can test the level of oxidative stress that your body is under by checking your urine for free radicals. Finally, they sell a variety of drug identification and adulterant screening kits, including an Ecstasy ID Test, an Opiate ID Test, a Speed ID Test, a Cocaine ID Test, and LSD ID Test, and the Mecke, Simon, and Marquis reagents.

The RECOVERY ESSENTIALS web site does a good job with citing the scientific literature that backs up their reasons for including the various supplements that they do in each of their products.

As far as vitamin supplements go, RECOVERY ESSENTIALS products are priced pretty steep. One can get a bottle of a hundred 1000 mg vitamin C tablets for about the same price as one of their packets. Their main benefit is that their products have been formulated to contain specific ingredients that may help combat the nasty effects of specific drugs. For the occasional tripper who doesn't already pay attention to nutritional supplementation, RECOVERY ESSENTIALS products provide targeted protection. Despite their high prices, I must give praise to these folks. RECOVERY ESSENTIALS is at the forefront of harm reduction. Their products are highly recommended to help combat the side effects from specific drug use.

The Volcano Inhalator, manufactured by STORZ & BICKEL, is a cool twist on *Cannabis* vaporizers, which uses a balloon/bag to collect the vapors. They offer a three-year warranty with these units (they are the only company that I can think of that has such an offer). The temperature range of the air

that flows through the herb can be set between 130° C and 230° C, allowing one to adjust to the optimum temperature for the specific product that one is using. (Herb must reach 235° C to begin to burn.) Powders and liquids can also be evaporated in the Volcano, and one can blow up several bags with a single filling of the chamber, depending on how much is placed into the chamber.

To work the Volcano, one dials in the desired temperature with the regulator knob and switches on the heat. A yellow indicator light signals that it is warming up, and when the light goes out, it has reached the correct temperature. The chamber is then filled with whatever quantity of herb you want to use. Then the balloon/bag is plugged onto the chamber and set on top of the unit. Switch on the compressor, and the bag is filled with sweet vapors; once filled, switch the compressor off and remove the bag. Plug the mouthpiece into the bag, and press your lips against it—this opens the flow. When your lips are removed, the flow is shut off; this way, you don't lose any of the vapor when not taking a hit or when the bag is handed around.

The Volcano is hands down my favorite vaporizer. It allows one to vaporize both a small amount of material or a larger amount of material, making it great for personal use or for parties. It is extremely well made, easy to use, and much less likely to burn down your house (or burn *you*) than many other designs. Also, there is no concern that you might take a hit which ends up being too hot, thusly burning your throat. There is no "timing" that has to be mastered with this machine, to be sure that you don't accidentally burn the material. The unit could be set on a kitchen counter, alongside a juice extractor or a blender, and one would just mistake it for some newfangled food processing gadget. The real joy in using this vaporizer is that it allows one to take multiple hits or pass the bag around without being tied down to the unit. This is truly liberating, and the unit is so enjoyable to use that I can see people using it not just because of the potential health benefits but because they like the method of ingestion better. It's just fun. There is something reminiscent of passing around a balloon of nitrous oxide when using the Volcano; a pleasant association. Even just *writing* this review made me want to fire up the unit. I am someone who owns a lot of different vaporizers, and yet until recently I still found myself smoking from a Proto Pipe more often than anything else, as it just seemed more convenient. Since I got the Volcano, that has changed; I rarely use anything but the Volcano these days. This is a big reason that the Volcano trumps everything else on the market: it gets used regularly. And in

the end, that is the whole point of such harm reduction efforts in the first place. Kudos to the folks at STORZ & BICKEL for creating such an original and well-conceived design!

There is only one theoretical drawback that I can see to this unit: there is a large air/volume ratio and a lot of surface area where the vapor might condense in the bag. Interestingly, this does not seem to be much of a problem. Even when the bag has been set down for a few hours and then returned to, one is still able to pull some vapor from it. I have been using it for some months now, with the same bag, and have noticed no condensed vapor collecting at all.

When I wrote a review on this unit for the fourth edition of my *Psychedelic Resource List* book, I commented that it was reported that the unit was not that efficient, based on some preliminary data that I had received regarding a study done by MAPS and California NORML. However, since that time I have learned that this is not actually the case. Further testing showed that this machine actually is quite efficient at liberating the cannabinoids, and I must apologize for passing along misleading data. These tests showed that the Volcano did not add by-products of the unit itself (plastics or metals) into the vapor stream and the vapor produced was free of the toxins that they looked for.

One problem that I recently had with this unit was that I had gotten into the habit of loading a fairly large amount into the chamber for use in groups. Without thinking about it, I loaded a similar amount for my personal use, and cleared one bag full of vapor myself. I ended up getting *way* too stoned—I hadn't been that stoned in years. Racked with paranoia, the insectoid alien overlords were appearing in the dirt at my feet, communicating telepathically through bad poetry and strange indecipherable writings formed from pebbles and bark chips on the ground. If you are only using this for yourself, remember to load merely a tiny bit of bud into the chamber!

The Volcano gets my highest recommendation; it is efficient, practical, and a joy to use. It sells for around 500 euros in Europe or 513 euros for those in the USA, postpaid. Although this price may seem outside the range that many people want to spend, consider how much you spend on *Cannabis* and what your health is worth. Check out their web page for more details.

## PSYCHEDELIC RESOURCE LIST — FINALLY AVAILABLE!

Massively Expanded and Updated Fourth Edition!

New Art Chapter! • New Cannabis Seed Chapter! • Many New Botanical Suppliers!

Provides Sources For:

INFO: Books, periodicals, web pages.

GATHERINGS: Festivals, conferences, seminars.

PEYOTE: Seeds, live plants, and other psychoactive cacti.

ORGANIZATIONS: Religious, non-profit, and professional groups.

PSILOCYBES: Spore prints, syringes, dried mushrooms, grow supplies.

TABERNANTHE IBOGA: Seeds, roots, full-spectrum extracts, and ibogaine.

GARDENING SUPPLIES: Hydroponics, lights, timers, nutrients, predator insects.

RESEARCH CHEMICALS: Tryptamines, phenethylamines, GHB analogs, & more.

SMART DRUGS & OTHER PHARMACEUTICALS: Overseas medication suppliers.

CANNABIS: Viable seeds for countless strains and suppliers of dried herb.

SALVIA DIVINORUM: Plants, leaves, seeds, extracts, and salvinorin A.

PARAPHERNALIA: Vaporizers, pipes, and sundry smoking supplies.

LAB SUPPLIES: Glassware, solvents, chemical sources, etc.

AYAHUASCA: Traditional and analog dried herbs.

OPIUM POPPIES: seeds and dried pods.

AND MUCH MORE!

8.5" X 11", 207 pages, illustrated, with over 650 reviews.  
 \$20.00 plus \$4.00 (USA), \$9.00 (foreign) for S&H.  
 CA residents add \$1.60 for sales tax. Available from:  
 Soma Graphics, POB 19820 (Dept. ER), Sacramento, CA 95819  
 Or order on-line with a credit card from:

**ERRATA:** In the Summer Solstice 2003 issue on page 62 we published a photo of a leaf (bottom right-hand side of the page, held by a hand), which was presented as being from *Diplopterys cabrerana*. This is incorrect; the leaf was actually from a *Psychotria* plant. Our apologies for the error. All of the remaining photos shown on that page are indeed *D. cabrerana*.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See www.entheogenreview.com for descriptions and prices.

# EXAGGERATING THE RISKS OF MDMA TO JUSTIFY A PROHIBITIONIST POLICY

by RICK DOBLIN, Ph.D.

The RICAURTE et al. retraction of their article claiming that MDMA causes Parkinson's disease, originally published in *Science* in September 2002 and retracted in September 2003, has created a unique opportunity for an interwoven series of challenges to the perception that any use of MDMA (Ecstasy) is exceptionally risky and dangerous. This perception has been created in the minds of the general public, regulators, and lawmakers by NIDA/ONDCP/DEA/PARTNERSHIP FOR A DRUG-FREE AMERICA. According to this dominant but misleading view, even a single or a few uses can cause significant long-term brain damage with important deleterious functional consequences. From a scientific perspective, however, claims about the negative effects of MDMA on dopamine, serotonin, and cerebral blood flow, by Drs. GEORGE RICAURTE, UNA MCCANN, and Dr. ALAN LESHNER, ex-Director of the NATIONAL INSTITUTE ON DRUG ABUSE, respectively, have either been retracted, shown to contain major methodological flaws, or are clearly misleading.

The controversy surrounding the retraction provides some relatively easy ways to explain how scientific information has been misleadingly presented by grant-addicted scientists and prohibitionists. This has facilitated the ramping up of penalties against the illegal use of MDMA, the efforts to shut down the rave movement, and the pressure to prevent research into the therapeutic uses of MDMA-assisted psychotherapy. Fortunately, the new NIDA Director, Dr. NORA VOLKOW, seems likely to live up to a statement she made in an August 19, 2003 *New York Times* interview, in which she said, "If you want to be a scientist, you cannot allow politics to get in the way of your objectivity."

## MDMA AND DOPAMINE

RICAURTE AND MCCANN now acknowledge that their evidence about MDMA damaging dopamine neurons was erroneous (RICAURTE et al. 2003) and was based on the mistaken administration to their primates of methamphetamine instead of MDMA. This was supposedly due to mislabeled 10 gram bottles of MDMA and methamphetamine which arrived from the same provider in the same package.

A September 18, 2003 editorial in *Nature* asked NIDA Director VOLKOW to conduct a "thorough public review of the circumstances and participants' roles in one of the more bizarre episodes in the history of drug research." The *Nature* editorial also accused former NIDA Director LESHNER (now Executive Director of the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, which publishes *Science*), of "pander[ing] to the Bush administration's jihad against recreational drug use." The accusation was based in part on his hyperbolic statements in the press release that *Science* issued to draw attention to the original article, in which he said: "Using Ecstasy is like playing Russian roulette with your brain function." A September 18, 2003 news report in *The Scientist* mentions that RICAURTE AND MCCANN have retracted a second paper and reports that two senior British scientists have demanded that *Science* investigate its review of the original article and release the comments of the peer reviewers. (These news articles can be found at [www.maps.org/mdma/studyresponse.html](http://www.maps.org/mdma/studyresponse.html).)

An October 14, 2003 article in *Lancet Neurology* reported that the Multidisciplinary Association for Psychedelic Studies (MAPS) has filed a Freedom of Information Act (FOIA) request with NIDA, seeking more data on RICAURTE AND MCCANN's other recent NIDA-funded research in order to determine whether additional studies need to be retracted. To date, RICAURTE et al. have accounted for less than 2.25 grams of the 10 grams of methamphetamine that was contained in the original bottle mislabeled MDMA, all of which was used in research before the mislabeling was discovered. No accounting has yet been made of which studies used the MDMA from the bottle mislabeled methamphetamine.

Since MAPS is seeking to conduct FDA-approved research in which MDMA is administered to human subjects, our FOIA request also seeks the release of more details about the design and results of RICAURTE AND MCCANN's subsequent studies that they mention in their retraction, in which they administered genuine MDMA to primates, both orally and by injection, and found no evidence of dopaminergic neurotoxicity. These studies can provide data that bears directly

on the estimation of the risk of dopaminergic neurotoxicity to subjects in the human research that MAPS wants to conduct.

RICAURTE AND McCANN's anti-Ecstasy bias is now more clearly visible. In their original *Science* paper (RICAURTE et al. 2002), the authors ignored three published human studies showing no effect of MDMA on dopamine (KISH 2000; RENEMAN et al. 2002; SEMPLE et al. 1999), claimed that they administered the equivalent of a "common recreational dose regime" despite a reported 20% mortality rate in their primates (later modified to a 13.3% death rate when RICAURTE et al. admitted that they actually used five more animals than they reported to gather the data for their original *Science* article), and ignored their own research showing that oral administration of MDMA is less neurotoxic than the injection of MDMA (RICAURTE et al. 1988). These and other criticisms of the original study were published in *Science* in a letter written by the MAPS MDMA/post-traumatic stress disorder (PTSD) research team (MITHOEFER et al. 2003).

RICAURTE et al.'s retraction letter itself provides further evidence of their anti-Ecstasy bias. In the retraction letter, RICAURTE and McCANN still claim that doses of MDMA used by some humans could cause dopaminergic neurotoxicity and Parkinson's, based on exceedingly flimsy evidence. MAPS' critique of the arguments in the retraction letter can be found at [www.maps.org/mdma/retraction/maps\\_response\\_100203.html](http://www.maps.org/mdma/retraction/maps_response_100203.html).

Ironically, recent animal research has been published showing that MDMA, when administered in combination with L-Dopa, actually helps reduce dyskinesias, painful symptoms of Parkinson's (IRAVANI et al. 2003).

## MDMA AND SEROTONIN

MCCANN et al.'s evidence from their PET studies in Ecstasy users published in *Lancet* (MCCANN et al. 1998), on which they based their claims that MDMA causes massive reductions in serotonin, is now generally considered to be based on methodologically-flawed data. Basically, the values for the serotonin transporter levels in McCANN's control group are so spread out, with some control subjects having 35 times more serotonin transporters than others, as to be biologically implausible. To deal with this variation, McCANN et al. performed a mathematical operation called a logarithmic transformation that reduced the spread of the data (log transforms are sort of like taking the square root of all the numbers and substituting those instead of using the actual numbers), something no other PET researchers have needed to do (KISH 2002). Subsequent studies by other researchers using the same PET technique generated control values similar to McCANN's Ecstasy users. A much larger and better controlled study, published in the *Journal of Nuclear Medicine* (BUCHERT et al. 2003), with 117 subjects as compared to McCANN's 29, found that former users of Ecstasy, who had consumed an average of 799 doses and had abstained for about 18 months, had serotonin levels identical to that of the control subjects. BUCHERT et al. found that current users of Ecstasy, with an average exposure of 827 doses, showed no reductions in some brain regions and only minimal reductions (4–6%) in two other brain regions, unlikely to be of even temporary clinical significance.

The data from McCANN et al.'s *Lancet* paper formed the basis of NIDA's major anti-Ecstasy educational campaign, the "Plain Brain/Brain After Ecstasy" image. NIDA had this image printed on hundreds of thousands of cards distributed in bars and restaurants across the United States, used the

image in NIDA publications and web sites, and encouraged its use in media reports, all part of its now abandoned 42 million dollar “club drugs” campaign. This image wasn’t even an accurate representation of the data in the *Lancet* article if that data had actually been valid. NIDA used images chosen for dramatic effect, comparing subjects from the extremes of the MDMA and control groups rather than from the subjects scoring closest to the median, using some normal individual variability to exaggerate the “evidence” of MDMA neurotoxicity. NIDA has now withdrawn this educational campaign and even told the PETER JENNINGS’ Ecstasy documentary team that it couldn’t locate a copy of the image!

From another perspective, NIDA’s anti-Ecstasy educational campaign, and LESHNER’s other efforts to pander to the BUSH and CLINTON administrations’ stance against recreational drug use, have been wildly successful. A simple chart showing the annual increases provided by Congress to NIDA’s budget during the tenure of LESHNER reveals the short-term dividends of exaggerating the risks of MDMA and other illicit drugs in support of prohibitionist policies.

## MDMA AND CEREBRAL BLOOD FLOW

Testimony that then-NIDA Director ALAN LESHNER gave on July 30, 2001 to the Senate Subcommittee on Government Affairs, illustrated with a large poster purporting to show that MDMA negatively affects (reduces) cerebral blood flow, was clearly misleading. The poster showed a healthy-looking brain with what was represented as normal cerebral blood flow, with this image labeled: “Baseline.” For comparison purposes, the poster also contained a second brain scan image of the same subject with reduced cerebral blood flow. This image was labeled: “Two weeks post-MDMA.” What LESHNER didn’t tell the Senators is that the scans were drawn from a study that showed no difference between Ecstasy users (N=21) and controls (N=21) in cerebral blood flow (CHANG et al. 2000).

The images LESHNER used in his Senate testimony came from one of the subset (N=10) of the Ecstasy users in the larger study who participated in Dr. CHARLIE GROB’S Phase I MDMA safety study. These 10 subjects were scanned at baseline, like the other 11 Ecstasy-using subjects in Dr. CHANG’S research. They were then scanned again after receiving two doses of MDMA administered in the context of GROB’S study, at time points ranging from two weeks to two to three months after the last dose of MDMA. Subjects scanned two weeks after MDMA showed a temporary reduc-

tion in cerebral blood flow, while subjects scanned from two to three months after MDMA showed a return to baseline. The impression LESHNER left the Senators with was that MDMA caused permanent changes in cerebral blood flow when the changes were both temporary and of no clinical consequence. Transcripts of LESHNER’S testimony, as well as the images he used to illustrate his testimony, can be found on NIDA’S web site, at [www.drugabuse.gov/Testimony/7-30-01Testimony.html](http://www.drugabuse.gov/Testimony/7-30-01Testimony.html).

Ironically, LESHNER didn’t realize that in order to participate in the Phase 1 study and receive MDMA, the FDA required subjects to have already had substantial exposure to MDMA. On average, the subjects in CHANG’S study had an exposure to MDMA of 211 times. Thus, the “healthy-looking brain” that LESHNER showed to the Senators to contrast with the image of the same brain two weeks post-MDMA was actually the brain of a heavy MDMA user at baseline! If he had fully understood the science underlying the images he showed to the Senators, LESHNER should have reported that the baseline image dramatically illustrated that MDMA caused no persisting long-term differences in cerebral blood flow as compared to the non-MDMA using controls. Instead, he used the image to convey an impression of the dangers of MDMA at odds with what the study actually demonstrated.

Frightening and disturbing images of the brain of an MDMA user that showed explicit holes in the brain that were claimed to have been caused by MDMA have been shown on an MTV special documentary about Ecstasy, as well as on an OPRAH WINFREY show. These images were graphically manipulated to represent areas of lower cerebral blood flow as “holes” and are completely fraudulent. According to *In the Mix*, a 2001 PBS educational program about drugs aimed at youth that NIDA helped create, LESHNER stated, “We’ve heard people talk about Ecstasy causing holes in the brain and of course that’s a bit of an exaggeration, but there is a core truth to it.” We should be appalled, but not surprised, at the fact that the young woman whose brain scan image was manipulated has been working for several years at the PARTNERSHIP FOR A DRUG-FREE AMERICA, miseducating other young people about the dangers of MDMA (her choice of employment, perhaps, reflecting the only *genuine* signs of brain damage).

## RESEARCH INTO THE THERAPEUTIC USES OF MDMA

Ever since MDMA was criminalized in the United States in 1985, exaggerated risk estimates have played an essential role

in preventing research into the therapeutic uses of MDMA. In 1985, the FDA even refused to permit researchers to administer MDMA-assisted psychotherapy to a dying cancer patient who had experienced no significant side effects and had obtained relief from pain, both physical and emotional, through the use of such therapy that he had received prior to MDMA being made illegal. An FDA official wrote that even dying subjects deserved to be protected by U.S. law from the potential damaging effects of MDMA neurotoxicity. In this case, it didn't matter that the damage was hypothetical, the benefits were real, and the patient was willing to accept the consequences of participating in the research.

In 1999, after human research with MDMA had begun in Switzerland, a group of Dutch researchers led by H.J. GIJSMAN tried to stop Swiss researcher Dr. FRANZ VOLLENWEIDER from conducting basic safety studies by claiming in a letter to the journal *Neuropsychopharmacology* (GIJSMAN et al. 1999) that VOLLENWEIDER was engaging in unethical research. Their rationale was that VOLLENWEIDER was administering MDMA to MDMA-naïve subjects, a design that VOLLENWEIDER considered useful to obtain the clearest evidence of the effects of MDMA but that GIJSMAN considered too risky due to the dangers of MDMA neurotoxicity. A debate took place in a series of letters published in *Neuropsychopharmacology*. VOLLENWEIDER defended his research and risk estimates (VOLLENWEIDER et al. 1999). Courageously, the editors disagreed with GIJSMAN and supported VOLLENWEIDER's research (LIEBERMANN & AGHAJANIAN 1999). Two years later, MCCANN and RICAURTE entered the discussion to raise the issue of the dangers of MDMA neurotoxicity from even a single dose (MCCANN et al. 2001) but were rebutted by VOLLENWEIDER (VOLLENWEIDER et al. 2001) and again by the editors (AGHAJANIAN & LIEBERMANN 2001).

Sadly, the world's only fully-approved MDMA psychotherapy study was successfully halted for political reasons, with efforts to restart the study complicated by RICAURTE. In 2000, in Madrid, Spain, Ph.D. candidate JOSE CARLOS BOUSO, with the support of MAPS, was able to obtain all the necessary federal and local permissions to start the world's first legally-approved controlled study into any therapeutic use of MDMA. The study was designed as a double-blind, placebo-controlled, dose-response pilot study into the use of MDMA-assisted psychotherapy in the treatment of women survivors of sexual assault with chronic, treatment-resistant PTSD. By April 2002, six subjects had been enrolled in the study without any complications. On May 6, 2002, favorable coverage of the study appeared in prominent Spanish me-

dia. On May 13, 2002, as a result of pressure from the Madrid Anti-Drug Authority, the Manager of the Hospital Psiquiatrico de Madrid sent a letter saying that he wouldn't let the experimenters use the facilities of the Hospital anymore. In October 2002, just one week after RICAURTE's paper in *Science* came out, the research team's struggles to resume the study were significantly complicated by the appearance in Madrid of RICAURTE, who gave a highly-publicized talk about his MDMA/Parkinson's findings at the invitation of the Spanish Anti-Drug Agency. Additional talks by RICAURTE in Spain in April, June, and July 2003, further reinforced both the scientific and popular perception in Spain of the dangerousness of even a few doses of MDMA. (More information on the still-halted MDMA/PTSD study in Spain, including a time-line of events with dates of approval, Spanish media articles, withdrawal of approval, talks in Spain about the dangers of MDMA by RICAURTE and media reports of the contents of his talks, is available at: [www.maps.org/research/mdma/spain/index.html](http://www.maps.org/research/mdma/spain/index.html).)

Since it was founded in 1986, MAPS has worked to sponsor FDA-approved research investigating the therapeutic uses of MDMA. From 1986 to 1992, concerns over the risks of MDMA neurotoxicity were used to justify FDA refusals to approve any research in which MDMA was to be administered to human subjects. Starting in 1992, after a change in personnel and policy, FDA approved three basic safety studies with MDMA. The evidence from these studies, as well as from research conducted abroad, eventually persuaded the FDA that the risk/benefit ratio of MDMA was favorable in certain patient populations. As a result, in November 2001, the FDA approved a MAPS-sponsored pilot study into the use of MDMA-assisted psychotherapy with treatment-resistant PTSD subjects.

The controversy over the neurotoxic risks of MDMA, and over its widespread recreational use, made it exceptionally difficult for MAPS to obtain Institutional Review Board (IRB) approval for our study of the use of MDMA-assisted psychotherapy in subjects with chronic, treatment-resistant PTSD. One IRB approved the study, then two months later revoked approval after an IRB official who wasn't comfortable with the approval of MDMA psychotherapy research spoke to MCCANN and two other researchers. The other two researchers actually supported the study (one initially and the other after MAPS agreed to add some language to the informed consent form), but MCCANN and RICAURTE refrained from doing so. The IRB refused to review the scientific evidence and made a policy decision to return the fee that MAPS paid

for the review. Five other IRBs refused to even accept the protocol for review. The one that did accept it finally tabled the review, after spending months formally reviewing the study before making it clear (through unreasonable demands) that the committee did not feel comfortable approving it. After diligent and persistent work, MAPS managed to obtain IRB approval in September 2003. (MAPS' interaction with various IRBs is discussed at: [www.maps.org/research/mdma](http://www.maps.org/research/mdma).)

However, the study is still not fully approved. Research can start only after the principal investigator, Dr. MICHAEL MITHOEFER, receives a Schedule I license from the DEA so that he can legally possess and administer the MDMA that will be given to the subjects in the study (each MDMA subject in the MDMA group will receive two oral doses of 125 mg each, three to five weeks apart). MITHOEFER submitted his application to DEA for a Schedule I license over 17 months ago, with a decision from DEA still pending. On October 28, 2003, South Carolina DEA agents and officials from the South Carolina Department of Health and Environmental Control (DHEC) finally inspected MITHOEFER's facility. They examined the DEA-required safe bolted to the concrete floor, the alarm system, and the MDMA tracking procedures, in order to ensure that the 3.5 grams of MDMA will be protected from diversion to non-research uses. On November 12, 2003, MITHOEFER received his Schedule I research registration (R1) from the DHEC. We expect that sometime soon DEA will issue MITHOEFER his Schedule I license so that we can start MDMA psychotherapy research after more than 18 years of struggle. (MDMA was criminalized in 1985 on an emergency basis, justified in part based on RICAURTE's research in rats showing that MDA, a drug related to MDMA, caused reductions in serotonin at some doses.)

The above review isn't meant to build a case that MDMA is harmless, or completely benign. MDMA has its risks, some of which can be fatal, like hyperthermia, a very rare occurrence that results from overheating, most often due to prolonged exercise and inadequate fluid replacement. The effects of heavy Ecstasy use on neurocognitive functioning is still being researched, with some well-designed studies showing that heavy MDMA users perform worse on some neurocognitive tests. Whether this is actually due to MDMA remains to be determined. What the above review is trying to communicate is that the risks of MDMA-related brain damage have been exaggerated, in yet another historical example of science being twisted to suit political ends. The risks that MDMA does present can be mitigated to a large extent by the wise use of harm reduction efforts. Unfortunately, the anti-rave legislation that Congress passed under the false assumption that MDMA caused unusually powerful brain damage after only a few doses perversely empowers police and prosecutors to use harm reduction efforts as a legal weapon against promoters and venue owners.

For almost two decades, MDMA research has been primarily focused on neurotoxicity research into the risks of MDMA, with MDMA psychotherapy research essentially forbidden. Perhaps the tide is turning and the next two decades will see a more balanced focus on research into both the potential risks and benefits of MDMA. Along with balanced research, a variety of social and legal structures may eventually be created that will minimize the potential harms of MDMA and maximize its benefits. If we will it, it need not remain a dream. ☉

# INTRODUCING THE MOKSHA METHOD

by YACHAJ PAYE

*Let us declare nature to be legitimate.  
All plants should be declared legal,  
and all animals for that matter.  
The notion of illegal plants and animals  
is obnoxious and ridiculous.*

*If the words  
"life, liberty, and the pursuit of happiness"  
don't include the right to experiment  
with your own consciousness,  
then the Declaration of Independence  
isn't worth the hemp it was written on.*  
— TERENCE MCKENNA

The availability of the spore syringe as a tool that can be bought and sold and sent through the mail may be in jeopardy in the United States, thanks to the spotlight shown on this item during the recent legal actions taken against the vendor PSYLOCYBE FANATICUS (see side-bar on page 88). While no precedent was set in that case which specifically labels the spore syringe as "paraphernalia" (and hence, illegal by federal standards), it is clear that many vendors of such syringes (as well as easy grow kits geared toward psilocybin-containing mushrooms) have self-censored their businesses and shut down sales in anticipation of a potential crackdown. It has never seemed hard to believe that the spore syringe easily *could* be considered paraphernalia. There are still quite a number of vendors that offer spore syringes, but it is hard to say for how long this will be the case.

If the spore syringe becomes officially restricted, availability of psilocybin-containing mushrooms in the United States may decline, black market prices may increase, and—most seriously—the legal safety of psilonauts could be jeopardized. Therefore, an alternative to the classic Psylocybe Fanaticus Technique (PF TEK), one which can do without ready-made spore syringes, is urgently needed.

Writing from the Netherlands, where I don't need a PF TEK replacement, I am nevertheless happy to present one in this

issue of *The Entheogen Review*. With the following method even newbie cultivators can directly grow their own mushrooms and even isolate the alkaloids by starting with a spore print, which is much more convenient to send by mail in an envelope than a syringe (and cheaper to mail as well). Depending on the context in which they are advertised, spore prints may also be considered "paraphernalia" at some point by United States. (The safest way to offer these prints for sale would be to provide them within a context of many non-psychoactive mushroom spore prints, sold for microscopic identification purposes, without any mention of growing them to produce drug-containing mushrooms.) If the United States did crack down on spore print sales within its own borders, it seems likely that companies in other countries could easily fill the void. If the most draconian laws came to pass worldwide, and the availability of spore prints from foreign markets was also restricted, this new method can be adapted for use with mushrooms collected from the wild. (For example, *Panaeolus subbalteatus* is a good choice for those wishing to collect starting material from the wild.)

As the case was with the original PF TEK, the new method is constructed from several older existing methods. Some of these are actually patented, which means they can not be used for commercial purposes without contacting the original authors. None of the techniques that are presented in this article are original or new inventions. But the combination of such building blocks in one overview, and especially the application of "McALPINE'S Medium" for soft agar cultures, has never published before. While I like to think that I am the first person who proposed that idea, because of the lack (or, depending on how you look at it, the surplus) of people who can call themselves the primary contributors to this collection of existing techniques, my proposal is to call it the "Moksha Method." Moksha was the name of the cultivated visionary mushroom employed in rites of passage by the residents of the fictitious island Pala, in ALDOUS HUXLEY'S 1962 novel *Island*, one of the first Western books which described entheogenic mushroom rituals applied to meditation techniques. The Moksha Method accomplishes:

1. Cultivation of mycelium and mushrooms with ingredients and utensils obtainable from any supermarket.
2. Preparation of *Psilocybe cubensis* fruiting substrate without vermiculite (an essential ingredient in the classic PF TEK).
3. Preparation of cultivation media with no autoclave, pressure canner, or other specialized sterilization equipment.
4. Germination of spores without a glove-box or HEPA flow-hood.
5. Collection of viable spores from wild-collected mushrooms (without the need of making a spore print).
6. Direct isolation of psilocybin from semi-liquid (kombucha tea-like) mycelial cultures, i.e. without the need to grow mushrooms.
7. Complete independence from commercial spore vendors.

With the Moksha Method it is no longer necessary to use the *Psilocybe cubensis* for table top production of psilocybin. You can use any psilocybin-containing mushroom which is collected locally. There is no need to order anything of questionable legality by mail or otherwise. While this article is focused on psilocybin production, this method can also be used for organic table top biosynthesis of other interesting mycelium metabolites. Examples are the blood-pressure-stabilizing and cholesterol-lowering compounds in oyster and shiitake mushrooms, asthma-combating and cardiovascular health-boosting medicinal compounds in *Cordyceps* (caterpillar fungus) and *Hericium* (lion's mane) and flavor-enhancing compounds from morels.

The downsides of the Moksha Method are that it requires more utensils, more work, and a longer incubation time than the classic PF TEK for *Psilocybe cubensis*. Also, the yield measured in weight of biomass or alkaloid production per jar is much lower compared to the performance of PF Substrate jars. As well, "backpack cultivation" (an attractive option of the "Hippie" variation on the PF TEK), is not possible (yet?). The Moksha Method is *not* an advancement in psilocybian microculture; when good spore syringes are available, they are a better route to use. But if the availability of spore syringes becomes scant, I hope this article helps in boosting access to quality entheogens (and perhaps induces lower prices for fungal medicines in general). The goal of this text

is to show how individual mycophiles, patients, and psychonauts can be self-sufficient—independent of any market and protected (as much as possible) against the legal risks of being a psilonaut in a country with a repressive regime. But please remember that this article is not an inducement to break laws! I write this from the Netherlands where the cultivation of psilocybin-containing mushrooms is legal. It is your responsibility to stay on the right side of the law in your country, whatever that may be.

### STEP 1-A:

*Preparation of one jar of solid agar for spore germination.*

Fill a 100–250 ml clear glass screw-cap jar with half a teaspoon of powdered brown rice (or some other grain such as flour), half a teaspoon of powdered agar agar (a vegetarian and heat-resistant alternative to gelatin, sold in most health food stores), and a tablespoon of water. Screw on the lid, boil the jar for 30 minutes in a pot filled with water, take the jar out of the water, open the lid and add a few drops of 3% hydrogen peroxide. (The details about this "MCALPINE'S Medium," and the uses of hydrogen peroxide are discussed in my article "Mushroom Cultivation: From Falconer to Fanaticus and Beyond" in the Winter Solstice 2001 issue of *The Entheogen Review*). Swirl the contents around so the hydrogen peroxide is distributed evenly throughout the medium. Swirl again when the agar is solidifying so a thin film of agar clings about half-way up the vertical sides of the jar. Close the lid and store the jar—it should be good for many months.

### STEP 1-B:

*Preparation of many jars of solid agar for spore germination.*

Spore germination is not a totally foolproof step. Contamination is common. Rather than making a single jar, as described above, many will find it to be more useful to create a dozen or more germination jars at once. Here is a recipe for my favorite nutrient agar—selected for a luxuriant mycelium growth—which I call "redgar."

Fill a dozen or so 100–250 ml clear glass screw-cap jars with boiling water. Put the lids on and set the jars upside down. Then turn them straight up again after a minute or so. This is to kill any micro-organisms that may be present in them. Fill a small pot with:

- 1) 500 ml cold tap water.

# EROWID.ORG

## Documenting the Complex Relationship Between Humans and Psychoactives

Erowid.org is a free, publicly available, online library containing more than 23,000 pages of information about psychoactive plants and chemicals, and their use, study, and place in our culture.

### VISIONARY ART VAULTS

[www.erowid.org/art/](http://www.erowid.org/art/)

One of the largest existing collections of online visionary art, with nearly 1,000 pieces of art from more than 280 artists. Includes the well-known and the obscure.

### CHARACTER VAULTS

[www.erowid.org/characters/](http://www.erowid.org/characters/)

A newly updated collection of information about more than 80 individuals important to the psychedelic subculture and the science of consciousness. Includes short descriptions, photos, links and bibliographies.

### REFERENCE VAULTS

[www.erowid.org/references/](http://www.erowid.org/references/)

A growing collection of scientific and medical references relevant to the study of psychoactives. Nearly 6,000 entries.

- 2) One tablespoon (= 20 grams) of maltose (malt sugar, used in beer brewing).
- 3) 1 gram British Marmite yeast extract. (This is optional for spore germination, but the mycelium looks much healthier when Marmite is present in the medium. Note that there are several different brands of Marmite. Only the British original is a mixture of yeast and vegetable extracts without added sugar. This is the one I prefer to use in all my experiments.)
- 4) One tablespoon (= 7.5 grams) of powdered agar agar.

Heat the ingredients until the water begins to boil, stir during heating. Take the pan off the heat source, then add 5 ml of 3% hydrogen peroxide and 1 ml of red food dye, and stir again. (The food dye is optional, but the reason for it will be discussed later on.)

Empty water from the jars and fill each of them with a 15–25 ml layer of the liquid “redgar” that you have produced following the instructions above. A turkey baster, balloon pipette, or syringe is useful during this process, to prevent spoilage for the transfer of the liquid medium from the milk-pan to the jars. Do this all in a “still air” environment (closed windows and doors), which is as dust-, kid-, pet- and smoke-free as possible. Wipe the floor and table top before hand, wear short sleeves, and wash your hands first.

Allow the jars to cool down well, while creating a vertical film of nutrient by swirling, as described in Step 1-A.

The red food dye has four functions. First, it is added as the last ingredient. Therefore you can always be sure that red media are peroxide protected; this prevents mistakes. Second, when the medium is evenly the same color of red, the peroxide is also mixed well. Third, this allows me to refer to the complete recipe above as “redgar.” The fourth and most important function of the food dye is that it is eaten by the mycelium: regions that become depleted of nutrients (and peroxide) will turn yellow.

## STEP 2:

*Collection and germination of a culture starter.*

Most cultivation manuals describe how to make a spore print from a mushroom. However, in order to collect spores, the mushroom caps need to be harvested at the time during

spore release. A useful alternative is to harvest a mature gilled cap (or at least a part of a gill), which contains mature spores. Dry it at room temperature. With a pair of flame-sterilized tweezers, you can cut a tiny part from a gill and stick it onto the vertical agar film of the inside of a redgar jar. Use one gill piece per jar. Screw on the jar lid.

You can monitor the germination process by looking at the side of the jars. At normal room temperature, any sign of growth visible with the naked eye within 100 hours is a bad sign. The same is true for any growth that is not white, or if a slimy residue begins to leak from the gill. White cottony fuzz growing from the gill piece up (in the direction of the lid of the jar) is a good sign. After a few days, when a lot of white fuzz is growing on the vertical agar film, it is advisable to cut a bit of "fuzz" off, using a flame-sterilized pair of tweezers (or a needle or a knife), and place it in the middle of the horizontal layer of solid agar in a fresh 250 ml jar. After three or four weeks of growth the layer should be completely colonized with white mycelium. Instead of a solid agar jar, the bit of white mycelium can also be placed in the middle of a jar of sterile grains (as described in the Winter Solstice 2001 issue of *The Entheogen Review* on page 130). It is advisable to

have at least two dozen perfectly white colonized culture jars before proceeding to the next step.

### STEP 3-A

*The small-scale preparation of five soft redgar cultures.*

This step is similar to Step 1-B. The only difference is the lower amount of agar. For 500 ml of nutrient, use 1 gram of agar, which is equal to 2 ml of agar powder when it is loaded into the back of a syringe with the plunger removed (measurement of agar powder by volume is often easier than by weight). Also different is the amount of liquid. Add 100 ml per 250 ml jar. Inoculate as described under step 3-B.

### STEP 3-B:

*Large-scale preparation of the soft redgar cultures.*

For optimum results, make sure that you have 250 jars ready of 250 ml each. These do not need to be screw cap jars (and plastic is also okay, rather than glass), but they must be clean. It is best to use new jars for this purpose. Transparent lids are ideal. Large boxes of plastic jars can be obtained cheaply from companies that sell packaging materials.

## • • • PSYCHEDELIC RESOURCE LIST • • •

Massively Expanded and Updated Fourth Edition!

New Art Chapter! • New Cannabis Seed Chapter! • Many New Botanical Suppliers!

Provides Sources For:

INFO: Books, periodicals, web pages.

GATHERINGS: Festivals, conferences, seminars.

PEYOTE: Seeds, live plants, and other psychoactive cacti.

ORGANIZATIONS: Religious, non-profit, and professional groups.

PSILOCYBES: Spore prints, syringes, dried mushrooms, grow supplies.

TABERNANTHE IBOGA: Seeds, roots, full-spectrum extracts, and ibogaine.

GARDENING SUPPLIES: Hydroponics, lights, timers, nutrients, predator insects.

RESEARCH CHEMICALS: Tryptamines, phenethylamines, GHB analogs, & more.

SMART DRUGS & OTHER PHARMACEUTICALS: Overseas medication suppliers.

CANNABIS: Viable seeds for countless strains and suppliers of dried herb.

SALVIA DIVINORUM: Plants, leaves, seeds, extracts, and salvinorin A.

PARAPHERNALIA: Vaporizers, pipes, and sundry smoking supplies.

LAB SUPPLIES: Glassware, solvents, chemical sources, etc.

AYAHUASCA: Traditional and analog dried herbs.

OPIUM POPPIES: seeds and dried pods.

AND MUCH MORE!

 — [www.entheogenreview.com](http://www.entheogenreview.com) —

Place a 125-gram jar of British Marmite yeast/vegetable extract in a large soup pan (25 liters or more). Remove the lid from the Marmite jar. Add enough water to cover the jar, bring it to a boil and wait until all the Marmite is dissolved. Remove the Marmite jar. Add a few more liters of water to the pan and fifty grams of agar agar powder. While stirring, bring the water to a boil and slowly add one kilogram of malt sugar and more water. In the end, the pan should contain twenty-five liters of liquid nutrients. Take the pan away from the heat as soon as the content begins to boil to prevent the malt sugar from caramelizing.

Have your jars ready. Fill one 250 ml jar with 3% hydrogen peroxide. Empty it into the pan of nutrients. Add about 50 ml of food dye. Mix the ingredients until the entire "soup" is evenly colored. Using a turkey baster or a large syringe, fill every jar with 100 ml of hot nutrient. Allow the jars to cool down, without the lids (!), in a clean "still air" environment. After an hour or so the liquid is solid and cool enough to be inoculated. By using a pair of flamed tweezers or a sterile scalpel, transfer a tiny fragment of white colonized solid agar (or a colonized grain kernel) to the middle of each soft redgar jar. The transferred pieces should not be wet, nor should they sink. Loosely replace the lid. Transparent lids are very handy at this point because they enable monitoring of the colonization process. Discard every culture which becomes slimy and replace it with a new one. Psilocybian cultures are generally more potent at lower temperatures, but the colonization time takes longer at lower temperatures.

## NATURE'S MIND

[www.natures-mind.com](http://www.natures-mind.com)

Supplier of strange, sacred, and rare botanical products  
SUCH AS

*Amanita muscaria*, *Anadenanthera peregrina*, *Argyreia nervosa*, *Dioscorea dregeana*, *Mucuna pruriens*, *Salvia divinorum*, *Sceletium tortuosum*, *Trichocereus peruvianus*, *Virola theiodora*, and many other exotic seeds, herbs, and extracts. We also carry ceremonial incense, shamanic tools and artifacts, books, and more.

CHECK OUT OUR WEB SITE FOR A COMPLETE LISTING.

We've got entheogens for the whole family!

### STEP 4:

*Harvesting and beyond.*

As soon as the surfaces of the cultures are covered with fungus, the mycelial mats can be lifted from the medium. With some species—such as *Psilocybe mexicana*, *P. semilanceata* and *P. tampanensis*—you can wait until the mycelium forms sclerotia. Others, like the "PF Stropharia" variety of *P. cubensis*, may even form mushrooms. Harvest those mycelia when the sclerotia begin to blue or when the mushrooms are just opening their caps. To stop post-harvest blueing (oxidation) of alkaloids, the mycelia can be washed in a solution of vitamin C and water, as I described in my article "Cookbooks and *Cubensis*" in the Vernal Equinox 2002 issue of *The Entheogen Review*. Mycelia can be converted into psilopunch juice with the methods described in that article for mushrooms.

*Psilocybe cubensis* var. PF Stropharia fruiting in a 250 ml jar containing 100 ml of redgar

### EXAMPLE

On October 25, 2001 a 250 ml jar, containing 100 ml of soft redgar (4 grams of maltose, 500 mg of British Marmite, 200 mg of agar, and 0.2 ml of red food dye) was inoculated with a piece of mycelium of *Psilocybe cubensis* var. PF Stropharia. The jar was kept at a temperature that alternated between 15° and 20° centigrade. On December 12th, 28 grams of fresh

Redgar harvest of one ounce (28 grams) of fresh *Psilocybe cubensis* var. PF Stropharia mycelium + mushrooms.

mycelium plus mushrooms (see photo) were harvested. After blowing the culture with a table fan for 48 hours, 2.2 grams of dried fungus was obtained. A staggering 49% of the dry weight of the nutrients was converted into dry fungus.

## EXTRACTING PURE ALKALOID

If using denatured solvents for extractions, one should first evaporate a few drops on a clear glass plate and then check this for residue by holding it over both a white and a black background. If any residue remains, one should choose a different solvent.

One hundred grams of dry *Psilocybe cubensis* was put in a kitchen blender, powdered and spooned into a quart jar. 635 ml 140 proof ethanol (acetone-denatured 70% ethyl alcohol) was added. (In the Netherlands, alcohol is available denatured with acetone, and cheaper when purchased this way. Regular 140 proof drinking alcohol can probably also be used. In the United States, one could try using EverClear grain alcohol of 190 proof, and add about 25% water to it. Some other denatured alcohols—such as those containing methanol or isopropyl alcohol—might also work, by watering them down to 70%, and this would be less expensive. When considering issues of “proof,” keep in mind that this is not standardized between England and America; 100 proof under the British system is 114.2 proof under the American system.) The quart jar was placed in the refrigerator at 4° centigrade for 24 hours. The contents were poured through and then scooped into a white T-shirt, which was squeezed. 290

ml of greenish liquid was collected into a measuring cylinder. The cylinder was placed in the refrigerator and the fine mushroom dust was allowed to settle. This process was repeated a second time, the liquids drawn up with a pipette (leaving the mushroom dust on the bottom of the cylinder). The liquids were combined and poured into a tall bottle, which was placed in the freezer. A thick layer of fine white dust formed on the bottom of the bottle in 24 hours. The liquid was removed with a pipette. The white dust quickly became bluish-green upon contact with ambient air. Conclusion: this cold extraction and precipitation method may be the simplest isolation technique for psilocybin powder that has ever been published. But why bother? The mycelium can be used “as is.”

## MOKSHA / PF TEK CONNECTION

One kilogram of malt sugar and 125 grams of Marmite can be converted into half a kilogram of mycelial powder, which should contain about one gram of psilocybin. But despite this superb conversion ratio—almost three times that of the “Hippie” variation of the PF TEK—the harvest in biomass per half-pint jar was merely one third of what the PF TEK provides. And as said, the alkaloid harvest of the Moksha Method per half-pint jar may even be only one sixth of that obtained using the straight PF TEK.

This weakness can be doctored however. The Moksha Method can be used to prepare liquid inoculants for PF Substrate jars. Just pour 50 ml of a freshly prepared 0.06% concentration of hydrogen peroxide in non-chlorinated tap water (or bottled water, if your non-chlorinated tap water is not available) into a colonized solid agar jar, close the lid, shake vigorously for 60 seconds, and add another 50 ml of tap water without hydrogen peroxide. Then draw up the contents with a syringe or pipette (through a pinhole in the lid) and inoculate a series of PF Substrate jars with it. Perhaps this can even be done with a turkey baster. Colonized PF Substrate jars can be multiplied by using “COUNTZERO’s” method, which I reproduced in Winter Solstice 2001 issue of *The Entheogen Review*. It is also possible to inoculate new redgar cultures with a piece of a colonized PF Substrate cake—mushroom or sclerotium. When doing so it is unadvisable to take a shortcut and directly place a piece of cake on a soft agar surface. Always put a tiny fragment of the to-be-cloned fungus on a vertical film of solid agar first and check for fast growing non-white mycelium (which indicates a mold infection) or slime that drops down from the fragment to the solid agar layer on the bottom of the jar (which

indicates a bacterial or yeast infection). Only the desired mycelium is pure white, never slimy and slow-growing from the fragment up towards the lid of the jar.

### INCREASING THE YIELD

It is known that mushrooms are clearly more potent than mycelia. For example, the mushrooms from *Psilocybe semilanceata* (the liberty cap) usually contains about 1% psilocybin (1 dried gram = 10 mg alkaloid) on average, with the mycelium of this mushroom containing about 2.5 mg of alkaloid per dried gram. Still, there may be a way to increase one's yield of psilocybin when using the approach of growing mycelium.

Published in August of 2003, ARNO ADELAARS' German book *Alles über Psilos: Handbuch der Zauberpilze* included a chapter titled "Psilocybin-Pilzkultur ganzjährig zu Hause." Written pseudonymously by F. SPITZKEGULUS and B. PARAMYCELIUS, these researchers used 60 grams of malt sugar per litre and found that mycelium from *Panaeolus cyanescens* (also known as *Copelandia* and "blue meanie") and mycelium from *Psilocybe azurescens* (the "flying saucer mushroom") were both more potent than mycelium from *P. cubensis*. Mycelia from *P. cyanescens* and *P. azurescens* contained about 5 mg of alkaloid per dried gram, whereas mycelia from *P. cubensis* contained about 2.5 mg of alkaloid per dried gram. In the end, the best way to generate more psilocybin when growing mycelium may be to switch from *P. cubensis* to one of the more potent species. ☉

## PSYLOCYBE FANATICUS BUST RESOLUTION

The bust of Robert McPherson a.k.a. Professor Fanaticus, the owner of the company *Psilocybe Fanaticus* and inventor of the "PF TEK" for cultivating psilocybin-containing mushrooms, has been resolved. In 1991, McPherson's company was the first to promote the use of the "spore syringe," which made cultivation much easier in a non-sterile environment. As such, it caught on like wildfire.

McPherson and other defendants were arrested in February of 2003 on several charges, including the conspiracy to distribute a controlled substance. On October 31, 2003, McPherson was sentenced to six months of home detention, three years of felony probation, and some forfeitures, based on a plea agreement (which allowed the conspiracy charges to be dropped).

One of the most disturbing bits of data revealed was the fact that McPherson had been told by a U.S. postal employee that "Seattle Narcotics officers [had] presented him with a warrant" for McPherson's POB details, only two months after he started up his business. (A "mail cover" operation, collecting the names and addresses of all of those who ordered from him could have been in place for the past twelve years, and McPherson knew that his POB was being watched!)

Another bit of interesting data was that McPherson blamed his misunderstanding of the laws involved on what he stated was incorrect information presented in the book *Sacred Mushrooms and the Law* by attorney Richard Glen Boire.

More details about the case and the plea agreement can be found on-line at [www.fanaticus.com](http://www.fanaticus.com). Because of the plea, no precedent was set with regard to spore syringes being specifically determined to be paraphernalia. Similarly, the threat to declare mere instructions on how to grow mushrooms as being paraphernalia, which was suggested as a possible outcome, has also been avoided for the time being. Overall, the outcome in this case was fairly positive, considering the prison time that McPherson might have been facing, and the implications that could have occurred for the scene in general.

## BACK FROM THE VOID

by ZOE SEVEN

---

*The following text is excerpted from the forthcoming book Back from the Void: A Modern-Day Shaman's Odyssey Continues by ZOE SEVEN, available in 2004. See [www.zoe7.com](http://www.zoe7.com) for more information.*

It's about 2:00 am, and I hear the sound of wailing sirens as I'm waiting in the emergency room for a nurse to tend to me. I sit there terrified as the walls continue to dissolve and the people around me shape-shift into horrible-looking monsters. Apparently, I have finally done some serious damage to my brain with my experiments, as I cannot seem to hold a coherent thought pattern in my mind for more than a few seconds. My brain feels as though it has been cooked, and I keep forgetting what it is I am thinking about in mid-thought. Likewise, I am experiencing Tourette's Syndrome-like symptoms, as I cannot seem to stop making these weird mouth/throat/respiration noises or keep myself from suddenly speaking my thoughts out loud, cursing and all. Fucking weird. On top of that I cannot stop from repeatedly crossing my legs, standing up, and sitting down. I'm experiencing extreme bodily discomfort, and all of these feelings make me want to jump out of my skin.

Delusional thoughts that border on insanity stream through my consciousness as my plight with discomfort continues. One of these thoughts is that the "Keepers of Reality" are coming to escort me out of physicality, as I've broken certain laws dealing with the secrets of existence (related to life and death), having seen "things I wasn't supposed to" while doing my experiments as depicted in *Into The Void*. Apparently, through my experiments, I'd ripped apart the fabric of reality—or at least my reality—having learned too much about the mechanics of space-time and creation. Therefore, I needed to be removed from the three-dimensional framework. And the Keepers of Reality would arrive at any moment to take me away.

It was the year 2000, and I had ordered through the Internet what are sometimes referred to as "research chemicals." I got some 2C-T-7 and some 5-MeO-DIPT (both of which are now Schedule I compounds, but back then they were not specifically scheduled). During this time, I had recently finished writing my book *Into The Void*. One thousand books had

just arrived from the printer, and my small apartment's living room/home office was filled with boxes. With my first book completed and printed, I thought I'd get a head start on another series of experiments that I figured would go into the second book of my trilogy.

At the time, I unfortunately did not have a scale that weighed in milligrams, only one that weighed in grams. Not wanting to be derailed from my curiosity, I decided to "eyeball" 10–15 milligrams of 5-MeO-DIPT so that I could try this new compound. But what actually happened—when I later retraced where I had gone wrong—is that I ended up ingesting about 80 milligrams of the compound; and the average dose should be more like 6–10 milligrams. I had initially ingested about half of the 80 milligrams, not realizing that I had "measured" way too much. I waited an hour to notice the effects, but felt nothing. Another half an hour went by, and since I was clearly not feeling *any* effects, I ingested a second dose. Unfortunately about five minutes after having taken the second dose, I began to feel the effects of the first one coming on strong.

At first, the effects of the 5-MeO-DIPT felt rather pleasant, similar to the effects of MDMA (a.k.a. "Ecstasy"), but without the "heart opening" psychological aspect; only the physical and tactile sensations were present. However, it very much felt as though I was getting higher and higher as the intensity of the effects kept climbing and my senses became more acute, especially my sense of touch, my hearing, and my vision. What's more, I felt as though I was vibrating full of energy. It was as though I was being electrified.

Since I knew it would be a few hours before the effects subsided, I decided to try and keep my mind off the experience and involve my attention with something else. Hey, I had experienced bad trips before and I thought this was simply another one I'd have to ride out. "No problem, Z," I thought to myself, "Just keep cool." Since I was feeling quite restless, I decided to watch some TV to help ease my nerves. Again, I did not want to freak out, although I was beginning to—and in a big way. So I flicked on the tube, but as soon as I settled on a program, the news commentator started to morph into a grotesque-looking Mr. HYDE kind of character. Which in

my state of mind freaked me out even more than I was already. So I shut off the TV. I then tried to listen to some thumping, upbeat music—Rock 'n' Roll—as opposed to the expansive ambient acoustic landscapes that I usually use in my experiments. I was beginning to hallucinate big time, and I was hoping that such music would help ground my senses in physicality.

*...Swallowing colors of the sound I hear.  
Am I just a crazy guy? (You bet.)  
Mama's gonna' worry, I been a bad, bad boy.  
No use sayin' sorry,  
it's something that I enjoy...  
Flying high again..."*

But after listening to a few bars of OZZY OSBOURNE, I felt worse, so I shut that off as well. I didn't know what to do. By this time I was feeling really messed up and scared. My face was pale white, my mouth was dry, my heart was beating really fast, my pupils dilated, my pulse was raising, my adrenaline was spiking, and my stomach felt as though it had been kicked in. On top of that I was feeling extreme anxiety, restlessness, and worst of all *fear*, even terror. I felt like an animal that was cornered and knows it is about to be killed.

Apparently, because of the overdose, I had overwhelmed my reticular activating system, because everything I saw caused an intense emotion of fear, panic, and terror. I guess I had inadvertently tapped into the "horror mode" that seems to exist as a "program" in our minds. To give you a sense of this, even glancing at my wristwatch was a scary experience. It was as though my brain's processor had gone out of whack. Vomiting, I reasoned, would help my body get rid of the drug. I tried to make myself vomit, by showing fingers down my throat, but I could only manage dry heaving. You see, I had fasted for about eight hours before the experiment. My muscles were contracting so much that it was as though I was crunching my fists (which I wasn't): all my veins were clearly visible, especially those in my arms and forehead. The top of my head felt like it was frying—like on those old anti-drug television commercials: "This is your brain on drugs." Shit, they weren't kidding in my case! What's more, I simply couldn't calm down. At that point the only thing I could think of doing was jumping in the shower to see if the intense pressure I was feeling all over my body and heat on the inside of my head would somehow subside. But after a few minutes under the running water, it actually got worse. I kept going "higher" and "higher," with no sense that this "climbing" would stop anytime soon. And there was this "knowing" deep

inside me that if I didn't get to a hospital soon, I would suffer brain damage, hemorrhaging, or worse.

However, I had a small problem. I did not want to call an ambulance. Because I'd overdosed on a "drug," I knew they would send the cops (at least this was the case in Florida, where I lived at the time). You see, I was feeling very paranoid because of what I was involved in. I had just finished writing a book about almost every major entheogen available (although the described experiments with specifically *controlled* substances were all fictional, of course). And my living room was full of boxes that I was sure the cops would want to check, which were full of my books on "drugs." So I scratched the idea of calling an ambulance.

I thought of driving myself to the hospital, as luckily I lived no more than a few blocks away from a major one. But I had another small problem. My car had no brakes; talk about bad timing. I sure as hell couldn't walk myself there, because it felt like at any minute my head would explode like in that movie *Scanners*. I was in bad shape.

After debating with myself for a few moments, I decided to make a go for it. I hopped into my car and drove myself to the hospital v-e-r-y s-l-o-w-l-y. Luckily I made it there without incident, and parked my car right outside of the emergency room. As noted at the start of this tale, it was around 2:00 am. But even so, when I went inside the emergency room lobby there were about twenty-five people waiting for their turn. I knew that I couldn't wait that long for my turn; I needed help quick. What's more, I felt like screaming at the top of my lungs, as I was completely losing it psychologically. The only thing that kept me from doing so was the realization that if I did scream, I'd never stop, and I would end up in the padded cell of some psychiatric hospital. I swear it felt as though I was one step away from total insanity. Then, I had another shock.

The person in the emergency room lobby taking down the names of the people arriving at the ER was a cop! I am not kidding. You can imagine what this did for my already messed up and paranoid state of mind. The visual distortions and delusional thinking continued to increase and were simply too much for me to take at moments. Everyone in the emergency room looked increasingly like bizarre cartoon people—mere caricatures of humans. To give you an idea of what the imagery was like, think of the distorting mirrors in a fun house—those that make one's legs look really long and upper torso really short. Or, the ones that make one's head

elongated and the entire body like that of a midget. That's what the people in the lobby, including the cop, looked like to me. In addition, it seemed as though everyone was just staring and laughing at me with these seemingly malevolent grins on their faces.

I told the cop that I had overdosed on a chemical that I had bought over the Internet and that I needed to see a brain surgeon quick, to discuss what I had done to my neuro-receptors. He saw that I was freaking out, but he remained v-e-r-y c-a-l-m, while asking me for my full name and telling me to take a seat and wait for my turn. I explained to him that he did not understand the gravity of my situation, that I was perhaps poisoned and that the reason I had come to the emergency room was because it was a FUCKING EMERGENCY! This couldn't wait! I felt like I was going to die. He took a long stare at me, frowned, and told me to sit down in a small area right behind him and wait while he called a nurse. I had brought with me the pages from Alexander and Ann Shulgin's book, *TIHKAL*, where the chemistry and effects of 5-MeO-DIPT are described, to show the doctor. I was sure he'd know what to do then. But as the minutes passed, there was no sign of a nurse. By this time I was *determined* to see someone about what was happening to me. Since I had consumed a lot of liquid before getting there, my stomach was full and I figured that if I vomited on the floor, then for *sure* they'd send someone over to take a look at me. I did, and two nurses came over immediately. I told them what had happened and they asked to see the pages from *TIHKAL*, grabbed a phone from where the cop was sitting, and called

poison control. "Finally," I thought to myself. But to my horror (or rather to my *added* horror), the people at poison control had never heard of 5-MeO-DIPT. They had no idea what the nurse was talking about, and they suggested that I drink charcoal, so that it could absorb whatever might be left in my stomach. I told them that what I *needed* was to see a neurologist and have a brain scan taken to ascertain the extent of my neurological damage, given the fact that I knew my brain was not functioning correctly and even felt like something warm had spilled over "in there."

An orderly came, put me in a wheelchair and took me inside the ER. There they gave me a gown to put on, and hooked an IV into me. Then they wired me up to an EKG and other medical equipment that monitored various body functions and brought over this pitch-black liquid for me to drink. But as soon as the liquefied charcoal came within a few inches from my mouth and nose, I wanted to vomit again. And I did. So the nurse said they'd have to shove these plastic tubes up my nose, through my throat and into my stomach so that the charcoal could reach my stomach walls and intestines and start absorbing the compound. Accepting my fate, I closed my eyes and the procedure began. As the thin, cold, tubes entered through my nostrils and slowly made their way down to my stomach, I could feel the ends of them scraping the inner walls of my throat. Trying to deal with the discomfort as best as I could, I shut my eyes even harder and began to question inwardly what was it that had happened to me in my life that led me to do the things I do. ☉

The Botanical Preservation Corps lives!  
The original ethnobotanical supply house,  
now under new management.

Wholesale list available on request.

#### **BULK HERBS & EXOTIC BOTANICALS**

The finest quality organically grown and wildcrafted exotic herbs:  
aphrodisiacs, immunotonics, sedatives, stimulants, medicinal inebriants,  
and more...

#### **AUDIO TAPES**

Many years of recordings from our famous BPC field seminars and conferences  
on the ethnobotany and chemistry of plants.

Highly informative and entertaining, speakers include:  
Jonathan Ott, Terence McKenna, Richard Evans Schultes, Alexander T. Shulgin,  
Ralph Metzner, Christian Rätsch, Dale Pendell, and many others.

New recordings coming soon!

#### **BOOKS**

The best new titles and hard to find books concerning  
ethnobotany, shamanic herbalism, and plant conservation.  
We stock all of Jonathan Ott's in-print titles, including signed collector's editions.

Visit our web site for our complete catalog, or send \$2.00 to:

**BPC, Box 1368 (Dept. ER), Sebastopol, CA 95473**

# KRATOM: THAILAND'S SECRET OF THE SOUTH

by STAN ADAMS

I'm in Southern Thailand again, Nakhonsitamarat Province. I'm visiting Thai friends from my student days at Berkeley—a wealthy young man and woman who are slowly inheriting the family fishing business, which they control vertically in the area from start to finish. This includes a fleet of 20-plus teak fishing vessels, an ice factory from which they fill the boats' hulls with ice, an off-loading and sorting station with refrigerated warehouses, and a fishmeal factory that turns whatever is leftover into pure pulverized fish protein to be sold to factories that make chicken feed.

Nakhonsitamarat is Thailand's notorious "gangster" province, which is known for its corruption and big crime families. This notion is reinforced by my Thai friends and family members elsewhere in the country, who always pantomime quick-draws and gunfights when I mention that I will be spending a few days there. And indeed the friends I am visiting hail from these same organized crime families.

When we were younger and more foolish we wouldn't go out at night without being armed and without the accompaniment of a bodyguard—somebody who would walk into the men's room ahead of us and kick the stall doors open one at a time to flush out any potential assassins. These days, all my friend is interested in is fish, and I am interested in *kratom*.

I arrived in the morning by plane. A massive terminal and runway were built for the single flight in from Bangkok and out again, daily each morning. I'm met at the terminal by SOMCHAI who is glad to see me. We drive in air-conditioned comfort to his riverside home and relax—sort of.

When SOMCHAI married SONG, SOMCHAI's father gave them a beautiful house opposite his own on the river as a wedding gift. The house would be perfect—worthy of an *Architectural Digest* spread—if it weren't surrounded on two sides by the ice factory.

The ice factory is in a massive hanger that towers over their home from behind. The constant hum of the coolant compressors create the primary base sound of the unbearably loud noises the factory is capable of.

One thousand blocks of ice—two meters long, about a half meter high, and a third meter deep—freeze under wooden covers in a grid beneath the factory floor. The fishing boats pull up alongside the house, just like pulling a car into a service station. These are large boats, all 60 feet long or more, with big wide bellies for hulls to store a month's worth of fish.

When the boats pull up, the ice workers fire up a phenomenally noisy hydraulic system that lifts ten blocks of ice from the floor in their molds and carries them to the "launch pad," where they are doused in a shower of warm river water and released from their molds. The workers pull the blocks with hand-held hooks and launch them towards a conveyor belt that carries them to a giant ice crusher (imagine a blender that could turn a two-meter block of ice into crushed ice in a matter of seconds). The noise is now blinding. The final step is a second conveyor—this one a long screw—that carries the crushed ice to the boat where it is directed by the deck hands into the hull.

But what interests me more than the fascinating creation and destruction of ice is what is lying on the table that the ice workers sit at to rest and chat between boats: a towering pile of *kratom* leaves, the menial laborer's friend.

*Kratom* has existed in Southeast Asia, primarily Southern Thailand, neighboring Myanmar (formerly Burma), Malaysia, and elsewhere for as long as there have been written records of life in the region.

Used medicinally, *kratom* can paradoxically be both a stimulant and a sedative. It treats motion sickness and sea sickness, and is used to flush the body of toxins. It can also be effective against diarrhea. It has a history of traditional use to combat addiction to opium, and later addiction to tobacco (and in the 20<sup>th</sup> century, addiction to cocaine, heroin, and most recently methamphetamine—the infamous Thai yaa baa or "crazy medicine").

It is also mildly addictive in and of itself, and can be found on work sites throughout Southern Thailand wherever menial labor is taking place. Workers chew *kratom* much as

workers in Peru and elsewhere in South America might chew *coca* leaves. *Kratom*-chewing workers describe “getting into a groove” with the substance—a mental and physical “place” where they focus only on the task at hand and it is neither boring nor exciting, it simply is. By chewing *kratom* the workers can withstand, without complaint, hour upon hour of backbreaking labor.

We scurry across the ice ramp, dodging the massive blocks, and I settle into the guest room of SOMCHAI’s house. There is a message from SONG waiting for him there: he is needed elsewhere for the next few hours. I tell him not to worry about me and he takes off in his truck. A few minutes later, between boats needing ice, I join the workers at their break-table and start chewing *kratom*.

The first time I tried *kratom* was at this same table, ten years earlier. It was then I learned that you separate the leaf “flesh” from its spine and chew the flesh as long as possible, swallowing everything. A sure sign of some serious *kratom* chewing is a scattering of jagged leaf spines underneath an outdoor table.

The leaves are slightly bitter but not unpleasant, and one doesn’t begin to notice anything at all until the third or fourth leaf, when a sense of energetic euphoria emerges. It’s a terrific feeling and one instantly understands the plant’s popularity amongst the working class.

Now the leaf’s peculiar property of being both a stimulant and a sedative emerges, and with a great deal of practice and skill Thai workers slow their consumption to the point where it continues to stimulate without tiring them. A carefully planned periodic chew after reaching this stimulant state is what is required to keep them “up.” Before I understood this, I blissfully chewed through leaves five, six, and seven, only to find myself almost narcotically sedated, complete with a nodding head and quick journeys in and out of dream-state. Time seemed to pass differently and my mind began to wander. At times this narcotic bliss has overcome me and I have fallen asleep. Fortunately upon waking, usually a short time later, I have found myself refreshed and not “groggy.” It should be noted that it is not safe to drive while experimenting with *kratom*, as the sedative state can sneak up on you and can be quite powerful.

By now, however, I am an experienced *kratom* chewer and I join the ice factory workers for a nice chew, pacing myself properly so as to maintain the energetic euphoria.

Soon the work day has passed and it begins to get dark. SOMCHAI, having completed his tasks elsewhere, returns home. He has a message for me—there is a problem at the embassy that will require me to cut my visit short and return to Bangkok in the morning.

As dusk settles in, we walk together to the town plaza where at night fresh food is served from carts and several dozen card tables are set up with folding chairs. We find some of SOMCHAI’s friends and join them for some noodle soup and the Nakhonsitamarat specialty of iced coffee chased with weak Chinese tea.

Here is where one can see aristocratic use of *kratom*. While SOMCHAI wouldn’t be caught dead sitting with his workers chewing *kratom*, somebody from his group of friends has brought a bagful and we all chew several leaves with our coffee and cigarettes.

The morning flight to Bangkok is early so we bid our friends good-bye and return to SOMCHAI’s for an early sleep and an early awakening the next morning.

Since *kratom* is hard to find in Bangkok and places north, we stop at the morning market for me to stock up before flying away from the South.

*Kratom* was made illegal in Thailand in 1943 under Field Marshall PIBUL and his occupying Japanese puppet government. By law all *kratom* trees were to have been cut down, and penalties for using, possessing or distributing *kratom* can be quite harsh. These laws seem to be upheld in Bangkok and the Central and Northern parts of the country but here in the South at the morning market *kratom* is sold openly by old women who wrap 20 leaves together with string and sit with piles of these little bundles, selling them for 6 baht each (about 15¢).

In the car on the way to the airport SOMCHAI and I relive some memories of our Berkeley days while I quickly chew enough *kratom* to get me buzzed for the flight, before I hide my bundles of leaves deep in my bag.

Nakhonsitamarat Airport is such that you have to walk out onto the tarmac and climb stairs to board the plane. SOMCHAI waits, smoking a cigarette, and smiles at me when I turn to wave good-bye at the top of the stairs. I look forward to seeing him again. ☉

# 4C-DOB NEWLY DISCOVERED AS PSYCHOACTIVE

by HARMALIST

*Butanamines are generally not considered to be visionary. However, one of my fellow testing bunnies found out that things are not always as one might think...*

At 11:00 pm on November 1, 2003, 80 mg of white crystals of 1-(4-bromo-2,5-dimethoxyphenyl)-2-butanamine (4C-DOB) were easily dissolved in a glass of water. The taste was bitter. My body weight is  $\pm 75$  kg. There was an alert after 15 minutes: a tingling in the extremities of my toes and fingers.

Over the next 30 minutes, more effects started to manifest. A discordance between my mind and speech occurred. Although I had phrases in my mind ready to be verbalized, it became difficult to say these phrases. Gradually, the formation of phrases in my *mind* became difficult as well, making it hard to express myself. I kept my sentences short. It wasn't that my mind felt lazy; it was more unable to focus on verbal activity. There was also some body tension. At the beginning of the alert, my lower legs and my head began to feel heavy. Increasingly, a certain body tension was noticeable, which was most expressed in the region of the popliteal space and the maxillary joints. The tension actually felt pleasant.

At about 12:00 am, the effects became more pronounced. Speaking was very difficult, and my body felt bloated. I had to sit or lie down. Closed-eye visuals (CEV) started to emerge. In the beginning, there were a few scintillating neon-blue stars on a black background. I recognized them from my mescaline adventures. (I usually refer to these as "mescaline spots," as they always occur when I take mescaline.) These shifted into larger spots, which continuously changed color and shape. The edges of my vision field (with eyes closed) were weakly illuminated, as if there was a light shining behind a black screen producing fluorescent edges.

At 12:15 am the CEV became very strong. However, it was impossible to interact with them. They were 100% influenced by the music that was being played. There had been a little bit of BACH and some CHOPIN. Every song had its own visuals, every new rhythm changed something about them. A fellow butanaminist made me listen to a specific electronic music song. I liked it and, based on the perceived visuals, my doped brain liked it as well. At a point when the music suddenly stopped, the visuals completely disappeared! There

was nothing but pure blackness. A new song was then played, and the visuals came right back. Phew!

Also around 12:15 am, open-eye visuals (OEV) manifested themselves clearly. These effects were very different from those perceived under the influence of other substances tested so far. My poster of LANG's movie *Metropolis* came alive. Yes, MARIA was breathing and her cheek moved. When I lay down on the bed, I noticed that the wooden balks supporting the ceiling were rippled. The way in which they were rippled was markedly different from how I see them under the influence of mescaline or psilocybin-containing mushrooms. Using either of these, I see the balks completely rippled, forming many short waves. However, with 4C-DOB, the waves were long—very long—and moving slowly. One might want to say they were "milder waves," but this would be a bad way to describe them. At least, it didn't feel as though they were milder. Rather, it almost seemed as though the butanamine side-chain of the molecule was determining the effect: longer side-chain, longer visual waves. Also, colors appeared much brighter than they usually do.

The trip peaked between 1:00 am and 1:30 am. There were many CEV and OEV, still determined by the music that was being played at the time. Most of the CEV were abstract. During this point of maximum effect, it was very difficult to move around much. An increasing body load was noticed. Spasms in the lower leg (around the knee) and some jaw-clenching were felt. However, these effects did not have a negative impact on the experience—they actually felt rather enjoyable.

The intensity of the visuals decreased very rapidly. By 3:00 am, there were only a few CEV noticeable. There was still a heavy body load. Around 4:30 am to 5:00 am, I had the impression that the trip was over. There were no more CEV and the body tension was decreasing. However, I must have been wrong about this "ending" of the experience, as when the light was turned on, my perception of colors was still not normal and objects seemed to wiggle a bit. Moreover, when I drank a cup of coffee sometime between 7:00 am and 8:00 am, the effects returned somewhat. My head felt heavy again, colors became a bit brighter, and there were again a few closed-eye visuals. It must have been around 10:00 am before I was completely back to baseline. ☉

# NETWORK FEEDBACK

## WHAT IS THIS CHEMICAL?

I was recently asked which research chemical company had the least expensive prices for MBDB (a.k.a. Methyl-J), and in searching around on the Internet, I came across a company selling something called 1-(3,4-methylenedioxyphenyl)-2-butanone. This name seemed suspiciously similar to the chemical name for MBDB, but it wasn't *exactly* the same and it cost about five times less than the lowest price I was able to find elsewhere for MBDB. I became concerned that some folks looking for MBDB might accidentally think that this compound was the same thing, and order it by mistake. And I also wondered what the hell the stuff actually was, so I asked SASHA SHULGIN. His response is below. — J.H., CA

The correct name for MBDB, or Methyl-J, is 2-methylamino-1-(3,4-methylenedioxyphenyl)butane. The name 3,4-methylenedioxy-2-butanone represents a chemical precursor to either BDB (J) or MBDB (Methyl J), and I would be amazed if it were psychoactive. It can be reductively converted to these two active products quite easily, by interaction with ammonia or methylamine respectively.

There *is* an active compound that contains the "-one" term, which indicates it is a ketone. But to get to it, the name would have to be changed a little bit, from a butanone to a propanone. This is 2-methylamino-1-(3,4-methylenedioxyphenyl)-1-propanone, which is the correct name for the compound that I call Methylone. This is the ketone analogue of MDMA with warm, MDMA-like psychoactive effects in the 100+ milligram range. I created it about a decade ago, and I understand that it is now being commercially offered for sale on the Internet. It will be described in the third book that ANN and I are currently working on. — SASHA SHULGIN

## REDUCE MDMA SIDE EFFECTS

I read the review of RECOVERY ESSENTIALS in the "Sources" column from the last issue of *The Entheogen Review* with great interest—specifically the part about what materials can be taken for prophylactic purposes by people who consume MDMA. I have to wonder about the wisdom of including 5-hydroxytryptophan in such a regime. Sure, it has antioxidant properties. But it strikes me that taking it prior to consuming MDMA, may increase the risk of trippers developing serotonin syndrome. If one feels the need to use 5-HTP to boost serotonin levels or for antioxidant purposes, the best time

to do this would probably be after the MDMA has worn off. Other antioxidants might be a better choice. I always take multiple grams of vitamin C (spread out over a few hours) the day before, during, and after consuming MDMA.

A friend of mine told me that the following vitamin regimen works well for alleviating some of the discomfort associated with the come down from MDMA. Start a day or two before intended ingestion and take the following three times daily:

- 1) Emer'genc-C packet (contains 1 gram vitamin C as seven mineral ascorbates)
- 2) A good B complex (with food)
- 3) Vitamin E, 400 iμ
- 4) "Nature Made" calcium 333 mg/magnesium 133 mg (take three of these, three times daily)
- 5) Can also add a good multi-vitamin to this schedule

Follow the above regime on day of ingestion but eliminate B complex, since food may not be ingested and B complex will upset the stomach without food. Double up on the calcium/magnesium upon ingestion of MDMA (taking six instead of three). My friend also sometimes takes 100 mg of 5-HTP the morning of ingestion, and 50 mg at ingestion. (As I mentioned above, I am concerned that ingestion of 5-HTP in this manner may not be a good idea.)

Without the above regime, my friend gets severe jaw clenching. This is said to be completely alleviated by the calcium/magnesium. Day-after effects can include brain fogginess, facial muscle soreness, and general lethargy. Brain fogginess and lethargy are both said to be significantly eliminated by the above regime, but not totally. Muscle soreness in face is nonexistent using the above regime.

Considering that a more powerful antioxidant might produce better results, while at BURNING MAN my friend and I each took a capsule that contained 180 mg of butylhydroxytoluene (BHT) and 80 mg of ascorbyl palmitate (a fat-soluble form of vitamin C). These are sold by LIFE SERVICES SUPPLEMENTS for use to preserve food oils (the FDA won't allow the sale of BHT for consumption).

With the addition of this BHT to the mix, my friend stated that *all* negative side effects were completely eradicated (even though a “double-dose” of about 200 mg had been taken), and reported the day after feeling much the same as on any ordinary (non-drug-consuming) day. Indeed, I too didn’t notice many side effects following the same dose of 200 mg (although I did get jaw clenching and facial muscle soreness the next day, as I hadn’t taken any calcium/magnesium). However, the next time I took MDMA, I did take a single dose of 1332 mg calcium and 532 mg magnesium, at the same time as I took the MDMA (along with my normal regimen of vitamin C), and I noticed significantly less problems with jaw clenching during the trip and less facial muscle soreness the next day. I plan to follow my friend’s pre-dosing regimen of calcium/magnesium in the future, and will also use BHT again to see if I can replicate the positive results that I had the first time. Hopefully this letter will encourage other readers of *The Entheogen Review* to try out BHT and report back on their results. — F.B., CA

It is worth pointing out that in RECOVERY ESSENTIALS “E-kit” the 5-HTP is contained in the third of four portions, which is recommended to be taken “when you are ready to come down, chill out and sleep.” It

seems reasonable to assume that this would be a safer time to take 5-HTP than at the start of a trip (which is not something that RECOVERY ESSENTIALS is recommending). However, we have heard of people (like your friend) pre-dosing with 5-HTP. Until some studies can be done regarding the safety of such a practice, we agree that it might be best to avoid this approach. We would be interested to hear more about the various prophylactic means that psychonauts use to protect themselves from the potential negative effects of drugs.

BHT is known to have tumor-promoting effects in specific situations, although in other situations it has been found to prevent cancer (and it has not been found to cause cancer on its own). It also has antiviral effects and is taken by some to control herpes outbreaks, and to combat AIDS. In rare cases, attacks can be brought on in asthmatics by as little as 250 mg of BHT. People with liver or kidney problems should not take BHT, and alcohol should not be consumed within a few hours after taking it. It seems doubtful that the occasional use of small doses like that which you mention would be of much if any risk. It is also recommended that BHT always be consumed in conjunction with vitamin C (as you reported doing).

Interestingly, some cannabinoids from *Cannabis* have been found to be better than vitamins C and E, and equal to BHT in their antioxidant properties, but these do not have known tumor-promoting effects. Scientists are looking at these for possible neuroprotective effects. Maybe we should all be getting stoned after we take MDMA? — DAVID AARDVARK

## SPORES & MUSHROOM GROWING TECH

Maybe others have had differing results from myself, but the spore syringes that I purchased from the SPORE TRADING POST ([www.sporetradingpost.com](http://www.sporetradingpost.com)) seemed to have a high rate of contamination. However, the LIL' SHOP OF SPORES ([www.lilshopofspores.com](http://www.lilshopofspores.com)) and RALPHSTER'S SPORES ([www.ralphstersspores.com](http://www.ralphstersspores.com)) offer spore syringes which, so far, have been free of contaminants.

I'd like some feedback from anyone who has used MAGIC's Soul Food Machine (see [www.mushroommagic.com/sfm.htm](http://www.mushroommagic.com/sfm.htm)). How successful can one be using such a device? What is the monthly yield? What sort of environment was used (i.e., sterile environment, average kitchen environment, etc.)? — VISIONARY GARDEN, NH

## 2C-T-7: VARIABLE EFFECTS

I had the opportunity to pass along four doses of 2C-T-7 at BURNING MAN this year to people who had never tried it. The product was bought from ESHU some years ago, when they were still in operation, and it came with printouts of GC/MS work that had been done to show that it was highly pure. It has been stored in a freezer since then. Each of the doses weighed 24 mg. I provided information about what to expect, but I had no actual contact with the four people who took the doses. I have no idea what their body weights were, and don't know what they might have consumed prior to or while on the 2C-T-7 (hence no idea of tolerance or drug interaction issues). Still, I found it interesting to hear that: 1) One person had no effects whatsoever; 2) One person had extremely mild and uninteresting effects; 3) One person had a "perfect" experience, "very visual and colorful," and 4) One person had an over-the-top way-too-heavy experience resulting in a freak out. I had actually passed along more than four doses, but the remainder was returned to me by my friend, as—after witnessing these reactions—she said that she felt that the material was too unpredictable. It is hard to say if these experiences reflect a typical variation of response with this compound (since the factors of weight/tolerance/concurrent drug use weren't accounted for), but I have since heard through the grapevine that dose/response effects from 2C-T-7 can be highly variable, with some people needing less than 10 milligrams for a full experience, and other people taking up to (or over) 40 milligrams. Interestingly, the word

was that many people at BURNING MAN were specifically looking for 2C-T-7, but few people had heard of or were interesting in the 2C-T-2 that I had brought. Perhaps part of the difference is the fact that 2C-T-2 is not yet scheduled; sadly, a drug seems to have more allure once folks hear that it is illegal. Anyway, for whatever the data is worth. — F.B., CA

## ANOTHER TRANSDERMAL POSSIBILITY?

Emu oil appears to be a good transdermal carrier for some drugs. Its composition of short-chain, non-polar mono-unsaturated fatty acids (and lack of phospholipids) allows it to easily penetrate the stratum corneum barrier of the skin. It is currently patented as a carrier for lidocaine, and is widely used to increase the absorption of MSM for arthritis sufferers. The AUSTRALIAN EMU ASSOCIATION, in conjunction with AUBORN UNIVERSITY, found that emu oil more than tripled the absorption of ketoprofen (an anti-inflammatory drug) over DMSO. Emu oil is widely available at health food stores and relatively cheap, so this might be something that *ER* readers will want to experiment with. — A.Q., TX

## MORE ACORUS CALAMUS

With regard to TALBY's remarks about *Acorus calamus* in the Vernal Equinox 2003 issue of *The Entheogen Review*, he asked for speculations about what he got so damned sick from ingesting the roots of this plant. I wish I had reported on the effects of this plant before he did, and maybe saved his gut the anguish. The first bioassay that I did was of the roots. A girlfriend and I ate about ten grams each of American *A. calamus* roots, and we had very pleasant LSD-like effects that lasted about twelve hours. The effects were moderate, but it was a sweet psychoactive euphoria. My next bioassay happened around two years later. I had acquired a commercial sample of pure *A. calamus* root extract (as an oil) from a supplier in India. This material was as crystal clear as distilled water. Unfortunately, I had no idea how much of this might represent a psychoactive dose (nor did my supplier or anyone else I asked). So early one morning I consumed about ten drops of this oil, and within 45 minutes I began experiencing noticeable psychedelic effects. About 15 minutes after that, I began to have intense nausea, which continued for six hours. I don't know how many times I vomited, but it

was a lot. Finally, after the six hours, I met up with a friend who had some *Cannabis*, and like TALBY reported, after smoking it the nausea subsided. At this point, I was able to enjoy the effect from the *A. calamus*, and it was truly a euphoria like few others!

Once when I was in an addiction recovery clinic, I was presented with a rundown of how the gastrointestinal system and liver deal with heavy toxins. It went something like this: A gastrointestinal disturbance will result in nausea that's almost always over quickly. For example, a person who consumes too much alcohol too quickly will usually vomit a few times in the course of an hour or less. However, if the response to a toxin is generated via the liver (regardless of whether the toxin is consumed quickly or over a longer period of time), the liver will often react with an "overload" signal. When it has too much toxicity to deal with, it sends out a chemical signal that triggers the formation of bile in the stomach, which causes vomiting. This is the liver's way of saying, "Don't send anything more through that makes me have to work any harder than I am, or I will die of exhaustion." Vomiting in these cases can go on for hours.

Then there are neurological factors that can cause nausea. JONATHAN OTT explained to me once that the occasional cramps and nausea associated with LSD ingestion aren't a gastrointestinal disturbance, but rather a reaction that originates from the autonomic nervous system. This may explain why *Cannabis* can ease the symptoms of prolonged nausea, as it can be neurologically soothing to some people.

I wouldn't recommend *Acorus calamus* in high doses to anyone. It can be easily converted into TMA (see UNCLE FESTER'S *Practical LSD Manufacture* for instructions). However, do be aware that TMA is illegal in the U.S. — P.H., NM

We have no idea what the composition of the oil you mention was, but it seems quite possible—since it was imported from India—that it was produced from the old world *Acorus calamus*, which seems to be reported as being more toxic than the American *A. calamus*. The differences between these two plants have been discussed a bit in past issues of *ER*. — Eds.

## TRACHELOSPERMUM JASMINOIDES

After pruning a couple of large plants, it occurred to me that it seems a waste to throw all of this ibogaine-containing foliage into the garbage. Is there a fairly simple process to

extract iboga alkaloids from *Trachelospermum jasminoides*? While separating and purifying the ibogaine itself would probably require a good deal of chemistry experience, what about producing a simpler crude extract, such as the “Indra extract” mentioned on page 30 of the Vernal Equinox 2003 edition of *The Entheogen Review*, in R. STUART’S review of “The San Francisco Ibogaine Forum.” — J.E., AZ

First off, we should present a couple of corrections regarding the article that you mention. The metabolite for ibogaine is 12-Hydroxyibogamine (not 12-Hydroxyibogaine, as stated in that article), and the correct name for this is desmethylibogaine (not decmethylibogaine). Our apologies for these errors.

The process that was mentioned in that review is described in the 2002 paper “Extraction Studies of *Tabernanthe iboga* and *Voacanga africana*,” by CHRISTOPHER W. JENKS (*Natural Products Letters* 16(1): 77–76). The stated goal of the paper was to present “a convenient, inexpensive, and efficient procedure to isolate and purify the alkaloids from *T. iboga* root...” To summarize the paper’s process:

- 1) Shredded or powdered root-bark was placed into vinegar and stirred occasionally for an hour. This was not heated, as boiling caused it to become impossible to filter and was found to be unnecessary.
- 2) The root bark was filtered out. For large scale filtrations, a cloth sack works fine. Coffee filters or filter paper can work on a small scale.
- 3) The marc was then re-extracted twice more, with the total combined extractions yielding about 87% of the alkaloid content that was potentially extractable.
- 4) Ammonia was used to basify the filtered extracts. The precipitate was solid, and after it had settled at the bottom, the upper liquid was carefully siphoned off, with the remaining portion (containing the precipitate) filtered, washed with distilled water, and then dried with a gentle warming.

The paper goes on to discuss additional purification and separation methods, but the above should be enough for the non-chemist to produce a crude extract. For further details, we recommend reading the original paper.

Alkaloids reported from the leaves and stems of *Trachelospermum jasminoides* include ibogaine, tabernaemontanine, vobasine and voacangine-7-hydroxyindolenine (ATTA-UR-RAHMAN et al. 1988). A more complicated extraction process for *T. jasminoides* is posted on the web at <http://leda.lycaem.org/?ID=16151>. The paper this extraction process is presented in suggests that the plant is not particularly high in ibogaine content. (It took about 5.5 pounds of dried plant material to create a gram of mixed alkaloids, not all of which was ibogaine.) So extracting it would probably only be worth doing for people who have access to a very large amount of biomass. We would be quite interested to hear from anyone who attempts to use the simple process outlined on *T. jasminoides*. — Eds.

## 5-MeO-DMT AND THE VISITOR

It used to be that when I did 5-MeO-DMT, I just sat or lay there during the experience. Then things began to change. At first there was some noise-making and looking around with my eyes. This occurred somewhat bashfully in the beginning. Then there were a few more explicit episodes of “speaking in tongues” and growling. Finally, I began to get up and walk around, exploring. This movement was initially cautious, but now I move more quickly from place to place and look at a great many things in more and more detail, as though I know that my time is limited. And the constant tone throughout is the feeling of a question: Who am I?

Here’s my theory: While I am disembodied “in the Void,” someone *from* the Void is embodied in me, and “he” is learning about our world—exploring and getting increasingly familiar with embodied existence in a three-dimensional world with linear time and gravity to deal with. It has taken several hundred “exchanges” with the Visitor to get to my current understanding of this phenomenon. The Visitor does not speak English (or any other language that I am aware of), but is occasionally responsive. With his visual attention and body language, he perceives, he navigates, and he can be “seen” to be “thinking.” I have no recollection of the Visitor’s actions, but I have received many reports following the fact from my sitters, and I have myself observed the Visitor in action on video several times. He’s quite a handsome fellow...

Recently, while under a considerable amount of stress and in a state of repressed anger, I vaporized a hyperspace-sized dose of 5-MeO-DMT. It had been several months since my last bioassay of this entheogen. While I was in the Void, my physical body (and perhaps my unconscious mind) began to explore my sitter’s home. In the middle of this process, my body started shouting and cursing—something which

### River’s Source Botanicals

had never happened before. My body then proceeded to attack his door jambs (one of my standard martial arts training activities when sober), and then my body punched a hole in my friend's wall. My body also made a threatening gesture to my friend when he spoke to me during this violence in an effort to make me stop and calm me down. I was not conscious of any of this. When I "returned," I felt fine. I had a pleasurable journey in the Void completely unaware of any physical activity that had occurred while I was away. As a result of this experience, I have decided to suspend my 5-MeO-DMT research efforts while I deal with some issues surrounding my apparent repressed anger. Or was it the Visitor that was angry? He's been "scary" to others before. Regardless, I am applying OCCAM's Razor, and proceeding under the assumption that it was simply me expressing emotions that I had been struggling with during that week. My current operational theory is that—at least during some of my experiences "in the Void," a primitive emotional part of my brain takes over the physical "me." Be careful "out there." — MoDu

## GOOD-BYE TO TRIP MAGAZINE

After six years and ten issues, *Trip* magazine (formerly *The Resonance Project*) will no longer be publishing. They will be printing up a much smaller number of their final issue than they normally run (just enough for subscribers and on-line sales), and this—issue No. 10—can be purchased via their web site. It's sure to be a collector's item. Subscribers who have issues remaining on their subscription will have various options on how to get credit, a subscription transfer to another publication, or a refund on future issues that have already been paid for. Check [www.tripzine.com](http://www.tripzine.com) after the first of the year for more details on how to cash in. — EDS.

# EVENTS CALENDAR

## ETHNOBOTANY PLANTS IN HUMAN AFFAIRS JANUARY 6–17, 2004

Held at the OHANA KEAUKOU BEACH RESORT in Hawaii, this 12-day intensive course explores humanity's relationship to plants. Ethnobotanist KATHLEEN HARRISON and ethnopharmacologist DENNIS MCKENNA discuss the role of plants in the evolution of civilizations, wars, migrations, religion, spirituality, art, medicine, and science. Guest lectures by local experts and field trips bring the subject alive in one of the most beautiful and biodiverse environments on the planet. Sponsored jointly by the CENTER FOR SPIRITUALITY AND HEALING at the University of Minnesota and the KOHALA CENTER in Kamehaha, Hawaii. See [www.csh.umn.edu/WhatsNew/index.html](http://www.csh.umn.edu/WhatsNew/index.html) or contact NANCY FEINTHEL at (612) 626-5166.

## AYAHUASCA HEALING RETREAT JANUARY 11–20, 2004

Held in the Amazon rain forest near Manaus, Brazil. There will be four ceremonies with ayahuasca, two ceremonies with *Salvia divinorum*, lectures on entheogenic/healing plant teachers, as well as workshops in the shamanic use of neurotechnology devices, lucid dreaming, group sharing, visionary art classes, transpersonal exercises, and local excursions. Staff includes consciousness researcher and author ZOE SEVEN, transpersonal psychologist SILVIA POLIVOY, and visionary artists MARTINA HOFFMANN and ROBERT VENOSA. For more information see: [www.ayahuasca-healing.net](http://www.ayahuasca-healing.net) or contact SILVIA at [silviap@house.com.ar](mailto:silviap@house.com.ar).

## SHAMANISM, ENLIGHTENMENT, AND SACRED SEXUALITY JANUARY 16–20, 2004

Held in Santa Fe, New Mexico, this is the confluence of three conferences in one, which means that the sessions of different topics will be held at overlapping times. Speakers include: ADYASHANTI, ANGELES ARRIEN, ARJUNA ARDAGH, CHAMELI

ARDAGH, LOU CARACCILO, JUDITH GASS, ROBERT GASS, CONNIE GRAUDS, GAY HENDRICKS, KATHLYN HENDRICKS, PETER LEVINE, BROOKE MEDICINE EAGLE, JOE MIGUEZ, RICHARD MOSS, ONYE ONYEMAECHI, ROBERT RABBIN, ISAAC SHAPIRO, JOHN SHERMAN, LEONARD SHLAIN, TINA DE SOUZA, JOSÉ STEVENS, MERILYN TUNNESHENDE, BARRY VISSSELL, HANK WESSELMAN, and PAMELA WILSON. Admission is \$645.00. See [www.bizspirit.com](http://www.bizspirit.com).

## HOLOTROPIC BREATHWORK JANUARY 30 — FEBRUARY 1, 2004

STAN GROF and TAV SPARKS lead Holotropic Breathwork sessions in Palo Alto, CA. \$315.00. For more information, write to HOLOTROPICS, 38 Miller Avenue, PMB 158, Mill Valley, CA 94941, call (520) 749-8884, e-mail [HoloGrof@aol.com](mailto:HoloGrof@aol.com), or see [www.holotropic.com](http://www.holotropic.com).

## ENTHEOGENESIS JANUARY 31 — FEBRUARY 1, 2004

Held in Vancouver, Canada. Presenters include: DAVID AARON, CHRIS BENNETT, RENEE BOJE, RICK DOBLIN, MARC EMERY, JON HANNA, PHIL LUCAS, JEAN MILLAY, THOMAS B. ROBERTS, CARL RUCK, ETHAN RUSSO, BENNY SHANON, and BLAISE STAPLES. Topics include: the Eucharist of Mithras; Pagan Shamanism; European Fairy Tales; Heretical Visionary Sacraments; Entheogens in the Hebrew Bible; Entheogenic Experience as the Basis of Religion; PSI and Psychedelics; *Cannabis*; Psychedelic Research; Iboga; Psychedelic Art; Legal Tactics and Advice; Spirituality; Ancient and Modern Witchcraft; and more. Artist LUKE BROWN will host a show of his entheogen-inspired creations. Djed and live music by NILS, ANDROGYNOID, CHARLEY HIGGINS QUARTET (acid jazz band). Sponsored by: [www.pot-tv.net](http://www.pot-tv.net), [www.theibogatherapyhouse.org](http://www.theibogatherapyhouse.org), [www.urbanshaman.net](http://www.urbanshaman.net). Held at the BRITISH COLUMBIA MARIJUANA PARTY, 307 West Hastings Street, Vancouver, B.C. Tickets: Canadian \$125.00, American \$95.00 (please send only money orders through the post), payable to: POT TV, 307 West Hastings, Vancouver, BC, V6B 1H6, Canada. For more information, talk descriptions and speaker biographies, see [www.entheogenesis.ca](http://www.entheogenesis.ca).

by JON HANNA

## AMAZON.COM'S SUPER-INDEX

On-line bookseller AMAZON.COM recently added a tool that allows one to search the entire contents of thousands of books for a keyword. This "super-index" is accessed by using the "search" box that appears at the upper left hand corner of their home page, and selecting "books" from the menu. It can be quite useful for psychedelic research projects. For example, I searched for "LSD" and got 4594 results. When I searched for "peyote" and got 1409 hits, they also offered up the chance to click onto "Related Searches: ayahuasca, mushrooms." (I've always felt that AMAZON.COM had a great but creepy method of target-marketing based on my past purchases.) I searched for "psychedelic" and got 3846 hits, I searched for "entheogen" and got 59 hits, I searched for "*Salvia divinorum*" and got 11 hits. Last, and also least, I searched for "entheogen review" and got three hits.

The hits that are provided give a few lines of text where the word(s) that you searched for appear(s) in the book. If you give AMAZON.COM a credit card number, you can then access the full text of some books on-line. They don't charge your card for this service; rather, it appears to be just an additional way that they collect data on those who use their web site.

**INAVAP**  
**POB 13171**  
**Minneapolis, MN 55414**  
**info@inavap.com**  
**www.inavap.com**

I reviewed the INAVAP vaporizer in my "Sources" column in the Vernal Equinox 2003 issue of *ER*. Although I liked some of the features of this vaporizer, I couldn't recommend it due to a couple of serious flaws. The wooden stem detached from the bowl after only a single use. And the stem got too hot to be comfortable to use as well.

Perhaps as a case of "the squeaky wheel gets the grease," shortly after I sent my review of the INAVAP to its manufac-

turer, they sent me a new model, which they state has an improved and more efficient ceramic heater that is manufactured specifically for the unit. And it also now comes with a stem that is molded out of teflon, rather than made from wood.

My first complaint has indeed been fixed. The stem and its interior metal bowl no longer detach from each other. Great. But my second complaint hasn't really been addressed much, as the stem can still get too hot. The instructions for use have been altered, explaining that if you place your lips around the stem rather than kissing it, you can "avoid burning your lip while inhaling." This is true, but why not just make the stem long enough that one won't have to worry about the heat? If you leave the stem screwed to the base (when you are not using it), it really gets hot. Always detach it after use, and only attach it just before you plan to use it, and the temperature troubles can be kept to a minimum. The new model (and new use instructions) are definitely an improvement over the previous one. Their web site currently lists the INAVAP as costing \$114.00.

**LEAP**  
**c/o Jack A. Cole**  
**27 Austin Road**  
**Medford, MA 02155**  
**info@leap.cc**  
**http://leap.cc**

LEAP is an acronym that stands for "Law Enforcement Against Prohibition." Yup, that's right, this is a bunch of cops who want to end the War on Drugs, God bless 'em. Some text from their web site, quoted below, describes their position. For more information, visit their site.

"Founded on March 16, 2002, LEAP is an organization that believes the United States' drug policies have failed and that to save lives, lower the rate of addiction, and conserve tax dollars, we must end drug prohibition.

"The stated US drug policy goals of lessening the incidence

of crime, drug addiction, juvenile drug use and stemming the flow of illegal drugs into this country have not been achieved. The failed policy of fighting a war on drugs has only magnified our problems but the US still insists on continuing the war, while pressuring other governments to also perpetuate these unworkable policies. LEAP believes a system of regulation and control is more effective than one of prohibition.

“LEAP is an international nonprofit educational entity based in the United States. We are applying for IRS 501(c)(3) tax-exempt status. The mission of LEAP is (1) To educate the public, the media, and policy makers, to the failure of current drug policy by presenting a true picture of the history, causes and effects of drug abuse and drug related crime; (2) To create a speakers bureau staffed with knowledgeable and articulate former drug-warriors who describe the impact of current drug policies on: police/community relations; the safety of law enforcement officers and suspects; police corruption and misconduct; and the financial and human costs associated with current drug policies; (3) To restore the public's respect for law enforcement that has been diminished by its involvement in imposing drug prohibition; (4) To reduce the multitude of harms resulting from fighting the war on drugs by ultimately ending drug prohibition.

“Membership in LEAP is open to anyone formally trained in methods of law enforcement, crime prevention and detection, and who currently or formerly was given the authority to maintain the peace, safety, and order of the community by any national, state/provincial, or local governmental agency (this includes police and federal agents; corrections, parole and probation officers, prosecutors and judges)—provided the prospective member believes the US war on drugs is failed policy and wishes to support alternatives to that policy aimed at reducing the incidence of death, disease, and addiction by ultimately ending prohibition.

“Members of LEAP are already spread across the United States and into other countries, which is fitting since US drug policy has ramifications that affect the entire world. LEAP is made up of people who intimately understand both the consequences of the war on drugs and the attitudes of the drug-warriors who are fighting that war. The members of LEAP are in an extraordinarily good position to educate other law enforcement professionals, recruit new members, and affect change to current drug policies because of their many years of living within the culture of law enforcement.”

#### L.J. ALTVATER

3435 Cesar Chavez Street #212  
San Francisco, CA 94110-4533  
sales@sunecho.com  
www.sunecho.com

L.J. ALTVATER is the visionary artist whose work is featured on the covers of this issue of *The Entheogen Review*, and above is his piece *The History Generator*. But these grayscale images don't do the full-color works justice. L.J. combines the surrealist worlds of HIERONYMUS BOSCH and RENÉ MAGRITTE with the bizarre structure of M.C. ESCHER, topped off with a healthy dose of DMT. When I first saw his oil painting *Talking Plants*, I was overcome with the feeling that *here* was an artist that was doing what I myself might be doing, if I wasn't so lazy as to never get any art done these days. L.J. has deft command over tryptaminic imagery, presenting visions of the “jeweled self-transforming basketball machine elves” (to paraphrase TERENCE) for all to see. He works mainly in two categories: paintings and POV-Ray digital images. His paintings tend toward the surrealistic, with his digital images more abstract (although there *is* some crossover in content and style between his chosen mediums).

The [www.sunecho.com](http://www.sunecho.com) web site that features L.J.'s work underwent a substantial revision a few months ago, with a new look, more art, and MP3 audio files of his music too. He even has animated clips posted now, for those with speedy web connections. The “Index” page of his site has a great “links” section with the sort of stuff that I could spend hours checking out. (Indeed, I got a bit distracted from my review of L.J.'s site by snooping around at the link to JIM WOODRING's site.)

L.J. has also done one of the coolest things that I have seen an artist do in recent times; he has created a Stereo View-Master Reel of his art. For a mere \$5.00, seven of his POV-Ray digital images have been reproduced as slides in a cardboard disk, and if you can get your eyes to cross *just* right (which can be a bit of a trick), the colorful double-images will meld into one vivid and seemingly three-dimensional scene. I fondly recalled the View-Master from my childhood. (And if you don't still have a dusty View-Master lying around from when you were a kid, L.J. will sell you one of those too, for only \$6.00.) You can also pick up L.J.'s *Green & Submarine* mini CDR for \$8.00 and his *Mission Hypnotic: Urban Paradise* CDR for \$8.00. Domestic shipping costs are included in the price; what a deal. And if you see some art at the site that you'd like a print of, ask L.J. what this might cost.

## RESEARCH CHEMICALS

Those who study chemicals that may have some effect on the mind are living interesting times. Never before has their been such a wide variety of "research chemicals" available (primarily via Internet-based businesses). I suspect that this "window of opportunity" may not be open very long, but no one can say for sure. Perhaps it will close slowly, as individual compounds become more popular—such as 5-MeO-DiPT and 2C-T-7—and distributed in pill form at raves as "new types" of "Ecstasy," only to then be scheduled. Perhaps it will close rapidly, with a multitude of arrests and on-line businesses shut down, such as what occurred with the DEA operations "Head Hunter" and "Pipe Dreams," which put a number of paraphernalia vendors out of business, and scared many of the remaining ones into shutting down voluntarily.

I occasionally get questions asking which research chemical companies are the best to deal with. I have not personally ordered anything from any of these companies, so I can only report back what I hear from those who do place such orders. Folks have also sent me letters expressing concerns and questions about ordering research chemicals, such as:

*Is the company a rip off?*

When I hear reports of rip offs, I investigate. Valid complaints are published in this column. Another place to find out about companies that have been reported as rip offs is [www.erowid.org/vendors/vendors\\_complaints.shtml](http://www.erowid.org/vendors/vendors_complaints.shtml).

*Is the company a DEA sting operation?*

This question is difficult for me to answer. But it seems unlikely that this is the case with most of the dozen or more companies that are selling research chemicals these days. It is more reasonable to assume that the DEA is watching these companies and their customers. It would be easy enough for the DEA to track web site traffic and have "mail cover" operations going on (where they collect the return address listed on envelopes sent to the companies' addresses).

*Do these companies keep customer records?*

It is reasonable to presume that such companies keep customer records. Some companies require the customer to agree to some sort of a "legal release" form, and certainly these would be kept on file by the company.

*Who has the lowest prices?*

Tracking and reporting on prices is difficult, due to fluctuations in the marketplace, as well as due to the lag-time involved with publishing a column in a print format. Go to a public library and borrow their computers to surf the web and compare prices. Research chemical companies can be found on-line very easily by going to GOOGLE or some other search engine and typing in the words "research chemical," "tryptamine," "phenethylamine," or some combination of these words. Or just type in the specific chemical name of what you are looking for.

*Is ordering chemicals from these companies legal?*

This question depends on several variables. Some companies sell chemicals that are specifically scheduled in other countries. These companies might have no problem shipping such chemicals to a customer in a country where the chemical is illegal. (It is no doubt difficult for such businesses to keep up on the laws in every other country.) It is a good idea to know the laws of the country that you are living in before you place an order. Many of the chemicals sold by these companies that are not specifically scheduled in the U.S. could be considered illegal based on various state and federal controlled substance analogue laws, under certain conditions. If the chemical structure is somewhat similar to a scheduled compound, the primary condition that would determine whether or not the chemical could be considered a "controlled substance analogue" is whether or not the chemical is sold for consumption or intended to be consumed by the

customer. There are many reasons why such chemicals could be useful for non-consumptive research, but if one is ordering them to consume them (and if this can be shown to be true in a court), then possession would be illegal.

*Are the chemicals sold known to be pure?*

This is indeed a good question. However, it is also something that *can* be answered via various analysis procedures, in those cases where the chemicals are not specifically scheduled. People who are concerned about purity can contact labs and get testing done, and there should be little problem with this due to the fact that the compounds are not scheduled. (The biggest problem could be that the lab contacted might be unlikely in many cases to have a reference standard for the chemical on hand.) In fact, such testing has already been initiated: see [www.maps.org/forum/2003/msg00275.html](http://www.maps.org/forum/2003/msg00275.html). With this on-line report, there were seven chemicals tested, and six of these were shown to be reasonably pure. The one that was *not* reasonably pure was 4-fluoro-amphetamine. Unfortunately, in this study, information about the vendors that were the source of the samples that were tested is not provided, which means that these tests don't provide any data of specific use to the consumer who is trying to decide which company to buy from. Hopefully in the future, someone will run tests and provide source data for where the chemicals originated. The point that I want to emphasize is that there is a real opportunity for consumer advocacy via testing to be done, with little concern that a lab won't perform the test (since the chemicals are not specifically scheduled), and certainly less concern that the person who instigates the testing needs to be worried (because he or she is not breaking any laws by providing an unscheduled compound for testing). If some company is selling crappy 4-fluoro-amphetamine, they should be exposed.

Just as there may be little in the way of quality control, there may also be equally little with regard to truth in advertising. Take for example the case of [www.yourlegalthighs.com/psychedelics.html](http://www.yourlegalthighs.com/psychedelics.html), which sells a product that they claim is "synthetic psilocybin." Their web site states:

"This product contains 4-HO-DiPT. We measure exactly 6 mg of 100% pure Psilocybin powder (4-HO-DiPT) into each pill with an acculab VI-1 mg digital scale. What is the active ingredient in hallucinogenic mushrooms? Psilocybin. Psilocybin (4-hydroxy-N,N-dimethyltryptamine) is exactly what makes you hallucinate. 4-HO-DiPT is Synthetic Psilocybin, and it's 100% Legal! This is legal, YES LEGAL, shrooms!!! To

say the least, along side 'illusion,' this product will blow your mind with hallucinations! Please read the link below. <http://www.erowid.org/plants/mushrooms/mushrooms.shtml>. WARNING: VERY STRONG HALLUCINOGEN."

If you actually click through on that link, there is a cautionary note at the EROWID site that let's you know about the horseshit advertising spewed by [www.yourlegalthighs.com](http://www.yourlegalthighs.com).

Not only is 4-HO-DiPT *not* "synthetic psilocybin" or "psilocybin powder" as they claim, but if it *were* psilocybin, it certainly wouldn't be "100% legal," since psilocybin is specifically controlled. Furthermore, the manner in which [www.yourlegalthighs.com](http://www.yourlegalthighs.com) sells their products (in pill form, described for consumptive purposes, with descriptions of the effects produced), makes them into *illegal* highs (in the U.S. at least), since this presentation clearly would cause them to be considered as being scheduled under the controlled substance analogue laws, or banned under FDA regulations that restrict selling "look alike" herbal/nutrient products that claim to mimic the effect of illegal drugs.

In an unrelated situation, a research chemical was advertised as "gamma-2C-T-4" (a misnomer for psi-2C-T-4, which is not known to be psychoactive). When tested, the "gamma-2C-T-4" turned out to be regular old 2C-T-4. (See [www.erowid.org/chemicals/2ct4/gamma/gamma-2ct4.shtml](http://www.erowid.org/chemicals/2ct4/gamma/gamma-2ct4.shtml).)

Some people who order research chemicals will only order from those companies that they have heard are reliable from friends. Others will only place small orders at first, to make sure that they do not get ripped off. Those concerned about leaving an electronic trail will order the products with a money order (not a credit card), and have them sent to a mail drop using an alias.

It is my hope that people who do order research chemicals will begin to get these tested and report back on the purity. Since a small sample of a few milligrams is all that is needed for many types of chemical analysis, a large investment in chemicals need not be made to check into purity issues, although the lab analysis costs could get pricey. Hopefully there are enough interested folks working in the area of chemistry that this sort of testing can be arranged quietly and pro bono. I look forward to hearing any future reports regarding analysis of any products from specific companies. Let's start naming names, folks. Good companies should get the kudos, and the bad companies should be taken to the mat. ☺

# DVD REVIEW

by GWYLLM LWYDD

Image by Steve Postman • www.stevee.com

The people that brought you *Liquid Crystal Vision*, the documentary on contemporary psychedelic culture, now present *Mind States Highzzz*, an overview of the MIND STATES IV conference ([www.mindstates.org](http://www.mindstates.org)), held in Berkeley in May of 2003. The DVD is divided into four sections.

1. **THE SHULGINS.** This part was culled from the “Ask the SHULGINS” question and answer session held on Sunday evening, which was indeed a highlight of the conference. The dynamic duo of ANN and SASHA field questions, from chemistry to life paths, adroitly answering all comers. This is delightful footage, worth the price of admission. Particularly if you have never met them or seen them speak, this section alone makes this a great DVD.

2. **INTERVIEWS.** This section was not part of the “official” conference program, and as such it offers new material that should be particularly appreciated by those who were in attendance at the event. Folks interviewed include both presenters at the conference and audience members. There are some nice chunky bits in here, as well as some fluff. The interviews were filmed against a bluescreen, so that psychedelic visuals could be added later. Unfortunately, some of these visual effects can be distracting, especially in the case

of the first interview. If you can get past that, however (and I did), you will find some fascinating tidbits here. STAN GROF’s presentation is illuminating, and MARK PESCE rants, raves, and riffs in his always-engaging manner. The MOUNTAIN GIRL section is also quite edifying. There is even a dash of humor, with visual artist LUKE BROWN doing rhythmic vocalizations, beat-boxing it for his Canadian friend’s quasi TERENCE rap. Some of the interviewees border on the spaced-out, but even so they were still engaging.

3. **BLOTTER ART & VISIONARY ART.** The Blotter Art segment has the esteemed MARK McCLOUD, lecturing with wit and heart—a true bright spot of the conference. MARK presents a myriad of excellent images of blotter, many that I was unfamiliar with. His encyclopedic grasp of the history of blotter is unbelievable. The man is a real resource to the community. His understanding of the subject, as well as his humorous mannerisms, all add immensely to this DVD. Wonderful stuff, and really in tune with the 60<sup>th</sup> anniversary of ALBERT’s wild ride, which this conference celebrated.

The Visionary Art segment covered some of the artists whose works were present at the conference. Not all of the artists who presented were covered, but ALLYSON GREY’s and MARK HENSON’s talks were given a good bit of time, and were quite entertaining. STEVEE POSTMAN’s part was short, and then there was a brief glimpse of a single painting by FRED TOMASELLI (unfortunately, the DVD did not identify whose painting was being shown). The focus jumped back and forth between various artists, in a free association of ideas and images. The slice from MARTINA HOFFMANN’s presentation was particularly enjoyable.

4. **MIXED MIND.** This section kicked off with a sliver of MARK PESCE’s talk. Good stuff, although the visuals that MARK had going on the screen behind him were overwhelming at times. Mr. PESCE is one of my favorite presenters; his ideas are fresh, and cover wide ground. His selection on the DVD was a pivotal point in my viewing. Next up was the “Control Culture” panel, with R.U. SIRIUS at the forefront. His section is far too brief, as he had the crowd roaring at times during his talk. A snippet from RALPH METZNER on the LSD panel then insightfully presents data about the historical trends that led

up to the present-day model of the psychedelic/entheogenic movement. This section then veers off into more from MARTINA HOFFMANN, followed by SHELDON NORBERG's one-man presentation of *Confessions of a Dope Dealer*, the theatrical monologue that he is well known for. Following this, Mixed Mind becomes a mixed bag, jumping from more with MARK HENSON, to WRYE SENTENTIA speaking on the topic of cognitive liberty, with a weird edit of ALLYSON GREY thrown into the middle of WRYE's talk. Unfortunately, the clips then dither hither and yon for a bit, in a free association that I found to be mismanaged. It revisits MARK PESCE, has two brief sections with MYRON STOLAROFF, then skips to V.S. RAMACHANDRAN, who was an amazingly energetic, engaging, and humorous presenter. It ends with more from the LSD panel: NICK SAND's thoughtful spiritual talk—another important section worth purchasing the DVD for.

I enjoyed much of this DVD, and each of the featured sections had its own highlights. Most of my criticisms are stylistic, and may not be even noticed by many. Some sections are grainy or pixelated—perhaps an unavoidable technical problem due to the low-level of available lighting at times. Although the presentation has many high-quality selections, it lacks a general cohesiveness.

Primarily, I'd like to see the *complete* presentation from each of the speakers released in the future. There are around 24 hours of presentations from the conference, which are barely touched upon with this DVD! My fervent hope is that they will all be made available soon. Until that day may arrive, *Mind States Highzzz* is available for \$28.00 (postpaid) at the web site [www.liquidcrystalvision.com/mindstates.htm](http://www.liquidcrystalvision.com/mindstates.htm). ☉

## NEW BOTANICALS

*Amanita muscaria*

*Mitragyna speciosa*

*Voacanga africana* root-bark

Plus many new species of seeds  
and a bounty  
of shamanic accessories.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**STATEMENT OF PURPOSE:** This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list (kept encrypted) is not for sale, rent, or loan to anyone for any reason.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. See [www.entheogenreview.com](http://www.entheogenreview.com) for descriptions and prices.

# THE KING OF BLOTTER ART: MARK McCLOUD SPEAKS...

Interviewed by JON HANNA

MARK McCLOUD is a 50-year-old artist and former art professor who has the largest collection of LSD blotter art in the world. This art collection has caused McCLOUD to be busted (and acquitted) twice on charges of "conspiracy to distribute LSD": first in 1992, and then more recently in 2000. Having dodged a Federal conviction two times may be more unlikely than lightning striking the same spot twice. MARK told me that, historically speaking, the Feds rarely lose their drug cases: "They don't want to put up a fight unless they feel confident of a conviction." His most recent trial took place in the conservative Midwest, in Kansas City. MARK believes that the prosecutors made a strategic blunder when they argued the legal "merits" of their case during the first half of the trial, and presented the evidence during the second half. Hundreds of framed blotter art images were freshly imprinted on the jurors' minds just before they left to deliberate. It wasn't possible that they could see these as anything other than art. The judge wasn't pleased. When the verdict was read, MARK jumped up with arms open and rushed towards the jurors, as if to give them all a big hug. "Mr. McCLOUD, if there is *one* word out of you, I'll hold you in contempt and throw you in jail," justice GARY FENNER snarled. MARK considered for only a couple of seconds. He had been facing a *life* in prison, and now the judge felt that a few days in jail was some kind of threat? "Your honor," MARK spoke up slowly and clearly, "Where I'm from, when someone saves your life, you *thank* them."

With his generous heart, MARK is someone that you immediately fall in love with. His abilities as a raconteur rival SPAULDING GRAY, TERENCE McKENNA, or NICK SAND. You can listen enthralled for hours to all manner of stories, as time slips away unnoticed. For example, he recently told me about how politicians in a specific area of South America take their job more seriously than those in the United States do, because if the townspeople are displeased at the end of the politicians' terms, they will strip them naked, smear honey on their genitals, tie them to trees, and let the squirrels feast on their scrotums. I protest. But with a twinkle in his eye, McCLOUD swears that it is indeed true. And somehow, I almost believe him.

I met up with MARK at his Victorian house in San Francisco—perhaps more reasonably described as a museum, considering the high ceilings and walls with every inch covered in all manner of art. Of course, much of this was blotter art, some of which still sported the DEA evidence stickers from his past run-ins. On a rainy winter day, we chatted about psychedelic art, LSD, and some of his current projects. His new business, BLOTTER BARN, produces beautiful, gigantic giclee art prints, in signed, limited editions, of enlarged blotter hits and sheets. Talk about inducing macroscopic visions...

JON: I *love* this idea of the giant blotter. It's genius, really. You're gonna make your mint on it.

MARK: Yeah, we thought that every bar should have one. Here's the funny thing. I showed them at this art space the other night, and the staff—who weren't familiar with blotter—asked if they were stereograms. You know, that type of art that you sort of view with crossed eyes, and a hidden image eventually pops out of it. A lot of those images have a psychedelic blotter art feel to them.

JON: Right. Perhaps that's an example of the "mall mentality" as a means to relate to blotter art. Those stereograms used to be popular on poster art in the malls of America. So kids who didn't grow up with LSD blotter art still have a naïve way to understand it, by lumping it into the arena of stereogram art.

MARK: That's a really good analogy. And I like it that way, where people can still enjoy the images, but not have the stigma that is sometimes attached to blotter art. Or the life in prison. [laughs]

JON: Which of course brings to mind the idea that someone should put stereogram images on blotters.

MARK: Well, you know, THOMAS LYTTLE actually did one of those. He unfortunately didn't invent one, he just grabbed a computer program off of a Mac. But one of those "signed six"—the first "vanity" blotter, produced solely as a collectible due to the autographs on it—that LYTTLE did is a stereogram—this little pink thing. It's off-center, because he had to square it up to fit the format. But it's still cool.

JON: The other computer software that might be exploited in creating new blotter art is that Photomosaic™ technology developed by ROBERT SILVERS, where he takes many small images and manipulates them as components to form a larger image.

MARK: Oh yeah, I love that guy's stuff. I have a *MAD Magazine*—their "400th Moronic Issue" from December of 2000—where they used that process. They grabbed a bunch of images of past covers and other art from the 'zine and made a big head of ALFRED E. NEWMAN.

JON: Recently it was suggested to me that there may be blotter going around that doesn't contain LSD, but rather which contains ergine being passed off as LSD. What are your thoughts about that?

MARK: How would that work? How do you get ergine into a solution where one hit is enough of a dose?

JON: Well, it's supposed to be about a tenth as active as LSD is, right? So someone could certainly get 500 micrograms, or a milligram, or a bit more, onto a hit of blotter.

MARK: I think that there's another thing going on that more easily explains differences in effect from LSD. There are two stages in the completion of an LSD synthesis process. The first involves turning the ergotamine tartrate into a psychedelic oil. And then from that, the oil is refined into a crystal. And what has been the custom in the last fifteen years, is to use the oil itself, rather than taking the extra work to produce the crystal. That's what's going on.

JON: Do you think that this is the reason that some people report that the quality of LSD is not as good as it was back in the 1960s?

MARK: That's one thing that may be contributing to such an attitude. But then there is also the dosage. Believe it or not, I think that the weakest hit I ever saw in the 1960s had to be 150 mics, or maybe about 100 mics, with some of those windowpanes. And back in those days we usually took around 500 mics. So *that's* the difference.

JON: Is there some difference chemically between the oil and the crystal? Or is this just a physical thing, like water and ice, and—if so—why would that make a difference in the effect?

MARK: The time it takes to come on to the effects from the oil is a lot longer in duration. The crystal acts faster. But, the oil is actually higher in psychedelic properties than the crystal. And that's one of the reasons that underground chemists stopped refining it to crystal. So it is the same chemical, but like you suggest with the water and ice analogy, it is in a different stage.

JON: So perhaps the stage that it is in is causing some manner of difference in how it is absorbed?

MARK: That may be possible, and that could also be why some people report that they can't get off as strongly as they used to in the 1960s. It doesn't come on as fast, and it is provided in a lower dose unit. It could be.

But here's my *other* theory about the complaints that acid isn't as good these days as it was back in the 1960s. Back then, our brains' synapses weren't all fucked up from doing a lot of cocaine. They weren't all blocked from ten years of doing bad coke.

JON: That might fit with my own experience, in that I've never done a lot of cocaine—barely any really—and I have never done a lot of speed. Now, I wasn't doing acid in the 1960s, so I can't make a comparison. But when I have done LSD, I've had *full-blown* psychedelic trips, and it has always been the same, keeping in mind some variation from set and setting of course. I have never gotten any "bad" acid, and all of the acid that I have taken has produced the exact same spectrum of effects as all of the other acid that I have taken. I sometimes get into discussions with old-timers about the "new" acid, or the "bad" acid that is on the street these days, and I

just don't comprehend what they are saying, because if I take enough of the 50-microgram (or so) hits that are available these days, I always have a full-blown psychedelic trip that is similar in effects to all of my other trips. But of course, not *all* of the old timers glorify the 1960s acid. Some who I have spoken with feel that today's acid taken in the right dose produces identical effects.

MARK: Well, you know, there are libraries of vintages from many different years, including a lot of the older stuff that was produced in the 1960s, that people still have in their collections. So it is pretty easy to compare the older stuff to the more recent hits.

JON: And what is your feeling regarding such comparisons?

MARK: That it's just the dose that people are taking. That dosage is the main difference between the so-called "good" acid of the 1960s and the so-called "bad" acid available today. People making a comparison to the stuff from the 1960s simply aren't taking a high enough dose of the currently available material. That, and perhaps their synapses are fried from coke abuse.

JON: So if you take a golden oldie on one day, and enough of some contemporary material to produce a dose of equal potency on another day, your feeling is that there really wouldn't be any difference?

MARK: Yes, I think that they would produce the same effects. They would be the same deal. But see, I'm not a snob. I do have friends that *are* real snobs about this sort of thing, and they'll only take a certain type of crystal. But I know better. And also, the effects have nothing to do with the *color* of the dose, for example, which some people still believe.

JON: That idea about the color of the dose producing different effects is related to test marketing that OWSLEY was said to have done, right? It's been said that he dyed the same crystalline material five different colors, stuck this into gel caps, and then sent it out to see what the consumer liked best. And different colors got different reviews. Red was supposed to be too mellow, green too speedy, and blue the happy medium. But it was all the same stuff.

MARK: Right.

JON: There is an appropriate quote from ABRAM HOFFER that was recently reprinted in OTTO SNOW's new book *LSD*, where

HOFFER said: “At 75 mcg some subjects react with a strong experience and others remain very tense and uncomfortable. At 100 mcg about 75 percent of normal subjects become very relaxed and remarkably free of tension. The remainder may require 200 mcg to get the same degree of relaxation. There must be a maximum degree of relaxation before the psychedelic experience is achieved; most subjects have very tense, unpleasant experiences when given too little LSD.” HOFFER said this back in 1967, so it was *known* back then that low doses produced the sort of side effects that some bullheaded old-timers attribute to what they call the “bad acid” that is produced these days. So, again, I think that it is the lower doses available on today’s market that are primarily responsible for the difference in effect, and even for the increased side effects that some of these old-timers report. As well, all of the side effects that are said to be due to the impure, or bad acid of today, were reported by some patients in the early literature from the 1950s: nausea, cramping, stimulation—this stuff is nothing new.

MARK: Now, I would say that “all acid is alike,” except for that RONNIE STARK acid. That shit was definitely from another planet. RONNIE’S acid... *forget* about it! It was like being shot out of a fucking cannon—really. And people might say, “Nah, that’s just due to the high doses.” But I don’t know that I can agree in this case. There was something about that acid—five minutes after taking it you could *hear* something happening to you, and within a half an hour you had nothing to do with this level of reality at all.

JON: Was it maybe a different chemical altogether?

MARK: No, I don’t think so. But it was something so well finished that it just coupled to you in a way unlike anything else. That’s the one that I saw change more lives than any other. Unfortunately, a lot of those people ended up in asylums.

JON: [laughs] So it wasn’t necessarily a change for the good?

MARK: No, because it was such a transforming experience that it took years for them to integrate it. I talked to poet JOHN GIORNO about this, because JOHN had tried that acid with RON, back in 1965, and he said, “RON was the walrus.”

JON: But you don’t think that this was just a dose-related thing, with people taking really high doses?

MARK: I don’t know. But I have said this to several people, and every once in a while someone will reply, “Dude, you’re

*right!* I tried that acid. And that was the weirdest acid that I ever took, and it was *definitely* different.” The real psychedelic art that came out—when things really transformed in the art world—was when RONNIE STARK’S acid was what was going around. Half an hour later you were on a different fucking planet, that had nothing to do with this one here. That you made it back at all, was like a miracle. It was fierce magical stuff—the stuff fables are made of. And I think that’s why the BROTHERHOOD [OF ETERNAL LOVE] was so successful, because they had that fucking incredible acid of RON’S.

I had a life-transforming experience on that acid of RONNIE STARK’S, which changed me around. I was a psychology major at the time, and by the end of that trip I had become an art major. What I thought people called “psychology” turned out to be called “art.” But, you know, English was my second language. [laughs] But that experience was really what sparked my collecting. It was my *love* for LSD that caused me to think, “Hey, I could frame one of these up and change the context.”

JON: What ever ended up happening with RON?

MARK: Well, that’s one of the great unsolved mysteries of our time. The government claimed that he died in 1984, but I’d bet he’s still around. One of the fantastic treasures of our time was that RON, apparently before he disappeared into the Italian Red Brigade, left a trunk full of acid buried in Death Valley, deep enough so that it would keep well at the low temperature it was stored at there.

JON: And that’s never been reported as having been found, right? You’re making me want to walk around Death Valley with a metal detector digging holes. [laughs]

MARK: Dude, I’m hoping that it’s gonna show up on one of those aerial photographs someday!

JON: But that story could just be urban legend.

MARK: Sure, but such legends are often based in truth. Either way, this is a good one. People who knew RON have said, “Not *one* trunk of acid, it was TEN trunks of acid.” And he was said to be that kind of a guy. When they arrested him, he was holding a Bulgarian passport in an Italian prison—they were holding him as a Red Brigade. And one of the CIA agents recognized him and had him brought back here to San Francisco, where he apparently died of that mysterious “heart attack” that they tend to get [laughs], but no one ever saw

the body. I bet they let him walk.

JON: So, the last time I saw you, we were discussing a book project that you were working on, related to blotter art.

MARK: Sure, that's my dream book, which I am still working on. It deals with the history of blotter paper as an art. We're still struggling with that, and I don't have the contract yet. I'm hoping to work with a fabulous English publisher called Sir EDWARD BOOTH-CLIBBORN EDITIONS. Sir EDWARD, who's now 84, told me that we're gonna do it. So I still have some faith. But there are possibly some legal troubles with it right now. There's potential copyright problems. How do you get away with including those images of MIKHAIL GORBACHEV in there? What's GORBY gonna think? You know, there *is* a GORBY protection league. [laughs]

JON: It seems as though, from an art historical perspective, that it is unreasonable for copyright issues to create too much of an obstacle. Perhaps with things like MICKEY. The MOUSE might be an insurmountable obstacle...

MARK: But not really... You know that WALT was expelled from the KANSAS CITY ART INSTITUTE for plagiarism? And they still haven't paid off their POOH bill. DISNEY is being sued as we speak for WINNIE THE POOH, although that's about to get settled. They never paid a cent to the copyright holder for unreported software and video sales.

Anyway, with my dream blotter book, I already have 250 pages of it produced, and Sir EDWARD told me that I can have 80 of these perfed, if I want to. They are produced in 8-flats, and he was willing to perf 10 of the flats, which is an incredible nightmare of an engineering problem, but what fun! So I have PAUL MAVRIDES as my book designer, who did the SUBGENIUS books, and then I have CARLO McCORMICK as my art hysterical writer, dealing with the aesthetic side of things, and then I will write the history side of it.

So that's who Sir EDWARD is. He did some work on *Bag One* with JOHN LENNON. He's been around forever, this old-timer. He was MARSHALL McCLUHAN's sidekick. He's got the best art book company in the world.

This editor named LIZ FARRELLY came out to a blotter show of mine in Los Angeles. She works for *ID Magazine—International Design*—and she's done a lot of books with Sir EDWARD. She worked on a book called *Highflyers* that came out in 1996, which is about the rave flyers in London. And she

saw the blotter collection and said, "Hey dude, come on out." And I said, "Yeah, I'll come on out." We were right about to produce the book, when the bust in 2000 happened. So I've had to re-initiate new contracts now, and get everyone in line.

My copyright attorney tells me that there is a realm of "found objects" that can appear in art, where you already *know* that the image is a rip-off. So we're hoping that some of these copyrighted images that have appeared on blotter art can be used in the book and that they will fall under that category of protection from lawsuits. The English even have a clause in their contracts where you have to be sure that what you are producing doesn't in some manner insult the Queen.

JON: You could publish the book in Mexico, and then you wouldn't have to worry about copyright laws at all, heh...

MARK: But that's not my focus. I'm trying to get it out there as a legitimate art form from a historical perspective. The book would be representing a couple hundred anonymous artists, so I have to give them their due respect. I want their little place in history secured. Then after that, sure, let the "vanity" blotter reign. But these original underground artists paid with their *nalgas*, you know.

JON: Are you aware of artists whose singular contribution to the art world is blotter art?

MARK: Sure. One of my dearest friends, who I collected for many years before I ever got to meet him—he was also serving a ten-year term—is FORESTER. He's a very famous guy. He did hundreds of sheets of blotter, and then got busted in the late 1980s. When he got out, I befriended him. I took him to that TIM LEARY show that we did, with TIM presiding, and he got to see all of his blotter framed up, and he couldn't believe it. So we became fast friends, and he comes over about once a month and we have serious talks. But that's all he's ever done, is blotter art. He's more of a mad scientist type who out of *need* got into the art world. But he was turned on by this guy called THE ELECTRIC BUDDHA, who had a 'zine in the Haight called *Stains on Paper*, which was published for about five years during the 1970s.

There's an idea that some of these underground blotter artists now hold to when wholesaling blank sheets. They will charge \$3.00 each if the customer is gonna dip them, and \$5.00 each if the customer is going to frame them. Some folks want to cut the customer a deal if he is going to propagate a hit, since that gives the art a good name on the street.

**The Bust Book** is an amazing collection of drug art. It was enjoyable to flip the pages and reminisce about which hits I had eaten or seen on the street during my younger days. Compiled by the DEA, and used as evidence against MARK McCLOUD, the facsimile edition produced by ADAM STANHOPE and McCLOUD is clearly a labor of love. Several mainstream media articles about McCLOUD's bust and acquittal at the beginning of the oversized binder (gold-foil-stamped on the cover, with an "Eye of Horus" design) provide a historical account of the case at hand. Following this, full-color reproductions from the original evidence book are carefully contained within 3-hole plastic sleeves. Each has data provided about what perfring machine was used on the blotter, the evidence number for the bust, a DEA-assigned descriptive name for the sheets, the number of hits seized, the drug content of the hits, and the date and location of the bust. The earliest busted sheet of acid is from August of 1982, with the most recent bust (aside from McCLOUD himself) being July of 2000. The date on this final bust was interesting: since McCloud himself was busted in February of that year, it would seem that the prosecution continued to collect "evidence" of McCLOUD's "guilt" even after they threw him in jail!

None of the sheets taken from McCLOUD's home had *any* LSD on them, and a few sheets seized from other locations also had no LSD on them. However, the hits that were seized that *did* contain LSD provide some interesting data on the range of potency that has been available over the last two decades or so. On the low end, there were sheets of "3-D Cubes" and "Roses" busted in Cave Junction in 1997 that only had a "trace" amount of LSD on them. Other dosed hits weighed in at 48 mics (1982), 63 mics (1986), 60 mics (1990), 37 mics (1991), 47 mics (1991), 62 mics (1992), 16 mics (1993), 23 mics (1993), 52 mics (1993), 78 mics (1993), 40 mics (1994), 51 mics (1994), 61 mics (1994), 69 mics (1994), 78 mics (1995), 63 mics (1997), 22 mics (1998), 27 mics (1998), 57 mics (1998), 22 mics (1999), 24 mics (1999), 24 mics (1999), 32 mics (2000), 51 mics (2000), with the highest dose being 107 mics (2000) for a hit of "Egyptian Eyes." Throwing out the two trace doses, this leaves 25 busts that the Feds presented specific dose data for, with an overall average dose of 48.56 mics. This is about one-third lower than the average 75 mics published by PHARMCHEM based on doses seized between 1969 and 1975, although it is worth noting that their results were calculated from a larger sampling of 2,200 doses that, when they contained LSD, ranged from 5 to 500 mics (EROWID 2003). Nevertheless, the assumption that today's hit of blotter acid is substantially less potent than that which was going around in the late 1960s through the mid-1970s seems to be borne out by the details presented in *The Bust Book*.

The format that *The Bust Book* is presented in, while historically accurate, also provides a good home where the connoisseur of contemporary "vanity" blotter can house his or her growing collection. As well, I have expanded the historical relevance of the book in the other direction, by downloading earlier representatives of blotter art in the form of "The LSD Blotter Index" (FRANZOSA et al 1987) from EROWID ([www.erowid.org/chemicals/lsd/lsd\\_history5.shtml](http://www.erowid.org/chemicals/lsd/lsd_history5.shtml)), which covers blotter busted from 1976 through 1986. Of course, produced as muddy black-and-white photocopies, this document collection pales compared to *The Bust Book*, but it does widen the scope.

Weighing in at around 140 printed pages, *The Bust Book* was produced as a signed, limited edition of 250 copies, and sells for \$750.00. A special premium edition, limited to a mere 10 copies, comes with a vintage "Eye of Horus" blotter art—the oldest known piece of blotter art still in existence—which is potentially worth the price of the entire book to a dedicated collector, and sure to go up in value. For information on how to order a copy of *The Bust Book*, check out [www.acidartz.com](http://www.acidartz.com). — JON HANNA

JON: You have *another* book project, however, that actually has recently been produced—*The Bust Book*, published with ADAM STANHOPE of ACIDARTZ.COM, right?

MARK: Let me tell you a little bit about *The Bust Book*. It begins with the bust of the "Eye of Horus"—you know, the "Eye in the Pyramid"—and then it goes all the way up to the bust of "Dancing Condoms." And in-between then it has numerous busts occurring throughout history in the United States, linking my collection of undipped blotters to these busts all over the U.S. What's valuable about this book, is that it is actually a history of blotter put together by the Feds. And it compares perforating machines, not just the artwork.

JON: So they can more accurately target where the undipped blotter may have entered into the market, by associating it with a specific perforation machine in a certain area?

MARK: Right. They break the history of blotter during this time into about eleven perforating machines, and then classify all of these different blotter images by associating them with specific perforating machines. Then they also provide the dosage that was on the seized street blotter, and the place and date of the seizure.

JON: Are there some busted hits in there that had the same image, but which had been perforated by two or more different machines?

MARK: Yes, thank God. What's neat about it is that you get to see that dosages on the same art also vary—there's some "Shields" in there that go down below 20 mics, and there are others that are around 80 mics. There's some other minor classifications in there too. For example, there's signed blotter, captured in King's County, from a friend of mine that has the second-largest blotter collection—a great guy called MAGIC MIKE.

JON: The interest in collecting blotter art has recently mushroomed into a huge phenomenon. There are many more people collecting it now than there were even two or three years ago.

What do you attribute that to? Is the desire to collect primarily driven by people who nostalgically look at a specific sheet, which reminds them of a certain time in their life when they were taking those hits? Or is there something else at play?

MARK: Well, preferably there *is* that association going on, and people are collecting their favorite hits. I remember being interviewed by a guy once, who works for *The Washington Post* now, and he was telling me that he had only tripped once, but it was under the pyramids at a DEAD show, and it was on an “Eye of the Pyramid” hit. Of course, when he saw a sheet of that framed up, I could see him flashback a little bit. So, I think that the beginning blotter collector does look for the one that “did it.” And then as one gets into it, the whole field becomes fascinating. Even the “vanity” blotter thing that is going on now—which never sees a drop of acid placed on it—for me, is an incredible achievement.

JON: It is indeed. On the other hand, there is a practical aspect to the “vanity” approach. These days we have hundreds of thousands of blotter images produced solely with the idea that they are only for art’s sake. Yet some people may chip off bits of this mountain and divert it to the street. In a pinch, it can be *practical* as well as alluring.

MARK: That’s the advantage of the time we are living in today. When blotter paper wasn’t considered an art form, it was a death sentence to be caught with a stack of it. And now it is kind of an honor to have a framed-up piece in your living room. It’s a good way to approach the topic without drawing a big line on a mirror.

JON: And with your BLOTTER BARN approach, there’s a whole new angle to the presentation of blotter art, taking it to an even higher level. Someday the name “McCLOUD” will be spoken in the same breath as “WARHOL.”

MARK: It’s true that I am trying to sneak them into the museums, I confess. My dream is to hang one in a museum somewhere, and have it work both ways. Have it be a valid art piece, and then, “Hey—nudge, nudge—that’s a four-way.”

JON: A *gigantic* four-way! [laughs]

MARK: I think that’s the next step to take. That’s the way to go with it and be true to my cause, which is to be an artist, and also perhaps invoke some penal reform. I’m hoping that I can eventually get one into the Vatican.

JON: What year did you start collecting?

MARK: In the late 1970s. I was still eating them back then, so my collection was kept in the freezer. And I had some that I would never eat, that ended up getting framed. But with most of them, I was scarfing them. So I kept them in the freezer for maybe the first five years of the collection. It wasn’t until I found this little old framer up on Noe Street, that I started framing them. And I only started out framing four-ways, and like nine hits—little tiny things. He didn’t know what they were. So I went to pick up a big framing job once and the shop was closed, and I thought, “Oh *fuck!* I bet this guy licked his fingers.” You know, because they were all loaded back then. I couldn’t find any undipped sheets back at that time. I was like anyone else.

JON: When I was dealing with the blotter art that I commissioned STEVEE POSTMAN to design for LSD’s 60th anniversary, some of which was signed by ALBERT HOFMANN and created as a fundraiser for EROWID and MAPS, I took a few of these autographed sheets to AARON BROTHERS to have them framed. AARON BROTHERS has a ludicrously low insurance amount per piece of art that you leave with them—something like \$200.00—that they will pay you if the trained monkeys they have working at their store mess up your art while they are framing it. Most of the 60 signed and numbered pieces that *are* available for sale have now sold, and the remainder that are available at the moment are going for \$1,500.00 each. And they will no doubt only go up in value. So I had to leave a few of these that were being framed there at the store for about a week. The manager had no idea of their *value*, right? But she clearly knew what they were used for on the street, and she thoughtfully suggested that the art be retained in the store’s safe. I think that she was worried that some hungry monkey might end up eating the art.

MARK: Right. Yeah, it was back when I saw a little hit of that HOFMANN design—you know, 20 hits of that “Father of LSD” design—that’s when I said to myself that I was going to start framing them. I included that blotter on the cover design for this issue of *The Entheogen Review*.

Anyway, I was on the board at the SAN FRANCISCO ART INSTITUTE back then, and they had this show every summer that was open to the public. As a board member, I suggested, “Since it is the 20th anniversary of the Summer of Love, I thought that we could show this.” I showed them my little blotter collection, and they said, “Cool dude.” And that’s how it happened. But you know, it was a fluke, because no one in

their right mind would have shown blotter back then. Only the S.F. ART INSTITUTE, of anyplace on the planet, would have done it. And then JACAEBER KASTOR came to that show and saw it, and asked me to do an exhibit at his gallery, PSYCHEDELIC SOLUTION, in New York.

JON: What ended up happening with that gallery? It was open in the mid-1980s, and then it closed down in the mid-1990s.

MARK: It just burnt JACAEBER out, and I can see why. He had half of the gallery dedicated to original art. He was showing people like MARK MOTHERSBAUGH, and AXEL—my favorite blood painter and silversmith, who used to do lost-wax work for H.R. GIGER and SALVADOR DALI. But then he had the other half of his gallery, where they were flipping posters. And it was the grind of the crowd flipping posters day-in and day-out that got to JACAEBER. If he had just said, “Hey, get out of here” to the poster crowd, or had done that in a separate spot perhaps, he might still be open. But the grind got him. Ten years of that grind will knock you out of the lottery.

It’s really hard to find a good art dealer. These days you can still call up JACAEBER and buy a JIMI HENDRIX watercolor from him for b’jillions, out of his living room. But it’s too bad that he couldn’t keep the gallery going. It was a perfect location—it was across from ELECTRIC LADYLAND STUDIOS. We all tripped the night of my opening, and then shut down the gallery to give PETER MAX a private viewing. He came in with this crowd of psychics, who were all telepaths. I don’t know if you’ve met that crowd yet, the telepaths, but man—they know you’re coming. They swept the place before he came in the building, to make sure that there weren’t any narcs in there. One look at you, and they know what you are thinking; they can see what you think. PETER was funneling lots of money into Congress at the time, trying to “turn on” Congress. He’s had some legal problems recently, but I like the guy. PETER’s one of my heroes. And he spends a lot of money trying to psychedelicize Congress, truly. He’s a weirdo.

I think that the interest in psychedelic art, that has been increasingly growing, is inevitable. It’s our time. The few and the proud have turned into the many. It’s left the ghetto. Slowly people have been able to *integrate* the psychedelic experience, and develop the psychedelic *individual*, and that’s what we’re seeing. It’s manifesting itself in the visual art world more. Of course, it has done this forever in the music scene, but now the visual arts are just starting to catch up. The phenomenon of blotter art as a collectible is just a reflection of the psychedelic individual’s new status in the 21st century.

JON: There’s many more of us now.

MARK: Exactly. And we’re all over in different countries. I was looking at a web page on EROWID today, and there was a donation up there from some nut in Buenos Aires, a little “Cheshire Cat” blotter image. So it’s really a worldwide phenomenon.

JON: The 1960s have been traditionally depicted and thought of by many as the psychedelic heyday. But I believe that there are *way* more people taking psychedelics right now than there ever were in the 1960s. Society in general may not see this; it doesn’t appear as explicit to them, because the radical political change is no longer as strongly associated with it, nor even the overt and “shocking” fashion statement. So psychedelic use today doesn’t draw nearly as much public attention as it did in the 1960s, but there is a lot more use actually happening. This is particularly easy to see when considering *Cannabis*, and it can be shown statistically via web page hits. For example, the web site POT-TV.NET gets over 800,000 page hits per day, and about 125,000 individual users per month. And even the more general-interest psychoactives web site EROWID.ORG recently reached around 500,000 page hits a day at their site. That is evidence of massive contemporary interest in this area.

MARK: There are many more people tripping now. I mean, suppose that there was the same amount of acid being made now as there was in the 1960s—and of course you would have to multiply this on a “per hit” basis by at least five times, considering that the doses back then were 250 to 500 mics, right? And today they are more like 50 to 100 mics. However, there are *many* more acid doses being produced now than can be accounted for by a simple multiplication by five times. There is much more acid being produced now. *Much* more. It’s turned into a world phenomenon and a major manifestation. It’s no longer just an American or a Czechoslovakian enterprise. It’s being made in many countries. The idea of Canadian acid in the 1960s was unheard of, for example.

JON: And I suspect that the interest will only continue to grow. Thanks for your contributions to this art scene MARK, and for taking the time to speak with me for *The Entheogen Review*. ☉

# THE HISTORY OF THE FIRST *SALVIA DIVINORUM* PLANTS CULTIVATED OUTSIDE OF MEXICO

by DANIEL J. SIEBERT

Several years ago I began working on a comprehensive book about *Salvia divinorum*. The book, tentatively titled *Divine Sage*, includes a chapter that describes the history of the plant in extensive detail. In the course of my research I have spoken and corresponded with many of the people who were involved in establishing and distributing the plant in the United States during the early years following its introduction to this country. I have also had the privilege of examining R. GORDON WASSON'S correspondence and field notes.

It has been generally assumed that *Salvia divinorum* plants were first introduced to the United States by WASSON. He collected several specimens of *hojas de la Pastora* between June of 1960 and October of 1962. In an effort to get the plant identified, he sent his specimens to CARL EPLING, who was at that time the world authority on New World *Salvia* species. Dr. EPLING had been teaching at the UNIVERSITY OF CALIFORNIA AT LOS ANGELES (UCLA) since 1924 and became Professor Emeritus in 1961. Much to WASSON'S frustration, the first few specimens that he obtained were, for various reasons, not sufficient for species identification. Finally, in October 1962, after much effort, WASSON obtained specimens that were sufficient. He secured these specimens during an expedition that he made to the Sierra Mazateca with ALBERT HOFMANN. EPLING identified it as a new species and published his description in December 1962, together with a separate paper by WASSON in which he described the general role of the plant in Mazatec culture (EPLING & JÁTIVA-M 1962; WASSON 1962).

Many people, including myself, have assumed that EPLING propagated a live plant from some of the material that he received from WASSON. This assumption was partly based

on the knowledge that EPLING provided a live *Salvia divinorum* plant to the UCLA BOTANICAL GARDEN in 1963, just a few months after receiving WASSON'S final shipment of specimens. It has been generally assumed that all of the *S. divinorum* plants grown in the United States up until 1979 were propagated from cuttings that originated from the plant established by EPLING (additional live specimens were introduced to the United States in 1979 by LEANDER J. VALDÉS III). This original strain has been distributed all over the world. It is commonly called the "WASSON and HOFMANN" strain—a name that identifies its presumed collectors. This name was first applied to the strain in 1992 by the now-defunct specialty botanicals company ...OF THE JUNGLE. They began listing it in their catalog as the "WASSON and HOFMANN" strain to differentiate it from another strain that they introduced that year, the "Palatable" strain, which was collected by anthropologist BRET BLOSSER in December 1991. As it turns out, the "WASSON and HOFMANN" strain is misnamed. This strain was not propagated from WASSON'S specimens—it was propagated from specimens that were obtained by another remarkable man, psychiatrist and ecologist STERLING BUNNELL. It is quite clear from WASSON'S correspondence with EPLING and others that he never brought live specimens of *S. divinorum* to the United States. The specimens that he obtained were all dried and pressed in Mexico.

In June of 1962, BUNNELL traveled to the Sierra Mazateca with poet, playwright, and essayist MICHAEL McCLURE. The main purpose of their journey was to collect live cultures of psilocybin-containing mushrooms for research that they were involved in at the INSTITUTE OF PERSONALITY ASSESSMENT AND RESEARCH at the UNIVERSITY OF CALIFORNIA AT BERKELEY (UCB). BUNNELL returned again with his

newlywed wife several months later, in the fall of 1962. While visiting the village of Huautla de Jiménez, he obtained live specimens of *hojas de la Pastora* from the Mazatec *curandero* ISAURO NAVE—who was, by all accounts, a truly extraordinary individual. BUNNELL brought the specimens back with him to California and planted them at his home. This was the first time that *S. divinorum* was grown outside of Mexico. He also deposited a pressed specimen at the UCB HERBARIUM. EPLING's botanical description of the species had not yet been published, and so the identity of the species was at that time still unknown (except to EPLING, WASSON, and a few of their close associates). BUNNELL's herbarium specimen, which was in full bloom, was collected on November 24, 1962, just six and a half weeks after the holotype specimen collected by WASSON. EPLING's description of the species was published together with WASSON's ethnographic

paper just a few weeks after BUNNELL returned from Mexico. After seeing EPLING's paper, BUNNELL traveled to Los Angeles to meet with him and to give him plants to grow at UCLA. An accession log of the UCLA BOTANICAL GARDEN (now the MILDRED E. MATHIAS BOTANICAL GARDEN) notes that a living specimen of *S. divinorum* entered the collection in 1963. The original accession number is UCLA 63-104. BUNNELL also gave a specimen to ALEXANDER SHULGIN, who at that time was working for DOW CHEMICAL in Walnut Creek, California. BUNNELL's plants were later propagated and shared with other botanical gardens and botanists, and those plants were further propagated. This strain, which should correctly be called the "BUNNELL" strain, was the first to become available commercially, and it remains the most common. Certainly it is the most widespread strain in cultivation today. ☉

# MIND STATES

## OAXACA

September 15–20, 2004

*Oaxaca, a sun-drenched city cooled by Mexican mountain breezes, is regarded by many as a spiritual center because of the ancient Zapotec and Mixtec cities that dominate the nearby hills. It is also a multicultural center—people from all over the world come to see the arts and crafts of the 16 different indigenous groups practicing their traditional ways in the region.* — IRIS DENTON, *Whole Life Times*, June 1998

The state of Oaxaca in Mexico is infamous due to the (re)discovery of several powerful entheogens in use by Mazatec healers in the Sierra Mazatec mountain area, including *Psilocybe* mushrooms and *Salvia divinorum*. In particular, the town of Huautla de Jiménez attracted those interested in discovering more about the native use of these visionary plants. Oaxaca City is the first stopping point in Mexico for many wishing to take the beautiful 6-hour scenic drive through a multitude of ecosystems to the Sierra Mazateca. In Oaxaca City, *curandera* MARÍA SABINA clearly holds the status of a folk hero—one can even find T-shirts with her face on them sold in the city square! Oaxaca is a great little city, with delicious food, friendly locals, and tons of art, both traditional and contemporary. It is home to the world's largest, longest-running open air market, and of course a trip to the amazing Zapotec ruins at Monte Albán will be part of the adventures during the MIND STATES OAXACA seminar. Join us in Oaxaca City! Spend a week in an intimate, relaxed setting, having stimulating conversations with the following presenters:

DEIRDRE BARRETT • BRUCE DAMER • ERIK DAVIS • ALEX GREY • ALLYSON GREY • JON HANNA • MANUEL JIMÉNEZ (tentative)  
JONATHAN OTT • DANIEL SIEBERT • ANN SHULGIN • SASHA SHULGIN • ALLAN SNYDER (tentative) • MARTHA TOLEDO

Each ticket is \$900.00 per person (early bird, before July 1), \$1,200.00 per person (from July 1 through September 10). Price includes admission to all lectures and field trips, accommodations (a single space in a double-occupancy room), access to the swimming pool and all other hotel amenities, and delicious Mexican breakfasts and lunches (vegetarian and vegan available). Airfare and transfer to the hotel (about ten minutes by taxi) are not included. Early registration is suggested, as space is limited. Payment for ticket(s) should be sent to: Mind States, POB 19820 (Dept. ER), Sacramento, CA 95819, USA. Credit card payment available through PayPal: send money to [mindstates@prodigy.net](mailto:mindstates@prodigy.net). For speaker bios and additional information see: [www.mindstates.org](http://www.mindstates.org).

## DOCUMENTARY FUNDRAISING

# ANN & SASHA: A CHEMICAL LOVE STORY

Contact CONNIE LITTLEFIELD at [connie@conceptafilm.com](mailto:connie@conceptafilm.com)

Director CONNIE LITTLEFIELD and cinematographer KYLE CAMERON have been filming with ANN and SASHA SHULGIN over the past two years, making a documentary that will bring *A Chemical Love Story* to the world. CONNIE and KYLE believe that telling this story is an important step towards increasing public acceptance of psychedelic use.

The Canadian government fully funded CONNIE's earlier effort, *Hofmann's Potion: The Early Years of LSD* through the NATIONAL FILM BOARD [www.nfb.ca/hofmann](http://www.nfb.ca/hofmann). This film features interviews with ALBERT HOFMANN, LAURA HUXLEY, RAM DASS, RALPH METZNER, STANISLAV GROF, ABRAM HOFFER, HUMPHRY OSMOND, DUNCAN BLEWETT and MYRON STOLAROFF, and it relates the details of the discovery of LSD, as well as its subsequent use in psychotherapy and to treat drug and alcohol addiction, prior to its eventual ban worldwide. The film has been broadcast extensively in Canada, Europe and on the SUNDANCE CHANNEL in the USA. It has also been used in university courses and community groups. Of this film, MARK ACHBAR—co-director of *Manufacturing Consent* and *The Corporation*—has stated: "*Hofmann's Potion* is an elegant, deftly constructed piece of filmmaking. CONNIE LITTLEFIELD brings an intelligent and compassionate eye to her ageing, highly engaging subjects. She brings us this gem of a film on the occasion of the 60th anniversary of the invention of LSD—just in time for a widespread revival in interest in the clinical and spiritual benefits of consciousness-enhancing substances."

*Ann & Sasha: A Chemical Love Story* is being produced independently. While CONNIE and KYLE have many of the skills and much of the equipment necessary to bring this story to the screen in a cost-efficient manner, they also live in Nova Scotia, Canada, so their travel expenses are relatively high.

Shot on digital video and 16 mm film, this documentary will be one hour in length. It will portray ANN and SASHA's work and lives, as well as the hypocrisy of a society in which some drugs are "good" and other drugs are "bad," where people like ANN and SASHA are both idolized and demonized at the same time. TIMOTHY LEARY called ANN and SASHA SHULGIN "two of the most important scientists of the 20th century." The implications of the SHULGINS' work extends far beyond national boundaries and into the future. You can help make this film a reality by making a tax-deductible donation.

While large donations are tremendous, small donations from many individuals also add up and will be of great help. Please consider donating \$10.00, \$25.00, \$50.00, or whatever you can afford. Those who can make donations of \$50.00 or more will receive a VHS copy of *Hofmann's Potion: The Early Years of LSD*. Donations to this project can be made by sending payment to MAPS, 2105 Robinson Avenue, Sarasota, FL 34232. Payment with a credit card can be made over the phone at (941) 924-6277, or electronically via [www.maps.org](http://www.maps.org). Please specifically note that your donation is being made for this film. For more information on *A Chemical Love Story* and other productions, please see [www.conceptafilm.com](http://www.conceptafilm.com). ☉

# OUTDOOR MUSHROOM CULTIVATION: MEANS AND BENEFITS

by TYLER D. FLYER

In recent years, much attention has been given to indoor mushroom cultivation employing sterile culture techniques and a controlled growing environment. Thanks to the Internet's mycological communities and more recently, *The Entheogen Review* (PAYE 2001; PAYE 2003), the PF Tek has emerged as the method of choice for those wishing to grow mushrooms indoors in the privacy and comfort of their own homes. While there is no denying that the ease and relative productivity of the PF Tek make it a great method for beginners, it needn't be the only method available to home cultivators.

It has been my experience that outdoor cultivation is a far superior method to indoor cultivation

based on cost, simplicity, productivity, and most importantly, potency. I am indebted to the ground-breaking achievements of mycologist PAUL STAMETS, who has worked for the last thirty years to further the development of mushroom culture and who has authored two definitive cultivation manuals, *The Mushroom Cultivator* (AGARIKON PRESS 1983) and *Growing Gourmet and Medicinal Mushrooms* (TEN SPEED PRESS 2000). Both books can be purchased directly from STAMETS via his web site ([www.fungi.com](http://www.fungi.com)), and both are highly recommended.

Commercial cultivation has come a long way from when the French first established outdoor beds inside caves and grew *Agaricus* (white button) mushrooms in the 18th century. Although commercial cultivators have refined indoor cultivation, allowing them to grow crops year round, most mushrooms now grown commercially were originally grown using natural culture techniques. People have been successfully

growing mushrooms outdoors for personal consumption for hundreds of years. It is my hope that by sharing my interest in outdoor culture, others will be inspired to try their hand at what I have found to be an enjoyable, enriching, and rewarding undertaking.

Natural culture, by definition, is simply the natural cultivation of mushrooms outdoors. After a suitable mycological area is constructed and inoculated with mushroom spawn, the cultivator simply allows Nature to take control. The key to success is creating an environment where the selected mushroom mycelium vigorously expands. The rate of mycelium growth, the time from

inoculation until fruiting, the duration of fruiting or time between flushes, and the quality of the fruit depend largely upon the quality of the spawn, the location of the cultivation bed, the selected substrate materials, and the prevailing weather conditions. Generally, the time of year when mushrooms are known to fruit in the wild is also the same time at which the inoculated outdoor bed can be expected to fruit. Although outdoor cultivation does not yield fruiting as often as indoor cultivation, the flushes can be even more prolific as long as the cultivator pays modest attention to the bed at critical aspects of the mycelium life cycle. For instance, while the indoor cultivator competes primarily with molds, wild mushrooms are the major competitors outdoors. If one uses old, aged wood chips and a low inoculation rate (5–10% spawn-to-substrate ratio), one can expect diverse mushroom species in the cultured beds. The easiest way to overcome these problems is to start with fresh, clean materials and to use at least 20% ratio of spawn to substrate.

## SITE LOCATION

The first step is to give careful consideration to the location of the outdoor beds. Some mycologists prefer to grow in beds located discreetly in their own backyards. But unless one lives in a fairly secluded area, I think that there is something to be said for growing and maintaining inconspicuous beds on landscaped public property such as courthouses, firehouses, libraries, police stations, schools, universities, and my personal favorite—suburban parks. By placing such mushrooms in the public domain, it is my hope that individuals educated enough to identify them can continue to perpetuate the mushrooms' existence.

One location worth specifically commenting on is cemeteries. Although some may feel that cemeteries are suitable locations for mushroom patches due to their extensive sprinkler systems, seclusion, and light foot traffic, I think that the most important question is whether or not the water on the cemetery property is potable. If the cemetery receives its water supply from the city, then one can be fairly certain it is a safe source for mushroom cultivation. But if the water is supplied by a well on the property, then chances are good that it may not be drinkable and, in my opinion, this is inappropriate for mushroom cultivation.

A suitable site for a garden is easy to choose and worth choosing correctly. The two most beneficial factors in a successful location are: 1) moisture and, 2) shade. The best indication of a successful location is simply to take a note of where you have seen mushrooms growing during the rainy season. By observing where water traverses after a heavy rain, one may realize the difference between too much water and not enough. For example, a gentle slope bordered by shrubs and other shade-giving plants is ideal. Borders along fences, sidewalks, and parks are great locations to put wood chips, especially underneath hedges or among tall grasses. The foliage acts as micro-condensers to supply plenty of humidity and shade to the mycelium. As a general rule, the thicker and denser the flora around the site, the less likely one will need a casing layer to ensure a humid micro-climate for the substrate. While I caution against exposure to direct sunlight because it dries out the wood chips, others have reported success growing mushrooms in vegetable or flower gardens (particularly rhododendrons). Gardens are blessed with plentiful waterings, and the shade provided by plants tends to keep humidity high near the ground. Always look at the north side of any wood chip pile or landscaped areas, as this will have the most shade. One advantage of parks and other

landscaped areas is their use of sprinklers. If the grass is green nearby, it's a good bet the area is watered frequently enough to support wood chips. If there are no sprinklers nearby, examining the area in the early morning for dampness would indicate whether or not it receives moisture daily, either as dew from foliage or condensate from overhead trees.

One last suggestion worth mentioning is that of "confining" the site. Any location that has definitive boundaries to prevent sprawl is preferred over an open, undefined area. It has been my experience that when the substrate is fully colonized and contained within distinct borders, fruitings tend to be much more prolific and longer lasting. It is as if the mycelium knows that there is no where else to go and initiates a massive "Fruit Now!" primordia formation in response to its confinement. This is an awesome sight that truly must be seen to be believed, with the mycelium expanding and pushing the substrate upwards several inches. Under such circumstances, it is rather effortless to harvest several pounds in a few square feet.

## ACQUIRING THE DESIRED SPECIES

This step will actually prove to be the most difficult for many mycologists. Along the Pacific West Coast where I live, there can be found several interesting mushroom species within the genus *Psilocybe*, such as *P. azurescens*, *P. cyanescens*, *P. cyanofibrillosa*, and *P. stunzii*. Though not a complete list, this demonstrates the diversity and distribution of these temperate, wood-loving *Psilocybes*. These species are by no means confined to the West Coast, as I know several acquaintances who have reported success at naturalizing *P. azurescens* and *P. cyanescens* in the Midwest around the Great Lakes region, as well as *P. caerulipes*, which is naturally found in the Midwest. Others have personally encountered *P. cyanescens* more so than any other *Psilocybe* species, but *P. cyanofibrillosa* is, for some, the unsung hero in the genus due to its prolific fruiting, pleasant taste, and above average potency. If one is unable to locate any wood-loving members of this genus on one's own, then I suggest joining a local mycological society or any one of the Pacific West Coast societies that quietly display members of the *Psilocybe* genus during their fall exhibitions. For more information on the identification, distribution, and habitats of those psychoactive members of the genus *Psilocybe*, I highly recommend PAUL STAMETS' *Psilocybin Mushrooms of the World* (TEN SPEED PRESS 1999). Although this is not a cultivation manual, it is the best work to date for identification purposes, filled with descriptions and beautiful color photographs of entheogenic mushrooms.

Of course, I would never encourage anyone to grow, possess, or consume such majestic and notable mushrooms as those *Psilocybes* that contain psilocybin/psilocin, as that would be illegal. Instead, I refer to King Stropharia (*Stropharia rugosoannulata*) to demonstrate cultivating these delectable wood-loving mushrooms.

The obvious advantage of the wood-loving mushrooms is the ease and simplicity of their growing substrates, which can be made from readily available materials. Provided that one selects a wood-loving mushroom species to grow, there simply is no need for manure or even grain substrate. Unless one insists on working with manure and making their cultivation experience as difficult and smelly as possible, I strongly encourage people to consider only those mushrooms that grow on woody substrates. For example, while some prefer to treat their substrates by sterilization or pasteurization, I have always left my materials untreated in their natural state with good results—provided that the substrate was fully colonized within three months or less.

Mushrooms can be cultivated through a variety of methods, depending on the grower's skill and starting materials. Some techniques are very simple and involve no technical expertise. Other methods, such as those involving sterile tissue culture, are much more technically demanding and out of the range of most home cultivators. The simpler methods for mushroom cultivation, requiring little or no technical expertise, are: 1) Spore mass inoculation, 2) Transplantation, 3) Inoculation with pure culture spawn, 4) Cardboard culture and, 5) The Mushroom Motel.

## SPORE MASS INOCULATION

Spore mass inoculation is by far the easiest way to grow mushrooms outdoors, although it lacks the rapid colonization of other methods and can result in sporadic "islands" of mycelial growth. Spore mass inoculation is accomplished by broadcasting spores onto prepared substrates outdoors. Spores must first be collected from the desired species. This can be accomplished by taking a mushroom cap that has been severed from the stem and laid, gills down, inside a plastic Ziploc® bag, or on top of a pane of glass or index card with a bowl or glass placed over the cap to minimize air movement and water loss. Within 12 to 24 hours, most mushrooms will have released thousands of spores in an outline similar to the radial symmetry of the gills. This outline, called a spore print, can be saved by simply sealing the template on which the spore print was taken. If one uses an index card or pane of glass to take a print, a second index card or glass pane can be placed upon the print and the edges sealed with masking tape. Once a spore print has been taken, it may remain viable for years, although viability decreases with time. Spore prints should be stored in a cool, dark location, free from moisture and temperature variation. When one is ready to use the spore print, the spores may be scattered directly onto the substrate, or first mixed with water before spreading onto the substrate. If one chooses to start a mushroom patch right away, one may wish to make a spore-mass slurry. This requires picking mature mushrooms and submerging them in a large bucket of water. One may opt to add one teaspoon of salt to inhibit bacteria and one cup of molasses to stimulate germination. After letting the mixture stand covered for 24 to 48 hours at room temperature, the solution is ready to be poured over the prepared substrate material. I know of one individual who uses this method successfully, with a slight variation in that the mature mushrooms are first placed into a food processor and made into a puree before adding the contents to the bucket with water, molasses, and salt.

### *Mimosa tenuiflora*

[= *M. hostilis*]

root-bark from Brazil

\$160.00 per kg, \$16.00 per 100 grams, \$1.60 per 10 grams.

### *Anadenanthera peregrina*

seeds from Brazil

\$200.00 per kg, \$20.00 per 100 grams, \$2.00 per 10 grams.

With either, any amount you like costs the same per gram!  
Shipping by Priority Mail (2–3 days) with tracking:  
\$5.00 for 1–500 grams, \$10.00 for 501 grams to 1 kilogram.  
\$5.00 more for each additional kilogram.

## TRANSPLANTATION

Transplantation is the moving of mycelium from natural patches to new habitats. Most mushroom patches have a vast mycelial network emanating from beneath each mushroom. Not only can one harvest mushrooms, but portions of the mycelium can be gathered and transferred to a new location. This method ensures the quick establishment of a new colony without having to germinate spores or buy commercial spawn. When transplanting mycelium, I recommend using a paper or plastic sack with a lightly moistened piece of cardboard or paper towel that will prevent dehydration. As long as the mycelium is kept in a cool, dark place, the mycelium will remain viable for months. I have stored mycelium samples in the refrigerator, wrapped up in damp brown paper and sealed in plastic Ziploc® baggies, for years with no apparent loss of vitality.

I recommend the gathering of saprophytic mycelium that grows on woody debris rather than mycorrhizal mycelium that grows in conjunction with another living organism in a mutually beneficial relationship. When one gathers wild mycelium from mycorrhizal mushrooms, it places the parent colony and living tree host in jeopardy. One must be sure to replace the divot with wood debris and to press it tightly back into place. Mycelium left exposed is more prone to disease, insect invasion, and dehydration. If properly done, transplanting saprophytic mycelium does not place the parent colony of wild mushrooms into jeopardy.

Be wary of greed. Just because one “discovers” a patch, certainly does not give one “claim,” or “ownership.” Even though one may have the ability to harvest an entire desirable patch, I encourage folks to take only the minimum amount of mycelium needed to get started. Once a patch has been significantly reduced, it loses a great deal of its vitality and may prove difficult to re-establish itself. One may choose to complete the circle of life by returning to the patch in the springtime and “feed” the patch by adding fresh wood chips, thus ensuring the mycelium’s existence for another year or longer, depending on the quantity and quality of wood chips.

When collecting wild mycelium, an emphasis should be made on attempting to collect mycelium that is clean and relatively free of dirt. The mycelium should ideally be moist, clean and white with a fresh, invigorating mushroom aroma. Some mycologists recommend mining mycelium from colonies such as those found two to six inches deep along the margins of sawdust piles near sawmills, nurseries,

composting sites, or rose and rhododendron gardens. Unlike patches found on soil, mycelium networks found in sawdust tend to be vast, clean, and relatively free of competing fungi. I would suggest only gathering mycelium from those colonies where one has previously identified and collected desirable mushroom species. I have had success with collecting both rope-like strands of mycelium that were relatively free of dirt and debris, as well as taking several thin (quarter inch diameter) branches that were covered with mycelium and then chopped into one inch lengths and added to prepared substrate material.

## INOCULATING WITH PURE CULTURED SPAWN

The use of pure cultured spawn to inoculate outdoor beds was revolutionized in 1933 by Dr. JAMES SINDEN’s discovery (U.S. patent no. 1,869,517) that grain could be used as a substrate for spawn, and then used to inoculate larger cultivation beds. While grain can be used as spawn for outdoor beds, it is better suited for indoor cultivation. Grain spawn can quickly attract birds, insects and slugs seeking out the nutritious inoculated seed for food. Because of this, wood-based substrates such as sawdust, dowel plugs, and wood chips are preferred for outdoor cultivation. Sawdust has the distinct advantage over other spawn substrates in that it has a greater number of particles per pound than any other substrate. Sawdust has the tendency to encourage rapid wispy mycelium growth at first, but because of the small chip size, cannot support the dense mycelial network necessary for fruit-bodies and quickly peters out unless introduced to larger particles. When the inoculated sawdust is added to wood chips, rapid colonization is assured because of the sheer number of inoculated particles. The sawdust and wood chips form a matrix in which the distance between the mycelial fragments is lessened, and allowing complete colonization faster than any other spawn substrate. The faster the colonization, the less likely competing fungi will have the opportunity to grow and establish themselves on the substrate. Care should be given to only use the sawdust of hardwoods and to entirely avoid conifers such as Pine, Cedar, and Redwood, as these woods contain resins that inhibit mycelium growth.

I cannot stress enough the importance of rapid colonization. If the spawn is too dispersed, the inoculated particles will not be close enough to form the contiguous mycelial colony required for fruit-body development. I have had the best success using at least 20–25% spawn to substrate ratio. For instance, if one has a one gallon jar of sawdust spawn, three

to four gallons of prepared substrate can be inoculated with a high probability of success. Although this may seem like a high ratio, rapid colonization is assured, taking as short as one week or as long as several months. Once the beds have been fully colonized, the grower may choose to expand the beds by adding more substrate material or induce fruiting if environmental conditions allow.

## CARDBOARD CULTURE

This use of cardboard is especially suited for the wood-loving *Stropharias* and *Psilocybes* because of their fondness for paper products and woody debris. The cardboard also seems to inhibit the growth of competing molds and fungi due to their substrate selectivity. The effectiveness of cardboard is due in part to the corrugated grooves that allow mycelial growth to rapidly channel through in search of food, and also to the increased surface area that allows for greater water absorption, and hence higher humidity for mycelium development. The mycelium likes its environment to be damp, not overly soaking wet and the corrugation permits greater water retention per square area than flat paper.

In order to use cardboard to jump-start mycelial growth, the cardboard must first be soaked so that an outer layer of cardboard can be peeled away, revealing the corrugated middle layer. Care must be given to soak the cardboard only long enough to wet the glue that binds the paper layer together. Soaking the cardboard for longer than 12 hours only softens the paper layers to the point where they tear, rather than peel apart. I have had best results laying the cardboard vertically in a plastic bin so that the corrugated channels are facing straight up and then slowly watering the cardboard so that water penetrates the middle layer. When I have laid the cardboard to soak horizontally, I have noticed that air can be trapped in the middle layer, making it difficult to wet the glue and peel the paper layers apart.

While some may prefer to recycle their cardboard boxes in this manner, all the soaking and peeling proved to be too much work for me, and I began to look for a better alternative. I soon learned that a 100 yard roll of 18-inch wide, one-sided corrugated cardboard could be acquired from any packaging store for around fifteen dollars. This proved to be a very wise purchase that I have not since regretted. The pre-soaking and peeling steps are completely unnecessary and corrugated cardboard is simply unrolled, cut to the desired length, and lightly hosed with water. After wetting both sides of the corrugated cardboard, it is allowed to hang vertically for a moment or two to let the excess water run off. Then, stands of mycelium, inoculated wood chips, or even the fuzzy tissue base of the stem of fresh mushrooms can be sandwiched between layers of the wetted corrugated cardboard (like lasagna). I noticed that the top-most cardboard layers tend to dry out the fastest, inhibiting mycelium growth, and the bottom-most layers can easily become too wet for mycelium growth; hence, the middle area seems to be the most productive environment for mycelium development. This is worth keeping in mind, so that one can either expect to lose a portion of the starting pile, or one may wish to pad the top and bottom of the pile with extra cardboard, further insulating the middle layer. Since the corrugated cardboard can be prone to over-watering, I have had best results with directly watering the cardboard conservatively and draping wet cardboard on top of the cardboard and mycelium matrix. This allows a humid environment that is favorable to mycelium development without creating a soaking wet one that is detrimental to mycelial growth. If one prefers to place the cardboard and mycelium layered upon one another into a plastic bin, I recommend using one that has holes in the bottom, such as a recycling bin, to allow excess water to drain. STAMETS recommends that once the mycelium spreads and covers a sizeable portion of the corrugated cardboard, the myceliated cardboard can be positioned in an ideal location and wood chips may be placed on top of the cardboard to create a cultivated bed. However, I have experienced the chips failing to colonize due the corrugated cardboard collecting standing water, thereby destroying the mycelium. I deal with this problem once the cardboard is suitably myceliated by cutting the cardboard into small sections (one to three inch square) prior to mixing with suitable wood chips. This is similar in theory to sawdust spawn in that by increasing the number of mycelium particles, the colonization time is reduced and subsequently the window for substrate competitors is lessened.

## THE MUSHROOM MOTEL

One productive method that has been developed over the last several seasons by my colleagues and myself is referred to as the “Mushroom Motel.” This method is ideal where space is a limiting factor. Instead of preparing and inoculating cultivated beds on the ground, plastic trays of inoculated wood chips are vertically stacked upon one another. Previous to the Motel’s conception, I was quite fond of using plastic recycling containers for Cardboard Culture, due to the holes in the bottom of the bins that allowed for excess water to drain. The problem I soon noticed with using 18-inch deep containers was the difficulty in maintaining uniform moisture throughout the many layers of cardboard and wood chips. I solved this dilemma by using stackable plastic trays that beverage distributors use to deliver soft drinks to convenience stores and that are often found out back behind the dumpsters. The trays are four inches deep, have handles on the sides, and feature plastic grid bottoms for even greater draining capability. The trays are simply filled with fresh, clean wood chips mixed with myceliated cardboard or wood chip spawn, and covered with several layers of wet corrugated cardboard before the next tray is stacked upon the first and the process repeated. The cardboard layer on top of the wood chips serves to maintain a humid environment for the inoculated substrate in addition to acting as a contaminant barrier. Because the mycelium grows on the cardboard covering as well as the substrate, I rotate the coverings frequently

1. The chips are in the tray, covered with cardboard. There is nice mycelium growth on the wood as well as the cardboard. • 2. Two sections of cardboard are measured and cut for the breadth of the motel. • 3. One section of the cardboard is measured and cut for the length of the motel. • 4. The three sections of cardboard are watered and soaked with a garden hose. • 5. The damp cardboard is reapplied to the motel and secured with bungee cords. • 6. Here are two stacks of trays. Notice the ample use of cardboard around the top and sides of the motel. The top trays should always have a brick weight on them.

either to use the myceliated cardboard as spawn or discard at the first sign of undesirable contaminants. I have noticed that oftentimes the inoculated substrate benefits from having weight, such as a brick or two, placed on top of it. This seems to hold the wood chips together and in close contact with one another until the mycelium network is better established. By using stackable trays, one can add or remove material to ensure a nice, tight fit from one tray to the next, thus only the top tray requires a weight. In order to provide a high-humidity environment without over-watering the substrate, one may choose to drape wet cardboard over the stacked trays and secure with bungee cords.

The advantages of this method are obvious. The Motel is especially suited to expanding and one is only limited by the number of trays one wishes to "borrow" from the beverage distribution company. The stackable trays take up a minimum amount of space, yet can be quickly and easily taken apart to examine each tray for mycelium growth, and adequate substrate moisture. Because each tray is a quarantined level with cardboard above and below, the spread of contaminants is greatly reduced. Should competing fungi be identified on the cardboard or substrate, it is a relatively simple matter to remove the offending tray from the Motel, thereby isolating the contaminants. In addition, each tray may be individually watered as needed without fear of over-watering the other levels. Once the substrate has been fully colonized and inclement weather nears, one may wish to transfer a tray to a suitable site. A quick flip of the tray pops the fully colonized substrate out like a hot baked cupcake from a muffin tin. The substrate can then be adequately covered with straw, Douglas Fir boughs, leaves, or damp sphagnum moss. Although the colonized substrate can fruit within the Motel during favorable conditions, the substrate really seems to benefit from going from a confined area with minimal air exchange to maximum air exchange in an ideal, inconspicuous location. Provided that the weather is conducive to fruiting, one can expect to see fruiting commence within a week or so.

As one can see, there are quite a number of different options for the home cultivator to utilize. One may wish to try several different methods or to adapt techniques to find what works best for them.

7. The same two stacks of trays shown previously in #6, but now draped over with wet cardboard. • 8. An example of "dieback." The white mycelium has a brown center, possibly due to contamination of competing yellow fungus seen on cardboard in right side of the photo. • 9. The contamination is spreading, as seen by growing brown area inside the white mycelium.

The tray should be separated and dumped if necessary. • 10. A chunk of one tray was placed in a flower pot, where it fruited. • 11. As soon as the first cool weather of fall sets in, the contents of several trays can be spread out under these shrubs and covered with Douglas Fir boughs. • 12. A nice selection of mushrooming chunks, that were produced using the Mushroom Motel method.

## PUTTING IT ALL TOGETHER: PREPARING THE BEDS

Once one has chosen an appropriate site and acquired the desired mushroom starting material, it is time to prepare the appropriate substrate, and if necessary, the beds. Timing plays a key role in this step, and the cultivator may have to experiment on their part in order to find the right methodology that best suits one's technique and environmental conditions. Bear in mind that maximum fruiting is achieved when the beds are given enough time to fully colonize before cold and rainy weather begins, triggering primordia formation.

For instance, outdoor beds may be inoculated from early spring to early fall. Although sufficient time is necessary to allow for full colonization, so are favorable temperatures, ranging from 45–70° F (7–21° C). Once temperatures deviate from this range, mycelium production essentially stops until advantageous conditions return. With this in mind, I have known mycologists in warmer climates to put off constructing and inoculating their beds until early fall when temperatures are more favorable to mycelial production. Thus, if one likewise puts off developing and inoculating the substrate until early fall, a more modestly sized bed and a correspondingly higher rate of inoculation (> 30 % spawn to substrate ratio) may be required for faster growth to provide the dense mycelial mat required for fruit-body production. For most wood-loving mushrooms, at least four weeks are required to establish mycelium density sufficient to survive the winter.

The spring is the best time to acquire clean, freshly cut wood chips for larger cultivated beds in temperate climates. The ideal substrate is composed of wood chips one-eighth inch in diameter to four inches length, with a minimum of leafy matter. If one acquires wood chips from February through April when the sap is running and before trees develop their foliage, one is assured of having the highest possible sugar, nutrient, and water content in the chips with an absolute minimum leafy material. I think that it is worth emphasizing the importance of having clean wood chips. In my experience, clean wood chips colonize much more quickly than dirty or muddy chips and I believe that this is because the dirt seals the pores of the wood chip and actually limits the amount of wood that is exposed and made available to the mycelium.

It is my understanding that irregular one- to four-inch size wood chips provide an ideal compromise between the smaller chips that provide greater surface area for rapid colonization and the larger chips that support dense mycelium growth necessary for maximum fruiting. As previously explained, sawdust allows for rapid, wispy mycelium development, but unless added to larger wood chip pieces, it quickly loses its vitality. If fresh, hardwood sawdust is available, it can be added in a 50:50 ratio (by volume) to larger, one- to four-inch size chips, to form an optimized substrate matrix.

While PAUL STAMETS has reported good results utilizing wood chips and bark from some conifers, such as Douglas Fir, I have seen slow, reluctant mycelium growth when such Fir chips were used, and even this was only when other hardwood chips were supplemented into the substrate. For best results, I recommended using only broadleaf hardwoods rather than softwood pines. Fast-growing hardwoods such as Alder, Birch, Cottonwood, Eucalyptus, and Poplars have a greater

YAGE.NET specializes in the development and hosting of entheogen-related web sites with an emphasis on ethnobotanical suppliers.

We're also home to the largest collection of ayahuasca resources on the web.

amount of sapwood than heartwood, and thus possess a relatively higher amount of sugars conducive to rapid colonization. The trade-off is that such species will also decompose more quickly than denser hardwood species, such as Oak, which will support saprophytic mushrooms longer. The two species that I have seen the most voracious and rapid mycelium development with are Alder and Eucalyptus, and I would recommend refreshing the cultivated beds with fresh, clean wood chips once a year to ensure a healthy fall crop.

If one has access to a shredder or chipper to reduce woody debris and miscellaneous materials to mulch, one could experiment with a variety of different hardwoods and various organic refuse such as grape vines, corn cobs, corn and vegetable stalks as suitable substrate material. One advantage to shredding your own chips would be to design custom substrate blends, such as Alder and Oak, so that the rapid colonization of Alder is combined with the longevity of Oak.

If one would prefer to let someone else do the work, there are numerous local sources for fresh, clean hardwood chips. I have received fresh wood chips from the local utility company, the city parks and recreation forestry division, and neighborhood arborists without having to go through the hassle of acquiring a chipper and doing the manual labor myself. Both sources were more than happy to place my name on a list to receive a truckload full of chips. The only problem with this is the chance of receiving wood chips from multiple species of trees. I recommend using an excuse such as mulching the flower beds, laying sod, or planting rhodo-

dendrons, in order to justify insisting on getting hardwood chips. In my opinion, it is worth going to the extra trouble and expense to ensure that one is receiving only broadleaf hardwoods. My landlord was only too willing to oblige reimbursing me for the expense of a truckload full of fresh, clean wood chips once I did a little landscaping around the property with the mulch.

Should one be unable to acquire Alder or Eucalyptus wood chips for a garden, fear not, for there are quite a few choices for the home cultivator. I have heard of amateur mycologists using Hickory and Mesquite wood chips that were located in the grilling section at the local hardware store. Although I have not tried such wood chips on my cultivated *Stropharia* beds, I suspect that this could be a convenient and reasonable source for many individuals who are unable or unwilling to locate fresh wood chips in bulk. Although this is by no means a comprehensive list, I encourage experimentation with the following woods:

SCIENTIFIC NAME	COMMON NAME
<i>Acer</i> species	Maples
<i>Alnus</i> species	Alders
<i>Arbutus</i> species	Madrones
<i>Betula</i> species	Birches
<i>Carpinus</i> species	Hornbeams
<i>Carya</i> species	Hickories
<i>Castanea</i> species	Chestnuts
<i>Castanopsis</i> species	Chinkapins
<i>Cornus</i> species	Dogwoods
<i>Corylus</i> species	Filberts
<i>Larix</i> species	Larches
<i>Liquidambar</i> species	Sweetgums
<i>Lithocarpus</i> species	Tanoaks
<i>Ostrya</i> species	Ironwoods
<i>Populus</i> species	Cottonwoods and Poplars
<i>Prosopis</i> species	Mesquite
<i>Quercus</i> species	Oaks
<i>Rhus</i> species	Sumac
<i>Robinia</i> species	Black Locust
<i>Salix</i> species	Willows
<i>Fagus</i> species	Beeches
<i>Taxus</i> species	Yews
<i>Fraxinus</i> species	Ashes
<i>Ulmus</i> species	Elms
<i>Juglans</i> species	Walnut

Before the wood chips are used, STAMETS recommends moistening them to near saturation. The drier the chips, the more

## NATURE'S MIND

[www.natures-mind.com](http://www.natures-mind.com)

Supplier of strange, sacred, and rare botanical products  
SUCH AS

*Amanita muscaria*, *Anadenanthera peregrina*, *Argyria nervosa*, *Dioscorea dregeana*, *Mucuna pruriens*, *Salvia divinorum*, *Sceletium tortuosum*, *Trichocereus peruvianus*, *Virola theiodora*, and many other exotic seeds, herbs, and extracts. We also carry ceremonial incense, shamanic tools and artifacts, books, and more.

We've gotentheogens for the whole family!

necessary this step becomes, and if one is using store-bought chips, then one might consider soaking the chips overnight. However, no matter how clean these wood chips may appear, hit them with a blast from the garden hose before putting them on the beds. This really makes a difference with growth; I am not sure if this is due to rinsing off dirt, dust, or plant residue, or if the damp chips just provide better kindling for the mycelium. The point here is to wash or rinse the chips just prior to putting them on the beds. You want the chips to be damp, but not dripping wet. If you are going to give the chips a good rinsing, make sure to do it away from the beds, so as not to flood them.
