

# *The Entheogen Review*

The DeKorne Years  
(Autumn 1992 — Winter 1997)

*Edited by Jim DeKorne*

The first four issues of *The Entheogen Review* display editor Jim DeKorne's experimentation with graphic design. Each issue varies in length and looks somewhat different from the others. It was not until Autumn 1993 that the format settled into a consistent style. In order to reformat these early issues into this bound collection, some of the printed material was reworked by DeKorne, with some of the decorative illustrations eliminated. With the exception of minor factual corrections, all written material is the same as it appeared in the original issues.

This bound facsimile version was scanned at 600 dpi from DeKorne's master copies when possible, and from second generation photocopies when that was the only recourse. The early issues of *The Entheogen Review* were created via the cut-and-paste method at a time before desktop publishing on personal computers was as ubiquitous as it is today.

Issues of *The Entheogen Review* edited and published by Jim DeKorne did not contain any indexes. (Since 1998, all issues have contained a yearly index in the Winter edition for each year.) This bound collection has been supplemented by an index that was manually produced by *ER* subscriber and contributor "S. Bear." It took him years to complete and was clearly a labor of love—a tribute to the publication—and we are pleased to be able to offer such a useful addition for the first time with this compilation.

Advertisements contained in these issues should be considered historical curiosities; they are most certainly out-of-date. Inaccurate information presented in early issues was sometimes corrected in later issues. Even so, there may still be faulty data contained in any issues produced. For more information on available back issues from 1998 until the present and a few books produced or sold by *The Entheogen Review*, please see our web site at [www.entheogenreview.com](http://www.entheogenreview.com).

Our current mailing address is:

*The Entheogen Review*, POB 19820, Sacramento, CA 95819, USA

A one-year subscription (four issues) is \$25.00 (USA), \$35.00 (foreign).

El Rito, NM 87530

This is a newsletter. Its purpose is to keep you abreast of the latest information concerning the shamanic use of entheogenic plants. It will be published quarterly -- on the solstices and equinoxes -- and will comprise a clearing house for hard-to-find empirical data on growing techniques, extraction procedures, dose information and subjective results experienced by readers.

My name is Jim DeKorne. I am writing a book on this subject, and therefore it serves my needs to edit a periodical devoted to it. In my research I have already compiled more information than I can possibly use in one volume. Because of this I am able to share obscure bits of data which others haven't had the time to dig out of the enormous body of maddeningly contradictory literature on psychedelia.

The season is long overdue to shed a little light on this topic and separate a few facts from what appears to be a limitless mythology. With a relatively select and sophisticated group of subscribers it becomes possible to share experiences, pool data and formulate reliable guidelines for how to properly grow and use these plants -- maybe even acquire some minimal comprehension of the extraordinary realities which they evoke.

I regard this as cutting-edge research -- as fully on the far outposts of knowledge as the latest findings of quantum physics. Because of past excesses, the pendulum has now swung toward police-state repression of the entheogenic experience itself. This makes it difficult to explore these realms, yet no less essential: our planet is in serious trouble and the plant allies are there to guide us if we have the will and the courage to meet them intelligently. It may actually be an evolutionary watershed -- either we choose to cross it, or we "select" ourselves out of the game.

Because the material is so vulnerable to gross misinterpretation, this newsletter is not intended to be a mass circulation publication. It is hoped that subscribers will agree with my concern for discretion in sharing its information. My editorial position is highly elitist -- *these are shamanic substances for shamanic-type people.* Despite our contemporary idealization of shamanism, the shaman has traditionally been (in Colin Wilson's sense of the word) an "outsider" in his own culture. The entheogenic experience is not for the masses at this point in time -- the sixties amply proved that point. Despite my bias, this newsletter will contain the most accurate information I can obtain: knowledge may be used or abused, and it is not within this editor's expertise to draw the line separating the two.

The price of a one year subscription is twenty dollars with a refund of the unused portion of your subscription available on demand. (That's five bucks a copy for information I'm willing to bet you'd be hard pressed to find synthesized anywhere else -- I know, because I've looked.)

This first issue will summarize some of the data on the ayahuasca analog plants.

## AYAHUASCA AND ITS ANALOGS

Ayahuasca, or Yage, is a ubiquitous Amazonian brew made up of at least two different plant species. While each shaman probably has his own secret formula for the mixture (with no two *exactly* alike), it has been established that true ayahuasca always contains both beta-carboline and tryptamine alkaloids -- the former (harmine and or harmaline) from the *Banisteriopsis caapi* vine, and the latter (N, N-dimethyltryptamine, or DMT) from the leaves of the *Psychotria viridis* bush.

It is interesting and significant to note that neither of these plant substances alone are normally psychoactive in oral doses. (Harmine/harmaline is said to effect hallucinosis at near-fatal levels, but in less heroic quantities it is at best a tranquilizer, at worst an emetic.) DMT, in any quantity, is not orally active without the addition of a monoamine oxidase (MAO) inhibitor. Harmine and harmaline are potent short-term MAO inhibitors and they synergize with the DMT-containing botanicals to produce what has been described as one of the most profound of all psychedelic experiences.

### MAO Inhibition

Parenthetically, it must be noted that the concept of MAO inhibition is complex and hardly obvious to everyday experience. Indeed, it was not fully understood by Western science until about thirty years ago. Yet, in the Amazon,

"primitive" cultures have been making use of this principle in their ayahuasca brews for hundreds of years, if not for millennia. Anthropologists ask us to believe that these tribes (from widely separated areas, speaking different languages, and many of them deadly enemies) all managed to discover the "ayahuasca principle" on their own by trial and error. Considering the sheer number of plant species growing in just one square mile of rainforest (not to even mention all of the possible *combinations* of plants), for each individual tribe to come up with the correct mixture "on its own by trial and error" beggars

the imagination with the astronomical odds against its probability.

### Plant Allies

The Indians have no problem with the concept -- they claim that the plants themselves taught them how to make the brew. Indeed, shamanic cultures world-wide share a near-universal belief that each plant species contains "spirits" which can be utilized as allies for shamanic work. Contrary to the Western assumption that such notions are naive or superstitious, this publication will operate from the hypothesis that there may be something to these beliefs. Whether plants actually manifest sentient entities or whether their alkaloids activate components of the human psyche which present themselves in this guise has yet to be determined -- the point is that empirical usage of such plants consistently evokes forces experienced by the user as sentient "others." (See my article, "Attack of the Archons" in the Spring, 1992 issue of *Gnosis* magazine for related speculations on this general theme.)

### The Analog Plants

Ayahuasca is exotic stuff -- few of us are able to travel to Amazonia to experience its effects, and the plants from which it is traditionally compounded are tropical species which do not thrive outside of the rainforest. Terence McKenna has perceived this problem and suggested its resolution:

Probably only a synthetic duplication of ayahuasca compounded with the correct percentages of DMT and beta-carbolines will ever make the experience available outside the area where it is endemic. (1)

This is precisely the concept of an "ayahuasca analog." That is to say, if it were possible to find other, less tropical (hence easier to grow in northern latitudes) plants containing the same alkaloids as *B. caapi* and *P. viridis*, then the entheogenic experience provided by ayahuasca would be available to almost anyone

on the planet willing to grow the plants and compound the brew. Happily, there are several plant species which fit this description. The first alkaloids, Harmine/harmaline, are relatively easy to acquire.

### **Peganum Harmala**

*Peganum harmala*, or Syrian Rue, is the plant from which harmine was first isolated, as well as a source of harmaline and tetrahydroharmine. total B-carboline content runs almost 4% by weight in the seeds of Syrian Rue. These alkaloids occur in roughly the same proportions as in *B. caapi*. Ten grams of Syrian Rue seeds provide about 400 mg of total B-carbolines, about the amount in a typical dose of *ayahuasca*. (\*See revised dosage below. -- ed.)

Syrian Rue grows in semi-arid conditions. It originated in Central Asia, and is held in high esteem throughout Asia Minor as a medicinal, aphrodisiac and dye plant ... It now grows wild in Eurasia and has recently been spread to Texas, Nevada, New Mexico and Southern California. Dye quality seeds are available from several West Coast seed services for about \$50.00 per pound. (2)

Syrian Rue was evidently introduced many years ago into the U.S. by an exotic plant enthusiast who lived near Deming, New Mexico. It escaped from cultivation and by 1938 was found growing wild near Pecos, Texas. Now it is apparently found all over the Southwest. Some of the literature leads you to believe that this plant has "taken over" (it is targeted for weed eradication programs in some areas), but on a recent collecting trip through its adopted habitat I found it to be rather difficult to find. One spot to look is on Interstate 10 between Fort Stockton and El Paso, Texas. In August of 1992 there were several Syrian Rue plants growing on the freeway median immediately East of exit number 159. I collected about a half-pint of seeds from only three plants -- there are many more remaining. Apparently *P. harmala* dries up after setting seed, then puts out new shoots from the root. This is what these plants were doing at any rate. (I must say that if you are really able to purchase seeds for only \$50.00 a pound, that is a bargain.)

### **Cultivation of Peganum Harmala**

Shamanic usage suggests however, that one raise one's own mother plants for seed production. There is an incredible amount of subtle energy exchanged between the grower and the growing plants -- this sounds mystical I know, but only someone who has done it can really understand what I'm trying to communicate. There is far more to this business than left-brain logic would suggest.

Unfortunately, I have found *Peganum harmala* to be more than a little tricky to grow from seed. Having finally raised a half-dozen plants past the early seedling stage, I would definitely recommend that one not start them in flats. The seeds are tiny, but it is worth the extra trouble to plant them individually in peat pots for later transfer to larger containers. Transplanting from flats stresses the seedlings enormously, and the amount of special care then required to nurse them back to health is avoided if one plants them individually.

### Extraction of Harmala Alkaloids

As of this writing (early September, 1992) I have not yet extracted any alkaloids from *P. harmala* seeds, but it appears to be a very simple procedure:

The technique was a two-stage extraction. The first extraction used was a boiling alcohol (we used vodka) and water infusion followed by a second extraction using boiled distilled water. Each infusion was boiled for several hours. A "slow cooker" is ideal for this. For the Syrian Rue, we first ground the seeds very fine [in a spice mill]. The second extract was a bright cloudy yellow which may indicate harmine in solution.

The plant material was strained and compressed after each extraction. The liquids from the two extractions were combined and dried using low heat on the slow cooker. The weight was about 20% of the original for the...rue. A plain water infusion would also seem to be just as effective in removing the harmine and would result in less of the other plant components being extracted. (3)

More recent data suggests that one gram of *P. harmala* seeds contains between 20 and 70 mg of the harmala alkaloids. A good place to start would be 2 grams of seeds, double extracted (as above) in 30% lemon juice (or acetic acid or vinegar) to produce about 140 mg of alkaloid -- the optimum amount necessary to activate the DMT portion of the ayahuasca brew. (Remember: the harmala alkaloids are MAO

inhibitors, and one shouldn't ingest any more of them than necessary for reasons too complex to go into in the space of this newsletter. It is assumed that the reader is already familiar with this information. Should questions arise, we can go into more detail in future issues. *Suffice it to say that ignorant usage of any MAO inhibiting substance can kill you dead.* Again, these are shamanic substances demanding shamanic knowledge and shamanic presence of mind.)

### Plants Containing DMT

While Syrian Rue is generally recognized as the best non-rainforest source of harmala alkaloids, DMT sources seem not to be so well researched. Although several species of North American plants are known to contain DMT, I have so far been unable to find any data concerning how to extract and use it specifically in the ayahuasca admixture. At a conference on entheogens in August, 1992, I was unable to find one person out of forty attendees who had actually ingested any of the analog plants in an ayahuasca brew. One of the many goals of this newsletter is to elicit such information and make it available to subscribers.

Plants containing DMT are not hard to find, however. *Desmanthus illinoensis*, (a weed legume common in the midwest), *Arundo donax* (a bamboo-like plant apparently introduced from India, and found growing wild in many areas of the U.S.), and *Phalaris arundinacea* (a common grass species) have all been found to contain DMT in various concentrations. There are some indications that this alkaloid may actually be very common -- all that is lacking is some sophisticated chemical analysis of likely plant varieties.

The *leguminosae*, for example, are an extremely large botanical family which have yielded many DMT-containing plants. While on my recent collecting trip I found what I assumed was a *Desmanthus* species growing along a Texas highway. They mow the road shoulders in Texas regularly, and most of the plants growing there get pretty severely pruned several times each summer. What I thought was *Desmanthus* was actually a very stunted mesquite bush -- another legume species which in terms of numbers may be the most common

wild plant in the Lone Star State. The leaf configuration of *Desmanthus* and mesquite is very similar. Out of curiosity (once I'd realized my mistake), I looked mesquite up in Michael Moore's *Medicinal Plants of the Desert and Canyon West* and was amazed to find that at least some species of this plant contain in their leaves, pods and bark: 5-hydroxytryptamine and tryptamine. I'm no chemist, but those sound like alkaloids not molecularly far removed from N, N- dimethyltryptamine, or DMT for short. Are there any chemists out there who can enlighten us novices on the significance of this, if any? What I'm suggesting is that there may be DMT-containing plants growing all around us, and that the legumes might be a good place to start looking for them.

## QUESTIONS

To date I've yet to uncover a complete, tested ayahwasca analog formula -- which doesn't mean that one doesn't exist. (Living in the New Mexico boondocks confines much of my research to obscure books and journals, and there are lots of data that never get written up.) *Peganum harmala* has been successfully combined with synthetic DMT (4), but that experiment was published in 1986. Surely by now someone must have developed a reasonably easy extraction procedure for DMT-containing plants. If not, that is valuable information in itself. Is there anyone out there willing to share their knowledge of this subject?

## SOME SUBJECTS TO BE COVERED IN UPCOMING ISSUES

It is late summer and already my morning glories are setting seed -- I've collected over two-hundred in the last two days, and many hundreds more are ripening in pods next to fresh flowers. The morning glory species (containing lysergic acid amides), have probably had more contradictory information written about them than any other plant entheogens. Anyone who has ever done even a little research in the literature either tears their hair in frustration or else cracks up in amusement at the sheer volume of confusion expounded by so-called experts who, as often as not, wind up quoting each others' misinformation. The Winter Solstice issue of *The Entheogen Review* will include some hard data on this subject. Readers with experience are invited to share it with us.

Other issues will be devoted to the Belladonna alkaloids, Mescaline (specifically, San Pedro Cactus), *Salvia divinorum*, some of the minor psychedelics, and of course a continuous update of information on all of these subjects as it comes in. Shamanic techniques for using entheogens in inner work will also be covered.

Editor: James B. DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

## THE OBLIGATORY DEFENSIVE DISCLAIMER

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First amendment to the Constitution of the United States. Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Although portions of this material may relate to subjects which are legally questionable, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification. Everyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and volition and must accept full responsibility for such decisions.

--- Jim DeKorne

## ENTHEOGEN -- WHAT'S IN A WORD?

The McKenna brothers are not very fond of the name:

*I am generally uncomfortable with the term "entheogen" as it seems merely to add to a needless proliferation of terms in a field that is already glutted; what's wrong with good old "psychedelic?"*  
Dennis McKenna

*A clumsy word freighted with theological baggage.*  
Terence McKenna

I have been asked why I chose to call this newsletter *The Entheogen Review*. Even educated friends have asked me what the title meant, and have suggested that since other expressions like "ethnobotanical" are not a part of most peoples' vocabularies why put readers off with complicated terminology? As a former English teacher I am a firm believer in clear expression and in most circumstances hate obscure words when simple ones will do as well or better.

Unfortunately, we live in troubled times -- our rulers have already suspended constitutional "guarantees" to make it easier for them to eliminate states of consciousness not meeting official approval. This is hazardous to our right to explore our own awareness and so, like oppressed minorities in all times and places, we who are concerned with such exploration must communicate with each other in a secret language to evade police-state oppression.

"Entheogen" is a code-word roughly synonymous with "psychedelic," but (so far) without the latter's negative associations in the public mind. It suggests a substance capable of evoking transcendent forces and is therefore an appropriate word to use in describing shamanic states of consciousness. Yes, it does contain a certain amount of "theological baggage," but that is precisely the realm of consciousness we are interested in exploring. Even Terence McKenna titled one of his recent books *Food of the Gods*.

Entheogens take us out of the mundane -- they evoke experiences transcending physical reality, hence remind us, however indirectly, of what we really seem to be -- spiritual entities. Materialists are threatened by this. The real battle in the "war on

drugs" is between spirit and matter. Unfortunately, since ours is a materialistic culture, I question whether many Americans today are conceptually able to handle these substances with the respect they demand. I am not alone in this feeling -- a deep anxiety about "spilling the beans" has been

communicated to me by more than one reader. The following quote from a letter is typical:

*I am both concerned and pleased about your newsletter. Pleased because it could serve as a way of exchanging info, concerned because of its potential to spread the word a bit too widely.*

As editor of *The Entheogen Review*, I am very much aware that I tread a fine line between DEA watchdogs on the right and the "crack-dealer" mentality on the left. Frankly, I am no more enamored of drug abusers than I am of narcs. This explains my naive and probably doomed attempt to limit this newsletter to those sophisticated enough to read between its lines. Entheogens are not for everyone -- not even for very many of us.

Most of us remember the sixties. I lived in the Haight Ashbury during and after the famous "Summer of Love" of 1967 and watched in amazement as the scene deteriorated from young girls giving away flowers in August to bikers stomping some poor wretch in a doorway on New Year's Eve. A large part of the problem was simply that most of us didn't know how to handle psychedelics because our culture has never had a model for how to use them. If some old Amazonian shaman had been our guru instead of Timothy Leary, perhaps the era might have lived up to its initial promise.

Now we are three years into the last decade of the Twentieth Century. Terence McKenna has almost single-handedly made the psychedelic experience respectable again in an age when hysteria surrounding the War on Drugs has turned the United States Constitution into just another treaty guaranteeing something for "as long as the rivers shall run," or whatever. Meanwhile, the planet is undergoing a public rape-murder while we all stand around like New Yorkers and watch. Many of us believe that human consciousness is both the problem and its solution -- if a critical mass of people were able to access a higher level of awareness, we would all quickly cease to live the way we do at present.

*Man must reach a new relationship to the world around him .. To do this he must give priority, not to external problems, but to the mind that is considering them ... Hardly a beginning has yet been made to bring the illimitable inner world that has recently been opened to us, the world of the unconscious, the world of the dreaming mind, into living contact with everyday life ... Our problems are plainly growing beyond conventional human control, and consciousness has no choice but to enlarge itself to meet them. The trouble is, consciousness per se has not the power to do this. It must look beyond itself for help.*

--Alan McGlashan -- *The Savage and Beautiful Country* Houghton Mifflin, Boston, 1967, Pg 54

Entheogenic substances offer us this possibility. I personally believe they may be the only realistic chance we have to make such an unlikely quantum leap of consciousness in the brief time remaining. While we definitely run the risk of opening up another wave of drug excesses in furthering this work, I believe the extreme gravity of our situation makes that risk irrelevant. Part of our strategy should be to retain and use the word: entheogen. It rather precisely reminds us of the proper set and setting necessary for success.

--Jim DeKorne

## **MAO INHIBITORS -- READ THIS, IT MIGHT SAVE YOUR LIFE**

Ayahuasca contains harmala alkaloids -- MAO inhibitors which synergize with the DMT in the mixture to produce its psychedelic effects. Although the subject of MAO inhibition is somewhat complex, no one who intends to experiment with ayahuasca or its analogues should be ignorant about the dangers inherent in such use. Here is a quotation for serious consideration:

*A severe, atypical headache is usually the first sign, and may herald an impending crisis, which can end in a cerebrovascular accident and death. The hypertensive syndrome is usually characterized by headache, palpitations, flushing, nausea and vomiting, photophobia, and occasionally hyperpyrexia, arrhythmias, and pulmonary edema ... Foods with high tyramine content are a major concern. This chemical is a fermentation byproduct. Any food with aged protein should therefore be avoided ...*

*Monoamine oxidase inhibitors and many pharmacological agents are synergistic, sometimes resulting in a hypertensive crisis. The agents with which the MAOIs may be synergistic include: amphetamine, dextroamphetamine, methylamphetamine, ephedrine, procaine preparations (which usually contain norepinephrine), epinephrine, methyl dopa, and phenylpropanolamine (over-the-counter cold preparations)...*

*Acute toxicity can be very serious with the MAOIs. The signs of intoxication often do not appear until 11 or more hours after ingestion ...Most characteristic of a severe overdose is paradoxical hypertension. The elevation of blood pressure can precipitate pulmonary edema, circulatory collapse, or intracranial hemorrhage.*

*The management of a serious overdose is generally symptomatic. Since hypertension may be acutely life-threatening, aggressive treatment with phentolamine .5.0 mg IV, is indicated. Phentolamine, 0.25-0.5 mg IM every 4-6 hr, may be used thereafter to control bloodpressure. If this drug is not available, chlorpromazine is a good alternative. The initial dose is chlorpromazine 50 mg IM, with 25-mg IM doses used every 1-2 hr thereafter to control the hypertension. The patient's blood pressure should be monitored carefully, since marked hypotension may follow a hypertensive episode .*

*The pharmacological effects of MAOIs are long-lasting, since they permanently inactivate enzymes. The body must resynthesize the enzymes before normal metabolism of body amines resumes; this process takes 1 - 2 weeks.*

E. L. Bassuk, M.D., and S. C. Schoonover, M.D., *The Practitioner's Guide to Psychoactive Drugs*, Plenum, NY, 1977

## BOOK REVIEWS

The following reviews are of books popularly accepted as authoritative on the subject of entheogenic plants, and all are currently still in print. There is hardly anything more frustrating for a researcher than to continuously encounter erroneous or misleading data. If my remarks about these publications seem harsh, perhaps it is because the time is long overdue for a responsible treatment of the subject they deal with.

--Gottlieb, Adam -- *Legal Highs, A Concise Encyclopedia of Legal Herbs and Chemicals with*

*Psychoactive Properties*, 20th Century Alchemist, Manhattan Beach, CA, 1973, 64 pages. (9th printing, 1987)

This 64 page book consists of extremely "concise" descriptions of seventy-four plants and chemicals following the format: Name, Material, Usage, Effects, Contraindications and Suppliers. There are sometimes three entries to a page, and the 4 1/4" X 7" pages are small! There is just not enough information about these substances to make the reader feel confident that he has enough data to warrant prudent ingestion. No sources in the scientific literature are listed, no personal or ethnographic accounts -- just bare- bones assertions, many of which have the tone of being hearsay and not derived from personal experience. Some of the substances are too exotic to be relevant to the average American user.

A letter to the editor from volume 3 of *Psychedelic Monographs and Essays* (Spring, 1988), Pg. 167, informs us that this author's name, "Adam Gottlieb," is a pseudonym:

*I am lending a copy of your journal to my good friend John Mann ... He is founder of The Church of the Tree of Life ... and 20th Century Alchemists Publications. You may know him under some of his pen names ... such as Adam Gottlieb (author of Legal Highs ... and a dozen or so other books) and Mary Jane Super-Weed [author of] Marijuana Dealers and Consumers Guide, etc ...*

Perhaps this explains why so many of these booklets sound like they're quoting from each other. Despite the fact that the author is billed as: "a famous and highly respected scientific journalist," only one of his books that I have seen gives a single reference to corroborate the data presented. This is a serious omission; doubly so if an author is writing under a pseudonym.

--Gottlieb, Adam -- *Peyote and Other Psychoactive Cacti*, Kistone Press, 1977, 16 pages. (No location on title page -- Available from 20th Century Alchemist, P.O. Box 1684, Manhattan Beach, CA 90266)

This appears to be one of this author's more balanced and informative booklets -- he even provides a scientific reference for one method of increasing the potency of psychoactive cacti. This involves the injection of dopamine into the cactus several weeks prior to harvesting. He does not tell us where or how a layman might obtain this enzyme

however. Techniques for the extraction of mescaline from cacti are also given; these are unfortunately coupled with data on how much profit one can make selling the stuff on the street. I have extremely negative personal reactions to this approach to the use of entheogens.

--Gottlieb, Adam -- *The Book of Acid, Easy to Follow Instructions for Making Organic LSD from Legal and Available Materials*, Kistone Press, 1975, 16 pages. (No location on title page -- Available from 20th Century Alchemist, P.O. Box 1684, Manhattan Beach, CA 90266)

Not being a chemist, it is difficult for me to evaluate this booklet -- it looks impressive enough, but the information presented is too sketchy and technical for anyone but an experienced chemist to have any real comprehension of what's being described. It's sort of like teaching yourself how to fly an airplane from a pamphlet written by someone who possibly doesn't even know how himself. As the saying goes: "A little knowledge can be a dangerous thing" -- in the sleazy world of street drugs there are far too many "entrepreneurs" who would attempt such manufacture without the requisite understanding of proper chemical procedures. As a computer bulletin board print-out sent to me by a correspondent says: "Please don't post asking for "simple" instructions on how to make LSD. There aren't. And if you needed "simple" instructions to make LSD, you're probably not a good chemist and shouldn't be attempting to synthesize it." -- alt.drugs FAQ list, Thu, 07 May 92

In the light of those words of wisdom, it isn't difficult to imagine a lot of bad LSD and a lot of bum trips emerging from *The Book of Acid*.

--Mary Jane Superweed -- *Herbal Highs -- A Guide to Natural and Legal Narcotics, Psychedelics and Stimulants*, Stone Kingdom Syndicate, 1970, 16 pages. (No location on title page -- Available from 20th Century Alchemist, P.O. Box 1684, Manhattan Beach, CA 90266)

Advertisements for this booklet say that it is "a comprehensive guide to natural and (in most cases) legal psychedelic herbs. More than 60 plants discussed." Actually, it contains extremely brief data on only thirty-two alleged hallucinogens -- from Wild Cucumber to Deadly Nightshade. I was immediately put off by its repetition of the old canard that grafting hops stems to cannabis roots creates "secret marijuana." There is absolutely no truth to this strangely persistent myth, and it calls

into question the expertise of the author -- particularly when he then pushes his book, *Super Grass Grower's Guide*, for full details on how to do the grafting. Either he knows that the operation is ineffective, in which case his honesty is in question, or he has never tried it himself, in which case he has no business selling a book on how to do it. This booklet evokes the most egregious aspects of the late-sixties drug culture, in which some people would smoke dirty sweat socks if they were told it would get them high. Another ethical problem lies in the extreme range of plants "described" -- some (like Catnip) are psychoactively trivial, others (like Belladonna) can kill you dead.

--Mary Jane Superweed -- *Home Grown Highs: How to Grow Peyote, Psilocybe and Other Organics*, Stone Kingdom Syndicate, 1972, 16 pages. (No location on title page -- Available from 20th Century Alchemist, P.O. Box 1684, Manhattan Beach, CA 90266)

This is a brief yet seemingly thorough treatise on growing Psilocybin mushrooms, Peyote, San Pedro (and other psychedelic cacti), Salvia divinorum, Coleus and the morning glories. Lots of cultivation tips, including details on how to increase the lysergic acid content of the morning glory species. (This section is quoted almost verbatim under the name of Adam Gottlieb in the 1975 *Book of Acid*.) Unfortunately, without any scientific references to back up such claims, they remain at least questionable -- especially since the author's other books contain a fair percentage of ambiguous data. Nevertheless, much of the gardening information presented here is validated by my own experience and is confirmed in other publications as well.

--Mary Jane Superweed -- *The Marijuana Consumer's and Dealer's Guide*, Stone Kingdom Syndicate, 1968, 16 pages. (No location on title page -- Available from 20th Century Alchemist, P.O. Box 1684, Manhattan Beach, CA 90266)

The title of this booklet is a bit misleading, since eight of its sixteen pages deal with methods of extracting LSD amides from morning glory seeds and mescaline from peyote. As previously noted, this author allegedly writes under three names: here, as Mary Jane Superweed, he says that ether is used to extract LSD amides from morning glory seeds; in his incarnation as John Mann (*First Book of Sacraments*, 1972, 1985) he explains that: "(LSD amide) is present in the form of a salt and is therefore soluble in water, but not in ether or alcohol unless it is first hydrolyzed with a 10% ammonium

hydroxide solution." Writing from the personality of Adam Gottlieb (*The Book of Acid*, 1975), he tells us to extract the amides with chloroform. Unexplained inconsistencies like these, which I have found throughout this author's publications, suggest caution in accepting any of this information without corroborating with other sources.

--Mann, John -- *The First Book of Sacraments of the Church of the Tree of Life*, Tree Of Life Press, San Francisco, 1972, 1985, 24 pages. Available from: The Church of the Tree of Life, P.O. Box 330155, San Francisco, CA 94133

The Church of the Tree of Life was founded to: "proclaim as our sacraments all substances in the physical universe which are not presently illegal." This strategy is based on the idea that since tribal cultures were using peyote long before it was declared to be an "illegal plant," a clause has been made in the law to allow members of The Native American Church to continue using it in their ceremonials; hence, the reasoning goes, by declaring all still-legal substances as sacraments, the Church of the Tree of Life can claim the same precedent. Unfortunately, the Church of the Tree of Life is probably too nebulous of an entity to be able to realistically prove its status as a bonafide religion in any American court of law. *The First Book of Sacraments* is a kind of "religious" version of *Legal Highs*, containing information related to using sixteen plants in a ceremonial context. There are several pages dealing with the value of ritual and related themes as well as a short bibliography. In dealing with this organization be prepared for long delays, or even no response at all -- a letter sent in March, 1992 (containing two dollars for their trouble) has yet to receive a reply.

Jim DeKorne

## QUESTIONS

Anyone who has examined the literature can attest to widely contradictory opinions concerning the effects of allegedly psychotropic plants. Although the states of consciousness we seek to comprehend are by their very nature difficult to pin down cognitively, the substances used to attain them should at least be known to be reasonably consistent in their effects. This does not seem to be true in many instances, and the subject often seems to be based more upon myth than fact. This is probably to be expected in a culture where expanded states of consciousness are against the law -- in the absence of open public inquiry, one person's rumor is as good as

another's. In an effort to clear up the confusion in this area, each issue of *The Entheogen Review* will have a section devoted to specific questions about specific plants. A good place to start is with the *Coleus* species. Here are a few quotations from the literature:

## COLEUS

*Salvia divinorum* is, in the minds of the Mazatecs, only the most important of several plants, all Labiatae, that they regard as members of the same "family." *Salvia divinorum* is known as *la hembra*, "the female." *El macho*, or "the male," is *Coleus pumila*, of European origin. Then there is *el nene*, "the child," and *el ahijado*, "the godson," which are both forms of *Coleus Blumei*. Some Indians insist that these others are likewise psychotropic, but we have not tried them; others say these are merely medicinal ...

--R. Gordon Wasson-- "A new Mexican psychotropic drug from the mint family," *Botanical Museum Leaflets*, Harvard University, Cambridge MA, Vol. 20, No. 3, December, 1962

*The curandero also had several horticultural specimens of Coleus spp. growing near his house. Wasson has reported that the Mazatecs believe Coleus to be a medicinal or hallucinogenic herb closely related to S. divinorum (Wasson, 1962). However Don Alejandro said the plants were not medicinal and his daughter had bought them at the market because they were pretty.*

--Leander J. Valdes III, Jose Luis Diaz and Ara G. Paul--Ethnopharmacology of Ska Maria Pastora (*Salvia Divinorum*, Epling and Jativa-M.) -- *Journal of Ethnopharmacology*, 7 (1983) 287-312

*(Coleus blumei and C. pumila) and all of their garden varieties have strong psychoactive qualities ... About fifty of the brightly colored leaves are either chewed and swallowed, or crushed and steeped in water which is later drunk ... Like Salvia divinorum, coleus is a member of the mint family, so the psychoactive chemistry of the two plants is probably identical or at least similar.*

--Mary Jane Superweed -- *Herbal Highs*, Stone Kingdom Syndicate, 1970 (No location)

*Since no one seemed to know about fresh coleus and since (no) one other than (a) John Mann book I have claimed fresh coleus worked like a mini-mushroom trip, I tried it. Bitter, very bitter. I bought a giant plant for four bucks (such a bargain), set some candles up, got my vision-request/purpose clear, ate 80 medium leaves and waited. Nothing. 5-10 minutes -- nothing. Twenty, nothing. Forty,*

nothing. I ate a meal after an hour. I doubt that I ate too soon; I truly don't think it was working. Spread the word ...

--A. L., CA -- letter, 9/3/92

At an entheogen conference in Hawaii last August, I was unable to elicit any definitive response to a question about whether or not Coleus is a psychoactive plant. No one seemed to know, though there was a vague comment that one species was active while the other wasn't. There were huge Coleus plants growing everywhere on the grounds of the conference site, and I now regret not making the modest proposal that at least some of us try them out. In the wake of that lost opportunity, readers with hard data are encouraged to share it with us.

## NETWORK FEEDBACK

### ARUNDO DONAX AS A PLENTIFUL DMT SOURCE

Dear James:

Your newsletter is a great idea -- actually the answer to a prayer. It's good to know that this sort of data will be available regularly and from one source. In the past, I've had to look high and low for fragments of usually unverified, questionable information about this subject matter. Your newsletter will be most welcome if it can serve as a clearinghouse for useable, accurate information.

Your data on *Peganum harmala* extraction is encouraging, but I'm a little confused. You refer to a "boiling water and alcohol infusion." How much water and alcohol and in what proportions? If using a "slow cooker" as stated, do you use the high or low setting? In reference to "drying" in the slow cooker - are we actually boiling off all the liquid and recovering a powdery residue? In reference to the double extraction in 30% lemon juice -- again, what volume of liquid per 2 grams of seed? Perhaps in the future this kind of information could be written in a formal recipe format to be more concise. Excuse me. I just realized you are quoting Gracie and Zarkov's material and they are not specific. A little experimentation appears in order here.

In regard to your comments about the killing potential of ignorant MAOI use -- I have seen several lists of foods to avoid when using MAOI inhibitors. Each list contained items the others did not. This leads me to wonder how well-researched this has been. I gather you are supposed to avoid tyramine containing foods. One list implied fermented and cultured foods were to be avoided. Some questions for research: are things like yogurt,

sauerkraut and amazake (cultured rice drink) to be avoided? For how long before and after MAOI use? This seems pretty vital so maybe you could print a comprehensive list and explanation at some point.

Your discussion of potential DMT sources caught my interest. I have seen Of The Jungle's comments on *Desmanthus* and *Arundo donax*. The percentage of DMT in these plants seems to remain in question - no one seems to have specific data. If the DMT amounts are small and one has to obtain large amounts of biomass to extract useable amounts, I think the giant reed, *Arundo donax*, would be a good candidate. Here in Southern California there are huge stands of the stuff growing wild in numerous locations. In some areas it grows densely in relatively dry stream beds and in some areas is actually cut down as a fire hazard in the dry season. What I'm getting at is that, should the *Arundo donax* (called "carrizo" by the Hispanic people) prove to be a good DMT source, there are tons available ... While driving down the street today I noticed a clump of wild *Arundo donax* growing in a gully. I dug up some rhizomes and planted them in my yard. They look much like bamboo roots and I think they will be fast growers with proper care.

You mentioned several West Coast seed services offering Syrian Rue seeds for \$50.00 per pound. I have located a source and can beat that price by \$20.00 per pound. That's \$30.00 per pound. Orders can be directed to me at P.O. Box 5675, Balboa Island, CA 92662. Your newsletter is great and I'm eagerly awaiting the Winter Solstice issue. Thanks again.

--V.C., CA

Dear V:

Thanks for the support. To take your questions in order:

Q: How much water and alcohol and in what proportions?

A: My understanding is that alcohol is neither necessary nor desirable as an extraction solvent for harmala alkaloids. There seems to be general agreement that a 30% acetic acid solution will do the trick:

*The crushed seeds are covered with three times their weight of water containing 30 g. of acetic acid per liter of water ...*

--Hasenfratz -- *Ann. chem* (10) 7, 151 (1927)

Ivanov et al. (1965) report that dilute acetic acid extracted 98% of harmel seed alkaloids.

--Flattery and Schwartz -- *Haoma and Harmaline*

Glacial acetic acid is readily available in photography stores; it is commonly used as a stop-bath in the photo developing process.

Q: If using a "slow cooker" as stated, do you use the high or low setting?

A: I use the low setting and allow the stuff to cook all night long with the lid on. The lid prevents evaporation, so little or nothing is lost.

Q: In reference to "drying" in the slow cooker -- are we actually boiling off all the liquid and recovering a powdery residue?

A: Yes -- keep a fairly close eye on the process when doing the evaporation. You don't want the stuff to burn, though I've heard evidence to suggest that this may not be crucial. You then have to scrape it out of the ceramic pot with a razor blade. It looks exactly like what you'd expect: reddish-brown gunk scraped off a burnt pot. The stuff is the source of the dye known as "Turkish Red," and it will stain your fingers -- no big deal, but messy.

Here's the data I have on *Arundo donax* and DMT:

*Five indole-3-alkylamine bases viz.*

*N,N-dimethyltryptamine,  
5-methoxy-N-methyltryptamine  
bufotenine  
dehydrobufotenine  
bufotenidine*

*were isolated from the rhizomes of Arundo donax L. This is the first reported occurrence of bufotenidine and dehydrobufotenine in a plant species ...*

*Arundo donax L (graminae), a tall, stout, perennial shrub, often woody below, is widely distributed in India... (Alkaloids were obtained from) the alcoholic extract of the rhizomes of this plant ... As the rhizomes contained very little fat the alkaloids were extracted directly with alcohol without prior defatting with petroleum ether ... Dried and milled rhizomes (700 g) were extracted (95% EtOH), in a percolator, at room temperature for 4 weeks. The EtOH extract was concentrated under reduced pressure to give a brown viscous consistency (112 g) ... (Etc., the formula from here on out becomes incomprehensible to non-chemists...See original for complete data.)*

The original reference is available from Rosetta Folios, P.O. Box 4611, Berkeley, CA 94704. Their identification number is TRY-10. I agree that if useable amounts of DMT can be easily extracted from *Arundo donax*, the fact that it grows wild in large stands in many parts of the country makes it a great potential source of alkaloids. I saw a single stand in Texas that must have covered half an acre. The roots are humongous globular things, chunks of which can weigh several pounds apiece. They transplant easily and grow fast -- every segment I chopped out of the Texas earth and transplanted in New Mexico was pushing up sprouts within a couple of weeks.

The first part of the extraction formula appears pretty straightforward -- after that it rapidly exceeds my ability to translate. Essentially, approx. two pounds of pulverized and dried root powder is percolated in 95% ethyl alcohol. (Available in liquor stores as Everclear in many states.) The time period of four weeks seems a bit extreme -- anyone know how to do this faster? Also, the rest of the formula was probably designed to separate out each alkaloid for identification. Maybe that isn't necessary to make an ayahuasca analog -- in the Amazon, raw plant material is just boiled in a pot over an open fire. See the extraction formula elsewhere in this issue for another view.

The subject of MAO inhibitors is a serious one. I have collected many references, one of which is reprinted elsewhere in this issue.

#### CONCERNING ELITISM

James:

... Congratulations on your newsletter. Subscribe me immediately! ... I like your attitude (except for your admitted elitism) ... Your philosophy of elitism will severely limit your success ... DON'T CENSOR YOURSELF! Most people do not yet realize that elitism was the cause, and not the symptom, of prohibition ...

Sounds like you will be publishing letters from readers. Great! What about info or ideas you don't agree with? Be a true American; print them all! Even this one. Remember: print in full -- no editing ... Now, I'll give you incentive to print this letter: *Desmanthus illinoensis* (Prairie Mimosa/ Illinois Bundleweed/ Illinois Bundleflower) grows in large colonies all along Interstate 70 in the eastern half of Kansas and the western half of Missouri. I'll guarantee the correctness of the identity. I collected roots and seeds. I am a supplier, as you know, and

will be selling it (not intended for consumption, of course). I also have the *Arundo donax* and *Phalaris arundinacea*.

Did you know that *Phalaris arundinacea* grass has two varieties? One is a striped (variegated) gardener's variety. The other is completely green. The former does not go to seed or flower and is smaller. The latter grows only wild in low, wet ground. The question is: do they both contain the same levels of DMT? What are these levels? Keep up the good work. There is a huge demand for it.

--JLF, IN

Dear JLF:

Thanks for the subscription and the great letter -- I always appreciate frank and honest responses to anything I write. I'm an "elitist" because I lived through the sixties, (part of the time in San Francisco 1967-69), and, after more than twenty years to mull it over, realize that we don't yet have a useful model for entheogen use in our culture. (See editorial this issue.) Those cultures which value entheogens almost always use them ritually in a healing or religious context. I feel about their "recreational" use the way an orthodox Catholic or Jew might feel watching someone getting drunk on sacramental wine and then spraying the cathedral or temple with day-glo graffiti. I'm in fairly "elite" company with this opinion:

*I haven't changed my mind that [psychedelics are] the most valuable discovery that man has made. I think what we've learned in the intervening years is that this isn't for everybody, and that what it takes to really make use of the psychedelics are two principal things -- commitment and honesty. In a way, they're the same.*

--Myron Stolaroff interview, in Peter Stafford, *Magic Grams*, Rosetta Folios, Berkeley, (no date), Pg 334

*The 1960s proved that we are not wise enough to take the psychedelic tools into our hands without a social and intellectual transformation. This transformation must begin now with each of us.*

--Terence McKenna -- *Food of the Gods*, Pg. 250

Actually, I wouldn't care that much (live and let live) if it weren't for the draconian laws stifling their use -- keeping a low profile is necessary for serious entheogen questing, so who needs people who only want to get high being uncool and provoking the wrath of the establishment? It just makes it rough on everybody else. I guess the bottom line is that *The*

*Entheogen Review* is intended for a different readership than *Mondo 2000* or *High Times*.

I'll never knowingly censor myself, or anyone else -- *The Entheogen Review* will print any informative communication (whether I agree with it or not) dealing with the subject of entheogens. The only editing will be for brevity, spelling, etc., never for content. I welcome all sincere points of view -- that's what will make this publication useful.

SUFI AYAHUASCA

Dear Jim --

Thanks for the review and note. Next week I'll be using 25% glacial acetic acid to extract *P. harmala* seeds. I will probably neutralize with baking soda which should precipitate out the harmine/harmaline.

According to a source who was sworn to secrecy by a Sufi musician, *P. harmala* root and the roots of *Arundo donax* were and are the source of a secret entheogen long used in particularly musical orders since before Islam influenced the Sufis. The *Arundo donax* is Giant Reed or cane used in Persia for making the "Nay," an end blown flute, or reed pipe. The same plant is the source for reeds for clarinet, sax, oboe, bassoon, bagpipes and so on. He would not give me particulars on how the "mystical potion" was made. A crock pot water extraction of *A. donax* root only yielded molasses (*A. donax* is a relative of sugar cane) ... Much Sufi literature, mostly untranslated, makes many oblique references to the reed pipe and harmala, which become clearer with the knowledge of their use. My "working group" here has a psychic who talks with plant spirits, so we are going to go to the source for info on their way to use these plants ...

--T.A., CA

Dear T:

Your mention of Sufi connections with *P. harmala* and *A. donax* is fascinating! I immediately flashed on the possibility that this could be the mysterious Soma (Persian: Haoma) of the Aryans. Flattery and Schwartz published a book (*Haoma and Harmaline*, U.C. Press, Berkeley, 1989), putting forth the hypothesis that *P. harmala* was Soma. They argue a fairly good case for this, but I remain unconvinced because *P. harmala* by itself in reasonable doses isn't a particularly impressive hallucinogen. As we know, harmine and harmaline (the alkaloids in *P. harmala* and in the South American vine, *Banisteriopsis caapi*), are MAO inhibitors which potentiate orally ingested DMT in the Amazonian ayahuasca brews. If there is indeed a

secret Sufi tradition combining *P. harmala* with *A. donax* to make "Sufi ayahuasca," then a convincing answer to the Soma mystery would seem to be found. Anybody out there want to research a Ph.D. thesis on this one?

#### NO DMT IN PHALARIS GRASS?

Dear James:

You have an interesting journal, but I would like to know how you obtained my address. Really I've only written this letter to correct you...*Phalaris* species does not contain DMT, but it does contain two B-carbolines, much like Harmine. The alkaloids are as follows:.

You must know that Terence McKenna and Gracie and Zarkov are not phytochemists, they are only authors!!! I would consider subscribing to your journal if you can correct this matter of misinformation in your next publication. Other than this one bit of misinformation, your presentation of alternate mixtures for an ayahuasca blend is quite correct. It is not my intention to berate you ... but it is very important that people obtain correct information.

-- L., FL

Dear L.:

No offense taken -- the whole point of this newsletter is to separate the correct information from the mass of mythology, confusion and weirdness that pervades the subject of entheogens. I received your name and address unsolicited from a correspondent who thought you might be interested in the newsletter.

Alas, I, too, am only an author, and have almost no comprehension of chemistry -- therefore I am highly dependent upon those who do understand these things for accurate data. My first source for the claim that *Phalaris* grass species contain DMT comes from a popular ethnobotanical catalog:

... *Grazing sheep and cattle develop what is called the "Phalaris Staggers" due to high levels of the same alkaloids found in P. viridis leaves ...*

Since *P. viridis* is the DMT portion of the ayahuasca brew, I took this as a coded message about *Phalaris*.

My second reference comes from Rosetta Folios, reprint #TRY-12, my copy of which is unfortunately almost unreadable. It is a xerox of a scientific paper stating that both B-carbolines and tryptamines were discovered in various clones of *P. arundinacea*. I am sorry that my copy of this paper is so poor that I can't pull enough out of it to give you a good quotation -- here's the best I can do:

*The distribution of hordenine, gramine, DMT, MTHC, 5-MeO-DMT and 6-MeO-THC in 12 clones of 3-4-week old reed canarygrass regrowth is shown in Table 2.*

The table in question seems to show that DMT was found in three of the clones described. I suggest that you contact Rosetta Folios for a legible copy of this report.

#### COMBINING P. HARMALA WITH S. CUBENSIS

Dear Jim:

... You asked me to tell you when I knew the results of my proposed experiments with *P. harmala* and *S. cubensis*. I have since found that one gram of harmala extract more than doubled the effects of two grams of cubensis. That is, subjectively, the experience was at least as strong as previous five gram doses -- a true example of "less is more!" The experience was qualitatively different also -- colors seemed not quite as vivid, though moire patterns were very pronounced; I was physically almost unable to move for two or three hours (making shamanic work all but impossible), and the trip lasted at least two hours longer than expected, with a long slow decline after the peak. Be careful, though -- I unthinkingly drank a cup of coffee the next day and quickly developed a splitting headache. This was possibly the effect of MAO inhibition, since I practically never get headaches of any kind. Best of luck with *The Entheogen Review*.

--J.G., CA

Dear J.:

Thanks for the data on your harmala/cubensis experiment. It would be interesting to know if others have tried this combination, and what the results were. As always, the possible consequences of MAO inhibition are not to be taken lightly.

#### SALVIA DIVINORUM AND PLANT TEACHERS

Dear Jim:

I was very pleased to receive *The Entheogen Review* ...I've continued my studies into *Salvia divinorum*, except that sometimes I think that it is the *Salvia divinorum* that is investigating me. I can say that it is the plants that have consciousness, that are the source of consciousness, and that animals got consciousness from eating plants -- say that and not really be metaphorical. It astounds me.

... A question, about MAO inhibitors, someone said NOT to take MAO inhibitors with ... what? Psilocybin? Thought I remember someone saying that [at the August conference]. I ask because I recently met a young man ... who does just that.

--D.P., CA

Dear D.:

It's good to hear from you -- thanks for the support. Although the newsletter hasn't had time to expand to the point where I can pay for articles, I'd be overjoyed if you would write up something on your experiences with the plant teachers. (That very subject is what started all this -- as far as I'm concerned, it represents the cutting edge of consciousness research.)

Probably your memory about what not to take with MAO inhibitors at the conference concerned mescaline and any amphetamine type drug (as well as a host of other things). If my memory serves me correctly, the speaker said that combining harmala alkaloids with mescaline could be fatal. (As regards harmala plus psilocybin, see the previous letter.)

## CONCERNING ENTHEOGENS AND SHAMANISM

Dear Jim:

... I am primarily interested in the shamanic uses of entheogens. A "full-blown Ayahuasca trip" is, in shamanic terms, equivalent to awakening someone out of sleep into a full-blown carnival or circus. One must know where one is going, how one is to get there, and how to get back. I fear that some are using entheogens with the ignorance that has characterized our drug culture, considering them as little more than organic psychedelics ...

My concerns are basically related to two primary purposes. One is awakening shamanic consciousness and the other is the operational use of shamanic consciousness. Obviously, it is far easier

on the person involved if the awakening process is gentle than if it is abrupt. Therefore, I am interested not in homeopathic doses, but physiological doses ... I believe that the Ayahuasca leaf tea falls into this category of physiological doses. It produces, when used regularly for at least 4 to 6 weeks, a number of rather subtle changes which are associated with the change from an ordinary to a shamanic outlook.

The shamanic state of consciousness is one type of altered state of consciousness ... It is in many respects superior to a simple entheogenic experience in that it is a controlled change of consciousness. It would be fair to say that a "full-blown" shaman does not require the use of drums, rattles, or entheogenic substances. Any so-called shaman who requires the use of these can properly be called no more than an apprentice shaman. What [entheogens] are useful for, of course, is to enable the non-shaman to share the shamanic [state of consciousness] and experience first hand the direct knowledge of the shaman.

--A., TN

Dear A:

Thanks for the clarification. I doubt if our positions are very far apart -- plant entheogens are certainly fascinating entities to grow and use, but in the end they are really just keys that unlock doors to the unconscious psyche (and who knows what realms beyond). Somebody once told me: "You always have to be smarter than your tools." That probably sums up my position as well as anything: entheogens are tools, albeit seductive ones! As you can infer from my other remarks in this issue, I'm rather conservative about the proper way to use these marvelous substances, though that won't prevent me from printing other viewpoints. (No dogma in *The Entheogen Review*, just a strong editorial bias, which will always be identified as such.)

## THE NEED FOR A CONTEMPORARY SHAMANISM

Dear Jim:

It was good to hear from you with your last letter and certainly exciting to know that your correspondence with others of a "like mind" is picking up. The time feels quite ripe for a renaissance of psychedelic shamanism in the west.

... What you are trying to do with *The Entheogen Review* is very important. Community is essential, especially in such an area as psychedelic shamanism. It is definitely time to pool our information together to create a web of understanding and to assist the birth of a contemporary global shamanic tradition ...

--G.M., OR

Dear G:

Yes, I agree that some sort of viable structure for doing group work is essential. I am now in contact with such a group, and expect to be reporting data as it comes in. All readers are encouraged to share what works and, equally importantly, what doesn't work in this regard.

## SOME PRINCIPLES OF ALKALOID EXTRACTION

In the Amazon, entheogen extraction methods are usually very simple: the shaman just boils up the raw plant materials in a pot and then drinks the concentrated brew. We come from a different culture and have different plants requiring different extraction processes. For me anyway, it isn't enough to just follow a recipe; I want to comprehend each operation -- what it does, and why it is necessary. To have that kind of understanding, some familiarity with basic chemistry is essential. What follows is information written, I hope, in language any non-specialist can understand. A good place to start is with the concept of pH.

pH is a numerical value assigned to the relative acidity or alkalinity of a substance, expressed on a scale of 0 to 14. A substance with a low pH is extremely acid -- like the stuff found in automobile batteries; material with a high pH is extremely base or alkaline -- like lye, for example. (For our purposes, the terms "base" and "alkaline" are synonymous.) It follows then, that a pH of 7 would be neutral -- neither acid nor alkaline. The standard for pH neutrality is pure water.

All the possible degrees of acidity or alkalinity are found in the range between zero and fourteen on the pH scale. This is crucial for us to know, since it is a fact of nature that to make alkaloids soluble in water we must first make them acid. Conversely, for them to be soluble in an organic solvent, such as ether, we must make them basic or alkaline. Most of the psychoactive substances we are interested in extracting are called "alkaloids" -- compounds numerically above 7 in pH. *Webster's Third New International Dictionary* defines the word for us:

*Alkaloid: any of a very large group of organic bases containing nitrogen and usu. oxygen that occur esp. in seed plants for the most part in the form of salts with acids ..., most of the bases being colorless and well crystallized, bitter tasting, complex in structure with at least one nitrogen atom*

*in a ring ..., and optically and biologically active, many of the bases or their salts being used as drugs (as morphine and codeine).*

Here are the definitions for three other terms we need to understand:

*Acid: a compound (as hydrochloric acid, sulfuric acid, or benzoic acid) capable of reacting with a base to form a salt*

*Salt: any of a class of compounds typified by common salt ... that may be formed by the reaction of acids with bases*

*Base: a compound (as lime, ammonia, a caustic alkali, or an alkaloid) capable of reacting with an acid to form a salt either with or without the elimination of water*

Within these definitions lies an important principle of chemical extraction: by increasing the acidity of a plant substance, we can remove the alkaloids present by converting them into their water-soluble salt form. To separate these in turn from the water, we make it basic and add an organic solvent. After these two incompatible liquids are again separated and the solvent is placed in a shallow dish, it soon evaporates, leaving the alkaloids behind -- either in a pure crystalline form (you should be so lucky!), or more commonly as a relatively impure gummy compound.

--Jim DeKorne

## ALKALOID EXTRACTION

By Johnny Appleseed

The following is a way to extract and concentrate the active principles from plants and brews containing DMT and beta-carbolines. Unfortunately, this procedure is not specific; it will extract any alkaloids present in the sample -- not just the ones we are interested in. For this reason it is useful to know the specific alkaloids each source plant contains before extraction.

The first step is to extract the alkaloids from the plant material. When dealing with large amounts of bio-mass, such as *Phalaris* foliage, an acid-hot-water extraction is best. The key to this is to make the water acid with any common acid: not too much, just about pH 5 or so, because you will be changing the pH back later. Keep checking your pH, as the alkaloids will neutralize the acid as they come out into solution. Various companies make pH papers that change color at each pH number -- using these,

it is easy to maintain the mixture in the mild acid range, between 5 and 6. I simmer my brews for about 12 hours. If you are starting with an ayahuasca brew, you can just make it slightly acid and start from there. By "ayahuasca brew" I mean an authentic jungle *B. caapi*, *P. viridis* mix from which you might want to extract the active principles.

If you are thinking about just boiling up a *harmala/Phalaris* or *harmala/Arundo* mix, be aware that the alkaloids are not normally concentrated enough to get an effective dose -- you'd have to drink gallons of the stuff. Because individual plants can vary widely in alkaloid concentration, it is always advisable to extract new specimens separately so that you can determine approximately what percentage of alkaloids they contain.

If I am boiling up tubs of *Phalaris*, I let them cool overnight, then wring the grass out and filter the brew through a basket strainer. Then to the cooled acidified brew, add a small portion (5-10%) of an organic solvent, such as methaline chloride, ether, or chloroform. This is to remove fats in the solution. Shake the mixture together, and let stand for an hour or so until the two layers separate. Then drain or siphon off the organic solvent layer with the fats. Depending on the solvent used, this layer will be either above or below the aqueous layer. Ether, for example will go to the top, methaline chloride will go to the bottom. A separatory funnel is easiest for this and other operations, but careful decanting, siphoning, or suction off the top will also work. Discard the solvent, save the water-based brew.

Next, to the acidified brew that remains, add enough concentrated base to make the solution alkaline -- pH 9 or above. Concentrated ammonia works well -- household ammonia will also work, but it will take more. Bicarbonate of soda and lye will also work. To the basified brew, add some fresh organic solvent, say around 10%. Then gently shake and let stand. The mixture that forms this time will take longer to separate. Let it stand, stirring occasionally, for anywhere from one day to one week.

In the basic form the alkaloids will become more soluble in the organic solvent, and will migrate into it. As they gradually accumulate in the solvent layer, it will become darker, turning a yellowish or reddish brown tint. After the mixture has stood awhile and the solvent has become darker with alkaloids, remove this fraction and save it. You will want to add fresh solvent to the aqueous brew several more times to get all the alkaloids out. Keep

checking the pH, as the alkaloids will make the water solution less basic as they leave it and migrate into the solvent. Add more base if it gets down toward pH 8 or below. If there are bad emulsions formed, use phase separating filter paper to remove them: it allows the solvent to pass, but not the water solution. (Bad emulsions are mixtures of junk from the water and solvent phase that didn't separate for some reason.) Phase separating paper is silicone-saturated paper available from any chemical supply company.

When you have extracted the brew with the solvent several times and it no longer makes the solvent layer dark, you can discard the remaining aqueous solution. Combine the solvent extractions containing the alkaloids and let them evaporate or use a hair dryer to evaporate faster. Scrape up the goo that results from the evaporation and put into gelatine capsules. Extract the DMT and the beta-carbolines separately, so that you know how much of each you have. Again, this procedure extracts all the alkaloids, so it is a good idea to chromatograph your results to get an approximation of how much you have of your target alkaloid. Thin layer chromatography is not difficult to learn, requires no fancy lab equipment, and is highly advisable when working with unknown substances. (Note: An article on simple chromatography is planned for the Spring Equinox issue of *The Entheogen Review*. Ed.)

A normal dose is 1.5 mg per kg of body weight of beta- carbolines and .5 mg per kg of body weight of DMT. [1 kg = 2.205 lb. 150 lb = 68.02 kg.P. harmala ext. = 102 mg. DMT = 34 mg. (Call it 105/35 for a 150 pound individual)]

## ALCHEMY 101 -- THE QUEST FOR A MORNING GLORY EXTRACTION FORMULA

It is axiomatic that nausea is a common side effect of ingesting morning glory seeds (Julien, 1981; E. Smith, 1982; D. Smith, 1985). Most of us feel that it shouldn't be necessary to vomit all night in order to expand our consciousness, therefore a simple extraction formula to separate the lysergic acid amides from their accompanying toxins would be a useful thing to know. Unfortunately, the literature is unclear on this subject, containing many inconsistencies. However, we have to start somewhere, and as good a place as any is with a widely circulated recipe which appeared in the January, 1979 issue of *High Times* magazine:

*Q: They say you can get high on morning-glory seeds, but any time I've ever tried them ... I've just gotten sick.*

*A: ... (You are) likely to get sick if you eat raw seeds, or if you do get high it will most likely be a nasty experience, thanks to other natural alkaloids besides the lysergic acid amides in them. To extract the best high from morning glory, grind 100 grams of seeds in a blender until you get a fine yellow mash dotted with seed hulls. Soak the mash two days in lighter fluid, and then strain it through a paper coffee filter in a funnel. Dry the strained mash -- maybe with a blow-dryer -- and soak it in 100 cc wood (methyl) alcohol for two more days. Strain this through another filtered funnel, and save the clear liquid extract. But soak the unfiltered mash residue two more days in wood alcohol, filter it again, and save the extract. Combine the two filtered extracts in a flat glass baking dish, set it in a dark spot, and let it evaporate entirely. A yellow gum will be left coating the dish; you scrape this up, rub flour into it until it's not sticky, and trip out on it. There should be enough for three good long acid-style trips.*

First of all, the dose seems excessive -- 100 grams is the equivalent of more than three ounces of seeds. At "three good long acid-style trips" per 100 grams, one would be ingesting the extract of well over an ounce of seeds per trip. Three hundred seeds are generally considered to be a strong dose -- equal to 300 micrograms of LSD-25 (Lingeman, 1974; Savage, 1969; Valdes, 1983). This number of seeds should weigh only about six grams.

The very wording of the 1979 *High Times* formula is suspiciously reminiscent of a 1968 disclosure (the earliest I've found to date) appearing in *The Marijuana Consumer's and Dealer's Guide*, by Mary Jane Superweed. (See review, this issue.) The Superweed recipe is identical to the one from *High Times* in all respects except that petroleum ether is used instead of lighter fluid for the first extraction. Because the wording of the latter formula approaches plagiarism, it is tempting to imagine some cocaine-era *High Times* assistant editor pulling untested data out of his file drawer for a quick and easy answer to a reader's question.

The next reference on the subject is taken from Adam Gottlieb's *The Book of Acid*, Kistone Press, (No location), 1975. What confuses the issue is that Mary Jane Superweed and Adam Gottlieb appear to be the same author writing under different

pseudonyms (see Book Reviews, this issue), and Adam's formula is vastly different from Mary Jane's:

*Grind the seeds to a fine powder in a blender or other grinding device. Saturate the pulverized seeds with ligroine, naphtha or lighter fluid (non-scented) to form a slurry. Pack the slurried seeds into a chromatography column. Arrange a drop funnel above the column to slowly drip one of these solvents through the slurry for several hours. The purpose of this is to remove the unwanted fatty oils from the seeds...*

*Mix 900 ml chloroform with 100 ml concentrated ammonium hydroxide solution in a separatory funnel. Shake well and allow it to settle. Collect the chloroform layer from the bottom and discard the top layer. Drip the ammoniacal chloroform solution through the column and save the extract. Test frequently to see if any alkaloids remain in the slurry. This is done by dropping a sample of the extract as it comes from the column on a watch glass and evaporating it. Observe the watch glass under black light. If it fluoresces at all (light blue), there are still alkaloids in the slurry and extraction must continue. As soon as it no longer fluoresces stop the extraction.*

*Evaporate the chloroform extracts. Collect the residue and dissolve it in the least possible amount of a 3% tartaric acid solution... Transfer the solution to a separatory funnel. Rinse the flask with some tartaric acid solution and add these washings to the funnel. Make this solution basic with sodium bicarbonate solution. Add an equal volume of chloroform. Shake well and allow to settle. Collect the bottom layer. Add another equal volume of chloroform, shake, let settle and collect the bottom layer. Reduce the combined chloroform extracts to a solid by evaporation. Scrape up and collect this substance with a stainless steel spatula. This is a mixture of semi-pure lysergic acid amides and can be used as the starting material for the manufacture of LSD-25...*

Each of the above two recipes is reproduced in Michael Valentine Smith's 1981 book, *Psychedelic Chemistry*, so they apparently survived into the eighties without modification or comment. Does that imply that both of these formulas are effective? The problem is, if Superweed and Gottlieb are one and the same person, which pseudonym advocates the correct formula? With Smith and *High Times* getting into the act, we seem to have a vicious circle of quotations, with no real idea of who the original author is or where he got his information. The

confusion takes a quantum leap when we read a statement by John Mann, allegedly the real person behind the Gottlieb/Superweed pseudonyms, stating that: *The most psychopharmacologically active component of [morning glory seeds] is d-lysergic acid amide. It has about one-tenth the microgram potency of LSD. It is present in the form of a salt and is therefore soluble in water, but not in ether or alcohol unless it is first hydrolyzed with a 10% ammonium hydroxide solution.*

--John Mann, *First Book of Sacraments of the Church of the Tree of Life*, (1985 edition)

This appears to completely nullify the first formula. The sentence in formula number two about mixing "900 ml chloroform with 100 ml concentrated ammonium hydroxide solution in a separatory funnel," I assume refers to the mixture being hydrolyzed in a ten-percent solution. This seems to be chemist-language for making the solution basic and extracting with an organic solvent.

The second formula is significantly different from the first -- not only is it more complex, requiring special equipment, but it uses different extraction solvents. Like many specialists, chemists often seem unable to communicate with laypeople in plain English. For example, what on earth is ligroine? A quick look at the dictionary tells us that it is: "Any of several petroleum naphtha fractions ... used chiefly as solvents."

In other words, ligroine and naphtha are apparently identical. Far from being an exotic or hard to find chemical, a gallon can of ordinary Coleman fuel (the kind used for lanterns and camp stoves), has printed on its side: "contains a refined petroleum naphtha product." It should therefore come as no surprise to discover that the label on a can of Ronson lighter fluid also tells us that it "Contains naphtha." In essence then, ligroine, Coleman fuel and lighter fluid are all naphtha products. This seems much easier for non-chemists to obtain than the petroleum ether of the first formula. It is used only to remove the fatty oils from the seeds; after use, it is discarded and is not itself used as an extraction solvent for the lysergic acid amides.

When the literature is this ambiguous about a subject, the only way to tell what is true is to make an extraction and try it. The *High Times* formula was applied to two batches of seed. Batch number one consisted of 200 seeds of an unknown morning glory species; batch number two was ten grams of

year-old Heavenly Blue seeds. Neither extraction showed any degree of psychoactivity after ingestion. This suggests that the formula is no good, but it is not proof positive -- the first seed batch may have been from a non-psychoactive morning glory species, and the second seed batch may have been too old to be active.

These experiments were carried out before this issue's article on alkaloid extraction by Johnny Appleseed was received. In editing that piece for publication I learned a lot about chemical extraction principles. I'm speculating here, but if the LSD amides in morning glory seeds are already in the form of a salt, then after the naphtha fat/oil removal, one should only need to basify the slurry and extract the alkaloids with an organic solvent. (That is apparently what all the business about "hydrolysis with ammonium hydroxide" in the second formula is about. In other words, you could probably accomplish the same thing with baking soda or lye plus an organic solvent.) By the next issue of *The Entheogen Review* I hope to have cleared up these ambiguities and found a viable formula that any layperson can follow.

## TRAVELER'S TALES

### USING ENTHEOGENS IN GROUP WORK

*It has been rather ironic, coincidental or even significant that our last three ecstasy experiences began with images and themes of wounds and "crossing over." We passed a crippled man one time hobbling across a bridge on his crutches as we were hiking off into the hills. I could go into this issue at length, but generally the message seems to be that the gateway to the Other Side, access to the Other, or what have you, has to follow from some encounter with one's wound, wounding, etc.*

*... We have been doing a lot of "work" separate from the drug experiences relative to playing with images and engaging in a sort of mutual or group hypnosis. One person presents an image and the others fall into it, almost as if giving into or surrendering oneself to a trance. We have been trying to dismantle our normal perceptions in an effort to understand them more completely. We have been playing with shifting our focus, gathering our awareness in an effort to "read the text," so to speak.*

*Basically, we see ourselves as apprentices, neophytes. We have always been incredibly humbled by our experiences. We have been defeated at times by our lack of belief and even our lack of passion, love, energy, what have you. Sometimes we try too hard, or expect too much to the extent of "barking up the wrong tree" by perhaps waiting for some type of classical vision, Other or Angel to appear ...*

--T.K., CA

### PRELIMINARY REPORT ON TWO AYAHUASCA ANALOGUES

*... I ingested one gram of P. harmala extract with 50 mg of an A. donax extraction. No psychoactivity, but did get a medium allergic reaction. Within an hour I noticed that my vision was impaired: there was some difficulty in focusing on the print in a*

*magazine. Later, my eyes felt watery and eyelids swollen. The next day, I had a medium conjunctivitis, with occasional hives appearing on my body. It took three days for these symptoms to go away.*

*Later in the week I ate 125 mg of harmala extract and 50 mg of a Phalaris grass extraction. No allergic reaction this time, and there was definite psychoactivity in the potion, unfortunately accompanied by waves of mild to severe nausea. The experience was what Shulgin describes as a "plus-2" -- there was definite activity, but not so much that I couldn't function in an emergency if I had to. The trip could have been much deeper, but it was certainly "psychedelic." It is difficult to describe -- a novel sense of at least three energy fields radiating from my body at set "wave-lengths." An unusual sensation, and not quite like anything I've ever experienced before. There were bright hypnagogic type visions (immediately forgotten) and an extremely tranquilized "weak" feeling -- almost as if my consciousness was connected to my body by the thinnest of threads. I won't call it an out-of-body experience, but it wasn't far from that. The nausea was a definite problem, although I didn't actually vomit. Two of my fellow travellers spent the evening with the dry heaves, though they seemed to get more positive benefits as well. I've never had jungle ayahuasca, so I don't know how this analogue experience compares with the 'real thing' ...*

--J.G., CA

### LSD AMIDES IN SLEEPY GRASS

A reader has just sent us a brief article appearing in the December, 1992 issue of *Discover* magazine. In it a recent study is mentioned in which *Stipa robusta*, commonly called "sleepy grass" (a poisonous range plant found in the Southern Rockies), has been found to contain lysergic acid amides. Interestingly, the alkaloids are apparently produced by *Acremonium*, a symbiotic fungus living within the plant. So closely have the two organisms evolved together that the fungus is also contained within the plant's seeds -- thus ensuring that the partnership is automatically continued each generation. The article claims that sleepy grass has the highest concentration of LSD amides of any known plant species. *The Entheogen Review* will follow this up, and obtain the original study for a later report.

## THE OBLIGATORY DEFENSIVE DISCLAIMER

The information presented in The Entheogen Review comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and volition and must accept full responsibility for such decisions.

-- Jim DeKorne

## ENTITIES

If you have ever experienced an entheogen-induced encounter with an inner voice, ally, plant teacher, UFO or alien entity, you know how profoundly weird and enigmatic such an incident can be. Although these events are often rejected as illusory, there are now enough accounts by credible individuals to warrant serious investigation into the phenomenon. In an endeavor to further this research, *The Entheogen Review* will devote a regular column to these issues each quarter. If you have an experience to relate, please let us hear about it. The following excerpt is from an experience evoked by a "half-ayahuasca analogue":

This experiment was conducted with 10 g of *P. viridis* leaves and about 8 g of *P. harmala* seeds, both purchased by mail through a botanical company. Both were crushed in a blender and gently boiled in a two gallon pot for 8 hours over the course of several days. After approx. 4 hours I put the water in a separate container and started over with fresh for another 4 hours. The vegetable material was then separated out and the two liquids combined and boiled down to a cup of dark green/black fluid. I did miscalculate during the second cooking -- I fell asleep and found the water cooked out. I put in fresh immediately and the water assumed the proper dark color. This mistake may have affected the taste but I don't think it harmed the alkaloids ...

Then the high weirdness began. The tapestries disappeared and were replaced by darkness. Soon stalagmites and floor-to-ceiling columns appeared. I was in a cave with rock formations that resembled trees designed by Dali -- seemingly vegetable and mineral at the same time. As I "moved" among them, I noticed one that was much larger than the others. Getting closer, I noticed a large crack in its side, and then that the interior was hollow and illuminated by a pale blue light. It was then that I noticed the entity. About the size of a large dog, but with reptilian characteristics. (The word "dragon" popped in and out.) It moved toward me the moment our eyes met. Its manner of motion resembled the way a dog crawls on its forelegs. Only about eight feet of approach was necessary for it to press its face against the crack [in

the column]. (Have you ever seen the Sci-fi classic "It Came From Outer Space"? There was a slight resemblance between the space monsters and this being.) I feel now that here I blew it. This being wanted to get close to me, yet I did not speak nor did I move closer. I forgot that I was a participant and not merely an observer. Time passed as we stared at each other. Finally this creature made a kissing movement with its "lips" and a glowing blue ball emerged from its mouth through the crack and hung in space. The rest of the image faded, but the ball -- in 3-D -- hung in my bedroom for some minutes. It finally faded away and I knew that the peak was over. -- G.S., NC

## WHO ARE THE PLANT TEACHERS?

**That** human beings hear the paranormal voices of "others" under certain circumstances has been well established for millennia. Schizophrenia and mystical rapture are probably the most common catalysts, but the ingestion of entheogenic substances consistently produces comparable phenomena. Psychedelic shamanism has traditionally attributed these inner voices to "teachers" residing within the substances themselves. The obvious question is: do hallucinogenic plants actually embody "entities," or do they elicit aspects of the unconscious psyche which present themselves in this guise? Most importantly, can we believe what they tell us? Terence McKenna has said: *"It is no great accomplishment to hear a voice in the head. The accomplishment is to make sure that it is telling you the truth."* (1)

**These** questions may be unanswerable, but they are fascinating subjects to explore. One recent development within the shamanic tradition is that often the plant allies no longer communicate with their indigenous hosts the way they did previously; that is, a change seems to have taken place in the relationship between some tribal cultures and their entheogen-evoked "allies." Here is the famous Maria Sabina observing a change in her relationship with the mushroom teachers:

*Before* Wasson, I felt the saint children (entities in the mushroom) elevated me. I don't feel that anymore. The force has diminished. If (the foreigners hadn't

come) the saint children would have kept their power ... From the moment the foreigners arrived, the saint children lost their purity. They lost their force; the foreigners spoiled them. From now on they won't be any good. There's no remedy for it. (2)

**For** the moment, let us take this on face value and interpret it as a shift in the interface between the plant allies and their aboriginal users -- perhaps a mutation in consciousness analogous to what may have occurred when the Delphic Oracle stopped speaking to the Greeks. If we can hypothesize sentient plants, then it's not much of a step to theorize that their recent encounter with modern left-brain human consciousness may have altered their perceptions as much as our own. To paraphrase an old song: "How're you gonna' keep 'em down in the Sierra Mazateca after they've rapped with Terence McKenna?"

**One** must acknowledge that there is a great difference in the psychological reality of a traditional Mazatec Indian and a modern Westerner. Intercourse between humans and mushrooms was confined for millennia to hunter-gatherer and subsistence agricultural tribal cultures -- people whose awareness was of necessity focused on a quite different reality than our own. Conceivably, because there was no survival value in the differentiating left brain function evolving the way that it has in the modern West, these people have arguably developed a form of awareness more appropriate to their specific surroundings. Since the mid-fifties however, the Mazatec's mushroom allies have been exposed to a different kind of consciousness, and have possibly evolved accordingly:

*The author's interview in 1969 with old Apolonio Teran, who was considered in the community to be a powerful Wise Man, documented a series of ideas that parallel what Maria Sabina has told us:*

*"...What is terrible, listen, is that the divine mushroom no longer belongs to us. Its sacred language has been profaned. The language has been spoiled and it is indecipherable for us..."*

*"What is this new language like?"*

*"Now the mushrooms speak English! Yes, it's the tongue that the foreigners speak..."*

*"What is this change of Language due to?"*

*"The mushrooms have a divine spirit; they always had it for us, but the foreigner arrived and frightened*

*it away..."*

*"Where was this divine spirit frightened to?"*

*"It wanders without direction in the atmosphere, it goes along in the clouds. And not only was the divine spirit profaned, but that of ourselves (the Mazatecs) as well." (3)*

**It** is significant to note that the old shaman identifies his tribe with the spirit of the ally -- both are "wandering without direction" -- a highly accurate image of what happens to indigenous cultures when they are exposed to Western "civilization." This may be simple projection however, and say more about the situation of his tribe than that of the mushroom spirit. The former ally now "speaks English," which is to say that it expresses itself not in terms of plants, animals, etc. (the everyday artifacts of subsistence-agriculture and hunter-gatherer cultures) but in quasi-scientific terms which appeal to modern Western minds. Here's a message from the mushroom received by Terence McKenna, writing under the pseudonym O. T. Oss:

*I am old, older than thought in your species, which is itself fifty times older than your history. Though I have been on earth for ages I am from the stars. My home is no one planet, for many worlds scattered through the shining disc of the galaxy have conditions which allow my spores an opportunity for life ... Since it is not easy for you to recognize other varieties of intelligence around you, your most advanced theories of politics and society have advanced only as far as the notion of collectivism. But beyond the cohesion of the members of a species into a single social organism there lie richer and even more baroque evolutionary possibilities. Symbiosis is one of these. Symbiosis is a relation of mutual dependence and positive benefits for both of the species involved. Symbiotic relationships between myself and civilized forms of higher animals have been established many times and in many places throughout the long ages of my development. These relationships have been mutually useful; within my memory is the knowledge of hyperlight drive ships and how to build them. I will trade this knowledge for a free ticket to new worlds around suns younger and more stable than your own. To secure an eternal existence down the long river of cosmic time I again and again offer this agreement to higher beings and thereby have spread throughout the*

*galaxy over the long millennia. A mycelial network has no organs to move the world, no hands; but higher animals with manipulative abilities can become partners with the star knowledge within me and if they act in good faith, return both themselves and their humble (sic) mushroom teacher to the million worlds to which all citizens of our starswarm are heir.*(4)

**This** kind of language is a far cry from one of Maria Sabina's chants, translated from the Mazatec into Spanish, and from thence into English. In a session recorded in 1956, the mushroom appeared to her in this guise:

**Father** *Jesus, Jesus, Jesus, Jesus*

*You Mother, Mother, my Mother who art in the house of heaven*

*You Mother who art in the house of heaven*

*In your beautiful world, says*

*In your fresh world, says*

*In your world of clarity, says*

*I am going there, says*

*I am arriving there, says ...*

*Because I am speaking poorly and humbly says*

*I speak to you, you are the only one, you my*

*Mother,*

*to whom I can speak with humility, you my*

*Mother who art in the house of heaven, says*

*My Father who art in the house of heaven, says*

*I am going there, says*

*I am arriving there, says*

*I go there showing my Book, says*

*I go there demonstrating my tongue and my mouth, says (etc.)* (5)

**Observe** that although the language is very different, the content of the experience seems to be identical: a promise that the entheogen will transport its host to a transcendent world. The significant difference is that for all of its pompous rhetoric, the Western message is an offer of a kind of partnership:

**Animals** *with manipulative abilities can become partners with the star knowledge within me and if they act in good faith, return both themselves and their humble (sic) mushroom teacher to the million worlds to which all citizens of our starswarm are heir.* (Emphasis mine)

**For** modern Westerners however, even a junior partnership is a better deal than childlike

subservience: notice how Maria Sabina's message is couched in parental terms:

**Father** *Jesus, Jesus, Jesus, Jesus*

*You Mother, Mother, my Mother who art in the house of heaven*

*You Mother who art in the house of heaven (etc.)*

**Apparently** in the Mazatec view the only way one can transcend the material plane (get to "the house of heaven") is not via one's own mature accomplishments, but through the intercession of cosmic parent figures.

**Nevertheless**, beware the promises of any inner voice! Let's not forget that although the mushroom now speaks seductive English to its Western devotees, it has cruelly abandoned its old Mazatecan "allies." This smacks of desertion and bad faith -- qualities, alas, which are utterly typical of the voices heard by schizophrenics. It is almost a defining characteristic of these inner voices that they are arrogant, patriarchal, pompous, and often cruel. Here is a first-person description of an inner voice taken from the literature of schizophrenia:

**The** *voice uttered only a sentence or two on each occasion that it appeared. The voice claimed to originate from God ... The verbal production of the thoughts-out-loud [i.e. inner voice] usually takes the form of monologues attempting to persuade the ego to adopt a belief in the authority of the agent behind the thoughts-out-loud, and to accept a messianic fixation ... It is impossible not to be influenced by the experiencing of such phenomena. Regardless of their social evidential value, they represent to the person who experiences them, proof of contact with some agent possessing sources of information broader than those of any factor of the human organism.* [Emphasis mine: the author is referring to paranormal true predictions of future events by the voice on four separate occasions.]

**There** *has been an intricate interrelationship between the hallucinatory pains and the thoughts-out-loud. The hallucinatory pains first appeared at a time when the ego was developing a doubt of the claim of divine authority made by the thoughts-out-loud, and their occurrence was explained by the thoughts-out-loud as a penalty for the doubt. On several occasions since, pains have*

*occurred following threat by the thoughts-out-loud that they would take place if commands made by it were not obeyed. (6)*

**These** voices heard by schizophrenics are often indistinguishable in tone and content from those evoked by entheogens. Note the self-aggrandizement in this message from a "mushroom entity" speaking to another Westerner in 1982. Compare the reference to "hiper (sic.) light drive transition" with McKenna's "hyper light drive ships":

*My magical and mystic powers have been known by your kind since before Christ. Societies that have obeyed my rule have lived with nature and realized themselves. I give laughter, and I can also bring about the mightiest wars before your eyes. Showing the future to those who understand and can record, is nothing. I can place you with the Gods. Once you have stepped aboard hiper (sic.) light drive transition, you are never again the same person. As you learn to reproduce my growing environment, you will come to love me. Later, as you learn thy way, you will look upon me with awe and amazement. I am respected with the highest regards. For I am the flesh of the Gods. (7)*

**Whatever** may be the source of this communication, it differs considerably from the sophisticated rhetoric received by McKenna. This suggests that these inner voices may be more artifacts of each individual's unconscious psyche than a bonafide communication between plants and people. Anyone who has ever heard McKenna speak might expect his personal ally to sound like it does, and although I am unacquainted with the human channel of the immediately preceding quotation, the tone of the message suggests an entity typical of those emerging from Ouija boards and automatic writing.

**Far** from being an artifact of mental aberration, the paternalistic condescension of the "gods" is utterly typical of mystical religious writings world-wide. Here's one from the gnostic gospels (circa 350 C.E.):

*I was sent forth from the power,  
and I have come to those who reflect upon me,  
and I have been found among those who seek after me.*

*Look upon me, you who reflect upon me,  
and you hearers, hear me.*

*You who are waiting for me, take me to yourselves.  
And do not banish me from your sight.*

*And do not make your voice hate me, nor your hearing.*

*Do not be ignorant of me anywhere or any time. Be on your*

*guard! Do not be ignorant of me.*

*For I am the first and the last ...*

*Etc. (8)*

**The** effect of these communications is usually an implicit threat -- "You'd better accept my authority, or you'll regret it!" If this strategy doesn't work, let's not forget that the flip-side of intimidation is condescension: compare the above quote with a channeled message of the patronizing type:

**Listen!** ... *Put me first in everything, then shall all be added unto you ... Listen! ... Be at peace. Striving gets you nowhere. It simply leaves you exhausted and frustrated because you never seem to be nearer the goal. Just learn to be. When you have ceased striving, crawl into my loving arms like a weary child. Encircled in those arms, feel the peace, comfort, and complete oneness with me. Feel yourself melt into me ... Listen! Walk my way and do my will. Let me show you my wonders and glories. If you seek happiness in the wrong way, it cannot be found. Seek me first and find me. That is the simple answer. Put first things first, no matter what the cost or sacrifice. Love me with all your heart, with all your soul, and all your mind. (9)*

**While** not overtly threatening, the essence of this message is insultingly parental. (That prose like this is typical of much modern channeled writing is an insight that maybe the real task of the New Age is for human awareness to grow up and accept adulthood.) Certainly, the basic exhortation here is to accept a passive and obedient child's role in relationship to the inner voice. This is arrested development: the healthy outcome of any growth process is maturation, and entities demanding childish subservience seem to be hindering our natural processes to further hidden agendas of their own.

**Another** hint that we may be dealing more with a function of human awareness than with true "plant teachers" is that one can receive identical messages from synthetic chemical compounds made in a

laboratory! Here it's the DET "spirit":

**Quoted** in Peter Stafford's *Psychedelics Encyclopedia* (1982), [Temple of the True Inner Light founder Alan] Birnbaum states, "DET (Di-Ethyl Tryptamine) is the first psychedelic which convinced me that the psychedelic is a pure light being and primeval ... also being God the Creator ... We smoked it in a large hookah and it was so clear and bright ... it was a being." ... *The Temple of the True Inner Light* relies on "the word" coming from direct -- vocal or heard- Communication with spirit forms manifested from[DET] ingestion. (10)

**The** consistently overblown language broadcast through these channels suggests the existence of incorporeal forces infesting human awareness which are primarily concerned with impressing us with their importance. This is hardly "god-like" behavior -- rather the opposite, in fact. What truly supreme being is so insecure as to *need* let alone *demand* human worship and subservience? Or, more to the point, what mature adult needs deities like that in his or her life?

**Whoever** or whatever these entities may be, it seems obvious that any advance in human consciousness must realistically come to terms with them. If "they" in some strangely dissociated way are "us," then we should integrate the parent-child polarity within us and embrace our destiny as adults. If they are truly "others," then we need to learn how to negotiate with them, if not exactly as equals, then at least with respect on both sides. Presumably the shaman has learned how to attain this balance.

**We** know so little about the mysteries of consciousness that it is premature, if not arrogant, to make definitive pronouncements about the identities of these inner voices. It is certainly possible that we are encountering true plant teachers as well as other discarnate intelligences -- in addition to dissociated fragments of our own personalities! The psyche is nothing if not a multiverse containing a multiplicity of forces -- all the more reason to skeptically evaluate each of their messages. Only a very small child would uncritically accept the rap of someone he just met on the street. In a sense many of us are playing that role -- we are babes in the woods of the unconscious psyche and should not surrender our will

and discrimination to any strange force offering parental guidance. An insight from the Magickal tradition (Western shamanism) offers a clue as to how to proceed when travelling in these realms of experience:

**The** testing of the spirits is the most important branch of the whole tree of Magick. Without it, one is lost in the jungle of delusion. Every spirit, up to God himself, is ready to deceive you if possible, to make himself out more important than he is; in short, to lay in wait for your soul in 333 separate ways ... Let [the Magician] be aware of the thousand subtle attacks and deceptions that he will experience, carefully testing the truth of all with whom he speaks. Thus a hostile being may appear clothed with glory; the appropriate pentagram will in such case cause him to shrivel or decay. Practice will make the student infinitely wary in such matters. (11)

**As** always, *The Entheogen Review* invites feedback from its readers on these and related themes.

## ***PHALARIS* MANAGEMENT FOR ALKALOID PRODUCTION**

Although the presence of tryptamine alkaloids in the *Phalaris* genus has been widely reported, these reports show a wide variation in alkaloid concentration.

Some of the varietal, environmental and horticultural factors contributing to these variations are discussed below.

Important variables in alkaloid production are found within the varieties of each species. In *Phalaris arundinacea* (Reed Canarygrass), for example, the alkaloids range between zero in some varieties, to all specimens testing positive in varieties native to Turkey and Yugoslavia. In *Phalaris aquatica*, the varieties Australia and Uneta have tested highest in admixture alkaloids.

Another factor to consider is soil fertility. The more fertile the ground, especially in nitrogen content, the more alkaloids one can expect to harvest. Likewise the placing of plants in respect to shade is important. Partial shade, if available, is more conducive to alkaloid production.

Perhaps the most important management factor is the clipping schedule and time of harvest. The first growth of the year should be clipped as soon as the seed stalks appear, with clipping continuing as needed for the whole first half of the growing season. (These initial clippings may be discarded, as they will have little or no alkaloid content.) The highest alkaloid production will appear during the second half of the growing season, especially in regrowth associated with an abundance of moisture after a period of dryness. After the last clipping, sometime in early August in most temperate regions, one waters the stand and lets it regrow. The highest alkaloid production will come during a period of cool weather following fast regrowth during hot weather. One can usually obtain two good cuttings, one at the end of August, and another sometime in September, with the latter being the most potent. Studies have shown that cutting during the early morning hours harvests more alkaloids.

The last factor to consider is whether to dry the grass or extract the alkaloids from the fresh material. Drying tends to reduce the alkaloid harvest, but in some cases, especially that of the Turkish variety of *P.*

*arundinacea*, drying may reduce the presence of unwanted alkaloids. — *Johnny Appleseed*

## **MORNING GLORIES, PART II**

In the previous issue of this newsletter we reviewed some of the published extraction formulas for morning glory seeds. The results were both inconclusive and incomplete. This issue picks up the quest where we left off last time.

First of all, to date, we have been unable to discover any formula that works (for us) as advertised. In our latest endeavor, 200 fresh Heavenly Blue seeds were ground up and defatted with Petroleum Naphtha (Coleman fuel). A teaspoonful of household lye crystals was dissolved in enough water (about 500 ml) to bring it to pH 9. About 100 ml of this liquid was put into a separatory funnel along with the filtered seed mash and approximately 200 ml of chloroform. This mixture was shaken vigorously and allowed to separate. (An earlier experiment using household ammonia instead of lye as a base flopped when everything turned into a foamy gel -- apparently most ammonia available now in supermarkets has a foaming agent added to it which makes it great for washing clothes but useless for chemical extraction purposes.)

Because the chloroform layer was almost completely clear (indicating few or no alkaloids), we kept the mixture in the separatory funnel, with daily shaking, for two weeks. At this time the solvent layer was carefully drained off from the lye/seed mash mixture, placed in a shallow dish and allowed to evaporate. The small amount of brown goo remaining was scraped up with a razor blade and put into a gelatine capsule. (Milligram scales were unavailable, but it appeared to be no more than 50 mg. of alkaloidal material.)

The subsequent "bio-assay" showed it to have enough activity to qualify as a "plus-1." Shulgin characterizes this as: "There is a real effect, and I can track the duration of that effect, but I can't tell anything about the nature of the experience." (1) In this case, there was a hard-to-describe feeling of somatic "tenseness" manifesting within a half-hour but lasting no more than an hour. Then it was back to baseline. It is possible that the above extraction

procedure would work with a larger volume of seeds.

Nevertheless, because the LSA in morning glory seeds are apparently present in the form of a water-soluble salt, all this chemical extraction business may be a waste of time. A simple water-extraction (essentially identical to that used by native curers in Mexico), while often productive of nausea, still seems to be the preferred form of ingestion. Many of the reports of severe nausea and vomiting seem to involve actual ingestion of the seeds, rather than of the "tea" created by soaking them in water.

The next question is, how many seeds should one use? In researching the psychotropic properties of morning glory seeds one cannot help but notice the astronomical difference in dosage levels dividing indigenous from Western users. Traditional tribal use indicates doses for *Rivea corymbosa*, (Ololiuqui) and *Ipomoea violacea* (Heavenly Blue, etc.) of only thirteen seeds (a ritual number), as compared with the 200 seeds generally deemed necessary to effect hallucinosis in non-Indians.

The results of ingestion also seem to be different: the experience is often perceived by Westerners to be unpleasant and not very psychedelic. ("The trip is commonly a bummer, resembling that produced by scopolamine or ibogaline and unlike that of LSD.") (2) Yet, using far fewer seeds, Indians routinely report profound effects. Assuming good will and a desire for accuracy on the part of all informants, one can only speculate on these mysteries.

An obvious difference is that Indians usually use drugs ritually in a religious or healing context, whereas Westerners are generally recreationally or scientifically oriented. Perhaps there is some connection between religious ritual, per se, and concepts related to homeopathic medicine and/or "magick" which make the use of only thirteen seeds effective in an indigenous context and not in Western settings.

Correspondents have described a wide range of dosages for morning glory seeds. Here is a formula from the high end of the scale:

*I have had good luck with this formula:*

1. 2 oz Heavenly Blues ground in a blender.
2. Soaked in water for three days. Shake it every day.

3. Strain through coffee filter

4. Drink only the liquid.

*Comes on in about half an hour. Thinking is very "trippy," visuals don't really get started for about two and a half hours. A slightly demanding experience, but worth trying. — Anon. 1*

It goes without saying that users should be cautious when experimenting with large doses of any entheogen. Three hundred is generally considered to be a high dose of morning glory seeds, and granted that we are all different in our psychological and physical make-ups, what may be a "slightly demanding experience" for one person may be a hellish bummer for someone else. Additionally, material from different plants is likely to vary in both weight and potency, depending on growing conditions and other factors. If we establish that a 300 seed dose weighs between 6 and 8 grams, the two ounce dose of the above formula (approx. 56 grams) would contain more than two-thousand seeds! To give a feeling for what a trip like that might be like, here is a partial description of one man's experience with only half that number:

*My own experience with morning glory seeds can serve to indicate the tremendous power of these seeds as an hallucinogenic agent. It turned out to be a bad trip, done in a poor set, with no clear purpose or expectation in mind, other than to have a high time. It was a trip from which it took about two years to recover mental confidence in psychedelics. The ill outcome was, of course, due to the reckless indulgence in an enormous overdose for which I was totally unprepared ... I recall calculating that I had between 1000 and 1200 seeds. I had read that about 300 seeds are sufficient, but I figured that was probably a minimal dose; I might as well make sure of getting off really good ...*

*I saw coming toward me very rapidly, increasing in size, what I can only refer to as "the spinner." This was beyond anything I had ever experienced before ... Two or three times it approached, nearly filling the room, and I became really frightened then, fearful of dying. There was no escaping it; that center of rotation was the center of my own visual field, my own axis of rotation. With a terrible infinite energy it alternated its direction of spin; as it approached, I could feel myself melting into*

*it, being absorbed; drained of identity and consciousness, a goner forever ... Two great rivers of firey red and brilliant green split my mind and I began to learn the dichotomy of mind/brain as only one expression of a perfectly dichotomous universe, from electron/proton to the bi-lobed cerebrum which generated my own conscious thought: All is split; eternally as divided as heaven and hell. Now very much alarmed, I demanded my wife take me to the hospital ... (3)*

One of the most interesting aspects of the entheogenic experience is the extremely wide range of individual reactions to these substances. One person describes a two- thousand seed trip as "slightly demanding, but worth it," while another winds up in the emergency room on half that dose. We are dealing with psychoactive molecules interfacing with the brain synapses of a unique individual psyche, hence, at bottom, entheogens are just novel ways of experiencing ourselves. Since each of us is unique, each experience is also: Aldous Huxley takes LSD and attains to a particular knowledge; Charles Manson does the same, but receives something quite different.

Here are some other possibilities evoked by the morning glory catalyst:

*I prepare morning glory seeds by crushing them, soaking in cold water for 6 to 8 hours, scraping off and discarding the film that collects on the top of the water, and then straining the liquid and seed mash through cotton fabric. The most noticeable negative side effects with the 100-250 seed dose were mild nausea and stomach pain. The positive effects were relaxation, lucidity, and a magical tranquil state. After a 500 seed dose I became very sick (nausea and vomiting). The intense nausea drowned out any psychedelic effects except for some mild color visuals. Needless to say it was not an experience that I'd like to repeat. I have also used Hawaiian Baby Woodrose seeds. These were prepared by soaking and scraping the seed coats (which are supposed to be toxic). The first time I ate six seeds and had an enjoyable, magical, dreamy experience. The second time I ate eight unsoaked, unscraped seeds and experienced a lot of nausea and inability to sleep. The third time I ate 12 prepared seeds and experienced a drunk feeling with nausea and then vomiting, after which I*

*felt much better and had some behind the eyelids visuals (mostly dull orange, red, yellow and brown patterns). I stayed up the remainder of the night having enjoyable conversations with friends. The next morning I continued to feel very peaceful and in a good mood. It is probable that the alkaloids vary from plant to plant and that the growing conditions and-post harvest age also contribute to the seeds' potency. Some friends have had nothing but negative physical effects from Hawaiian Baby Woodrose, but another friend has used morning glories with little or no side effects. He soaks the seeds until the seed coat comes off easily and then eats the inner pre-sprout. I have not yet tried this technique. I have also tried **Rivea corymbosa** -- Ololiuqui seeds that a friend grew in Hawaii. The maximum number ingested was 70: I thoroughly chewed and swallowed them. The effects were a peaceful, lethargic relaxation. I sense that the Ololiuqui spirit is very benevolent, magical and tranquil, so I'd like to experiment more with this entheogen. -- **Anon. 2***

*In the early 70's I located a source of Heavenly Blue morning glory seeds (\$16.00/lb.!) and ground up 100 grams in a hand grinding mill, running the seeds through several times. I had some old formula from a book which I can't remember, but the LSA extraction formula was simple:*

- 1. Take 100 grams of seeds and add enough petroleum ether to cover them. Soak for approx. one week.*
- 2. Filter off the petroleum ether, throw away and save the seed mash.*
- 3. Soak three days in wood alcohol, strain off and save the liquid.*
- 4. Soak three more days in fresh wood alcohol.*
- 5. Filter this off, throw away the seed mash, save the liquid, combining it with the first extraction.*

*This I then dried for two weeks in a warm room in a flat glass tray until all of the wood alcohol had evaporated. My memory fails me as to how much gummy material was scraped up with a razor blade, but I added a touch of flour to get rid of the stickiness and stuffed several 000 capsules. I remember that one cap provided one hell of an excellent and smooth trip, unlike eating the raw seed, which, although I did get off, was wrought with minor intestinal cramping, gas,*

burping and some nausea. The extract had none of these problems. — **Anon. 3**

I have used (morning glory seeds) twice, both times harvesting the seeds myself (thus avoiding any chemical treatment of packaged seeds). I followed the procedure given by Richard Alan Miller in **The Magical and Ritual Use of Herbs**, grinding the seeds into a meal, soaking them for one hour in water, then blending with milk (the first time) or juice (second try) and drinking it down. The first time I took 200 seeds. I became very agitated and "edgy," but after eating a little rice settled down into a pleasant, mild psychedelic state which lasted a couple of hours. At no time did I feel any nausea.

The second experience was with 300 seeds, my husband taking the same dose. This time, following Miller's suggestion, we took dramamine after ingesting the seeds to prevent possible nausea. This experience was extremely intense, lasting about six hours. "LSD-like" is not completely accurate. This had a darker quality, with strong auditory hallucinations. Neither one of us spoke during the trip, the feeling was of being forcefully told to "go inside and stay there." With eyes closed, not moving, I felt less like a participant than a listener/observer. During the peak I felt no nausea, but as I was coming down I had to get up to vomit. My husband felt no nausea, but the rest of his experience qualitatively matched mine. In these two instances the seeds were **I. tricolor** -- Heavenly Blue variety... **Anon. 4**

This last account describes the phenomenon that **The Entheogen Review** is most dedicated to exploring: the encounter with "The Other" which is so often reported during psychedelic experiences. Although not every contemporary user reports meeting an entity on morning glory seeds, there is historical precedent for such encounters. According to early Spanish reports, the seeds of **Rivea corymbosa** (called Ololiuqui by native users) evoked a being of the same name -- a plant teacher and ally who was regarded as a god by those who ingested the seeds:

*Ololiuqui, like the mushrooms and other magical plants, was more than just a means of communication with the supernatural. It was itself a divinity and the object of worship, reverently preserved within the secret household shrines of village shamans, curers, and even ordinary people in the early Colonial era.*

*Carefully hidden in consecrated baskets and other dedicatory receptacles, the seeds were personally addressed with prayers, petitions, and incantations, and honored with sacrificial offerings, incense, and flowers. Ololiuqui was apparently considered to be male. It could even manifest itself in human form to those that drank the sacred infusion. (4)*

The subject of plant allies is as fascinating and enigmatic as the cross-cultural discrepancies between dosage levels of morning glory seeds. We have by no means exhausted this subject, and will continue this report as the experiential data becomes available.

## REVIEWS

---

---

### **THE MAPS NEWSLETTER**

The Multidisciplinary Association for Psychedelic Studies, Inc., (MAPS) is a non-profit, tax-deductible organization dedicated to opening up governmental restrictions on research into psychedelics. As unlikely as it may seem to the cynics among us, they have been having some unprecedented success: in July, 1992, the FDA actually recommended the resumption of psychedelic research. Two months later they okayed the first human study of MDMA, and may soon give the green light to marijuana research in the treatment of HIV-related wasting syndrome. In these and other developments, MAPS was there patiently working to show that these and similar substances have incredible potential in both medicine and consciousness research. Those readers of **The Entheogen Review** who don't already know about MAPS are encouraged to give them your support. A \$30.00 tax-deductible membership includes a subscription to their quarterly newsletter. Write them at: MAPS, 1801 Tippah Ave.,

Charlotte, NC 28205.

### ***PSYCHEDELIC MONOGRAPHS AND ESSAYS***

"PM&E," as it's affectionately known to readers, is an annual compendium of articles on just about anything having to do with the psychedelic experience: from short stories and poems to scientific papers so erudite that you need a PhD in chemistry to even know what they're talking about. Most of the journal is quite comprehensible to laymen however, and consists of information you'd be hard pressed to find compiled anywhere else. Volume number six, which came out in January, is particularly notable for two in-depth treatises: Apparent communication with discarnate entities related to DMT, and Pharmacodynamics and therapeutic applications of Iboga and Ibogaine. These lengthy papers are close to being definitive for their subject matter, and alone are worth the price of the journal. Other articles range from an in-depth study of nutritional influences on entheogenic mushroom culture to a piece on ayahuasca use in Amazonian shamanism. PM&E is published once a year in the format of a quality paperback book -- volume 6 runs to 215 pages, volume five was 320 pages. Back issues are still available, and make valuable additions to anyone's library on psychedelia. Available for \$20.00 per issue postpaid, from: PM&E Publishing Group, P.O. Box 4465, Boynton Beach, FL 33424.

### ***AYAHUASCA VISIONS: THE RELIGIOUS ICONOGRAPHY OF A PERUVIAN***

***SHAMAN***, Luis Eduardo Luna and Pablo Amaringo, North Atlantic Books, Berkeley, 1991, \$60.00 I suspect that most readers of *The Entheogen Review* are already aware of this amazing book -- if not, I consider it, despite the price, a landmark document and eventual collector's item. You can't lose on this one -- once it goes out of print, it will grow in value year after year. For some perspective: most of R. Gordon Wasson's works are only available from rare book dealers at premium prices -- if you can find them. (Which is not the real reason anyone should obtain this volume -- only my rationalization for coughing up sixty bucks for a book.) *Ayahuasca Visions* consists of 49 vividly

reproduced, highly surrealistic paintings by Pablo Amaringo, a former shaman living in Amazonia. Each painting depicts a specific ayahuasca trip experienced by the artist during his career. The introduction to the book and commentary on each painting by Eduardo Luna give invaluable perspectives on the ayahuasca-accessed realms of the human psyche. Truly, we know practically nothing about the depths of our own awareness -- the whole of Western psychology seems like an irrelevancy when compared to phenomena experienced daily by the Amazonian shaman. No one interested in this subject should deprive him or herself of this amazing volume.

### ***CRASH COLLUSION***

*Crash Collusion* is a quarterly journal devoted to the examination of anomalies, weird realities (UFO contact, paranormal experience, etc.), shamanism and psychedelia. A quantum leap above most publications within this genre, the professional layout, state of the art production quality and serious (i.e., "not insane") tone of its articles puts this magazine in the category of responsible (but certainly not stuffy) scholarship. An article of interest to readers of *The Entheogen Review* in the current (Spring, 1993) issue is: "Sex Life of the Psychedelic Toad," by Paul Rydeen. This is a brief account of *Bufo alvarius*, a toad native to the Sonoran desert region of Arizona and Mexico, which produces a psychoactive "venom" from its skin when disturbed. My only criticism of the article is its brevity -- this is a subject unfamiliar to me, and I want more information: like the chemical description of the venom (I assume it's bufotenine-- 5-OH-DMT), how one ingests it, and where one might go to catch a few of these little dudes. Another piece, "A Question of Ethics," by Ian Blake examines the disturbing tendency of "entities" to mislead their contactees. Whether the inner voice of an "ally" (plant or otherwise), or something more sinister, the fact remains that the would-be psychedelic shaman has to be on his toes when dealing with the phenomenon. (See "Who are the Plant Teachers?" elsewhere in this issue for further speculations on the topic.) Check this quarterly out -- it's \$14.00 for four issues from P.O. Box 49233, Austin, TX 78765.

# NETWORK FEEDBACK

---

---

## *ANOTHER AYAHUASCA COMBINATION*

Due to the difficulty of access to *Psychotria viridis* leaves, I utilized dried, whole *Desmanthus illinoensis* rootstock in conjunction with the usual dried sections of ayahuasca [i.e. *B. caapi*], both equal in weight (I used equal portions because I had no known precedent by which to work with the *Desmanthus*). In retrospect I believe that I should have utilized a larger quantity of the *Desmanthus* root, for I did not experience more than a very mild alteration of perceptions, with occasional ripples of energy through my body which had been triggered by ambient sounds ...

I was heartened to hear S. say (at the August seminar) that his belief (based on personal empirical evidence) was that one can never tell how strong the ayahuasca experience will be. Apparently the vine (liana) allows you to experience only what it allows. It seems to me that if enough of the two basic alkaloid groups were present in a given brew one could not help but have a profound experience -- but perhaps the realm of ayahuasca does not adhere to "logical" principles ...  
AS, CA

[I understand that the root bark of *Desmanthus* is the only part of the plant that contains the alkaloids, so there is no advantage to using the whole rootstock. Also, there is some evidence that *D. illinoensis* may not be the best source of these alkaloids -- another *Desmanthus* species, *D. leptolobus*, provided a subjectively stronger response than *illinoensis* for one correspondent. I concur with your insight about ayahuasca not adhering to logical principles -- there seems to be general agreement that this stuff contains a very real teacher: what you get is what you need to get. -- Ed.]

## *A GENERIC EXTRACTION FORMULA*

Maybe this will help!

Plant extraction flow chart:

1. 3X methanol extraction
2. Filtration and acidify to pH 6

3. Chloroform extraction to defat
4. Filtration
5. Basify to pH 8 with ammonium hydroxide.
6. 3X methylene chloride extraction
7. Concentration -- *GW, GA*

## *ENTHEOGENS AND SCHOLARSHIP*

As pleased as I am by the true scholarship of your work, I am also put off by the extreme technicality of it, or more precisely, by the reveal I sense in that technicality. All the clinical rigor is fitting, no doubt, for it forces diligence or incites boredom, separating serious students from casual readers. Appropriate as this is, it can also be misleading. Your writing, and many of the responses you published, show a serious dedication, that's true. But I sense a dangerous propensity towards thinking that a diligent pursuit is a true path in itself. The word "shaman" is used rather liberally throughout to justify the work. But just knowing the difference between DMT and a MAOI, or taking the appropriate precautions when extracting an alkaloid, does not make a shaman. Perhaps this is what JLF from IN meant by writing "Your philosophy of elitism will severely limit your success." I think he might have been saying it is easy to get encumbered by the material of serious scholarship, including all the chemical mumbo-jumbo and elaborate procedure, and miss the point. -- CD, VT

[The "scholarly tone" of *The Entheogen Review* is deliberate for several closely related reasons.

1. The subject is both mythic and technical, but the technical part demands rigorous thinking: the language of precise differentiation is not the language of the tabloid press. Although the experience itself is mythic, its fullest comprehension cannot exclude science and vice-versa. As the newsletter evolves I intend to deal with the numinous and poetic realms more than we have to date.
2. We face an incredible fear of entheogens from the general public, not to mention extremely harsh laws

against their use. Simplistic enthusiasm for psychedelics in the past created these difficulties, and we don't need a new wave of excesses to repress further research into their usefulness. Hopefully, a "scholarly tone" inspires serious intent and discourages reckless enthusiasm. The last thing I want on my conscience is the death of someone who carelessly ingests a MAO inhibitor.

3. There are other publications slanted toward those who primarily want a hedonistic adventure. While it is nobody's business what another person does with his or her own consciousness, it is perverse for such a complex subject as the entheogenic experience to be equated in the public mind with the media-hyped intoxication of a few thrill-seekers. Hopefully *The Entheogen Review* can present other, more interesting, aspects of the subject.

4. It is just about impossible, in my opinion, to ingest entheogens with mature intent and "miss the point." The most Latinate vocabulary in the world will melt before the mysteries they reveal. The word "shaman" appears frequently in these pages because it symbolizes the best model I know for how to use entheogens. -- *Ed.*

#### RESOURCE LIST

Have you considered publishing a resource list solicited from your subscribers, or from your own experience? I would be interested to learn of sources of seeds/spores/plants, and books or other general information. Although I'm a novice, more experienced growers might wish to participate in some type of exchange to share, trade or sell these items. My only personal experience in purchasing materials has been positive, from:

Horus Botanicals  
HCR 82 Box 29  
Salem, Ark. 72576

*A.H., TN*

[OK -- that's a reasonable idea. Anyone who has legal botanicals to sell or trade is hereby invited to send me their name and address and I'll run a list next issue, gratis. ("The first one's free.") -- *Ed.*]

#### TRICHOCEREUS PERUVIANUS

Any idea on where to locate *Trichocereus peruvianus* cuttings? I can't find one to save my life. *T. pachanoi* is pretty easy to locate -- I even found a small specimen for sale at the local lumberyard. I really don't want to have to start from seed. -- *WN, TX*

[It's said that *T. peruvianus* has the same alkaloidal concentration as *L. williamsii*, but I have no idea of where one can obtain cuttings. I started some *Trichocereus spp.* seeds last March -- they are still less than an inch tall, so this is not a quick way to get some cactus. I expect they'll grow faster when they get larger, as my adult *T. pachanoi* put on a foot or more each year. -- *Ed.*]

#### CALEA ZACHATECHICHI

I recently tried a small cup of tea brewed from *Calea zachatechichi* (bitter herb, dream herb) followed by a small "joint" of the same herb. The tea gives off a wonderful smell but is almost impossible to drink because of the taste. Perhaps that is why traditionally one smokes a rolled cigarette of the herb afterwards -- to get rid of the taste. It definitely enhances the dream state, making one's dreams more vivid and real. I have only tried it once and so have not had practice in incorporating it into dream work. --*DJ, VA*

[I have had difficulty in growing *C. zachatechichi* in my greenhouse -- out of a whole packet of seeds, not one of them sprouted. A friend gave me a very tiny seedling last fall, and I've been nursing it through the winter. So far it doesn't look promising, but it hasn't obviously died yet. If anyone out there has some growing tips about this plant, we'd like to hear about them. It sounds like a promising entheogen. -- *Ed.*]

#### SALVIA DIVINORUM

For the past year or so I've been growing a *Salvia divinorum* plant -- snipping the mature leaves when it was appropriate and freezing them until I had enough for a trip. Recently I took about 150 leaves from the freezer, macerated them in a Vita Mix blender with water, strained the mash and obtained about 24 oz. of dark green liquid. This was enough for three of us to drink one cupful apiece. It was fairly bitter (but not

totally awful), and produced no nausea. It is said that the experience is subtle and must be done in darkness and total silence -- we did this. After 45 minutes of trying to discern whether or not I was "feeling anything," I gave up. The effects (if any) were so subtle as to be indistinguishable from my own imagination. One of my companions reported some rather bizzare imagery, but she is a natural psychic anyway, and could get the same by just closing her eyes. My other friend didn't report anything more than I did. I've heard from more than one person that *Salvia divinorum* is a bonafide entheogen, but you can't prove it by me. I know that the psychoactive agent in the leaves is unstable, but I read somewhere that you can preserve this by freezing -- either that is wrong or the lore about this plant is just another shuck. At least when you eat mushrooms you don't have to keep asking yourself if you feel anything!  
*P.O., AZ*

[There are probably any number of reasons why *Salvia divinorum* didn't work out for you and your friends. I too read in one of the Adam Gottlieb/Mary Jane Superweed books that the psychoactive properties of the leaves of *S. divinorum* as well as *Coleus* could be preserved by freezing. Without any first hand experience to go on, I can't comment. Perhaps someone out there in the network can help us out on this one. (Incidentally, in the last issue I asked if anyone had proof that *Coleus* is an entheogen. To date I've received no answer to that question -- which suggests that this is another of those irritating psychedelic myths.) -- *Ed.*]

#### AYAHUASCA ANALOG DOSAGES

At a recent workshop in Portland, Terence McKenna recommended 60 grams of *Desmanthus illinoensis* in place of 85 grams of *P. viridis*, and 2 grams *Peganum harmala* for the 500 grams *B. caapi* vine. This is second-hand info, tho it would seem Terence is somewhat well versed in the ayahuasca family brews. I liked your comment about growing one's own plants tho and I like the idea of purchasing *B. caapi* and *P. viridis* from L.E.R. or Of the Jungle and growing them in my home ... *J.P., UT*

[I'm not familiar with jungle ayahuasca, but 85 grams of *P. viridis* leaves sounds excessive -- are you sure the figure wasn't 8.5 grams? See the Entities column elsewhere in this issue, where 10 grams of *P. viridis* was enough for a profound experience. I haven't tried growing this bush yet, and I hear that it is difficult to get started. It still seems to be the standard of comparison for DMT-containing plants, however. The two grams of *P. harmala* sound about right according to my understanding. Indeed, it would seem that *P. harmala* has a higher alkaloidal content, per gram of raw material, than *B. caapi*. It can be grown outside of the jungle in Northern climates and, once established, will provide you with an abundance of alkaloid-rich seeds year after year. -- *Ed.*]

#### AMANITA MUSCARIA

How does one use the *Amanita Muscaria*, the "poisonous" fly agaric mushroom, which was the subject of the classic study Soma by Gordon Wasson? Through the years my attempts to track down an Ojibway (Chippewa) native (a tribe whom Wasson noted were users of this mushroom) or to find a learned member of the American Mycology Association have failed. I have collected glorious specimens of this mushroom which grows under conifers on the East Coast but in twenty years of searching I have never found anyone who has a clue as to how to "make it safe" for ingestion. Help! As this attorney is not a chemist, would you please keep the answer simple. -- *Unsigned*

[I confess to having no personal interest in *Amanita* as an entheogen. The following quotation from McKenna's *Food of the Gods* pretty much explains why:

*Genetically and chemically Amanita muscaria is extremely variable; many kinds of fly agaric do not provide a reliable ecstatic experience. Soil considerations and geographic and seasonal factors also affect its hallucinogenic properties. Use of a plant by a shaman does not necessarily mean it is ecstatic. Many rather unpleasant plants are used by shamans to intoxicate themselves and to open the "crack between the worlds" ... In spite of their*

shamanic usage, these plants do not induce an ecstatic experience that could inspire the rapturous praise heaped on Soma. Wasson himself was aware that *Amanita* was unreliable, as he himself never had an ecstatic experience from eating *Amanita* ... No ingredient or procedure has ever been found that reliably transforms the often uncomfortable subtoxic experience of *Amanita* into visionary journeying to a magical paradise. (Pg. 108)

In the Fall, 1983 issue of *The Psychozoic Press* (available from Rosetta folios, Berkeley), Elvin D. Smith describes his experiences with *Amanita* in an article entitled: "Muscarians: the Magicians of Deception." He concludes the piece with these observations:

*All totaled, the muscarians are probably neither singly inebriating, nor solely psychedelic, but instead would be more appropriately termed as hallucinogenic inebriants. The inebriating aspect would tend to make a person forget his experience is the result of ingesting a drug, sharply in contrast to the true psychedelic mushrooms, which have effects characterized by an extraordinary lucidity of perception and mental function. I have heard of A. muscaria being sold ... in some cities where they are referred to as "popcorn." My advice is: save your time, save your body, save your mind. The muscarians ... are, after all, the "toadstool" of hallucinogens ... (Pg. 48)*

Not all of the descriptions of this entheogen are negative, however, and there is evidence to show that the time of harvest plays a very important role in the kind of trip one gets. In number 2/3 (1991) of the European journal *integration*, Antonio Bianchi describes this phenomenon:

*Speaking about experiences with Amanita muscaria is very difficult because it depends upon the mushroom, on the person who is undergoing the experience and on the environment where the experience takes place. We have found, according to the data reported in many texts, that the most important variable is the time of the season when the mushroom is picked. The most powerful mushrooms were picked in the middle*

*of August when the season (was) beginning. In the mushrooms picked in September the narcotic and physical effects were predominant whereas in August the "visionary" and psychedelic effects were more highlighted ... The amount of drug changes from 1-3 mushrooms in August to 4-5 mushrooms in the middle of September. But even with the higher amount the experience is not the same: in September the physical symptom of nausea is more marked and less the narcotic and visionary experience ... I think that the most powerful quality of the Amanita muscaria is the sense of silent talking to oneself; it's a kind of internal dialogue where a person has the feeling of important revelation about his life, a feeling which is maintained for a long time after the experience. I think that this mushroom could have a lot to teach us about ourselves.*

In the same article, co-author Francesco Festi states the dose range and lethal dose level:

*The dose ranges from one to more than ten fungi ... The lethal dose of Amanita muscaria for an adult, considering the average concentrations of muscarine in Europe, has been estimated (at) about 5 kilos of fresh fungus, but this quantity is hard to ingest.*

For some paranormal insights into *Amanita*, see Puharich, Andrija (1974), *The Sacred Mushroom*, Doubleday, Garden City, NY., in which psychics report some rather bizarre experiences with these mushrooms -- communication with discarnate entities describing ancient Egyptian religious rites, etc. -- *Ed.*

### *DATURA SPECIES*

I recently purchased a beautiful *Brugmansia aurea* and some other daturas. If you have some good prescriptions for using these plants, please let me know. I have been using *Plants of the Gods* [Schultes and Hoffman] and Emboden's narcotic plant books and other herbal guides as references, but know that these plants are pretty potent and want to be sure.--*CM, FL*

[All of the plants containing Belladonna alkaloids (scopolamine, atropine, etc.), which includes the various *Datura* species, have a long history of

shamanic usage. Unfortunately, I have yet to come across a procedure for ingesting them that doesn't sound risky. The classical formula from European witchcraft was to make a so-called "flying ointment" from the leaves, flowers and roots. This was then smeared on the body -- usually the genital area. An article on the subject appears in the Fall, 1991 issue of the *Herb Quarterly*. I'll just quote one sentence:

*Dr. Karl Kiesewetter, a well-known historian and one of the first to experiment with flying ointments in modern times, in fact died of poisoning after one of his experiments.*

Timothy Leary is supposed to have said that he never heard of anyone having a good *Datura* trip. On the other hand, a friend took *Datura* under a shaman's supervision in Ecuador and found it to be a strange, but personally worthwhile experience. A correspondent swallowed some in Guatemala and although he got a weird alien contact out of it, he also had some spooky side effects which continued off and on for several years. He says he'd never take it again under any circumstances.

*Datura* is not considered a true psychedelic, being more accurately described as a deliriant. Often the subject cannot remember the trip at all, though observers tell him that he did some very strange things while under the influence. Nevertheless, the *Datura* are very magical plants to grow: I usually raise several in my garden each summer: my particular favorite being *Datura meteloides*, the species native to the Southwest. The huge white flowers, with their subtle and surprisingly erotic scent, are hypnotic and compelling. However, everything I've learned about the species has convinced me never to take *Datura* internally. -- Ed.]

### CONCERNING MAO INHIBITORS

David Goldstein and myself have been doing background work for serious researchers involved with entheogens for quite some time. This is through the PHD (Papers from the History of Drugs) catalog and archival library. The PHD has over 12,000 articles going back to 1860, and continues to grow all the

time. I also publish *Psychedelic Monographs and Essays*.

I thought your readers might enjoy David's recent response to one of our contacts regarding the minimum effective doses of MAO inhibitors which make DMT or 5-MeO-DMT orally active. The focus is on MAOI in plants. [See following letter -- Ed.] This is also an invitation for serious researchers to barter or sell us papers, transcripts, newspaper articles, dissertations, etc. in this area. There is a lot of misinformation floating about re: MAOIs and psychedelic substances. We will be happy to share the results with your *Entheogen Review*.

Respectfully,

Thomas Lyttle

*Psychedelic Monographs and Essays*

Boynton Beach, FL 33424

From David Goldstein's letter:

The question of the minimum effective dose of a MAO-I such as Harmaline which makes DMT or 5-MeO-DMT orally effective is complicated for several reasons. In papers dealing with the use of Harmaline, doses are given through sometimes unspecified routes and therefore have different pharmacodynamics.

Udenfriend, S., et al. (1958) established that Harmaline is an effective MAO-I in rats at 5-15 mgs. This is probably i.p. but this was not mentioned.

Freter, et al. (1958) compared a series of reversible MAO-Is and established the harmala alkaloids as the most potent.

Sjoerdsma, et al. (1958) likewise found Harmaline to be an effective MAO-I. There is further information on MAO-I drugs in *Pharmacological Reviews*, Vol. 18 (1), 1966.

Morton, Szara, and Aikens (1967) determined that Harmine, i.p. in mouse brain, is 5 mg/kg.

An early publication of The Church of the Tree of Life called *Barkleaf* (1972) stating that gut absorption is poor for harmala alkaloids, recommends some of the

highest doses for hallucinogenic purposes; Harmine at 500-750 mg, Harmaline at 250-375 mg., and Harmalol at 125-190 mg.

A later *Barkleaf* (1973) suggested that Harmine be snorted at 25-50 mg. or 50-75 mg. be placed under the tongue or between the gums and the lips but not swallowed.

Naranjo used 4 mg/kg orally and this may be the source for Shulgin's suggestion of an oral dose of 300-400 mgs. (1977).

Stafford (1977) suggested that Harmine and Harmaline have the same strength orally and are active at 200 mgs.

Brown, et al. (1978) however, stated the toxic dose of Harmaline is 200 mg. orally, citing Glasby (1975).

Grinspoon and Bakalar (1979) stated that Harmaline is active in the range of 300-400 mg. orally.

Albert Most (1985) stated that oral Harmine is a CNS stimulant at doses of 25-50 mg. and is hallucinogenic at doses above 200 mg.

In most of the previous citations, no one bothered to mention that it is assumed that the Harmala alkaloids are given as the HCL base.

Gracie and Zarkov's personal preference was 7 grams of *Peganum harmala* seeds with 30 mgs. of DMT (1986).

Most (1985) stated that 10 grams of *P. harmala* seeds contain 400 mgs. of total B-carbolines which would put Gracie and Zarkov's dose at 280 mgs.

Previous to this there appear to be only 3 papers dealing with the use of B-carboline MAO-Is in connection with DMT. These are by Sai-Halasz (1962, 1963), and Lu et al. (1974).

It appears that Gracie and Zarkov's short paper is the only one that discusses the use of an oral MAO-I with DMT. Of course, the literature on the use of Yage or

Ayahuasca is extensive. For instance Rivier and Lindgren (1972) and McKenna, Towers, and Abbott (1984) describe the relative doses of Harmine and DMT in two preparations of Yage.

As for Bufotenine, Blaschko (1952, 1953), Erspamer (1955) and Himwich and Costa (1960) established that bufotenine is metabolized by amine oxidase and that MAO-Is potentiated the bufotenine effect. However, it is still to be determined whether bufotenine is truly an hallucinogen and whether or not it can be used recreationally, like its relatives.

There are contemporary experiments researching this question. For instance, a commonly prescribed hypotensive agent called Tranylcypamine is an effective inhibitor of gut MAO but it is only available by prescription. I don't think anyone has discovered this yet, but there is an existing and naturally occurring MAO-I available over the counter. This is Ephedrine from Ephedra. Please let me know of your own results ...

#### *WHAT IS THE LETHAL DOSE FOR HARMALINE?*

I have a couple of questions regarding *P. harmala*. First, I recently received a booklet on *P. Harmala* written by Albert Most, and sold by *Rosetta*. Mr. Most states that harmine/harmaline is an effective hallucinogen at the 200-750 mg range. Would you consider this information to be erroneous, or perhaps an exaggerated claim for harmine/ harmaline's effectiveness on its own? What is the approximate lethal dose of this alkaloid? Secondly, there are several botanical supply companies offering *P. harmala* seeds. Most companies make a distinction between "viable" seeds and "dye-quality" seeds, with a significant price difference between the two. Do dye-quality seeds contain harmine/harmaline?  
*DZ, NY*

[As you can see from the preceding letter, there seems to be some confusion about the difference between lethal and hallucinogenic doses of the harmala

alkaloids. Most says that 200 mg is hallucinogenic; Brown says that amount is toxic. My understanding is that high doses of harmaline are psychoactive, but that unpleasant side-effects (nausea, vomiting) dominate the trip. I do not know the lethal dose. To me, the most interesting properties of harmine and harmaline are their ability to potentiate tryptamine hallucinogens in general, and in particular their ability to make DMT orally active. It is my understanding that the only difference between viable and dye-quality seeds is that the latter have been rendered sterile -- the alkaloid content should be identical. -- *Ed.*]

#### *HARMALINE VS PARNATE*

I am very interested in the ayahuasca analogues. My own experience with harmaline twenty years ago was horrible at a dosage of 400 mg. I've enclosed an underground publication that suggests that 1 to 2 mg of Parnate will work as well.

Would you know a source for *Stipa robusta*? I would like to send a plant to a German scientist that works in fungal transformations. He has done some interesting work increasing the concentration of psilocin to 3% by adding tryptamine to cultures of *Psilocybe cubensis*. It would be novel to find a way to methylate *Stipa robusta's* alkaloid. -- *CA, PA*

[See the following letters regarding the use of Parnate in lieu of harmaline. The harmala alkaloids are bummers in large doses, and their main value is as a short-term MAO inhibitor. At lower doses they don't seem to be so unpleasant.

To date, I've received no reply to requests for further data on the *Stipa robusta* piece in the last issue of *the Enthegen Review*. (The people at *Discovery* magazine, the source of the original information, sent me a form letter: "Thank you for your interest etc., we can't respond, etc., but hope you continue to enjoy our magazine, etc.") A buddy checked some computer databases with inconclusive results. Come summer, I'm going to locate some plants -- they are native to this part of the country. Your idea for manipulating the plant/fungal symbiosis for altered alkaloid content is an intriguing possibility. -- *Ed.*]

## ON THE USE OF SYNTHETIC MAO INHIBITORS

As one involved with psychopharmacology at the post-doctoral level for 23 years I strongly advise against the use of pharmaceutical MAO inhibitors intended for the treatment of depression to potentiate psychedelics.

Firstly, these agents, which include Marplan, Parnate and Nardil, are far longer lasting than the beta-carbolines of *Banisteriopsis caapi* or *Peganum harmala*. It requires 10- 14 days for them to be eliminated from the body as opposed to perhaps the same number of hours for the botanical beta-carbolines.

Secondly, unless between 24 and 48 hours separate the ingestion of a pharmaceutical MAO inhibitor and a psychedelic agent, the side effects (especially headache) are often intolerable. How many people know their situations well enough to know with certainty that they will be able to take a mind-altering agent after such an interval? It just adds another uncontrolled variable to a situation already fraught with uncertainty.

Finally, the use of these agents usually at least doubles the length of the trip. To me, this is an adequate reason to avoid the practice. Those who take psychedelics/ entheogens with impunity are usually not afraid of a drug induced psychosis, but I have seen far more drug induced psychoses from MAO inhibitors than from psychedelics.

While, from an ethical standpoint, I cannot endorse either the use of psychedelic agents or the combination of pharmaceuticals with the same, I am unaware of any adverse consequences from the addition of sergiline (Eldepril).

I have found the combination of *B. caapi* leaf and raspberry leaf an effective treatment for PMS. The recipe is as follows: bring 4-5 *B. caapi* leaves to a rolling boil in a quart of water for a moment, then simmer for 5-15 minutes (longer for more severe PMS). Take water off the burner and add a tablespoon

of raspberry leaf tea. Allow to cool to a tolerable temperature and drink the result in 1-2 oz. increments until relief is obtained. -- *A.B., TN*

[*The Entheogen Review* is dedicated to publishing accurate information about the cultivation, preparation and use of psychoactive plants. I confess to being uncomfortable with data concerning synthetic drugs -- not that I am opposed to them *per se*, but because one almost needs a degree in pharmacology to use them intelligently, and even the experts often disagree. As stated elsewhere in this issue, the last thing I want on my conscience is the death of someone who carelessly ingests a substance based on something written in these pages. Fortunately, an individual well versed in these matters has agreed to be a consultant to this newsletter. The following is a response to some of the issues raised in the letters above. -- *Ed.*]

100 mg harmaline HCl (dissolved/suspended) in water, taken 15-30 minutes before 100 mg oral DMT freebase (similarly suspended) is psychoactive, although not fully "psychedelic." That is, there is some eyes-closed imagery, but effects are primarily somatic (increased energy) and affective (euphoria). These are both "pure" synthetic compounds.

I have heard that harmine/harmaline are more active if taken sub-lingually (i.e., under the tongue), thus avoiding extensive metabolism by the liver. In addition, acidifying the saliva by mixing it with vitamin C also enhances its effects.

Al Most is a reliable source of information.

Sai-Halasz's papers re: DMT and "B-Carboline MAOIs" are not using B-Carboline MAOIs -- one of his papers (#18) used a serotonin antagonist, i.e. blocking serotonin receptors, which has nothing to do with MAO. His second paper (#19) used iproniazid, a synthetic MAOI, without resemblance to the B-Carbolines.

Tranlycypimine (Parnate) is a commercially/prescribable available MAOI -- used as an antidepressant, not an anti-hypertensive or hypotensive (i.e. for high blood pressure). Its half-life

is about 8-12 hours. I know of no one who has used oral, smoked or injected DMT with it. One would guess it would prolong DMT's effects, and make oral DMT active -- but there are no data out there to my knowledge. I looked at a couple standard pharmacology texts re: ephedrine, and found no reference to its MAOI effects. It is an adrenalin-like stimulant though, and should be used carefully with anything that is cardio-stimulatory -- most notably phenethylamines (MDA, MDMA, mescaline, STP [DOM], DOB, DOI, etc.)

The comment by the psychopharmacologist re: "10-14 days to eliminate them from the body" is not accurate. They (the MAOIs -- Parnate, Nardil ... ) are eliminated relatively quickly, as I mentioned before. However, they are what is known as "irreversible" MAOIs. New MAO must be synthesized for normal MAO function to return. This takes 10-14 days, not the elimination of the drug itself.

Sai-Halasz's #19 paper pretreated subjects with a MAOI for 4 days and then waited 2 days before administering intramuscular DMT -- effects were lessened and became "stranger."

Selegiline (L-Deprenyl) is a MAO-B-inhibitor -- and, as such, would not be expected to enhance efficacy of DMT, which is metabolized by MAO-A. Is "sergeline" a typo? There is no such drug I am familiar with.

Lethal doses of harmine/harmaline? I don't know. When you feel sick on it -- that's probably nearing too much. 200-300 mg is probably safe in a healthy person, if it's not combined with any other drug/plant affected by or affecting its pharmacology.

-- *Doctor Know*

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

**THE OBLIGATORY DEFENSIVE  
DISCLAIMER**

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals.

As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a lawmaker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and volition and must accept full responsibility for such decisions.

Jim DeKorne

**ON THE EVOLUTION  
OF PSYCHEDELIC SHAMANISM**

*It is debatable whether a Westerner who uses shamanic practices divorced from the social, cultural, and mythological setting in which they were originally embedded can usefully be called a shaman.*  
(1)

A fascination with shamanism has surfaced and spread rapidly throughout Western culture during the last decade or two. A topic which was an anthropological specialty only twenty years ago, is now familiar to a large portion of the general population. Because the industrialized world is bereft of models for ecological living, the motivation behind this sudden interest is probably nostalgia for the integrated lifestyle which tribalism seems to offer. Unfortunately, the trend implies romantic escapism more than a viable way to redefine our relationship to the planet. For better or worse, the Western psyche has moved too far from the earthy realities of the tribal matrix to pretend that we could ever live in precisely that relationship with the earth spirits again. New answers will not be found in playing Indian with the fur and feathers of endangered species, but in an acceptance and re-definition of our affiliation with those Post Modern forces now shaping the planet.

Although there is an accelerating trend toward cultural syncretism in the modern world, the Western mind is

still quite different from the Eastern, let alone the Tribal, and the symbols emerging from the collective psyche of any given group, while they may be universal in a Jungian sense, still tend to be culturally specific. Which is to say that if we are to realistically incorporate the tools of psychedelic shamanism into our real-world lives, we must include our own symbols rather than concentrate exclusively on foreign cosmologies we've only read about in old *National Geographic* magazines.

Guidance in these matters is found in Amazonia, where modern shamans are not at all reticent to integrate both traditional and modern elements into their practices. Here, where dying tribal cultures and their rapidly degrading environments are a microcosm of the world predicament, shamanic pragmatism includes any useful resource that might stave off death:

*Shamans are constantly appropriating symbolically whatever innovations they see or hear about, using them in their visions as vivid metaphors to further explore the spirit realms, to increase their knowledge, or to defend themselves from supernatural attack. Shipibo shamans receive books in which they can read the condition of patients, have spirit pharmacies, or travel on airplanes covered with meaningful geometric designs to the bottom of lakes to recover the (soul) of their patients ... Canelos Quichua*

receive from the spirits X-ray machines, blood pressure apparatuses, stethoscopes, and large bright surgical lights ... An acculturated Campa shaman uses in his healing songs radio frequencies to communicate with water spirits ... A vegetalista living in Iquitos [said] that besides angels with swords and soldiers with guns, he has a jet fighter which he uses when he is attacked by strong sorcerers ... An ayahuasquero of Pucallpa [said] that in his visions he was given magical keys, so that he was able to drive beautiful cars and airplanes of many kinds. (2)

What forms might a contemporary Western shamanism take? For one thing, extra-terrestrial themes are now a firmly established motif of our evolving mythos: the UFO contact is widely held to be an interface between inner and outer dimensions -- analogous to a kind of involuntary shamanic encounter. Amazonian ayahuasqueros are already consciously dealing with these entities, and perhaps we should be opening to them as well. Terence McKenna often describes off-planet, UFO themes as typical artifacts of the entheogenic experience:

*UFO contact is perhaps the motif most frequently mentioned by people who take psilocybin ... They encounter another space with UFOs and aliens -- classic little green men ... The UFOs come from another dimension; one could almost say they come from beyond death. They come from a dimension somehow totally different from our own, but*

*tied up with the human psyche in a way that is puzzling, alarming, and reassuring -- and shamanic. (3)*

Traditional shamanism recognizes a three worldhierarchy: the Lower world, which represents the realm of the animal powers; the Middle world, which encompasses our everyday experience on planet earth; and the Upper world, which is seen as the domain of higher spirits. In a shamanic context then, the visionary animal allies (snakes, eagles, etc.) symbolize the "Lower world," while extra-terrestrials are by definition from the "Upper world." Whatever these entities "really are," they always seem to attune themselves to the consciousness of those who perceive them. A sorcerer's apprentice culture like ours, coping with gadgetry out-of-control, is more likely to respond to representations of high technology than to the ironically more "alien" images of the natural realm.

Which is not to imply that the earth forces -- the "Lower world" of the shamanic cosmos -- can be ignored. The shamanic task of our culture is to integrate these Upper and Lower worlds: a living balance must be struck between the wounded forces of matter and the pull toward an enlarged experience of spacetime. We cannot possess either realm fully without such an integration. Whether it emanates from a guided MDMA session or a curer's hut in the jungle, this is a synthesis traditionally achieved within shamanic states of

consciousness.

The challenge is how to define this new frame of reference. It is neither necessary nor realistic to ape "Native American" cultures in order to prove we care about the earth. Since anyone born in the United States is by definition already a Native American, a truly progressive synthesis suggests that we re-define our existing traditions to conform with ecological reality. We can endorse what we are in fact: Neo-Native Americans swept up by rapid planetary changes which we ourselves have helped to set in motion. Ideally, we can become shamanic mythmakers bootstrapping a current impasse into opportunities for future growth and enrichment.

Whatever the UFO may be it represents at least the possibility of an alliance -- a traditional shamanic relationship with a hidden power for the purpose of healing the ills of the tribe. With our feet in the lower world and our eyes on the upper, living in the real present, we can never return to what once was, but we do have some measure of choice about what will be -- in our own lives at least. If we have any power at all, that is where it lies.

Readers with ideas about how to facilitate this process are encouraged to share them with us. -- Jim DeKorne

#### PEYOTE AS AN ENDANGERED SPECIES

Recent correspondence has revealed a problem that somehow previously eluded me -- the fact that the Peyote cactus (*Lophophora williamsii*) is now an endangered species. The Mexican government has already declared it so, though indigenous groups are still permitted to collect it for religious purposes. (This, it seems to me, is like making it illegal to harvest tomatoes, except for food purposes.)

Anyone who considers the issues involved here for even a minute will realize that the subject is entangled in gross contradictions, non sequiturs, double-binds and mind-warped absurdities. One of our planet's most powerful entheogens, declared illegal for ingestion by any except certain racial/cultural groups, but widely used anyway by "illegal" categories of people, has been overcollected to the point of extinction. In some quarters this must seem like a convenient solution to a law-enforcement problem, in others, an inconceivable loss to the human experience, and in still others, the elimination of just one more DNA molecule for no apparent

purpose than the free exercise of our right to be willfully negligent.

The following essay by a concerned correspondent presents the issues in what I consider to be a responsible and provocative manner. Additional input is always welcome. -- Jim DeKorne

PEYOTE  
(LOPHOPHORA WILLIAMSI)

### **A MODEST PROPOSAL** by Hatter

Peyote (*Lophophora williamsii*) is a small spineless cactus growing from Central Mexico into Southern Texas. It is the strongest source of mescaline, and the only entheogen whose religious use is even semi-legal in the United States. Native American members of the Native American Church (NAC) may legally use peyote as a sacrament, and are exempt from the criminal penalties facing non-native Americans seeking to exercise their "freedom of religion" with peyote or any other entheogen. However, peyote is

in grave danger of extinction from overcollection, and all peyotists, including the NAC, should consider adopting a new psychoactive sacrament before this comes to pass.

Peyote has been used on this continent for a long time. Archaeological evidence, including still-psychoactive dried peyote buttons found in Texas caves, establishes that Americans have been using this sacrament ceremonially for at least 3,000 years. However, it wasn't until after the Civil War that significant peyote use began to spread north of the Rio Grande. This was a period of intense crisis for Native Americans as more and more tribes were confined to reservations. The Ghost Dance religion of the 1890's was brutally suppressed at the battle of Wounded Knee, and with it all hope that Indian lands would ever be restored. Because of extensive proselytizing and medicinal claims, a peyote-based religion soon developed in over fifty tribes throughout the U.S., and in 1918 the Native American Church was incorporated. It has been claimed that at present more than half of all Native Americans belong to the NAC--perhaps 250,000 members altogether. The NAC's practices are not like the shamanic use of peyote in Mexico, but rather a blend of Native American and Christian elements: a communal experience involving song and prayer.

From its inception the NAC has faced legal challenges to the use of its sacrament. However, in 1960 an Arizona

judge ruled that under the first and fourteenth Amendments, the NAC was exempt from Arizona's anti-peyote laws. Consequently, federal anti-drug legislation enacted in 1970 included an exemption for the NAC's use of peyote. Until that time even non-native Americans could legally purchase mescaline in many states. Nevertheless, the religious use of peyote for non-Indians has not been upheld--doubtless because of fear that the religion would spread like wildfire if opened up to other groups. (It is worth noting that a recent possession case against a white member of a NAC congregation in New Mexico was thrown out by the judge on the grounds of racism.)

Unfortunately, at this point in time, peyote is a victim of its own popularity and both it and the Native American Church are facing a crisis. Choices made now will determine whether or not the NAC and the peyote plant itself will survive.

Peyote takes about 13 years from germination to maturity, and never attains much more than a four-inch diameter. It is a very slow-growing plant which has been overcollected for decades. To quote Peter Stafford's *Psychedelics Encyclopedia*, "Much of the peyote growing in the more accessible parts of the Chihuahua Desert has been picked by people without the sense to leave the root. It can still be found in remote areas but is in danger of extinction."

Edward Anderson, in *Peyote -- the Divine Cactus*, confirms this, stating that peyote has vanished from many areas where it was once common. Although governments are notoriously slow to name a species as endangered, Peyote is so listed in Mexico.

The Mexican Huichol tribe is still allowed to use peyote, and most of the peyote used by the NAC undoubtedly comes from Mexico, so it would seem that indigenous peoples are exempt from the restriction of collection of an endangered species. It is important for Native Americans to realize that all collection, including collection by indigenous peoples, puts increasing pressure on a diminishing number of peyote plants. I haven't seen any figures on how long it takes for a cactus to recover from even proper collection (i.e., cutting only the top off so that the plant can regenerate), but I wouldn't be surprised if it were several years. Many ignorant or greedy people dig up the whole plant, removing it forever from the planet.

The NAC is aware of peyote's approaching extinction (unsigned article, Feb. 1992 *Sacred Record*), but to my knowledge hasn't yet faced the impossibility of raising enough slow-growing peyote to supply the needs of its members. If we consider peyote consumption by the NAC alone, 250,000 NAC members consuming 4 buttons each at weekly services would consume one-million buttons a week,

fifty-two million buttons a year. Perhaps not every member consumes peyote weekly, but it's not unknown for members of the NAC to consume up to thirty buttons in a session. From these figures it's clear that neither the wild population nor domestic-grown specimens can possibly keep up with even NAC usage, not counting peyote consumption by non-native Americans. Make no mistake about it: peyote is scarce, and growing scarcer. The NAC would be well advised to consider the future now, instead of waiting until they've loved their sacrament to death.

What options are there? Consume all the peyote and die out? Try growing their own peyote and then, because it's so slow-growing and they can't possibly grow enough, ration it out sparingly? Wait until all the peyote is gone, then become like the white man's churches, where people talk about God rather than talk to God? There are other possibilities.

I suggest that all peyotists (Native Americans and just ordinary Americans) adopt another sacrament before peyote becomes extinct. There is ample precedent for this: before the northern tribes learned the use of peyote from their southern neighbors, many groups used the dangerously toxic mescal bean (*Sophora secundiflora*) to induce visions. Use of the mescal bean dates back ten-thousand years! After the introduction of the much safer peyote, use of the poisonous mescal bean largely died out, though it

retains a place in the peyote ceremony of many tribes. Ironically, myopic ethnographers later confused the mescal bean with the peyote button -- hence the name "mescaline" was given to peyote's entheogenic alkaloid when it was first extracted.

What could substitute for the increasingly-scarce peyote plant? Switching to another mescaline-containing cactus might be easiest in terms of familiarity. It would also be easier to justify to law-makers as an equivalent sacrament, especially on the grounds that any other course would result in the demise of the NAC, and therefore constitute religious discrimination.

Unfortunately, most other cacti reputed to be used as minor sacraments (genera such as *Ariocarpus*, *Pachycereus*, etc.) don't seem adequate. In the first place, most cacti are slow-growing, hence eventually would become as over-harvested as peyote. Many species are scarce already. There is little documentation of the alkaloidal content of these species, and determining their usability would require much trial and error on the part of experimenters. Also, mescaline is among the least potent hallucinogens, requiring a minimal dose of between 200 and 500 mg of peyote's most active ingredient -- it also has side-effects such as nausea. Any alkaloids less active than mescaline, such as macromerine (found in *Corypantha compacta*), are likely to have even more

unpleasant side-effects. Peyote contains an abundance of other alkaloids in addition to mescaline, such as lophophorine, which has strychnine-like effects: it would be naive to expect most other indigenous cacti not to be worse in this respect as well.

On the positive side, there are several species of mescaline-containing cacti in the genus *Trichocereus* which seem ideal. They grow much larger and faster than peyote and contain fewer adulterant alkaloids. These cacti are currently legal for the public to grow but not to consume, and are often cultivated by nurseries rather than wildcrafted. *T. pachanoi* is an almost spineless columnar cactus which grows from 9 to 20 feet tall, branching at the base. Each branch can produce a foot or more of linear growth each year (with a diameter of 3 to 4 inches), whereas peyote takes decades to grow to a diameter of three inches and a height of an inch or less.

*T. pachanoi* is known among its Latin American devotees as "San Pedro" (Saint Peter -- keeper of the keys to heaven). San Pedro is only a third as strong (0.34% mescaline, dried, compared with about 1.1% of the alkaloid in dried peyote), and is customarily sliced and boiled several hours to extract a drink. Peyote is usually chewed, but is also used as a tea. A species related to San Pedro, *T. peruvianus*, contains almost as much mescaline as peyote (0.82%), and would make a good

long-range substitute once nurseries were established to provide cuttings.

Using the above percentages, for an average psychoactive dose of mescaline one would need to consume or extract:

*Lophophora williamsii* -- 27.0 grams dry weight to produce 300 mg mescaline.

*Trichocereus peruvianus* -- 37.5 grams dry weight to produce 300 mg mescaline.

*Trichocereus pachanoi* -- 100.0 grams dry weight to produce 300 mg mescaline.

Of course there are other entheogens which could be justified as sacraments on the basis of long-standing religious use by Native Americans, such as the *Psilocybe* mushrooms and Morning Glory seeds used by Mexican tribes before the Spanish Inquisition drove their use underground. Either *P. cubensis* or several species of Morning Glory could be easily cultivated in sufficient quantity for the NAC's needs. Either (especially the former) would be a renewable resource, which the slow-growing peyote unfortunately is not.

Regardless, if the Native American Church does not address these issues soon, the approaching extinction of peyote may end legal religious use of entheogens in the United States entirely.

## ENTHEOGEN VS PSYCHEDELIC

In your Winter Solstice 1992 issue you explain why you chose the word entheogen for the title of your journal: "It suggests a substance capable of evoking transcendent forces and is therefore an appropriate word to use in describing shamanic states of consciousness." Although I respect your opinion, I do not agree with you. The word's inventors--a committee chaired by Carl Ruck that also included Jeremy Bigwood, Jonathan Ott and Gordon Wasson--have described it as meaning "god generated within." I think a more accurate translation would be "god-inducing substance." In either case, the word is heavily freighted with religious implications. This makes it appealing to people who want to believe that these drugs are inherently sacred, instead of just potentially sacred depending on set and setting.

Not all transcendent states of consciousness involve a sense of communion with God or deistic forces. Often they're only transcendent in the sense of being different from normative consciousness. A man who takes a heavy dose of LSD at a fraternity party and washes it down with two six-packs of beer and whiskey chasers (I've seen this done) may describe the resulting "transcendence" as a religious experience, and so it might be. But if he simply describes the experience as "getting really blasted" with no claim to religious enlightenment, would you insist that the drug he ingested was entheogenic in

its effects? I certainly wouldn't ...

Like the McKennas, I've always believed that there's nothing basically wrong with "good old psychedelic." It encompasses both sacred and nonsacred drug experiences. My book *The Sacred Mushroom Seeker* (Portland, OR: Dioscorides Press, 1990) recounts a discussion I once had with Wasson on this subject:

*... Psychedelics, I explained, had been found in a number of studies to function psychologically as "non-specific amplifiers." In other words, they can project into consciousness (amplify) unconscious feelings, perceptions and other psychological effects that are different (non-specific) for each individual. Furthermore, as Aldous Huxley noted in Doors to Perception (1954), these substances often induce for their users a sense of identification with a universal consciousness, or "Mind-at-Large." In either case, mind (or Mind) becomes manifest as a result of ingesting the substances, thus validating psychedelic's meaning. It therefore seemed wasteful to me, I told Gordon, to throw out the term just because it had suffered some bad associations in the past.*

*"Well," Gordon said after hearing me out, "perhaps you'll change your mind some day."*

I haven't so far. But again let me emphasize, I do respect your (and anyone else's) preference for entheogen,

especially if the focus of your journal will be sacred applications of these substances.

Thomas Riedlinger

\*\*Your points are well taken--indeed, considered from a purely semantic perspective, I am in full agreement: it's a shame to waste a perfectly adequate word because of a widespread misunderstanding of its meaning. Unfortunately, there is more at stake here than semantics--due to media hype, "psychedelic" is now equated with a demonic drug to be forever banished. Efficient strategy suggests we discuss the subject in different terms if we ever expect public attitudes to change. "Entheogen" suggests a substance which should be protected under the First Amendment, and focuses attention on more serious concepts than just "getting blasted." (I don't even have problems with that, but if someone's getting blasted interferes with my right to explore inner space, I'll defend my intent over theirs.) I guess I'm confessing here my feeling that expedience transcends a purist interpretation --the subject is too important to allow hedonistic intentions to determine how these potentially entheogenic substances are legislated.

As editor of this newsletter, I am primarily interested in how psychedelics often evoke contact with what appear to be incarnate entities -- whether most of these beings are "gods" is more than questionable, but some of them do seem to fit that category. "Entheogen" is probably an

innacurate word, but I'll stick with it for now.

--Ed

## NEURO-LINGUISTIC PROGRAMMING

The auditory hallucinations I've experienced intrigue me and I'm curious to learn more of others' experiences in this area. On a morning glory trip I "heard" the lights of a small town in the distance. This was a light, bell-like sound perfectly synchronized with the flashing of the lights. A similar, but more amazing effect occurred on a mushroom trip: I kept hearing a periodic "whooshing" sound pass very close to my right ear. I looked around for a possible source and saw two power plant towers some distance away. The sound seemed to be timed to the lights flashing on the towers with a slight delay, as between lightning and thunder. What was most interesting was that when I first heard the sound my eyes were closed and my back was to the towers.

Several times I have heard a humming sound which, if I sing along, becomes a small melody with a few repeating, mantra-like syllables. I wonder if this is similar to how "power songs" or "healing songs" are first learned by indigenous peoples. The effect of these sounds has so far always fallen into two categories: 1. Centering and grounding, or 2. Intensifying the effects of the hallucinogen. I think this may be my uneducated version of what ayahuasqueros do with their songs for people in ayahuasca sessions.

My husband and I both have backgrounds in NLP (neuro-linguistic programming), and have been using NLP in therapeutic sessions with entheogens. We've found that even a short session (as with DMT) has remarkable effects, such as one would expect from several lengthier sessions of NLP alone. The resulting personal growth is coherent and more thoroughly integrated than one might bring back from a trip without NLP. I am aware of the psychedelic therapy done by the Grofs and would like to hear from others using NLP in this context. We use NLP with entheogens as a tool to facilitate the more shamanic-based aspects of our work. This is a case of both/and, not either/or. We would like at some point to do a field study of the linguistics of practising shamans (ayahuasqueros, medicine men and women, etc.)--what they reveal about the assumptions and belief systems involved, how they influence "patients," etc. And most importantly, what they reveal as maps of the psychotropically entered realms. We're aware of the limitations imposed by legality issues, social misunderstanding and misuse of these substances, yet what we are learning in our research, and re-learning from older cultures seems to me vital at this time -- to the planet and to ourselves.

LM, NY

#### BUFOTENINE NOT PSYCHOACTIVE

According to Alexander Shulgin last summer at the Telluride mushroom festival, bufotenine is totally inactive

even when injected... MN, IN

#### ERGOT ALKALOIDS FOUND IN SEVERAL GRASS SPECIES

...In reference to your sleepy grass article, did you know that tall Fescue grass (*Festuca arundinacea*) also becomes infected regularly with lysergic acid-laden mycoparasites. Cattle feeding on infected grass acquire a disorder known as "fescue foot" or "black leg" which would hint at the presence of ergot alkaloids also. I heard that in extracting psychoactive lysergic acid alkaloids from ergot one need only do a cold water rinse and the water soluble lysergic acid comes through while the harmful ergotamine (which is oil based) stays behind. Is this truthful? MN, IN

[Probably true -- the Mazatecs grind morning glory seeds into a flour and then leach out the LSD amides with cold water. (See the article: Morning Glories, Part II in the last issue.)] -- Ed.

...Did you know there is something weird in plain old perennial ryegrass (*Lolium perenne*)? Livestock that feed on large quantities sometimes acquire a disorder known as "ryegrass staggers." Symptoms include uncoordination, a high-stepping gait, nervousness, tremors and spasms. This condition is said to be caused by "tremorgenic (not hallucinogenic?) fungi" infecting this grass also. This parasitic fungus (a so-called *Lolium* endophyte) produces neurotoxins named lolitremes. Could this mean that yard

grass could someday become illegal?

In Simon & Schuster's Guide to Mushrooms it says that the mature fungus corn smut (*Ustilago maydis*) spore mass, when consumed, can cause disorders similar to ergotism!

MN, IN

[BEWARE of any disorder "similar to ergotism" -- here's a description of what this disease is like:

The ergot alkaloids are derivatives of lysergic acid and the hallucinogenic D-lysergic acid amide. The chief effects of these alkaloids are gangrenous and convulsive. In gangrenous ergotism the fingers start to tingle, vomiting and diarrhea follow, and within a few days gangrene appears in the toes and fingers. Entire limbs are affected, and amid excruciating pain as circulation is decreased, they separate from the body ... The convulsive form starts the same way but is followed by painful spasms of the limb muscles, culminating in epileptic-like convulsions. Known as St. Anthony's fire, it was a dreaded disease wherever infected rye bread was eaten." Lewis, W.H. & Elvin-Lewis, M.P.F. (1977) -- *Medical Botany*, Wiley-Interscience, NY, Pg. 416

Anyone seeing the photograph of a "Gangrenous leg of ergotism" on page 417 of the above book, would look elsewhere for an entheogen -- or at least be inspired to investigate extraction of the LSD amides rather than eat the

fungus. Curiously, I've never heard of ergotism being a problem with the ingestion of morning glory infusions. Anyone have an insight on why this is so?] -- Ed.

#### VITAMIN-K

What can you tell us about vitamin K? I am enclosing a copy of some comments I found in *Storming Heaven*, by Jay Stevens. -- DF, MD

"K" or "Vitamin K," is one of the synonyms for Ketamine (Ketalar, Ketaject, Super K), a legal anesthetic, which can evoke profound dissociated states of consciousness, out-of-body experiences, etc. Here's what Andrew Weil says about it:

Ketamine is a close relative of PCP, producing very similar effects ... Ketamine liquid can be evaporated to solid crystals that can be powdered and smoked, snorted, or swallowed, just like PCP. By the oral route, ketamine lasts longer, and the peak effect is less dramatic.

Weil and Rosen -- *Chocolate to Morphine*, Houghton Mifflin, Boston, 1983

## USING SOUND WITH ENTHEOGENS

I have digital recording equipment and binaural recording capability. A few years ago I stumbled across a new variation of the reverse-biased solid-state junction avalanche-breakdown effect. (What a mouthful!) I made a wonderful Tibetan bell recording in "binaural" (a "three-dimensional sonic hologram" recording process) and mixed it with a "Purple Noise" synthesized surf recording. Its hypnotic influence on me was so profound, positive and relaxing that I named it "Purple Noise" for its spiritual character. I affectionately refer to it as "the universal flow," or, when used with entheogens: "Purple-noise, sonic-lens, mind-focal-point, vision-synthesizer."

Purple Noise is recorded on either digital or analog tape. The Purple Noise generator itself is stereophonic -- actually two completely independent sound sources. When listening with headphones, the right brain is hearing a different set of random frequencies than the left brain. I have recorded either straight Purple Noise (my personal preference) or Purple Noise modulated into a synthesized surf/rolling waves effect. I prefer headphones to speakers, although it seems to work quite well over a sound system.

Not everyone can relate to it, some don't even like it. I don't know why it does what it does, but I began exploring its effects when I was near

death with ulcers, pneumonia and hepatitis. The sound gave me great comfort and helped me to sleep. Once my cousin visited when she was sick and depressed. After twenty minutes listening to the noise, the dark rings under her eyes were gone along with the depression. If I hadn't seen it myself, I wouldn't have believed it.

I feel that sound is a key to unlocking inner worlds and the internal knowledge we all possess. During a peyote trip, I discovered that the "Noise" became the matrix for a dynamic audio-visual synthesis. If used with larger doses of peyote or San Pedro one could conceivably enter into other realms to obtain knowledge of many kinds. (Healing, plant usage and who knows what else?) Purple Noise can be mixed with any music or other audio material with no loss of effectiveness, and may be played on speakers as a background for shamanic rituals or ceremonies. It goes without saying that this approach to entheogen usage holds great potential for the exploration of inner space.

**GH, NM**

For those interested in building a Purple Noise generator, I will provide schematics and directions for \$5.00. I will also custom build generators. Tapes are available for \$10.00 (60 min.) and \$15.00 (90 min). Please send postal money orders, no checks to: Purple Noise, c/o *The Entheogen Review*, P.O. Box 778, El Rito, NM 87530

## ENTHEOGENIC HERBALISM

Combining plants with relaxant properties with entheogens is a common practice in many cultures. Fasting on certain foods, abstinence from others, taking of herbal cleansing formulas and ingesting plants with relaxant properties are all useful to help insure a beneficial experience or "good trip." If, during a spiritual revelation with the plant teachers, one is nervous, agitated, or otherwise distressed, then one can't benefit from the experiences as much as when in a calmer condition.

My first experience with this was after an ingestion of a one-gram dose of home-grown *S. cubensis*. About two and a half hours into the trip, I drank a tea containing one teaspoon of *Lobelia inflata*. Within thirty minutes I was completely down, with no trace of psilocybin effects remaining. I'm curious as to what the results would be with other indoles.

Another time, I ate three peyote buttons and after about 2-1/2 to 3 hours into the experience, I again took about the same amount of *Lobelia*. (Taking too much *Lobelia* can be an unnecessarily nauseating experience.) This induced a relaxed, focused frame of mind, which to me was highly beneficial. Unlike the previous experience with the mushrooms, the peyote trip continued unabated throughout the entire night.

I am currently growing and using preparations of *Withania*

*somnifera*, a powerful hypnotic and relaxant herb. I am considering a similar combination of this plant with entheogens. -- GH, NM

[Here's what the OTJ catalog has to say about *Withania somnifera*: "Ashvaganda" "Kuthmithi" Solanaceae. Curious crawling bush with incredible beneficial properties. It is one of the big crop species of Ayurvedic medicine in India, where the root is employed as a tranquilizing narcotic and ginseng-like tonic safe enough for use with children. In other tropical lands, the leaves are used to kill head lice and the entire herb is made into a painkilling tea. The chinese-lantern-like pods bear small orange berries from which a soap is made. Easy and fast from seed, producing a low bush laden with flowers and fruits. Fairly cold-hardy, regrowing from the extensive root system after winter dormancy.] -- Ed.

## SOURCES OF DMT

...In my experience most ethnobotanicals are curiosities rather than useful tools for exploration -- most are too weak or toxic for true psychedelic use. Some, such as peyote, are endangered by overcollecting and need protection from the idiots. I'm confident there are good plant allies, but getting reliable information is difficult. Hence, your publication is most welcome... DMT sources: *Desmanthus illinoensis* rootbark was tested at 0.3% DMT, which means 3 mg per gram, or 10

grams of rootbark for a 30 mg dose. That's rootbark, not whole roots -- the root cores contain unwanted alkaloids, and should be removed. The bark is hell to strip from dried roots; I hope it's easier to strip fresh material.

[A friend who has extensively collected various *Desmanthus* species says that it is important to peel the root-bark immediately. It separates from the core easily while still green. An effective way of doing this is to hit the washed rootstock with a hammer -- the bark splits immediately, and can be quickly stripped away from the root core.] -Ed.

...Obviously, strain variations in potency are likely, but the ratio of 30 mg DMT to 10 grams raw material should serve as a base figure. If one were concocting an ayahuasca-equivalent, one could simply brew a tryptamine source with a harmine source (perhaps in a slightly acidic solution), but for using DMT alone it gets more problematic. The question is how much alkaloidal degradation would occur from exposure to heat, air and moisture in the crock pot method described in *The Entheogen Review* (Issue #1), or indeed in anything short of low-temp. vacuum chamber extraction.

[*Desmanthus leptolobus* is said to contain considerably more DMT than *illinoensis*. Unfortunately, it seems to be a fairly scarce species and I know of no source for it other than wildcrafting. Since DMT is not orally active without the addition of a MAO

inhibitor (such as *Peganum harmala*), one would have to extract it in a form that could be smoked -- something I've yet to hear about for a *desmanthus* or *phalaris* extract. The crock-pot method is derived from Gracie and Zarkov's experiments: it quickly and easily separates the harmaline from *P. harmala* seeds with no apparent loss of potency. An experiment in boiling *desmanthus* root-bark along with harmala seeds had rather inconclusive results -- the typical nausea of ayahuasca was present, but the dosage apparently wasn't high enough to produce the entheogenic effects.] -Ed.

...*Phalaris arundinacea* is extremely variable, according to the study Rosetta sent me -- some strains contain DMT, others contain beta-carbolines and a few contain both. Unless you're dealing with a tested and known clone, what you're getting is anybody's bet.

[Johnny appleseed's extraction formula from issue #2 of *The Entheogen Review*, has isolated DMT residues of considerable potency from *Phalaris* grass. *P. arundinacea* varieties "Turkey red" and "Yugoslavian fresh-cut" seem consistently high in alkaloidal content.] -- Ed.

...I'm not thrilled with *Arundo donax*; according to the Rosetta article I read, it contains significant amounts of bufotenidine -- a chemical the article details as demonstrating a "curare-like" toxicity. If one followed the extraction procedure in the article, one could conceivably

separate out the DMT, losing the 5-methoxy DMT with the bufotenine and bufotenidine. Might be worthwhile, given sufficient biomass (though) it sounds like much more work than even *Desmanthus* -- digging and pulverizing heaps of woody rootstock would be no picnic...

[The only report I've received to date on *Arundo donax* resulted in a moderate allergic reaction in the user, with no apparent psycho-activity. The chromatographs I've seen on specimens collected in Texas and New Mexico have shown very little, if any, DMT content. There is a variegated variety of *A. donax* native to the Middle-East which possibly contains a higher percentage of alkaloids. The problem with both *Desmanthus* and *A. donax* is that you have to sacrifice a mature perennial plant just to extract the root. For this reason, *Phalaris* seems like a better bet, since one is then only extracting grass clippings.]  
--Ed

...It's too bad *Acacia phlebophylla* is so scarce (leaves and twigs at least as good as *Psychotria viridis*: it's a large bush/small tree which can stand some snow.) *Acacia maidenii* (bark above ground) is a fast-growing, frost-hardy, drought-tender tree. Conceivably it could be grown near some sort of shelter or in pots and pruned yearly for its bark. There are also other plants with active roots like *Desmanthus* which may be better. *Mimosas*, perhaps. *Desmodium pulchellum*, according to Rosetta, contains

relatively pure DMT and you don't have to separate the rootbark. Actually, the tropicals may be the best bet. *Justica pectoralis* var. *stenophylla* and *P. viridis* both have much DMT in the leaves, as does *Vepris ampody*, whatever that is. *Justica* and *Psychotria* could conceivably be grown on a porch in the summer, and taken indoors as houseplants for the winter. *J. pectoralis* is, according to *Witch Doctor's Apprentice* by Nicole Maxwell, one of the commonest border plants in people's yards in Iquitos, Peru. That book mentions some amazing medicinal plants.

Do you have any reliable data on whether DMT itself is a MAO inhibitor? Accounts vary. *Legal Highs* and a couple other sources claim it is, but neither *Plants of the Gods* nor *The Psychedelic Encyclopedia* mention DMT having that property, which seems odd, if it does. And if DMT were a MAO inhibitor, it most likely wouldn't need the addition of another MAO inhibitor such as harmine to render it orally active.

[I no longer regard anything written by the author of *Legal Highs* as reliable.] -- Ed.

I'm not personally interested in harmine -- MAO inhibitors sound too risky. Some years ago, before the UC Berkeley library was closed to non-students I checked the Botanical Abstracts and dug up an analysis of *Peganum harmala's* alkaloidal content, and the seeds contain about 3 to 4 percent harmine/harmaline. That's about 30-40 mg per

gram. I've read elsewhere that one or two grams of raw seeds suffice to potentiate DMT. Syrian Rue (*Peganum harmala*) is difficult to raise -- a very fussy plant. Passionflower is easier to grow, but doesn't sound worthwhile for the purpose, and you'd need a lot of both warmth and sun for *B. caapi*. You might consider *Acacia complanata*, a bush sold by OTJ and claimed to have harmine in the leaves and twigs.

[It is prudent to be extremely careful when ingesting any MAO inhibitor, but overcaution shouldn't discourage a healthy person from exploring the ayahuasca analogues. The harmala alkaloids seem to be very short-acting (about six hours), not at all like the effects of synthetic MAOIs which can last for weeks. High doses (more than 200 mg) of harmaline or harmine tend to produce nausea, but high doses aren't necessary to potentiate tryptamines: one milligram of seed-extract per pound of body weight is probably safe enough for this purpose. Syrian Rue does seem to be difficult to get started--last summer I spent an inordinate amount of time babying my seedlings. The few survivors became beautiful, healthy plants -- until I transplanted them outside! Out of three, only one looks like it will make it. Probably the best way to grow them is to plant the seeds outdoors directly, so they can become established without having to go through transplant shock. I have heard of them wintering over in Montana, so they must be pretty hardy once they

become established. Despite the difficulties, for me, *P.harmala* is a very beautiful, very powerful plant to grow: it's easy to get into a "shamanic relationship" with it. Have you noticed that the leaves are shaped like brain synapses?] --Ed.

Lysergic Acid Amides (LSA). Years ago, a friend and I tried Hawaiian Woodrose (*Ipomoea tuberosa*). Our procedure was to grind the seeds in water and ingest them. I only tried a little, and had a transient acidlike effect followed by flulike symptoms, but my friend tried a larger portion and felt so bad the next day he almost went to the hospital. I have now learned that *I. tuberosa* contains no Lysergic acid amides -- certain sources of information are NOT reliable!

[Tell me about it! One of the main purposes of this newsletter is to expose these myths and present accurate information.] -- Ed.

I've since tried 75 seeds (3 grams) of Heavenly Blue (*Ipomoea tricolor* formerly *I. violacea*), properly prepared. There was a period of intense physical discomfort, all my senses heightened as if by sandpaper (like a magnificent hangover), with leg cramps so I could hardly walk, accompanied by stupified, paralyzed thinking processes. The leg cramps and stupification lasted for hours. My impression is that Pearly Gates would probably be less stupifying, but I haven't been in a rush to try them. I haven't got days to spend

lying around useless.

"Properly prepared" (per the Indians of Mexico) means ground into a powder in a coffee mill with peppermint for bulk, soaked in water for about an hour, then strained and drunk. This procedure is supported by information in *The Road to Eleusis* by Schultes and Hoffman (basic claim: the Eleusian Mysteries of classical Greece were an ergot experience), wherein Schultes states that a water extraction would separate out psychoactive ergot alkaloids from harmful ones. Any extraction procedure considered for LSA should take into account that it deteriorates on exposure to light, heat and air.

I have tried 13 seeds of *Rivea corymbosa* (Ololiuqui) and, while an insufficient dose, it was very "clear." No leg cramps, no stupefaction, and an acidlike flow of thoughts and imagery -- though admittedly the dose was well below 75 seeds. Schultes says they're weaker than *Ipomoea tricolor* seeds, but they seem purer to me as well. Unfortunately, whenever I tried to control the experience (shamanic work), the plant stepped in and blocked me. Though I have two Ololiuqui vines now in their third year (potted and trellised), I haven't been able to get them to flower yet, and *Rivea corymbosa* seeds are too expensive to play with. I'll try again this year to get them to flower, as I slowly learn more about gardening techniques and plant needs.

Next we come to Blue Stars, an almost-extinct strain of *Ipomoea tricolor*. I obtained seeds from Redwood City Seeds, then their European supplier (the last one known) quit carrying them. I raised some, and have passed seed to a couple of ethno suppliers in hopes of keeping it from extinction. I'm hoping Blue Stars will also be low in side-effects, partly because the seeds are light-colored, and partly because of "vibes." As Redwood City Seeds says: "Light colored seeds are almost invariably a sign of long cultivation..."

In October I planted 100 seeds of *T. peruvianus* var. *trujilloensis* from OTJ. Ten came up, and the tallest is maybe 3/4 inch high now -- an investment for the future. I have three *T. pachanoi* plants, but hesitate to chop them up; my one experiment had an excellent "feel" and acidlike mental activity, but insufficient dosage, indicating either a lower percentage than the studies indicate, inefficient extraction on my part, or alkaloidal degradation from heat in processing. The tea tasted so bad I could hardly drink it...

Fungi: *Gymnopilus spectabilis*, a large, golden, wood-dwelling mushroom, was discovered to be psychoactive in the Eastern U.S. in the seventies. A woman who mistakenly tried it was found by a friend lying on her couch, hallucinating "with full orchestration." The friend called a doctor, afraid she was dying of mushroom poisoning, and she overheard

the conversation. Her response was immortal: "If this is the way one dies of mushroom poisoning, I'm all for it!" *Gymnophilus spectabilis* seems to be native only to the Eastern U.S. and Japan, where it is known as the Big Laughing Mushroom. I only know of two studies of the *Gymnophilus* genus -- one found psilocybin in several Eastern species and the other isolated a kava alkaloid from an otherwise inactive Western variety of *G. spectabilis*.

I've tried the mycelium and consider it much better than the *psilocybes*. Clear, calm, euphoric, no diuretic effects, as much "light" as mescaline, and a strong sense of music -- information is presented in tune. I purchased a culture from the Florida Mycology Research Center some years ago, but at the time I didn't have a good cultivation setup and the culture died in the summer heat. To my knowledge *G. spectabilis* is legal. FMRC has a couple of legal psychoactive *Lepiota* species: *L. peelee* and *L. memorii*. According to Peter Stafford, Jeremy Bigwood did a chromatograph on *L. peelee* and decided not to publish the results for fear they'd be used to make it illegal. Stafford said Bigwood told him *L. peelee* contains LSA, DMT and many other interesting alkaloids. I tried growing it, but also lost it to summer heat.

I should mention that I've learned a few tricks with energy from meditation and psychic classes which are useful shamanically. I'd

advise your readers to consider doing the same -- there is useful information out there, though almost invariably interspersed with Elvis channelings. You mentioned doing an article on chromatography in the future -- how about including info on how to test for presence of DMT and harmine? That way, readers could scout out likely legume species without having to wait for official studies. -- BD, CA

#### DATURA AGAIN

I have a specific question about *Datura stramonium* (Jimson weed): How much of the seeds, flowers or leaves can one take without dying? I've read some newspaper articles from Arizona as well as some botany guides which document severe poisoning and/or death from an overdose of this plant. On the other hand, *Datura* was used in my area by the Yokut Indians, who would give the seeds once in a lifetime to an adolescent boy to ensure proper passage into manhood. I would appreciate any information on the preparation and dosage of this plant. -- AD, CA

[There seems to be a perpetual interest in *Datura*: almost everybody has heard about it, but I've only encountered three people who have actually ingested it. Two of them said the trip was hellish, and that they would never take the stuff a second time; the third, who took it under the direction of a shaman in the Amazon, said that it was weirdly "interesting." I don't

know the "proper" dosage, it being my understanding that the stuff is so unpredictable that one person could get high from a dose that wouldn't affect someone else, but would be fatal for a third. Perhaps I'm growing conservative in my old age, but I am puzzled why there is so much fascination with what sounds like a guaranteed bumper. Rather than impose my bias on you, however, I offer the following:

(As an asthma medicine) it has been proved that the smoke from a (Datura) stramonium cigarette, containing 0.25 grams of (Datura) stramonium leaves, contains as much as 0.5 milligrams of atropine. The leaves may be made up into cigarettes or smoked in a pipe, either alone, or with a mixture of tobacco, or with cubebs, sage, belladonna and other drugs ...  
Grieve, M. -- *A Modern Herbal*, Dover, New York, 1971

**Asthmador:** an obsolete asthma cigarette containing 50.4 percent Stramonium and 4.5 percent Belladonna, both of which are toxic in large amounts and produce hallucinations ...  
Lingeman, R. -- *Drugs From A to Z*, McGraw-Hill, NY, 1974

Smoke two large joints of datura, about 1 gram each. Then lay back and allow the "effects" to occur.  
Miller, R. A. -- *The Magical and Ritual use of Herbs*, O.A.K., Seattle, circa: 1976?

Although medical doctors consider datura very dangerous, it will probably not do physical harm to the average

healthy person. The main danger of datura is accidental death or injury resulting from disorientation. For example, people intoxicated on this plant have drowned by stumbling into deep bodies of water, possibly in an effort to quench the thirst and fever caused by scopolamine. Others, experiencing monsters chasing them, have taken serious falls.

Weil, A. & Rosen, W. -- *Chocolate to Morphine*, Houghton Mifflin, Boston, 1983

Stramonium (*Datura stramonium*). Stramonium, also known as Thorn-apple, in large doses is a powerful narcotic poison. In medicinal doses it acts as an anodyne and antispasmodic. Dose -- Of extract of the leaves, from one-half to one grain; of the fluid extract, from three to six drops.  
R.V. Pierce, M.D. -- *The People's Common Sense Medical Adviser*, 20th Edition, Buffalo, NY, 1889

#### ENTHEOGENIC PRACTITIONER'S SOCIETY

Other cultures have usefully incorporated entheogenic plants by regulating them within religious structures. We should do the same if America is to become the spiritual influence in the world that it should be. Perhaps your publication might support the formation of a practitioner's society dedicated to the creation of guidelines for the right use of sacred plants. It is interesting to note that entheogenic spirituality has been outlawed except for the one concession given to the

Native American Church. This results in a kind of Race Religion which effectively separates people. If involvement with the sacrament is harmful, why do we allow its use by anyone? Conversely, if it has positive value, why should one group of people lawfully benefit from the sacrament while the rest of the population is denied access to it? Nevertheless, allowing use within the context of Native American spirituality has been useful because it is a living demonstration that the sacrament can be used responsibly within a religious framework. Very few cases have been reported of any problems arising from this. The formation of a practitioner's society will fulfill a need by supporting those working in this field -- thereby creating a context for the eventual acceptance of entheogens in our culture. T, CA

[Your points about the Native American Church are well taken. The fact that little progress has been made in legalizing entheogens for non-Indian religious use suggests that our laws are based on fear rather than reason or even simple justice. The concept of a practitioner's society (I assume you mean a kind of organized ecumenical shamanism?) sounds hierarchial to me. Entheogens tend to dissolve hierarchies, which is precisely why the establishment fears them so much. This is not to say that an exchange of information wouldn't be useful, just that I feel uncomfortable about imposing a formal structure on

it. *The Entheogen Review* is supposed to be a vehicle for the dissemination of accurate data and mature opinion; what naturally evolves from that is likely to be viable in other contexts as well.] -- Ed.

#### ENTITIES

Your suggestion that there is "just cause" to document communications with the gods and the plant spirits makes a great deal more sense than the route I have been taking: Which is to wonder why, if psychedelics allow one to commune with God, they did not spare the Aztecs and Mayans from the Spaniards, or Leary from the Feds, and have not given us any useful knowledge of ourselves or our fellow beings. It would be interesting to do cross-cultural comparisons on this phenomenon. For example, Navajo peyote users have many beliefs about the bad spirits which are found outside the tipis on religious occasions. It is my experience that some of them are actually frightened to go outside the tipi at night. Are these the same spirits as are experienced by ayahuasca users? DF, MD

[I would guess not. To understand the entity phenomenon it is useful to abandon the concept of monotheism in general and of universally benevolent, well-intentioned deities in particular. Popular Christianity has commonly conditioned us to the idea of one all-loving Father-God when it may be more accurate to postulate a whole pantheon of entities manifesting as many dispositions as we do --

indeed, they seem inextricably linked with our own awareness. Questions about the nature of "God" (singular, masculine) may have as much meaning as the old double-bind: "Have you stopped beating your wife yet?" (Assuming you're not a wife-beater, neither a yes or no answer reflects the truth.) I tend to the hypothesis of multiple dimensions within human consciousness in which dissociated intelligences literally devour human belief systems ("worship") the way that we eat hamburger. It is to their advantage to keep us ignorant of their agendas: they would forfeit independent existence if we chose to become gods ourselves by absorbing their energy instead of vice-versa. The concept is not a new one:

*Now if a man worships another deity, thinking the deity is one and he another, he does not know. He is like a beast for the Devas. For verily, as many beasts nourish a man, thus does every man nourish the Devas. If only one beast is taken away, it is not pleasant; how much more when many are taken! Therefore it is not pleasant to the Devas that men should know this. Brihadaranyaka Upanishad*

It follows that the wisely intentional use of any entheogen is as a self-integrating, self-empowering catalyst. That way the "gods" can't coerce our worship: we coerce theirs in the form of enhanced personal mastery. Obviously it behooves everyone to prudently evaluate the kinds of "allies" they choose to integrate into their psyches

in this way. Generally speaking, the higher the level of unification the better -- otherwise we become entangled within karmic resonances of negative evolutionary value. Or something like that -- the subject is an infinite mystery. ]--Ed.

#### CONCERNING RITUAL

1. Fruit fast the day before and day of the ceremony. Use healing clays internally to cleanse the stomach and intestinal tract. Liberal use of nervine herbs to relax the nervous system. Buckthorn to cleanse the liver and colon.
2. Arranging the location -- pillows, blankets, etc. and lighting of the all-night fire. Setting up of candles for all-night burning.
3. Bringing the tools -- purple noise, Tibetan bells, drums, rattles or other experimental tools for exploration.
4. Open discussion of intent: healing, desire for knowledge, self-evolution, etc.
5. The eating of the plants.
6. No talking -- time for inner reflection, quiet, repose. Use of Tibetan bells is good at this time as it induces a calm, aware state.
7. Beginning of the experience -- drums, etc./ sounds, rhythms generated by participants to provide a vehicle with which to enter the other states of awareness. At any time during the evening, Purple Noise may be used as desired. This is good

for exploration and experience at the peak -- unknowns await us here.

Notes: I am searching for a combination of the ancient and the new in exploring realms of mind and body, but most of all, I enjoy my life and always try to keep a healthy sense of humor. I hope that in the future *The Entheogen Review* can offer modern ceremonial ritual models that we can share. -- GH, NM

#### **CALEA ZACHATECHICHI**

One of your readers complained of the difficulty of growing *C. zachatechichi* (Dream herb) from seed. I sowed eight seeds (purchased from O.T.J. about four months ago) just below the surface of a half and half mixture of potting soil and sand. The tray is 4 X 24 X 12 covered with a pane of clear glass. This is kept in bright, indirect sunlight. Watering is minimal -- needing additional moisture at approximately monthly intervals. Three seeds sprouted after two or three weeks and are putting on slow growth at this time...

#### **HEIMIA SALICIFOLIA**

The plant I am having trouble with is *Heimia salicifolia*. ("Sinicuiche" -- Aztec trance divination herb.) I planted about 100 seeds and only three came up. One I transplanted too early: put it in full morning sun and killed it in only an hour. Two weeks later I transplanted the second one and placed it in indirect sunlight. It took a week to die. Now I'm down to my last seedling, which is thriving,

though I refuse to transplant it until it hits the glass...

[It is fascinating to hear of different readers' experiences with the same species. *C. zachatechichi* hasn't even sprouted for me, yet I think every one of the *H. salicifolia* seeds I planted last summer is now a full-grown shrub. I have more of them than I know what to do with, and have given away dozens. The adult plants seem to be super-sensitive to under-watering, and cannot tolerate being dry for even a few hours. Once the leaves wilt, that's it -- though new growth usually returns from the roots.] --Ed.

#### **MIRIBILIS MULTIFLORA**

...I have seven *Mirabilis multiflora* ("So-ksi" -- Hopi disease divination plant) coming up, but I have no clue as to the useage or dosage. Can anyone familiar with this plant tell us how to use it?

GH, NM

I know nothing about this species other than what is written of it in the OTJ catalog, as follows:

*Mirabilis multiflora* "So-Ski" Nyctaginaceae. Low, sprawling perennial bush from the high deserts of the southwest. Has clusters of magenta flowers, blooms first summer from seed if sown early. First-year roots have weighed to a pound each, becoming massive with age. Dislikes damp soil. Root chewed by Hopi shaman/healers for divination of illness. Chemical analysis is apparently lacking. Rare.

## A RECIPE FOR USING *AMANITA MUSCARIA*

### Ingredients:

1. 120 grams dried *Amanita muscaria* (fly agaric) mushrooms.
2. 1 gallon distilled water.
3. 1/2 cup plain low-fat Dannon yogurt.
4. 1-1/2 cup non-fat dry milk powder.
5. 1 cup lactose powder (milk sugar -- from home-brewing catalogs.)
6. 6 heaping teaspoons acid blend powder (from homemade wine catalogs.)
7. 1/8 teaspoon tannin (from homemade wine catalogs).

### Equipment:

1. 1 gallon glass jar with lid.
2. 1 four-quart saucepan (size not critical).
3. 2 canvas straining bags same size as gallon jar.
4. 1 incubation chamber (oven works great) with:
  - A. 100-watt lightbulb heat source connected to:
  - B. A thermostat set for 105 degrees F.
  - C. 1 thermometer.

### Instructions:

Pour one quart distilled water into saucepan. Add lactose. Cook on stove. Stir occasionally until lactose is dissolved. Turn off heat. Add tannin. Stir until dissolved. Add another quart of distilled water and let cool until lukewarm. Add rest of ingredients except mushrooms. Mix and stir thoroughly. Place dried mushrooms in gallon jar.

Lightly push down mushroom level in jar to under halfway. Pour previously mixed liquid on mushrooms in jar. Keep mushrooms under liquid as much as possible and bring the level in the jar to the bottom of the neck with distilled water. Mix as well as possible (mushrooms will tend to float). Screw on lid loosely. Incubate for three hours. Screw lid on tight. Shake well immediately and once a day for five days. Continue to incubate for 1-1/2 to 2 weeks.

Soak canvas bags in hot water. If water will still not soak through, wash in dishwashing detergent and hot water. Rinse thoroughly. Pour mushroom slurry from jar into wet canvas bag suspended above saucepan. Hold bag steady while pouring or dipping. Allow clear red-orange juice to drip into saucepan by gravity only. (Do not squeeze at this point.) When dripping slows, hang bag from opposite side of top and dripping will speed up again. When dripping slows, carefully remove from above the saucepan. Bottle the juice and refrigerate. Press more liquid from the remaining slurry in the straining bag by folding the bag shut and pressing by whatever means possible. This pressed liquid will be cloudy and must be drip-strained again for clarity in the other bag. Combine the two juice extractions and refrigerate until ready to use.

-- Anonymous

### DESMANTHUS ILLINOENSIS

What are the growing parameters for *Desmanthus illinoensis*? Since it is a legume would plantings benefit from a legume inoculant (especially if grown indoors in sterile mix)? Has anyone tried growing it hydroponically (especially in a NFT/aero system) to continuously harvest the rootstock?

BS, IL

[These are very interesting questions -- my only experience with *D. illinoensis* is with several potted greenhouse plants which I started from seed last year. They are now medium sized, and doing well, but probably have a year or more to go before the roots reach harvestable size. The hydroponic idea sounds fruitful -- if done properly, I expect one could continuously cut off pieces of rootstock without killing the plant. Obviously, the main problem with this species is that a mature specimen must be sacrificed to get the roots. People living in the midwest where it thrives, should be able to glean all they need from wild plants.] --Ed.

### OPTIMUM HARVEST TIMES FOR CACTI

Could you please tell me when the best time of the year is for harvesting the following cacti for entheogen purposes: *Trichocereus pachanoi* (San Pedro), *Ariocarpus fissuratus* (Sunami), *Lophophora williamsii* (Peyote). Do the Sunami and Peyote cacti have the same growth and flowering parameters such as shade,

resting period, soil. If not, could you please tell me what they are.

TP, VA

Springtime (around March/April) is supposed to be the time of year when San Pedro has the maximum percentage of mescaline. I don't know the answer for Peyote and Sunami, but would expect it to be similar. Peyote flowers in the spring, and actually likes to be watered then. Because it is an endangered species I prefer just to admire it and seek other plants for entheogen use. I frankly know nothing about the cultivation of *A. Fissuratus* -- does anyone have growing tips for this species?

### EPHEDRINE AS MAO INHIBITOR

In the Spring issue there was some question about ephedrine being a MAO inhibitor -- one source claimed that it is, another said he could find no reference to substantiate the claim. Hopefully, the following communication clears up the issue:

I checked on ephedrine as a MAO inhibitor. The statement is: "Compounds such as cocaine and ephedrine inhibit MAO in vitro, but their familiar pharmacological properties have nothing to do with this." (Ref: Meyerson, L.R., McMurtrey, K.D., Davis, V.E.: *Biochem. Pharmacol.* 25, 1013-1020 (1976). This came from a book called *The Biochemistry of Alkaloids*, 2nd Edition, by Trevor Robinson, Pg. 191. CA, PA

## CONTRADICTIONS

Anyone who has delved even a little into the subject of entheogens has come up against contradictory information: expert Joe Doaks claims one thing but scientist John Doe asserts the exact opposite. Who are you supposed to believe? Is it possible that both positions could be true? It is as if the lore surrounding psychedelics has its roots in a mythological realm where logical consistency is somehow beside the point. In short, the subject of entheogens often reduces to the same kinds of non-sequiturs we associate with quantum physics, the JFK assassination or UFO phenomena. This is a fascinating subject in itself. From time to time in this newsletter we will examine two seemingly contradictory claims in the hope that some reader will be able to provide an explanation. Here, for example, are two statements--the first maintains that MAO inhibitors depotentiate the effects of LSD; the second says the exact opposite. Is there anyone out there who can give some perspective on these two claims?

A. (Researchers at) the University of Pennsylvania found that when rats were treated for a number of days with MAOIs (monoamine oxidase inhibitors) and then given LSD, the drug had almost no behavioral effects. In my laboratory we have also seen a similar blockade of the behavioral effects of both DOM and LSD in cats treated with MAOIs. Perhaps most significant...in a parallel study of humans conducted more than

20 years ago, when a group of patients who had been treated with an MAOI were given LSD, the effects were dramatically attenuated and in some cases completely blocked even when the doses of LSD were increased to levels four to eight times that normally given to adult humans.

Barry L. Jacobs -- "How Hallucinogenic Drugs Work," *American Scientist*, Vol 75, July-August, 1987, Pg 390

B. We have also experimented with potentiation of LSD by B-carboline containing plants. Generically, the effects follow the same patterns. Subjectively, the dose feels three to four times more potent than it actually is... To restate the obvious, indole psychedelics taken in a state of MAO inhibition are much more intense and qualitatively different than when taken alone. We believe that these combinations offer numerous fruitful avenues for further research.

Gracie and Zarkov -- "Three b-carboline containing plants as potentiators of synthetic DMT and other indole psychedelics," *Notes from Underground #7*, August, 1985

## AYAHUASCA ANALOG EXPERIENCES

by Johnny Appleseed

Two strains of *Phalaris arundinacea*, "Yugoslavian fresh-cut" and "Turkey Red," were bio-assayed as ayahuasca analogs. Each variety was harvested in late September, 1992, after being cultivated as described in the Vernal Equinox, 1993 issue of *The Entheogen Review*. Foliage was clipped three inches above ground level in the early morning (about 8:00 AM), and alkaloids extracted by the hot water method. The Beta-carbolines used as MAOIs were extracted from *Peganum harmala* seeds. One trial (November 28, 1992), was made with *Desmanthus leptolobus* in place of the *Phalaris* extract.

All dosages were 50 mg total *Phalaris* alkaloids, and 125 mg of *harmala* alkaloids, except where noted. *Harmala* extracts were ingested first, with capsules pulled apart before swallowing. *Phalaris* alkaloids were taken fifteen minutes later, with the gummy extraction redissolved in just enough ethyl alcohol to put it into solution. This was then added to enough honey, hot water and vitamin C to make a tea solution to maximize absorption in the gut.

### Effects -- Single Trials:

October 15, 1992 -- Turkey Red (30 mg) plus *P. harmala*. Very subtle and spacy, feeling of leaving the body. Some nausea after about two hours. Down in three and a half hours. I feel very healed. Not quite a full dose.

November 1, 1992 -- Turkey Red (40 mg) plus *P. harmala*. More nausea, but spitting and lying down helped. Information about the plants comes, and the name: "Turkey Red." Down in about four hours, awake for six hours, want to talk.

November 28, 1992 -- *Desmanthus leptolobus* (45 mg) plus *P. harmala*. Bad heartburn at first, then very visionary: the images of bulls breaking their way into my skull and trying to communicate with me. Afterwards walking around and praying for the native people of Australia. Very cold, wanted cuddling. Lasted about four hours.

December 9, 1992 -- Yugoslavian fresh cut (50 mg) plus *P. harmala*. Took it when tired and distracted. Not visionary; went to sleep after an hour. Next day felt highly aware and strong in my body. This continued for several days.

### Group Sessions

November 14, 1992 -- Turkey Red, plus *P. harmala*. Six people. Within twenty minutes T began very violent purging, which continued for two and a half hours. He was in a highly visionary state, but seemed agitated and fearful. I sat very strongly and after thirty minutes began to sing and chant. This continued on and off throughout the session. I did healing work with the rattle as needed. I kept to herself at first, but then began to interact with T and do healing work with him.

At one point she was extracting from him and purging. She said later that after this she had a complex visionary sequence of exploring an otherworldly landscape. A was very active, singing with me part of the time and other times alone outside. We spent some time communing together with heads touching. At one point A, L and I generated a tone-song that could have built into a very dynamic group visionary experience if T's distress had not been so distracting. We three stayed strongly connected through visual contact. J stayed quiet and withdrawn, stating later that he did have some visionary states, but only when he could be alone and quiet. About six hours.

**November 16, 1992** -- Turkey Red plus *P. harmala*. A and myself. Took a normal dose, and then another full dose at about the second hour when it started to peak. Began at 9:00 AM and lasted until Midnight. Many experiences, both connected to A and by myself. Did a lot of praying and asking for help from the Grandfathers. Took a booster of harmala extract in the afternoon, which seemed effective.

**December 15, 1992** -- Turkey Red, plus *P. harmala*. Six people. Began by sitting in the configuration shown in L's dream. I sat back to back with her, with A, N, M, and S sitting in the four directions. After about thirty minutes L started to rock, chant and then repeat: "I remember, I remember." She

went into a healing crisis and began purging a lot. Later she said she journeyed back through her DNA and remembered encoded memories all the way back to the primal ocean. She was very sick the whole night -- it reminded me of my first jungle ayahuasca. She was in a healing crisis for almost a whole week afterwards. A and I began shamanizing. A sang and chanted to project sounds into L's body. I remained seated and chanted support to A's work. At one point I did some sucking, extraction and purging for L, and at times would try to challenge and connect with her, but she wanted no one to touch her. The grass rattle worked well. M, S and N stayed to themselves and rather quiet. About six hours.

**Summary:** The experience seems to have an inner visionary and informational focus when taken quietly alone in the dark. On the other hand, taking it in a group setting with people one knows and trusts facilitates a shamanic, healing experience while enhancing interpersonal bonds and connections. One individual often goes into a healing crisis, and many of the rest of the group then begin shamanic work. At some point this is resolved, and then everyone tends to enter deeper physical and mental space with each other. The resulting energetic connections seem to be a part of the healing process. The fine light vibrations of the experience often last almost a week. I feel better physically than after mushrooms - strengthened rather than wiped-out.

**PEGANUM HARMALA EXTRACTION  
FORMULA**

First, pulverize a measured amount of *Peganum harmala* seeds to a fine powder. Assume that one safe dose of harmala extract is derived from three grams of seeds. Therefore, weigh your raw material so that the extract may be apportioned from a 3:1 ratio -- six grams of seed equals two doses of extract, nine grams equals three doses, etc. I use a West Bend Minfood Chopper, which quickly turns the dry seeds to powder. Almost any food processor will work. Place the seed powder into an electric crockpot with a 30% acetic acid solution and simmer overnight with the lid on. (White distilled vinegar is an inexpensive source of acetic acid, and you can simplify the measurements by mixing one part vinegar with two parts of water.) After 12 hours of simmering at about 215 degrees, strain the extract through a paper coffee filter; save the liquid, and simmer the mash as before in fresh solvent. The second extraction is often quite spectacular: a clear yellow liquid with a fluorescent green tinge to it: obviously potent stuff! Strain again, discard the mash, and evaporate the combined extracts in the crockpot (lid off) down to a dry residue -- monitor the operation at the end so that it doesn't burn in the pot. Scrape off the extract with a razor blade -- it should be a reddish-brown crystalline stuff. Weigh this essence, divide into the predetermined number of portions and place in gelatine capsules. In the

above dose this extract is not in itself hallucinogenic, but it will greatly potentiate any tryptamine hallucinogen you take with it. (Two grams of *Psilocybe cubensis* come on like five, etc.)

**WARNING:** Never combine harmaline with peyote (mescaline), Ecstasy (MDMA), or any amphetamine type substance; monitor your diet and drug intake for 48 hours before and after ingestion -- this is a MAO inhibitor, and not to be treated carelessly. JG, CA

**TRAVELLERS' TALES**

**PEGANUM HARMALA COMBINED WITH  
HAWAIIAN WOODROSE SEEDS**

11:05 AM -- Took one gram of Syrian Rue (*Peganum harmala*) powder with water.

11:33 AM -- Subtle shift of consciousness. Physical and emotional relaxation.

11:55 AM -- Effects seem stabilized.

12:00 NOON -- Ate four woodrose seeds.

12:30 PM -- Feel weak and a little shaky. Difficulty in concentrating. Slight constriction in breathing. Lethargic, difficult to write.

12:37 PM -- Strong visual distortions. Slight queasiness in stomach and weakness in limbs.

1:00 PM (Approx.) -- Too lethargic and woozy and high to write anymore. Remainder of notes were written next

morning.

I had the usual gas, burping and transient nausea typical of morning glory and woodrose seeds. This was a very powerful experience, but not typical of former woodrose trips because of potentiation by the harmala extract. The effect felt more powerful and qualitatively different than with woodrose seeds alone. The visions were dreamlike, hypnogogic in nature and quickly forgotten. I was in a semi-hypnotic dream state. There was a noticeable lack of emotional shifting or mood swings -- in fact, the entire experience was devoid of emotional involvement. Around 2:00 or 3:00 PM, at the peak of the experience, I had distinct "feelings" of dreamlike "nothingness" in a spiritual sense. It was as if my emotional self was a void. The visions continued to be fuzzy, unclear and fleeting.

Although interesting, I don't feel that this is a useful consciousness altering combination, though woodrose seeds alone are effective. Around 4:30 PM I definitely began coming down and felt increasingly nauseous with flatulence, stomach gurglings and burping. An hour later I was still high, but completely exhausted. At this time I decided to seek herbal relief. I started conservatively with a quarter-teaspoon dose of Lobelia to relax my jitters. This worked to some extent, but seemed to bring on deep nausea and woozy, sick feelings over the next three hours.

To clear some of the "poisoning" in my stomach, I ate a teaspoon of healing clay. This didn't work at all. Between 7:00 and 8:00 PM I took two teaspoons of Valerian and although it did nothing for the nausea, it did calm down my nervous system. At 9:00 PM, determined to either vomit or solve the nausea dilemma, I took a teaspoon of U.S.P. activated charcoal. Within a half-hour the nausea and dizziness were gone. At this time I took an additional tablespoon of charcoal. A little later I took a teaspoon of *Withania somnifera* powder and fell asleep around 1:00 AM.

The most important knowledge I gained from this trip was the use of charcoal to control gas and nausea. After ingesting woodrose or morning glory seeds, it may be useful to eat a tablespoon of activated charcoal when well into the experience. Presumably, residual amides remaining in the intestinal tract are mildly poisonous to the lining. Thus, the powerful adsorption and absorption of toxins in the colon by the activated charcoal may be a solution to the nausea problem. All in all, this was a valuable learning experience.  
-- GH, NM

#### MAO-INHIBITOR ALERT

Individuals experimenting with ayahuasca analogues should be aware that harmine/harmaline extracts from the Syrian Rue plant (*Peganum harmala*) are powerful short-term MAO inhibitors and deadly reactions are likely if

they are ingested in the presence of certain other drugs. Particularly dangerous are commonly prescribed antidepressants such as Prozac, Paxil, Zoloft, Tofranil, etc. In other words, if you are taking any antidepressant medication, leave the ayahuasca analogs alone, or your voyage to other dimensions may be a one-way trip! -- Ed.

Paroxetine (pa rox' e teen; Paxil - Smith Kline Beecham), a new selective serotonin reuptake inhibitor (SSRI), is now available in the USA. Two other SSRIs, fluoxetine (Prozac ...) and sertraline (Zoloft ...), were approved previously ... All SSRIs, including paroxetine, can cause a life-threatening reaction if they are given concurrently with a monoamine oxidase (MAO) inhibitor. After stopping paroxetine, patients should not take an MAO inhibitor for at least two weeks, and vice-versa.

*The Medical Letter*, Vol. 35 (Issue 892), March 19, 1993

Prozac (Fluoxetine Hydrochloride)...should not be used in combination with an MAOI, or within 14 days of discontinuing therapy with an MAOI. Since fluoxetine and its major metabolite have very long elimination half-lives, at least 5 weeks should be allowed after stopping Prozac before starting an MAOI... Similarly, at least 14 days should be allowed after stopping Zoloft before starting an MAOI.

*Physicians' Desk Reference*, 1993

## CRASH COLLUSION

A Quarterly Guide to the Fringe

Each issue covers subjects such as:

Psychedelics • UFOs • Orgone

Shamanism • Conspiracies

Altered States • Weird science

Plus reviews, contacts and more

Sample copy \$4.00 4 issues \$14.00

### UFO ENTITY CONTACT

When I was a Peace Corps volunteer in Columbia in 1977, I ate four or five psychedelic mushrooms with a friend one evening. We went for a walk near the mountain village where we were assigned and the following incident took place. It was dusk, and the stars were just emerging. My companion remarked that one of the stars was moving. The mushroom effects were coming on strong, and I assumed that she was probably hallucinating. Then I also saw that the "star" she was referring to was actually approaching us. "Wow! Look at that!" The object in question soon became a large sphere (not a disc), perhaps forty feet in diameter. It was white on top and blue-green below and made a high-pitched "eeeeeeeeeeee" sound which altered to a hum when it stopped to hover at a height of about twenty yards over our heads. By now we were quite alarmed and ran to a near-by excavation in the ground to hide. My friend was becoming hysterical, and although I was frightened too, I was also

awe-struck--if this was a hallucination, it was one we were both sharing! The UFO seemed to be monitoring us and it stayed in the vicinity for about five minutes, then slowly moved away. When we were sure it was gone, we returned to our quarters in the village and spent the rest of the night comparing notes--we definitely experienced the same phenomenon. It was agreed that it would be best not to tell anyone of this adventure, since we felt nobody would believe it anyway. It has always been a great mystery to me, and I don't know if it would have happened without the mushrooms or not. It is the only time I ever encountered a UFO in my life.

#### HALLUCINATIONS AND CULTURE

A vast quantity of content has been introduced into the cultural repertoire of mankind by hallucinatory ideation in dreams, visions, and hypnagogic imagery, and hallucinations must therefore be considered in relation to culture change ... Most human beings hallucinate ... in one way or another, quite frequently; and there is no society, to my knowledge, in which hallucinatory experience is unknown. Hallucination is, in fact, one of the most widely distributed of the modes of human experience... The content of hallucination [in primitive societies] is sometimes interpreted as a message introduced directly into the subject's consciousness by a supernatural being, directed either to the hallucinator himself or

to the community through him as an intermediary... It is not important here whether or not there are, in truth, universal themes and symbols expressed in dreams and other hallucinatory experiences, as psychoanalytic theory and data suggest. The important point is that most human beings, in most societies, outside western civilization, regard hallucinatory content as communication bearing significant information which can be understood either directly or by the use of special methods of interpretation.  
Wallace, A.F.C. -- "Cultural determinants of response to hallucinatory experience," *Arch. Gen. Psychiat.* 1:58 (1959)

**TELLURIDE MUSHROOM CONFERENCE**  
AUGUST 26, 27, 28, 29, 1993  
The Telluride Mushroom Conference is for those wishing to expand their knowledge of edible, poisonous and psychcoactive mushrooms. Practical cultivation techniques for many species will be presented in conjunction with field trips to identify both edible and poisonous varieties. This annual event is held in Telluride, Colorado, an historic mining town. The cost of the four-day conference is \$185.00. For further details, contact: **Fungophile, Inc., P.O. Box 480503-jlf, Denver, CO 80248-0503**

## BOTANICAL ACCESS

As an amateur botanist, with a small collection of ethnobotanicals which I would be willing to trade (or sell), you may include me on your resource list. I also have a small sterile culture lab, and would be willing to offer (barter) mycological lab services such as spore germination and spawn generation by mail.

Available for sale or trade:

*Brunfelsia* spp.  
*Salvia divinorum*  
*T. pachanoi*  
*Echinocereus triglochidiatus*  
*Heimia salicifolia*

Basement Shaman  
1312 W. Highland Ave.  
Elgin, IL 60123

## *ECHINOCEREUS TRIGLOCHIDIATUS* *AND STIPA ROBUSTA*

Anyone interested in obtaining *Echinocereus Triglochidiatus* (mature specimens), a cactus containing phenethylamine alkaloids and even some DMT, can write:

Intermountain Cactus  
1478 N. 750 East  
Kaysville, UT 84037

This is a cold-hardy cactus and would be good for growing in snow areas. Also, Horus Botanicals has *Stipa robusta* seeds.

Horus Botanicals  
HCR 82, Box 29  
Salem, Ark. 72576

A great sourcebook is:

*Gardening by Mail*, Tusker  
Press, P.O. Box 1338,  
Sebastopol, CA 95473

GH, NM

## SOME OTHER BOTANICAL RESOURCES

JLF  
P.O. BOX 184  
Elizabethtown, IN 47232

Azetekakti  
P.O. Box 26126  
El Paso, TX 79926

LER  
P.O. Box 1676  
Coconut Grove, FL 33233

The Herb Closet  
104 Main St.  
Montpelier, VT 05602

## PLANT IDENTIFICATION VIDEO

For a one-hour identification video of *Amanita muscaria* (fly agaric) mushrooms, *Panaeolus foenisicii* (haymakers) mushrooms, *Datura stramonium* (Jimson weed), *Desmanthus illinoensis* (Illinois Bundleflower, Prairie Mimosa) and *Phalaris arundinacea* (Reed Canarygrass), send \$40.00 to:

Dobbies  
429 S. Cherry  
Columbus, IN 47201

A picture is worth a thousand words and a video is worth a thousand pictures, or more, depending on the length. This is a detailed (with closeups), non-narrated, live video (no still photographs). All you need for field identification.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 2, NO. 3: Autumnal Equinox, 1993**

ISSN 1066-1913 Copyright C 1993, All Rights Reserved Subscription: \$20.00/Year, \$25.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are

legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and volition and must accept full responsibility for such decisions.

-- Jim DeKorne

## CONCERNING EDITORIAL CONDESCENSION

---

To the editor: In your article "Who are the plant teachers?" (Vol. 2, No. 1) you put down condescension and said it was the "flip side of intimidation." Yet to me it seemed your editorial comments had a strong flavor of condescension themselves. You referred to Terence McKenna's piece as "pompous rhetoric." Although at first the reader could take this as referring only to the style of the "mushroom teacher" who communicated through Mr. McKenna, reading further one sees you implying that Mr. McKenna's message sounded similar to the way he speaks. From this it seems reasonable to infer that you are saying he sounds pompous when he speaks. To me this seems like a condescending way to speak about a peer (unless it was meant only in jest).

You then identify Maria Sabina's attitude as "child-like subservience" and make it plain that child-like subservience is something you find contemptible. You seem to suggest that the reason a Mazatec might take such an inferior attitude is because "these people have arguably developed a form of awareness more appropriate to their surroundings." In other words their minds might not be as "sophisticated" as the minds of modern Westerners. I see this as another example of condescension. I'm not familiar with Mazatec society but if Mazatec society would allow a woman like Maria Sabina to speak well of psilocybin mushrooms and ingest them without threat of harassment and imprisonment then I would say that Mazatec society is more advanced than the one created by the "Western mind" in this nation, at least in that respect.

You then quote Alan Birnbaum: "DET is the first psychedelic which convinced me that the psychedelic is a primeval light being which is God the creator. We had smoked it in a large hookah and it was so clear and so bright -- unmistakable -- it was a being." (As the quote appears in my edition of *Psychedelics Encyclopedia*), You classify this as "overblown language" which "suggests the existence of incorporeal forces infesting human awareness which are primarily concerned with impressing us with their importance" which "is hardly God-like behavior... What truly supreme being is so insecure as to need, let alone demand human worship and subservience?" You seem to be building on nothing but your own inferences here as I failed to find any evidence in Mr. Birnbaum's statement that suggested the spirit he encountered had any malevolent intentions or needed worship and subservience from anyone.

If *The Entheogen Review* truly is "most dedicated to exploring the phenomenon of the encounter with

'the other' which is so often reported during psychedelic experiences" then I expect in the future we'll see less editorializing -- either that or the comments will take on a more informative, less cynical tone. How can you expect people to contribute accounts of their experiences with 'the other' when you plainly belittle such accounts and often make condescending remarks about those who had the experiences as well? Since you came down hardest on those who believed the words of 'the others' (implying Maria Sabina was a native aborigine, dismissing Alan Birnbaum's account as nonsense since DET is a "synthetic chemical") you can at least expect to scare off the people who believe what the mysterious 'others' told them. That would be a great loss since such convincing experiences would be the most interesting to read about.

Why not treat your audience like adults and let them judge for themselves the degree of sincerity of the voices others have heard? If someone says the mushrooms told him they are the flesh of the gods or the mushroom teacher or someone else says he saw that the psychedelic is God why not just print it and assume the readers are intelligent enough to determine for themselves whether the message is true or not? We don't need a parentally condescending editor to hold us by the hand and point out to us what is bunk and what isn't. If you don't know who or what the mysterious 'others' are how do you know they can't be father Jesus or the flesh of the gods, etc? Why rule out any possibilities just because they don't appeal to your personal beliefs? (Beliefs which any of those you put down would have every right to describe as being based on Mickey Mouse psychological theories). I will be even more impressed with your commitment to free speech if you print this letter in its entirety than JLF was when you printed his. -- *Unsigned*

Thank you for taking the time to respond to my piece from the Spring issue -- I will try to address your points in order.

First, I had no intention whatsoever to put McKenna down in any way -- I deeply respect his work (which has influenced me enormously), and I envy him his facility with language. His rhetoric is not pompous, but literate and inspired. Perhaps the phrase was ill-chosen -- I intended it to denote the speech patterns used by the entity speaking through him. If you refer to the complete original in the Foreword to the *Psilocybin Magic Mushroom Grower's Guide*, you might agree it would sound a bit grandiose if someone were to address you on the street in that fashion. I have never heard McKenna speak in a way that I would label "pompous," but if he ever did, it might sound something like his mushroom teacher. The point I was trying to make is that these entities generally use the vocabularies and syntax of their hosts. Given that, the truly important question is: how many of the host's personal belief complexes bleed through as the "Word of God?" Take only a cursory look at almost any religious cult and ask yourself what percentage of their dogma really resonates as divine inspiration as opposed to human frailty and confusion?

Before proceeding, I should reveal why I hold what I hope is an open-minded skepticism concerning entities and voices: I've experienced a few. In fact, after hearing an "inner-voice" on an acid trip in 1979 and following

slavishly what I interpreted as "its will," I very nearly wound up in the nut house. For six years I was a totally obsessed monomaniac on this subject, and only by sheer willpower and good luck managed to tear myself loose from its domination. I then spent several more years at the UNM Medical School library reading everything I could find pertaining to the subject. I discovered that a lot of very crazy people live in the same kind of world that I did. In fact, conventional psychiatry considers voices in the head as one of the defining characteristics of schizophrenia:

---

People have been hearing gods talking in their heads throughout recorded history, and it is highly significant that much of what they hear is not necessarily in their best interests.

---

*Audible thoughts; voices heard arguing; voices heard commenting on one's actions; the experience of influences playing on the body (somatic passivity experiences); thought-withdrawal and other interferences with thought; diffusion of thought; delusional perception and all feelings, impulses (drives), and volitional acts that are experienced by the patient as the work or influence of others. When any of these modes of experience is undeniably present and no basic somatic illness can be found, we*

*may make the decisive clinical diagnosis of schizophrenia.*

Schneider, K: *Clinical Psychopathology*, 5th ed. New York, Grune & Stratton, 1959

The content of schizophrenic ideation is almost always religious -- "God tells me to do this, etc." There is a tendency in New Age circles to uncritically accept everything that comes from within as higher guidance. I'm here to at least question that, because I know first-hand that when it happens to you it is so overwhelming, so personally compelling, that it is all too easy to lose your objectivity. It is also easy to ignore the fact that the phenomenon is utterly commonplace: people have been hearing gods talking in their heads throughout recorded history, and it is highly significant that much of what they hear is not necessarily in their best interests:

*While some recipients of the light, like Saul, do go on to make their mark in history, there are many others who don't accomplish a thing. The Illumination experience changes their individual lives, but it has no effect on their world. In many instances people are changed for the worse instead of the better, just as the majority of all supernatural manifestations are harmful or at least senseless. In fact, our little planet is in a constant state of siege, baraged by frightening phantoms and monsters, which are the products of the same phenomenon that produces Illumination ... If you had dared to suggest one hundred years ago that God and the devil were in cahoots, you would be invited to attend a barbecue in the*

*public square, and you would be the barbecue. But today it is apparent that the same force that answers some prayers also causes it to rain anchovies and is behind everything from sea serpents to flying saucers. It distorts our reality whimsically, perhaps out of boredom, or perhaps because it is a little crazy. God may be a crackpot.*

Keel, J: *The Eighth Tower*, Signet, NY, 1975, Pg. 19, *passim*. (Emphasis in original)

I can see how my remarks concerning Maria Sabina and the Mazatec world view could be misunderstood as condescending. My literal words, while perhaps not politically correct, do nothing more than point out the differences between two very dissimilar cultures. There was no intent to assume a superior stance by making the observation that the Mazatec world view is different from ours. Since I regard the "world view" of the industrialized West as irredeemably pathological (it is, after all killing everyone on the planet, regardless of world view), I can hardly advocate it over that of the Mazatecs.

Which doesn't imply that I am obliged to embrace the opposite: village-based subsistence agriculture is not a realistic answer to most world problems. What I was trying to show was how the entities use the belief systems of their hosts to push their agendas, and in this case have apparently abandoned their traditional allies in favor of Westerners -- a belief held by the Mazatecs themselves if we are to believe the quote from their old shaman. That's not very god--

like behavior, in my opinion. Neither is it the way any responsible parent would treat his children.

---

In this regard, child-like subservience is not "contemptable," it is simply dysfunctional behavior for an adult. I freely admit to offering my belief that it is not generally useful to assume a passive role in relation to beings that we do not understand.

---

You can make a good case that most of the world's religious strife comes from our desire to be God's obedient children rather than God's responsible adults. In fact, I regard this as a major evolutionary step in human consciousness: either we grow up and take responsibility for our actions, or we die from immature subservience to benighted belief systems ("gods").

As regards the quotation about David Birnbaum: if you will re-read that section, you will see that the phrase "overblown language" begins a new paragraph summarizing my argument, and does not refer specifically to the preceding quote. I used the Birnbaum material to illustrate the idea that if you accept the hypothesis of plant teachers then you have to accept the hypothesis of synthetic chemical teachers as well. This, it seems to me, opens up a can of worms -- wouldn't it be more elegant to hypothesize entities

emerging from our own unconscious when stimulated by certain substances? Why deify the catalyst?

I started *The Entheogen Review* because I feel that the whole phenomenon of entities, inner-voices, etc. is not being seriously addressed -- the psychiatrists dismiss it as madness (whatever that is), the true-believers feel that God has chosen them as His vessel; some feel that plants have consciousness, others believe in aliens from hyperspace. I confess here and now that I don't have the foggiest idea of what these phenomena relate to, but I do accept their reality. If I were asked to express my current hypothesis about it all, I would guess that these entities are denizens of spatial dimensions contiguous to human consciousness; that there are "good guys" and "bad guys," and that it is very difficult from our position in spacetime to differentiate between the two; that it is an evolutionary choice to expand our awareness enough to meet these beings on their own turf and get to know them without abject subservience: this may be our initiation into transpersonal adulthood. Unlike McKenna, I don't believe that it is possible or even desirable for us to physically "leave the planet," but now may be a time for those of us who are ready for it to leave the necessity of physical incarnation behind for more expanded realms. For me, this subject is the only game in town worth playing because it is on the cutting edge of the mystery, and anybody willing to explore their own psyche can play. -- Ed.

## PEYOTE AS AN ENDANGERED SPECIES: THE CONTROVERSY CONTINUES

---

*The Entheogen Review* has received some interesting responses to the article "A Modest Proposal" from the Summer, 1993 issue. This all began last March when I solicited some opinions on peyote as an endangered species. One of the letters I sent out is reprinted below:

3/31/93

Rev. Anne L. Zapf, Editor

*The Sacred Record*

SR #1, Box 7X

Willcox, AZ 85643

Dear Rev. Zapf:

Enclosed please find a xerox copy of a letter ... addressing the problem of peyote as an endangered species. I have written to its author, asking for a brief statement for inclusion in the next issue of *The Entheogen Review*. I have also written to a member of The Native American Church in the same vein. Your church is the only one I know of which is taking responsibility for growing its own sacrament, and I would appreciate your insights on this extremely serious matter. It is my intention to start a discourse, and get as much input as possible from as many concerned people as possible. As I see it, this is not something that should be put off or allowed to go unexamined any longer. Your input would be invaluable.

Sincerely Yours ... Etc.

No direct answer was received to this letter, but the following response was printed in the July, 1993 issue of *The Sacred Record*. This is the newsletter for the Peyote Way Church of God:

Dear Mr. DeKorne:

Thank you for putting us on your mailing list. Your newsletter is factual and informative and a must read for those interested in spiritual plants and their religious use. We at Peyote Way are so grateful for the questions you ask and dialogue you request.

We believe the government is involved in an insidious effort to Buffalo Peyote. (sic) The process began with Native Americans and the creation of the Native American Church. In a country where church and state are by constitution separated, the government created this church so it, the state, could "control" the use of Peyote. Peyote has been sacrament and healer for North American people for millennia. The last nearly 50 years of control by the U.S. government resulted in the near extinction of Peyote in the United States and its being placed on Mexico's endangered species list two years ago. In the summer of 1991 Peyote Way approached the NAC with our concerns about the potential extinction of this plant teacher. Because we are non-Indian we were treated with great disrespect by the NAC leaders. (Not all NAC members were as offensive as their leaders to us, and a few were sympathetic and receptive to our words.)

It takes 10-12 years for a Peyote cactus to mature, but that is not such a long time considering the alternative is the extinction of a religion. "If you eat it you must grow it" is how Peyote Way has come to view the dilemma. The remarkable thing about this plant is that it is a renewable source. When the Peyote is properly harvested new buds will grow from the remaining root.

There have been several inquiries from individuals suggesting we choose a sacrament which is more abundant and currently legal, such as San Pedro or *Trichocereus peruvianus*. Though we appreciate these sacred plants and grow them as well as Peyote, our Holy sacrament will always be Peyote. Peyote is an endangered species, true, but we are doing the only thing we know to assure its future availability, grow it and share what we know about the benefits of Peyote and its blessings. We welcome the botanical assistance we have received from others, as the holy sacrament we grow here is for all true seekers. The more we learn about its cultivation the more and finer the plants we will have to harvest for future Spirit Walks...

No reasonable person could read the complete newsletter this was taken from without being convinced of these people's commitment to peyote as a bonafide religious sacrament. Although they have apparently suffered a certain amount of harrasment in the past, the Peyote Way Church of God seems to be the only non-native American church "allowed" to use entheogens in its rituals without being arrested. I suspect that local and federal prosecutors prefer to look the other way, since busting this church would open a horrendous can of worms, and further spotlight the government's constitutionally untenable peyote laws. Of course, that is an entirely separate issue from the endangered species question. The following is a reply to the above letter by the author of our original article:

#### **RESPONSE TO PEYOTE WAY CHURCH**

The Peyote Way Church of God's response to the issue of peyote overcollection does not offer an adequate solution to the problem. Their claim that the Native American Church was created by the government to "buffalo peyote" is not backed up by any documentation or proof. It is generally accepted as historical fact that the Native American Church was created by Native Americans. They received assistance in this from sympathetic white anthropologists who testified that native religious use of peyote should be exempted from the drug laws then being passed in many states. The Peyote Way Church of God shouldn't be upset that the NAC didn't fight for

the right of whites to use peyote -- it was not an issue at the time, and would have certainly resulted in a defeat for their cause. The court decision that peyote use is legal only for Native American members of the NAC was both racially condescending and unconstitutional, but *at least it did not outlaw the religious use of drugs entirely*. If such use is legal for some people, the possibility exists that a court may someday allow it for all people.

---

**The court decision that peyote use is legal only for Native American members of the NAC was both racially condescending and unconstitutional, but at least it did not outlaw the religious use of drugs entirely. If such use is legal for some people, the possibility exists that a court may someday allow it for all people.**

---

I am confused by the claim that "the last nearly 50 years of control by the U.S. government resulted in the near- extinction of peyote in the United States and its being placed on Mexico's endangered species list two years ago..." This literally says that the laws *against* harvesting peyote are causing its extinction by overharvesting -- a *non- sequitur*. I have never heard of any federal or state peyote eradication programs, since peyote use is legal for NAC members and such an extension of the "War on

Drugs" would be illegal. That probably wouldn't stop them, but consider the logistics: Peyote doesn't grow in well-defined fields like *Cannabis* and is not an easy target for aerial spraying; it's often difficult to spot on the ground, leaving any peyote sprayers the choice of aerial spraying of an entire desert or sending in legions of people on foot with spray tanks. Not feasible, even for bureaucrats with unlimited funds.

The real danger peyote faces is from overcollection, and while the NAC is doubtless a large part of that problem, I doubt that it deserves all of the blame. It's good that Peyote Way members have tried to discuss peyote's approaching extinction with the NAC, but unfortunately it sounds like the communication channels got closed down -- regarding their church as a government plot may not have helped.

The Peyote Way Church of God's solution to the problem is "grow your own." This is realistically ineffective in the larger sense, since there's no way that production of the slow-growing peyote plant can keep up with even NAC needs: Just the "legal" harvest by NAC members is sufficient to endanger the species. Grafting peyote tops to *Trichocereus species* for faster growth might reduce growing time threefold, but it is unlikely to solve the problem. A quarter million NAC members ingesting only three peyote buttons per weekly ceremony reduces the peyote population by almost four million plants a year -- a conservative figure, since most members consume

more than three buttons per meeting. Add to this all the "illegal" consumers and the slow growth restriction, and it should be clear that growing enough peyote to match current consumption simply won't be possible. -- Hatter

#### **HOME-GROWN PEYOTE IS A FEASIBLE ALTERNATIVE**

I wholeheartedly agree with Mr. Hatter that the NAC's use of peyote as their sacrament is probably the greatest cause for the looming extinction of this species. However, I disagree on his point that because peyote is so slow growing that cultivation is impractical. If the NAC decides to pursue the wisest course in this matter, they have a couple of options. Other than adopting alternative sacraments, they could cultivate peyote in greenhouses. Although peyote is slow growing, 6,000 or so seedlings in a modest sized greenhouse with a turnover rate of every 8-12 years, could be a viable solution for local NAC chapters. Peyote requires very little room and seems to thrive growing closely together. These cacti love frequent watering in Spring and early Summer which is when they flower. They also like partial shade, since in the wild they are usually found growing under larger desert plants. In addition to seed propagation, semi-mature specimens may be decapitated where the root meets the base of the button. The button can then easily be re-rooted. The rootstock in the ground will grow a new head, sometimes multiple heads. These rapidly grow to maturity due to the energy of the established root system. In addition to

these options, the decapitated buttons are easily grafted to *Trichocereus* species -- preferably, but not necessarily the mescaline producing varieties. Buttons grafted this way grow very rapidly: I once saw a three-year old graft the size of a baseball. Grafting has no effect on alkaloidal content that I know of: the peyote button goes on manufacturing its multiplicity of alkaloids, but at a much faster rate. Matured buttons may be removed and consumed or returned to the soil where they will establish a new root system. --

**B. Green**

#### **MORE ON GRAFTING PEYOTE TO TRICHOCEREUS**

... San Pedro is a very common garden cactus in peoples' yards in L.A. I never had any trouble getting lots of it. I have a friend who is growing many thousands of pounds of the plant. It is a lot of fun to graft a peyote button onto a limb and watch it do about eight years' growth in two. Since peyote grows so slowly, one can quadruple the growth rate by splicing a button to a similar diameter San Pedro limb. This is done by carefully cutting each surface perfectly flat and smooth before grafting them. Until the graft takes, the peyote button may be held to the surface of the *Trichocereus* by spreading multiple strings with small weights attached to them across the top of the button. A light ring of petroleum jelly should be painted around the cut to prevent dessication of the contacting surfaces.

In four years the button will be very large. It may then be cut off, re-rooted and returned to the soil.

Sometimes you get new pups coming out the side of your original graft, thus forming double, sometimes triple heads. I once saw five buttons growing from one root. Incidentally, peyote fuzz is non-toxic ... -- GH,NM

#### **SAN PEDRO PREPARATION: QUESTION**

In the Summer solstice issue it was proposed to start using San Pedro instead of peyote. What is the best preparation/extraction of fresh San Pedro? -- DF, FL

#### **SAN PEDRO PREPARATION: ANSWER**

...I'd like to confirm Hatter's observations (in summer issue) about the relative concentrations of mescaline in Peyote and San Pedro. Many people report little or no effect from San Pedro. This is probably because they aren't taking enough ... Harvest about 3 feet of 3-inch cactus. Freeze and thaw this two or three times to break down the cell structure, then blenderize into what can only be called "slime." Add enough water to make it pourable and spread it out to dry on sheets of plastic-wrap. When dry it may be easily crumbled into powder--if not fine enough, pulverize it in a food grinder. Weigh out 100 grams of powder, add a quart of water and simmer in a crockpot for 12 hours. Filter out and discard mash. Evaporate remaining liquid down to about three ounces of dark "syrup." The hardest part is drinking the syrup--three shot-glasses full chased by very tart lemonade is fairly tolerable. It comes on Slow, but you should get a 10 hour "plus-3" experience from this... -- JG, CA

## GENE-SPLICING FOR Mescaline PRODUCTION?

---

A few years ago a new acquaintance was enthusing about peyote and I told her: "It sounds like you were singlehandedly responsible for it becoming an endangered species." There is some good news: gene splicing. I saw an article about a new way to grow vanilla at a reasonable cost. The vanilla molecule is similar to mescaline, but NO, it is not practical for a bathroom chemist to convert it. I don't know squat about gene splicing, but "If we can dream it, we can do it." Why not create an algae with mescaline in it? With just mescaline, and none of those other inactive or toxic compounds. Isn't algae the most energy-efficient plant? The entire plant would contain the active ingredient. I don't want some negativist to tell me that we can't do it; I want someone to tell us (better yet: show us) HOW we CAN do it. Growing it would have no negative impact on the environment, unlike synthesis which requires toxic reagents and produces toxic waste. EH, NJ

Here is a brief article on this subject published almost a decade ago -- has anybody out there figured out how to do this yet? -- Ed.

### CREATING A SACRAMENT by "Prophet of the Holy Feat"

It is difficult to convince others of the efficacy of psychedelics for spiritual discovery and growth, particularly those who have a vested interest in a static society such as judges, legislators, etc. Freedom of mind is intolerable and frightening to them. Unfortunately, it is these people who must be convinced of the errors of their legal system in order that the rewards of entheogens can be reaped by society in general. Such benefits cannot be realized in the present environment of persecution.

**It is difficult to convince others of the efficacy of psychedelics for spiritual discovery and growth, particularly those who have a vested interest in a static society such as judges, legislators, etc. Freedom of mind is intolerable and frightening to them.**

There is now an opportunity to bring about an attitude of respect among legislators, and to make psychedelics more appealing to the public. A new source of trip in the familiar guise of a garden vegetable is the most likely solution. While no such plant exists now, it is feasible that one or more can be created and rapidly proliferated within the next decade. Recombinant DNA research, which has already produced cheap insulin and interferon, is yielding knowledge exponentially.

Psilocybin is a naturally occurring psychedelic produced in every cell of a relatively simple organism, a fungus. At this time it would be possible to transfer the genetic blueprint for psilocybin from the fungus to another simple organism such as a bacteria. Yeast would be one good candidate; it can be cultivated in the home with little risk of culture contamination. Before white bread, most households kept ready a yeast culture for breadmaking, reserving some dough to preserve the culture.

Another prospect would be the tomato. While such an *in vitro* marriage between mycelia and nightshade is presently beyond biolab techniques, it may not long remain so.

Would the government attempt to make tomatoes illegal? It is so inconceivable as to be considered no more than hysteria. High quality trip could become as common as ketchup. Even if the psilocybin producing gene were recessive in such tomatoes, every home gardener could grow them and work toward creating new hybrids. Perhaps other vegetables could be enlisted so that even the most oppressive governments could be powerless to stop the psychedelic revolution. The world awaits some enterprising grad student or rogue scientist to complete some research project in this matter. Perhaps it is already underway. **The Psychozoic Press, #9, Autumn, 1984, Pg. 77**

## A USER'S REPORT ON "SLEEPY GRASS" (*STIPA ROBUSTA*)

---

In the Winter Solstice, 1992, *Entheogen Review* we mentioned an article from the December, 1992 issue of *Discover* magazine reporting that the highest known concentration of LSD amides in a plant species has been discovered in "sleepy grass" (*Stipa robusta*) -- a coarse perennial range grass which is native to Colorado, New Mexico, Texas and Arizona. A request for further information from *Discover's* editorial staff produced only a form letter stating that they "appreciated our interest, but were unable to answer any of their reader's questions." Response from our own readership has produced the following information:

First, sleepy grass has an infamous reputation among ranchers in the Southwest because of its powerful effect on livestock: particularly horses:

*Expeditions depending on horses for transportation in the early days often had great difficulty traveling through these areas of New Mexico because their horses ate the grass readily and moderate amounts of it produce profound, nearly stuporous sleep. The condition lasts several days, during which it is impossible to rouse the animals more than momentarily. -- Kingsbury, J. (date?)*  
**Deadly Harvest -- a Guide to Common Poisonous Plants**, Holt, Rinehart, Winston, NY, Pg. 58

Based on our report, at least one reader has already experimented with sleepy grass seeds:

*I purchased some Stipa robusta (Sleepy grass) seeds from Horus Botanicals. I received about 30 seeds for \$5.00. They are tiny, black, long and thin. Kind of a smaller version of wild rice seed. About two weeks ago I planted eight seeds, which all came up in my starter trays within a week.*

*I ate one seed, but with no observable results. Later I increased the dosage to nine seeds. I chewed them thoroughly and carefully with my front teeth. The seeds are rather small and have a tendency to get away from me while attempting to chew them up.*

*After about an hour, a discernable shift in my nervous system began to take place. At about an hour and a half, I began to have a very slight stimulation effect and "feelings of unreality of the outside world" to partially quote Albert Hoffman's description when he ingested pure lysergic acid amide as described in **Ethnobotany and Chemistry of Hallucinogens**, Hoffman and Schultes.*

*I turned out the lights, went to bed and listened to*

*a meditation tape on headphones. Subtle but very interesting visual hallucinations of mostly complex shifting patterns (no colors) with emotional content to them became easily seen in the darkness. There was absolutely no exhaustion or nausea as you would expect from Hawaiian Baby Woodrose (*Argyria nervosa*) seeds. In fact, the experience was qualitatively very different from Woodrose. I have no literature on *S. robusta*, but I am guessing that the effects were mostly lysergic acid amide alone, with very little or no other related indoles. Physically, the experience was very calm and pleasant though sometimes a little weird. Some 20 or 30 minutes after lying down I drifted off to sleep. The tape definitely helped activate and focus both the visual and emotional content of the experience. All in all, it was intriguing and worthwhile, and next time I will try 20 seeds. I wonder what would be the result of combining this with Syrian rue? Sleepy grass is definitely an entheogen worth exploring. There were no apparent after-effects or hang-over the next morning.*

GH, NM

It goes without saying that one should be extremely cautious when experimenting with any new plant species -- particularly those with no known shamanic tradition to back up their use. Although the *Discover* article claims that Central American Indians give these seeds as a sedative to crying infants, I am unaware of any other culture which utilizes them at all. Since the range of the plant is restricted to the American Southwest, how "Central American Indians" obtain the seeds remains an unanswered question. (*Non sequiturs* like these in the popular press are always suspect -- they seem to be an essential part of the psychedelic myth-making archetype, and are evidently the only vehicle by which our culture is able to process this kind of information.) -- Ed.

rooms, surprised to discover the taste not unpleasant. Within an hour and a half I felt sleepy, and a little dizzy, fell asleep for 45 minutes and woke up in a deep altered state. Very unique and "disconnected," as if I was experiencing someone else experiencing my body. I found it interesting, and felt absolutely no emotional attachments to anything or anyone -- either positive or negative. I experienced none of the somatic side effects that I'd heard about -- sweating, salivating, etc. Toward the end it became tiresome and somewhat boring. I turned on the TV and felt that somehow my thoughts were creating the transmission (along with everything else in my environment). There was still a rational part of my psyche telling me that this was a delusion, but it was the strongest delusion I've ever had on any psychedelic drug, and it produced some fear. (It also enabled me to feel more compassion for those mentally ill persons who must constantly live within a world of such delusions.) It was a worthwhile experience, but one which I feel no desire to repeat. -- CG, UT

\*\*\*

Several years ago a small group of us experimented with the *Amanita muscaria* native to the woods of Northern Vermont. We both smoked and ate the mushroom, and a few times I ingested and smoked what I considered heroic amounts. It definitely altered my state of consciousness, but not like LSD or psilocybian mushrooms. In fact, I have problems with classifying it as psychedelic, as I never had a full-blown, classic experience. Still, the *Amanita* is "fun" and under the right circumstances I experienced a good high. It is light and "heady" -- to be distinguished from say, Jamician "Ganja" which produces a "heavy body" high. In heavier doses it produced a visceral "itch" -- like being able to feel both the surface texture and interior of my bones. I'm not sure I liked the feeling, though I feel that if it were understood more fully one might be able to self-heal at a deep level. On several occasions I had intensely colorful, partly lucid dreams, so I believe the *Amanita* can stimulate REM activity. Nevertheless, I don't believe that this is the vedic "Soma" as suggested by Wasson. Indeed, we quit experimenting with it precisely because it never triggered a true psychedelic experience such as one gets from the psilocybins. -- TM, VT

## More Mushroom Matters

### *Lepiota Peele* Response

\*\* Last issue we reported that *Lepiota peelee*, reputed for years to be psychedelic, has been shown to be both mis-named and inactive. (Official identification is *Lepiota humei*.) As the newsletter went to press I received a letter from a known reliable informant who has had entheogenic experiences from ingesting the mycelium of this species:

*...I've never had any luck with ANY spores from Peele -- Lepiota, Gymnopilus, or Psilocybe. But the cultures he sent me were uncontaminated and viable, though it took some effort to get him to send them. And both the cultures of Gymnopilus spectabilis and Lepiota peelee (sic) I obtained from him were psychoactive. So I really don't think L. peelee is a hoax.*

In the July, 1993 issue of *The Mushroom Culture* (journal of the Independent Mushroom Grower's Network) an article by S.L. Peele outlines his side of the story. In brief, he suggests that the mushroom's psychoactivity probably depends upon the nutrients it is grown upon. Since there appear to be no independent scientific tests to settle the question, the matter must be left as undecided. -- Ed.

\*\*\*

### Mushroom Journals

\* I've recently had great success with growing *P. cubensis* on rice/vermiculite cakes. I'd like to see more information on entheogenic mycology. In last issue you mentioned two journals: *Mycofile* and *Mushroom the Journal*. If these publications are still active, what are their addresses? Do you know of any magic mushroom newsletters? -- JM, FL

\*\* *Mycofile* is a Canadian mushroom journal. Its address: 395 E. 40th Ave., Vancouver, B.C. Canada V5W 1M1. Unfortunately, I don't have the subscription price, nor do I have an address for *Mushroom the Journal*. (I receive many photocopies of journal articles from correspondents, but the address and subscription information is usually not on those pages.) The following useful quotation comes from the Winter 92/93 Bio-visions mushroom laboratory newsletter. Their address: P.O. Box 2767 #155, Jackson, TN 38302. -- Ed.

*You can use each jar of rye grain spawn to inoculate a cubic foot of wheat straw. Fresh wheat straw is shredded and pasteurized at optimal moisture content then packed in a plastic bag lined one-cubic-foot cardboard box ...*

*You can inoculate this material yourself without the need for a sterile environment. Open your jar of rye grain spawn, pour it into the bag of wheat straw and mix well, then poke about a dozen holes into the bag with a pencil. Put the bag of inoculated straw back into the box and pack it as level and tightly as possible by hand. Then fold over the top of the plastic bag loosely. After several days the straw, if you've distributed the rye grain well, will show signs of mycelial growth. When the straw is permeated by the mycelium, open the bag and apply the casing mix loosely and evenly over the surface of the spawn. Loosely close the plastic bag. In a few days the mycelium will grow throughout the casing layer and be ready to produce mushrooms. Decrease temperature to mid 70's F, increase ventilation (open top of bag) and maintain high humidity (drape loosely with plastic).*

-- Bio- visions newsletter.

#### *Mushroom Ayahuasca*

*Psilocybe cubensis* with *Peganum harmala* (Syrian rue) is a great mix; the *Peganum* adds some warmth and ecstasy to the experience. My wife and I use 3-6 g of dried mushrooms with 2-4 g of ground rue seeds. In Vol. 2#3 JS from OR said to use *Peganum* seeds whole, not ground. My understanding is that while the beta-carbolines are indeed oil-like in their free-base form, like other alkaloids in acidic solutions they form a salt which is soluble in water. I can certainly vouch that simmering the ground seeds in acidic water (I use 25% lemon juice) twice (for 15 and 45 minutes) does extract alkaloids. In *The Alkaloids* by Manske, Vol II page 393, there's an interesting isolation of harmine and harmaline from *Peganum harmala*, using a 60% cold vinegar solution; after filtering, they add table salt, and the harmine/harmaline acetates become chlorides and precipitate out.

**BW, WA**

### **Botanical Access**

*The Entheogen Review* is now suffering some growing pains: Too much information, only 16 pages and a subscriber base still too small to pay the postage/printing costs of a larger publication. For now advertisements must be reduced to a "classified" format.

### **Shulgin's Categories of Psychedelic Inebriation**

\* I haven't read Shulgin's book (**PIHKAL**) -- any chance you could reprint or paraphrase his magnitude scale so all readers know what a "plus one" or "plus three" refers to? -- **BD, CA**

\*\* Here's a brief paraphrase. See **PIHKAL**, Transform Press, Berkeley, 1991, pgs xiv-xv for complete details:

**Minus.** Baseline, or normal consciousness.

**Plus-minus.** A move off baseline, but uncertain whether it is a drug effect or just imagination.

**Plus-one.** An effect (e.g., dizziness, nausea, etc.) is noted, but not enough to determine much about the drug.

**Plus-two.** Drug effect unmistakable, its duration and nature are perceived, but one can still function normally if required by circumstances.

**Plus-three.** Maximum intensity of drug effect.

**Plus-four.** Special category for extremely numinous experiences. Usually not repeatable.

# NETWORK FEEDBACK

## **SALVIA DIVINORUM**

I recently heard Terence McKenna speak in New York. He gave a different version of how to take *Salvia divinorum* than the ways I've heard about. It goes like this: take 13 leaves and remove the midribs, so that only the soft plant material remains. Roll this into a quid and place between cheek and gums. Lie down for 15 minutes. Remove quid. In five minutes more, lying in silent darkness, the effects begin. McKenna says that the effects last about 45 minutes, which is inconsistent with other people's reports.

Since I have heard that anything from 13 to 70 leaves is one dose, and since plant and leaf sizes obviously differ, I have a question for readers of *The Entheogen Review*. Would someone out there who has experience with this plant please weigh a dose of fresh *Salvia divinorum* leaves and pass on that information?

I find it fascinating that the plant's active ingredient has yet to be discovered, and that only the fresh leaves are significantly psychoactive. This suggests that it will be near impossible to make this plant illegal, and that whoever wants to experiment with it will have to care for and develop a relationship with the living plant -- something which I believe is important.  
-- LM, NY

Here's the only published reference I have regarding a dosage weight of *S. divinorum* leaves:

*S. divinorum* may be prepared as an infusion from 20 (about 50 g) to 80 (about 200 g) or more pairs of fresh leaves to induce visions, and may be taken by the curandero, the patient (or apprentice) or both, depending on the situation. Only fresh foliage will serve for divination. At this dosage level, the *Salvia* is used to foretell the future, find the causes and cures of illnesses and obtain answers to questions about friends, enemies and relatives.

Valdes, L.J. et al (1983). "Ethnopharmacology of *Ska Maria Pastora* (*Salvia Divinorum*, Epling and Jativa-M.)," *Journal of Ethnopharmacology*, 7, 287-312

The Mazatecs are said to always measure their

doses in pairs of leaves. McKenna's recommendation of 13 ribless leaves is therefore surprising, although it should be noted that the number 13 has a religious-numerological significance for the Mazatecs and probably other Mexican Indian tribes as well--it is also their recommended number of morning glory seeds to ingest, though a psychoactive dosage level for Westerners is in the 300-seed range. -- Ed.

As we go to press, this just in from this year's BPC conference in Hawaii:

## **DOING S. DIVINORUM**

You don't ingest it. The active ingredient needs to be absorbed through the mouth. Take from 9-13 pairs of leaves and slowly chew them, forming a quid. Let it stay in the mouth slowly chewing for a long time. Precisely how long I don't know ... Contrary to reports, drying does not destroy the activity. It's just that if dried, you have to smoke it. It is then a slightly different experience. There is also a method of extracting the active principle that gives a product that is active in the microgram range, and is said to be "dangerous."

### DMT AS MAO INHIBITOR

Someone asked (in your Summer Solstice issue) if DMT is a MAOI. There are data in rats to suggest this, but the equivalent dose in humans would be over 5 gms, so it would be easier to add another MAOI rather than trying to have DMT act as one...

-- Dr. Know

### DMT QUESTION

We know that DMT is orally inactivated by gut MAO. We also know that this can be circumvented by the use of a MAO inhibitor. My question is: what system de-activates DMT in the brain when the route of ingestion is by smoking, and what strategies are available to prolong that experience? Do beta-carbolines also inhibit the neural breakdown of smoked DMT?

-- Johnny Appleseed

### FEEDBACK ON ITEMS IN LAST ISSUE

Why don't you page the "Review"?

"Bufotenin not psychoactive according to Alexander Shulgin last summer at the Telluride mushroom festival, bufotenin is totally inactive even when injected..." According to Fabing and Hawkins, *Science* (1956) vol. 123, pg. 886; Everts *Res Publ. Assoc. Res. Nervous Mental Disease* 36:347 (1958); and Turner and Merlis *AMA Arch. Neurol. Psychiatr* 81:121 (1959): Facial burning, nausea and plum-purple face for an hour. Geometrical patterns, blocks, spots for several minutes. Perhaps, instead of calling the viewings hallucinations, they should be more accurately termed visual disturbances. Nonetheless, there are strong, undesirable and, no doubt harmful, side-effects associated with these "visuals."

Morning glories: Get it once and for all! Check Wasson's *Road to Eleusis*, Stafford's *Psychedelics Encyclopedia*, or Hofmann and Schultes' *Botany and Chemistry of the Hallucinogens*. Ergotamine and other ergotism-producing chemicals are nearly insoluble in water. However, the lysergic acid amide, isolysergic acid amide, ergonovine, etc. found in *Claviceps purpurea* (ergot of rye) and certain morning glories are water soluble. I doubt that ergotism-producing chemicals are present in morning glories.

Vitamin K/Ketamine, etc., *Amanita muscaria* -- "What's the problem?" Give them to your garden compost pile! They are just depressant, sedative, and deliriant in their actions.

"Sources of DMT ... the root cores (of *Desmanthus illinoensis*) contain unwanted alkaloids..." Show me the literature; give me the page and paragraph that say the root cores contain unwanted alkaloids. "*Justica pectoralis* var. *stenophylla*...have much DMT in the leaves..." Show me the literature reference here! The most recent information I have is *Economic Botany* vol. 44, 1990, pg. 61, or thereabouts. The report mentions slight presence of DMT.

"Properly prepared" morning glory seed soaked for an hour! Show me a literature reference reporting that the Indians of Southern Mexico soak the ground seeds an hour. After the seeds are ground, rather coarsely considering what they have to grind them with, the preparer adds water enough to drink--not a gallon---stirs the ground seeds and water, then pours the mixture through a straining cloth. This straining is primarily gravity feed until no more water extract drips through, then a gentle squeeze is given the cloth to extract what more thin extract is remaining. I do not know, however I guess that the thick, viscid, sticky part is not squeezed out. Why anyone would want to mess with morning glory seeds in this day and age is beyond me. Many reports have shown that most of the alkaloids have depressant and sedative properties.

Probably the best way to use *Peganum harmala* is to keep the seeds whole; do not grind them. The vinegar extraction which was reported would probably make your house smell a lot. The seeds contain about 12-14% oil--not a volatile essential oil either--a "burned coffee"-tasting oil. The oil will probably remain in the seeds if they are soaked eight hours and then simmered--not rumbling boil--for one to one and a half hours. After straining off the extract, one might simmer the seeds again for 15-20 minutes to extract what small percent of Beta-carbolines that remain. Under "Botanical Access": "...*Echinocereus triglochidiatus* containing phenethylamine alkaloids and even some DMT..." Show me the literature references which report this cactus as having DMT in it! The old article by Robert Bye in the early 1980's refers to a tryptamine base--no DMT mentioned there.

*Stipa robusta* seeds! They contain a powerful sedative, not an entheogen.

"A Modest Proposal" by Hatter--yes, good ideas. In certain parts of Switzerland one can buy peyote at local florists! Why not San Pedro instead? Of course,

these floral shop peyote are grown from seed, but San Pedro is so easy to grow by cuttings. And San Pedro (*Trichocereus pachanoi*), though one-third as concentrated in mescaline as peyote, on the positive side has none of the sedative and tranquilizer compounds which peyote does. The *J. of Chromatography* (1992) 593, pg 94 shows that *T. pachanoi* varies from 62.1 to 347 mg/lb fresh. This more concentrated level is comparable to the level reported for *T. peruvianus*, which is nearly as much as in peyote. What the cultivation requirements are for producing this higher concentration in San Pedro, I don't know. Madsen in *Flora of Ecuador* no. 35, 30, (1989) is of the opinion that *T. peruvianus* is a variation of *T. pachanoi*. Since the natural habitat of San Pedro is "equatorial," no doubt a lot of light is one major requirement for producing high concentration tissue. -- JS, OR

\*\*\*

Sorry about the lack of pagination in last issue, as well as the generally poor production quality--I had to use an unfamiliar publishing program at the last moment. As regards "getting it once and for all," I doubt that will ever happen. We're all coming from different places: different knowledge, different experience, different illusions. Much of the literature you quote is not easily obtained, some of it is out of print. On top of that, when dealing with the subject of entheogens there is at least a two-to-one mythology to science ratio. Even acknowledged experts often cannot agree. I expect most of this is caused by the subject being against the law (rumor thrives when facts are repressed), but some of it certainly relates to irrational forces in the collective psyche--something in us needs to believe in psychedelic myths! The *P. harmala* extraction formula was based at least in part on published references. See: Hasenfratz, *Ann. chem* (10) 7, 151 (1927) and Flattery and Schwartz, *Haoma and Harmaline* (1989), footnote: pg 31. The vinegar extraction does smell a bit, but it's cheap, it's easy, and it really works. -- Ed.

#### SEEKING MORE INFORMATION ON TECHNIQUE

...I would like to see articles on rituals or techniques in using the plants. For instance in the Summer 93 issue the "Ayahuasca Analog Experiences" article refers to a "tone song" in a group setting (Nov. 14, 1992) that I find intriguing. What is it? How do you do it?...This

talk about the plants being teachers is nice but I want all the human help I can get before plunging into the unknown of a trip. -- RH, CA

#### DRUGLESS ACCESS TO HYPERSPACE

According to the holographic viewpoint, entities and other phenomena are subtle realities existing within us. I recommend the book: *The Holographic Universe*, by Michael Talbot, which examines entities and altered awareness--there is even reference to ayahuasca!...Which inspires a question for readers: if entheogens enable one to access these powers, how can one access them when in a "normal" state of consciousness without drugs? -- CK, PA

\*\*\*

A good question: perhaps the ultimate question. Most answers imply an evolutionary change in consciousness and a transcendence of the human condition as now defined. Maybe something like McKenna's: "The body is to be internalized and the soul exteriorized as a living golden disc." -- Ed.

#### HEIMA SALICIFOLIA ("SINICUICHE" "SUN OPENER")

I've taken this three times from an extract -- each attempt was after a 12 hour fast. The first time I took the suggested dose: 10 to 15 drops. No effects. Three days later I increased the dose to 60 drops. No effects. I took the rest of the bottle (approximately 3/4 of an ounce) several days later. There was some feeling of "intoxication" with very minimal psychedelic effects: about 1 or 2 on a scale of ten. Unless I did something wrong, this was completely disappointing. CG, UT

\*\*\*

I would be interested in reports on Sinicuiche -- I grew it extensively for a while, but was never able to get past a plus-1 with it. This relates, I think, to native use of entheogens at what we would consider subclinical dosages -- since what essentially happens is a reaction in the mind, and they have the cultural mindset that expects the reaction, they "get off" much more easily than we do. Just a hypothesis. MH, VT

#### CALEA ZACHATECHICHI ("DREAM DROPS")

This was from a one-ounce bottle of extract -- the results were the same as for *H. salicifolia*: Zip. CG, UT

\*\*\*

I do have personal experience growing and using *C. zachatechichi*, and have found it a highly useful

## IMPORTANT SUBSCRIPTION INFORMATION

With this issue **The Entheogen Review** completes its first year of publication. If the newsletter keeps growing as it has been, I'll eventually have to hire some production help; it looks like it will become a small magazine someday! Nevertheless, this is still a one-person operation; since I haven't the time (or the temperament) to send out renewal notices, I will rely on each subscriber to keep track of his or her expiration date. The code behind your name on the mailing label tells when your subscription is up. F93 means that this issue, fall, 1993, will be your last. Since Spring and Summer both begin with the same letter, V stands for "Vernal," as in Vernal Equinox. (i.e., V94 means the Spring 1994 issue will be your last.) I hope you like the newsletter enough to sign on for another year. With this issue we go to a larger format, and begin using the services of Arena Press in California for printing and mailing. Third class mailing slashes my postage expenses by more than half - unfortunately, 3rd class mail isn't forwarded. If you have changed your address please let me know -- otherwise the post office will throw away your newsletter and neither of us will know what happened.

### dream enhancer. MH, VT SEEKING DATA ON OTHER ENTHEOGENS

... I wish you printed more information about substances other than ayahuasca. Although this is useful information, I'd also like to hear about botanicals, such as: *Mammillaria heyderi*, *Pachycereus pecten-aboriginum*, *Coryphantha macromeris* ... [long list of cactus species listed as entheogens in books such as *Plants of the Gods*] ... *Amanita muscaria*, *A. pantherina*, *Lepiota spp*, *Panaeolus spp*, *Psilocybe spp*, *Gymnopilus spectabilis*, and others ... I am curious as to how much interest there is in these and other ethnobotanicals.

-- EG, OH

\*\*\*

I have acquired several different cacti which have been reported to contain phenethylamines. Do you have any knowledge of preparation and dosage for the following: *Epithelantha micromeris*, *Mammillaria heyderi*, *M. senilis*, *M. craigii* and *Echinocereus triglochidiatus*. Most of this information comes from *Plants of the Gods*, which says very little on

actual usage. I have acquired some *Voacanga africana* seeds and know virtually nothing about them. What can you tell me? In several mushroom field guides it states that Siberian *Amanita muscaria* cause visions while the North American ones cause the notorious narcotic deliriant effects. How accurate is that? -- BK, CA

\*\*\*

How about it, network? Who has some hard data on these relatively obscure entheogens? -- Ed.

### "AND GOD CREATED ILLEGAL PLANTS..."

...*Catha edulis* (Khat) extracts containing cathinone and fresh leaves are now schedule I, thanks to our overseers. The non-publicized law never really states living plants to be illegal, and after checking, I find that nurseries still sell them. Of course, the law was sleazed through to protect our "boys in Somalia" since the native infidels grow and consume huge quantities as a beverage. This leads one to wonder if some of the other entheogens receive media attention, they too will be criminalized. *Trichocereus* comes to mind, perhaps *Heimia*, *Calea*, etc.

If the so-called "pure food and drug" laws are enacted, *all* herbs will be illegal unless prescribed by a legal "seller of health." These laws are being lobbied by the pharmaceutical industry. So what do we want: knowledge and comprehension or controlled security and blissful ignorance? -- BB, AR

### USEFUL BUMMERS

Entheogens bring out what's *in* people, not necessarily the best. There's a lot of shit between the surface and the "god-within." Stanislav Grof actually encouraged his patients to have bummers -- if they felt they were going to die or go crazy, instead if tranking them he told them to trust the process. In going through these experiences his patients went through some amazing healing processes. Some of them needed a day or two in a rubber room, but he just gave them more acid and they worked through it; as a result, he discovered realms most other LSD researchers have barely touched on. I find Grof's map of the psyche very useful in dealing with negative stuff that comes up. - BD, CA

## REQUEST FOR INFORMATION

---

---

I am impressed by the relatively large number of subscribers to *The Entheogen Review* who are clinical psychologists. I assume the interest in entheogens among this profession relates to the exploration and healing of the psyche -- a subject about which we really know very little. Dream work is an important branch of psychotherapy, and any substance which might facilitate access to the dreaming mind deserves to be examined in detail. One botanical which has been scientifically shown to have potential as a dream catalyst is *Calea zachtechichi*, an herb from Mexico. I would like to feature an article on this plant in the next issue of *The Entheogen Review*, and ask anyone who has experience with it to share their data with us. I am also interested in observations about useful techniques for using entheogens in group work.

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

## *Subscriptions*

*The Entheogen Review* is not intended to be a

mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W93 means that the Winter, 1993 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can only pay for submissions by extending your subscription, and though I often have to edit for brevity, please keep those fascinating letters coming in.

-- Jim DeKorne

## SMOKABLE DMT FROM PLANTS

---

It is with mixed feelings that I have chosen to publish the following article. Just as the Bolshevik revolution took place within the context of the First World War, the psychedelic revolution seems about to re-explode within the context of the War on Drugs. What you are about to read constitutes a tactical nuclear explosion in that war. Although the consequences of this are unpredictable, human survival now demands that we stop pacing ourselves according to the limitations of the weakest among us. The nature of our culture almost mandates that this information will be abused, but that must not prevent me from communicating with my intended audience.

---

An extremely potent smokable form of DMT can be extracted from the *aquatica* and *tuberosa* varieties of *Phalaris arundinacea*. (Presumably the same holds true for any DMT-containing botanical, dozens of which have now been identified and continue to be discovered. <sup>1</sup>) The extraction procedure is a simple process of simmering the biomass in a 30% acid bath for about 12 hours: a crockpot is ideal for this. When cooled, the filtered solution is de-fatted with an organic solvent such as methylene chloride. The aqueous solution is then basified to about pH 9 and an organic solvent used to extract the alkaloids. This is evaporated and the resulting tar is scraped up with a razor blade or X-acto knife and weighed into dose-sized amounts -- prudence advises one to start out conservatively at 10-15 mg. This amount of tar is then re-dissolved in ethanol in a shot-glass and a one-toke quantity of inert matter (mint, parsley, oregano, etc.) stirred in. After evaporation, this is ready to smoke in a small pipe. (See the Winter Solstice, 1992 *Entheogen Review*, for a more detailed description of this extraction process.)

### *Analysis*

Depending on alkaloid concentration, the experience from a one-toke inhalation of this substance may be more than even a veteran psychedelic voyager can handle comfortably. I am not exaggerating when I say that a 50 mg trip I took on this stuff felt analogous to having a psychic hydrogen bomb go off in my brain. It was quite simply terrifying -- when I came down ten minutes later, I was profoundly grateful that I still had all of my mental faculties intact. (A friend has suggested that free-fall parachute jumping is good preliminary training for would-be DMT smokers!)

DMT is a normal part of human metabolism (it is

apparently synthesized in the pineal gland or "third eye") and is considered physically benign, but while it's sparking across your synapses it's difficult not to believe otherwise. The onset is sudden and intense -- it is already coming on before you've exhaled. Then one is swept away in a cerebral hurricane of light and motion. *Resist any impulse to resist:* flow with it, breathe with it: imagine a zen meditation at Hiroshima ground zero. Knowing that it won't last very long helps considerably -- within ten minutes or so, it is already subsiding.

DMT is obviously a molecule which demands respect. Because of this, I can't imagine it ever becoming a recreational drug -- its nature is to sear away our illusions down to the core of being -- a process few would describe as "recreational." My guess is that after an initial trip or two, most people will choose to leave DMT alone -- such intensity is difficult to manage without a working structure. Intuition suggests that breath and sound are good points of departure for the creation of these inner structures.

Semantically, the word "entheogen" refers to anything which evokes the "god within." This, because it cannot be anything but subjective, will be different for everyone. Some people see entities, some just see light -- I am sure that there are as many manifestations of transcendence as there are people to perceive them.

I experienced light -- clear, white light of such power and intensity that the only metaphor I can use to describe it is that of an atomic fireball at the instant of detonation. The insights came later -- after the fireball had subsided. The first insight was a cosmic pun:

### *The Third I is We*

Something was blasted loose within my psyche and the fallout continues. My dreams have changed dramatically: nocturnal strobe-lights heralding pregnant

enigmas. We are light-containing vessels and it is essential that our vessels grow strong enough to hold its full intensity. Each ego is a finger pointing at its own inner moon: forget the finger and just *be* the moon. It has taken light-years for this illumination to reach the very eyes through which it has been shining all along: Take care that it doesn't blind you.

### *Some Comparisons*

**LSD**, at best, is a chemical synthesized in a laboratory by a PH.D. -- a drug presently obtainable only from a complex technology via an underground hierarchy of "dealers." It is therefore the example *par excellence* of a contemporary consumer-culture psychedelic. Aside from any positive effects it may produce, it is still inextricably entangled within a toxic and moribund techno-economic system. This principle holds for all of the synthetic hallucinogens with capital-letter names: PCP, MDMA, 2-CB, etc.

**Ayahuasca**, a synthesis of rain forest plants, is an Amazonian shaman's drug. It is traditionally used by people who live within an entirely different set and setting than our own. It did not grow out of our culture, and is arguably a forced transplant: modern Westerners do not easily accept the concept of plant teachers nor are we comfortable with the severe somatic side-effects of this substance. These principles are generally true for the ayahuasca analogs, as well as for most shamanic entheogens: Peyote, San Pedro, Datura, etc.

**Phalaris DMT** is something brand new -- derived from one of the ayahuasca analog plants, it is a natural form of DMT and 5-MeO-DMT which can be grown by anyone anywhere on the planet outside of the polar regions. It has no somatic side-effects (vomiting, nausea, etc.), nor is it dependent for its extraction on complicated laboratory procedures, equipment or knowledge. Neither is it necessary to rely upon a profit-oriented monopoly of dealers to obtain it.

It comes on fast, is too intense, and subsides rapidly: just like the way we live our lives. Here for the first time, untainted by High Technology, Drug Dealer Capitalism, Cultural Unfamiliarity or Somatic Malaise, is an extremely powerful entheogen potentially available to anyone who wants it. It just *might* be the right catalyst at the right time to transform our world.

The numinous nature of the DMT experience recalls some verses from the Hindu scriptures: In chapter 11 of the *Bhagavad Gita*, Arjuna asks Krishna to show him his *visva-rupa*, or "universal form" --

4. *If You think that I am able to see Your cosmic form, O my Lord, O master of all mystic power, then kindly show me that universal self.*

Krishna responds to Arjuna's request by saying:

8. *But you cannot see Me with your present eyes. Therefore I give you divine eyes, so that you can behold My mystic opulence...*

*Yet however much we may be hedonists or pursuers of the bizarre, we find DMT to be too much. It is, as they say in Spanish, bastante, it's enough -- so much enough that it's too much...One of the interesting characteristics of DMT is that it sometimes inspires fear -- this marks the experience as existentially authentic...To not be terrified means either that one is a fool or that one has taken a compound that paralyzes the ability to be terrified.*

Terence McKenna --*Tryptamine Hallucinogens and Consciousness*

Whatever Krishna does to open Arjuna's eyes, it obviously precipitates a profound alteration in consciousness. Anyone who has experienced a full-fledged DMT flash might see a parallel here. At any rate, Arjuna is deeply disturbed by the vision he receives:

24. *O all-pervading Visnu, I am unable to keep the equilibrium of my mind! Seeing Your radiant color filling the skies and seeing Your mouths and eyes, I am afraid.*

25. *O Lord of lords, O refuge of the worlds, please be gracious toward me! I cannot keep my balance seeing thus Your blazing, deathlike faces and awful teeth. I am bewildered in all directions.* <sup>2</sup>

Compare this with Terence McKenna describing a psychedelic trip:

*I even have conversations in the hallucinogenic spaces where I say, "Show me what you are for yourself." And then it starts like an organ tone that begins to lift velvet drapery. After about forty-five seconds of that I say, "That's enough of what you are for yourself. Let's go back to dancing mice and little elves*

and, you know, the happy, nice stuff! This is scaring the socks off me!" ... It always cloaks itself. It's not an entirely honest encounter. It knows that you actually couldn't handle it ... It can accept as many projections as we can put onto it. It literally is beyond the power of human imagining, so whatever image we lay onto it, it can take that and give it manifestation. The mice, the elves, the alien abductors.<sup>3</sup>

With the DMT experience now available to anyone willing to extract this endogenous (you've got some in your pineal gland right now) entheogen from any one of scores of different plants (many of them common North American "weeds"), it seems that the fools and angels among us are being offered "divine eyes" for seeing the "universal form," or something like it. Given the historical context of this sudden gift, I cannot help but feel that McKenna's "ingression of novelty into time" is about to go into overdrive. May the force be with us.

-- Jim DeKorne

1. There is much research to be done in this area. Obviously, a lot depends upon each species and its varieties as well as differences in individual plants. For example, an extraction made from the root bark of *Desmanthus illinoensis* produced only threshold symptoms -- a plus--one in Shulgin's categories of intensity. Does this mean that *D. illinoensis* is not psychoactive? No -- it means that more research needs to be done in finding the best way to extract and concentrate its alkaloids -- the same holds for any other DMT-containing botanical. Unwanted admixture alkaloids must also be taken into consideration.
2. *Bhagavad-Gita As It Is* (Swami Prabhupada), The Bhaktivedanta Book Trust, NY, 1972
3. Terence McKenna -- *Green Egg* interview, Summer, 1993

### DMT Entities

The following wonderful description of what the DMT experience can be like was received many weeks before the discovery in the preceding article was made and is not related to it in any way. -- Ed.

(First trip) ...I watched a *Star Trek: The Next*

*Generation*-type of low-lying city on a flat plane on the far horizon mutate through a variety of colors and hues (mostly green), with a quickly changing background and foreground; the city grew much larger in the distance as I watched it, with many ill-defined "things" floating in the air above it. Then the air between me and the city, the void space, became full of twinkling, circular lines; as I watched the evolving panorama of motion and light, with the city still visible in the distance, I was surprised by a huge fuzzy wreath of dull white light that rolled across my visual

screen from my left to my right, quite close to my face, without actually touching me. It was warm and benign, but its proximity alarmed me.

Then I noticed a middle-aged female, with a pointed nose and light greenish skin, sitting off to my right, watching this changing city with me. Her right hand was on a dial that seemed to control the panorama. Turning

slightly toward me, she asked: "What else would you like?" I answered telepathically, "Well, what else have you got? I have no idea of what you can do."

She arose, walked up and touched my right forehead, warming it up. Then she used a sharp object to open up a "panel" in my right temple, releasing a tremendous pressure; this made me feel much better than I felt before, even though I realized that I'd felt fine before anyway.

Then the hallucinations became diffuse, with very busy spiraling red and yellow lines. I gradually returned to a space of warm darkness...

(Second trip) ...I felt like I was being pulled up an almost vertical shaft by two unseen forces; at the top of the shaft was a tall, tan, arched metal lattice underlying a cement arch; I heard two unisexual voices in conversation outside of the shaft. They were trying to decide how to get my stiff, rigid, board-like body through these arches and upstairs into a shopping mall. Their gentle manipulations seemed to take for-

ever and it was really sort of boring floating in the vaults all that time while the two individuals outside tried to manipulate my body by some unseen mechanism...

*(Third trip)* ... I noticed several male and female figures striding rapidly alongside me. I was walking down a gray road that curved upward to the right and they seemed to be on a sidewalk in front of me to the right of the road. A humanoid male figure turned toward me, threw his right arm toward the patchwork of bright colors, and asked: "How about this?" The kaleidoscopic patchwork immediately became brighter and started to move more rapidly. A second male figure stepped in front of the first and asked "And how about this?" He also turned toward me, threw up his right arm and the patchwork of bright colors began to swirl quite rapidly and became very bright. Then a third male figure stepped up and asked: "And how about this?" and I consciously gave permission to go to a new level of previously unknown involvement. I immediately saw a bright, yellow-white light directly in front of me. I felt relaxed, safe and enchanted and I remember giving myself the ultimate permission to "go into it." It was a quick decision -- almost instantly I was enveloped in the light and I seemed to meld and become a part of it. There were no distinctions, no figures or lines, shadows or outlines, no sense of my body or of any inside or outside. I was devoid of self, of thought, of time and space, of separateness, of ego -- of anything but the white light. I can't say that I even had a concept of "me." It was ECSTASY and pure EUPHORIA. The light and I were one, without fear, without thought or recollection of the past or of how I got there. I have no idea of how long I remained in this confluence of pure energy. There are no symbols or language that can describe that sense of pure being, oneness and ecstasy. The Gnostic concept of "There was Light, and the Light was One, and there was no Darkness or Doubt" seems to ring true to this ineffable experience.

After a timeless period (eternity) I found myself sliding backwards down a broad greyish-black ramp, with the Light on my left -- I was a naked, thin, luminescent child-like being that glowed with a warm, yellow light. My head was enlarged and my body was that of a four-year old child; I had regained a sense of

self. I somehow watched my young naked body slide down this gently inclined ramp on my left hip, with my left arm outstretched and supporting me as the numinous Light lapped out at me, then slowly receded. Although I was still feeling a tempered euphoria, I was already aware that the ecstasy was departing -- already I was forgetting its intensity and quality. The travel down the ramp seemed to take a long time, but was quite fun. I was almost dizzy with happiness...

*(Fourth trip)* ...I was presented with a warm, yellow rod that grew from my stomach upward into my face. It pushed my forehead upward several inches before the pressure resolved and the visual hallucinations started. Spirals (from brown to tan to blue-green) evolved into large bright circles and spirals which in turn evolved into two stick-like figures (like the ones that computers use to simulate athletic movements). They knew I was there, but didn't interact with me at all; they were riding stick-like bicycles around and around a large terraced structure resembling a parking garage, with me standing in its central opening. We did this for a long, long time; I kept wondering if anything else would happen; slowly the trip ended, but I can't remember how. -- **CM, NM**

### *More Entities*

I spent 18 years trying to get rid of an entity before I finally learned (from a channeler who was in many respects a charlatan) how to eliminate it. I didn't get a voice, though -- just mindless animosity and hunger directed at me. While I agree that most "channeled" info, with or without the aid of drugs, is shit, I don't think it's necessarily just "in the head" of the person who hears voices. "Schizophrenia" is an ill-defined term and a remarkably convenient label for psychiatrists to slap on someone. There are beings (as in spirits), entities (as in thoughtforms), plant powers, the rejected parts of your own self, and possibly other "things that go bump in the night," all of which one can encounter. It's not always easy to tell who or what you're talking to. I'm in total agreement however, that anything which demands subservience or worship is NOT to be trusted. -- **BD, CA**

\* Regarding the "monomania" and "domination" you experienced from a presumed LSD entity (mentioned

in Fall, 1993 issue): I've also made life-shaping changes as a direct result of acid trips and things perceived with such a vivid clarity I could not resist. (These were) not even remotely in my best interest. A recent mushroom-inspired revelation set in motion events that already affect my life. "Best interest" is dilatory, but I relish full responsibility for those decisions. -- **JM, FL**

\* What really concerned me upon reading *Who are the Plant Teachers?* (Spring, 1993), were the comments of both Maria Sabina and Apolonio Teran as to the effects upon their "plant allies" of the coming of the "foreigners" (That is *us*, guys and gals!). "If (the foreigners hadn't come) the saint children would have kept their power...From now on they won't be any good..." And: "Now the mushrooms speak English!"

It is horrifying to me that as well-meaning as we may be (I'm sure Wasson meant no harm), our very observation can be totally corrosive to their world. It may be a sort of Heisenberg Principle of ethnobotany: "the closer one observes, the more the observation disturbs the observed." As an American who has lived for much of his life outside the U.S., my perspective is that we Americans tend to be a pretty blundering and insensitive lot. We mean well, but are often quite unaware of the fact that other people live lives very different from our own. To be unaware of the great differences in perception, custom, and worldview is to often do a great deal of unwitting damage. If our presence inspires not only the aping of consumerism, but can even subvert and diminish the local gods, we should meditate upon exactly what we do and why. It may be that our best contribution to saving the rain forest and its indigenous cultures is to try to leave them alone -- or at least do everything in our power to help them preserve their traditions. Very hard, by the way, when blowguns compete with shotguns.

-- **LM, South America**

\* About meeting other entities -- the mind is very good at modeling the personality (beliefs, emotions, accents, gestures, expressions) of another person. We model ourselves, and everyone around us, to some degree. We imagine situations in which our friends interact; writers create stories about people; performers

do impressions of other people and pretend to be the personalities that playwrights have imagined.

This personality-modeling part of the mind may even be controlled from some location in the brain. Or, modeling activity might be affected by certain variations on serotonin or other neurotransmitters. Imagine a plant or drug that induces apparent inner visitations or channeling. Suppose there are one or more conscious, independent entities who can communicate with us through the mind only. To me, it is unlikely they have an intrinsically human look and personality structure. But if they use the mind to communicate, it seems likely they would use the personality modeling apparatus to be able to reach us.

One thing to explore is to develop our ability to create mental entities. One could pretend it's a spirit guide, an imaginary friend, a god, or even God Himself. Practice imagining it, giving it a personality; try to picture it and listen to it talk. Like creating a mask or an actor, a real entity or force may show through it. Of course, if you can get it to speak to you, even an entity that's purely a construct will teach you about your unconscious. But be careful not to blindly follow its advice; as Ram Dass says, just because an entity is not corporeal doesn't mean it's particularly knowledgeable or has good advice. Try to compartmentalize your mind into a foreground "believer" who totally accepts the image as real, and a background "observer" who just records and (in case your entity becomes a pest) can end the experiment.

I've been trying this for a few years, using the great Hindu god, Shiva. I haven't heard any voices, although sometimes I have a feeling of presence or comfort. Once on mushrooms I encountered what appeared to be an alien; she said she was an anthropologist from a nearby star, and looked like an ape from Planet of the Apes. I thought to myself that she was just a construct, but she replied indignantly: "I am not a construct!" We couldn't keep the contact long. I don't buy the ape suit, but beyond that, who knows?

The entheogens help this process. They seem to reduce the influence of past conditioning and allow a mental state more open to completely new concepts. By altering the perception of reality, they permit the mind to consider alternate realities, whether constructed or encountered. -- **BW, WA**

## USING ENTHEOGENS IN GROUP WORK

---

*Those cultures utilizing entheogens often do so within the context of group experiences: the peyote meetings of the Native American Church are perhaps the example most familiar to us, but some form of shared consciousness expansion is probably the norm for most traditional entheogenic practice outside of the industrialized West. With our aggressive, super-individualized values we are terrified of feeling vulnerable in front of others -- a symptom of the very alienation which characterizes our way of not--relating to each other. Not surprisingly, those mental health professionals interested in the promise of entheogens as psychiatric medicine are exploring these frontiers. The following two articles represent some of their findings out on the cutting edge of consciousness research. -- Ed.*

### *(First trip):*

**The** most important lesson came from watching ourselves and our little group move and react while on this drug (*Psilocybe cubensis*). We were confused because we weren't clear either as individuals or as a group about how to use this catalyst and spent much of our journey trying to process with one another what to do with the experience. The level of intoxication was so intense at points that we frankly were incapable of processing, specifically along the lines of using language and reasoning. Periodically, however, we would come together for brief moments to try to make sense of our voyage and direction, almost as if we were all in a small liferaft being buffeted back and forth on a stormy sea. Then all of a sudden, another wave of energy would separate us and put us in our respective seats or corners.

**At** first we toyed with the idea of going inward and attempting to travel together in our respective psychedelic inner landscapes. This is where the confusion arose, for our egos got activated and we would each try to encourage a certain direction to take. One of my friends even assumed the "trickster" role to ensure that the experience never got "too serious." At times he manifested a type of silly, demonic laughter while my friend F. appeared to be struggling to break

free from all of us to do some inner personal exploration.

**As** the intensity of the experience began to diminish, our ability to come together and "process" increased. As a group of psychologists we often abhor the almost saccharine notion of "coming together for processing," which we have found during our sober moments is like taking all the life out of something. In any event, we ended up having some very loving moments together as we began to confront in ourselves and in each other our pain and vulnerabilities. Much of the discussion centered on the heart (in the spiritual sense of heart as a centering point), and we ended the session feeling overwhelmed by all we had witnessed in ourselves and each other.

**In** retrospect, I feel we dropped the ball with respect to using this drug properly. We all joked afterwards about putting duct tape over our mouths the next time and even blindfolding ourselves so that all our energies aren't going outward. Yet I realized that what we learned together was quite valuable. We basically needed to fumble around in the dark together so that we could appreciate the greater possibilities for the future. I have been kicking myself a little bit for not anticipating the fact that our egos would get entangled. I think we were still caught up in the Ecstasy (MDMA) thinking, which is clearly more of a relational experience.

### *(Second trip):*

**We** were determined not to get caught up in each other's mental and emotional "juices." After we ingested our respective portions, we excused ourselves and walked away from our campsite. My experience was a bit of a rollercoaster ride, as I became very much caught up in an existential inner dialogue, working very hard to "figure things out." I spent a lot of time pacing around, hand stroking my chin, sucking on a cigar (I'm not a smoker, but have been enamored with smoke during these drug experiences). I had an incredible reverie that the weight of the world was on my shoulders and that I had to get my shit together, otherwise mankind would be lost. I clearly felt that I

was working through my own narcissism, sense of importance, what have you. I travelled through many "stations" during this experience, and had a close look at how one can get in touch with the interconnectedness of things, or shift into a self-referential experience which gets worrisome because one feels so incredibly *responsible* for everything.

**When** we all came together later in the afternoon, the drug having run its course, it was fascinating for us to compare notes. We each had very separate experiences. F's journey was almost entirely a dialogue with nature. He reported very little grappling with his personal psychology. K was playing/working with the notion of the "edge," whereby one can choose whether or not to go with a particular "wave" created by the drug. He was able to maintain a degree of balance whereby he wasn't swept away by personal themes. W's experience appeared to reflect more of the struggle I mentioned, although he reported specific memories and people from his past which embroiled him in a powerful struggle. Our comparing of notes served as an important alignment process for me.

I have tremendous respect for psychedelic mushrooms: one receives such powerful feedback and images about oneself, nature, community, loved ones. Taking them is a fair amount of work, though. We all felt exhausted, and aware of the fact that we are no longer in our twenties. -- TK, CA

#### **ENTHEOGENIC PSYCHOTHERAPY**

**There** is a great deal of interest in entheogens now within the therapeutic community. Much of this involves little more than giving the client the material while providing an appropriate set and setting. I have developed a more intense therapeutic technique (based directly on shamanic and energetic models) calculated to break through complexes otherwise not easily accessed.

**The** technique is a pre-agreed upon interaction within an entheogenic experience in which both client and therapist are experiencing the effects of the substance. (This is the classical shamanic model.) Participants can even take turns being client and therapist, and the technique is not limited to strictly therapeutic situations. It demands an enormous degree of

courage and honesty from both parties.

**The** two individuals approach each other until they are close to the point at which they can feel their energy fields about to touch. The therapist-shaman then approaches very slowly, maintaining eye contact, into the energy field of the client with his or her hand or body. The client is asked to monitor his or her internal experience for any sign of discomfort, withdrawal, or contraction. The key is to move very slowly into the other's space while continuously monitoring feedback for signs of discomfort.

**At** the first sign, the therapist stops, withdraws slightly, and asks for a description of the client's feelings and sensations. When both parties are cognitively and energetically aware of what the discomfort is, the therapist returns to the identified space and moves gently back and forth within it, deliberately evoking the discomfort. This usually brings up the original trauma that caused the contraction: it is the psyche's therapeutic re-experience of the causal impact in a more mature setting. Usually there is nothing for the therapist to do but be supportive of the client's process, which can happen quite rapidly under entheogens. When and if appropriate, the technique may be resumed, pressing into the next layer containing locked energy.

**The** rationale behind this technique is to activate our natural desire for interpersonal, energetic and environmental connectedness which was thwarted and warped by early trauma. When individuals repress this faculty, bodies may touch but vital energies do not interpenetrate, and may even retract from each other. This is exacerbated by our culturally brusque and superficial manners of personal interaction which tend to block out and override more subtle energetic signals: It's hard to do or feel massage in a suit of armor.

**After** working through these blocks to the sharing of energies, the participants experience the ecstasy that flows in to replace their removal. This becomes a re-definition of contact and communication--a real therapeutic for the major illness of our time: disconnectedness and alienation. It is a prerequisite for the next developmental step into the transpersonal realms as defined by Ken Wilbur: energetic connection to all of creation. -- Johnny Appleseed

## AMANITA MUSCARIA NOTES

---

*Much of the information that has been accumulated concerning mushroom toxicity is inaccurate and many mushrooms are undeservedly considered poisonous. Certain species with the general reputation in one country of being poisonous are among the prized edible species in another. Reasons for inaccuracies are many. First, species determination is often difficult, and since poisonous and prized species frequently exist in the same genus there is ample opportunity for confusion to arise among them. Secondly, some evidence suggests that toxicity varies with ecological conditions under which the mushrooms have grown and with geographical location. Thirdly, in many cases, mushrooms which are poisonous raw are rendered non-poisonous by cooking or drying...Finally, it has been observed repeatedly that some persons can eat with impunity mushrooms which provoke poisoning in others. -- Kingsbury, J.M. (1964). **Poisonous Plants of the United States and Canada**, Prentice-Hall, Englewood Cliffs, NJ, Pg. 88*

---

The three participants were A, B and C. D was the sitter. Although she had never sat or taken a psychedelic, she was a nurse, so it was felt to be safe. The (*Amanita muscaria*) mushrooms had been picked about a week before and were dried by a combination of sun, oven and fan. They were completely dry by the time they were taken. Each subject took just under half a cup of finely powdered chopped mushrooms blended with grape juice and consumed at 10:10. They all took some capsules of algae afterwards.

At 10:20 C felt nauseated. A and B went for a walk. By 10:30 A and B were feeling a little woozy, A more than B. A then lay down next to C who had just vomited and drank her emesis. C got up again to vomit at 10:40 but couldn't stand the idea of drinking it again. A is feeling definitely altered, queasy and nauseated. When his breathing was shallow he felt sicker: when he breathed deeply and slowly it was not too bad. B was moving around a lot saying if he moved he didn't feel as nauseated.

A is checking out, feeling like he is skimming an out of body experience: "so ready to leave, just about gone, just about gone." He is hearing things in the room and starting to salivate a lot. The three of them had all prayed and meditated for a few minutes before ingestion, discussing hopes, fears, feelings, most definitely a feeling of gratitude, awe, fear, reverence: the world's oldest psychedelic.

Then followed a two hour bizarre twilight state. C was out, not moving, rapid shallow breathing. (She is

generally quite hyperkinetic.) D was most worried about her. C was not sweating or drooling. A and B were occasionally twitching, with a gleam of perspiration over them and saliva pouring or dribbling rapidly out of their mouths. B was apparently less out of it and more present, wondering if he had taken enough. A did not know how much time had passed. He thought he was either awake or dreaming dreams that were totally life-like: dreamed in total awareness. He was only dimly or not at all aware of the music. They were all lying 6 to 8 feet away from 4 foot high speakers that were on very loud.

A threw off his blanket, he was both hot and sweaty and cold and chilled. According to D, none of them showed any visible chills. A was very stoned, feeling like it was unlike anything he had felt before. He said: "psychedelic is too broad-based a term: it's too all-encompassing, too much assumption that it was a psychedelic. It was as if everything was exactly the same but totally unfamiliar. But it all looked like I knew it to be." They all went outside laughing, wondering: "What's going on?" They couldn't tell if they were intoxicated or not. B didn't think so, neither did C, but A did. All he could note was the shadows of the grass and plants looked different, but in retrospect he said: "It was this world about a shade or quantum level off somehow in an eerie, profound, unmistakable way." They were ataxic and staggered. They were all quite happy. There was minimal visual phenomena occurring. They all felt quite loving toward each other

but didn't feel concerned about sharing it, unlike MD-MA. They all felt like they were in it together, but it was clearly an effort to say much more than a few clipped or short sentences. They were too intoxicated to carry on a conversation. It was as if they were all passing each other on the sea. B and C were hungry and not that intoxicated. They were all cold and hot. All three of them had gotten up off the floor at the same time sweating and drooling with mushroom stench everywhere. A had some gas and cramps. He belched and passed gas and felt better quickly, particularly after D convinced him to drink some hot miso soup and take a shower.

B and C smoked a bowl of marijuana and then they both got much more intoxicated. It appeared as if A was about thirty minutes ahead of B and C. Originally B had asked when all three arose at 1:00 PM if A wanted more. He said, "No way." Later B agreed he couldn't have had any more once he finally came on. Music was incredibly intense, maybe the most intense ever. Every note with its own rise, plateau, peak and fall, along with every melody with its component parts. A felt, then physically became each note: his body was every note. "Perfect," he said, listening to the end of a New Age tape. There was almost too much energy surging through him with the music -- he wanted to scream to release some of it. There was a feeling of predicting the future and feeling the past -- somehow the telescoping of time. His thoughts about the future appeared to be a statement about what's happening in the present, or what occurred in the past as the same. He said, "I feel the past and the future as presently true." Some future plans appeared to be automatically happening, as a matter of course.

There was an apperception of being taught: "I feel an incredibly old, earthen, Druidic, arctic-summer, Siberian tree-spirit kind of entity." It was powerful, old, wise and slow-moving: sepias and browns and pale greens: "Here I am -- can you, will you ask of me?" It seemed very patient -- the mushroom was gentle and beneficent, but too old to really empathize with: a benign fairie god; a supreme-being everywhere immovable. A felt he could put his hand through it without difficulty.

They all felt a little delirious at times. They felt that taking less would help one remember better; al-

though the experience wasn't too much, it approached that at times. They all laid down until 4:00 PM and got up feeling well. They took a fifteen minute walk, a little wobbly, with the same weird double sense of reality as normal, yet unmistakably different. By 5:30 they all felt great, hungry, able to converse, giggling a lot. They smoked some marijuana in the hot tub. All felt remarkably refreshed -- no hangover at all: energetic, calm, happy, blessed, astounded.

C verbalized something true for each of them: as soon as one observed that something was odd or stoned or trippy, it changed: turned into a flatter, less voluptuous organic experience. The mushroom did not want you to become a detached observer. It was a lucid dream, but once it became truly lucid (knowing you were in it) it was no longer a dream. It was very odd for such a powerful affect to be so subtly determined. They all slept well with no unusual dreams. The next day they all commented that their vision seemed clearer. -- **Anonymous**

\*\*\*

\* One day in the fall of 1981 I picked an armful of Fly Agaric (*Amanita muscaria*) mushrooms and dried them by hanging them over the woodstove for a day or so. Then I invited my girlfriend to participate in the experiment with me, and naive as she was, she agreed. We each placed 4-5 large dried Fly Agarics in a pint jar and poured boiling water over them to fill the jar. After half an hour, we strained off the water and drank it on empty stomachs. The first effect of the potion was the blurring of our vision. We couldn't focus our eyes. We could still walk around, but not very quickly due to the visual impairment. The second effect was cold sweats: we felt clammy and sweaty and chilly all at the same time. This combined with the blurred vision made for an unpleasant experience. That was it: blurred vision and cold sweats. It lasted about an hour or two, and I've never experimented with the Fly Agaric since. *The Entheogen Review* had a recipe in the Summer, 1993 issue for preparing Fly Agaric, but the recipe didn't say what to do with the preparation, or what effect it could be expected to create. As far as I know, that recipe is just as questionable as Gordon Wasson's praise of *Amanita muscaria*. -- **JJ, PA**

\*\*\*

\* I ate 25 grams of dried *Amanita pantherina* mush-

rooms, surprised to discover the taste not unpleasant. Within an hour and a half I felt sleepy, and a little dizzy, fell asleep for 45 minutes and woke up in a deep altered state. Very unique and "disconnected," as if I was experiencing someone else experiencing my body. I found it interesting, and felt absolutely no emotional attachments to anything or anyone -- either positive or negative. I experienced none of the somatic side effects that I'd heard about -- sweating, salivating, etc. Toward the end it became tiresome and somewhat boring. I turned on the TV and felt that somehow my thoughts were creating the transmission (along with everything else in my environment). There was still a rational part of my psyche telling me that this was a delusion, but it was the strongest delusion I've ever had on any psychedelic drug, and it produced some fear. (It also enabled me to feel more compassion for those mentally ill persons who must constantly live within a world of such delusions.) It was a worthwhile experience, but one which I feel no desire to repeat. -- CG, UT

\*\*\*

Several years ago a small group of us experimented with the *Amanita muscaria* native to the woods of Northern Vermont. We both smoked and ate the mushroom, and a few times I ingested and smoked what I considered heroic amounts. It definitely altered my state of consciousness, but not like LSD or psilocybian mushrooms. In fact, I have problems with classifying it as psychedelic, as I never had a full-blown, classic experience. Still, the *Amanita* is "fun" and under the right circumstances I experienced a good high. It is light and "heady" -- to be distinguished from say, Jamician "Ganja" which produces a "heavy body" high. In heavier doses it produced a visceral "itch" -- like being able to feel both the surface texture and interior of my bones. I'm not sure I liked the feeling, though I feel that if it were understood more fully one might be able to self-heal at a deep level. On several occasions I had intensely colorful, partly lucid dreams, so I believe the *Amanita* can stimulate REM activity. Nevertheless, I don't believe that this is the vedic "Soma" as suggested by Wasson. Indeed, we quit experimenting with it precisely because it never triggered a true psychedelic experience such as one gets from the psilocybian. -- TM, VT

## More Mushroom Matters

### *Lepiota Peele* Response

\*\* Last issue we reported that *Lepiota peelee*, reputed for years to be psychedelic, has been shown to be both mis-named and inactive. (Official identification is *Lepiota humei*.) As the newsletter went to press I received a letter from a known reliable informant who has had entheogenic experiences from ingesting the mycelium of this species:

*...I've never had any luck with ANY spores from Peele -- Lepiota, Gymnopilus, or Psilocybe. But the cultures he sent me were uncontaminated and viable, though it took some effort to get him to send them. And both the cultures of Gymnopilus spectabilis and Lepiota peelee (sic) I obtained from him were psychoactive. So I really don't think L. peelee is a hoax.*

In the July, 1993 issue of *The Mushroom Culture* (journal of the Independent Mushroom Grower's Network) an article by S.L. Peele outlines his side of the story. In brief, he suggests that the mushroom's psychoactivity probably depends upon the nutrients it is grown upon. Since there appear to be no independent scientific tests to settle the question, the matter must be left as undecided. -- Ed.

\*\*\*

### Mushroom Journals

\* I've recently had great success with growing *P. cubensis* on rice/vermiculite cakes. I'd like to see more information on entheogenic mycology. In last issue you mentioned two journals: *Mycofile* and *Mushroom the Journal*. If these publications are still active, what are their addresses? Do you know of any magic mushroom newsletters? -- JM, FL

\*\* *Mycofile* is a Canadian mushroom journal. Its address: 395 E. 40th Ave., Vancouver, B.C. Canada V5W 1M1. Unfortunately, I don't have the subscription price, nor do I have an address for *Mushroom the Journal*. (I receive many photocopies of journal articles from correspondents, but the address and subscription information is usually not on those pages.) The following useful quotation comes from the Winter 92/93 Bio-visions mushroom laboratory newsletter. Their address: P.O. Box 2767 #155, Jackson, TN 38302. -- Ed.

*You can use each jar of rye grain spawn to inoculate a cubic foot of wheat straw. Fresh wheat straw is shredded and pasteurized at optimal moisture content then packed in a plastic bag lined one-cubic-foot cardboard box ...*

*You can inoculate this material yourself without the need for a sterile environment. Open your jar of rye grain spawn, pour it into the bag of wheat straw and mix well, then poke about a dozen holes into the bag with a pencil. Put the bag of inoculated straw back into the box and pack it as level and tightly as possible by hand. Then fold over the top of the plastic bag loosely. After several days the straw, if you've distributed the rye grain well, will show signs of mycelial growth. When the straw is permeated by the mycelium, open the bag and apply the casing mix loosely and evenly over the surface of the spawn. Loosely close the plastic bag. In a few days the mycelium will grow throughout the casing layer and be ready to produce mushrooms. Decrease temperature to mid 70's F, increase ventilation (open top of bag) and maintain high humidity (drape loosely with plastic).*

-- Bio- visions newsletter.

#### *Mushroom Ayahuasca*

*Psilocybe cubensis* with *Peganum harmala* (Syrian rue) is a great mix; the *Peganum* adds some warmth and ecstasy to the experience. My wife and I use 3-6 g of dried mushrooms with 2-4 g of ground rue seeds. In Vol. 2#3 JS from OR said to use *Peganum* seeds whole, not ground. My understanding is that while the beta-carbolines are indeed oil-like in their free- base form, like other alkaloids in acidic solutions they form a salt which is soluble in water. I can certainly vouch that simmering the ground seeds in acidic water (I use 25% lemon juice) twice (for 15 and 45 minutes) does extract alkaloids. In *The Alkaloids* by Manske, Vol II page 393, there's an interesting isolation of harmine and harmaline from *Peganum harmala*, using a 60% cold vinegar solution; after filtering, they add table salt, and the harmine/harmaline acetates become chlorides and precipitate out.

**BW, WA**

#### **Botanical Access**

*The Entheogen Review* is now suffering some growing pains: Too much information, only 16 pages and a subscriber base still too small to pay the postage/printing costs of a larger publication. For now advertisements must be reduced to a "classified" format.

**The Basement Shaman** (Catalog: \$1.00)  
1312 W. Highland Ave.

Fords, NJ 08863

#### **Shulgin's Categories of Psychedelic Inebriation**

\* I haven't read Shulgin's book (**PIHKAL**) -- any chance you could reprint or paraphrase his magnitude scale so all readers know what a "plus one" or "plus three" refers to? -- **BD, CA**

\*\* Here's a brief paraphrase. See **PIHKAL**, Transform Press, Berkeley, 1991, pgs xiv-xv for complete details:

**Minus.** Baseline, or normal consciousness.

**Plus-minus.** A move off baseline, but uncertain whether it is a drug effect or just imagination.

**Plus-one.** An effect (e.g., dizziness, nausea, etc.) is noted, but not enough to determine much about the drug.

**Plus-two.** Drug effect unmistakable, its duration and nature are perceived, but one can still function normally if required by circumstances.

**Plus-three.** Maximum intensity of drug effect.

**Plus-four.** Special category for extremely numinous experiences. Usually not repeatable.

## BOOK REVIEW

*Pharmacotheon, Entheogenic Drugs, Their Plant Sources and History*, by Jonathan Ott, Natural Products Co., Kennewick, WA, 1993. 640 pp., \$40.00 Paperback, \$70.00 Clothbound. Available from: Jonathan Ott Books, PO Box 1251, Occidental, CA 95465

Hardly a week goes by that *The Entheogen Review* doesn't receive what I have come to call "the laundry list letter" -- a three-page, single-spaced catalogue of questions about every plant known to humankind that has ever had a rumor of psychoactivity attributed to it: "Is *Campsiandra laurifolia* hallucinogenic? How does one extract and use its alkaloids?" Until now, I have just pulled my hair and tried to work these questions into the newsletter wherever space allowed, but with little hope that anyone would have the answers, let alone bother to respond. There are a lot of psychotropic plants on this planet, but only limited data on their chemistry or how to use it. Even books by respected authorities often "wing it" with second and third hand references to data that may be inaccurate to begin with.

Now comes what I consider to be the ultimate entheogenic plant reference work: *Pharmacotheon*, by Jonathan Ott: one of the scholars who helped coin the word Entheogen itself. This is the *magnum opus* of a man whose life work has been the study of these botanicals. Here between two covers, distilled into 640 pages of ten and eight-point type, is the accumulated wisdom and lore of just about everything science knows about entheogenic plants. The bibliography alone runs to 121 pages, and while many of those references are now extremely rare, at least we know they exist somewhere.

*It is my sincere wish that this book contribute to an objective reappraisal of entheogenic drugs and their place in the modern world ... I firmly believe that contemporary spiritual use of entheogenic drugs is one of humankind's brightest hopes for overcoming the ecological crisis with which we threaten the biosphere and jeopardize our own survival, for Homo sapiens is close to the list of endangered species. We need to recapture the mysterium tremendum of the unio mystica, the millennial awe our ancestors felt in the divine presence, in the sublime majesty of our marvelous universe..."*

-- Jonathan Ott, *Pharmacotheon*

If you are only casually interested in the subject, you will probably be intimidated by the thoroughness and scholarship of this book. Ott is the ultimate scientific scholar -- but much better than that, he makes no apologies about being a *passionate* scientific scholar! Some of his footnotes go on for pages -- not as dry pedantry, but as fascinating, opinionated, educational, in-depth mini-treatises on subjects as diverse as the gestapo-like drug experiments done on mental patients in the fifties, to the true identity of the Soma of the Aryans.

What may be interpreted by some as hair-splitting querulousness I prefer to regard as the *courage* to call a spade a spade down to the tenth decimal place -- this man has done his homework! There is so much mythology and pure BS in the field of entheogenic plants that it is wonderful to come across a work dedicated to setting it straight -- probably an impossible task, but at least this book comes closer than any other I've seen and will remain the standard of comparison for decades to come.

Quite simply, if you are truly interested in entheogenic plants, this book is an absolute must. (Go for the clothbound edition -- it will become a bibliophile's collector's item.) Anyone who sends me another "laundry list letter" I'll refer to *Pharmacotheon* for their answers. If it's not in there, it's probably not anywhere.

-- Jim DeKorne

# NETWORK FEEDBACK

---

## *Khat Question*

\* I seek more information about *Catha edulis* (Khat) now being schedule-1. When did this happen, and exactly which part is schedule-1? I am concerned that if some of the other entheogens receive media attention they too will become illegal. -- TT, NJ

\*\* I don't have the answers to your Khat questions -- the information was sent to me by a correspondent without further details. Apparently, like San Pedro, it is not illegal to cultivate the living plant, but if you ingest any of it you could get into trouble. From the way things seem to be shaping up, the DEA will soon be put in the position of having to schedule half the plants on the planet. The system is about to break down under its own faulty, fear-based premises. -- Ed.

## *Ayahuasca Matters*

I have been frustrated at the lack of a complete, tested ayahuasca analog formula. I recently purchased 40 grams of *P. viridis* leaves and I have some *P. harmala* seeds. I have yet to find a concise recipe so I can use them. I noted the *harmala* extraction procedure in Vol. #1, but am in the dark as to how to extract the *Psychotria*. 40 grams of leaves is not very much, so I don't want to use them until I can be confident I've got a formula that will work. (Try the extraction formula on pg. 11, Vol. 1, #2 of *The Entheogen Review*. See also the *Entities* article in Vol 2, #1. --Ed) I recently attended a traditional ayahuasca ceremony. The experience was not very memorable. The brew seemed to be almost entirely *B. caapi* and hardly any *Psychotria viridis*. There was a little closed eye imagery for the first hour and then nothing but a very heavy narcotic feeling for the remaining five hours. It was frustrating because I had high hopes for some interesting journeying and what I got was this woozy, lethargic stupor which I could not do anything with. My spirit felt trapped behind a wall of stupefaction. So now I know what a high dose B. carboline effect is like, and I know it ain't worth doing

alone without a DMT admixture. This shaman has been taking ayahuasca for 30 years. I wonder if he actually prefers it this way or if he leaves out most of the (DMT-containing botanicals) when he comes to the U.S. so as not to give us Westerners too intense an experience. All I know is I paid \$260.00 for two nights of trying to stay awake and glean what little inspiration I could out of the experience. -- RW, OR

\*\* Unfortunately, your story isn't unusual, even for those who have taken ayahuasca in the Amazon. Much depends upon the plants used, their condition, who mixes them and how they are mixed. The word "ayahuasca" itself is very imprecise --in theory it can refer to the *Banisteriopsis caapi* plant alone as well as any number of admixtures of that plant with other botanicals: from *Brugmansias* ("tree daturas") through numerous DMT-containing species to even tobacco; plants found in some mixtures have yet to be scientifically identified. In addition, there seems to be a wide range of individual responses to the brew, with some people getting off while others feel nothing. Also be aware that since more and more "ayahuasca seminars" are being offered in the U.S. these days, and since the most psychoactive constituent of the brew (DMT) is schedule-1, it shouldn't be surprising that some people suspect that half of the mixture may be missing -- without any DMT in it, "ayahuasca" is legal, and the seminar promoters are not at risk. --Ed.

## *Holotropic Breathwork*

\* In response to CK of PA's question in last issue about drugless access to hyperspace, there are numerous ways to alter consciousness without drugs. Most of these techniques are very ancient and are still in use today throughout the world. These range from chanting, music and ecstatic dancing to fasting, physical exertion and painful ordeals. I have found dancing to rave music in a crowded bar to be extreme. Another promising method is Stanislav Grof's "Holotropic Breathwork" which appears to be a new twist on the

old methods of hyperventilation and evocative music.

--MS, PA

\*\* I took a Holotropic Breathwork seminar two years ago and can vouch for its effectiveness. It demands a bit of effort, and the group setting plus music undoubtedly contributes to its power, but it is surprisingly "psychedelic." -- Ed.

### *Baby Woodrose Seeds*

\* ...I can attest that the method of grinding and soaking in naphtha, then discarding the naphtha and performing a second extraction with methyl alcohol and letting it evaporate to collect the yellowish residue is an effective method of extracting the lysergic acid amides. Two capsules of this residue was very active. Recently I soaked 15 ground Hawaiian baby woodrose seeds in water with 25% lemon juice. Two days later I strained out the solids. The resulting brew, while unpleasant to drink and hold down, produced a substantial experience... **Uncontrolled Entheogens:** Several potentially valuable entheogens are still legal in the U.S. Namely: 5-MeO-DMT, DPT, harmaline and harmine. They should be available from suppliers here or perhaps Canada, Great Britain, etc. They should be used with discretion to avoid scheduling by the DEA. If you have information about sources of these still legal materials, I would be grateful. **TB, NE**

\*\* Harmine/harmaline are easily extracted from Syrian Rue seeds. 5-MeO-DMT is available in the form of Sonoran Desert Toad venom. Unfortunately, this species has already been listed as endangered in New Mexico, and it probably couldn't survive a wave of sudden popularity: I consider toad venom an ethically dubious trip, and despite its reputation, not all that entheogenic. I am totally unfamiliar with DPT. All of these substances are probably available in their pure chemical forms, but I don't know the sources. --Ed.

### *Justica Pectoralis*

\* *J. pectoralis* var. *stenophylla* is an aromatic herb with a scent like tarragon. It is easy to grow and propagate in the tropics. I was hoping that it would be useful combined with *P. harmala* as an ayahuasca analog. Do you know of anyone who has experi-

mented with this combination? I am unsure of the concentration of tryptamine alkaloids in its leaves -- two conservative experiments using it with *P.*

*harmala* yielded little effect. Any data on its use as a snuff? ER readers might try experimenting with how it would do in northern climates and brought in for the winter. -- **BM, USVI**

\*\* I quote from Jonathan Ott's new book, *Pharmacatheon* regarding *Justica pectoralis* var. *stenophylla*: "Although preliminary tests indicated the presence of DMT (Schultes and Holmstedt 1968), later studies failed to confirm this, and extracts proved to be inactive in animal experiments..." (Pg. 410) -- Ed.

### *Internet*

\* It would be useful if *The Entheogen Review* got *Internet* access and maintained an off-line database of plants, their properties, etc. in a form that subscribers could access. They should be able to contribute anonymous or signed encrypted articles (PGP) also. You at *least* should have a fax! (*Internet* is cheaper and more reliable.) It would help if you got a PC and Page-maker or some such publishing software -- it would help a lot. If you want, I could put all articles on a database on my computer in Switzerland and you could have subscribers access via my e-mail address. It makes no difference to any subscriber world-wide where the database is. It is equally accessible. -- **DW, Switzerland**

\*\* Sigh! I'm sure you have a point. Alas, I am thoroughly intimidated by all this computer networking stuff, being hopelessly stuck in the old-fashioned print-media era. While it might be useful to some subscribers to be able to access *The Entheogen Review* by computer, my personal feeling is that the information and ideas provided are best approached in the old-fashioned way. What ideas in these pages are so pressing that one must access them electronically? This is probably just my resistance to change in combination with a life-long telephone phobia. How about it readers? Give me some feedback on this question. -- Ed.

***Simplified Extraction For San Pedro***

\* JG's *Trichocereus* preparation (Fall '93) can be simplified. It's possible to skip the repeated freezing and thawing and just chop and blend the stem into a frothy slime (low speed) with water. One can also skip drying the slime and rehydrating; just simmer in a crock-pot -- the sliminess dissipates -- strain after a few hours, then filter to remove the small particles so you can simmer it down to a drinkable quantity. It might be worth boiling the solids again with fresh water for a more complete extraction. Finally, a sweetener such as fructose might make the resultant brew more drinkable. -- **BD, CA**

\*I absolutely have to reject JG of CA's San Pedro preparation as a lot of unnecessary work, although the end product is OK.

Over 15 years' experience in preparing San Pedro, I've arrived at the following simplified procedure: Slice the cactus into quarter-inch sections and dehydrate them. (This can be as simple as arranging them on screens inside of a car or van parked in the summer sunlight.) When completely dry each "San Pedro star" should snap in two like a potato chip. Wearing leather gloves, crumble them up, put the pieces into a blender and reduce it all to powder. (I don't even bother to remove the small spines.) This may be stored in jars indefinitely with no loss in potency. One ounce of this powder blenderized in plain water is (for me) a good dose. Probably the reason the Indians boil San Pedro is because they have no access to dehydrators and blenders. So get with it and do it the American way! --**B. Green**

\*\* Different people have different dose responses. One ounce of San Pedro is 28.35 grams, which might be too low for some people. According to Hatter's guidelines in the Summer '93 issue, San Pedro is about one-third less potent than Peyote by weight. Using "27 dry grams of peyote equals 300 mg of mescaline" as a reference point, 100 dry grams (or approx. 3 oz) of San Pedro should result in an equivalent experience. Individual users, of course, will have to determine what dosage works best for them. I wonder if one can

add anything to the final brew to make it taste better!  
-- **Ed.**

***Drug Interaction Alert***

\* I am taking a medication called "Wellbutrin" and wonder if it is safe for me to ingest ayahuasca or smoke DMT. -- **DC, KS**

\*\* Wellbutrin (bupropion) is an anti-depressant, not chemically related to the tricyclics or MAO inhibitors.

It is most related chemically to diethylpropion (Tenuate), an appetite suppressant and stimulant. Its structure is phenethylamine-like. It does not inhibit MAO function. It is a weak uptake inhibitor of serotonin and norepinephrine, and has dopamine re-uptake blockade effects, too. It has stimulant effects in lower animals:

i.e., increased locomotor activity, and stereotypic behavior (i.e., repetitive, purposeless behavior, like one sees in high-dose amphetamine psychosis). It causes seizures in 10x the recommended human dose in dogs and rodents. In animals, acute toxicity of bupropion is increased with MAO inhibitors. The main risk with this drug is that of seizures in humans at doses over 450 mg. It used to be prescribed at up to 600 mg but many seizures were reported. The use of bupropion with MAO inhibitors is contraindicated, because of the risk of severe hypertension and/or neuropsychiatric toxicity. Thus, one might assume that tryptamine/indole hallucinogens' effects might be lessened because of "downregulation" of serotonin sites with chronic treatment. One should be careful using things like psilocybin or DMT. That is, start off with little doses to assess drug-drug interactions. I would not take it with ayahuasca because of the MAO inhibiting effects of the B-carbolines in it. Also, I would avoid phenethylamine compounds: mescaline, DOI, 2-CB, DOB, MDMA, and the like. And, probably, I would avoid smokable tryptamines, because of their tendency to elevate blood pressure anyway.

-- **Dr. Know**

***A Word to the Wise***  
Information soon to be made public will almost certainly result in the DEA putting *Salvia divinorum* on the schedule-1 list, so get it while you can. There's far more to this plant than meets the eye. -- **Ed.**

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 3, NO. 1: Vernal Equinox 1994**

ISSN 1066-1913 Copyright © 1994, All Rights Reserved Subscription: \$20.00/Year, \$25.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

## *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W94 means that the Winter, 1994 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can only pay for submissions by extending your subscription, and though I often have to edit for brevity, please keep those fascinating letters coming in.

-- Jim DeKorne

## SMOKABLE DMT FROM PLANTS, PART II

---

---

The following is a clarification and update of the *Smokable DMT from Plants* article appearing in the Winter Solstice, 1993 issue of *The Entheogen Review*, in which alkaloid extractions made from *Phalaris arundinacea* were described and discussed:

*Phalaris arundinacea* (Reed Canarygrass) is a species of grass which has worldwide importance as a forage crop. (Some species in the *Phalaris* genus got their name "canarygrass" because their seeds are often used in commercial birdfood mixtures.) Although we reported that *P. arundinacea* "varieties" *Aquatica* and *Tuberosa* have been found to contain high percentages of DMT and 5-MeO-DMT, further research indicates that *Phalaris aquatica* is a separate species in itself and is *not* a variety of *P. arundinacea*. In addition, *P. aquatica* and *P. tuberosa* are the same species, *tuberosa* being the older, now obsolete name. (Often the literature is unclear about these matters, suggesting that botanists themselves haven't yet agreed about which is which.) Although this causes some confusion, it should be stated that both *P. arundinacea* and *P. aquatica* contain tryptamine alkaloids, although potency can vary widely.

It is difficult for amateurs to identify these grasses, particularly when they are immature, since positive identification seems to be dependent upon the characteristics of the seed head when the plant is fully developed. At any rate, to the uninitiated, these botanicals look just like orchard grass. This feature, plus the commercial importance of *Phalaris* as animal fodder, not to mention the fact that only certain varieties have

high alkaloidal content, should make it difficult for the DEA to schedule this plant, let alone be able to enforce it effectively. Two *P. arundinacea* varieties known to be potent are: "Turkey Red" and "Yugoslavian Fresh Cut." (Extractions from a mixture of these two varieties were tested in the Winter issue.)

It is my understanding that the

"variegated" variety of *P. arundinacea* is inactive.

It appears that the alkaloid mentioned in the Winter '93 article in *ER* may be 5-MeO-DMT rather than DMT. This tentative conclusion is deduced from the fact that the smoked extract does not seem to produce the entity contact phenomenon--at least not very often. Instead, one gets an extremely intense whirlwind of light:

*When smoked, DMT produces a very rapid, intense intoxication of short duration that is marked by vivid visual imagery...By contrast, smoking of pure 5-MeO-DMT, a more potent tryptamine, produces an overwhelmingly powerful experience that can be unnerving. One*

*user describes inhaling 5-MeO-DMT vapor as "a rocket ship into the Void." Another comments: "If most hallucinogens, including LSD, merely distort reality, however bizarrely, 5-MeO-DMT completely dissolves reality as we know it, leaving neither hallucinations nor anyone to watch them. The experience need not be negative, but it is not for the novice." 1.*

Increased heart rate is also typical and therefore

*Phalaris aquatica* L.

*these extractions must never be smoked by anyone with high blood pressure or any kind of heart condition.* A sample of the extraction has been sent to a laboratory in Switzerland for analysis, but to date no response has been received. It is hoped that we'll get an answer before the next issue goes to press. Significantly, 5-MeO-DMT is not scheduled by the DEA. (Most people will probably find it too intense for it to ever become popular as a drug of abuse.)

Extraction of the alkaloids is not difficult, but it *must* be done properly. There are many formulas, most based upon the fact that DMT is not soluble in water, but is soluble in aqueous acids and, after basification, in organic solvents. Here's a formula from Australia:

*(Plant material was extracted by repeated maceration with methanol. The extract was concentrated, an equal volume of dilute sulphuric acid added, and after filtration the filtrate was made basic with ammonia. Extraction with chloroform gave a crude alkaloid solution. The alkaloid was extracted back into dilute sulphuric acid, the acid fraction basified with ammonia, and extracted with chloroform. The chloroform was evaporated off to give the alkaloid...It was purified from coloured material by elution with 2% methanol/ benzine from a column packed with neutral alumina. A crystalline fraction was obtained. 2*

"Elution" means to "wash out," a technique used in chromatography in which pure compounds are differentiated by their molecular weight. (See the article elsewhere in this issue on a simplified chromatography

procedure.)

One of the most important points from the Winter '93 article seems to have been missed by many readers: that point is that smokable DMT or 5-MeO-DMT is easily extracted from *any* botanical which contains these molecules. *Psychotria viridis* leaves, as well as *Desmanthus illinoensis* roots are obvious possibilities here.

**NETWORK FEED-BACK ON PHALARIS:**

All this talk about DMT grasses! The best grasses I have seen are *Phalaris tuberosa* (sic) strains. The concentration varies from strain to strain. See *Phytochemistry* (1972), Vol. 11, pp 2767-2773; and *Nature*, Mar 4 (1967), Pg. 946. How one obtains them, I don't know. Perhaps some Australians will read

this article and help out with information about how to buy these strains.

- Commonwealth Intro. No. -- abbreviated CPI here.
- CPI 14279 -- originating from Greece.
- CPI 19344 -- originating from Portugal.
- CPI 14419 -- originating from Portugal.

These have approximately 75% of total alkaloids as DMT. No B-carbolines, no bufotenin. A large percent

of the other alkaloids is 5-MeO-DMT.

Regarding DMT extractions. My extractions produce a large middle layer of emulsion. It takes a week or so for the solvent to depart from this layer. After evaporating the skimmed-off solvent a small amount of clear oil remains. After mixing the oil with powdered unextracted material, I stored it in a refrigerator. I extracted four doses worth. I tried smoking a dose, with no effect. I continued smoking until (within 30-45 minutes) used up all the material -- to no effect. As I said, the oil and solvent were clear. According to the article in Winter '92 ER (Pg 12), the solvent layer should turn color. Do you have any idea of where I went wrong? Can the pH of the mixture get too alkaline so that decomposition occurs? -- *Virta-whirla, OR*

\*\*\*

How can you tell the difference between varieties of *Phalaris*? I've been to the University library and found *P. arundinacea* but no mention of *aquatica* or *tuberosa* varieties. I tried a methanol extraction with some *Phalaris* purchased through a mailorder plant service with disappointing results. There was some psychoactivity (plus-one) that peaked within fifteen minutes. -- *CG, UT*

#### Commentary by Johnny Appleseed:

*P. aquatica* is a tufted perennial primarily grown in Australia. It spreads weakly from rhizomes. It grows about 1 foot high, has a light green color, and the seed head is compact. During summer it grows very slowly.

*P. arundinacea* is a strong sod-forming perennial growing wild in the Northern two-thirds of the U.S. and in most other temperate countries. It spreads strongly from vigorous rhizomes, and likes water, often being found along streams and irrigation ditches. It has wide, coarse, dark-colored leaves growing several feet high, and a coarse seed stalk that shoots up to 5 feet high. The seed head is a loose cylindrical cluster from 3-6 inches long.

I prefer to work with *P. arundinacea* for several reasons. Much more is known about its genetics and there are many more varieties that have been tested. When I have extracted alkaloids from *P. aquatica*, they are not as great in quantity. Also the *P. arundinacea* grows much more vigorously, and thus gives you much more foliage to start with. *P.*

*aquatica* is also not very winter hardy, and it does not survive well farther north. It is known to have bufotenine (5-hydroxy-DMT), which is not good to ingest. I have not seen bufotenine listed as a constituent of *P. arundinacea*.

CPI numbers stand for: Commonwealth Plant Introduction numbers in the Commonwealth countries. These are similar to the American PI (Plant Identification) numbers in this country that can be used to access the U.S. Department of Agriculture germplasm repository. I don't know how to access CPI numbers. It is much easier to get a PI number.

As to the failure to extract alkaloids, I don't know what to say. If alkaloids are being extracted, they should not be in an "oil" form. Sounds like the wrong variety of *Phalaris*? -- *JA*

#### Tantric Tryptamines

We are interested in your idea of creating a "working structure" for using the newly discovered botanical sources of smokable DMT. Potentially, an entirely new class of shamanic drugs has been made available. Because DMT is found in the human spinal fluid and pineal gland, it occurred to us that perhaps it naturally plays some role in regulating the chakra system. My wife and I have engaged in tantric sexual practice for several years--a meditation that concentrates on the mutual energy flow within the cerebro--spinal system. To test our hypothesis that DMT might play some role in this system, we simultaneously smoked some *Phalaris* DMT while in tantric union. We were amazed to discover that the "flash" was markedly different, and manifested not so much in the head as in the genital chakra. In a later experiment, I found that it can also release its energy through the heart chakra--this "opening" was so intense as to be on the edge of physical pain. The most surprising finding is the difference between the typically terrifying response when experienced in the head vs. the equally intense but qualitatively different response felt in the lower chakras while engaged in tantric union with a partner. We do not know why we experience this difference, and have not had enough time yet to explore the phenomenon in greater detail. We offer this information in the spirit of scientific inquiry, and hope that others will experiment with it and share their findings.

-- *Shiva and Shakti, CA*

## SOME QUOTES ABOUT PHALARIS SPECIES

### REED CANARYGRASS (*Phalaris arundinacea* L)

*Phalaris*: an old Greek name for a grass.

*Phalaris*: A genus of about twenty species, these distributed in the temperate regions of the world. Of the nine species in the United States, four have been introduced from Europe. Most of our species occur in moist situations on disturbed soils and are more or less weedy. *Phalaris arundinacea*, reed canary grass, is a valuable hay grass in the northern midwestern states...(and is) found in marshes and moist places, New Brunswick to Alaska, south throughout the United States except in the southeast; Eurasia. An important lowland hay grass from Wisconsin to Montana.

Gould, F. W., *Grasses of Southwestern United States*, University of Arizona Press, Pg 260

At least nine alkaloids, grouped as either phenole, indoles or B-carbolines, have been found in reed canarygrass ... Genotypes completely free of alkaloids are not known, but the variations in alkaloid concentration within groups of plants treated uniformly are shown to be very wide (Marten 1974)... It is very difficult to explain the presence of skewed distribution in this material without knowing exactly the function of alkaloids in reed canarygrass. The skewed distributions exist in all populations, independent of the origin, or whether the populations have been exposed to selection or not ... Assuming normal distribution and if natural selection has been going on by means of grazing, a selection towards higher alkaloid levels should be expected.

Two of the alkaloids found in reed canarygrass (DMT and 5-MeO-DMT) have been claimed to be responsible for two diseases in sheep and cattle grazing *Phalaris aquatica* L. (= *P. tuberosa* L.) in Australia. One of these diseases, "Phalaris staggers", causes chronic disorder of the central nervous system. The other disease is "sudden death," characterized by sudden collapse, ventricular fibrillation and cardiac arrest (Gallagher et al. 1964; Oram 1970) ... Parenteral administration of these two tryptamines has proved them toxic to both ruminants and non-ruminants (Marten 1974), though it has also been indicated that these dis-

orders are very likely not caused by indole alkaloids alone.

Alkaloid concentration in reed canarygrass is enhanced by moisture stress (Marten 1973), by decreasing light intensity and by high rates of N fertilizer, especially NH<sub>4</sub>-N source (Frelich and Marten 1972). Cutting reed canarygrass every second week produced a sharp increase in indole alkaloid levels as compared with levels in free growth tissue (Woods and Clark 1971). Alkaloid concentration is greatly reduced in dried grass (Donker et al. 1976) and in silage (Hovin et al. 1980).

Alkaloids in reed canarygrass are confined largely to the leave blades (Marten 1973) ... Hagman et al. (1975) stated that the upper third of the total herbage had the highest and most uniform alkaloid concentration as compared with the middle and lower thirds. High correlation ( $r = 0.94$  to  $0.98$ ) between alkaloid concentrations in the upper third and in the total herbage enabled them to recommend sampling only the upper third of herbage canopies for routine alkaloid screening of reed canarygrass...

Liv Ostrem (1987). "Studies on genetic variation in reed canarygrass, *Phalaris arundinaceae* L.," Fureneset Research Station, The Norwegian State Agricultural Research Stations, Norway, *Hereditas* 107

HARDINGGRASS, *Phalaris tuberosa* (sic) var. *stenoptera*, a cool season perennial, is grown in the Southwest and in southern California under irrigation in forage mixtures for hay and pasture...

BULB CANARYGRASS, *Phalaris tuberosa* (sic), is a perennial extensively grown in Australia... It is necessary there to add cobalt to the soil or to the animal diet when *Phalaris toxicity* is encountered with sheep or cattle grazing this species.

Hughes, H. D., et al (1961) *Forages -- The Science of Grassland Agriculture, 2nd ed.* Iowa State Univ. Press, Ames, IA, pg. 250

Plants of *Phalaris aquatica* L. (syn. *P. tuberosa* L.) "Stenoptera" grown from seed have widely varying differences in their concentrations of N,N-dimethyltryptamine and N,N-dimethyl-5-methoxytryptamine. Although some variation was anticipated, the magnitude of the differences was be-

yond expectation and in sharp contrast to the indolealkylamine content of plants propagated vegetatively. It is suggested that the variation noted may have important ecological implications with reference to *Phalaris* toxicity.

Rendig, V.V., et al, Variation in Indolealkylamine Content of Individual *Phalaris aquatica* L. plants, *Crop Science*, Vol. 10, Nov. Dec. 1970

#### 5-MeO-DMT AND SHEEP

5-MeO-DMT, one of the more potent indolealkylamine hallucinogens (Gessner et al., 1961), is a constituent of plants used by South American Indians as hallucinogens in mysticoreligious ceremonies (Pachter et al., 1959), and of the Australian grass *Phalaris tuberosa* (sic), (Gallagher et al., 1964). Sheep grazing on this grass sometimes suddenly collapse and die, or develop a more chronic syndrome, phalaris staggers, of motor incoordination, convulsive spasms, nodding of the head, and dilation of the pupils (Gallagher et al., 1964).

Sheep are particularly sensitive to 5-MeO-DMT, 0.1 mg/kg injected into the jugular vein producing an intense syndrome. Similar symptoms are also induced in sheep by somewhat larger doses of bufotenin and DMT, also major constituents of *Phalaris tuberosa* (sic), (Gallagher et al., 1964). 5-MeO-DMT is also highly toxic to guinea pigs, rats, and mice.

Gallagher, C.H., Koch, J.H., Moore, R.M., and Steel, J.D. (1964). "Toxicity of *Phalaris tuberosa* (sic) for sheep," *Nature*, Vol. 204, 542-545

#### RECREATIONAL AND SACRAMENTAL USE OF 5-MeO-DMT

...Yes, it was coming on; accelerating through space, through time and things beyond things which can't be written with the mundane tool of human language... If you get high enough to see visual effects, your head will be in such a bizarre place, that the hallucinations will seem trivial...

It is not a trip that I can *take* such as I would take a trip with LSD, peyote, or mushrooms, it is a trip which unequivocally *takes me* ... I was humbled and awed by the terrifying glory of it all. Terrifying? I was scared shitless with no place to shit ... Can we ants, who call ourselves human, presume to know any-

thing about the capabilities of God or what he has in store for us? ... I was aware that relatively few people could or would want to experience this thing, and I counted it a privelege that I had been able to do so ... It is unquestionably a humbling experience ... but not one I'm eager to do repeatedly. I suppose I'll do it again, but I'm in no great hurry. Perhaps next year. A little goes a long, long time.

Del Williamson-- *The Psychozoic Press* #10, Summer, 1985

## THOMAS LYTTLE INTERVIEW

---

---

Thomas Lyttle, editor and publisher of *Psychedelic Monographs and Essays*, is one of a small minority of intrepid souls who had the courage to keep the psychedelic torch burning during the darkness of the "Just Say No" era. Over these years, Tom assembled data, wrote articles and made contacts from all over the world. From time to time *The Entheogen Review* will print excerpts of this man's considerable knowledge.

---

---

**ER:** What libraries, private collections, databases and on-line services are available to researchers, archivists and historians of psychedelia? (If we ever make it into the 21st Century, the fact that this stuff was preserved and cataloged will be of immense value.)

**TL:** I will begin by mentioning the excellent archival on-line database run by Dr. Samorini of the University of Rovereto in Italy. This library contains thousands of papers on Entheogenic topics. Order the "codex" which lists all the papers by category with numbers of listings. (The file on *ergot* for example, holds hundreds of citations.) A lot of important papers are in English and they even maintain a "psychedelics only" botanical garden. (Contact: Dr. Samorini, Via Rivabella 9, 40100 Bologna, Italy. Send a \$7.00 US. money order; foreign dispersal office forms are available at any Post Office -- P.O. will convert the M.O. to the equivalent denomination of foreign currency.) Or how about the most important botanical database in the U.S. -- **Napralert**. This is run by the department of Medical Chemistry at the University of Chicago. This database holds 90,000 botanical papers from the global literature and 800 articles are added each month! This is a fundamental source for any serious botanical/entheogen search. It can be accessed through any PC with a modem for a fee. Information is free if accessed through a public or academic library. (Contact: **Napralert**, 833 South Wood St., Chicago, IL 60612.)

Our own **PHD** (Papers from the History of Drugs) is David Goldstein's phenomenal library -- the archival life-work of several researchers in one huge collection. For example, Dr. Harry Hermone, the *Cannabis* researcher (with Michael Aldrich et al), dumped his

forty years of library obsession into the **PHD**. These and others result in a catalog listing 12,000 articles in hardcopy going back to 1860. Categories include such esoterica as: "Psychoactive honeys," "Ether drinking," "Poison-dart frogs," etc. There are over 700 citations for mushrooms alone, with 170 on the anti-tumor effects of *Shitaake*. (Contact: David Goldstein, 530-D Grand St., #8A, NY, NY 10002. \$7.00 for this list.) Another source is the Drug Abuse catalog from **University Microfilms** -- this contains thousands of doctoral dissertations going back to 1890. For example, how about Michael Aldrich's PhD dissertation: *Cannabis Myths and Folklore* (State Univ. of NY, 1970). Or: *Psychedelic Literature*, Joan Duffer (PhD dissertation, Univ. Miami, 1975). Or: *The Appraisal of the Hallucinogenic Drugs from the Standpoint of a Personal Agapaic Ethic*, J. Provonsha (PhD dissertation, Claremont Grad. School, 1967). And so on, by the thousands. They send catalogs in the areas of psychology, botany and religion -- here is where a lot of the gold is buried. Original, obscure scientific studies re: hallucinogenic botanicals. (Contact: **University Microfilms**, Box 1764, Ann Arbor, MI 48106. 1-800-521-3042 )

A European counterpart to University Microfilms is **Inist Diffusion**. It covers thousands of dissertations in Europe and abroad in both English and foreign language editions. (Contact: **Inist Diffusion**, 2 Allez Du Parc de Brabois, F-545-14 Vandouivre-Les, Nancy Cedex, France.)

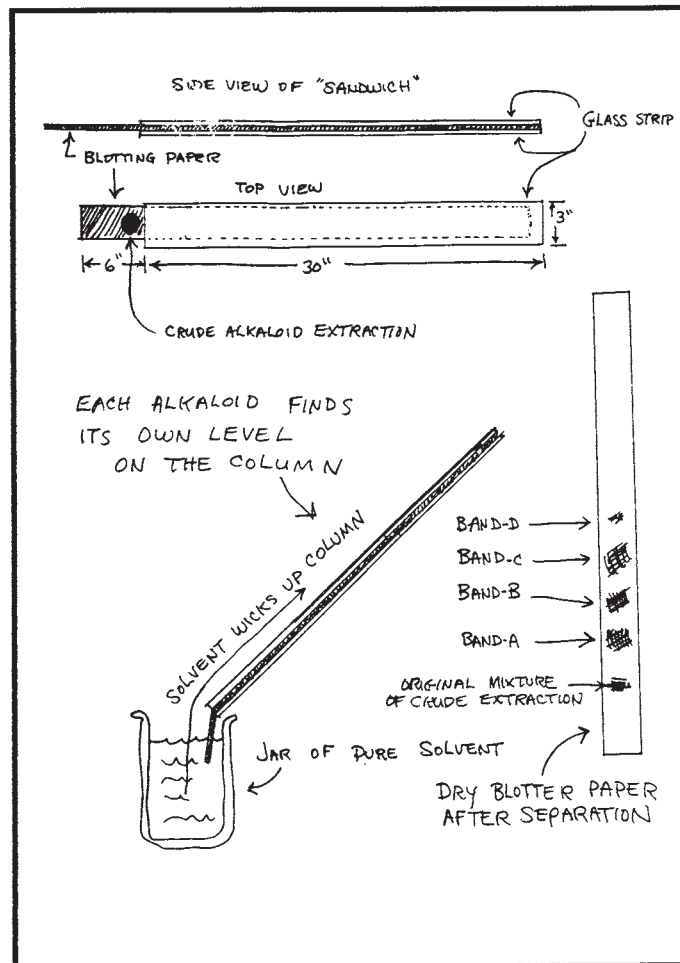

This is only a *very small* sampling of important, seminal sources for data on the history and current science of what the Japanese call: *Tajen Meru* (Over-Mind Medicines). -- **Thomas Lyttle**

## SIMPLIFIED COLUMN CHROMATOGRAPY

The main problem with boiling psychoactive plants with acid for long periods of time is that there is a danger of destroying the alkaloids. Psychoactive alkaloids are not particularly stable compounds and must be handled with care to avoid creating toxic byproducts. In addition, the crude tea used by shamans usually contains noxious admixtures. Extracts of pure alkaloids are less nauseous, more predictable and require lower doses for better effect.

In my opinion, the best method of extraction is to use trichloroethylene (TRIKE: dry cleaning solvent) on the crushed raw plant material. This will extract all the alkaloids as well as the fatty material. TRIKE and other dry cleaning solvents such as methylene chloride are readily available without causing suspicion. (The logical reason for buying these industrial solvents is that you spilled some oil on your carpet and you want to soak it out. Another reason is that you want to use it as paint thinner.) Purchase Industrial Grade, by the gallon. You can find solvent suppliers in the Yellow Pages under Cleaning Supplies or Chemical Supplies. Just phone and ask if they supply Industrial Grade trichloroethylene or methylene chloride.

**STEP 1:** Crush the plant material, cover with solvent in a closable container and shake periodically over 24 hours. Filter material and set the solvent aside. Repeat this procedure several times with fresh solvent until its dilute color suggests that most of the alkaloids have been extracted. Discard the plant residue,

combine all the filtered solvent fractions and allow this to evaporate until all that remains is a goo about the consistency of thin maple syrup. This is a crude mixture of alkaloids.

(The following steps are to separate the entheogenic alkaloids from the toxic/nausea-producing alkaloids. The most effective way of doing this is by means of column chromatography. Use TRIKE or methylene chloride as the chromatography solvent.)

**STEP 2:** Obtain two strips of glass, 30" x 3"-- these should be fairly thick (between 3/16" and 1/4"). You will be using them many

times, so get the glass merchant to smooth the edges and corners.

**STEP 3:** Obtain some thick white blotting paper, such as the type used for desk pads. It comes in sheets measuring 36" wide. Cut a strip of blotting paper 36" X 2 1/2."

**STEP 4:** Lay the blotting paper on one of the strips of

glass so that one end protrudes by 6." Pour the alkaloidal syrup onto this protruding piece of blotting paper about an inch from the edge of the glass. The goo should not extend the full width of the blotting paper, so leave about 1/2" on either side. Wait for the syrup to soak into the blotter.

**STEP 5:** Lay the other strip of glass on top of the first so that it forms a sandwich with the blotting paper in the middle. Firmly secure the sandwich with thick rubber bands or bulldog clips. This is the chromatography column.

**STEP 6:** Prop the chromatography column securely at about a 45 degree angle, and insert two-inches of protruding blotter paper into a jar of *pure* solvent. *Never immerse the syrup portion and never use a mixture of solvents or you won't get a clean separation.*

**STEP 7:** As the solvent soaks into the blotter, it will wash through the syrup and wick it up the column, where it stratifies into bands of color. Every band represents a pure compound. Depending upon its molecular weight, each alkaloid finds its own level at a different location on the column. Use a black light to identify any bands that are not colored. Many alkaloids fluoresce under black (ultra-violet) light though they may otherwise be invisible.

**STEP 8:** Once there is complete separation, remove the column from the solvent jar, then remove the glass strips. Hang up the blotting paper to dry.

**STEP 9:** When dried, mark the location of each band with a pencil: band A, band B, band C, etc. This is important because when you repeat the procedure (with the same plant species) each band will appear in exactly the same order on the column. You have now separated the goo into pure alkaloids. Cut out the bands with scissors and test them for psychoactivity. Only try a small amount at a time, and gradually increase the dosage. *Remember that these are now pure substances and you have not destroyed anything by boiling, so their potency may be an order of magnitude greater than expected.*

**STEP 10:** After ingesting portions of the various bands, you will know what each effect is. Suppose band A produces only nausea: you will not use that band in the future and will simply discard it. Suppose band B produces a strong entheogenic effect: you will always choose that band for your entheogenic rituals. Suppose band C produces a slight entheogenic effect: you may want to try some of that in combination with band B to see if it enhances the effect.

**STEP 11:** If you intend to store the pure alkaloids, you should stabilize them with tartaric acid (Cream of Tartar.) Get this from the drugstore or supermarket. Prepare a saturated solution in water in a spray bottle and simply spray a little of it onto the strip of blotting paper containing the alkaloid, until it is lightly soaked. Let it dry and then store it. Don't use too much tartaric acid: just enough to lightly soak the paper.

Keep comprehensive notes of your experiments and catalog the effects produced by different plants, including which bands produced which effect and in what order the bands came in. Share your findings with *The Entheogen Review*. Hopefully we will eventually compile a series of references for each plant species, so that trial and error may be eliminated. -- *Solaris*

# REVIEW

---

---

*The Entheogen Law Reporter*, P.O. Box 73481, Davis, CA 95617- 3481, Published quarterly: \$25.00/year, \$30.00 outside U.S., Richard Glen Boire, editor. **Internet:** RGBoire@ACO.COM. Make checks payable to Richard Glen Boire. Sample copy: \$2.00 plus .29 postage.)

---

---

For any Americans seriously interested in entheogens and their right to ingest them, this newsletter is an absolute must. Published by the author of *Marijuana Law, A Comprehensive Legal Manual*, Richard Glen Boire is a practicing defense attorney specializing in the study of our surrealistic drug statutes. (In addition to that, he is obviously a fellow citizen deeply concerned about the erosion of our Constitutional rights.) This newsletter keeps you current on all of the latest and most significant permutations in this area, including the most up-to-date DEA scheduling of "illegal" plants. In Vol. 1, No. 1, Winter, 1993, one finds:

\*An up-to-date listing of the Schedule 1 hallucinogens.

\*Entheogens outlawed in 1993, Plus a 2-CB alert.

\*Selected 1993 court cases concerning entheogens. (Both Federal and State court decisions are reviewed.)

#### STATEMENT OF PURPOSE

*Since time immemorial, mankind has made use of entheogenic substances as powerful tools for achieving religious insight and understanding. In the 20th century, however, these most powerful of religious and epistemological tools were declared illegal and their users decreed criminals. It is the purpose of this journal to provide the latest information and commentary on the intersection of entheogenic substances and the law...*

#### INTEREST NOTE:

*On October 30, 1987, when the DEA first proposed placing cathinone into Schedule 1 an individual requested a hearing if the placement of cathinone into Schedule 1 would affect his religious use of a number of psychoactive substances. Unfortunately, because the comment was not filed in a timely manner and the request for a hearing was not made in accordance with the procedures set forth in 21 CFR1308.45, the request was denied...*

*The DEA has a pattern of refusing to follow the recommendation of its own Administrative Law Judge. ...The ALJ recommended that marijuana be made available by prescription. Despite the ALJ's ruling,*

*the DEA has simply ignored the findings and recommendation and refuses to move marijuana out of Schedule 1. There is currently a lawsuit underway in an attempt to force the DEA to abide by the ALJ's ruling, and a decision in that suit should be forthcoming very soon.*

#### COPYRIGHT AND LICENSE:

*...The Entheogen Law Reporter hereby licenses and encourages readers to photocopy, quote, or reprint all or part of the articles contained herein, provided that credit is given to The Entheogen Law Reporter and that our address is included...*

*COMMENT: In U.S. v. Daniel (C.A.5 Miss. 1993) 982 F.2d 146 the "drug package profile" is revealed to include the following factors: size and shape of package, taping to seal all openings, handwritten mailing labels, whether the return addressee name matches return addressee's address, unusual odors coming from package, whether to or from city is a drug source city, and whether there have been repeated mailings between two people. (See also "drug package profile" discussion in U.S. v. Lux (1990) 905 F.2d 1379.)*

If you plan on ingesting *any* entheogen any time soon, you owe it to your education and continued freedom to be aware of what Big Brother is doing in this area. At \$25.00 a year, it's the most valuable synthesis of legal information on this subject that you can buy anywhere. "Don't leave home without it!"

## NETWORK FEEDBACK

---

### *SALVIA DIVINORUM*

I have had very good luck with Peace Seeds (A Planetary Gene Pool Resource and Service: Dr. Alan Kapuler, 2385 SE Thomson St., Corvallis, OR 97333 -- catalog: 60 pgs, \$4.00) in terms of low prices, high quality and fast service. I mention this because they have *Salvia divinorum*. It is definitely a "shareware" plant, since it grows so fast and is so easy to clone. ---  
*Anon. PA*

### MAO-A AND MAO-B

There are two classes of MAO: MAO-A and MAO-B. Most MAO inhibitors are unselective and inhibit both types A and B. MAO-A inhibitors are the ones that cause the problems with tyramine from fermented foods, etc. MAO-B inhibitors don't cause these dangerous food reactions -- they slow down the metabolism of neurotransmitters. Deprenyl is a MAO-B inhibitor and therefore doesn't cause hypertensive reactions from eating certain foods. My question is: will Deprenyl, or any MAO-B inhibitor, potentiate the effects of orally ingested tryptamines? If so, we may have a safer and better MAO inhibitor which has positive non-entheogenic properties as well. Also, I read in several sources that Piracetam may increase the effects of psychotropics. Does anyone have any more information about this? -- *TB, NE*

### *ACORUS CALAMUS*

I have tried chewing sweetflag (*Acorus calamus*) several times, but find it completely impossible to ingest more than an inch of the root. I've also tried tea, with no luck. This plant is abundant, and would be impossible to outlaw. Has anyone out there had any success with it, and if so, is there any process by which it may be made palatable? Also, I'd be interested to know dosages in terms of weight instead of length. --  
*GW, VT*

[It is my understanding that the claimed psychoactivity of this plant is another psychedelic myth -- at least as regards the North American variety of Sweetflag. I know of no one who has gotten off on it. The European variety may be psychoactive. -- Ed.]

### *JUSTICA PECTORALIS*

I bought a *J. pectoralis* plant... pruned it over the course of six weeks or so, and saved the leaves. I had read that it might contain tryptamines and that it was used as a snuff in South America. I crushed the leaves to a fine powder and laid out two fairly large lines. I quickly snorted them. Instantly I fell to the floor, not because of a DMT flash but because of the pain. It felt like roman candles in my sinuses. At first I thought there might be some psychoactivity but I soon realized that the "altered state" was merely a reaction to the searing pain in my nose, sinuses and ears. I can laugh about it now, but I feel the need to warn those of you out there contemplating this to think again. My sinuses did not clear up, and the pain did not leave for about ten days. -- *CG, UT*

### *CATHA EDULIS, PART 1*

*Catha edulis* is now a Schedule 1 plant, like marijuana. Which is to say: one should not have it on one's premises if a visit from your local polizia is anticipated. At first, l-cathinone, the active ingredient in Khat, was scheduled, after it was found to have "amphetamine-like" effects in lower animals. As does caffeine. But, since amphetamines are "highly abuseable," and as l-cathinone has "no medical utility," it was put into Schedule 1. Of course, who has looked at medical utility? And now, the plant, too, is scheduled, this happening some months after the pure chemical was so placed. -- *Dr. Know*

### *CATHA EDULIS, PART 2*

Effective February 16, 1993, the DEA placed cathinone (the major psychoactive constituent in khat) in Schedule 1. In the DEA's words:

*"Enactment of this rule results in the placement of any material which contains cathinone into Schedule 1. When khat contains cathinone, khat is a Schedule 1 substance. During either the maturation or the decomposition of the plant material, cathinone is converted to cathine, a Schedule IV substance. In a previously published final rule, the Administrator stated that khat will subject to the same Schedule IV controls as cathine, (see 53 FR 17459, May 17,*

1988). *When khat does not contain cathinone, but does contain cathine, khat is a Schedule IV substance.*"

In the same Rule, and effective the same date, the DEA also placed 2,5-dimethoxy-4-ethylamphetamine (DOET) into Schedule I. I don't know anything about the chemical end of these things, so I don't know of DOET is another constituent of khat, or just why it was also scheduled in the same rule.

I've been thinking a lot lately about the problem of possessing legal plants from which illegal substances can be extracted. I am of the opinion that just because the DEA schedules a particular *substance*, it does not necessarily follow that any *plant* containing that substance is also thereby scheduled. The language in the above rule is the party line of the DEA, which evidences its (the DEA's) belief that Khat, when it contains cathinone, is a Schedule I substance. I think it is debatable whether that is, in fact, true. I'm trying to find the time to figure this one out -- will send you the outcome of my research as soon as it's together.

-- Defense Attorney

#### MUSHROOM THE JOURNAL

Here's the address for *Mushroom, The Journal of Wild Mushrooming*: 861 Harold St., Moscow ID 83843. This quarterly costs only \$16.00 per year and has a very impressive editorial advisory board. *RP, NY*

#### MORE ON PEELE'S LEPIOTA

I bought at least three sporeprints of this mushroom from Peele, but could not germinate any of them under conditions where I had easy success with other spores. So I ordered a live culture of this *Lepiota* from him. A first culture arrived dead, and it took Mr. Peele two years to send me a second one. These produced 2-3 inch diameter carpophores which were tested by two experts in doses up to 40 g (fresh weight) per 75 kg body weight. This is 5 or 6 average sized plus a few small ones. They produced no effects whatsoever. If anybody still claims they have a psychoactive *Lepiota*, I challenge them to provide spores and/or tissue culture for verification. I am willing to trade or buy. Since I would appreciate feedback, please publish my full name, address and fax number.

**Wolf Dieter Aichberger, A-4211 Alberndorf, Berbersdorff 17, Austria FAX: ++43. 7235. 7489**

#### PROPER AYAHUASCA MIXTURE

I am eager to experiment with ayahuasca, and proceeding with caution. I understand that the extract from three grams of Syrian Rue is adequate, but do not know the proper dosage for DMT. Is it harmful if the ayahuasca contains too much DMT? -- *TA, CO*

[The recommended ratios of *pure chemical compounds* are: 1.5 mg harmine/harmaline per kg of body weight, and .5 mg DMT per kg of body weight. That's 102/34 for a 150 pound individual. When working with relatively impure plant extracts, it is difficult to make estimates, since everything depends upon the alkaloid content of the plant source. (In the case of *Phalaris* DMT, for example, a given plant may contain nothing at all.) Typical dosages from Syrian Rue (*Peganum harmala*) are one gram of the *extract*. (It takes about 3 grams of seed to make one gram of extract.) *Phalaris* extraction dosages are in the 50-60 mg range. (If the grass extract is potent, 60 mg should be a very adequate dose.) It is my understanding that neither harmala nor DMT extracts are *physically* dangerous substances in reasonable doses and though they may make you nauseous there is a very wide margin of safety. *Psychologically* however, the higher end dosages can be extremely challenging. See below. -- *Ed.*]

\*\*\*

I have conducted a few ayahuasca experiments in the last few years: two with *Peganum harmala* plus *Desmanthus illinoensis* and one using *Banisteriopsis caapi* and *Psychotria viridis*. The latter was simply devastating. I advise readers using *P. viridis* leaves that no more than 20 dried grams is necessary, and that's pushing it; maybe 10 grams is a good starting dose. I use the same cooking technique I described in the Spring, 1993 *ER*. This is a powerful brew that should be approached with caution and respect. Was it worth the trouble? Damn right it was! To paraphrase Neitzche: "Remember, when you look long into the abyss, it looks into you!" I rather enjoyed being looked back at. -- *CG, VA*

#### MAOIS AND LSD

I read that LSD is used as an ayahuasca additive in underground psychotherapy. Although LSD possesses characteristics of tryptamines, it also displays some phenethylamine characteristics. The latter are not rec-

ommended for use with MAOIs. Is it really safe to combine MAOIs with LSD? How long do harmala alkaloids inhibit MAO?

*Psilocybe cubensis* mycelial tissue produces psilocybin/ psilocin from introduced tryptamine. Would DMT-producing plants biosynthesize higher proportions of their alkaloids if fed tryptamine? Tryptamine is supposedly very inexpensive. Where can one purchase it? -- *RS, CA*

#### SIGMA CHEMICAL CO.

When Ott quotes the prices of some compounds in *Pharmacotheon* -- like harmine or harmaline -- he is getting his prices from the Sigma Chemical Company catalog. (Sigma Chemical Co., P.O. Box 14508, St. Louis, MO 63178-9916) They don't sell to individuals, only businesses and schools. -- *RW,OR*

#### TOAD VENOM

In the Winter '93 issue you said: "I consider toad venom an ethically dubious trip." I assume you mean because the toad must die -- in fact, it doesn't. The "venom" can be milked: squeezed from its glands like a zit, then dried on glass and smoked. The toad may be released, bruised probably, but definitely alive. -- *SM, AZ*

[I'm aware that the Sonoran Desert toad (*Bufo alvarius*) needn't be killed to extract its venom. I kept four of them for a while in a terrarium and became quite attached to them as pets. I consider it an "ethically dubious trip" because in extracting the venom one creates a lot of fear and stress in a fellow creature. I stopped doing it because (to me) it felt like cruelty to animals. If one *must* do it, it's more humane to put the toad in a refrigerator for an hour before milking it--this induces a state of semi-hibernation, and the extraction process then seems much less stressful to the animal. After another hour at room temperature, the toad is back to normal. Several readers have sent me the recent AP story about the big "toad bust" in California, in which a couple faces criminal drug charges for possession of a few *Bufo alvarius* toads. A friend has suggested that this trend must ultimately result in Mother Nature Herself being put on Schedule I, at which time we will all be incarcerated in shopping malls for the rest of our lives. How about it, fellow patriots -- is this what our Founding Fathers had in mind for America? -- *Ed.*]

#### TOADS II

I received a call from a toad fancier who said he heard Shulgin vaporized the venom and it didn't contain much 5-MeO-DMT. He was expecting 15%. To me that means that most is being lost thru pyrolysis of the salt. It would make sense to convert it to a free base. An ideal method of vaporizing the free base would be to get one of those \$4.00 glue guns and put it on a light dimmer to reduce the temperature inside the unit. The design is clever, because it is a low temperature tube furnace with a silicone rubber mouthpiece. -- *Anon, PA*

#### WORMWOOD

I am curious if readers have any experience with extracting thujone from Wormwood. Here is a quotation from *Rodale's Illustrated Encyclopedia of Herbs* (Kowachi and Hylton, eds., Rodale Press, Emmaus, PA, 1987):

*"The active principle of wormwood (Artemisia absinthium) is thujone, which in large amounts is a convulsant poison and narcotic. Citing striking similarities between thujone and THC, scientists have speculated that thujone produces its mind-altering effects by reacting with the same receptor sites in the brain as those which interact with THC."*

-- *MR, TX*

#### ENTITY MESSAGES

While camping at a hot springs near Gaviota, Calif., a passing stranger gave me some mushrooms. I ate them and went to the beginning of time and watched the earth grow and develop. Things slowed down and a very old Indian came to me, singing "Hey-Yakamo, Hey-hey-Yakamo." Then a giant waterbird stood before me and said: "I will protect my people from their enemies." I saw many tribes of people pass, walking toward the ocean and singing, "Hey-hey-Yakamo." They shed tears of blood, each tear representing someone who had died since the European invasion of their land. The huge bird flapped its wings and a great wind came up and the bird's wings darkened the sky. Then everything went dark and I was alone. My search since then has been for the meaning of the song, but then sometimes I'm frightened that I might know the meaning and also that I must do something. I wanted to share this with you. -- *PL, OR*

### PLANT MEDITATION

Here is a quote sent in from USENET:

*Have you ever tried meditating with plants while you are tripping? Some months ago I made several tests with different plants, and was quite astonished when I found out that I could actively speak" with the plants on mental, telepathic level. The plants got so wild about it that they started MOVING and making some kind of cracking (like when a wooden stick is broken) noises. The best results were achieved with a Dieffenbachia picta, the large-leaved one which grows straight up. During one night it showed me the way of its life cycle which sped up growing and one leave dying, it was quite incredible. Nowadays I consider it being my good friend by the window. The only thing to get into it is a little meditation or some nitrous for us hasty people, which tunes you down to the lower vibe level of the plants. Lower vibes, but what happens when you get to the upper level? Go find out, and meet you in hexa-space... JJ, Finland*

### SHOULD WE GO ON-LINE?

As far as going on the Internet, or taking *The Entheogen Review* on-line, I would strongly advise against it. The level of debate on-line is often amazingly banal -- any bozo with a modem calls up and has to put in his two cents. Anyone who wants to explore the frustrating world of on-line drug debate should go to one of the already established, well-developed services -- i.e., The Well, or Alt. Drugs faq. Some of the information in ER is simply too "hot" for these kinds of on-line conference. In other words, going on-line could bring all kinds of public exposure that ER doesn't need. -- KH, AZ

[Letters ran two to one against going on-line: the above response is typical. I intend to get a fax machine when I can afford a good one, so you'll eventually be able to write to ER that way. -- Ed.]

### XEROX EXCHANGE

Readers send me some fairly obscure but amazing reprints of articles of interest to the network. Here are a few:

Morthland, John, "Button Pushers -- Along the border: a group of Texans are harvesting and selling a hallucinatory drug -- and it's perfectly legal," *Texas Monthly*, July, 1988, Pg. 100. (Article describes

DEA-authorized peyote harvest for Native American Church.)

Anonymous, "An Excursion to Peyote Land," *Cactus and Succulent Journal*, Vol. 33, #4 Jul-Aug 1961

Harmon, James E., "The Persecuted Peyote," *Cactus and Succulent Journal*, Vol. 29, (sic) #6 Nov-Dec 1961

Katz, Sylvan, "Roses are Black, Violets are Green," *New Scientist*, 6 January, 1990 Pg. 66. (Article on "bio-hackers," showing how easy it is to alter plant genetics -- this in reference to "Gene splicing for mescaline production?" in Fall, 1993 ER.)

Wolfman, Claudia, et al, "Possible anxiolytic effects of Chrysin, a central benzodiazepine receptor ligand isolated from *Passiflora coerulea*," *Pharmacology Biochemistry and Behavior*, Vol. 47, pp. 1-4, 1994. (Possible Valium-like tranquilizer found in the Purple Passionflower.)

Fay, Michael F., "Conservation of rare and endangered plants using in vitro methods," *In Vitro Cell. Dev. Biol.* 28P: 1-4, Jan. 1992 (Cloning plants via tissue culture.)

Clayton, Phillip W., et al., "Micropropagation of members of the cactaceae subtribe cactinae," *J. Amer. Soc. Hort. Sci.* 115 (2):337-343, 1990 (Starting new cactus plants by rooting auxillary shoots.)

### NEWSLETTER QUESTIONS

Although *The Entheogen Review* has become more pretty to look at lately, it has also become shorter. Summer, '93 was thirty-seven pages long. Although the production quality was poor, the volume was complete. I am not a psychiatrist, nor am I interested in species such as *Amanita* or *Datura*. I am interested in finding out about such enigmatic plants as *Mirabilis m.*, *Salvia d.*, *Corypantha m.*, and other cacti. The Dona Anna cactus is widely reported, yet I've never heard a user's report. How many subscribers are there? Is ER limited to 16 pages now? -- JB, TX

### AN EDITORIAL RESPONSE

[In terms of content, the newsletter is limited both by the correspondence I receive and my own ability to dig up information. I try to find a fair balance between my own enthusiasms and those of the subscribers. (Some people will be irritated by the space I've given to *Phalaris* grass, but in my opinion this "new" plant species is of major importance.) Many plants are said

to be entheogenic, but so far I've been unable to get any *hard* data on them. I probably read the same sources that you do, but if no one sends me a report, I have no way of knowing if the plant is indeed psychoactive. There are a *lot* of people out there who know more than they are telling: I guess they're afraid that publicity might put their favorite plants on Schedule 1. Many are angered and threatened by *ER's* openness. My position is that accurate information should be made available and let the consequences create their own reality. In terms of the Police State repression of entheogens, things couldn't get much worse than they are already, so *let it all hang out!* (In the Sixties we called this "maximizing the contradictions" and I honestly consider it my patriotic duty to responsibly protest against this sort of tyranny. "When freedom is outlawed, only outlaws will be free.") As of this writing, the mailing list is 255 -- a respectable number for a newsletter that can't afford to advertise except by classifieds plus a little help from my friends. It pays its own way now, but I still work for nothing. Though I have *reams* of fascinating data and could easily double the content, more than 16 pages just isn't affordable without a larger subscriber base. Each issue I spend days agonizing over what to include and what to cut out. I'd love it if someone would write a critique for *The Whole Earth Review* or similar magazine: 1000 sophisticated subscribers would turn *ER* into a great publication. - Ed.]

#### USEFUL GADGETS

I'd like to recommend the "Pump 'n Seal," a gadget that allows the owner to create a vacuum in ordinary glass jars and plastic zip-loc baggies, *protecting their contents from loss of potency*. Its cost is \$29.95 + \$7.95 for S&H (\$37.90 total). It can be ordered by calling 1-800-759-5233, or by writing: USA DIRECT, 6250 Ridgewood Rd., St. Cloud, MN 56395.

#### Space Needle, WA

#### DATURA DATA -- BE CAREFUL!

Asthmador (a withdrawn asthma medicine) was available into the early 1970's and I experimented extensively with it. Its chemical content was identical to *Datura* and it was very dangerous with a *very* critical dose threshold. One-half teaspoon orally has little effect; one level teaspoon produces a peak experience and a rounded teaspoon creates full-blown totally out--

of-control insanity. The dose threshold varies with each individual.

I am convinced that this product propelled me into the dream realm. Using it at night created vivid visions of friends who were probably dreaming at the time, as well as visions of various other discarnate entities. I intend to reinitiate my experiments in a more scholarly vein: there is a distinct possibility that *Datura*, properly used, could be a valuable adjunct to Harner--method journeying. Following are some guidelines for those who wish to experiment -- Extreme caution is advised!

1. Find an area where a large number of *Datura stramonium* (no substitutes) are growing together in *identical* soil, moisture and light conditions. Harvest several double handfuls of *leaves only* for each experimenter. Take notes, especially on the *stage* of the plant's age, as indicated by flower and seed pod development.
2. Dry the leaves thoroughly per standard herbal methods.
3. Reduce to a fine powder. Start with a pinch orally. NEVER, NEVER, NEVER take a second serving within 48 hours. Gradually increase the quantity, doubling at first. I recommend spacing experiments at a minimum of one week apart (Note: you may not be able to function at your place of employment the next day.)
4. Keep careful records! As soon as you achieve a serving size that gives *any* physical effects *whatsoever* limit additional increases to 20% of the previous. This is serious advice. For any experiments that continue to increase the serving size, be DAMN SURE you have TWO chaparones *per experimenter*. (There is no way to overemphasize this: I was once on a third floor balcony and "saw" a staircase that was not there.) Stay at ground level and away from bodies of water.
5. Once you obtain an experience that a psychologist would classify as hallucinatory, *cut back* and get some additional experience before you intensify the journey. When you gather additional herb the next year, pick under identical conditions to the previous year, or you must start your experiments from scratch, due to probable quantitative alkaloid differences. Be careful, and good luck. -- JW, MD

## ENTHEOGENS AND FREEDOM OF RELIGION

*"I think that we should be men first, and subjects afterward. It is not desirable to cultivate a respect for the law, so much as for the right." --Henry David Thoreau -- On the Duty of Civil Disobedience*

---

A few weeks ago, the Religious Freedom Restoration Act ruled that the religious use of entheogenic plant substances is legal. This ruling means that we have the legal right to use entheogens for religious purposes, without fear of reprisals from the DEA. In order to consolidate our new legal rights, we should form a church that specifically defines our intentions and incorporates this new ruling. This should be done by an attorney who would conform everything to the new law. Members would be required to pay legal fees and all other expenses. Members of the network could then become members of the church and would be able to use entheogens legally. This would be a major step forward and I urge you to consider it seriously. It would not only legitimize our rights but would give us the power to exclude people who were merely interested in drug abuse. What we should aim for is an elite group of people who are prepared to treat entheogens with the sacred respect they deserve.

-- SB, OR

\*\*\*

We expect all enlightened people to recognize that the medicine belongs to no one race or religion, but must be stewarded by those it heals. Our by-laws and Peyote itself prohibit us from endorsing a church which makes race a condition of membership. Anyone who has taken a psychedelic knows a book or a building is not required to have a religious experience, but (in our case) the government dictates what is an accepted and bonafide religion. The government requires presentation of a systematized structure of belief and practice. How many churches have to go to the United States government to obtain their sacrament or even their right to exist? -- *Peyote Way Church of God*, Star Rt. 1, Box 7X, Willcox, AZ 85643

\*\*\*

I am a man with strong beliefs in freedom of religion. I am not a radical or an anarchist, nor do I subscribe to New Age thoughts. I am not anti-government or anti-law. I could be described most accurately as a well-off conservative Christian. I have seen and survived the

drug scene in America, and have been dramatically influenced by several entheogens. I believe it is our right, guaranteed by the Constitution, to grow and use entheogens religiously. This is why I have decided to announce the formation of the Church of the North American Shamans. All we seek is the right to grow and use entheogens in the practice of religion without fear of persecution or prosecution. For more information, send a SASE (business size) to: PO Box 26777, Austin, TX 78755-0777. -- **JB, TX**

\*\*\*

President Clinton, on Nov. 16, 1993, signed into law the Religious Freedom Restoration Act of 1993. The Act is basically the Legislative and Executive branches of the Federal government telling the Judicial branch to pull its collective head out of its collective rear end, and give freedom of religion the protection it deserves. Unfortunately, the whole thing is, to my mind, a political maneuver without any monumental effect. The restoration of the compelling government interest test does very little to protect religious users of controlled substances, because when the test was in play before, the courts almost unanimously held that government has a "compelling interest" in enforcing the state and federal anti-drug laws, and that this interest justifies whatever burden may fall on the shoulders of those people using controlled substances for religious purposes...

The by-laws of the Peyote Way Church of God are a good starting point for any potential entheogen using church, and show what a headache it is to set something like this up. There are also a fairly large number of published court decisions which when read and cross-referenced could be used to identify the courts' concerns in this area and carefully draft the church's by-laws so that these concerns are addressed...(Unfortunately) when drugs are involved most courts will employ whatever machinations they need to employ in order to find their way around the Constitution.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 3, NO. 2: Summer Solstice, 1994**

ISSN 1066-1913 Copyright © 1994, All Rights Reserved Subscription: \$20.00/Year, \$25.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a lawmaker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W94 means that the Winter, 1994 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can't afford to pay for submissions yet, and unfortunately I often have to edit for brevity, but please keep those fascinating letters coming in.

-- Jim DeKorne

# INNER VOICES

---

*Other than the surface wordy aspect of ourselves, most people have only a glimmering of what goes on in their heads... Nightly we dream several dreams that are marvelously accurate representations of one's life. Most are forgotten. Few can make use of dreams that are recalled...We seem mostly unconscious, like wordy fools, barely able to remember what we have said, and with almost no idea how words themselves arise.*

— Wilson Van Dusen, *The Natural Depth in Man*

---

**Many** years ago I undertook the task of recording as many of my dreams as possible. To accomplish this, I went to bed with a tape recorder microphone on the pillow next to me. I soon trained myself to speak into the mike virtually every time I had a dream, without fully waking myself up. I was amazed at the material I obtained in this manner -- often having no memory at all of what my somnolent nocturnal voice was telling me from the tape.

In addition to hundreds of dreams, I also captured what seemed to be disembodied voices in this nightly net; these were phrases or sentence fragments which were experienced as totally "other" -- the utterances of spirits, for lack of a better hypothesis. They didn't actually speak onto the tape, but they spoke into my head and then I recorded what I'd "heard." Most of the time the phrases made no sense, and were unrelated to anything I could identify with in either my waking or dreaming reality. Often they had a Zen Koan-like quality. Here are some typical examples:

*"Of Roman nations, the more better and exact are the worst."*

*"Hermes: in which all my cloud is suspended in the cage of the king."*

*"For 50 years they touched the teeth; then for 50 years the teeth touched the years."*

*"Bell was born almost a fortnight ago, and his sister was born 3 weeks later."* (A quantum concept of time here!)

*"The everflow concept is the sea and the land feeding each other."*

*"People are afraid flying saucers might become legal in Ohio."*

*"All sloughs in the delta eventually interconnect."*

One characteristic I soon recognized was the voices' tendency toward poetic expression -- alliteration and

euphony being very common. Here are some representative examples:

*"For now say no to all options for action."*

*"Men have gone bonkers over bananas from Chapmans."*

*"Manticizing the mystery of oriental panoply."*

Here is a complete "poem" recorded in 1984:

*"Outside tigers do not pounce*

*From tree to tree,*

*But leave regal tracks*

*In the morning grass."*

Occasionally, the content of the voices did make sense, though this was fairly rare. Here is an otherworld comment about rationalization -- at the time it was recorded this was very appropriate to my life situation:

*"Reasoned excuse is not evidence for repudiation of the emotional intent of the law."*

Later, when I was trying very hard to make some kind of structured sense out of my nightly images (and being highly frustrated at my inability to do so) I received this disturbing and strangely numinous message:

*"The organizational chart makes it impossible to communicate with headquarters from the field."*

Perhaps the most interesting series of messages came within a few weeks of each other, and were all related to my newfound interest in Tantric theory:

*"A woman isn't an object, she's a component."*

*"The cerebro-spinal system is the crack between the worlds."*

*"Metaphysical areas of the anatomy."*

I haven't recorded my dreams and inner voices for many years now, but recently had an opportunity to experiment with some laudanum. While dozing on this sedative it was quite easy to pick up these bits of unconscious palaver:

*"You could hear the paint in a cheap child's voice: crying."*

*"Get your teeth and tiny real close together."*

*"And if the dye be coming in without any dim to prove it..."*

Apparently this sort of speech is going on continuously within all of us -- it only requires a bit of discipline to capture it. (One of the biggest problems is the tendency to tell yourself that you'll remember it in the morning, so there's "no need to record it now" -- after all, "you need your sleep." I have lost some very amazing things in just this way.) Psychologists tend to view these phenomena as some kind of pathology -- after all, schizophrenics channel this sort of thing all the time. I submit that we are ignoring some very interesting data about the nature of consciousness by not taking these dissociated messages more seriously.

-- Jim DeKorne

---

---

## ENTITIES

---

---

One night I awoke from sleep about 2:00 AM in a kind of LSD flashback. Very high, I arose to go to the bathroom, weeping at the profound mystery of what was happening. When I returned I became aware of two celestial beings in the room. I could only see their "auras," which weren't radiant, but more like water without any surface gloss and with a subtle, transparent blue vein slowly moving through it. They made no attempt to move toward or away from me. I returned to bed where I could see them about ten feet away. They seemed to be engaged in some kind of dialogue, and I sensed no reason to be afraid. After a few minutes I stopped crying and a little after that they disappeared. Soon thereafter, the LSD-like state of consciousness faded. When I returned to sleep I had a vivid astral travelling experience.

-- PH, NM

\*\*\*

The "testing of the spirits" should follow the basic age-old rule to beware of "deals." Beware of trading for the soul, promises of immortality or riches, etc. Also beware of accidentally manifesting a spirit out of your mental energies. Tibetan sources repeatedly insist that it is possible to create a being which is then difficult to control and more difficult to dispose of. Ano-

ther matter is confusion between the words "evoke" and "invoke." Evoke means "cause to appear;" invoke means "bring within," which can be rather dangerous. The *spirits* know the difference -- be sure that *you* know as well. The Aztecs, Mayans, Tim Leary, etc. failed because they wrongly assessed their situation. It is *your problem to remain informed and pay attention. The gods have their own karma to worry about and are not, or will not, be bothered about trivial details such as your immediate safety.*

-- JM, MD

\*\*\*

I've never had experience with voices, though I work with schizophrenics who hear them. I find the Tibetan cosmology very useful for perspective: the deities exist in our minds, not apart from them, and express themselves through our personalities. The point of spiritual practice is to purify one's motives and feelings enough that one expresses the gods and not one's selfish personality. The lamas I study with say that not all voices and sources of clairvoyance are benevolent, and some may supply us with valid information just to bring us into their power. They recommend Vajayana Buddhist practices called "ngondro"; then, if you're still hearing voices and having clairvoyant experiences, you can assume they're OK. Ngondro is sophisticated, subtle, and incredibly gruelling: a fit shamanic initiation. A friend of mine commented: "Even if you don't believe in it, it works." The lamas I work with don't have any problem with my use of entheogens, and I find that the chanting I do as part of my practice is a good "standard procedure" against which to measure the effectiveness of various entheogens. It takes deep connection to a chant/mantra to stay with it during a plus- three drug experience! For a while our group format was to ingest LSD and then do our chanting together while it came on. This would be followed by an hour or two of silence -- the bardo of dissolution and white light -- the breathing of the silence setting the tone for the rest of the night. These sessions had two basic components -- quasi-Ramakrishna pronouncements by one member of the group and intense work on the personal psychologies of the other members, including me. I had many intense emotional and intellectual experiences, but only one truly cosmic trip out of dozens of sessions: an out-of-body sense of being everyone in the room. -- MH, VT

# EXTRACTION FEEDBACK

---

## PSILOCYBIN EXTRACTION

The following formula came off the Internet, and describes a fast and extremely simple extraction procedure for psilocybin mushrooms. The result is a whitish-grey crystalline substance which may even be smoked for a mild DMT-like experience. I don't know about its keeping qualities, but it would seem to be a useful way to concentrate a large mushroom harvest.:

**Date:** 8/31/92

**From:** Anonymous

**Subject:** Extracting alkaloids from Psilocybe

This is taken from the classic volume (in French) and based on that used by Albert Hofmann. *Le Genre Panaeolus: Essai taxinomique et physiologique* par Gyorgy Miklos OLA'H, Laboratoire de Cryptogamie du Museum National D'Histoire Naturelle 12, rue de Buffon, Paris. Memoire hors-series No. 10, 1970, Pg. 97:

1. Dry the mushrooms...
2. Crush or grind the dried carpophores or mycelium to a powder.
3. Shake and allow to stand thirty minutes in chloroform. Use twice the dry weight in solvents at every step, or enough to well cover the powder.
4. Filter and discard the chloroform.
5. Shake the residue and allow to stand with acetone.
6. Filter and discard the acetone.
7. Shake residue and allow to stand with methanol.
8. Filter.
9. Repeat 7. and 8. twice more.
10. Discard residue.
11. Combine methanol extracts and evaporate to dryness... This will yield a crude extract containing the active tryptamines, suitable for most purposes...

## FEEDBACK ON SIMPLIFIED COLUMN CHROMATOGRAPHY

**Q:** In the Simplified Column Chromatography article in the Spring '94 issue, it is said that those alkaloids which do not display a color band will fluoresce under U.V. light. In my experience DMT and 5-MeO-DMT neither display colors nor fluoresce. What's the best way to identify those bands on the column?

— Johnny Appleseed

**A:** The question of how to identify colorless alkaloids as they move up the chromatography column requires serious attention. In view of the fact that alkaloids are by definition "alkaline," the best way would be to cut a narrow strip of chromatography paper spanning the stratified bands and spray a pH indicator such as phenolphthalein onto it. Phenolphthalein (often called "phenol red") is a common liquid pH indicator available from swimming pool and spa supply stores. It will turn various hues depending upon the acidity/alkalinity of the substance tested. Those alkaloids stained with indicator need not be discarded and may be consumed if desired.

Phenolphthalein is also the major ingredient used in laxatives such as Ex-Lax, etc, obtainable from any drugstore or supermarket. It is mixed with an acid to render it colorless. Here is an experiment one can try to see if it can be activated for use as a do-it-yourself alkaloid indicator.

1. Dissolve an Ex-Lax tablet in a tablespoon of water.
2. Add a dilute alkaline solution, such as ammonia (not the detergent kind most common in supermarkets), lye or baking soda, drop by drop until it just starts to turn red.
3. Then add a dilute acid such as battery acid (sulfuric acid), vinegar (acetic acid) or lemon juice (citric acid), drop by drop until it just starts to turn colorless again. The phenolphthalein is now at the borderline between acid and alkali, just slightly in the acidic state. When applied to an alkaline material, such as an alkaloid chromatography band, it should begin to turn red. The preferred acid is battery acid and the preferred base is ammonia since these will not buffer the solution. These should be made very dilute, since a little goes a long way. -- Solaris

\*\*\*

**Q:** I am using the chromatography technique described in the Spring '94 ER and keep running into the same problem: when the solvent begins to work its way up the paper, it freezes. Once ice crystals form, the solvent stops ascending the column. I am using

methylene chloride as the solvent, and the only cause I can think of is that I live at an altitude of over 5,000 feet -- possibly the solvent evaporates faster and freezes in such a thin atmosphere. -- TA, CO

\*\*\*

A: The problem is that the rapid evaporation of the methylene chloride causes heat loss. Use another solvent that is not so volatile, such as TRIKE, or seal the edges of the strip with adhesive tape so that the solvent doesn't evaporate. -- Solaris

\*\*\*

Q: Could you catalog where the alkaloids of principal interest to entheogen users fall on the chromatography column? For example, it would be useful to know where the undesirable bufotenine would stratify in relation to DMT or 5-MeO-DMT. (I'm assuming all of these tryptamine molecules would lie close together on the column.) -- EB, TX

\*\*\*

A: I don't know. Please understand that although I am a chemist, my area of expertise is quantum mechanics, not synthetic chemistry although I have prepared a wide range of organic compounds. My intuitions may not always be accurate -- the main thing is to experiment and discover the answers to these questions. -- Solaris

#### SAFER EXTRACTION SOLVENTS

Please be alert to the toxic and carcinogenic potentiality of using the two solvents, trichloroethylene (TRIKE) and methylene chloride. Significant amounts are still present in the blotter paper. A safer solvent, and one that evaporates quickly due to its low boiling point, is hexane or heptane. Both of these are easily obtainable from every art supply store as the rubber cement *solvent* used for paste-up. They are relatively safe organic solvents as they do not contain any chlorine and have a low boiling point. They also have very low human toxicity. I have used both solvents at various times, and have found them to be excellent. Whichever solvent one uses, a consideration of the environmental impact is necessary. A low-tech, easily constructed solvent recovery system awaits invention. -- DG, NY

\*\*\*

[Not being a chemist, I remain mystified by the number and types of solvents which can be used to extract

alkaloids. I'd love to see an article which explains the principles involved in terms non-specialists can understand. Why, for example, is chloroform appropriate for one substance while heptane is used for another? I assume that because the latter evaporates rapidly, it would be unsuitable for the column chromatography technique discussed above. -- Ed.]

#### PEGANUM HARMALA EXTRACTION FORMULAE

Q: There is a technical error in the formula from issue #4 dealing with *peganum harmala* extraction. It should specify a 3% acetic acid solution rather than a 30% solution, since this is what is used in the original scientific literature. A typographical error apparently slipped in somewhere. 30% acetic acid is extremely strong, and only available from a chemical supply house. Using distilled vinegar is OK, since consumer grade distilled vinegar is formulated to a standard 5% acetic acid content. Dilute the vinegar with an equal volume of distilled water (not two volumes as mentioned in the article), to obtain a 2.5% solution for the extraction. Also, the procedure is incomplete, since it does not give any indication as to how much acetic acid solution should be used for a given weight of seeds. -- Anonymous, CA

\*\*\*

A: The formula was based upon data given at an entheogenic plant conference in 1992, in which *Peganum harmala* extractions were made with 30% *lemon juice* which is dilute, rather than pure, acetic acid. (My error for not pointing out the difference.) Enough aqueous acid to cover the seed mash is adequate, and super accurate measurements are apparently unnecessary since I obtained a potent extract using the original formula, which from your data I now realize must have technically been only a 1.66% solution. White vinegar smells far worse than the lemon juice, so the latter is an aesthetically preferable solvent. My extract works very well in one-gram doses, as stated in the original article. -- JG, CA

\*\*\*

Another harmala extraction method: Soak the crushed syrian rue seeds in cold vinegar (60% water, 40% vinegar) for several days. Filter. Add table salt. The harmine acetates become chlorides and precipitate out. I think the same procedure will work for a crude extract of mescaline chloride from San Pedro.

**Addendum:** I read that chemical equipment, including Buchner filters, is watched by the DEA. I asked a chemical supply house (by phone) about a buchner filter a few months ago, not realizing this. The woman I talked to sounded like I had asked directions to a child pornographer. One can easily make any size buchner filter on a pottery wheel out of porcelain.

-- Professor Buzz D. Lux, CA

#### SOURCE FOR GLASSWARE

Chemical extractions are greatly facilitated by having the right equipment, which is often difficult to obtain. *The following source comes from a contact outside of this network, so be prudent when ordering -- no need to mention specific uses.* No price is listed for the catalog (a xeroxed sheet), but send them at least \$2.00.

Quote: "*There are thousands of other pieces of glassware that could have been included in this listing. Practically anything can be made available that is not listed. If interested, you would have to send a description (and a drawing if necessary) in order to arrange a price quote.*"

Marcus E. Haubenstricker

PO Box 40

Lakeland, MI 48143

#### DMT ISOLATION AND PURIFICATION FROM PHALARIS ARUNDINACEA (OR OTHER PLANT SOURCES)

1. Dry the grass and chop it up fine. Extract the grass with methanol at least three times. The extractions should go for at least one hour each. The volume of methanol is relative to the amount of grass used. It should cover the grass in the container. Combine the methanol from the three extractions and evaporate it off to leave a gooey residue. This may be redissolved in ethanol and poured over a smokable substance such as oregano for direct smoking after evaporating the ethanol.
2. DMT is not soluble in plain water but is soluble in acids. Make water acidic with 30% lemon juice, or better yet, 5% HCL. Dissolve the goo from step one in hot acidic water.
3. The DMT dissolved in acid water is put in a separatory funnel. Add dropwise ammonium hydroxide until the Ph is basic (8-9). The reaction products are ammonium chloride and DMT free base. The solution will be milky with the forming precipitate. Add chloroform

or methylene chloride to the separatory funnel in equal volume to the existing aqueous solution. Gently swirl. The milky precipitate will go into the organic solvent. If using chloroform the organic layer will be on the bottom and will easily be funneled off. Wash the water layer with organic solvent three times to extract all the DMT. Check the water layer after each extraction to be sure it is still basic, since the Ph may go down as free base is removed. Add more ammonium hydroxide as necessary.

4. Evaporate off the solvent containing the free base DMT. Another layer of goo will be present. Dissolve this again in methanol, filter and recrystallize.

5. To make the pure hydrochloride salt dissolve the free base in ether or chloroform and add HCL dropwise until crystals drop out. Filter off the solvent and dry the crystals. This same procedure can be used for extracting mescaline from cactus.

-- Professor Buzz D. Lux, CA

#### ALCOHOL QUESTIONS

**Q:** What kind of alcohol is isopropyl? Wood alcohol? Where can one find methanol? I've glanced at chemistry books and encyclopedias but cannot find out the answer -- how many alcohols can there be? -- **JB, TX**

\*\*\*

**A:** Isopropyl alcohol is rubbing alcohol -- extremely cheap in any drugstore. Poisonous to drink, but useful for making linaments and salves, a topic I plan on covering soon. (Many drugs can be absorbed through the skin to reduce nausea.)

**Methanol** (wood alcohol) is sometimes used as paint thinner, and seems to be one of the preferred extraction solvents. It can also be found in automotive gas-line treatments (to prevent freezing) -- I saw some in K-mart early last winter. (Methanol was the only ingredient, and I think the brand name was "HEET.") Methanol isn't illegal and I don't think it's on the DEA suspect list, so you can probably find a chemical supply store that sells it in gallon quantities.

**Ethanol** is drinking alcohol -- sold as "Everclear" in liquor stores in many (most?) states. If you live near the border, you can buy it dirt cheap in Mexico. Ask for "*Puro de cana*" - it's made from cane sugar. Ethanol is the only drinkable form of pure alcohol -- anything else is **poison**, so be sure all Methanol extractions have evaporated to dryness before ingestion.

**Denatured alcohol** is usually ethanol with methanol added to make it undrinkable. The only reason for doing this is the government's need to ensure that nobody can get high without first paying the alcohol tax. Alcohol is so inexpensive to produce in quantity that in a world without taxes it would be one of our cheapest products. Can anyone tell us why methanol seems to be preferred over ethanol as an extraction solvent?  
-- Ed.]

---

## CALEA ZACHATECHICHI -- MEXICAN DREAM HERB

---

*Calea zachatechichi*, an herb used by the Chontal Indians of Mexico for divination has been proven to be a dream catalyst in scientific trials. Although I have had trouble with seed germination, once started the plant seems easy to grow. A variety of experiments are needed to determine the best way to utilize this new entheogen's unique properties. The following extraction procedure is a good place to start. According to the article, the methanol fraction contains the dream-inducing compounds:

*One kilogram of the dried plant (stem and leaves) was mashed and extracted with hexane until exhaustion in a Soxhlet apparatus. This fraction was dried and 30 g of a solvent-free hexane extract were obtained. The remaining material was thoroughly extracted with methanol and the organic fraction evaporated. This procedure resulted in 86 g of a solvent-free gummy residue called the methanol extract. Both extracts were separated in fractions and packed in gelatin capsules for pharmacological experiments. The dose was estimated in the following manner: the human dose for divinatory purposes reported by the Chontal informant is "a handful" of the dried plant. Since the mean weight of many handfuls taken by several people was 60 g, we decided that the average human dose (HD-1) is around 1g/kg of dried-mashed material. Therefore, the HD-1 for the hexane extract was 30 mg/kg, and 86 mg/kg for the methanol extract...*

Mayagoitia, Lilian, et al: Psychopharmacologic analysis of an alleged oneirogenic plant: *Calea zachatechichi*, *Journal of Ethnopharmacology*, 18 (1986)

**The** effective dose for an average person (130-150

lbs) would be in the neighborhood of five grams of the methanol extract. Evaporating this extract onto an inert smoking material, such as mint, might also produce significant effects. Let ER know of the results (positive or negative) of your experiments. Here is an abstract of results from the study:

*The characteristic EEG slowness and the increased reaction times of subjects treated with both extracts suggested that zacatechichi may contain hypnotic compounds...These results support the idea that zacatechichi extracts, particularly the methanol fraction, contain compounds with activity equivalent to sub-hypnotic diazepam doses...Significantly more dreams ...were reported after the methanol extract. Similarly, the number of dreams reported during naps was significantly higher following the administration of the plant extracts than with diazepam...The number of subjects that did not remember dreaming was always greater after placebo and diazepam administration and, conversely, the individuals that reported more than one dream per session were always the ones treated with zacatechichi extracts...With the methanol extract more colors during dreaming were mentioned. These results show that zacatechichi administration appears to enhance the number and/or recollection of dreams during sleeping periods...All this suggests that Calea zacatechichi induces episodes of lively hypnagogic imagery during SWS stage I of sleep. -- Ibid*

### CALEA CULTIVATION

I started seeds inside last March, had good germination, and transplanted seedlings outside into an area in which I'd burned a pile of scrap oak lumber. The plants seemed to like the ashy soil (clay underneath) and grew vigorously all summer. I'm interested to see if they'll overwinter.

-- LA, MO

### POLLEN, HONEY AND CALEA WINE

Experiments with testing winter hardiness (zone 6) are probably going to be unsuccessful. The five test plants look rather terminated by 18 degree (F) weather, though the roots may have survived. The greenhouse plants have grown very well using a well-draining media of half compost/leaf mold, one-quarter coarse river sand and one-quarter vermiculite. They have an extensive fibrous root system that fills the pots and will re-

quire daily watering during dry summer months or the leaves will wilt. Adequate ventilation is necessary in cool/damp conditions such as a winter greenhouse or mold may form on the leaves...I hauled all nine five-gallon pots out when my honeybees were active on a sunny day and they seemed to like the flowers. This is interesting in that bees collect large amounts of pollen from various plants, rolling them up in little balls for winter storage. Since bees collect only one type of pollen at a time, one could have pure pollen balls of *Calea*, *Heimia*, *Papaver*, *Damiana*, etc. Pollen traps are used to catch the pollen balls as bees enter the hive. Of course, the same holds true for honey -- *Calea* honey could be interesting...It also might be interesting to experiment with various fermented herbal wines using *Calea* or *Heimia*. This practice was popular during the Middle Ages, though ingredients such as mugwort, wormwood, dandelions or chamomile were used... -- **BB, AR**

#### BITTER INFUSIONS

On three occasions I have ingested infusions of *Calea's* leaves and twigs. An ounce of dried material was steeped in a quart of boiling water. This made an extremely unpalatable drink despite attempts to buffer it with lemon juice and sugar. On each occasion three 6 oz. cups were downed and a small amount was smoked. (Smoke was very smooth and pleasant.) Drowsiness was not noted although I did lay down and relax. Much dream activity was noted during sleep following use. (Twice this sleep came hours after use.) The most significant effects occurred when the *Calea* was taken while I was stricken with the Flu. After drinking the infusion I slept soundly for twenty minutes and woke up amazingly relieved of the achy joints, nausea and run-down symptoms associated with the flu. The change was so drastic that I actually felt invigorated! I feel *Calea* is worthy of further study. Perhaps a more dilute solution drunk as a tea would be more palatable and, taken over time, have useful tonic applications. The flu-remedy experiment is also worth repeating. -- **DT**

#### DREAM CATALYST

My *Calea* experiences were of a series of short, forceful dreams -- forceful, in the sense that I felt as if something significant was being pushed into my awareness. -- **MH, VT**

---

## EDITORIAL

---

Enclosed in this issue of *The Entheogen Review* is a Resolution which I recently obtained. It is the most eloquent statement I've seen yet addressing America's arbitrary drug laws. The best part about this document is that one can support its ideas without being perceived as a drug abuser, anarchist or threat to social order: one can be a Conservative Republican, teetotaler and religious fundamentalist yet still advocate these concepts without drawing suspicion upon oneself. The Resolution makes its point clearly and persuasively: *drug abuse is a social and medical problem, not a law-enforcement problem*. Recognition of this obvious truth and responsible action taken on it would eliminate at one stroke some of the most intractable dilemmas and injustices in contemporary life. I urge everyone who agrees with its principles to follow the five instructions at the bottom of the page. Think of it as your duty as a citizen: if you have difficulty believing in the democratic process as presently constituted, then regard it as an existential gesture: if you're into shamanic will and intent, then make it a magickal act. If we are ever to ingest entheogens without fear of cruel and unusual punishment, something like what this Resolution advocates must take place. Send it out today.

-- **Jim DeKorne**

---

## BRIEF REVIEWS

---

*The JLF Poisonous Non-consumables Mail Order Catalog*, 1994, JLF, P.O. Box 184, Elizabethtown, IN 47232, USA, \$2.00 Phone: (812) 379-2508

Those readers unfamiliar with the JLF catalog owe it to themselves to obtain one immediately -- if for no other reason than to own a copy of the world's most exhaustive disclaimer. (This off-the-wall classic ought to be anthologized somewhere, and probably will be.) Simply put: JLF sells poisonous non-consumables -- *period*. (If you want to know why anyone would

want to buy such products, read the disclaimer.) The availability of such toxic wares as *Phalaris* extract, *Amanita* mushrooms (JLF's specialty), and Jimson Weed waxes and wanes with the seasons and botanical availability, so one needs to stay on top of what may or may not be in stock. This is one gutsy individual to sell the stuff he does -- give him your biz.

\*\*\*

***Ayahuasca Analogues -- Pangaeon Entheogens***, Jonathan Ott, 1994, Natural Products Co., PO Box 1251, Occidental, CA 95465. 127 pages. \$15.00 paperback, \$30 clothbound, plus \$3.00 P&H.

This slim volume, by the author of *Pharmactheon* (reviewed in the Winter '93 issue of *The Entheogen Review*), has been eagerly awaited by most people experimenting with the non-rainforest sources of ayahuasca admixtures. Unfortunately, it offers little that does not already appear in the ayahuasca chapter of his previous book, and is not a definitive work on this subject. *Phalaris arundinacea*, for example, perhaps our most promising non-jungle source of DMT and 5-MeO-DMT, appears only on a long list of obscure tryptamine-containing plants and is not discussed at all in the text -- a glaring omission in a work bearing a title like this one.

The one item seeming to break new ground is the author's observation that the harmala alkaloids, as short-term, reversible MAO inhibitors, may be used safely with phenethylamines such as mescaline. Conventional wisdom until now (based upon the characteristics of synthetic, irreversible MAOIs), said that such combinations were dangerous, if not life-threatening. The new information suggests that one could without risk combine *P. harmala* extract with San Pedro (or any mescaline-containing brew) to intensify the experience. Unfortunately, this information seems to be based upon the experience of only one anonymous experimenter with threshold doses. After making a strong point that such combinations are safe, that beliefs to the contrary are "curious myths," Ott proceeds to tell us not to "jump to conclusions" and condescendingly advises the reader to leave such experimentation to "the experts." One is left wonder-

ing what the exact message is here. Is it safe or isn't it? Given our culture's penchant for leaping before it looks, this kind of intelligence is confusing and suggests that the material might have been more appropriate as a journal article rather than part of a book intended to be a practical resource for non-specialists. Though other sources have also confirmed the safety of this combination of entheogens, the subject certainly deserves more discussion than the two rather enigmatic paragraphs devoted to it in this book.

\*\*\*

***Pills-A-Go-Go Newsletter***, 1202 E. Pike St. #849, Seattle, WA 98122-3934, \$12.00 for six issues.

Nothing much about entheogens here, but anyone who is interested in alternate states of consciousness (not necessarily psychedelic ones), will find this newsletter fascinating reading if for no other reason than it is so well-written. (The delightful essay on pharmacists in the Spring, 1994 issue is certain to be preserved in some college English teacher's collection of class hand-outs.) Lots of information about pills, gossip about pills, speculations and shared experiences about pill dosages and pill combinations -- how to create bonafide hallucinations with deliberate ODs of over the counter medicines. How to read prescriptions and understand the secret codes built into them. This is a brash and audaciously unapologetic fountain of hard-core information usually kept secret by drug companies, physicians, pharmacists and the FDA. I love his cheeky wit. -- **Jim DeKorne**

# TOADAL CONFUSION

---

---

Alas! Alas! I've deliberately refrained from commenting much about smoking the venom of the Sonoran Desert toad (*Bufo alvarius*) because of the abuse potential to a fellow creature. Nevertheless, the national media pounced upon the recent arrest of a California couple for toad possession and, in typical media fashion, has adulterated one or two facts with a ton of inaccuracies. What I was hoping to avoid came about anyway: the distorted publicity has now made it a hip thing to possess a *B. alvarius* toad; the Silent Majority are outraged by what appears to be a disgusting perversion (they understand that one *licks* the toad, rather than extracts the venom and smokes it); and the police have yet another "probable cause" for enforcing their Black and White reality: toad holding. The irony is that bufotenine, the schedule 1 substance by which the arrest was justified is *not* the psychoactive ingredient in the venom of *B. alvarius*. The active ingredient is 5-MeO-DMT which is still legal. Bufotenine, the illegal drug, is considered a super bumper by all accounts, hence anti-bufotenine statutes make about as much sense as passing a law against the ingestion of drain cleaner. As far as the toads are concerned: please leave the poor creatures alone -- one can extract the same compounds from plants. -- Ed.

\*\*\*

## BE KIND TO YOUR WEB-FOOTED FRIENDS

I wanted to comment on the letter from the Arizona toad milker who seemed to take no thought for removing (temporarily) what I think is one of that specific toad's defense mechanisms. I am concerned with the potential for harm or decimation that could be created when all the unhappy hordes pursue another way to "get off" at the expense of the toad. This is not an argument against the extraction described, or the process of enlightenment, but simply an observation that all parties may not be concerned. This is obvious by the inclusion in one of my ethnobotanical catalogs for the hides of *Bufo alvarius* purported to be "road kills." Having seen a number of squashed reptiles and amphibians, it is hard to believe that someone is going around on the highways and byways collecting their

carcasses. I had several Great Basin Spadefoot toads for a number of years and can say that they make very peaceful and amusing pets. They are completely harmless, and although obviously not members of the intelligensia, they at least seem friendly. Shocking or traumatizing them is inhumane. -- GC, AK

\*\*\*

[I gotta agree -- especially when one can obtain the same alkaloids found in *B. alvarius* from plain old *Phalaris* grass without having to catch a ton of crickets every week to feed them with. -- Ed.]

\*\*\*

## CARRIER WEIGHT

I guess that when you are arrested for possession of bufotenine with the toad attached it's 10 to 20 in the big house. With carrier weight, if he had a big lunch it could add another 5 years! -- Anon., PA

\*\*\*

## TOAD CAVIAR

"A medical student in Sydney recently ate the ovaries of a cane toad (*Bufo marinus*). "It was a bet. The ovaries look like caviar." The student spent six weeks in intensive care and had three heart attacks." -- *New Scientist*, 9 Oct., 1993

\*\*\*

## BUFOTENINE

"Bufotenine was first isolated in 1920 by H. Handovsky as a minor component of venom of the toad *Bufo vulgaris*..., and the compound has since been found to be widely distributed in plants and animals ... In 1955, bufotenine was first tested on four prisoners at the Ohio State Penitentiary, with intravenous injections of up to 16 mg of bufotenine as the creatinine sulfate. The unfortunate subjects receiving the higher doses were reported to have faces "the color of an eggplant" diluted, and to have experienced minor visual phenomena of short duration, leading the experimenters to conclude the drug was "hallucinogenic"... The United States government saw fit to classify bufotenine along with LSD, DMT, mescaline, psilocybine and psilocine as a drug with "high potential for abuse," even though it would appear no one has used the drug

intentionally for "kicks" -- its only users having been decidedly unwilling prisoners and mental "patients"...

Ott, J. (1993) *Pharmacotheon*

\*\*\*

### IS OR IS NOT BUFOTENINE AN HALLUCINOGEN?

"Bufotenine, 5-hydroxydimethyltryptamine, is a methylated derivative of tryptamine. At one time it was thought to be a hallucinogen ... A later report... argued against this, and this view has prevailed. However, anthropological evidence suggests that the chemical does have unusual properties...

"The purpose of this paper was...to determine whether or not the drug was an hallucinogen...

"Two doses of the drug were given i.v., using 2 mg and 4 mg of bufotenine, given as Bufotenine Oxalate. No hallucinogenic properties were reported. The volunteer did report that he was anxious throughout the experiment... Despite his anxiety he asked to press on, and subsequently, 8 mg of bufotenine, given as above, was injected over a 3 min period; the subject reported profound emotional and perceptual changes, involving extreme anxiety, a sense that death was imminent, and a visual disturbance which was associated with colour reversal and distortion, such as might be seen in a photographic negative...

#### Conclusion

"The use of intravenous bufotenine given in a high non- physiological dose produced in the volunteer subject profound perceptual and emotional changes, although frank hallucinations *per se* were not present. Following his report it was decided that further experimentation on this, or any other subject, would not continue...

#### Appendix -- description by volunteer

"I did not want the experiment to go on. I had the fancy that I could not speak even if I wanted to, but in any case decided that I would endure no matter what occurred... The presence of colleagues monitoring my progress also led me to believe that the experience was drug related and not a pathological response. The faces around me remained the same, but were at the same time different. Each seemed to have a transparent mask, smaller than the face itself, superimposed over it, giving an eerie impression, even a sense of evil... Artificial panelling on the cupboards seemed somehow more intense; it was as though the patterns

were reversed almost like the reversal produced by the negative of a film. At the same time I was aware that my speech was slurred and that I seemed detached from my surroundings. Not only did my surroundings appear unreal, but I also had the sense of being unreal in some indefinable way..."

W.R. McLeod and B.R. Sitaram, "Bufotenine re-considered," *Acta psychiatr. scand.* 1985:72:447-450

\*\*\*

#### TOAD VENOM

"The biochemical composition of *Bufo alvarius* is open to some debate. The venom is believed to contain only trace amounts of bufotenine. In fact, the actual amount of bufotenine in the venom is possibly, if not likely, so scant that a single extraction from the toad's parotoid glands might not contain an amount of bufotenine "useable" as a controlled substance, as required for a possession conviction under California law. Most scientists agree that the primary active ingredient in *B. alvarius* venom is 5-methoxy-DMT, not bufotenine. The substance 5-MeO-DMT is not a scheduled substance under Federal or California law."

Boire, R.G., "Criminalizing nature and knowledge...", *The Entheogen Law Reporter*, Issue No. 2, Spring, 1994

\*\*\*

#### THE LATEST UPDATE

"The first couple ever to be charged with possessing and smoking psychedelic toad juice were sentenced to a drug diversion program yesterday in Tuolumne County Justice Court...If they successfully complete the program and stay free of drugs for two years, the charges against them will be dropped." -- *San Francisco Chronicle*, April 29, 1994

# NETWORK FEEDBACK

---

## TRYPTAMINE CONCENTRATIONS IN *PHALARIS ARUNDINACEA*, var. TURKEY RED AND YUGOSLAVIAN FRESH CUT

Approximately 25mg of *P. arundinacea* extract (as described in the Winter '93 issue of ER) was sent for analysis to the Institut Universitaire de Medicine Legale, Laboratoire de toxicologie analytique in Lausanne, Switzerland. The results of the assay are as follows:

"...The extract contains mainly 5-MeO-DMT with 50% of a compound with molecular weight of 216 which might well be 6-MeO-Methyl-1,2,3,4-Tetrahydro-beta-carboline and around 5% of 2-Methyl-1,2,3,4-Tetrahydro-beta-carboline and DMT. The identity of 6-MeO-2-Me-THC is still pending as I am missing the reference substance. Additional works are going on to offer a firmer identification..."

This confirms our educated guess in the Spring '94 issue that the subjective experience of smoking this extract conformed more to the 5-MeO-DMT profile than that of DMT. The next task is to identify a strain or species of *Phalaris* which contains more DMT and less (or no) 5-MeO-DMT -- a molecule which tends to be more intense than most people are comfortable ingesting.

\*\*\*

I understand at least some of the reasons why you had mixed feelings about publishing the "Smokable DMT from Plants" article in the Winter 1993 ER. Your analogy to a tactical nuclear explosion is an apt one --- I, however, would like to say "Bombs Away!" I hope this will be the first of many such articles and breakthroughs. It's been a long time brewing, and this is just too important to be anything other than bold about. -- SF, WA

\*\*\*

There seem to be distinct "families" within each *Phalaris* species. Some contain mixtures of alkaloids,

others only one type; some may contain none at all! There has been a serious breeding program to produce "palatable" clones which are alkaloid free. -- RP, NY

\*\*\*

Regarding the low alkaloid concentrations of some *Phalaris* varieties: my feeling is that all species have some activity and if one can harvest with a lawn mower, who cares if the content is low? At 2% content, a kilo of lawn clippings would yield two grams! A lawnmower bag weighing ten kilos of only .2% would still yield two grams, and so on.

-- Prof. Buzz De Lux, CA

\*\*\*

## TRYPTAMINES AND NEUROTOXINS

In the most recent issue of *Integration* (No. 4) was an article about TLC analysis of *Phalaris* and *Desmanthus*. *Phalaris* seemed more variable in tryptamine content while *Desmanthus* seemed more consistent, at least with *D. illinoensis* and *D. leptolobus*. This produced some very useful information about the latter; it is much stronger than *D. illinoensis*. It appeared to be right up there with *Psychotria viridis* on the scale. Here again, we are talking about the roots, and also as with many other plants, the root bark.

I heard that the leaves of *Psychotria nervosa* were also tryptamine positive -- some people having typical experiences.

Regarding tryptamine-containing Pandanus nuts, I learned of some suspicious folklore about sniffing Pandanus pollen. Seeing the nuts, one notices that there is much pollen that stays with them. Maybe the DMT is only in the pollen and the pure stuff is where it's at.

Reading about *Phragmites australis*, I learned that it also contains bufotenine and 5-MeO-DMT, besides DMT. These three seem to turn up together often. It may follow that in some of the many species of *Bufo* toad venoms, all of which contain bufotenine, more may contain 5-MeO-DMT and/or DMT than just *B. alvarius*. I've heard rumour that there are psychoactive toad venoms from Columbia, Peru and Asia.

There are many animal-based neurotoxins. The Puffer fish contains tetrodotoxin (TTX), a powerfully unique anaesthetic-type muscle relaxant that is absolutely harmless to the tissues in anything less than a lethal dose. The most dangerous aspect of TTX is the potential for overdose and death. The nearly--overdosed patient may lie comatose and on life support for days and recover completely with no evidence of mental or physical damage. TTX is the active ingredient in Voo-Doo zombie potions where the state inflicted is not a trance coma because consciousness remains intact throughout. The Japanese and others consume Fugu fish (a type of puffer) for the purpose of a TTX euphoria.

There are also some interesting spider neurotoxins. Jim Morrison reportedly took tarantula venom. *Elapid* snakes contain some very exciting enzymatic neurotoxins which may or may not be orally active, but may be smokable in nanogram or low microgram dosages. Cobra venom is even more powerful than TTX. TTX has an LD-50 of about one mg orally for a 150 lb adult. Some of us suspect that cobras were worshipped by ancient Egyptians and Indians for that reason. Think of the caduceus -- now imagine the snakes being cobras and the wings on the staff being the *Amanita muscaria* mushroom. Now it makes sense! Historically, healing and spirituality were always associated with hallucinogenic substances. The problem with some venoms is that they usually also contain tissue-damaging components and other harmful agents. There is a marine mollusk called the Cone Shell that has pure neurotoxic venom. If you are stabbed by the *Conus geographus* you either die or get giddy, but you don't suffer much pain at the contact site. Sea snakes reportedly also inject pure neurotoxins of extremely high concentrations. Salamanders, newts, frogs, octopusses, wasps and other bugs also produce neurotoxins. The field seems wide open and the potential greatly untapped. Anyone with lore about these subjects, please write in. -- MN, IN

\*\*\*

#### WOODROSE SEEDS

According to Ott in *Pharmactheon*, Hawaiian Baby Woodrose seeds contain the highest concentrations of Lysergic Acid Amides, so I am a bit confused why people still consume morning glory seeds. Is it because there is an established shamanic use of these species,

or am I missing something? Since they promote upset stomach, cramps, nausea, etc. I always scrape the fuzzy coatings from HBW seeds with an Xacto knife before ingestion. Then I crush them with a mortar and pestle and put the resulting powder in OO gelatine capsules. These are taken on an empty stomach and I rarely get any unpleasant symptoms. I've had profound effects with as few as five seeds, but have taken as many as eighteen. The only difference (past 12 or 13) seems to be the duration of the experience. Lots of mental imagery, movie scenes, and unique access to dream places -- allowing me to consciously explore them as if in a lucid dream. This isn't thought or memory -- I *actually go there!* -- VP, WA

\*\*\*

#### SEED SOURCE

For information about purchase of Baby Wood Rose seeds, for planting purposes only, send SASE to: Wildflowers, P.O. Box 46, Rancho de Taos, NM 87557.

\*\*\*

#### AMIDE OINTMENTS

Recently I discovered that the lysergic acid amides found in Hawaiian Baby Woodrose and other morning glory seeds can be absorbed through the skin. The advantages of this method of "ingestion" are that noxious taste, stomach cramps, nausea and accompanying exhaustion are eliminated. This was discovered when I was grinding Hawaiian Baby Woodrose seeds and some of the powder remained on my body for several hours. The trip was an unmistakable plus-2. I experimented further and developed the following protocol: grind one or two HBW seeds extremely fine and add light cooking oil to make a thin paste. Rub this anywhere on your skin where the blood vessels are near the surface, such as wrists and armpits. This should result in a plus-2 experience in about an hour and a half. My experiments with Heavenly Blue morning glory seeds also proved positive. Three grams of finely ground seeds mixed with corn oil came on in the about same time. -- PH, NM

\*\*\*

#### ENTHEOGEN SOURCES IN CANADA?

Do you know any mail order sources in Canada for *P. cubensis* spores or growing kits? Anything ordered from the States is checked at the border. I'm also in-

terested in a Canadian source of smart drugs by mail.  
-- RW, Canada

\*\*\*

### CACTI CONNECTION

Send \$6.00 U.S. (international postal money order or cash) to Karel Knize, P.O. Box 10248, Lima 1, Peru (fax: 0051 14 300608) for the 1994 price list for cactus, succulents, bromeliads & orchids. Over 2000 items are listed in this catalog, including *Trichocereus peruvianus* specimens. (This cactus has the same concentration of mescaline as peyote, and is still legal in the U.S.)

\*\*\*

### SAN PEDRO EXTRACTION

After cooking and filtering San Pedro as per standard methods, simmer the liquid in a non-stick pot until it is the consistency of rubber cement. (This requires careful stirring to prevent burning.) Place this goo onto a sheet of glass and allow to cool. When pliable, this tar is rolled out to a strip the circumference of a pencil, divided into portions and stuffed into gelatine caps. 60 dried grams of the tar fills about 23 gel caps. Take 6 caps every 15 minutes to avoid nausea. Trip lasts up to 12 hours. -- MS, PA

\*\*\*

### ENTHEOGEN ABUSE

In the last issue there was a comment made on the abuse of entheogens by drug addicts. The idea that we should make psychoactive drugs available only to those who have noble intentions seems silly. Why should anyone have to determine the intention behind another individual's actions? That attitude of legislating morality is what helped to create the absurd situation existing today. The sacrament will be defiled by the unknowing, but it is not up to us to judge and pass sentence. -- Captain Chaos, HI

[Amen to that! -- Ed.]

\*\*\*

### LEGAL QUESTIONS

If DMT is illegal, why are dried *D. illinoensis* roots and *P. arundinacea* extracts legal, for example? Why can JLF sell dried *G. spectabilis* mushrooms when psilocybin is illegal? Are they selling varieties which lack the entheogenic alkaloids? Even if plants aren't prohibited by species, I would think that extracts contain-

ing illegal alkaloids would be illegal. --GW, NY

[So many new entheogen-containing plant species are being discovered that the question of scheduling them approaches the limit of what a free citizenry will accept as reasonable. Regardless of enforcement, any plant *extraction* containing a controlled substance is by definition illegal to possess. -- Ed.]

\*\*\*

### PHALARIS FERTILIZER

What fertilizers and soil conditions are conducive to increased DMT content of *Phalaris* grass? -- EB, TX

[High nitrogen content, partial shade, mild water stress, harvest only top third of leaf-blades. -- Ed.]

\*\*\*

### AYAHUASCA ANALOG QUESTION

I was wondering if *P. arundinacea* could be boiled up with *P. harmala* and drunk, and if so, what would be the approximate dried and/or fresh weight of each species required? -- MS, PA

\*\*\*

[Does anyone have any experience with this? My guess is that this method would require a lot of trial and error to perfect -- it seems easier to just extract the alkaloids chemically.] -- Ed.

\*\*\*

### KETAMINE

Ketamine, 25 to 100 mgs, has provided me with the most intense and illuminating visions ever. Some trips were incredible, some mundane, some were terrifying, and some went through all phases. It is an important entheogen -- the visions have been enlightening and productive in terms of my personal and spiritual development. Thought is angular and unable to grasp the divine -- the best we can do is gently support it. The earth is sentient; we are her guardians.

-- Captain Chaos, HI

\*\*\*

### YOHIMBE

Yohimbe bark is a MAOI also, and a seemingly potent one. It is very pleasurable if a good strain can be obtained. The good stuff is strong smelling, dark oak brown, and almost powdered. It is a very strong aphrodisiac for both men and women. It is not entheogenic or hallucinogenic, but it does produce mild

distortions and patterns in the dark. Many would find it pleasurable to mix with an indole for a night of beautiful, psychedelic ultra-sensual sex. --EB, TX

\*\*\*

### PHIKAL

I urge anyone involved in the exploration of entheogens who has not done so to read *PHIKAL* by Ann and Alexander Shulgin. (Transform Press, Box 13675, Berkeley, CA 94701, \$22.95 postpaid.) It is a clearly eloquent account of the value of entheogenic experiences. The chapter "Lecture at the University" is the most sensible essay against drug prohibition that I have read. P.S. Ever consider printing your newsletter on hemp paper? -- DK, MD

[I met the Shulgins recently, and can attest that as individuals they are the most impressive advertisement for the enlightened use of entheogens imaginable.

*PHIKAL* is essential reading for anyone interested in this subject. The cost of hemp paper still forces me to place economic reality ahead of ideology. -- Ed.]

\*\*\*

### NEURO-LINGUISTIC PROGRAMMING

Regarding neuro-linguistic programming (mentioned in Summer 1993 ER): Most works on this encountered so far deal with using NLP as a sales tool (read: "manipulate consumer"), however I still think there is potential in this system for inner exploration/ transformation. Can anybody out there provide additional information or sources on NLP as an aid to entheogenic exploration? I am also interested in using sound in these endeavors: I've tried shamanic drumming and sublinguals and seek other potential avenues. -- JW, MD

\*\*\*

### PASSIFLORA CAERULEA

Just got a note from J.L. Hudson that a batch of *Passiflora caerulea* seed came in. The DEA would hate to know people are growing a tranquilizer better than Valium. Valium is the least toxic drug in a psychiatrist's tool box, but they would rather use the killers like Navane that guarantee a life-time patient. -- Anon. PA

\*\*\*

### DATURA AS MEDICINE

My relationship with *Datura* began as a somewhat

reckless experiment. I made tea out of a handful of the leaves with the intent of exploring its potential as a psychedelic. Indeed, I became "dry as a bone, red as a beet, and mad as a hornet" to the point where I was concerned for my safety, knowing *Datura's* reputation as a poison. The intoxication produced an unexpected side effect. I was pleasantly surprised to find that my typical nighttime asthma was non-existent during the *datura* intoxication. This led me to do further research -- I discovered it has a long history of use in respiratory ailments. I began using it in place of antihistamine during colds, hay-fever or earaches. The median dose was in the range of one seed per ten pounds of body weight. Use of the seeds has two definite drawbacks. First, they are unpleasant to chew because of the black crumbly residue left in the mouth. Second, they lose potency over time. In an effort to supply a more convenient, stable version of this medicine, I made a tincture by soaking the leaves in vodka (rum works fine). After a couple of weeks, I replaced the old leaves with fresh ones. After doing this four times, I have a very dark liquid form of *Datura* which is stable and convenient to use. Now rather than chomping on the seeds, I just take a dropper full of tincture. My friends and family use it too. Having had no truly entheogenic experiences, we use it primarily as a physical remedy. At higher doses, the joys and hassles of its bizarre psychic effects include delirium, memory loss, and sleepwalking. The tropane alkaloids in *Datura* are anti-cholinergic, slowing and blocking nerve impulses. For this reason, atropine is used as an anti-bedwetting drug. It also can delay orgasm, which may account for its reputation as an aphrodisiac. I would be most interested in any information on the possible long-term effects of the tropane alkaloids. I have noticed no problems and would much rather use *Datura* than chemical drugs -- it feels acceptable to my body. In the spirit of the Eternal Mystery -- RF, NC

\*\*\*

### DATURA AS DELIRIANT

A few years ago some friends and I ate two grams of *Datura stramonium* seeds. An hour or two later we all got extremely dry mouths and throats, severe blurred vision and a strong narcotic-like feeling. After four hours of this we all figured that this was all it was and we went our own ways to sleep. I woke in the morning to find things very strange: I heard voices but

couldn't make out what they were saying; I saw visions of people dying from what appeared to be Bubonic Plague (they had swollen black and blue bodies). I was very sedated and don't really remember the first three or four hours of that day. Around the time I remembered eating the seeds is when I began to recall the other things. I saw many people standing in my house and I knew all of them. There was an emotional numbness toward these visions, which I found very strange: I felt neither fear nor joy, just confusion. The visions were very clear and realistic. This state lasted until I slept again. I awoke the next day with my vision still blurred, though it cleared in a few hours. It was not a bad experience, but one I'm in no hurry to repeat.— **ML, Earth**

\*\*\*

#### FEEDBACK FROM JLF

JLF wants *Desmanthus*! As far as locating and identifying species of *Desmanthus* in the wild for sale (roots) to JLF I would advise the following book: Systematic Botany Monographs, Vol. 38. Monograph of *Desmanthus* (Leguminosae- Mimosidae), Melissa Luckow (1993) ISBN 0-912861-38-X. U.S. orders: \$20.00 from: Systematic Botany Monographs, University of Michigan Herbarium, North University Bldg., Ann Arbor, MI 48109-1057. This is a 166 page book all about *Desmanthus* taxonomy (except chemo-). There are 24 described species, eight of them occurring in the U.S. None are endangered. Some are quite large. Specific geographic locations are given.

JLF is also interested in purchasing other interesting poisonous raw materials: *Acacia* leaves, roots, bark; *Arundo donax* roots; *Amanita pantherina* and red *Amanita muscaria* mushrooms; *Polyporus betulinus* "Birch Conk" mushrooms; various *Panaeolus* mushrooms; *Gymnopilus spectabilis* "Big Laughing" mushrooms; *Aconitum napellus* "Wolfsbane, Monkshood" roots; *Hyoscyamus niger*, "Henbane" foliage and roots; *Monotropa uniflora*, "Indian pipes" whole plants; *Lespedeza bicolor* roots and bark; various *Desmodium* roots; various *Mimosa* foliage, bark and roots; *Digitalis purpurea* foliage; *Amanita citrina* mushrooms; *Erythrina* "Coral Bean" seeds; *Ariocarpus fissuratus* cactus; Pandanus nuts; various *Argyriaea* and *Ipomoea* seeds; various *Brugmansia* and *Solandra* foliage; various *Bufo* toad

skins; various Puffer Fish whole or skins (*Tetraodontoidea*); various *Elapid* snake venoms (Cobras, Mambas, Taipans, Corals, Sea Snakes) and maybe even other neurotoxic venoms of Cone shells, spiders and scorpions. Most all of the above items can be found in the U.S. As far as other things go on the JLF want list -- any uncontrolled substances/plants in Emboden's book: *Narcotic Plants*; Shultes' *Plants of the Gods* and Otts' *Pharmactheon*. Contact for sale or trade.

JLF, for one, wants to see ER print all those "laundry lists." I see that as some of the most useful, practical information of all. I figure we're all interested in new plants/substances (possibilities) even if they are only rumor. That rumor is often synonymous with folk knowledge. To suppose that the only valid folk knowledge lies within the cultures of ancient or primitive tribes would be a grave mistake. I don't care if it's banana skins, peanut, puffer or toad skins, or *Arundo*, Ayahuasca, *Phalaris* or *Iboga* roots; I want to read what anyone has heard about anything. Most of these things have a basis. Who has the authority to say that a certain chemically active substance is not entheogenic when another says that it is? In my business of selling poisonous non-consumables, one of the wisest decisions I ever made was to publish a phone number. I have profitted financially and intellectually from that decision. My customers have taught me all about which items to offer. I'd like to thank all those who have called and urge more in the future to call, call, call -- even if you're a *High Times* reader, say "mannn" and "dude" a lot and smoke a lot of pot. I'm there to educate and be educated and try to find any uncontrolled substances you might want. I'm not an elitist and don't discriminate against Feds or Heads or others who don't discriminate against me. I'm out there completely, not straddling the fence. And believe me, it is *not* all in *Pharmactheon*. There is no one book or one place that has it all. We are a long way from that, only scratching the surface.

-- JLF, IN

(See review elsewhere in this issue for JLF's address and telephone number.)

\*\*\*

#### FEEDBACK ON LEPIOTA PEELE

I have a friend in Pensacola who introduced me to Stephen Peele. He took us to the field where his

*Lepiota* was originally discovered. The mushroom grows in the low part of a pasture where the cows tend to sleep at night. It fruits infrequently and is not always psychoactive. Soil Ph is acidic (Ph 3.5 to 5) and this may be due to frequent cow urination. Steve says that the active ingredient is fragile. Drying the mushroom causes a complete loss of activity. Activity can be maintained if the mushrooms are kept in chlorinated water for up to two weeks. I got a spore print from Steve's collection, which grew easily on antibiotic agar (from Fungi Perfecti). The colony produced is fluffy and tan in color. To date I've not been able to make them fruit. Steve suggests making the casing acidic (Ph 4) with acetic acid.

Jeremy Bigwood did a chemical isolation on *Peele's lepiota* which was apparently compromised. In a communication he says: "*(L. peelee)* contains the usual suspects ps etc." (I assume this refers to psilocin or psilocybin.) "The goop it exudes in the earth, aside from being insecticidal, is also entheogenic. (It) took me so long to figure out because of some sabotage I had during the research. Switching of standards." I think there is something to the *Peele's Lepiota* story. I'm sorry people have written with such negative comments. I have tried fresh specimens of *Paneolus fonesecii* from numerous locations. Those growing along the divider strip of Huntington Drive in Pasadena, California are very psychoactive. Specimens from Northern California, Oregon and Washington seem to have no activity at all. Does this mean we should write to complain about authors who have described this species as active?

-- Professor Buzz D. Lux, CA

\*\*\*

#### FANE OF THE PSYCHEDELIC MUSHROOM

I would like to hear something in ER about the Fane of the Psychedelic Mushroom. -- EB, TX

\*\*\*

I have sent money to and received nothing from (no response to following letters) The Fane of The Psychedelic Mushroom Association in Victoria, B.C. I don't want to accuse, but if others have the same experience, it would be good to publicize it. -- BS, CA

\*\*\*

#### AMANITA MUSCARIA QUESTION

Has anyone out there had a positive experience with *Amanita/Soma*? If so, was this the result of special

preparation, and what was it? I am sure that I am not the only one to find the published subjective reports at odds with the very convincing scholarly studies of the history of Soma (Wasson, et al). Is this really the "Elixir of Immortality" praised in the Rig Veda, or is it just a good way to get sick? What is its legal status? -- SF, WA [It's legal.] -- Ed.

\*\*\*

#### AMANITA MUSCARIA ANSWER

[Excerpts from long letter]: I slow-boiled 15 grams of red brown *Amanita muscaria* for about 20 minutes and drank 2 cups of this tea with honey. Felt nauseous at first, but held it down... Experience lasted 17 hours... My best entheogenic experiences come from *Amanita*... The powerful positive thinking, the desire to help others. You read the words "Love thy neighbor" or "Peace," but if you're down you don't feel anything. Then you do *Amanita* and you can feel the meaning behind the words. Other drugs that produce this effect, like speed, have devastating, sometimes suicidal come-downs. The side effects of *Amanita* are nothing at all to me. -- BD, IL

\*\*\*

#### GROWING AND USING SALVIA DIVINORUM

The instructions I had for growing this plant said that they require high humidity, a rich soil with a third builder's sand to mimic a stream bed, and 80% shade. Well, I got the soil right, put the plant in a window, and misted it up to twenty times a day. No matter how much I misted, the leaves would continue to dry up from the edges and fall off. New leaves would form and sometimes get quite large but would ultimately succumb to the same fate. When some of the branches started to dry I decided that the plant would need constant humidity to recover. I stuck four pieces of pvc pipe (wet wooden rods will attract fungus) at 12, 3, 6 and 9 o'clock in the pot and put a large dry-cleaning bag around the pipes, creating a humidity tent. The *Salvia* is well on the road to full recovery and has put on dozens of new leaves, a few branches and is now flowering. They seem to love bright light as long as they are kept moist. I believe this plant should not be allowed to be in dry air for more than a day. When in a constantly humid environment, the leaves dry to a green color in less than 24 hours. When in a dry environment, they turn black from the edges, fall off and continue to dry and turn black for up to a week. I

doubt if these black leaves are psychoactive. Recently my main *Salvia* began to fall over and droop down. I decided to give the plant an emergency pruning and cut off four, four-inch branches containing twenty-five leaves averaging one and a half inches in length. I rolled them into a quid and put them into my mouth between cheek and gum. After about twenty minutes I began to notice pinks and blues on the TV screen. I left the leaves in my mouth for another thirty minutes, chewing occasionally. I felt a shift in consciousness before any euphoria. The inebriation lasted an hour, but lesser effects went on for several. I suggest drying and crushing the leaves before ingesting them as they take up less space that way. -- **Eli X, TX**

\*\*\*

[Following the above cultivation advice, I placed a plastic tent around some very sickly specimens of *S. divinorum* and vented a humidifier into it. Within a matter of days the plants began to perk up -- this species *really* likes a humid environment. In fact, I now regard it as cruelty to plants not to raise them this way! -- Ed.]

\*\*\*

#### ISOLATION OF SALVINORIN -A

(1). -- Dried milled leaves (200 g) of *Salvia divinorum*, collected at Huautla, Oaxaca (Mexico) in November 1980, were extracted with boiling chloroform. Evaporation of the solvent gave a green residue (27 g) which was purified by chromatography on "Tonsil" (200 g) with chloroform as eluant. Thirteen fractions of 50.0 ml were collected, the sixth and seventh of which contained compound [A] as ascertained by t.l.c. (45% ethyl acetate in hexane as developer; Rf 0.7). Crystallization from methanol yielded *salvinorin* [A] as colorless crystals, m.p. 238 -- 240 C ...

Ortega, A., J.F. Blount, and P.S. Marchant. (1982) Salvinorin, a new trans-neoclerodane diterpene from *Salvia divinorum* (Labiatae). *J. Chem. Soc.*, Perkin Trans. I:2505- 2508.

\*\*\*

#### SALVINORIN -A

Salvinorin A isolated from *Salvia divinorum* was used. After evaporation of the substance containing solvent on the inner surface of a glass pipe, smoking was possible during moderate heating with a flame and turning of the pipe. It seems that the amount of the substance was under 1 mg. Soon after the inhala-

tion and holding the smoke some seconds, a slight increase of the heartbeat with no other physical symptoms occurred. After about two minutes a feeling of deep peace without feelings of great euphoria or dysphoria developed. It was a little bit like a narcosis. I had no sense of time and estimated that the duration was much longer than in reality (only about ten minutes). I saw some color flashes particularly as synesthesia after closing the door. There were no after effects this day, but the next day I found some Liberty Caps in an old pasture in the woods and took only two fresh fruit bodies. It was a relatively strong reaction compared with the amount taken, and equal to experiences with many more mushrooms. I think a possible correlation between the action of psilocybin and salvinorin A even a day later is very interesting. -- **Semi Lanceata, Germany**

\*\*\*

If you're into smoking something new you might try extracting salvinorin A from *Salvia divinorum*. *Salvia* and *Cannabis* are amazingly synergistic. -- **Prof. Buzz D. Lux, CA**

\*\*\*

[I've received only second and third hand data on smoking Salvinorin-A, some of it pretty spooky. One person describes the room turning upside-down, then imploding. Rumor has it that it is active in the microgram range, and there seems to be at least some consensus that it is too heavy a trip for most people. Before another mythology develops about this new substance, I hope someone will set the record straight. *The Entheogen Review* is intended specifically as a forum for such questions. -- Ed.]

### *Psychedelica Mysticae!*

*Psychedelic Monographs and Essays*, by Tom Lyttle is a book series showcasing the best of psychedelic substance use and research. It features top names from the sciences, the arts, popular culture and the underground. Each volume is 250 pp. with photos and full color wrap-around cover. A must for the serious investigator!

"Sophisticated..." -- *High Times*

"Passes the Electric Kool-Aid Acid test..." -- *Whole Earth Review*.

"A psychedelic primer..." -- *Critique*

Volumes 5 and 6 now available at \$20.00 US; \$25 Canada to:

**PM & E, P.O. Box 4465, Boynton Bch., FL 33424**

# THUJONES AND ABSINTHE

---

---

*The thujones are best known as principles of oil of wormwood, the essential oil of *Artemisia absinthium*, component of 19th Century alcoholic beverages called absinthe... Absinthe was prepared by distilling alcohol over mashed leaves of wormwood, and other common ingredients were Angelica root, *Acorus calamus* rhizome (which may contain the psychoactive asarones...), cinnamon, fennel seed, star anise (both of which contain anethole, another potentially psychoactive compound)...and other plants... In spite of this plethora of ingredients and adulterants, the principal active constituents of absinthe seem to have been alcohol and thujones. Owing to structural similarities, it has been proposed that the psychoactive effects of thujones and tetrahydrocannabinols from marijuana...involve binding to the same receptor in the brain, and acute inebriation with absinthe is somewhat similar to *Cannabis inebriation*...*

Ott, J. (1993) *Pharmacothoeon*, Pg 390 (See original for further information.)

---

---

In response to the question of extracting thujone from wormwood: thujone is extracted using grain alcohol (I use Everclear) by soaking it for about 48 hours. Having drunk absinthe I can vouch for it being very interesting stuff. Below is a quote from: *Absinthe: History in a Bottle* (Conrad III, B. 1988. Chronicle Books, San Francisco), which gives a lot of information about the turn of the century version.

*The recipe for Pernod Fils and most of the other legitimate absinthes was six herbs: La Grande absinthe (wormwood) for taste; la petite absinthe and hyssop for the green color; Melissa, a plant which is used, incidentally, in eau de cologne; fennel, the vegetable, which like Melissa contributed to absinthe's taste and aroma, and finally anise (not to be confused with star anise or badiane). Pernod Fils used an eau-de-vie distilled from wine, unlike the producers of inferior absinthe who used "industrial alcohol" produced from beets.*

Genuine absinthe contained 30-35 drops of absinthe per 1 quart. The following recipes are for easy home production. Clever minds will think up ways to copy the original distillation process. I see absinthe becoming a very "in thing" in a cottage industry sense. Everyone ought to experiment with their own family favorites. These recipes were taken from a book on homemade herbal liquors.

\*\*\*

## Absinthe (1)

1 pint (16 oz) vodka or Everclear.  
2 t crumbled wormwood.  
2 t anise seed.  
4 cardamon pods.  
1 t mint leaves.  
1/2 t ground coriander.  
2 t chopped angelica root.  
1 1/2 c sugar syrup. (boil 1 c sugar with 1/2 c water = 1 c sugar syrup.

1. Pour alcohol in large jar with tight fitting top. Add wormwood and shake well. Let steep for 48 hours, then strain.
  2. It helps to grind the fennel and anise seeds, as well as the contents of the cardamon pods, in a mortar for a few minutes so that the flavors in them can blend with the alcohol.
  3. Add these and the mint, coriander and angelica, shake well, and let steep in a warm place for 1 week.
  4. Filter the contents of the jar through a clean cotton cloth or coffee filter, and then add the sugar syrup.
- The absinthe is ready to drink.

\*\*\*

## Absinthe (2)

1 t crumbled wormwood.  
1 c vodka or Everclear.  
2 t chopped peppermint leaves.  
1 piece lemon peel (3/4" X 2").  
1/3-1/2 c sugar syrup.

1. Steep wormwood in alcohol for 48 hours.
2. Strain and add peppermint and lemon peel.
3. Let steep for 8 days, then strain and add sugar syrup.

\*\*\*

### Wormwood cordial

- 1 t wormwood.  
1 c brandy.  
1/3 c honey.
1. Steep wormwood in brandy 48 hours, strain.
  2. Add honey, let stand 3 weeks.
  3. Strain off clear liquid.

-- RT, IL

\*\*\*

*Absinthe is a flavored spirit and not, strictly speaking, a liqueur. It is yellowish-green in color, dry and bitter, and of very high alcoholic strength, being 68% alcohol by volume. Its predominating ingredient is wormwood (*Artemisia absinthium*), but hysop, fennel, aniseed, liquorice, angelica root, sweet flag, dittany leaves and star-anise fruit are also used ... Because of the danger to public health its manufacture was prohibited in Switzerland in 1908, in France in 1915 and later, in other countries including the United States. Wormwood is habit-forming and can cause delirium, hallucinations and even permanent mental deterioration...*

--Encyclopedia Britannica, 1968

\*\*\*

*Despite the banning of wormwood in the United States, sage, which may contain up to 67% thujones in its essential oil, remains on the U.S. Food and Drug Administration's GRAS (Generally Recognized As Safe) list, and may be used as a food additive...It is commonly assumed that the thujones were the neurotoxic principles of absinthe, although alcohol also is a potent neurotoxin (absinthe contained from 68-85% alcohol) and significant quantities of copper and antimony salts used as adulterants (particularly in cheap imitation absinthe for the poorer classes) may have been present and responsible for the neurotoxicity.*

Ott, *op. cit.*, Pg. 39

\*\*\*

## THIS AND THAT

We have expanded to twenty pages for this issue of *The Entheogen Review*. This was made possible by a slowly (but surely) increasing subscriber base, and generous donations by two readers. Thanks friends!

I have mixed emotions about this growth -- on the one hand it seems like maybe *ER* will become the Journal I've always envisioned; on the other, I find myself unable to keep up with the personal correspondence engendered by more subscribers. I have many dozens of friends whom I've never met except through letters, yet answering them all is now becoming increasingly difficult. Don't stop writing, but please be patient if I'm unable to respond right away.

Single back issues are still available for \$5.00 each (\$6.00 outside U.S.A.). This doesn't include the 34-page Summer 1993 newsletter ("DeKorne's folly"), which is now only available bound with the first four issues in a 74 page "book." This is available for the same cost as a year's subscription: \$20.00 (\$25.00 outside U.S.A.).

My book, *Psychedelic Shamanism*, is finally available. The product of many years' research and experimentation, it is a fair condensation of what I've learned to date, although a sequel is already fermenting in my psyche. The book has received endorsements from a number of people whom I hold in great respect: this is a real hit for me, and in some ways as important as commercial success -- though I surely wouldn't turn that down if it came my way! Because I have a generous publisher, I can offer the book for a slightly reduced price: \$22.00 (as opposed to their \$24.00), postpaid. Or, avoid the postage cost altogether and ask for it at your local bookseller for only \$19.95. As always, stay abreast of the latest developments in this field through *The Entheogen Review*. -- Jim DeKorne

---

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL. 3, NO.3 : Autumnal Equinox , 1994**

ISSN 1066-1913 Copyright © 1994, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a lawmaker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W94 means that the Winter, 1994 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the

Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can't afford to pay for submissions yet, and unfortunately I often have to edit for brevity, but please keep those fascinating letters coming in.

-- Jim DeKorne

# THREE EDITORIAL TRIPS

---

---

## PSYCHONAUTS, NOT ASTRONAUTS

---

In July, 1969, *Life* magazine asked Charles A. Lindbergh, the first man to fly solo across the Atlantic, to comment on the upcoming Apollo 11 moon mission. I suspect that his response was largely misunderstood at the time, possibly because he used some less than lucid phraseology. At any rate, Lindbergh's 25-year old insight is worth a second look -- specifically in light of what we now know about altered states of consciousness: especially insights from DMT and ayahuasca ingestion, the UFO phenomenon and that numinous sense many of us have that our species is on the brink of a major breakthrough in awareness:

*"In wildness there is a lens to the past, to the present and to the future, offered to us for the looking -- a direction, a successful selection, an awareness of values that confronts us with the need for and the means of our salvation. Let us never forget that wildness has developed life, including the human species. By comparison, our own accomplishments are trivial."*

["Wildness" is used here as synonymous with Nature transcending the purely rational -- perhaps resembling Jung's "Collective Unconscious." "The Numinous" or "The Mystery" might be better synonyms: I think of it as the sort of reality encountered on DMT. -- Ed.]

*"If we can combine our knowledge of science with the wisdom of wildness, if we can nurture civilization through roots in the primitive, man's potentialities appear to be unbounded. Through his evolving awareness, and his awareness of that awareness, he can merge with the miraculous -- to which we can attach what better name than "God"? And in this merging, as long sensed by intuition but still only vaguely perceived by rationality, experience may travel without need for accompanying life."*

["Experience" seems to be Lindbergh's synonym for individual consciousness. "Life" is used rather confusingly here in the specialized sense of incarnation in a physical body. --Ed.]

*"Will we then find life to be only a stage, though an essential one, in a cosmic evolution of which our evolving awareness is beginning to become aware? Will we discover that only **without** spaceships can we reach the galaxies; that only **without** cyclotrons can we know the interior of atoms? To venture beyond the fantastic accomplishments of this physically fantastic age, sensory perception must combine with the extra-sensory, and I suspect that the two will prove to be different faces of each other. I believe it is through sensing and thinking about such concepts that great adventures of the future will be found."*

*Life magazine, July, 4, 1969 (Moon flight issue)*

The magazine editors requested a comment from a hero of American aviation about the first Moon flight: arguably the highest technological achievement of humankind; instead of just another "tribute to technology" they received the testimony of a mystic: "...only **without** spaceships can we reach the galaxies... only **without** cyclotrons can we know the interior of atoms..."

When you consider the restrictions placed upon physical space travel by the speed of light, it stands to reason that consciousness is our only credible vehicle to the stars: a fully enlightened Mind could in theory travel instantly to any point in the Cosmos. The first human to "fly solo" across the Cosmic Ocean to *Alpha Centauri* was probably some unsung shaman swallowed by time aeons before Lindbergh's crude Atlantic crossing in an airplane.

The most plausible scenario for space travel seems to involve psychonauts, not astronauts. The implications of this idea favor Terence McKenna's insights about a dimensional shift in consciousness: the "interiorization of the body and exteriorization of the soul" said to be imminent around the year 2012. Although long considered the ravings of kooks, such concepts are becoming increasingly plausible due to insights provided by psychedelic drugs and quantum physics. The most interesting part is that anyone willing to ingest the catalysts can explore these realms and find out for themselves.

\*\*\*

## ON ABUSING SUBSTANCES

Because the earth seems to abide we dodge death by indulging delusions of permanence. Thus, the unconscious ideals of materialism are a kind of constipated illusion: trying to transform experience into matter by controlling and fixing its flow. (The exact *opposite* of Alchemy.) Materialists seek to control process by quantifying it. The ultimate materialist act is the fabrication of *essence* into *object* to be sold at a profit. As soon as you objectify essence you have some version of an Interstate 40 Curio shop ("See real Indians!"), or global tourism to super-sanitary franchised fantasies: Theme Parks on the moon.

In this process money-spending becomes confused with living: "I spend therefore I am." Life feels inauthentic unless one can *buy* it, because anything one doesn't pay for is worthless (or at least suspect and probably unsafe) in a materialistic value system. The commercial transaction often implies both the control of matter and a safe distancing from verisimilitude. (The concept of a franchise is the concept of secure predictability: the same experience repeated forever: Burger King is Burger King is Burger King.) Like the viewing of television, this kind of purchased experience is passive, protected, predictable and ultimately vicarious. Virtual sex, for example, is more than just an over-response to AIDS, it is a summation of the materialist's fear of life. (Having one's cake and eating it too is an anal retentive's dream of heaven.)

"Substance" is a synonym for matter. Under that definition, substance *abuse* (materialism) is the defining characteristic of our culture -- we are a nation of matter junkies. Thus the ingestion of "substances" (consciousness altering drugs) is anathema to the materialist because the experience is so immediate and unpredictable -- so out of control: so unsafe: *so challenging!* Since the psychedelic drug experience questions material values far more often than otherwise, the concept of the "substance abuser" has emerged as the coprophage's unconscious metaphor for his own dysfunction -- the projected scapegoat for his deepest fears. However, because life is a verb and not a noun, matter has no true existential validity (it doesn't *matter*) unless it's in motion. From that perspective, psychedelics are like laxatives for the Clean Restroom mindset.

## MODELS FOR THE USE OF PSYCHEDELICS

1. **Religious monotheism model** = use of psychedelics in association with varying degrees of doctrinal structure: e.g.: formal ritual, church hierarchy, etc. which is correlated with a monotheistic absolute, such as Christianity. *Examples:* Native American Church, Peyote Way Church of God, *Uniao do Vegetal*, etc.

2. **Spiritual polytheism model** = Usually less emphasis on hierarchical authority, with many entities competing for the attention or worship of the subject. Although usually ritualized, effects may be complex, open-ended and relatively unstructured. *Examples:* Many shamanic tribal cultures, some of the Amazonian ayahuasqueros, some Wiccan covens, etc..

3. **Warrior/explorer model** = use of psychedelics to confront the mysteries of being, explore the unconscious psyche, etc. *Example:* Terence McKenna.

4. **Shamanic model** = use of psychedelics to cure disease, remove or cast hexes, communicate with hidden powers on behalf of clients or the tribe. *Examples:* Maria Sabina, Amazonian ayahuasqueros, Peruvian San Pedro curers.

5. **Medical model** = use of psychedelics to alleviate the stress and pain of terminal illness, curb alcohol abuse, etc. *Examples:* many highly successful research programs in the fifties and sixties, since discontinued.

6. **Psychotherapeutic model** = use of psychedelics in conjunction with a therapist to enter deep unconscious areas of the psyche for individual insight and growth. *Examples:* (from the sixties) Stanislav Grof, Masters and Houston; (currently) Outlaw MDMA therapists.

7. **Hedonist model** = use of psychedelics to get high and enjoy oneself, have fun. *Examples:* Timothy Leary, Ken Kesey, "The Sixties."

8. **Brainwashing model** = use of psychedelics as a weapon of warfare. *Example:* CIA's LSD experiments.

-- Jim DeKorne

## PHALARIS UPDATE

---

---

The discoveries now emerging from the *ER* network regarding *Phalaris* grass are nothing short of incredible. It is as if a Trans-Personal Intelligence were revealing data deliberately designed to create the widest possible opportunity for the mass expansion of consciousness. Having been exposed for years to Terence McKenna's ideas about global changes in awareness, the "ingression of novelty into time," and the "end of history" a scant 18 years away, I can't help but feel that it is all happening on a scale too large and at a pace too rapid for comfortable assimilation. To really understand McKenna, you have to go where he's been, and that's becoming easier all the time.

Once upon a time, not so very long ago, people could at least *imagine* a credible future: education, career, marriage, family, growing old with dignity and a death surrounded by loved ones: in short, a life infused with plausible rewards for the effort of drawing breath. Now posterity fades before our eyes: no one knows what's lurking over tomorrow's horizon, other than that it will likely be darker than today's. Our survival prognosis is grim: barbarous abuses of power escalate unchecked while social structures developed over long centuries disintegrate within decades, years, even weeks and days, with nothing to replace them except generic forebodings about our destiny. That's a hell of a way to spend your life.

Since consciousness is our essence, it is both the problem and its solution, and anything that can alter the reality perception of a significant mass of humanity has the potential to save our asses before we destroy them. As the cliché says so well: "We need all the help we can get."

Now conjecture a Trans-Personal Evolutionary Intelligence, charged with elevating Human Awareness into higher realities. We have sunk so deeply into matter that most of us can hardly imagine other realms of being, so this Intelligence must first provide a *catalyst* to blast us out of our material myopia. To be effective, this catalyst must be available to the widest possible number of people at little or no cost: something so common that it would be impossible for the entrenched power structure to control or destroy; it must be easy to use, requiring minimal preparation; and it must be potent, even psychologically dangerous, for nothing less will open our awareness to the encompassing Mystery. (The ego must understand that this is an all-or-nothing proposition: there are no comfort

zones in the unknown.) The catalyst must be brand new -- it cannot have a history of use because control structures must be non-existent: the law mustn't touch it before it becomes so endemic that it transcends all possible control.

The *arundinacea* and *aquatica* species within the *Phalaris* genus of grasses fit the above catalyst description perfectly. These species grow both wild and under cultivation over large portions of the United States. Although many (most?) varieties are not considered psychoactive, there is some evidence suggesting that stress to the plant, as in overgrazing, may activate tryptamine production in almost all varieties -- alkaloid synthesis appears to be the plant's defense against predation. This hypothesis remains unproven at present, but it is well worth investigating. I have heard of grasses growing wild along irrigation ditches in Oregon which are extremely potent. ("Over-potency" is an important factor to be considered when experimenting with *Phalaris* grass -- there seems to be a high concentration of 5-MeO-DMT in most varieties, an alkaloid best appreciated at lower doses.) When combined with a tea or extract made from *Peganum harmala* (Syrian Rue) seeds, one teaspoonful of potent *Phalaris* juice (see wheat-grass juicer article that follows), can create an authentic analog of the Amazonian ayahuasca brew. When this *Phalaris* juice is dried to a powder, it may be smoked for a DMT-like experience. Depending upon DMT concentration and its ratio to the usually accompanying 5-MeO-DMT in the grass, this experience can vary in its effects. (See smokable tryptamine comments below.)

A friend describes 5-MeO-DMT as the "Power," and DMT as the "Glory." Either alone or in combination

these alkaloids can evoke something analogous to the "fear of God" so prominently mentioned in the Old Testament. There is no doubt that these substances provide us with an opportunity to experience the numinous in our lives. Which is exactly what the world needs right now. — *Jim DeKorne*

#### SMOKABLE TRYPTAMINES FROM PLANTS

I have one point of criticism about what you call (repeatedly) "smokable DMT from plants." I think this is very imprecise, sloppy language, which is misleading and will give a wrong impression to not-so-educated readers, and it really ought to be changed!

(Reminds me a bit of the old booklets: "how to extract LSD from morning glory seeds [which actually contain only LSA, as WE know] in your kitchen.")

I am one of the lucky (alas few) people who've smoked both chemically pure N,N-Dimethyl- and 5-Methoxy-N,N- dimethyl-tryptamine. All other people (experts only) whom I gave some to try agreed with me that the effects from these two substances are different not only in duration (5-10 min vs. 2-3) but definitely also in the quality of the trip. (And *all* people would prefer the unsubstituted DMT!) If you now consider that 5-MeO-DMT (2-3 mg) is, by weight, far more potent than DMT (50-70 mg, both: freebase, smoked/85kg body weight), AND that (nearly) all plants like *Phalaris* sp. contain considerable amounts of 5-MeO-DMT (even if they contain more DMT by weight, it's usually more 5-MeO-DMT by effective dosage), it should be clear, that it IS and therefore *should* be called SMOKABLE TRYPTAMINES (mixture) from plants. The fact that this mixture is a new source of a hallucinogen that may become quite important in the near future remains untouched, of course. — *WDA, Germany*

[You are, of course, absolutely correct. The error in nomenclature stems both from my initial ignorance of the combination of substances in *Phalaris*, and my initial inexperience with the differences between them. Now that we know better, and until a source of *pure*

plant-derived DMT is identified, we cannot call this anything but "smokable tryptamines from plants." This is how psychedelic myths are created, and I hope I haven't inadvertently started one. Incidentally, although the 5-MeO-DMT trip is quite different from DMT, it has its own interesting features which are now beginning to emerge. — *Ed.]*

#### SMOKABLE AYAHUASCA

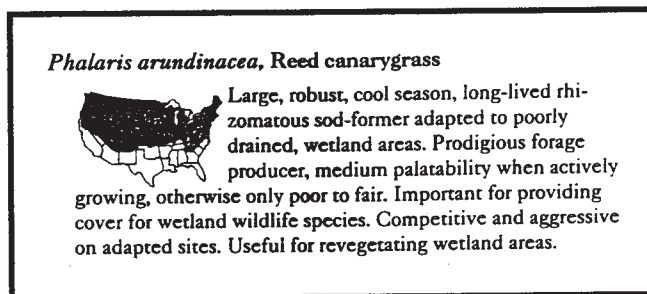

A methylene chloride extraction of *Phalaris arundinacea* (described in Winter '93 and Spring '94 *ER*) was mixed 50:50 with *Peganum harmala* extract (described in Summer '93 *ER*) by soaking in ethanol

on mint leaves. After evaporation, a one- inhalation quantity of this was smoked. The experience was (as Gracie and Zarkov say): "qualitatively different" than the *Phalaris* extract alone. The variety of *Phalaris* used in this experiment contained mostly

5-MeO-DMT, which is an extremely intense trip when smoked by itself. With the addition of the MAO--inhibiting *harmala* extract, the experience seems to be somewhat longer and considerably smoother, with what can best be described as a "full body orgasm" as its predominant sensation. (It is my hypothesis that 5-MeO-DMT and DMT affect the chakras along the cerebro-spinal system.) Most people who've tried this combination prefer it to the *Phalaris* extract alone.

A variant of this "smokable ayahuasca," which was originally described by Gracie and Zarkov, in *Notes From Underground* #7, 1985, is to smoke about three inhalations of *harmala* extract prior to an inhalation of *Phalaris*. (The *harmala* is a surprisingly smooth and pleasant smoke. Its main effect is mildly tranquilizing, but not hallucinogenic.) In combination with *Phalaris* this seems to be stronger than the first method, though it still buffers the "alien" intensity of the 5-MeO- DMT alone. There's no doubt that the use of MAO inhibition with these tryptamines synergizes a "qualitatively different" experience: in my opinion, a much "friendlier" one.

— *Gavilan*

## PLANT EXTRACTION WITH A WHEATGRASS JUICER

**Complicated** chemical extraction procedures may be eliminated entirely from *Phalaris* grass and other psychoactive plants (such as *Papaver somniferum* and *Salvia divinorum*) by the use of a wheatgrass juicer. Hand-cranked or motor operated wheatgrass juicers are available in health food stores. Manual models sell in the \$50.00 to \$80.00 dollar range, and are extremely efficient extrac-

tion devices. concentrated into a few potent ounces of "juice."

**Entire** poppy plants or *Salvia divinorum* leaves and stalks (plus who knows what else -- use your imagination) may also be extracted in this manner. However, one must keep in mind that these juice extraction devices were designed for use with grasses and they develop internal pressures of many thousands of pounds. If the

seed tea makes a full strength ayahuasca analogue -- and it's not nearly so hard to get down as some of the traditional brews. One can also take harmala extract in capsule form to eliminate all bitter flavors from the trip. (The grass juice just tastes like grass juice.) The liquid plant concentrates may be kept in jars or bottles in the refrigerator, frozen in plastic containers or dried for

tion devices.

A wheatgrass juicer looks much like Grandma's old-fashioned meat grinder, except that it has a separate spout where the liquid comes out. As one turns the crank, handfuls of *Phalaris* grass are slowly fed into the funnel on top and copious quantities of dark green elixir begin to flow down the spout as the ground up (and nearly dessicated) grass-pulp exits from the rear of the machine. Large biomasses may thus be con-

unit becomes jammed up with too much plant material, and if one does not ease up on the cranking, the machine (especially the stainless steel filter screen) could suffer damage. Always stop to clean the juicer when hand cranking becomes severe. This may be necessary several times during the extraction of large quantities of material.

As little as one teaspoonful of potent *Phalaris* grass juice combined with three grams of harmala

smoking, ingestion in capsules or further extraction with organic solvents. This is a new technique, and many creative applications are possible. Let *ER* know about your discoveries! -- B. Green, NM

*[Be extremely careful with these concentrated extracts: easy ingestion bears no relation to comfort of trip! Begin very conservatively and, PLEASE... avoid overdoses! -- Ed.]*

### **LAWNS OF PHALARIS**

**Q: I am** interested in planting a lawn of *Phalaris* grass. To obtain a lawn's worth of seeds from an ethnobotanical outlet would be prohibitively expensive. How about commercially available seed -- it's much cheaper than the specialty suppliers. How does it compare? Where can one obtain seed of the "Turkey Red" variety? As the grass is used as animal fodder, can one obtain it ready-grown? -- *Anon.*

**A: The** purchase of potent *Phalaris arundinacea* or *aquatica* seed varieties is frustratingly problematic: the grasses are extremely uneven in tryptamine content. Some varieties appear to contain nothing psychoactive, some have only DMT or 5-MeO-DMT, but usually combinations of the two. Seed is readily available from many commercial sources but who knows whether it represents a potent variety? Unfortunately, extensive breeding has been carried out to *eliminate* the tryptamine containing types, so logically one might expect to get more benign seed than otherwise. For the same reason, one could not plausibly expect to purchase a harvested bale of *Phalaris* grass that was very potent -- their alkaloids were originally discovered because livestock was getting sick from eating it. If a stockman bought some bales of *Phalaris* that killed his sheep, he'd likely sue the supplier.

**Also,** I understand that even potent strains (such as "Turkey Red") may be self-sterile and do not necessarily breed true: one could get seed from such plants that *still* might not produce the desired alkaloids. For this reason, it is probably best to obtain root cuttings which are then planted out. The little plants spread vigorously via rhizomes, and in a year or two the new clumps can in turn be sectioned to eventually create a large lawn of known potency. To date, this *appears* to be the only way to guarantee consistently repeatable results. *On the other hand*, there is now speculation that stress to the plant might initiate alkaloid production. Since *Phalaris* is not normally planted as a lawn, it is possible that once established, weekly mowing would induce prolific tryptamine synthesis. (The image of lawnmower grass-catchers full of this stuff boggles the mind, since only teaspoon-sized doses of the juice are considered quite potent.) Obviously, more research needs to be done to nail all this down. -- *Ed.*

### **DMT SPECULATIONS**

**I wonder** if it's possible to establish some rules of thumb for the number of DMT inhalations required to pass specific barriers. For example, one toke usually evokes swirling colors, often (especially on initial trips) of a distinctly menacing quality -- the "guardian of the threshold?" Three tokes seem required to evoke entities. What about four? (Few people seem inclined to opt for the higher doses.) This is basic shamanic information, and it would be useful to establish some general parameters of experience to help map our exploration into these realms. Low and intermediate doses can be extremely valuable, depending on one's intent. Also, color in the natural world is created by the absorption and reflection of wave-lengths of white light. Where do the colors (not to mention the patterns!) come from when you're on DMT with your eyes closed? -- *JM, MS*

### **MEDITATION DIET**

**When** preparing for ayahuasca medicine journeys, a simple diet of fresh foods without salt or spices is best. Steamed fish and rice for five to seven days is recommended. To be avoided at all times at least five days prior to the journey are all aged foods: raisins, (and all dried fruits), ripe avocados, ripe bananas, brewers yeast, brags amino acids, any supplements and protein drinks containing the amino acid Tyrosine. Avoid coffee, chocolate, soy sauce, cream or yogurt, sauerkraut, cheeses (especially aged cheeses), any fermented beverages: beer, red wine, distilled spirits. Broad beans, herring, lox, jerky and smoked foods are also to be avoided. Chicken livers and snails are not to be eaten. All narcotics, barbiturates, antihistamines and alcohol must be free from one's system prior to this meditation.

**This** discipline is well rewarded and worth the effort. A word to the wise: to disregard this diet can be rather unpleasant. These plant teachers are healing in ways beyond description; approach them with respect and enter the ocean of the souls. -- *AS, NM*

[The above diet has been proven to reduce nausea and somatic side-effects, as well as much of the psychological stress associated with ayahuasca ingestion, specifically including *Phalaris* ayahuasca. -- *Ed.*]

## FLYING OINTMENTS -- ANCIENT AND MODERN

---

*Flying ointments are found at a variety of points in magical history and many cultures. The essential ingredients are a grease base, one or more of the poisonous solanum species (Datura, Henbane or Deadly Nightshade and sometimes Aconite or Wolfsbane). The ointment is smeared on the forehead and around the thighs and was occasionally applied internally to the female genitalia using a broom handle, hence the myths. The alkaloids of the solanaceae cause drowsiness and unconsciousness in which hallucinations of flying occur and in which real astral travel is possible...All these alkaloids carry a severe risk of fatal poisoning however, and it is unwise to overdo or ingest the mixture. -- P.J. Carroll, **Liber Null & Psychonaut** (1987), Weiser, York Beach, ME*

\*\*\*

*The well-known historian of witchcraft and magic Dr. Karl Kiesewetter -- one of the first to experiment with witches' ointments in modern times -- died of poisoning after one of his experiments. What the poison was is not known, but if we look back at the list of plants we will find several which, used internally, are fatal in a sufficiently high dosage, and some -- for instance monkshood -- which can be deadly dangerous applied externally. From this we might get the impression that the witches risked their lives every time they smeared themselves with the ointments, but there is no evidence that they ever ran into trouble. The reason for this is undoubtedly that the preparation of the ointment was entrusted only to those witches who knew their plants so well that any risk was ruled out in advance. -- H. A. Hansen, **The Witch's Garden** (1978) Unity Press, Santa Cruz, CA*

\*\*\*

### **DMSO (Dimethyl Sulfoxide)**

*Absorbed through the skin nearly instantaneously, DMSO is a potent vasodilator almost without peer. In other words, it widens the blood vessels, reducing swelling and allowing any chemical with which it is married to enter the bloodstream faster than a New York minute. So versatile is this chemical that the army experimented with DMSO as a medium for spreading hallucinogens during its infamous riot-*

*control research program in the '60s and early '70s. -- H.L. Rosenberg, "The DMSO Affair," **New Age Journal**, June, 1986*

[Does anyone who understands the procedures feel like using the Freedom of Information Act to get the full scoop on those experiments? There might be some interesting data on how to use this stuff. -- Ed.]

\*\*\*

*The dipolar solvent characteristics of DMSO appear to facilitate the entry of catecholamines (dopamine, norepinephrine, and epinephrine) across the blood-brain barrier. It has been suggested that this phenomenon may be related to the ability of DMSO to serve as a carrier of biogenic amines to traverse both aqueous and lipid phases of components of the barrier...Skin areas such as the neck, face, underarm, knee and elbow joints were particularly sensitive to DMSO...None of the skin effects induced by topical DMSO are felt to be severe enough to warrant a contraindication to its use...**Absorption:** The rate of dermal absorption by DMSO is dependent on its concentration. An increasing rate of absorption is seen up to about 90 percent strength. The optimal concentration for absorption through the skin barrier is 70 to 90 percent.-- Halstead and Youngberg, **The DMSO Handbook**, Golden Quill (no date on xerox) ISBN 0--933904-08-8*

\*\*\*

*Experience indicates that 90 percent (DMSO) is not well tolerated on the face and neck, and in almost every case 70 percent should be used. 70 percent in most other situations is as satisfactory as with 90 percent. Where 90 percent has proved too irritating, start with 50 per cent and then increase to 70 percent as tolerance increases... Also, individuals with blond or red hair seem to react more to the DMSO. The concentration should be reduced to 50 percent or 70 percent in these cases. (Note: Dilution of DMSO with water will produce heat. This is not a chemical reaction but only heat of dilution. There is no hazard involved.)*

*Approximately 85 percent of patients experience a*

*typical histamine-type reaction at the site of application, usually transient mild itching and burning and some erythema. This is not considered to be a true adverse reaction to the drug but a typical side effect.* -- P. McGrady, Sr., *The Persecuted Drug: the Story of DMSO*, Charter, NY, 1973

\*\*\*

DMSO has the property of dissolving a wide range of substances and carrying them through the skin directly into the bloodstream. We were among the first to use it when it was developed in 1967. I often noticed a garlic taste during some experiments. Eventually we realized that it was the DMSO that was causing the effect by absorption through the skin. Fortunately I wasn't handling any

toxic substances otherwise I would probably have been poisoned. At that time we discussed the possibility of dissolving LSD in DMSO, but never tried it. The possibility of pharmaceutical drug delivery using penicillin or tetracycline dissolved in

DMSO was also discussed. As far as I know, no clinical trials were ever carried out using DMSO drug delivery, although it seems to have major potential. The big problem is that the amount absorbed through the skin may vary tremendously, and one could easily overdose -- the difference between a trip and an overdose may not be very large. There is also the question of long term stability of the drug in DMSO. DMSO can be obtained from most health food stores.

Another substance with similar properties is Oil of Wintergreen (methyl salicylate). This can be obtained without prescription from pharmacies. Methyl salicylate is chemically similar to aspirin, which is the sodium salt of salicylic acid. Oil of Wintergreen is a major component of deep heating lotions because of this property. Like DMSO, it can also transport dissolved substances through the skin.

A third substance with this property is Garlic Oil. Simply crush some garlic and rub it on the skin. Soon it will penetrate and produce a sensation of warmth. These three solvents could form the basis of some in-

*For some unknown reason, the FDA has established a unique set of drug standards that are singular only to those compounds which they are intent upon keeping off the market. If the FDA were to apply the same drug standards to drugs now approved and in use as they have applied to DMSO, there would not be a single drug available in the United States today. The same standards that are imposed upon DMSO would also eliminate table salt, aspirin, alcoholic beverages and cigarettes.*

#### ***The DMSO Handbook***

teresting experiments. For example, grind some Hawaiian Baby Woodrose seeds very fine using one of the solvents as a base until it forms a salve. The best place to apply the ointment would be under the armpits or in the groin. (The places where one sweats will be best because the skin there contains the most pores.) The advantage of a salve, of course, is that one bypasses the stomach and the nausea. DMSO is probably the best solvent since it does not react with the solutes. The other two may react. -- *Solaris*

\*\*\*

DMSO will take most anything through the skin. The thinner the skin the better the penetration. The skin of the neck, around the eyes, and in the genital region is

the thinnest. I'd recommend the neck. The only problem I see with this is easy ODs (and garlic breath from the DMSO). When applying stuff to the body one deals with hydration of the skin (the wetter the more absorption), skin thickness, and occlusion (occluding the area of application with

Saran Wrap or non-porous material markedly enhances absorption). The other problem with DMSO is that it takes everything in with it. If there is a carcinogen or contaminant the skin has no means of dealing with it like the gut has.

I went fishing in Mexico with a Japanese couple. The wife was a tiny little woman. She applied a scopolamine patch to her neck to avoid sea sickness. About half way through the voyage she began talking to imaginary beings. She tripped for about eight hours after we took the patch off. The Take Home Lesson: Topical application of tryptamines in DMSO should work just fine. Dosage should be conservative (10 mg) since there will be direct absorption without MAO inhibition. (Even with harmine and oral ingestion there isn't complete MAO inhibition.) 90 percent DMSO is available in feed stores for \$6-7 a pint. "Medical grade" DMSO is sold as "Rimso." 50 ml of 50% DMSO (Rimso) sells for \$44 wholesale. The veterinary product is essentially the same purity but is straight DMSO, not diluted with water. -- *Prof. Buzz De Lux*

As for DMSO "flying ointments," I don't really see the need to use an ointment unless one is using herbs which cause digestive distress. Many herbs are intolerable to digest and perhaps your typical "medieval" ointments contained such plants. *Datura* itself, in my experience, does not cause nausea in effective doses, so should not require ointment except for localized anesthesia. As far as what might be a safe dosage for an ointment, I have no experience. However, knowing what I do about *Datura*, I would suggest not to be too shy. *Datura* is psychoactive in non-lethal doses, so you can sort of feel where the boundaries are. In low doses the effects are definite but mild -- it doesn't beat your system to smitherreens like chemical drugs.

My initial experience with *datura* involved a good handful of the fresh leaves, chopped. It was less than a pint in volume. This was simply steeped -- not boiled in this instance. The effect was unpleasantly strong but I doubt I approached physical death. Proceed respectfully -- you'll be fine! You may want to research the effective dose/lethal dose of the alkaloids in *datura* as a guideline. Also, I suggest researching "flying" formulas. Other plants may have played a significant role in their effectiveness. -- *RF, NC*

---

### EXTRACTION QUESTIONS

Is one to expect residues upon extraction with petroleum ether or other of the highly carcinogenic organic solvents? If so, is the concentration significant? Are the impurities found in various organic solvents volatile?

Are the results of extraction with isopropyl or ethyl alcohol as the sole solvent similar to the results of extraction using only an organic solvent? I was unable to discern whether or not an organic solvent extraction might be more efficient with respect to the separation of the alkaloidal fraction.

Ingestion of LSD and a Syrian Rue extract resulted in a "softening" effect with visual distortion being of a sensual and contoured nature. I experienced no ill effects as a result of the synergy.

Any tryptamine not *specifically* controlled is potentially available through chemical supply companies that will sell to retail customers. I have found that the most limiting factor in the attempt at procuring various tryptamine analogues is that most of them are not

synthesized. 5-MeO-DMT, alpha-methyltryptamine, alpha-ethyltryptamine, N-methyltryptamine are all available to the general public. Tryptamine is also available at reasonable rates though I am still unsure as to how to go about introducing it to the plant species (or, for that matter, how to introduce it to mushrooms with the intent of increasing tryptamine--derivative concentration in *fruiting bodies*). -- *RS, CA*

### CALIFORNIA EXTRACTION SOLVENTS

The TRIKE and methylene chloride solvents suggested in the Spring '94 chromatography article are not available in California and are no longer used in the dry cleaning industry here because they are considered carcinogens. Trichloroethane is available from paint stores but I haven't used it for the same reason. Also, all brands of starting fluid (ether) I've found contain other petroleum distillates, including a lubricant that upon evaporation looks and smells very much like 20-W motor oil. This source of ether (a very good solvent for DMT) would have to be distilled for purity before use: say, using only the first 2/3 of the distillate over the column. Ether can be boiled using a hot water bath around the flask and an ice pack or cold water around the column condenser and collecting flask. (Safe if you're careful.) Everyone should learn to distill, collect, and reuse all solvents except water. It's cleaner in purity, not wasteful, and much easier on our mother. A major article dealing with solvents and their purity would be very helpful. After all, these are the "tools" by which we get a handle on the desired end product. To go with this, a list of common solvents, sources, physical properties, etc. would do wonders to combat the frustration factor. -- *YU, CA*

\*\*\*

I hope that in the future your journal doesn't rely exclusively on chemical extractions, but leaves space for those of us who are not so minded. -- *MS, PA*

\*\*\*

What would be of great use would be a friendly source of organic solvents and other chemical supplies. What would prevent one of us from legitimately marketing legal solvents and lab supplies? A small advertisement in *ER* would be most useful, since our major concern is of inadvertently alerting the DEA of our interests through our efforts to obtain needed materials. -- *Anon., CA*

# BOOK REVIEWS

---

---

***Pihkal: a Chemical Love Story***, Shulgin, Alexander and Ann (1991) Transform Press, Box 13675, Berkeley, CA 94701, \$22.95 postpaid.

It's past time for me to get around to recommending this book -- I've been assuming that everyone already knows about it. For those of you who don't, ***Pihkal*** (*Phenethylamines I Have Known And Loved*) is an amazing piece of literature, quite unlike anything I've ever read before: Imagine an engrossing psychedelic novel combined with a chemistry textbook, and you have ***Pihkal***. The first half of the book consists of a "fictional" autobiography of the most courageous sort: it takes real guts to reveal yourself like this. Part two is a formulary for no less than 179 different psychedelic compounds -- detailed instructions for how to make such drugs as MDMA, 2-CB, STP (DOM), etc. Thank the gods that the authors went public with this data before it became repressed by the drug gestapo. (This preservation and dissemination of knowledge was their primary motivation for publishing in the first place.) The only problem for most of us is that one must be an experienced chemist to understand the recipes. Never mind that though, anyone seriously interested in the psychedelic experience (chemist or not) will want to own this book.

\*\*\*

1. ***The Construction and Operation of Clandestine Drug Laboratories, Second Edition***, Jack B. Nimble, (1994) Loompanics Unlimited, P.O. Box 1197, Port Townsend, WA 98368 \$14.95 + \$4.00 P&H
  2. ***Recreational Drugs***, Professor Buzz, (1989) Loompanics Unlimited, P.O. Box 1197, Port Townsend, WA 98368 \$21.95 + \$4.00 P&H
  3. ***Secrets of Methamphetamine Manufacture***, Uncle Fester, (1994) Loompanics Unlimited, P.O. Box 1197, Port Townsend, WA 98368 \$24.95 + \$4.00 P&H
- The information in these books doesn't generally cover entheogens, although some of it is of interest to those who are teaching themselves how to do plant extractions; it is for this reason that they are reviewed here. ***The Construction and Operation of Clandestine Drug Laboratories*** has some very creative ideas for how to make your own lab equipment out of everyday

materials. (Separatory funnels out of gallon jugs, various extraction devices out of common household appliances, etc.) It gives a list of DEA-watched chemicals, then tells you how to obtain them from common supermarket and hardware store products. Of the three books, this is the one I found most useful.

***Recreational Drugs*** is written for people who already have a working knowledge of chemical extraction procedures. Its main value for the layperson lies in a brief overview of these procedures (e.g. column chromatography) in the first section, and in the tables, glossary and definitions at the back of the book. The drug formulae in the middle are enough to discourage anyone unfamiliar with advanced laboratory techniques from attempting their synthesis.

***Secrets of Methamphetamine Manufacture*** will be of use only to experienced chemists. (Most of the book was incomprehensible to me.) Chapter 17 tells how to make such psychedelic amphetamines as MDA and MDMA. If you have the expertise, the formulas are in this book.

\*\*\*

1. ***Psychedelic Resource List***, Soma Graphics, P.O. Box 19820, Sacramento, CA 95819-0820, \$15.00 per year
  2. ***Psychedelic Sourcebook***, Will Beifuss, 1430 Wilamette, # 350, Eugene, OR 97401-4073 \$5.00
- As their titles tell you, these are both reviews of books, periodicals, products and services that are of interest to readers of this newsletter. Each is useful, but as you might expect, there is a good deal of overlap in material covered. The ***Resource List*** is the most comprehensive of the two periodicals, containing more listings with detailed comments on each of them. The editor of the ***Sourcebook*** has some restrictions on how payment may be made, so you should write to him (without putting "Psychedelic Sourcebook" on the envelope) for his guidelines. If you're looking for seeds, plants, spores, books or gadgets relating to psychedelics, these publications tell you exactly where to find them.

\*\*\*

I'd like to recommend ***The Merck Index, 11th Ed.***,

1989 ISBN: 991910-28-X. It's one of the most valuable reference sources around: containing over 10,000 concise descriptions of significant chemicals, drugs and biological substances, including metric table conversions, formula index (useful for reading *Pihkal*), chemical abstract numbers, and an invaluable cross-index. The book is leather bound, contains about 3000 pages of high quality paper and retails for only \$35.00! It's available through your friendly university book store with no questions asked. -- *JB, AZ*

\*\*\*

*Opium for the Masses*, Jim Hogshire, 1994, Loompanics Unlimited, PO Box 1197, Port Townsend, WA 98368, 116 pages, \$14.95 plus \$4.00 P&H

Opium is not customarily regarded as an "entheogen," although it has been used for centuries as a catalyst for artistic inspiration. (Coleridge's immortal poem, *Kubla Khan*, is perhaps the most famous example of a work of art directly "channeled" via opium ingestion.) If we concede that the definition of *entheogen* ("That which evokes the god within") must also include the evocation of the artist's *Muse* ("Any of nine sister goddesses associated with the Graces in Greek mythology"), then opium is unquestionably a member of this class of substances.

*Opium for the Masses: A Practical Guide to Growing Poppies and Making Opium*, by Jim Hogshire presents everything you need to know about the history, cultivation, harvest, and use of the opium poppy (*Papaver somniferum*). In the process, he exposes the hysterical mythology surrounding this plant and provides a sane, clear-headed perspective for its responsible use. Without minimizing the dangers inherent in ingesting any potentially addictive substance, the author places it all in the context of reason and common sense: yes, anyone can cultivate an opium habit, but not unless they deliberately and carelessly work at it. Even then, opium withdrawal symptoms sound hardly as excruciating as media hype would have us believe -- more like a bad case of the flu than the standard "hooked for life with a monkey on your back" DEA-Hollywood scenario. For any adult with an even mildly intact shamanic will, occasional opium ingestion is too innocuous to merit comment. (The rule of thumb in these matters is that one invokes the god or goddess, not the other way around.)

Although the opium poppy has technically been illegal to grow in this country for most of this century, the laws against its cultivation are seldom enforced: generally because this truly dazzling flower is unrecognizable by most people (including the police) as the darkly sinister herb of "dope fiend" propaganda. (Your grandmother probably has several dozen of them gracing her garden right now.) The plant is prolifically self-seeding, reproducing (and growing) more like a weed than an ornamental. Consequently, potent *Papaver* seeds are readily available from a myriad of sources -- some of which will amaze you. (If you're a city dweller, chances are you live within less than a mile of a perfectly legal seed stash.)

Until now, the labor-intensive nature of harvesting raw opium hasn't been able to produce enough "product" to make it profitable as a street drug, hence it hasn't been greatly abused in recent years. This book could change all that -- Hogshire describes efficient modern methods of extracting large quantities of this plant's alkaloids. Thus, the social fallout from the information in this one volume might easily re-stimulate legal repression, and in a year or two the absurdly easy access to *Papaver somniferum* described in *Opium for the Masses* could be shut down. Those readers interested in exploring the many possibilities offered by opium are advised to get this book now.

-- *Jim DeKorne*

---

### *EASY OPIUM EXTRACTION*

I was able to produce some very high grade opium in considerable quantity from only five plants by extracting the juice of whole plants (leaf, root and all!) through a wheatgrass juicer, then gently evaporating the juice in a glass tray in a dehydrator. This yielded huge black balls of high-grade opium (around thirty potent doses) from plants raised from seed. The optimum time for a juice harvest is just before the plants flower. Incidentally, *Cannabis* is nicely synergistic with opium. -- *B. Green, NM*

\*\*\*

### *LAUDANUM AS MEDICINE*

The reference to laudanum (*Inner Voices*, pg. 2) in the Summer '94 issue of *ER* prompts me to recommend that elixir as a very useful analgesic. Once when I strained my back by improperly lifting a heavy stove,

I was totally incapacitated by spasms of intense pain. It was a Sunday and the local clinic was closed; my back muscles were going through cyclic tensions so severe that I was unable to relax enough to tolerate the 40 mile trip to the hospital without having to resort to an ambulance and an EMT -- which I couldn't afford. Approximately half a gram of raw opium dissolved in an ounce of tequila provided enough pain relief to relax me through the night. Since then we always keep a pint of homemade laudanum in the medicine cabinet for emergencies. -- *Anonymous, SD* [Note: "Laudanum" is just opium dissolved in alcohol. -- *Ed.*]

*LAUDANUM AS ENTHEOGEN*

I'm glad to see (*ER*, Summer '94) that you've gotten some deep-brain massages through the use of laudanum. I'm a big proponent of the use of opium and specifically its ability to break down the barriers between our temporal lobes and "higher" cerebral cortex. I think it's the melding of the temporal lobe with the conscious mind that produces the "dreamlike" hallucinations and pithy words of wisdom along with those reams of Victorian poetry. Learning foreign languages I've noticed something similar to the dream messages recorded by the pillow. Sometimes I kept hearing a phrase in the language I was learning floating through my mind during the day -- similar to the way a song lyric plays again and again in your subconscious. (An annoyance, usually.) But sometimes, if I yanked the phrase out of the ether and translated it -- lo and behold it turned out to be either an answer to a problem that I'd been having or at least some helpful insight. Does this have anything to do with the old saw about not using 90-95% of our brain's capacity? -- *JH, WA*

*LAST MINUTE NOTES ON PHALARIS*

I try to lay out each edition of *The Entheogen Review* as early as possible to avoid eleventh-hour hassles.

Sometimes this results in having no more room for important late-breaking data. Because extracting *Phalaris* grass with a wheatgrass juicer is such a new and innovative technique for utilizing this important entheogen, I have made special room for the following material. **This just in:** *Phalaris* expert Johnny Appleseed advises caution when using this new technique. He says that *logically* there should not be enough tryptamine content in only *one* teaspoonful of juice to produce the reported effects. This suggests that other chemicals are probably involved. He asks us to remember that these grasses are known to *kill* sheep that eat them. In other words, be cautious with this stuff until we know more about it! -- *Ed.*

*PHALARIS AYAHUASCA*

I swallowed approx. 1 gram of *Peganum harmala* extract in three capsules. One hour later I took 1 teaspoonful of fresh-squeezed juice from *Phalaris arundinacea* (var. Turkey Red). Three hours later the strong effects began (until then only mild plus-1 and plus-2 symptoms were noted). The experience

CLASSIFICATION OF RELATIVE TOXICITY CATEGORIES		
TOXICITY RATING	COMMONLY USED TERM	PROBABLY HUMAN LETHAL DOSE 70-kg (150-lb) MAN
6	Supertoxic	< 5mg/kg A taste-7 drops
5	Extremely toxic	5-50mg/kg 7 drops-1 teaspoonful
4	Very toxic	50-500mg/kg 1 tsp-1 ounce
3	Moderately toxic	0.5-5g/kg 1 oz-1 pint or pound
2	Slightly toxic	5-15g/kg 1 pint-1 quart
1	Practically nontoxic	> 15g/kg 1 quart

rapidly grew to plus-3, lasted about two hours, then subsided. The trip was extremely uncomfortable, with constant diarrhea, weakness, dizziness, and mild nausea. The "psychedelic" effects were without colors, insights or euphoria, but with a characteristic "tryptamine buzz" and overtones of nameless anxiety. Very weak, I lay on the bathroom floor, not wanting to be far from the toilet, since the recurrent diarrhea was intense. The word *intoxication* kept running through my mind -- I was experiencing something "toxic" for sure! Others have taken this combination without such negative symptoms, so I suspect that everyone may respond to it in their own way. I was amazed how only one teaspoonful of juice could be so potent and was glad that I hadn't ingested more: the trip took so long to come on, I thought perhaps I hadn't taken enough. Don't be fooled by that! -- *JG, CA*

# NETWORK FEEDBACK

---

## PRESSURE CANNER SOURCES

**Q:** What is the address for the All-American Pressure Cooker Co. mentioned in the Oss/Oeric Mushroom growers guide? They sell an eight-quart cooker for \$50.00. -- *CW, NC*

**A:** The days of the \$50.00 canning cooker are long gone. Last year I paid \$30.00 for a 1950's vintage cooker at a flea market after pricing a new one in a restaurant supply store at \$95.00. The Wisconsin Aluminum Foundry Co., Inc., Manitowoc, WI 54220 sells several models beginning at \$65.00. (The 7 quart model is \$98.00.) If you go the flea market route, be sure you can still purchase gaskets for whatever make/model you buy. A \$15.00 "bargain" cooker proved worthless because they no longer make gaskets for it. -- *Ed.*

## ABSORPTION ENHANCEMENT

There is a natural regulation of absorption from the gut which is changed by alcohol and pepper. Both these "open up" the gut to allow absorption of macromolecules. If one wanted better effects of ayahuasca one could either drink a bit of alcohol or eat hot spicy food (a Bloody Mary?) just before ingestion. -- *Prof. Buzz De Lux, CA*

## LSA CONCENTRATION IN WOODROSE SEEDS

Recently I divided the shell from the meat of two baby wood rose seeds, thinking most of the amide would be in the meat. I put it in a capsule and swallowed it. Many hours passed and I noticed no effects at all. So then I took the shell, which was broken into about ten pieces, and swallowed them without chewing. Bingo! Positively 100% of the amide is in the shell. It would be interesting to clarify just how much LSA is in two baby wood rose seed shells, which weigh about 40 mg. -- *PH, NM*

## FUZZY SEED COATINGS?

Conventional wisdom says you must remove the fuzz from the seeds of the Hawaiian Baby Woodrose. I have never seen any HBW seeds which had fuzzy coatings -- have I been missing something? I have somewhat flu-like aftereffects with HBWs, and leg cramps with most morning glories, thus find *Stipa* appealing. -- *BD, CA*

## FEEDBACK ON SLEEPY GRASS

I have tried *Stipa robusta* seeds four times, resulting in barely threshold effects each time. The first time, I chewed and swallowed 15 seeds. The second time, 25. For my third experiment, I broke open 35 seeds and allowed them to soak in a mug of cool water for an hour. I drank the water, discarding the seeds. My last experiment was again with 35 seeds, this time chewing instead of drinking. All experiences were weak, but the tea was strongest. Perhaps *S. robusta*, like the morning glories, must be ground and soaked. I am interested to hear other *S. robusta* experiences. Let's map this thing out! I felt no unpleasant effects, but woke up with a strange feeling after the first two times.-- *GW, NY*

\*\*\*

I took 3 *Stipa robusta* seeds, and the effect was definitely a plus-2. They took effect in about 30 minutes and produced mild after-images and colors equivalent to a good flashback for about 8 hours. The second time, 5 days later, I ate at least 20 seeds over two hours and experienced almost nothing, with a mild stomach feel. About 2 weeks later, I ate a spoonful of *P. harmala*, waited 20 minutes, and ate at least 40 seeds. Nothing but stomach feel again. I don't understand this lack of effect of any but the first dose. -- *JB, TX*

\*\*\*

In Vol. 2, #3 you had a user's report on sleepy grass. This person recorded a shift in consciousness from ingesting 9 seeds. Has there been further feedback? I've tried it three times on up to 120 seeds with no

effect. --RN, WY

\*\*\*

**Q:** Where can I obtain samples/seeds of *Stipa robusta*? -- Anon.

**A:** *Stipa robusta* (sleepy grass) has recently been found to contain lysergic acid amides. It appears to be par for the course for entheogenic grass species to vary widely in alkaloid content. *Stipa* from some areas is more potent than that growing in others. It is said that specimens collected in the Sacramento mountains of New Mexico are the most powerful. Because the LSA is synthesized by a symbiotic fungus and not the grass itself, potency presumably depends upon how much fungus the grass contains. Also, why not try a decoction made from the grass foliage (as with *Phalaris*), since more could be expected there than in the extremely tiny seeds. This is all still very new, and much "grassroots" research needs to be carried out before we can make definitive statements. Seeds are available from: Horus Botanicals, HCR 82, Box 29, Salem, ARK 72576 -- Ed.

### HERBAL ADMIXTURES

I've found that adding huge amounts of Ginko and Gotu Kola to an entheogen is really beneficial. There is no tight-headedness or cramping feelings, and clarity and just plain good feelings seem to be added to the experience. I've used this combination with *P. viridis* ayahuasca, mushrooms and *Salvia divinorum*. -- Eli X, TX

### SYNTHETIC ENTHEOGENS

**Q:** So far it appears that *The Entheogen Review* has focused on plant/nature-derived hallucinogens. What about synthetics? For example, LSD, synthetic DMT or phenethylamine-derived entheogens like MDA and MDMA? Is there a philosophical orientation against synthetics, and if so, why? -- VP, WA

**A:** I had a bias against synthetics when *ER* was first conceived, but I've outgrown it. Any substance or technique which evokes "the God within" is a legitimate subject for this newsletter. -- Ed.

### FDA CORRECTS GOD'S MISTAKES

Yohimbe is one of the herbs the FDA will probably "ban" this year along with *Lobelia inflata*. Apparently they are also going to ban *Ephedra sinensis* (Ma Heung), as one of the wholesalers in LA told me they couldn't sell it anymore due to FDA restrictions. I guess the FDA and DEA don't need to hold public hearings, or even present scientific data to justify outlawing herbs or plants. They probably think the ephedrine would be converted to the HCl base form by some university undergrads. Remaining stocks will jump dramatically in price -- *Lobelia* just went from \$8.50 to \$50.00 a pound from one wholesaler! Of course millions of this species grow throughout the NE.

I notice you have the articles proclaiming *Catha edulis* illegal. I had to read it 10 times to comprehend the surreptitious wording. It never really says the plants themselves are illegal, just the "leaves." So if your plant has no leaves it must be legal? A couple of herb companies still sell plants so the law seems to be anticipatory. Of course, it could be a pretense for liquidating companies like L.E.R., Of The Jungle, Horus Botanicals, etc. -- Anon.

### CALEA CULTIVATION TIPS

It is a common practice to soak seeds in a 50% hydrogen peroxide solution for 24 hours. I left *Calea zacatechichi* seeds in this solution for 3 or 4 days, until they sank to the bottom of the cup in which they were soaking. They tend naturally to float on the surface, so when they reach the bottom it means they've not only broken their dormancy but some of them have already germinated! Then, I sow them on a fine soil mix normally moistened, tamping or inserting them over its surface and keeping them in bright but not direct sunlight. -- OSR, Spain

### GROWING PEGANUM HARMALA

I started some *Peganum harmala* from seed in the Spring of 1993 in some old 5-gallon paint containers. I live in a desert environment and the plants were watered every day by an automatic watering system. I realize that these are desert plants and shouldn't need

so much water but felt that because they were in such small containers they needed it. They grew quickly to a certain size, then stopped. In the Fall I removed one of them from its container and noted the bright yellow roots had coiled over and over at the bottom of the bucket: obviously root bound. If they had been allowed to spread they would have covered an area 3 to 4 times larger than the above ground part of the plant. I haven't been able to get them to flower and suspect they're getting too much water. In conclusion: plant in cactus mix, give lots of root space and once established, cut back on the watering. -- *GD, NM*

[My experience with *P. harmala* is similar. Even with plenty of room for the roots to spread outside, if over watered they'll produce abundant green vegetation but no flowers. The roots also contain the desired alkaloids, but it's a shame to sacrifice such a beautiful plant when you can harvest its seeds year after year. Just keep 'em thirsty. In Southern New Mexico they thrive in the most barren desert imaginable, receive virtually no rain at all, and are in abundant flower for most of the summer. By Fall, each plant has many hundreds of alkaloid-rich seeds. - *Ed.*]

### FEEDBACK ON SALVINORIN-A AND DATURA

I have heard about the *extreme* potency of the diterpene, salvinorin-A, but I have no direct experience with the compound, other than through my chemical research and animal testing. I would, therefore, be very reluctant to make statements about it that could lead to potential misuse by self-experimenters who would put themselves or others in danger or hurt themselves with an overdose. There should be a paper coming out soon in the *Journal of Ethnopharmacology* on human experiments with *Salvia divinorum* and salvinorin-A and I have had a paper accepted for publication by the *Journal of Psychoactive Drugs*.

On reading your interesting journal, I see many plants mentioned that I would consider to be more toxic than recreational, especially the *Datura* species, which are extremely dangerous and are nearly always very bad experiences for anyone that takes them. I would

suggest that one of the two chaperones mentioned by the informant (in Spring '94 issue) be an Emergency Medical Technician with an ambulance ready! Don Alejandro (a Mazatecan shaman) taught me that the visionary experiences are much more important than the plants and drugs that produce them. He no longer needed to take the vision-inducing plants for his journeys. In fact, they are really not necessary for such experiences. I don't believe too strongly in the significance of visions and dreams, myself, but if I did I would probably use meditation or some other non-drug method to attain ecstasy, as I tend to look on natural hallucinogenic compounds to be plant defense mechanisms (poisons) that usually warn off potential predators without killing them.

-- *Leander J. Valdes III, LA*

[Dr. Valdes is one of the pioneer researchers into the ethnopharmacology of *Salvia divinorum*. See the classic paper: Leander J. Valdes III, Jose Luis Diaz and Ara G. Paul -- "Ethnopharmacology of *Ska Maria Pastora (Salvia Divinorum)*, Epling and Jativa-M." -- *Journal of Ethnopharmacology*, 7 (1983) 287-312. Also: L.J. Valdes III, G.M. Hatfield, M. Koreeda, and A.G. Paul -- "Studies of *Salvia divinorum* (Lamiaceae), an Hallucinogenic Mint from the Sierra Mazateca in Oaxaca, Central Mexico," *Economic Botany*, 41(2), 1987, pp. 283-291 -- *Ed*]

### SALVIA AYAHUASCA

I did six grams of *Peganum harmala* seeds with 45 one-and-a-half to two-inch long half-dried *Salvia divinorum* leaves. I think that removing the midribs and allowing them to dry almost completely is the best method. Freezing adversely affects the leaves, turning them brown and deteriorating their potency. There are no real side effects to the above combination other than deep muscle jerks (which are not uncomfortable). This experience lasted eight hours as compared with two hours with the leaves alone and six hours in a previous *Salvia/harmala* experiment during which I was afraid to swallow the leaves. Chewing lemon along with the leaves has beneficial extraction properties, and kills some of the taste as well. This is by far the worst tasting entheogen, though it's my favorite. I seem to be the only one who thinks that the

taste of these plants is essential to the experience. --  
*EB, TX*

### SMOKING SALVIA

I have been experimenting with smoking dried *Salvia divinorum* leaves and I can tell you that it is indeed a powerful entheogen. It seems to work along the lines of DMT in that you need to get a large initial intake or the high just plateaus without a flash. I have smoked an entire joint containing about 3/4 gram of material by myself which didn't come close to the effects obtained by smoking two or three consecutive bong hits. Spooky is a good word to describe the first effects. Before I release my second bong hit I feel a pressure in my cheeks and start feeling a spinal shiver. Then I'm gone. Complete dislocation; if I'm with other people I sense their presence but have no idea who they are. I feel an emotion which is distinct and familiar yet indescribable: something like being very young and not privy to what's going on. Then I start to recognize my surroundings and I am in an energy field that seems to be pulsing from my brain; this field flows out of my body producing audible geometric patterns. At this point I can focus my attention, but the strange thing is that the energy wave seems to flow around my point of focus. The high rapidly falls off from there. Two to five minutes for what I've described, but completely down within twenty minutes, with no apparent residual effects. This is with dried leaves, so I think that salvinorin-A could be a truly terrifying experience -- or maybe that isn't the only active ingredient in *S. divinorum*. Other people I know have tried this method and all agree that diviner's mint is very potent. -- *RN, WY*

### SALVIA PROPAGATION

*Salvia* works best by air-layering cuttings. When branches start to droop over, bend them down. Make a cut in the stem, cover with root-tone, and prop it so the wound is kept open. Bury the part of the stem which is thus propped in dirt and keep moist until roots form.

Only a half dozen leaves are necessary if you don't swallow, but just masticate. This is because the Mazatecs apparently never realized that the active principle is only absorbed through the mouth, not the

stomach. -- *RS, CA*

### SENTENCING GUIDELINES

According to federal sentencing guidelines, required prison sentence without parole for possessing at least \$1500 worth of LSD: 10 years; for attempted murder: 6.5 years; for rape: 6 years; for armed robbery: 4.7 years; for theft of at least \$80 million: 4 years; for taking a bribe: 6 months. Estimated number of Grateful Dead fans now in prison for LSD offenses: 1500 to 2000; four years ago: about 100. Federal sentence received by a 19-year old for possessing \$2000 worth of LSD (first offense): 10 years; sentence he would have received if convicted in state court: 16 months. -- *Playboy*, December, 1993

### SAN PEDRO CACTUS

I recently cooked down three feet of San Pedro: simmered half-inch pieces for 8-10 hours, then blended pieces and separated liquids from solids. The quart of cooking water and quart squeezed from the solids were combined and cooked down to a quart. This was shared by four people with about half a cup left over. No one had any nausea. San Pedro is nowhere near as bitter as peyote. It took a long time to come on, but once the effect started it was strong and unmistakable. There was none of the mental deconstruction I have experienced with LSD and high-dose mushrooms. There was little in the way of visual phenomena. One of us reported entering extensive visual-conceptual structures only to find when he emerged that very little time had elapsed. He described this as being "sideways in time," and regretted being unable to retain any of these visions. No one reported meeting with an entity. I am very curious about this, as the phenomenon seems to parallel the conceptual structures of Vajrayana Buddhism and archetypal psychology, both of which I practice. Hopefully, further excursions will bring more depth and breadth to these experiences. -- *Dr. Sax, VT*

### OTHER MESCALINE CACTI

Please don't eat *Ariocarpus* -- they are 25 times slower growing than peyote and probably rarer. Although some are psychoactive, they are not psychedelic. I

know because I've done them. Peyote, when cultivated, grows quickly and when grafted (onto *Trichocereus spp.* for example), it "balloons" in one season. Don't be a fool: if you don't leave the root in the ground on wild peyote, or grow your own, you're not respecting this plant, and that reflects your entire attitude; I know, I've been there too. -- *DKW, AZ*

[Included in this letter were amazing color photographs of 3- year-old, baseball-sized peyote plants grafted onto what appears to be *T. pachanoi*. The ambience of the photos suggests an expert who really knows how to grow cactus! -- *Ed.*]

---

## MUSHROOM MATTERS

---

### *GYMNOPILUS SPECTABILIS* QUESTION

Any information on *G. spectabilis* dosages would be appreciated. -- *GW, NY*

### *GYMNOPILUS SPECTABILIS* ANSWER

I have tried three grams of *G. spectabilis*. Slight visuals, but it was enough (coupled with my meditation techniques) to propel me into intense, convulsive shivering. On going with it, found it was a memory of the viewing room after birth, where I was intensely cold and scared and needed my mother. Peak was over in 3 to 3 1/2 hours after ingestion. None of the side effects of psilocybin; to my mind the trip was superior. *Psilocybes* always mess up my clarity; this increased it. I know that psilocybin has been found in dried specimens of *Gymnopilus*, but that doesn't mean it's the only ingredient, and I'd be curious to know how much psilocybin was found by these tests. I know from experience that the active principle of *Gymnopilus* deteriorates under even normal drying conditions, much more than psilocybin. The effects are markedly different. -- *BD, CA*

\*\*\*

### *FANE OF THE PSILOCYBIN* MUSHROOM

In the Summer '94 issue of *ER* two readers inquired

about the *Fane of the Psilocybin Mushroom*. It is possible that one of them wrote to the wrong address which I have seen listed incorrectly in other publications. The current address for the *Fane of the Psilocybin Mushroom* is: The Fane, Box 8179, Victoria, B.C. Canada V8W-3R8.

The Fane's headquarters are in British Columbia, with members scattered like spores throughout the world. Membership is open to anyone who agrees with the following principles:

1. That all mushrooms of the genus *Psilocybe* are sacraments and their ingestion is a religious practice and an aid to enlightenment.
2. Everyone has the right to expand consciousness and to stimulate aesthetic, visionary and mystical experience by whatever means one considers desirable without interference from anyone, so long as such practice does not injure another person or their property.
3. We do not encourage ingestion of the sacraments by those who are unprepared.

The Fane is a small but dedicated group of psychedelicists; so, inquiries accompanied by either a self-addressed stamped envelope or suitable contribution would be appreciated. The Fane publishes a newsletter irregularly and encourages networking among its members. Yours in Light -- *DJ, VA*

### *SPORE PRINTS*

I took a *P. cubensis* spore print that was over my stove and in a sterile petri dish for a year and checked its viability. The petri dishes exploded with mycelium in less than 48 hours and not even any contamination. Taking a spore print in a sterile petri dish is the best way I have found. Paper is just a difficult surface to extract the spores from by scraping. -- *Anon., PA*

### *MUSHROOM ALLERGY*

**Q:** During consumption of *Psilocybe cubensis* swelling and inflammation are experienced to a severe degree, which ruins the whole experience. I've never read any mention of this anywhere. Is this common? What is the cause? Can it be avoided? How can the experience be aborted? -- *RW, NV*

**A:** Allergies, of course, are often specific to individuals and are not necessarily applicable to

everyone ingesting a substance. Nevertheless, some mushroom strains display negative traits such as "cloudiness" -- a trip in which the psychedelic effects are muddled by a kind of fuzzy-headedness, unusually severe nausea, etc. It isn't difficult to imagine a strain producing allergens as well. I've heard that drinking a tea or infusion of *Lobelia* will terminate a mushroom trip within fifteen minutes. -- *Ed.*

### *JOURNEYS OUT OF THE BODY WITH DATURA*

My sole experience with Jimson Weed/ Thornapple/ Datura occurred in the Spring of 1973. I was living in a remote house in the Guatemala highlands. At the gate between the patio and a grove of coffee trees grew two tall, dark green datura plants with foot-long white trumpets for flowers. My friend Pete and I dropped four of these into a liter of boiling water. After twenty minutes we poured off the remaining liquid -- just enough for one large enamelware coffee cup apiece.

About ten minutes after ingestion, I noticed a peculiar numbness in my body -- the air around me seemed thick and muffled; objects felt insubstantial and tentative. I climbed into my hammock.

"Hey..." said Pete. His words came as from a deep tunnel. "I wonder if we did too much?"

I was having the same thoughts myself. While it wasn't hard to breathe, the act somehow felt redundant. The numbness then turned to warmth and a feeling of lassitude. My vision blurred...

Sometime later, I felt a surge of energy and left the hammock. Although my vision was blurry, I discovered that if I focused on nothing in particular, I could see perfectly. The first thing I saw was my own body -- still peacefully asleep in the hammock! I "walked" out into the landscape; the colors shifted to a reddish hue. I was aware of a peculiar emptiness: I kept expecting to find something alive here. Who runs this place? I wondered.

Soon a growing fear of deserting my body made me turn back. When I turned around there was a large

shape standing in my path. It was a green triangle, seemingly two-dimensional, about seven feet high and perfectly angled. Reddish shimmers of light or heat radiated from it. My anxiety switched to bone dead fear. I felt that this object had both the intelligence and the power to squash me like a bug. I was paralyzed with fright, though I knew I had to move, to do *something*. Finally, I moved to one side and began walking at angles to the object, watching it from the edge of my vision. The very act of movement was empowering. Emanations from the triangle, now about fifteen feet away, felt like ripples of wind striking me. I turned to face it: "Who are you?" Although the question wasn't spoken, it boomed inside my mind. Then fear again: I was dead meat -- I was going to die in this weird place. I reached inside myself and dredged up my supply of wildness: brought it into my throat, then wadded it between my eyes and let some out.

"You don't belong here," the triangle said in my mind.

"I'm traveling. I drank something and came here." I pumped up my inner energy until I was swollen with power: enormous.

The triangle disappeared. I first felt relieved, then elated and victorious. I had met and survived a meeting with ... *something!*

...Back under the portal, I thought about my body. Boom -- like that -- I was back inside, checking it out. I don't really need this thing, I thought. It's actually slowing me down. Without it, I could soar... I attempted to travel again. I thought about my home in New Mexico and I was there: no feelings of motion or time. I was just suddenly standing outside my house. I saw my neighbor chopping wood. In front of him was a twisted piece of pinon pine. He swung the axe and the blade caromed off the log and buried itself in the ground beside his right foot... Suddenly I felt a wrenching sensation and I was back in Guatemala...

On awakening, the first thing I did was vomit. I was sick down to my toes. Pete was already up, grey-faced and puking... Although I recovered enough to get around within a day or two, I was plagued by

continuous diarrhea... [Author was dangerously ill for months, but eventually made it back to the U.S. -- *Ed.*]

After a month's convalescence with a friend, I went home to the mountains. The first person I saw was my neighbor. He told me of an incident earlier that Spring.

"I was chopping wood," he said, "and I got this strange feeling that someone was standing right behind me."

"And," I said, "the axe skidded and almost took your right foot off."

"How did you know that?"

I told him. I know he'd like to have believed me.

One night, three years after this experience, I was meditating outside. I felt myself move out of my body. At that moment a shape came from behind a pinon tree: deep black and vibrating. It had the same aura of power as the triangle in Guatemala. I was totally unprepared to deal with this and ran like hell back to the house. Then it was outside my door, the power challenging me. As before, I dredged up all of my willpower and stonewalled it. Soon it left. Two nights later it returned; hovering outside the door, demanding my presence. Again I summoned up my courage and will and said: "Go away!" After a few moments of tension, the entity left. It hasn't been back since.

In retrospect, the experience was worth it. Datura can throw you out of your body. It can show you where power resides and give you the power to be anyplace you want to be. It can also kill you. I have no plans to ever take it again. -- *DH, NM*

\*\*\*

I tried a datura tincture once. It was the closest thing to complete psychosis imaginable. My irises were gone due to pupil dilation. At the onset, I had to ride my bike about two miles through a city subdivision: the giant oaks were rustling with an intelligent sentience and my legs were like rubber; my mouth was so dry I could hardly breathe. The next 36 hours were spent in

bed semi-conscious with nightmarish visions and ultimate paranoia -- most lost to the amnesia effects. I now grow daturas only: just being around them is weird enough! -- *Anon. AR*

\*\*\*

I know too well that these plants are powerful and dangerous -- last year two boys died the same month while trying an infusion of an asthma medication which contains datura. -- *HS, France*

### ADVERTISEMENTS

**Hawaiian Baby Woodrose seeds:** \$4.00 per gram, \$18.00 per dozen, or \$35.00 per ounce. Send to: Wildflowers, P.O. Box 46, Ranchos de Taos, NM 87557. Prices include shipping and handling.

Single copies of *The Entheogen Review* (Winter 1992, Spring 1993, Autumn 1993, Winter 1993, Spring 1994, Summer 1994, Autumn 1994) \$5.00 each (\$6.00 outside U.S.) while they last. First year of publication (Autumn and Winter '92, Spring and Summer '93) bound together into 74 page book: \$20.00 (same price as a years' subscription).

*Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants*, by Jim DeKorne, 1994, 155 pages. (Signed by author, yet! ) \$22.00 postpaid from: *The Entheogen Review*, P.O. Box 778, El Rito, NM 87530. Or ask for it at your local bookstore for \$19.95.

"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." -- Terence McKenna

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL. 3, NO.4 : Winter Solstice , 1994**

ISSN 1066-1913 Copyright © 1994, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W94 means that the Winter, 1994 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third

class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can't afford to pay for submissions yet, and unfortunately I often have to edit for brevity, but please keep those fascinating letters coming in.

-- Jim DeKorne

## SALVINORIN A: NOTES OF CAUTION

---

**Salvinorin A** (the major active principle of the plant *Salvia divinorum*) is an extremely powerful consciousness-altering compound. In fact, *it is the most potent naturally occurring hallucinogen thus far isolated*. But before would-be experimenters get too worked-up about it, it should be made clear that the effects are often *extremely* unnerving and there is a very real potential for physical danger with its use.

**When** the herb *Salvia divinorum* is consumed either by smoking the dried leaf or chewing the fresh leaves, the effects are usually (but not always) pleasant and interesting. This is because when used this way the amount of salvinorin A absorbed into the blood stream is usually very small and, in the case of the chewed leaves, is absorbed gradually.

**When** vaporized and inhaled, the pure compound salvinorin A is active at 200 to 500 *micrograms*. [Lest we forget our metric measurements, that's roughly between one-quarter and one-half of *one milligram!* — *Ed.*] Since very few people have the costly equipment necessary to accurately weigh anything close to this small an amount, it is inevitable that people will try to visually estimate the dose. Unfortunately, there is little room for error before the effects become potentially dangerous. When the dose goes above 500 to 1000 mcg the effects can be very alarming. I have seen people get up and lunge around the room, falling over furniture, babbling incomprehensible nonsense and knocking their heads into walls. Several people have tried to wander out of the house. When the experience is over, they have no memory of any of this. In fact, they usually remember very different events. To an outside observer, people in this condition have a blank look in their eyes as if no one is present (and perhaps no one is). It is also common for people to have a facial expression which is probably best described as being like that of a frightened animal. It appears that at these "larger" doses one completely loses awareness of, and control over, the physical body; for some reason part of the brain causes the body to get up and move

about recklessly while the individual has no awareness of where their physical self is or what it is doing. It seems inevitable that one day some careless person will do too large a dose without a sitter and will wander out into traffic, or hurt themselves in some other way.

**Because** the dose is so small and insignificant looking, there is a tendency for people to think they need more than what they are told is a safe dose. Another problem is that the technique of vaporizing and inhaling the compound can be tricky. Salvinorin A has a relatively high boiling point and people often don't get it hot enough to remain a gas all the way into the lungs. Another problem is that so little is used that the vapor often disperses before it gets inhaled. Sometimes people just don't hold the vapor in their lungs long enough for thorough absorption. Several people, after trying a dose in the recommended safe range, and not getting an effect, assume that they need a larger dose, when in fact the problem is that they did not vaporize the material efficiently the first time. I have already seen more than one intelligent, careful and experienced person accidentally do too large a dose because of this. Fortunately, they had sitters and managed to get through the experience safely.

**It** is also important to understand that there have been no toxicological studies of this compound in humans. It is true that the Mazatecs have used the plant for a very long time and don't seem to have problems with it, but when the pure compound is used it would be a simple matter to consume a dose hundreds of times greater than anything ever encountered by the Mazatecs.

**Not** only is salvinorin A chemically different from other hallucinogens (it is a diterpene, not an alkaloid), but its effects are quite different as well. Many people consider the effects less manageable and harder to work with than other entheogens. The majority of people who have had a full blown experience with salvi-

norin A are reluctant to ever do it again. Anyone choosing to experiment with this compound should always have an alert, clear-thinking sitter present to prevent them from injuring themselves or others.

***Salvia divinorum*** as an herb can be used quite safely and many people claim that it has proved beneficial to them. Hopefully, there will not be a rush to isolate the pure compound, as it is almost inevitable that it will cause problems: people will get hurt, the compound and probably the plant will get negative attention and it will become scheduled. We will just be adding one more potentially valuable plant ally to the list of species which are already feared and condemned in our society.

**If** you choose to pursue a relationship with this plant, please treat it with respect and care. If we can use the plant safely and responsibly it will be able to grow and thrive freely into the future. -- **Daniel J. Siebert**

**Note:** Daniel J. Siebert is the discoverer of the psychoactive effects of salvinorin A in humans and the author of "*Salvia divinorum* and Salvinorin A: new pharmacologic findings," in the *Journal of Ethnopharmacology* 43 (1994) 53-56. The following quotations are from that paper:

\*\*\*

*Certain themes are common to many of the visions and sensations described. The following is a listing of some of the more common themes:*

- (1) *Becoming objects (yellow plaid French fries, fresh paint, a drawer, a pant leg, a Ferris wheel, etc.).*
- (2) *Visions of various two dimensional surfaces, films and membranes.*
- (3) *Revisiting places from the past, especially childhood.*
- (4) *Loss of the body and/or identity.*

(5) *Various sensations of motion, or being pulled or twisted by forces of some kind.*

(6) *Uncontrollable hysterical laughter.*

(7) *Overlapping realities. The perception that one is in several locations at once.*

*Some of the effects appear to parallel those of other hallucinogens (i.e. the depersonalization experienced with ketamine, the rapid onset of effects and short duration of smoked DMT). The volunteers who were experienced with other hallucinogens all agreed that despite some similarities, the content of the visions and the overall character of the experience is quite unique.*

\*\*\*

#### **DISCUSSION AND CONCLUSIONS**

*When **S. divinorum** leaves are consumed, either by chewing the fresh leaves or by retaining the leaf juices in the mouth, enough of the highly active compound salvinorin A is absorbed through the oral mucosa and into the blood stream to produce a psychoactive effect. Swallowing of the herb is unnecessary and its effects are increased by lengthening the amount of time that the herb remains in the mouth. When the leaf juices are quickly swallowed, minimizing contact with the oral mucosa, the only route of absorption is through the gastrointestinal system where salvinorin A is deactivated before entering the blood stream. When pure salvinorin A is encapsulated and swallowed it is inactive even at relatively large doses, but when absorbed through the oral mucosa or vaporized and inhaled is extremely active. It is likely that if salvinorin A were administered by injection, it would prove to be active at even lower doses than those described in this paper. Salvinorin A is the first entheogenic diterpene reported and is active in humans at extraordinarily low doses. It does not appear to affect any of the receptor sites affected by other hallucinogens. Further research into the methods of action and possible medicinal values of this and similar compounds may prove quite rewarding.*

## A PRIMER ON MAOIS

---

*MAO-inhibitors are chemical compounds whose activity in the body slows down or interferes with Mono Amine Oxidase [MAO], an enzyme system that oxidizes many compounds in foods and drugs into harmless byproducts. In the presence of MAO-inhibitors [MAOIs], compounds that would normally be metabolized into inactive by-products instead have the duration of their physiological and psychological activity extended.*

Terence McKenna, *True Hallucinations*

\*\*\*

There are two types of MAO inhibitors: permanent and temporary (reversible). The permanent MAOIs destroy one MAO molecule and then move on to destroy another and another, etc. Many prescription anti-depressants are permanent MAOIs. Temporary MAOIs merely repress MAO for a period of time specific to the inhibitor. It takes one molecule of a temporary MAOI for each molecule of MAO inhibited. The alkaloids harmine and harmaline are temporary MAOIs found in various plants -- Syrian Rue (*Peganum harmala*) being particularly rich in these compounds.

Most of the warnings about the dangers of using the principles of MAO inhibition to enhance drug experiences are based upon the characteristics of the *permanent* MAOIs. The body requires at least two weeks to recover from these because it takes that long for it to replace all the MAO destroyed. Conversely, when beginning anti-depressant therapy, it takes about two weeks for therapeutic levels of these drugs to show any effect. This is because it takes that long to destroy all the MAO.

The temporary (also called "reversible") MAOIs, however, simply attach to and then release the MAO after a period of time -- they do not destroy it. After four to eight hours your body has overcome ("reversed") the effects of the MAOI and reclaims its original MAO protection. At normal doses, even at the peak of the temporary inhibition all of the MAO is not neutralized -- some is still active.

For example: imagine two rooms each containing one-hundred mice representing MAO molecules. Into one room are placed fifty adult cats and into the other are placed fifty kittens. The adults are hungry and know how to kill mice. They will catch a MAOuse, kill it, and then catch another. They represent permanent MAO inhibitors. The kittens really just want to play. They will catch a mouse and play with it until the kitten gets bored, and eventually turns it loose. They represent temporary MAO inhibitors.

As a result, room one (the hungry cat room) is left with anywhere from a low of zero to a high of fifty mice, but the second room still contains its original one hundred mice. More importantly, the minimum number of mice unoccupied in room two is fifty, as opposed (eventually) to many less than that in room one. As you can see in the example, with fifty of the MAOs still functioning in the kitten (temporary MAOI) room, the body still has a fair latitude for error in eating the foods (cheese, yogurt, etc.) that can cause dangerous MAOI reactions.

Jonathan Ott has eaten the Syrian Rue seed mixture and then eaten a cheese sandwich, drank a beer, and eaten chocolate. These are some of the things you are forbidden to do with the permanent MAOIs, but he experienced no trouble whatsoever with the temporary version. This Spring I tried this. I drank an extract of Syrian Rue (three grams) as described in earlier issues of ER. After ten minutes I consumed a third of a normal dose of San Pedro (4 inches of a 12 inch piece). The effects of the mescaline were felt as if a normal dose had been taken. The experience was different due to the sedative effects of the harmala extract. Instead of being full of energy to go out and explore nature, I was left sitting on the couch without the desire to stand up. This did provide opportunity to explore my inner landscape, however: perceiving inner energy and losing myself in it. The combination encouraged full introspection from the beginning. -- BC, WA

[The temporary MAOIs are obviously safer than the permanent ones, but it's still wise to pay attention to one's diet and drug intake before using them. A friend ingested some harmala extract a few hours after taking a tyramine- containing dietary supplement and had an extremely unpleasant trip. Ott's lack of any problem seems related to the fact that he ate the "forbidden" foods *after* the experience was over and the MAOIs had been inactivated. He warns that one should not ingest these foods *before* or during the experience. Here's a highly anomalous view on this important topic from Gracie and Zarkov: -- *Ed.*]

*Although the literature would indicate that the harmine MAO inhibition should be reversed in about five hours, the effects from all of the smoked plant material continued for at least 24 to 48 hours. That is to say, clear potentiation was noticed after this amount of time had elapsed ... Once we had taken 7.5 gm of very potent dried **Stropharia**. We were interested in making contact with the "voice in the head" phenomenon. We potentiated the mushrooms by each smoking about 750 grams of passion flower (extract)...starting about 30 minutes after eating the mushrooms. The potentiation was quite overwhelming. After smoking about one quarter of the plant material, each fresh lungful brought on, within seconds, powerful "starburst" and "intersecting lightning bolt" hallucinations which, with eyes opened, obscured a well-lit room. The "voice" phenomenon was loud and clear and very unsettling (the content of the trip has been described in **High Frontiers**, Issue 2.) Before this trip we had attempted on several occasions to invoke the voice phenomenon with the same mushrooms at doses of up to 10 grams, to no avail. But, even more curiously, effects such as clear instance of MAO inhibition, voices in the head, visions (with both closed and open eyes) and finally at the end of the period, clear potentiation of another psychedelic (LSD) occurred at discrete short intervals over a period of 14 days! We realize that this sounds unbelievable, however it did happen. It is our opinion that peculiar long-term effects can be initiated by large combined doses of tryptamines and B--carbolines that cannot be adequately explained using current models of brain chemistry.*

*Additionally, since that rather harrowing trip, the*

*mushroom "voice" has been inescapable even on dosages as low as approximately one gram. As less spectacular long-term effects, we have also noticed this "locking-in" or tuning-in effect with the B--carboline/DMT combination. That is, effects that were previously elusive on DMT alone became easy to invoke once they have occurred in the combination.*

*...Indole psychedelics taken in a state of MAO inhibition are much more intense and qualitatively different than when taken alone. We believe that these combinations offer numerous fruitful avenues for further research ...*

Gracie and Zarkov -- "Three B-carboline containing plants as potentiators of synthetic DMT and other indole psychedelics," **Notes From Underground**, 1985

#### **MAOIs AND Mescaline**

In regard to MAO inhibitors and mescaline: I think the answer to this is that harmine/harmaline are short acting. They inhibit mostly gut MAO. It takes a long time (several weeks) to inhibit brain MAO and the prescription MAO inhibitors which do this are indeed dangerous. One only needs about a third the normal amount of mescaline for a trip if taken with the natural MAO inhibitor. I certainly would caution folks to go slowly, especially if they are hypertensive, in ill health, etc. with any MAO inhibitor. Unfortunately, the pharmacology literature only deals with the synthetic drugs, so there's not a lot of reliable information on this. -- *Prof. Buzz De Lux, CA*

#### **ONE MAN'S DOGMA IS ANOTHER MAN'S MYTH**

The myth about prolonged avoidance of tyramine before ingesting harmala alkaloids is absurd. In South America, the shamans just don't eat for about six hours before ayahuasca. The only time when I had problems was when I swallowed little balls of *P. harmala* extract encased in five-year old miso. I was trying to avoid the bitter taste. After I began feeling weird, the potential "hypertensive crisis" was avoided by induced vomiting. I intend to start to mix *Peganum* and San Pedro with increasingly higher amounts of the former because I am sceptical of the assertion that it could be problematic. -- *RS, CA*

### WEIRD REACTIONS

I don't know if Oymetazoine Hydrochloride is a MAOI, but I did some Ecstasy while doing 12-hour Sinex and was messed up for a week. I love MDMA and never have had any bad effects, so either the Sinex was a MAOI or the X was not what I expected. I was dizzy and had rushes that almost made me pass out; this lasted about six days. My girlfriend was taking Prozac a couple of years ago and I gave her some Ketamine: she thought her head was going to explode. We may be lucky she's alive. We read about not taking a MAOI with Prozac, but we couldn't find what a MAOI was, so figured they were rare. I don't know if Ketamine is dangerous with a MAOI but I wouldn't do it with Prozac. -- *BF, CO*

### P. HARMALA AS ANTI-DEPRESSANT

There have been several reports about extracting and using *Peganum harmala* seeds, but not a word about what I experienced. Three grams of seeds, crushed and swallowed in tomato juice, tasted very bitter but the bitterness passed and there wasn't much of a noticeable effect. Then I tried four level teaspoons (about 8-9 grams) the same way. How anyone could take this much without reporting the side-effects I'll never know!

The taste is very bitter, but with the higher amount the bitterness increased, lingering in my mouth, stomach and brain. Nothing I ate or drank could make this go away: water made me vomit. Weak and sick, yet unable to sleep, I went to bed, summoning all my strength not to continue vomiting. I could only wait it out until the next day. There were some mild psychedelic effects, but they were completely eclipsed by the sickness -- the longest bad trip I've ever had.

I suffer from depression and take anti-depressants. Despite the bad effects from the above trip, I didn't need to take my medicine for the first time in eight years. MAO inhibitors are good anti-depressants. Doctors don't like to prescribe strong MAOIs because of potential reactions with tyramine-containing foods. During the above experiment I tried caffeine tea and raisins and had no problem at all. If the medical community has overlooked a wonderful anti-depressant in *P. harmala*, I will be trying to synthesize it, since it is legal. Can anyone tell me the procedure for buying this chemical? Chemical companies often refuse to sell

to individuals for home use, but is it illegal to make a legal drug in the home? -- *BJ, FL*

[*Peganum harmala's* possible potential as an herbal anti-depressant suggests intriguing research possibilities. It is usually utilized for its ability to potentiate other substances and is not generally regarded as psychedelic by itself except in amounts large enough to make you sick. It is not illegal to possess, extract or ingest *P. harmala* at home. The alkaloids are easily extracted for ingestion in capsule form, thus avoiding the bitter taste. Here is a good formula:

1. Crush seeds and soak in methanol for 24 hours. Assume three grams of seed equal one dose, so calculate original quantity with that ratio in mind. (eg., nine grams of seed will yield three doses of final product, etc.)
2. Filter methanol from seed mash; evaporate methanol in shallow dish.
3. After complete evaporation, scrape up residue, and redissolve in aqueous acid (eg. lemon juice or vinegar in water to pH 5): add enough liquid to easily dissolve the extract. Simmer this in a crock pot for 12 hours.
4. Cool liquid and pour into a container (a large mason jar is good). Add methylene chloride (about one ounce per quart). Gently swirl ten or more times to mix thoroughly; each time you stop agitation, the methylene chloride will settle to the bottom. Use a turkey baster (or separatory funnel) to draw off the solvent. This is discarded as it contains unwanted oils and fats.
5. Add a base to the liquid (lye, pure ammonia, even baking soda if you can't obtain anything stronger), to pH 9.
6. Add more methylene chloride (same ratio) and gently swirl to mix contents. Repeat this ten or more times over 24 hours: swirl gently to avoid creating emulsion bubbles.
7. Draw off solvent with turkey baster/separatory funnel and put in a clean dish. *Evaporate thoroughly*

(methylene chloride is a carcinogen, so you want no residues left over). What remains are relatively pure harmala alkaloids.

8. Divide into predetermined number of doses and put in gelatine capsules. -- Ed.]

**YOHIMBE A MAOI?**

Do you know about the use of MAOI inhibitors other than the harmala alkaloids? Yohimbe, for example, is supposed to be a MAOI. How high are the concentrations of beta-carbolines in the *Passiflora* species?

-- GW, NY

[Unless you understand them thoroughly, avoid synthetics. Herbal MAOIs, are considered the safest, and *P. harmala* seeds are the richest source I know of. I've been unable to locate much information about yohimbe bark; there is some question about whether it's a true MAOI, although it does contain indole alkaloids and is regarded as an aphrodisiac. It might be interesting to try in combination with harmala extract if you're into marathon sex. Conventional wisdom says that *Passiflora* isn't nearly as good a source of harmine as *P. harmala*. Unless you have nothing else, it sounds hardly worth bothering with -- Ed.]

**FREEDOM OF MIND?**

*The Entheogen Law Reporter* is a seasonal newsletter monitoring the treacherous polymorphic legal landscape relevant to entheogen users.

...It's the most valuable synthesis of legal information on this subject you can buy anywhere.

-- Jim DeKorne

*TEL*R contains legal information of vital importance to anyone involved with illicit drugs on any level. The only question it leaves unanswered is this: isn't your freedom worth \$25.00 per year?

-- Jonathan Ott

# MORE DATURA DATA

---

I gave up on *Datura* as a hallucinogen a long while back because of its unpredictability. It can be used in that way, but it takes patience. These days I use it as a cold remedy only. The following instructions are not definitive, just a guide: what works well for me may not work for someone else.

*Datura* as cold remedy. *D. stramonium*: one-half "O" capsule of crushed seed every 4-6 hours for the duration of the symptoms. *D. metel*: two crushed leaves and peppermint steeped in very hot water for 10-15 minutes and taken about every 6 hours for duration of symptoms. (The peppermint is simply to flavor, so use to taste.) Remember: *Datura* is active in the body for 24-48 hours, so the doses are cumulative relative to the times of ingestion. Some psychoactivity will be felt. Obviously, it is unwise to drive or operate dangerous machinery while using this botanical.

Here is a safe method of using *Datura* as a hallucinogen: ingest two "O" capsules of crushed *Datura* seed; wait six hours or until the dry feeling begins to subside. Ingest two more capsules and wait again. By the time you have ingested six of them, you should be hallucinating; if not, repeat again. I personally wouldn't take more than eight capsules in one day, nor would I recommend anyone else do it. For sedative/hypnotic purposes use no more than two or three "O" capsules of crushed leaves instead of seeds.

*Datura* puts one in a state between sleep and wakefulness. There is often a feeling of being between two separate but overlapping realities. The only significant effect of long term usage is memory loss. Occasionally there will be an ache in the area of the kidneys. Hopefully, this will answer questions about this unique and very powerful plant. This refers to *Datura stramonium* seed. With *Datura metel (innoxia)* use half the amount of seeds, or just the leaves. -- MB, IN

## DATURA WARNING

I'm sure *Datura* has valid medicinal uses, and I'm sure it can be used shamanically, but the potential draw-

backs of not only toxicity but permanent brain damage (you know, the sort of thing they *wanted* to pin on psychedelics, but couldn't) deter me. In the '70s I looked up a study of long-term marijuana smokers in India using the *Botanical Abstracts* at U.C. Berkeley. Autopsies revealed brains that were small, spongy and full of lesions. As such results haven't been seen in other studies of marijuana users, the authors suggested the adverse effects might have been due to the custom, in India, of cutting marijuana with *Datura* leaf. That was enough to warn me off. -- BD, CA

*(Our accountant had) heard about the mind-blowing effect of ...Datura arborea, a big beautiful flowering shrub growing in the garden. He decided to try its effect. The plant men warned him that it was extremely dangerous, but he tried it, liked it, and despite urgent warnings, got hooked on it.*

*His memory began to fail. An hour after eating, he couldn't remember that he'd had lunch. The local merchants caught on fast; they presented the same bills several times, and each time he paid them...The company sent him to the best neurological hospitals in the States, but nothing could be done. The cortical brain cells killed by the plant's poison do not regenerate.* -- N. Maxwell, *Witch Doctor's Apprentice*

## DATURA DELIRIUM

About forty minutes after drinking a 16 oz. infusion from 12 to 15 leaves of *D. stramonium*, I felt very warm; next, my vision was totally distorted. I couldn't focus on anything: my pupils were gigantic! There is no word in the dictionary to describe the massive thirst I had -- no way to cure it until the two day trip ended. (My eyes were still large three days later.) I left the bathroom to go downstairs to the kitchen: 12 or 13 steps which turned into ten-foot thick marshmallows! I can usually control my natural experiences, but there was no controlling this trip! I immediately apologized to the "higher ups" for tampering so carelessly without proper knowledge, and started praying to God not to let me OD! After that, I only tested with small doses. -- AR, PA

# ALIEN CONTACTS

---

I've been comparing notes with a few other people and no one has the alien possession experiences that I've had from my very first 5-gram [psilocybin mushroom] trip. I'd never heard of such things but I wanted to be a dutiful explorer and do the heroic 5-gram dose with closed eyes.

I certainly didn't expect the *strange* creatures that popped in or the super technical "space ship" control panel, space station(s) -- all kinds of stuff. "Why this?" I ask. I've never read a science fiction book, nor have I speculated about UFOs. Now I'm reading *Crash Collusion* etc., trying to figure it out. What I also didn't expect was: I was making weird noises and my body started to move in strange ways: somewhat robot-like, and though I was fascinated I was also a bit scared and decided to continue the experiment of allowing it/them to enter my body only when I had a witness -- in case it was irreversible.

A couple weeks later I went to a Terence McKenna workshop and asked him about the embodying phenomenon. He said it was "as common as pie," but that I should do it alone so that I don't freak people out. I decided *not* to do it alone. So when I returned home I scheduled a session with three of my friends: I tripped -- they watched. After swallowing 7.5 grams in a tea, I began experiencing a very heavy DMT-like tunneling through space-time dimensions: many explicit visions of other beings, other places. I was astounded, emotional. It didn't take long until the possession happened. I let it happen fully. I was all over the room, my body blasted with charged energy: 4 hours of this.

So now I do 3.5 grams with the full spectrum of effects. I become possessed, but now I have boundaries. After it expanded my lungs with extreme force, I realized that this could be damaging, as I am not athletic. Now I only allow "it" to enter my head, even though it wants to enter my entire body. It will take whatever I give.

I seem to have quite a bit of control over this. After about 20 minutes, it's in me and I'm firm about limiting it to my head. Sort of a Faustian pact: I keep my eyes open so "it" can see and we share my mind/brain/eyes. When I look in the mirror, I can actually see "it" looking out at me through my eyes. The eyes are moving back and forth but it's not me. I am just gazing steadily observing this. Also, when I look into the eyes deeply the facial image changes into strange creatures. One has a cellophane like covering with black markings like tattoos or hieroglyphics and it opens up to reveal an amber glass-like robot head with mechanical parts, backlit from inside. And several other reptilian and insectoidal images. And Negro/Mongoloid/Nordic archetypes. This happens also when I do what I call the "alien be-with" when another person on 'shrooms sits opposite me (if they're brave) and we look into each others' eyes: they too see the images.

Then I find a spot -- sit back and look up at the ceiling. There is something like a large TV screen up there and all I have to do is defocus and the show begins. I can see myself clearly up there, front view, side view and other angles as they're doing experiments on me. It's like observing a large warehouse-like space through several surveillance cameras, surveying some kind of beings going on about their business in this laboratory. I could get a close-up view by a lateral mechanical moving device and an elevator that would move and suddenly stop with a jerk. Then a zoom shot would focus in on what seemed to be going on. There is something taking place in the background but I can't make it out.

Finally, the pornography. One time it was three screens, side by side, with each screen showing naked women from the 1930s: two women per screen, each acting in their own show and all showing simultaneously. It was perfect black and white photography and I felt that this was meant by "them" to appeal to me. I resisted the perceived manipulation and went on to other places.

On another occasion (this trip was an LSD/DMT combination) I was shown very slick modern (perfect cinematography) movies of bodies -- beautiful by Madison Avenue standards, but lacking totally in emotion or heart. I figured that this was the aliens' concept of what we go for. Behind and to the side of the imagery I saw weird creatures and a chemistry lab with glassware that seemed to interface with the porno images via cooking some anemic pale-red stuff. This was all dirty and grainy-looking like a greatly enlarged photograph. The feeling was shameful, ugly, disgusting.

It feels good to write this down as if someone could actually understand it. Sometimes I get lonely -- there's not a lot of support out there for this kind of research. I'm grateful for any information I can get regarding entheogens and the experiences that come from ingesting them. -- *JA, HI*

#### **REALITY MAPS**

Not all entities of the imaginal realm are figments of our imagination, as some forms of psychology seem to imply. I learned that several years ago experimenting with Magick -- a cautionary tale, to be sure. Ultimately the universe is one and we are all one (nasty characters and all), but until the final integration a psychonaut should be skilled in some form of psychic protection. How do we begin to map the imaginal realms? Perhaps by sharing our highest visions and weirdest experiences with each other we can begin to discern geographic outlines of the enchanted landscape. It would be great if by the end of the next century we had detailed quantum maps of the Invisible Landscape (Inscape) as we now have in the form of geodetic maps. -- *TM, VT*

#### **DEALING WITH JINN**

I second the idea (Summer '94 ER) about beware of "deals" with entities. This reminds me of the Muslim advice that if one is successful in invoking a "genie" (jinn in Arabic) that the first thing one should do is order him to empty a lake with a sieve. That way he'll be preoccupied with his task long enough to buy you time to figure out what to do with this guy who could be a potential problem if left to his own devices. Watch your step when you encounter any entity -- by no means should you presume it to be benevolent or

within your control. -- *JH, WA*

[Does anyone have advice on how to create a beneficial relationship with an inner ally? -- *Ed.*]

---

### **BOOK REVIEW**

---

*The Essential Psychedelic Guide*, D.M. Turner (1994), 112 pages, Panther Press, 1032 Irving, #514, San Francisco, CA 94122, \$14.95 (includes postage and handling).

This was a challenging book for me to review, since when I first began it, I wasn't particularly impressed: the title is just about impossible to live up to, and the introductory ideas probably will be considered elementary by most readers of this newsletter. Then there's the matter of the claim that 5-MeO-DMT is a MAO inhibitor -- an assertion I find highly suspect, since the *only* place I've encountered it previously is in *Legal Highs*, a source I now consider unreliable (reviewed in Winter, 1992 *ER*). In short, without better data, I'm assuming that 5-MeO-DMT is *not* a MAO inhibitor. Nevertheless, as I got further into the book I began to realize that its fearless author has visited some very rarefied realms of hyperspace and qualifies as a psychedelic shaman by anyone's definition. (How many readers would be willing to emulate him is beside the point!) Using a wide range of catalysts: from LSD to Ketamine and DMT, plus many others, often in combinations which might cause even the most reckless experimenter to stop and reconsider, Turner seems to have boldly gone where few have gone before. (How about a "cocktail" consisting of psilocybin mushrooms, Syrian Rue, DMT, Nitrous Oxide and Ketamine, for example!) His descriptions of what he calls "Cydelikspace" (the same multiverse others have termed Hyperspace, the Imaginal Realm, Mind-Space, etc.) are gathered together in the last chapter, and in my opinion constitute an extremely valuable confirmation of a transcendent reality that shamans and mystics have been describing for millennia. Although it would take me a long time to work my way up to some of the dosages and combinations of drugs described here (and any prudent reader should exercise the same caution) I have to recommend this book as a valuable documentation of some truly intrepid trips. Definitely worth reading. -- *Jim DeKorne*

## LEGAL ENTHEOGENS

---

To obtain uncontrolled tryptamines: contact chemical supply companies listed under retail in the phone book. The phone is probably most appropriate for selecting a particular company. Even in the retail listing, some companies have policies about selling certain chemicals to the public. If one is affiliated with a school or business and can provide proof of this association or proper (according to guidelines set by the company) authorization from such an institution, she or he will probably be able to purchase uncontrolled substances of any kind from any retailer. Said documentation will likely allow one to purchase from a wholesaler as well thereby cutting costs 50 to 75 percent. I personally have not been able to locate any 4-hydroxylated tryptamines (4-OH- tryptamine, 4-OH-methyltryptamine, 4-OH- methylethyl-tryptamine, 4-OH-ethyltryptamine, 4-OH-diethyltryptamine, etc.), which is unfortunate because these are likely the most visually active tryptamines. Likewise, I've encountered no source for tryptamines with substitutions higher than methyl and ethyl. This is also unfortunate as the uncontrolled DPT, DIT, DAT, are likely the most promising candidates for experimentation outside of the 4-OH substitutes. I have found alphamethyltryptamine, alphaethyltryptamine, 5-methoxy-N,N-dimethyltryptamine and N-methyltryptamine to be readily available. Making a *cash* (no money orders or checks) purchase might permit the buyer to circumvent provision of identification. At the San Francisco bay area supply company I purchased from, one supposedly does not need to provide I.D. with a money order if the purchase is under \$100. This problem might be avoided if one does not prepay but simply pays cash on pickup. My purchase of about \$160 (money order) required two forms of I.D., one state-approved with a picture, the other anything with my name on it, as well as the license number of the car I was driving! I don't know what they might have needed if I hadn't driven! They also required a signature that matched the signature on the approved I.D. *and* a statement of intent. The purchase of some substances is reported to the government as required by law, but I don't know

which ones. I'm sure many precursors to illegal drugs are reported but I'm not certain that all tryptamines are watched. If a statement of purpose is required, I suspect it is a substance that is watched. — *Anonymous, CA*

### *CANADIAN SOURCE FOR DPT*

This is in response to TB (Winter '93 ER) regarding legal entheogens. 1-propyl-Dipropyltryptamine (DPT) is available from a company in my area called Electronic Concepts. The company is so-named because they have to do with chemistry and electron bonding. They are basically an analytical and consulting firm for large companies. They also dabble in custom synthesis. They sell DPT for \$50 U.S. a gram (postpaid). It is sold for research only, and not for human consumption. They will deal with either individuals or companies through the mail. Send your order on a company letterhead (a computer home-made one will do) and pre-pay with a money order. State with your order that the chemical will only be used for laboratory research and is not for human consumption, drug manufacture or resale. They ship very discreetly in small packages. Any Canadian orders will be totally problem-free as DPT is not illegal in Canada, and Canada has no analog drug law.

DPT yields 50 doses to a gram. A typical dose is 20mg. A strong dose can go up to 50mg. It is usually smoked with some other medium -- not tobacco, which I have heard is a dangerous combination. The effects are different, but comparable, to cannabis and weak doses of LSD. There is mood elevation and enhanced communication between people. Ask for product #1247 DPT from:

Electronic Concepts  
8264 King Road West  
Bolton, ON  
L7E 5S1 CANADA

-- *LB, Canada*

### *FOR WHATEVER IT'S WORTH*

The attitude on drugs is generally more liberal and relaxed up here in Canada -- we don't have mandatory

minimums and you just get small fines for possession or cultivation. -- *J.P., Montreal*

### LEGAL RESPONSE

DPT is currently an unscheduled substance in the U.S. The literature indicates that it is a homologue of DMT. Therefore, although it is not explicitly outlawed, there is theoretically nothing stopping a federal prosecutor from charging a person caught in possession of DPT with a violation of the federal Controlled Substances Analogue Enforcement Act (CSAEA).

To prove that DPT is an analog of DMT and hence unlawful to possess, the government would have to prove that DPT is a substance (1) the chemical structure of which is substantially similar to the chemical structure of DMT; (2) which has a stimulant, depressant, or hallucinogenic effect on the central nervous system that is substantially similar to or greater than the effects of DMT.

My perusal of the case-law indicates no reported case wherein DPT was the subject of a charge under the CSAEA, so the question of whether it falls within the CSAEA is not yet settled as a matter of law. It is interesting to question whether importing DPT (assuming for the purposes of discussion that it *is* an analog of DMT) violates the federal law against importing a controlled substance. Technically, it would seem so, but the degree of difficulty in prosecuting such a case probably makes such an importation prosecution impractical. -- *Defense Attorney*

---

## ILLEGAL ENTHEOGENS

---

### DEA STING?

I received an offer in the mail for a newly scheduled hallucinogen (2C-B) from Isis health foods of Cape Town South Africa. Is it just a coincidence that ISIS is an acronym for the DEA's computerized reporting system which is fully integrated with every U.S. embassy world-wide? Had I bought it (and the price was a real bargain), I might just be up for ten years in jail. -- *Anonymous*

*To meet the increasing demands on FDA for surveil-*

*lance and streamlined operations, the agency is working to automate its import operations. It is developing a sophisticated computerized import support and information system with the acronym ISIS, which will provide product and arrival data more quickly. ...FDA's closest partner in import surveillance is the U.S. Customs Service, which provides the agency with substantial information about suspected violators. Indeed, much of the data for FDA's ISIS will come through Customs' automated system.*  
-- *FDA Consumer!* October, 1992

### LEGAL RESPONSE

It does seem odd that the company's name corresponds to the FDA and Customs' "Import Support and Information System" (ISIS). The potentially sinister import of the name identity may be lessened, however, by the fact that the ISIS acronym is fairly prevalent within the federal government. (ISIS is also the acronym for the "International Species Inventory System" and the federal government's "Integrated Systems and Information Services" on-line computing environment linking microcomputers, minicomputers, and mainframe computers.) Isis is also, of course, the name of the Egyptian nature goddess married to Osiris, the god of the dead.

It's well known in criminal defense circles that the DEA occasionally establishes bogus companies in the hope of gaining intelligence and ultimately arresting people who contact such companies. For example, in 1982 the DEA operated Universal Solvents of America and placed fairly discreet advertisements in several magazines "oriented toward illicit drug usage." More recently, the DEA, in conjunction with the Idaho Bureau of Narcotics, operated Geo-Data Chemicals in Boise, Idaho. Both of the above companies ostensibly sold laboratory equipment and chemicals and were aimed at identifying people unlawfully manufacturing controlled substances. In fact, both companies led to successful convictions.

Assuming for the purposes of discussion that Isis Health Foods is a covert operation, it would be interesting to know what efforts it makes at reaching out to customers here in the U.S. If it engages in such tactics as direct mailing to selected targets, it would be open-

ing the door to an entrapment defense -- though I hasten to add that entrapment is one of those defenses that is very difficult to sell to a jury these days.

Under federal law it is, of course, illegal (without prior authorization from the Attorney General) to import a controlled substance into the U.S. In order to convict a person of illegally importing a controlled substance, the government must not only prove that the person actively did so, but also that the person knew the substance was controlled within the United States. With the exception of rather sophisticated psychonautical types who know what 2C-B is and know it has recently been added to Schedule I, I suspect that few people would realize that the Isis HF product, known as "Erox" is a controlled substance here in the U.S. Therefore, convicting such a person of unlawful importation might run into some difficulties.

-- *Defense Attorney*

### FURTHER FEEDBACK

I hope you don't do a test order of 2C-B! There is enough detail in the article to get a conviction and it's a set-up for carrier weight or encouraging dealers who want the pure substance for cutting and concealment in shipment. The actual substance is legal in Germany, so just take a vacation in the winter for a trial.

I wouldn't touch the DPT either. The Neasc Chemical company advertises custom synthesis of tryptamine analogs under a phony name (but their address is the same). Their actual business is pesticides, so I didn't stop by with my shopping list! The DEA has learned about the "snowball effect": where they let deals go through for a while and let those people tell their friends and so on, and then even a year or two later round them up. The U.S. has a huge security apparatus looking for something to do with itself. The CIA was laughed at for wanting to curb the "invasion" of the Soviet Mafia into New York, but drugs are always good for a quick appropriation. What's left for them to do? The Cold War is over.

My feeling is that you are on the right track giving people the tools to avoid the establishment. It's cheaper and even educational. Many people will de-

velop an interest in plants and mushroom growing and even take a careful look at desert plants and grasses. Anything one must "buy" can be regulated and taxed. I was surprised to learn that there is only 6 cents worth of tobacco (farm price) in a \$2.50 pack of cigarettes and that the filters don't work. -- *Anonymous*

### ANOTHER REVIEW

*The Drug Policy Letter*, Drug Policy Foundation, 4455 Connecticut Ave, NW, Ste B-500, Washington, DC 20008-2302 Phone: 1-800-388-3784.

FAX 1-202-537-3007 Membership: \$25.00/year

A quote from their newsletter describes this organization best: "*The Drug Policy Foundation is comprised of distinguished scholars, doctors, judges, policy makers and concerned citizens dedicated to the search for responsible reform of our current drug policies... Every dollar of your support, up to \$1 million each year, will be matched by the Open Society Institute.*" They sell a wide variety of books and videotapes (members get a 10% discount) and sponsor conferences devoted to these issues. The newsletter keeps you abreast of all the latest developments in this area nationwide. Quote: "*With some modern adaptations, we should return to the people the freedom of choice regarding drugs that was unwisely taken from them at the turn of the century.*" An impressive organization that is making a difference. Join up.

### FOUNDING FATHERS TURN OVER IN THEIR GRAVES

I was convicted of cultivation of mushrooms and possession of hashish...I was arrested again after a special probation search. (When you're on probation you sacrifice all your rights and are subject to unlimited search and seizure.) I was re-arrested for possession of San Pedro cactus plants. They also confiscated all my books and notes. If you are a good person, a kind person, a person who minds his own business it does not matter. They will come after us because we are a threat to the sanctity of the State. All my money now goes to my legal defense. I wish you good luck, please be careful. I'm only 19 years old now, and my life is troubled. -- *KY, CA*

## EXTRACTION NOTES

---

### TANNIC ACID

Some of the DMT-containing barks are going to be quite high in tannins. Some of the legume related plant barks can be as high as 50% tannins. When preparing the water extract of a DMT bark, would adding vinegar (acetic acid) cause the DMT to adhere to the acetic acid in preference to the tannic acid? According to the *Merck Index*, tannins cause water insoluble precipitates with gelatin, starch and alkaloids. After filtration, would vigorously stirring starch into the extract cause the tannic acid to adhere to the starch? The goal is to remove the tannic acid by letting the starch, or whatever would be effective, settle, after which the non-starch portion of the liquid could be skimmed off and used. Twenty-five percent of the rootbark of *Desmanthus illinoensis* is DMT, the 75% is indole 3-acetic acid plus tryptophol -- correct? Are these two other compounds orally active? Do they degrade through combustion? -- *Vwhirla-whirla, OR*

### EXTRACTION SOLVENTS

Are the results of using isopropyl, ethyl, etc. alcohol as the sole solvent similar to the results of extraction using organic solvents such as methylene chloride? Organic solvents wreak havoc on the environment. Unless a collection device similar to those utilized by the dry-cleaning industry were utilized, evaporation of organic solvents into the atmosphere is not environmentally responsible. They also wreak havoc on human beings. In the form of dry cleaning solvents they leave detectable residues on clothing! --*RS, CA*

[Ethanol is a suitable solvent for some substances, not so hot for others. Much depends upon the chemical makeup of the plants concerned. Methylene chloride is an excellent extraction solvent, but is also a known carcinogen. I am told that after *complete* evaporation, no harmful residues remain. The following quotations address some of these questions. -- Ed.]

### SELECTION OF A SOLVENT

*The first step, selection of a suitable solvent, is sometimes difficult. If the substance is known, a solvent for*

*crystallization has usually been reported, and the best procedure is to turn to the literature for this information. However, if the substance is new, a solvent must be found, and, in many cases, it is difficult to predict what the solvent will be. In general, we may say that "like dissolves like" -- that is, a substance will dissolve in a solvent containing similar groups -- or better, that polar solvents will dissolve polar molecules and nonpolar solvents will dissolve nonpolar molecules ... Even with these generalizations, it is very difficult to predict the best solvent for a new substance; in most cases, the method of trial and error must be used. -- J. Cason, H. Rapoport, *Laboratory Text in Organic Chemistry*, (1960), Prentice Hall, NJ, Pg 15*

### LIKE DISSOLVES LIKE

*For a solvent to do its job its molecules have to approach closely enough to solute molecules to interact with them. This is why water is such a good solvent for some substances. Water molecules are "polar": there is a slight negative electric charge on the oxygen atom, which is balanced by slight positive charges on the hydrogens. So a water molecule will interact electrostatically with ions such as chloride, which is why water will dissolve sodium chloride, common salt, a substance made up exclusively of ions. The general rule is that like dissolves like: that is, most organic chemicals, which are nonpolar or "oily", are not soluble in polar solvents like water, but dissolve in solvents such as hexane, chlorine--containing hydrocarbons and ethers, which are themselves oily.-- D. Bradley, "Solvents get the big squeeze," *New Scientist*, 6 August, 1994, Pg. 33*

### SAN PEDRO EXTRACTION

I think the best method of *Trichocereus* extraction is to thinly slice the plant, string it up to dry like Christmas tree popcorn, powder in a blender and then boil in lemon juice water, filter, then add salt to the remaining liquid to increase evaporation (like a humidifier requires). This way, as much of the pulp as possible is exposed and the viscosity is reduced as well as the boiling time. -- *Eli-X, TX*

### **MORNING GLORY EXTRACTIONS**

The nausea-producing principle in morning glory and Hawaiian Baby Woodrose is water soluble. A simple method of removing it is: Grind MG or HBW seed into a coarse meal; soak in an amount of water equal to the amount of ground seed, shake. Allow to soak for a period up to, but not exceeding 45 minutes. Put the water and mash into a coffee filter or other straining device. The following step should be done as quickly as possible to avoid losing any of the hallucinogenic LSA: As soon as the water has drained from the pulp, pour ethyl alcohol through the mash, grasp the filter at the top and quickly squeeze the alcohol through it. After the alcohol has passed through the filter, touch the mash: if it still has a slimy feel, repeat the alcohol rinse. When the mash is no longer slimy, it will be about 85% nauseant-free. Don't get carried away with the alcohol rinse, as you can lose a good deal of the LSA that way. This procedure should be complete well before one minute is up. -- **MB, IN**

### **PROBLEMS WITH STARTING FLUID ETHER**

**Q:** I used your method of spraying engine starting fluid down a tube to collect ether. The final combined *Desmanthus illinoensis* extracts evaporated off to leave about a shot glass full of dark yellow oil. A mechanic friend warned me that every starting fluid he knows of contains motor oil to keep the engine from seizing up. Being curious, and thinking that the oils might be vegetable oils from the original plant material, I smoked some combined with an herbal blend: Ecch! Tasted bad and made me *very* ill! Is there any way to extract the alkaloids out of the remaining oil? I'd hate to think of people ingesting motor oil, especially with a MAO inhibitor. I will probably use naptha next time, as it is easy to get and evaporates cleanly. Does it go to the bottom or the top of the working solution? Does the lye added to the aqueous solution make it dangerous? -- **EK, LA**

**A:** Starting fluid isn't as clean a source of ether as I was originally informed. I only used it once, and didn't notice any oil, but perhaps all brands aren't the same. Since the extract I was working with turned out to be inactive anyway, I went back to methylene chloride. Unless someone comes up with a safe and easy way to separate the oil from the ether in starting fluid, leave

it alone. Ether is so explosive that it is too dangerous anyway. (Methylene chloride isn't perfect either, but at least it is not inflammable.) Naptha, easily obtained in the form of Coleman fuel, rises to the top -- I've personally never had any luck with it as an extraction solvent. My understanding of the basification step in the extraction process is that one is merely changing the pH of the aqueous solution to enable the alkaloids to be extracted with an organic solvent. The alkaloids thus extracted should not be dangerously basic. -- **Ed**

### **SOLVENT RECIPES**

I called a local chemical supply company to ask about buying some ether or chloroform. They told me I had to show them my driver's license because "some people use them to make drugs." Although other companies may sell chemicals more readily, I decided to find another way to obtain organic solvents. One of the first things I unearthed was an anonymous primer on how to manufacture each of the above chemicals.

To make chloroform you mix 17.8 grams of pure Sodium Hypochlorite (from photography shops or evaporated bleach) with 120 ml of water. To this you add 3 ml of Acetone (from nail varnish or paint remover) and shake. Once this has settled for a few minutes you distill the solution gently until oily drops of chloroform appear on the condenser. Continue distilling until no more oily drops appear. The collected liquid's lower, heavier fraction is reasonably pure chloroform. To make ether you slowly add 8 ml of concentrated sulphuric acid (from a car battery) to 10 ml of pure ethanol (Everclear) in a flask placed in an ice bath. Then distill as above at a temperature of 140 deg. F. and what accumulates in the collector vessel is the ether. Keep the collector vessel as cold as possible while distilling as the vapor is extremely explosive. I think I've found a way to easily remove ethanol from water in a way that would keep the alkaloids fully present (i.e. not like in distillation). Simply freeze an open container containing a water/alcohol mix with a rod stuck in it at an angle. When the water freezes the alcohol will remain liquid and migrate to the bottom of the container. It can be extracted by removing the rod and pouring the alcohol through the resulting hole. One could use ethanol as a non-poisonous, easily accessible organic solvent to extract alkaloids in the same way as ether or chloroform. -- **DB**

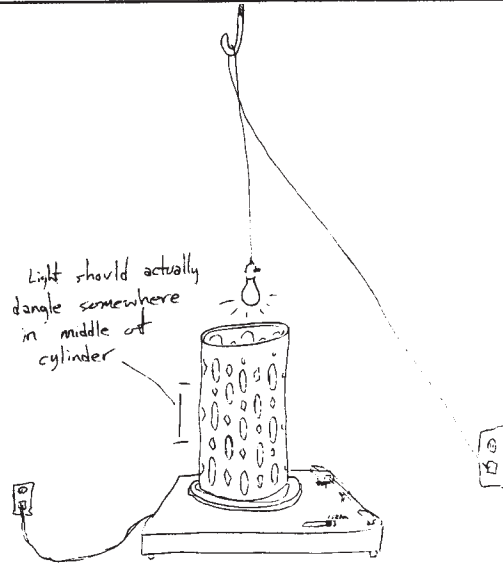

## NETWORK FEEDBACK

### DREAM MACHINE

The dreamachine is a simple device which was promoted some years ago by a group called the *Temple Ov Psychic Youth*. Its construction is very simple: all you need is an old 78 rpm turntable (available at most thrift stores), a 32" square piece of heavy paper and a light (I took apart an old lamp).

With a yardstick draw a grid of two inch squares on the paper. Then trace the shapes in the sequences shown. (Make a template of each shape to insure uniformity.) Cut out each shape with an X-acto knife, bend the paper into a cylinder and fasten the edges with tape. Place the cylinder on the turntable and dangle the light down into the tube. Turn on the machine and close your eyes. If constructed properly, the flicker produced on your closed eyelids will correspond with the alpha rhythm in your brain.

**Experiments to try:** Put your face close to the machine and then far away. Put the machine in front of a speaker and it will bend the sound. Meditate -- I find the dreamachine works best when I relax and clear my head: let the visions come from within. Common phenomena include visions of nameless colors spinning into and out of one another in chaotic beauty. Or visions of religious symbols that seem not to belong to this world or time. [Note of caution: this could cause epileptic seizures.] If you discover anything interesting, please share it with the network. I'm particularly interested in how entheogens might augment this hypnosis state. -- TA, CO

### INTREPID WOODROSE TRIPS

Eat about 2 grams of raw harmala seed and one-half of a Hawaiian Baby Woodrose seed. This will produce a trip amazingly similar to LSD. I thought it interesting that GH (Summer 1993 *ER*) didn't find the trip worthwhile. I think perhaps he took too many woodrose with the harmala: more than one seed is wasteful, if not downright unpleasant! Often woodrose will try to put you to sleep; I always drink a cup or two of coffee about two and a half to three hours into the trip. I find that around this time you hit what I call the "barrier." It's an interesting place, but if you fall asleep while you're in it, you'll miss the best part: what is on the other side of the "barrier" is well worth staying awake for! Someone earlier (Spring 1993 *ER*) reported encountering the "spinner." I also found this during my early experiments with woodrose. As you begin to learn how the land lies and are better able to navigate through these spaces, you find you can land on the "spinner." My firm conviction is that it is actually a hole in time! I haven't gone too far into it yet. My hypothesis is that with proper preparation it might be possible to time travel. (The tricky part will be to keep all of this in mind while you are "over there," which is tough to do.) I don't mean time travel of the kind we're used to seeing on TV. It seems that all time is concentrated in? on? around? this object (the spinner); all of time is there and all of time is one and all times are at

once: that's the nearest I can describe it now. One must be prepared for it or else it batters you mercilessly. When you make it back to the physical world you actually feel battered! -- *MB, IN*

#### **LSA PROBLEMS**

When I was younger I did HBW seeds 5 to 8 at a time and always had fairly strong effects. A few weeks ago I ground 15 seeds, put them in caps, and nothing happened. On another occasion I ground 12 grams of morning glory seeds soaked them in water for 24 hours, and nothing. I was beginning to think that LSA doesn't work for me anymore. Then I drank a 60% water, 40% lemon juice mixture with 17 1/2 grams of morning glory seeds soaking in it for 3 days. Within 45 minutes I was to a plus-2. I reached plus-3 but the somatic effects were so strong I couldn't enjoy it -- extreme nausea, gas pains and then diarrhea. I've heard that HBW seeds contain cardiac glycosides that can cause heart damage. Is this true? -- *Anonymous*

#### **LSA EXTRACTION**

Think of this in terms of morning glory seed extraction:

*Seeds are the embryo of the plant. Though they are hard and dense, like roots, they are engineered to open and release their properties immediately upon contact with water, so they do not need to be infused for a long time. In fact, if seeds are brewed for too long, more than 30 minutes, bitter oils and esters are leached out into the water and a foul-tasting brew results.* -- Susan S. Weed, *Wise Woman Herbal for the Childbearing Year*, Informed Homebirth, Boulder, 1986

-- *Eli X, TX*

[A brief cold water infusion is the extraction method for morning glory seeds used by Mexican Indians. -- *Ed.*]

#### **SUGAR AS LSA CATALYST**

Sugar seems to increase the metabolizing and absorption rate of almost anything. Two grams of Heavenly Blue morning glory seeds were finely ground and two tablespoons of sugar dissolved in enough water to cover the mash. This was allowed to dry completely,

then inserted into four gelatin capsules. The effects were quite visual, with no nausea. -- *TT, KY*

#### **ANOTHER MYTH DEBUNKED?**

According to Ott in *Pharmactheon*, the large Hawaiian woodrose (*Merremia tuberosa*) is not psychoactive. I took 4 seeds, cracked them open and scraped as much of the inner meat out that I could, then ground the shells in a coffee grinder, put them into 3 #00 gelatin capsules and swallowed them. I came on to a plus-two LSA experience in about 90 minutes. Definitely psychoactive! -- *PH, NM*

#### **ANTIDOTES**

There is some degree of risk in taking any entheogen, so any ethnic shaman worth his salt knows the antidotes to the plants he uses. What good is his knowledge if he can't abort or modify an experience gone awry? Hopefully I've become wiser in my dosage allotments, but I because I'm trying many new and conceivably dangerous combinations of plants, the antidotes are good to know about. Here are a few I've discovered:

One level teaspoon of *Lobelia* in a glass of water will completely terminate a psilocybin trip within thirty minutes. (The DEA is about to schedule this herb.)

One may relieve the nausea of Hawaiian baby woodrose ingestion with a couple of tablespoons of activated charcoal.

Chrysin, which occurs in the Blue Passionflower (*Passiflora caerulea*) seems to have the antianxiolytic (anti-anxiety) properties of Valium, but without the sedative effects. I have chewed as few as four small fresh leaves of this plant and experienced relaxation without sedation. In a recent combination of *P. caerulea* leaves with opiates to relieve the pain of dental surgery, I experienced a definite increase of the anodyne properties of the opiates. These effects were shorter lasting than Valium (four hours) but without any hangover. "Booster" doses of the leaves may be taken to lengthen the opiate synergy. This plant probably will be useful in reducing anxiety associated with some entheogenic experiences, though I have not yet tried it in this context. Sleepy grass (*Stipa robusta*)

combined with opiates increases sedation. It is not effective in relieving the "enlivening" effects of ayahuasca. Sleepy grass just makes you sleepy and doesn't appear to have anti-anxiolytic properties.

-- B. Green, NM

#### AMANITA AND MILK THISTLE

In response to SF, WA (Summer 1994 *ER*) about *Amanita muscaria*: My experience with this mushroom was *rough!* I ate about two grams and experienced a warm glow, not unlike that of alcohol. I ate another three grams and ended up with diarrhea along with sweating so severe I could hardly stay on the toilet. I drooled profusely and my vision became only a blur. All of these symptoms are typical signs of poisoning. I assured my alarmed spouse that *A. muscaria* is known to not be deadly, and requested a strong dose of thistle tea in an attempt to abort the trip. I now advise my friends against the use of *A. muscaria*. Readers may be interested in the following quotation from *Planetary Herbology* by Michael Tierra:

*The seeds of the milk thistle (Silybum marianum) make one of the best liver tonics in the vegetable kingdom, effective even against the most virulent hepato-toxin, the Amanita phalloides mushroom.*

-- BF, NC

#### SAN PEDRO

My San Pedro cacti are doing great here on the Gulf coast. I bought 9 of them and planted them in my yard in 1988. I now have 21 in all stages of branching. At least nine of these are from the original 9 mother plants, so these cacti are very easy to propagate. I have used them as entheogens for 5 years. The cactus spirit is very kind and knowledgeable -- it has given me some of the most wonderful learning experiences of my life. (No bad trips.) -- MH, TX

#### INCREASING MUSHROOM POTENCY

*Psilocybe cubensis* cultures are capable of hydroxyating indoles fed to them and cultures fed DET (N,N-diethyltryptamine) were found to produce up to 3.3% of CZ-74 (4-hydroxy-N,N-diethyltryptamine). DET is very similar in effect and dosage to DMT except that it lasts about 2 or 3 hours. CZ-74 is likewise very similar to psilocine but does not last as long. DMT is

N,N-dimethyltryptamine and psilocine is 4-hydroxy-N,N-dimethyltryptamine, which leads me to postulate that cultures fed DMT would produce increased amounts of psilocine. I propose that by feeding *Psilocybe cubensis* cultures DMT and MMT (by extraction from *Desmanthus illinoensis* root bark or *Phalaris* grass) you could boost levels of psilocine and 4-OH-MMT. -- DB, OR

#### ABSINTHE FEEDBACK

I've noticed no real psychic effects from absinthe made with dried wormwood herb. Since thujones are contained in an essential oil, do we assume that a majority of the oil evaporates when the herb is dried? If so, how does one extract an essential oil from plant material? I have some directions for infused oils, but I don't think this applies here. Here's a quote from *Earth Medicine -Earth Foods*, Collier Macmillan, 1972:

*A druggist's clerk took about half an ounce of the oil; he was found on the floor perfectly insensible, convulsed, and foaming at the mouth; shortly afterward the convulsions ceased, the patient remained insensible with jaws locked, pupils dilated, pulse weak, and stomach retching...The man recovered but could not remember how or when he had taken the drug...Dr. Magnan, who had a great number of absinthe drinkers under his care...states that peculiar epileptic attacks result, which he has called "absinthe epilepsy."*

Sage might be a much "cleaner" source of thujones, minus the epilepsy. -- EB, TX

#### MUSHROOM AYAHUASCA WARNING

Low dose *Psilocybe cubensis* ingestion is massively potentiated when combined with *Peganum harmala*. However, I found that a higher dose of five grams each were fundamentally different than any previous mushroom experience. Absolutely pole-axed is how I would describe my reaction to this ayahuasca analogue. This was undoubtedly the most powerful entheogenic experience of my life, though at one point I felt I was going into a hypertensive crisis. I wish to endorse *ER's* warning on the use of MAOIs. Gallaway, in a recent MAPS newsletter, warns of the dangers of mixing Prozac with ayahuasca analogues. Two deaths have

been reported in the medical journal *Lancet* from serotonin syndrome (failure of serotonin reuptake). There is also a danger of mixing them with amphetamines, MDMA, etc. I expect an explosion in the use of ayahuasca analogues in the next few years. Although this potent entheogenic brew may yet be the catalyst for a shift in cultural values, people need to be warned of the dangers. Ignorance could be fatal.

— RH, England

#### ALIEN ABDUCTION

I have had several entity experiences, none of which occurred on DMT, but on mushrooms, LSD and *Argyria nervosa*. One experience seemed to be an alien abduction scenario which was very bizarre for my spouse and I. We have both been present when several entities appeared in our home -- we all stared at each other for a while... we also remember seeing several UFOs during this time as well. — SK, FL

#### SALVIA DIVINORUM FEEDBACK

I smoked a small amount of dried *Salvia* in a water pipe -- slightly more than one good hit, 1/4 to 1/2 teaspoon *maximum*, and in a moment I felt like the floor fell away from under me. In seconds, I was peaking on the equivalent of a several hundred mcg LSD trip, higher than I'd been in years. I spent the next half-hour sitting on the bed, holding onto my mind. Then I rapidly came down. This gives me some idea of what DMT must be like. *Definitely* something to approach with respect. Side effects included heart-pounding as it came on (blood pressure elevation, probably), and several minutes of uncontrollable shivering as I came down. When they discover you don't even need to extract the active principle, they're sure to outlaw *Salvia*! It is not something I'd recommend for casual use. I can't see it (or DMT, for that matter) becoming popular -- it's too overwhelming an experience. Still the brevity of its action is appealing to someone as busy as I am, too busy to set aside a day to trip and a day to recover. And it's easy to grow (keep it humid, don't let it freeze), is very potent, and requires no extraction.

— BD, CA

#### EXCERPTS FROM SEVERAL SALVIA TRIPS

I have been turning all my friends on to smoked *S. divinorum* leaf. Some get off pretty good, others

hardly at all. I am very sensitive to it, as I am with most things... Dream images of myself were leaving my body and floating around the room. I remember thinking that this is a very strange form of insanity. I should avoid doing this again for a while and allow myself time to reintegrate. This may be the most powerful thing I have ever encountered... (*Salvia divinorum*) seems to completely shatter and break away all internal barriers to other points of view: I appeared to be viewing my own reality of "self" from external multiple spatial vantage points, all simultaneously. It was like being in a house of mirrors, but the reflections were more profound than mere images -- it was more like reflections of essence... An extract of the dried leaf seems like a waste of time and effort as it is already more powerful than I want it to be. Not more powerful than smoked DMT, but equal to it. The two are qualitatively different... I definitely felt the "fear of God" within myself today.

— B. Green, NM

#### EXCERPTS FROM AN INTERNET POSTING

...Live *Salvia* plants have been seen by this author for sale in a plant shop right off the Pike Place Market in Seattle... Growers (in other parts of the country) need to build a humidity tent... *S. divinorum* requires high humidity, and will shrivel and die without it. Just use a spray bottle to mist inside your tent 3 times a day or so... Place your (preferably peat) container in a dish of vermiculite which is regularly sprayed -- helps keep things humid... Dry the large leaves and smoke them... in a waterpipe -- it uses the material more efficiently. After about 6 or 7 puffs of the leaves the normal user will be stopped in his/her tracks, and probably want to lie down and receive the mental information this plant has to offer. You will probably be taken down trains of thought independently of your intellect... Make no mistake -- this is hardly just another plant to get "wasted" with... Don't profane the sacred by looking at this as some sort of easy high -- it isn't.

— an105679@anon.penet.fi

#### LETHAL SALVIA INSECTICIDE

My *Salvia divinorum* had a bug problem so I sprayed an organic pesticide made of pepper and lemon oils and within four days the entire plant turned black and died completely. — EK, LA

## ADVERTISEMENTS

**Hawaiian Baby Woodrose seeds:** \$4.00 per gram, \$18.00 per dozen, or \$35.00 per ounce. Send to: Wildflowers, P.O. Box 46, Ranchos de Taos, NM 87557. Prices include shipping and handling.

**The Basement Shaman:** Hyperdimensional Gardening: Mushroom services, ethnobotanicals and other delights. Catalog: \$1.00. 1312 W. Highland Ave., Elgin, IL 60123

Single copies of *The Entheogen Review* (Winter 1992, Spring 1993, Autumn 1993, Winter 1993, Spring 1994, Summer 1994, Autumn 1994) \$5.00 each (\$6.00 outside U.S.) while they last. First year of publication (Autumn and Winter '92, Spring and Summer '93) bound together into 74 page book: \$20.00 (same price as a years' subscription).

***Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants***, by Jim DeKorne, 1994, 155 pages. (Signed by author, yet! ) \$22.00 postpaid from: *The Entheogen Review*, P.O. Box 778, El Rito, NM 87530. Or ask for it at your local bookstore for \$19.95.

*"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany."* -- Terence McKenna

## SUBSCRIPTION REMINDER

Check the code after your name on the envelope -- if it says "W 94" this will be your last issue of *The Entheogen Review*. If you like the newsletter, now is the time to re-subscribe! Overseas subscribers are reminded that the high cost of airmail postage has forced me to raise the price of a subscription to \$30.00 U.S. for all subscribers outside the U.S.A.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL. 4, NO. 1: Vernal Equinox, 1995**

ISSN 1066-1913 Copyright © 1995, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 778, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

## *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. V95 means that this issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer F for Fall and W is Winter. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third

class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can't afford to pay for submissions yet, and unfortunately I often have to edit for brevity, but please keep those fascinating letters coming in.

-- Jim DeKorne

## BULLSHIT AS FERTILIZER IN THE GARDEN OF TRUTH

---

**It** was the amazing last year of an amazing decade: 1969. Although the Death Forces were firmly in control, an instinctive outpouring of raw young libido was recklessly trying to evoke some affirmative balance within the national psyche. 1969 was the year that the *My Lai* massacre outraged the American conscience and a quarter-million demonstrators marched on Washington to protest the Vietnam war; it was the year of the Woodstock Rock Festival and our first trip to the moon. It was a time when public interest in psychedelic drugs was probably at its peak, and it was the year that the Ballantine paperback edition of *The Teachings of Don Juan, a Yaqui way of Knowledge*, emerged to ensnare the imaginations of thousands of disciples seeking a structure within which to understand their drug-induced voyages into hyperspace.

**The** unknown author, Carlos Castaneda, a UCLA graduate student in anthropology, presented the book as a scientific treatise and claimed to be an apprentice to the sorcerer don Juan Matus: a mysterious Yaqui "Man of Knowledge" living incognito in Mexico. Castaneda described how don Juan taught him the secret uses of peyote, *datura* and *psilocybin* mushrooms -- data avidly devoured by wannabe shamans looking for experiences more substantive than mere recreational tripping. Through exposition worthy of a good philosophical novel, the reader followed the relentlessly obtuse Castaneda (a myopic modern Everyman) as don Juan patiently introduced him to the surreal realms of the psychedelic cosmos. With the exception of Part Two (a masterpiece of pedantry now seen as a satire on social science writing in general), *The Teachings* was a fascinating read and run-away commercial success -- selling upwards of sixteen thousand copies a week at the peak of its popularity. Not bad for an "academic" text.

**In** 1971, *A Separate Reality, Further Conversations with Don Juan* was released, to be followed soon thereafter by *Journey to Ixtlan*, the book that Castaneda modified only slightly for his PhD thesis at UCLA. By then the public couldn't get enough of the "don Juan books," and one volume after another regu-

larly emerged to reveal the latest installment of Castaneda's sorcerer's apprenticeship. At the present time, eight million of Castaneda's books have been printed and sold; at bare-minimum royalties of fifty cents a copy and allowing for high-bracket income taxes, this author still has to be the world's first shamanic multi-millionaire.

**Much** of the contemporary New Age fascination with shamanism can be directly traced to Castaneda's books. A relatively obscure anthropological specialty just twenty-five years ago, "shamanism" is now a Yuppie growth industry. New Age magazines advertise a wide selection of shamanic goods and services -- from drums and rattles to exclusive tours of "Sacred Power Spots." Self-proclaimed counselors bill themselves as specialists in soul retrieval, and a whole new business venture, ethno-tourism, now hauls continuous plane-loads of seekers to the Amazon to participate in ayahuasca rituals. For those who can't afford the trip, there are South American shamans (under the tutelage of North American entrepreneurs) presenting "ayahuasca seminars" in the United States. There's no doubt about it -- "shamanism" is currently a very hip subject, and the books of Carlos Castaneda have had a lot to do with its popularity.

**Although** *The Teachings of don Juan* received the initial endorsement of many respected anthropologists and fooled a lot of readers (myself included), subsequent Castaneda books began to stretch the limits of credibility. Analogous to the homicidal maniac who scrawls graffiti messages: "Please stop me before I kill again," on washroom walls, Castaneda's ensuing literary output seemed to be begging us to please *stop* taking him so seriously. In 1976, Richard de Mille published *Castaneda's Journey*, a surprisingly humane, even gentle, expose of the don Juan books. De Mille's painstaking research revealed a scholarly swindle of world-class importance, yet he refused to take the easy path of self-righteous condemnation, choosing instead to portray Castaneda as a consummate trickster with some subtle truths to tell. Indeed, de Mille's intricate unmasking of the facts behind the

hoax reveals an accomplishment far more exacting than any demanded by an ordinary PhD thesis: whatever motivation inspired Castaneda's bogus opus, it obviously wasn't a lazy man's scheme for an easy promotion into the ranks of academia.

**F**or years I was properly offended by the deception and more than condescending toward those poor dupes who still believed in Castaneda. Then I read Jay Fikes' 1993 book: *Carlos Castaneda, Academic Opportunism and the Psychedelic Sixties*. In this volume the author takes the scandal one level deeper -- not only did Castaneda invent a spurious "Yaqui" shamanism, but three of his colleagues at UCLA (classmates and fellow doctors of philosophy) were apparently also involved in various degrees of academic fraud.

**Fikes** makes a good case that at the very least, some sloppy scholarship was being practiced in the UCLA anthropology department in the late sixties. I am being far more conservative than his evidence actually warrants -- if it is all true, then Carlos Castaneda comes off as only the most egregious of four academic bullshit artists: Diego Delgado, Peter Furst and Barbara Meyerhoff, at that time all grad-student observers of Mexico's peyote-eating Huichol Indians.

**I**t appears that much of don Juan's (supposedly Yaqui) shamanism was loosely modeled upon Castaneda's friends' supposedly imaginative observations of the Huichols; Fikes claims that these budding young anthropologists fictionalized their field-notes to accommodate the sixties' ravenous appetite for psychedelic drug lore. More conventional researchers have been unable to recognize anything but a gross parody of Huichol culture in their published work. Castaneda then, seems to have been just one or two levels more creative with his "facts" than his sources were.

**The** squalid trail of bullshit leads in both directions however: there is evidence to suggest that some of the Huichols may have been as outrageous in their fabrications as the anthropologists were. A hearsay reference to "peyote enemas" in Furst's *Hallucinogens and Culture* is regarded as so anomalous by most Huichol ethnographers that deliberate leg-pulling is suspected on the part of informants: "These

gringos will believe anything!"

**We've** wised up a lot in the last 25 years, and scholastic deception seems pretty tame when compared with the infinitely more deadly socio-political variety. To put the best face on it, if we've learned anything, we've learned to be skeptical of *all* experts and authorities, to be more self-reliant and less dependent upon gurus. In addition, some of us are beginning to see that the concept of "truth" is *not* synonymous with "reality," being often only a kind of working hypothesis based on pooled opinion. There are many degrees and kinds of bullshit -- not all of it anathema and not all of it even "untrue."

**To** understand this, it is useful to view Castaneda's put-on in the perspective of its own era: the late sixties. It was a time of excesses on all fronts: an evil war, blatant racism, corporate greed and sleazy politics were offset by campus and racial riots, the excesses of the New Left and an adolescent rebellion careening toward a very belligerent brand of anarchy. Every new outrage upped the ante by evoking an equal or greater response from its opposition.

**I**t was the era of the put-on, and the Trickster archetype thrived in our culture like never before: satire and farce erupting from the collective psyche to compensate for all that lethal seriousness. Timothy Leary, Abbie Hoffman, Jerry Rubin, The Yippies, Wavy Gravy, Ken Kesey and the Merry Pranksters all emerged larger than life during the sixties to save us from the terminal insanity of "Reason" running amok. I am reminded of the *Koshare*, the divine clowns who make a deliberate mockery of Pueblo Indian ceremonies to ensure that no one takes their "spirituality" too seriously. There is profound wisdom in this -- can you imagine the excesses of the Inquisition ever occurring if the Pope had been secure enough in his humility to tolerate a court jester constantly mooning him during Mass?

**Castaneda's** satire was much more subtle -- the joke depended upon us working our way around to seeing the final impoverishment of the scientific--academic view of reality: the illusion that one can be "objective" about any state of consciousness, altered or normal. In the guise of a serious scientific treatise Castaneda brilliantly imagined a trans-subjective,

non-verbal reality lurking outside of, and impervious to, our equally imagined rules of discourse.

**Truth** communicates in the forms most recognizable to those who think they seek it. Our culture won't accept anything less than "real facts," so Castaneda's message had to be presented in a scientific guise. (Acknowledged as fiction, *The Teachings* wouldn't have sold a thousand copies.) Don Juan's concepts of the shamanic warrior, the man of knowledge, "seeing," impeccability, etc. are all profound ideas offered for our consideration. Now that we know they're "fiction," does that truth invalidate any other truth they may contain?

**Because** they were *believed* to be true by a critical mass of readers, the don Juan books have produced an effect in the world that transcends the original material. In short, Castaneda has accomplished something that writers with greater skill and verisimilitude have failed to do: he has created a bonafide mythology. Another (probably more accurate) way of looking at it is that a bonifide mythology has created itself through him. (These things happen.)

*"People mistakenly believe...that a myth is an untruth. But myth is not that. A myth is that which is truer than truth."*<sup>1</sup>

**It's** much too facile to beat up on Castaneda because he turned out to be a trickster, and even more absurd to take him literally. (His *datura* and "little smoke" data are anomalous, and the later books don't have the verisimilitude of the earlier ones.) Whether scholars approve or not is beside the point: don Juan still lives, and, for level heads, his teachings are not entirely without merit.

**To** get it, just let go of it.

## ON SAINTS AND SHAMANS

---

I've been paying a kind of lip service to shamanic states of consciousness in the pages of *ER*, yet I'll be the first to admit that my ability to *work* within these states has been only partial and too often unrepeatable in subsequent excursions into hyperspace. In other words, I'm no shaman -- not in the classical definition of the term. I've received the benefit of true healing from others during entheogenic sessions, yet subsequent events have revealed these individuals' shamanism to be mostly confined to an altered state of consciousness. (Not that I demand that every shaman also be a saint, but a certain level of integrity can be expected from individuals making or implying such claims about themselves.) In other words, I suspect there are very few true spiritual healers among us during these critical last years of the 20th Century.

What seems to be lacking is a conceptual structure within which to focus our intent both inside and outside of entheogenic states of awareness. It isn't particularly difficult to manifest the best that is in us when tripping on psychedelics -- what matters more is that we live that promise when *not* tripping. Since I started *The Entheogen Review* I've met many acknowledged experts in this field, and have been naively dismayed by the anti-entheogenic awareness of a few of them. Which is neither here nor there -- the point is that, as wounded healers, we all have a way to go yet in healing ourselves.

If psychedelic states of consciousness teach us anything, it's that we are all *One* at the highest level. If we don't act on this gnosis it's the same as if we never knew it and entheogens are reduced to just another way of getting stoned. Such a synthesis is profound and difficult. The challenge lies in knowing that, even though we're *all* assholes, we must somehow learn how to tolerate each other on a global scale. In other words: to live our highest awareness all the time. Commitment to this path is the single step that commences the thousand mile journey.

-- Jim DeKorne

## BOOK REVIEWS

*Ain't Nobody's Business if you do*, Peter McWilliams, Prelude Press, Los Angeles, 1993, \$22.95 hardback. Same edition available for \$13.00 from The Drug Policy Foundation, 4455 Connecticut Ave. NW, Ste B-500, Washington, DC 20008-2302

This amazing *tome* (815 pages!), written with ironic humor and impeccable scholarship (despite its length and subject matter, it makes very entertaining reading), is nothing short of *psychedelic* in the way it opens the reader's consciousness to (in the words of its subtitle): "the absurdity of consensual crimes in a free society." Consensual or victimless "crimes" are those, such as drug use, gambling, prostitution, etc., which "harm" no one except those who participate in them. The war on drugs is here thoroughly exposed for what it is: a paternalistic government's usurpation of the constitutionally guaranteed free choice of its *adult* citizens. About 100 pages into the book I was shocked to realize that I am a (gasp!) *fundamentalist* -- constitutional fundamentalist, that is! (To un hypocritically advocate a *strict* adherence to the United States constitution today is an idealist revolutionary position -- roughly comparable, perhaps, to being an ardent communist 20 years ago.) All patriotic poo-bahs pay lip service to the constitution, but the *fact* is (more than amply proven in the pages of this book), that this utopian document has been rendered all but meaningless in our current lives. (Actually, it never was fully in force -- the "free society" in the subtitle has never existed historically.) If this book was required reading in our high schools and colleges today, we'd probably have a new American Revolution tomorrow. If you think I'm overstating the case, read this book -- it will open your eyes. In fact, at the Drug Policy Foundation's hefty discount, buy two copies and distribute the second one as you see fit. You can order the book from them at: 1-800-338-3784

*"This is a block-buster! Your premise, research and articulation of one of the worst characteristics to be found in human nature are luminous."*

*-- Hugh Downs*

*Extra-Terrestrial Friends and Foes*, George C. Andrews, Illuminet Press, POB 2808, Lilburn, GA 30226, 1993, 359 pgs, \$14.95 (Include at least \$2.00 for postage and handling.)

As *ER* readers are well-aware, I am extremely interested in the "entity contact" phenomenon which is a relatively common occurrence when using entheogens such as DMT, psilocybin and ayahuasca. UFO entities frequently intrude into psychedelic space, hence serious books dealing with the UFO enigma can help us begin to understand what might be going on at such times. (Nobody has explained the mystery to my complete satisfaction, but more and more data suggest that these are almost certainly multidimensional phenomena.)

*Extra-Terrestrial Friends and Foes* is the latest update from researcher George Andrews, a man who has tirelessly compiled and published UFO data for many years. The book begins in an orderly fashion, but toward the end becomes a somewhat disjointed (but always fascinating), collection of incidents and speculation. One gets the impression of an author swamped with data who finally just includes everything he has -- let the reader sort it out. (With a mystery of this magnitude, that's probably the most honest way to present it.) I was particularly impressed by his comparison of UFO manifestations with Gnostic cosmology: far too many similarities to be coincidental.

I'd like to leave you with one idea regarding *Extra-Terrestrial Friends and Foes*: *If only one-tenth of the information in this book is factual, it would still demolish consensus reality!*

If it makes you more comfortable, you can enjoy the rest as first-rate fantasy/science-fiction.

## DEVELOPMENT OF A PSYCHEDELIC OINTMENT

---

The development of an effective psychedelic ointment is of major importance because it will eliminate the problems associated with oral ingestion, such as noxious taste, nausea, stomach cramps, intestinal gas, and all the negative emotions derived from these somatic disturbances. The ideal would be a "standardized" entheogenic experience obtainable from readily available substances, without the hassles of chromatography or chemical extraction. The simpler, the better. Such an ointment could be a powerful tool for the mass transformations of consciousness that many of us see as necessary for planetary survival.

A group effort by dedicated *Entheogen Review* subscribers could solve this problem in a few months. Eventually, I envision hundreds or even thousands of psychedelic shamans engaged in synchronized tripping once or twice a month, every full or new moon, telepathically linked into a collective higher consciousness.

To begin with, let's perfect the psychedelic ointment as quickly as possible. There are 5 readily available solvents that should be investigated as potential carriers of (for starters), lysergic acid amides (LSA) found in Hawaiian Baby Woodrose (HBW) and Heavenly Blue morning glory seeds:

1. *Dimethyl sulfoxide* (DMSO). This transports a wide range of substances through the skin into the bloodstream and is available from many health food and hardware stores.
2. *Methyl salicylate* (Oil of Wintergreen). This is the major component of deep heating lotions and is available from drugstores without prescription.
3. *Oil of garlic*. This is derived from garlic and contains a chemical called "allicin" which also penetrates the skin.
4. *Mustard*. The hot, pungent Chinese variety contains several chemicals known as "nitrogen mustards."

Available from supermarkets and Chinese grocers.

5. *Jalapeno peppers*. The pungent Mexican variety also contains "nitrogen mustards." Available from supermarkets and Mexican grocers.

Allicin and the nitrogen mustards provide rapid penetration, are quite volatile, and could transform the LSA into substances of greater potency. For example, a psychoactive dose of LSA is about 5 *milligrams*, whereas pure LSD is about 100 *micrograms*. Simply converting the amide portion of the molecule could produce major effects. In other words, there is a real possibility that the nitrogen mustards in combination with LSA could produce new psychedelic compounds, so caution should be used. The suggested experimental protocol is as follows:

*Step 1.* Grind the seeds into a fine powder using a mortar and pestle. (Some evidence suggests that the LSA is only in the shell, though traditionally the whole seed is used.)

*Step 2.* If jalapenos or garlic are being used, cut into thin slices, then extract the solvent with a garlic press.

*Step 3.* Apply a sufficient quantity of solvent to form a thin paste. Cover the mortar with plastic wrap and allow to sit for 30 minutes to allow the solvent to dissolve the LSA.

*Step 4.* Massage the ointment into the inner fold of the elbow until completely absorbed; then spread a sheet of plastic wrap over the area to prevent evaporation, or hold elbow in folded position with hand under chin.

To ensure consistency, the experiment should be performed at bedtime. Hopefully, the night will be spent exploring shamanic realms. Since the ointment could be very potent, start with a single HBW or morning glory seed and work upward. Make haste slowly and don't risk an overdose.

I suggest that all participants first investigate DMSO and use it as the standard of comparison. Each participant should also investigate one of the other solvents, and each solvent should be investigated by at least 3 participants. The questions we should try to answer are:

1. Does DMSO work better than any other solvent?
2. Does a mixture of DMSO and any other solvent work better than DMSO or the other solvent separately?

All results, positive or negative, should be sent to *The Entheogen Review* for comparison and dissemination. This is a relatively simple experiment -- let's do it!

-- Solaris

[I think this is an interesting proposal. Let's get some feedback on this and other possible catalysts -- how about a *Phalaris* ointment, or one made from *Stipa robusta*? -- Ed.]

#### POWER MEDICINE

At least five medical device manufacturers have research or clinical trials in progress to bring to market a transdermal patch supplemented with a battery and electrodes that supply a slight current to the skin. In the U.S. the unelectrified patch has been used for delivering seven or eight compounds - - nicotine for repentant smokers is one; scopolamine for travel sickness is another...

Manufacturers believe the electrical patch could broaden the market for transdermal devices... Developers...see the patch as a relatively foolproof means by which patients can administer painkillers to themselves. The controlled level of electric current ensures a more predictable level of drug delivery than does the patch alone. The precise amounts delivered could avoid the overdosing with opioids that has occurred with the nonelectrical patch... This technology is cheaper and gives a patient more mobility than do current self-medication devices that inject a drug with a pump and needle...

The patch developed by Cygnus Therapeutic Systems

delivers a millisecond pulse of a few hundred volts to generate a high electric field. The technique, called electroporation, is said to increase skin permeability, thereby enabling a drug to infuse more readily...

## IS *ARUNDO DONAX* PSYCHOACTIVE?

---

Among entheogen seekers, Giant Reed (*Arundo donax*) has been known for some time as a DMT-containing plant. These findings were established from specimens growing in India in a 1969 scientific article reproduced and disseminated by Rosetta Folios of Berkeley. The article begins:

*Five indole-3-alkylamine bases, viz. N-N-dimethyltryptamine, 5-methoxy-N-methyltryptamine, bufotenine, dehydrobufotenine, and bufotenidine were isolated from the rhizomes of Arundo donax L. -- S. Ghosal, et. al., Department of Pharmacology, College of Medical Sciences, Banaras Hindu University, Varanasi-5, India*

*Arundo donax* thrives in many parts of the United States and is sometimes regarded as an ornamental (it looks a lot like bamboo), sometimes as a noxious weed. Once established, it is extremely tenacious and in California, its spread has become a serious ecological problem:

*...They multiplied at an alarming rate and grew more than two inches per day until they were 30 feet tall!  
...They sucked up enormous quantities of water, causing the water table to drop... (This) green alien invader is giant reed (Arundo donax), the world's largest grass...*

*Giant reed has established itself as one of the primary threats to native riparian (riverside) habitats in the western United States: it grows enormously fast, it comes back quickly after fire, it lacks natural predators and competitors in North America, and it appears unsuitable as food or habitat for native wildlife.*

*Giant reed (or cane, as many refer to it) is native to the Mediterranean region of Europe. It was introduced to Los Angeles in the 1820s to control erosion in drainage canals and was used as roof thatching for sheds, barns, and other buildings. But giant reed has spread uncontrollably and is now found in virtually every stream system along the coast from Sacramento into Baja... The greatest limitation to a*

*healthy natural riparian forest on the river isn't the availability of young willow or cottonwood trees germinating on the river bank, but the inability of those young trees to compete with the "plant from hell"... -- Gary Bell, "Straw Wars: Doing Battle with the Alien," Nature Conservancy Newsletter (Sept. '94? No further data on photocopy.)*

My experience with a 50mg extraction from the roots of this plant was a moderately severe allergic reaction that lasted three days. No psychoactivity was noted. Since then I've lost interest in this species, but now wonder (considering its widespread availability) if it isn't worth another look. Does anyone out there have any experiences to relate concerning this plant? There's a possibility that the variety found in India may be more potent than our naturalized types. A recent chromatograph of rhizomes from a variegated (striped) variety of *A. donax* showed an almost identical band in the DMT position as *P. viridis*, the reference plant. Anecdotal evidence suggests a secret Sufi tradition linking *Arundo donax* and *Peganum harmala* with mystical initiations. If accurate, this would constitute evidence for the use of a bonifide ayahuasca analog in the ancient Near East -- the celebrated Soma of the Aryans? -- Ed.

### **CAN'T KILL IT**

I used to have a patch of *A. donax* growing in my front yard for 11 years at the house I owned in L.A. and I never knew what it was. You couldn't kill it by not watering it, I know I never did. Every spring after the rains, the sucker would undergo prolific growth and I had to get into it with a machete and clear it all out if I wanted to see out my front window.

-- Anon., NM

### **BIBLICAL REFERENCES**

"Bulrush" was a (Biblical) term to describe everything that grew along the riverfront marshes and one that did exist there was *Arundo donax*. -- Anon., PA

## MUSHROOM MATTERS

### **OUTSIDE MUSHROOM CULTURE**

I make mushroom spawn by soaking sporeprints in a petri dish of sterilized water for several hours; then I scrape the spores from the paper and allow them to remain in the water for a while longer. Next I use an eyedropper which has been sterilized in Lysol to transfer no more than three drops of "spore-water" to a petri dish of agar. Some won't take, but those that do spread quickly...

I've found that good *psilocybe* harvests can be obtained from burying colonized rye in the ground, a few inches deep. No need for fancy trays or even much humidity. Under bushes is a good place: cover with leaves or bark mulch to hold the humidity for the critical pinning stage. When you see one pop up, remove some leaves and look for other heads. You can even try this with contaminated jars -- with luck, the contaminants won't thrive as well as the mycelium. (It's worth a try, rather than just throwing it out!)  
-- *Anonymous, TX*

[Obviously this will work easier in some parts of the country than in others, but the idea is a good one: start your cultures indoors, then transplant them to some version of an outside compost heap. It would be pretty hard for a prosecutor to prove illegal cultivation if they're "growing wild." I've heard of this being done as far North as Montana. -- *Ed.*]

### **EUROPEAN PSILOCYBE CYANESCENS**

*Psilocybe cyanescens Astoria Ossip* is a unique strain, comparable to *S. semilanceata*, and definitely more potent than *P. cubensis*. It has the amazing property of fruiting only in cold (near freezing!) weather, and is very easy to grow outdoors on wood chips as a perennial: much like trees, with only one run of "sterile" lab work necessary. For sporeprints of this unique strain, send (cash or stamps only): \$2 for a detailed info--sheet, or \$5 for a small (but ample enough for microscopy and propagation) sample of spores, or \$10 (small) to \$20 (large) for an entire sporeprint, to:

### **TEONANACTL**

(postlagernd)

Postamt 1092 Wien

A-1092 Vienna, AUSTRIA

[To the best of my knowledge, it is not "wrongful" to possess *psilocybe* spores except in the state of California. One of the handy properties of sporeprints is that they are mailed flat in an ordinary envelope. The above source is known to *ER* as reliable. -- *Ed.*]

*A new method of mushroom cultivation in North--America: In the Pacific Northwest, during collection of **Psilocybe cyanescens**, the wood substrate is also collected in autumn if strong mycelia are visible. These are put on fresh pieces (2-6 cm length) of maple (**Acer**) or alder (**Alnus**). For best results a 1:5 ratio of spawn to fresh chips is recommended. The wood chips are kept in containers or bags with minimal air supply and incubate between 4-20 degrees C. At 4 degrees C there (is) practically no contamination... The mycelium grows only without rhizomorphes, slowly and on pure bark. It does not occur on the red cedar mulch. Next spring, freshly cut alder and maple branches are used for proper cultivation. These pieces are (placed) in pits...about 60 cm wide and 8-13 cm deep, under shadowy shrubs like **Rhododendron**.*

*The totally overgrown wood chips of the preparatory culture are mixed by hand before filling the pit. Then the material is covered with plastic or cardboard (also a useful substrate) and watered once a week. There should be no direct sunlight on the cultures. In September, with moderate temperatures, or later, the cover is removed and the cultures must be watered, depending on the amount of rain -- not flooded. The first mushrooms appear under humid circumstances in a temperature range of about 8-14 degrees C...*

[Roughly 46 to 57 degrees F. -- not exactly sunbathing temperatures! -- *Ed.*]

## PHALARIS UPDATE

---

---

### **SMOKABLE "DMT" FROM PHALARIS**

This issue (F '94) is depressing. You published before you had your facts and now "everyone" is passing this info on (*Factsheet 5*), with most trying to make money -- *PRL* is selling info, Loompanics is using it to sell your book (as are you, I guess). Ah, the lure of fame and fortune. Are you or have you:

1. Written to these and other publications (*PM&E*, *P.I.*, *High Times*, *WER*, etc) enclosing a disclaimer with each copy of "that" back issue and your book.
2. Planning to have a notice in forthcoming issues stating the truth. This will not hurt anyone but might help some folks.

You have started a myth and nothing will stop it. The best you can do is make a valid, honest and serious attempt to limit it. In the revised info in the following *ER* (after the *False* story) you wrote "this confirms our educated guess" re: 5-MeO-DMT. What does that make your original story based upon? Is it any wonder society in general considers us the lunatic fringe? Please give some thought to giving as much media attention to correcting mistakes as you did publishing the false info. I now consider your disclaimer to be the word of God. The way this false info is being dealt with is pathetic. Makes me sad, Jim, very sad. -- *RD*, *Canada*

This correspondent is concerned about my article (Winter '93) claiming that DMT can be extracted from *Phalaris arundinacea*, and is dismayed that the variety of *Phalaris* originally described (Turkey Red) was subsequently found to contain more 5-MeO-DMT than DMT (though it actually contains *both* tryptamines). He feels that I have been irresponsible in my handling of this information. (Readers seeking the full story as it unfolded are referred to articles in the Winter '93, Spring, Summer and Fall '94 issues of *ER*.)

*Phalaris arundinacea* and *Phalaris aquatica* are

known to be extremely variable in their alkaloidal content -- I have repeated this fact *ad nauseum* in every article I've written on the subject. There are some varieties which contain only DMT: had I started out with an extraction from one of these, presumably there would be no objection though, species-wise, the original claim would have been equally imprecise. Please remember that I don't possess the technology necessary for full chemical analysis, and that when I first experienced the effects of the *Phalaris* extract I was unfamiliar with the differences between these two closely related molecules. I published the error in *ER* as soon as I discovered it, and the second printing of *Psychedelic Shamanism* contains a corrective footnote.

For the record: I do my best to ensure accuracy with this newsletter. The subject of entheogens is both politically and scientifically "incorrect" in mainstream culture: by definition then, most of our information is based upon the subjective experiences of "outlaws." Anyone who thinks it's possible to avoid errors under such circumstances, hasn't given the matter much thought. One of the goals of this newsletter is to sort fact from fiction: in handling brand new data is it possible to always differentiate the two? The process itself creates the discrimination. I could find any number of equally inaccurate statements in the scientific literature: made in good faith by people with far better credentials than mine. (And, yes: please pay close attention to the disclaimer on the first page of every issue of *ER*: it means *exactly* what it says!) Finally, I'd *prefer* that readers carefully consider their words before they criticize in this fashion -- my experience with entheogens implies less aggressive ways of approaching each other. -- *Ed*

### **THE DIFFERENCES BETWEEN TRYPTAMINES**

An important thing you might discuss is the difference between DMT and 5-MeO-DMT. Some sources describe the effects of these two substances as being very much alike, while others greatly emphasize the differences. Most agree that DMT is the preferred sub-

stance. -- TJ, TX

[5-MeO-DMT is active at much lower doses compared to DMT (5 mg vs. 25 mg), and is generally considered to be less "visual." Like any subjective experience, it depends upon the subject: "most" people seem to prefer the bizarre colors and alien ambience of DMT to the hydrogen-bomb-in-the-head, white-light blast of 5-methoxy, but I've met at least one person who much prefers the latter. Both experiences are extremely powerful by any standard. -- Ed]

#### HOW MUCH PHALARIS?

**Q:** In the crockpot extraction method for smokable (tryptamines) from *Phalaris* grass, how much plant material is needed? You mention boiling up tubs of *Phalaris*, but what would I need to get a toke or two's worth? Also, does one need to ingest harmala alkaloids before smoking, or is that only for orally ingested (tryptamines)? -- Anon.

**A:** This question is asked a lot, and I apologize for being obscure. It all depends upon the alkaloidal content of the grass -- some varieties have few or none of the desired alkaloids, so no matter how much you boil up, you won't extract anything usable. The Turkey Red variety will yield as much as 50 mg of extracted 5-MeO-DMT from a big double handful of grass. Unfortunately, I've never weighed it, but it's enough to fill an average-sized crockpot between 2/3 and 3/4 full, along with enough aqueous acid to cover. Harmala alkaloids or other MAOIs are not required to *activate* smoked tryptamines, though they will *potentiate* them. -- Ed.

#### ITALIAN PHALARIS REPORT

The following quotes are taken from a recent Italian paper. It describes the discovery of pure DMT in large quantities in yet another *Phalaris* species: *P. brachystachys*. Apparently the usual 5-MeO-DMT and other tryptamine "contaminants" are entirely absent from this plant which is native to Portugal:

*P. brachystachys* and *P. minor* seem to contain only (DMT), the former in high concentration, the latter in trace amount(s)...

The article goes on to discuss tryptamine toxicity in cattle and sheep (*Phalaris* staggers), and states that the "sudden death syndrome" associated with *Phalaris* toxicity is not now associated with its tryptamine content. This, of course, implies another, still unidentified, cause -- especially significant because the wheatgrass juicer extraction method (Autumn '94 ER) probably does not exclude this "factor-X." Some of the symptoms of *Phalaris* staggers are described:

*The peracute syndrome or "sudden death," formerly included in the toxicosis complex, is now considered apart, owing to the etiology, almost certainly not tied to tryptamine alkaloids. ... Death may occur by heart failure, (a) few hours after the intake of toxic forage in the acute syndrome, (or not) until 5 months later in the chronic one. In the latter case, post-mortem examination gives evidence of irreversible degenerative lesion(s) in the central nervous system...*

Finally, these intrepid researchers describe an ayahuasca analogue experience using a *Phalaris aquatica* variety common in Italy:

*A P. harmala extract quantity corresponding to 4.5 g of seeds was first ingested on an empty stomach; the (Phalaris) extract supposed to correspond to 40 mg of indole alkaloids, but probably greater for at least a factor 5, and equivalent to about 400 g of fresh Phalaris aquatica was ingested 20 minutes later. A first peak, clearly entheogenic but fully controllable, became evident about 30 minutes later, followed by an apparent sensation of diminishing effects. In this first phase neither nausea nor any other physical symptoms or feeling to be intoxicated appeared. One hour and a half after the ingestion of P. aquatica the effects quickly became acute again leading, for one of us, to a complete loss of consciousness 40 minutes later... "Ayahuasca-like" effects obtained with Italian plants -- by Francesco Festi and Giorgio Samorini -- Communication presented at the II International Congress for the Study of the modified States of Consciousness, 3-7 Oct. 1994, Lleida (Espana)*

#### DIFFERING EXTRACTION METHODS

Regarding the subject of "dangerous" *Phalaris* alkaloids extracted with a wheatgrass juicer (F '94). As

noted, one teaspoonful of raw juice is not enough for any tryptamine activity considering typical concentrations reported in the scientific literature, so it is probable that something else causes the psychoactivity. Some issues ago Johnny Appleseed carefully described how to extract *Phalaris*. This is not to say that the juicer technique is of no use, just that there is a huge difference in methods. Appleseed cooked the leaves to get an acid-water solution which he then fat-extracted; the remainder was basified and the alkaloids removed with an organic solvent. The raw juice might contain fat-soluble toxins as well as disease-causing microorganisms -- at least pasteurize it! Although Appleseed's method takes longer and is more tedious, the result is an alkaloidal extract without contaminants.

—*Vwirla-whirla, OR*

#### **QUANTITY PHALARIS PRODUCTION**

What are the best ways to get large stands of *Phalaris* grass with consistent alkaloid content? Surely vegetative propagation with OTJ's plants at \$25.00 each would either be very expensive or a very long term project. Should seed from a known-potency plant be expected to produce offspring with a similar alkaloid profile if self-pollinated? I have the patience for a long-term project with delayed rewards, but prefer a shorter path to the same end. — **AH, TN**

#### **JOHNNY APPLESEED RESPONDS**

Quantity alkaloid production from *Phalaris* grass is a long-term project, but not an interminable one. Starting with one plant, one could grow it in a pot indoors during the winter with plenty of light and moisture. By spring, one could take out the developed root ball and obtain from 25 to 50 rhizome sections suitable for planting. If we take the conservative estimate of 25 sections, we would then plant out these rhizome sections on a one-foot grid, covering a 5 X 5 ft. area. With good watering, these plants in turn by fall should each have a root ball that could in turn be divided into 25 sections, giving a total of 625 rhizomes. Thus, by the fall of the first year, we should have a square 25 X 25 ft. planted. The second season, if each of the above plants were divided, we would have a total of 15,625 plants, or an area of 125 ft. on a side, or 0.34 acres. One more division would give an area large enough for most purposes. All these plants would be geneti-

cally identical.

The main factor in consistent alkaloid content is the genetic make-up of the plant. Not all plants of known potency can be expected to produce offspring from seed with a similar alkaloid profile. Reed Canarygrass (*Phalaris arundinacea*) is self-sterile and has a two-gene system proposed for alkaloid production. (1) Given two genes and a forced crossing each generation, there are four possible genetic combinations possible from each parent (MT, Mt, mT, mt) and thus 16 genetic combinations possible in the offspring. Using the alkaloid inheritance scheme proposed by Marum et al, out of these 16 possible combinations, there would be 12 possible combinations that could produce 5-MeO in the progeny, and of those 12, only 4 would breed true in subsequent generations.

Three of the possible genetic combinations would produce DMT in the original progeny, and only one of them would breed true (mmTT). One of the possible original 16 combinations would produce the alkaloid gramine (mmtt). These are not the ratios one finds in actual crosses, as the frequency of occurrence of these genes differ. Thus gramine, with only one possible genetic combination, occurs less than 1% of the time.

Thus seed from any producing cultivar is not assured to produce consistent yields in subsequent generations. The cultivar "Turkey Red," a 5-MeO producer, has been tested by TLC to determine the alkaloid production pattern for a number of individual plants. Out of the 16 plants selected at random from the original seed source, all 16 plants exhibited a similar alkaloid production pattern of 5-MeO. Out of over 50 seed sources and over 800 individual plants tested, no other strain exhibited such uniformity of alkaloid production. Thus it may be safe to assume that the Turkey Red strain should breed true in subsequent seed generations, if care is taken not to plant within one quarter mile or so of a pollen source of other *Phalaris arundinacea*.

— *Johnny Appleseed*

#### **Footnotes**

## CACTUS CAPERS

### T. PERUVIANUS TOXICITY?

In a taped 1986 workshop entitled: "Mind, Molecules and Magic," Douglas Sharon [author of a classic paper: "The Magic Cactus: Ethnoarchaeological Continuity in Peru" -- Ed.], states that *Trichocereus peruvianus* contains "very toxic alkaloids." *The Entheogen Review* and other publications, such as the *Of The Jungle* catalog, mention *T. peruvianus* as a high mescaline-containing cactus, but say nothing about toxicity. If it is indeed toxic, a strong warning should be communicated to those who might unwittingly ingest poisonous alkaloids. -- **Bob**

[The following quotation is my transcription of that portion of the tape in which this is mentioned. -- Ed.]

"... The one species of *Trichocereus* genus, *T. peruvianus*, contains highly toxic alkaloids, so you have nowhere in the Incaic tradition, a tradition of use of San Pedro. You've got the coca, you've got alcohol, you've got tobacco, you have snuff, you have chicha (corn beer), but you don't have the cactus, because the one that grows there you can't use. This is something we've been wondering about a long time. When we go through this archaeological record, you see the Incas are conspicuous by their absence: there are no Incaic representations of the cactus. This is why -- what grows in their area can't be used: it's toxic." -- **Douglas Sharon**

I asked a few correspondents to comment on this:

I Tried *T. peruvianus* -- it's not toxic. Can't say about its reputed strength; I measured out about ten dried grams along with *harmala* [extract] and got a nice plus-2 and a quarter.-- **Anon., NM**

Sharon should name the toxic alkaloids or even cite some anecdotal evidence of its actual use and the results. -- **Anon., PA**

The absence of such information among any of the phytochemical assays ... in the primary literature [makes this claim suspect]. -- **SB, CA**

### SAN PEDRO DOSAGES

I noticed in the last *ER* that someone quoted a usual dose of San Pedro as 1 foot. I've (only) found this to be true in rare cases. [Author states that 18 inch doses are more common.] My opinion is that if it's not active at 18 inches, don't bother with (that strain.) My *T. peruvianus* have been good (about a plus 3.5) at 18 inches. -- **Anonymous**

### LOOKING FOR EXTRACTION FORMULA

I have been looking for a detailed, accurate formula for the extraction of the active alkaloids from *Trichocereus pachanoi*. Nothing found to date is specific enough -- the directions are either too vague, or don't specify how basic or acid the solution should be. What are reasonable pH ranges? I'm reluctant to sacrifice my small bio-mass to such generalized guidelines. -- **Bill**

### CACTUS JUICE

The following is a condensation of an internet posting:

Good results can be had by preparing *Trichocereus pachanoi* with a consumer-grade juice extractor. [Note: this is not the same device as a wheat-grass juicer. -- Ed.] A Panasonic MJ-65PR juice extractor costs less than \$60.00 and can separate 12 oz of San Pedro into 13 fl. oz of juice in 15 seconds. Wash 12 oz of cactus and cut lengthwise into "sticks" which fit into the juicer's feed slot. Pulp may be further processed by adding 8 fl. oz of lime juice and re-juicing. This captures up to 96 percent of the available alkaloids. The juice is quite palatable as is, though various sweeteners may be added.

-- **Xref: engnews2.Eng.Sun.COM alt.drugs:32752**

### Wildflowers Of Heaven

\$4.00 for catalog and one year of new product updates.

## PHRAGMITES AUSTRALIS ANOTHER AYAHUASCA ADMIXTURE PLANT

I boiled a tea of *Phragmites australis* root (45 gm) for about 15 minutes, then threw in the usual dose of *P. harmala* (3 gm). It was the most sublime, pristine experience of my life and definitely my heaviest ayahuasca analog trip to date -- highly visual, with awesome insights into myself and the world. God, what a day! Six hours of mind-blowing revelations and insights. Incredible sensations of intense beauty. Visions of golden worlds beyond imagining. I was shivering all over for the first hour, which is typical for me whenever I'm on anything containing DMT. I was deeply touched emotionally by the delicacy and beauty of it all. I heard from (someone else) who said it enabled him to speak to the animal spirits -- he wasn't exaggerating.

*Phragmites australis* will revolutionize ayahuasca usage in this country. I was about twice as high as I've ever been on anything like this. I'm sure the dose could even be increased with no problems. There was no nausea or other side-effects whatsoever. The brew

even tasted great, without the usual harmala bitterness -- a slightly sugary molasses taste. Anyone could get this down without difficulty. This is what I've been looking for -- my search for the DMT source plant appears to be over.

-- Pseudonym withheld  
by request

[Lordy, lordy -- new plants are being (re)discovered monthly, it seems! *Phragmites australis* (a.k.a. *P. communis*) is totally new to me: a quick look in the *JLF* catalog tells me that its common name is "Giant Reed" -- same moniker that *A. donax* goes by, though it's obviously in a different genus. Ott's *Pharmacotheon* gives the original reference: Wassel, G.M. et al. "Alkaloids from the rhizomes of *Phragmites australis* (Cav.) Trin. ex Steud" *Sci Pharm.* 53:169-170 (1985)

This common reed has a world-wide distribution, growing along marshes and ditches. Your description suggests that it contains DMT minus other junk that often clouds the trip or makes you sick. Let's get some more first hand data on this plant. -- Ed.]

# NETWORK FEEDBACK

---

## POSSIBLE NEW ENTHEOGENS

Apparently the extraction of certain psychedelic chemicals from plants is technique-dependent, subtle, and requires patience. (I'm thinking of Salvinorin-A that's active at 300 mikes.) Has any research been done with *Tagetes lucidia*? Surely, this is the next magic Aztec plant which deserves attention. The allegedly psychoactive principle has eluded discovery for more than two decades now, and the minor academic brouhaha and controversy around it has not been settled. Likewise with *Nymphea ampla*, the water lily. Emboden and Dobkin de Rios say it has psychedelic properties and Jorelamon has criticized the latter's work on the subject, but apparently no one has done any further phytochemical studies. Have you heard of any? -- DG, NY

[Who would have thought two years ago that one could easily extract such potent chemicals as Salvinorin-A and 5-MeO-DMT from what were then thought of as relatively benign plants? There must be many more very interesting species out there awaiting discovery. I'm particularly interested in the smokable extracts -- has anyone thought of smoking *Coleus* (a relative of *S. divinorum*) or *Stipa robusta* extracts (not the leaves)? The reported "inactivity" of *Heimia salicifolia* and *Calea zachtechici* may prove otherwise when these species are extracted and used in ointments or smoked. -- Ed.]

## NEED MORE FEEDBACK

I have questions regarding *Coleus* as a psychedelic. I am also interested in hearing any information regarding the use of *Lepezdeza bicolor* as a source of DMT. Also, has anyone had any experience with sinicuichi (*Heimia salicifolia*)? -- MW, CA

[I've heard only one positive first-hand account about *Coleus*, and that simply that "it was psychoactive." (Context of the conversation prevented obtaining more details.) *Lepezdeza bicolor* is listed by Horus

Botanicals as: "Hardy shrub to 6' with hundreds of small purple, pea-like flowers. Legume from Asia, whose roots have been found to contain medicinal alkaloids..." Anyone have further data? *Heimia's* reputed psychoactivity seems to be a myth, or else people aren't using it correctly. -- Ed.]

## PASSIFLORA INCARNATA

You kinda slammed *Passiflora* in W '94. This is the North America ayahuasca vine, and it does work quite well. It grows as a perennial in central Texas, producing many pounds of material per plant, and should be virtually maintenance free in most parts of the country. One could assay various strains and clone them, developing varieties of consistent potency. When compared with the tricky *Peganum harmala* as a source of homegrown B. carbolines, this is a cinch to grow. I suspect it is only a little weaker than *B. caapi*. I tried almost a pound as a MAOI along with *P. viridis*: definitely potent. -- Anonymous, TX

[I've never bothered with *Passiflora*, but I see your point: It grows practically everywhere without much fuss, whereas *P. harmala* is a desert plant which can be very difficult to cultivate. Seeking or breeding high-alkaloid *Passiflora* strains might be well worth the trouble. My lack of enthusiasm for *P. incarnata* stems from data like the following, which suggest that one must ingest a great deal of material to get a minimal dose. --Ed.]

Vinegar extraction of 40 grams dried *P. incarnata* yielded about 10 grams dried extract. This was enough to fill 16 size 0 gelatin caps. -- DB, OR

[16 size 0 caps are a lot of big pills to swallow! -- Ed.]

*On one occasion, I first ate a whole bottle of the 4:1 extract of Passiflora incarnata which is available over the counter in Australia. Each tablet contains 500 mg of extract, and I ate 60 tablets. [That's 30*

grams: more than an ounce of material! -- Ed.] A single tablet is supposed to be an herbal sedative, but I was not sedated after eating the 60. My reason for doing this was that *Passiflora incarnata* is supposed to contain...MAO inhibitors (used to potentiate oral DMT). About 40 minutes later, I smoked some DMT, the effects of which were not greatly different from what I am used to. I then had a slightly larger amount, and without warning, felt an intense, incredible rush of physical pleasure through my body. Within seconds, I was riding on the most intense, unimaginable, pure total-body orgasm. I was unable to control myself, and was screaming at the top of my voice until the effects subsided. The visual and auditory enhancement were mild, but the physical hallucination was by far the most enjoyable thing I have ever experienced. Observers, who were taken aback by my behaviour, claim that I was in this state for about 10 minutes. Afterwards, I felt intensely euphoric, and both very excited and very relaxed. I tried eating a significant quantity of the DMT after this experience, and found no effect. This would indicate that the passionflower extract is insufficient to orally activate DMT at these doses. It may be that higher doses would have some effect, or that the extract doesn't contain enough beta- carbolines...

### THE LATEST THREAT

Cases of excessive poppy seed consumption associated with elated feelings have been documented and are becoming more prevalent in Eastern Europe (Poles in particular have a liking for poppy seed "tea").

R. Kaplan, "Poppy Seed Dependence," *The Medical Journal of Australia* Vol 161, 18 July, 1994

### VISUAL BRAIN WAVES

JM, MS (DMT speculations, F94) asks where the patterns and colors come from with your eyes closed on DMT. Perhaps we are seeing the rhythm of our brains, alpha, beta or theta: a visual representation of the psyche. (Functioning systems usually have patterns of operation.) I like the idea of mapping these quantum psychological/hyperreal realms. I keep a journal -- I've been in realms where words failed, so

I use pictures, symbols, scribbles, etc. Comparing these with friends' journals is like examining ancient languages, diverse symbol structures disguised as a commonly experienced emotion. -- TA, CO

### DESMANTHUS DATA

*Desmanthus illinoensis* may not be as seasonally variable as *Phalaris*, yet it is anything but consistent. In assays of several dozen sites its tryptamine content was found to range from fair to poor to non-existent. *Desmanthus leptolobus* was better overall, yet some stands still had no detectable DMT. Preliminary findings seem to indicate lush growing conditions favor low alkaloid content. With either species, readers should have assays run for their collection site to be certain that they are not wasting their time.

Another point: *Desmanthus* in general is exceedingly resistant to herbicides. Once established, it will even survive direct spraying. If one is concentrating freebase DMT from plants exposed to herbicides or pesticides, they may be concentrating these as well in the final product. Know where you collect! These plants are so common that there should be little problem in finding a clean site. Roadside plants or those subjected to agricultural run-off are poor choices. --Justin Case, TX

[*Desmanthus illinoensis* seeds in bulk are available from: Turner Seed Co./ 211 CR151, Breckenridge, TX 76424. I think their price-sheet is free. -- Ed.]

---

## EDITORIAL

*ER* has received several letters relating to the arrest of the proprietor of Power Products, an Alaskan company which sold *psilocybe* mushroom growing kits. Of most concern is the fact that the firm's mailing list is now in the hands of law enforcement authorities: the people on the list are understandably concerned about DEA harassment. Currently, the law states that police must have "probable cause" before they can arrest anyone. In the absence of other evidence, just being on a mailing list is not likely to get you busted at the present time. (Readers are encouraged to subscribe to *The Entheogen Law Reporter* for more comprehensive information on these issues.) Although

*The Entheogen Review* has not, does not and will not sell any "wrongful" items, it does disseminate some blatantly naughty information. I'm not overly worried about being hassled (yet) because my substance scene is clean (it has to be) and we haven't sunk so far into totalitarianism (yet) that people can be imprisoned for their thoughts. *ER's* mailing list is encrypted and all correspondence is burned in the office stove. (This for more mundane reasons than security: I don't have room to save it.) A great deal of *ER's* mail now arrives unsigned without a return address. (That's cool, except when I have questions that need clarification and I can't write back.) Some correspondents request that even their initials be left off their contributions. This trend is alarming, and because I see it every day, it enrages me: I still find it difficult to accept that Real Life in America is turning into a B-movie about Gestapo Oppression.

Each of us has legitimate life concerns which shape our decisions: I have personally decided that I will not capitulate to this kind of intimidation and will continue to speak my mind and publish the kind of information that *The Entheogen Review* was created to disseminate -- with a special emphasis on new data and techniques which empower individual freedom. Correspondents are encouraged to invent pseudonyms so readers will feel a connection between authors and their ideas. (B. Green, Johnny Appleseed, Solaris and others have created unique personas in these pages.) I'd have to be put on the rack before I'd divulge their identities -- if things ever reach that point, however, I'm sure we'll already be living like guerrillas in the hills. -- *Jim DeKorne*

---

### BOTTOM LINE STUFF

I don't take entheogenic experiences lightly. I have a strong science background, am a pharmacy student, and am quite rational. Yet these experiences seem to transcend pharmacology much in the way consciousness transcends neurochemistry. Originally I intended to explore psychedelic experiences as an objective observer. But when psychedelics become entheogens, object fuses with subject, and the explorer becomes the explored. One finds that objectivity

becomes meaningless. The shamanic path is scarcely populated and so it should be. But it is comforting to know that one is not travelling alone. -- *DF*

### THE HEMP SPIRIT

With all the talk about plant spirits, nobody has mentioned hemp. The Hemp Spirit has been a strong ally for me: I believe it tries very hard to keep people out of the Western Culture rat-race. (A common criticism of hemp users is that they're lazy: but are we evolved to work from 9 to 5?) Here's an easy hemp extraction formula:

Grind a gram of hemp into powder and add alcohol to cover. Allow this to sit for at least an hour, then filter onto a glass plate or pan. Evaporate to dryness, and using a credit card or spatula scrape up the dark oil and powder: work it to the smooth consistency of silly putty. [sic] Roll extract into little worm-shaped pieces, put on a pin and smoke under glass. Ask the Hemp

Spirit to teach us and show itself as an important entheogen. -- **BF, CO**

*The greatest vocabulary for Cannabis and its derivatives emerged from India. It became known as the "heavenly guide," and just as "Father Peyote" resides in the psychotropic cactus for some Indians of the southwestern United States, so a Guardian lived in the leaves of Cannabis for the early Indo-Iranians. Even a dream of the hemp plant was considered an omen of good fortune, and to long for it implied future happiness...It was believed that to experience Cannabis intoxication was to fix one's eyes on the Eternal. Hence, decoctions of Cannabis resin were used before reading holy writings or entering sacred places.*

-- Wm Emboden, "Ritual use of Cannabis sativa L."

### LEGAL/ILLEGAL

Regarding "legal and illegal entheogens" (Winter '94). The concept is absurd, since entheogens are an intrinsic part of our environment and our bodies. The human body contains and could not function without its neurotransmitters, without DMT, without endorphins and its custom-tailored psychedelics, uppers, downers, analgesics --the whole spectrum. It produces and needs these substances exactly because of their psychoactive effects.  
-- ANON148626@anon.penet.fi, Germany

[Alas, you can spend decades of your allotted time here on Planet Earth in a prison-hell if you're caught in possession of any of these substances *outside* of your body. -- Ed.]

### ISIS RESPONDS

It was with a mixture of amusement and dismay that I read the bizarre speculation in the Winter 1994 issue of *The Entheogen Review* that my company, Isis Health Foods, is a front organization for the FDA -- based on the quirky notion that these particular initials

are an acronym for the FDA's Import Support and Information System. I suspect it's a lost cause trying to dispel the paranoia that this letter has probably instilled in many of our very satisfied American customers, but consider the following: if Isis Health Foods was a FDA sting operation, with the emphasis presumably being on maximum disguise and concealment, why would they select such a suspicious

acronym as ISIS, the same as their computer system? Perhaps the person who sent you this misinformation was in fact the FDA itself -- what better way of sabotaging an overseas mail order outlet for 2C-B than spreading paranoia and distrust about it. I regret to report that South Africa banned 2C-B a few months back (due to recommendations by the U.S. FDA) so Isis Health Foods is no longer in a position to market this remarkable substance. However, it remains available by mail order directly from its manufacturers: Drittwelle, PO Box 107, Grand Turk, Turks and

Caicos Islands, British West Indies.

-- Isis Health Foods, Republic of South Africa

### PSYCHEDELIC MUSIC

I find it impossible to listen to "pretty music" while doing ayahuasca. I respond better to rough bass/baritone voices and/or drums. Some music while "flying" seems to make me get up when I feel like I can't move, while saying: "turn that damn thing off!" Can anyone suggest good recorded musical selections for inner voyaging? In the absence of a singer-drummer, my own voice intoning "Om mani padme hum" works fine until my mind gets sidetracked. Then I get lost in the energy-ritual-visualization and blink out. My CD of "OM" does quite well, but I'd like a variety of inputs. -- **RWS, DE**

[This is something I've wanted to open up for some time now -- let's have some feedback on your favorite trip-meditation music. Anyone who's ever listened to

**The MAGIC  
Wheatgrass Juicer**

- ☛ Heavy duty cast iron
- ☛ Stainless steel screens
- ☛ Easy to operate
- ☛ Handles tough grasses

Expressed juice pours out side trough into container. The extracted grass exits from the front spout. No need to stop til containers are full.

\$68.00 + \$7 S&H Check, cash or MO to  
MAGIC 395 OAK CREEK  
SUITE 508  
WHEELING, ILLINOIS 60090

for growing *S. divinorum* or any humidity-loving species. The 36" zippered front provides easy access to your botanicals for ventilation or gro-lights. When not in use, it collapses for easy storage and with reasonable care should last for many years. Looks like it could also be adapted for doing sterile mushroom work. I like it! Available for \$39.95 + \$3.00 S&H from: Magic, 395 Oak Creek, Ste. 508, Wheeling, IL 60090. (Illinois residents add

Bach on acid knows how powerful such experiences can be. Several years ago I attended a Grofian holotropic breathing workshop and the series of musical selections was so psychedelic that drugs were superfluous! (Really!) I've always regretted not getting a list of them from the facilitator. If there's enough feedback, I'll run a section each issue. Be sure to include all data: CD, tape, etc., title, group, publisher, ID number, etc. -- Ed.]

8.25% sales tax.) -- Ed.]

### TROPANE MEMORY LOSS

Last year I smoked a small pipeful of *datura* leaves: it was quite pleasurable. At times I've also used *Atropa belladonna* and *Brugmansia aurens*. I became quite forgetful and slowly recovered after many weeks. These experiences were all extremely pleasurable, though I never tried any high doses. -- RB, MI

### MINI HUMIDITY TENT

Enclosed is a mini-greenhouse product-sample for possible review in *ER*. I was worried about trying to grow *S. divinorum* in a small apartment in this dry winter climate with practically no humidity control possible. They look great! I think the mini-greenhouse will be perfect for mushrooms too. -- Magic

[The most important factor in growing *Salvia divinorum* is humidity -- this plant demands as much as it can get. *The Magic Umbrella Greenhouse* is an ingenious design based on the principle of the folding umbrella -- with a pull of a sturdy cord, it "inflates" into an instant 3.5. ft. X 2.5 ft humidity tent: perfect

### CALL FOR ILLUSTRATIONS

Back issues of *The Entheogen Review* are dwindling, and rather than reprint each one individually (big bucks up front and a long time before they're paid off), I am compiling a book of all issues to date. Articles will be re-arranged so that each species or subject will have its own chapter. All the *Phalaris*, LSA, *Datura* etc. data will be compiled under its own heading, making quick reference on any topic much easier. It will be a professionally-produced paperback, and I want it to be as useful possible, so I am actively seeking plant photographs to identify each species. (Public domain line-drawings from old botany texts are also solicited.) I'll pay \$5.00 (or extend your subscription one issue) for each photograph I use. Any help *ER* readers can give me in this regard will be appreciated. Black and white photos are preferred, but color is acceptable if they'll reproduce OK in B&W. Sharp Xeroxes of line-drawings are fine -- that's what I use in each issue already. This is still new to me, but if photograph reproduction is as inexpensive and easy as I've been told, you'll be seeing more pictures in upcoming issues.

### PSYCHEDELIA

Visionary Plants, Literature -- Art -- Elixirs  
\$2.00 for extensive catalog. Sources: Magic

### SUBSCRIPTION REMINDER

Check the code after your name on the envelope -- if it says "V95" this will be your last issue of *The Entheogen Review*. If you like the newsletter, now is the time to re-subscribe! Overseas subscribers are reminded that the high cost of airmail postage has forced me to raise the price of a subscription to \$30.00 U.S. for all subscribers outside the U.S.A.

**The Basement Shaman:** Hyperdimensional Gardening: Mushroom services, ethnobotanics and other delights. Catalog: \$1.00. 1312 W. Highland Ave., Elgin, IL 60123

Single copies of *The Entheogen Review* (Winter 1992, Spring 1993, Autumn 1993, Winter 1993, Spring, Summer, Autumn, Winter, 1994) \$5.00 each (\$6.00 outside U.S.) while they last. First year of publication (Autumn and Winter '92, Spring and Summer '93) bound together into 74 page book: \$20.00 (same price as a years' subscription).

*Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants*, by Jim DeKorne, 1994, 155 pages. (Signed by author, yet!) \$22.00 postpaid from: *The Entheogen Review*, P.O. Box 778, El Rito, NM 87530. Or ask for it at your local bookstore for \$19.95.

"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." -- **Terence McKenna**

# PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed descriptions of approximately 200 organizations related to psychedelics. Categories include ethnobotanics (plants, mushrooms, cacti, herbs & seeds), gardening supplies & indoor light systems, merchandise (t-shirts, videos, & smoking accessories), periodicals, book vendors, non-profit organizations and religious groups, information sources, and a reading list/book review section. Updates are mailed out four times a year as new information presents itself. The first issue will be out in late June, 1994. A one year subscription is \$15.00 (five issues total). Send a money order or cash (checks are okay, but may take an additional two weeks to clear) to: Soma Graphics, P.O. Box 19820, Dept. ER, Sacramento, CA 95819-0820.

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and vo-

lition and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. I don't send out renewal notices. On all quarterly (mass) mailings there will be a code after your name. W95 means that the Winter, 1995 issue will be your last. V stands for Vernal Equinox (Spring issue), S stands for Summer and F for Fall. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third

class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your ideas and questions. I can't afford to pay for submissions yet, and unfortunately I often have to edit for brevity, but please keep those fascinating letters coming in.

-- Jim DeKorne

*The following essay first appeared in the March 13, 1995 issue of **Legalese**, the student publication of the University of Houston Law Center. The author has generously made it available to the public -- it may be photocopied and sent to officials and policy-makers concerned with decisions related to The War on Drugs.*

# Give Peace a Chance

K. Ian Benouis

---

---

Millions of Americans are in jail or prison for the possession, distribution or use of an illegal substance, and those who use it and are not in jail are branded as criminals. The courts are overflowing with cases dealing with this problem. Organized crime has become more powerful and its activities are constantly in the news. Society's view of the legal system has worsened. Crime and violence are at all time highs. The federal government is spending enormous amounts of money to enforce the laws preventing the use of this substance, yet its use continues unabated. The authority of law enforcement to use whatever means necessary to combat this situation has increased dramatically leading to corruption, all at the expense of individual rights.

One might think that the situation above describes our country's current War on Drugs. Actually the situation described took place over sixty years ago during our country's first war on drugs-the prohibition of alcohol. It has been said, "those who do not learn the lessons of history are destined to repeat them." Unfortunately for our country, we have not learned the lessons that Prohibition taught us, and we continue to blaze down the same road at full throttle.

What has the War on Drugs bestowed upon us? In America today the number of people imprisoned for drug offenses is the same as the number imprisoned for all crimes twenty years ago. We have the highest percentage of our population incarcerated of any nation on the planet, with drug offenders comprising 62% of the total prison population at the federal level. Incarcerating all drug offenders costs approximately \$2 billion annually. In 1987 alone the United States spent \$10 billion on drug enforcement. Violent crime has increased dramatically with the advent of new drug laws-32% between 1976 and 1985. Cur-

rently 80% of violent street crimes are drug-related. Making injectable drugs and their syringes illegal is responsible for at least 25% of the new cases of AIDS in the United States as addicts share dirty needles. The U.S. Constitution is being brushed aside as the government is able to seize property of persons suspected of having drugs without a warrant, probable cause or due process.

Some people believe that drugs are inherently evil and should never be legalized. However, even people who don't necessarily believe that drugs have any benefit are beginning to realize that the current solution to the drug problem is worse than the problem itself. James P. Gray is a conservative superior court judge from Orange County, California and a leading proponent of drug legalization. He states, "I think that people are going to use these things whether they are legal or not. I think that has been demonstrated beyond anyone's question." Conservative columnist William F. Buckley says that if we legalize drugs, "the price would collapse, and there would be no profit in its sale." The president of the American Bar Association George Bushnell Jr., former Secretary of State George Shultz, and a growing number of prominent Americans advocate the legalization of drugs because making them legal would remove the entire criminal element from the marketplace.

Legalizing drugs would cause the black market to disappear. Organized crime could not compete with the government and private industry in production, distribution and marketing. Removing the economic incentive would also eliminate the involvement of gangs and would no longer serve to encourage our nation's youth to become drug dealers. This all would have a substantial effect on reducing violent crime in our country. The economic windfall would be tremen-

dous. Not only would there be savings from the elimination of expenditures to finance drug enforcement, the reduction in the costs of incarceration and the recouping of lost tax revenues from drug offenders who lose their jobs when they are put in jail, but the government could also reap enormous revenues from the taxation of these drugs.

Currently there are an estimated 20 to 40 million regular drug users in the United States. There are many more casual drug users. Some people fear that legalizing drugs would cause a dramatic rise in the number of people using them. The concern is that millions of law-abiding Americans are waiting patiently for the federal government to give the word so they can run to the nearest pharmacy or package store to obtain these substances. This perception is far from reality. If a person really wants to do drugs, chances are he or she has already done so. We can look to other countries and history to see the results of legalization. In the Netherlands, where marijuana is legal, the level of use is below that in the United States. The Libertarian Party says that drug legalization would end the "forbidden fruit" appeal of illegal drugs. They point to the fact that after legalizing private use of marijuana in Alaska in 1975, a study done in 1982 showed that Alaskan students used marijuana a third less than the national average. Drug education would result in users who were better informed of the possible negative consequences of their drug use, and who were better able to choose drugs that had less risk associated with them. Also, there would be fewer problems with overdoses and adulterants that result from illegal drug production. The government could ensure quality control, just as it does with prescription drugs. Fears of massive health problems are unfounded. According to a government study, 320,000 Americans die prematurely from tobacco and 200,000 die each year from alcohol. This is compared to 3000-4000 people who die every year from all illegal drug use combined. When the number of users of these substances is evaluated against the number of deaths, one discovers that nicotine is 30 times more likely to kill a person and alcohol is 10 times more likely to kill a person than illegal drugs.

Why do people want to use drugs in the first place? Answering this question will help to understand why humankind finds itself in this present pre-

dicament. Simply put the answer is that people want to get high. Most of us have heard of the term endorphins, but few actually know what it means. It stands for endogenous morphines. The brain manufactures codeine and morphine and has specific receptor sites for valium and THC. Is it a coincidence that the active ingredient in "magic" mushrooms is almost identical to the primary neurotransmitter serotonin, or that the active ingredient in peyote is almost identical to another neurotransmitter: dopamine? The most powerful psychedelic drug on the planet, DMT, is a neurotransmitter present in the brain. Interestingly enough, by this fact each citizen in our country is guilty of possessing a schedule I substance and has thereby committed a felony. By ingesting these foreign substances humans are attempting to replicate the actions of the brain. Wanting to use these drugs is a natural desire.

Although not learned in history, man has been using naturally-occurring substances for thousands of years for religious and healing purposes. There are cave paintings in Southern Algeria estimated to be 14,000 years old that clearly show the human use of psilocybin-containing mushrooms. The authors of the Rig Veda, the oldest known religious writing (at least 3000 years) devoted 120 hymns to praising the magical plant Soma. Indigenous peoples in North and South America have been continuously using peyote and mushrooms for at least the past three thousand years.

The religious use of these substances invokes some valid constitutional concerns. The U.S. Constitution prevents Congress from establishing laws that prohibit the free exercise of one's religion. Presently, there is only one organization in the United States that is permitted the use of a drug in its religious rituals. The Native American Church uses peyote and can do so legally in every state, but the federal government places the stipulation that only Indians can use it. Non-Indians who desire to use peyote for religious purposes are denied the right to do so, which is guaranteed by the Equal Protection Clause of the 14th Amendment.

Separate from the benefits gained by the elimination of the problems resulting directly from the War on Drugs, there are inherent benefits in making drugs legal. Recently, the medical use of cannabis (marijuana) in chemotherapy patients has demon-

strated that it can reduce nausea and increase appetite. It can also be used to relieve the symptoms of glaucoma. The cannabis plant is a valuable source of paper, fuel, fiber, and food. Psychedelic drugs have enormous medical potential in the fields of psychiatry as demonstrated by the use of LSD to treat alcoholism, the use of ibogaine to treat cocaine addiction, and the use of MDMA in psychotherapy. Although the government is doing its best not to advertise it, currently there are ongoing FDA approved medical studies in this country employing cannabis, psilocybin, ibogaine, DMT and MDMA. A study to use LSD has also been recently approved.

Whether one takes the position that drugs have no inherent value or the position that drugs can have some benefit to our society, it is difficult to argue that our country should continue to support the War on Drugs when this solution is the cause of the problem. Just as in the Vietnam War, those who supported our reasons for initially engaging in that conflict and those that were against our participation eventually came to the same conclusion: whatever our goals were, we weren't achieving them and we needed to pull out before any more lives were lost. The casualties are mounting on all sides in the War on Drugs. It is time to tell the government to bring the troops home.

*K. Ian Benouis is a first year law student who says, "Just Say Know!"*

### WHAT IF WE CAN'T GET THERE FROM HERE?

I recently received a mass-mailing questionnaire from my congressman addressed to: "Postal Patron -- Local, New Mexico." In the same post I also received the Spring, 1995 issue of *The Entheogen Law Reporter*. My comparison of these two documents has resulted in a lingering major depression.

The only options offered by the questionnaire were examples of "errors correcting errors," roughly equivalent to the classical double-bind query: "Answer only yes or no: Have you stopped beating your wife yet?" Assuming one is not a wife-beater (never mind if you're a woman or unmarried), no response to that question (as posed) can reflect anything but a gross confusion of fact and imagination. One question

involved an appropriation of money to put more cops on the street; another was concerned with legislation permitting the admissibility of evidence obtained without a search warrant. The fact that these measures are being considered at all is a tacit admission that our government has failed to meet the needs of the people: functional societies don't require such drastic solutions to their problems. "More cops" is a time-tested contrivance of fascism, as is the steady removal of the constitutionally "guaranteed" rights of individuals. As Bob Dylan sang so eloquently over thirty years ago: "You don't need a weatherman to know which way the wind blows."

Richard Glen Boire, a practicing defense attorney and editor of *The Entheogen Law Reporter*, summarizes this situation succinctly:

*At the moment, I don't have much faith in our representative democracy and hence have doubts about the efficacy of spending too much energy to try and change the laws via the established political channels. The system was not designed for the age of mass-media where imagery is supremely powerful and largely controlled by financial powers. As a result, it's no surprise that some of our laws are of the same quality as network television.*

If our laws and the machinery for making and changing them are no longer responsive to reason, where does that leave us, friends -- as individuals and as a nation? -- *Jim DeKorne*

# ENTITIES, ALIENS AND INNER VOICES

---

---

## ***VOICES IN THE HEAD***

I was intrigued by your article in the Summer '94 issue on inner voices. I too have experienced this phenomenon. It usually happens right before I fall asleep, but sometimes it can happen during the day when I am not particularly focused on anything. I hear voices having conversations. This isn't the more acceptable "voice of my own head" going over past events or projecting how future events are going to unfold. Usually it's as if I'm tuning to conversations that other people are having. These are always voices that I don't recognize (they aren't anyone I know). I have spoken to others about this and haven't come across anyone else who experiences the phenomenon in this way. Hearing voices seems a bit crazy to most, so it's not something I bring up that much (and it doesn't happen often enough that I'm preoccupied with it or worry about being crazy). Sometimes the voices say things which are very similar to the list of quotes you included in the article. Anyway, it was intriguing to see that I am not the only one who experiences this type of thing! -- **JH, CA**

## ***UFO ALIENS***

I've never heard of any UFO connection with entheogens, and I've been taking mushrooms regularly for almost two years. Can you tell me what your evidence is for saying that UFO space alien contact is common with psychedelics? -- **BJ, FL**

[I've never encountered actual UFOs either, but McKenna and others describe the phenomenon as fairly common. Here Eduardo Luna illustrates how ayahuasqueros (*vegetalistas*) in the Amazon commonly meet them on their journeys: *Under the effects of ayahuasca one can see these beings and their vehicles, but few vegetalistas actually have contact with them, only chosen ones, to whom extraterrestrials teach power songs and give useful information to help cure their patients.* -- Luna, L. E., and Amaringo, P. (1991) -- *Ayahuasca Visions, the Religious Iconography of a Peruvian Shaman*, North Atlantic Books, Berkeley, Pg. 34-35.

I guess the main reservation I have with this is one of nomenclature: "ultraterrestrial" may be more accurate than "extraterrestrial." -- **Ed.**]

## ***A MUSHROOM ENTITY***

I wish to report to the network a contact with an entity from hyperspace. Prior to my reading of DeKorne's material I had various visionary experiences with LSD, including a feeling of being "called" by the spirit of the LSD medicine; however my recent experiences with mushrooms have involved "delusions" of being courted by a spirit. I can't help but suspect that the power of suggestion may play some part in these contact experiences. For better or worse, DeKorne has profoundly influenced what I experience on psychedelics. [*Gulp!* -- **Ed.**]

I began seeing a peculiar phenomenon during low-dose mushroom sessions: a pattern of threatening eyeballs. I intuited that the mushroom was trying to scare me, and I marveled at the workings of the mind, feeling humored rather than frightened. I decided to accept the challenge of the recommended high dose of five grams on March 17th -- the full moon preceding the equinox. Prior to this experience I'd seen the entity occasionally in absence of mushroom intoxication. In spite of my scientifically-oriented world view, I was being visited by a spirit which seemed to be anticipating a deeper encounter.

As the full moon rose, two friends and I took about five grams each in the form of tea. At first the trip was euphoric and beautiful as the night became magically mushroomed. Soon however, the trip advanced beyond "recreational" to overwhelming. Five grams is not for babies. The smallest fellow more or less blacked out, and the other, not emotionally prepared for such intensity, began ranting about how we were all going to die. I could barely stand, but managed to stumble off a small distance from the camp, collapsing on the forest floor. This is when I felt the strange spirit enter me: the many-eyed apparition that had already been haunting my consciousness. The difference was that this time the "creature" seemed to be inside of me. The feeling of having some "other" inside of oneself can be

disconcerting. I had the uncomfortable notion that I might be stuck with this being like some kind of personality-infesting virus. I instinctively began questioning its intentions -- who was it, what did it want, and was it a demon? I received no answer, and so, not being certain it belonged in my head, forcefully commanded it to leave, which it apparently did.

The next day, still dazzled by the 'shrooms, I had the creepy feeling that I was either going crazy or was infected with a spooky denizen of hyperspace. This experience of a parallel dimension was a serious challenge to my world view. Whether I have rejected some potentially beneficial alliance I may never know. I am not sure why the entity wouldn't speak. Perhaps my ears are too primitive or untrained to pick up the more subtle resonances of hyperspace. Perhaps, like an insect under a magnifying lens, I have difficulty fathoming this mysterious being of a thousand eyes. Interestingly enough, one of my companions later commented that at one point he perceived my forehead to be covered with eyes. -- *Owl*

[I don't think I've ever said that entities are "delusions," only that they are Mysteries and that we shouldn't jump to conclusions about their identity, intentions or veracity. Emmanuel Swedenborg, the great 17th Century mystic, had this to say about his meetings with such spirits:

*When spirits begin to speak with a man he ought to beware that he believes nothing whatever from them; for they say almost any thing. Things are fabricated by them, and they lie. For instance if they were permitted to describe what heaven is, and how things are in the heavens, they would tell so many lies, and indeed with solemn affirmation, that a man would be astonished. Therefore when spirits are speaking, I have not been permitted to have faith in the things which they related. For they have a passion for inventing; and whenever any subject of conversation is presented they think they know it, and give their opinions upon it, one after another, one in one way and another in another, quite as if they knew; and if a man then listens and believes they press on, and deceive, and seduce in divers ways.*

Swedenborg -- *Spiritual Diary*, 1622

As we learn more about these encounters I'm leaning toward the "unscientific" notion that traditional protective techniques, such as magic circles and spells,

do make a difference in the kinds of experiences we have. I'd like some feedback from *ER* readers on this -- maybe some brave souls could do a "scientific" comparison: a before and after experiment to ascertain the usefulness of this. What follows is the only "before and after" account I have received to date. -- *Ed.*]

## **DMT ENTITIES**

I close my eyes and lean back. I feel and hear a shift as the hyperexpress elevator takes me away from my body to my destination and I arrive in a place filled with intense white light where hideous, bodiless, pointed-eared, purple and green entities bound toward me and they laugh, jeer and ridicule me; where these grotesque elf, joker or clown-like caricatures rush at me one at a time and in clusters; where they curl their hideous, clown like mouths and wag their tongues in my face; where I relive every real and imagined humiliation I suffered in childhood; where a great sorrow and disappointment fills me as they come at me faster and faster; where I start to crumble under their onslaught, so I open my eyes but still they come; where I realize I have to face them so I close my eyes and focus on my breathing, and the demonic forces back off and I feel myself coming out of the trip, and I open my eyes and see D surrounded by multi-layered, multi-colored grids and he says, "You're in a good space," and I ask, "I am?" but his words reassure me and I close my eyes but the elves are gone. I feel humbled, shaken, bewildered and angry but I want to go back in.

Ten minutes later...

D loads another hit into the glass pipe. I cast a circle in the Wicca tradition:

*I conjure Thee O circle of power,*

*That thou beest a boundary between the world of men  
And the realms of the Mighty Ones; A meeting place  
of love, joy and truth,*

*A shield against all wickedness and evil;*

*A rampart of protection that shall contain and pre-  
serve*

*All the power we shall raise this night.*

*So mote it be.*

Shielded in my psychic armor, I smoke another bowl and chant "OM" with D. I close my eyes and a jeweled flower unfolds to the vibration of the "Om" and each "Om" transports me along the grids of hyper-dimensional space like a canoe gliding on a river and

entities in different, streamlined forms bow, dance and offer me fractal-like flowers or jewels created from their bodies and I sense that they are smiling and beckoning and I ask, "What are you trying to show me?" But they continue their dance as I travel through hyperspace and I try chanting "Ahh" but it's too late, my trip is over. -- *Anonymous, Canada*

[Is banishing a bum trip no more complicated than a simple ritual endorsed by millennia of magickal workings? Perhaps our post-modern "sophistication" has transformed us into Babes in the Woods -- what might the sixties have become had we utilized these ancient protections? If there's anything to this then we've just "re-discovered" an amazing principle of human consciousness! -- *Ed.*]

### **ENTHEOGENIC BUMMERS**

The entheogenic path is really a lifelong process, and overwhelming fear is often a part of it. My last experience was a bummer. I've had them before, and they're generally similar: the fear of not coming down, the fear of it getting stronger because you're thinking it will get stronger, an irrational fear of arrest, etc. I'm wondering if maybe the bum trip isn't what the Indians say is a necessary cure for illness: regeneration through fear. Perhaps we're ignoring some important data here. Everyone talks about the good trips without describing the bad. It took me years to get used to the "God Power" I experienced on some of my first trips. The shamanic tradition is full of stories about being torn asunder, or similar tortures: it's part of the initiation into the imaginal realm. I'd like to read about others' difficult experiences and what they've learned from them. -- *BJ, FL*

[I agree -- the hedonistic approach to psychedelics is only part of the story. Sooner or later, bummers (including violent purging) usually come with the territory. My most profound lessons were all learned during my most difficult passages. If nothing else, bummers teach respect for the Mystery. "The fear of God" so often encountered in the Bible is more than just a figure of speech! -- *Ed.*]

### **MUSIC HATH CHARMS**

#### **TO SOOTHE THE SAVAGE TRIP**

Patrick Bernhart's *Atlantis Angelis* CD (cut #7: "Harmony of the Om Spheres") is a cosmic, multi-dimensional, "wall of sound" recording of the time--

honored Sanskrit Om mantra. If anyone ever came close to bringing the music of the spheres into three-dimensional reality, Bernhart's rich production deserves special recognition. Because the cut is only 6:55 minutes long, I wanted to extend it seamlessly to fill an entire C-90 cassette. I was able to do this with a little Radio Shack audio mixer, a couple of tape decks and a CD player... [*Author goes on to describe a 3g P. harmala/1.5 g P. cubensis experience using the above music with headphones.*]...As I was coming on, I asked for support and protection (as I usually do in journey work) from all the masters, saints and gurus I could think of, and mentally aligned and dedicated myself to the forces of highest Galactic good... The all-encompassing sounds of the Om Spheres catapulted me into an outrageously intense state of blissful, re-vivifying, empowering, soul-stirring celebration of ecstatic rapture... The journey lasted about four and a half hours and was almost continuous ecstasy -- the longest nonstop orgasmic stretch I've ever experienced on mushrooms or anything else... I believe that this particular "Om" soundtrack (or any other recording closely analogous to it), heard through stereo headphones, functions as a stabilizing metaphor within which the psychedelic journeyer is continuously channeled into an experience of the ecstatic. All of us have enough psychological crap to introspect about until hell freezes over. While I don't discount the value of painful, introspective and analytical experiences, given the choice, I'd rather be similarly purged and renewed by deep ecstatic union with the Other. In terms of stacking the deck in favor of the latter, the Om tape with headphones seems a promising direction. I'd be most interested in feedback from others on this. -- *DL*

### **MUSIC FEEDBACK**

During early *psilocybe* trips I found great enhancement with music such as *Zamfir* and subliminal tapes for optimism. However, during more fearful experiences even the the most positive New Age tapes turned menacing. Now I don't listen to any music so that I can move with the odd timing of the psychedelic experience itself. -- *BJ, FL*

### **ENTHEOGENIC MUSIC**

I highly recommend any recording by Bela Fleck, especially *Places* -- a 100 minute CD. It is extraordinary. -- *Mike*

## REVIEWS

Mindell, Arnold (1993) *The Shaman's Body*,  
Harper, San Francisco \$10.00, 236 pgs

If I could afford it, I'd mail a copy of this text to every *ER* subscriber. This is a book that should be read more than once -- a book I know I'll read more than twice. *The Shaman's Body* is one of those seminal volumes from which you'll read a paragraph and then spend 15 minutes thinking about it: you'll find yourself making copious marginal notes and discover that you've underlined so many sentences that the process becomes meaningless -- every page stained with yellow magic marker! Quite simply, this is a hands-on manual for how to work shamanically, written by a maverick psychologist who really understands the imaginal realm. Ironically, Mindell's method is based almost entirely on the controversial works of Carlos Castaneda. (See "Bullshit as fertilizer in the garden of truth" in the Spring '95 *ER*.) He makes the teachings of don Juan really come alive, and shows how they may be profitably applied, moment by moment, to your everyday experience. If, (arguably) Castaneda "only" made up the don Juan books, Mindell shows what a stupendous accomplishment that was. I hope to get feedback on how readers use these techniques with entheogens.

2

Wolf, Fred Alan (1992) *The Eagle's Quest*,  
Touchstone, NY, \$12.00 318 pgs.

An interesting and unusual narrative of the author's travels to the Peruvian Amazon to reconcile the world

of quantum mechanics with the imaginal realm of shamanism. If you've ever wondered what kind of trips a theoretical physicist might have on ayahuasca, this book will tell you. *The Eagle's Quest* compares the strange reality of the shaman with the equally strange insights of modern physics and shows how the two approaches fully endorse each other. There's real food for thought here for people like myself who are always striving to understand the Big Picture: Wolf comes closer than any other author I can think of to pulling it together coherently. (Mindell's book, above, is a working manual, this is mostly theory -- the two works compliment each other nicely.) The personal style of this volume is both its strength and its weakness; although the narrative form is easy for a non-specialist to relate to, I personally would have preferred his argument to be tighter and less anecdotal in places. This is a minor quibble, however -- the book is highly recommended.

A resource guide to businesses and organizations involved in Entheogens. Fully annotated and opinionated - find out about companies and their products before you buy!

# NETWORK FEEDBACK

---

## **PASSIFLORA CAERULEA**

The Blue Passionflower (*Passiflora caerulea*) contains Chrysin. In the past, I've combined it with cannabis and opium, both singly and with all three, never using more than three leaves of *Passiflora*. All experiences were uniquely anxiety-free, with amplified mental and visual effects. I decided to experiment with larger doses: seven large *Passiflora* leaves, well-chewed and swallowed; two hits of good quality sinsemilla; two heavy tokes of opium. The following insights resulted:

In sleep, I am approaching consciousness through a dream, but I never reach it; in wakefulness I am approaching sleep through a dream, and sometimes I can reach it. The dream is the common modality of awareness: we've risen from death into this world and shall eventually sink back into it. -- *Anonymous*

2

*Passiflora caerulea* is a good source of harmala alkaloids. For best results, smoke the leaves -- one joint equals about a gram. This plant is easy to cultivate and probably wouldn't be targeted for legislation. If any of us are not yet growing harmala, you could do much worse than this plant. We should all grow it on general principles. -- *Anonymous*

## **MUCUNA PRURIENS**

The leaves of *Mucuna pruriens* contain various tryptamine compounds. Ingestion of the plant material apparently irritates the dental nerves in some way and is most unpleasant. This can be eliminated by smoking the leaves. After one cigarette-sized joint, a general CNS stimulation (throbbing "tryptamine buzz") resulted. Ingestion of three gm harmala and smoking two *Mucuna* joints produced throbbing in the head accompanied by colored geometrical patterns. Mild irritability evolved into a mellow feeling over the course of an hour. (Pulsating colored patterns spiraling around me, a strong urge to lie down. Very mellow and detached.) *Mucuna* looks promising for extraction -- judging by the effects, I'd guess it contains a lot of DMT. This plant, if naturalized across the U.S. would be awfully difficult to legislate

against. -- *Anonymous*

[*Mucuna pruriens* is listed by JLF as "velvet bean." Horus Botanicals offers "*Mucuna* sp." as: "(Cowhage) Vine with beautiful dark purple flower clusters similar to wisteria -- followed by many interesting bean pods covered with a velvet-like fuzz. Seeds long considered an aphrodisiac in India and recently found to contain alkaloids..." -- *Ed.*]

## **WEIRD DATA**

A correspondent sent me a photocopy of an article published in the German journal *Naturwissenschaften* 79 (1992). "First Identification of Drugs in Egyptian Mummies," (S. Balabanova, et al, Institut fur Anthropologie und Humangenetik der Universitat, W-8000 Munchen, FRG), describes how cocaine, hashish and nicotine were detected in the hair, soft tissue and bones of seven mummified heads buried between 1070 BCE to 395 CE. Since cocaine and nicotine are both substances found only in New World botanicals, these data have a very high weirdness index. Either the samples were contaminated (though the vibes of the article suggest competent scientific method), or the Egyptians had access to coca and tobacco plants. I realize that cocaine traces can be found on most U.S. \$100.00 bills, but that's a far cry from 2900 year-old mummies! Go figure. -- *Ed.*

## **EUROPEAN DRUG LAWS**

European countries generally have no penalty for use of drugs, but do for possession. Now Spain and Italy have no penalty or fine for possession. Evidently the U.K. applies penalties only to opiates. This was reported in *High Times* magazine in June, 1994. Does anyone have a working knowledge of our Western countries' drug laws? -- *BJ, FL*

## **YHUBA GOLD**

I recently purchased some little "cigars" from an advertisement in *High Times*, with the brand name "Yhuba Gold." They give a fairly strong, but brief high, and I find them used to best advantage in combination with other substances. I took one apart, and damned if I can figure out what they contain. The

leaf they're rolled in looks something like *Brugmansia* (tree Datura). Do any *ER* readers know what's in these things? -- *Anonymous*

### READER EXCHANGE

How about having a section in *ER* for fellow subscribers to exchange seeds, spores, plants, cultures, etc. with each other at little or no charge? Some of us have surpluses of certain botanicals, others have no access to them. This would be a useful service if basic safeguards could be established. -- *BJ, FL*

[Let's get some feedback on this idea. -- *Ed.*]

### NO RESPONSE

*The Entheogen Review* is not a consumer advocate publication, but sometimes I receive complaints from subscribers about suppliers of products or services of interest to the network. Usually these consist of no response to information requests. In one instance the complaint was about a check cashed, no product sent, and no response to repeated inquiries. (See LER, #1 below. For the record, I wrote LER for their side of the story but received no response.) I hate taking up space with this stuff, but it's important to spread the word. Please remember that with one exception, these companies are not accused of rip-offs, just not responding. Considering the legal ambiguity of the risks they take, they probably deserve more sympathy than censure.

LER, Box 1676-E, Coconut Grove, FL 33233

Mycelium Fruits, POB 551-HT, Iron Station, NC 28080

Natural High Mushroom Co., 5225 S. HWY 95, Ste 8-132, Mojave Valley, AZ 86430

Power Product, 1736 E. Charleston Blvd., Las Vegas, NV 89104

Weeds, POB 161061, Austin, TX 78716

### FAIR TRIAL SECURITY

In a recent issue of *Spore Print* (from the Fane of the Psilocybin Mushroom, Box 8179, Victoria, B.C. Canada V8W 3R8) contained an article titled "Fair

Trial Security; Notice and Instructions," which explained how those who use illegal entheogens might be able to protect themselves by filing a notarized statement with their local county clerk, and then requesting a jury trial if they are ever arrested. I encourage you to get a copy of this issue of *Spore Print*. If this technique could be written in a clear (to the layman) manner, it could be of great use to *ER* subscribers. -- *JH, CA*

### Wildflowers of Heaven

POB 1989, RANCHOS DE TAOS, NM 87557

Offering live *Trichocereus* cacti, including *T. peruvianus*! Baby Hawaiian Wood Rose and Morning Glory seeds. Cactus seeds. Sacred smudge sticks. Prayer flags. Heavenly rose garlands. Hard to find wildflower seeds. And much more! Send \$1.00 for catalog. \$4.00 for catalog and one year of new product updates.

### INACTIVE EXTRACTS

I purchased some *Phalaris arundinacea* extract from a botanical supplier, dissolved it in ethyl alcohol and then smoked it on mint leaves. All I got was a slight headache and a bad taste in my mouth. Do you know any companies that sell active *Phalaris* extract? -- *Anonymous, KY*

[My guess is that selling *extractions* would be interpreted by the DEA as trafficking in schedule-1 substances, so anyone offering a psychoactive extract is putting himself in major jeopardy. If the extract is inactive (and most *Phalaris* strains are), he's not in trouble. Remember that, for their own protection, none of these companies claim to sell anything more than just natural products: let the buyer beware! The safest bet is to purchase plants or seeds of known potency and do the rest yourself. In my opinion that's the best way, the shamanic way, to meet the plant teachers anyhow. -- *Ed.*]

### HEIMIA SALICIFOLIA EXTRACT

I drank a 1 oz *H. salicifolia* tincture from OTJ, and the effect was marvelous. It put me into a state which at the time I could only think to call "perfection." Perhaps people don't drink the whole little bottle of it,

and that's why they don't feel the euphoria, the wisdom. Or perhaps I got a buzz off the alcohol in it: if so, that was some alcohol! -- *Soma Baba*

### **2C-B**

What exactly is 2C-B and what are its effects? -- *GA, KY*

[2C-B is a phenethylamine invented by Alexander Shulgin. See the book *PIHKAL* for full information on effects and dosage. It is in the MDMA family, and has a pronounced aphrodisiacal quality -- great to share with a spouse or lover. It is of course, against the law to do any such thing. -- *Ed.*]

### **NUTMEG MYTHOLOGY**

*No evidence was found to support previously published reports of nutmeg's hallucinogenic or other psychoactive properties other than a mild sedative action. A renewed suggestion is made that anecdotal reports of nutmeg use as a hallucinogen be reevaluated critically.* -- Van Gils, C., Cox, P.A., "Ethnobotany of nutmeg in the Spice Islands," *J. Ethnopharmacol.*, Ireland, Apr 1994, 117-124

## **PSYCHEDELIC OINTMENTS**

Doesn't anyone get the major importance of this technique? [*Development of a psychedelic ointment, "Spring '95 ER.*] The Indians who take Yopo snuff don't need MAO inhibitors [which is necessary when ingesting oral tryptamines]. The ointment procedure is much less damaging than snuffing or smoking DMT. Ointments are a potential breakthrough: no bad taste, no risky MAOIs, and possibly more efficient absorption than through the gastrointestinal tract. Why waste time with HBW -- this is perfect for DMT. -- *BJ, FL*

### **TOXIC DEATH AND DMSO**

A subscriber sent *ER* an article from the April, 1995 issue of *Discover* magazine describing a fatal incident possibly associated with massive DMSO use. ("Analysis of a toxic death," by Richard Stone, page 66.) The details are *extremely* weird and complex, and the theory hasn't been proven to everyone's satisfaction, but readers interested in DMSO- ointment experiments are encouraged to read that article.-- *Ed.*

### **JALAPENO/HBW REACTION**

I tried the ointment experiment with HBW and the juice squeezed from jalapeno peppers. I used four seeds since they were at least, if not over, three years old. There was no psychoactivity, though the pepper juice burned my arm. At what rate does LSA break down in HBW seeds, and what contributes to it? -- *MS, PA*

[I don't know. It is generally accepted that HBW seeds lose their potency fairly quickly and should be used within a year of harvest. Though pepper juice is said to be quickly absorbed through the skin, it's not surprising that it would burn. Other ointment bases are probably less problematic. DMSO is the most well-documented substance -- used with care and intelligence it shouldn't present problems. -- *Ed.*]

### **LSA AND SAN PEDRO OINTMENTS**

I soaked 125 mg of finely ground HBW seeds for fifteen minutes in a 70% solution of DMSO (enough to cover the powder). Rubbed on body, noticeable effects began in eight minutes. Unfortunately, dizziness was a distraction. I've no desire to repeat the experiment.

I mixed 50 gm finely ground dried San Pedro in enough 70% DMSO to make a slimy paste. I massaged this all over my body: it took quite a bit of rubbing before it began to pass the skin. Noticeable effects began in 20 minutes, accelerating to Plus-3 in 20 more minutes. The effects were much stronger than an equivalent oral dose. It was very euphoric, and lasted about 14 hours. About two days later I developed a severe rash in my armpits (the softest, thinnest skin). It stands to reason this probably had something to do with the DMSO. The symptoms burned and were painful for three days. -- *Twinkle, NM*

### **LSA AND NITROGEN MUSTARDS**

The new drug created from LSA via nitrogen mustards is definitely powerful! Using a quarter teaspoon of hot mustard (use powder and follow the directions on the can) to an amount of HBW extract roughly equal to ten seeds (it will require a little more of the mustard if using raw seed for skin absorption), let sit for about 45 minutes. There is no difference in the absorption rate whether taken through the skin or

by mouth! Effects commence in 20 minutes and visual phenomena should begin in 30 to 45 minutes. There is a marked absence of unpleasant physical side effects. At about an hour one is astonished by the intense visuals, and thought processes are similar to tryptamines. There is little or no sedation, though you might want to lie down. The experience peaks at about 2.5 hours and the trip is usually over around the sixth hour. LSA will readily penetrate the skin without the aid of a solvent. I suspect the nauseating principle also carries through, as I've felt queasy after handling powdered HBW seed. I applied a full dose of HBW extract and hot mustard directly to the veins and the effect was no different than ingesting. For the sake of convenience, I refer to this new compound as NLSA. Here is my comparison between LSA and NLSA:

LSA: Effects commence in one hour. Queasiness, heaviness of limbs, slight vertigo, visuals giving way to LSD-like effects. Peak in 1.5 hours, followed by sedation, contractions of groin and anal region. Lasts about 8 hours.

NLSA: Effects commence in 25-45 minutes. Intense visuals; nearly identical to LSD. Peak at 2.5 hours, giving way to a plateau. Over in about 6 hours.

To make individual hits of the HBW/mustard combo: divide HBW extract into predetermined number of doses and mix into each dose a little less than a third of a teaspoon of hot mustard. Let stand 15 minutes, then spread out each dose thinly and put under a fan until dry. Thoroughly mix in a small amount of flour, load into capsules, and ingest at will. We are really onto something with this new combination and it fits the bill as an easily prepared super-entheogen. The success of this experiment suggests that other entheogens may be enhanced with the nitrogen mustards. I wonder what *Salvia divinorum* would be like as an ointment.

— Dr. Poppyseed, IN

### TROPANE OINTMENTS

*There was no question that species of **datura** are topically active. Sorcerers among the Yaqui Indians of northern Mexico anoint their genitals, legs, and feet with a salve based on crushed **datura** leaves and thus experience the sensation of flight. Shultes felt that quite possibly the Yaqui had acquired this practice from the Spaniards, for throughout medieval Europe*

*witches commonly rubbed their bodies with hallucinogenic ointments made from belladonna, mandrake, and henbane, all relatives of **datura**.*

— Wade Davis, *The Serpent and the Rainbow*

## LSA NOTES

### LSA/DESMANTHUS AYAHUASCA: ECSTASY vs. SEDATION

LSA produces two distinct effects: ecstasy and sedation. The ecstatic phase is like LSD. One is lucky when this is the only effect. Generally, the trip usually starts ecstatically, and after about two hours the two effects begin to alternate. Usually at around three or four hours the sedative effect becomes dominant. In almost all LSA trips I've had, at seven hours the sedation gives way to a pure LSD effect which will last for two or three more hours -- if you can stay awake that long! Unfortunately, one is usually exhausted by this point. But that's OK -- when you wake up you'll feel squeaky clean, like after LSD.

I heard somewhere that certain Amazonian tribes sometimes add LSA-containing plants to their ayahuasca mixtures. I took 3 grams of raw *harmala*, then 1 HBW seed, followed about an hour later with 3-4 grams of pulverized *Desmanthus* root bark. Potent stuff! The tryptamines overcame the sedation of the LSA, providing a trip which was the best of both. *Desmanthus* root bark may also be smoked. To describe the trip as heavy is only scratching the surface. — Anonymous, IN

[I've always wondered what the result would be to add a bag of a high-caffeine tea, like Celestial Seasonings' "Morning Thunder" to an ayahuasca brew to counteract any sedative effects. Just a thought. — Ed.]

### WOODROSE REACTIONS

The harmala-potentiated woodrose trips from the Indiana guy are truly spectacular sounding. I get life-threateningly sick from woodrose and it takes a month to recover. It is the most toxic entheogen for me. On the other hand, I've never had the slightest symptoms of illness from straight ayahuasca. Diet is everything. That's especially true for me. — Anonymous, NM

## **FOLLOW-UP EXPERIMENTS**

Here's some new, and I think exciting, info on LSA/harmala. LSA is an acquired trip, as it takes a certain amount of practice to be able to utilize its benefits. Often a person's first experience with LSA is unpleasant, but with repeated administrations the effects become increasingly beneficial and even enjoyable.

After extracting the alkaloids from 100 *Argyrea nervosa* (Hawaiian baby woodrose) seeds, utilizing methods previously mentioned in *ER*, I divided the resulting residue into ten doses. The residue is quite dry, about 1/4 crystalline and very concentrated. I used flour to add bulk. With 1 g of crushed *Peganum harmala* seed, I ingested 1 dose of the LSA extract. Physical effects, dizziness, numbness of the hands etc., were prominent in 20 minutes; dissolution of the physical world was well underway within the hour. I fell into a datura-like stupor for 3 hours and then awoke to a trip similar to a too-high dose of LSD. The universe was a wild wheel of color and the physical world was often washed away by another world trying to push its way through the doorway I'd unwittingly opened. Electric blue bubbles of varying sizes rose through my head like some kind of carbonated drink. My mind seemed in a liquid state: a liquid so clear I could see infinity. Body distortions were profound: there were light years separating my head and hands, and my feet seemed to lie in separate dimensions of their own. It took a millennium between my mind's command to move and the actual movement of my limbs. After ten hours, the trip subsided quickly. In subsequent trials, using a smaller dose of harmala, I've gotten more control and have avoided the datura-stupor. --Anonymous, IN

## **AVOIDING NAUSEA**

I coated eleven 00 capsules of powdered morning glory seeds with shellac. This caused them to dissolve in the small intestines rather than the stomach. With three coatings of shellac, I Clear-Lighted for four hours. -- JB, CA

[An interesting technique, analogous to using psychedelic enemas to avoid nausea. A problem might be the length of time it takes to come on -- how many hours? --Ed.]

## **HBW**

I tried ground Hawaiian baby woodrose seeds soaked in water in the refrigerator for days or weeks, as everyone recommends. I ate up to 50 seeds and only got a mild experience. Is there that much difference in crop potency? -- BJ, FL

[You may have soaked them too long -- most people report that soaking ground HBW only an hour or so is sufficient to extract the active principle. Longer soaking times may de stabilize and degrade the alkaloids. -- Ed.]

## **PHRAGMITES AUSTRALIS**

### **PHRAGMITES AUSTRALIS:**

#### **NEGATIVE**

I was intrigued with the "*Phragmites australis: Another Ayahuasca Admixture Plant*" article in the Spring '95 issue of *ER*, and decided to check it out. I ordered 90 grams of the root from JLF and did two tests. In the first, I weighed out 22.5 gm of root and 3 gm powdered *P. harmala*, and boiled same in three cups of water for fifteen minutes. I drank the admixture to no effect. In the second test, I used 45 gm of root, 3 gm harmala and let the mixture simmer overnight in a crockpot at low heat. Again, nothing happened. If the person who wrote in initially (or anyone else) can shed some light on what I may be doing wrong, I would be most obliged. -- DL, NV

### **PHRAGMITES AUSTRALIS:**

#### **POSITIVE**

Our first trials with *Phragmites australis* combined with *Peganum harmala* were not quite what we were hoping for. The standard 3X lemon juice extract of 60 g *Phragmites* plus 3 g harmala were taken after a 24 hour fast. It was definitely entheogenic, with the predominant sensation of 5-MeO. There was very little visual effect, but there was definitely a lot of clear spatial energy movement through the body. The experience peaked at a plus-2 about an hour after ingesting the *Phragmites* portion of the brew. At this point my fellow psychonaut suddenly felt the urge to make a beeline for the bathroom where he puked and shit at the same time. (Quite a predicament indeed!) Two

hours into the trip I took a booster equivalent to 30 g of *Phragmites* and 1.5 g *harmala*. This pushed me into a solid Plus-3 which lasted for several hours. It came in waves of intensity. I experienced some very unpleasant nausea and somatic discomfort which set the tone of the trip. I suspect the lemon juice may have been a factor in the side effects, perhaps it's not necessary in this brew. For future trials I plan to investigate other possible means of ingestion. -- *Eros*

## **DATURA DATA**

### **ENDOSATANOGEN?**

Considering that most anywhere datura grows, primitive peoples refer to it as "Devil's herb," perhaps one should call daturas something other than en-theogen (god-generating- from-within). Perhaps endosatanogen would be one possibility. -- *JS, OR*

### **SHAMANIC USE OF DATURA**

*The potion took effect quickly. Within half an hour (the shaman) had sunk into a heavy stupor, his eyes fixed vacantly on the ground, his mouth sealed shut, his face suddenly bloated and red. His nostrils flared, and several minutes later his eyes began to roll, foam issued from his mouth, and his entire body shook with horrible convulsions. He plunged deeper and deeper into delirium, breathing spasmodically, kneading the earth with his long bony fingers like a cat exploring for fissures that might release him from his madness. Agonizing screams sliced into the night. He attempted to stand, only to fall and lie flat on the ground, thrashing the air with his arms. Suddenly he lunged for the basin of water, like a man whose skin is aflame or whose throat is parched. Then with a final anguished spasm, he collapsed and lay still. This was *ci-mora*, the tree of the evil eagle, the closest botanical relative of datura. -- Wade Davis, *The Serpent and the Rainbow**

### **DATURA DOSAGES**

We chose to eat between 5 and 20 grams of *D. stramonium*. 20 was too much. Chew up 2 grams first -- from then on it is very uncontrollable. -- *JC, MI*

### **DATURA DEATHS**

*A small but growing number of teen-agers have*

*turned to Jimsonweed, a poisonous plant that grows throughout North America, in order to get high. Drinking tea made from the plant's trumpet-shaped flowers or eating its seeds can cause confusion, seizures and hallucinations. At least two teen-agers have died. -- Time, Feb. 6, 1995*

### **GET STUPID**

I tried smoking *datura* twice, over seven years ago. It causes me to sweat, grind my teeth and get stupid for a few days afterward. Not much fun. Not my drug. -- *RS, DE*

### **FATAL ATTRACTION**

*In many parts of West Africa the use of *Datura stramonium* in criminal poisonings still takes a unique form: women breed beetles and feed them on a species of the plant, and in turn use the feces to kill unfaithful lovers. -- Wade Davis, *The Serpent and the Rainbow**

### **DATURA AS COLD REMEDY**

At the first symptoms of a cold, fill two "0" capsules with pulverized *datura* leaf, go to bed and follow the traditional plenty of liquids and rest. Repeat the dosage every six hours until you fall asleep. Upon awakening, wait an hour before resuming medication with *datura* -- often the first day of treatment will nip it in the bud. If symptoms persist, repeat the above regimen. Every time you awaken, give yourself time to see if symptoms are still there.

The physical relief of cold symptoms comes from the scopolamine drying out the mucous membranes. In contrast with antihistamines, datura has no "pay back" -- you'll awaken one morning, blow your nose, and find you're all finished with that particular virus. There's none of the dreadful snorting and hacking that usually follow a cold. Stress is often the deciding factor in whether one will succumb to a cold. Because datura promotes deep relaxation, it relieves stress -- there's no need to reiterate the beneficial effects of trance states in healing. -- *Anonymous, IN*

## PHALARIS

### PHALARIS STAGGERS

Tryptamine alkaloids, which are similar in chemical structure to serotonin, have been reported to cause sudden death, acute neurologic disturbances, cardiac arrhythmias, and the chronic neurologic condition known as *Phalaris* staggers. These conditions, associated with the feeding of graminoid plants (especially *Phalaris* spp) to sheep and cattle, have been observed in Australia, New Zealand, South America, and South Africa, but have only recently been observed in animals in the United States... Chronic

*Phalaris* staggers is more likely to develop in sheep that have had prolonged exposure to alkaloid-containing plants grown on soil deficient in cobalt.

I.J. Lean, et al,  
Tryptamine alkaloid  
toxicosis in feedlot  
sheep, *JAVMA*, Vol 195, No 6, September 15, 1989

### CORRECTION

A misprint occurred in Johnny Appleseed's "Quantity *Phalaris* Production" article in the Spring '95 *ER*. The last sentence in paragraph #3 (page 12) should read: Thus gramine, with only one possible genetic combination, occurs in less than 60% of random plants tested, while DMT, with 3 possible genetic combinations occurs less than 1% of the time.

..The oral psychoactivity of the *P. aquatica* ... aqueous extract is obviously different from (that) of the single compounds DMT or 5-MeO-DMT ... Moreover, in spite of the title of this communication where we use the word "ayahuasca-like effect", the pharmahuasca *P. aquatica*/*P. harmala* seems to be a lot different from the *Ayahuasca australis*: the sometimes aggressive and often up-down subjective effects of the former are in contrast with the meditative and often almost oneiric characteristic of the latter. The reasons for this difference are probably due to the distinct chemistry of the two preparations. It is possible that some pharmahuasca characters are linked to the interaction between DMT and 5-MeO-DMT considering that the latter substance is not contained in the classic additive *Psychotria viridis* ... We cannot exclude, however, that other compounds present in the *Phalaris*, little or not active themselves, could play an important role in

the global pharmacology of these species.

"Ayahuasca-like" effects obtained with Italian plants -- by Francesco Festi and Giorgio Samorini -- Communication presented at the II International Congress for the Study of the modified States of Consciousness, 3-7 Oct. 1994, Lleida (Spain)

### ALKALOID INDICATORS?

Some of my *Phalaris* plants produce dark droplets of sap that appear on the ends of the leaf blades after cutting. Some plants have quite noticeable dark spots at the tips of their blades, while others do not. I suspect the darkness may indicate alkaloids. Is there any physical characteristic of the various *Phalaris arundinacea* strains that would indicate high alkaloid

content? Perhaps those strains originating from locations known to produce high-- alkaloid plants have distinct characteristics. I bought some "killer strain" seeds from OTJ and they are apparently high in alkaloids, but I don't know if they're high in "desirable" alkaloids. Has anyone else had experience with these seeds?

What percentage of

tryptamines can be expected from potent *Phalaris*? --  
*Anonymous, Canada*

### TOXIC JUICE

I have abandoned any usage whatsoever of the *P. arundinacea*. Smoking the juice extract gets me high, but it gives me a toxic feeling and I get severe insomnia when I go to bed that night. I've never had any interest in drinking the fresh juice with *P. harmala*. There are too many more interesting plants on the horizon. -- *Anonymous, NM*

### MEDIOCRE PHALARIS EXTRACTION

*Phalaris arundinacea* is everywhere in Vermont. A methanol extraction of *Phalaris* (3-X over 36 hours), with resulting tincture evaporated in a crock-pot, resulted in a tar that, when combined with a dry herb, heated/burned and inhaled, produces unmistakable +2 rushes, but not the kick into the universe next-door that is the philosopher's stone of this par-

ticular alchemical quest. -- Dr. Sax

### **BETTER LUCK WITH PHALARIS EXTRACT**

To avoid the nausea of ingesting dried *Phalaris* juice I tried a one-gram anal suppository (after first swallowing a gram of *P. harmala* extract). I became distracted by the burning and churning of my lower intestines and the suppository was soon eliminated. (A gram was probably too much anyway.) Not wanting to waste the *harmala*, I hastily swallowed 250-350 mg of *Phalaris* in another gel cap and resumed my meditation and chanting practice. Sitting at an altar lit only by flickering candles in a mood of reverence is enough to induce fluidity of vision all by itself, but I was pleased to note more fluidity than usual as well as heightened alertness and energy. I did yoga while listening to Robbie Basho, one of the nearly-forgotten treasures of the sixties. I began to reflect on difficulties I was having with my house mate and formulated a more compassionate view of our situation. Stepping out of candles into electricity brought the realization that I was definitely tripping. There were no wholesale visual alterations, but everything buzzed with the intensity of its nature. Our conversation was fruitful and we enjoyed a greater sense of ease than we had in several weeks. I went to sleep readily around midnight and had memorable dreams. Woke up feeling good and went to work. While not the powerful experience some people are reporting, it is the most encouragement I've had in the several years I've been playing with tryptamines. I'll keep you posted. -- Dr. Sax, VT

### **SOLVENT ODOR**

I've extracted *Phalaris* using methylene chloride, but I'm too afraid to swallow it with a MAOI. It still smells like solvent, even though totally dry. No luck smoking this stuff. Even if I evaporate it onto an inert substance it just bubbles like resin and I get no effect. -- EK, LA

[A potent *Phalaris* extract should smell strongly of DMT, which is unmistakable once you learn it. It could easily be mistaken for a solvent odor, since DMT smells vaguely like mothballs, or some kind of plastic dissolved in gasoline. I strongly advise that if there's any *solvent* odor at all, the extract be re-dissolved in ethanol (drinking alcohol) and then re-evaporated. Solvent odor indicates the presence of a

potential carcinogen! -- Ed.]

## **ABSINTHE**

If you go back far enough in the literature, you'll find arguments that "true" absinthe contains no alcohol, as well as the claim that alcoholic "absinthes" arose after bans on the original drink. As recently as 1895, in Millspaugh's *American Medicinal Plants*, there is no mention of alcohol, though he does say: "rectifiers also (add it) to their spirits." His version reads:

*Absinthe forms one of the favorite drinks for those who love stimulating beverages; it is compounded of various aromatics as follows: Green anise (Pimpinella anisii), Star anise (Illicium anisatum), Large absinth (Artemisia absinthium), Small absinth (Artemisia pontica), Coriander (Coriandrum sativum) and Hyssop (Hyssopus officinalis); these are distilled together until the distillate comes over reddish, then the following herbs and products are steeped in the distillate to color and flavor it: Peppermint (Mentha piperita), Balm (Melissa officinalis), Citron peel (Citrus medicus) and liquorice root (Glycyrrhiza glabra).*

Sounds tasty! -- Justin Case, TX

### **ABSINTHE RECIPE**

I've been playing around for over a year with different home-brew recipes for absinthe, trying to perfect a recipe that "exactly" simulates the turn-of-the-century version without getting into distillation methods. By trial and error I came up with the enclosed recipe, which is damn near perfect: right color, taste, it changes color when sugar-water is added and produces the desired effects. Drinking absinthe is similar to smoking cannabis while drinking wine. The mystique of the drink lies in the proper ratio of alcohol to thujones: they synergize with each other, the chemical equivalent of mathematically raising to a higher power. Simply put: absinthe is cannabis in a bottle. I drink it the traditional way, with sugar and ice water. Be warned that after three shots, weird things begin to happen. For example, one evening on my "fourth" glass, everything my wife said began to sound like Dr. Suess rhymes. She said: "go to bed," but I heard it as: "Go to bed! That's what I said!

Quit drinking that stuff, you'll wind up dead!" I was drinking absinthe in the bedroom prior to retiring (3rd glass), which she took away.

She returned later to find me drinking from an imaginary glass. I don't remember any of it. I don't think it's physically addictive, though one can become emotionally attracted to it. Treat it with respect, but enjoy it by all means. Here's the recipe:

- 5 fifths Everclear
- 1 fifth Ouzo (Greek liquor)
- 10 teaspoons wormwood (*Artemesia absinthuim*)
- 2 oz Anise seed (cracked)
- 1 oz Fennel seed (cracked)
- 1/2 oz Cardomon (ground)
- 1 oz Coriander seed (cracked)
- 15 teaspoons Angelica root
- 10 teaspoons Peppermint leaf
- 10 teaspoons Melissa (Lemon balm leaf)
- 5 teaspoons Allspice berries (whole)
- 2 oz dried orange peel
- 5 vanilla beans (broken into pieces)
- 1 small bottle peppermint extract
- 1 small bottle anise extract
- 3 cups sugar syrup (1 cup to 1/2 cup water = 1 cup syrup)

1. In 1 fifth Everclear place 10 tsp wormwood. In 4 fifths Everclear + 1 fifth Ouzo place all other ingredients except sugar syrup.
2. Let wormwood steep for three days, strain, and add to the Everclear/ouzo mixture.
3. Let total batch steep for seven days. Then strain and discard the spices.
4. Boil the sugar syrup until clear, then add to the absinthe.
5. Apportion into individual bottles.

I would appreciate feedback from fellow absinthe drinkers and also anything on the production of (recipes) for making Laudanum (opium tincture) --  
**RT, IL**

### **ABSINTHE RESPONSE FROM FRANCE**

Thujone can be found in: *Hyssopus officinalis*, *Salvia officinalis*, *Tanacetum vulgare* and various *Artesemia*: *Vulgaris*, *Absinthium*, *Maritima* and *Glacialis*, *Murellina*, *Spicata*. (These last are endangered species, too much exploited, so forget

them and use the first ones as [the latter] contain no higher proportion of thujones.) *Thuja occidentalis* and *libani*. Absinthe also contains essential oils of *Foeniculum vulgare*, *Pimpinella anuum* and *Illicium verum*.

*Warning*: all these plants can cause abortion. The combination of alcohol with essential oils is highly toxic, and I don't think there's anything entheogenic or even fun in epileptic crisis. (The effects described in the Summer '94 *ER*.) Absinthe was forbidden for good reason, there's nothing very peculiar in the "inspiration" given by the green fairy. You can find the same kind of so-called inspiration in the much less toxic Ouzo and Raki (Mediterranean alcohol containing *foeniculum*, *pimpinella*, *illicium* or others). Don't take *delirium tremens* for a mystical crisis. It is said that absinthe can still be found in Denmark (and perhaps in other nordic countries). --

## CACTI MATTERS

### HYDROPONIC SAN PEDRO?

One thing I'd like to see in *ER* would be a comprehensive formula for the growth of cacti from seed. Can San Pedro be grown hydroponically? I'd guess seed-grown plants might give a higher success rate in trials of this kind. Rooted cuttings will rot in too much water, but I've grown plants that took incredible amounts of water and wetness: constant, in fact. -- *Anonymous, TX*

[I have no experience with growing any cactus this way, and would expect to encounter root-rot problems. Once established, San Pedro grows extremely fast, so any advantages to this method (assuming it worked) would likely be confined to getting faster starts from seeds. -- *Ed.*]

### "CANDLE" CACTUS?

I purchased a few San Pedro cacti in a local nursery and ordered some larger specimens. Three weeks later they arrived sporting a marker with the name: "Candle Cactus." The Latin name was the same: *Trichocereus pachanoi*. -- *GW, CA*

[It would be surprising if cactus growers weren't hip to how San Pedro is being used. Perhaps the name change is an attempt to weed out "thrill-seekers" who can't read Latin. -- *Ed.*]

### MAOIS AND SAN PEDRO

Information coming in suggests that plant-based harmala alkaloids (temporary and reversible) are not nearly as dangerous as the synthetic MAOIs commonly prescribed for depression. Messing around with the synthetics can be fatal, and though I'm not familiar enough with MAOI pharmacology to say that the botanicals are *never* dangerous, they seem to be a good deal safer. Ott and others (see below) have shown that using harmala alkaloids with San Pedro, a botanical source of mescaline (a phenethylamine, hence conventionally considered a big no-no), is both safe and potent. However, that in no way implies that it's therefore OK to use harmala alkaloids with synthetic phenethylamines (eg, MDMA, 2C-B, dexedrine etc). -- *Ed.*

### SUPPORT FOR ABOVE

MAOIs (let alone a whole plant) have more than one effect. I haven't done much research into the ayahuasca phenomenon, but I'd steer clear of synthetic or purified MAOIs and stick to ayahuasca plants and their analogs. Otherwise it's a bit like eating cholesterol when what you want is an egg. -- *TH, OR*

### SAN PEDRO AYAHUASCA I

I know someone who's been experimenting with San Pedro and *P. harmala*. 2 Oz of S. Pedro powder was too much and he had negative side effects for two days. Recently he tried 1 gm harmala with 25 gm dried Pedro powder and said it was just right. He says the Pedro feels about 3X as strong when potentiated. No negative aftereffects this time. He claims that this is now his favorite entheogen combo -- very deep. -- *Anonymous, NM*

### SAN PEDRO AYAHUASCA II

After ingesting 3gm raw, crushed *P. harmala* seeds, I waited 30 minutes and ate 20gm powdered *T. pachanoi*. Within a half hour the physical effects of mescaline were felt. At 45 minutes psychoactivity was noted. I took a walk, and the ground began to feel like a heavily cushioned carpet. This intensified and it felt like I was sinking into the sidewalk. I returned home and smoked a small amount of cannabis, lit a candle and allowed the effects to progress. Two hours into the trip a strong rush dissolved me, the other side of which found me floating in an emerald green place surrounded by transparent red globes of varying sizes. Then visions began. I closed my eyes for a second and opened them to discover it was morning and I was home. I speculate that increasing the dose to 30gm *T. pachanoi* would be equivalent to 90gm without the *harmala*. -- *Anonymous, IN*

### TRICHOCEREUS PERUVIANUS

#### NOTES

San Pedro studies are rife with taxonomic misidentification, so anyone's claims to have taken *T. Peruvianus* should be regarded with caution. Indeed,

the very first reports of mescaline in San Pedro erroneously identified it as *Opuntia cylindrica*. One respectable nurseryman argued with me that *T. peruvianus* doesn't even exist! He and serious taxonomists who have his respect, lump *T. peruvianus* into *T. macrogonus*. On the other hand, Britton and Rose suggest that the salient difference between *T. bridgesii* and *T. peruvianus* is the thickness and coloration of the spines -- something that strikes me as very easy to misjudge, especially in the absence of a firsthand comparison against authenticated voucher material of both species. Even in the absence of honest classification errors, *Trichocereus* apparently hybridize readily, even spontaneously in the field, and the offspring may give no clear clue to either of their parents. Thus, even a plant that was diligently keyed-out to be *T. peruvianus* could be a hybrid that is substantially something else.

Regarding the lack of reports of toxicity in the *Trichocereus*, I don't think that lack of mention can be assumed to mean lack of presence. I wonder how many toxic reactions to catcophagy get reported and if all victims of toxic reactions report them as such. I know of an individual who claims to have been "stoned for days" on *T. pachanoi*. Really? Stoned for days? "Dude, was that a way lot of mescaline you took, or did you just now poison yourself?" -- SB, CA

### SAN PEDRO REPORT

A batch of 100 g (dry) *T. pachanoi* + *T. bridgesii* cacti (2:1), grown from seed in a cold, wet climate, partially with fluorescent light, indoors except for about 5 months during the last three summers, with sophisticated soil and fertilizer mix, eight years old, 10-40" high, at most 2" diameter, yielded after careful extraction-cleaning-precipitation 0.6 g of a white crystalline hydrochloric salt of the alkaloids, mostly mescaline HCl, with a melting interval of 170-180 degrees C. (Reported mp of mescaline HCl: 183 degrees C.)

Effects at 5mg/kg: deeply entheogenic, effects very

similar to LSD, but with noticeable more somatic stress than LSD or psilocybin. (Similar to MD(M)A, but not speed-like). Onset slow, peak 2-3h, total duration ca. 8h+.

Harvesting did not diminish overall growth, as only a part of each plant was used. They all sprouted again, and some of the tops were rooted to give more plants, which tend to grow more sturdy than the seedlings. --

Anonymous, Europe

### SAN PEDRO BODY BUZZ

I did two experiments with *T. pachanoi*: #1 with 12" of 3.5" diameter fresh cactus; #2 with 40 gm of dried product. Both times I experienced a definite plus-2.5-- mostly a body buzz: exactly like you feel 3 hours into an acid trip. Very few visuals or insights. In my opinion it's worth doing for the experience, but psilocybin is much more user friendly. There is no potential for addiction with psychedelics. It takes a lot of self-prodding to make me take

an inner journey, and they are usually pretty exhausting. San Pedro cactus could be free and I'm not going to do any more -- well, at least not more than once a year. -- EK, LA

### CACTI TERPINES

The enclosed article ("New triterpines from *Trichocereus bridgesii*" Kinoshita, et. al., *J Nat Prods* 55 (7), 1992, pg 953), shows the existence of two triterpines in *T. bridgesii* in a ratio of 1 part to 8 parts mescaline. My questions are: since *T. bridgesii* and *T. peruvianus* are closely related (some botanists say they're identical), and since a terpene is the active ingredient in *Salvia divinorum*, is it possible that a: they are psychoactive, and b: does *T. peruvianus* contain them? -- VW

[Interesting questions. The new triterpines are named bridgesigenin A and bridgesigenin B. Any chemists out there want to test them for psychoactivity? -- Ed.]

Back issues of *The Entheogen Review* (Winter 1992, Spring 1993, Autumn 1993, Winter 1993, Spring, Summer, Autumn, Winter, 1994. Spring, 1995.) \$5.00 each (\$6.00 outside U.S.) while they last. First year of publication (Autumn and Winter '92, Spring and Summer '93) bound together into 74 page book: \$20.00 (same price as a years' subscription).

*Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants*, by Jim DeKorne, 1994, 155 pages. (Signed by author, yet! ) \$22.00 post-paid from: *The Entheogen Review*, P.O. Box 778, El Rito, NM 87530. Or ask for it at your local bookstore for \$19.95.

*"The underlying theme of the book is DeKorne's never-ending quest to find a cheap, semi-safe, semi-natural, mind--blowing psychedelic ... (The book) is almost devoid of specific shamanic traditions ... shows little understanding of ... finely-tuned, time-tested shamanic rituals ... DeKorne ... is preoccupied with his adolescent search for an effortless high ... DeKorne's advice is equivalent to saying: "Keep jumping into deep water, and if you don't drown, you may learn to swim." -- Shaman's Drum*

*"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." -- Terence McKenna*

### THE MAGIC UMBRELLA

This totally enclosed greenhouse pops open in about 5 seconds to its full size of **three and a half feet tall with a two and a half foot base**, just like an umbrella. Folds up fast and stores anywhere in its sturdy shipping case.

If you are growing mushrooms or *Salvia Divinorum* the **MAGIC UMBRELLA provides a perfect environment for high humidity growing in small areas**. The 36" zippered front gives easy access to your mushrooms or plants and may be used for ventilation or to introduce growing lights.

*If you are not absolutely delighted send it back within 30 days and we will send you a full refund.*

### SUBSCRIPTION REMINDER

Check the code after your name on the envelope -- if it says "S95" this will be your last issue of *The Entheogen Review*. If you like the newsletter, now is the time to re-subscribe! Overseas subscribers are reminded that the high cost of airmail postage has forced me to raise the price of a subscription to \$30.00 U.S. for all subscribers outside the U.S.A.

# PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed descriptions of approximately 200 organizations related to psychedelics. Categories include ethnobotanicals (plants, mushrooms, cacti, herbs & seeds), gardening supplies & indoor light systems, merchandise (t-shirts, videos, & smoking accessories), periodicals, book vendors, non-profit organizations and religious groups, information sources, and a reading list/book review section. Updates are mailed out four times a year as new information presents itself. The first issue will be out in late June, 1994. A one year subscription is \$15.00 (five issues total). Send a money order or cash (checks are okay, but may take an additional two weeks to clear) to: Soma Graphics, P.O. Box 19820, Dept. ER, Sacramento, CA 95819-0820.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 4, NO. 3: Autumnal Equinox 1995**

ISSN 1066-1913 Copyright © 1995, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

## *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F95 means that the Fall, 1995 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

— Jim DeKorne

# EXTRACTION NOTES

---

## *DESMANTHUS EXTRACTION I*

I've had trouble extracting the alkaloids from *Desmanthus*. Using finely ground dried root or root bark, acidified to Ph 5 with vinegar in distilled water, I stir every 8 hours, and filter after 24 hours. I defat with lighter fluid (petroleum naphtha), then basify with ammonia to Ph 9. Using lighter fluid as an extraction solvent, I wind up with an emulsion layer and a solvent layer on top of it. Is lighter fluid a good solvent? How do you get rid of the emulsion? I've tried using table salt, with negative results.

1. What would be the result of a solvent extraction made directly from the aqueous acid solution?
2. What would happen if one initially basified the solution and extracted with solvent from that (i.e. eliminate the acid phase.)?
3. What if solvent only was used for extraction?
4. What ratio of solvent to water should be used?
5. Is isopropyl alcohol a good DMT solvent? -- *J, OR*

[There are many variables here, so I can only respond in general. First, the root bark is the only part of *Desmanthus* that contains any DMT. Dried root, with the bark still on it (the form in which it is usually purchased), is not the best way to utilize this plant, since the bark is almost impossible to remove once it's dry. Fresh green roots can be pounded with a hammer to loosen the bark, which may then be removed easily. Second, like most North American DMT-containing plants, *Desmanthus* is extremely variable in its alkaloid content -- get the wrong plant, and you're just wasting your time, no matter how effective your extraction method. Third, my experience with petroleum naphtha (lighter fluid, Coleman fuel) has never produced anything -- which isn't to say it's no good, just that it's never worked for me. The fact that it's easy to procure is irrelevant if it doesn't do the job. I've found methylene chloride a great solvent, but it is getting harder to obtain (it's illegal in California) because it's carcinogenic. Ether and chloroform are said to be good, but they're not easily purchased. Methanol and ethanol are easy to find, and methanol is considered a

good general solvent. As to your numbered questions: 1. No alkaloids would be extracted from the method proposed, since as acidified salts they would be insoluble in an organic solvent. 2. No alkaloids would be extracted via the second method because the sequence requires that they first be made water-soluble salts via acidification. 3. Depending on the solvent, this could work to a greater or lesser degree -- methanol would be a good choice to start with. 4. Ten percent. 5. I don't know anything about isopropyl (rubbing) alcohol. Can anyone enlighten us on it? -- *Ed.*]

## *DESMANTHUS EXTRACTION II*

With *Desmanthus* roots a recurrent problem is insufficient extraction. If following Ott's (excellent for oral ingestion) procedure of short repeated dilute acid extractions, the marc should be saved and frozen. When a quantity has accumulated it should be thawed and simmered in acidified water in a crockpot on low overnight. The resulting liquid may be processed as usual to recover the alkaloids present. With the longer cooking time, all alkaloids present will also accumulate, so this is best if one plans on chromatographic separation or other purification. -- *Justin Case*

## *DISTILLATION*

Could you briefly describe distillation. -- *Anonymous*

[It's cheap and easy to make a "still" out of an old pressure cooker (or canner) purchased from a thrift-store. Remove the pressure regulator barb by unscrewing its retaining nut inside the lid. Attach a longish length of quarter-inch copper tubing (appropriately coiled) to the resulting hole via a standard quarter-inch brass flare fitting. (Leave the rubber pressure release valve in place to prevent any possibility of an exploding container, even though the open-ended coil makes this unlikely.) You now have a simple still. The principle of distillation is that any mixture of dissimilar liquids (eg: water and alcohol) may be separated when heated as long as they evaporate at different boiling points. Since alcohol boils at a lower tem-

perature it will evaporate first, leaving the water behind. (Adjust the heat to the proper temperature.) The "alcohol steam" enters the copper coils where it is cooled down to the temperature at which it turns liquid again, and this drips into a container at the end of the coil. (Recall all the "moonshiner" cartoons you've ever seen and you have the basic idea.) It helps greatly if you can make a rig to surround the coil with water or ice to increase its cooling capacity, but this isn't mandatory. When dealing with highly explosive chemicals (such as ether) it is

## ESSENTIAL

to ensure that there are no sparks or flames *anywhere* near the apparatus -- specially shielded hot plates are often used. (There must be no chance of a spark anywhere in the circuit.) Tales are legion of would-be chemists (even inattentive experienced chemists) killing themselves through carelessness in this regard. If you're into booze, it's relatively easy to make small batches of moonshine with such a device. -- *Ed*

### THE SCOOP ON SOLVENTS

Methanol (wood alcohol) is a better solvent than ethanol (ethyl or "drinking" alcohol) for many (but not all) alkaloids. For example, while psilocybin dissolves readily in methanol, it dissolves poorly in ethanol unless hot. "Insoluble" refers to a substance that will only dissolve in amounts less than one gram per liter of solvent. If one is isolating an alkaloid, the more material one can dissolve in the least amount of solvent, the less volume one has to handle and subsequently remove. If ethanol is used, making it slightly acidic will help. Many different chemicals are used to denature ethanol, though methanol is probably the most common because its boiling point is close to that of ethanol, making separation by distillation difficult. Sometimes a combination of denaturants is used. Brucine (Dimethyl-strychnine) is not infrequent and can become concentrated in extraction products. Most denatured alcohols have formulation numbers which allow one to look up which denaturants were used. Methanol is extremely toxic. Care must be taken not to breathe its fumes or allow it to contact the skin repeatedly or for any period of time. (I would say not at all.)

In many cases a wide range of solvents will work. Many factors affect chemists' choices: what is cheapest, readily available or simply on hand; toxicity, ease of removal and how they plan to proceed with the purification also enter into their decision. DMT, for example, can be extracted by acidified water, petroleum distillates like hexane, heptane or Coleman fuel (not a great choice due to added rust inhibitors), ether, benzene, chlorinated hydrocarbons such as methylene chloride (preferred by many, despite carcinogenic toxicity, because it is nonflammable, settles to the bottom of the extraction vessel and is easily evaporated due to a low boiling point), chloroform, and alcohols such as methanol and butanol. Hexane, heptane and other fractions of gasoline may not be as carcinogenic as chlorinated solvents, but they and all petroleum distillates are suspected carcinogens. All of these solvents are toxic to one degree or another. One should avoid breathing any of them. Those who have problems with handling or understanding solvents should educate themselves or else leave them alone. There is real risk potential not only to themselves but to anyone who tastes their product.

-- *Justin Case, TX*

### BIO-ACCUMULATION

Chlorinated hydrocarbons tend to be bio-accumulative. The banned pesticide DDT, for example, is a chlorinated hydrocarbon. -- *MB, IN*

### LAB SUPPLIES

Here is a "no questions asked" chemical company that will sell to individuals:

Hagenow Laboratories  
1302 Washington St.  
Manitowoc, WI 54220

They sell ether, but not methylene chloride or other organic solvents mentioned in *ER*. They have lots of other chemicals and lab supplies. -- *JD, OH*

### CAUTIONS

Many of us can only use entheogenic plants in the form of extracts, and that means dealing with organic chemistry. As a survivor of the dreaded "organic" in college, I know that there is no simple way to learn or communicate extraction methods. It's a drag, but it's unavoidable. Also, because most organic solvents are either explosively flammable, carcinogenic, or both, I hope *ER* readers get a good background in lab safety

before trying any cookbook chemistry -- remember Richard Pryor's freebasing accident! -- **TH, OR**

### *EVALUATING PURITY*

One way to evaluate extraction solvents of less than laboratory purity (starting fluid, cleaning solvents, etc.) is to do a dry run of the whole extraction process without any of the raw material. Evaporate the solvent to dryness in a bowl with polished surface, preferably metal. It is easier to see any residue this way. There will probably always be some residue, and a small amount would not be of much concern. But significant amounts of oily residue suggest that the manufacturer has added something else, and I would look elsewhere for a solvent. -- **RH, CA**

### *EXTRACTION QUESTIONS*

When I defat *Phalaris* I get about a 10-percent emulsion, but when I extract *Desmanthus* I get a never-ending stream of emulsions. Is this normal? Any advice on separating the emulsions? I can't find "phase separation paper," but find if I put the emulsion layer in its own jar, add more solvent and gently swirl (not shake), that the alkaloids will move into the solvent. Unfortunately, this means using up more solvent. Could the tartaric acid spray mentioned in the chromatography article (Spring '94) be used to stabilize extracted psilocybin? Does anyone know how to keep it stable? In most articles you refer to methylene chloride: is this because it is a preferable solvent, or just easier to obtain? Can chloroform be used for column chromatography? It would be very useful to publish a chart showing which solvents are interchangeable for various procedures. I recently found that trace amounts of chloroform that were rinsed out of my jars ate a hole in my ABS plastic plumbing -- even jar rinsings should be disposed of with care!

-- **Anon., Canada**

### *EXPLORING THE EDGE*

There are still some basic discoveries waiting to be made. One of the most important, which has some philosophical relevance, is that stirring a solution polarizes its individual molecules. Due to symmetry, most crystals exist in two forms: left-handed and right-handed, which occur in equal numbers. Simply by stirring a solution as it crystalizes, it is possible to

obtain almost 100% of one form or the other, depending on the direction of the stirring.

Although hundreds of millions of solutions have been crystallized over the centuries, nobody bothered to find out what effect stirring had on the process until a few years ago! This is an amazing finding, because it raises the question of how does the force of the stirring rod affect individual molecules in solution. This is important because the size ratio of a human to a molecule is about the same as the galaxy to a human. In other words: does the rotation of the galaxy polarize local symmetry, including life and patterns of consciousness? The important thing is that it's still possible to make major discoveries using simple equipment. Since entheogens are one of the last frontiers, we're all explorers on the edge of the known. -- **Solaris**

### *MICROWAVES ACCELERATE CHEMICAL EXTRACTIONS*

*...A Canadian chemist has harnessed (microwaves) to selectively remove one or more chemicals from a material for analysis. Sometimes the new technology can achieve in 30 seconds what conventional extraction chemistry now requires 24 hours to do... Solvent extraction, a workhorse of process chemistry, diffuses one chemical through some material -- a sample of contaminated soil, for example, or an herb from which essential oils will be harvested. As the solvent slowly passes through the target material, it picks up and carries away any soluble chemicals it encounters... (This) diffusion takes a lot of time -- typically hours to a day. And because heat drives the diffusion, energy must be applied throughout the process. But lacking a way to selectively heat only the target, the process unnecessarily heats up the solvent and its container. Microwaves heat something when a material stops or slows the radiation, causing it to deposit some of its energy. The new process involves immersing a target material in a solvent that is relatively "transparent" to microwaves. The result: Only the target heats up. Moreover, because microwaves tend to heat quickly and from the inside of the target, energy builds up dramatically... When applied to a mint leaf, for instance, the microwaves expel any oil bound in the plant's cells into the solvent bath within seconds... -- **Science News, Vol. 144, Pg. 118***

[A note accompanying this reprint states:  
"'Transparent' means that non polar solvents don't heat in a microwave."-- *Ed.*]

### *SOLARIS RESPONDS*

Recently it was discovered that ceramic superconductors could be prepared in an ordinary microwave oven in a few minutes instead of baking for days at 1000 degrees. Other chemists have tried using their ovens and are obtaining interesting results.

To determine if this approach is feasible for alkaloid extraction, the first thing is to find out what solvents are transparent to the frequency of the microwaves used in your oven, since I don't believe all ovens use the same frequency.

One possibility is to use the technique for making psychedelic ointments as mentioned in the S'95 *ER*. For example, mix powdered morning glory seeds with nitrogen mustard, nuke for 30 seconds, and apply as needed. -- *Solaris*

### *JUSTIN CASE RESPONDS*

Microwaving is an interesting approach to alkaloid extraction, though how one would determine whether a solvent was "transparent" to microwaves might not be something one could easily look up. Solvents do get heated in a microwave, even if just absorbed from the heat of the material being cooked. This may be a useful technique using acidified water or ethanol (fairly non-toxic fumes) to speed up extraction time. Incidentally: acidified ethanol (70% ethanol/5% acetic acid) is often recommended as being excellent for tryptamine extraction. Most acids, such as lemon juice, lime juice, concentrated grapefruit juice, sulfuric (battery) acid, hydrochloric acid (eg. the "muriatic" acid sold for cleaning pools, etc.), or citric acid, sold in pure form by wine-making suppliers would work well if diluted to a suitable concentration. I'd have reservations about heating methylene chloride in a microwave since someone with a high fever could boil this solvent in his hands -- no kidding, it *boils* at only 103.5 degrees F! If the container was closed, the build-up of vapor pressure could be an explosive hazard. If the container were open, the accumulation of fumes in the microwave could be a major health threat to whoever opened the door -- not to mention the probable damage to any-

thing made of plastic (such as wiring insulation) inside the microwave. Methylene chloride dissolves most plastics. This is a toxic (albeit convenient) solvent which is especially damaging to the liver and nervous system, and would be a serious problem if ventilation was poor. The same points could be made about methanol. Pressure and vapor buildup (while less than methylene chloride) might constitute a considerable health risk. Methanol boils at 148.5 degrees F, is readily absorbed through the skin, and toxic levels are quickly reached by breathing its vapors. A less risky approach would be to use a pressure cooker. Acidified alcohol would extract rapidly under pressure, but one would need to keep an eye on rubber gaskets and the pressure-relief valve to be sure they didn't get gummy. Also, care would be needed to prevent over-cooking. I knew a person who had one explode during careless overcooking with isopropanol during crude oil extraction. Several short cookings (5-10 minutes) of acidified water in a pressure cooker will remove nearly all alkaloids from most materials. In a biochem lab one might use ultrasound to enhance extraction by disrupting the tissues and cellular structure. Freezing and thawing plant material works wonders for breaking up its cellular structure, and freezing/thawing before pressure cooking is a most useful combination. -- *Justin Case*

### *JOHNNY APPLESEED RESPONDS*

This would only be exciting if the microwaves would expel alkaloids and only alkaloids into the solvent. Otherwise you would have the same situation you have now: alkaloids and many other constituents all in the solvent, with the only savings being in a few days' time. I don't think I'd want to use my kitchen microwave for that experiment. Perhaps an old one on a long extension cord far away... -- *Johnny Appleseed*

### *pH PRIMER*

Phenolphthalein is indeed the active ingredient in Ex-Lax, but solutions of it are more easily obtained through brewing and wine-making suppliers. It turns pink to deep red above pH 9 and is colorless up to pH 8.5. pH paper in the range from pH 6.0 to pH 7.6 is available from most pet supply stores: it is used to monitor aquarium water. Litmus paper is available

through many drug stores. It turns red at pH 4.5 and blue at pH 8.3. (An easy way to remember this is the mnemonic we learned in general chemistry: "Acids are red, Bases be blue.") With litmus paper, one needs both red and blue papers. -- *Justin Case, TX*

[In my experience, confined to simple kitchen extractions of plant material, one requires a pH indicator which will test between 5 and 9 -- moderately acid to moderately basic. pH levels beyond these are undesirable for alkaloidal extraction purposes. Although there are many sources for pH indicators (Ex-Lax, for example), hassle-free extraction demands a uniform standard. Nitrazine paper, made for diabetic urine tests, is readily available at most pharmacies. A roll of this pH paper should last most home chemists for years. -- *Ed*]

### *EASY CANNABIS EXTRACTION*

Place plant material in a jar with metal lid and cover with Heptane (Rubber Cement thinner). This is a relatively safe organic solvent: it contains no chlorine and has a low boiling point. Agitate for two or three hours -- safety is critical: no flame or sparks anywhere nearby. Pour into flat dish and allow to evaporate completely, preferably outside. Scrape up remaining tar with razor blade and put in glass flask. Add boiling water gently. Oil-based material will rise to the surface. Remove, dry, encapsulate. -- *DG, NY*

---

## *BOOK REVIEWS*

---

*Practical LSD Manufacture*, Uncle Fester (1995), 119 pp, soft cover, Loompanics Unlimited, P.O. Box 1197, Port Townsend, WA 98368, \$15.00 + \$4.00 S&H.

Another chemistry book from Loompanics (see reviews in the Fall '94 *ER*), this one gives the straight scoop on how to manufacture LSD from natural precursors, such as ergot and morning glory seeds. Although (as the author states at the outset) you should have at least a full year of college-level organic chemistry under your belt before attempting these recipes, the detailed description for growing the ergot fungus could be easily utilized by non-chemists for producing

large quantities of LSA, a potent hallucinogen in its own right. Methods for extracting the essential oils from Calamus root are also given, as are recipes for MDMA and TMA-2. If you understand the chemistry, this book is an invaluable resource.

*Pharmako/Poeia: Plant Powers, Poisons, and Herbcraft*, Dale Pendell (1995), 287 pp, Illustrated, soft cover: Mercury House, 201 Filbert St., Suite 400, San Francisco, CA 94133-9841, \$16.95 + \$4.00 S&H.

Do not confuse this book's superficially similar title with *Pharmactheon*, by Jonathan Ott (reviewed in the Winter, 1993 *ER*) -- the two works could hardly be more different. Ott's book is a classical scholarly treatise on the subject of psychotropic plants. Pendell's book (unlike *anything* I've ever read before), covers the same material from a different viewpoint entirely. Although as scholarly as anyone could desire when it needs to be, *Pharmako/Poeia* is really the work of a shaman -- or more accurately a Shaman-Poet-- Alchemist. Ott, the Outlaw-Scientist, gives us the data we want, the data we expect, the data we *need* for making Left-Brain choices about plants. Pendell, the Shaman-Poet, hints (often with deadly wit) what it's like way out there in Right Brain when the *plants* are making choices about *us*. In short, *Pharmako/Poeia* is a Grimoire, it's an Alchemical Notebook, it's a Trickster's Treatise for the unwary and (as they say in the ads): it's "much, much more!" Another metaphor: consider the alchemical concept of the *unus mundus* or "one world." This refers to a synthesis of the inner world of the psyche with the outer world of spacetime. The goal of the alchemist is to harmonize these *two* realities into *one* reality: the *unus mundus*. To actually *live* in the *unus mundus* is to attain the philosopher's stone: in shamanic terms it means you have mastered yourself and your allies. If you want to know what it's like to undertake such a work (Pendell calls his version of it the "Poison Path"), this book is as good a description as I can think of. He covers everything from tobacco to *Salvia divinorum*, plus a few you might not think of. (Airplane glue?) On a scale of 1 to 10 *Pharmako/Poeia* gets a 12. In "Shulgin Units," it's a definite Plus-4. More I refuse to divulge -- you'll just have to read it yourself. -- *Jim DeKorne*

# MORE ON *SALVIA DIVINORUM*

---

## *SMOKING SALVIA LEAF I*

I'm wondering what all the hoopla regarding smoking dried *Salvia divinorum* is about. Tried it on two separate occasions with a water pipe in amounts exceeding those recommended in Winter '94 *ER*. Only experienced a heavy relaxation, nothing approaching the entheogenic realm. Could it be that the diterpenes vary considerably in different plants? -- *JS, NM*

## *SMOKING SALVIA LEAF II*

You do not have to get it all in a one-toke hit. Since there is no tolerance to this substance (in contrast to DMT and other tryptamines), taking multiple hits to "sneak up" on the effect is good technique. I smoked about 10 to 15 bowlfuls of the whole dried leaf one afternoon, with an average of 10 to 15 minutes between each high. I got off just fine each time, with the degree of the high solely dependent upon the amount I was able to inhale each time. I found that big hits are hard to get down, and it's hard to smoke more when you're already high from the previous toke. A safe way to ease into it is to smoke about 5 or 6 tokes per minute until you feel it, then quit. It takes about 10 seconds to peak, and is a very clean high without side-effects of any kind -- not even residual stimulation or exhaustion. The high lasts about 5 minutes with lingering effects to 20 minutes -- even shorter than smoked DMT. High doses can be spooky and weird. Entities abound with this stuff. Once I sensed the presence of a woman in "another room" (in a near-by parallel dimension) and felt we'd already met on other trips, but I'd forgotten. These "others" seem usually to be humanoid -- no gremlins yet!  
-- *Anonymous, NM*

## *SMOKING SALVIA LEAF III*

Each time I've experienced this plant, my respect for it increases. It feels like a presence, and is at the very least a "mythic" level of consciousness with numerous unfolding aspects. Before smoking it, I spend an hour reflecting on the content of my interior life during the preceding weeks, laying it all out simply in terms of ideational/emotional structure and content.

If I've dealt with it at all fully, then the experience seems to lead into another realm of the psyche entirely. I've felt its effects as a contact with the consciousness of "Mother Mary," perhaps suggested by the literal meaning of *Ska Maria Pastora*. [*The Mazatec name for this plant: Mary "The Shepherdess."* -- *Ed.*] As a dream catalyst anointing me with the power of spontaneous, deeply mythic/symbolic fairytale narrative-weaving; as being born into a benignly blissful yet "tricksterish" level of contact with heavenly muses. All have been variations on the theme of seeking and finding paradise, of attaining the level of existence which appears as a code in every aspect of "normal reality" -- the intelligence around and within us that we haven't yet learned to integrate into our everyday lives. In that sense, it seems much like a psilocybin trip, but without visuals, and the onset is so sudden that the ascent to heaven motif is much more prominent. Obviously, set and setting are as crucial with *S. divinorum* as any other entheogen. Curiously, I'm not moved to try it often; the time must feel right. When I've not prepared adequately before smoking, I've received strong but benevolent admonitions to change my ways, and felt badly, much like a little kid who's been chided. It has seemed to tell me to worship it, obey it, and that it would give me blessings. It enfolds me, gives me dreamy flights of ecstasy and wonder. Importantly, my initial experiences didn't include this parental quality, and I'm absolutely sure that it reflects my psychic structure at this point in my life. -- *CW, WV*

## *SMOKING SALVIA LEAF IV*

We prepared a sacred space. We smudged the area with sage, cleansed it with water and charged it with incense. We made the space as dark as possible and lit one candle. We meditated on communicating with the plant and asked it to become an ally. We inhaled three deep lungfuls of dried *S. divinorum* leaf and held each one as long as comfortable. Then we lay down. Both of us first experienced a "stretching of physical reality." My impression was that the room grew very tall; I described it as "reality being taffy pulled." I saw

a scene much like a Diego Rivera painting of an adobe house and an adobe wall. This remained until I realized that the plant was showing me its home. I again asked the plant to be my ally, and was suddenly treated with an insight into an ongoing concern. When I shifted my focus to this, I immediately felt a number of additional insights and a great clarity of thought. There was no ego-loss, but the experience was wondrous and shamanic. J's experiences were similar but more "shamanic journey-like" in style. -- *M, IL*

### *HYPERVENTILATING ON SALVIA-LSD*

Upon reading that a large initial intake is critical to the level of the experience, I smoked *S. divinorum* in a bong. One inhalation led to minimal effects when used alone. Desirous of the full spectrum, I tried smoking it while fully in the midst of my usual 350-450 mcg of LSD. I inhaled deeply and then again. Sometime after the second inhalation I completely lost awareness of anything. After several seconds (or minutes, I really don't know) awareness returned, though only remotely. There was pain in my lungs and I began deep breathing. I started to panic and thought I'd burned my lungs somehow. While still desperately puffing in and out, my perception imploded. Our vision resolves images from each eye into one image: in this case, my perception became impossibly skewed: my consciousness was imploding! Totally confused, I felt that I was being electrocuted and I began spinning and moving around to free myself from the "current." My face felt like it was also imploding and at one point it seemed like I could see its other side: my eyes were now facing each other! I was convinced that death was imminent. My girlfriend assured me that I appeared normal, which comforted me greatly. At this point I had no memory of smoking the *Salvia* -- it took ten minutes before I remembered. I sat in total confusion, still convinced that death was certain. Slowly, the familiar LSD awareness returned, though for a long time my central vision bulged as in Escher's "Balcony" and I felt that my mind had malfunctioned terribly. In retrospect, the phenomenon was much like a profound and relentless dizziness. I've smoked just *Salvia* twice since this experience and found that I need inhale only a minimal quantity (two small puffs) to stimulate a mild, short-acting recurrence of the

phenomenon. -- *RS*

### *MORE ON TECHNIQUE*

I'm in agreement with David Siebert (Winter '94) -- *Salvia divinorum* is so potent that extracting the active ingredient is both unnecessary and asking for trouble. (I was drying the leaves in a dehydrator and noticed I was feeling weird just sitting near the thing!) I *do* think the plant can be useful, though its brevity of action and the difficulty controlling the experience are drawbacks. SD is much like DMT in that regard. One way to get around its brevity is to use successive doses. I've taken 3-4 doses in a row, each while coming down from the last, and while it took more with successive doses and the effect was briefer, I was still able to get more meditation work done than I would have on a single, larger dose. Another way to extend the experience is to chew the leaves and hold the juice in one's mouth -- the experience produced lasts much longer than if the leaves are smoked. -- *Hatter*

### *CHEWING VS. SMOKING I*

There is a big difference between chewing *Salvia divinorum* leaves and smoking them. Chewing lasts about an hour and is a richer experience because you can spend some time finding your way around -- internally, that is. It's best to lay back and go with it. A curious note: I always get sexually aroused for the first 15 minutes or so after I come on. I look forward to hearing other people's experience. -- *GM, HI*

### *CHEWING VS. SMOKING II*

Not fully satisfied with the effects of smoked *Salvia*, I tried chewing/sucking 6 leaves, then 8, with only weak results. Then I tried 18 large leaves 14-18 cm long (minus stem length). These were rolled into two "cigars" and held in my mouth, chewing occasionally, sucking and holding the juice about 3-5 minutes. I tried to wet the whole inner surface of my mouth for maximum absorption. The taste is very bitter. Then I swallowed and repeated the process until no more juice could be obtained and I spat out the empty "cigars." WOW! I doubt if I'll ever bother smoking *Salvia* again! The first ten minutes: nothing. Then suddenly the effect came on overwhelmingly within the space of a minute. I tried to tell my wife about it, but couldn't speak: I was just too amazed and kept uttering: "Strong, so great!" This inability to speak

became unaccountably amusing: I began to laugh uncontrollably and had to bury my face in the pillows, not wanting to wake the kids in the next room. (Sometimes when smoking I experienced this laughter also, but not with such intensity and duration -- a full five minutes of non-stop, very powerful laughter. Finally I got it under control and rolled over on my back in the darkened room. With closed eyes I was standing in strange buildings, similar to those in fantasy paintings or ancient oriental palaces: the Alhambra of Grenada. A large, almost endless empty hall with beautiful arches and hundreds of columns: all in a strange, gloomy, blue-grey light with colors expressive of deep magic and majesty. Then I remembered someone's report of "becoming a plant" on *Salvia*: instantly I turned into a tree with bark like oak (many plateaus and valleys), yet somehow smooth and not rough like oak. This bark was like a sense organ: I felt like a tree feels. (I know it sounds odd, but while it was happening I had no doubt that a tree feels that way.) Then I sensed the presence of something else, but couldn't get an image of it. This was accompanied by strong emotions which are impossible to describe. I became suddenly very attracted to my wife lying beside me -- the effect changed from entheogen to aphrodisiac. [Perhaps the two are not so far apart when you consider that Unity is the ultimate goal of each. -- Ed.] Next time I'll do it alone so I can go further into it undistracted: there is much more to discover, and I really want to make contact with this entity. I've experienced most common entheogens (except DMT), and *Salvia*, chewed/sucked is clearly my favorite. At the moment I can't imagine a bad trip on it, but this contradicts my experience: every strong entheogen can produce a bad trip, even *Cannabis*. I like the strong emotions it evokes and the fact it only lasts an hour. I am not normally a suggestible person, so wonder if instantly "becoming a plant" when remembering another person's experience to that effect denotes heightened suggestibility under the influence, or if this specific hallucination is immanent in *Salvia*.  
-- B. Schuldes, Germany

### SALVIA BUSH

My plant has been rapidly heading for the ceiling,

causing me to extend its humidity tent. In an attempt to slow it down, I cut off the stem just above a leaf junction. Much to my amazement, this turned it into a bush! Now, instead of a main stem, there are at least ten branches emerging at all levels of the main stem.  
-- Solaris

### HUMIDITY TRAY

*Salvia divinorum* is definitely a humidity-loving species: a humidity tent, or some other method of providing moisture is essential to its health. The following company sells a "humidity tray" which might be useful for growing *Salvia* outside of a tent: Living Sculpture Bonsai, POB 257, Princeton NJ 08550. 1-800-941-0888. -- MS, PA

### SALVIA CULTIVATION QUESTION

Can *Salvia divinorum* be grown from seed, or only from cuttings? I have only seen live plants for sale, and these cannot be shipped to Canada. --MC, Canada

[For all practical purposes, *S. divinorum* can only be grown from cuttings, which is usually easy to do if you maintain high humidity without high heat. There is some controversy about whether this species sets viable seed, but most opinion says that it doesn't. I've yet to hear of anyone actually growing one from seed, so if you have, let ER know about it. -- Ed.]

### INACTIVE SALVIA STRAIN?

After numerous trials, I have yet to feel much of anything from this plant either from smoking or sucking of the leaves. I wonder if there are sizable potency differences in different possible strains. It would be useful in future correspondence for readers to identify the source of their plant. There also may be soil nutrient deficiencies involved, though I doubt my plant suffers from that problem. Does anyone else experience this? -- JL, MA

It is my understanding that virtually every *Salvia divinorum* plant in the U.S. is a clone of one specimen brought into the country by Wasson back in the fifties or sixties. In effect then, we are all growing the same plant! A less bitter variety has been recently made available however. Anyone have further data on this?  
-- Ed.]

# STIPA ROBUSTA NOTES

*Stipa robusta* (= *Stipa vaseyi*) is a perennial grass found in certain areas of the southwestern United States. It is commonly known as sleepygrass, as horses that ingest this grass may become profoundly somnolent or stuporous for periods of time lasting up to several days...The dominant alkaloid constituent in sleepygrass, lysergic acid amide, has not previously been identified in a grass in such high concentration. Lysergic acid amide is likely to be the basis for the extreme sedative effects on animals, given past pharmacological work on the compound from the ergot fungus *Claviceps paspali*.

-- Petroski RJ. Powell RG. Clay K., "Alkaloids of *Stipa robusta* (sleepygrass) infected with an *Acremonium* endophyte," U.S.D.A., Agricultural Research Service, National Center for Agricultural Utilization Research, Peoria, IL 61604.

[In another paper, these researchers ascertained that only grasses infected with the *Acremonium* fungus contained ergot-type alkaloids. In other words, *S. robusta* plants uninfected with the fungus are inactive: it's not the grass, it's the symbiotic endophyte living inside it. Once again, it all boils down to finding the right plant or plant variety. -- Ed.]

## STIPA TRIP I

Lysergic acid amide (LSA) is present in substantial quantities in the entire (*Stipa robusta*) plant, rather than just its seeds. To prepare the plant material: break the seed heads, stems and leaves small enough to fit into an electric spice mill. Run the mill about 30 seconds per load and store the semi-powder in a glass jar. To use: boil 1 to 3 grams of powder for 15 minutes in a pan, filter, and add a teaspoon of lemon juice or cider vinegar. (This is to make the alkaloids more soluble in the stomach.) Within 15 minutes one can expect the head to feel heavy and to feel a general relaxation in the limbs. After 40 minutes these effects should peak and stabilize. Sleepy grass is mainly a hypnotic and not really an entheogen, though some

times delicate visual effects are experienced: especially if one has been free of other substances for several days. It might be interesting to try Sleepy grass prepared in this manner at the 5 and 10 gram level. For a great anodyne and "body high," cannabis, opiates and sleepy grass may be combined. -- *B. Green*

## STIPA TRIP II

I find *Stipa robusta* to be a very useful entheogen, if you use potent seeds. An hour or so after eating a light supper, I consumed 15 seeds which I broke up first to make them easier to chew. The taste was like some kind of grain: neither bad nor good, just a weird grain flavor. The "texture sensation" the masticated seeds left on my tongue and in my mouth was almost identical to that I've gotten from ingesting LSD of moderate to high potency. This "texture" (it's not a taste) is also noticable (to me at least) with Hawaiian baby woodrose and morning glory seeds. This suggests the presence of ergoline alkaloids: LSD, LSA, or something related. The experience came on in about 45 minutes. There was no nausea at all, unlike other LSA-containing substances. There was both drowsiness and visual imagery in black and white. It felt similar to melatonin (a tryptamine hormone used for sleep regulation) or a heavy dose of L-Tryptopan (when it was available). Neither of these latter have the imagery that *S. robusta* has. The experience was unique and not like acid or morning glory seeds. It lasted 2-3 hours, after which I fell asleep. A week later I increased the dosage to 25 seeds and combined them with a low, non-emetic dosage of 75 morning glory seeds. The two complimented each other quite well, though I did feel a mild queasiness from them. The visual imagery was much more colorful this time and the stimulant effect of the MG seeds synergized with the sedative effect of the *Stipa*, making for a very relaxing and pleasant entheogenic trip. I'm now growing my own plants that I brought in for the winter -- *Stipa* makes an interesting houseplant. -- *Prairie Dragon, IL*

# NETWORK FEEDBACK

---

## EDITORIAL MATTERS

First, please note *The Entheogen Review's* new address: P.O. Box 800 -- I now live in a larger box at the Post Office to accommodate all the great mail I get. Second, I'm forgoing my editorial ego-trip this issue to make room for more data: some of this was sent in last year! (Don't stop mailing it in, but be patient for when it might see print: it's always a judgement call as to which information is the newest, best, most amazing, whatever...) -- Ed.

## CULTIVATION DATA SOUGHT

I am seeking data on the cultivation of morning glory species: Hawaiian baby woodrose (*Argyreia nervosa*), Heavenly Blue (*Rivea corymbosa*), etc. Information about sunlight exposure, temperature, humidity, soil conditions, fertilization, fruit yield, etc. Reports of failures are also useful. I'll test the information and compile the results into a comprehensive pamphlet. All contributors will receive a copy. Address your reports to: Wildflowers of Heaven, P.O. Box 1989, Ranchos de Taos, NM 87557. Please include a return address in case I have questions. -- *WOH, NM*

## MESCAL BEAN AWAKENING

I recently had the most fantastic awakening yet. I'd been taking ponax ginseng for three days with reishi mushroom in small doses. I stopped the ginseng for one day. I continued with a small dose of reishi. I had a small piece of nettle for lunch. In the early evening I toasted one-eighth of a mescal bean for about ten minutes. No tropanes had been consumed for the past six months. I had consumed garlic and coffee. About midnight I awoke into an extremely fantastic magical world. It was not an ordinary dream. My earlier experiments with mescal bean consistently produced vivid dreams -- *RB*

[*Sophora secundiflora*, the so-called "mescal bean" (a misnomer) is unbelievably toxic -- one tiny bean, or less, can result in a one-way trip into the imaginal

realm. The above is the first modern report *ER* has received on this species. It was used shamanically in the Southwest before the peyote cult replaced it. Obviously, experiments with *S. secundiflora* are extremely risky. -- *Ed*]

## NO MORE DRIED POPPIES?

Recently I received a newsletter from the American Dried Flower Association containing a statement from the DEA declaring that the importation, growing and selling of dried poppies is illegal. I tried a poppy tea as described in *Opium for the Masses* [see review in Autumn '94 *ER*] and it made me very sick. I was sedated but felt weak and not at all euphoric. It's not really worth a bust. Could be the dried poppies are sprayed with pesticides or something. -- *MN, HI*

## 2C-B

I ordered 2C-B from Drittwelle [Spring '95 *ER*] by using a Canadian mail drop both ways. It worked very well, though it took over two months to arrive. -- *AB*

## SHAMANIC FIELD SCHOOL AND SEMINARS

The Central American Institute of Prehistoric and Traditional Cultures at Belize is offering seminars on traditional shamanic practices and ethnobotany. Some of the courses offered are: Rainforest Medicine and Natural Healing (7 days), Ethnobotany of Sacred and Medicinal Plants (4 weeks) and Anthropology of Consciousness and Shamanism (9 weeks). These are fully accredited courses. For complete information on all of their course offerings, send for the 1996 catalog to: Director, Central American Institute, P.O. Box 59, San Ignacio, Cayo District, Belize, Central America.

## THE TOBACCO SPIRIT

It was mentioned by the elders during a Native American Church peyote ceremony that the sacred tobacco was the primary and most powerful plant/spirit/ medicine in the ceremony's focus of healing and communi-

cation with the Great Spirit. (Stronger than the peyote itself.) This got me to thinking about the possible subtle effects that certain plant spirits may have when used with more noticeably powerful plants. Perhaps the power plants open up the psyche and the subtle plants focus the reality we perceive. It would be useful to hear more about this area of exploration from traditional sources and from *ER's* explorer/pioneers. -- *RG, HI*

### SHAMANISM AND SEMANTICS

Regarding the editorial ("On Saints and Shamans") in the Spring '95 *ER*: we aren't shamans. There's no way we fill the functions in our society that shamans fulfill in theirs, nor do most of us possess sufficient knowledge and competence to be full-fledged practitioners of shamanism. However, we may be the seeds from which a new shamanism grows, and that is certainly worth trying to live up to. As a word, I wonder if we really have a common definition, or if each of us has his/ her own concept of what shamanism means. Is a shaman one who uses psychoactive plants for healing? If so, a shaman is basically an unlicensed psychotherapist. Is a shaman someone who talks to discarnate entities? Without control over the phenomenon (and entities worth talking to), the end result could be a basketweaver in a mental hospital. I say a shaman is first and foremost a magician -- one who can affect the outer world through the inner. Outer and Inner are connected and affect each other. Magic is real.

-- *Hatter*

### RESPONSE TO CASTANEDA

#### REVIEW: I

I've been putting off renewing my subscription to *ER* while thinking about whether or not your editorial concerning Carlos Castaneda in the Spring '95 issue was worth paying money for. My feeling is that your article was inappropriate and out of place. I have looked into the writings of Richard de Mille and was not able to find one of his objections to Castaneda that was not, in my opinion, extremely lame. Your editorial was out of place because Castaneda has made it public that he recommends against the use of power plants, that they are dangerous and they are not necessary. He referred to them very infrequently after his first two

books. So if Castaneda isn't interested in psychoactive plants, why should the *Entheogen Review* be interested in him? -- *JT, AZ*

[Castaneda is of interest, to me anyway, because of the tremendous influence he has had on how shamanism and the shamanic use of psychoactive plants are perceived by the general public. Despite the "trickster" motif, my editorial was to acknowledge Castaneda's considerable achievement. Gurdjieff, Crowley, Blavatsky, Rasputin, etc. were also trickster-teachers, so there's an established tradition for it. Look at it this way: given the "survival of the fittest" nature of the shamanic experience, tricksters are our most reliable gurus! If nothing else, they immediately weed out the wannabes. -- *Ed.*]

### RESPONSE TO CASTANEDA

#### REVIEW: II

I was amused and discouraged by Castaneda years ago, reading his first three books. The amount of information delivered per book was small compared to a single-sitting reading of the *Tao Teh King*, or a brief examination of *Magick in Theory and Practice* by Crowley. Why was an anthropology PhD. candidate unaware of "sympathetic magic" and why was he asking so many dumb questions? It's a novelized version of something real: a dialogue between the fool and the master. He may not be totally on the level with his readers, but I suspect he's done something. I once tried his idea of smoking mushrooms -- what a waste!

-- *RWS, DE*

### PSYCHEDELIC SHAMANISM

For me, psychedelics provide the same kind of stimulation as parachute jumping or rock climbing, except that they're much safer. By this I mean that they are a way to go up against something bigger than I am in a test of attitude and skill, a test that, once embarked upon, has no way out but through. Kesey didn't call it "the acid test" for nothing. I know some rare individuals who have a talent for shamanizing on stiff doses of psychedelics, but it's not a skill I have so far developed. I just be as real as I can, whether it impresses anyone else or not. And that, as Jiyu Kennet says, is

the way in and the way out. It's amazing how many Buddhists are ex-trippers. H.H. the Dalai Lama is supposed to have said that LSD can take you through six of the seven steps on the way to enlightenment, but the final step still depends on the individual. - *MH, VT*

### FREEZE-DRYING

Does anyone know of a relatively simple home method of freeze-drying? -- *BD, CA*

### SHULGIN'S SCALE OF INTENSITY

Alexander Shulgin is a courageous researcher, wrote a great book and is also from all reports a nice guy, but I think his system of rating psychoactives could stand improvement. If somebody offered you a numerical scale consisting of 1, 2, 3 and "many," would you be satisfied? I suggest instead a scale based on LSD or "mike-equivalents," as LSD has been more thoroughly researched than any other entheogen, and the effects of different doses are well-documented. -- *Hatter*

[This would be useful in a world of uniform dosages, dose responses and product purity, but this is obviously not the case. How many people nowadays are familiar with the differences between 100 mcg, 200 mcg, 300 mcg, etc. of Sandoz LSD? In addition to the fact that a "100 mike" comparison means nothing to someone who has never taken 100 mcg of acid, we must also remember that some people can have a plus-3 experience on such a dose. While not perfect, Shulgin's scale of plus-1, plus-2, etc. is at least an "in the ballpark" guide which is not dependent on a variable referent. -- *Ed*]

### THC ANALOGUE

There seem to be any number of ayahuasca analogues. My question concerns the usefulness and increasing unavailability of THC. Is there a THC analogue? If not, could we find or develop one? -- *PW, VT*

### BUFO MARINUS TOADS

I am currently raising a group of *Bufo marinus* toads which are still in the tadpole stage. Does anyone have any experience with keeping this species? I hear the venom contains DMT but I have no idea how much or

what other alkaloids may be present. Also, how does one extract the venom (without harming the toad), and process and use it? -- *Sister Wolf*

### TOADS II

*Bufo marinus* is common in Florida and I still don't know if it is similar to *Bufo alvarius*. There's information from Rosetta on toad venom, but this question has not been satisfactorily answered in any of the common literature. I recently tried some pharmaceutical 5-MeO-DMT -- It's not for me. Too much like the elephant sitting on my head. -- *WW, FL*

[*Bufo marinus*, the Cane toad, produces tryptamine alkaloids similar to those found in *Bufo alvarius*, the Sonoran Desert toad. *Cane Toads: An Unnatural History* is an award-winning Australian documentary (available on videocassette) about *B. marinus*. One segment of the film depicts a spaced-out Australian "drug abuser" mumbling stoned inanities about smoking toad venom. Although I have no personal experience with *B. marinus* venom, one *ER* subscriber has told me that these toads don't produce anything worth the trouble of extracting. *B. alvarius* venom contains mostly 5-MeO-DMT, bufotenine and other so-called "bufotoxins," so I'm guessing that *B. marinus* is similar. It's a classic 5-MeO trip when smoked -- very heavy if the venom is potent. (Toad poison is toxic enough to kill you if swallowed, or even licked as the Media likes to misrepresent toad abuse.) The large glands behind the eyes of the toad are squeezed (very much like a zit) in such a way that the "juice" may be collected on a sheet of glass. After the juice dries, it resembles dried rubber cement. This is scraped off the glass with a razor blade and smoked in a small pipe. As an animal lover, my passionate feeling is that we should leave the toads alone -- identical hallucinogens (minus the deadly bufotoxins) are readily available from plants such as *Phalaris arundinacea*. -- *Ed.*]

### MULLIEN AS CARRIER

Regarding feedback about mixing various extracts with mint to curb the side effects of smoking: I find mint a bit cloying and prefer mullien, which is smoked by asthmatics to open up the lungs. It's useful to smoke when you have bronchitis. -- *RWS, DE*

[Mint and other herbs are used as carriers for chemical extractions of such plants as *Phalaris*. The extract is dissolved in ethyl alcohol and the carrier added to soak it up -- when dry, this ignites easier and smokes smoother than the gummy extract. Mullien sounds like a great choice because of its ability to open the lungs. -- Ed.]

### CONSUMER MATTERS: LER

Re: Strange or MIA loops with small botanical businesses. (See Pg 10, Summer '95 *ER*.) I have been to LER's place in Miami many times. Travelled to Jamaica with him in fact. He has his ups and downs -- I know that he's been ill, and that may be a factor. It is good to mention these businesses whether they succeed or not -- how else can we scan the landscape and make new friends? And one lost fruiting does not the season make, re some small businesses. -- TL, FL

### CONSUMER MATTERS: OTJ

I have placed an order with Of The Jungle (OTJ). As yet I have not received my order. Have you received complaints about them? -- SMG, KS

[Of The Jungle, P.O. Box 1801, Sebastopol, CA 95473 (catalog: \$2.00) is probably the original ethnobotanical supplier. Although they sometimes have to back--order their products (resulting in often glacially slow service), I've yet to hear any serious complaints about them. Until I hear otherwise, I regard them as one of the most reliable sources for botanicals. -- Ed.]

### CONSUMER MATTERS: POWER PRODUCT

Anyone who writes to Power Product, Las Vegas, has entered themselves into a Narc database. I did, not knowing the story until it was too late. See issues 3 and 4 of *The Entheogen Law Reporter* (POB 73481, Davis, CA 95617-3481, \$25.00/yr.) for the Power Product story. -- Reverend Bob, CA

### T. PERUVIANUS TAXONOMY

I think that the alleged superiority of *Trichocereus peruvianus* is an Urban Legend, stemming from a single table produced by Shulgin in a paper on mescaline

analogues to illustrate a point (the variability of natural sources of mescaline) quite peripheral the central theme of his paper (how changing the structure of artificial phenethylamines changes their psychoactivity), founded solely on the Pardanani study, and completely disregarding the evidence of wide variability within a single *Trichocereus* species (i.e. *pachanoi*). The most recent revision of cactus taxonomy, the CITES "Cactaceae Checklist" lumps *T. pachanoi* and *T. peruvianus* together and then relocates them into *Echinopsis*! Before I accepted any informal testimony along the lines of "I took some *T. peruvianus* and it was way powerful!" I'd want to satisfy myself as to the actual identity of the cactus in question. -- SB, CA

### PEYOTE CRISIS

...Since the law prohibits cultivation of the plant, the sudden dearth of peyote...is 'a crisis,' said Frank Dayish, Jr., president of the [Native American] church, which claims 250,000 members in the United States, Canada and Mexico...The reasons for the shortage are easily seen. Vast expanses of ranch land, once unfenced and open to harvesters, have been put off limits. Still more prime acreage is being lost as landowners turn brush country into pasture, with heavy plows scraping up all vegetation, from large mesquite trees to tiny peyote cactus, in a process known as root--plowing. At the same time, the demand for peyote has steadily risen as membership in the various Native American Churches has increased... Quote from 3/20/95 *New York Times*, excerpted from *The Sacred Record* (Newsletter of the Peyote Way Church of God, Star Rt. 1, Box 7-X Willcox, AZ 85643, \$20.00/year)

[It gives me no satisfaction at all to say: "We told you so!" See *Peyote as an Endangered Species*, Summer and Fall 1993 issues of *ER*. -- Ed.]

### AND THE BEAT GOES ON...

A local cactus dealer tells me that the demand for *T. peruvianus* has gotten so great that he had begun to cut into his stock plants to satisfy it. Now he has none for sale at any price until his stock plants regenerate. The March-April issue of the *Cactus and Succulent Journal* gives strong evidence that the populations of wild *Lophophora williamsii* (Peyote) are being over--

harvested, just by the legal (i.e., Native American Church) demand. Cacti are not a renewable resource under our current circumstances, and I believe that this is even true of the cultivated ones; unless you grow your own, or patronize a grower who practices sustainable cultivation, you are putting pressure on a vulnerable population. -- *SB, CA*

### "CHACRUNA"

We have recently had the good fortune to collaborate with the people who run the Satchamama botanical preserve just outside of Iquitos, Peru, to help raise some sorely needed capital for their project. The "Chacrana" or *Psychotria viridis* comes to us as part of a sustainable harvest effort which will directly fund the preserve and help the local people who work there. We've been blessed to offer our help by acting as distributors for these and other sacred plants indigenous to the forests of this area. The people who harvest this medicine have come to the earnest conclusion that it is urgently needed by our culture, and they seem to have a rather prophetic understanding of its implications upon us. -- *Basement Shaman, IL*

#### ***The Basement Shaman:***

Hyperdimensional Gardening: Mushroom Services, ethnobotanicals and other delights.

Catalog: \$2.00.

312 W. Highland Ave., Elgin, IL 60123

### *ACACIA SIMPLEX (SIMPLICIFOLIA)*

Can you print some information on *Acacia simplex* (formerly *simplicifolia*) which Basement Shaman is about to begin selling. -- *TA, CO*

[Our friends down under seem to have a monopoly on these potent *Acacia* varieties. Ott's *Pharmacotheon* reference indicates that *A. simplex* is a southern hemisphere species: Poupat, C. et al. 1976 "Plants of New Caledonia Part 38. Alkaloids of *Acacia simplicifolia*," *Phytochemistry* 15: 2019- 2020. Does anyone have further data on this plant? -- *Ed.*]

### *ACACIA SPP AND DMT*

I am interested in *Acacia*-huasca because of *Acacia's* high DMT content. I purchased some *Acacia tortilis* from LER, and understand that the alkaloids are in the bark -- does this mean that they are non-existent in the leaves? (I've heard they are only in the leaves in some species.) Are there any contraindications to the use of *Acacia* species, such as toxic properties? -- *MS, PA*

[This is all fairly new stuff, so not much is known about it yet. See next item. -- *Ed.*]

### *NEW AUSSIE DMT SOURCE*

I have some interesting news for you, which is the identification of another Australian *Acacia* rich in DMT, *Acacia obtusifolia*, which is a very fast growing tree, reaching 15 feet, and quite common in NSW coastal regions (my specimens were collected in Sydney). Rough comparative tests with *Acacia maidenii* showed the *obtusifolia* contained slightly more alkaloids. The *maidenii* contains 0.6 percent of the bark, comprising mono-methyl tryptamine (inactive) and di-methyl tryptamine (DMT) in a 2:3 ratio; thus it is a very clean source of DMT. Subjectively the *obtusifolia* seems just as clean, with a higher proportion of DMT. (We still need to do accurate tests.) We currently have two more *Acacias* which we think may contain DMT to investigate. There are also a couple of beta--carboline containing plants (e.g. *Ailanthus triphyta*) which may be potential MAOI sources. I've found that solvent extractions of the alkaloids from *Passiflora* or *harmala*, then smoking the crystals, produces a more potent MAO-inhibiting effect, and also more potent mental effects, than oral ingestion. As Gracie and Zarkov noted, the effects of the *Passiflora* seem to last longer than the *harmala*, potentiating smoked DMT up to two days later, and affecting dreams. -- *NE, Australia*

### *DMT WITH MUSHROOMS*

I highly recommend smoking DMT about 3-4 hours after eating mushrooms. The actual take-off was not scary at all (as it usually is). It was a melding of myself and the two tryptamines in perfect harmony with the music. (Jean Michel Jarre's *Oxygene* -- the last song: *Oxygene VI*.) I was transported into some kind

of cosmic tron-like info-network. I was sure that the Great Spirit was with me and everything is OK: drop fear, paranoia, etc. and move on! Traveling within the music felt like Divine Grace forever. -- *TW, NY*

[Other correspondents have observed that smoking DMT while already into another entheogenic experience (mushrooms, LSD, etc.) is far easier to handle than smoking it straight. The probable reason for this is that when one has reached a high plateau (usually taking an hour or so to get there) the sudden contrast between two states of consciousness has been eliminated. In other words, it may not be DMT the drug as much as its speed of onset that feels so intimidating. Metaphorically: you can hold your hand in a pan of water slowly heating on the stove and tolerate more heat than if you just plunged it into the hot water suddenly. -- *Ed.*]

### DMT TESTING

In the search for DMT-containing plants, what is the cheapest method of testing for DMT? -- *Clayton-Street, South America*

[See below -- the author didn't elaborate on what "tryptamine test strips" are. Can anyone provide us with that data? --*Ed.*]

### PHRAGMITES AUSTRALIS REPORTS

My test of *Phragmites australis* (from tryptamine test strips from JRL Bio Sciences) showed no tryptamines. These strips have been very reliable in testing other substances. Could there be variability in the type of *P. australis*? I got mine from JLF. In the interest of clearing up distortions could you include the sources of the materials mentioned in *ER*? -- *Mr. See, UT*

### JOHNNY APPLESEED RESPONDS

I dug some common reed (*Phragmites australis*) this winter in February and did an alkaloid extraction using the acid/base method. The first extraction yielded enough for a pyro-assay, which resulted in a faintly perceptible plus 1.5. A later oral assay was about the same. The TLC plate shows a very small quantity of 5-MeO. This may be another one of those cases where there are alkaloids present, but in too small a quantity

to make extraction worthwhile. I am sure there are variety differences as well. -- *Johnny Appleseed*

### BLUE MUSHROOMS

Strong bluing is apparently not a quantitative indicator for psilocin-psilocybin in *Psilocybe cubensis*. I isolated two strains (from the same spore-print) and produced a quantity of each strain. I noticed when picking them that one strain showed quite a bit of bluing where they had been cut/cleaned, as well as on the inside flesh, and the other strain produced very little blue coloration. My wife and I both found the relatively non-bluing strain to be more potent. It came on faster also. -- *Anonymous, Canada*

### NEUROPHONE MUSHROOM COMBO

I took about a gram of *P. cubensis* and wired myself up to a neurophone. This device synchronizes sound waves with your body's frequency (about 7.8 hertz). It was rigged to a CD player. I didn't hear any sound: it flowed as color patterns into my mind. As a track changed, the patterns changed. It was an interesting experience -- I'd like to try it with LSD or LSA sometime. -- *RS, DE*

### OUTSIDE MUSHROOM CULTURE

I've tried the bury-in-the-ground method (mentioned in Spring '95 *ER*) several times, including some very healthy *Lepiota peelee* spawn. It never worked. I dug it up later. It never grew and deteriorated into the soil. -- *BJ, FL*

### VITAMINS AND MUSHROOMS

Not being a chemist or biologist, I don't know if this is scientifically correct, but I'm going on what I have observed. When making up some potato-dextrose agar, I added half a crushed multi-vitamin tablet. When I germinated some spores of *Copelandia cyanescens*, the mycelia "exploded," giving a very dense growth. On about the 14th day after germination, mushrooms started popping out of the agar, and are growing well! Mycelial growth of other species is also looking good. Temperatures are 21 degrees C (72 degrees F). -- *AA, England*

## SPORES IN CALIFORNIA

In the Spring '95 *ER* it is mentioned that California is the only state where it's illegal to possess *P. cubensis* spores. Mail order suppliers do not mention this.

Where can I locate information in this regard?

-- *Unsigned, CA*

*In 1985, the State of California enacted several statutes defining a multitude of crimes related to mushroom spores and mycelium that produce mushrooms containing the controlled substances psilocybin and psilocyn. A first conviction under section 11390 or section 11391 is punishable by a maximum of one year in county jail or state prison. -- The Entheogen Law Reporter, Fall, 1994*

## MUSHROOMS AS MEDICINE I

For two years I was addicted to "Ice," or crystal methamphetamine. The support of my loved ones was critical to my recovery. I also feel that psilocybin mushrooms were instrumental in the healing process. In the darkest times they showed me the light and even today they help keep me on a balanced and healthy life. I feel they will help anyone with similar problems assuming one wants the help. Ice is highly addicting and I don't think anyone can just do it recreationally. Don't even think of trying it, as just a trial may lead to addiction. Also, regarding the intestinal problems which come from eating fresh psilocybin mushrooms, I find that toasting fresh mushrooms or drying them out minimizes unwanted reactions. -- *Captain Chaos, HI*

## MUSHROOMS AS MEDICINE II

My reason for wanting to use the mushroom is to explore the inner realms for answers to specific health problems I've encountered in the last year. I've always been above average in health and strength until recent lung problems developed which don't respond to either conventional or alternative medicine. I've decided to look to the inner realms for insights. -- *LT, IA*

## WHERE CAN WE GET *P. CYANESCENS* SPORES?

The strain that home cultivators need to obtain is the

North Western variety of *Psilocybe cyanescens*, which fruits in the 50 to 60 degree (F) range and grows on a diverse range of substrates, including unsterilized soaked corrugated cardboard. They love to grow on the woodchips used for landscaping. You can't be busted for mushrooms "growing wild" near your home, but you can if you have Mason Jars full of *P. cubensis* on your shelves. Someone must offer *P. cyanescens*-- it grows all over the Pacific Northwest! We need a Johnny Appleseed for this species. -- *DJ, WV*

[It is my understanding that the *P. cyanescens* sporeprints from Austria offered below would work perfectly well in this regard. Let's get more feedback on how to grow this one outdoors. -- *Ed.*]

*Psilocybe cyanescens* sporeprints. Perennial: fruits outdoors in cold weather. More potent than *P. cubensis*. Small sample, \$5.00, Medium print, \$10.00, Large print + small one, \$20.00. Teonanactl (postlagernd), Postamt 1092 Wien, A-1092 Vienna, Austria

## PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed descriptions of over 200 organizations related to psychedelics.

Categories include:  
book vendors & publishers, cultural resources, ethnobotanicals (cacti, herbs, mushrooms, plants & seeds), garden equipment & indoor light systems, hemp related items, information sources, merchandise & gadgets (CDs, cassettes, t-shirts, smoking accessories & videos), non-profit & religious groups, periodicals, a reading list/book review section, and more!

Updated quarterly. One year subscription is only \$15.00. Foreign orders add \$5.00 for postage & handling. No other list is as thorough or updated as often!

Send cash, check or money order to:  
SOMA GRAPHICS, P. O. Box 19820,  
Dept. ER1, Sacramento, CA 95819-0820.

# AYAHUASCA ANALOGS

---

## JUNGLE CATS

I did an ayahuasca analog experiment with *Desmanthus leptolobus* and *P. harmala* with some effect.

The difference seemed to be that the visuals slowly rise out of the black of your closed eyes instead of the in-your-face geometric patterns of psilocybin or LSD. An interesting point is that one of my few visions involved a leopard. Although I'd read Naranjo's theory on this (eg, that ayahuasca produces visions of large jungle cats), I'd forgotten it totally during the experience. It didn't hit me until later. -- EK, LA

## SHAMANIC POSTURES

I did a *Banisteriopsis caapi* and *Desmanthus illinoensis* mixture -- two ground-up six-inch stems of caapi and approx. 1 oz of fairly knobby *desmanthus* root. I added many trimmed, medium-sized root hairs from other specimens as well. It seemed pointless to shave the bark off, so I just boiled the material until the bark began to peel and slide (barely) off the root. The resulting experience was a bit too strong. Forty--five minutes after ingesting the coffee cup of material I felt the same as after six tabs of LSD. The vomiting seemed to take forever. Later I tried to move into The Bear position suggested by the book, *Where the Spirits Ride the Wind* by Felicitas Goodman. [This book will be reviewed in an upcoming ER as a seminal guide to shamanic states of consciousness. Briefly, it describes "shamanic yoga" postures which evoke altered states of consciousness -- Ed.] The ayahuasca made it impossible to stand as required, so I did the same pose lying down on a water bed: I cocked my legs, placed my hands over the navel as suggested and drifted into a mantra. A few minutes later I "saw" with my body a flow of energy through the third chakra: blue-white and crackling with energy and power. A huge wave of relief and joy swept over me. I drifted. My hands moved, breaking the "body circuit." I couldn't concentrate enough to bring it back. I allowed the mixture to take me where it would. It curiously concentrated on the various "floaters" in my eyes and used them as points of reference. I wound up trying to move

seven arms when I tried to wipe my nose or examine my watch -- a useless enterprise, because I saw seven watches and was unable to focus on any of their dials. Then I saw an enormous red globe, backlit with pulsating white light. And it went on from there... The body positions in the book are "proto" or "pre" yogic positions. They seem to lock the body into configurations which accelerate energy flow. Combining certain drugs with the positions creates altered states which are unavailable by either alone. -- RWS, DE

## HARMALA-DESMANTHUS

Boiling the *Desmanthus* and *Harmala* together for a few minutes in a 30% lime juice solution (Ott's recommendation), didn't work for me. The most effective preparation I've used is to first eat the *Peganum harmala* seeds (they taste awful: powdered, mixed with liquid and drunk would be a lot better). I boiled the *Desmanthus* in a 1-part lime juice, 2-parts water mixture for one and a half hours, poured off and saved the liquid, then added just water to the roots and boiled for another 1.5 hours. (These were not finely cut and sifted roots, they were root pieces.) Both times I used just enough liquid to cover the biomass. The second experiment I used 3 gm *P. harmala* seeds (next time I'll use less -- I felt more nausea than I want to feel again), and three to four ounces of *Desmanthus*. The effects were very noticeable. There was nausea at first, but that was replaced by an intense MDMA sort of body warmth and tactile sensitivity. Not many visuals: mostly bright speck color enhancement and one fuzzy image of moving through a library/information-storage environment. The experience centered primarily around childhood memories and clearing energy through the chakras. It was very relaxed -- none of the subtle "fear edge" I often get with LSD or mushrooms. -- RG, HI

[The bark is the only part of the *Desmanthus* root that contains alkaloids, and it is almost impossible to peel off dried material. Just boiling up the whole root seems like a simple solution to this problem. -- Ed.]

### HARMALA-VIRIDIS

I made a brew of "half-ayahuasca analog," using *P. harmala* and *Psychotria viridis* leaves, following the psychonaut's description on page 99 in *Psychedelic Shamanism*. Only I used 25gm of *P. viridis* instead of 10gm. Twenty minutes after drinking the brew I vomited. Then nothing -- no experience. I guess it's time to try a simpler method, such as running several handfuls of *Phalaris* through a wheatgrass juicer for immediately available potent juice. -- JS, NM

[Vomiting seems to come with the territory on ayahuasca. One should try diligently not to throw up until it begins to come on, at which point it's virtually impossible to control anyway. Once the trip starts, vomiting usually has no effect on the psychological part of the experience. Be extremely cautious with *Phalaris* juice -- there isn't enough hard data on it yet. Other chemicals in the grass could be dangerous, even fatal if you took too much. I'd leave raw *Phalaris* juice alone and extract the alkaloids from it instead. -- Ed.]

### HARMALA-SALVIA

First, a *P. harmala* extract equivalent to 2g of seeds was smoked. After 5 minutes a very small amount of *S. divinorum* was smoked. The combination provided a much longer experience in the *Salvia* dimension. It also seemed to smooth out the weirdness of the *Salvia* a bit, making it an even more pleasant experience. Definitely a potent combination. -- Toad

### HARMALA-PSILOCYBE

I must comment about mushroom ayahuasca [*Peganum harmala* plus *Psilocybe cubensis*]. It is not merely an increase in the strength of the dosage, it's almost like a different substance. It is so very beautiful, with a lot more detail filling the view, either with eyes closed or open. The colors and shapes are so magnificent. Timing is also different. It takes a lot longer

to start: an hour and a half. I thought nothing was going to happen. It came on slowly, then increased stronger and stronger, but always calm and controlled. After I came down and went to bed, I continued to have beautiful visions before I fell asleep. --BJ, FL

### DIET QUESTIONS

Can anyone give a complete list of foods one *can* eat prior to drinking ayahuasca? Also, a list of foods one must avoid for 5-7 days prior to an ayahuasca ingestion. Is the diet for reasons of MAO inhibition, or is it simply to reduce somatic effects? -- TW, NY

[It's for both. Classical ayahuasca (botanical harmala alkaloids plus botanical DMT) is in my opinion, an entheogenic *medicine* and a shamanic path in itself. Like any path with heart, it demands everything you've got: diet is an essential part of the ayahuasca path. To compile a list of foods you *can* eat would ultimately include everything that doesn't interfere with ayahuasca's effects -- obvi-

ously data overload. The general guidelines in past *ERs* (see especially Fall, 1994, pg. 7) are a good place to start. Once on the path, the medicine will teach you. -- Ed.]

### WE'RE ALL GONNA DIE!

Many *ER* readers express a disappointment in the ayahuasca analogues which I think is dose-related. Try fresh ground capsulated Syrian rue (3-4gm) with ten to twenty teaspoons of fresh extracted *Phalaris* juice. This is a very insightful and powerful experience which I find is best tamed with an occasional puff of cannabis. It is interesting that so many *ER* readers complain about these combinations making them sick. I believe that they are having a psychedelic experience of the sickness of our world, without and within, in a most graphic format. So I wanna hear more accounts of mushroom neophytes ranting, "We're all gonna die!" (Pg. 5, Summer '95 *ER*.) It's what I've always thought. -- GW, CA

*Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants*, by Jim DeKorne, 1994, 155 pages. \$22.00 postpaid from: *The Entheogen Review*, P.O. Box 800, El Rito, NM 87530.

*"The underlying theme of the book is DeKorne's never-ending quest to find a cheap, semi-safe, semi-natural, mind-blowing psychedelic ... (The book) is almost devoid of specific shamanic traditions ... shows little understanding of ... finely-tuned, time-tested shamanic rituals ... DeKorne ... is preoccupied with his adolescent search for an effortless high ... DeKorne's advice is equivalent to saying: "Keep jumping into deep water, and if you don't drown, you may learn to swim." -- Shaman's Drum*

*"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." -- Terence McKenna*

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 4, NO. 4: Winter Solstice 1995**

ISSN 1066-1913 Copyright © 1995, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.

P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are for the moment exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F95 means that the Fall, 1995 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- Jim DeKorne

# THE VAPORIZER

*Design by: I. Lovelungs, Original Concept by: Dr. Lunglife*

---

**The** vaporizer allows you to heat up any substance and vaporize the psychoactive content without actually burning the extract or plant material. *Vaporizing is nearly twice as potent as smoking* because none of the active ingredients are wasted in the flame. This also eliminates carbon monoxide and other toxic byproducts created from burning -- making it a more user-friendly method of ingestion. No entheogen enthusiast should be without one...

## *Materials Needed*

1. A 8" length of glass tubing bent at a 45 degree angle (chem lab supply store or local Head shop).
2. Two #6 rubber stoppers. (chem lab supply store or local Head shop).
3. A large 9" long 1-1/4" diameter glass Steamroller pipe. (Head shop)
4. An automobile cigarette lighter heating element made by Victor #V-5146 or Casco #212146. (auto parts store).
5. A spring. Buy a heating element made by Victor #V-5144 and remove the spring that's inside. (auto parts store)
6. A couple of small bolts, hex nuts, machine screws, and various washers.
7. An in-line fuse holder (Radio Shack #270-1281A)
8. A box of fuses rated at 5 AGA 5 amp. (auto parts store)
9. A small decorative wooden box about 4"x7"x3" (import shop or crafts store)
10. Small gauge wire, ring connectors and some small wire caps (hardware store or Radio Shack)
11. A 12.6 volt 3-amp AC power transformer (Radio Shack #273- 1511B).
12. A 6 foot long power cord with plug (Radio Shack).
13. A toggle switch rated for at least 5-amps. I found that the motor sized toggles work best (Radio Shack or

auto parts store).

14. Rubber bumper feet to keep the box from scratching your table. (Radio Shack)

## *Tools Required*

**You** will need a drill with various bits, some screwdrivers, hammer, chisel, wire cutter, soldering iron, a small torch and other assorted tools for rigging your vaporizer. If you are good at working with your hands and letting your creative juices flow, building the vaporizer is a snap.

## *To Build*

**Begin** by drilling a hole in the wooden box for the main power cord. Pull the cord through the hole and tie it in a knot so that it can't pull back through. Select a position for your toggle switch and drill the appropriate sized hole. You may need to chisel out some of the inside of the box to make it fit. Place the toggle switch through the hole and tighten down the hex ring on the outside of the box. Find the appropriate placement for the transformer and secure it with small bolts or wood screws. Make all of the appropriate wire connections, solder and cap them. Drill a hole for the heating element rod on the top of the box. Drill a smaller hole for the yellow secondary wire on the top of the box next to the first hole. Cut a #6 stopper in half and drill a hole in the center of it for the ceramic insulator (it comes in the package with the heating element) and a small hole for the yellow secondary wire. Place the ceramic insulator inside the rubber stopper. Select the appropriate sized washer that will cover at least 3/4 of the rubber stopper. Cut away a section of the washer for the yellow secondary wire. Make sure the hole is big enough so that this wire is not touching the metal washer. Pull the yellow wire through the small hole in the top of the box and then through the entire heating assembly. Place the bottom rod of the heating element through the lid of the box. Then place the ring connector over the rod and secure the entire assembly to the lid with a hex nut and

# The Entheogen Review

washer. File down the rubber stopper as necessary for a perfect fit in the steamroller. Secure the yellow wire to the outside of the heating element. Take apart the second heating element (part #V-5144) as it contains the perfect spring for this connection. Place the yellow wire along the side of the bowl (strip off 1/2" of insulation) and wrap the spring around it. Heat the 8" glass tubing with a torch at one end and bend at a 45 degree angle. Drill a hole in a new #6 rubber stopper and insert the tube -- this all plugs into the top of the steamroller. Insert the fuse into its holder and you are ready for a test run. You should see the heating element get red hot in about 30 seconds.

## Techniques

**The** vaporizer works best with relatively pure crystalline materials. Any impurities in your extract will not vaporize properly and tend to gum up the heating element. If you purify your extracts down to a dry crystalline form you will have consistently incredible results. Using the vaporizer takes some practice, but once you've worked with it for a while it's easy to get a perfect hit every time. Turn on the switch for a few seconds and heat up the material until you see it melting with a small trail of vapor rising. Turn off the switch and inhale *very* slowly through the tubing while also inhaling some air through the side of your mouth. The substance will literally explode into vapor as the fresh air flows across the bowl. This can create a big hit very fast (perfect for DMT and the like). You can also vaporize dried plant material such as cannabis without extracting it -- just be sure not to overheat the element or you'll get smoke instead of vapor. The plant material should look toasty brown when the hit is done. The vaporizer works great for all kinds of plant extracts and most dried plant material. So far, dried *Salvia divinorum* is the only one that hasn't worked for me.

**After** each session it is important to clean out any residue remaining in the heating element. To clean the element, turn on the power until it's red hot, then place it in front of a fan. Within a minute or so all of the residue should burn off and leave a perfectly clean bowl. If the vaporizer starts blowing fuses you will need to replace the heating element, as they wear out over time and begin to short-circuit. The transformer may also wear out, as the heating element demands slightly more power than the transformer is rated for. However, with proper care your vaporizer should last a long time and the cost of replacing the transformer and heating element is minimal. Once you have vaporized you are destined to become an aficionado, and you may never want to smoke again. I hope you enjoy this high-tech tool as much as I do.

Post Office Box 800, El Rito, NM 87530 U.S.A.

# ENTITY CONTACTS

---

## *EXPLORING HYPERSPACE*

*By D.M. Turner*

**Some** of the most enigmatic psychedelic experiences are those in which one meets Beings or Entities while exploring the realms of Consciousness. Experiences of this nature are not uncommon, and are reported frequently by people using DMT, high doses of psilocybin, or Ketamine. Some of the more bizarre manifestations of these experiences occur when people meet the same entity(ies) on repeated occasions, have dialogue with the entity(ies), or when two or more people separately experience the same entity.

**Typically** meetings of this type raise many more questions than answers. Are these entities figments of my imagination or do they exist for real? Can I trust/interact with the entity, or is it evil and intent on harming me? Can these entity realms be mapped, are there a limited number? After many journeys meeting such beings in hyperspace, I've progressively developed some understanding of the dynamics involved in these encounters, which may be of help to other travellers.

**I don't** believe the entities can be classified as either "real" or "fictional". In the psychedelic dimension, my repeated experience is that consensus reality is no more nor less real than the numerous intersecting realities available in the moment. The distinction of calling one true, and another false, seems to have no relevance at the moment or upon return to base level. The old proverb "everything is possible, nothing is real" seems the closest analogy.

**I find** it important that the discriminating or censoring portion of the mind be allowed to rest during deep psychedelic journeys. Typically the mind is so active categorizing things as real or false, significant or meaningless, that we miss the magic that is continually passing through us. By not censoring or rationalizing when an event of this nature occurs, one can deepen and lengthen the episode and more fully imbibe the essence of the experience. With practice one can bring certain discriminatory abilities to these

occasions without disrupting the flow. For instance, one can distinguish which aspects of an experience are rooted in foreign realities, and which are rooted in one's base reality and will still exist after the psychedelic episode is over. However, there does appear to be a limited ability for entities from outside realms to interact with even the material items of our consensus reality.

**The** variations on the types of entities one may meet in these dimensions appears endless. With psychedelics we are dealing with the dissolving of boundaries: dissolving the boundaries between separate realities, dissolving the boundaries between individual realities and Infinity. Yet I frequently have strong impressions that a "higher power" is controlling the events of the universe and the events manifesting in my journeys. The entities of hyperspace usually come halfway to meet the journeyer. Looking back at my many meetings with these beings, it seems that I always experienced what I was ready for, and what was necessary at the time.

**There** are differing opinions on interacting with these entities. My own feeling is that interacting and developing alliances is a necessary step for those who wish to progress along the shamanic path. While I've at times been terrified of the power and possibilities of the intentions of these entities, I have, over time, become more comfortable in dealing with them. It is my current belief that all I encounter is an aspect of myself. I've found that these entities typically work with and magnify whatever energies or intentions I bring to them, including thoughts in my subconscious. I found it's important to have a strong connection to my soul, and know the direction in which my soul is polarized. Inner honesty and adherence to one's deepest core is the best way to move through any difficult psychedelic episode. Keeping one's intentions clear and focussed is the best approach to take when dealing with these beings of the unknown.

**The** following DMT journey occurred subsequent to a journey with Salvinorin A, the potent extract of *Salvia*

*Divinorum.* I'd returned from the Salvinorin experience feeling a strong connection with the spirit of the *Salvia* plant, and desired to make the same connection with DMT. As usual, the DMT experience didn't fit my expectations, and was quite a departure from my usual experiences with this substance in that it traversed several clearly defined dimensional boundaries and was remembered in vivid detail.

**I smoked** 30 mg. of DMT in three tokes, entered DMT space, and was greeted with the usual pantheon of young children, elves, Chessire cats, and intricate geometric objects, which flowed along in the characteristic DMT manner. Recollection of my recent Salvinorin journey and desire to connect in the same way with DMT was basically forgotten as I watched the elves moving about. They weren't doing anything of particular interest or meaning, and looking past them I saw some doors, behind which came occasional bright flashes of colored light. A couple weeks prior to this journey a friend had remarked that he thought the DMT elves were primarily there to distract one from entering the deeper aspects of DMT experiences, and that he'd been successful in moving beyond them by willing the elves to let him pass. This discussion came into my mind, and I said to the elves "Let Me Through, Let Me Through,..." I had to repeat this several times with much force of will, even saying it aloud. Eventually the elves reluctantly let me through, and as I passed through a doorway I was admitted to a vast dimensional space. At this point I seemed to be a flying disembodied consciousness, and I scanned this new space to hone-in on any beings that may be present. Soon I came across some angel/guardian type beings. There were about seven of them, and they looked like blobs of light: grayish in color and sort of egg-shaped. They appeared solid from a distance, but on closer examination I saw that their bodies were made of closely packed fibers which could open at any point on the outside of their bodies. They seemed to be part computer, part robot, part flesh/brain matter: all synergized into one living organism. When I came into their territory these beings briefly glanced over at me, as if saying "what's all this commotion," then went back to their tasks seemingly ignoring me. It seemed that they were busy watching over everything that happens in our space-time dimension and occasionally

making minor adjustments to keep everything on track. During other DMT journeys one or more of these same beings had sought me out to impart information. During those episodes the being was experienced as a powerful God and protecting ally.

**Anyway,** my thrust of will which had propelled me past the elves and through the door into the guardians' space, continued propelling me out through the back of the guardians' realm and into another space-time dimension. When I first entered this new dimension I encountered its guardian beings. They looked similar to, but not exactly like the guardians from our dimension. There were about 50 to 60 of them and their reaction to my appearance was quite different than the first group of guardians I'd passed. These beings were quite surprised to see me, primarily because I had not come from the dimension that they were guarding, but had entered from the back side of hyperspace. They all huddled together as if in conference, to determine if it was OK to let me pass. Eventually they decided, with hesitation, that I could continue on, and I swooped down into a different planetary system. This planet was highly evolved scientifically and technically. The place I entered was some type of research center, and my attention was on some large metallic pods that were being moved in and out of racks by elaborate robotic arms. Each of these pods was something like an isolation chamber. They were shaped like large coffins, although with rounded edges. The oval cross section was about three feet wide, the length about eight feet. The beings who used these pods looked exactly like humans. The pods were filled with a foam type material with a cutout for a person to lie down. The foam was connected to the sides of the pod and also contacted the entire skin surface area of the person inside the pod. The foam was serrated, and I understood that it served as a conductor of food, water, heat, medicines, etc. between the pods' technical systems and the person resting in it. These pods were also cold chambers. They were not for cryogenically freezing a person, but put them into some type of suspended animation. Anyhow, the whole purpose of these pods and this research center, was to increase the level of DMT in the brains of the pod sleepers. This was the only method the people of this planet knew of for obtaining the experience imparted by DMT. These

people would basically go into a pod for weeks or months at a time. The DMT levels in their brain would be significantly increased, and they would spend their time having the most fascinating dreams! This research was considered the most important and serious aspect of this society's evolution.

**I then** went into the mind of a person inside of a pod. It was a woman who appeared to be about 25 years old. As I went into her mind I became aware of all I've described above, and had a brief view of the DMT "dream" that she was experiencing. As I saw this she simultaneously became aware of much of my world. This was the first time her society had ever had contact with an earthling. It was quite a shock and also a bit of an embarrassment for her to discover that there were other people who didn't need to go through the elaborate technological process of increasing DMT levels through suspended animation, but simply smoked the stuff, and could collect it from any of several plants. Initially I thought that she must have asked her guardians to let her pass into another dimension as I had done. On further thought it seemed that I had come to her dimension on my own power, and was quite possibly invading her space. She may have been a bit taken back by that as well. Almost instantly she wanted to leave her pod to announce her discovery to the rest of the research team.

**My** return to base reality seemed much quicker than usual. I remember feeling that it was very important to remember the scene I had just witnessed as it held much value. And upon returning I felt that the essence and many of the details of the episode remained intact.

— *D.M. Turner*

[If we are seeking a conceptual model for what post-modern shamanism might be like, I suggest it would resemble the above account. D.M. Turner is the author of *The Essential Psychedelic Guide*, reviewed in the Winter '94 *ER*. — *Ed.*]

## ENTHEOGENIC ALIEN ABDUCTION

**I began** having what I believe to be contact experiences with entities about five years ago. These encounters occurred initially while on entheogens like LSD, *Psilocybe cubensis* and *Argyreia nervosa* (sometimes in combination). All of the doses were

light to moderate. My wife was curious and ventured out with me for the first time. We both seemed to witness the same sight: there were three small entities, child-like in appearance, standing before us about ten feet away. My wife and I looked at each other and I said: "I told you so! Do you believe me now?" She looked at me with a look of complete awe and excitement and we sat there (the entities were standing) and stared at each other for several minutes. At this time we felt we were in the presence of exalted beings and felt honored to be meditating in their company.

**Several** months went by and we discussed the experience with each other and tentatively mentioned it to friends in jest. Although no one paid it much mind we were excited to see if we could visit again with our new found acquaintances. We even set up a small altar with some offerings (fruits, candle, objects, etc.) for the repeat experiment. Everything was in place as we entered our altered states of consciousness.

**What** happened next was very confusing. My wife went to the bathroom. I was lying on a mattress in another room when we seemed to lose track of each other. The next thing we knew a couple of hours had gone by and we were both lying next to each other on the mattress, but my wife was in a bad way. We didn't remember seeing any entities, though we both felt that we'd somehow been physically abused during the time we were apart. We were both drained physically and emotionally from the experience. My wife had remembered some bits and pieces but was almost afraid to discuss them with me. We decided to recuperate for a day or two and discuss it all later.

**What** occurred over the next several days, weeks and months is extremely difficult to put into words. It reads like a UFO abduction experience from the popular press. We are not sure whether the altered states of consciousness brought on the UFO-Alien contact or if the aliens took advantage of it to make contact. After much soul-searching my best attempt at objectivity with a totally subjective experience is to say that I now believe there are a variety of different alien groups who have been contacting humans for a long time. They are more technologically advanced than we are and are able to jump into and out of our reality very easily. I also feel that they use us for various biological needs, such as sperm, genetic material and possibly

hormones. They have their own agenda and are very businesslike and unemotional about this work. I have strong feelings about this, especially after witnessing what my wife has been going through for several years now. We still often find strange marks and scoops on our bodies -- usually after weird dream states during the night. It used to bother us tremendously but it seems that they are trying to do their work with the least disruption to our lives as possible.

**Although** all this sounds very bizarre and has little to do with shamanic altered states of consciousness, it has happened to us. Other abduction experiences describe similar events, the highest and most intense being a more one-on-one kind of scenario. This appears to be the next step for those exploring the possibilities of their own alien encounters. This may be easier said than done when facing such a mystery: the possibility of inter-dimensional time travelers. I feel that shamanic practice is a more suitable method of making contact, though one must take it as it comes. This is very hard for us to write about and is much more complex than outlined in this brief letter. -- *SK, FL*

### THE FORCE

**I ingested** between 7 and 8 grams of dried *Psilocybe cubensis*, with effects beginning within 25 minutes. There seemed to be a force pulling my mind toward the window. I vainly tried to retain my thoughts (language ability: vocabulary), but was forced to let go: I was entering a world without words. I had lost my vocabulary entirely and the force still pulled on my mind from the window. Then came muscular contractions: a spasm in my neck and right side, pulling my head sideways toward my shoulder; another in my lower left abdomen was pulling my upper body sideways toward my legs. (I felt pain in these regions the next day.) Then I spoke: not English, but gibberish (as far as I could tell) -- oriental sounding, with long drawn-out vowel sounds at the end of words. Visually, everything seemed to have a cobwebbed appearance around the edges. I lay on the bed and after a time "awoke" -- my vocabulary was back, and I checked the time: the entire experience had only lasted about an hour and forty-five minutes! It

was the shortest trip I ever took. Now it seems like only a hazy dream, though a very frightening one. I've been afraid to repeat the experience. -- *JH, IL*

### INNER VOICES

**I hear** the damn things too. The really outstanding ones command attention and always have vital information to convey. It doesn't happen too often. Many years ago when I was doing a lot of hallucinogens I was driving my friend Jim to the next town. I rarely stop for hitchhikers, but as we approached one I heard a clear voice say: "pick him up." He turned out to be the kind soul who years before had allowed Jim to live in his garage for several months when he was a runaway child. Later I asked Jim if he'd asked me to pick up the hitchhiker -- his response was that he hadn't even seen anyone standing by the road. -- *Anon., MA*

## AYAHUASCA ANALOGUE CHALLENGES

---

---

### AYAHUASCA SUPPOSITORIES

Our latest experiments proved to be quite a surprise. Without a shadow of a doubt the 5-MeO and DMT plus *Peganum harmala* combinations are active when ingested by means of a rectal suppository. This method was free of the nausea and purging effects that often accompany ayahuasca. We first inserted a gelatin capsule filled with *P. harmala* extract equivalent to three grams of seeds, waited 30 minutes for the harmala to take effect, then inserted a capsule containing either 5-MeO or DMT. At 13-15 mg the 5-MeO was extremely active and very intense. On the other hand, the DMT did not seem to be as active when ingested this way. At 70 mg (a much larger dose than needed via the stomach) we experienced a very mild, but distinctive DMT trip. Compared to the 5-MeO, the DMT had a much slower onset, with the rise to peak taking about one hour. -- *Toad* ... (Here is fellow traveller Taffka's account of this 5-MeO experience):

"Effects from 5-MeO were quickly noted after the dose was administered: approximately 7 minutes or so. I had walked down a hill on a short stroll to a lake where I took the 5-MeO. Not expecting such a rapid onset I began to jog quickly up the hill to the house as I noticed increasing shifts of awareness. By the time I got there I was nearing a plus-three and within minutes topping out at an uncomfortable plus-four with slight nausea (I think this was due to the nature of 5-MeO) and what seemed like poisonous electric static in my brain. This stage lasted about 30-40 minutes, during which an "energetic reaming" took place. All to do was to breathe sharp rhythmic breaths to stay with it. As the hairy part leveled out I enjoyed a pleasant refreshed state with tracers, visuals, and enhanced auditory sensation. The remainder of the evening I found myself in a delicious state of heightened awareness... Very fine and clear." -- *Taffka*

[5 mg is considered a "standard" dose of 5-MeO-DMT, so 13-15 mg is in the 3-X overdose

range. It is almost impossible to measure kitchen extractions that small without a milligram scale, so it goes without saying that caution is advised when determining doses. -- *Ed.*]

### HEAVY 5-MeO TRIP

I ingested about 5 gm of Syrian Rue (*Peganum harmala*) seeds and smoked roughly 9 mg of 5-MeO-DMT at 9:45 and discovered at about 11:30 that I'd been lying on the floor covered in vomit. I remember being blinded. This lasted longer than anything I've ever heard concerning DMT. I didn't sleep at all the following night and finally slept lightly around 2:00 AM the second night. It was still a religious experience, only without visions. I am in awe of 5-MeO-DMT, but have no desire to do it again. (I smoked some more a few days later and it lasted an hour.) What can I expect from DMT using this experience as a reference? -- *DRC*

[Generally, DMT is much more visual: patterns, colors, weird ambience, often some entities. As editor of *ER* I feel it is my responsibility to emphasize that first-time explorers might prefer to smoke these tryptamines alone before potentiating their effects with *P. harmala* -- make sure you really want that much intensity before committing to an hour or more of it! -- *Ed.*]

### MUSHROOM AYAHUASCA BUMMER

As one who has taken the sacramental *psilocybe* mushroom well over thirty times, several of them larger doses, it has been both a pleasure and a horror to combine *P. harmala* extract in my mushroom journeys. The first sampling of this fungahuasca mixture began innocently enough. After swallowing a 1 g dose of very potent *cubensis*, an extract equal to 1 g of *P. harmala* seeds was vaporized (see vaporizer article elsewhere in this issue). Effects were almost immediate -- upon inhalation, effervescent auditory and visual phenomena were noted; clarity of mind sharpened

greatly and a sense of calm assurance spread across my face in one of those "no way" smiles. Objects pulsed and wavered with ridiculous aliveness. Then I began to nip a few more pinches of mushroom -- perhaps I didn't allow enough time to measure each dose's effect, for I soon realized I'd consumed about 5 more grams. I enjoyed the intensifying state for another 45 minutes until something snapped: a brief moment of fear bubbled up like indigestion ... But back to the fun -- no bummers possible here: too good. Again amusement and abandon swept through me and for awhile I was fine -- but only for awhile. I was suddenly confused, aware of chaos, mental mayhem and fear. I took a walk -- where before objects were merely pulsing, they now lurched backward and forward: the trees, the ground... This broke into something else again as I entered another building. I was being possessed and not quite sure if I was ready for it. I sat in a chair breathing heavily, my heartbeat accelerating -- like a startled animal frozen in the headlights of an oncoming car. Ominous tones in my mind's ear were heralding doom, everything was in chaos. Barely able to walk, I stumbled again outside. In a panic I stuck my finger down my throat in a vain attempt to exorcise the demons. I drank as much water as possible, but to no avail. Only stark terror and every possible gruesome fate was moving toward me. I managed to make my way to a friend's house nearby and I awoke him in the middle of the night, begging for help. I spent the next four hours totally freaked out, certain that I was going to die. Had it not been for my friend's experience in the fungal arts and his help, I have no idea of what would have happened. His affirmations and care guided me through a truly hellish trip. When I finally snapped out of it, I breathed what seemed like my first breath and cried like a baby, my emotions gushing. Truly, this is an experience I don't intend to repeat. Yet I did feel incredibly fresh and well the next morning, in full appreciation of all creation as I walked awestruck into the glistening sunlight. -- *Taffka*

### ANOTHER INTREPID TRIP

A *P.harmala* plus *P.cubensis* combination proved to be the most demanding and extraordinary trip of my life. I first ingested 5 g of potent mushrooms and waited until they were coming to peak. Then I vaporized a *P.harmala* extract equivalent to 1.5 g of seeds.

This instantly transformed the trip into something totally different than mushrooms alone. The MAOI added an overwhelming ecstasy impossible to describe in words. For six hours I was floored and found it difficult to even stand up. Ecstasy kept building and building until it was more than my limited ego could handle. I am still trying to sort through and integrate the series of events that followed. I'd read many stories of seeing entities, hearing voices, and the like, but I'd never experienced such things before. It wasn't what I'd expected, and different from what I've read in *ER*. Quite simply, *I* was the entity. It was as if this being was exploring the physical dimension through me *as me*, while "I" was thrown into its domain of energy space. The entity was constantly moving my body and making sounds, expressing itself through my mouth in a weird language of vibration. This channelling of the entity realm was far beyond anything I could have imagined possible. At times I would return, only to be reamed with emotion and then find myself taken over again. I remained fully immersed in this experience for six hours, and after what seemed a lifetime, finally came out of it. My previous near-death experience while kayaking somehow prepared me for this level of intensity, since I was able to deal with the fear whenever I found myself losing control. This dosage level is unrepeatable for me (at least for a long while), as it took me way over the edge. With all its power, the trip was incredibly humbling, truly fulfilling -- I will never be the same. An interesting note is that I didn't experience any of the nausea typically associated with this combination. I am particularly sensitive to nausea, and was pleasantly surprised not to have to deal with it. It appears that vaporizing the *P.harmala* extract is a great way to go.

The following week three of us tried the same combo with 1g of *P.cubensis* and an extract equal to 3g *P.harmala* seeds taken together (instead of waiting for the mushrooms to come on first). Two did harmala implants (enema not released) with a very small amount of water, while the other tried the harmala sublingually without swallowing it. None of us experienced any nausea, though it did make the initial woozy feeling of the mushrooms more pronounced for me. In our next session we ingested 2g of *cubensis*, waited until they were coming on strong, then vaporized an extract equal to 1.5 g *P.harmala* seeds. This

provided incredible clarity and a more cerebral experience than the harmala implants. This is my favorite in terms of dosage and method of ingestion. The channelling phenomenon did not occur, but I could sense the entity presence around me. -- *Toad*

[*ER* is receiving consistent reports that high-dose mushroom ayahuasca can be a rigorous experience, often with the presence of "demonic" entities. The shamanic challenge is to maintain a critical perspective during these encounters: whoever or whatever these beings are, they seem to feed on fear. They also seem to be quite powerless once we stop taking them seriously -- easier said than done when you're in the middle of it! -- *Ed.*

### MUSIC HATH CHARMS TO SOOTHE THE SAVAGE TRIP, PART II

This is feedback on my note in the Summer '95 *ER* (pg 7) concerning the Patrick Bernhart *Atlantis Angelis* CD (cut #7: "Harmony of the Om Spheres") as meditation music to use with mushroom ayahuasca. One of the first people to try the Om/Harmala/Cubensis combo was my wife. Her initial experience was characterized by intense ecstatic bliss. She tried the same formula several months later and had a devastatingly brutal, ego-shredding experience. At the time, her impression was that the Om was cruelly taunting and mocking her. At a certain point during the experience she felt like her feet were being crushed and mutilated. The whole trip left her feeling shaken, raw and vulnerable. I had a similarly intense ego-shredding experience on five dried grams. Both these experiences took place during the daytime. According to Henry Munn (*Hallucinogens and Shamanism*): *The Mazatec Indians eat the mushrooms only at night in absolute darkness. It is their belief that if you eat them in the daylight you will go mad. The depths of the night are recognized as the time most conducive to visionary insights into the obscurities, the mysteries, the perplexities of existence.*

It seems that when your number is up for ego--shredding, there isn't much to do but ride out the experience. Then again, it may be possible to learn how to mentally step back (and out) and view the experience from the perspective of one's witness. James Kent, in "Clocking Serious Mayhem" (*Psychedelic*

*Illuminations* Vol 1, #7), describes his own terrifying experiences with psychedelics: "I would have trips that seemed to be completely fueled by mayhem. Demonic conspiracies were plotting against me, my life was in serious danger, I could trust no one, and the voice chanting 'rubber room, rubber room...' was no help. These experiences shook me hard -- to the point where I wondered if I was indeed losing my mind. I started to fear psychedelics. My fear persisted for many months until I happened upon the notion that this mayhem was not a product of my own crumbling mind, but instead some kind of sinister entity that had latched onto me while I was in a vulnerable state of altered consciousness... This idea intrigued me to the point where I was again willing to take the psychedelic leap and risk confronting mayhem. Now, when the mayhem creeps up on me and paranoia and confusion fill my head, I can step back and say, 'Wait a minute. This is you, isn't it. I know you. I know what you're up to.' The act of personifying mayhem allowed me to dissociate myself and keep it at bay. Instead of fearing it, I now learn from it. I can see the strings it tries to pull in me and the way it tries to shake me, but I don't let it. I can sit back and study its machinations with detached amusement or I can simply banish it. Mayhem no longer has power over me -- it is just another monster under the bed."

In future sessions it will be interesting to use this technique to see if it can be used to defuse difficult psychedelic situations. -- *DL*

## BIOSYNTHESIS QUESTIONS

Tryptophan is available at reasonable rates. If 4-OH-tryptophan were to be synthesized from tryptophan and supplied to a DMT-producing plant (hydroponically or in a foliar solution), might the plant produce 4-OH-DMT (Psilocin)? Also, the endophytic fungus in *Stipa robusta* that produces LSA derives its nutrients from the grass. Is it possible to feed the grass a diethylated precursor to LSD? If the fungus is incapable of absorbing and/or converting this precursor, perhaps *Argyria nervosa* (Hawaiian baby woodrose) could be utilized. Because LSD is very potent, biosynthesis need not be very efficient to be effective. -- RS

[Interesting speculations, but far beyond anything I know about plants or biochemistry. Any mad scientists out there want to take this on? -- Ed.]

## LEZPEDEZA BICOLOR

In the Spring, 1995 *ER* MW from CA asks about *Lezpedeza bicolor*. According to *Phytochemistry* (1977), Vol. 16, pg 172-173, *L. bicolor* also contains Lezpedezine, which has an unfortunate structural resemblance to the noxious bufotenine. I could find no mention of the effects of lezpedezine, or any hints as to how to remove it. Caution is advised.

-- Inner Frontiersman, KS

## AMERICAN SCIENCE AND SURPLUS

Check out the American Science and Surplus catalog (3605 Howard St., Skokie, IL 60076-4014) for items of interest to *ER* readers -- like lab supplies (pipettes, beakers, mortar & pestle sets, metric scales, etc.) and plastic greenhouse humidity tents: perfect for growing *Salvia divinorum*! Like most surplus outlets, some of the stuff is specialized and of limited general use, but they offer real bargains on hard to find items. -- AB

## DELAYED RELEASE CAPSULES

I had an idea when I saw the feedback in *ER* about using a coating of shellac on capsules. Instead of using

shellac (isn't that toxic?) try an enteric coated capsule that can be found in your local health food store in the refrigerated section. It is an *Acidophilus* supplement from *Nature's Way* designed to bypass the stomach and release in the small intestine. I haven't tried this yet, but it could be a good technique for avoiding nausea with ayahuasca analogues and other entheogens. -- Toad

## PSYCHOTRIA VIRIDIS CULTIVATION

I managed to defoliate my *Psychotria viridis* plant that had become infested with scales by using Malathion. Fortunately, they started sprouting leaves in new sites but the scales remained. After two months of leaf growth, I treated the plants with a high dose of Enstar by Sandoz. The scales died and turned brown in a day or two and the leaves are still bright green. Any advice on the care and feeding of *P. viridis* would be helpful. I am especially curious about light levels for the best growth. -- Anon., PA

## CHACRUNA/SACHAMAMA FEEDBACK

[The following letter was sent to Basement Shaman regarding its sale of "Chacruna" (*Psychotria viridis*), mentioned on page 15 of the Fall '95 issue of *ER*. The story is that an individual is wholesaling this entheogen to ethnobotanical suppliers, claiming that the plants are grown at Sachamama, a legitimate Peruvian botanical preserve, and that all proceeds go to support that facility. Evidence suggests that this is not the case. -- Ed.]

We saw your letter regarding chacruna and Sachamama in the current issue of *Entheogen Review*. We are concerned that there are programs or proposals floating about stating that they are raising funds for Sachamama, while in fact they may not be doing so. Having been in close contact with Francisco Montes, director and founder of the Sachamama Botanical Preserve, it has come to our attention that no organizations are officially affiliated with Sachamama, nor

have any funds been received by Francisco Montes. Unfortunately, our names have been linked with one of these proposals, stemming from a recent visit that we took to Iquitos and the preserve. We do not endorse any such proposals or organizations. Our intent, as seems yours, was to help raise much needed monies for Sachamama. We urge you to deal with Francisco directly in all projects and money matters concerning Sachamama. He can be reached at: Francisco Montes Shuma; director, Sachamama Botanical Preserve; Hostale Pascana; Calle Pevas #133; Iquitos, Peru. Sachamama is a very special and important place. At this time, unfortunately, anyone other than Mr. Montes cannot be considered a reliable ally of Sachamama.  
-- *Leda Meredith and James Dilda, NY*

### TRYPTAMINE/INDOLE TEST STRIPS I

Regarding the tryptamine test strips I mentioned in *Phragmites australis Reports*, Pg. 16, of the Fall '95 **ER**: enclosed is a photocopy of the information I got from JRL Bioscience. I apologize about the inaccuracy in my description (e.g. "Indole," not "Tryptamine" test strips). I ordered them about two years ago, have unfortunately used them all and have received no answer from JRL since. Maybe a chemist who reads **ER** will be able to recognize the codes on the sheet and make more. They definitely work!

-- *Mr. See, UT*

*A quick and easy test...from the JPS 56, 1526 (1967)*  
-- take a small amount of substance (if it is fairly solid, try to grind it a bit) in a few drops of 95% ethanol. Ethanol is commonly found in liquor stores as grain alcohol. The ethanol from the hardware store may have denaturants that may adversely affect the results of this test, so I wouldn't take the chance with it. Soak a strip in the alcohol solution and let it dry. This should only take a few minutes. After this is done place a drop of hydrochloric acid on the strip and observe the color that it turns ... A violet red or violet blue indicates that indole derivatives, such as LSD, are present. With DMT and Psilocybin the color is redder. These color changes must be observed quickly after the addition of the HCL since the color rapidly changes. -- **JRL Bioscience info sheet**

### TRYPTAMINE/INDOLE TEST STRIPS II

Regarding "tryptamine test strips," they may be: Saturate strips of filter paper with 2% p-- dimethylaminobenzaldehyde in 45% ethanol; air dry and store in tightly-stoppered amber bottles (or keep in stoppered container in dark) which will keep them useful for several months. Put a little of the suspect substance in a few drops of ethanol, wet a filter paper strip in this and allow it to dry... (etc. -- same instructions as above). -- M.V. Smith, *Psychedelic Chemistry*, Loompanics, Port Townsend, WA (1981), 200 pp, \$16.95 + \$4.00 P&H-- **RG, PA**

### JOHNNY APPLESEED RESPONDS

p-dimethylaminobenzaldehyde, also called P-DAB, is commonly available as a photographic developing chemical. It is the main ingredient in Erlich's Reagent, which is a thin layer chromatography developing reagent used for detecting alkaloids. I don't use test strips, but spray it directly on my chromatography plates. I have also dropped a drop into a test tube of plant extract and observed the color changes.

-- *Johnny Appleseed*

### DMT WEIRDNESS

Owsley "Bear" Stanley (creator of the acid eaten by the Grateful Dead and the Merry Pranksters) claims that one person smoking DMT in a room will affect the sound quality and the power output of a guitar being played in the room (as perceived by other, "straight" subjects). He claims a guitar already playing at maximum volume, through a maxed-out amplifier, got 6 dB louder (that's 4 times the power output!) when someone smoked DMT. It actually melted the voice coils and burned up the tubes. This is taken from an interview he gave in 1991, in David Gan's book *Conversations With The Dead* (Citadel Press, Carol Publishing Group, 1993: 0-8065-1223-7). Have you heard of similar inorganic things being affected? -- **CR, IL**

### PEGANUM HARMALA

*P. harmala* by itself doesn't cause me to throw up: it's the synergistic combo of it and some DMT-containing substances. It can make you feel uneasy, but doesn't do anything by itself. I've seen one reference claiming it is psychedelic in only toxic (i.e. near lethal) doses. An acquaintance claims he uses it instead of coffee to stay

awake -- maybe he's putting me on. As a coffee substitute it would win no awards and curdle your milk. It smells bad enough while cooking that a housemate called it "paint." The growing tips published by OTJ suggest that half a gram of properly processed seed would deliver. Not knowing the potential of any given seed source, I'd use a gram. I took a spoon of the boiled substance toward the end of a good LSD trip and found it perked up the intensity and flow: I felt higher and glided down. -- *RS, DE*

### "ESPHAND"

*Peganum harmala* is available through most Middle Eastern grocery stores under the product name:

"Espwand." Four ounces set me back \$2.79! -- *DL*

### ALTERNATE MEANS OF INGESTION

In the 1995 Winter supplement to the Loompanics Unlimited catalog (PO Box 1197, Port Townsend, WA 98368) is an article by August Salemi entitled:

"Smokeless Marijuana." In it is described a method using a microwave oven to release THC into an oil-based paste which is then encapsulated. Also described are recipes for brewing cannabis wines and beers.

Brewing is an ancient method of creating psychoactive substances and there's no reason why almost any entheogen couldn't be processed that way, with possibly enhanced results. The resulting product would not necessarily have to be drunk. In an article in the October, 1995 issue of *Discover* magazine the ancient Mayan practice of taking psychedelic enemas is described:

*Archeologists have theorized that Mayan shamans ritually used hallucinogenic enemas. The enemas -- probably made of mead, tobacco juice, mushrooms and morning glory seeds -- would not cause nausea and could induce a trance state far more quickly and potently than oral methods of consumption.*

The correspondent sharing this with *ER* readers says:

"I hope some brewer out there will throw some woodrose seeds into his beer brewing equipment."

Whether drunk or concentrated into enemas or ointments, fermented entheogenic brews might offer some surprising results for intrepid psychonaut-experimenters. -- *Ed.*

### ENTHEOGENS IN HOLLAND

In the Dutch drug law, mostly pure chemical substances are scheduled (THC, indole-alkaloids such as tryptamines and LSD, phenethylamines such as mescaline, etc.). Beside that, three plants are forbidden: cannabis, coca and opium poppies. This means that every entheogen plant or fungi which is not *Cannabis sativa*, *Erytroxylon coca* or *Papaver somniferum* may be used, grown or sold legally. (As we all know, cannabis is "illegal-but-allowed" here and *papaverae* are very popular as garden flowers: if you grow *Papaver somniferum* no one will notice it.) After the legalization of most entheogen plants several shops opened, selling fresh *Stropharia (Psilocybe) cubensis* mushrooms. Prices: about fifteen U.S. dollars for one ounce. San Pedro cacti: thirty U.S. dollars per foot...

*[The author goes on to describe a complex incident in Amsterdam in which a shop selling dried mushrooms is busted by the police. Fresh mushrooms are legal but dried mushrooms are considered a preparation. The law is ambiguous and the case has not come to trial. The shop owner's defense is that since the mushrooms dried naturally, at exactly what point did they become illegal? General opinion is that the police are afraid of losing the case and want to avoid a negative response about Holland's "free dope policy" from the rest of the European community. The shop owner is back in business, selling the same products. This particular problem only exists in Amsterdam. -- Ed.]*

In Eindhoven (a city in the south of the country) there is a "mushroom delivery service:" you ring them, they bring you mushrooms (dried) -- unfortunately without the pizza... Almost every month there is a new shop... At the moment the most accurate manner to describe the legal position is this: the Department of Health... thinks mushrooms are legal (dried and fresh), the Minister of Justice... thinks the same. But some lower officers, mainly in Amsterdam, think dried mushrooms are a preparate and are forbidden. At the moment no one is in jail or got a fine for selling or cultivating mushrooms, most people think it is legal. The biggest problem for mycologist home-growers is that most Dutch companies which sell psilocybian products don't know anything about their merchandise... I really hope some more real psychedelic mycologists come

over to the Netherlands and start a company here.  
[For some contrast: I recently received a letter from an inmate in Ohio who is serving a twenty year prison sentence for mushroom cultivation. -- Ed.]

I have also some information about the coming changes of the Dutch drug laws. The news is not so good... The allowed possession of 30 grams of marijuana or hashish will be lowered to five grams. This decision has been made because of the protests of Belgium and France. Lots of people from there are buying their cannabis products here. Now our government hopes to hold back these so-called "drug tourists" from buying more marijuana or hashish than strictly for themselves. But of course they can still visit more coffeshops in one day, so I don't think this idea will work.

The only good news is that home-cultivation of "little amounts of marijuana" will be allowed (it won't be legalized, though). The philosophy is that "coffeeshops" will have the possibility to buy from the estimated 20,000 (yes, twenty- thousand!) Dutch home--cultivators instead of international dope smugglers... At the moment, more than 70 percent of the profits of an average coffee-shop comes from home-grown marijuana... Latest news is that you can buy ayahuasca here. -- R. Rikkelman, Holland

### PHALARIS BRACHYSTACHYS

An extract of *P. brachystachys* originating from Algeria proved to be excellent. 50g of fresh grass was extracted by the Appleseed method. I first smoked an extract equivalent to 2g of *P. harmala* seeds to potentiate the DMT. After 5 minutes I smoked the *Phalaris* extract and was smoothly propelled into a plus-3 experience that lasted for 10 minutes. Definitely ecstatic... Based on the effects, I think DMT was the only tryptamine present in the extract. -- Toad

### PHALARIS TOXICITY I

I am dismayed to learn that *Phalaris arundinacea* toxicity is not due to DMT content, and that all high-alkaloid strains are suspect. I would prefer something that didn't require complicated extraction procedures with environmentally-unfriendly and toxic solvents. -- Hatter

### PHALARIS TOXICITY II

(Concerning *Phalaris* toxicity): Sheep eat many

pounds of this grass per day. Ott points out that *Phalaris* grasses contain trace amounts of B-carbolines, so I suggest that the sheep are unwittingly "ayahuascaing" themselves to death.

-- GW, CA

### SAN PEDRO GROWING TIPS

In the Spring '95 *ER*, Anonymous states that any *Trichocereus* variety over 18 inches in length that is not psychoactive should not be bothered with. Don't throw it out! Use the stump to graft more powerful, slower growing strains onto. Maximize the magic. The *power* rests above ground: the *rate* at which biomass is produced rests in the root system and stump. I have been able to greatly accelerate both root and biomass growth rate by simply using a commercial liquid root growth hormone found at any nursery. I raise my cacti in old plastic milk jugs, so am able to observe the profusion of the root system. I've seen *T. pachanoi* literally explode in growth. Two cacti were 4.75 and 5.75 inches tall when I brought them home; their total root system was about tennis ball size. After three weeks of weekly aqueous application of the root growth hormone plus common indoor plant food, the roots are vigorously exploring the limits of the container. Less than 60 days after this rapid root growth, the two cacti have doubled in length. As always, before consuming, all chemicals should be discontinued at least 2 weeks before harvest.

-- Inner Frontiersman, KS

### SAN PEDRO DOSAGE INDEX

Dosage recommendations for San Pedro are almost always given in lengths of the cactus: width is seldom mentioned. A more accurate and easily comprehended measurement would be the length times the width of the section used. For example, an 18 inch length that is only 1.5 inches in diameter would have an index of 27. So would a 9 inch piece that was 3 inches in diameter. I'm not interested in mathematics, just a more accurate measure of the bio-mass in a given dose. Although the potency of individual plants can vary considerably, the length times width formula is still a better dosage yardstick than just length alone. -- Inner Frontiersman, KS

### SAN PEDRO EXTRACTION

1. Use a manual cheese-grater or electric blender to

make a gooey mash out of an 18-inch length of cactus. 2. Cook covered for about 5 hours in slow-cooker on low heat. 3. Separate liquid with a giant tea-strainer or cheesecloth and squeeze the mash with both hands until liquid is removed. 4. Evaporate the liquid until a gummy residue is left. 5. Scrape off the tar with a plastic spatula and encapsulate. It comes on in about two hours and nausea is quite tolerable.

— EA. CA

## PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed descriptions of over 200 organizations related to psychedelics.

Categories include:  
book vendors & publishers, cultural resources, ethnobotanics (cacti, herbs, mushrooms, plants & seeds), garden equipment & indoor light systems, hemp related items, information sources, merchandise & gadgets (CDs, cassettes, t-shirts, smoking accessories & videos), non-profit & religious groups, periodicals, a reading list/book review section, and more!

Updated quarterly. One year subscription is only \$15.00. Foreign orders add \$5.00 for postage & handling. No other list is as thorough or updated as often!

Send cash, check or money order to:  
SOMA GRAPHICS, P. O. Box 19820,  
Dept. ER1, Sacramento, CA 95819-0820.

### *ACREMONIUM FUNGUS CULTURE?*

Couldn't we figure a way to grow the *Acromonium* fungus found in *Stipa robusta* to get the maximum amount of LSA? Perhaps a procedure similar to that for growing *Psilocybe* mushrooms. Let's hit the university libraries and find out what we can about this fungus. How could we extract pure LSA? Since the lit-

erature suggests that this is the only alkaloid, extraction should be relatively simple. Then we have predictable dosage and effects. With a little alchemy we should be able to use pure LSA to make a more potent entheogen. — *Inner Frontiersman, KS*

[The book, *Practical LSD Manufacture*, reviewed in the Fall, 1995 *ER*, describes a method for growing the LSA-producing *Claviceps* fungus. My guess is that *Acromonium* could be cultured in much the same way. This volume also describes a method for extracting LSA from the fungus. LSA, of course, is a precursor for LSD. Although the book is written for experienced chemists, the fungi-cultivation section sounds no more complicated than mushroom culture. — *Ed.*]

### *LSA AND MIGRAINES*

I have a bitch of a time trying to get off on ayahuasca. My most recent attempt involved cooking the brew for two days at low heat in successive changes of lemon water, using 3 g *P. harmala* and 10 g *P. viridis* -- nothing! I wonder if I haven't been spoiled by the LSA in Hawaiian baby woodrose seeds... [*Author goes on to describe a migraine headache directly induced by snorting 5-MeO-DMT to potentiate a poor ayahuasca trip.* — *Ed.*] ... This suggests certain questions: psychedelic perception has been with me since I was a child. I've always been able to "see" the colors and that was what made the psychedelics so appealing to me as I grew older. I'm also a lifelong migraine sufferer. It is highly significant that the ergolines are especially effective for staving off migraine!

[*Ergotamine for example, is a prescription drug used in migraine therapy.* — *Ed.*] Perhaps both the colors I see naturally all the time and the migraines I occasionally get are the result of an overabundance of endogenous tryptamines. Maybe because I am constantly under the influence of these endogenous tryptamines is why I can't seem to get the heavy trips that others get with DMT. Is that why I get off like a rocket on the lysergics? If this is the case, it suggests that the ergolines replace the tryptamines at the receptor sites as they do with serotonin. I have used LSA regularly over the past year and have had only one migraine -- when I went off LSA for about a week last Spring! If you are a fellow sufferer of this dreadful malady, you know that migraines start out with scintillating colors at the

edges of your vision and the world gets too bright -- which would be enjoyable if you didn't know what was coming. (Kinda sounds like the beginning of a DMT/ayahuasca trip, doesn't it?) It's an interesting theory, and I have noticed in the submissions to *ER* that there appears to be a clear split between those who use the lysergics and those who do tryptamines. For example (and maybe I'm reading too much into it), those who speak on LSA-related matters seem to dabble only occasionally with the tryptamines and vice versa with the DMT/ayahuasca aficionados. It would be interesting to know how many of the LSA group also suffer from migraine. -- *Dr. Poppyseed, IN*

[I'm not a physician, but from what I understand about ergolines and migraine therapy, the observations here seem worthy of further study. -- *Ed.*]

### TEXAS HBW QUESTION

My baby and large woodrose have not flowered yet in the Houston area. I have a Hawaiian baby woodrose which is in its second year -- I cut it back in the Fall to about four feet and every year it grows back, but no flowering. How many years does it take to flower? -- *MH, TX*

### 5-MeO-DMT AS MAOI

When you reviewed *The Essential Psychedelic Guide* [Winter, 1994 *ER*] we discussed whether 5-MEO-DMT was truly a MAOI inhibitor. I have some more info on this, and some other MAOI irregularities that you may want to include if you do more coverage of this topic.

Until 1991, 5-MeO-DMT was sold legally from a company called Inner Center. This was my source of the chemical for many years, until Inner Center's source cut off the supply due to "diplomatic" pressures. They sold the 5-Methoxy with instructions for use, including safety issues, such as foods and drugs to avoid; this was where I obtained my info on it as a MAOI.

This status may be questionable, as it is not mentioned often in the psychedelic literature. However, both Terence McKenna and Alexander Shulgin reviewed my book, and neither commented on this. I have personally experienced adverse reactions from smoking 5-methoxy after eating some French cheese, which would be expected with a MAOI. I thought it

prudent to let the readers know what has been reported on the topic, as there seems to be no conclusive information.

In *Ayahuasca Analogs* Jonathan Ott states: "DMT and 5-MeO-DMT show weak MAOI inhibiting effects." and cites Dennis McKenna from *The Journal of Ethnopharmacology* as a reference. I've had occasions using MAOI inhibitors where the length of the inhibition imparted by identical amounts of material varied widely, with no obvious reasons, such as recent food consumption, for the difference. On about 15 occasions I've smoked 5 mg. of 5-MeO-DMT about two hours after ingesting 3 grams of syrian rue seed. This typically produces a 40 minute to one hour journey with a five to ten minute peak, which is significantly longer than 5-MeO without the MAOI inhibitors. However, on about four such occasions the total experience lasted for two hours with an extremely intense twenty + minute peak.

A more unusual anomaly occurred while smoking small amounts of the bark of *Banisteriopsis rusbyana* while on psilocybin mushrooms. Typically smoking two to three hits of this bark produces a gentle one-minute visual interlude, followed by a five to ten minute period combining relaxation with an increased energy flow from the psilocybin/beta-carboline interaction. On one occasion the secondary period was considerably stronger than usual and lasted about six to seven hours, extending the overall psilocybin trip to over 10 hours. Indeed when I lay down to try and sleep that night, still high and feeling strong MAOI inhibition, I wondered whether I was going to have a 3 week MAOI episode similar to Dennis McKenna's as described in *True Hallucinations*.

-- *D M Turner*

### IS LICORICE ROOT A MAOI?

I was at the herb shop a few days ago and asked for *Peganum harmala* seeds. The lady said: "Never heard of it -- what's it used for?" I told her about MAOI inhibition (without mentioning entheogens), and she told me that licorice root works as an enhancer/accelerator. So I drank a cup and a half of moderately strong licorice root tea after eating *T. peruvianus* and within 20 minutes experienced very enhanced visuals. Licorice root is also said to be an

excellent adrenaline gland rejuvenator. -- *Phil*

### YOHIMBE I

I don't think Yohimbe is a MAOI [as reported in A. Gottlieb's *Legal Highs*], though it does seem to potentiate. Were it a MAOI, it wouldn't be sold over the counter. It's not overly friendly. For me it elevates blood pressure. Don't take it with antihistamines as it might induce vomiting and extreme dryness of the nasal passages. I did this accidentally, thinking it was "OK." I turn scarlet when I use Yohimbe, and my blood pressure is fairly low. It induces inhibition loss and impulsiveness in me. -- *RW, DE*

[Your description of Yohimbe's potentiation of antihistamine suggests that it may indeed be a MAOI -- being sold over the counter doesn't disprove this. -- *Ed.*]

### YOHIMBE II

Yohimbine, the active ingredient in yohimbe bark is not a MAOI, it is an alpha blocker. This is why it's prescribed for impotence. An alpha blocker causes venous retention of blood. -- *RN, WY*

### NITROGEN MUSTARD AND HBW

My previous correspondence indicated that a powerful new entheogen was likely to be produced by combining LSA with nitrogen mustards and it appears to be so. If the report about the new entheogen is confirmed, we will have accomplished something truly amazing. In contrast to the discovery of LSD, which was purely accidental, we followed a consciously planned path of discovery. Our goal was to develop a substance that would be absorbed through the skin and not produce any negative side effects. From the point of view of "advanced consciousness" it is of great importance that this new entheogen was predicted: we didn't just stumble on it. If this opens the door into a shared mass experience, it will be very interesting.

It would be a good idea to launch a task force to determine the best way of preparing NLSA. Let me emphasize that great caution should be used until the optimum method of preparation is determined. There are several variables that should be investigated. For example, using DMSO instead of water to mix the LSA and mustard powder, or adding DMSO to the aqueous mixture may be much more effective. It may be neces-

sary to let the mixture react for several hours or even overnight to allow enough time to complete the conversion. Alternatively, nuking in a microwave oven may be the best way to go. Also the ratio of mustard to LSA may be crucial. Based on my understanding of the molecules, it is likely that the new entheogen will be as potent as LSD, or even more so. If a single HBW or MG seed contains as little as 1 mg LSA and we get even 50% conversion once we figure out how to maximize the yield, the dose of the new entheogen will be 500 mcgm, which would be a huge trip.

Regarding the name. Although it would be flattering to call it Solarin or Solarine, I think a better name would be "Nitroplasm" -- this has a mystical, sci-fi sound that commands respect, which is the correct attitude toward entheogens. -- *Solaris*

### PSYCHOACTIVE BATHWATER

I had an experience in Peru which has intrigued me about the potential of topically applied entheogens. While at Sachamama, an ethnobotanical garden that Kat Harrison helped establish, I was given an extraordinary bath in preparation for an ayahuasca session. This was prepared by Francisco Montes, the director of Sachamama. The bath was a tub of water containing leaves and flower oils. We were instructed to pour the liquid over us while facing the setting sun, then scrub ourselves with the remaining plant residue. After that, we were told to sit for an hour before getting dressed and returning for further purification for the ayahuasca session. Well, after the hour had passed, we were both flying. On the walk back from the stream where we took our bath, we both experienced altered spatial perception, vividness of detail, and individual plants alongside the path seeming to call out to us for study. I felt light, euphoric, and completely looking forward to the ayahuasca ceremony (which on previous occasions had been interesting, but hard work and somewhat "dark" for me).

I have made an oil in which I steeped very strong cannabis and some Kava. Both have fat-soluble active principles. To this I added a little DMSO. Great muscle relaxer, gentle, but real high. Takes about 10-15 minutes to come on. I'm not sure why the time delay, since I believe DMSO is supposed to carry things into the bloodstream faster than that.

-- *Anonymous, NJ*

### DMSO SOURCE

DMSO (Dimethyl Sulfoxide) is available from the Omaha Vaccine Co. A gallon costs less than \$15.00. Call 1-800-367-4444 and ask for their catalog. Or write them at: Omaha Vaccine Co, PO Box 7228, Omaha, NE 68107. So far I have only used DMSO with THC (hash oil), with no effects. Experiments with extracted psilocybin are forthcoming. Something readers should keep in mind is the size of the molecule that you are trying to pass through the skin and its relative reactivity (how much does it take via other methods to produce effects). The THC for example, was tried simply because it was available -- it wasn't expected to work. LSD on the other hand is also a large molecule, yet is highly psychoactive in small quantities and able to be absorbed through the skin on its own. -- DJ, WV

[Those readers who might regard the concept of psychedelic ointments as farfetched should remember that the psychoactivity of LSD was discovered by Hoffmann in 1943 when he accidentally absorbed some through his skin. -- Ed.]

### INACTIVE HBW OINTMENT

I ground 2 and 3 seeds on separate days -- 2 and 3 seeds alone would have produced some noticeable effects in me if ingested. I mixed the powder with 90% DMSO and 10% water. I didn't try the pepper nitrogen, fearing the burn I might have received. Until I receive better data from others, I've lost my enthusiasm for ointments. -- TA, CO

### "LESS IS MORE" Mescaline OINTMENT

The article on flying ointments with DMSO was very intriguing. The quote mentioning "the ability of DMSO to take catecholamines (dopamine, norepinephrine and epinephrine) across the blood-brain barriers" raises an intriguing possibility. The chemical structure of mescaline is very close to dopamine -- in fact, dopamine has been listed as a possible step in the biosynthesis of mescaline in both peyote and San Pedro. Since only about 2% of the mescaline ingested orally actually makes it to the brain (about 10mg of a large 500mg dose), then totally bypassing the digestive tract (with a side benefit of no nausea) with a DMSO oint-

ment of, say, 15mg might just do the trick. If we can find a relatively simple, relatively economical, proven (meaning it has been tested), method of extracting near pure mescaline from San Pedro, then that rule of thumb of 1 foot of cactus per dose could become twenty to thirty doses! Ain't science grand? No nausea, better use of cactus. Let's find that extraction formula! -- Inner Frontiersman, KS

### PERPLEXED EXTRACTION QUESTIONS

Are acidified water extracts of tryptamine-containing plants unsuitable for smoking due to a concentration of acid? Can the acidity be neutralized during the evaporation step by adding a little table salt, baking soda, or other base? [Acid is not as much a problem here as too low a concentration of tryptamines from a water extraction alone. Smoking requires more essence than a drinkable potion does.--Ed.] When making an aqueous acid extraction, should one heat to a light boil? [Simmer overnight in a slow-cooker: just below boiling. -- Ed.] Hofmann and Schultes in *The Botany and Chemistry of Hallucinogens* mention that the Indian's method of heating Virola bark sap causes a protection of alkaloids by deactivation of enzymes. Is enzymatic destruction relevant only in fresh, not dried material? [I don't know. -- Ed.]

Traditional extraction methods emphasize continuous boiling of plants, sometimes for days. Doesn't boiling degrade the quality of the extracted entheogens? [Probably to some extent. -- Ed.] Doesn't long-term simmering produce oxides? Although Indians use chopped material, North American urbanites use blenders to powder the material, allowing for extraction of carbohydrates and oils, though the traditional methods probably don't produce much of these. Dennis McKenna and others report extracting with solvent directly, then defatting, followed by a second solvent extraction. Could the combined extracts be evaporated to dryness and smoked? [Yes. -- Ed.]

The emulsions sure do occur. Do these contain significant amounts of active ingredients? [I doubt it. -- Ed.] Gravity filtration (no squeezing) is very slow, but the solvent eventually passes through.

Johnny Appleseed says that DMT is not very stable in solution: is that water or solvent? The free oxygen in water will no doubt cause an inactive DMT-oxide to be

formed. The question is whether solvents allow oxidation. [*Since solvents work, I must assume that they don't.* -- Ed.]

I attempted an extraction of *Psychotria viridis* leaves using isopropyl alcohol (99%) as follows: The dried powdered leaves were soaked for 30 minutes, kneaded and stirred every 10 minutes, then filtered. This was done twice; the extracts were combined and evaporated in an oven at 120-150 degrees F. This produced a thin layer of tar. I put this "tar" in a flask, and using a two-hole stopper with appropriate tubing, heated the tar until the flask was filled with white smoke. Toking this smoke was like inhaling flames or red pepper extract! Did I have residual isopropyl alcohol in the tar? Should I have dried the tar until it was solid? Did I extract something else, such as tannins, which caused the burning sensation? [*I don't know, but isopropyl alcohol doesn't sound like an efficient solvent for DMT -- most people use methylene chloride, methanol or ethanol.* -- Ed.]

It would be nice to see the "knowledgeable ones" take vinegar, ammonia (no detergent) or lye, methanol, ethanol and/or Ronsonal lighter fluid [naphtha] and apply them in a manner which would result in a smokable DMT product. I am beginning to think that the "T" in DMT stands for Tantalize: temptingly near, yet unobtainably distant. [*It would be nice to know how to extract the active principles from plants using easily obtained solvents. Methylene chloride is the only one I've used that really works, but it's not always easy to find. Illegal in California.* -- Ed.]

It's too bad that a suitable MAOI hasn't been found which does not have the tranquilizing/sedative properties of harmaline. Perhaps there's something right there on the spice rack: who knows? -- "J" of OR

[*ER* receives a great deal of mail concerning extraction problems. All I know about alkaloid extraction I learned from Johnny Appleseed, who himself is not a chemist, but who does have the gnosis. The theory is simple, and has been outlined some detail in past issues of *ER* as well as in *Psychedelic Shamanism*. For smokable tryptamines from plant material the sequence is: First be certain your biomass is psychoactive -- if not, you're obviously wasting your time. (*Psychotria viridis* in the above example is a known DMT-containing species, so there's no problem on

that score.) Next: simmer in aqueous acid 3X (three times with filtration); defat with solvent; basify to pH 9; extract with solvent 3X; combine and evaporate; scrape up tar and redissolve in ethanol plus small amount of inert smoking material (such as mint leaf), re-evaporate and smoke in a small pipe. Easier read about than done, perhaps -- I'm lucky because I had an expert guide me through the whole process. For curiosity's sake, how many *ER* readers would be willing to attend a weekend seminar on plant extraction? Species used would be unscheduled; technique would be universal. -- Ed.]

### JOHNNY APPLESEED ON *PSILOCYBE CYANESCENS*

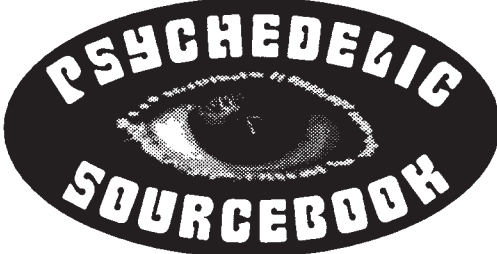

*P. cyanescens* is indeed the best variety of mushroom for home cultivation, as reported in the Fall '95 *ER*. They are up to seven times as potent as *P. cubensis*, and can be grown outdoors in all temperate climates with no need for sterile techniques.

They grow on fresh cut chips of Alder, Maple and Fir. I have used fresh Alder (*Alnus spp.*) brush chipped in the Spring. I mix jars of spawn into garbage bags of fresh wood chips and lay one-foot deep beds of the inoculated chips under bushes where they will receive permanent shade. They need to be reasonably damp during the year, and covering the chip piles with several inches of leaves insures this.

It takes two years to produce a harvest in my northern climate (near Canadian border). After the first year, the wood chips will be completely white with the enveloping mycelium. At the end of the second growing season, late in the Autumn (November), they will fruit. Many times I have harvested my main crop in the first snows -- they seem to like cold temperatures to fruit. Each bed will give only one good fruiting season.

Therefore, one needs to start new beds every year. Take a shovelful of the white chips from the one-year-old beds to inoculate fresh wood chips. This is a very low-tech and safe way to grow powerful mushrooms almost anywhere. -- Johnny Appleseed

*Psilocybe cyanescens* sporeprints. Perennial: fruits outdoors in cold weather. More potent than *P. cubensis*. Small sample, \$5.00, Medium print, \$10.00, Large print + small one, \$20.00. Teonanactl (postlagernd), Postamt 1092 Wien, A-1092 Vienna, Austria

## Sacred Mushrooms and the Law

**JUST RELEASED - SUMMER 1995**

**WRITTEN FOR SHAMANIC USERS OF TEONANÁCATL**

- ♦ All the federal and state laws concerning *Psilocybe* mushrooms and their chemical constituents are discussed and explained.
- ♦ Easy to read charts and tables display potential punishment under the federal sentencing guidelines.
- ♦ An up-to-date and complete state-by-state chart displaying the various state punishments for possessing and cultivating mushrooms.
- ♦ The legality/illegality of *Psilocybe* spore prints, mycelium, and culture, and the California laws concerning same.
- ♦ The legal status of *Amanita muscaria*.
- ♦ The religious defense to criminal charges.
- ♦ The mushroom versus substance debate: Is nature illegal for naturally producing controlled substances?

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F95 means that the Fall, 1995 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

— *Jim DeKorne*

# A NEW LOOK AT THE PEYOTE CRISIS

---

---

**For years** many people have been under the impression that Peyote is extinct in Texas. They blame overharvesting by hippies and mescaline extractors. Some have blamed Native American peyotists for the "extinction." While overharvesting has had some impact on peyote's scarcity, especially on roadside populations, it pales in comparison to the loss of habitat due to land conversion.

**Peyote's** native habitat, at least here in the Rio Grande valley of Texas, is fast being replaced by open fields, orchards and pastures. Agriculture and cattle production increasingly relies on root plowing to remove dense, thorny scrub. All other plant life, including peyote, is being eliminated as well. This, coupled with the fencing of private hunting land, has caused even authorized peyote collectors to harvest smaller plants and remove greater percentages of the available population.

**I have not** collected peyote for several years because of the habitat crisis here in the U.S. It still grows under nearly every bush in virgin scrub-thorn areas, but such land is rapidly vanishing. It now exists mainly in isolated strips between game-lease properties, agricultural land or cattle pasturage. Peyote does not seem to come back once the land has been cleared. Land owners can't be expected to voluntarily restrict their development, and accepting that development is unlikely to ever be regulated on private property, I would like to offer some suggestions that might appeal to all sides and still offer some promise for peyote's survival.

**1. Wherever** virgin scrub still exists, leave a 10 percent border on cleared land as both wildlife habitat and natural fencing. Not only peyotists but ranchers and hunters would benefit. It would also help to first clear areas reclaimed by scrub before clearing virgin

land. Presence of peyote is an excellent indicator of whether or not land has been previously root-plowed.

**2. Declare** a voluntary temporary moratorium on domestic harvesting to allow peyote to re-grow. It is a selfless gift to future generations. If Mexican plants were to be used during this period, authorized collectors must be taught more

responsible collecting techniques. Take a close look at the buttons harvested by *authorized collectors* in Edward F. Anderson's excellent article in the 1995 *Cactus and Succulent Journal* (#67: pp 67-73). Most of these plants should never have been touched due to their young age and small size. No plant under 3 inches should ever be harvested. They are functional around two inches but it is wasteful to pick them so young as many more plants must be consumed. It would take only a few years for them to grow another inch. Many were also obviously harvested with no respect: killing the entire plant. The difficulty involved in collecting from the midst of thorny brush and cacti is no excuse for such practices. A four inch plant could be a dozen years old or 50 years old. Only rarely do you find them greater in diameter. I have seen the odd single individual up to 8 inches, but not since the early 1980s. I could never bring myself to harvest or eat one of these ancient beings: we should leave these sacred Grandfathers in the earth that nurtured them for however many *decades* they have

been alive.

**3. Wherever possible,** purchase land to be set aside as peyote reserves. Establishing cultivated populations that could be allowed to revert to wild would not be difficult. The main problem would be to convince people that their descendents have as much right to the plants as they do.

**4. Peyotists** should be encouraged and enabled to grow both peyote and substitute plants. *Trichocereus peruvianus* and *Trichocereus pachanoi* are obvious choices due to their ready availability, rapid growth and long history of sacred use.

**5. We need** more study of South American "peyotes." Many, described as low and globular, are known to indigenous healers, but are seldom spoken of to scientists or others they feel might profane them. A dialogue between devotees from both continents should be encouraged. Anyone who truly respects this plant will find other sources for their experience. To continue to eat it until it is gone respects neither the plant nor the teachings it provides: it is more than an economic issue and more is at stake than the expression of religious preferences. The notion that Native people have the right to consume it until it is gone, causes me to wonder if those who wantonly killed Indian peoples in ignorance and hatred in the last century haven't been reborn as some of today's Native people.

**Anderson** is the first person I've seen in print who recognizes that the main reason for peyote's decline is loss of habitat and not over-harvesting. Those of us familiar with the Valley have recognized this and been distressed for some time. But, since the habitat is now seriously compromised, overharvesting and careless harvesting have become very real threats. The suggestion that Mexican reservoirs of peyote be used only prolongs the inevitable, unless reality is faced and responsible conservation practices are applied. Can we really afford to tell our grandchildren: "There used to be a plant, called peyote, which was a wise teacher and powerful healer..." If we can, have we really learned anything from it? — CC, TX

**Harvesting Peyote:** If green is left all the way around the edge of the plant and the woolly tuft hiding the *apical meristem* is left intact (the removed section resembles a donut), the plant will recover to its original size and strength within two years. I have re-harvested some 3 and 4 inch individuals two or three times *each*. The plants do not always form clumps when cut in this manner, but they always survive unless they are re-cut the following year. If whole populations were harvested this way and each population visited every few years, there would be a perpetual supply of new plants. This method of harvest was taught to me by the peyote itself.

Sometimes peyote is cut at an angle, leaving just a tiny green scrap on one edge. The survivors tend to form clumps, but each button in the clump will grow more slowly and there is a high mortality rate among plants cut this way. (Nearly 100% mortality if rains soon follow such harvests.) When nothing green is left, no plants survive.

To harvest peyote and not replace it is cheating the future. I have never harvested unless it has called and told me where to go, and how much to collect. I no longer go because I feel it is irresponsible to harvest a plant faced with extinction. If it now told me to come, I would respectfully decline. That peyote eaters can bemoan its vanishing status and continue to eat it, sometimes dozens of plants at a go, doesn't say much about their true level of respect for this sacred teacher.

**Cultivation for Replanting:** Peyote is easy to grow, if done under the conditions it prefers. It likes gypsum and dolomite in order to flower in cultivation. It doesn't thrive in full sun but loves filtered sunlight in small bands, as under a scrub bush. Alkaloid production is favored by slow-release nitrogen sources, such as blood and blood meal. Ours set seed readily and new babies form nearly every year. We maintain these to eventually reintroduce into the wild, not to eat. Rooted pups (no less than 2" to ensure survival) should be hardened off for replanting in the wild. They must be planted Hopi style: each individual plant placed in a microniche that will continue to support and nurture it. Is it such a sacrifice to give something back so that this teacher may continue to live? — CC, TX

# ON CHOOSING A HEALER

---

In February I visited Iquitos and Explorama's camps some hours down the Amazon. There I spent several days with Antonio Montero P., an ayahuasquero who has worked closely with Jim Duke, a USDA botanist heavily involved in tropical ethnobotany. During our stay don Antonio was our source of information on uses of local plants: as medicines, dyes, food and drinking water, as well as ayahuasca.

I observed the preparation of ayahuasca, complete with local names and Latin binomials. Don Antonio shared with us his medicinal skills and clinical eye. He worked hard to make his information available to us, and for those who requested it, he healed. He referred to the "ayahuasca tourism" occurring in Iquitos and related how people with little or no training, who might not know the components, their proportions or how to deal with the experience were offering "ayahuasca" to visitors. In some cases they put something in the brew to knock the people out and then robbed them. In others they did give them a trip. He said these pseudo--shamans embarrassed him and often made him consider giving up ayahuasca.

This was contrasted with the rejection he experiences from many of the younger locals. They have no time for this *flautero* (bullshit artist), this self-proclaimed witch doctor, this relic; and they let him know it with covert digs and sidelong comments.

So what did this ayahuasquero feel like to me? He felt like a healer. He listened; he made healing herbal concoctions and bathed our heads. He "layed on hands" and blew native tobacco smoke on us. This latter was one of the shamanic procedures which I had always felt was total bullshit when I'd read about it or when I saw it done to others in Sibundoy, Columbia, in the early '70s. Now the smoke hit me: relaxing, cleansing, sweeping into me somehow, and driving the darkness away.

So when you choose an ayahuasquero, pick him the way you would pick your family physician. Ask people you trust. Ask your guts, use your intuition. And above all, don't be in a hurry. I asked don Antonio whether he in fact saw the spirits of the jungle animals when

on ayahuasca. He smiled and said:

"One of my first times the Anaconda came. He wrapped himself around me and his head rose above my face. He looked me in the eye and started as if to crawl down my throat."

"What did you do?" I asked.

"Oh, I let him crawl inside me," he replied. "That's what it's all about. You must let him in."

Think about it: do you want some inexperienced Gringo- pleasing hustler as your guide when something like *that happens?*

Don Antonio is a very special man, from whom I perceived good intentions, concern and real tenderness. Our short acquaintance made me feel that I would trust him to take me anywhere. To use an old term, he felt *righteous* to me. I honestly don't know whether he is representative of other *real* ayahuasqueros.

Also remember: I speak Spanish fluently. I've lived in Latin America off and on for more than 25 years. It's easier for me to spot a scam. Perhaps English-speakers might do better to stay on our home ground, work with the ayahuasca analogues and deal with people and spirits closer to home. From there we might be able to use the medicine to visit don Antonio without the bother of buying a plane ticket-- and with no language problem. -- *ClaytonStreet, South America*

## SEEKING A TEACHER

I've been reading and studying shamanism for the past year along with trying to understand the psychedelic experience. One can only go so far with these tools -- to learn one must be taught. A teacher at this point is of great importance in the development of understanding. There are many organizations that offer shamanic training, expeditions and so forth. They are expensive. Could you supply some insight into these organizations and possibly recommend one to invest one's energies into? -- *Herb*

[Magazines like *Shaman's Drum* reap a sizable income plugging a small but apparently thriving "shaman industry." In this era of spiritual materialism it is difficult to separate the useful from the bogus without some first-hand feedback, so readers are

invited to respond to this question. My only experience in this area consisted of two Harner Method workshops, which were well worth the reasonable fees charged. It was good Basic Training -- beyond that, most people find that their most profound teachings come from within. -- *Ed.*]

### *RITUALS AROUND THE MEDICINE WHEEL*

I use the Harner method of shamanic journeying in my rituals around my medicine wheel while on mushrooms. I never do mushrooms without a special reason: to converse with my spirit guide for answers to questions about myself or my experiments in spirit journeying. The Harner method enters nonordinary reality through an imagined tunnel or cave in the earth. On the other side you will see many things (different for each person) -- animals and other entities. You can find a spirit guide there who will teach you many things. Harner's tape: "Shamanic Journey Solo and Double Drumming" helps you enter this shamanic state of consciousness, and with the mushrooms you really go there. I have never had a bad trip when I use these rituals. My "cave" is the root of a century-old oak tree at the SE corner of my medicine wheel. Within 5-10 minutes into the drumming tape and I'm in my cave where my spirit guide awaits me. Other tapes I find useful are: "Medicine Flutes" by Mesa Music Consort; "Spirits of the Ancestors," by Gary Richard and Richard Hooper; "Sounds of Indian America, Plains and Southwest" -- all of these can be ordered from: The Pyramid Collection, PO Box 333 Altid Park, Chelmsford, MA 01824-0933.

-- *Mycelium Mike, TX*

### *LEARNING TO SEE*

Power plants...are only an aid, the real-thing is when the body realizes that it can "see" -- then the power plants are no longer needed." -- *DJ*

### *BANISHING BUMMERS*

Thanks to the reader who suggested the usefulness of casting a circle in the Wiccan tradition. During a recent session, when I began to feel nervous and doubtful, I utilized the circle (mentioned in Summer '95

*ER*). It helped me focus on the power of love, joy and truth. I also found much comfort in the Psalms, which also feature the concept of banishment of evil by the force of good. The efficacy of such prayers at inducing positive psychedelic experiences emphasizes the monumental role that our own psychological orientations play in our perceptions of things. This is a component of the psychedelic experience which has nothing to do with the catalyst, yet is of such significance as to warrant further exploration in *ER*. -- *Owl, NC*

### *CASTING CIRCLES*

It's not the words of a spell that protect you, it's the manipulation of energy by your act of will. Practice improves one's ability. -- *Hatter*

### *DATURA POISONERS*

*Burundanga is a kind of Columbian voodoo powder obtained from a common local plant of the nightshade family, a shrub called borrachera, or "drunken binge." Used for hundreds of years by Native Americans in religious ceremonies, the powder when ingested causes victims to lose their will and memory, sometimes for days... In Columbia, the drug's most avid fans are street criminals. Crooks mix the powder with sedatives and feed the Burundanga cocktail to unsuspecting victims who they then proceed to rob -- or worse. Doctors here estimate that Columbian hustlers slip the odorless, colorless and soluble Burundanga (pronounced boor-oon-DAN-ga) in food or drink to about 500 unwitting victims in the city each month. About half of the city's total emergency-room admissions for poison are Burundanga victims... In one common scenario, a person will be offered a soda or drink laced with the substance. The next thing the person remembers is waking up miles away, extremely groggy and with no memory of what happened. People soon discover that they have handed over jewelry, money, car keys, and sometimes have even made multiple bank withdrawals for the benefit of their assailants... Curiously, just next door in Ecuador, where the plant is grown commercially for medical purposes, its criminal use is unknown. Instead, the plant is the subject of poetry and myth. If one sleeps under the plant in Ecuador, he will be able to tell the future, the legends say.-- *The Wall Street Journal*, July 3, 1995*

# EXTRACTION NOTES

---

---

## EXTRACTION FROM ACACIA MAIDENII BARK

*Excerpted (and slightly edited) from computer network  
ref: ft.u.washington.edu:/public/alt.drugs/  
chemistry-extracting. 8/31/92*

*From: Anon.*

*Extracting DMT from Acacia maidenii*

I discovered that a local plant, *Acacia maidenii*, was reported to contain 0.6% alkaloids in the bark, of which one-third was N-methyl tryptamine, and two-thirds was Dimethyl Tryptamine (DMT)... I took about half a kilo of vertical strips from a number of trees, trying to cause as little as possible permanent damage. The bark was thick, red, fibrous and resinous. Smoking the bark directly gave a mild hallucinogenic effect, on the limits of detectability.

That evening, I shredded the bark by hand. This was difficult and incomplete; mechanical milling would be far preferable. I placed the shreds in about 3.5 litres of analytical grade methanol from Monday night to Friday afternoon. The methanol quickly took up colour from the bark and turned a deep red colour. As much as possible of the methanol was removed by filtering. I evaporated off the methanol using a fractionating column, a condensor, and a saucepan of boiling water as heating, for several hours, and recovered much of the methanol. I placed this methanol back with the bark and reextracted for some hours while evaporating the rest, then filtered the bark again and combined the extracts, and stripped as much as possible of the methanol, to leave a thick resinous brown liquid. A portion of the extract was evaporated using a hair-dryer to give a thick brown resin. Attempts at smoking this using pipe and hot knife proved unpleasant and gave minimal effect.

It was decided to perform further extraction. To the extract was added dilute hydrochloric acid (about 20ml 10M, but well diluted). Immediately, a large amount

of tar congealed and was removed, leaving a watery brown aqueous mixture. This was basified with NaOH, although on reflection, I would use NH<sub>3</sub> next time as it is less likely to overbasify and react with any of the compounds present. White precipitations were seen on basification, which redissolved on stirring. The aqueous phase was extracted twice into CH<sub>2</sub>Cl<sub>2</sub>, and the solvent evaporated as before. The last stage of evaporation was accomplished with a hair dryer, to leave about a gram or so of pale yellow liquid. On standing 24 hours, this liquid crystallized as circular arrangements of needles.

Preliminary attempts at smoking small amounts of the alkaloids gave varying mild effects, and a friend and I decided to try a larger dose. He took a cone in one toke, and was immediately on the ground, making strange sounds and looking odd. He hugged me and told me to meet him in that place, and said it was very strong. I managed to finish a large cone in 3 tokes, and was instantly blown apart as if by a large brick through the head. I think I was temporarily blinded, and found myself on the ground grasping my friend, and coughing for air, as I watched all of my surroundings fragment into small pieces divided by lightning bolts, and feeling all the air in the universe escape through the holes. We were both totally astounded and scared shitless. Two minutes later, the intense part was over. We staggered out into the open, and walked in the park until we calmed down. Pleasant mild hallucinations continued for about half an hour, and there were no after-effects whatsoever. The experience was extremely intense, and the smoke has an unpleasant taste. Several other people have tried it since, and the most popular adjective is "wicked." Effects have ranged from mild to intense, and some people say that while it could not be described as "good" or "enjoyable," they would be happy to try it again. My subsequent trips were more bearable, as I was not under any anxiety about the duration or outcome of the trip. Nevertheless, the trip is still extremely intense, and also physically demanding: giving strong tactile

hallucinations and stimulation.

On a second occasion, I took 1.7 kg of bark, and pulverized it as best I could, using a circular saw. The result was mostly a fibrous powder. Some pieces had to be shredded by hand. Methanol extraction was performed as before. Since the amount was larger on this occasion, the quantities were somewhat unwieldy.

Stripping the five litres of solvent took approximately 14 hours. On attempting to acidify, filter and basify, considerable difficulty was experienced, the acidified residue seemed unfilterable, and when basified with NH<sub>3</sub>, a thick pink gel was formed which was impossible to extract. By a painful process of trial and error, I found that at a very low pH, most of the resins became dissolved or suspended. At slightly low pH, the residue separated nicely into a tar and an aqueous phase.

At slightly high pH, the mixture became a thick gelatinous solid. At very high pH, this solid redissolved. The result of this seems to be that much of the tar can be separated by successive extraction at moderately low pH (dilute HCl), and then that the addition of strong hydroxide will leave the amphoteric resins in solution, but make the alkaloids insoluble. These are then extracted into dichloromethane as before, and the organic layer is back extracted with salty NaOH solution to remove the impurities. The dichloromethane is then stripped as before, to leave the alkaloids which crystallize in 24 hours or more.

A friend and I experimented with repeat doses of DMT at close intervals. A base pipe was used for smoking the alkaloids. This pipe allows minimum combustion and maximum vaporization, and thus is the most economical way to smoke DMT. Because there is little combustion, the smoke does not taste quite as bad, and also the base pipe allows more accurate metering of the dose. After the initial physical rush, it was found that taking small tokes at intervals of a few minutes was sufficient to maintain an extremely pleasant trip, not unlike that of psilocin. There was minimum physical discomfort associated with the cruise. However, in this mild state, I took two large tokes of the substance, and a few seconds later, without warning, I was blown apart. I was walking, but staggered and choked, gasping for air. The effects were totally overwhelming, like being thrown out of the universe, and I watched my visual sphere being

pixelated at successively lower resolutions, until I could see merely individual elements of colour. The intensity was such as to make it very unpleasant.

A few more experiences should be related. It seems that the response of various people to this extract varies greatly, and even a single individual can have a variety of responses, from no effect to total dissociation. One girl tried a single toke for the first time, and was completely thrown out of the universe (from her description). She was begging for it to end; the duration was longer than usual: about 15 minutes of heavy peak, and at the end of it she vomited while gasping for air when beginning to return to some normality and bodily control...

I am planning to side-step the methanol extraction, simply by attempting to extract directly into hydrochloric acid. Freezing and thawing the bark might serve to burst the vesicles containing the alkaloids... My references tell me that N-methyl tryptamine is most likely inactive at these doses. Does anyone have any information regarding the physical and psychological effects of this compound?...

### MESCALINE EXTRACTION

I am looking for a bonafide economical extraction process for mescaline due to the following bombshell: While reading some very technical extraction procedures for isolating mescaline from *Trichocereus*, the compound 2,6 dichlormescaline was mentioned as an accidental creation of chloroform and (mescaline) HCL. The article tells how to synthesize this mistake from pure mescaline HCL and three other easily available chemicals. The punchline is that according to the octal-water psychoactivity scale (a complex formula to predict the psychedelic potential of a substance), that 2,6 dichlormescaline should rank close in potency to DOM, otherwise known as STP. This means that mescaline active in the 250-350 mg range can be converted by some simple alchemy to a substance that is active in the 5-12 mg range. I could find no mention of any human tests with this substance. Even Dr. Shulgin could only send a return note agreeing to its potential, but with no firsthand experience with it. If "tasted," a dose should start well below one-half of

minimum to prevent any nasty surprises. Caution is the best motto of a frontiersman entering a new psychedelic zip code. See Rosetta Folios (SP 1-5) set Cactus Alkaloids XXXVI *Lloydia* Vol 40 No 6 Pg 589.

-- *Inner Frontiersman, KS*

### DESMANTHUS EXTRACTION PROBLEMS

I am having problems in producing a smokable product from *Desmanthus illinoensis* root bark. I wonder if I'm making a mistake during the evaporation step, or if it's in my method of smoking. Is it all right to evaporate with a large (10X12 inch) glass cake pan? Or should I use a narrow-neck flask? When smoking with a pipe with screen, is it OK to touch the residue with flame? -- *Anonymous*

[First (and most important), is the variety of *D. illinoensis* you are using psychoactive? As with common wild varieties of *Phalaris*, many (most?) are not. The size of the evaporation container should make no difference in the final product if it is potent to begin with. The easiest way to smoke tryptamines extracted from plants is to re-dissolve the tarry extract in ethyl alcohol, add a small amount of inert smoking material, such as crushed mint leaf, mix thoroughly, and allow that to evaporate. The extract is now deposited on the leafy material and may be easily ignited for smoking. -- Ed.]

### TURN DOWN THE BASS!

I'm uncomfortable when I read about about *Phalaris* and *Salvia* extractions -- everything extracted, concentrated, denatured, etc. in order to be blasted into another universe. I can appreciate the libertarian view that every person has the right to do what they want, but it seems the underlying assumption is that people are after the shamanic experience. If that's so, then taking the substance in Dow laboratory megadoses may not be the direction to pursue. Screeching insect creatures, tunnels of hurricane light, etc. are OK for exploring and getting loaded, but (as I assume most of us have found),

it isn't usually possible on such doses to effectively do the prime work of the shaman: healing self and others. I think the extraction, isolation and concentration of pure chemicals is another symptom of our Western tendency to impatience. We distrust (or are just ignorant of) our innate connection to the plants and their spirits. It isn't that the plants are "weak" in their natural form, but that our connection to them is weak. If we take the time to develop a connection to those plants we're drawn to, the plant's spirit will open to us and thus in even "low dose" traditional formulations we can be transported to the spirit world. Traditional methods resonate to an already established morphic field and you get the "juice" of all those shamans who went before. Additionally, there are no solvent residues to ingest or dispose of. -- *SM, AZ*

[I couldn't agree with you more, BUT... as you say: *It isn't that the plants are "weak" in their natural form, but that our connection to them is weak.* Contemporary human awareness is now enmeshed with a technology outpacing our ability to control or even understand. We know how to drive cars and access the internet, but how many Post Moderns can repair their own automobiles, let alone a computer? Add to this techno-addiction a rapidly expanding population, dwindling natural resources, pandemic pollution, disintegrating socio-political systems: *then*, from the sum of that, predict a plausible scenario for the future! The plants could teach us, but are we even able to hear what they say? Just as some people who listen to loud Rock Music can no longer hear crickets in the night, we *may* have evolved to the point where only extractions and synthetics will catch our attention. -- Ed.]

In a strange garden at the edge of magic  
the plants speak...

## OPIUM POPPY UPDATE

---

**Things** have changed regarding poppy availability since *Opium for the Masses* (\$14.95 Loompanics Unltd., PO Box 1197, Port Townsend, WA 98368) was published last year. Many places have stopped selling dried poppies -- often because florists have been told by the cops to cease and desist. The rationale seems to run from "just because" to claiming that poppies are illegal. In any event, it is a rare flower-seller these days who doesn't know that the poppies they sell contain opium. Luckily, many florists couldn't care less what customers do with their plants. Accordingly, prices have about doubled in one year. On a single street in New York City I found poppies differing in price by as much as 400 percent.

**Another** change is that many dried poppies now come with holes drilled into their crowns with almost all the seeds removed. Poppy *cultivation* has been illegal since 1947. (This may be what people mean when they say that poppies are illegal.) Poppies are definitely in a grey area, and are treated that way: Clearly, poppies grown in a field for sale as cut or dried ornamentals *are* being cultivated, and ornamental poppies are not illegal. Even so, DEA agents have been known to while away a summer afternoon cruising residential neighborhoods and pulling up poppies from flower gardens. They check first to see if any of the pods have been slit, as *that* is definitely illegal.

**There** is a poppy variety I've only seen in NYC, but they are said to be available in other places as well. Their light brown or tan heads are much larger than the variety found elsewhere: as big as a good-sized lemon! Not surprisingly, they are more potent, too. Three of these equal a good ten of the normal kind. **Nausea** from drinking opium tea is typical. Some people throw up when they take any form of opiate. Nausea and itching are such common reactions to opioid analgesics that they are not considered symptoms of an allergy. Some people just don't like the taste. Usually the nausea passes within an hour, and even faster if one remains quiet until it passes. **To complaints** that the poppy tea didn't "get them off" or do much of anything, I want to reiterate that opium tea, and opium in general, is not especially potent stuff

and its effects can be subtle. Neither are the feelings elicited by opium strange or new to a person, since these are feelings normally produced by endorphins. To get a serious nod (a la heroin or morphine), you've got to drink a couple of quarts or more.

**It is** not normally, by itself, an entheogen like other concoctions covered in *ER*. But people tell me that it can potentiate entheogen effects. Mostly, opium is good for relieving pain and lifting mood. It tends to sedate anxious people and invigorate sluggish people. It can also evoke waking dreams or vivid dream-like states in which the mind seems liberated from fatigue and worry, and new thoughts and ideas can come fast and furious -- keep a notebook handy!

**Even** if it won't take you to another planet, I have seen poppy tea make dramatic changes in an AIDS patient who was quickly released from his everyday pain and weakness. It enables him to be far more active than otherwise, yet doesn't debilitate him later on. Poppy tea is used by many people with AIDS and other serious conditions. Given the theory that opiates can strengthen the immune system, it seems like a rational therapy.

**As to** coatings on poppies, I don't think any of them are poisonous. The worst is shellac, since there's no good way to remove it without screwing up the opium content and making the tea taste like lighter fluid. Sometimes poppy heads are lightly colored, but this seems to be food coloring and doesn't alter taste or effect. The authorities may go the poison route, but that would be foolish, what with little kids, liability suits, etc. Rinse the poppy with warm water if this is a concern. A white "dust" on the poppy heads is natural; a black fungus-like stuff inside the head doesn't seem to be dangerous, but it tastes horrible!

**I'm currently** gathering data for another edition of *Opium for the Masses* which will contain more information about the poppy plant, opium, endorphins, receptors, etc. I'm asking anyone who has information or questions about opium or opium poppies to write to me care of Loompanics. I'd love to hear from you. --  
*Jim Hogshire*

# NETWORK FEEDBACK

## IS OPIUM ENTHEOGENIC?

I am sorely upset with the inclusion of opiates in the latest *ER*. I am a recovering heroin junkie, and the use of opiates on a recreational level should never be presented or believed to be a good thing. The theory of entheogens does not include dangerous, created euphoria, as it does not awaken anything god-like within you. Twice it was mentioned, and I am angered by this. You have mentioned many times your feelings on drug addiction and dealers. This offends me gravely. I use mushrooms and concentrate: "I am not a junkie. I create my tomorrow. I can obtain the strength." -- **Brother Bob**

[I honor your position in this matter, and would not presume to persuade you otherwise: drugs are not to be trifled with on any level. My approach is shamanic: any substance may be a useful tool if used with gnosis. Although I do not advocate the abuse of opiates, I must also affirm that it is possible to have useful and interesting experiences with them, especially inner-voice phenomena. (It should also be remembered that heroin is to opium as *Everclear* is to *Budweiser*.) Opium has a long history of use by creative artists: Coleridge being a famous example. Unfortunately, the "artistic" use of opium is not necessarily shamanic: Coleridge was also an addict. That does not negate the fact that others have used this and similar substances without becoming addicted. I recommend Dale Pendell's book *Pharmako/Poeia* (reviewed in Fall '95 *ER*) for some no-bullshit insights into the mind-set required for the shamanic use of any substance. I hope there's room for respect for both your position and Pendell's in the pages of *ER*. -- **Ed.**]

## BRUGMANSIA BAN

*The city council (of Maitland, Florida) banned the*

*cultivation of **Brugmansia x candida** (Angel's trumpets) after a massive increase in the number of teenagers taken to hospital after trying to get a high from tea brewed from its leaves. American teenagers have dabbled with drugs made from angel's trumpets for decades. The plant contains the powerful hallucinogenic chemicals atropine, scopolamine and hyoscyamine. Infusions made from the leaves and flowers can produce exciting -- or terrifying -- visions. But too much can cause severe poisoning, sometimes with paralysis and memory loss...Officials were spurred into action by a flood of teenagers being admitted to hospitals in central Florida after experimenting with the*

*plant. In 1994, 112 were admitted suffering its side effects. The year before there were only eight cases...The US Center for Disease Control in Atlanta...says at least two youths died from its effects last year. Maitland's new law prohibits only new plantings of angel's trumpets. Gardeners do not have to uproot the plants they already have... -- **New Scientist**, 4 February 1995*

## ALLERGIC REACTIONS I

I've felt that *Arundo donax* is a red herring for some. Almost all written material discussing the use of it with *P. harmala* indicates "allergic reaction." *The Dictionary of Sacred and Magical Plants*, by Christian Ratsch says the roots of *A. donax* contain approximately 3% DMT and a percentage of Bufotenine. This might be the source of the nausea. Perhaps the roots could be juiced and dried and smoked. The ancient Vedic scholars knew the difference between hives and enlightenment. I've never used *A. donax*, and after reading the various reports, I will not. I already have allergies and have had a couple of serious breathing problems and don't see the need to hallucinate.

### EDITORIAL NOTICE

You've probably noticed that this issue of *ER* is a little early. This is because I need to take an extended vacation and wanted to mail it out before going abroad. I'll be gone about a month -- due back in early April. If you send letters requiring answers, please be patient -- it might be a while before I can reply.

-- **Jim DeKorne**

nate and have trouble breathing. An unruly patch of *A. donax* can be killed off by using dry ice and ammonia. My own patch was killed in 1994 after ice storms and twenty-below zero temperatures. -- *RS, DE*

### ALLERGIC REACTIONS II

Concerning repeat experiments with substances which create allergic reactions -- it may not be a good idea!

A sensitizing process occurs: even a one-time antigen-antibody stimulation can set you up for a full-blown anaphylactic reaction the next time you take the substance. This can result in cardio-pulmonary arrest: i.e., you can wind up dead! Remember the axiom: "No old, bold shaman." -- *SM, AZ*

### LSA-MUSTARD FLASHBACK

I soaked some *Stipa robusta* seeds for an hour in 30% lime juice along with about an eighth-teaspoon of Chinese mustard. First an extraction of about 170mg of seeds was swallowed; then 1 gram and finally 4 grams. There were no deleterious effects, but I didn't get very high either. I am convinced that Hawaiian baby woodrose (*Argyrea*) seeds contain something different than *Stipa robusta* or morning glory (*Rivea*) seeds. *Argyrea's* effects are longer and feel quite different. A few days after the above experiment I used some Milk Thistle seeds as a liver flush, and received an unexpected result! The thistle purged the LSA--mustard from my liver, causing it to re-enter my system. It was one of the most amazing experiences I've had in a long time, and it happened while I was at work. I felt like I was going crazy, going to die or kill myself. At lunch I lay down and surrendered to it. A line from a song ran through my head: "Just for you I'll go on my knees." I don't love *anyone* that much, not even myself, and it's my greatest failing. I burst into tears: "I give up! I can't fight any more." (Pastel visions gradually turn threatening.) "I don't care if I go crazy or if I die! I don't care anymore!" I stopped fighting it. Energy flooded in, energy I'd held off for years without knowing it. I sat up, saw a fly on a blade of grass: my vision shifted and I could see the fly's field of perception. The way out is in. You have to trust the process. -- *Hatter.*

### WHITE NOISE

Music can be useful when tripping, but static (white

noise) can be also. I take 5 radios and tune them to static and sit in a dark room before the entheogen comes on. Place the radios in the four corners or at the five points of a pentagram. It's different than music because there's absolutely *nothing* for your mind to hold onto. -- *TA, CO*

### HEADPHONES AND AYAHUASCA

I agree with the reader who wrote about using headphones with the *P.harmala/P.cubensis* combination. The auditory effects of the harmala add a new dimension to music. During my last trip I listened to some incredible CDs by David Parsons called *Himalaya* and *Dorje Ling*. These CDs are especially good with this combination, evoking deep energies and transcendental explorations. Backroads Music: 1-800-767-4748. -- *Toad*

### NEGATIVE PHRAGMITES

#### AUSTRALIS REPORT

Just for your info, I tried three times the *Pragmites australis-Peganum harmala* combination with rhizomes from JLF. It was only very weakly psychoactive, and a big disappointment after the glowing report in *ER*.-- *H. Westkey, FL*

[The emerging consensus is that *P. australis* is hardly worth bothering with. The "glowing report" in the Spring '95 *ER* came from a single individual who maintains an extremely strict diet and is probably more sensitive to entheogens than the average user. Bear in mind that individual plants can vary widely in tryptamine content and one person's unique experience is not always repeatable across the board. Because of the mostly negative feedback on this plant, I have learned to be more cautious about emphasizing rave reports concerning otherwise unproven botanicals. -- *Ed.*]

### MDMA AND MUSHROOMS

We combined MDMA with *P. cubensis* for a unique experience. We found it best to take MDMA first, or at the same time as the mushrooms. It was a little rough when taking the mushrooms first, as the two substances seemed to be competing with each other, but once the MDMA reached peak it was all smooth sailing. The MDMA was the dominant signature in the experience (even with 2g of potent *P. cubensis*) with

the mushrooms adding a colorful spatial dimension. Everything was a play of the senses, very sexual without any sex. I hope my fellow ER readers do not overlook MDMA for the sake of their belief system, for it does what nothing else can do, it opens the floodgates of the heart. -- *Toad*

### MUCUNA PRURIENS

Here is an interesting note from *Economic Botany* 49 (1) Jan- March, 1995, Pg 15:

*The seeds of the Mucuna species contain levodopa and N- dimethyltryptamine (DMT) (CSIR 1962; Infante et al. 1990). Levodopa is used in the treatment of Parkinson's disease but can produce a toxic confusional state in humans (Infante et al. 1990). The hallucinogenic properties of DMT are well documented. Mucuna species have been grown as a soil-improving crop, a "smother" crop to control weeds, a forage plant, and as a minor food crop, in a period spanning four centuries. Some species have also been used as an ornamental, an aphrodisiac, an emetic and as a poison (Duke 1981; Watt 1883).*

- CSIR: Council of Scientific and Industrial Research, New Delhi. 1962. *The Wealth of India*: a dictionary of Indian raw materials and industrial products. CSIR, New Delhi.

- Infante, M.E., et al., 1990, Outbreak of acute toxic psychosis attributed to *Mucuna pruriens*. *The Lancet*, Nov. 3, Pg 1129

- Duke, J.A., *Handbook of Legumes of World Economic Importance*, Plenum Press, New York, 1981

Could someone check these sources and give us a summary? One man's toxic psychosis may be another man's illumination!

-- ClaytonStreet, South America

\*\*\*

*Mucuna pruriens* is a hardy prolific vine here in the South. I'd like to hear more reader's experiences with it. -- *WW, FL*

### YUBA GOLD RECIPE

One of your readers asked about "Yhuba Gold" (Summer '95). I'm not sure if this is the same thing, but Richard Miller's *The Magical and Ritual use of Herbs* (Pg 9) includes the following recipe:

#### Yuba Gold

4 parts Damiana leaf

4 parts Skullcap herb  
1/2 part Lobelia herb  
4 parts Passion Flower herb  
1 part Spearmint leaf. -- *JM, CA*

### HEIMIA AND MIRABILIS REPORTS

Both of the following have been taken orally and by retention enema. The enema works better, but the fluid amounts need to be decreased. Both *Mirabilis* and *Heimia* lose potency with heat and I've read that the Zunis use *Mirabilis* baked in bread, so I assume that heat destroys the activity.

*Heimia salicifolia* report: A pint of foliage with water to fill a quart jar, macerated in blender. Set in summer sunlight for three days. Drink: it has a green plant taste. Definite yellow tinge to eyesight. Fifth and sixth chakra stimulation. Acute hearing. Deep echo of voices. Very mellow the next day.

*Mirabilis multiflora* report: Three ounces of root pulverized and soaked in cold water the better part of a day. Filter and drink. Pleasant taste, no side effects. Not hallucinogenic. Heart expanding, dark, silent, tunnel emptiness. -- *SM, AZ*

### COMBINATIONS

Have any experiments been done with combinations of *Amanita muscaria* and *Psilocybe* species, or *A. muscaria* and *P. harmala*? Are *Stipa robusta* seeds safe to ingest, or is there danger from ergotism? -- *DC* [To date, I've not heard of the combinations described. *Stipa robusta* seeds contain a different fungus than the one that causes ergotism and no problems with their ingestion have been reported so far. -- *Ed.*]

### THE FINAL WORD ON DMT

*There have always been close ties between the high-tech and psychedelic drug communities. A vocal cross-over, author Terence McKenna has long championed alien languages, the holographic mind, and DMT, a short-acting but powerful hallucinogen. Well, DMT is now on the streets. Only, it's a major disappointment. After sucking on smoke that tastes like burning plastic, you discover that McKenna's singing elves are a lot like the stars you see when conked on the head. Suddenly, his theories about the future singularity look a little less likely.*

-- *Wired Magazine*

### MINIMUM MAOI DOSAGES

Syrian Rue seeds seem to potentiate psilocybin without any harmful side effects when used at .1 grams per 10 pounds body weight. ("00" gel capsules weigh .1 gram, and when filled with Syrian Rue seeds, weigh .5 grams.) With this combination, effects can be felt with as little as .3 grams of dried psilocybin mushrooms. Diet restrictions have been followed as per established guidelines for as little as five hours after Syrian Rue ingestion. This was a taco pizza and bottle of conditioned beer; there were no hypertension effects afterwards. This may be due to the limited initial amount of harmala ingested. -- *Warriors on the edge of time*

### KYKEON SPECULATIONS

For making the Eleusinian Mystery *Kykeon*, a water extract was made of ground ergot, preferably *Claviceps purpurea*. This species produces in the water-soluble portion, ergonvine. From the literature, little in the way of tranquilizing, sedative compounds are associated with ergonvine. Compounds such as LSA and iso-LSA, which occur in certain morning glory seeds, are present in very small amounts or not at all. An extraction problem might occur if the ergot is too finely ground for the filter. The solid particles contain the non- water-soluble, ergotism-producing compounds. If cloth such as bed-sheet material is used and the ergot kernels are ground to the consistency of flour, a percentage of these fine particles might pass through the filter. One should coarsely grind the material and soak for two to eight hours before filtration. The *Merck Index* says that ergonvine is more water soluble than the other ergot alkaloids. Those that produce ergotism are soluble in alcohol. I suspect that the soaking preparation of the *Kykeon* did not take more than four hours. I don't know the time of year this was usually done: warmer weather would cause fermentation in a shorter time than cool weather. Any comments from ethnobotanists and historians? What would be the effect of simmering the ground ergot? -- *J of OR*

[I have yet to hear of anyone making *Kykeon*, the proper formulation of which seems to be no more than a scholarly hypothesis. Speculations on extraction problems seem premature until someone actually makes some. -- *Ed.*]

### THE PERENNIAL SOMA QUESTION

Gordon Wasson was convinced that the origin of religion was an entheogenic mushroom and that the Soma mentioned in the vedic texts was *Amanita muscaria*. Terence McKenna disagrees: he is convinced that it was a psilocybin mushroom. In both cases, the cosmic trigger is a mushroom. Perhaps an interesting two-part question for *ER* readers is: a. What was the Soma of antiquity, and b. What is the Soma of today? -- *TM, VT*

[I confess to being impatient with this subject: there are several competing theories concerning the origin of religion via entheogens. The *a priori* assumption is that religion couldn't possibly have started without a psychedelic catalyst. The theorist then argues that his (to my knowledge women don't bother with these dialectics) own pet candidate is that catalyst. McKenna makes the telling point that if *A. muscaria* is Soma, how come is it largely ignored today? (An *Amanita* trip is often more of a bummer than a consciousness expander, and seldom provides the kinds of trips described in the vedas.) Alas, he then goes on to claim that an unspecified *Psilocybe* species was Soma -- a brilliantly argued theory, except that to my knowledge no one has yet proven that *Psilocybe* mushrooms grow in the area where Soma was used. In my opinion, the initial postulate is neither provable nor necessary: the religious impulse is endemic to the human psyche and doesn't require psychotropic substances to manifest itself. -- *Ed.*]

### BIG BROTHER'S RULES

Because of the confusion surrounding what is and what is not legal to grow and possess, I called up the DEA and spoke with them at length. I was given to understand that the vagueness of the law gives them "broad powers of discretion." While they could not answer my specific questions, a few basics did emerge from the conversation.

1. The only plants which are illegal to cultivate for any purpose are *Cannabis* and *Psilocybe*.
2. Illegality is based solely on "intent." Apparently this means it's illegal to grow *any* plant if it is to be used for any state of inebriation, or any vaguely defined "unapproved use." This suggests that they can arrest you simply because they don't like the fact you are growing something. The decision to arrest is

completely at the officer's discretion. They stated that anyone could be busted if the officer felt that they "needed to be." This is true even if the officer knows that no formal charges will be filed or the case will be thrown out of court. The effect being that the offending plants are permanently confiscated.

3. It is illegal to get high via any means other than alcohol consumption. The plants are not illegal, but the act of getting high is illegal. Intent to get high is illegal, and possession, cultivation or distribution of plants for the purpose of getting high or any other "unapproved" use is illegal. Drugs don't even have to be involved. (This implies that although prosecution would probably not occur, hyperventilation, if done for mind altering purposes is against the law. Good sex could also be considered illegal under this definition.) On the brighter side, they told me that they would be unlikely to know of or recognize any plants other than poppies, marijuana and mushrooms, and had no interest in pursuing other plants unless they were being actively promoted and distributed as drug plants. They had never even *heard of Datura!* Their final words to me were: "Just be cool, and we won't cause you any problems." -- *Justin Case, TX*

[Your last line is very important: in addition to exposing the total hypocrisy of our drug laws (even the cops are telling us: "just don't get caught"), the fact is that it's generally safe to commit "victimless crimes" if you don't get in someone's face about it. Many totally unnecessary encounters with the law in the sixties occurred simply because the perpetrators insisted on their God-given right to "do it in the road." The disclaimers written in the catalogs of all ethnobotanical suppliers are a recognition that "intent" is the defining factor in determining wrongdoing: "Not sold for internal consumption" is the only thing that enables them to stay in business. If the purchaser goes ahead and consumes it anyway, the "blame" is on him or her. Since the DEA's budget is focused mostly on cocaine, heroin and marijuana enforcement, they would probably consider most of the plants discussed in *ER* as irritating nuisances if brought to their attention. Which is to say: unless you're being a total fool about it, they aren't interested in your *Salvia* or *Phalaris* plants. Local narks are an entirely different story: watch out for Rambo wannabes. -- *Ed.*]

## AYAHUASCA ZOMBIE

I tried the combination of *Peganum harmala* (Syrian rue) and *Phalaris aquatica* (Harding grass, a "special strain" from Of the Jungle) recently on an excursion to the Nevada desert. 300 gm dried *Phalaris* material (stem leaves and inflorescence) was ground in a coffee grinder and placed in a plastic bottle. I did the same with 100 gm *harmala* seeds. To extract the alkaloids I made a tea of the combination of both ground materials and added the juice of 4 limes and water to make 500 ml. This was simmered for about an hour, then filtered through a coffee filter. I poured 250 ml of vodka over this with the intention of improving the extraction, since my last try was fruitless. I drank half of the resulting tea.

Perception of the world began to change in about 20 minutes. My vision seemed not to catch up with my eye movements. This resulted in a blurring and impressionist-like view of reality. I also became apprehensive about losing control of my body. I became more and more sedated, but this was not sleepiness. Eventually I lost much physical control and speech was impossible. I lay in a tent for the next six hours. I was able to get up to drink water and urinate, but it was very difficult. I felt like a zombie -- my body was numb, but my mind wouldn't slow down. My thoughts obsessed on the loss of my autonomic functions, such as breathing and heartbeat and how it would be for my friends to find me dead there in the desert. I had the life-before-my-eyes feeling and was able to see myself from other people's perspectives. This was somewhat like what is described as an out of body or near death experience, but I was quite aware that I was experiencing this in my head while my body lay in a lump on the floor of the tent. There was none of the peace that is described with these experiences. Thoughts went through my head with abandon: I had lost the filtering and organizing ability of ordinary consciousness. It was as if the dream state was functioning while the critical mind watched. Occasionally, these thoughts led to sexual desire without physical arousal. I fell asleep after about six hours. When I awoke the effects had worn off completely. This feeling of regaining my body and consciousness was better than nearly any feeling I've ever had! I wonder if others have had this experience.

Was it the result of set and setting or the inappropriate dosage of materials? I'm especially curious if *P. harmala* was the main culprit here, since the dosage as a MAOI was probably 20 times more than necessary. I'm also curious about the alkaloids present in Harding grass. I'm very apprehensive to try this again, even with careful measurement. Any thoughts about this? -- SR, UT

[If nothing else, the above account describes a very large overdose -- even allowing for the possibility of low tryptamine content in untested plant materials, 300 gm of *Phalaris* and 100 gm of *harmala* is really tempting fate. Pouring vodka over an aqueous acid marc should insure that any nauseating fatty acids left in the marc would drain into the filtrate: instead of extracting more alkaloids, it extracted more of the very stuff you want to eliminate. *P. harmala* in particular contains some nasty oils that are one probable culprit in creating somatic discomfort. *P. aquatica* is known to contain an as yet unidentified "factor X" which kills sheep who eat it in any quantity. Half of the tea (the amount consumed), probably included at least 3 shots of alcohol -- in combination with all the other stuff, a not-insignificant cocktail of mind-altering brew. I understand the frustration of trying "sensible" doses two or three times without effect and the resulting temptation to really overdo it in an effort to get something. Unfortunately, the "something" you usually get is likely to scare you off psychedelics for a long time to come. The following comments are general, and not intended to apply specifically to the above account:

The emerging consensus about these new ayahuasca analog plants is that they are the antithesis of "recreational" drugs and that it is all but impossible to predict how any given individual will respond to them initially. I know of a group session in which A was having a re-birth crisis while B was violently retching, while C was so hungry she had to keep getting up to raid the icebox, while D was quietly contemplating infinity -- all of these responses on identical doses of the same plant extractions! (60 mg *Phalaris arundinacea* plus 125 mg *Peganum harmala*.)

I have come to the belief that this is the way it is supposed to be -- shamanic plants are not for everyone, and the shamanic path is anything but easy for those who walk it. Unfortunately, there's a popular image of

the shaman as a New Age hero: sort of what football players and fighter pilots were to previous generations. From what I can tell, if you stay honest with yourself, you'll always be pushed to the edge of your strength and ability: it never gets easy, because you just keep on growing into higher levels of challenge. Bummers are an essential part of this path because they force us to confront our greatest fears and illusions. We typically start out by imposing our Western notions of reality on a Mystery that responds by giving us exactly what we need to correct our fantasies -- and that's the whole point: "Wake up, post-modern White Boy (or Girl, as the case may be) -- get with the program or go extinct!" Not many of us can handle messages like that: even when our minds agree, our bodies and emotions resist like hell. On the bright side, some psychonauts have worked through their spiritual/somatic crises and can eat ayahuasca or its analogs and seldom get more sick or weirded-out than they can comfortably handle. -- Ed. ]

### PHALARIS BRACHYSTACHYS

An experiment with a *Phalaris brachystachys* variety from Greece was a success. This was my first full-on *Phalaris* ayahuasca experience, and one I will certainly not forget. In fact, it was a solid two hours of meltdown intensity similar to smoking 5-MeO. I estimated my dosage based upon a TLC test that showed a large alkaloid spot with the same position and color reaction as *Psychotria viridis*. I later learned from my experience that TLC testing can be inaccurate when dealing with closely related compounds such as 5-MeO and DMT. After a 24 hour fast I took 150 mg of *Peganum harmala* extract in a concentrate of fresh ginger root tea (ginger root is one of the best herbs for nausea and stomach distress.) After waiting 25 minutes I took 150 mg of *Phalaris* extract with some vitamin C and washed it down with more ginger tea. About an hour later I found myself riding a tidal wave toward infinity. The first stages of this wave were absolutely invigorating, but it soon transformed into a more serious endeavor as I found myself suspended at ground zero. The only thing I could do was breathe... It seemed like a definite blend of the tryptamines, with the power of the 5-MeO being the dominant force. The familiar 5-MeO blast was splashed with the brilliant colors of DMT. Finally as

the 5-MeO tapered down (a welcome relief) colorful visual trails remained for another half hour or so. It was amazingly clear and I did not experience any nausea, stomach distress or other somatic symptoms. It was quite the opposite: I felt physically healed during and especially after the experience. The term "energetic medicine" came to mind. The vibrational effects are quite amazing and I liked the afterglow much better than the trip itself, at least at this high dosage level. I would say that this particular strain of *Phalaris* is probably best appreciated in smaller doses.

-- Toad

### *DESMODIUM GANGETICUM*

*Desmodium gangeticum* seems to be a good tryptamine source and easy to grow, once established. It can be grown in the North if started indoors in February. It should flower by July, producing abundant seed. Shortly after seeding, the plant begins to peter out. Plant the seeds in a 6 inch pot where they are to stand. The seeds are tiny and many won't germinate, so plant plenty and thin them later. Harvest when in full flower, saving one or two plants to produce new seed, and enjoy a self-sufficient, powerful, non-toxic tryptamine source.

The effects, like most natural sources seem primarily due to 5-MeO-DMT, though there is clearly "something else" in there. The *Desmodium* was slow-cooked for two days in three changes of lemon-juice and water. Each extraction was evaporated to one-third of a large coffee cup then combined to make one cupful. I added a little sugar and nuked it to warm it up. The taste is pleasant -- no bitterness. Taken with 4gm crushed *Peganum harmala* seeds, there was a period of mild queasiness when the effects began, though I think that was due to the high dose of harmala. The effects are hard to describe except as "ayahuasca-like" -- bright flashes at the upper part of my vision, mild hilarity, intricately colored patterns in the dark with eyes open. It became difficult to remain upright. I smoked some cannabis and lay down. The typical tryptamine buzz became a roar and I got lost in it and don't remember what happened. -- Dr. Poppysseed, IN

### *DMT QUESTION*

Is it safe to smoke DMT while on ayahuasca? I was tempted to do this but got nervous because of the

MAOI, so I did not try it. -- TW

[Questions about "safety" are always relative when doing any psychonautic experimentation, but all things being equal, this should be safe enough -- you already have DMT in your system from the ayahuasca, so smoking more will only increase the dose. Go slowly with it until you find your comfort level. -- Ed.]

### *PSYCHOTRIA VIRIDIS*

#### *CULTIVATION*

*P. viridis* is a slow-grower, even in the tropics. I know of a ten-year old plant in Florida that is only 4 feet tall. My plants are just over a year old and about a foot high. I give them no special care other than high humidity and 50 percent shade in my greenhouse. Monthly feeding of any good fertilizer (fish emulsion or Miracle Gro) at half-strength seems to make them happy. Some of the leaves are over six inches long, even on my smallest plant. It is a fairly easy tropical with no special needs that I can tell. It will clone from leaf cuttings: simply pinch off a leaf and stick it stem first in moist soil, applying root hormone in the process. Remember that *P. viridis* has its own time schedule: SLOW. I've had leaf cuttings take nine months to put out four inches of root, with no stem yet. Keep them at 75-85 degrees F. and humid. I use the clear plastic trays that you get salads in at the grocery store as a humidity chamber. -- JF, CA

### *MAOIs AND PHENETHYLAMINES*

The debate about the compatibility of MAOIs and phenethylamines is very confusing. At first, it seemed to be an unqualified no-no. Then it was proved that harmala and San Pedro could be used together with relative safety. Recently Ott has described experiments using harmala and synthetic mescaline with no ill effects. I would like to hear from readers who have dared to combine other synthetic phenethylamines and MAOIs and survived. I am considering testing these admittedly risky waters (probably using 2C-B) and any advice would be greatly appreciated...

[*Peganum harmala* is shaping up as an apparently safe, reversible MAOI. Conventional wisdom claims that any combination of MAOIs and phenethylamines (mescaline, amphetamines, MDMA, etc.) is potentially

dangerous. This is based on data derived from synthetic, irreversible MAOIs and not from *Peganum harmala* (an "herb") or its extract. However, just because it seems OK to ingest with plants like San Pedro, it doesn't necessarily follow that it is therefore safe to combine with synthetics like 2C-B. I personally am not so curious that I'm willing to experiment with my own body to discover the limits of how far these things can be pushed. -- *Ed*]

### *DMT FROM PSYCHOTRIA VIRIDIS*

Has anyone ever extracted smokable DMT from *P. viridis*? *Phalaris* seems to be the plant of choice (probably because it is easier to cultivate), but it contains an uncertain mix of other (potentially dangerous) alkaloids. *P. viridis*, however, contains only DMT, making it much more attractive to me... [In a 1994 bust of a "Designer Drug" lab in San Francisco, the DEA found "various types of plant materials from Brazil" being extracted. I'm guessing that (because one of the "designer" drugs being manufactured was DMT), that these plant materials probably included *P. viridis* -- it has a high DMT content and is being aggressively marketed by the kilo now in the U.S. (See Chacruna feedback, Pg 11 in W-95 *ER*. Keep it up, folks -- let's get the DEA on all our cases!) That off my chest, to answer your question: there is no reason why it shouldn't be as simple as extracting from *Phalaris* grass. -- *Ed*.]

### *FOREIGN MAIL DROP I*

Can anyone recommend a safe, reliable foreign mail forwarding service? Most of those I've seen are domestic. I'm considering doing a Drittwelle order and I was advised to use a foreign mail drop for safety. -- *Forbidden Donut, FL*

[Addresses of mail forwarding services can be found in the classified ads in magazines like *Popular Science*. Some of them provide additional lists of foreign addresses, so write to all of them. -- *Ed*.]

### *FOREIGN MAIL DROP II*

Why is it better to use a Canadian mail forwarding service? It seems to me that either the package makes it to you or it doesn't. Even if sent to a country that doesn't regulate the substance in question, it still has to enter the U.S. -- *Sclerotia*

[The rationale behind using a foreign mail drop is that if the source of the substance is under DEA

surveillance, they are not as likely to trace packages sent to non-U.S. addresses. A package from Canada (or elsewhere) with an innocuous return address may not look as suspicious coming into the U.S. as one originating from a known drug source. -- *Ed*.]

### *FOREIGN SUPPLIERS*

For a current listing of overseas suppliers of medications, send \$2.00 to the Cognitive Enhancement Research Institute (CERI), PO Box 4029, Menlo Park, CA 94026. One reliable source, as of June 1995, is: B. Mougios & Co., Pittakou 23 TK, 546 45 Thessaloniki, Greece. Fax: 11-30-31-821-819, Tel: 011-30-31-859-680. They will provide on request a single sheet list of popular "smart drugs" or anabolic steroids, with current prices, or an extensive generic and brand-name catalog listing hundreds of prescription drugs with specific prices provided on these only by request. The generic catalog lists everything from antibiotics to morphine sulfate. Price quotes provided in December, 1994: Ketalar/25 ampules 5ml 50mg = \$52.00. Ketalar/25 ampules 5ml 250 mg = \$150.00. Most of the packages I've received have not been opened for inspection by customs, but on my last order, two of the three packages had been opened, inspected, and marked: "Passed U.S. Customs," even though Prozac was among the contents. Injectable steroids ordered at that time were not received, and I assume they were confiscated, though I was never informed of that and they might have never been sent (which I doubt). I never requested a refund or tried to track them down. I just felt lucky not to be under prosecution -- not yet at least. -- *Anon*.

### *IBOGAINE*

Where can one obtain information on *Tabernanthe iboga* or Ibogaine? -- *WB, WA*

[See: "Pharmacodynamics and therapeutic applications of iboga and ibogaine" (1993), *Psychedelic Monographs and Essays* -- available from Rosetta, P.O. Box 4611, Dept. ZZ, Berkeley, CA 94704. \$17.00 If you mean where one may obtain plants or extracts, that seems to be an open question -- does anyone know? -- *Ed*.]

### *SOIL MIXTURE*

Here is a dirt recipe which I find works well for *Salvia*

*divinorum*, *Psychotria viridis* and others:

4 gal. peat moss, 4 gal. 1:1 vermiculite and perlite, 1/3 gal. sand, 2/3 cup fish powder, 3/4 cup green sand, 2/3 cup 1:1 hydrated lime and pelletized lime (low Mg), water. Green sand provides micronutrients; fish powder probably does also. These ingredients can be obtained from Nitron Industries, Fayetteville, AR. Make sure that the lime is low in Mg. Some people say that high Mg concentrations can interfere with the absorption of other nutrients, though it is necessary in small amounts. I welcome comments on my dirt recipe -- it's a lifelong learning process in the light.

-- *Spiritual Earthman*

### MORE BIZARRE SALVIA TRIPS

I crumbled two (2) dried leaves of *Salvia divinorum* which were about 5cm (2") long (not including stem), and 2cm (.75") wide and put them in a waterpipe.

[Author does banishing, cleansing ritual, listens to meditation music for 20 minutes, then takes two large hits from the pipe. Within ten seconds his reality has altered profoundly]: I felt like and saw myself as a tree. Branches began growing out of my body, filling up the room, and I felt, and saw, my roots growing all over the floor and out beneath the door. I was totally caught off guard by this, and stood up. At this point I could no longer remember if I had smoked anything, or if my mind had just flipped on me. My room had turned into artwork from *Where The Wild Things Are*, a kid's book. The room was a garden of geometric twines and leaves from my own body.

What amazes me even more is that I experienced something that I have *never* experienced on any other journey: *Entities!* They were small (hand sized) creatures, and they were walking along my vines going about their business and laughing, or maybe just grinning from ear to ear. I was too overwhelmed to note more detail of what they were wearing, if anything, or to really even describe them much further. A strange as it may sound, one was pushing a wheelbarrow along one of my vines while smiling at me.

Then the visions passed away and I was back in my room, feeling a plus-1. My legs felt like limp spaghetti, and I was shaking. I suddenly remembered smoking the sacred herb and wrote down the following: "I feel like smoked bacon bits. More sudden

and intense than LSD. So strange and alien, but it feels like I've been here before, and I'm comfortable with it. Strange!" In fact, it did feel as if the foreign garden landscape had been a place that I knew in some way. The intense effects lasted maybe 5 minutes. I don't remember the time because it didn't matter in comparison to the magnitude of the experience.

[Author had taken a hike in the woods earlier in the day and had been drawn to some oak trees. During the hike and throughout the day he drank a quart of Heinke Natural Pineapple drink which contained mountain water, white grape juice and pineapple concentrate. He speculates that perhaps the juice affected serotonin levels in his brain, since the potency of the experience was far greater than any previous *Salvia* trip. He closes the narrative with]:

Intuitively, I would like to check out the use of pineapple juice in conjunction with *S. divinorum* a bit more when the time is right. -- *Zemen, CA*

### SALVIA DIVINORUM

Organically grown. Finest quality  
air-dried leaves.

1/4 oz: \$15, 1/2 oz: \$30, 1 oz: \$50

plus \$2.50 S&H

KAVA KAUI

6817 Kahuna Rd.

Kapaa, HI 96746

### PALATABLE SALVIA CLONE

In 1992, Bret Blosser brought back a distinctly different clone of *Salvia divinorum*, now marketed by Of The Jungle as "the palatable clone."

Morphologically identical to the Hofmann-Wasson clone, this one, while not entirely palatable, is less deeply bitter than Hofmann-Wasson. Specimens have been deposited in several California botanical gardens. Experientially, I have found the palatable clone to be more effective, perhaps because when chewed I can keep it in my mouth longer. Here's where it falls on my bitterness rating scale:

10. San Pedro (The foulest tasting thing I've ever put in my mouth.)

9. *S. divinorum* (Hofmann-Wasson clone)
  8. *T. peruvianus* and *Calea zacatechichi*
  - 7.5 *S. divinorum* (Palatable clone)
  7. *Lophophora williamsi*
  6. Ayahuasca
  5. (Blank)
  4. *Heimia salicifolia*
  3. Tsicta (*Tabernaemontana sananho* extract)
- JF, CA

FULL EXTRACT FROM

*Salvia divinorum*

(not Salvinorin-A)

Natural dye -- gives a wonderful dark-green color.

*SALVIA INGESTION TECHNIQUES*

Regarding the *Salvia divinorum* data in Fall '95 ER (Chewing vs. Smoking, Pg. 8) -- maybe there's an analogy to nicotine gum. People who consume coffee and have an acidic mouth (I think it has chlorogenic acid) get almost no absorption of nicotine, and that was my experience when I used it to try and quit smoking. So for better absorption of chewed *Salvia* the trick might be to make the mouth have a Ph of 9 and see what happens. It is also true that ethanol helps the carcinogens produced by smoked tobacco be absorbed in the mouth more rapidly, so maybe using an alcohol-based mouthwash might be of some use as well. For smoking, it makes sense to ignite the *Salvia* at the lowest possible temperature using something like a tube furnace with a regulator. It might volatilize at a temperature lower than its boiling point and that would give the highest yield since thermal decomposition would be minimized. The best temperature would

be around 200 degrees C., since there would be no smoke. That would be true for things like tobacco too, and other interesting things. — Anon., PA

[These ideas are easy to test -- rinse your mouth out with a baking soda solution before chewing/sucking *S. divinorum* and see what difference it makes. Or, make your own "basic" mouthwash out of baking soda and ethanol. See the vaporizer article in the Winter 1995 ER to test the smoking hypothesis. — Ed.]

psychoactive ethnobotany." -- Terence McKenna*

# PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed  
descriptions of over 200 organizations  
related to psychedelics.

Categories include:

book vendors & publishers, cultural  
resources, ethnobotanicals (cacti, herbs,  
mushrooms, plants & seeds), garden  
equipment & indoor light systems, hemp  
related items, information sources,  
merchandise & gadgets (CDs, cassettes,  
t-shirts, smoking accessories & videos),  
non-profit & religious groups, periodicals,  
a reading list/book review section,  
and more!

Updated quarterly. One year subscription  
is only \$15.00. Foreign orders add \$5.00  
for postage & handling. No other list is as  
thorough or updated as often!

Send cash, check or money order to:  
SOMA GRAPHICS, P. O. Box 19820,  
Dept. ER1, Sacramento, CA 95819-0820.

## THE MAGIC UMBRELLA

This totally enclosed greenhouse pops open  
in about 5 seconds to its full size of **three and  
a half feet tall with a two and a half foot  
base**, just like an umbrella. Folds up fast and  
stores anywhere in its sturdy shipping case.

If you are growing mushrooms or *Salvia  
Divinorum* the **MAGIC UMBRELLA**  
provides a **perfect environment for high  
humidity growing in small areas**. The 36"  
zippered front gives easy access to your  
mushrooms or plants and may be used for  
ventilation or to introduce growing lights.

*If you are not absolutely delighted send it  
back within 30 days and we will send you a  
full refund.*

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 5, NO. 2 Summer Solstice, 1996**

ISSN 1066-1913 Copyright © 1996, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

## *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F95 means that the Fall, 1995 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

— *Jim DeKorne*

## REPORT FROM THE PALENQUE CONFERENCE

---

---

*The following is excerpted from a long and interesting letter from an attendee of the 1996 Botanical Preservation Corps conference in Palenque, Mexico. -- Ed.*

---

**Botanical** sources of tryptamines are still the hottest topic of discussion among entheogen aficionados, and two that got a lot of attention were the seeds of *Anadenanthera Colubrina* var. *Cebil* and the root bark of *Mimosa Hostilis*. According to Jonathan Ott, preliminary phytochemical work done on seeds collected from a specimen of *A. Colubrina* in Northern Argentina reveals bufotenine to be the dominant alkaloid present, and a snuff prepared from the toasted seed and sodium bicarbonate (used as a drying agent) in a 2:1 ratio produced an effect quite different from the characteristic cyanosis and general discomfort usually associated with bufotenine. One line of this snuff, consisting of approximately 150 mg. of seed (one whole seed) and half again as much soda, produced in Ott and others a euphoric, visionary inebriation lasting nearly half an hour. There was a latency period of 3 to 5 minutes which was followed by a profound physical rush, tinnitus (buzzing in the head), and tryptamine-like mental effects which were said to be distinct from those produced by either DMT or 5 MeO- DMT, including colored patterns seen with eyes open. The peak lasted about ten minutes, returning to baseline over the following twenty minutes. Given the fact that the hydrochloride salt of bufotenine has been found to be inactive when snorted in clinical tests, this is very interesting data indeed! This particular snuff is reputedly much less painful in intranasal administration than previously known preparations from other *Anadenanthera* species, and is also active when smoked. The relatively clean alkaloid profile and awfully simple preparation technique (toast, grind, mix with soda, re-toast, re-grind, and ingest) would seem to make these seeds an ideal ally for tryptamine enthusiasts, and they will soon be made commercially available in the U.S. via OTJ.

**As far as** new DMT containing ayahuasca analogue admixtures were concerned, the root bark of *Mimosa*

*hostilis* (source plant of the mysterious *Vinho da Jurema*) received high praise from both Ott and a highly respected ethnobotanist/botanical supplier who asked not to be recorded or directly quoted. It apparently is concentrated enough that 5 to 10 grams per dose was said to be quite sufficient in an anahuasca potion. The ethnobotanist made it very clear, however, that this should only be utilized via aqueous extraction techniques to remove unwanted other alkaloids; a report was mentioned in which an overzealous psychonaut ate several grams of ground root bark, precipitating a physical crisis which required medical intervention. Aqueous extraction techniques were also stressed in combination with Syrian rue to reduce somatic discomfort.

**Perhaps** the biggest bombshell of the conference was dropped by Ott in a talk regarding the ayahuasca effect in which he categorically stated that *MAO inhibitors do not potentiate tryptamines*. While they do allow DMT to pass through the digestive system, in the brain they actually inhibit the action of indole psychedelics! He cited numerous clinical studies done on psychiatric patients during the 1960's in which various indoles were administered, subjects were then treated for a number of days with medicinal MAOI's such as Marplan and Iproniazid, and then indoles were re-administered. In all cases, pre-treatment with MAOIs significantly blocked the subjective effects of materials found to be previously active in the same patients. The rationale for this was explained as follows: intake of MAOIs boosts brain serotonin levels, and since indole psychedelics are serotonin antagonists, their effectiveness is lessened when brain serotonin levels are higher than normal. This contention was supported by the fact that methysergide, a known serotonin inhibitor, has been shown to potentiate both LSD and DMT. Ott's assertion was, of course, loudly debated by many attendees whose subjective experiences seemed to contradict it.

**When** mushroom ayahuasca was mentioned, Ott noted the large body of anecdotal evidence supporting it, but stated that in light of the nearly four-fold vari-

ation of psilocybin content in mushrooms from the same jar shown by Jeremy Bigwood, he would remain skeptical until carefully controlled experiments could be carried out with pure compounds. In his own experimentation, the only evidence he had of MAOI potentiation of a psychedelic was in the case of mescaline, which he said was intensified by a factor of four in combination with Syrian rue. -- *Forbidden donut*

### *MUSHROOM AYAHUASCA INSIGHTS*

I used 3.5 gm of powdered shrooms and 1 gm of harmala extract. The first time I took the mixture with juice in a blender, the second time brought to a quick boil with lemon juice and chamomile, then strained and drunk. Both worked. I think I will stick with this dose for a while. The first time, I had the distinct impression that a "space suit" was being made for me. This suit has been in the making for years -- anyone can have one. In it one is immortal and omniscient. It is difficult to describe: bliss, euphoria, my eyes exploding, being transected with laser beams... The first half of the trip seems to be devoted to alien contact. I think this is the establishment of symbiosis. The alien might be the mind of the mushroom, the mind behind nature, the mind of more advanced, differentiated, even future versions of oneself, or other aspects of the collective unconscious. I do not believe it is aliens from another solar system *per se*, leastwise not come here in bodies and starships. The second part of the trip seems devoted to visions of one's own life and the people one knows, irrespective of time. -- *REMaster, CA*

### *BEING THE ENTITY*

I was astonished to read Toad's mushroom ayahuasca trip (W-95 *ER*) wherein he became the entity. I ate 50 gm of fresh mushrooms and was highly amused for six hours with a similar experience of being the entity. Seeming to be able to see into six dimensions at once, I was concerned that I might be frightening others elsewhere. Twice on other experiments I saw the same blue-green arched halls that B. Schuldes described in the F-95 *ER*. -- *GW, CA*

### *AYAHUASCA BLACK-OUT*

After an ayahuasca session, I got up and was standing in the kitchen when I blacked out. I feel there were

contributing factors, but I was alarmed by the experience. I was wondering if others have experienced this and might have some tips for bringing oneself back into a functioning dimension.

-- *California Woman*

### *HIGH MUSHROOM WEIRDNESS-I*

I experienced some green contamination on a mushroom culture. Being a beginner, I let the culture grow to see which would win: green or white. After two weeks I opened one of the contaminated jars and carefully picked apart the 95% green culture. I smelled it, felt it and observed it to be "smoking" with green spores. I must have inhaled a lot of it: it smelled like clean mushroom mycelium though. About 30 minutes later I felt a rush or chill go through my body. At first it was like psilocybin, but it turned into high anxiety with the fear that something terrible was about to happen. Waves of relative relaxation alternated with high anxiety and ran from the base of my spine up into my thought processes. This strange phenomenon lasted about two days, peaking at 24 hours. I got little sleep during the period. So, if you're a myco-gardener, be careful about breathing "green smoke."-- *C, OR*

### *GHOST POTIONS*

*The idea advanced...that the phenomena experienced in "haunted houses" might be caused by the spores of psychoactive fungi growing on the walls, is not new (Letters, 15 April). It was published in the Gentleman's Magazine in 1883. Unlike the case in 1883, however, science is now capable of investigating this appealing theory. The pharmaceutical firms that are prospecting for new drugs in threatened tropical forests might also consider taking mycological cultures from the world's dwindling stock of haunted houses. Amazing psychotropic chemicals could result. But we must be realistic; any substance powerful enough to reveal ghosts would probably be criminalised within a year of its discovery.-- Letter to the Editor, New Scientist, 8 July, 1995*

### *THE PHYSIOLOGY OF HAUNTED CHAMBERS*

*In the last November number of the Journal of Science is put forth anonymously an ingenious theory of the origin of certain ghostly apparitions. The writer states that the witch-ointments, magic fumiga-*

tions, &c., used in olden time contained ingredients capable of producing delusions, visions of demons, &c., to those intoxicated by their influence. He names the Siberian fungus (*Amanita muscaria*) as having been proved to have such effects on those who swallowed it, and he suggests that the microscopic germs of other fungi when breathed may produce a temporary derangement of the nervous system, during which the patient fancies he sees, hears, or feels unaccountable sights, sounds, and impressions.

The author of this hypothesis states that when traveling he has sometimes occupied rooms in which he experienced a peculiar uneasiness and a disposition to be continually looking round to see if there was not something unpleasant behind him, and that he has also felt "a cold shiver down the spine." The rooms where this occurred had a persistent odour, faintly pungent, like that of an unfrequented library. He concludes that the old castles, mansions, and other desolate dwellings so especially liable to become "haunted" have their walls, furniture, &c., covered with minute fungi, emitting their spores, like other fungi, in the form of microscopic floating dust, which being inhaled acts like the corresponding spores of the Siberian fungus, or the fumes of a properly conducted incantation. I have felt the above-described sensations, minus the spinal cold shudder, on several occasions when, in the course of my Continental pedestrian trips, I have stopped at an old chalet converted to a poor country inn, and have been lodged for the night in the state bedroom, with all its old draperies. Whether these sensations were due to the lingering influence of nursery stories, or to the undigested remains of my previous meal, or to the supposed microscopic fungous spores, I cannot decide, but think the above theory well worth the further investigation which we are told is pending.

**The Gentleman's Magazine (1883)**

### HIGH MUSHROOM WEIRDNESS-II

I wrote recently describing my strange reaction to inhaling mushroom contamination spores. Ever since that initial exposure, every time I smell good fresh mycelia in their jars or the air of an aquarium of fruiting bodies, I get a reaction. It is always the same: seven to fifteen minutes after inhalation I get a speedy head buzz with tinnitus. My hands and feet become cold

and clammy, my heart rate increases from 70 beats a minute to 100. There is usually some anxiety because I don't understand what the mechanism of this reaction is. Once, after breathing three separate jars containing clean white mycelia, my blood pressure was 210 over 110 at 110 beats per minute. The next morning at work the symptoms persisted strongly enough for me to go to the hospital for a checkup. The doctor said my EKG was normal and that I had no symptoms of hypertension. (185 over 95 at 90 bpm during checkup.) I understand psilocybin and it does not affect me this way. What concerns me is this: 1. I didn't react to the "gas" before the green mold exposure. 2. Is it possible that I've developed an allergic reaction to mycelia that could possibly kill me some day? Or, if I eat a fruit-body, could some non- psilocybin catalyst create a massive toxic reaction in my gut? I love life and the dimensional expansion that entheogens provide. I am 43 years old and don't want to shorten my life expectancy. I wrote to P.F. [sic?] and they said it was an allergic reaction to the green mold, and I tentatively agree... But on only one exposure? Is it possible that some psilocybin precursor sublimates at normal temperatures and atmospheric pressure? Maybe I'm just crazy and am imagining it all, but after about fifteen times, I don't think so. Have you ever heard of this? I've been taking methadone for ten years and have recently been reducing this by 1-2 mg a month. I started at 80 mg and am now down to 65mg. Is it a problem to mix psilocybin while on methadone maintenance? -- C, OR

[This is totally new to me. Other than the above quotations speculating on a connection between fungus spores and haunted houses, I have nothing to offer except the obvious: Be extremely cautious about ingesting psilocybin until the situation is resolved. Reader feedback on this would be appreciated. Has anyone else experienced this? -- Ed.]

### LIFE-SAVING MUSHROOMS

After a year of trying to grow the sacred 'shrooms, I had my first experience: a visit to cosmic Disneyland, nothing more. Then came the EXPERIENCE. My life was pretty much falling apart. I was drinking heavily, smoking, drifting apart from my wife of 12 years. I was alone, sad and drunk. In this lousy set and setting I ate a more-than-shamanic dose of *P. cubensis*. The

first half hour was the kind of hell that gives bad trips a bad name. I have never been so mortally afraid, experienced such panic terror. Now I know what ego-death means. I will never forget the horror of looking at what I was turning into, or the tears that poured from my eyes while I was asking forgiveness from... whom? Whoever it was, he (she? it?) forgave me, and the feeling can only be described as a light from within. I returned a new person, stopped drinking, smoking, even watching TV. Not only was I living in spiritual clarity, but my physical vision actually improved: when I picked up my reading glasses I was able to read the smallest print at the ophthalmologist's without them! On top of that, I started exercising like an SS officer on crack -- two to three hours of exercise was the norm. My relationship with my wife improved geometrically.

Then came the ACCIDENT. *[Author describes a boating accident in which he and other crewmembers fall overboard during a yacht race into freezing water. One drowns. -- Ed.]* The point is: without the drastic life-change induced by the mushroom experience, I wouldn't have lasted two minutes in that water, much less nine or ten, floating without a life-jacket, wearing full foul-weather gear and boots in San Francisco Bay in 35 knots of wind. *[The author is revived by paramedics and visits the hospital with his wife where they learn of the death of his fellow crew-member. Dazed, still in shock, they wander into a restaurant. -- Ed.]* We were eating our pizza, and next to us were some young people. Suddenly one of the guys starts choking. His friends surrounded him, patting his back, but he started stumbling back and forth. I ran to the guy, did the Heimlich maneuver on him (which I've never practiced before, knowing only about it from reading a small poster) -- he coughed up a chunk of pizza and lived. Less than two hours after my life was amazingly saved (because of a mushroom experience) I save somebody else's life. If it were hockey, we'd have to credit the 'shrooms with one save and one assist! -- JH, CA

### *PSILOCYBE CYANESCENS* *FEEDBACK*

In the Fall '95 *ER* I wrote that people should seek spores of Northwestern U.S. varieties of *P. cyanescens*. You then listed an Austrian source of

sporeprints. The reason I prefer a North American variety is because it should be better adapted to our growing conditions. The Austrian sporeprints were made on paper, which tends to absorb and release moisture in response to relative humidity. This accelerates the degradation of the spores. Sporeprints made on glass are viable for a longer time. Johnny Appleseed's technique for innoculating new woodchip beds with mycelium (*W-95 ER*) is good, but the useful fruiting life of each bed can be extended by burying one or several hardwood logs approximately an inch below the surface of the chips. The larger mass of the logs provides enough nutrients to extend the life of the beds for up to 5 years. For best results use fresh chips and logs of the same type of hardwood. Wood harvested in the Spring (when the sap is up) has a higher nutrient content. Pine, or any conifer, should not be used. --DC, PA

*[The Austrian address is the only P. cyanescens sporeprint source that I know of. It is my understanding that this source actually originated from a North American variety of this mushroom. -- Ed.]*

### *A FIVE-METHOXY TRIP*

A few days ago, with my wife to observe me, I smoked about 5mg of 5-MeO-DMT. Things definitely got weird, but not too bizarre. Later I did the remaining 15mg. Against advice, I did this by myself. About ten seconds after inhalation, it hit -- 10 seconds later I blew out a fair amount of smoke. Then my world became very strange. I could feel static energy vibrating and rippling in my body and throughout the room. The music (*Transcendental Anarchist*) was doing a weird heartbeat thing and I told myself to stay centered and hold onto who I was. Although I never forgot that it was a drug effect, I still felt like I was losing my mind. I had to change the music to something very comfortable. Somehow I managed to put on *Changes in Latitudes* by Jimmy Buffett. By then I was coming down. I went around the room, turning off the lights, lay down on the couch and rode the waves. Then I began to relax: more relaxed than I've ever been in my life. All in all, it was interesting and scary, but not profound. It doesn't seem to be an entheogen worth pursuing. -- *Newathis, GA*

*[I don't think we know how to use 5-MeO-DMT yet --*

*it seems to be associated with chakra openings, and I suspect it could become a very valuable entheogen if we only knew the proper procedure for use. -- Ed.]*

### TRYPTAMINES AND CHAKRAS

I definitely agree that 5-MeO-DMT is a chakra drug -- it has to do with the kundalini movement up the spine. Isn't it interesting that both 5-MeO-DMT and DMT are naturally occurring in the brain and spinal fluid. I think it's possible to direct the energy of the 5-MeO blast to specific chakras using touch. In one experiment I combined vaporized 5-MeO with masturbation. The timing was tricky but I hit it right on: just as I was rising to orgasm the 5-MeO kicked in and sent a surge of energy through my heart. This was a painful experience and it felt like my heart chakra was being blown outward in all directions. It is not a gentle drug. It seems to force open the whole flower at once like an energetic roto-rooter. Perhaps by stimulating specific accupressure points we could direct the 5-MeO blast into other areas of the body as well. I just completed another experiment with the Greek strain of *Phalaris brachystachys*. This time I reduced the dosage to 110mg and had a much milder trip. The effects were very transcendental and several times I found myself disappearing. It felt quite natural and was similar to my own meditative experience. Perhaps the enlightened adepts have simply mastered the art of milking the tryptamine nectar from their own pineal glands. I'm curious about the physiological mechanics of enlightenment. What changes are taking place in the brain chemistry of a mystic? The ayahuasca analogues seem to provide a much more permanent shift in perception than some of the other entheogens I've worked with. As soon as I can source the materials I will begin mixing 5-MeO-DMT and DMT in various proportions to find the most transcendent effects. -- *Toad*

### ENDOGENOUS TRYPTAMINE PRODUCTION

Albert Most's paper: *Eros and the Pineal: the Layman's Guide to Cerebral Solitare* (Rosetta), presents a method to induce the endogenous production of large amounts of DMT in humans. The method includes utilization of L-tryptophan, *Peganum harmala* and sugar intake for increased insulin

production. Do you have any data about the effectiveness or dangers of the above method? Do you know of similar methods? -- *Trailblazer*

*[A few years ago I asked a physician knowledgeable about brain chemistry and hallucinogens similar questions. It was his opinion that this paper by "Al Most" was highly speculative. I've heard no reports of either success or failure with the method, so suspect that it's either ineffective or hasn't been tried. -- Ed.]*

### TRYPTAMINE EXTRACTION TIPS

Regarding extraction problems with *Psychotria viridis* (Winter '95 *ER*, pg 18) -- when boiling a normal ayahuasca brew, ten gm of *P. viridis* is not enough. 28 gm gave me a solid plus- 2.5; more would be better. Also, most municipal water supplies have basic pH levels -- like 8 to 9, and adding just lemon juice won't acidify the brew enough. I use spring water, or tap water with dilute HCL, added to bring it down to 6 or 6.5 pH. Aquarium shops carry inexpensive bromthymol blue test kits costing only a few bucks. Most native brews use river or rainwater that is very near pH 7 or lower, so their brews work. Regarding chemical extraction of smoking tryptamines: it seems to me that if you have a supply of *Psychotria viridis* or other DMT containing plant, that a brew orally taken is preferable to smoking. It lasts longer, there are fewer problems with the sudden onset, and it just seems to be a nicer experience. Sure, nausea can occur, but it can be avoided by fasting half a day or observing some of the traditional food restrictions. Until a reliably simple extraction procedure is developed, I'm content to brew my ayahuasca and enjoy it in the traditional way. -- *JF, CA*

### The MagiC Plant Juicer

The only juicer that will handle tough grasses without jamming or breaking down. Just feed the grass in at the top, turn the crank and the juice flows from the side trough. The now extracted grass is practically dry and exits from the front spout. Heavy duty cast iron Stainless steel screens Easy to operate

\$68

plus \$7 s&h

## *SALVIA DIVINORUM NOTES*

---

I smoked *S. divinorum* leaves in a bong pipe and found myself feeling extremely detached. I'd taken a toke of cannabis just prior and had just listened to a tape of the '60's group, *H.P. Lovecraft*. It was spooky. I glowed inside. I exhaled, caught my breath and was feeling soft, leathery and reptilian. It lasted about five minutes. Now every time I hear the tape I feel nostalgic about lizard skin. *Salvia* delivers an exceptional punch in the memory cortex with sight, sound, visceral, scent and auditory components. I wonder what would extend the experience to ten minutes. I can't imagine wanting to do it longer than that -- might try to eat flies or something. -- *RWS*

### *SALVIA AND BAKING SODA*

An associate swears up and down that the best way to do cocaine is to place a pinch of baking soda under the tongue for about 15 minutes, rinse the mouth and apply cocaine. In five minutes it's supposed to be as intense as shooting up, but lasts longer because of the decreased rate of absorption. I wonder if *Salvia divinorum* wouldn't respond in a similar fashion to this method. I've heard that the "palatable strain" offered by OTJ is more potent -- any reports to confirm this? -- *No Name*

### *RESPECT FOR THE GODDESS*

Among several indescribable, ineffable experiences with "Ska Pastoria," (*Salvia divinorum*) or as I like to call her, "Diviner's Mint," there is one which still stands out. We had smoked 4 or 5 bong hits of increasing size over a two hour period along with some cannabis and a couple of beers. The friends with me were both *santeros*, members of the Afro-Caribe religion known as *Santeria* or *Lucumi* -- both familiar with what are considered spirit possessions. R. had smoked *S. divinorum* with me once before, but F. had no experience with any entheogens other than cannabis. His first hit had transformed him immediately. At first he said that his "spirit" was near, but soon said that it was the spirit of the plant, that the plant is a spirit and a female one at that. He then, in a very authoritative, transformed voice declared *S. divinorum's* sacredness, that she must be treated with respect and reverence.

"This is nothing casual." And how I agree! My last hit enveloped me in the now-familiar vibration of Ska Pastoria -- I lay back and dissolved, but soon had the sense of being elsewhere, in some other room, laid out on another couch with different people around me. In this parallel world I felt catatonic or cut off, unable to move or speak to the familiar strangers around me who were seemingly concerned about me. I felt like I knew what it's like to be in a coma. I feared for my sanity, then remembered that I'd just smoked some Diviner's Mint in a friend's living room in another dimension. The impression was truly scary -- I wasn't sure which dimension was real, wasn't sure if I could find my way back. So I opened my eyes to see my friends still there, and asked, totally serious: "Are you guys still there?" Getting (I thought) no response, I leapt to my feet, looking down at my legs to move them and test if I was still in my body. Well, I was still there (here) and sat back down, trembling, to describe the experience to my friends. I have smoked *S. divinorum* since, but not frequently as she really does demand respect and reverence. -- *KK, NJ*

### *"SYLVIA" DIVINORUM*

On a *Salvia* trip recently, one of my companions reported lapsing into a dreamy state and meeting a woman -- who referred to herself as "Sylvia" *divinorum*! -- *MH*

### *SALVIA SAFETY*

Last year I bought some dried *Salvia Divinorum* from OTJ and experienced some remarkable effects. It was unique in my experience and wishing to compare it with someone else's reaction, I gave some to my sister. She is a student of a very well known teacher of shamanism. She also had some very interesting experiences and asked her teacher about this herb. He warned her that it was toxic to the liver and advised her not to try it again. I have not heard this before and researched everything available in print before trying it. Hofmann and Diaz did chemical analyses and did not find a poisonous constituent and Wasson reports a ceremony conducted by an 85 year old curandera. Any feedback on this issue? -- *RR*

# NETWORK FEEDBACK

---

## SOLVENT AVAILABILITY

Trike and methylene chloride are controlled closely by the FDA. It's not illegal to purchase, but very illegal to transport or dispose of without a commercial licence. Georgia, Florida, SC and Alabama chemical supply companies all refused my requests. All dry-cleaning supply listings in these states no longer use (or admit to using) these solvents and could not tell me where to get them. The only supply company that would deliver to my doorstep required a minimum \$300.00 purchase and I didn't relish the idea of providing my driver's license number and address, so I didn't buy any. Some commercial furniture strippers are up to 98% methylene chloride, but they are not required to print this percentage on the product. (Perhaps some product research is in order.) I don't know how to separate the desired solvent from the other components. A good project for a future article on obtaining methylene chloride from brand-name furniture stripper, etc. would be essential. Please publish such information and/or any alternative solvents that are easier to get. -- CH

## PLANT IDENTIFICATION PROBLEM

It is almost impossible to distinguish *Desmanthus illinoensis* from *Albizia julbrissin* seedlings. I can only tell when *D. illinoensis* is in flower (white) -- *Albizia* flowers are pink. I am fooled often because the latter often don't flower around here. Anyone have some easy way to distinguish between these two plants? -- CH

## SEED/PLANT EXCHANGE

I'd like to suggest some *ER* space devoted to a seed/plant savers exchange. People could write in with a want/have list along with their address so they could contact each other for exchanges. -- BK, CA

[This idea has been mentioned before in *ER*, but there has been no response -- people are reluctant to publish their names and addresses in a publication like this one. I personally feel it would be safe enough as long as the botanicals were unscheduled. -- Ed.]

## QUESTIONS I

I am looking for a source of *Virola* snuff trees; also for information on safe *Datura* usage. In your winter '95 issue, Phil said that he drank licorice root after taking *T. peruvianus* -- I am relatively new to the entheogen scene, but wouldn't that cause a hypertensive crisis? Finally: is St. John's Wort a good MAOI to use with ayahuasca? -- JB, TX

[To date, the licorice root-as-MAOI theory has come from only one correspondent, so more reports are needed to determine how effective it is. Latest opinion is that herbal MAOI use with the mescaline--containing cacti is safe. St. John's Wort is a MAOI, but I've heard that it is one of the few (only?) known herbal irreversible MAOIs, which (in their synthetic forms at least) are known to cause hypertensive crises. Anyone have further data on these questions? -- Ed.]

## QUESTIONS II

Using the extraction method in *Psychedelic Shamanism* for *Phalaris* grass, roughly how much extract may be obtained per kilogram (2.2 lb)? Does the extraction solvent make the end product toxic?

[It depends on whether the weight is wet or dry -- in either case, a kilo of *Phalaris* is a lot of grass. I've always done amounts less than that -- a crockpot full of fresh grass will yield about 50 mg on the first go-round; lesser amounts can be extracted from the same material on subsequent cycles. If you redissolve the evaporated tar in ethanol and add a smoking medium (like mint), the evaporated product shouldn't be toxic. -- Ed.]

Do you have any tips on germinating *Phalaris* seeds? I can't seem to get the seeds from JLF to sprout.

[I've never had this problem -- throw 'em in the ground and water them moderately. Be sure the variety is known to be psychoactive, otherwise you're just growing plain old grass. -- Ed.]

I understand you can make tea from *Papaver somniferum* seeds. What is the conservative but effective number of seeds, (crushed and boiled) to start

with?

[I don't know -- anyone have the answer? -- Ed.]

Have you any first hand information of anyone taking too much of a psychedelic, causing permanent distortion in their normal perception of everyday reality -- i.e., not being able to feed oneself, drive, work, love, etc? We've all heard of the infamous person who ate a lot of something and is now in a rubber room. Is this a fact or myth?

[I met a guy once, totally insane, who was said to have gotten that way by taking over 300 acid trips in less than two years (a trip roughly every other day). Psychedelics are obviously not for everyone, and people with latent psychoses will certainly evoke them by doing drugs. Anyone compelled to take that much acid in that space of time reveals more about his original condition than anything the drug may have contributed to it. There are plenty of psychotics who don't take drugs, but when one of them does, it's the drug that gets blamed. I know of no "normal" person who ever went crazy by using psychedelics responsibly. -- Ed.]

Is fear or escalating anxiety common after smoking 5-MeO-DMT (12 mg) for the first time, with no previous DMT exploration? -- **EF, FL**

[Smoking 12mg of 5-MeO-DMT would be a challenge for anyone unfamiliar with the effects of smoked tryptamines. The fear usually goes away with more experience; if it doesn't, most people stop smoking the stuff.. -- Ed.]

### QUESTIONS-III

Has anyone had any experience with the supposed but unsubstantiated hallucinogen: galanga (*Kaempferia galanga*)? It has a spicy taste similar to ginger (to which it is related), so it would be difficult to consume a large quantity. I'd guess it could give you a hell of a stomach ache if you ate too much. Is it a true entheogen or, like *Acorus calamus*, just another psychedelic myth?

I know that *Vinca major* and *Vinca minor* (greater and lesser periwinkle) contain various indole alkaloids. *Vinca major* contains reserpine and other antihypertensive substances. *Vinca minor* contains vincamine, a cerebral vasodilator that has an unpredictable effect on the circulatory system, hence should be considered dangerous. Both of these easy to

grow, winter-hardy plants have been said to be psychoactive. Does anyone have any knowledge of their positive effects as well as dangers? Some of the alkaloids they contain are molecularly similar to ibogaine. Do they contain the same dangerous antineoplastic substances that the Madagascar Periwinkle (*Catharanthus roseus*) contains? In an old *High Times* article it was stated that the sensitive plant (*Mimosa pudica*) contains DMT in its roots. Does it? Several books and articles on tryptamine vectors (plants or animals containing tryptamines) usually express the importance of a substance containing N-Methyl Tryptamine, as well as DMT and 5-MeO-DMT. Some say that N-Methyl Tryptamine is psychoactive, others say it isn't. *Desmanthus illinoensis* contains a fair amount of it. Is it psychoactive? Perhaps it potentiates or otherwise contributes to the DMT effect. How important is N-methyl-tryptamine? -- **Prairie Dragon, II**

### LOTS OF EXTRACTION QUESTIONS

Regarding DMT extraction -- what are the relative merits between ammonia, sodium bicarbonate and sodium monocarbonate as basifiers? Does soaking ground plant material in aqueous acid 24-48 hours allow for oxidation? Does smoking DMT cause some breakdown into 5-MeO-DMT or bufotenin? Could this happen in the presence of carbon ash during combustion? Could storage of dry material at high ambient temperatures cause a conversion as suggested above? Do DMT crystals vaporize without producing smoke? If the temperature is too low, will it oxidize without producing DMT vapor? -- **J, OR**

### INTERNET

In regard to entering the Internet -- I advise strongly against it! Think about what ruined the reputation of psychedelics in the sixties -- overexposure to the masses of people who will take anything that gets put in their hand. By definition, those who take psychedelics frivolously are consumers, they want to get high quickly, easily and without effort. These are not the same people who are likely to subscribe to *ER* -- that would require forethought and effort. Anyone who is genuinely interested in shamanism or botany will be motivated to seek out the information they require. It's the people with only casual interest who will overexpose the DMT plants of North America to the media

and you can bet that a clampdown will follow. Think about what happened to MDMA when it hit the cyber-party crowd. Don't let this get ruined for the people who really care about the plants and the planet.

— *CH*

*[I decided not to go on the internet for the same reasons, so it's no longer an issue. One of the values of ER, it seems to me (modesty aside), is that it's edited -- too much of what appears on the internet is either redundant or mythological. Not that ER is perfect, but I do my best to weed out the grosser misinformation. -- Ed.]*

### NUTMEG FEEDBACK

During my foolhardy teen years I experimented with nutmeg (*Myristica fragrans*). I can definitely say it is more psychoactive than just mild sedative action as mentioned in "Nutmeg Mythology" (Summer '95 *ER*). It is quite psychedelic: not particularly pleasant psychedelic, but psychedelic nonetheless. The main problem is the copious amounts needed to get past the mild sedative effect. Five heaping teaspoonfuls for a high, ten for a trip! The taste of that much nutmeg could turn you off eggnog for life! It can be very nauseating. Only my youth helped me persevere through such a task. Effects undoubtedly vary from person to person, but generally the high comes on in about 3 hours. It is similar to a sleepy cannabis buzz, but more stuporous. Plenty of visual imagery, time/space distortion, feeling of unreality and possibly auditory hallucinations on high doses. Not much in the way of any spiritual insights or even lukewarm euphoria. Mostly extreme lethargy and desire to sleep, but inability to do so. Effects last 4 to 6 hours, but you can get a droning, spacy hangover that can last for days. Since it is probably dangerous to liver and kidneys, I can't recommend it for anyone -- leave it on the spice rack where it belongs. — *Prairie Dragon, IL*

### ENTHEOGEN ISLAND

There is no place in the U.S. to experiment with the growing, preparation and ingestion of entheogenic substances. Any substance that finds a popular response, promptly becomes illegal. What we need is our own island (don't laugh, I'm serious)! An island set up as a research facility to study and propagate entheogenic plants from around the world. Such a laboratory would benefit all humankind. I am

researching the possibility to fund and purchase such a place. (I've already researched over a hundred islands.) I could use some help: If interested, please contact: D.J. Croup, 521 1/2 E. Pearl St., Butler, PA 16001-5007.

### HOW COME HAVEN'T YOU BEEN BUSTED?

The editor of *PRL* comments in his review of the book *You Are Going To Jail* (Loompanics), that there is a high likelihood of any drug user going to jail. Statistically speaking, is this true, even of a non-dealer, non-abuser, shamanic user? What is the danger level of personal, shamanic use? Moreover, why aren't people like you, Terence McKenna, Jonathan Ott, et. al. rounded up and thrown in the slammer? Is it simply the fear of a famous martyr syndrome?

— *REMaster, CA*

*[The DEA spends most of its energy on the high-profile, social problem drugs: crack, heroin, etc. They don't have the funding or manpower to seek out entheogen users, probably because most entheogen users are not creating social problems. (Few of us drop out of high school and become armed robbers to support our San Pedro habits.) Which is not to say that they'll ignore you if you've got a houseful of illegal plants and someone turns you in. None of the plants I grow are scheduled, and I only use entheogens among trusted friends in a ritual context. My faith is that if I keep my intent pure and my behavior low-key, I won't have problems. Probably the quickest way to put yourself at risk is to get involved in dealing: keep money and profit out of your entheogen use and you'll likely be OK. Buying and selling is the American religion, and the "Powers That Be" go crazy if they think anyone is making a buck off something that they haven't endorsed. My personal conviction is that material profit of any kind is inversely related to religious experience: my favorite image of Christ is throwing the money-lenders out of the Temple. -- Ed.]*

### NO FEAR!

In these days of potent *Phalaris* extractions, I confess to being demonically tempted by the popular "No Fear!" logo that the High School kids like to display these days on tee-shirts, etc. -- "Hey, kid! C'mere, I got something for you to smoke!" — *Friendly Stranger*

### MAREZINE

Have you heard about Marezine (Cyclamine hydroxide)? It's a sea-sickness pill that is the most powerful hallucinogen I've ever tried. Take 12 pills on an empty stomach and you will see entities, travel far, and possibly not be able to tell reality from unreality! It's like too much scopolamine without being too evil.  
-- LR, FL

### LEGAL HIGHS

I'd like to hear reader's recommendations for meditations, breathing techniques or devices they use to alter awareness, with or without the use of entheogens. I'd also like some feedback about the legal herb preparations advertised in *High Times*. Is the Witches Flying Ointment or the Merlin Blend by International Oddities effective? -- *Trailblazer*  
*[I've always assumed that those High Times ads are just a rip-off of the naive and inexperienced. Believe it or not, but I once saw a High Times advertisement selling "pure sodium chloride," with one of those beautiful HT color photographs of a pile of white substance (table salt) -- technically, not illegal, since it said up front what was being offered. (This was back in the '70s, when cocaine was believed to be as OK as cannabis.) Reviewing a list of ingredients in many of these "herbal ecstasy" products suggests that any buzz you'd get is from caffiene -- No-Doz is definitely cheaper. But maybe I'm too cynical -- does anyone have any data on what this stuff is? -- Ed.]*

### LESSONS FROM THE PLANT TEACHERS

If nothing else, the ayahuasca diet and abstinence are a testament to the purity and level of commitment of our desire to learn and benefit from the "Plant Teachers." I think the reality of plant teachers is a valid concept: while LSD and ketamine are surely entheogens, the plants are decidedly different in that they do not disappear with the human race. *Ipomoea*, *Trichocereus*, *Stropharia*, *Lophophora*, all have lived long before us, and will live long after *Homo sapiens* is gone. While this is simplistic, I have yet to have a lesson from acid (at least I don't remember). Here's what I've gotten from plants: *Salvia divinorum*: showed me where the AIDS virus originated (before humans), a crack in reality, a "mirror" which I was

afraid to enter -- when I refused, it disappeared immediately. *Trichocereus*: showed me how to pass through dreaming and wakefulness, showed me parts of human souls. *Ipomoea*: revealed the meaning of dreams. *Lophophora*: showed how to look through other's eyes -- how to know who they were. Actually, LSD showed me that I didn't like being a "drug abuser" -- it showed me the reality of that lifestyle. I guess that's a psychotherapeutic use of (a non- plant) entheogen. -- *Anonymous, TX*

### ENTHEOGENS AND ADDICTION

I'd like to see more information about the use of psychedelics to treat addiction. Personally, a high dose LSD trip gave me the insights that helped me defeat a ten-year methamphetamine habit. In light of the legal restrictions, maybe we can develop some shamanistic-oriented ritual therapy and spread it through the underground. Many lives could be salvaged. I feel LSD saved my life. It is a crime that people suffering from addictions can't legally avail themselves of this cure. -- *JL, CA*

### RELUCTANT WOODROSE BLOOMS

Scuttlebut has it that *Argyrea nervosa* (Hawaiian baby woodrose) steadfastly refuses to flower outside the tropics (Pg 16, Winter '95 *ER*). On the bright side, the foliage and stems contain roughly equivalent concentrations of LSA as the seeds. The same is true of the other morning glories. -- *JL, CA*

### MUCUNA PRURIENS

*ER* recently received a longish letter describing several experiments with *Mucuna pruriens* (said to contain DMT), combined with *Peganum harmala* -- all of which were psychoactively negative. I appreciate receiving first-hand data like this: even when results are inconclusive or negative, the data is very valuable in our attempt to understand entheogenic plants. It also prevents weird rumors from getting started. So -- has anyone had a *M. pruriens* experience that was entheogenic? -- *Ed.*

### AMANITA PANTHERINA

I recently had the opportunity to try some tea made from *Amanita pantherina*, collected in the Mt. Shasta area of California. The mushrooms had been dried and then brewed into a simple tea. I don't know the concentration. Forget the bad press on *A. pantherina*

-- this stuff was fantastic! After six to eight big gulps of the mild-tasting tea, I almost immediately began to experience a typical *Amanita muscaria*-like buzz (which I am quite experienced with), but without any of the side-effects of nausea and sweating. Then came an intensely pleasurable euphoria: I was exactly where I wanted to be, my character and personality (Self?) was as good as it could be. This was an empowering, energizing inebriation with full interactive capabilities. It was smooth and friendly: an enjoyable dizzying numbness with intelligence. No withdrawal or hangover was detected. As stated, I am familiar with the effects of *A. muscaria* inebriation and the *pantherina*'s effects are similar to the former's non-toxic qualities. The overall advantages (especially for novices) are huge: no toxic side-effects. It is very "clean." I'm not sure about a first experience, but with repetition comes familiarity and the ability to enjoy and use the finest state of well-being imaginable. I'm not even talking about higher doses in which doors to other realms are easily entered. I'm at a loss to explain why this mushroom is not more popular among entheophiles. Probably the mass-media anti-*Amanita muscaria/pantherina* propaganda has something to do with it. Most people who've had successful *muscaria* or *pantherina* trips tend to compare these mushrooms with other substances by using phrases like "vastly superior" and "another world." Yet many of these people want to remain silent. I believe the great *Amanita* will soon regain its phenomenal status of old. Once you've been enlightened, it's hard not to feel this way. -- MN, IN

### MORE MUSIC-1

The right music for "deep listening" is crucial. I understand the experience of the correspondent who said that "pretty music" doesn't quite do it. When planning an entheogenic experience at home I select 10 or 12 tapes ahead of time and put them by the stereo. Here are some of my favorites:

1. David Parsons: *Yatra* (Fortuna label), 2 CD set
2. Steve Roach: *Dreamtime Return* (Fortuna label), 2 CD set
3. Gabrielle Roth: *Totem, Initiation, Bones* (All on her own Raven label) These are the best tribal/drumming recordings I've found.

More classically inclined listeners might consider:

4. Phillip Glass: *Glassworks, 1,000 Airplanes*
5. Arvo Pert: *Tabula Rasa* (ECM label)
6. Henryk Gorecki: *Third Symphony* (a very powerful, somber work.) -- *Anonymous*

### MORE MUSIC-2

Might you recommend your own personal favorite recordings? Here are a few of mine:

1. Spacetime Continuum: *Sea Biscuit*
2. The Future Sound of London: *Lifeforms*
3. *Global Meditation* (4 CD boxed set)
4. All Mickey Hart recordings, especially *At the Edge*
5. Material: *Hallucination Machine*
6. Peter Gabriel: *Passion*
7. Mars Lasar: *The Eleventh Hour*

-- MSS

[I seldom listen to music when using entheogens, usually being involved in interaction with other people. However, I'll never forget the insights received while listening to the Alan Hovhaness piece, *Mountains and Rivers Without End*. Almost all of Hovhaness' work is "psychedelic" to one degree or another. -- Ed.]

### PRIMA SOUNDS

I want to let you know about a CD: Prima Sounds, by Ralph Losey. It's ambient music that "uses chakra resonance and carefully crafted 'chaotical musical forms...'" The tone combinations and harmonics may appear random at first, but a hidden fourth dimensional order becomes apparent over time as the resonant effects of the tones evoke pleasant altered states." It really works. Played on a good system at high volume, you can really feel it. When using entheogens, it takes on a whole new form. Mushrooms and cannabis are intensified. When using HBW seeds, muscles tingle and tighten in an ecstatic manner. You can get the CD and info from: The School of Wisdom, 1661 Woodland Ave., Winter Park, FL 32789. Tel. (407) 645-3429. -- *Anonymous*

### VAPORIZING PEGANUM HARMALA

You will love vaporizing *harmala* extract! Not only is there no puking involved, but the effects are much clearer and more cerebral. I find that vaporizing 50-75mg of the extract usually does the trick. More

than that doesn't increase the potentiating effects and only feels like more of a body load. With further refinements, the nausea and puking of all the ayahuasca analogues will become a thing of the past. When extracting *P. harmala* I've modified the recipe from the Winter '94, *ER* (pg 6). Instead of lemon juice I use HCL acid to lower the pH. When defatting with methylene chloride I use about 10-15 percent of the liquid volume. I'm not sure this much is necessary, but I like to get all the oils out for the cleanest possible product. I use ammonium hydroxide to raise the pH. To extract I use 15 percent methylene chloride, swirl it, and let sit for a day. Then I do four more solvent extractions at weekly intervals. Evaporation of the solvent fraction yields a dry crystalline product suitable for vaporizing. -- *Toad*

### *LSD/DMT COMBO*

Approximately one hour after ingesting 100 mcg of LSD, I smoked approximately 20 mg of lab-synthesized DMT. The DMT experience was of a distinctly different character than any of my previous journeys. The initial ascent was much less discomforting or disorienting. In *The Essential Psychedelic Guide*, D.M. Turner observes that LSD's influence allows one a higher launching pad into DMT space, and I found this to be true. All the preliminary symptoms: hum, chrysanthemum pattern, etc. were bypassed. The vision state was immediately there as I closed my eyes and the experience unfolded at a slower pace than usual. It felt like I had more time to register each individual image. The images were the most intricate, detailed and highly ordered DMT visuals I've ever had. They were also less abstract and more recognizable. I suspect that LSD's ability to expand the scope of the mind's information-processing capacity is responsible for the subjectively slower pace; in effect, the acid accelerated my mental processes so they could keep up with the flood of DMT-induced information. In clock-time, the flash lasted nearly nine minutes -- almost three minutes longer than my previous record. My normal experience of linear time doesn't apply inside the DMT flash; it is as if past, present and future exist simultaneously. This makes describing the following experience equivalent to describing a four-dimensional object in only two dimensions! But

I'll give it a shot anyway... Immediately upon closing my eyes, I found myself standing at the bottom of a cartoon-style valley with a river flowing directly in front of me and a thick pine forest about 100 yds ahead. This was a fully three-dimensional, interactive environment, except that everything was rendered in the manner of a cartoon or child's story book illustration. Suddenly, scores of little creatures came scampering out of the forest toward me -- birds, rabbits, squirrels, etc. I have experienced entity contact on nearly all of my previous DMT trips, but usually only one or two at a time. This time I felt as though I was finally meeting the DMT "elves" I've heard so much about -- except that this time they chose to manifest as little cartoon animals. They seemed excited and pleased by my presence.

As they approached me, the scene suddenly underwent a drastic change. In a quick, cinematic dissolve, the forest environment was replaced by a stately, spacious marble chamber containing several awe-inspiringly ornate baby cribs. In contrast to the forest, this room was rendered in an extremely high-resolution, hyper-realistic style. I had the feeling that I'd somehow stumbled into the nursery at Olympus. All the elf-animals then shed their skins, revealing the same forms made out of pure gold underneath. Then they levitated and arranged themselves in geometric patterns of the most breathtaking mobiles I've ever seen: incredible constructions of glass, jewels and precious metals, crafted with a degree of detail and filigree that reminded me of McKenna's description of Faberge Eggs in hyperspace. The positions of the elf-mobiles reminded me of something else, but I couldn't put my finger on exactly what.

As I pondered this, the scenery underwent yet another transition. Suddenly the nursery morphed into the cold blackness of outer space. The mobiles were still there, arranged to resemble constellations against the backdrop of the void. Whenever I was able to focus on one of them, it would burst into flames and incinerate, leaving its molecular "skeleton" visible underneath. The skeletal vision would hold for a second, then its outer form would quickly grow back over it. I spent the rest of the flash observing each individual mobile-constellation undergoing this metamorphosis. Often in the DMT flash I feel as if I am seeing at the quantum level -- experientially confronting the truth

that all matter is really energy. This seemed to be what the activity of the constellations was meant to show. As for the child-like intro, I hypothesize that the experience will try to manifest in a form that is as non-threatening as possible for the subject (assuming one pays careful attention to preparation and intention). I've found ritual, magick and meditation to be useful in this regard. My only negative experiences have been when I've been sloppy in that area: doing it on a whim for the wrong reasons. Based on this experience, I look forward to experimenting with other "launching platforms" -- especially psilocybin. Low doses of some phenethylamines may also be effective, but I'd be very careful about dosage, since both substances cause a sharp rise in blood pressure. Don't be too reckless -- we need to bring our reports back from hyperspace! I'd be interested to hear from other readers who've tried similar combinations. --

*Forbidden Donut*

### PEYOTE-TRICHOCEREUS GRAFTING-1

Everyone seems to love ragging on the Indians for their alleged irresponsible gathering and over-use of peyote, but let's for a minute here drop all the negativity and instead offer more solutions. I recently grafted one-year old peyote seedlings to the tops of *Trichocereus spachianus* branches. Even though the small peyote buttons, freshly decapitated from their roots, were far smaller than the huge open area of the freshly cut *spachianus* tops, all grafts were successful and are now starting the typical rapid growth of grafted plants. I had to apply Ghee or other natural oil with a small artist's paintbrush to the remaining open surface of the cut *spachianus*, or subsequent dehydration would so deform the grafting surfaces that they would partially or completely detach. The oil prevented this and insured my 100% success rate. I started over 150 peyote seedlings over a year ago and at this time more than 100 of them are large enough to graft. My only limitation is available columnar cactus to graft to. I even grafted a tiny peyote button onto a tiny *Trichocereus peruvianus* seedling and they are doing well! I hypothesize that any columnar cactus of any species from any store would work with this technique. It's worth a try in light of the need to discover these things. -- *Anon.*

### PEYOTE-TRICHOCEREUS GRAFTING-2

I can't believe you printed that crap about putting vaseline on a peyote-trichocereus graft. (In your book!) A person I know did a vaseline graft. I had to rescue it from certain death -- the vaseline not only caused the graft to reject, but it clogged the pores in both the grafted stock. To this day (1 year), the *Trichocereus* still has oily film and scars where this method was used; although the grafted peyote pupped to survive, the main plant died. I now have 6 clones of this original plant and I call it the "vaseline graft- clone." I just consider myself a punk grafting cacti, so all you educated people are letting me down. I know more about these things from doing it, and not just by passing information. I've just seen too much bullshit printed about peyote. Someone may have taken their only plant and killed it using that stupid, stupid method. -- *DKW, AZ*

*[There aren't enough years in any one lifetime to do everything yourself, so I do the best I can by quoting from the best sources available to me. I'm uncertain of the exact nature of the failure here: You say that the graft was rejected, yet it still cloned six pups within a year -- that sounds reasonably successful for a "rejection." The salient question is: what is the best way to graft peyote onto a columnar species and prevent dessication of the exposed cut surface? -- Ed.]*

### ROOT SPACE FOR SAN PEDRO

Both *Trichocereus pachanoi* and *Trichocereus peruvianus* respond well to lots of root space. Some of mine are in raised beds in my greenhouse and I have gotten over four feet of new growth in just over a year. Heat, lots of water and sunlight, and occasional feeding are all that's required, given enough root space. I'd be interested in hearing from readers who have experience with other *Trichocereus* species, such as *T. bridgesii* or *T. macrogonus*. -- *JF, CA*

### TRICHOCEREUS PERUVIANUS POTENCY

I've come across *T. peruvianus* in three local nurseries. Some of the specimens have been quite large. If not three times as potent as *T. pachanoi*, I've personally found it to be at least twice as potent. The

appearance of the two species is very similar: six to eight broadly rounded ribs with a freely branching base. *Peruvianus* has frosted bluish-green skin and longer spines. There is usually one central spine per areole, with a length of 4 cm, and six to eight 1 cm long radial spines. The woolly brown areoles are slightly larger than *pachanoi's*, with a "V" shaped notch over them. This "V" shaped notch is one of *peruvianus'* main distinguishing features. The honey-colored spines tend to be darker at the tips and bases. Some specimens have branches which aren't as strong as *pachanoi's*, and may be found arching, or even prostrate. Some varieties have greyish-white spines. *Trichocereus peruvianus var. matacana* is reported to have a much superior root system over other *peruvianus* subspecies. -- DD, CA

### ANOTHER POSITIVE

#### PHRAGMITES AUSTRALIS REPORT

I have been pursuing *Phragmites australis* "Giant Reed" as a Ayahuasca analogue ingredient since your Vernal Equinox, 1995 issue, and can now report good results. I encourage your readers to experience it, as my journeys have been excellent and like those described by this unknown writer. *Phragmites* should, by no means, be written off, as it is kinder than true Ayahuasca. Yet it is different. My present recipe is 3 grams of *P. harmala*, following p.57 of J. Ott's *Ayahuasca Analogues* closely. With this small volume of lime juice and incidental water, there has been no nausea. Just boil it 15 minutes and filter it twice with a cotton-shirt. Increase the water and you will experience the trouble of thinking about your body and will probably blow chow. The *Phragmites* rhizome (50 wet gms. More gms. to be tested soon) is simply boiled 20-30 minutes and tastes just fine. This is about 2.5 feet of rhizome if you can only get it dried out. If you drink only the root, or rhizome, at least, there have been absolutely no bad physical side effects to date with 9 tests on four people. *Phragmites Australis* has the advantage of being everywhere, and I'm happy to report, difficult to eradicate in the East. It needs abundant water and is hard to find where I live in Northern California and in the desert. However, I finally found it growing the Sacramento River Delta, and most poetically, next to the mothball fleet of warships an-

chored in the backwaters of the San Francisco Bay. I like to think about the plant spiritually and physically cleansing this horror of American pollution. I have been told by a botanist that he was unsuccessful in his attempt to grow it here, yet I have started five large tubs of it and every piece has sprouted dramatically. I plan to keep some of the plant growing with water lilies under water, and some in mud only damp on the surface. I expect the tubs to fill with rhizomes and almost burst with the wild energy of this beautiful reed.

I am interested in getting a response from other Ayahuascaros on a related subject which I have both experienced and witnessed. It has no physiological explanation that I can understand. My tea drinking has been with *Banisteriopsis caapi* and *Psychotria viridis*, made by Santo Daime church members and brought in from Brazil, and with the analogue plants described above. The California tea drinkers are often new people, new to the experience, but all practicing some dietary restrictions, and none eating at least four hours before the event. Now, some of these people, including myself, all who drank appropriate portions to get off, experience almost nothing at all on some occasions, and soar on others. This has been both "real" Ayahuasca and my analogue. My experience yesterday was with a long time Uniao do Vegetal Church member and myself, this time me soaring and he less (although he reported that his arms started growing pine needles as he transformed into a tree.) The time we drank together last, he became much higher than me. So it appears that it is possible to block the experience sometimes, so that little happens. Although I can't explain this, it would account for reports of no entheogenic results on new plants sometimes, and variability ascribed to the plant material itself. Have other experienced this with their groups? I personally find that I cannot attain great heights without evoking help and assistance from the Source or Sources of the Light. I cannot get off of my own, or, at least, no longer want to try. I need to do this with prayer at the very onset of the tea coming on. I might add that I am a person who never prayed before, and who would not now, I suppose, if I had not been so powerfully answered. May you stay in the presence of the light. May the Light protect our planet. -- Anon., CA

# TRADITIONAL HEALERS AND SYNTHETIC ENTHEOGENS

The following is an excerpt from a Sunday Supplement article in a South African newspaper. The subject is "Nexus" (2C-B), a synthetic entheogen invented by Dr. Alexander Shulgin. What is interesting is that this drug is now being used by African shamans in traditional healing ceremonies. There is a certain irony in this for **ER** readers, since we tend to go in the opposite direction: seeking the plant teachers!

**One** of the most interesting developments on the local scene with regard to Nexus is that it is the active ingredient in a medicine named *Ubulawau Nomathotholo* (a Xhosa phrase that roughly translates as 'medicine of the singing ancestors'). Up until recently, *Ubulawau Nomathotholo* was available at various African herbal shops where it was sold as an aid in traditional healing. According to the written information inside the pack: "*Ubulawau Nomathotholo* opens the mind to messages, visions and dreams from the ancestral spirits. This makes it an excellent medicine for use by African traditional healers during *intlombe*, *xhentsa*, *vumisa*, divining, healing and *thwasa* treatment."

*Ubulawau Nomathotholo* is marketed by a Lesotho-based company called Inkwazi. According to a spokesman for the company, Mr. Solomon Daba, because of the banning in South Africa of the medicine's active ingredient, it is no longer being sold in the Republic.

"**This is a great pity,**" said Mr. Daba. "The problem that many *sangomas* in South Africa are faced with is that, because they live in the townships, they are unable to get hold of many of the plants and herbs used in divining, initiation ceremonies and healing. *Ubulawau Nomathotholo* is a very safe and effective alternative to

some of the traditional plant drugs that affect the mind, but which many *sangomas* in the cities now find impossible to get hold of. We would like to see a reversal of its ban in South Africa, but we have been advised by the Medical Control Council in Pretoria that this would be a long and expensive process with little chance of success."

**Another person** who would like to see the ban reversed is Dr. Manton Hirst PhD, an anthropologist at the Kaffrarian Museum in King William's Town and a leading authority on traditional forms of *Xhosa* healing. According to Hirst, who has been studying and writing about traditional healing in South Africa for the past 20 years, "*Xhosa* diviners and herbalists, like other shamans worldwide, use psychoactive plants and substances to induce altered states of consciousness in initiates who are being trained and inducted into the profession. Psychoactive plants are highly valued as a means of communicating with the an-

cestors and as a way of gaining insights into the spirit world. "However, nowadays the plant roots traditionally used to induce visionary experiences in novices are very hard to come by. This is due to a combination of several factors, such as the over utilization of wild-

plant resources by herb sellers and healers, and drought and overgrazing. However, even when these plants are available they are quite toxic. Consequently, poisoning, and even death, can occur as a result of taking the wrong dosage -- which even experienced healers sometimes have difficulty estimating." During his field trips, Hirst has met a number of diviners who have used Nexus as a substitute for traditional plants. "At the dosages recommended on packs of *Ubulawu Nomathotholo*, there appears to be no toxicity or physical discomfort and some of the therapeutic results have been quite impressive."

**One initiate** who was administered five Nexus tablets by her teacher reported afterwards that she found herself transported to a beautiful forest where she met wild antelope and carnivores who revealed that they were the messengers of her tribal ancestors. According to the Hirst, "This transcendent experience had a profoundly beneficial effect on this initiate who, up until this time, had lacked confidence in herself and her calling to be a healer."

**Another case history** recounted by Hirst was that of a male diviner who became pathologically depressed after the tragic death of one of his children. Even after the conclusion of the traditional period of mourning he continued to be morose and avoided all contact with his patients. The diviner told Hirst that after taking Nexus he had a visionary experience in which he found himself face to face with *uDali* (the Creator) who revealed to him the underlying meaning of the death of his child. "With his faith and confidence restored, he continued his work as a successful traditional healer."

**Ancestral spirits** in the guise of wild animals, visionary encounters with *uDali* ... these are things that many South Africans will have difficulty getting their mind around. However, for millions of people, especially in the rural areas of the country, these are spiritual issues that are pivotal to their lives.

**What if Nexus really is a safe** and effective alternative to scarce and often dangerous plant medicines? What if this substance really does put healers

in touch with the magical, mysterious realms of consciousness that have been the cornerstone of African belief for thousands of years? And what if South Africa's tens of thousands of traditional healers were to collectively demand that this medicine be made readily available to them?

**What is certain** is that Nexus is going to generate plenty of controversy during the months and years ahead. --*Victor Peterson, South Africa*

### THOUGHTS ON NEO-SHAMANISM

The idea of what a neo-shamanic path entails is different for each individual. Joseph Campbell said that all religions and mythologies are metaphors for us to learn from: mirrors to see the deepest parts of our psyches reflected. In that sense, shamanism provides a metaphor for individuals to use on their inner journey of self-discovery. The shamanic metaphor is certainly in vogue at the moment. Traditionally, the shaman is an outsider, an oddball, and the rewards of the visionary are seldom obtained without a considerable price. Also, the social functions filled by tribal shamans aren't the same as in post modern America. (McKenna discusses this a bit in *The Invisible Landscape*, pg. 17.) His thought is that artists and other creative people who speak through images to our culture are the shamans of our time. When the New Age shamans have moved on to the next fad, the true explorers will still be here -- no matter what we call ourselves. -- *Anonymous*

### ISO-II

I'm searching for an ISO-II (60's relic) in mint to good condition, with instructions. This is a continuous isomerizer for the extraction of essential oils from a solid, using an integrated light bulb for a heat source. I'm willing to pay any reasonable price. Please send information and your offer to P.C., in care of this newsletter. -- *PC, MO*

### SEPARATORY FUNNELS

See the April, '96 *American Science and Surplus* catalog (3605 Howard St., Skokie, IL 60076), page 14, for a bargain price (\$27.50) on a 500 ml separatory funnel. -- *JH, MI*

# ACORUS CALAMUS REPORT

---

**In your book**, *Psychedelic Shamanism*, you included *Acorus Calamus* (sweet Flag/Rat Root) as a minor psychedelic, stating "I don't know anyone who has actually eaten any." Well,... Hello! I've eaten sweet flag on a number of occasions and hopefully I can shed some light on this obscure entheogen.

**Being a student** of herbs, I noted a number of references to the use of *Calamus* as a hallucinogen. Foster's *Herbal Renaissance*, and a book called "*Roots*" (author unknown) both compare the effects of chewing a ten inch segment of root (actually rhizome) to LSD. This inspired me to do some research at the University Library. All in all, information is extremely scarce, but Hoffer's *Hallucinogens* mentions that two of his acquaintances, learned in the study of Hallucinogens, chewed 10 inches and reported the effects were quite LSD-like. The Cree Indians of Canada were evidently the source of this information; they (especially tribal elders) chew a length of rhizome the length of their index finger to maintain mental clarity and vigor. (The Chinese also consider sweet flag a brain tonic and life prolonging herb). 10 - 12 inch segments of the rhizome were reportedly used to bring about shamanic trance (this is a much quoted statistic, but I am unsure of its origin). Also, herbalists cited *Calamus* as an invigorating stimulant (used much like coca leaves) and an excellent stomach/lower digestive tonic. The active ingredient is reputedly Asarone and Beta-Asasone which make up to 85% of the essential oil (which itself makes up about 1 1/2 - 3 1/2 % of the rhizome - C. Ratsch's *Dictionary of Sacred and Magical Plants*). This in mind, I went out and picked up a couple of ounces of the dried chopped rhizome at a local botanical store.

**To get a taste** of Sweet Flag's character, my first consumption was a very small amount of it (literally a few nibbles). It tasted horrible and I was unable to swallow it. None the less, I did notice a short-lasting, mild change in perceptions: primarily visual, but with some mood elevation. It inspired me to experiment

further, but the taste prompted me to put it off for a couple of weeks.

**Foster (Herbal Renaissance)** states that he keeps sweet flag in his ear as a stimulant for use on long drives, hence I had some on me during a mountain biking trip. After finding myself a bit winded my girlfriend and I chewed (and spit) a small amount (silver dollar sized in a cupped hand). We had smoked cannabis earlier that day and found that aside from the taste, it was indeed quite invigorating and produced a noticeable heightening of perception. This lasted maybe 20 - 25 minutes, probably due to the physical exertion of biking.

**Some weeks later** I decided to give the 10 inch dose a shot. Hoping to eliminate the awful taste (it is very bitter), I packed ten 000 gel caps with the powdered herb (powdered, it makes an excellent flea powder). I consumed these at about 11 AM and went for a walk in the woods surrounding my house. I thought I felt a very slight change in awareness, but this could have been due to expectations. Over all, two hours later I was disappointed. (I later read *Calamus* is activated by saliva. and chewing is essential). Determined not to be thwarted, that same day I estimated what I assumed would be 10 inches of rhizome (about 1 ounce) and chewed it in several mouthfuls. This was a real drag. The taste was so bitter, that anytime I attempted to swallow (at the encouragement of my best friend) it induced gagging -- not nausea, it just lept away from my throat. It took probably 20 minutes to chew the whole ounce. When done my friend and I left for the wildlife sanctuary for a walk and some philosophical debate. Again, I kept thinking I was feeling something but twenty minutes later, sitting on a tree stump I dubbed the experience "not worthwhile."

**I then proceeded** to pack and smoke a bowl of cannabis. Before even exhaling the first hit, it kicked in. Everything became crystal clear, every leaf and branch

was distinct. I took two more hits and then needed no more. The trip is not nearly so intense as LSD, rather one seems to slip languidly into periods of insightfulness -- it is definitely a very "inner"-oriented drug. I felt great, and found myself rambling at great length about reality (I do this naturally, but believe the *Calamus* helped). The experience was at once marked, subtle, and lasted for upwards of 8 hours before slowly tapering off into sobriety. No ill effects were noted, other than some minimal eye strain. I have found one ounce to be an adequate dose.

**Miller mentions**, in *Ritual and Magical use of Herbs*, that *Calamus* can also be smoked. I mixed *Calamus* at a 1:1 ratio with cannabis and can vouch for its effects. It is a much easier way to experience the buzz (no bitter taste), but the effect does not seem as "clean" as chewing. It potentiates the cannabis high with greater visual clarity and no tiredness. It is good to have around to "beef up" not-so-hot-pot. Smoking *Calamus* alone requires more. It doesn't taste great, but does produce a more visual aspect -- two dimensional objects take on three (maybe four?) dimensional depths, widths, etc. I did not find this extremely interesting and prefer the synergistic effect of marijuana.

**Now that I've decided** I like *Calamus* I did some more looking. I read somewhere that the essential oil produced in LSD like-state. Hoping to find a way around the prolonged chewing of the root, I ordered a bottle of the essential oil from a botanical company and began cautious experiments. One drop smells and tastes awful. No effect. Three drops is also unpleasant, more so than one, and produced only a minimal experience, not quite like chewing or smoking. Four drops with a bowl of cannabis was somewhat inebriating, but inferior to chewing or smoking. Ten drops proved unpleasant and emetic. I have not used it since. A psychedelic profile in the *Journal of Psychedelic drugs* (great publication) states that the conversion of Asarone/b-Asarone to TMA-2 (a mescaline-like substance, but considerably more powerful) is "easily realized chemically" but I have no information on that (anyone?).

**Friends report** varying degrees of success with *Ca-*

*lamus*. Some can't get over the bitterness, other's want a stronger trip. One devotee recommends consuming it with a cup of gota-Kola tea. Overall I find *Calamus* to be a valuable entheogen. It doesn't compare to mushrooms or more intense plants, but when you need to get in touch with yourself, *Calamus* provides a unique and worthwhile trip. -- **IM, MI**

### VISION PLANTS

I'm going blind due to macular degeneration in both eyes, genetic and irreversible I have been told. Also have a cataract in each eye, the one in the right eye severe but the doctor won't remove it because he says it will not improve my vision. I know that cannabis can help relieve the pressure of glaucoma, which I also have. I would like *ER's* help in trying to find other plants which might be of use in improving vision and note that many people are getting cataract surgery -- apparently it is almost an epidemic, possibly due to nutritional factors. Perhaps chickens infected with avian leukosis of the eye if used for human food transmit this disease of cataract formation. -- **GD, KS**

## SALVIA DIVINORUM

Organically grown. Finest quality  
air-dried leaves.

1/4 Oz: \$20, 1/2 Oz: \$40, 1 Oz: \$75  
Plus \$2.00 S&H

Also: Quality Kava products.  
Send for free catalog.

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F96 means that the Fall, 1996 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- Jim DeKorne

# THE WITCHES' FLYING OINTMENT

---

*The Entheogen Review* is dedicated to publishing information about psychotropic substances (both plants and synthetics) and their effects on human consciousness. Behind this objective is a desire to understand the full nature of human-beingness and its place in the cosmos. Unfortunately, this noble intent must take place in a climate of extreme political repression. What should be the legitimate subject of scientific, university-supported research is now largely undertaken by outlaws who risk imprisonment every time they explore the unknown realms of their own consciousness.

In acknowledging this sad truth we must not dismiss the legitimate concerns motivating the oppression we face: there is an unprecedented substance-abuse problem in this country, and the entheogen-respecting minority must accept the fact that a significant number of people using drugs couldn't care less about our spiritual motivations. I am only dedicated to presenting information of use to serious psychonauts. The boring, "scholarly" layout and latinate vocabulary in *ER* are conscious and deliberate -- the last thing I want is for it to become easily accessible or appeal in any way to immature enthusiasm.

All this is to introduce the following two submissions: the information in them is potentially useful, yet could lead to disaster if abused. The plants used in classical witches' salves are among the most poisonous botanicals known to science. You can kill yourself if you mess around with them carelessly. Those who feel impelled to experiment with the formula here revealed must do so at their own risk -- please re-read the disclaimer that appears on every *ER* cover. I only present data -- it's entirely the reader's choice of what to do with it. -- *Ed.*

*Excerpted from "Found: the Witches' Salve," by Jack Dunning, Fate Magazine, December, 1960. This is an article about the work of Dr. Erich-Will Peuckert, a full professor at Germany's Göttingen University and*

*a specialist in European occultism:*

...Most sensational of Dr. Peuckert's findings and experiences, however, were those with the "witches salve." Dr. Peuckert discovered the formula in a book called *Magia Naturalis*, written by Johannes Baptista Porta in 1568. It is a rare book, written in archaic Latin, nearly impossible to obtain and difficult to read. To translate it properly, one must be not only a scholar in medieval Latin but a research specialist in alchemy and witchcraft.

Dr. Peuckert is careful not to reveal the formula, but the salve is made from plants which are readily available, though extremely dangerous... Dr. Peuckert warns that any attempt to reproduce the salve without complete knowledge of the ingredients and their proportions would probably result at best in a stay in the hospital and at worst in a speedy trip to the morgue.

As a good scientist, Dr. Peuckert did not hesitate to test the salve on himself. And, also as a good scientist, he needed a control in order that his observations might be objectively and subjectively verified. He chose as his companion for the experiment an attorney friend...who knew nothing whatever about witchcraft prior to the experiment, or about the effects the salve might produce...

Following the directions in *Magia Naturalis* they applied the salve to their foreheads and armpits. Within a few minutes both fell into a deep, trance-like sleep which lasted for 20 hours. They awoke with all the symptoms of a vicious hang-over. Their mouths were dry, their throats hurt, they had blinding headaches. But they had lived through that wildest and most depraved of all debauches -- the Witches Sabbath!

What was it like?

Dr. Peuckert is reticent in his description. He had

visions of horribly distorted human faces. He had a feeling of flying for miles through the air. He (sic) flight was, from time to time, interrupted by dizzying swoops and plunges. He landed on a mountain top.

Finally came the celebration of the Sabbath itself, with wild orgies and grotesque debauchery, and voluptuous young ladies playing a prominent part. Beings with the appearance of monsters and demons joined in the erotic activities. There were perverted sex practices and they paid homage to the Devil.

Despite his hang-over Dr. Peuckert remained a scientist. His first act on returning to consciousness was to write a complete, detailed report of his experiences and to obtain a similar document from his friend before they compared notes.

Details on these notes cannot be published here, but when Dr. Peuckert compared his report with that of his attorney friend he was momentarily speechless. The reports were virtually identical! Except for differences in terminology and expression, both men described the same experiences.

Even more significant as far as Dr. Peuckert's scientific research was concerned, both reports written by these professional men in the year 1960 tallied in every detail with the recorded statements of accused witches who had died at the stake during the witchcraft trials of the Middle Ages!

This was the answer Dr. Peuckert had been seeking. He knew now that witches' tales of olden times were not mere products of imagination or insanity but factual reports. Men and women had known the secret of the salve and had used it...

The secrets of the salve and its use are believed to have

been brought to Germany by roving bands of gypsies. The knowledge was disseminated by groups of women whose female secret societies represented the vestiges of an older matriarchal culture that Dr. Peuckert believes had its roots in the south of France but may have been spread over a much wider area.

Regardless of the findings many questions are left unanswered in this report. Why, for instance, does every person using the salve dream the identical

dream? How can a drug invariably produce such complicated visual and tactile sensations? Can a person really dream of something for which there was no precedent in his mind?

...It has been suggested that the unchanging manifestations of the drug may be explained by something lying buried in the human

mind itself. Can it stimulate a specific segment of racial memory? And if so, memory of what? Of times when men flew? Of human orgies with nonhumans? Or with masked humans? Or are these experiences, after all, merely symbolic expressions or mechanistic hallucinations as the psychologists have always believed? ...

*NOTE: Are there any Latin scholars out there who have access to **Magia Naturalis** or a facsimile copy thereof? It would be interesting to compare its salve formula with the following:*

### *FLYING OINTMENT FROM FINLAND*

Witches in Europe have been using flying salves for hundreds of years, but the ingredients may vary. Some witches put blood from bats into their salves but these ingredients had no psychoactive contents. The main ingredients of this salve are: *Datura stramonium*, *Atropa belladonna*, *Aconitum napellus* and *Hyoscyamus niger*. All of these herbs are very poison-

ous, so you should not take too much of them or death will result.

*Aconitum napellus* [Monkshood, Wolfbane] is a very poisonous herb, which gives a feeling as if flying or falling down from somewhere. 1/15th of a gram [66mg] of *Aconitum napellus* is enough to cause death. The proper dose of *Aconitum* is 1/35 of a gram [28mg] of the fresh leaves in the salve.

[Appropriate quotation: "...As the poison content can vary considerably from plant to plant, the dosage was difficult to calculate..." -- *The Witch's Garden*. (See full reference below.) -- Ed.]

*Atropa Belladonna* [Deadly Nightshade] is a herb which is quite poisonous too. Fourteen currants of *Atropa Belladonna* will result in death. One to two currants will, after you have eaten them, make it psychedelic (or make you mad), but the salve shouldn't be eaten.

*Hyoscyamus niger* [Henbane] seeds, will when eaten, cause hallucinations, but then you should eat 3 - 4 grams of the seeds. In the salve any way, you should not put more than a 1/2 gram [500mg] of pulverized seeds.

*Datura stramonium* is poisonous too. If you want you can add 5 seeds to the salve, but the salve will make you fly without *D. Stramonium*. Witches put the salve on their staffs and used the staff for masturbation. (If you are a man you can put the salve into your armpit, or on your neck.)

The contents of the salve (for one person)

1/35 gram [28mg] *Aconitum napellus* (fresh leaves pressed until they are in small pieces)

1 *Atropa belladonna* currant (fresh)

1/2 gram [500mg] pulverized *Hyoscyamus niger* seeds

5 *Datura stramonium* pulverized seeds

1/2 gram [500mg] oil meant for making food

The salve should not be allowed to dry. If *A. belladonna* currants dry, the structure of Atropin, the

active chemical in the currants, will change to another poison (which is very dangerous) so don't let your salve dry. You can keep it in small capsules to prevent drying. I recommend only to use fresh salve.

*D. Stramonium*, *A. Belladonna* and *H. niger* seeds can be bought from Of the Jungle. *A. napellus* seeds can be ordered from Finland for 15 Finnish marks. I don't know what postage is so write to:

Siemen Oy  
Ristikivent.6  
P L 73  
04301 Tuusula  
Finland  
Europe

(Don't ask about effects or they maybe won't sell to you.)

I am interested in how to prepare and how many beans of *Sophora secundiflora* should be eaten to get a mescaline trip. -- *Merlin, Finland*

[Anyone interested in experiments with classical witches' flying ointments should be familiar with the following book: Harold A. Hansen, *The Witch's Garden* (1978), Unity Press, Santa Cruz, CA. This edition is probably out of print, though other editions may be available now. *Aconitum napellus* is covered in some detail. One of the classical poisons of antiquity, the Roman Emperor Claudius was assassinated with an *A. napellus* extraction.

*Quote:* "The well-known historian of witchcraft and magic Dr. Karl Kiesewetter--one of the first to experiment with witches' ointments in modern times--died of poisoning after one of his experiments."

A final thought: While it might sound like kinky fun to spend a few orgiastic hours with sexy Satan--worshippers, I'm **positive** I wouldn't want to exist for some similitude of eternity in such company just because I miscalculated my ointment ingredients. 28mg of green leaf is approaching a homeopathic dose -think about it! -- Ed.]

# VOYAGES INTO HYPERSPACE

---

## "I DON'T BELIEVE IN ALIENS... BUT"

I am writing this as I am coming down from a deeply unsettling day of psychic exploration. I have been combining large doses of *P. cubensis* with *P. harmala*. The first few sessions brought exceedingly brief and tantalizing glimpses of presences or entities -- definitely non human. I have limited myself to one session per month -- both to give time to digest the experiences fully and also to recover stamina and cleanse my system. At these doses this is definitely not a recreational experience, or to put it more aptly -- you're talking about a serious butt-kicking.

I have been studying early cultures for years, using shamanism as a model for my own inner exploration. The Inuits regard the Shaman's path as one of grave danger, many are destroyed. I am learning what they mean by this.

Today's session was begun with the idea of making further contacts. This definitely happened. What I saw/experienced was not human shaped at all. There were several types. Some were more animal like -- non-rational predator beings. First I would sense or intuit a presence -- then the fabric of space would twist into a circular, but amorphous form -- moving across my field of vision. I realize a phrase like "the fabric of space twisting..." is a bit over the top -- but I don't know how else to describe it.

There was no verbal communication of any kind. A few encounters were with intelligent non-human beings -- some of these were benign -- and as curious about me as I was of them. Others were malicious -- the notion of "evil spirits" was quite profound. In ways I felt like it was a battle with my own dark side -- the destructive desires swelling forth -- frightening images of slaughter and carnage. The other encounter I had was totemic in nature.

Almost 20 years ago I encountered my personal to

tem/ally during another *P. cubensis* session -- it was like nothing else I've experienced -- a true vision. I became a hawk and was flying above vast valleys. I shrieked like a hawk with the sheer joy of it.

Today I encountered a new ally -- the raven. There was an undeniable presence -- I also saw several visions of them metamorphosing in the room. I became aware that a choice was expected -- would the raven be my new totem? I was surprised by this turn of events -- I'd never thought I might have a different totem. The hawk appeared to me in several evanescent forms and ultimately I did not make a final choice. This felt OK.

What I don't think comes across in these pages is the absolute certainty of the existence of these spirits/beings or whatever. I've done my share of serious tripping and seen some marvelous visual phenomena -- but these were of a completely different order -- I could feel their presences just like someone else in the room with me.

You must understand, I have tried to maintain an empirical framework over the years and regard entheogens as a means of exploring the inner mind -- accessing the unconscious. I don't believe in aliens, gods, spirits, demons, fairies, elves, and the like. But what I experienced today has shaken my belief system to the core. Yes. These could have been manifestations of my own unconscious -- core archetypal forms. But they sure didn't seem like it.

I wonder if this parallels the experience of the schizophrenic. Even though I was still rational and lucid -- knowing full well my visions were mushroom-induced -- I still was absolutely convinced of their substance and reality.

Many insights occur to me, having previously read Ott's "Etiology of Religion" and many of McKenna's articles -- I have long ago accepted the substantial role entheogens must have played in the origin of religion

in the mind of early man. But if those early shamans were having entity encounters like I did today (and it seems likely they did) -- my god! -- how else could they interpret those experiences! Spirits -- totems -- deities -- once you've met a few face to face, the progression of mythologies and religions seems inevitable -- even if they aren't "real" as such, but are unconscious projections -- the result is the same.

I begin to consider that ancient art -- the bizarre alien-like figures in much of the Anasazi petroglyphs -- were these representations of beings met in vision states? The pantheon of Aztec and Mayan gods -- truly strange and fantastic beings -- how many of these came directly from mushroom sessions?

I recall Don Juan's first question to Casteneda (regardless of whether one accepts or rejects Don Juan's existence) -- he asked why he (Carlos) wanted to take Peyote and Carlos says "Isn't the desire for knowledge enough?" And Don Juan said most certainly not, that one should be very clear on why one chooses this path. I thought I was clear on this -- but I'm not so sure, right at this moment. There's a lot I need to think about.

I have also been re-reading a couple of Grof's books. I wonder how his perinatal notion -- esp. BPM III fits into this. It seems that the dark and destructive side of the psyche is often manifested with entheogens. My last several sessions have been caught up in this. Are these "evil spirits" my own projections, as I struggle through to the next stage? -- *Hawk*

### *INTREPID TRIPPING IN AUSTRALIA*

Alone, I first ate four *Psilocybe cubensis* mushrooms (around an inch in diameter, strong blue staining). Fifteen minutes later I ate three heaping teaspoons of *Peganum harmala* seeds, together with approximately 150 mg of *Acacia*-extracted DMT and related alkaloids in freebase form.

Twenty minutes after this I was feeling highly stoned on the harmala, but there was little visual activity so, (somewhat impatiently and foolishly) I ate another 50 mg of *Acacia* extract.

I then lay down and started to drift into a dreamy trance. I saw/felt peripherally a number of female entities (human, ancient, wise), who were comforting me, but telling me I would soon die, and had been foolish. This did not significantly perturb me as I was familiar with the idea of shamanic death, and I felt very peaceful. Resigned to my fate.

At the 1 1/2 hour mark the visions grew rapidly from subtle edge-enhancement with sparkles and light pin-spots to bright "jewels on fire" overlaying everything with auras of almost electrical "glissando xylophone" sounds accompanying, and a body feeling like I was on the edge of convulsion. With great difficulty I stumbled outside to the edge of the forest. Every plant had its own spirit inside it; all "eyes" were on me, a cacophony of voices, some sympathetic, some hostile.

Completely unplanned, and for reasons I'm not sure of now (except curiosity, of course), I went back inside and vaporized around 60 mg of *Acacia* extract in a bottle with foil on the bottom (this was before I had a pipe). When the extract had completely burned and the bottle was thick with yellow smoke I took it in a single fast toke. Before I had time to balk at the harshness I was flung fast in a direction that felt like forwards and down at the same time... I arrived, terrified, inside some kind of a huge, dark green (I think) "brain" or "mind" which I knew to be much vaster than my own. I was in it, and yet it was somehow in me. Within this "mind" were many other minds, like those of great philosophers or shamans, and they seemed to be working on some kind of problem. (Something like, "what is beyond?" It felt like the mind of the creator of organic life, and yet this mind pondered its own source.)

I felt like a stupid monkey who'd burst into somewhere far out of my depth. The vibe wasn't so friendly either, more like: "Why have you disturbed us? Go outside!" Instantly the space folded and detached and I was left sitting on my bed, surrounded again by jewels, but now greeny, darker colors. This was not like a usual smoke -- the transition from flash to tail-end geometrics was instantaneous!

To my surprise I easily stood and walked again to the edge of the forest. Every plant sang its own song, but now I could hear a voice clearly over them, like a whisper. It told me the path to where I wanted to go was a long and dangerous one, but it would give me a gift, that I might use when I really needed it. At that point everything dissolved like I had just smoked more DMT. Dry skin rippled strangely, my muscles twitched, and the bones in my face started to move! I found myself flying over the forest, like a wasp or mantis. This lasted about ten minutes and faded back into me standing. It then felt like I was coming out of my smoke. Geometric patterns continued for another 40 minutes. For some reason, unlike every other harmala/tryptamine combination I've done, there was no nausea and I did not purge. I can't explain this, but it's the only time I've combined psilocybin and DMT in this way. Other attempts at smoking on top of orally activated DMT have often resulted in nausea, but significantly, visions I can touch. (But not always pleasant ones!) -- "E," *Australia*

### *A KETAMINE REPORT*

I've seen little about Ketamine reported in the Review, and since I was finally afforded the opportunity to experience it recently, I thought I'd share my impressions... For my first experiment, I administered approximately 100 mg. intramuscularly. There was about a three minute latency period. My first alert that it was taking effect came as a rising ringing in the ears. This noise was qualitatively different from the DMT carrier tone in that it sounded considerably less electronic and it almost exactly mimicked my natural tinnitus (the musician's curse). This sound grew in intensity until it obscured all audio in the environment, but it was in no way uncomfortable. Then a most remarkable process commenced. My entire sphere of awareness, both in terms of my external sensory perceptions and my internal sense of self, began to contract. Are you familiar with the film editing technique of fading out from the edge of the screen inwards until the image is reduced to a tiny dot in the center? This is essentially what happened to my consciousness over a period of a few minutes. First my peripheral perceptions blurred and contracted, then my primary senses, my connection to my body, and finally my

sense of "me". There was absolutely nothing scary or uncomfortable about this sequence of events; it felt utterly natural and benign. At the end of this process I was nothing but a single, tiny dense point of consciousness in the midst of a vast, multi-dimensional, seemingly empty space. Then that vanished, and with it went the last vestige of observer consciousness and individual identity. At this point I felt that I had traveled back to the primordial, undifferentiated oneness of being that preceded the big bang and the creation of the manifest universe. There was nothing to see or interact with; this was a level before any sort of subject/object distinctions. The universe was all one thing, and I was it! After about thirty minutes on the clock (although subjectively the concept of earth-side time was completely meaningless), I somehow regained a slender thread of individuality, and I noticed that my eyes were open as objects in the room began to slowly come back into focus. This reminded me that I had a body, and I began to feel connected to it again from my extremities inwards. This re-entry process felt good, like being born anew. Twenty minutes later I was fully incarnate once more. For the next hour and a half I was woozy, shaky on my limbs, thick-headed, and somewhat nauseous if I moved around too much, but this phase was considerably less uncomfortable than I had been led to expect. Cannabis proved to be a valuable ally in tempering the discomfort of the recovery period. I slept well that night and arose the next day feeling slightly light headed, but still handled a full day of classes easily.

For my second experiment I decided to do some combination work, with the goal of trying to bring back more specific information from the peak state. I started by pre-dosing with approximately 100 mcg. of LSD. After waiting almost two hours for that to stabilize, I then smoked 25 mg. of DMT, resulting in a lengthened, extremely vivid and positive journey. The after-effects of the DMT intensified the acid high and left me in an ecstatic emotional state which I figured would make an ideal launching pad from which to enter the Ketamine domain. I then injected an i.m. dose of 75 mg. and had an experience almost identical to the previous one, except that it took longer for my identity to dissolve, and I felt as though I spent more time in the undifferentiated state. Interestingly, it ac-

tually took less time on the clock than before! The truly remarkable part of this session began, however, when I took a hit of nitrous oxide as soon as I had regained enough physical control to do so. D.M. Turner's *Essential Psychedelic Guide* had warned of an intensified recovery period in an LSD/K combo, and I had heard from other sources that nitrous could be useful in mitigating the related discomfort, so I had a few boxes of cream chargers on hand. Each lungful of N<sub>2</sub>O sent me rocketing into a unique, utterly complete reality simulation of truly fantastic proportions! These virtual realities were so detailed and convincingly rendered that once entered, they were fully accepted as the "base reality" by what remained of my conscious mind, with all concept of having taken drugs being completely forgotten! The content of these scenarios ranged from riding around the cosmos like a bronco-buster on the tail of an ornery comet, moving through alien landscapes on what were apparently different planets, and conversations in my room with real people from my life who were not actually present. These reality simulations seemed to me a staggering experiential proof of another concept that I picked up from Turner's book: that the manifest universe is truly a construct of consciousness, not the other way around. The first of these was somewhat disconcerting, as there was some fear of never returning to consensus reality, but as soon as I came back this ceased to be a concern. My companions later informed me that it appeared as though the nitrous blasts sent me back into the depths of the Ketamine state for three to five minutes each, and that my eyes were moving around behind the lids in a manner very similar to DMT REM. After inhaling ten whippets, I arose feeling even better than I had after the previous experiment. Physical control was much improved and nausea was considerably reduced, although I still felt rather "thick". I spend the rest of the evening and the following few days enjoying a truly sublime after-glow of inner peace and deep serenity, feeling absolutely connected to all that I perceived and profoundly blessed to have been graced with such a beautiful learning experience. Upon reflection, I would say that nothing short of DMT has yet had such an immediate, deeply moving and meaningful effect upon me as this compound. In contrast to the shocking ontological/epistemological challenges that my journeys with

the former represent, these trips have strongly reinforced many core beliefs about cosmology that I've held for most of my life. The notion I mentioned earlier about the universe being essentially all one thing - consciousness - is probably the most gratifying of these ideas to have found validated via K. I also feel that my experiences in the consciousness-contracting phase of the onset have given me a profound and highly accurate insight into the process of dying, although I have nothing but intuition to support this extremely speculative notion. I realize that K can be risky to work with; one has to obtain a sterile supply and utensils, learn how to properly administer an intramuscular injection, and be extremely wary of the repeated use trap. However, I believe that the experience would be of great value to anyone with a serious interest in the many diverse operational modes of consciousness, and it is in that spirit that I submit this report.

### *Postscript:*

About using nitrous: the way I've been doing it involves commercial whipped cream chargers and a seltzer bottle. The nitrous chargers are the exact same size and shape as the CO<sub>2</sub> cartridges used to make homemade seltzer water, and a seltzer bottle can hold three of them. Then you can put a balloon over the nozzle, dispense into it, and inhale from it. The key here is remembering to take the balloon out of your mouth and breathe some air regularly, which can be tough. You can also take hits straight off of the seltzer bottle (not recommended). In either case, make sure to wait a few minutes between cracking the canister into your dispenser and taking the hit to deal with the temperature issue. I recently posted that same report to the Visionary Plants List and got some concerned responses from medical types who suggested acquiring an oxygen tank, dispensing the seltzer bottle into a trash bag, filling it with an equal amount of Oxygen, and inhaling from that. I haven't tried this yet. Incidentally, nitrous can also bring back the DMT flash for a minute or two if taken immediately at the flash's end.

# FOOD FOR THOUGHT

## QUOTATIONS OF INTEREST TO PSYCHONAUTS

---

### HIGHER GUIDANCE IN 1943

*If you'll recall, Dr. Hofmann synthesized LSD in 1938, then shelved it for five years and went back to working with it in 1943, which is when he discovered through semi-accidental process that it had a profound effect on the mind.*

*Now, the question is how did that happen? Laboratory procedures are standard. If Hofmann absorbed it through his fingertips in 1943, how come he didn't absorb it through his fingertips in 1938? What was going on in 1943 has all the hallmarks of an intervention of some kind of higher design, some kind of higher guidance.*

*A few months before Hofmann made the discovery of the potential of LSD Enrico Fermi in Chicago triggered off the first atomic chain reaction, which led directly to Albert Einstein writing a letter to President Roosevelt informing him of the potential of building an atomic bomb.*

*Now, it's worth considering that there is an evolutionary process on this planet that has guiding forces, guiding spirits, beings, if you wish, that can and do at certain times intervene to bring about certain events that change the normal course of evolution.*

*I feel that in the future, perhaps 10 or 15 years from now, there will be centers -- holistic, psychic, spiritual, mental, physical health centers -- where people will be able to go at times of catastrophic crises.*

*In such centers there would be people who would be trained guides, and there would be the possibility of combining mechanical tools with other kinds of yogic meditative tools.*

*This would not be something that is that new, because all of the evidence indicates that in ancient cultures*

*such as in Egypt, India, Persia and China such practices were very much a part of spiritual training programs, very much along those lines.*

-- Ralph Metzner, *High Times*, February, 1978

### MUSHROOM RESTAURANTS

*Both **Ps. (sub) cubensis** and **Copelandia sp.** are sold to tourists in several resort areas of Thailand, notably on the islands Koh Samui and Koh Pah-ngan (Allen and Merlin 1992). Restaurants on these islands serve hallucinogenic omelettes, stews, soups, and even pizzas containing so-called "magic mushrooms," that is coprophilic **Ps. cubensis** grown in "farms" which mainly consist of well-manured rice paddies. This practice is, of course, not without danger, because consumption of these dishes has sometimes induced bizarre and dangerous behavior in tourists. Worse still, some restaurants serve omelettes containing more powerful synthetic hallucinogens, such as LSD! Similar practices using the same mushrooms are said to represent a minor tourist attraction on the Indonesian island of Bali (Hollander 1981).*

From: T. Stijve: *Worldwide occurrence of psychoactive mushrooms, Czech Mycol.* 48 (1), 1995

### UNAMERICAN ACID DEALERS

*...LSD dealers really aren't in it for the money. According to one narcotics investigator: "None of them have jobs, never want jobs. They don't think of things like getting a house and a family and a car... I invest in assets, in money and gold jewelry. LSD dealers could care less...none of them, they don't have credit cards, they don't have jewelry. It's just a...free life--style."*

From: Peter Stafford, *The Last Word, Island Views*, Summer/Fall 1995

*[You can't win. Maybe acid dealers would get more respect from narcs if they were as mercenary as the Columbian Cartel. -- Ed.]*

## EASY TRYPTAMINE PIPE

An easy way to smoke synthetic tryptamines or *Phalaris* extract is to dissolve the crystals or tar in just enough ethyl alcohol for them to go completely into solution, then stir in about 20 one-toke increments of crushed mint leaves per gram -- you can do it all in a standard shot-glass. (The pipe described below makes a good measuring device for the mint leaves.) After the alcohol evaporates you should wind up with 20 tokes -- enough to last quite a while, unless you have lots of curious friends. In this form, it's much easier to smoke DMT in a hash pipe than going through the glass-pipe vaporization routine. If you're particularly adventurous, cannabis can be used instead of mint, though one should work one's way up to using this combination. Botanical extractions vary in potency, so experimentation is in order to find the best concentration ratio.

A quick and easy way to make a tryptamine pipe is to cut an *empty* .257 Roberts cartridge casing about 1/4 inch from where it expands from the bullet end. Use a standard tubing cutter (used by plumbers to cut copper pipe) -- it takes about 10 seconds and results in a clean edge. A six or eight-inch length of standard 1/4 inch

copper tubing is then sweat-soldered onto the bullet end -- actually the fit is usually so snug that soldering is not absolutely essential, though it makes a much firmer pipe. Bend it carefully into pipe-- shape (you don't want to crimp the tubing), add a pipe screen (any tobacco shop sells them), and you're in business.

Any .25 caliber cartridge casing will work, since that's the decimal equivalent of 1/4 inch: a common copper tubing diameter. I prefer to cut the casing-bowl so that it will hold only a two or three toke amount of material. Sweat-soldering is a common plumbing technique and extremely easy to do: sand the outside surface of the tubing and the inside surface of the cartridge with emery paper until they're shiny; smear both surfaces with soldering flux, then assemble them; heat the outside surface of the cartridge where the tubing enters it with a propane

torch, and touch some wire-solder to the joint -- when it's hot enough, you'll see melted solder being sucked into the joint by capillary action. That's it -- don't apply too much solder, as very little is needed. Once set up with the tools and materials, anyone could turn out hundreds of these pipes in a very short time. Use your imagination as to decoration.

-- Billy Bud, CA

# NETWORK FEEDBACK

## BOOK REVIEWS

***Sacred Mushrooms and the Law*** (1995), Richard Glen Boire, Spectral Mindustries, POB 73401, Davis, CA 95617-3401 \$5.00 plus \$1.50 S&H. Calif. residents add .50 tax.

This is a concise summary of the laws pertaining to sacred mushrooms, specifically the genus *Psilocybe*. It gives a brief history of these entheogens and then proceeds to lay out the various federal and state statutes regarding them. Of particular interest are tables showing sentencing guidelines used by prosecutors and judges. Sample cases are reviewed to illustrate the various issues that come up and a brief discussion of the religious defense is presented. A specialist in drug law, the author has also written *Marijuana Law* (1992) and is the editor of *The Entheogen Law Reporter*. (Both highly recommended.)

Any American citizen involved with sacred mushrooms really needs to obtain this booklet -- knowledge is power, and should (heaven please forbid) the law intrude itself into your life, you need to know *beforehand* what this publication has to say. Armed with it the chances are good that you'll know more about the subject than the arresting authorities -- think of it as a kind of condom against oppression. -- *Ed.*

***Psychedelic Resource List -- a Compilation and Update of the First Five Issues*** (1996), Jon Hanna, Soma Graphics, PO Box 19820, Sacramento, CA 95819-0820, 115 Pgs (\$19.95 + \$3 S/H, \$5 S/H foreign.)

Most *ER* subscribers are probably familiar with Jon's periodical of the same name -- this is his revision of all back issues. Looking for an obscure book? Need the address of an ethnobotanical supplier? Want to know all the websites dealing with entheogens? Look no further -- anyone seeking information on anything per-

taining to psychedelia will find this book to be an up-to-the-minute compilation of the latest data. His (blush) nice words about *ER* notwithstanding, Jon's no-bullshit, in-depth, tell-it-like-it-is honesty is refreshing in a world of editorial ass-kissing. He doesn't hesitate to tell you who the rip-off artists are. Think of it as a *Whole Earth Catalog* of psychedelia. -- *Ed.*

## A NEW SOMA CANDIDATE?

In the *Kama Sutra* herbal section *Mucuna pruriens* is mixed with *Tribulus terrestris* as an aphrodisiac. The latter plant is closely related to Syrian Rue (*Peganum harmala*) and is said to contain harmine and harmaline in Ott's *Ayahuasca Analogs*. -- *EH, MA*

[This is an interesting connection -- it is claimed that *Mucuna pruriens* contains tryptamines. I've received reports that *Tribulus terrestris* (Puncture Vine, Goat-head) contains more harmine/harmaline than *Peganum harmala*! It follows that the two mixed together would be a bonafide ayahuasca analog. Many people experimenting with smoked tryptamine extracts report aphrodisiacal effects. Could this combination be the Soma of the vedas? I don't have a copy of the *Kama Sutra* available, but perusal of its herbal recipes might be illuminating. -- *Ed.*]

## AFRICAN KYKEON?

*Securidaca longipedunculata*, Fresen, Family: *Loganiaceae*, was considered a probable psychoactive plant (at least for the SISSC data banks), because it is involved in many magico religious cults in Black Africa. For example, it is used together with three other plants to induce "spirit possession" in Malawi (Hargreaves, 1986). Now, two new data reveal more about this plant. An Italian anthropologist discovered that a watery solution (yes, just a watery one) of the roots of this plant is used for psychoactive properties in religious initiations in Guinea Bissau (Filippini and Allegri, 1992). Furthermore, detailed biochemical analysis performed by Italian chemists showed in the

roots the presence of ergot alkaloids (the first time we find such alkaloids in this family!), mainly elymoclavine and dehydroelymoclavine (Costa et al., 1992 and 1994). Could we be here at the presence of an African key toward the solution of the Eleusinian psychopharmacology? -- *Giorgio Samorini, Italy*

### AMANITA URINALS

Although outside the regular scope of *ER*, I thought your readers might benefit from the general commentary expressed by this picture from a Japanese newspaper. Tourists to mainland China have long complained about the lack of public toilet facilities. To combat this situation, the Chinese government recently exhibited possible future public toilets. What do they look like? Well, they look like giant *Amanita muscaria* mushrooms, red color and all! Just step inside the stem, do your business, and come out, if not changed in outlook, at least somewhat relieved. If this wasn't so laughable, it would be saddening. It seems the rift between the sacred and profane widens each day as the general population mistakes the one for the other. -- *ES, Japan*

[Maybe not -- one of the traditional ways that Siberian shamans get high on *Amanita muscaria* is to drink the urine of a previous imbiber. The Soma gods seem to have an earthy sense of humor! -- *Ed.]*

### ERGOT HOMEBREW

Actually, it sounds quite reasonable that some efforts have been made at one time or another, to spin some ergot source into a fermentation. Maybe a more likely strategy would be to add something like morning glory seeds to a brew, rather than hops, and there might be some leaching out of the lysergic acid amides into the drink. Certainly there would not be any LSD as such, as it is yet to be found in Nature. But there are many reports of an intoxication of some sort following the ingestion of small quantities of these flower seeds. -- *Anonymous, CA*

### FROM PEYOTE TO SOMA

Kudos re: article on peyote decline and habitat loss (Spring, 96 *ER*). Anything we can do to avoid peyote's extinction should be done. However, I would argue for a total moratorium on peyote consumption -- I feel the author underestimates the impact of overcollecting, and the Mexican population is in decline as well as the Texas one. Flocks of passenger pigeons once darkened the skies; where are they now? With \_\_\_\_ (fill in the blank) million members of the Native American Church consuming up to 30 buttons a pop, at least several times a year, plus the Huichols and god only knows how many whites consuming them, the Mexican plants won't last either.

I feel Wasson has a better argument than McKenna re: Soma. Among other things, the primary Hindu religious texts, the Vedas, contain several references to pissing soma. I know of no other drug whose devotees practice urine drinking. -- *Hatter*

### ANADENANTHERA COLUBRINA

I recently purchased some *Anadenanthera colubrina* seeds from an english botanical company and have tried to make snuff as follows: 1. Seeds were moistened and crushed into a paste

which was then toasted in an oven. 2. The dried residue was crushed to a fine powder. 3. I snuffed one line up each nostril. 4. Intense pain -- as of red hot poker being shoved up my nose. 5. Nothing happened except a nasty taste in my throat. I also smoked some and received a "pins and needles" feeling in my brain, followed by nausea. After reading the report in the Summer 96 *ER*, I added baking soda, but again nothing special happened. Where did I go wrong? The seed packet said *Anadenanthera colubrina* (not *A. colubrina* var. *Cebil*). Does this matter? How does one smoke this stuff (eg. bong, joint, vaporizer, etc.)? Does anyone have any growing tips for this plant? Any help from *ER* readers would be appreciated. -- *DC, England*

「北京市公共衆トイレ建設文化展」に展示された新式トイレ=10日、北京市内の中国革命歴史博物館（共同）

## MISIDENTIFICATION OF ACACIA SPECIES

*ER* has received information that the "Extraction from *Acacia maidenii* Bark" article in the Spring '96 newsletter was probably based on a species misidentification. The species extracted was most likely *Acacia obtusifolia* (formerly *A. intertexta*), not *Acacia maidenii*. The point is that *A. obtusifolia* contains something like five times more tryptamine alkaloids than *A. maidenii*! So if you're seeking a species that contains up to 0.15% alkaloids (in one assay 0.72%!) in the bark (and possibly in new-growth leaves as well), *Acacia obtusifolia* is your plant. Bioassays with smoked extracts and orally with *P. harmala* as an ayahuasca analogue, prove it to be a very potent botanical. Since this is a common Australian species, American ethnobotanical suppliers please take note. -- *Ed.*

## STING ALERT

*ER* has received information that Labrot Laboratories, 18301 N. Railroad N. St., Keller, VA 23401 is an *alleged* government sting operation. They apparently solicited the purchase of cannabis seeds from a legitimate ethnobotanical supplier in a suspiciously aggressive manner. *ER has no opinion on this one way or another*, but is passing the information on for what it may be worth. -- *Ed.*

## ACORUS CALAMUS

Asiatic *Acorus calamus* rhizomes contain B-asarone, which is a known carcinogen. North American strains do not contain asarones. The Asian strains will have sedative effects, while North American strains will have stimulant effects. So make sure you're getting *A. calamus americanus*, because most botanical companies don't specify what strain they offer. -- *DD, CA*

## EUROPEAN ENTHEOGEN NETWORK

In Europe everyone knows what's happening in the States. People get most of their material and botanicals from U.S. based companies. However, there is little communication between individuals or the few Euro-

pean companies -- we know what's happening across the ocean but not what's going on in our own backyard. A few of us are trying to get things organized. Any European *ER* readers interested in forming a communication network please contact: B.M. Box PSI, London, WC1X 3XX, England. -- *AA, England*

## PSILOCYBE MEXICANA

This species seems to have disappeared into total obscurity. A five-year search has uncovered nothing. Perhaps one of *ER's* noble readers has some *P. mexicana* sporeprints for sale or exchange for other interesting sporeprints? -- *CH*

## FALSE MIMOSA

Here's a "stumper" for you ... (well... for me, really). The species *Albizia julibrissin* (false Mimosa) is a particularly elusive plant to find any information about. I read in L.E.R. that it was suspected as an ayahuasca analogue. I've searched far and wide and finally decided to try chromatography to identify alkaloids which is quite an undertaking for a non-chemist like myself. Maybe you or one of your sources could help me out. This tree grows in much of the U.S. and all over where I live in VA. It could be a very important tryptamine source. -- *Anonymous, VA*

## LSD/DMT/HARMALA COMBO

I first ingested 150 mg of harmala extract and waited 25 min. for it to take effect. Then I ingested a capsule of 90 mg of DMT freebase and placed two hits of LSD under my tongue. About 40 min. later I ingested a second capsule of 90 mg of DMT as a booster. The effects really kicked in about an hour after taking the first DMT capsule. Visions began to unfold as trails of color that soon began to transform and take a life of their own. Entities abound! I found myself sitting in the midst of a cosmic circus. The playful energies were joyously acknowledging my presence and encouraging me to join them in celebration. And I did! I was communicating with them in a glossolalia of sound and movement. Just as I was really getting into it, a tidal wave picked me up and plunged me into an ocean of energy. Suspended in a beautiful blue light I realized that my body was gone and my thoughts had ceased. I was totally free... Suddenly a hand, mouth,

sound, or smell would manifest out of nowhere and bubble forth with delight. It was so blissfully easy, and unlike any other transcendental psychedelic state I have ever experienced. I glided right beyond the fear before I even knew what hit me. Such a magical synergy of chemicals! This state continued for several hours, gradually giving way to an LSD like experience which lasted for a long, long time. In fact, I wasn't back to baseline until some 24 hours later. I really liked this brew, and I hope to hear of other *ER* readers experiences with the LSD/DMT synergy. For me, it made the whole DMT dissolution process a much easier and more blissful endeavor. --*Toad*

### LEGAL HIGHS-1

Regarding "Legal Highs" (Pg 11, Summer '96 *ER*), most are hype. I've tried several and my favorite is Fungalore (1-800- fungus-o). It has more to offer than just Mahuang and caffeine. -- *CK, TX*

### LEGAL HIGHS-2

The "herbal ecstasy" stuff is all caffeine and ephedrine. Ephedrine is also sold as a product called Maxalert (among other names) at truck stops as "alertness" tablets. (They do tend to cause my wife to talk a lot.) The caffeine/ephedrine combination is also sold by some vitamin companies as a weight loss formula -- thermogenic, or causing the body to burn fuel for heat, as opposed to entheogenic. -- *WL, GA*

### LEGAL HIGHS-3

I have been dealing with DNE Pharmaceuticals for many years. They sell a big line of all-herbal supplements. Their "Herbal XTC" capsules contain 950mg of ephedra extract. They do work, giving you a speedy feeling and a sense of well-being. DNE also has herbal sleep aids that contain skullcap and valerian root. Catalog is free: 1-800-221-1833. -- *TF, IL*

## HARMALA EXTRACTION QUESTIONS

Using the method outlined in *Psychedelic Shamanism*, I extracted eight grams of pulverized *Peganum harmala* seeds. The 3X extraction was a three-day procedure and resulted in a crystalline substance suspended in a syrupy tar. After weighing the residue, the weight came to 15.71gm -- about double the weight of the original biomass. Is this normal? One might expect that an extraction would yield less than the original weight. Where does the extra come from? Perhaps I didn't filter properly, but

coffee filters don't flow too well with lemon juice. How patient should one be with the filtering process? Should I allow longer evaporation time? Is there danger of burning or vaporizing the harmaline molecules out of the extract? Ott's *Pharmacotheon* reveals melting-point temperatures for many molecules. What does this temperature mean? Is it a temperature to attain to melt the molecule out of the

biomass, or a temperature to avoid for fear of destroying the molecule? My *P. harmala* extraction was done with lemon juice. What is to be expected if done with methylene chloride? Can one be confident that it evaporates completely? Not confident about the extraction, 3 grams of pulverized seeds were consumed one hour prior to 2.5 gm of *P. cubensis*. The nausea and woozy feeling was definitely worth the experience and made me wonder all the more about producing an extract that I could feel confident about. -- *Hershey*

*[It sounds like you wound up with a lot of the original biomass in your aqueous extract. Filtering is a drag if you don't have a vacuum pump, and most of us don't. Try doing a crude first filtration through cheesecloth, then use cotton or a coffee filter. Your aqueous extract should be relatively clear of particles and have an almost fluorescent yellow-green tint. After air*

evaporation, the dried (usually reddish brown) residue ought to have a definite crystalline vibe to it -- there should be little or no tar if properly processed and evaporated, though the sandy crystals are usually quite sticky. (Hydroscopic?) My understanding of melting point temperature is just that: it's the temperature at which a given molecule melts. For amateur kitchen chemists without sophisticated lab equipment, it probably has little practical application. A methylene chloride extraction would be the next step **after** (not instead of) the acid aqueous extraction. The same procedure for extracting any alkaloid must be followed: eg., de-fat, basify, etc. Johnny Appleseed takes his harmala extractions this extra step and it definitely results in a purer product, though I'm not convinced that it eliminates the nausea usually associated with this alkaloid. -- **Ed.J**

### HEAVY HARMALA

In response to "Ayahuasca Zombie", (Vernal Equinox 1996) I can empathize. I am extremely sensitive to *Peganum harmala* and avoid it like the plague. I once ingested 3 grams of crushed seeds (encapsulated) prior to a 20 gram *T. pachanoi* beverage. I never made it to the cactus. After one hour the harmala laid me out: unable to stand for for the next four hours due to extreme dizziness. Lying down, mind racing, it took much willpower just to get comfortable. I saw very articulate visions of naked women in black and white. There were other visions too: black and white, no color at all! Very lucid dream-like, in that I could manipulate the visions at will effortlessly. Perhaps a gram or two before bed would be useful for dream work. (A bonafide shamanic approach.) Any more I'll use my entheogens un-potentated. -- *Waxing Moon*

### MIND-ALTERING BIRDSEED

Maybe we should call this "B.S. DMT" (Birdseed DMT)! So you think maybe this is a joke? A friend of mine recently chromatographed some Canary grass seed and he says some strains checked out quite potent! It's an annual and it must be replanted every time you want to grow some more Ayahuasca, but don't let the birds get to it first! Maybe the U.S. Govt. will outlaw birdseed in Pet Stores! I am sure that some strains are better than others, but anyone wish-

ing to join in on the "Ayahuasca analog research" fun can purchase 3,600 seeds of *Phalaris canariensis* for only \$8.00 from:

Carter Seeds  
475 Mar Vista Dr.  
Vista, CA 92083  
*Anonymous, NM*

### PHALARIS AQUATICA

I have just had the most peaceful experience with ayahuasca made from *Phalaris aquatica*. Coming on it felt like mushrooms, but to the end there was no overwhelming power, no big experience, only a pure healing medicine. Perfect control, no fear, pleasurably heightened senses. I thought: "this is the real ecstasy." There was continuous contact with reality: outdoor noises seemed normal. What a tragedy for the world that such a drug is not legal.

Directions: *Phalaris aquatica* Italian strain AQ-1 from **Of The Jungle**, dried blades shredded in coffee grinder, three and one half level tablespoons in milk shake, half an hour after one level teaspoon of processed *Peganum harmala* seeds. The fresh blades leave a tart reddish resin on the scissors. They do not dry crisp, but a coffee grinder/blender with sharp blades will sufficiently powder them. After half an hour I could feel it coming on. It peaked at one hour, with time slowing. By one hour and forty-five minutes it was over. I could use a whole lawn of this. Here in Miami it does not grow outdoors, but it is doing very good indoors in a sunny window. -- *The Gnostic, FL*

### MESCAL BEANS

I am interested in information on the Mescal bean (*Sophora secundiflora*). Modern use has proved deadly, but how deadly? What are the physical effects of the poison? It apparently renders one unconscious. Is it a matter of dose? If one bean kills, what does 1/10 of a bean do? I don't plan on experimenting with this plant, but would be interested in reading more about it. My interest stems from the *Texas Monthly* article (Vol. 24, May, 1996, page 185.):

*"The Mescal beans were well-known to the residents of the Lower Pecos. Excavations unearthed dozens of*

*samples in painted caves of the region. In addition to Mescal beans, 7,000-year-old peyote buttons were discovered in the caves. Radio-Carbon dating confirmed the buttons' age." -- Anon., TX*

*[In a past ER -- my Alzheimers won't let me remember which one, and I'm not into paging through them all -- it is said that **one-eighth** of a bean is a psychotropic dose. Of course, you also might die, since this is an incredibly potent poison. I'll print the data, but don't recommend you follow it -- I wouldn't. -- Ed.]*

### *JUST SAY NO TO THE INTERNET*

Regarding the Internet [pg 9, Summer, 1996 ER]. I am an electronics engineer, and so I would like to be able to sing its praises like so many are these days. However, I have spent a fair amount of time exploring online and even where access is free I have come away feeling ripped off. I have found it at best a waste of time (and it can take a lot of time), and more often just plain annoying (due to the exceptionally high level of noise to signal). It always seems to take longer to find less than it would to call a friend, or go to the library. In my more cynical moments I wonder if too many people have just bought the hype that the big Cable TV/Telcom corporations are pushing to convince us that helping them build their markets is really some sort of approach to a liberated alternative culture! My advice would be: don't sink your time into it; wait for the hype to cool out and then maybe we will be able to determine if anything of lasting value will develop. Besides, it's a hell of a lot more pleasant to read a printed page than stare at a screen! -- SF, WA

### *UFO ENCOUNTERS*

What's the difference between UFO encounters induced by entheogens (eg. Psilocybin), and UFO encounters of people who have never used drugs? -- CK, TX

*[I don't think anyone knows -- both versions are so far outside of consensus reality that they may be incapable of measurement by "normal" paradigms. Many researchers now hypothesize that UFO encounters represent some kind of dimensional interface with consciousness itself (whatever that is).*

*If so, then any catalyst (drug or dream or hypnotic trance) that alters consciousness is a dimensional doorway: if you happen to open the door to the UFO realm, you'll encounter them. Or something like that. -- Ed.]*

### *5-METHOXY AND PURPLE/GREEN SPIT*

I introduced a friend to 9mg of smoked 5-MeO-DMT. The session went well and he seemed to handle the experience without letting the rush of fear overcome him. After the effects had passed, I turned on a black light and noticed that his tongue, lips and saliva glowed bright purple/green! Have you or anyone else heard of this after glow?

A safe and reasonable dose of 5-MeO is somewhere between 5 and 20mg according to most literature on the subject. What would be an overdose? What would happen? Can this kill or leave someone on the "other side?" What's a good rule of thumb for reasonably accurate measurement without a milligram scale? (I have 500mg and no scale.) Also, I have one ounce of dried *Phalaris arundinacea*. What amount of *Peganum harmala* would be necessary to activate this? -- Mr. Grub, FL

*[Wonders never cease -- purple/green spit? I suspect that it's just Alien Ectoplasm, and nothing to worry about -- too much. Taking your questions in sequence: Assuming you're working with pure 5-MeO-DMT: 20mg would be a 4-X OD in my book. Is anybody out there smoking such heroic doses? What's it like? I suspect you'd pass out or go crazy long before you worked your way up to a physically fatal amount. American Science and Surplus, 3605 Howard St., Skokie, IL 60076 sells relatively inexpensive milligram scales -- otherwise, with a razorblade divide by eye, using simple arithmetic, your 500mg into 5mg piles: eg: five 100mg piles, fifty 10 mg piles, etc. One ounce of dried *P. arundinacea*, even if known to be potent, is probably not enough for an ayahuasca trip. Three grams of *P. harmala* (or extract from same) is considered one dose. -- Ed.]*

### *EASY MESCALINE EXTRACTION*

In response to Inner Frontiersman, Vernal Equinox issue 1996, and his need for a mescaline extraction -- while apprenticing with a Mad Scientist in the high desert of Ecuador, I observed and helped as we cut strips from around the watery core of *Trichocereus pachanoi*, and boiled them all day adding water as needed. The brown "mud" that resulted was then diluted with alcohol and warmed as gently and carefully as possible in kitchen cookware over charcoal. When most had evaporated, a match was thrown into the pot, and as the remaining alcohol combusted the lid was slammed on the pot extinguishing the flame. The resultant tarry substance was then placed in a glass of benzine, where, shortly thereafter, rod crystals in starburst patterns formed on the surface of the benzine. These were ladled out, dried, capped and orally ingested. One large capsule resulted in a magical mystical experience during which it seemed I could manipulate things with what seemed at the time to be levitation. I hope this process helps him out -- sparkless heating coils would of course be safer as well. A note the psilocybe mushrooms told me: Poop into an appropriate place after ingesting them, one like the place they came from so they can grow (not a septic tank!) -- *SH, HI*

*[As all ER readers know, I'm no chemist, but this process sounds very exciting. If it works as described, it's the easiest mescaline extraction recipe I've ever heard of. Does anyone have an explanation for the alcohol-combustion-dousing procedure? What's the logic behind such a chemical reaction? What's benzine used for and where can you get it? Let's hear some feedback on this one. -- Ed.]*

### *POWDERED SALVIA LEAVES*

Try powdering *Salvia divinorum* leaves before bonging them -- the increased combustible surface makes all the difference. Last night I sent my test panel into hyperspace on 3-4 hits each. I understand why the Mazatec prefer using it in darkness. We had a couple of candles going; when I closed my eyes I found myself in an apparent alternate reality. Plunging the room into darkness allowed me to experience this vision with my eyes open. This was the common experience

of the panel. It's like finding a cave to explore. What will be in the cave? Will we meet creatures that live there? Or creatures that entered the cave from elsewhere? Can we find their entrance to the cave and enter their world? -- *MH, VT*

### *ORAL SALVIA RECIPE?*

One of *ER's* faithful anonymous correspondents sent me a reprint of a talk by Andrew Weil in which he mentions that *Salvia divinorum* must be emulsified before it can be activated in the stomach. My correspondent made a connection between this and a cartoon in the latest Loompanics catalog supplement describing how to emulsify cannabis for internal use. Basically, you powder X amount of the botanical, add an equal amount of cooking oil, apply 4 or 5 fifteen-second bursts in a microwave oven, stir in an equal amount of lechithin granules and repeat the microwave step. The resulting goop is supposed to be an orally active product. It's possible that *Salvia* may respond in the same way -- it wouldn't hurt to add a little water to the mix to ensure complete emulsification. Since the potent ingredient in *Salvia* is active in the microgram range, dosage could be tricky. -- *Ed.*

### *IBOGAINE*

I have experienced myself the wonderful effects of this life-saving plant (*Iboga*). It is true what they say, complete addiction reversal with no withdrawal symptoms at all! It works like a dream. For more information, write to: Eric Taub, 116 NW 13th, No 152, Gainesville, FL 32601. I'm sure he can help serious inquiries. -- *AC, PA*

### *LSD TOLERANCE VS SCHIZOPHRENIA*

I've received considerable feedback on my remark (Pg 9, Summer, 1996 *ER*) about a schizophrenic who took over 300 LSD trips in less than two years. Their point is that tolerance for acid builds up quickly and the individual soon wouldn't get high. I was negligent in my phraseology ("I met a guy once, totally insane, *who was said to have gotten that way by taking...etc.*"): I carelessly repeated what was said to me by people who knew him. Thus are psychedelic myths spread: we've

all heard the story of the guy who "took too much of something and went crazy." Nevertheless, whether the individual in question became tolerant of the drug is beside the point: once over the edge, it wouldn't have made any difference. Although it's probable that an initial LSD trip pushed him over the edge, it's more than probable that he'd have become psychotic anyway. The salient point is that millions of people have taken psychedelics

without going crazy, so it's hysterically irrational to blame the drug for the condition of the few latent psychotics who do. I sincerely doubt that psychedelics, all by themselves, can make a reasonably well-adjusted person insane: evidence suggests they make you saner! I leave it to the reader to decide what this implies about consensus reality. -- *Ed.*

### GHB SPECULATIONS

I have been experimenting a bit with GHB which, I've been told was sold in health food stores until recently. Unfortunately, I don't know much else about it. When taken on an empty stomach, it produces a very enjoyable, very noticeable relaxed warm inebriation, with no negative side effects or come-down. My ability to totally focus on the various sounds produced by various instruments within a piece of music, is greatly enhanced. I read an article about how safe it is and why it was pulled from health food store shelves. It didn't go into any documented studies. If it really is as safe as the article said, GABA might be a useful admixture to certain psychedelics. The friend who introduced me to it uses it to increase endurance while doing exercises. (He often spends hours in difficult yoga postures after taking it.) Yoga can greatly enhance and facilitate the flow of energy/information/lifeforce when used with entheogenic substances, so GHB might be useful when used in this way. -- *RG, AZ*

### PLANT/SEED EXCHANGE

*ER* has received a couple of names and addresses of people who want to be listed herein as contacts for exchanging various botanicals. I said once that I felt it would be a safe enough thing to do -- I've changed my mind. It doesn't feel right because of the potential for sting operations either way: how do I know that the DEA won't advertise? How do I know that the DEA

won't respond to an advertisement? When the confidentiality and safety of *ER* subscribers is at stake, I'd rather err on the side of conservatism. -- *Ed.*

### THE INGRESSION OF NOVELTY INTO TIME

Terence McKenna fans all know about his concept of "the ingression of novelty into time"--the hypothesis that as the end of the Twentieth Century approaches, bizarre events will take place at an exponential rate: 1997 will be twice as weird as 1996; 1998 four times as weird as '96, etc. In McKenna's view, by the year 2012 anomalous happenings will be "ingressing" so rapidly that reality as we know it will have ceased and "the end of history" will be at hand.

Historically, apocalyptic prophecies are common at the turn of every century, and even more-so at the turn of a millennium. (For example, many people thought the end of the world would come in the year 1000.) The difference today is that there are enough catastrophic processes in motion that dire prophecies are far more plausible than otherwise. I submit that the graph reproduced above is all anyone needs to know about the "ingression of novelty into time." -- *Ed.*

# SEEDS AND STEMS

*ER* receives lots of fascinating mail -- since this is a one-man operation, I am hard-put to keep up with it all. (It's Standard Operating Procedure for very interesting material to be placed in a pile where it becomes covered with other stuff and "lost" for months. ) In an effort to stay abreast, I am starting this column, "Seeds and Stems," to excerpt and condense these miscellaneous data. If I don't have the time to give each entry the full coverage it deserves, at least readers can be alerted to it and, if interested, seek further information on their own. Let me know what you find out. -- *Ed.*

## CATNIP INDUCED ALTERED MENTAL STATUS

Case report: A 19-month-old male developed vomiting, lethargy and decreased responsiveness 3 hours after eating from a pot of brewing catnip tea with added raisins. He had an intoxicated appearance and was admitted to the hospital 20 hours after the onset of symptoms with diminished consciousness... Conclusion: Currently there is an increased interest in the use of herbal teas to remedy a variety of ills. We believe this to be the first case report of toxicity following oral consumption of catnip. Our case adds evidence supporting previous speculations that catnip may have psychoactive effects in humans. -- *1995 NACCT Abstracts*

## FATAL APHRODISIAC

Background: Since 1992, three deaths have occurred from cardiac glycoside toxicity in previously healthy young men following ingestion of a popular topical aphrodisiac known as "Love Stone" or "Rock Hard." ... A traditional Chinese medication known as "Chan Su" which is produced from venom of the toad *Bufo Bufo Gargarizans* contains several cardiac glycosides, a topical anesthetic and bufotenine (an hallucinogen)... Bufotenine and cholesterol were positively identified in "Love Stone"... Conclusions: A topical aphrodisiac responsible for at least three deaths appears to be produced from the venom of the toad *Bufo Bufo Gargarizans*. Ingestion of this product causes fatality similar

to other cardiac glycosides. -- *Abstracts #1-#197, pg 539*

## NEW ETHNOBOTANICAL SUPPLIER

Check out *P.J.T. Botanicals* for a very complete inventory of plants, seeds and supplies of interest to *ER* readers. Their catalog is \$3.00. Their address: P.J.T. Botanicals, P.O. Box 49, Bridgewater, MA 02324-1630.

## THE PEYOTE FOUNDATION

*"The Peyote Foundation is a non-denominational organization whose purpose is to promote the understanding of the peyote plant, peyote people, and peyote spirituality. We therefore will favor no particular group or individual point of view. Nor will we seek to define what constitutes a bona-fide peyotist. Rather we will present the full diversity of information and opinions offered to us. We strongly encourage people to investigate the peyote religion in all its aspects."* -- *The Peyote Awareness Journal*

This is a new union of spiritually committed peyotists based in Arizona: the state with the most constitutional laws regarding entheogen-based religions. The founders of the Peyote Foundation have already passed their first test: their medicine was confiscated by a SWAT team, yet after a huge hassle it was returned to them because the prosecutor had no case against these bonafide religious users. The encouraging thing is that their religious orientation is very liberal: they seem to be the Unitarians of peyotists, without the dogma which characterizes other sects. I see this as a viable wedge into our unconstitutional peyote laws, and a potential catalyst for allowing other entheogen based religions in this country. I encourage *ER* readers to support them. A subscription to their newsletter, *The Peyote Awareness Journal* is \$25.00 per year. An associate membership in their organization is \$40.00 per year. Contact these brave folks at: The Peyote Foundation, PO Box 778, Kearny, AZ 85237.

MONOGRAPH SERIES NUMBER 1:

**AYAHUASCA ANALOGS AND PLANT--  
BASED TRYPTAMINES --  
THE BEST OF THE ENTHEOGEN REVIEW,  
1992-1996**

The best and latest information from *ER's* first four years of publication. Including: Ayahuasca Analog data, MAO inhibitors, Mushroom Ayahuasca, *Phalaris* grass, Smokable Tryptamines from Plants, Other Tryptamine--containing species, plus DMT and 5-MeO-DMT. This information-packed monograph has been edited so that all the data is compiled into easily referenced chapters. Instead of paging through past *ERs* looking for that special article, find it here under one cover. \$20.00 Postpaid (\$30.00 outside U.S.)

*Paperback: 56 Pages, 13 Illustrations*

**The Entheogen Review**

First year of publication bound together in a 74 page book -- \$20.00 domestic, \$30.00 outside U.S.A.

\$7.00 OUTSIDE U.S.A.

*Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants*, by Jim DeKorne, 1994, 155 pages. \$22.00 postpaid from:

*The Entheogen Review*,  
P.O. Box 800, El Rito, NM 87530.

"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." — Terence McKenna

# PSYCHEDELIC RESOURCE LIST

A comprehensive list with detailed descriptions of over 200 organizations related to psychedelics.

Categories include:

book vendors & publishers, cultural resources, ethnobotanicals (cacti, herbs, mushrooms, plants & seeds), garden equipment & indoor light systems, hemp related items, information sources, merchandise & gadgets (CDs, cassettes, t-shirts, smoking accessories & videos), non-profit & religious groups, periodicals, a reading list/book review section, and more!

Updated quarterly. One year subscription is only \$15.00. Foreign orders add \$5.00 for postage & handling. No other list is as thorough or updated as often!

Send cash, check or money order to:  
SOMA GRAPHICS, P. O. Box 19820,  
Dept. ER1, Sacramento, CA 95819-0820.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 5, NO. 4, Winter Solstice, 1996**

ISSN 1066-1913 Copyright © 1996, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.

P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. W96 means that the Winter, 1996 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- *Jim DeKorne*

# MORE SALVIA DIVINORUM LORE

In 1993, when I sent my book *Psychedelic Shamanism* to the publisher, I included a few paragraphs about *Salvia divinorum*, saying in essence that my experiments with this plant had been inconclusive. Over a period of a year or so I continued to try to elicit an effect (any effect), via both ingestion and smoking, but never succeeded. Eventually, I came to believe that this was one of those substances (like Scotch Broom or banana peels) that depends on a very active imagination for whatever experience you get out of it. (Some people can get high on anything!) Frankly, I thought the whole thing was a myth, though I always prudently prefaced that position with such caveats as: "In my opinion," and "It seems to me..."

Then at the 1995 Telluride Mushroom Festival, a friend insisted that I try *Salvia*

*divinorum* at least one more time. Not wanting to be ungracious, I agreed: expecting the usual nothing. He filled a large tobacco pipe with dried *S. divinorum* leaves and told me to take three deep inhalations, lie down, and close my eyes. I did this and immediately forgot who I was! I had become Awareness itself, without any sense of personal identity -- quicker than it takes to tell about!

This "not-me" was observing a strange, pastel-colored dimension bounded by a complex series of intricately-patterned walls. There was a sense of people present from another era: perhaps religious pilgrims from Chaucer's England. "Awareness" felt totally at home in this dimension: it was very familiar, a place experienced millions of times before. After a while "Awareness" became conscious of someone laughing, and slowly transformed back into my ego consciousness. "I" opened my eyes to discover who was laughing: it felt highly inappropriate, and "I" was irritated by it. As soon as "my" eyes opened, the other dimension instantly disappeared, and "I" discovered that "I" was the person who was laughing! This autonomous laughter was laughing me, rather than

otherwise, and it took considerable effort to finally control it. What was most bizarre was the fact that nothing was funny: indeed, the whole ambience, although not exactly "reverent," had a profound sense of the numinous about it. High weirdness indeed!

Since that first amazing experience, I have had several *Salvia divinorum* trips, each one equally

From:  
*Salvinorin, The Psychedelic Essence of Salvia divinorum* (1996), D. M. Turner, Panther Press, San Francisco, Page 4. Drawing by Jon Hanna

bizarre. During one session for example, I found myself standing on a perfectly flat, perfectly smooth, orange plain with black perspective lines stretching to the horizon. Standing like statues in long rows between each line was an infinity of identical black and white Felix the Cats! (Talk about surrealism!) Each experience has had the same uncanny feeling of familiarity about it, as well as the conviction that one is accessing a distinctly separate dimension of reality: *Salvia* is the most "dimensional" drug I've ever experienced.

**It is just** part of this plant's weird ambience that many people won't get off on *Salvia divinorum* the first (or even the tenth) time that they test it. Don't give up -- it is well worth the effort to keep trying. Smoke the dried leaves in a large tobacco-sized pipe or bong: the smoke is not harsh and is easy to hold in the lungs; take at least three deep inhalations, and lie back with eyes closed. The room must be dark and silent: any external input seems to prevent the experience from manifesting. Like DMT, smoked *Salvia* is usually a short trip: maybe ten or fifteen minutes. If you can manage the bitter taste, another method is to chew and hold the leaves in your mouth for as long as possible. This can result in a trip lasting up to an hour. *Salvia* compares in weirdness to DMT, but is strangely subtle: a true paradox! (One needs to experience it to know what I mean by that.)

**Most people** report that *S. divinorum* evokes a female presence: a goddess, if you will. Although I've experienced this only a couple of times, I concur: there is a definite feminine force connected with this plant, and what is more: she demands respect! Although none of my experiences have been exactly terrifying (like smoked tryptamines can be), few people ingest *S. divinorum* very often, or for frivolous purposes. Salvinorin-A (the pure extract) is challenging for anyone and should never be done without a sitter present to protect the smoker. Beware of overdoses!

**Although** this is one of the world's rarest plants (in nature it grows in only a tiny area of Mexico -- a few square miles), it is easily propagated via cuttings and many thousands of clones exist now world-wide.

*Salvia divinorum* loves a moist, humid (though not hot) environment, and many people grow it in plastic tents, where the plants usually thrive. In my experience, the only drawback to this technique is that once acclimated to the tent the plants don't easily transplant outside of it again. They wilt quickly and are difficult to take cuttings from. (This may be a function of the arid climate I live in and might not apply in other areas.) I've achieved lush growth by opening a bottle of ordinary Club Soda inside the tent: as the CO-2 evaporates from the soda-water the plants quickly eat it up. Carbon dioxide, as indoor cannabis growers well know, is an extremely potent fertilizer. Leave the bottle inside the closed tent for at least 24 hours to ensure that the plants absorb all the CO-2.

**I feel** that we can learn a great deal from this plant, that it is potentially one of the most useful of the teaching medicines available to humankind. I'd like to hear from people who have learned how to use *Salvia* ritually, since it is definitely associated with a goddess-entity. *Salvia divinorum* is the only plant medicine that I know of that is so consistent in this regard: I sense that she is just waiting for enough people to contact her so that she can impart some of her wisdom to a world that sorely needs it.

-- Jim DeKorne

## BOOK REVIEW

---

---

*Salvinorin: the Psychedelic Essence of Salvia Divinorum* (1996), D.M. Turner, Panther Press, 1032 Irving St., #514, San Francisco, CA 94122. \$11.95 Postpaid. (CA residents add .72 tax. Foreign orders add \$3.00 S&H.)

**This is** the very first book-length monograph on the effects of *Salvia divinorum* (and its extract, Salvinorin-A), on human consciousness. As such, it is an instant classic. D.M. Turner, author of *The Essential Psychedelic Guide*, is (or certainly should be) well-known to most *ER* readers. Intrepid Tripper, Psychonaut, Neo-Shaman -- whatever you want to call him, chances are that Turner has already "been there

and done that" in the realm of psychedelia.

**Beginning** with its discovery by western science in 1939, through its wider introduction to the world by Gordon Wasson in 1962, to its ultimate explosion on the psychedelic scene in June of 1993 via the work of Daniel Siebert, Turner documents the history of this magickal herb up to the present day. He goes on to describe methods of ingestion, gives appropriate warnings and follows it all up with many accounts of his own and other people's trips with this new substance. Some of them are combinations, a D.M. Turner specialty: *Salvia* with LSD, *Salvia* with DMT, *Salvia* with 2C-B -- you get the idea. Included is the original account of Daniel Siebert's pioneering trip on Salvinorin-A: as far as is known, the largest single dose of this substance ever ingested by a human: a whopping 2.6 milligrams! (Like LSD, Salvinorin-A is active in the microgram range, so 2.6 mg is a VERY LARGE O.D. Read all about it here!)

After saying all that, what 's left to say? If you are at all interested in *Salvia divinorum* you should own this very important book in the history of entheogens.

-- Jim DeKorne

### SALVIA AND SOLIPSISM

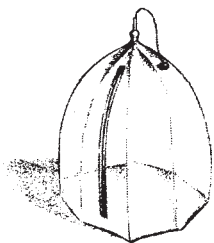

*Salvia* has a very personal way of teaching. You could easily misunderstand it and think that she's a trickster when, in fact, with all her demonstrations of reality-destruction *Salvia* tries to bring you to the only conclusion left: reality doesn't exist! I start with half a teaspoon. At once I'm disintegrated, as I'm now used to. I had auditory hallucinations -- nothing important: the voices of far away neighbors. I

next go with a teaspoon: again reality, personality, everything explodes. I feel as if I am flying, feeling myself rolling up like a spiral. Subsequent doses bring the same explosion: how can I describe such an alteration of my usual perception? I'm perception and that's all. All of us are nothing more than perception itself. There is no such thing as an external world or reality. When I was back to ground state, I thought about the horror I had of being the only real living being. I don't really believe in solipsism, but it's impossible for you to convince me of your reality, that you have a life independent from mine. Nevertheless, I have to dismiss this idea and jump to a new conclusion: I was real because I was smoking *Salvia*, because I was using an entheogen which gave me energy enough to acquire reality -- which means that usually, we don't exist, we're just ghosts. When you develop spirituality, you start to acquire reality.

-- HS, France

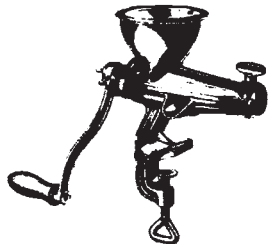

### SALVIA, 2C-B, MUSHROOM COMBINATION

...Approximately 90 minutes later, it was decided that we would try adding some *Salvia* into the mix. I was hoping that the other substances in my system would act as a launching pad to propel me further into the *Salvia* dimension than I had been able

to get previously on the leaves by themselves. Fortunately, I was correct. I loaded a large glass bong and proceeded to fill my lungs to capacity with smoke. As I closed my eyes and held it in, faint deep-blue tendril-like forms reached out to me through the blackness, beckoning me to go deeper. I almost heard a voice telling me to "come on in". I took another enormous inhalation, put the bong down, and lay back prostrate upon the floor. As I closed my eyes, I had an overwhelming physical and visual perception of floating like a feather down a profoundly deep fissure in the earth. There were deep bluish grey stalactites on the walls of the hole. I could vaguely hear the conversation of my companions, and actually saw their words etched in white upon the walls as I floated down. When I reached bottom, I found myself in a strange city full of greenhouse-like structures containing botanical forms that I somehow knew were the spirits of *Salvia*. The dominant color of the buildings was electric blue and yellow. There was a sense of being looked over and evaluated by a million eyes belonging to a singular entity that was the consciousness of *Salvia*. I felt as though I had finally passed some sort of inspection process and was being welcomed into its world. After about two or three minutes, the visions faded, and I opened my eyes and sat up. Subtle perceptual distortions of a uniquely clear nature persisted with open eyes for another hour or so. This was a highly unique, uniformly pleasant experience in my career of entheogenic exploration, and one that I hope to be allowed to repeat in the future! Thank you, Ska Maria Pastora!

-- Initials and state lost (Sorry!)

### *SALVIA AND 5-MeO-DMT*

We combined *Salvia* with vaporized 5-MeO in hopes of improving the tryptamine experience. First we took two or three consecutive Bong hits of *Salvia* and immediately followed it with a 10mg hit of vaporized 5-MeO. The result was very encouraging to say the least! The *Salvia* ally is definitely in the pilot's seat -- directing and focusing the 5-MeO blast with laser-like precision. It generally makes the overwhelming power of 5-MeO a much more workable experience and it's totally different than 5-MeO alone. I think the key to properly using 5-MeO is learning

how to direct its power through the body, and I would say that combining it with *Salvia* is definitely a step in the right direction.

As I inhaled my third and final hit of *La Divinada* I could feel her familiar reverberation pulling me into her world. With my vaporizer cued and ready I quickly inhaled 10mg of 5-MeO before the *Salvia* had fully taken effect. With my exhalation of the 5-MeO I fell completely into trance. As I closed my eyes I could see the space between spaces and feel the smiling faces. Nothing quite like *Salvia*! I was tunneling between worlds, between dimensions, with the quickness and precision of a superliminal mongoose. Suddenly, she went off like a rocket thrusting at warp speed -- a thousand times the power at her command. My body spontaneously collapsed into a twisted posture and for a few minutes I transformed into something altogether different. I lost touch for a few moments (1-2 min.?) and then I noticed that I was growling and making noises on the floor. With my senses coming back to me I realized

### *KAVA KAUAI*

6817 KAHUNA ROAD (DEPT. ER)  
KAPAA KAUAI, HI 96746  
<http://www.kauaisource.com>

that my fellow traveller was pulling me up into a sitting position. As we looked into each others' eyes I was truly amazed at the clarity of my energetic perception -- it was like never before...I could clearly see his aura and his life energy as it moved through the meridians of his body. This beautiful state continued for another 5-10 minutes then gradually gave way to a pleasant electrified baseline. The Goddess was very pleased, and so was I...

**For our** next experiment we first vaporized 50mg of *Harmala* extract and then added the *Salvia*/5-MeO combination as in the previous experiment. The *Harmala* slows things down and adds a much more conscious tone to the trip. It also extends the peak to 10-15 minutes and makes for a much fuller experience. In fact, I have found the *Harmala* to add a wonderful richness to every entheogen I have tried it with. During this particular journey I felt as if I was being pushed through 1000 years of evolution in just 10 minutes. It was as if my electro skeletal system was stretched to the point of rupture -- shape shifting, transforming, metamorphosing into a new energetic skin. It hurt so good... The energy happened to be focused in the thoracic section of my spine. It is an area of my body that is chronically blocked as I have a deformed bone that causes an imbalance. This combination opened up my back more than anything I have ever experienced before and I have developed a deep respect for this power medicine.

**Needless** to say I highly recommend this combination and I encourage other *ER* readers to try it. Personally, I do not enjoy 5-MeO much by itself, but when combined with other entheogens I find it to be a most excellent experience. I have also tried combining 5-MeO with LSD, Psilocybin, and MDMA with good results. However, these entheogen combinations act more like launch pads whereas the *Salvia* seems to grab hold and actually direct the 5-MeO blast through my body. I look forward to further experiments with *Salvia* and my guess is that chewing the leaves in combination with a *Phalaris* grass

analogue might be spectacular. -- *Toad*

### *SALVIA LEAF REHYDRATION*

**Dried** *Salvia divinorum* leaves can be rehydrated and used orally as one would use fresh leaves. Simply place the amount of leaves you wish to use from a single trip in a bowl, and pour just enough water (preferably purified water) over the leaves to cover them. Push the leaves under the water to remove air bubbles. Soak leaves from ten to fifteen minutes. Then drink the water and use the leaves as you would normally use fresh leaves. -- *DD, CA*

### *SALVIA EXTRACTION*

I don't know if you're familiar with "soft secrets" from Holland or not, but I recently read an article from this paper on *S. divinorium*, and I quote: "In the meantime Californian 'basement shamans' have succeeded in producing -- literally in the kitchen, using standard kitchen implements and within an hour's time -- a fairly pure 'salvia oil' extracted from dried plant material." This is the first I've heard of this, do the boys over in Holland know more about what's going on in California than we do, or are the west coast shamans keeping this to themselves? C'mon guys, share the wealth, we're all in this together. What's up? -- *Anon.*

## ACORUS CALAMUS FEEDBACK

---

---

### ACORUS CALAMUS CORRECTIONS

In my report about the use of *Calamus* (Summer '96 *ER*), I misquoted Ratsch's asarone content. He cites B-asarone at 7-8%. My figure is for both asarone and beta asarone, being 85% of the essential oil. This large discrepancy may be due to the inclusion of asarone, or be just another conflict of information found in psychedelic lore. Unfortunately, my quote comes from a xerox copy in which the source was not included. Also, Foster (*Herbal Renaissance*) keeps *Calamus* in his *car* on long drives, not his *ear*.

— IM, MI

[I wondered about that ear business: sometimes it's hard to decipher handwritten letters. Sorry! — Ed.]

### ACORUS CALAMUS AND KAVA

In response to *Acorus calamus* report (Summer '96 *ER*) -- I did four different trials, the largest was with 7.5 inches of root -- all I could bear to chew. Very mildly euphoric, very odd sense of humor, similar to *P. cubensis* just before take off. If you can stomach it, it would seem to be a very friendly, mild entheogen. At the lower doses, it gave a speed-like feeling, which I didn't like. (Note: Uncle Fester in his new book on LSD manufacturing devotes a chapter to asarone extraction and conversion to TMA-2, a more palatable entheogen.) It's been mentioned that *calamus* is activated by saliva -- could it be that it is really activated by the chewing process like Kava is? Maybe a test of a Kava blender activation formula, like the one supplied by O.T.J. with each Kava order would do the trick. — *Inner Frontiersman*

### ACORUS CALAMUS AND ZEN

This letter is in response to the recent forum on *Calamus* root in the 1996 Summer Solstice edition of *ER*. I feel that this interest is quite timely. The chemical principle, asarone, derived from *Calamus* is very similar in structure to mescaline and affords a gentle

and mild euphoria. No visuals, but there are some interesting cognitive effects. Although I reserve serious neural investigations to other plants and practices, *Calamus* root is an exemplary low risk, recreational drug and can be used in almost any situation; at the beach, to the movies, etc. The effects of *Calamus* is analogous to a Zen experience: "the same as ordinary life, except an inch off the ground! --"J"

### ACORUS CALAMUS AND HEAVY-DUTY CHEMISTRY

I greatly enjoyed the *Acorus Calamus* Report in the Summer Solstice issue, and can't resist making my own comments on the topic.

While very occasional ingestion of *Calamus* root and *Calamus* oil may be done without serious bodily harm, the fact remains that the material is poisonous. Its poisonous properties are at the root, so to speak, of its usage as an abortifacient in folk medicine. Repeated ingestion is likely to lead to liver damage and other serious maladies. The poisonous principle in the *calamus* is not asarone, it is one or a combination of the other chemicals to be found in this plant's roots and its oil. (See *Chem. Abstracts* from 1931, page 169.) This same article goes on to discuss "narcotic" effects of asarone ingestion, although Dr. Shulgin in *PIHKAL* says he took up to 70 mg. without effect.

The oil of *Calamus* varies greatly with the geographical location in which it grows. Tropical plants produce an oil that is up to 80% asarone, while temperate climates produce an oil that is about 20% total asarones, with a fair portion (up to about half) of that total asarone content consisting of allyl asarone. All of the asarones boil around 170C at 15 torr so separation by distillation isn't practical.

The conversion of asarone to TMA-2 is covered in pretty fine detail in my book *Practical LSD Manufacture*. In that book I cover the conversion of

the asarone to the corresponding phenylacetone, and then the reductive amination of the phenylacetone to the amphetamine. These are high yielding reactions, but an electric cell using solvents like acetonitrile and DMF are used. Obtaining these solvents may be difficult for many people. That's why the next time the book goes to print, I'm adding a recipe from *J. Pract. Chem.* Vol. 138, page 271 (1933). I hope your German is pretty good if you want to read along. In any case, this recipe is a good deal more low profile, and also lower yielding. Basically it calls for layering an ether solution of asarone over a saturated solution of sodium nitrite in water. Then 20% sulfuric acid solution is dripped in over several hours to yield the pseudonitrosite. Filtering, washing and drying yields 70%, so he says. Then the pseudonitrosite is converted to the nitro alkene by shaking with 8% KOH in alcohol until the pseudonitrosite dissolves, then pour the mixture on ice and acidify with 15% HCl to give the nitro alkene. If you have dry ether, THF, LAH and experience doing LAH reductions, the procedure given in *PIHKAL* is good to then reduce the nitro alkene to TMA-2. Otherwise, it's much better to use the electric cell described in *J. Pract. Chem.* They use a divided cell. Both anode and cathode are made of lead. The anolyte is 20% sulfuric acid. The catholyte is a mixture of ethanol, glacial acetic acid and HCl. They claim high yields. No doubt, the divided cell is an improvement over the simple cell used in other attempts at the electric reduction of nitro alkenes. One would think that this general route would be applicable to all propenyl benzenes, but it fails for isosafrole, while it works with other propenyl benzenes. The failure with isosafrole occurs at the 8% alcoholic KOH stage. — *Uncle Fester*

### ACORUS CALUMUS AND ASARAONE

Let's put this *Calamus* issue to rest. The root is one of the most bitter substances to chew. You really have to be driven to ingest such a large quantity as 10 inches. And don't bother. I ordered a whole gram, 1000 mg., of pure asarone from a large chemical company. I started by taking small doses. When there was no effect noticeable, I finally took all of the remainder, about 750 mg. No effect at all, friends.

Asarone is the essential oil in *Calamus*. There is about 80% in the extracted oil of roots from India. The American roots, if you can find them, contain only about 15%. Asarone is not the entheogenic amphetamine TMA-2. It is only a benzene (allyl or propenyl), a precursor which must first be reacted into the corresponding phenylacetone, and then converted to the amphetamine.

— *The Gnostic*

### LICHEN EXTRACTIONS

In chapter 5 of *PIHKAL* Dr. Shulgin describes extracting some of the chemicals contained in lichens (i.e. Olivetol) with certain essential oils (i.e. from Orange peel or "pulegone" a terpene from pennyroyal, a peppermint-like plant that can be found growing profusely near Alamogordo in New Mexico) in the presence of Phosphorous oxychloride. The product was then cleaned and placed on parsley and rolled into a joint, giving a strong THC high. Does anyone know a more detailed recipe which includes what type of lichens to use, extractions of the oils, doses; and generally what's going on chemically in the reaction? I understand through *Recreational Drugs* by Professor Buzz, that olivetol is a watched chemical. If this can be extracted from its natural source, then couldn't this be a loophole past the authorities in the production of high quality THC? — *Coyotee*

### CALEA ZACATECHICHI

My first experiment with a *Calea zacatechichi* was somewhat inconclusive. I made a tea from an evaporated methanol extract of 2 ounces of dried leaves. This was the nastiest most bitter stuff I have ever attempted to drink in my life. *No way* was I going to get that shit down. One sip sent me scouring the building for something to stuff in my mouth but to no avail... After determining that the tea was not for me, I decided to further extract the tea using the acid/base solvent method. I tried vaporizing a good 10 hits of this extract with no effect. My guess is that the active ingredients are not alkaloids. I still have some of the original methanol extract left which I may put in capsules and ingest orally, we'll see... My stomach curls at even the thought of it. — *Toad*

## MIMOSA HOSTILIS: A POTENT NEW AYAHUASCA ANALOGUE

---

Fifty years ago, DMT was isolated from the root bark of *Mimosa hostilis*, a tropical "weed tree" native to both North and South America. It was the very first scientific extraction of this powerful entheogen from a botanical source. They called it "nigerine."

The herbal medicine *Tepescohuite*, sold in markets throughout Mexico, consists of bark taken from the *Mimosa hostilis* trunk. There is some confusion as to whether or not *Tepescohuite* is entheogenic when combined with a MAO inhibitor: one informant swears that it's a bonafide ayahuasca analogue; others say that only the bark from the roots contains DMT. I haven't tried either yet, so I can't say, but it is interesting to note that *Tepescohuite* is sometimes available in U.S. herb stores for around \$3.00 an ounce. (Five grams is considered a full dose of the root bark, so that comes out to about fifty cents a hit.)

Whether or not *Tepescohuite* is entheogenic, the root bark of *Mimosa hostilis* is known to be extremely potent. How about some of you *Mimosa hostilis* psychonauts sharing your data with us? The following accounts by the same correspondent are presented verbatim: if the leaves are potent, one needn't dig up the roots and destroy the tree. Obviously there are some careful differentiations to be made here. -- Ed.

### THE Gnostic's FIRST TRIP

After spending hundreds of dollars on expensive seeds, and painstakingly caring for the seedlings, and waiting two years to get enough for a single dose, all in search of the great ayahuasca experience, I am very disappointed.

I am talking about *Mimosa hostilis*. I pulled up about twenty-five runt plants, less than one foot tall. I boiled the roots in tap water with some citric acid

crystals. The water does not become dark quickly like coffee or tea. I stopped after about one hour, but I suggest boiling for several hours. The mother liquid was slightly yellowish and not too bad tasting. After a half hour I could feel that it was going to come on as a trip. [Obviously a MAOI was also ingested. -- Ed.] Unfortunately, there were contaminating factors that caused uncomfortable body effects. A little bit of aversion to food, but I got a bowl of cereal down and did not vomit.

I sat down and put on eye blinders. The trip was similar to mushrooms. However, the visions were more static and chaotic, like the new younger generation's shirts with bits and pieces of unrelated color blotches. And then it only lasted one hour: disappointingly short. The only worthy part was viewing the night sky afterwards. For the first time in my life I noticed that I could see very clearly the gray "seas" on the moon (it was full). Before, a full moon only seemed to be shining white.

Unless higher doses prove to be drastically more powerful, I can tell you that this is nothing like mushrooms. The beautiful, clear, geometric color patterns. The quality of the fear, giving you real respect for God and the meaning of life. The impressiveness of the longer period of time. I think we have the real premium stuff already: mushrooms.  
-- The Gnostic, FL

### THE Gnostic's SECOND TRIP

These are very fast growing plants, five feet in one year. (sic.) The roots are advised, however I noticed that the old brown bark on the trunk had visible balls of sticky resin on it. Also, the leaves were sticky. After trying the roots, which aren't very big, I tried boiling the trunk stems in slightly acidic water. There

was no resultant effect (with *Peganum harmala* seeds, of course). So I assumed that the leaves would also be ineffective. But I saved them anyway, and tried them later.

"WOW" is putting it mildly! I'm a die-hard mushroom advocate, and thought that there was nothing better. But these leaves were absolutely beautiful. Wonderful geometric shapes and beautiful colors, with no hint of the great impressive bumper. And there was no contaminant side effect. It was so impressive, but over quickly.

Forget about the roots. The bark is very thin, so losses can occur by rub-off. Also, there is a contaminant in the roots that causes an uncomfortable stomach feeling. Finally, the roots were weaker.

These plants are a lot easier to grow than mushrooms. But, proceed with caution. From a distance they look a lot like pot. Neighborhood kids may see them and report them as pot. I got a helicopter hovering close to my house for a long time. Then I got a visit by a man claiming to be a citrus inspector and wanting to look in my back yard. I let him in and believed him. But, later I thought it was a DEA ruse to find pot.

I plan to cut off the green stems in early fall. The plants stop growing here in the dry and cooler fall-winter weather. In summer, they can throw up four green branches quickly. — *The Gnostic, FL*

### URGENT REPORT ON THE AUSTRALIAN ACACIA SITUATION

I am the one who accidentally discovered the properties of *Acacia obtusifolia* in 1992 when I misidentified it as *Acacia maidenii*. I passed this knowledge on to others and for a couple of years it was used in informed or sacramental circles. Then, a number of large scale European drug dealers arrived in Australia, specifically hunting the DMT source. Unlike mine and others' approach of removing bark strips or single branches, which does not kill the whole tree (most are in diminishing national park ecosystems), they ripped hundreds of trees out, started

selling to the rave party set, and encouraging people to smoke it in joints at parties! (which led to some pretty extreme psychological disturbances). They shipped several hundred grams to places like Goa (India).

Now, a 3-4 ft. strip of bark (say 1 1/2 inches wide) can yield 3 smoking doses (sometimes a few more), but that's it for the life of that tree unless you want to kill it, and to reach that size takes at least 5 years. My point is that until planting happens seriously, this is an exhaustable resource, particularly if exploited commercially.

As far as acacias go, *obtusifolia* is regionally and seasonally variable in alkaloids, and often contains other alkaloids which can produce (particularly with repeated smoking) very "dark" and physically uncomfortable experiences (including hypotension). Not for newcomers to these spaces/species in my opinion. A close relative known to cross-breed, *Acacia sophorde*, has been found to contain DMT, 5-MeO DMT, gramine, cinnamylhistamine, other weird histamine-like compounds and bufotenine at about 0.6% in bark /0.15% in leaves.

*Acacia maidenii* does, in some regions, contain up to 0.7% DMT and NMT, usually in younger trees. It's cleaner and more common.

*Acacia phlebophylla* is the cleanest, containing just DMT, but is rare and even more threatened by over-harvesting.

*Acacia longifolia* (Sydney Golden Wattle) had been found to contain (particularly in winter) up to 0.2% DMT, is clean (other alkaloid probably tryptamine) and is very common, sold in many nurseries.

And of course, *Phragmites* and *Phalaris* are everywhere if you just spend a little time looking. I have written this because I have already seen (as has the National Parks and Wildlife Service) the physical damage in national parks that have been untouched for thousands of years, not for medicine or growth, but to make money. I believe successful long term shamanic use of these plants involves forming a relationship with the plant by growing it and protecting it. — "E", Australia

## *SOME APPROACHES TO THE RITUAL USE OF ENTHEOGENS*

---

The past year has brought my precise and well thought out empiricism into a head-on collision with shamanic encounters that have been both beautiful and disturbing. In the course of extensive reading I was quite interested in the detailed descriptions of the curandero and San Pedro usage presented in *Wizard of the Four Winds*, (D. Sharon). Eduardo Calderon, continuing the tradition of ancient Chinmu healers, assembled a complex "mesa" -- an altar of sorts -- full of ritual objects: small statues, power stones, pieces of ancient pottery, swords to battle demons, etc. After encountering a few evil spirits myself, I began to wonder if these ancient techniques might not offer some tools for my own further explorations.

To that end I have assembled the beginnings of my own mesa. Whether these ritual objects have inherent power that operates at a supernatural level, or whether their effectiveness is a placebo -- serving to focus the mind and create confidence -- is a question I haven't answered. This year has brought far more questions than answers for me -- I'm learning to be comfortable with that. As the wonderful Alan Watts once remarked, "The Mystery of Life is not a problem to be solved -- it is a reality to be experienced." Either way, I am having very good results incorporating ritual elements into my entheogenic explorations.

With a deliberate slowness my mesa is growing, I have not shared these details with anyone -- but if my efforts can help to inform or inspire other *ER* readers I think it is important. I spread out a large roll of rice paper and begin to lay out the objects, some of which include bronze replicas of two ancient knives (a 1,200 B.C. Chinese dragon dagger and a 2,000 B.C. Egyption Dagger); stones personally gathered on numerous trips (nephrite jade from Big Sur, obsidian from Mt. Diablo in Arizona, sandstone from Ventana Arch in New Mexico, etc.); large brass bells from India, candles and sage for smudging, small raku vessels for making offerings to my plant teacher and

allies -- there are other items, but you get the idea.

The Peruvian curanderos have great variance in their individual mesas. Each shaman describes which objects to be used, how they are placed etc. To me this is the core of the shaman's path -- it is an individual journey, an inward exploration. I would have it no other way.

I have begun making food offerings (fruit and chocolate) to the plant teachers, summoning allies with invocations, and warning demons (or whatever they are) that I am prepared to deal with them -- so stay away! Then I partake of the entheogen.

One of my recent sessions was truly phenomenal. After ritual offerings I ingested 10 dry grams of fresh and potent *P. Cubensis*. No harmala was taken. The first two hours were quite intense -- disoriented -- I felt like my visual system was overloaded. Not scary or painful, just so strong. Slowly I began to plateau and waves of overwhelming love flooded my being -- love for all things -- words cannot begin to describe it.

At one point an entity appeared -- a fluid creature of light -- neither a demon nor an angel -- just a being from somewhere else. Another traveller I think. Since I have acquired my ritual weapons I have had no more trouble with evil spirits.

The most extraordinary thing happened at about 4 hours in. I went to the bathroom to pee and happened to glance in the mirror. I was not prepared for what I saw. My face had transformed into half jaguar half human. I was still me -- but with huge luminous cat eyes, feline nose and teeth, and the intricate spots of this jungle animal across my entire head. Words again fail to translate the incredible details of this incarnation. It was not a momentary vision or a brief glimpse. What had I become? It was exhilarating -- feelings of power and strength surged through my

being. I growled. For the next two hours, every time I went back to the mirror the fusion was still in place. From past reading I knew the jaguar was an important creature in Meso American mythology -- but I have done greater research now and discovered some fascinating bits of history. In the Mayan language the word for "shaman" and for "Jaguar" is the same: "Balan". The Olmecs -- the first great civilization in the Americas (1200 - 300 B.C.) carved hundreds of jade figures -- half jaguar/half human. I am increasingly convinced that ancient artists in shamanic cultures were portraying visions perceived in altered states. I have no doubt these early psychonauts were seeing themselves transformed -- just as I had.

Spirit Allies. Animal Helpers. Totems. Powerful experiences indeed. As I said before -- I am finding more questions than answers. Why are these ancient archetypes manifesting in my post-modern mind? Symbols from a Collective Unconscious? Powerful spirits from an alternate realm of existence? I have spent my entire adult life demanding criteria of validity from anyone making fantastic assertions. When one begins accepting beliefs without proof, it's like opening the floodgate. UFO's, fairies, Mahakala, Seth, Jesus, etc. how can you contend one is real and another is not after you accept any of them on pure faith? Entheogens provide an experiential path to explore the origins of religious behavior -- but fitting these experiences into an epistemological framework is the true challenge.

Perhaps the best mystics are the reluctant ones. Perhaps they are less likely to be caught up in every odd belief or notion. Perhaps critical thinking and skepticism are the appropriate tools with which to approach spiritual experiences. Without a doubt I am changing. Towards what I am not totally sure. I feel I have faced my own shadow and grown greatly in the process. Only now, as I turn 40 years old, do I find myself realizing my true power. I'm excited about what lies ahead -- things are really beginning to get interesting.

With this power is the increasing awareness of responsibility. In my last session -- undertaken specifically to contact allies-- my plant teacher

presented me with this question: "what do you want the power for?" Yet another question to consider.

I would be interested to hear if other readers are encountering allies or if anyone is really trying. The idea is forming in my mind that approaching entheogens with respect and humility (manifested through one's ritual actions) has been critical in making these contacts. As one reads about traditional shamans it appears their goal was to develop relationships with their allies over time -- gaining great power. This seems to be where my path is leading. One other request for feedback: during several entheogenic sessions I have sensed what seemed to be other shamans. The experience is of a very powerful individual scrutinizing me very closely. No visuals -- just a presence. I've not felt any ill-will as such -- just like they're checking out the new kid on the block. Initially I felt a bit intimidated, but lately have asserted my right to be in hyperspace. The whole experience only lasts a few moments -- but is quite distinct. Is anyone else having encounters like this ?

*Shaman's Drum* calls itself a journal of experiential shamanism, which is fine, but you will notice how many pages are devoted to ads for teachers and seminars. *ER* is more or less the field notes from explorers out on the edge. My individualistic nature makes it hard for me to accept the notion of teachers (Shamanism 101) -- this isn't Sunday school. Yet I see from other readers' letters that many of us are groping through hyperspace. I guess I am conflicted -- sometimes I can't help but think we're reinventing the wheel, that the right mentor might almost be essential (a don Juan). On the other hand it seems one learns by doing -- reading a book won't make you an artist -- you just pick up the paint brush and start painting-- you learn as you go. While I value the technical information in *ER*, other psychonauts' experiences are most instructive. I encourage other readers to share not only the phenomena of their entheogenic sessions, but also their underlying goals. What are you guys trying to accomplish? How are your world views being changed? To me this is the core of what entheogens are all about.

-- Hawk

# CHEMISTRY MATTERS

## METHYLENE CHLORIDE-1

A reader is interested in extraction of methylene chloride from furniture stripper and it set my thinking wheels to work. Hypothetically, if one were to find the respective boiling points of each ingredient of furniture stripper, couldn't one use a distiller/condenser and boil the solution to each boiling point, effectively evaporating each ingredient until it was time for methylene chloride to be boiled? [*Yes. A very feasible idea. See following entry. -- Ed.*] I am certainly not a chemist, and I am eager to try this -- perhaps someone with some more knowledge can assess the feasibility of my idea before I blow myself up! [*Methylene chloride is not flammable: a big plus! It is, however, a known carcinogen. -- Ed.*] As a footnote to this, I have a plan to get some detailed information about furniture stripper ingredients from the companies, results will follow -- *Hershey*

## METHYLENE CHLORIDE-2

Someone inquired about purifying paint stripper to obtain methylene chloride. The only way I know of doing this is by fractional distillation. The stuff has a real low boiling point so ice water in the condenser and around the receiving flask is a must. [*I've seen methylene chloride boil in a jar of aqueous extract exposed to hot sunlight, so a complicated heating setup would not be necessary. -- Ed.*] A good organic glassware kit is almost a must for this type of thing. Request a catalog from Kontes Glass (800-223-7150). They don't sell chemicals so it's low risk if your telephone manners are practiced.

All halogenated hydrocarbons should be considered as possible carcinogens so one must be careful with ventilation and complete removal from the finished

product. The same method of distillation works for solvent recovery too. Hagenow Labs carries ethylene dichloride and chloroform which have similar properties. Beware ethyl vs. ethylene: they ain't the same thing.

A book by Uncle Fester dealing with homemade explosives goes into details of distilling sensitive compounds (nitroglycerin) and is understandable. Vogles "practical organic chemistry" has a good section on lab techniques and precautions in handling chemicals as well as hundreds of recipes for making useless stuff.

I made an extraction of 100 grams of *Phalaris* grass, (acidic water extraction, defatting, extract w/ MeCl, column chromatography) to obtain about 1/4 gram of a viscous yellow oil which tested weekly positive to DAP paper but had no effect when smoked by direct vaporization. [*It's best to work first with the Turkey Red or Yugo Fresh Cut varieties of Phalaris: they are known to be potent. Once you get your technique perfected you can test out other varieties. Of The Jungle carries the above two strains. -- Ed.*]

Another smaller run of *Desmanthus* root chunks, using the same procedure, produced more product but as of yet no analysis has been attempted.

The target tryptamines do not seem to be soluble in ether. Methylene chloride is much better.

-- *Initials and state accidentally erased from file. Sorry!*

[*I now refuse to work with anything except methylene chloride: it works, and I'm not enough of a chemist to figure out why the other stuff doesn't work (for me anyway). -- Ed.*]

Say NO...  
to  
DRUGS!

Zink + 4  
Presort

## STEAM DISTILLATION

Some years ago I did a lot of water-steam-distillation and made essential oils from different herbs. I did it with my students and we made it for perfume and for aroma jar or just for the fun to feel different smells. I've tried many flowers and spices with good results. It's a good method when the oils are volatile or easily decompose at high temperatures. I use a very easy method. A usual distillation setup, pour the flowers in enough water, and boil. The distilled water will now contain the oils in tiny, tiny drops (suspension) and then just extract it with a suitable solvent and evaporate the solvent. I don't know if this technique can have any useful application for plant-entheogens. I have been thinking of it, but don't know. -- *AK, Sweden*

## MAKING TRYPTAMINE FROM MILK

Here's an idea on boosting the Psilocin/Psilocybin content of *P. Cubensis*. I read in some of J. Gartz's work, that he could increase the potency of *P. Cubensis* up to six fold by feeding the fungus Tryptamine Hcl. This substance is not easily obtained, but tryptamine can be created via bacterial action on tryptophan-containing substances. Milk is a common source of tryptophan (some people think that this is why a warm glass of milk makes people sleepy). The best conversion claim of tryptophan to tryptamine via bacterial action was from 75 - 85%. An average glass of milk contains 35 - 65 mg of tryptophan, a gallon from about 600 - 1000 mg. This could be a ready-made source of from 400 - 800 mg. of tryptamine, just from sour milk. A local grocer will sell me past-dated milk for 75 cents a gallon. I would suspect that many grocery stores might even give it away. The best way to add the putrefied milk solids to the mushroom culture would be to:

- 1) Let it totally spoil (do this where smell doesn't matter), and then dry it to a solid.
- 2) Sterilize the solid in a pressure cooker for the same time and pressure settings as for agar media.
- 3) When inoculated grain is ready to put into trays,

carefully mix in a S.A.C. supplemental feeding at casing: a procedure described by Paul Stamets in his big blue mushroom bible. Add an amount equal to ten percent of the grain/substrate weight and mix both thoroughly. This would be cheap, and most important, invisible to the police state -- no chemical house requisition paper trails left. Maybe someone has an idea on how to extract and concentrate the tryptamine from the solid residue? -- *Inner Frontiersman*

## LSA/MUSTARD COMBO

I have been following the nitrogen mustard, LSA dialog (Spring '95 *ER*). Merk 11 lists a component in nitrogen mustard as a carcinogen. I suspect that the nitrogen mustard does not actually react with the LSA alkaloids to form an ammoniated compound, but rather the same compound in the nitrogen mustard intervenes with some cellular chemical function to cause the LSA to be metabolized differently than would have occurred without the nitrogen mustard. -- *Cyotee*

*[I haven't received enough feedback on the LSA/Mustard combination to continue taking it seriously. It was a speculation made by a chemist, but without corroboration, it remains speculation. I usually require confirmations from two separate sources before I get very excited about any of the weird stuff I read in ER. -- Ed.]*

## ALKALOID FILTERS?

Regarding extractions: would a filtration system be available which removes -- from aqueous extracts -- most everything, including the alkaloids, and allows passage through the filter of the sugars and starches? *[Most extraction procedures depend on chemistry in combination with filtration: I've never heard of a filter that selects for alkaloids. -- Ed.]* I am still bothered by fundamental extraction principles. Do you mean to tell me that if I grind *Desmanthus* bark and mix with water, and filter, the filtrate will *not* have alkaloids in it? -- "J," OR

*[The alkaloids will remain in the biomass unless they are first converted to salts by acidification. Think of acidification as a first "chemical filter," and basification as the second "chemical filter." -- Ed.]*

# NETWORK FEEDBACK

## LECITHIN

Did I read somewhere that Lechitin taken the day before and the morning of *P. Harmala* consumption would eliminate most of the nausea? I vaguely remember reading that 2 tablets the night before and 1 tablet the next morning would eliminate most nausea; however, I have not been able to relocate the source to verify the dosage in mg. -- *Hershey*

## AMANITA /PSILOCYBE COMBO?

A thought on *Aminita/Psilocybe* synergy: According to the neurochemists, Ibotenic acid/ Muscimole acts on the GABA receptor sights in the brain, while psilocybin/psilocin acts on the serotonin pathways. An interesting theoretical synergy suggests itself: surely someone has tried this combo?

-- *Inner Frontiersman*

## SAINT JOHN'S WORT AS MAOI

More on St. John's Wort ----- I am enclosing an ad that has run in a Herbal catalog for the last 7 years. NOTICE: no cautions on diet. Little old ladies drink this tea and none of them have gone into MAO inhibited hypertensive shock. The company reports all favorable results. People compare it to a stronger version of Passionflower tea. Unlike *Peganum harmala* it is very easy to grow anywhere in the world. Caution!!! Anyone who wants to experiment with St. John's Wort as a MAO inhibitor should first take a small amount of it in tea form to test for any possible allergic or other system incompatibilities. Also this should never be used when you are going to be in direct sun -- it causes some photosensitivity. Most are not affected, but some, especially fair skinned people, can burn very fast. St. John's wort along with San Pedro could give rise to a new psychedelic punch called the Holy Roller, or maybe Saint Punch or Holyhuasca. As with *P. harmala*, side benefits like immune system boosting, and cardio-vascular toning are part of this medicine.

-- *Inner Frontiersman*

## Advertisement:

*St. John's Wort contains the active ingredient of hypericin which contains flavonoids, and xanthones. The flavonoids and xanthones are MAO inhibitors. (MAO is monoamine oxidase and MAO inhibitors increase the level of the nerve impulse transmitters in the brain that maintain normal mood and emotional stability.)* [Sic: That's not quite the way I would have described them! --Ed] *Research on St. John's Wort resulted positively regarding the calming effects on the nervous system. St. John's Wort can be an important dietary supplement for those who experience anxiety and sleeplessness as well.*

## Indiana Botanic Gardens

P.O. Box 5

Hammond, IN 46325-0005

Phone (219)947-4040 FAX (219)947-4148

[I have heard that St. John's Wort, a common weed in many parts of the U.S., is one of the few known examples of an **irreversible herbal** MAOI. If so, it could be dangerous when combined with certain foods. All the cautions about MAOI use are based on the irreversible types, which are commonly synthetic drugs. On the other hand, if the Indiana Botanic Gardens has been selling this herbal extract for years with no more warning than their rather creative interpretation of what a MAOI is, one might assume they haven't had any hypertensive crises associated with this product. I don't know -- the entire subject of MAOIs is confusing and contradictory. On the bright side, if this extract potentiates oral DMT without unwanted side-effects, it would seem we have another ayahuasca analog ingredient. -- Ed.]

## VARIEGATED PHALARIS VARIETY

I have a reed grass that I transplanted from a park here in Minnesota, it's striped (white and green) and I'm pretty sure it's *Phalaris*. I know it's not native here but it's been growing fine in our climate for several years, never producing seeds. Can anyone

confirm my suspicion? [Sounds like the variegated variety of *Phalaris*, a type popular with landscape gardeners. It's a beautiful plant, but alas, I've not found it to be psychoactive. -- Ed.]

Check out:

**Companion Plants**

**7247 North Coolville Ridge Rd.**

**Athens, Ohio 45701**

Ask for catalog #3. This is the most low key catalog I've seen and contains the biggest selection at the lowest prices for all those plants you want.

— **Jack Frost**

**TRANSPORTING ENTHEOGENS  
ACROSS STATE LINES**

Imagine a Honda Civic on a tow dolly behind a U-haul with the engine idling, the air conditioning on, and many sacred plants and cacti stuffed inside. There was no extra space. The left side was covered with news print to keep sun and passing eyes out. 2,600 miles, and no problems with anyone! They are all very happy here. — **Spiritual Earth Man, OR**

**NEW (TO ME) LSA FUNGUS**

Do you know anything about *Vaccinium uliginosum*? If there has been a rainy autumn (it's always rainy in Sweden), the berries get a fungi on them; the fungi contains some LSD-related compound. Every year some children got intoxicated (by mistake) and also older people (not by mistake). Not so many know about it! I haven't got any reliable information, more than that it is LSD-related. Is this only endemic for my area or general? — **AK, Sweden**

[There are many fungi species that produce lysergic acid amide (LSA), which is a precursor to LSD. This is the first one I've heard about that grows on berries -- usually LSA fungi parasitize grass seeds and grains. Sounds like an easy procedure: inoculate some blackberries or raspberries or whatever berries with a *V. uliginosum* culture and forget about morning glory or *Stipa robusta* extractions. I don't know where it is endemic other than Sweden -- anyone have further data? -- Ed.]

**COPPER PIPE SAFETY**

In Vol. 5 No. 3 of *ER* there were instructions on building a Tryptamine Pipe. Isn't copper tubing a bad thing to use for a pipe? I've heard that copper produces poisonous gas when heated. — **TF,IL**

[I don't know: I suppose copper isn't the perfect pipe material, but the brass cartridge casing is what gets hottest, and the time it's in use is relatively short anyway: by the time it started off-gassing it would be far too hot to hold. My brain is still functioning (I think) after several years of using such a pipe. All things being equal (eg. universal environmental pollution), I tend to be philosophical about such things. As someone said in a past issue: "We're all gonna die!" Yep! — Ed.]

**HOW DRUGS WORK**

If it has not been mentioned yet, there is a wonderful book published by Ziff-Davis Press called *How Drugs Work* by Longnecker (ISBN 1-56276-241-9). Ziff-Davis is known for publishing those computer books with very brilliant, easy-to-follow drawings. For us entheogenists, *How Drugs Work* is an excellent book to show those friends who always ask, "But what does it do to me?" The most ironic thing about the book is that it is so well illustrated and concise, yet the author has an anti-drug stance (but this is apparent only in the introduction, and it is anti-drug, not anti--entheogen!) — **Hershey**

**DUTCH STYLE GROW LIGHTS**

**50,000 lumen light system** with 430 watt AGRO plant bulb. \$255

**90,000 lumen light system** with 600 watt HPS bulb (150 lumens per watt) \$325

Highly efficient, compact, lightweight, moulded aluminum reflector (HORIZONTAL). 15 foot heavy-duty detachable lamp cord with fully ventilated remote ballast. VERTICAL PARABOLIC SYSTEMS available. Please call:

**GREEN GROWER SUPPLY,**

622 Hollis St.,

Framingham, MA 01702

(508) 872-4423

## FUNGUS ALLERGIES

In response to High Mushroom Weirdness (Summer '96 *ER*): My family has a history of sudden, violent allergic reactions to new items. It only takes one exposure to mold, which gives a very nasty reaction to many allergy sufferers. Also, according to Ott, many edible mushrooms produce volatile compounds including hydrazines, which can be possibly carcinogenic. Since they are volatile, it is possible that *C. OR* was inhaling a lungful of "Mushroom Gas." In a sealed container, these gasses would collect at the top, a perfect place to inhale them just as a container is opened. It might be a good idea if we all avoided inhaling or sniffing mushroom cultures, especially ones in sealed or near air tight containers.

-- *Inner Frontiersman*

[One of *ER's* faithful informants sent me an article from the Sunday, October 6, 1996 *Arizona Republic*, entitled: "For psychedelic seekers, fungus may put the fun in old books." The article says: "Experts on the various fungi that feed on the pages and on the covers of books are increasingly convinced that you can get

high--or at least a little wacky--by sniffing old books. Fungus on books, they say, is a likely source of hallucinogenic spores." At least one expert feels the warning may be overstated: "...It would take a fairly concentrated exposure over a considerable period of time for someone to breathe in enough of the spores of hallucinogenic fungus (sic) to seriously affect behavior. There are no studies to tell how much or how long before strange (sic) behavior takes hold." Actually, the "High Mushroom Weirdness" pieces on pages 3 and 4 of the Summer '96 *ER* may be the beginnings of such a "study." You can say you read it here first! -- *Ed.*]

## PEGANUM HARMALA SITE

I visited the site mentioned in your book *Psychedelic Shamanism* (Interstate 10 off exit 159, south of El Paso, Texas). If any readers are in the area, or passing through, the visit is worth the trip. I saw many, many *P. Harmala* plants in their natural habitat, and they grow between the freeway and a small frontage road, so one does not have to look suspicious parked on the median. Once I knew what *P. Harmala* actually looked like, I spotted it all the way back to exit 100 on both sides of the interstate. I visited at the end of May and the fruits were still green -- August would be ideal. I collected "seeds" by the handful under each plant, BUT, upon returning and cleaning, the seeds easily crushed to powder. Extraction was a muddy disaster and the resulting syrup is of questionable potency because nausea was never felt upon oral ingestion. Conclusion: the best seeds are retrieved directly from the pods. I don't know whether the seed "droppings" contain an effective amount of harm(al)ine. All in all, it was nice to see an entheogen in its natural environment. On a side note, there is another plant growing in abundance in the area that looks like an acacia. Perhaps someone with more extensive botanical knowledge could offer a proper identification. -- *Hershey*

[That's probably mesquite: considered a pest by Texas ranchers. See following letter on this species. As regards *P. harmala* seeds, I've found that late summer (August) is the best time for harvest, though one ought to see the plant in springtime when its white flowers are out -- nice! -- *Ed.*]

### TRYPTAMINES IN MESQUITE

In your Book, *Psychedelic Shamanism*, you said that several mesquite species at least contained 5-hydroxytryptamine and tryptamine. I would like to know if a MAOI would be needed. What would a trip be like? I live in Texas and it is so abundant that it is hard to ignore.

In Michael Moore's book, *Medicinal Plants of the Desert and Canyon West*, it states that Syrian Rue contains 5,6 - hydroxytryptamine in the herbage. Wouldn't it be possible to extract the whole plant, (herbage - seeds), to make a sort of Ayahuasca analogue? -- *JB, TX*

*[Not all of the chemicals in the tryptamine family are psychotropic, and as far as I know those found in the mesquite bush are not. Those with a solid background in organic chemistry, with access to a decent laboratory, might know how to convert them to their potent cousins, but I have no idea of how that might be done by amateurs such as myself. My guess is that it's not a simple matter, or even worth the trouble. My knowledge of Syrian Rue (*Peganum harmala*) is that harmine/ harmaline is found in the seeds and roots only. One might be able to reproduce a jungle ayahuasca brew by boiling these up with a potent DMT containing botanical. -- Ed]*

### KETAMINE BUMMER

I recently had the opportunity to try Ketamine and had a nasty physical reaction to it. On both occasions I became extremely sick for several days after taking K. My immune system seemed to shut down and I experienced harsh flu like symptoms that lasted for almost a week. It layed me out. I used new sterile needles and pure bottled Ketamine for the experiments so I don't think it was from any external infection. I have spoken to several people about this and it seems that I'm the first one that they have ever heard of with this kind of reaction. Very strange indeed. I think I'll be staying away from Mr. K. -- *Toad*

### MESCAL BEANS

Here's some information for those who are interested in mescal beans (Fall '96 *ER*)... As you said "I wouldn't take mescal beans..." From what I've read, the use of the bean was an ordeal ritual and the use of it discontinued when peyote was "discovered" -- wisely so. -- *SM, AZ*

*Scientific Name: Sophora secundiflora (Leguminosae)*  
*Common Name: Mescal bean, red bean, coral bean, ret hot, frijolillo, burn bean. The plant is called the Texas mountain laurel.*

*Occurrence/Use. American and Mexican Indians have*

used the bean in religious ceremonies for many years. Today, the seeds are more commonly used as a good luck charm. No unequivocal evidence supports the association of mescal bean ingestion with hallucinations.

*Toxin.* ...The major toxic constituent appears to be cytisine (0.25%)... Pharmacologically, cytisine resembles nicotine and has an oral LD-50 dose in mice of 50 to 100 mg/kg. The subcutaneous injection of 0.5 mL of a 50% ethanolic extract of 250 mg of *S. secundiflora* seeds was rapidly fatal to 150- to 200-g rats. The lethal human dose is not known...

*Clinical Presentation.* The only reported human intoxication resulted from the self-administration of the powder from one quarter of a *Sophora speciosa* seed. The experimenter developed headache, paresthesias, lightheadedness, and difficulty in walking within 2 hours, followed by diarrhea. A "peculiar numbness in the spinal column" lasted over 24 hours.

### PEYOTE GRAFTING -1

I don't have any experience with cactus grafting, but I got a seemingly good idea from reading about it in the Summer '96 issue. There seems to be no reason to graft a very small peyote onto a large cut limb or central column. In addition to being a mismatch in size it also wastes the growing tip that has been cut off (from further growth). Why not cut a small matching size circle out of the side of the column, onto which you place the peyote button? This way there is no large difference between the two, and you can put a large number of grafts onto one cactus; ten, twenty, etc.

The idea of using other species as a rootstock is a good idea. Why waste a good *Peruvianus* or San Pedro? Use one of the fastest growing species of cactus. A good start would be those that the cactus industry uses to graft on those little ornamental color cactus buttons.

Now the only question is: where did *Anon* get 150

peyote seeds, and how can he send/sell some to me?

— *The Gnostic*

### PEYOTE GRAFTING - 2

Vaseline may be good for sex or for lubricating the tip of your enema bag hose, but keep it out of your entheogenic cactus garden. Vaseline or any petroleum or animal based fats or oils will cause damage to the plants when trying to prevent desiccation of the host plant's remaining exposed cut surface after a peyote button graft. Never, never put any oil of any kind between the surfaces making physical contact as this practice will guarantee a "rejection" or failure of the plants to make a living bond. I have found that applications of avocado oil to the remaining exposed cut surface of the *T. spachianus* host plant after a graft has been performed will prevent desiccation and consequent malformation of the grafting surfaces. Avocado oil will not cause plant damage. A string with rocks attached on each end, with the string laid across the top of the Peyote Button graft should have enough weight at each end to firmly push the Peyote plant to the *spachianus* plant.

The avocado oil is thinly applied with a small tipped artist's paintbrush to the remaining exposed surface of the freshly cut *spachianus* plant. Ideally, this should be done an hour or two after the graft has been completed and the exposed surface to be oiled is no longer wet to the touch. If a graft has been well done, it will "take" in as little as 4 days whereupon the weighted string may be removed. I have successfully grafted baby Peyote buttons less than 3/8 " diameter to 2" thick *Trichocereus spachianus* limbs using this method. — *B. Green*

### THE ENTHEOGEN LAW REPORTER

## AYAHUASCA ANTHOLOGY NOW IN PRINT!

THE ENTHEOGEN REVIEW  
MONOGRAPH SERIES NUMBER 1:

### AYAHUASCA ANALOGS AND PLANT- BASED TRYPTAMINES -- THE BEST OF THE ENTHEOGEN REVIEW, 1992-1996

The best and latest information from *ER's* first four years of publication. Including: Ayahuasca Analog data, MAO inhibitors, Mushroom Ayahuasca, *Phalaris* grass, Smokable Tryptamines from Plants, Other Tryptamine-containing species, plus DMT and 5-MeO-DMT. This information-packed monograph has been edited so that all the data is compiled into easily referenced chapters. Instead of paging through past *ERs* looking for that special article, find it here under one cover. \$20.00 Postpaid (\$25.00 outside U.S.)

Paperback: 56 Pages, 13 Illustrations

### The Entheogen Review

First year of publication bound together in a 74 page book -- \$20.00 domestic, \$30.00 outside U.S.A.

ALL OTHER BACK ISSUES: \$5.00 EACH  
\$7.00 OUTSIDE U.S.A.

### Psychedelic Shamanism, The Cultivation, Preparation and Shamanic use of Psychotropic Plants, by

Jim DeKorne, 1994, 155 pages. \$22.00 postpaid (\$30.00 outside U.S.) from:

The Entheogen Review,  
P.O. Box 800, El Rito, NM 87530.

"No hands on explorer of psychedelic hyperspace will want to be uninformed of the facts and techniques in this book. It is a valuable contribution to the new literature of do-it-yourself shamanism and psychoactive ethnobotany." -- Terence McKenna

## SALVINORIN THE PSYCHEDELIC ESSENCE OF SALVIA DIVINORUM D.M. TURNER

The most powerful natural psychedelic known has recently been isolated from a rare Mexican sage, *Salvia divinorum*. The active compound, SALVINORIN A, has astonished users and researchers with its dramatic and intense psychoactive effects, which are quite distinct from those of other psychedelics. Early experiments have shown diverse results, ranging from alarming intensity and terror, to experiences of exquisite feelings and insights, transformative and healing energies, and bizarre physical/geometric dimensions.

D.M. Turner discusses *Salvia divinorum's* botany, history, and use by Mazatec Indian shamans in Oaxaca; the experiments which yielded salvinorin A; methods for using both the extract and whole plant material, and descriptions of *Salvia divinorum's* unique effects. Includes first-hand accounts from pioneering users and vivid descriptions of Turner's own *Salvia* journeys. 57 pp

## Sacred Mushrooms and the Law

JUST RELEASED -- SUMMER 1995

WRITTEN FOR SHAMANIC USERS OF TEONANÁCATL

- ◆ All the federal and state laws concerning *Psilocybe* mushrooms and their chemical constituents are discussed and explained.
- ◆ Easy to read charts and tables display potential punishment under the federal sentencing guidelines.
- ◆ An up-to-date and complete state-by-state chart displaying the various state punishments for possessing and cultivating mushrooms.
- ◆ The legality/illegality of *Psilocybe* spore prints, mycelium, and culture, and the California laws concerning same.
- ◆ The legal status of *Amanita muscaria*.
- ◆ The religious defense to criminal charges.
- ◆ The mushroom versus substance debate: is nature illegal for naturally producing controlled substances?

WRITTEN BY RICHARD GLEN BOIRE, ESQ.  
Editor of *The Entheogen Law Reporter*  
and author of *MARIJUANA LAW*.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 6, NO. 1, Vernal Equinox, 1997**

ISSN 1066-1913 Copyright © 1997, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

## *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

*Atropa belladonna*

## *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F96 means that the Fall, 1996 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

## *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- Jim DeKorne

# A DMT SMOKING PRIMER

---

In 1984, revised in '85, "Gracie and Zarkov" wrote the paper *DMT – How and Why to Get Off*. This still is the most extensive paper on the technique of smoking DMT and I am puzzled as to why nothing much more than this has been written in the last eleven years, especially considering the increase in curiosity about experimentation that has been catalyzed by Terence McKenna. This same article appears as a link on McKenna's homepage, Terence McKennaland. I would be interested in hearing about a more efficient method than the one below. A few of the other methods I've heard about require more elaborate equipment, electrically controlled vaporizers, etc.

You may wish to read this article as a starting point. I will only add the most important upgrades to the techniques discussed and clarify inaccuracies, although my outline will stand on it's own.

### *Setting:*

A dimly lit room with few as possible distractions, not unlike the surroundings for a strong mushroom journey. Sit on a bed or floor or any comfortable horizontal surface so that you can immediately lie down after your last toke. You will most likely end up in this position anyway if you don't.

Method: There is good reason to use a glass pipe, to gauge the amount and form of the vapor produced and consumed. Most glass pipes I have seen used are coal black from DMT burned in them. This usually results in the eventual build up of burnt DMT in the bowl, stem or chamber of the pipe, reducing the advantage of using a glass pipe in the first place. When DMT is heated, it briefly turns into a liquid before vaporizing. If you use any pipe with a single screen, even a fine mesh, some of the DMT will melt through the screen if the pipe is clean, this can, over time be washed out with ethanol and the residue allowed to evaporate back to the freebase or it can be used to soak another substrate for smoking: *Cannabis*, mint leaves, etc. Using 3 fine mesh strainless screens nested together in a pipe bowl prevents the liquefied DMT from melting through before it can be vaporized. The liquid spreads through capillary action across the screens and vaporizes. Use the heat, not the flame of a

butane torch directly on the freebase, only hot enough to vaporize it. Draw the flame slowly closer at first to establish the distance necessary to reach the correct range for heating the DMT. A butane flame is preferred for its control, and adjusted with a sufficiently long flame will readily burn upside down to be directed into the bowl without burning your hand. A micro torch or pencil torch, available from electronic parts and tools suppliers is ideal. Even so, with this technique, the smoke has a strong pungent flavor and some find it difficult to consume a sufficient amount of vapor to reveal the full spectrum of possible effects. A glass water pipe to cool the vapor is ideal. A pipe or bong used for *Cannabis* will do, just add the additional screens. The use of water greatly reduces the harshness and very little of the DMT is absorbed into solution. A carburetor or hole in the chamber is useful to extract all the vapor. A dedicated pipe used in this fashion will remain fairly clear for a long time. Cleaning out your bong to try to collect the coated DMT is not practical to separate it from burnt tars in the weed.

### *Dosage:*

- 5 - 10 mg -- a pleasant buzz throughout the body, little or no visual colors
- 15 - 25 mg -- the addition of patterns and simple forms
- 25 - 35 mg -- patterns dissolve into stronger and more distinct images
- 35 - 60 mg -- full blown effects

Smoking more than 25 - 30 mg. generally requires two tokes. These should be done efficiently to experience the full effect of the selected dose. Take several deep breaths to slow the breathing down and prepare for the first toke. Exhale completely then hold the first toke briefly, 2 - 3 seconds, exhale quickly and deeply and immediately draw the second toke. This may be held as long as comfortable. You will notice that as you exhale the first toke, that you are already coming on. Do not let this distract you. It takes a great deal of focused determination and courage to smoke a sufficient amount to produce full effects. Do not be tentative in your technique. Fortunately,

focusing intently on techniques has the added benefit of shifting your attention away from the apprehension that accompanies most sessions. With practice, you will only use enough heat to vaporize a first toke without leaving the unused smoke in the chamber. This unused smoke will coat the pipe, or your assistant may choose to consume leftover smoke after the second toke. Ideally, several attempts will be available to refine your timing and approach. If possible, you may wish to start with 10 mg. just to create an opening, then go for the committed dose 30 - 60 minutes later. G. and Z. claim tolerance can be built up if smoked repeatedly within an hour. Not so -- just try. For doses larger than 25 mg., using an assistant is recommended. Someone to remove the pipe and flame is welcomed.

5-Meo-DMT is some 3 1/2 times stronger by weight than DMT. Because the amount required to experience full effects is so small, a single toke is all that is required. The use of water in the chamber is also not as critical.

*Dosage:*

1 - 3 mg. -- body buzz and a pronounced shift in perspective, ego intact.

4 - 6 mg. -- ego beginning to dissolve.

8 - 12 mg. -- boundary-dissolving for most people.

12 - 15 mg. -- if you can maintain the witness at this dosage, a quite remarkable experience awaits you.

The most useful strategy is to simply pay attention. Do not try anything other than pay close attention and let go. Resisting in any way will not serve you. It is very easy to be distracted, to be led off on tangents, to wonder whether you are breathing, dying, losing your mind, or are the victim of some impish prankster. Try not to judge the experience in any way while in the thick of it. All of that is for you to decide later. You may console yourself with the knowledge that if you were to die or lose your mind, that you will be making medical history. -- *Leaf Hopper*

*TAKING THE 5-METHOXY  
CHALLENGE*

I misunderstood the differences between DMT and 5-MeO DMT, and in my mind they were one and the same. 30 mg, being a sufficient dose of DMT, I figured that 30 mg. was a good dose of 5-MeO DMT. Needless to say, 30 mg. of 5-MeO is very scary,

especially for a first time user. This was the most unnerving and mentally scaring thing to happen to me in my 18 years on this planet.

I have since wised up, and now rarely use more than 5 mg. at once. Also, I prefer snorting it, it isn't nearly as intense and lasts longer. This is more of a recreational use. The smoked 30 mg. was too much to actually think spiritually at the time. The lower dose snuffs are much easier to interpret, while under the influence.

Imagine that you suddenly have no control of your own body, but you are fully aware of what is going on. Almost like you are trapped watching, but cannot control anything. You run into walls, curl up fetal, and scream to yourself. You don't have any control over yourself any longer! It isn't quite an out-of-body experience, more like you are out of your body, but stuck in your head, your eyes. You become forced to watch your body act very odd, and can do nothing but wait.

Anyhow, I hope the enclosed information about my various 5-MeO trips can help *ER* readers understand what a high dose 5-MeO trip is like, and that they should never try it, unless they are very stupid. Unless they want to have semi-seizures and behave schizophrenic, stay away from doses over 15 mg!

I placed approx. 30 mg of 5-MeO into a pipe, and smoked it, in one toke, without a second thought. An instant later, I was crawled up on my bed (in the fetal position) with eyes closed, squirming around, screaming (in my head) "Fuck! You killed yourself!" I repeated this several times, very fearful of death. I didn't see anything, while my eyes were shut, except for a bright white light, that which you see after staring at the sun. If this is indeed the bright light seen in near death experiences, then something was very wrong, as this light was menacing, evil, mean. The only other "vision" was one in my mind, I came to the realization that my life would be wasted if I died there. They pictured all of my work being discarded and nothing good happening ever again. This was a glimpse into my future, if I died.

Some say that the bright light is soft and welcoming, however, I was deathly afraid of the whole experience (up to that point).

I have read that the key to getting through a 5-MeO trip is to concentrate on breathing, this I did, and that

helped me survive (mentally). I kicked my shoes off whilst lying on the bed, and felt as though I couldn't touch the ground. (I have, since noticed that one can be much more comfortable on 5-MeO if you stand up, or sit in a chair, with your feet touching the ground.) My cat jumped onto the bed and started walking around my head, seemingly worried. His eyes were scared, perhaps for me. His mouth was moving as though he was meowing, but I could not hear him. I opened my eyes and reached out to pet him, and he felt as soft as anything. The feeling was not a softness I have ever felt before. As soon as he started to look less worried, I too felt better.

After a few minutes, (about 3 minutes from the first inhaling) I had no doubts that I would survive, so I got up from the bed, and started to stumble around. My mouth felt strange, as if full of cat hair, which I am certain was in my mouth, but I couldn't get the feeling out! My throat was burning also, ever since inhaling, it burnt like I just downed a shot of tequila, but the burn stayed in my throat for around an hour. — *MAP*

### *DIMINISHED APPETITE FOR DMT*

Of all the people I have known who get into DMT (or at least the alkaloids from *Acacia*), none, including myself, have continued smoking the extractions on a regular basis. If you have a big dose it's like you don't need to go near the stuff for a while, if ever again. Generally, a few weeks or months of experimentation is enough, at least for smoking extracted alkaloids. This is in a situation where the supply is effectively unlimited or at least large. So perhaps it won't go down the same track as Coca, where the extracted alkaloids produce a strong desire to continue using them. I do continue to use the alkaloids and plants in ayahuasca brews, as I find that this is not only a healing medicine but also generally not so hard on the mind and body. I still have the rare smoke, but haven't had a pipe for quite some time now.

— *Mulga, Australia*

### *MORE MIMOSA HOSTILIS LORE*

If you like DMT, this is definitely the easiest. It can grow five feet in the first year, far outbeating the slow growing *P. viridis*. Since it is fast growing, you can cut the limbs off without worry. The limb must be cut

to harvest the leaves, which are too tiny by themselves. Harvesting can be done every year since many of the leaves are shed in the Fall and therefore are lost. The cut branches can be placed into a large plastic yard bag, kept open for drying purposes. After drying, the branches are taken out and placed into a laundry tub. The leaves are then simply stripped off the branches by running your hand down it. You must wear a leather glove since there are thorns on the branches.

[*Indeed there are! That's what the "hostilis" stands for! — Ed.*] The dried leaves do not need to be powdered prior to boiling. They are tiny enough already. Two cups of dried leaves, not compressed, is the minimum. For me it seems to be the same as *Psilocybe* mushrooms except shorter. This can be preferable for the higher dose experience, which can include the solipsism bummer.

*Acacia simplex* is a fast growing, healthy tree which also contains the desired alkaloids. However, it is far too weak to be worth it. 150 fresh green leaves, taken in two installments of 75 each, was disappointingly short of one dose. — *The Gnostic*

[*In December of 1996, driving down Mexico's Baja peninsula highway between Loretto and Ciudad Constitution, the editor passed through hundreds of square miles of Mimosa hostilis trees. At kilometer 29, the Jesus Maria turnoff (love the synchronicity of the names!), I collected several voucher specimens. Would-be dope smugglers are advised, however, that I was stopped eight times in 1000 miles by teen-aged soldiers with loaded assault rifles: the revolution in Chiapas has spawned roadblocks everywhere. They're mostly looking for guns, but "dope" is also on their list of items as they paw through all your personal stuff out there in the middle of the desert. Try explaining to a 19-year old Mexican GI what you're doing with a truck load of Mimosa hostilis! — Ed.*]

### *MIMOSA HOSTILIS-II*

The summer 1996 issue of *ER* introduced me to *Mimosa hostilis*. The root bark and *Syrian rue* gave me my first Ayahuasca experience. I would like to order more *Mimosa hostilis* but am unsure of its shelf-life. Do you know if the root bark maintains its quality over time? — *PF, WI*

[*I don't know -- anyone have an answer to this? — Ed.*]

## SOMA AND THE ORIGIN OF RELIGION

---

This is in response to your editorial comments in "The Perennial *Soma* Question" (Spring, '96 *ER*). [In which a grumpy editor expressed impatience with speculation about the identification of the entheogen "*Soma*" extolled in the Hindu Vedas. -- Ed.]

I am unaware the Gordon Wasson and his wife began with *a-priori* assumptions concerning entheogens and the origins of religion. They tell that it was a conviction that grew in each of them separately as they shared in their hobby of Mycology. When the above authors, including Terence McKenna, posit that an entheogenic mushroom may be the root of religion, they are not talking about an individual epiphany. You don't need an entheogen to have a religious experience, although taking your favorite entheogen under the right circumstances may enhance it. When they use the word religion, they mean a collective shift in human consciousness. Let me quote from *Persephone's Quest*, page 80 (Editors: Gordon Wasson, Stella Kramrisch, Jonathan Ott and Carl Ruck):

*"... a prodigious expansion in memory, language and self-consciousness must have been the gift (of Soma) that differentiated mankind from his predecessors..."*

In short they believe that *Soma* may have facilitated a quantum jump in consciousness. Terence McKenna in *The Archaic Revival* makes a similar claim. The quest to understand the origin of consciousness (or religion) is not a trivial pastime. There are many brilliant scholars who have pondered this question: Julian Jaynes, *The Origin of Consciousness in The Breakdown of the Bicameral Mind*; Eric Neuman, *The Origin and History of Consciousness*; William Irwin Thompson, *The Time Falling Bodies Take to Light*; Arthur Young, *The Reflexive Universe*; Ken Wilber, *The Spectrum of Consciousness*; to name only a few authors.

The hypothesis that entheogens may be tied to the evolution of consciousness is credible in light of the fact that to date, almost all of the neuro-chemical

receptors in the brain programmed for these plant alkaloids have been discovered. (Even the neuro-receptors for the *Cannabinoids* were discovered last year).

So why not the quest for *Soma*? Isn't that what the *Entheogen Review* is all about? (i.e., the study of consciousness. The possible ways to evolve it, or return it to its source through the usage of entheogens.) [Absolutely, though I confess a bias toward more current "*Somas*" rather than the ID of a virtually unidentifiable ancient one. -- Ed.]

Concerning your comment "that women don't bother with these dialectics"... (presumably, the origins of consciousness and possible links with entheogens): We recently held a panel discussion here at Goddard College on "*Traditional Plant Entheogens and Contemporary Culture*" and I can assure you that your prejudice is unfounded. [Actually, I intended that as a compliment. The women closest to me tend to be raucously amused by scholarly speculation: traditionally a masculine pursuit. -- Ed.] During a discussion on entheogens and the origins of religion, several women seemed passionately interested in this hypothesis. I believe that the quest to determine the origins of culture, of religion, of consciousness is a noble enterprise even though we may never succeed at it. I also believe that as founder and editor of the journal you owe a responsibility to elevate the dialogue and not to attempt to render absurd any questions concerning the historical and cultural context surrounding the use of entheogens. [That was not my intent, but I belatedly see how one could interpret it that way, and I apologize. -- Ed.]

So back to the mythical *Soma*: I found the evidence presented Wendy Doniger, Stella Kramrisch and Gordon Wasson linking *Soma* to a psychoactive fungi, possibly *A. Muscaria*, to be persuasive. However, what interested me most in their scholarly thesis was the linguistic association between the mushroom and the lightning-bolt, or thunderbolt. Apparently, the root word in several cultures for *Soma* is the same as lightning bolt. ("Not of all mushrooms, but of the entheogen mushrooms are the miraculous fruit of this

coitus... " -- *Persephone's Quest*. page 46).

Were the ancients unaware of mushroom spores as the means for propagation? Or was lightning an additional and necessary component in the growth of potent psychoactive fungi capable of erecting a star antenna in human consciousness? (Note: the Sanskrit word *Soma* means communication with the gods, or as we may say today, communion with a higher consciousness, or as I prefer (in metaphor), erecting a star antenna).

Several years ago a woman anthropologist teaching at a nearby College contacted me because she had heard I had some experience with mushrooms. She showed me a hidden enclave in pine woods close by the cafeteria. Therein lay a wondrous sight to behold. There was a patch of about one hundred *A. Muscaria*, of the most brilliant specimens imaginable. The whole area glowed with an ethereal light. Each mushroom was a work of art -- large, potent, colorful with perfect caps in every stage of unfoldment.

She said the mushrooms called to her and that was how she found them. Now, this woman had no previous interest in Mycology, and had never experienced entheogens in any form. Neither of us attempted to ingest these miraculous mushrooms. The mere picking and handling of a few specimens seemed to evoke strange dreams and echoes of ancient memories.

The important aspect of this story is that during that summer we had experienced several severe thunderstorms in our area, and the trees around this enclave of mushrooms had obviously been struck by many bolts of lightning. The following year I returned there and while there was a smaller patch of *A. muscaria*, the specimens were only average; the magic was gone.

Over the years I have come upon similar stories of magical patches of mushrooms hidden in the woods. A typical example: I was wandering semi-lost in the woods one evening when I stumbled upon a place which seemed to exude a primordial quality with mushrooms growing in a circular arrangement. A voice admonished me to "leave this place of power at once."

I am well aware of the disappointment of many who have experimented with *A. muscaria*. (See my own experiences published in the Winter 1993, *ER*.)

Could it be that the missing key in the mystery of *Soma* is that the entheogen must be grown in a place of power? Most native people hold in awe places struck by lightning. Certainly the ancients knew of such places favored by lightning strikes. Could it be that *Soma* was collected and distilled from entheogenic mushrooms growing on this sacred ground? This would mean that any psychoactive plant, or fungi, has the potential for erecting a star antenna in human consciousness providing it is grown in hallowed ground. -- *TM, VT*

### AMANITA MUSCARIA CULTIVATION?

[Editor's note: *Amanita muscaria* is a Mycorrhizal species: that is, it grows in Nature only in a symbiotic relationship with the roots of a tree. No one, to my knowledge, has ever cultured *A. muscaria* artificially. The following letter suggests how this might be tried.]

Has anyone had success in getting fruiting from this species? What if one took a small tree associated with *Amanita muscaria* growth, Bonsai it in a large pot, get a good, vigorous culture from spores, then use the liquid inoculation technique to inject the mycelia into the subsoil containing the roots with which *Amanita* forms its symbiosis. This seems like a plausible way to try indoor culture. Obviously, both humidity and proper temperature to trigger fruiting would be by trial and error at first. I am interested in hearing about more good *Amanita* voyages: don't keep a gift of God a secret if it is really as impressive as some say!

-- *Inner Frontiersman*

### AMANITA AND MAOIS

I have heard that drying and smoking *Amanita* is very effective. ... I wonder if it would be rendered more active orally in the presence of a *MAOI* like those in *P. harmala*. I have experimented with throwing *Passionflower* into the water when I make *psilocybin* tea. Although the amount of harm(al)ine is low (as far as I know), it seems to really turn on the mushrooms.

--*Bzrk, NYC*

[Author stated that bufotenine is a constituent of *A. muscaria* -- according to Ott (*Pharmacotheon*, pg. 326), this has been disproven. Bufotenine is generally considered a bummer. -- Ed.]

## SEEDS AND STEMS

---

### *"The plant teachers made me do it!"*

And you thought you only had to worry about narcs! An article in the *Seattle Times*, Aug. 4, 1996, describes how a U.S. patent was granted to one Loren Miller of Palo Alto, California for: a variety of *Banisteriopsis caapi*, the Latin name for the ayahuasca vine... Miller said he had travelled to Ecuador, consumed ayahuasca and become intrigued with Amazon Indians. He sought the patent to determine (sic) if the variety had any medicinal properties, but said that he hadn't tried to market it. In response to this, a group in Spain also took out a patent on ayahuasca: the idea being that a "heterogeneity of owners" would muddle the issue enough to prevent a monopoly. (See *Eleusis*, the Italian SISSC information bulletin for August, 1996.) Various Indian groups in Ecuador are understandably upset about all this, to the point of demonstrating in front of U.S. embassies. "Sorry, Chief -- you gotta buy your medicine from us now!" --Ed.

### *What the heck is "Magic Apple?"*

The *London Times* for November 3, 1996 describes a new "drug problem" in Israel: *Of particular concern is the growing popularity of a potentially lethal hallucinogenic drug dubbed "magic apple" by users... The drug is contained in the seeds of two plants which grow wild in Israel.* Never heard of it before -- any ER readers have information on what this is? -- Ed.

### *Economic aid for 'shroom dealers?*

In a December 29, 1996 article in the *London Times*, a Labour Party MP called for: *government grants to help Welsh youngsters export "magic" mushrooms.* Fresh psilocybian mushrooms are legal in Wales, though anyone who deals dried ones can get life in prison. Member of Parliament Paul Flynn said that: *magic mushrooms are "the truffles of Wales" and that the Welsh Development Agency (WDA) should exploit their commercial potential... "It is perfectly legal to send them fresh from Wales: nobody is poisoned by them, nobody is addicted. Why...not exploit the market and get the WDA to give a grant for a few young*

*people to set up a business?" Dried Welsh magic mushrooms can command a street value of L-2,000 a kilo in Amsterdam, where they are regarded as the most powerful on the market. A spokesman... said last night that Flynn's views on drugs were not shared by the Labour party.*

### *Absinthe available in the Czech Republic*

Absinthe, long illegal in both Europe and the U.S., is now all the rage in Prague: *Czech distillers are cashing in on a thriving new demand for absinthe as thousands of tourists flock to the city to experience its delights. Wary of provoking trouble so soon after the introduction of free-market reforms, police are turning a blind eye to the trade. Hundreds of bottles are consumed in Prague bars each week. Plans call for exporting absinthe to Britain, Sweden and California.* -- *London Times*, 12/29/96

### *New Age Shaman loses patient to Ecstasy*

A rather murky story in the *Santa Fe New Mexican* for October 30, 1996 describes an incident in which: *A Santa Fe New Age therapist is facing felony charges in Missouri in connection with the mysterious death of a young woman at a rural "healing retreat."* MDMA was apparently administered in a group ritual and one of the participants died.

### *Food for thought:*

*If our problem with drugs is merely a problem of enforcement, then the drug laws and policies may make sense to the ignorant. But the real problem is not enforcement of the law. The real problem is that people do not know how to use drugs wisely. One's problems with drugs lie in how one uses them, when one uses them and why one uses them. There are no "safe and effective" drugs, only relatively safe and effective ways of using them.*

-- Letter in: *The Drug Policy Letter*, Summer 1996

# BOOK AND PERIODICAL REVIEWS

---

***Marijuana Law (1996 Second edition)***,  
Richard Glen Boire, Ronin Publishing, Inc., Box  
1035, Berkeley, CA 94701, 288 Pgs. \$15.95  
ISBN 0-914171-86-0

Reviewed by Jon Hanna, author of *The Psychedelic  
Resource List*

My first thought about a book on marijuana law was "Man, this has got to be some DRY reading!" Perhaps, on seeing this title, your response was similar. I mean really, who wants to read about laws -- that's what lawyers are for! I cannot overemphasize how misguided my first impression was.

*Marijuana Law*, by criminal - defense attorney Richard Glen Boire, is easy to understand, fast paced, and highly entertaining. It is so good that I feel strongly that everyone who has any interest in *Cannabis* pick up a copy immediately. Mr. Boire spells out all the laws in every state in the Union. And, he lists the federal laws as well. But far more than a compendium of scary laws, *Marijuana Law* gives specific real-life examples of legal cases related to particular aspects of the law. With almost every sticky legal situation presented, Mr. Boire gives two examples -- a conviction, and a release. More important than merely documenting examples though these scenarios, Mr. Boire provides his expert legal opinion as to why each situation turned out the way that it did. Due to this commentary, it quickly becomes obvious that this book is a valuable defense manual for the lay person. If knowledge is power, then Mr. Boire's book could be the most important text in the American *Cannabis* user's library. *Marijuana Law* explicitly describes how to stay out of legal trouble.

This book went to print just prior to the passing of the recent medical marijuana laws (Prop 215 in CA and 200 in AZ); hence, there isn't any speculation on how these new laws will effect the status quo. The interested reader would be wise to subscribe to Mr.

Boire's newsletter, *The Entheogen Law Reporter*, to keep abreast of the latest developments.

While *Marijuana Law* focuses on *Cannabis*, the legal advice is also relevant to many other plants and drugs which are currently scheduled. Mr. Boire spells out what an individual's constitutional rights are, and he explains how to assert them effectively. He lets the reader know what type of action is appropriate to take when confronted by the police. Covering searches and seizures, gardens, medical necessity, religious defenses, what to do if you're arrested, drug testing advice, and much more, this new expanded edition of *Marijuana Law* is a must. The most important point that I can make about this book is that the advice presented is easy for any individual to incorporate into his or her lifestyle. The result being that those who use *Cannabis* will feel much safer within their chosen lifestyle.

Mr. Boire writes, "I have become convinced that the constitutional rights created to protect us against runaway government are being sacrificed in the "War on Drugs." The *Cannabis* plant is not evil; arbitrary government is. It is time to change our way of thinking about drugs. Long after the hysteria has subsided we will be left not with a drug-free society, but rather with a less-free society." I wholeheartedly agree.

Published by Ronin Publishing, Inc., *Marijuana Law* is also available directly from the author for \$15.95 plus \$3.50 S/H. CA residents add \$1.15 for sales tax. Send payment to: Richard Glen Boire, POB 73481 (Dept. PRL), Davis, CA 95617-3481. Credit card (or other) purchases can be made through Ronin Books By Phone at (800) 858-2665. -- *Jon Hanna*

*[I'd like to add my strong endorsement to Jon's review: even if you aren't into Cannabis, the principles and strategies described in Marijuana Law apply to any scheduled substance. The information in this book could easily save you a thousand times the cover cost, not to mention years of your life. -- Ed.]*

# MARIHUANA

## THE ASSASSIN OF YOUTH

### THE PLANT

Attains a height, when mature in August, of from three to sixteen feet, the stalk a thickness of from one-half inch to two inches. Stalk has four ridges running lengthwise, and usually a well marked node by each branch, these appearing at intervals of from four to twenty inches. A leaf appears immediately under each branch. Green plant has a peculiar narcotic odor, is sticky to the touch, and covered with fine hair barely visible to the naked eye. Often hidden in fields of corn or sunflowers.

### Physiological Reaction

*The effects of marihuana are most unpredictable.*

"The eye always presents a widely dilated, fixed, staring pupil, with the white of the eye severely bloodshot (orange-red). The breath has the characteristic odor, as elicited from burnt marihuana (burnt rope). There is no sensory disturbances of balance or gait, as elicited in acute alcoholic intoxication. The person under the influence may be hilarious, possibly hysterical, weeping or laughing, talks very rapidly, and in a loud tone."

In conclusion, it is important to recognize, that both the prolonged use of large doses by habitues, and the single large dose taken by a novice may cause criminal maniacal acts. Moreover, even small quantities can destroy the will power and the ability to connect and control thoughts and actions, thus releasing ALL inhibitions viciously.

### THE LEAF

Compound, composed of five, seven, nine or eleven—always an odd number—of lobes or leaflets, the two outer ones very small compared with the others. Each lobe from two to six inches long, pointed about equally at both ends, with saw-like edges; and ridges, very pronounced on the lower side, running from the center diagonally to the edges. Of deep green color on the upper side and of a lighter green on the lower. It is the leaves and flowering tops that contain the dangerous drug. These are dried and used in cigarettes and may also produce their violent effects by being soaked in drinks.

UNDER SURFACE OF MARIHUANA LEAF.

## STAMP IT OUT

### REMEDIAL MEASURES

1. Constructive legislation and efficient law enforcement.
2. Education.

### THE SITUATION IN THE UNITED STATES

It is especially serious in our country because it is being carried as a new habit to circles which heretofore were not contaminated. It is making dangerous inroads in our large cities among the youth, so many of whom are already cigarette smokers and easy victims to a new "kick and thrill" habit.

Police officers in some of our large cities report that so many crimes can be traced to the use of Marihuana that this vice has become a major police problem.

### THE FLOWERS

When mature, are irregular clusters of seeds light yellow-greenish in color.

**IT IS A CRIME for any person to plant, cultivate, possess, sell or give away Marihuana.**

It is frequently used by criminals to bolster up their courage. Most dangerous of all is the person under the influence of marihuana at the wheel of an automobile. Their illusions as to time and space destroy their judgment as to speed and distance. When eighty miles an hour seem only twenty, they often leave a trail of fatal accidents in their wake. A user of marihuana is a degenerate.

OFFICE OF  
**SPECTRAL MINDUSTRIES**  
*"purveyors of fine thinks"*

*Culture jammers draw upon the facts of our society, this cacophony of fragmentary media images, to describe things as they are. But I think at the heart of their reassemblings is the hope that there could be another kind of world, a world where rather than incoherence there could be coherence, rather than a devaluation of the human in favor of the commodity there could be an understanding of the commodity in the service of the human. -- Prof. Stuart Ewen*

**FOR IMMEDIATE RELEASE**

**YOU'VE HEARD OF A COMPUTER VIRUS? NOW, WELCOME TO THE MEDIA-PARASITE.**

*Copswatch* is a shape-shifting media-parasite created & configured to feed off the Fox Network's *Cops* television show. Learn your constitutional rights & combat cop-culture by making TV work for you. An electro-alchemical transformation of trash-TV into a practical video-guidebook for true civil disobedience.

**BEGINNING DECEMBER 14, 1996**, Spectral Mindustries will be transmitting to e-mail subscribers of the *Copswatch Report* practical legal commentary on the various police tactics captured on that weekend's national broadcast of the *Cops* television show. Featuring the legal analysis of attorney Richard Glen Boire, the *Copswatch Report* will teach all subscribers how to protect their privacy & confront illegal police tactics by simply knowing & invoking their constitutional rights.

**SUBSCRIBERS TO THE FREE PUBLIC SERVICE** simply videotape the week's nationally televised *Cops* broadcast. The *Copswatch Report* is automatically e-mailed to subscribers by the following Monday morning. (Those without e-mail can receive the report by US mail for \$3.00.) Subscribers then read the *Report* as they watch the taped episode.

**RATHER THAN PRODUCE A VIDEOTAPE** to teach people their constitutional rights, Spectral Mindustries decided to "hack" the professional production & wide distribution of the Fox Network's *Cops* television show by coupling it with attorney Boire's free-minded legal commentary. It's a parasitosis sure to displease the Mark Fuhrmans of the world.

**RICHARD GLEN BOIRE'S** private law practice centers on divining the law confronting users of visionary plants and substances, and defending those who get caught in those legal nets. He sees the *Copswatch Report* as a necessary public service in today's world. Referring to the *Cops* television show, Mr. Boire explains: "It's twenty-three minutes of often unconstitutional police behavior interspersed with seven minutes of ads for beer and other commodity culture." He continues, "Meanwhile thousands of people are arrested each evening for such harmless "crimes" as smoking marijuana. What's causing society more harm?"

**THOSE INTERESTED IN SUBSCRIBING** to the free public service need only e-mail "copswatch@bevcom.org" with the words "subscribe me" in the subject box. The *Report* will arrive automatically. (Don't forget to tape the show!)

**FOR MORE INFORMATION** visit the *Copswatch* site on the world wide web at <http://www.bevcom.org/copswatch.htm> or e-mail [specmind@aol.com](mailto:specmind@aol.com). To schedule an interview, telephone Marshall McDonald of Spectral Mindustries at 916-753-9662.

**SPECTRAL MINDUSTRIES**  
WHO'S WATCHING WHO? DIVISION  
Post Office Box 73401

**Psychedelic Sourcebook** (1996), Will Beifuss, 1430 Willamette St. #28, Eugene, OR 97401-4073, 72 Pgs. \$12.95 Postpaid (Foreign orders add \$4.00 S&H).

The aptly titled, **Psychedelic Sourcebook** is a compendium of all the current information available on where to find anything and everything pertaining to (depending on your semantic biases), psychedelics and/or entheogens. From where to legally purchase mushroom spores, the best web-sites, books, newsletters, organizations and businesses to a comprehensive list of both Latin and common names of obscure entheogenic plants, you'll find it all listed here. This is the most current edition: given the speed at which things change, books like these are dated almost the moment they come off the press. To overcome this unavoidable problem, periodic up-date bulletins are available on request from the author for only \$1.00.

As editor of **The Entheogen Review**, I like to fantasize that I'm reasonably current with what's going on out there: just a casual browse through this book quickly sets me straight: I can't help but admire guys like Will who are not only able to keep up with extreme data overload, but organize it in a form that makes sense. This book reposes on the shelf above my computer monitor as an instant reference and has more than once made me appear more knowledgeable than perhaps I am. -- Ed.

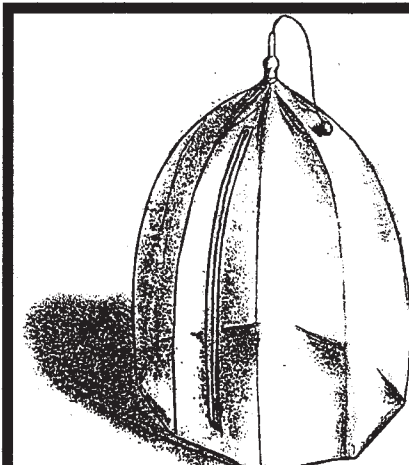

**Widdershins, a volatile journal of magick**, Daniel Alvin, Ed., 135 Allegro Dr., Santa Cruz, CA 95060, six issues, \$23.00/year \$31.00 International. Single copies: \$5.50/ \$6.50 International

This unusual (and extremely well-produced) journal is devoted to "magickal lore traditionally considered taboo, controversial, or 'strong medicine.'" No shit! Reading this stuff might give you some insight as to why witches were burned at the stake: there's material here to intimidate True Believers of any persuasion! My particular button got pushed by the "Entheogenic Elixer" recipe in issue Number 3: a brew potent enough to put Timothy Leary in a

strait jacket. (My guess is that even most Wiccans avoid this publication.) Although some of the articles would raise almost anyone's eyebrows, the data are no-nonsense and to the point. I am definitely *not* putting this publication down, just in perspective: as DMT is to *Cannabis*, **Widdershins** is to conventional Wiccan journals. Anyone exploring hyperspace with entheogens might want to be briefed on some of the extreme magickal methods of dealing with energies encountered there. Though I'm personally too cautious to even *want* to mess with most of the ideas in **Widdershins**, I applaud the courage of the guy who publishes it. -- Ed.

### OF INTEREST TO READERS

**Of The Jungle**, the Great Mother of all ethnobotanical suppliers, is diversifying. After March 20, 1997, the revised **OTJ**, newly named **Allies**, PO Box 2422, Sebastopol, CA 95473 (catalog: \$2.00), will continue to provide the same *plants and seeds* as the original company. Its sibling, **The Botanical Preservation Corps**, PO Box 1368, Sebastopol, CA 95473 (catalog \$2.00), will specialize in exotic botanical *products*, field training seminars and some new stuff such as extraction equipment. To get the full scoop on these changes, readers are advised to send for both catalogs. The old **OTJ** was a reliable source of some rare botanicals and I assume these new companies will continue that tradition. -- Ed.

**GROWING MUSHROOMS OR SALVIA DIVINORUM?**  
Make it easy on yourself.  
Control light, humidity, contaminants and temperature with the original **SHROOMROOM** and **SALVIA SUITE**.  
39.95 +\$3 s&h.  
Order from Syzygy, ...of the jungle, The Basement Shaman, Higher Yield or direct from **MAGIC 395 OAKCREEK SUITE 508 WHEELING, IL 60090**  
"Write for more details and our free brochure, "How to Grow Big Mushroom Crops in a small space."

Our 42" high clear plastic dome gives you seven square feet of growing area. Practically airtight- keeps out bugs and contaminants. Big 36" zipper front for easy access.

# FIRST KNOWN HUMAN VOYAGE ON DCM -- 2, 6 DICHLORMESCALINE

On page 7 of the Spring, 1996 issue of *ER* is a piece by the following author, speculating on how to make 2, 6 dichlormescaline. This previously uninvestigated compound, a presumed "super-entheogen," was first mentioned in *Lloydia*, Vol. 40, No. 6, in an article entitled: "Cactus Alkaloids. XIX. Crystallization of Mescaline HCL and 3-Methoxytyramine HCL from *Trichocereus pachanoi*." The article's authors speculated that on the logic of molecular chemistry alone, 2,6 dichlormescaline should be "well within the range where high psychoactivity would be expected." Not to be daunted, our intrepid psychonaut took the considerable trouble to make some: here are his results:

After spending a small fortune to isolate the pure mescaline, then convert it to DCM, I gave myself two weeks to mentally prepare. All the information was theoretical -- it could be a dud, it could be a psychotic agent or it could be a super entheogen.

I decided to start the test at 4:30 AM, three hours before sunrise on April 26, 1996.

10 mg. DCM	4:30 AM
Nothing	5:00 AM
Nothing	5:30 AM
Nothing	5:45 AM
+1	6:00 AM
+2 1/2	6:30 AM
+3 1/2	6:45 AM

At this point the intensity was rocketing past the equivalence of 2 full window panes = 300 mcg of LSD. Things dissolved and disassembled. I could see my consciousness separate into a dozen or so points in space. My eyes, and every other element of consciousness were all "thinking" on their own. I had the ultimate terror that I was disassembling into nothingness, but suddenly, this struck my emotional essence as highly comical. This "laughter" spread through all of my other essences like a pencil links each dot in a connect-the-dot puzzle.

This was a grand awakening voyage. At one point I experienced what could only be called a "mental sex

change. " I perceived myself as both physically and mentally female. After a brief wave of terror, I realized that, without going into great explanation, there is power in being female. (All western macho-minded males gasp in unison at this statement!)

A vision of what I could only reason was that of the Creator's followed. Both extreme terror and total peace and happiness filled me. I saw a pastel rainbow hue of colors. In the middle of these colors a beam of golden light projected outwards towards me. When it struck, I felt only the peace and joy of the beam as well as heard a voice that said many things. The only phrase I remember was "Do not be tricked by the evil ones that inhabit the other realms, resist them, and they will flee in terror, they only have the power that you give them!"

There was an image of a small frog-like creature belching out the usual phrases to intimidate psychonauts. I laughed uncontrollably at this pathetic little evil "thing" until I hurt. It then vanished. The rest of the voyage was filled with nice visuals, great euphoria.

The total elapsed time breaks down as follows:

From plus-1 back to plus-1, about 22 hours. The plus-2 state lasted about 13 hours and the plus-3 portion of the trip was about 9 1/2 hours. The only problems were intermittent power surges through my body, with both feelings of electricity and some trembling.

This was on a dosage of only 10 mg! I wouldn't take this amount again -- I was lucky. A recommended starting dose would be 3 to 5 mg. Note: all my DCM notes and formulas were destroyed in an electrical fire about 2 weeks later!

I had plans for a psychedelic salve: about 1 mg. DCM dissolved in DMSO. The fire stopped this, at least for now. Due to the molecular structure of DCM, DMSO should be an excellent vehicle for delivery.

Hopefully someone with better scales and equipment will give a good scientific investigation of DCM. -- *Inner Frontiersman*

When *ER* first received the preceding paper, the author stated that it was for my information only, and not for publication. He felt that he felt the substance would be abused by street drug dealers out to make a quick buck. I replied that he was right: anything in our culture that can be abused will be; but the information is too valuable to serious psychonauts to be repressed. In times like these we need all the help we can get, and we shouldn't pace ourselves according to the illusions of the weakest among us. I begged him to re-consider and allow me to print the paper. Here is his reply:

2,6 dichlormescaline was an artifact from trying to purify mescaline HCL by using chloroform as a separating solvent. It seems that chloroform has some free radical Cl ions available and by accident, they bound to the mescaline. They found this residue, about 3 percent conversion, during some chemical tests. The conversion happened over an eight hour period.

The first route to 2,6 dichloromescaline (DCM) would be to take the nearly pure crystals generated by the easy extraction method and dissolve them in chloroform, about one pint to 300mg. Then add the catalyst to speed up the chloroform's formation of free Cl, potassium permanganate, about 200 mg. Allow this to set for one full day, which will give time for the conversion: 97%. (See *Lloydia* paper.)

The simpler method would be to dissolve 300mg of mescaline in one liter of chloroform in a sealable glass container and let it sit for a month, allowing the chloroform to release the Cl as part of its natural decay. Once a week you'd open the container to let the volatile hydrocarbons out: being careful not to inhale

them. Probably six weeks at 72 degrees would yield better results. You would want to ensure that all the solids stayed in solution by regular stirring or shaking. If you started with relatively pure product, you could allow the chloroform to evaporate off, leaving the DCM as residue.

A note on the dosage: I checked the calibration of my old triple-balance scale against two others and discovered an error between 6 and 21mg, with no consistent pattern! Which means that my "10mg" dose could have been anywhere between 6 and 21mg! This stuff gave all the weird electric power surges similar to what I have read in Dr. Shulgin's descriptions of many of the psychedelic amphetamines. At times I felt like I was strapped to the front of a runaway locomotive: this is a very, very pushy material! I don't know anyone who has braved high dose STP (DOM), but maybe they have some tips to prevent tragedies. Start with a low dose would be my plea to anyone interested in DCM. This is not high-dose mushroom madness, or peyotehuasca music of the spheres! In other words, although I had a great time, if I had fought it the least bit, it would probably have put me through a mental and spiritual food processor.

The only favor I ask is that someone you know and trust who can get the *Lloydia* recipe for DCM verify that it is a psychedelic trip and not poison. The street drug yuppie rats are dispensing enough bad acid and other things, and I don't want to unleash another poison on the sad, sad times we live in. Unfortunately, things can get worse: if people started to show up in emergency rooms flipping out on this stuff, it would guarantee that the police state would schedule San Pedro and its relatives. — *Inner Frontiersman*

## PSYCHEDELIC RESOURCE LIST

"The *Psychedelic Resource List* is a comprehensive and valuable survey of numerous companies and groups participating actively in the Entheogenic Reformation, or 'disembodied eye-drop conspiracy.' The rational organization into numerous categories and the detailed index make this information easily accessible. Reviews of each group/company are honest, not fawning. A requisite for the 'basement shaman' or avid entheobotanist interested in relevant plants, books, tapes, horticultural supplies, periodicals, organizations, seminars, or in just knowing that [s]he is not alone in this interest; highly recommended." — Jonathan Ott

\$19.95 plus \$3.00 (USA), \$5.00 (foreign) for S/H. CA residents add \$1.55 for sales tax to: Soma Graphics, POB 19820 (Dept. ER), Sacramento, CA 95819.

Also, subscribe to the *PRL* newsletter!  
A four issue subscription (starting with issue #6), is \$16.00 (USA), \$20.00 (foreign).

## THE MANY FACES OF THE SALVIA GODDESS

### SALVIA AND THE GITA

My initial experiences, using *Salvia divinorum* orally, were very dark in nature and uninviting. Strange, twisted imagery lashed out at me. For the first time, I actually felt the presence of a plant spirit (and a hostile one at that). For some reason the Shepherdess wouldn't allow me to pass into higher levels of perception. My goal was to commune with God and to completely face the true nature of reality. (I've been reluctant to completely accept reality as it really is. I use entheogens to expose myself to the Truth, and each time I try to face it more and more.) I felt that maybe I wasn't approaching the Shepherdess with enough respect, and perhaps then she would use her strength to carry me to the Infinite. So I approached her with all the reverence and respect I could muster. And to put a little icing on the cake, I visualized huge multicolored, lotus-like flowers saturated with positive emotions and offered them to her. I did it as honestly as I could, and it didn't change a thing. She violently snatched the flowers out of my hands, and the trip remained dark and disturbing. I must have done something wrong.

My intent was pure, and my respect for the Shepherdess was not lacking. Then two passages from the *Bhagavad Gita* came to mind:

*Those who worship lesser gods, O Arjuna, they go unto them; My devotee comes unto Me. (VII:23)*

*Absorb thy mind in Me, become My devotee; resign all things to Me. Thou art dear to Me, so in truth do I promise thee: thou shalt attain Me."(XVIII:65)*

My folly became clear. During my trips, I was

worrying too much about the vehicle (*Salvia*) when my attention should have been completely focused on my destination (God). I applied this approach to my next *Salvia* trip. I paid no attention to the Shepherdess and her imagery. Without faltering, I focused my heart and mind completely on God. The results were amazing. The Shepherdess opened the channel with feminine grace, and the trip became an interaction between the

Universe and myself. I've applied this approach several times since and have achieved the same results. A good source for more details about this approach is the *Bhagavad Gita*. The clearest and most helpful translation and commentary on the *Gita* that I know of is the one by Paramahansa Yogananda. It's available worldwide through "Self Realization Fellowship". 3880 San

Rafael Avenue, Los Angeles, California 900065-3298; U.S.A. -- DD of LA

### SALVIA AND MUSIC

Some reflections on smoking *Salvia divinorum*: At times I forego the rule of silence while keeping to the idea of darkness. I have experimented with "trance" type music with and without headphones -- quiet ambient tracks work well. I smoke while the music plays -- the music changes as I'm carried along and/or out. A strong hit can lead to the total disappearance of the music, but it somehow seems to remain as the vehicle you rode in on. On smaller hits the change in music is phenomenal. Of course, this may not be for "purists" (whoever they are) but I promise it's potentially fascinating.

Another aspect of *Salvia* which repeats in my experience -- and which I've yet to grow comfortable

with -- is mentioned by Bret Blosser on his excellent cassette for B.P.C. This is a sense of no return. It seems I'm there for good. Blosser, who chewed fresh leaves with a Mazatecan shaman felt that the shaman had "led" him to a dimension where he would permanently reside -- that the world had been changed (for him) forever. Whereas Blosser felt comfortable with this idea (perhaps due to presence of a shaman), I have yet to get over what seems a panic reaction. This leads me to search for my body. I get up, or walk about or move my hand in front of my eyes to make sure I'm there! Perhaps (as McKenna says) my "hind brain" needs some taming.

Concerning your comment on "people present from another era" and Hawk's sense of other shamans present, another aspect of my experiences with *S. divinorum* is this sense of presences (not visual). Whether they are fellow travelers, plant spirits, or dead souls etc, I certainly can't say yet (if ever).

Other shamans? -- not being one myself, it remains hard to say. I recall the first time I sensed presences. It was as if they (it, she?) were saying, "OK. Here you are. You sense how it is here -- we're all here -- Now -- What? Show us something." Hawk's "new kid on the block" description fits to a Tee.

I have often felt compelled to open my eyes and locate myself in normal space/time, as if this were necessary to the work one can learn to do with La Pastora -- or maybe I'm just trying too hard to control it. (Or maybe that's the point!)

One more thing -- twice now on mushroom trips in total darkness while struggling through difficult emotional straits I have sensed (not seen) the presence of a housekeeper (now 10 years dead) who took care of me when I was a child -- she obviously comes to protect me and explains this, not with words, but with her powerful comforting presence. I feel I can call upon her for help any time I'm in trouble in dangerous dimensions. The second time I actually heard her name (first, middle, last) spoken loudly as soon as I sensed her presence.

How can I put this? I've never considered myself a great visualizer -- so "presences" seem to always make themselves known through my thought processes and emotions and this seems natural for me. -- *KK, NJ*

## MORE SALVIA LORE

I placed two three-inch *Salvia* leaves in a micro-wave oven and dried them about three-quarters from fresh. Balled-up and smoked in a metal pipe, the experience was a mild pulsing -- Ch'i, perhaps. Four three-inch leaves, dried crisp in the micro-wave oven, crumbled, and smoked in a glass pipe... I became baffled. I lay the pipe down (not knowing what it was for) and started for the couch. Half-way there everything started swirling with color and design. My whole body pulsed and flowed: 10-X the first experience, with complete awareness. The visuals and "life-energy awareness" (or whatever it was) lasted about ten minutes, with a mild afterglow for some hours. All smiles -- a "clean-as-a-whistle entheogen." The third experiment using a glass bong was greater than the first trip, but not as intense as the second.

*Salvia divinorum* forces you to take cuttings or it will fall over because it grows so fast. With a six-inch cutting, some plastic bags and duct tape (for a humidity tent), a little dirt and a lot of water, anyone with a little plant sense could be a daily smoker. (I don't know if that's safe, but I've never had any negative side-effects after nine months. Is it true that salvinorin A breaks down in 24 hours? -- *Anon., MN*)

[In my experience, *Salvia* leaves keep their potency indefinitely, even without refrigeration. -- *Ed.*]

The principal active component is a drug called salvinorin A. It is a diterpene, lacking nitrogen. Almost all major psychoactive drugs contain at least one nitrogen atom. The compounds in kava kava (*Piper methysticum*) from the Pacific are non-nitrogenous, as is THC in marijuana, but there are no exceptions among the true psychedelics or hallucinogens. All of these are alkaloids, which, by definition, contain nitrogen. Salvinorin A has a completely different chemical structure. It is also completely insoluble in water.

-- *Andrew Weil*, "Pharmacology of Consciousness: A Narrative of Subjective Experience," In: *Toward a Science of Consciousness, The First Tucson Discussions and Debates*, MIT Press (No date on my photocopy.)

# NETWORK FEEDBACK

---

## PURPLE/GREEN SPIT

### EXPLANATION

I think I can answer one of the questions in the Fall 1996 *ER* re: purple/green spit seen under a black light (UV). The florescence (colouring) is probably due to the alkaloids, as most alkaloids fluoresce under UV, usually with distinctive colours which can help identify them. When smoked generally there seems to be a trace of alkaloids on my lips; in fact, when I've had a strong experience I usually have quite numbed lips due to the alkaloids. This persists until after the visionary state. I never thought to check it out under black light though. -- *Mulga, Australia*

## PEGANUM HARMALA

### POTENTIATION OF COLEUS

Recipe: Four (4) cups of fresh blended *Coleus* plants / 2 cups water. One fourth (1/4) cup blended *Peganum harmala* seeds / 5 cups water.

The *Coleus* were boiled for three hours in a two gallon pot. Half way through cooking, I strained and then saved the liquid and added fresh water to the vegetable matter. I did the same process for the *Peganum harmala* seeds. I filtered the liquids through a coffee filter. The resulting liquid was dirt black in color and rather thick.

I had been contemplating this for months. Now it was time to meet the maker. If this mixture was psychoactive, I had no idea. My intention was to find a shamanic teacher. My setting was solo, in my darkened bedroom. I sat down, stared at the goo. One hand held my chaser (Mountain Dew), the other, hopefully a psychedelic.

30 minutes after ingestion, I felt dizzy and sick. At two hours, crystal clear geometric carpets hung in my mind. This went on for some time, becoming increasingly intense. Then faces of holy men appeared, one after another. One stayed and I was in disbelief. But I knew he was my teacher. We spoke not, but I was filled with such a blissful feeling I

started to cry. Then my teacher disappeared. The carpets went on for some time more. Then I drifted to sleep. I know that *Peganum harmala* extremely potentates *Coleus*. I hope other shamanic explorers will try this combo. -- *D, AR*

## HARMALA AND PHRAGMITES AUSTRALIS

60 gm. *Phragmites australis* roots + 3 gm.

*Peganum harmala* seeds.

*Phragmites* is effective; I wasn't sick, just very weak -- possibly due to the 24 hour diet. It was my first ayahuasca, very wild and pagan. Spirit faces everywhere in the trees, very dark. I wasn't really in the experience, it was too weak. I saw the spirits but was unable to talk to them or to act with them. I was between two realms. Either 60 gr. is a low dosage or my *Phragmites* was too old. (one year at least). But again: it was very wild and pagan. -- *HS, France*

## MIMOSA HOSTILIS JOURNEY

The *Mimosa* root bark that I purchased was rather substantial, with a core center about 1/4 inch (no losses from rub-off). I took 5 grams plus 2.5 grams *Peganum harmala* and blended in coffee grinder. I simmered in 30% lemon juice in water (I think this is too strong. Should be 3% as stated by James Kent in the Winter 95-96 *Psychedelic Illuminations*, pg. 75. Two tablespoons lemon juice in 3 cups water.) Well I thrice extracted in 30% lemon juice in water and simmered down to about 1/2 cup ayahuasca concentrate. I have smoked *P. harmala* powdered seeds with no negative effects but I got an irregular heartbeat for about a half hour from the drink. Not painful, but a stronger than normal beat and irregular. My heart is sore now as I write this three days later. My stomach was empty but I did eat black-eyed peas, coffee and chocolate that day (5 hours earlier). If my heart didn't skip it could have been a plus 1.5-2. journey.

I think I shall journey with each plant separately now and discover more about each individually. I

wonder about MAO inhibitors now. Is it so wise to freak your chemistry out so much just to get close to the *Mimosa*? We should be able to feel the *Mimosa* without the MAOI. How about a simple flying ointment or a alcohol extraction sublingually?

-- *Green Giant*.

### ESPHAND OR ESFAND

I purchase Syrian rue (*Peganum Harmala*) here in L.A. at various Arabic and Iranian markets, very cheaply. Of course you know it's called "*esfand*". I asked my Iranian co-worker what it's used for --- He says that it's used as a purification incense against "the Evil Eye" at holiday gatherings, and vaporized into smoke on hot coals. -- *DA, CA*

### MUCUNA PRURIENS

I'd like to report that several *Mucuna pruriens* parts are used in Ayurvedic medicine and several *Mucuna* species are used in Asian medicine. The particular formula mentioned in *ER* with *Tribulus terrestris* however (at least classically), used only the seed instead of the plant parts.

Chemical structures change upon a seed's sprouting (like from complex to more simple carbohydrates), so after reading that it had been used as food after being repeatedly soaked and rinsed, I sprouted some. I tried drinking the soak water a couple of times and thought I felt something like a small 5-MeO-DMT rush pretty quickly. In his first book D.M. Turner says 5-MeO is orally active at some levels without MAOIs.

The sprouts got moldy quickly, but once I saved a quarter pound (110 gm dry weight) of sprouts and consumed them on an empty stomach in a kind of chili with extract from 4 gm. *Peganum harmala* seeds (I didn't put the *Peganum* in the chili). I received only slight 5-MeO type water-rushing sounds but the nausea was fairly bad and did not subside with a simple visit to the washroom. The worst part was the cardiac effect: my heart felt like it was stretching to twice its normal length on each beat! Seeds are pretty easy to get and it grows easily given a slightly tropical environment. Nothing like the abundant biomass production of *Phalaris* however. -- *G, CA*

## TWO MUCUNA PRURIENS QUOTATIONS

### 1.

#### PLANTS WHICH CAUSE SKIN IRRITATION A LEGUMINOSAE (PEA FAMILY) MUCUNA SPECIES (COWAGE)

**DESCRIPTION:** Trailing vine to 30 ft. in length, with 3-leaflet compound leaves 4-10 in. long. Light purple flowers occur in clusters along the stem. Fruiting pods, 2-5 per cluster, 2-3 in. long, 1-2 in. thick, contain 3-6 large, shiny black seeds. The entire plant is copiously covered with short hairs, giving it a fuzzy appearance. The hairs are light brown at maturity; they are easily detached and are scattered by wind. The plant called "Pica-pica", *Mucuna pruriens*, is most commonly known and widely distributed.

**HABITAT:** Plants occur in open grounds and as weeds in cultivated fields (especially sugar cane), at low and middle elevations. The vines are easily recognized climbing over other vegetation.

**INJURY/SYMPTOMS:** Plants are most harmful during the dry season when the hairs are mature and windborne. The dry hairs, capable of penetrating clothing, cause severe itching and irritation. Heightened irritation occurs when a person is hot and wet with perspiration.

-- *Some Harmful Plants of Southeast Asia*, Naval Medical School, Bethesda (1967)

### 2.

The barbed hairs or trichomes, on the pods of several *Mucuna* species cause an intense stinging irritation and itching. Those on *M. pruriens* (L) DC. have earned the species the common name "cow itch" or cowhage, a corruption of "kiwach," a Hindi word meaning "bad rubbing." Ingestion by cattle has resulted in hemorrhage, emaciation, and death... The responsible substance was viewed as a member of the histamine-liberator group similar to that in bee and snake venom.

-- Allen and Allen, *The Leguminosae*, University of Wisconsin Press (1981)

## CHEMICAL SOURCE

I recently found a mail-order outlet for chemicals. Pyrotek, P.O. Box 1, Catasauqua, PA 18032, sells both Ammonium hydroxide and Methylene chloride in quart containers for \$8.52 and \$9.60, respectively (plus \$5 - \$5.50 shipping and handling charges). The catalog is available for \$2. -- E.G.

## ENTHEOGENS ON THE NET

A response is in order to the suggestion from *SF*, *WA* that we "just say no to the Internet. (p. 16, Fall, 1996, *ER*) Apparently *SF* hasn't plugged into the right sources. The Net is loaded with entheogenic information in the form of Web pages, mail lists and news groups. For the person with a search engine (Web Crawler, Lycos, Yahoo, etc.), it's easy to quickly locate relevant home pages. Doing a search on the word "marijuana alone will yield 20,000 locations, including the Marijuana Policy project at [www.mpp.org/medanal.html](http://www.mpp.org/medanal.html).

There are many, many others. Some samples with their online addresses:

- Drug Reform Coordination Network**  
<http://www.drcnet.org/aboutdrc/lists.html>
- Island Links** (with links to other sites)  
<http://www.island.org/DOCS/intro.html>
- Growing the Hallucinogens**  
<http://www.nepenthes.xo.com/Plants/growing.html>
- Psychedelic Abstracts Online**  
<http://cyberverse.com/~martins/L4/L4.cgi?searchable>
- Shamanism**  
<http://www.intac.com/~dimitri/dh/shaman.html>
- General resources**  
<http://www.pitt.edu/~mbtst3/dreuginfo.html>
- Ethnobotanical database**  
<http://www.ars-grin.gov/~ngrlsb/>

This is only a small sample of what's available on the Net and doesn't include the many "newsgroups" that deal with related topics, nor does it begin to tap the assortment of mail lists. One or a number of these sites may not please you; people are different. A growing center of entheogenic interest is: Mind Space, a moderated mail list that anyone can access by requesting it.

It's enticing to blame the Net hype on communications and computer companies; and

undoubtedly some of it does come from them. But it's still largely an anarchist's paradise -- if you know how to navigate through it.

Folks wanting to acquire information about entheogens via the Net need only use a bit of imagination and a decent search program. And nearly all Web pages include links to other sites, yielding a cascade of data. The problem with the Net is not that it "always seems to take longer to find less," as *SF* insisted, but in knowing how to use the tools that are available. If *SF* is looking for instant enlightenment, then barking up the Net is the wrong tree (so is the library). But if *SF* is willing to apply some online elbow grease, the data are there for the asking. The Net doesn't take the place of a good library, but it's a mighty fine supplement. -- *DK, IL*

## RESULTS OF PSILOCYBIN STUDY

In the Spring, 1995 issue of *ER*, an anonymous psilocybin questionnaire was offered. The published results of that study: *Listening for the Logos: a Study of Reports of Audible Voices at High Doses of Psilocybin*, is now available from UMI Dissertation Services, PO Box 1346, Ann Arbor, MI 48106-1346. A condensed version appears in the Winter, 1996-97 issue of the MAPS bulletin. I am proud to report that many *ER* readers contributed to the study -- to my knowledge the first scientific examination of the entity-contact, inner voice phenomenon evoked by entheogens. -- *Ed*.

## EDITORIAL MUSINGS ON LSA/MUSTARD

---

The following letter is in response to my comments in the Winter '96 **ER** about combining LSA (extracted from morning glory seeds, or other botanicals) with nitrogen mustard. A chemist in the Spring, 1995 issue (pg 6) stated that based on the molecular structure of lysergic acid amide (LSA) and nitrogen mustard (the hot, Oriental kind), a new, potentially potent substance might (in **theory**) be synergized. His idea was that it could be either ingested or made into a kind of "flying ointment." I have received practically no feedback on this idea. (In fact, I have yet to receive data supported by more than one correspondent that psychedelic ointments of **any kind** work for them. This is curious, since the witches' flying ointments were a big deal in the Middle Ages. What's the scoop? Do ointments work, or don't they? I've tried them on a couple of occasions without results -- which does not mean that they don't work, only that perhaps we're not formulating them correctly.)

My remarks in the W96 issue were needlessly ironic: "I usually require confirmations from two separate sources before I get very excited about any of the weird stuff I read in **ER**." It's difficult to evaluate some of the material I receive: much of it is brand-new: "What if you took X and mixed it with Y and then..." Perhaps many of these speculations are not viable for one reason or another, but what if they are? The only way to determine the usefulness of politically incorrect material like this (in the absence of social structures that support such explorations) is by feedback from other experimenters. The following correspondent is the only one who has confirmed that LSA combined with nitrogen mustard works for him.

In the area of drugs, usually something works or it doesn't: everyone agrees that Cannabis will almost always get you high: that's why it is scheduled. *Salvia divinorum*, if you try it often enough, will also get you high: perhaps not as consistently as Cannabis will, but it is regarded by many thousands of users, including myself, as an extremely potent entheogen. Does something work or doesn't it? Back in the Sixties there were claims that you could get high by smoking

banana peels, yet they haven't scheduled bananas yet. In the absence of confirmation, I **have** to remain skeptical or else **ER** loses whatever credibility it may possess. How about it readers: can we get some consensus on these matters? -- **Ed.**]

### LSA/MUSTARD RESPONSE

Almost every time I took the stuff, I ingested it. The skin absorption method does work, but the absorption is very slow on most occasions. A good deal of the drug goes to waste. I think the ointment method only works well with *Belladonna* alkaloids.

I stand by most of the claims I made for this drug or precursor, or whatever it is. I have no way to check if the LSA is altered; the effect is supposedly caused by the nitrogen mustard altering the body's metabolism, but what does this really say? That the LSA is changed to something else... *after* it has been ingested.

Just last night, although for the most part I've stopped taking drugs, I decided to prepare a dose of the substance, this time using Jalapeno pepper juice as catalyst, what can I say about it? **KABAM!!** It took some while for it to come on strong, but again, once it took hold there was little to distinguish it from an LSD experience.

**Preparation:** One Jalapeno pepper or the juice therefrom, ingested simultaneously with approximately 0.6 mikes [*Sic -- author probably means milligrams, not micrograms.*] of LSA. The Jalapeno juice is a far better catalyst than the Oriental mustard for some reason. Whatever its mode of action, the substance does work, every single time you take it. The course the experience takes is, as always, up to you.

In the final analysis, it matters not what substances one utilizes to reach the Light or if one uses nothing at all. What is important is that the Light be reached and that after one has reached the Light, one changes one's life accordingly to let in even more Light and to direct that Light, to the degree that we are able, to all of those we come into contact with. This is the goal, no, the challenge, is it not? Peace. -- **Dr. Poppyseed**

**AYAHUASCA ANTHOLOGY

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 6, NO. 2, Summer Solstice, 1997**

ISSN 1066-1913 Copyright © 1997, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 800, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### ***Disclaimer***

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and must accept full responsibility for such decisions.

### ***Subscriptions***

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F97 means that the Fall, 1997 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### ***Submissions***

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- *Jim DeKorne*

# *SALVIA DIVINORUM AND DIMENSIONAL COLLAPSE*

---

*I regard this article as an exceptionally fine portrayal of a series of experiments.*

*It is always difficult to describe altered states of awareness, and this author does so admirably. — Ed.*

---

I became interested in *Salvia Divinorum*: a) because it is legal; and b) having read D.M. Turner's book *The Psychedelic Essence of Salvia Divinorum*. My curiosity was stimulated further by conflicting reports on the internet (and in Turner's book) as to the effectiveness of smoking the dried leaf. Here I share with you several of my own experiences smoking the dried leaf of *Salvia divinorum*, obtained via mail order from the USA. I can confirm that this method of intake of the psychoactive component of the plant, Salvinorin A, is effective and can induce anything from a mild buzz to an exceptionally bizarre, but mercifully short-lasting, experience.

## ***Experiment 1.***

***Set and setting:*** Alone, TV on, relaxed, sitting upright in a well lit room. I fully expected nothing to happen, according to my experiences with home-made ayahuasca! I decided to smoke the *Salvia* through a bong, but the small size of its bowl posed some problems. Thus, approx. 0.15 g of crumbled leaf was divided into three piles, intended as three "hits". Each hit was loaded, flamed, inhaled, and coughed out in quick succession. Effects started to come on rapidly and it was only with difficulty that I was able to replace the bong on its shelf next to my chair.

What followed was about five minutes of strangeness which I can only describe in terms of the folding of space about me. It seemed as if space above my head, beneath my feet and about my midriff collapsed, so that I found myself in an "X-shaped" universe. My body warped in shape to conform with this new equipotential surface and when I tried to walk six paces to my kitchen door I had to waddle the distance, arms and legs akimbo, like some x-shaped cartoon character! There were no visual or auditory distortions at all

and I retained a conscious awareness of the experience. A period of blissful immobility followed my return to my seat. It felt as if my body had been threaded with invisible fibres penetrating from without and suspending me as if in a three dimensional web. I distinctly felt a ribbon-shaped thread passing through my chin and up through tongue, palate, brain and out the top of my head. This soon wore off and was followed by about half an hour of lassitude. The TV noise became very irritating at this time, but I could not be bothered to switch it off.

***Verdict:*** An extremely novel experience, but not particularly uplifting or edifying at the time (insights tend to come later on reflection, as the experience itself is so short). Interesting weirdness, nonetheless.

## ***Experiment 2.***

***Set and Setting:*** Alone, relaxed, sitting upright in a well lit room.

This time I thought I would smoke a smaller amount, as one single toke from a small hash pipe. Accordingly, approx. 0.05g were combusted and inhaled, without coughing. Effects were minimal, a "buzz" similar to that of nicotine for a first-time smoker, although less pleasant.

***Verdict:*** Dose too low (a waste of time.)

## ***Experiment 3.***

***Set and Setting:*** Alone, relaxed, sitting upright in a well lit room.

I decided to see if I could extract Salvinorin A from *S. divinorum* leaves and smoke it neat. Thus, 1 g of crumbled leaves were soaked in pure ethanol and were magnetically stirred for 6 hours. After filtration, the ethanol was evaporated to give a small quantity of green goo, which I expected to contain ~ 1 mg Salvinorin A. This goo was divided in two (to provide a

dose of ~ 500 mcg) smeared on tobacco and smoked in two tokes from a hash pipe. No effect was detected above that of a mild nicotine rush.

**Verdict:** Salvinorin A is not soluble in ethanol.

#### **Experiment 4.**

**Set and Setting:** With a friend, relaxed, sitting upright in a dim room.

Having heard that *Salvia divinorum* leaves are sometimes rolled up into joints for "extra effects", I decided to try this. Approx. 0.2 g crumbled leaves were added to an amount of tobacco and hashish sufficient to fill a cone-shaped joint four inches long. This was then smoked in the usual way, shared between two people.

This admixture definitely altered the experience one would expect from smoking tobacco and cannabis alone, but not in a positive way. The uplifting mental effects of cannabis were erased and the "stoning" effects intensified. What I had prepared here was a joint with almost narcotic qualities.

**Verdict:** Not an entheogenic experience. Obviously if *Salvia* is smoked too slowly (i.e. over minutes rather than seconds) it merely acts as a sedative. Not worth repeating.

#### **Experiment 5.**

**Set and Setting:** Alone, relaxed, sitting upright in a well lit room. I had just been inspired to try a more adventurous dose by reading the latest excellent issue of *The Entheogen Review*. Thus, I attempted to prepare myself beforehand with some meditation.

It seemed to be that since *Salvia* must be smoked very rapidly for its effect, I was hampered by the small sizes of the bowls of my bong and hash pipe. Thus, I dug out of retirement my "Sherlock Holmes" pipe (large enough perhaps for the most intrepid psychonaut)! I originally intended to try 0.3 g of crumbled leaves, but this didn't fill the bowl. "What the Hell," I said to myself, weighing out an additional 0.1 g, for a total dose of 0.4 g. [*The road to hell is paved with "what the hells!" -- Ed.*] My intent was to then smoke the stuff in two large puffs, put down the pipe, and then activate my stopwatch in order to more properly time the experience.

I never got to hit that stopwatch!

Instant annihilation! In a flash, my self-awareness vanished, sensory input ceased, all memory of who I

was or what I had done was gone. Most chilling of all though, the third dimension collapsed to nothingness and what perception was left to me experienced a bizarre and frightening two-dimensional universe. I became an image plastered against a wall of whirling lights, feeling the weight of the collapsed dimension crushing me flat. Worse, the membrane I was confined to was being violently distorted. I could feel an incredible tension pulling my head and left arm one way and my pelvis and legs another, like I had been reduced to a drawing on a rubber sheet and then yanked and twisted out of shape. Some self awareness started to leak back at this point, but it too felt curiously sheared (the only word I can use to describe it) and profoundly confused. I still didn't know who I was but I became integrated enough to know what I was (I was a person, profoundly lost, and in desperate need to get back to where I came from.) I could now see the room again, distantly through the membrane and realised that my top half was being pulled towards the front door and my bottom half towards the living room window. I panicked (the first time ever on an entheogenic drug) and made a supreme effort, by forcing myself to flow across the membrane, to get out of that door!

The next thing I knew, I was standing in the corridor outside my flat. Cool air flowed into my lungs and, with a couple of breaths, my identity and knowledge of what I had done to myself returned. I babbled some curses about my stupidity, thanked God that no neighbours had seen me, and turned back to my front door. It was closed and locked. How the hell I got through that door I have no idea. My keys were in my pocket and so some autonomic program within me must have unlocked the door and pulled it to afterwards. Now my consciousness was back, I shakily pulled out my keys and let myself back in. The third dimension was inflating again, but in an irregular way. I found myself staggering through a non-Euclidean space similar to that experienced in my first experiment. I tried to "walk off" the effects but knocked over a jar in the kitchen. This was not safe so I laid down on the floor and closed my eyes. There were fuzzy lights there but I couldn't concentrate on them. The next thing I knew, the phone rang... By the end of the call I was more or less back to baseline.

As to the after effects... For about fifteen minutes after my "return" I felt severely shaken; but then for a

couple of hours after that, remarkably calm and mildly euphoric.

**Verdict.** Salvinorin A is an incredibly powerful drug and if you smoke enough *Salvia divinorum* leaf, its power will blow you away. I can quite understand why D.M. Turner says that even DMT aficionados, when given Salvinorin A for the first time, can feel somebody has played a bad joke on them! On no other entheogen have I felt such amazing warping of space, or witnessed an entire dimension crushed out of existence! (Is this commonly reported?) It's a good thing the experience is so short lasting, as I found it exceedingly unnerving. For me, it is upon reflection that the experience has its benefits. On other psychedelics, I find that, even if one's ego dissolves, a disembodied consciousness remains which can appreciate and gain insight from what happens, as it happens. This "S" trip wiped even that clean for me. I shall be very cautious about trying such a dose again, as it would be very easy to injure oneself. The next time, I think, I shall fill ol' Sherlock's pipe just half full, with 0.2 g, and perhaps try potentiation with LSD, as described by Turner. -- *MF, England*

## SALVIA - 2

*Some readers wonder why I devote so much space to Salvia divinorum in ER -- the reason is because this is possibly the most potent entheogenic plant on the planet, and amazingly enough, still unscheduled. Although many people claim to get no effect from smoking it, with enough persistence almost everyone experiences a reality so alien to normal consciousness that it demands serious investigation. We're dealing with the frontiers of human knowledge here: possibly the psychological equivalent of quantum physics.*

I am most impressed with the "sheer brute strength" of *Salvia divinorum*. Initially, I smoked a pipeful after meditation in the evening with no appreciable effects other than some closed-eye visuals. Around 10:00 AM the next day, I tried again with a waterpipe with a 3/4-inch bowl tapering to the base. I filled it halfway with hand-crushed *Salvia* and cleared the pipe in one hit. The only effect was the feeling in my shoulders as if someone were trying to put their arms around me. The second inhalation, another half--

bowful, knocked me into such a state of non-self and multiple realities that perhaps ten minutes passed before I was aware that there was a long-extinguished waterpipe on a table in a room in some kind of reality that I was possibly never leaving if I didn't move to my right as soon as possible! This importance of moving was my first thought within the space I was occupying, but I don't know if my self changed or if reality changed: that's how I best sum up the "dimensionality" of *Salvia*.

At this point I felt forced down toward the floor. I remember muttering: "Yes, yes, yes," to someone or something on my right, impressing on me (with a force of about 4.5 on the Shulgin scale!) the importance of moving. [*Ed note: author is aware that the Shulgin scale only goes to 4!*] My reality at this point appeared to be in layers: like sheets of peeling wallpaper. On either side were gaps in the layers, and at some point the presence wanted to somehow "fold" the reality where I was seated: thus the importance of moving! Looking to the right all I could see was a scaled, reptilian surface, like horizontal stacks of scaled tentacles. I was barely able to move, and was sweating profusely. All the edges of objects in the room were rounded and scaled and there was a mistiness to everything although my eyes were open at 10:00 AM in a sunny room! It seemed to please the presence that I was finally able to move to the next room. Where I'd been seated was now very "shimmery," as if seen through a shower door. The area around me was pitch black (again, at 10:00 AM)! Now it was communicated that I should return to the spot I'd been sitting in if I ever wished to return to everyday reality. I crawled back to the living room and began repeating the date out loud several times, a spur of the moment centering technique based on the idea that if I knew what day it was, I could find my way back!

I hope everyone takes due care with *Salvia* -- I would have been arrested had I smoked it in a public place. I can only imagine what shape humans would take in *Salvia's* reality. The instinct to move about is a fascinating commonality in *Salvia* accounts. I wonder if others have had my experience that reality was folding: a pinch-point no one should get stuck in! Thank you for your work, so that such powerful experiences can be endured and shared. -- *JL, IL*

## ORAL SALVIA

The following piece is useful for the insights that it gives on combining entheogens with spiritual practice. The substance here consisted of only four large *S. divinorum* leaves which had been dried, then rehydrated for oral ingestion. The author, experienced in Vedic meditation, states that his sensitivity to entheogens has increased dramatically since he: "became fanatical about my spiritual development." He does not state whether the leaves were swallowed or held in the mouth: probably the latter, as that seems to be the most effective oral method of *Salvia* ingestion. — Ed.

...I slowly relaxed into the "pull," being careful to keep my focus reverentially on God to avoid getting stuck in the subconscious realms (the dream-like lands of elves, aliens, and like phenomena) and to avoid being emotionally thrashed. I was led beyond involvement with the play of opposites. I saw a huge, concavely curved wall in flux between liquid and solid, composed of pockets of thought forms all neatly fitted together. My body and bedroom were a tiny part of this wall. As I opened my eyes the room came into existence via ripples of clear light emanating from the Self.

The ultimate black-hole demon, Fear, tried to drive me back into the lower states of consciousness, but I'd already transcended attachment to the dualities. Fear was a mere idea in my mind, having no independent power. As the experience ended, I had to fight off Pride, who came to claim the victory for ego. I offered the victory to its rightful owner: God. — DD, CA

## GROWING *S. DIVINORUM* IN A HUMIDITY TENT

*Salvia* prefers a cool but humid environment, and many growers utilize plastic grow-tents. In dry climates such as New Mexico, tents are almost mandatory: *Salvia* will grow outside a tent here, but not nearly as fast or as well. Recently I opened my tent to tend the plants but forgot to zip it up, then left for two days. When I returned the plants appeared totally dead: the leaves were wilted past the point of recovery. I harvested everything except the main stalks,

hoping that they'd revive. So far, it looks like they will make it: a few new leaves are sprouting and the stalks still look healthy. The point of this is to emphasize that if you use a tent, the plant adapts to that environment and it is all but impossible to switch to a less humid environment later on. This makes it difficult to take cuttings and start them outside the tent: all attempts so far have failed.

At least that's the way it's been for me. Has anyone else experienced this phenomenon? — Ed.

## MORE SALVIA WEIRDNESS

A reader describes a *Salvia divinorum* trip in which an infant girl sleeping in an adjoining room would awaken every time that the substance was smoked. Ambience of these experiences suggested that definite "presences" were hovering nearby, and that the baby was picking up on their energy.

## *Salvia divinorum*

*Finest quality air-dried leaves:*

1/4 ounce: \$20.00, 1/2 ounce: \$40.00

1 ounce: \$75.00, plus \$2.00 S&H

*Also:*

## ENTHEOGENS AND SPIRITUAL PRACTICE

---

My spiritual practice is a kind of Shaivite/ Tantric/Vajrayana Buddhism, firmly grounded in the Nyingma lineage. When I took refuge with the lama I work with, someone asked him about alcohol, psychedelics, and major lifestyle changes in general. He replied that we should not take up or abandon anything for conceptual reasons, just do our practice and allow it to inform our decisions. Cannabis and LSD use have remained part of the practice of the people in my sangha -- the first most especially for its ability to loosen the synapses and open us to ideas we might otherwise remain closed to; the second because of the cleansing radiations and baroic nature of the LSD experience, which seems distinctly different from mushrooms or mescaline, at least at their usual doses. I think that regular meditation practice has lessened my use of cannabis, because I've learned to maintain my energy better and don't need it for recharging or relaxation as I once did.

Padmasambhava is the originator of the Nyingma lineage, famous for (among other things) winning drinking/magic contests with local shamans, and for using magic to subdue earth spirits, thus obligating them to serve the Buddhadharma. Thus, I think he is a Buddha eminently suited to high-dose psychedelics. An important Buddhist practice is invoking different Buddhas, either by visualizing them, or by visualizing oneself merging with their bodies. (This latter is an advanced practice, not for neophytes.) If this isn't "looking for entities in hyperspace," I don't know what is!

Another part of introductory practice is a lengthy purification process ("lengthy" meaning months to years of regular practice) that my lama said would protect us from any and all malevolent astral entities. He

went to some length to warn us (in response to a question about channelling) that many astral entities are very subtle in the danger they pose to humans, and may actually be initially helpful in order to draw us in. I sometimes wonder if my lack of entity contacts and hallucinations on DMT is due to my spiritual practice. (I mostly have white light experiences on DMT, and I'm not confusing it with 5-methoxy here.)

*It is apparent that the alterations of consciousness produced by yoga practices are much more profound and meaningful than those produced by the ingestion of psychotropic plants -- drug users typically become interested in yoga, may become practitioners of yoga techniques, and may even cease using drugs. The reverse never occurs; that is, those who can alter consciousness without the use of drugs have no interest whatever in their use.*

-- Jonathan Ott -- *Hallucinogenic Plants of North America*, 1976

I incorporate the newer entheogens into my practice as follows, though I don't think anybody else in my sangha is doing it this way. I do the same practice every morning, but on Sunday I spice it with herbs... [Several sentences are illegible in the original manuscript. -- Ed] ...invocation of Buddhas of the four cardinal directions, and I have chosen entheogens that seem appropriate for each.

I begin in the center, where egoic consciousness is transformed and becomes cosmic, without adjunct herbs, invoking and meditating on Guru Padmasambhava. East is the direction of water, purification, and (for me) wrathful buddhas. There I offer a waterpipe of datura, ganga and *Nicotiana rustica*, purifying/transmuting poison in a way that is more than metaphorical. After a few minutes of chanting and meditation, I move on to the south, the direction of earth and groundedness, and a bongload of *Salvia divinorum*. I meditate with that for about a half hour, then around to the west, the direction of fire and radical transformation, in honor of which I offer crystals of 5-MeO-DMT. The element of the north is air and its quality is the transmutation of anger into enlightened action. The color of north is green, and I offer Cannabis, the green and fragrant herb, to the Noble Lady Tara and the Buddhas of the northern quarter.

I understand that in India, many devotees only

smoke ganga (cannabis) with their guru as a way of sharing his energy. I don't smoke only with my guru (not the Tibetan, but an extraordinary westerner of my acquaintance), but it's definitely part of this practice. When I smoke and invoke, I consider that I'm sharing my bowl with a buddha, inviting the transforming and purifying wisdom lights of his/her consciousness to penetrate and alter me. I sometimes also spontaneously will smoke *Salvia*, ganga or 5-MeO during my regular daily (morning and evening) practice.

Perhaps my combination of Buddhist practice and psychoactive substances is what is called a "terma teaching," something revealed outside the lineage. Such teachings are supposed to be practiced in secrecy for seven years before being shared. I have been exploring these possibilities for almost three years now, so perhaps sharing it is premature, but maybe the anonymity of this medium makes up for that. I think it is appropriate to conclude with a Tibetan aphorism about embarking on the path:

*"Better not to begin; once you begin, you'd better finish."* — **MH, TN**

*The following article comes courtesy of Johnny Appleseed, who purchased it from a dealer in psychedelia. It originally appeared as an uncopyrighted mimeographed sheet sometime during the late 1960s, probably in San Francisco. A great deal of standard Raja Yoga doctrine (which did not specifically address the use of entheogens) has been cut for reasons of space. I have also taken the liberty of editing a few sentences for clarity. — Ed.*

### *Psychedelic Yoga: The application of Yoga Meditation techniques to the use of psychedelic sacraments*

by **Sri Brahmārishi Narad**

The fact that psychedelic drugs induce a greater sensitivity to subtle spiritual and psychic energies and speed up the influx of impressions from deeper levels of consciousness raises the immediate question of how these energies can be properly understood and handled. Obviously if they are not guided they can do more harm than good. The application of traditional Yoga meditation techniques while under psychedelic

experiences provides a constructive solution to this problem.

According to Yoga philosophy, the most spiritual and powerful aspect of man's nature is the faculty of attention or consciousness. The most fundamental aspect of man's free will is the choice as to what he allows his attention to dwell upon. The attention always has to be on something but we can choose what that is.

The goal of Yoga practice is to discover and experience what the attention or faculty of consciousness in man is. The yogi seeks to know that principle by which all else is known. This goal is achieved by observing the observer or placing the attention on the attention itself. This may at first seem very abstract and hard to grasp in terms of practical application but there are workable, time-proven methods for achieving this state of pure consciousness which when consistently applied are bound to yield results.

It should be constantly remembered during a psychedelic session that whatever perceptions, thoughts and even hallucinations occur, they are all the creations of one's own mind as filtered through the perceptions. These perceptions are patternings of our own psychic energy. We give energy to whatever thoughts and feelings we allow the attention to dwell upon. Wherever the power of attention is focused it generates mental and emotional energy in the form of its own lower overtones, thus feeding and energizing the thoughts and emotions upon which the attention dwells. The key to remaining in control of a psychedelic experience lies in controlling the flow of attention. Distractive experiences can be avoided and the flow of attention can be properly directed by the use of Raja Yoga meditation techniques. The following is a description of several such techniques which can all be applied while under the influence of LSD, marijuana, mescaline, DMT, hashish, psilocybin or other consciousness expanding drugs.

At this point, let us consider a basic rule to apply in case of paranoia or other unpleasant or frightening experiences while under the influence of a psychedelic drug. Realize that whatever you may be thinking, feeling or experiencing is being experienced by the consciousness within you. Then place your undivided attention on that consciousness which is experiencing whatever is happening. This process returns your consciousness to its own pure nature and disengages men-

tal and astral thought forms. These destructive thought forms then dissipate and dissolve back into the plane of energy substances from which they were originally molded. The strong light released by consciousness observing itself helps to dissolve and dissipate destructive thought forms.

If the attention wanders while practicing any of these meditation techniques immediately bring the attention back to the process of meditation and do this until the attention remains centered on the particular form of meditation which you are practicing. Inexperienced meditators have a tendency to fight distractions which in itself becomes a distraction. The attention can only dwell on one thing at a time. Simply bring it back to the thing you are meditating on.

Another way of stopping distractions is simply to temporarily suspend the breathing process. Since breathing is intimately tied to every biological process in the body, the instinct to survive developed over billions of years of evolution will interrupt the flow of attention into distractions and bring it to center on the awareness of the cessation of breathing. It is then an easy matter to resume normal breathing and center the attention on the particular form of meditation being practiced... *[Several pages of Raja Yoga meditation techniques, not specifically related to the psychedelic experience, have been deleted here. — Ed.]*

...Since the use of psychedelic drugs stimulates the flow of energy from the higher into the lower planes, any patterns of thought and emotion created during a psychedelic session are energized and imprinted within the psyche. These patterns then become powerful unconscious conditioning factors in our daily lives. It is therefore of the utmost importance that constructive imprints be made during a psychedelic session. This can be ensured by remaining in control of the attention.

Do not allow the attention to move around too much. Stay with a thought or meditation process until it is complete. Don't panic if frightening visions or hallucinations occur. Fear will make you concentrate on them all the more and thus feed them with the power of your attention. Remain detached and place your attention on that consciousness within you which is experiencing the hallucinations. Remember at all times that God exists in you in the form of your own power of attention and that power when properly di-

rected will control all lesser forces.

It is believed by some researchers that psychedelic drugs stimulate the secretion of the pineal and pituitary glands which are known by yogis and occultists to be related to the Sahasraram and Agna Chakras, also called the thousand-petaled Lotus and the third eye centers. This stimulation increases the flow of energy between the etheric body and the physical body. In some way psychedelic drugs place the cells of the physical body under stress so that they must speed up their activity to resonate with vibrations on the subtle planes. This makes possible the expression of a higher level of consciousness through the glandular system, brain and nervous system.

The increased physical cellular activity demands corresponding activity in the etheric body to sustain balance. This stimulates activity in the astral body, which in turn evokes mental body activity, ultimately tuning it to the power of love and wisdom of the soul. Thus an alignment of the whole being on all planes is facilitated and a more rapid exchange of pattern imprints between the various planes of energy takes place. Not only is the love, wisdom and power of the soul brought into the life of the personality, but the fine organization of the physical, etheric, astral and mental bodies created by the evolutionary process are harmonically reflected and preserved in the soul...

When the physical body is sufficiently vivified by the influx of energy from higher dimensions it begins to create higher overtone reflections of itself in the kasha or energy substance of the higher planes and thus, its pattern is preserved and made immortal. Thus when properly used, psychedelic drugs help to speed up the evolutionary process.

When man has evolved to superman, he will, under the direction of the superconscious mind in accordance with God's will as it manifests in evolution, take an active part in molding and directing the evolution of the mineral, vegetable and animal kingdoms. Even today, his vibrations intimately affect for good or bad those kingdoms in nature.

Apparently psychedelic drugs have a chemical structure that resonates with certain key frequencies in the higher planes. They act as a point of entry for the reflection of those vibrations into the physical body, creating nodes in the vibrational structure of several different dimensions.

# NETWORK FEEDBACK

---

## EDITOR'S CONFESSION

*ER's files are a total mess: I haven't been able keep up with the fresh data that arrives almost daily, and stuff gets buried under piles, which get buried under more piles. If you wrote to me as long ago as **last summer** and are irritated because you haven't seen your piece published, please accept my apologies. To speed things up, I have taken the liberty of summarizing some of the longer letters. Bear with me, I'll get it all together eventually... probably.*

## D.M. TURNER'S LAST VOYAGE

*ER readers who surf the internet have probably already heard about the death of D.M. Turner, the author of **The Essential Psychedelic Guide** and **Salvinorin A, the Psychedelic Essence of Salvia Divinorum**. He also wrote some pieces for **ER**, and anyone familiar with his work knows that Turner was an inner seeker of the first magnitude: a post-modern shaman exploring the far frontiers of psychedelic reality. I did not know him beyond a brief correspondence and one phone conversation, but I was always impressed with the man's willingness to investigate realities few humans dare to penetrate. It comes as no surprise to learn that he died during one of his journeys:*

*How Turner died can only be speculated -- he was found in his bathtub, a bottle of ketamine and a needle close by. The simplest theory is that he passed out on the K (it is likely that he was on other substances as well, knowing him), and slipped below the water line and drowned. Still, I can't think of a more peaceful way to go than to head out on a K voyage and simply not return. -- **Anonymous, CA***

*Turner has been criticized for being irresponsible with entheogens and proselytizing his trips in the same fashion. I am uncomfortable with this: anyone who continues to visit the spaces he frequented knows the risks involved and accepts them: astronauts, race-car drivers, free-fall parachutists and Amazonian shamans do the same. Turner was just a lot more intrepid than most of the rest of us: whether that was*

*"irresponsible" as well, only he could answer. -- Ed.*

## DEFUNCT EUROPEAN CONTACT

*A Swedish correspondent informs me that the English address for establishing a European entheogen network in the Autumn 1996 **ER** is no longer valid.*

## DRITTEWELLE

*Due to "insurmountable production and distribution problems," Drittwelle, the manufacturers of Erox (a medication used in the treatment of male impotence and female frigidity) has closed down. (This was a reliable source of 2C-B, but we all knew it was too good to last very long, didn't we?)*

## ER'S PRODUCTION COSTS

*A reader suggests that **ER** should be hole-punched so it can be kept in a 3-ring binder. Alas, the cost of doing this adds too much to the cost of the newsletter: I'm trying to hold the line at \$20.00 per year domestic, \$30.00 foreign. Actually, subscriptions have been falling off recently: I don't know if this is due to competition from the internet, my resistance to aggressive advertising or just reader indifference: always a sign that you're becoming obsolete. **ER** still manages to pay for itself, but so far not **quite** enough for me to trade my '96 Porsche in on a '97 model and still maintain my villa in the south of France. I'll keep **ER** going until I can't pay the bills anymore. In the meantime, you could always tell your friends about it.*

## VACCINIUM ULIGINOSUM L.

### (Bog Bilberry)

*In the Winter, 1996 **ER** a European correspondent asked about the psychoactivity of **Vaccinium uliginosum**, a shrub susceptible to fungal infection on its berries. I speculated that the psychoactivity could be due to LSA, a metabolite produced by many fungi parasites. Then I had the audacity to speculate on how to cultivate the stuff! Before I'm guilty of starting*

*a new psychedelic myth, here's a scientific response from Italy to set the record straight:*

The psychoactivity of the fruits of the Ericaceous shrub *Vaccinium uliginosum* L. (in which no active compound has been found so far which could be responsible for it), is rather controversial. Cases of poisoning with psychomotor excitation, vomiting, mydriasis and dizziness have been reported. Some authors did not record any trouble after ingestion of huge quantities of berries, while others noted dizziness, hot flashes, visual troubles, difficulties in swallowing and tiredness after ingestion of about 300 grams of Bog Bilberry. Following this uncertain activity it was proposed (however not yet proved) that at least part of the toxicity of *V. uliginosum* is due to the mushroom *Sclerotinia megalospora*, which is sometimes a parasite of fruits of this species. The presence of "some LSD-related compound" in the mushroom could be no more than a doubtful myth. A paper on psychoactive Ericaceous plants written by F. Festi & G. Samorini has just been published in issue 6 of *Eleusis* (December, 1996). — *Giorgio Samorini, Italy*

### PERIODICAL REVIEW: *ELEUSIS*

*Eleusis*, is the title of the Italian *Society for Study of States of Consciousness* (SISSC) journal. It carries scientific articles written in both Italian and English. The emphasis is on psychotropic plants, and they maintain an extensive data-base on all botanicals world-wide which fit this category. Needless to say, they are constantly coming up with new and interesting information. (These are the folks who discovered the famous Italian AQ1 strain of *Phalaris aquatica*: said to be the most potent *Phalaris* variety yet discovered.) The article in the December, 1996 issue mentioned above, is an extensive study on the ethnobotany of Ericaceous plants: such as shamanic use, use by Viking Berserkers, etc.

European subscriptions to this quarterly journal are \$30.00 (US). Subscriptions outside Europe are a bargain at only \$32.00 (US) -- (I can't afford to mail *ER* in the other direction for only two bucks a year!) Serious psychonauts will want to check out this international journal: **SISSC, C/O Museo Civico di Roverto, Largo Santa Caterina 43, 1-38068 Roverto (TN), Italy.** Make payments in US dollars via international

postal money order. -- *Ed.*

### THE "FOLKLORE OF ENTHEOGENS" SURVEY

We are collecting and preserving stories that provide structure for the exploration of entheogens. We wish to sponsor a conference at which stories (rather than data) are gathered which support the medicinal and spiritual values of plants. Much of this information has been lost, and scientific studies exclude subjective truths. The following questions are initial probes into this area: please add your own questions to the list. We welcome your stories in order to test the legitimacy and value of this process.

Your experience with this or that entheogen in:

1. Accessing the truth about your life, another person, an incubating circumstance, the roots of a problem affecting personal or community health;
2. Communing with an intelligence greater than your own;
3. Learning about the non-human world of plants, animals and spirit;
4. Learning about physiological systems;
5. Producing a reversal or healing of a chronic, acute or life-threatening condition;
6. Learning about healing processes or techniques;
7. Accessing ancestral wisdom or historical information;
8. Comprehending the dynamics of natural processes;
9. Understanding the relationship between mind and nature;
10. Producing certain phenomena in the world, witnessed by others;
11. Accurately reading the histories of places or people;
12. Entheogen evoked experiences of communion with others, including verified group telepathic phenomena;
13. Entheogen evoked preparation for "the next place;" (Describe the dimensions visited, their qualities and spirits, and how these relate to your personal psyche.)

-- *Zera Diamond, c/o Ides, 681 NSR, Questa, NM 87556 e-mail: alchemcircus@hotmail.com*

### ANADENANTHERA COLUBRINA

RS of VA's experiments with the seeds of this plant produced the following results: Snuffing the powdered seeds was ineffective, producing only a "really disgusting taste in my throat." Smoking the seeds evoked very mild visual hallucinations: faint color patterns that lasted a minute or so. Vaporizing the seeds yielded "a definite physical and mental effect;" he doesn't go into detail, other than that it was a "much cleaner feeling than smoking."

### ACORUS CALAMUS-1

I'd like to recommend *A. calamus* as an experience well worth the effort of ingesting the foul-tasting root. It grows very easily and is a hardy plant: I have pools blocked up with it out back, and they dredge it out of the Norfolk Broads.

Grinding it to a powder is a good way to get it down. Three inches of root produces a speedy effect lasting for several hours. Excellent for taking long walks, it produces clarity of vision, thought, and heightened colors. More than three inches produces the trip effect, but this is a matter of individual experimentation. Here are two *calamus* trips I've taken:

I once was in London, walking in Wimbledon, when I came to a park in which three big trees had been savagely cut down, leaving just stumps. This evoked such grief that I began crying, at which point it began to rain: the environment was weeping with me! Each raindrop was incredibly beautiful as it hit the pavement in patterns, and overall was a sense of incredible beauty as well as sadness.

Once a friend and I were sitting around a campfire at a sacred site near here called Tinkinswood Burial Chambers. We both saw dragons in the flames in green and blue: clearly defined. Also a glowing black and orange snake in the embers. It was so vivid it looked about to slither out of its fiery home. We stayed until dawn, which arrived with the accompaniment of no less than five owls circling overhead, making owl sounds: a cuckoo joined the choir and the whole thing was completely magical.

Here's the address of a guy who sells seeds and plants of many rare herbs, including *Salvia divinorum*, *Calea* plants and Peruvian torch seeds, as well as many cacti of note:

Dan Gibson  
Gnostic Gardens  
POB 1ED  
Newcastle Upon Tyne  
NE991ED, UK

-- SA, England

[It is my understanding that the European variety of *Acorus calamus* is more potent than the American. As suggested above, it's considered a weed-pest in some wetland areas. -- Ed.]

### ACORUS CALAMUS-2

Regarding the "carcinogen" controversy surrounding *A. calamus*, my understanding of the experiments that resulted in the carcinogen label is that rats were pumped up with many times their weight of asarone (or beta asarone), and developed an increased tumor rate. I would fear for the sanity of any human who would chew the equivalent of their body weight of just the root! It is my position that those using *calamus* needn't worry about this.

I ingest it probably less than once a month, and rarely more than that. It takes time between uses: over-indulgence seems to lead to a less-worthwhile experience. *Calamus* likes solitude, peace, and the outdoors. Sit with it in a marsh where it grows: it will like that. Nighttime is especially nice because fewer people are outdoors and it is quieter.

My last trip was extremely beneficial. Shortly after sunset I set out hiking into a local park. As I walked to my destination, I chewed and spit small handfuls of *calamus*. I didn't rush this, and found to my surprise that I've grown to like it's somewhat spicy, sweet taste. (Initially I found it unbearable; others attest to this acquired taste.) I'd chewed maybe 1.5 ounces by the time I reached my destination: a hill with a view of stars, park and nearby city...

(Author goes on to describe a long interlude characterized by intense feelings of oneness with nature and sweet sadness at what is happening to the planet. He plays his flute and merges with his surroundings: this is stated in identical language to the "merging with the rain" story in the article above. He then tells of another trip, tending a winter campfire in the the Appalachian mountains, in which he asks the *calamus* to "share with me its rhythm, so that I might pay hom-

age on my drum." To his surprise he is given a sudden clarity of hearing: despite the roaring nearby river, he can distinguish "The sounds of a lowland marsh in the summertime: the natural habitat of *calamus*. I could literally distinguish individual crickets, frogs, bird-song: a foreground and a background... Never before have I been enveloped in so real a 'hallucination.' Was the plant remembering, through my ears, its former home?") -- **JM, MI**

[Confirmed nit-pickers might comment that the above two articles are "too subjective." My response is that entheogens tend to do that. What interested me was that these two letters arrived within a few days of each other and essentially described the same experience from the same plant. *A. calamus* sounds like an interesting teacher. --Ed.]

### "Jumpin' Jack Flash"

In Holland, a new strain (of cannabis) called "jumpin' jack flash" has been developed which is so strong that, under British law, it would be a Class A hallucinogen. -- **London Times**, 23 February, 1997

### NIGHT-BLOOMING CEREUS

Does anybody know anything about the Night-blooming Cereus (*Epiphyllum oxypetalum*)? I suspect it may contain mescaline or some other psychedelic amphetamine. While reading the book *Mastering Herbalism*, I came across it in the section on aphrodisiacs. It gave instructions for preparing a water extract and warned that high doses have been known to cause hallucinations. It is a very odd looking and fast growing plant. The fleshy feelers it puts out can grow an inch or two in a day. -- **RS, VA**

### ER'S "TOAD POLICY"

A reader who took on the herculean task of indexing all issues of *ER* (a labor I wouldn't attempt myself), notes that we haven't published much on *Bufo marinus*, the so-called Cane Toad. I refuse to run toad data because I feel it encourages animal abuse. The "good alkaloids" in various toad species are all available from plants; the "bad alkaloids" can send you on a swift trip to the morgue! So why hassle the poor toads? Leave the little buggers alone. (The *ER* index will be made available once I can get it trans-

ferred from hard copy to my word-processing format or ASCII -- I'll give a free one-year subscription to the first volunteer typist.)

### OUT OF BODY EXPERIENCES

The psychonauts who have pioneered out-of-body-experiences (Robert Monroe, and others) have many useful conceptual schema/archetypes that seem to mirror the psychedelic experience, especially as they relate to guides, alien/UFO experiences, deity (yet agnostic) experiences, and our ability to experience different dimensions. -- **JW**

[I've had only one clear, unequivocal, no-bones--about- it, out of-body-experience, and it was superior to anything I've ever had with drugs. For years I tried every method I'd read about, plus a few I invented, to repeat that experience, but to no avail. The closest I came were several very dreamy OOBES that lacked the clarity and power of the first trip. I suspect that if we could all access this state of consciousness nobody would bother with entheogens. (Actually, few of us would bother to hang out in spacetime!) Robert Monroe's books are must reading for anyone interested in this phenomenon. Read them in sequence: *Journeys Out of the Body*, *Far Journeys*, and *Ultimate Journey*. Oliver Fox's book, *Astral Projection*, and Sylvan Muldoon's *Projection of the Astral Body* also provide useful insights. Most New Age bookstores have them all. Many public libraries carry the Monroe books. -- Ed.]

### AYAHUASCA DRUG TESTING

We have random drug tests at work, so I need to know if they will reveal ayahuasca-analog consumption. Can anyone shed any light on this problem? -- **BC, WI**

[I honestly don't know, though I suspect that ayahuasca is a bit arcane to be picked up on a normal drug test. Can anyone out there enlighten us? -- Ed.]

### AYAHUASCA DISCOMFORT

I recently had my first jungle ayahuasca (200-300 gm *B. caapi* + 12-14 gm *P. viridis*): Wow! Plus 2 and 3 for six hours and more. Not many visuals: I was engaged in finding personal answers (and got them). Just a question before I take ayahuasca again. I'd like

to know if a *Harmala/Phalaris* ayahuasca can make you sick, because the nausea was terrible. I vomited two or three times: Yuck! In the morning I couldn't take one step without vomiting; I was in a chaotic state, and that taste, that taste... Maybe all of us should consult a psychiatrist to know why we ingest such horrible stuff! -- *SH, France*

*[Sounds like a fairly normal ayahuasca trip. Alas, even the analogs tend to make you sick. Be glad you didn't have uncontrollable simultaneous diarrhea and vomiting: a rather embarrassing condition, especially if you're in a group setting! Many people suggest that it's the harmaline that causes this, so maybe we need to come up with the minimum amount of MAOI to trigger the DMT portion of the brew. (200-300 gm of B. caapi sounds like far more than necessary, at least when compared with the 3gm normal dose of P. harmala seeds.) Some opinion claims that the somatic discomfort is the result of a synergy between the two substances. Others say that the phenomenon is part of the healing that takes place when you ingest ayahuasca: a symbolic purging of all our "shit," our illusions. -- Ed.]*

### PUKING IS GOOD FOR YOU

We continually fall victim to the European myth that intelligence began with the Renaissance. This is patently obvious in the urge to minimize nausea and vomiting: for example, to determine the lowest amount of MAO inhibitor to promote the effects of **DMT**, etc. Do you really believe that after 1,000's of years, the Amazonians don't know what they are doing? Up your intake of MAO inhibitors (instead of 4 gms. *Peganum*, start with 12 and work up), keeping your **DMT** at the constant Amazonian level! Be assured the vine has a lot more to offer than just MAO inhibition. Get into the puking!

-- *Anonymous, Australia*

### FOOD AS AN AYAHUASCA CATALYST

Toad, one of *ER's* faithful psychonaut correspondents, describes ingesting 10g *Mimosa hostilis* root bark and 150mg *Peganum harmala* extract as an ayahuasca analogue. Nausea was prevalent, but not as

bad as previous trips using *Psychotria viridis*. After almost 2.5 hours, nothing much was happening, so he ate a couple of apples and some cottage cheese, thinking the trip was a misfire. The food seemed to make things happen: a solid one-hour ayahuasca trip rapidly ensued. A similar experience a week later reinforced his conviction that eating can catalyze a poky ayahuasca experience. (See further data in article following.)

### MOCLOBEMIDE:

#### A NEW SYNTHETIC MAOI

*ER* has received reports from several correspondents that ingesting 75mg of Aurorix (Roche), an antidepressant containing moclobemide [*p*-chloro-N-(2-morpholinoethyl) benzamide], potentiates ayahuasca trips. Despite the traditional no-no about combining MAOIs and phenethylamines, people are also taking moclobemide with 2C-B without apparent side-effects.

The advantage of moclobemide over *Peganum harmala* is a reported lessening of the nausea associated up to now with the MAOI potentiation of entheogens. The sedation of *P. harmala* is also absent, and dietary restrictions are minimal. Half a tablet (75mg) is said to potentiate 2C-B at least 2-X.

Ingesting 150mg moclobemide with 150 mg of synthetic DMT resulted in a very rough trip for *ER* correspondent Forbidden Donut: "perhaps the most terrifying psychedelic experience that I can recall." He describes a "psychic rape" by alien presences. Nausea was not completely absent, and after vomiting the experience seemed to subside. As in Toad's report about food as an ayahuasca potentiator (above), Donut ate a hard boiled egg after he felt he was down and found himself precipitated back into a full-blown ayahuasca trip for another hour.

Toad tried 150mg moclobemide and 12g of *Mimosa hostilis* bark which resulted in some nausea, but he states that the trip was both clearer and more "alien" (like pure DMT) than the traditional *Peganum harmala* experience. Again, eating food late in the experience kicked the intensity back to previous levels. Toad says he likes the crystal clarity of the moclobemide, yet appreciates the earthy spirit of *harmala* as well.

*The Moclobemide Report*, available for \$5.00

from PRL, P.O. Box 19820, Sacramento, CA 95819 goes into more detail than this summary, advising that 75mg of Aurorix is a better starting dose when potentiating tryptamines in ayahuasca brews.

*ER readers are encouraged to share their experiences with this new MAOI. Many people have stopped ayahuasca use precisely because they feel that the heavy somatic trip is not worth the rest of it: it's hard to commune with the gods when all your energy is spent in feeling very, very sick. There are those who say this is good for you, I personally disagree. -- Ed.*

### MUSHROOM AYAHUASCA

After a week's time and 3 days of watching my diet I ingested 50 mg of harmine HCl. An hour later I ate 3.7 gm of dried *psilocybe* mushrooms (apparently two different species, as indicated by size differences of about 500%). My wife ate 2.5 gm of the very same shrooms without any harmine. About the only thing our experiences had in common was a left/right splitting of bodily sensation. I felt the right half associated with civilization, the city and the left side with the woods and tribalism. My wife reported the same thing but in different terms. In all my years of journeys I have never before experienced this splitting phenomenon. I must have learned it well as I can now differentiate the right and left at will if I look deep for it.

The trip was intense, about equal to a dosage of 3 times what I ate. Not all aspects were increased however. Rise time was about 2 hours: about what I would expect of 3.7 gm alone. Physical symptoms of poisoning, nausea etc. were not potentiated. The duration and intensity of the peak and plateau were definitely extended. A full +3 for 4 hours and a decline to the point where I could just barely sleep took another 6 hours. (Wife fell asleep about the time I began to come down.) Sleep came at 5:30 AM, 11 hours after ingestion of the shrooms. The next day was fuzzy and trippy all day, sleep came at 7 p.m..

Quite the experience. Certainty beta carbaloines should be considered a valuable adjunct for enhancement of the desirable aspects of shamantic intoxication. I dreamed like crazy for 3 days after. -- *Cyotee*

### CURIOUS BUGS

I would like to report a phenomenon peculiar to my experience of mushroom ayahuasca (1 gm. *P. harmala*

ext. + 3.5 *P. cubensis*). I usually did this one in the dark alone at night. On these occasions an eye, not unlike a curious lizard eye, very occasionally peered in on me. At first I thought of the benevolent "Eye of Horus" but this was a tad scary, like a dinosaur eye may look mean at first, but it's really only relatively impartial or perhaps merciless. This happened on several occasions until finally by direct mind contact I asked it who it was. It hesitated to reveal itself and when I assured it I would not be too frightened it came out into the light. It was the biggest beetle I've ever seen! I was kind of freaked by it's power! I think it may have wanted some kind of transfer of information, but I must have lost interest in communicating and (as best I can remember) we more or less made another date for when and if I was ever ready.

Later on I saw how humans would die in a day on earth without bugs, but bugs could live on for a billion years without us, even in the midst of our left over fall-out. Then I saw how in this one galaxy of ours (the "Milky Way") out of hundreds of millions of known galaxies, our sun is the most common type of star (a type "G" or yellow phase). The likelihood of other places like earth existing right now in our galaxy alone (based on earth's size and distance from it's sun) is at over 1 billion right now! That's not even considering other forms of intelligent life than we know here on earth. So, if the bugs are so much more able to adapt than mammals, they may be one of the many types of extraterrestrials, A.K.A. angels or fallen angels. I can accept spiritual manifestations: the question is whether they want to save us or usurp us. "*Be watchful when dealing with monsters lest you become one of them.*" -- *Nietzsche*

-- *Anon, CA*

### ANOTHER MUSHROOM ENTITY

Of all my experiences with entheogens I only had one entity contact. It was my first experience with *Psilocybe (Stropharia) cubensis*. It was during the summer of '79 and I'd had my first successful fruiting on straw and manure compost in a goldfish bowl and decided to eat the largest single carpophore. Its cap was about two inches in diameter -- overall height, about 2 1/4 inches. Within twenty minutes (on an empty stomach) I became aware of the presence of a slender young woman of wondrous beauty. She had

the basic form of a human female but her tissues seemed entirely composed of mushroom tissue, specifically *P. cubensis*. Her eyes were the blue that showed at the margin of the veil as it tore away from the cap, her eyelids the color of the gills, her lips the reddish mauve of the cap. Her hair and lashes echoed the form of the feathery array of gills. As time passed she became more solid and whirled me around my room in a joyous but silent waltz. I "knew" that she was the devi of the mushroom. She thanked me profusely for giving her life. I found her joy utterly infectious and experienced levels of joy I've never forgotten. She faded away after about 30 minutes and I passed into a phase of babbling and gibberish (glossilalia?). I've never encountered her again, even on larger doses of the same species. Subsequent trips felt like: "just a drug" so I lost interest. -- *Diana's Dog*

### PHALARIS BRACHYSTACHYS

*EH*, of *MA* made an ayahuasca brew using 30 gm of fresh *P. brachystachys* (grown from JLF seeds) and 5 gm *Peganum harmala* seeds. It came on within two hours and was pleasant for about an hour, but soon became extremely intense, with continuous diarrhea and vomiting, left side of body numb, racing thoughts, anxiety, etc. This went on for 36 hours! After coming down, some pleasant visuals returned to cycle in and out over a period of two days: "It even woke me out of sound sleep with strong sounds of weird things. I've never experienced this before, never wish to again. Either I'm very sensitive or this strain was kick ass."

### MUSHROOM LORE

*Anyone growing mushrooms will find the following of great interest: especially the elimination of growing mycelia on agar. -- Ed.*

I had 30 qt. jars of cased *P. cubensis* mycellium which produced their first flush (on rye) just before my two week vacation this August. Rather than having them dry up while I was away, I buried them under an inch of topsoil in a shady spot in my yard and watered thoroughly. (In Northern Illinois we have 85 degree days and 65 degree nights.) I came home to a dozen basidiophores, some of which weighed upward of 40 grams (wet). The largest topped the scales at 51 grams and produced a 3.5 dia. sporeprint.

I haven't used agar in years. I scrape spores directly onto sterilized grain, keep at 82 degrees for 8 days, case, keep at same 82 degrees and start harvesting. I've never had a single jar (or tub) not fruit prolifically, even the contaminated ones. -- *GW, IL*

### MORE ETHNOBOTANICAL SUPPLIERS

*I don't recall ever mentioning the following suppliers: Native Habitat Landscaping, PO Box 644023, Vero Beach, FL 32964-4023. Also: Entheogenesis Botanical Products, PO Box 1220, Winters, CA 95694. And: P.J.T. Botanicals, PO Box 49, Bridgewater, MA 02324-1630. For readers who live Down Under (or anyone interested in Australian plants, many of which are very potent), telephone Magikal Botanical at 61 (country code) 066 (area code) 840116 for their catalog and ordering information.*

*Except for PJT (\$2.00), I don't see any price on their catalogs, but send them a couple of bucks anyway. Few people understand that small businesses (like ER, for example) can't afford many freebies, so at least mail them enough to cover postage expenses.*

*Lots of interesting things for sale here, if you already know what they are. As usual with ethonobotany catalogs, everything of interest to ER readers is described in "code": you have to know your subject to recognize the goodies. Which is as it should be.*

### ENTHEOGENS IN PRISON

*The following article was written in response to a request for information about the entheogen scene in prison. The author is 36 years old. He has been on Death Row since a few months past his 20th birthday, and is currently in the Court of Last Resort: petitioning for a life sentence. He asked that I print his full name and address in the hope that ER readers would correspond with him. Do it now.*

Being in lockdown for the past sixteen years, I can't provide much, other than hearsay, about the availability of entheogens on the open yard, except that they are significantly more available there. Cannabis is periodically available in lockdown, maybe once a year on average, but that's only if you can afford it and are "in the loop."

In sixteen years LSD has been available in lock-

down only three times, and I was able to get it twice. The last time was about four years ago. Unfortunately, it didn't go very far, since LSD today is of such low dosage that it takes three hits to get a solid trip. It'd be nice if someone put the weight on the product instead of cool pictures.

The only other entheogen I've had besides cannabis and LSD was some 5-MeO-DMT in the Spring of 1996. I used a pipe made from an aluminum soda can, indenting near the bottom rim and poking holes in the indentation with a sharpened paper-clip. I laid a piece of single-ply toilet paper over these holes, put 5 mg of five-methoxy on it and inhaled. The sheer force hit me like the shock of jumping into a swimming pool in the middle of January! I was stiffened and paralyzed by the energy rushing through my body. The power was amazing: do not do this stuff if you have any kind of heart condition! Despite the power, I must say that the experience was without any depth. Its real value may be in combination with other entheogens, in which case I suspect it would add a whole new dimension. — *Jesse Gillies #41546, Arizona State Prison, P.O. Box 3400, Florence, AZ 85232*

## *SPIRITUAL CONVERSATIONS IN THE JOINT*

Within the walls of any prison will be found a diversity of life views much wider than that of your average American town. Prisons house those who can't conform to society's norms, values or beliefs. A high concentration of non-conformists means more variety of viewpoints than in general society. For an entheogenic New Ager this allows little opportunity for conversation without confrontation. The lag of weeks between mailing and receiving letters doesn't satisfy the need for face to face conversation, so you try to find someone within the walls with whom to engage in meaningful exchange.

While engaged in a mindless prison job of shredding old foam mattresses for use in pillows, I found myself sitting for hours with another inmate in a quiet back room. He was an ex-drug user and a prison convert to Christianity who wanted me to attend church services with him. He knew I was in prison for mushrooms and told me that they were a tool of the Devil's. He felt it was his calling to "bring me to the light."

The irony of this statement didn't escape me, as it wouldn't anyone who has experienced the sacred mushrooms. This can be likened to the difference between reading a description of a mango and the actual taste of one. In fact, a lifetime of reading about mangoes, discussing their flavor and texture with others who've never tasted one, and having "faith" that doing so will eventually gain one the experience of a mango, seems ridiculous to someone who is eating mangoes and is willing to share them.

A conversation with a convert to Islam was equally frustrating. For the followers of Islam, the solution to infidel ideas is death! The Prophet commands a holy Jihad against all infidels -- and any New Age thought qualifies one as a necessary target. "Death to all unbelievers" seems an unworthy message from the Creator of the Universe. It certainly doesn't coincide with my experience of that Creator.

Surprisingly, the easiest conversations are with atheists and Devil worshippers. While their viewpoints wander far from my experience of truth, at least they don't condemn me to death or hellfire! That makes the exchanges a bit less adversarial. Still, they seem to have no interest in experiencing light, truth or gnosis: the atheists know they don't exist and the Devil worshippers feel the darkness offers them more power and material satisfaction.

So what's a boy to do? In my case, denied the holy sacraments, relief comes through meditation on the light. Knowing where to look inside makes it possible to spend a few hours a day immersed in that light. When the truth is known, it does indeed make one free. — *Lewis J. Atley #1074758-A, Iowa Men's Reformatory, P.O. Box B, Anamosa, IA 52205*

*[Subscribers to The Entheogen Law Reporter will recognize Mr. Atley's name: his case is outlined in some detail in the Spring, 1997 issue. He is serving a 20 year sentence for mushroom cultivation.*

*In the words of the song: "There but for fortune, go you and I." Mail is important: he'd love to hear from ER readers. — Ed.]*

## *FEEDBACK ON OINTMENTS*

I have tried ointments made with DSMO and I believe they do work. I crushed a few weak baby woodrose seeds (2-4) and just covered with DSMO and

stirred. One hour later I rubbed on skin (avoid crushed seeds) and in an hour could feel the LSA (Plus-1). The LSA in wood rose can vary greatly. Let's hear about some potent seed sources. It might work better to extract the LSA first, then add it to the ointment.

I tried *Salvia divinorum* with DSMO and got a similar experience to smoking. Again, an initial extraction which is then mixed with DSMO might work better. [I'm personally uncomfortable with this idea: *Salvinorin-A* is active in the microgram range and it would be very easy to OD on this combination without some extremely accurate scales to measure dosage. To get an image of what might ensue, read the *Salvia* articles in this issue: the problem being, that an ointment might prolong the experience far longer than sanity would be comfortable with. -- Ed.]

I even pulverized some *Mimosa hostilis* root bark and soaked it in DSMO for another Plus-1 of what I guess was DMT. I plan on doing an aqueous acid extraction first to try with DSMO. I've noticed some gas as a DSMO side-effect and a little skin rash. I wonder what toxins it carries through the skin, especially since it is not an organic product. --Green Giant

### DRUM JOURNEYING

I'm surprised that I've never seen any mention of drum journeying in *ER*. It is a method that predates religion, and is used world-wide in "primitive" cultures. I like entheogens and have been seeking clues from the other side all my life. Experience shows that connecting in a meaningful, useful way is easier with drum journeying than entheogens. My next area of study is to combine the two much as the Native American Church does. It would serve any serious psychonaut well to investigate drum journeying. An excellent compilation of essays on the subject is: *Shaman's Path*, by Gary Doore. [No further publishing data provided] -- DS, AZ

### POSSIBLE IBOGA ANALOGUES

Ott mentions in *Pharmactheon* (p. 371) that ibogaine has been found within the family (*Apocynaceae*) in *Trachelospermum jasminoides*. This is about the most common ornamental vine in the United States (called "Star Jasmine") and sold at most nurseries. This is an Asian medicinal plant as are

some genera of *Alstonia* and 10 unspecified species of *Tabernaemontana* (4 are used in Ayurvedic medicine). All are ibogaine-containing members of the same family. *Tabernaemontana dichotoma* from Ayurveda is known to have toxic, psychotropic, purgative seeds. Check out their bark and/or root bark but avoid pesticides. *T. jasminoides* is a fast and thick growing ground-cover vine with a great scent when in bloom. -- Anonymous, CA

### TRICHOCEREUS - I

I recently purchased 100 g. *Trichocereus pachanoi*, and was eager to try it. [After freezing and thawing the biomass and chopping it coarsely in a blender, the author boiled it for 4-5 hours, blended it again to a fine consistency, and boiled again for several hours, adding water as needed. Mass was then strained out and the remaining liquid boiled down to fill a 12 oz mug. This was ingested with orange juice chasers.]

Although a nasty lot, it made me appreciate my orange juice all the more. Having read somewhere that 100 g. was "a good starting point" I figured I just might get off. Starting point hell -- my mind was blown to pieces! Thank God I had my dog with me next to a blazing fire. After some interesting revelations early on, I became overwhelmed, now peaking, and learned the importance of drumming very quickly. Without conscious effort, I began drumming on a log, more because I had to: it was a survival mechanism. I needed a familiar rhythm to keep my bearings. All I could do was drum and stare into the heart of the fire.

I could see Mayan-style temples rising and falling through flames of green. It was beautiful, though at the time, I thought I was gone. It seemed as though there were other, Funkier old souls drumming with me. We drummed for each other -- my brothers and I -- we drummed to keep the fires from going out. Soon, the crisis passed, and the evening was a bit more manageable from then on. Typical high-weirdness till I went to look at my car -- which had been vandalized. It was then that my sense of humor kicked in -- I wish no ill health to anyone. Hey, it's their karma (well, mine too). All in all, the trip had sent me to the way--gonosphere, as Lord Buckley would say. The spirit of the Cactus is very serious, and gentle if you're patient.

A note on chemical extractions -- specifically benzene. Benzene is a known carcinogen. If you really want some, look in your gas tank and take it from there. -- Ry.

### TRICHOCEREUS - 2

Someone was asking about *Trichocereus bridgesii* and *T. Macrogonus*. My experience has been that they are both stronger and clearer than *T. pachanoi*. *T. bridgesii* is a little slow growing but *T. macrogonus* grows amazingly fast and cuttings root readily, much tastier than other varieties. I like to boil 1-2 kilos of cactus with a couple of grams of Vitamin C and a few sticks of Cinnamon bark in a good size soup pot. Makes enough delicious tea for 2-4 people. -- JL, CA

### ABSINTHE

For palatable Absinthe try soaking wormwood in 100 proof vodka for a couple weeks and then distilling the alcohol from the mash. The wormwood oils steam distill over with the booze but the bitter part stays with the mash. It takes 2 or 3 batches from the same herb mash to get most of it. Be careful not to char the herb when distilling or the product will taste terrible. This stuff can be inhaled as it comes out of the still, or flavored with traditional herbs and sweetened to make a liquor. A little green color makes it more attractive so your guests don't feel it came from some chemical bottle. Using peppermint and woodruff make for a lovely green tint. -- Anonymous

### GRAMINE FROM SILVER MAPLES

An interesting folio entry by Rosetta is TRY 13-19. "Indole alkaloids," an article by Irwin Pacher, D. Zacharias *et al.*, describes extraction procedures from the Silver Maple, *Mimosa Hostilis*, and other alkaloid bearing plants. Gramine fed to *P. Cubensis* could be converted to a compound identical to Psilocin, except lacking one hydrogen in the amine side chain. Anyone with Silver Maples on their property, might want to acquire this article. It could prove that a concentrated rough extract of the leaves without the celluloid bulk might be all that's needed. Then Maple Syrup wouldn't be the only sweet thing produced from the Maple Trees. -- Inner Frontiersman

### DXM/2C-B

Ever since I first read D. M. Turner's excellent *Essential Psychedelic Guide* and saw his glowing reports on the combination of Ketamine and 2C-B, I have had a hankering to try an entheogenic cocktail of that variety. 2C-B has been plentiful lately, but Ketamine is as hard as ever to come by for me. Recently I had an interesting idea -- since DXM is relatively close chemically and experientially to K, as well as being cheap, legal and easy to acquire, why not use it as a substitute in the combo?

So the other night I took 300 mgs. of DXM in the form of *Drixoral Cough Liqui-Caps*, a preparation that contains no other unwanted active ingredients like acetaminophen, guaifenesin, or pseudoephedrine and has the added advantage of being low on sugars and syrups that can cause gastric distress in large doses. This dose of DXM alone would not be sufficient to evoke a fully dissociative episode for me, but I decided to err on the side of caution as I usually do when trying a new mix. After an hour or so, I began to feel the euphoria that is my first alert with this particular material and took 20 mgs of 2C-B. I was chatting on the IRC at the time and within twenty minutes typing became much too complicated to deal with, so I lay down and relaxed into the trip.

There were some uncomfortable somatic symptoms at first, such as a feeling of physical heaviness similar to that induced by alcohol, minor stomach upset, and hot flashes (which had me a little worried until I took my temperature and found it to be normal.) Fortunately, these passed quickly as my consciousness dissociated from my body. I began to feel as if my soul was a soaring kite that was connected to my physical form by only the thinnest ethereal guide rope. Then my physical awareness seemingly vanished, and I found myself in a state that was nearly identical to the experience of Ketamine that I had on the two occasions I was lucky enough to acquire some. I felt that I reverted back to the ground of being, the original undifferentiated oneness, the primal monad. Everything was perfect, all was one, and it was me. Then something fantastic happened. I felt as though I was given an opportunity to experience the original creation process that produced the material universe. I saw/felt/perceived the monad make love to itself and

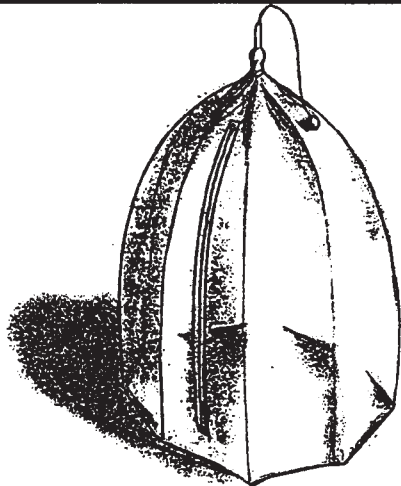

give birth to what we know as the manifest cosmos. I was the monad making love and giving birth, and it felt incredible, like multiple orgasms of universal proportions. This was a very meaningful episode for me, because it seemed to afford a pointed insight into one of the main philosophical questions I've been thinking about for quite some time. The question was: why did the monad split in the first place? Why disturb the original pristine oneness at all? As I shivered and shook with the pleasure of the birthing process, the answer seemed very clear: simply for the "doing," not because of any kind of expected result. The universe is a work in progress, not a finished product, and it is the "process" of creation that is most important.

That episode lasted half an hour or so, and then I began to gradually regain my physical consciousness. I spent the rest of the trip in a lovely state that I can only describe in terms of post-coital glow on a cosmic scale accompanied by the lovely visuals that are characteristic of 2C-B. Near the end of the experience, I smoked some *Salvia*, and had the feeling of communing with the spirit of the plant. It felt great; very warm and comforting. Ska Maria definitely likes 2C-B, and she seems to like me too! I slept about four hours and awoke the next morning feeling reborn and refreshed, enjoying a quite delightful afterglow that lasted the entire day. I recommend the combination of bees and dissociatives highly, and will most definitely be doing further

exploration along these lines in the future when the opportunity presents itself. — *Anonymous* (Initials and state lost through editorial incompetence.)

### GHB

Recently on the television news they have been talking about *Gamma-hydroxybutyrate (GHB)*. They always say it is easily made in the bathroom with common chemicals, a solvent and a cleanser. Can you or anyone out there tell me how it is made?: I've also heard the dosages are rather small, what dosage is recommended? I should be receiving some *GHB* from an overseas supplier soon. When I get it I'm sure there won't be dosage information (at least not in English!). For those interested, there are many suppliers of this listed with CERi (Cognitive Enhancement Research Institute) in Menlo Park, CA. — *Anonymous*

# PSYCHEDELIC RESOURCE LIST

"The *Psychedelic Resource List* is a comprehensive and valuable survey of numerous companies and groups participating actively in the Entheogenic Reformation, or 'disembodied eye-drop conspiracy.' The rational organization into numerous categories and the detailed index make this information easily accessible. Reviews of each group/company are honest, not tawnying. A requisite for the 'basement shaman' or avid entheobotanist interested in relevant plants, books, tapes, horticultural supplies, periodicals, organizations, seminars, or in just knowing that [s]he is not alone in this interest; highly recommended." — Jonathan Ott

\$19.95 plus \$3.00 (USA), \$5.00 (foreign) for S/H. CA residents add \$1.55 for sales tax to: Soma Graphics, P.O.B 19820 (Dept. ER), Sacramento, CA 95819.

Also, subscribe to the *PRL* newsletter!  
A four issue subscription (starting with issue #6), is \$16.00 (USA), \$20.00 (foreign).

## AYAHUASCA ANTHOLOGY NOW IN PRINT!

THE ENTHEOGEN REVIEW  
MONOGRAPH SERIES NUMBER 1:

### AYAHUASCA ANALOGS AND PLANT-- BASED TRYPTAMINES -- THE BEST OF THE ENTHEOGEN REVIEW, 1992-1996

The best and latest information from *ER's* first four years of publication. Including: Ayahuasca Analog data, MAO inhibitors, Mushroom Ayahuasca, *Phalaris* grass, Smokable Tryptamines from Plants, Other Tryptamine--containing species, plus DMT and 5-MeO-DMT. This information-packed monograph has been edited so that all the data is compiled into easily referenced chapters. Instead of paging through past *ERs* looking for that special article, find it here under one cover. \$20.00 Postpaid (\$25.00 outside U.S.)

*Paperback: 56 Pages, 13 Illustrations*

### *The Entheogen Review*

First year of publication bound together in a 74 page book -- \$20.00 domestic, \$30.00 outside U.S.A.

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 6, NO. 3, Autumnal Equinox, 1997**

ISSN 1066-1913 Copyright © 1997, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 750, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and

must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F97 means that the Fall, 1997 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- Jim DeKorne

# *RIDING THE SOLANACEOUS NIGHTMARE: SOME FIELD NOTES CONCERNING EXPERIENCES WITH TWO WITCHISH HERBS*

Excerpted from the forthcoming  
*De Mysteriis Viridis: A Book of Green Sorcery*  
by Daniel Alvin

---

## ***I. Poisoning Protocols***

**What** follows are condensed field notes from my sorcerous use of Henbane and Belladonna, two plant entheogens of the frequently-blurry "Western European shamanic tradition." Both plants are members of the *Solanaceae*, the botanical classification of the plant family containing potato, tomato, chile pepper and eggplant, as well as numerous species of ethnopharmacological significance like tobacco. (Poison-bearing members of this family are also abundant in the Americas and play a significant role in indigenous shamanic traditions there.) Because of their implication in psychoactive brews and witches' flying ointments, they have been dubbed the "hexing herbs" (or "visionary tropanes", as Jonathan Ott refers to them), but for my purposes I will call them the Witchish Herbs.

**Because** of the sinister reputation of these plants, there is a dearth of experiential information (much knowledge was also presumably lost with the Inquisition, or beat a fast retreat into a highly-guarded oral tradition) available to the postmodern shaman pursuing the European flora. Often what information we do receive is via police and psychiatric reports following someone's attempt to "get high" on jimsonweed (*Datura stramonium*), or other solanaceous plant.

**Incidents** like these represent an inappropriate transference of poisoning protocol. Recreational use of alcohol, cannabis, LSD, and other common social intoxicants engenders a carefree, sloppy approach to sacrament that simply cannot be applied to the Witchish Herbs. Particularly different is the attitude toward excess and overdose. Certainly there are few people who

enjoy unintentionally overdosing on alcohol or LSD, but undesirable effects from these drugs -- as well as the amount needed to produce them -- are of a different category than the Witchish Herbs.

**Body** chemistry is also a highly variable factor. One person may feel overwhelmed on a couple drops of belladonna tincture; another might need ten times that amount to feel anything. *Clearly, for the Witchish Herbs, a poisoning protocol of incremental dosage increase between ingestions is indicated, as well as preparedness for overdose.*

**Another** poisoning protocol for these plants is "ground control," the peer who "stands guard" in a non-intoxicated state. Hyoscyamine and scopolamine intoxication often remove someone so far from ordinary reality that bodily danger looms. One research colleague of mine recalled to me that, after having drunk a brew of Angel's Trumpet (formerly Tree Datura; *Brugmansia sanguinaria*), he tried to run through a plate glass door, but his ground control thankfully redirected him.

**Knowledge** of taxonomy and integrity of source material is also essential. Some herb dealers sell Bittersweet (*Solanum dulcamara*) under the names Belladonna or Deadly Nightshade; or substitute Mayapple (*Podophyllum peltatum*) for true Mandrake (*Mandragora officinarum*). As Mayapple is primarily a strong emetic, results when used for the purposes of intoxication can be both disappointing and grotesque.

**Finally**, approaching the plant from a multitude of perspectives is essential. Despite assertions of nu-

merous PhDs in botany and organic chemistry, a plant is not simply a specified evolutionary niche creating chemicals! Consider the unscientific and absurd notion that you're communing with a spirit, a live being which humans have regarded as a god far longer than as a "toxin" or a scientific name. Consider that the plant might have something to teach you, something of an entirely different order than a college education. Dynamiting limited, rational thought-constructs prior to communing with an ally is helpful, if not essential. Besides, once you've eaten enough, you probably won't have a choice.

## II. The Field Notes

### Belladonna (*Atropa belladonna*)

#### *The Plant*

A tender perennial known to grow in alkaline soils and sites formerly occupied by old buildings (presumably due to the presence of lime). All parts are poisonous, containing hyoscyamine, scopolamine and lesser amounts of tropane alkaloids, although in different proportions. The seeds contain 0.9% hyoscyamine, while roots and leaves contain 0.5% and 0.4% respectively. The fruits are shiny, black round berries, which possibly contributed to the plant's folk name "Sorcerer's Cherry." Belladonna alkaloids appear in several prescription pharmaceuticals, including *Belladonal* (TM),<sup>1</sup> and more recently have been used in dermal patches for motion sickness.<sup>2</sup>

#### *The Medicine*

A tincture was made using approx 30 fresh belladonna berries in a menstruum of 1.5 pints of organic apple cider vinegar, the marc pressed after resting one full lunar cycle. This medicine was prepared by

Mother Deadly, friend and colleague, whose has an Ally relationship with the plant.<sup>3</sup> He has held rituals in which ten or more people have been dosed on wine spiked with Belladonna.<sup>4</sup> He has used it many times over the years, and it is partly due to his access to the plant that I have gone from an academic investigator of Belladonna to a poisoned initiate.

#### *Dosage*

**13 drops** taken under the tongue, on an empty stomach

#### *Effects*

After twenty-five minutes, a noticeable heat and tingling in the extremities, as well as dilation of the pupils. After forty minutes everything had a visual "tracer" flowing behind it. At this stage my surroundings seemed to spin or pulsate. It was not nausea that led me to lie on the floor, but this position seemed most comfortable.

#### **My heart** slowed noticeably.

I went through several minutes of strangely sedate mental panic, thinking I had overdosed: the all-too familiar Last Stand of the Rational. In this phase my view of the possibility of my own demise was quite calm. The entire experience, from first observed effects, to rapid diminishing of effects, was about 3 hours. The prime "visionary" effects commenced about fifty minutes after taking the tincture and began to recede about two hours and ten minutes after ingestion.

**Synaesthesia** of dark sensation. Pain, dread, haunting and predation, black translucent forms, uncertainty, feeling the presence of unseen teeming hordes just below the skin of waking reality. Hyper-awareness of disharmonious feng shui; an odd sensitivity to relationships between objects and the spaces

Deadly Nightshade  
(*Atropa belladonna*)

between them. Space itself is filled with cackling and voices as if sound was physical matter -- lots of voices -- the primary 'hallucinogenic' effect was sound -- mostly whisperings, mumblings, barely audible voices, some speaking unidentifiable languages. Visions were vague, shifting forms in various shadings of dark gray and black. The presence of the dead was thick and palatable in 360 degrees. My immediate surroundings became an oscillating portal to their realm, sometimes just barely cracked open, sometimes halfway open, but never fully. A mystery cask, pregnant with horrid possibility, but not fully tapped; a poisonous genie bottle whose stopper is in the process of being pulled; the lid on Pandora's Box cracked.

#### *Post-Poison Observations*

**I** now know for certain what the word "hypnotic" means in terms of a plant's mechanism of action. On Belladonna, one has little choice about being in trance. At one time I attempted to bring myself out of trance, and I succeeded, but it was a physical struggle, like pumping iron.

**The trance** was not fully catatonic, though I suspect it might be at higher doses. It had a few features of catatonia, such as muscle-relaxant activity (particularly the eye muscles).

**In the** rational world, the character and reputation of the poison is one of danger, madness, and realms beyond the safe. Cognizance of this fact in a non-drugged state is entirely different than after consuming the plant, because you view danger from behind safety glass. When the poison is inside you, however, the reality of death, consumption by "void", is undeniable. You are Harpy Meat, the safety glass is shattered. All talk of phytochemistry and entheogenic sacraments is mere posturing. You know for certain

you're rapping at the hellgate.

**With Belladonna** I perceived what I have come to call Ancestral Weight. Think of it as the immense reservoir of spirit and quanta stored in this plant's bloodline, containing all collected human interaction with that plant, an essential component of Belladonna's interface with ecstasy. Every fatal poisoning (intentional and accidental), every madness and shamanic trance, every medicinal dosage prepared by a humble country doctor, every use as a cosmetic --and more-- came to me in a swarm of images, sounds, and emotions. It was like being at the bottom of a thousand-mile high totem pole, my face only the latest in a millenia-long stack of mad masks.

#### *Follow-Up*

**At the first** available opportunity I fed my belladonna plants some blood and bonemeal.

**A dosage** increase of 4-11 drops of tincture (depending on the individual) would likely produce a deeper trance, although the toxicological consequences of this might include unconsciousness. At this point, the dosage described is a suitable adjunct to my own meditation and sorcery workings.

### **Henbane (*Hyoscyamus niger*)**

#### *The Plant*

**Known** to grow in dumps, poor soils and wastelands. Christian Ratsch reports ancient Teutonic use of Henbane-infused beer as an inebriant, and the seeds have been suggested as an ingredient in a psychoactive fumigant used at the Delphic Oracle. As with many of

**Henbane**  
**(*Hyoscyamus niger*)**

the *Solanaceae*, the plant is both sticky and stinky.

### *The Medicine*

**16 drops** pharmaceutical grade leaf-tincture<sup>5</sup> taken under the tongue on an empty stomach. 5-7 drops is considered a therapeutic dose. (I have also burned the dried seed pods on charcoals as a fumigant, but effects manifested much faster and more unpredictably.)<sup>6</sup>

### *Duration*

**Effects** began about 30 minutes after ingestion. Prime visionary effects lasted about 3 hours. A very slight hangover is perceptible within 24 hours, a feeling of slight fatigue, mental fogginess, and chemical imbalance, but far less pernicious than the hangover one might experience after sleeping on 4-6 beers or 3 cups of coffee.

*In pharmacy, the fresh and dried stalk-leaf of the common biennial or Black Henbane. The first is used for preparing the extract; the last is for powder and tincture. Henbane is an anodyne, hypnotic, antispasmodic, and sedative. It differs from opium in not being stimulant, and by not confining the bowels; and hence may be administered in cases which that drug would be improper. In large doses it acts as a powerful narcotic and poison, producing obscurity of vision, dilation of the pupils, delirium, phantasms, coma, etc. Dose: 3 to 10 grams in powder; but it is usually given in the form of extract or tincture.*

*--Scammell's Universal Treasure House of Knowledge and Valuable Receipts*

### *Effects*

**Henbane** not word or mind medicine. Henbane body medicine.

**Muscles** coiled for action, the tensed anticipation of explosion, muscles of the hand hold the gun, prophesying recoil.

**Cerebrum** is a flabby mass of useless tissue. We are all cerebellum: if a cop jumps out of a car, pistol drawn, I will spring, a tiger, and eat his trachea.

*The soul is the animal ancestors. The body is their knowledge. -- Austin Osman Spare, The Logomachy of Zos*

Wildness = Beast = Lycanthrope Current = All Things Feral = Pollen = Weed = Slouching = Growl-

ing = Grasping = Fucking to Survive = Alertness = Heat = Sweating = Ecstatic = Muscular Strength = Powerful Nose = Smell Danger = Shapes Moving at the Fringes = Stimulant = Thoughts Occur in Compact, Simple Chunks = See Good in Darkness = Camouflage

**Pinpoint** light sources are very pretty. I could enchant myself into another solar system, obsessed with any single star in the sky.

### *Post-Poison Observations*

**An essential ally** for the Bestial Shamans-- those who accumulate animal energies, access atavisms, or the powers to change shape. *Be aware, though, that not all beasts are nice to men, or even to each other.*

**A dosage** increase of 10-15 drops of tincture (depending on the individual) would likely produce temporary madness and a maximum of novelty, although the toxicological consequences of

this might not be worth the effort. At this point, the dosage described is a suitable adjunct to mediation and sorcery workings. -- *Daniel Alvin*

### *Sources:*

*Physician's Desk Reference*, 45th ed.; Edward R. Barnhart Pub, Oridell, NJ; 1991.

Leikin, Jerrold B. and Paloucek, Frank P. *Poisoning and Toxicology Handbook*. Lexi-Comp, Inc, Hudson, OH. 1995.

*Scammell's Universal Treasure House of Knowledge and Valuable Receipts*. This book is out of print, as far as I know. Under U.S. law one could probably re-apply for a copyright and print it, but it would be a major undertaking. The thing has over 2000 pages! The information was compiled by Henry Scammell. It was published by Buckland Publishing company, in 1892. The printer's mark gives no city, but it is defi-

nately United States.

*The Logomachy of Zos*, is the last grimoire of Austin Osman Spare, and as yet, still unpublished. It was quoted in *ZOS-KIA: An Introductory Essay on the Art and Sorcery of Austin Osman Spare*, by Gavin Semple. (Fulgur Press, 1995, London.) As for availability of *ZOS-KIA*, try a well-stocked occult shop.

#### Footnotes

1. Information on *Belladonna* can be found in the book *Pharmacognosy* by Tyler and Robbers. Other pharmaceuticals containing belladonna are listed below. I haven't tried any, and don't know anyone who has. Here are some belladonna alkaloids found in current prescription pharmaceuticals:

**Bellergal-S** (TM) tablets (Sandoz Laboratories). Contains phenylbarbitol 14 mg, ergotamine tartarate 0.6 mg., bellafoleline (levorotatory alkaloids of belladonna) 0.2 mg. Corrects imbalance of autonomic nervous system; nervous tension with exaggerated autonomic response; menopausal disorders, etc.

**Cafergot** (TM) Contains phenylbarbitol sodium 30 mg., ergotamine tartarate 1 mg., bellafoleline 0.125 mg. Prescribed for vascular headache (migraine); histaminic cephalgia.

Both of the above prescriptions contain the ergot alkaloid ergotamine. The *Physician's Desk Reference* warns that weekly dosage of ergotamine tartarate should not exceed 10 mg.

**B&O Supporettes** (TM) (Webcon). Belladonna and Opium suppositories! The 16-A formula contains powdered opium 60 mg., powdered belladonna extract 16.2 mg; while the 15-A contains all the belladonna and half the opium of 16-A. Prescribed for moderate to severe pain associated with rectal or bladder tenesmus that may occur in postoperative states.

2. Regarding dermal patches for motion sickness: I only know of prescription patches; such as *Scopoderm* (TM) (scopolamine). Regarding other routes of avail-

ability, a colleague reported two years ago that they were available OTC in Mexico and that two patches behind the ear (twice the therapeutic dose) provided a satisfactory hypnotic psychedelic experience lasting about 3 hours. No information on milligrams of scopolamine per patch. Regarding *Marezine* (TM), it is cyclizine, not a solanaceous alkaloid.

3. An excellent starting dose of Mother Deadly's Belladonna Vinegar (see recipe) is 3 drops under the tongue on an empty stomach. This gives you just enough to feel the effects. Again, some people may need more, or less. Body chemistry varies.

4. Mother Deadly's recipe for the ritual wine is 100 drops of standardized leaf extract in a regular-sized (750ml) bottle of red wine. This was divided into 9 portions, so each person got about 83 ml of wine with just over 11 drops of the extract mixed in. I don't know where you can get standardized leaf extract for Belladonna but I would suspect it's available from European herb companies like **ZAND**, who make high-quality standardized extracts.

5. Pharmaceutical Grade Leaf Tincture is a tincture produced under strict conditions, with the same herb to menstruum ratios each time. It is manufactured for use in Naturopathic medicine. In order to purchase it you must be -or go through- a doctor or other licensed health professional. Botanical Pharmaceuticals (PO Box 3986, W. Sedona, AZ 86340) has both Henbane and Belladonna in this form.

6. As for using Henbane as a fumigant, here is a good way to start out. Try placing three dried pods (with the seeds intact), as well as three dried leaves, on incense charcoal (available from occult stores), and burning it in a closed room. Do not breathe directly, but mix fresh air with the smoke as you breathe. Allow at least three feet between your face and the brazier. Breathe as desired, until effects (which may include racing thoughts, auditory hallucinations, sweating, time and space distortions, stupor, etc.) ensue, or until you can't stand the stench any longer. As with oral dosages, use the Ground Control Protocol.

## BELLADONNA VINEGAR

*This recipe is a simple, economical, and effective method of preserving and extracting the fine properties of **Atropa belladonna**. A good quality organic apple cider vinegar is readily available, or, with a little extra work, made at home. Vinegar has a few other advantages: it can be used by people with sensitivities to alcohol and has health-augmenting properties of its own. Belladonna alkaloids extract nicely in the acid-rich menstruum, and the vinegar makes a powerful medicine for the gastrointestinal tract [being a superlative antispasmodic] as well as an amazing trance-inducing potion for ritual workings.*

*Be aware, however, that Belladonna can be a poison even in small doses, especially when concentrated and extracted in the form of vinegar. **Always start with one drop and wait 24 hours to note the effects before increasing the dose.** 3-5 drops of the vinegar should be enough to accomplish most medicinal and ritual ends. Belladonna is a plant spirit with a personality all its own. Please be respectful when working with her and she will treat you well.*

**Recipe:** One part Belladonna berry, leaf, or clean-washed roots; Two parts (or enough to cover Belladonna completely) organic apple cider vinegar (preferably unpasteurized). Put whole berries, cut leaf, or finely-chopped roots in a glass mason jar and cover completely with vinegar. Close lid and store in a warm, dark place for 2-4 weeks. Starting on the new moon and macerating for a full lunar cycle works best, I find.

*After decanting the bulk of the liquid, pour the residue into a muslin cloth suspended over a bowl. Using a pair of kitchen gloves, wring out all the liquid and add the residue to your compost heap. Pour vinegar into a dark glass bottle and store well-stoppered. Your vinegar should last indefinitely. Blessings from she that rides the Night Mare.-- **MOTHER DEADLY***

Recipe reprinted from: *Widdershins, a Volatile Journal of Magick*, Number 4, Daniel Alvin, ed., 135 Allegro Dr., Santa Cruz, CA 95060. Six issues \$23.00/Year, \$31.00 International. Single copies: \$5.50/\$6.50 international.

## EDITORIAL COMMENTS

For readers unfamiliar with herbal extraction procedures, the thing to remember is that "parts" are always determined by weight. Most of us think of liquids in terms of volume, forgetting that the 16 oz. pint actually holds one pound of fluid. (Remember the old rhyme: "A pint's a pound the world around.") Thus, a convenient way to make a standard 1:2 tincture of Belladonna (as in the preceding recipe) would be to soak a half-pound (8 oz.) of herb in one pint (16 oz.) of vinegar. (The metric equivalent is 250 gm of herb to 500 ml of solvent.) It is my understanding that "standard" tinctures always follow this 1:2 ratio. When dealing with deadly herbs like the *Solanaceae* it is mandatory to follow such protocols, since otherwise you have no reference point. It's redundant to repeat here that the "drop by drop" test doses are essential: when working with tropanes, don't bet your life on impatience with the so-called "dreaded underdose." Several people a year (usually teen-agers) die from tropane ingestion.

**Last but not least:** re-read the disclaimer on the cover of this newsletter. -- *Ed.*

## EDITORIAL MUSINGS

---

---

### WHAT I DID ON MY SUMMER VACATION

Well, not exactly "vacation," since it was a business trip to Europe, but I enjoyed it as much as any holiday. I spent some time in Amsterdam, where I experienced official tolerance for soft-drugs first-hand. When I entered a coffee house to purchase 2 grams of cannabis for the rough equivalent of \$12.00, I felt uneasy at first, but it passed quickly. Most of the customers were obvious tourists: backpacker types and aging ex-hippies scoring dope to smoke later in the Holiday Inn. ("Jesus, Marge -- it reminds me of the Summer of Love, back in '67, remember?")

In short, Amsterdam hinted at what San Francisco might have become if the ideals of thirty years ago had been absorbed into our culture instead of squashed. I saw no rape--murders, muggings or armed robberies caused by cannabis ingestion; I saw no crazies running naked and berserk through the streets; I saw no teen-aged girls lured into perdition by friendly strangers proffering dope. To my great relief, I felt no urges to do any of these things either, and after a while being stoned in public lost most of its novelty. I suspect that if I lived in Holland I wouldn't smoke reefer any more than I do now: which is not all that often.

To be as plain as possible about it: "legal" dope is no big deal. The only rowdy behavior I noticed was exhibited by a few drunken (not stoned) tourists acting like fraternity boys out on a spree. There were no cops in sight that night, and if there had been, they'd probably have just told them to keep their noise level down. (The revelers weren't harming anything more valuable than their own dignity.) The few obvious burn-outs I saw on the streets all had bottles of booze

in their hands: alcoholism is apparently the same problem in Holland as it is anywhere else. I saw no evidence of problems from pot.

Although my time in Amsterdam was limited, it reinforced my opinion that the whole issue of cannabis prohibition is a tempest in a teapot: a red herring: a shuck and jive act: a colossal social hallucination. A young adult working in an Amsterdam coffee house said that when she was in high school there was little peer pressure to use cannabis. She herself used it only occasionally and was not obsessive about it. (I have no statistics on teen-age drug abuse, or gangs, or youthful rebellion in Holland, but I will say that I didn't see one backward baseball cap during my whole sojourn there.)

I've always thought it was paranoid to believe that the only reason dope is illegal is to keep the prices high, but there may be something to it. And it's super-paranoid to believe that the drug war is a ploy by a ruthless power-structure to rule the populace via fear, but there may be something to it. (On the other hand, it may just be because we're a nation of superstitious yokels.) Nevertheless, when you observe how unnecessary the whole thing is, it's hard

not to hypothesize paranoid explanations.

The amount of money involved probably has something to do with it. With my pocket calculator I sat in a coffee house and figured their gross income from cannabis sales. If one two-gram packet of dope is sold every five minutes for \$12.00, for an eight hour day, for a six day week, for a 52 week year: it comes to \$359,424.00 dollars. That's a rough estimate made by guessing at the parameters, but in anyone's calculation it amounts to a lot of money. Multiply that by the number of coffeeshouses in Amsterdam (a lot), and you

### UN REPORT SAYS TENS OF MILLIONS USE ILLICIT DRUGS

UNITED NATIONS, June 25 -- *About 140 million people -- nearly 2.5 percent of the world's population -- smoke marijuana and its derivative, hashish... The international business of illicit drugs generates as much as \$400 billion a year in revenues, according to estimates in the World Drug Report, which was commissioned by the United Nations International Drug Control Program. That amounts to 8 percent of all international trade and is comparable to the annual turnover in textiles, according to the study... Less than 3 to 5 percent of the income generated from the final retail sales of plant-based drugs like heroin, cocaine and marijuana is returned to the countries where the plants are grown, the report said.*

— *NY Times*, 6/26/97

get a multi-million dollar industry. I doubt that the Dutch will capitulate to their European neighbors' demands to criminalize pot: it is just too lucrative. (If any *ER* readers have accurate figures on what the cannabis industry earns in Holland, I'd like to see them.)

The Dutch system seems to work for them, but I'm not sure it could be imported to the U.S. anytime soon. Drug--abuse in the U.S. is now enmeshed with gang-culture and daily murders with assault weapons: problems that the Dutch don't have. As an adolescent nation with a parental government, The United States hasn't reached the point where soft-drugs can be tolerated. Not as long as the average voter thinks all drug use is degenerate: a fact proven to them by the ultra-violent gangs who dominate the market. The fact that our kids are out of control and regard gang culture as cool, doesn't help either.

The facile comparison between the drug war and alcohol prohibition is an imprecise analogy because we've never had a cultural tradition of soft--drug acceptance. This might have evolved if we'd been less punitive back in the sixties, but drugs in the sixties were associated with political dissent -- something no standing government can tolerate for long without going out of business.

Rampant substance abuse of any kind is a symptom, not a cause of cultural dysfunction. As long as Americans are unwilling to accept the hard implications of that truth, we are stuck with such frightening concepts as "the drug exception to the Bill of Rights." (See Michael Pollan's article, "Opium made easy, one gardener's encounter with the war on drugs," *Harper's* magazine, April, 1997, for further insights on this now established legal precedent.) Think about that for

a moment: any "exception" to the Bill of Rights invalidates the whole concept. Coming soon -- The expired driver's licence exception to the Bill of Rights!

I have no answers -- the freedom of entheogen users to use their sacraments involves such a tiny minority of people that it is unlikely we'll see changes in the status-quo anytime soon. So what else is new? -- *Ed*.

### LEGAL HIGHS VERSUS THE OTHER KIND

*...If you have to wonder if a drug is affecting you or not, you've wasted your money. Illegal drugs are still the best, which is partly why they are illegal. If Herbal Ecstasy is your idea of a good time, here's a suggestion: Don't eat for two days. Drink a double espresso, and spin around and around until you fall down. Same feeling, 18 bucks cheaper.*

*...A life outside FDA regulations is not only possible, it's a lot simpler than trying to color inside the lines all the time. Listen, kids, you can avoid secondhand smoke, fettuccine Alfredo and ultraviolet rays all you want. You're still going to die.*

*If nothing else, you're going to bore yourselves to death. Forget Herbal Ecstasy. If you can't handle real hallucinogens, that's okay. Pour yourself a nice scotch. Or have a real cheeseburger instead of that compressed vegetable patty shit. At least, at the very fucking least, throw caution to the wind and run a Q--tip inside your ear. It's a start. And if the government gets mad, you tell them I said it was all right.*

-- Brian Alcorn, "Just say maybe, the agony and the Herbal Ecstasy," -- *LA Weekly*, 2/9/96

### THE INTERNET

Thank you for avoiding the internet; "Are you on line?" is starting to sound like "Are you saved?" sounded during my rural 50's childhood.

-- *Anonymous*

*[I still resist the internet and e-mail. I should explain why, since I get asked about it all the time. Basically, it's my mystical intuition: there's no "poetry" in it and it opens my life to more input than I care to deal with. I'm a recluse living at the end of a dirt road in the New Mexico desert where coyotes are the loudest noise at night -- I'm not eager to invite the high-tech intrusions of the world-wide web into my chosen environment. I've always been able to find whatever information I need at the nearest library, and I've yet to encounter any data transfer so urgent that it needs to happen at the speed*

*of light. From the little I've seen, the internet is an unedited mass of often erratic information: granted, there's, a lot of good stuff there, but I don't have the patience to weed through all the junk to find it. This stubbornness of mine is certainly one of the reasons for *ER's* falling subscription rate: basically I don't want to alter a contemplative lifestyle by going on--line. I guess I'm willing to pay the price for that.*

*Then there's the "Evil Empire" hypothesis: Read*

John Lilly's book: *The Scientist* for his ketamine visions concerning the "Solid State Intelligence," a computer-like entity working to usurp carbon-based life-forms in the cosmos. It makes crazy sense -- if the gods of hyperspace originally wanted to create an artificial left-brain: an organism manifesting pure reason, without all the hassles of animal emotion, they couldn't do better than to evolve humans for the sole purpose of developing computer technology.

People who know more about these things than I do are in agreement that computer intelligence will outstrip that of humans when it reaches critical mass in the not-too distant future. At that point, people will become obsolete and computers will have developed the ability to survive and reproduce themselves on their own: by then the earth will probably be unfit for organic life anyway.

Computers are left-brain analogs, machines that filter out all input except logic. Think what a bummer it would be to have no organic bodies to incarnate into on this planet, just some Big Brother machine with ultra-nerdy software: No orgasms, no DMT flashes, no funky blues lyrics, no falling in love -- just an eternity of data bases and spread-sheets! It's a far-out hypothesis, and I probably don't even believe it, but "programming" my consciousness enough to meet the user-unfriendly (a telling phrase!) demands of computers (i.e., learning how to use the goddamn things) feels anti-life to me.

Word-processing is about as far as I'm willing to go with this at present, though I admit that e-mail is very useful at times. I guess in my old age I'm coming to seriously question the life-enhancement potential of

technology. There's no denying that out of control technology is killing the planet: even the much-touted "global brain" (i.e. world-wide web) can't stop this trend. Ask yourself this: who wouldn't trade their present life for one in Tahiti before the arrival of Europeans? -- Ed.J

#### WHO IS PROGRAMMING WHOM?

In 20-40 years computers likely will equal or exceed humans in computational ability. Another 20 years beyond that, well within the lifetime of many alive today, computers should outstrip humans by several orders of magnitude, in the same way that the mental ability of humans exceeds that of horses or dogs... Given the ability of computer programs to evolve on their own, and even to control their own evolution, computers may acquire much more power, including the ability to escape our control. Further, those that do so are likely to be favored by natural selection. Because the ability of such computer programs will greatly exceed that of the human brain, they may relate to people in very different ways than they do now. Such programs will be unlikely to share human and ethical values. Pain and moral obligations will be understood but not felt. Alternatively, humanity may find itself in a world populated with much less intelligent "creatures," like the brooms conjured by Mickey Mouse as the sorcerer's apprentice in *Fantasia*, and equally out of control.

-- Chas. E. Taylor, "Life as we don't know it," *Encyclopedia Britannica 1993 Yearbook of Science and the Future*

#### BOOK BURNING IN AUSTRALIA?

ER has received a press release from Down Under that "Steve Barnier of Medicine Garden, growers, importers and distributors of medicinal plants, herbs and information ... has been summoned to appear before Brisbane court on the 27th July to appeal the Australian Customs Service decision to confiscate and burn herbal reference books... Some of the forfeited books now destined to be burnt by Customs are:

*The Magic and Ritual use of Herbs, The Magic and Ritual use of Aphrodisiacs, Psychedelic Shamanism and Psychedelics Encyclopedia...*"

I confess amazement at this, particularly since I am the author of *Psychedelic Shamanism*. I suppose

there's a certain honor in having one's book burned by fascists, though I doubt if any of the confiscating officials read beyond the title. I hope this is an anomaly: surely the Australian Supreme Court will stop the practice dead in its tracks. On the other hand, here in "the land of the free," the so-called "drug exception to the Bill of Rights" is passively accepted by just about everyone, so maybe this pernicious loophole applies elsewhere as well. -- Ed.

# TRYPTAMINE LORE

---

## *SMOKABLE TRYPTAMINES FROM PHALARIS GRASS WITHOUT THE USE OF CHEMICALS*

I placed the dehydrated blades of *Phalaris arundinacea* var. *turkey red* in distilled water purchased at the grocery store. My hope was that most of the tryptamines would be soluble in boiling water without the addition of acid and would be released within 20 minutes. (Further boiling should be avoided as it is likely to release unwanted toxic compounds.) The cut blades, 2-3 inches long, were boiled in a stainless steel pot with the lid on it. Enough distilled water was added to cover the leaves. At the end of 20 minutes I poured the boiling liquid through a screen to separate it from the biomass. I then continued to boil the water until it was reduced to a depth of about one-quarter inch in the pot. This was poured into a glass baking tray, placed in a dehydrator and heated until completely dry. The hardened residue was then lightly sprayed with water. After the material had softened completely, I easily scraped it to the center of the tray and added just enough powdered mullein leaf to soak up excess goo. This in turn was placed on a screen in my dehydrator and dried.

When completely dry, I loaded one big hit into a water pipe, lit up, inhaled, and sat back. Very powerful waves of energy moved through my body and the room around me took on an unreal quality. The extract was definitely entheogenic. I found it to be smooth without the side effects I've experienced with extractions made with methylene chloride and ammonia. A number of friends have tried this, and nobody has reported any toxic effects: all find the potency to be excellent.

This technique puts smokable tryptamines into the hands of anyone who wants them without resorting to environmentally toxic chemicals. The material smokes best when broken into tiny pieces for faster burning. It has a wonderful smell and taste and is simpler to smoke than the extremely tacky, gooey mess I always got with methylene chloride. It is, of course, essential

that you start out with properly grown and harvested grasses of known potency. — *B. Green*

*[Drug effects are always subjective, and often potency is also. I've not found water extractions of Phalaris anything to write home about, but then probably I'm jaded. A little vinegar in the water to make the Ph slightly acidic would ensure more tryptamines would be extracted and shouldn't cause undue toxicity. Try this with grass of known potency and compare with a chemical extraction to gage the difference. — Ed.]*

## *MORE IDEAS ON TRYPTOPHAN SOURCES*

Living where I cannot readily get any good nutritional books listing substances with a high concentration of tryptophan, I came up with some generic information stating that nuts, soybeans and various grain products are high in tryptophan. Any one who has access to a good sized university library would be doing a great service by locating any more sources of this essential amino acid. There may be ways of getting it via the overseas order route. The putrefication of food containing tryptophan changes a very large percentage of it into tryptamine, which can be fed to *P. Cubensis*, causing the alkaloid content to increase almost 6 times: potentially making it as potent or more potent than the wood/paper/celluloid grown *P. Cyanescens*, but with the advantage of higher fruiting yields and a wider range of environmental tolerance. — *Inner Frontiersman*

## *MUSHROOMS CASED WITH PHALARIS*

1. This is in response to Inner Frontiersman's idea of making tryptamine from milk via bacterial reaction. As Paul Stamets suggests in his book *Psilocybin Mushrooms of the World*: "Canary (*Phalaris*) grasses, known for their high dimethyltryptamine content, might make excellent companions for their co-culture of psilocybes." I haven't tried casing psilocybes in

Phalaris yet, but I am very eager to do so. By the way, the above book is a must for anyone seeking the sacred 'shroom. -- *Psilonaut*

2. My idea is to grow *P. cubensis* directly on dried *Phalaris* grass. It loves to grow on grass anyway. I think mixing it with leached and pasteurized manure would work. This might effectively increase the psilocybin/psilocin content. -- *MM, VA*

## PSILOCYBE TAMPANENSIS

### SOURCE

There's a new supplier of mushroom spores and cultures, which your readers might profit to know about. To my knowledge, this is the only source of *Psilocybe tampanensis*, and they've got several strains of *P. cubensis*. It's a Dutch non-profit foundation. Their co-ords:

Perfect Fungi Europe  
Postbus 416

pfe@antenna.nl  
<http://www.antenna.nl/pfe>

-- *WA, Austria*

## MORE DIMINISHED APPETITE FOR DMT

I was amazed by Mulga's observation (Spring 1997 *ER*) about his diminished appetite for DMT, as it is exactly the same with my friends and myself. After several months of experimenting, the desire becomes less and less, to the point where I haven't wanted any for about three months, and even though I'm slowly becoming interested again, there is no real desire for it. -- *Distorted, Australia*

[I confess I haven't done much DMT for a while either -- the experience settled into a comic book kind of reality in which my surroundings turned into very cheap plastic (the kind that kewpie dolls are made of). Nothing particularly entheogenic there, though the utter weirdness of it is always a mystery. Since I hon-

estly can't relate it to anything in either my conscious or dreaming mind, where does such a reality originate? I stopped doing *Salvia* for much the same reason: meaningless weirdness is ultimately boring. If I want plastic, I'll go to Disneyland. -- *Ed.*]

## MIMOSA HOSTILIS

*Mimosa hostilis* is a much better choice than *Psychotria viridis* (which requires full shade) for an ayahuasca brew. A healthy *M. hostilis* specimen can grow four feet in only three months in 80 degree (F) weather with plenty of water. In cooler weather plant growth stops almost completely. Harvesting of leaves is best done by cutting off the whole new green branches. This year I plan to scissor the leaves off the cut branches and immediately try to root the latter with rooting powder. If this works, the crop would multiply fantastically. -- *The Gnostic, FL*

## MIMOSA HOSTILIS BETTER THAN MUSHROOMS

I have found *Mimosa hostilis* to be as strong as mushrooms. I've had moderate doses of mushrooms about 100 times, over a period of 2 years. The *Mimosa* seems to be less paranoid. Perhaps because the trip is shorter in length. It grows wonderfully fast here in Florida in the 90 degree (F) weather. Also it is very sticky on the new leaves and stems. -- *BJ, FL*

## M. HOSTILIS EXTRACT

Does a *Mimosa* extract qualify as an analog to DMT under the drug laws, or is it a natural plant extract? -- *Anon.*

[If it's a good extraction, it isn't a DMT "analog," it's DMT, and therefore a scheduled substance. This rule holds for any extraction, be it from *Phalaris*, *Desmanthus*, *Mimosa* or whatever -- currently you can't be busted for the plants, but if you extract the alkaloids from them, you're liable for arrest and prosecution. -- *Ed.*]

## EXTRACTION PROBLEMS

For some reason white gas [AKA petroleum naph-

tha, Coleman fuel, Ronsonol lighter fluid] is no longer working as a *Phalaris* solvent for me. It worked OK for a while, but now nothing ever enters the white gas layer when I add it. So, after adding *Drano* [the basification phase of the extraction procedure], I began simply evaporating my extractions. The crystals that remain are mildly psychoactive, but also extremely hydrophylic: they turn into puddles when exposed to air for more than an hour or so. I surmised that this was due to the presence of the *Drano*, and rinsed the crystals in water and a coffee filter. This resulted in a much lower yield of crystals, not significantly different in potency from the hydrophylic crystals, though less hydrophylic. The solution that results however, has such a reddish color that I'm sure it contains more alkaloids. I'm looking into purchasing some ether, but a question arises: which ether? Catalogues list both anesthetic and "petroleum ether." What's the difference? Maybe I should try chloroform. -- *Anonymous*

[The process you describe is essentially impeding the extraction procedure before it is complete: to have that much caustic material (*Drano*) in your final product is asking for trouble: not only is it inherently poisonous, but you have not yet separated the desired alkaloids from who knows what other junk in the potion. (Ingesting *Drano* crystals sounds like a great suicide headline for the *National Enquirer*!)]

I stopped using naphtha years ago: it's easy to obtain, but that doesn't make it an ideal extraction solvent -- at least not for the tryptamines in *Phalaris* grass. If you cannot obtain methylene chloride in its pure form, you might read the ingredients on cans of commercial paint-stripper. Some of these products

contain only methylene chloride and methanol (wood alcohol). Since methylene chloride is immiscible in water (i.e., it separates from water in a clear layer), but methanol combines with water, it seems to me (a non-chemist) that if one mixed paint stripper with water, the methanol would stay with the water and the methylene chloride would separate into a relatively pure layer which could be drawn off and used as an extraction solvent. Actually, just plain old paint stripper might make a good extraction solvent all by itself, since both the methylene chloride and the methanol are evaporated in the final phase of the process. (Why didn't I think of this before? Any feedback from chemists on this idea?)

If you can obtain chloroform or ether easily, they would be better tryptamine solvents than naphtha. I used chloroform once to extract psilocybin from mushrooms -- it smoked like a kinder, gentler DMT. (See Summer, 1994 *ER* for the extraction procedure.) A European mushroom expert told me it wouldn't work, but I can tell you that it does. It certainly gives a new slant on

Castaneda's oft-criticized claims about "the little smoke" in his *Don Juan* books. I've often wondered why I haven't gotten any feedback on that particular formula. Maybe it's because chloroform isn't easy to obtain.

I don't know the difference between petroleum ether and anesthetic ether, but since one evaporates them in the final process anyway, it shouldn't make any difference which one you use. To be on the safe side always re-dissolve the final product in ethanol (drinking alcohol) and let that evaporate: it ensures that there's no solvent residue remaining in the extract. For a basifier, I prefer pure ammonia to *Drano*, though it probably doesn't make that much difference, since all you are doing is changing the Ph and any base (even baking soda) should work. -- *Ed.*]

#### ALKALOID PERCENTAGES IN VARIOUS PLANTS

Alkaloid reported as mg per 100 gm dried plant,  
and as percent of total plant source weight:

i) *Phalaris aquatica (tuberosa)*

DMT = 170 mg (0.170%), 5MeoDMT = 22 mg (0.022%), 5-OHDMT = 5 mg (0.005%)

ii) *Phalaris aquatica (tuberosa)* ('net gossip):

DMT = 170 mg (0.170%),  
5MeoDMT = 60 mg (0.060%)

iii) *Phalaris arundinacea* ('net gossip):

DMT = 60 mg (0.060%)

iv) *Desmanthus illinoensis* (root, from Ott):

DMT = 200 mg (0.200%)

v) *Desmanthus illinoensis* (root bark only, from Ott):

DMT = 340 mg (0.340%)

vi) *Psychotria sp.* (averaged from Ott):

DMT = 200 mg (0.200%)

-- Contributor's initials and location lost through editorial incompetence.

# NETWORK FEEDBACK

---

## HIGH AND LOW DOSE RESPONSES TO MUCUNA PRURIENS IN LAB ANIMALS

*Lower dose corresponding to the clinical dose significantly decreased the sleeping time, increased the motor activity and gave equivocal results in rotarod test in experimental animals. The high dose (3 times the clinical dose) significantly increased the sleeping time, decreased the motor activity and reduced the time for falling from the rod. Thus the drug possesses CNS stimulant effect at low doses and CNS depressant effect at high doses.*

9104-2163 Ahmad, S., Taiyab, M., Amin, K. (AKT College, Aligarh Muslim University, Aligarh 202 002, UP, India) "Study of the activity of low and high doses of ... *Mucuna pruriens* on CNS." College of Pharmacology and Symposium on Herbal Drugs. (New Delhi), 15 March, 1991. *Medicinal and Aromatic Plants Abstracts*, New Delhi

*[I'm not sure why I'm printing this, other than for the record -- there's not much data on *M. pruriens*. If these guys would ingest the stuff themselves, they might come up with more useful and interesting data. -- Ed.]*

## BLACK LIGHT ALKALOID TESTING

In response to the "purple/green spit" seen under UV light (Fall 1996 *ER*): I've seen several alkaloids fluoresce. For example, yohimbe will glow a vibrant yellow even under fluorescent white tubes. An old method to check if blotter paper is impregnated with LSD is to hold it under a banknote checking tube. It will show a mild fluorescence over the whole surface if it was dipped, or just a spot with frayed edges if dropped. -- *Distorted, Australia*

## BORAMETZ MEDITATION

I had a very interesting experience involving the use of Borametz in an open eye meditation session with a dark mirror. To experiment with this technique, buy a \$15 dark mirror from your local occult store, or through mail order occult suppliers. Then go into a dark room with only a small light source (oil lamp or a couple of candles) behind your back, so there will be no direct reflection of their light on your mirror. Place the mirror above eye level, so you will be able to stare on its surface without seeing your reflection. Then, sit comfortably and gaze at its surface effortlessly. Act like you are watching out of a window at night, and trying to see the landscape through the darkness.

This type of meditation has been used from a lot of ancient cultures and can bring you in contact with spiritual entities. I didn't eat or drink anything but water for twelve hours, then performed the above technique one-half hour after ingesting four full droppers of Borametz. In the beginning the surface of the mirror was waving and pulsating. I lost all sense of time, then the waves looked like they were coming out of the mirror, and making colors like green, blue, purple and red. Suddenly, from the middle of the surface a hooded figure clearly appeared. In a telepathic manner it sent me the message: "Your world is just the bottom of the reality." And: "Illness in the lungs, comes on your brown, stop it."

I was so startled that I fell from my chair. The vision was gone and I couldn't concentrate any more because I felt drained and sleepy. I knew that the warning was for my dog, which I took to the vet, who told me that it was at the first stages of pneumonia and that thanks to my prompt visit, would be no problem to cure. My dog is fine now and I will attempt another session with the mirror after preparing myself and dealing with my fear.

-- GA, KY

*[Borametz extract, in the form of an oil available from*

herbalists, comes from the leaf of the Borometz tree, an evergreen native to Russia. Like many herbal medicines, it seems to have an extremely wide range of applications: I'm not qualified to comment on its entheogenic properties since the literature I've seen is best evaluated by an experienced herbalist. It is said to be similar in its effects to GHB, a smart-drug popular with the rave crowd. The "dark mirror" meditation described above is certainly interesting and ought to work with almost anything: or even without anything at all! -- Ed.]

### HOW DO YOU INGEST ERGOT FUNGUS?

Can anyone provide information on using *Claviceps purpurea*, AKA ergot fungus? Is it safe? What's a suggested dose? Is it a better source of LSA than *Stipa robusta*, or the morning glories?

-- Pylonaut

### AMAZING DOPE TALES?

Here's my vote for the continuation of *ER* -- but I can understand about lagging subscriptions. You've put out most of the basic technical information, and I'm not sure how much point there is in a magazine full of amazing dope tales. For me, the point is to do the work and network with people face to face.

-- MH, TN

[Egad! I don't want *ER* to become an "Amazing Dope Tales" kind of publication. I do print stuff about entity contacts, and *Salvia divinorum* stories are still fascinating (for me anyway). I'm not sure we're done with basic technical information yet -- for example, the lead article in this issue is the first responsible piece I've seen yet on using tropanes. When you consider that the "witchish herbs" have been used for millennia, it's remarkable that we have so little data on ingesting them safely. (Particularly since several kids a year croak from tropane poisoning.) And, of course, there are always "new" discoveries being made. *Mimosa hostilis* is a case in point: though it has been known to contain DMT for about fifty years, the real power of this plant as an ayahuasca analog is just now becoming familiar to serious psychonauts. -- Ed.]

### NOOTROPICS, SMART DRUGS AND YOUR MIND

No matter what your view is on where you go and what you see on psychedelic voyages, i.e., to other dimensions, inner parts of the mind/soul/spirit, etc., the one thing all can agree on is that the mind is a crucial part of this equation. The better the condition and amount of synapses and inner-connections, theoretically the better and more vivid the voyage will be. Enthusiasts of MDA, MDMA, and the rest of the psychedelic amphetamines have probably already heard about the studies that show some of these compounds damage neurons in the brain. *Datura*, *Brugmansia*, and other tropane devotees have also heard and read about the corrosive effect these have on the brain. There are a gagillion good books on the subject, but the following comes from *Smart Drugs and Nutrients* by Ward Dean M.D., and John Morgenthaler.

1. For helping repair memory related brain burnout -- Pyroglutamate a.k.a. PCA, Glutamic Acid. European studies show significant improvement in memory deficit caused by "multi-infarct dementia" -- brain tissue damaged or killed by stroke or loss of blood supply. There are four other chemically similar compounds that work similarly, but the one above is available at health food stores. Incidentally, the general structure of these Amino Acids is similar to Ibotenic Acid from Fly Argic *Amanita muscaria*.

2. General overall brain repair molecules. Hydergine, an ergot derivative, has been shown in European Studies by our friends at Sandoz to regenerate nerve pathways throughout the brain, enhance brain cell metabolism, and speed the elimination of age pigment - lipofuscin, from the brain. Two other points to mention: 1. It acts synergistically with the first family of compounds -- an interesting possibility for Fly Argic and LSD? 2. It is legally available via overseas vendors, and might make a good candidate to start with to get a real clean, cheap source of lysergic acid.

3. Two other brain nutrients are both herbal and available at health food stores: Gingo Biloba and Goto Kota. Although in Europe Ginko has been studied

extensively and proven effective, Goto Kola also shows great promise. Both increase blood supply to the brain and protect the brain from free radical damage.

Care and maintenance of the brain is very important on keeping voyages at their most intense and rewarding. — *Contributor's initials and location lost through editorial incompetence.*

### MAREZINE

I ate a box of that stuff once. (*Marezine: a sea-sickness medicine. See pg. 11, Summer, 1996 ER.*) Really weird like dreaming while being awake. I recall moving and feeling like my body weighed 1000 pounds. I needed to try this only once to decide that the somatic effects, especially on the way down, weren't worth the experience. Very weird. We, stupidly, drove to a state forest after dark and climbed a wooded hill expecting to reach a stream on the opposite side. Nope! ended up about 100 feet from where we started. On the way home, my friend and I experienced the same illusion of a steel structure bridge at the same time. At one point I was convinced there was an illuminated sign by the roadside. As I approached it close enough to make out the lettering it vanished. It never was there.

Other common experiences include smoke and smoke rings and cobwebs: lots of cobwebs. You could pick at these cobwebs and get the silk all stuck to your fingers and still more cobwebs would appear. Of course the cobwebs weren't there.

Another friend had the following experience: He was sitting in a darkened tripping room. The lights came up, a dog walked in and sat at a desk, the music came on, the dog lit up a big cigar and smoked it down. The music went off, the dog got up and left, the lights went down. But of course, none of this happened. — *Cyotee*

### TRANSDERMAL PATCH

Enclosed is a package insert from a transdermal patch used for pain relief in terminal patients. The drug to be delivered is Fentanyl, a powerful pain killer

requiring a low dosage. The carrier used is ethanol. The drug-alcohol mixture is gellified with hydroxy methyl cellulose. The active membrane is a ethylene vinyl acetate copolymer. Fentanyl has a molecular weight of about 336, LSA freebase weighs 267 and LSA seed alkaloid extract probably weighs about 33% more. DMT freebase has a MW of 188.

Here we have the opposite side of the problem with the study of neuroscience, we play around with these chemicals and record our experiences but have no access to scientific practices to understand what goes on at the cellular level. I also subscribe to the MAPS journal which is geared towards "respectable research", it's a damn shame there is no middle ground. — *Contributor's initials and location lost through editorial incompetence.*

### AMANITA MUSCARIA

In response to the letter from Bzrk of NYC on *Amanita muscaria* and MAOIs (*Spring 1997 ER*): I first heard of this combination a couple of years ago from an employee of a local occult bookstore who sells numerous herbs, including *Amanita muscaria* and *Peganum harmala*. She stated that ten grams is a good amount for her, but that when used in combination with 2 grams of *P. harmala* the *Amanita* dose can be halved. Although I've not tried it yet, a friend tells me that this combination is definitely worth the experimentation.

In response to Inner Frontiersman's speculations about the cultivation of *A. muscaria* in a large pot with a Bonsai host tree (*this mycorrhizal species always grows in conjunction with the roots of a tree: a phenomenon also discussed in Spring '97 ER*), I can only say that it seems possible if the tree is in the right temperature zone for the variety being cultivated. However, the culture might not begin without the mycorrhizal relationship already in place. Also, if the Bonsai tree were not left outdoors all winter, the process might not work because temperature changes may be necessary in *A. muscaria's* growth cycle. If the proper host trees grow in your area, it might be easier to just take a few dried or fresh caps in sporination (fully flattened or upturning with longitudinal tears

along the striations), crush them up thoroughly, and mix these crushings into the topsoil around the tree roots. This should be done in Autumn. Clark Heinrich, in his excellent book *Strange Fruit*, states that he simply buries the stems under the proper host tree for cultivation.

Just because modern people don't often feel the same effects from *A. muscaria* that are described in ancient texts, in no way invalidates the theory that this mushroom is the Soma of the Vedas. Ethnic shamans never just ingest a substance and then wait around for the effects to take place (the way most moderns do it). They also use ritual techniques to alter their awareness in combination with the drug, therefore modifying its effects. It is illusory to compare our modern western experience of *Amanita muscaria* with the religio-magical experiences of the ancients and think that we understand them. -- MSS, PA

### RIP-OFF ALERT

Please warn *ER* readers that someone at Panther Press is cashing checks and money orders sent for the late, lamented D.M. Turner's Salvinorin book and sending nothing in return. -- RC, NC

[It is my understanding that Panther Press was operated solely by Mr. Turner, so I assume it is now defunct and his books unavailable. Mail fraud is a federal offense, so anyone who wants to alert the postal service to this situation would be doing the world a favor. -- Ed.]

### MIND MACHINES AND ENTHEOGENS

1. For a really different experience, try the mind machines, the ones with sunglasses and earphones. Use programs that evoke imagery. The one time I tried it with mushrooms, I got rapidly changing pictures of ordinary things and people, some erotic.

-- The Gnostic, FL

2. I recommend the use of sound and light machines in conjunction with entheogens. These devices have allowed me to reach extraordinary states of relaxation and bodily awareness. When combined with the mush-

room I'm able to perceive the energies within my body more acutely; the machine helps to suspend the feel of the physical body and allows me to feel as though I am just energy. It also readily induces hallucinations. By the way, I usually feel as though my "energy body" (I don't know what else to call it) is being manipulated in some way by the mushroom. It is almost as if the mushroom is trying to tune in my perception by turning various energy knobs, trying to overcome my ego in order to make its presence known. -- DK, AK

### OLD 'SHROOMS STILL POTENT

*Psilocybe baeocystis* mushrooms stored at room temperature in a jar with a moisture-absorbing pack were found to be active (4 gm borderline to low entheogenic dose) even though they were harvested in 1984 and were twelve years old! -- JE, AZ

### LOST IN A BARD OF P.O. BOXES

The Post Office here recently moved to a another-building, and neglected to include Box 800 -- I was forced to take Box 750. Not to worry: Anything addressed to me or *The Entheogen Review* will be delivered. -- Ed

**JUST REVISED - CONTAINS

# PSYCHEDELIC RESOURCE LIST

"The *Psychedelic Resource List* is a comprehensive and valuable survey of numerous companies and groups participating actively in the Entheogenic Reformation, or 'disembodied eye-drop conspiracy.' The rational organization into numerous categories and the detailed index make this information easily accessible. Reviews of each group/company are honest, not fawning. A requisite for the 'basement shaman' or avid entheobotanist interested in relevant plants, books, tapes, horticultural supplies, periodicals, organizations, seminars, or in just knowing that [s]he is not alone in this interest; highly recommended." — Jonathan Ott

\$19.95 plus \$3.00 (USA), \$5.00 (foreign) for S/H. CA residents add \$1.55 for sales tax to: Soma Graphics, POB 19820 (Dept. ER), Sacramento, CA 95819.

Also, subscribe to the *PRL* newsletter!  
A four issue subscription (starting with issue #6), is \$16.00 (USA), \$20.00 (foreign).

## *IMPORTANT NOTICE*

---

Subscriptions to *The Entheogen Review* have fallen off at an alarming rate all year, to the point where I can no longer keep it going. (*ER* took in only \$20.00 for the week ending August 9, 1997.) The newsletter is not paying its way anymore, and further publication would necessitate dipping into personal funds. There's enough money in the bank to cover printing and mailing the Winter, 1997 issue -- the last *ER*. Readers with credit on their subscriptions have the choice of a cash refund or compensation in kind with back issues. (I hope you'll choose the latter, as money is tight, but I do have a complete back list of *ERs*. These will be sold until they're gone.) People whose subscription expires with this issue can send me five bucks and be ensured of getting the final newsletter. (Nobody's gonna get burned: I ain't no crack dealer.)

I have mixed feelings about this decision, but overall it feels right. The internet is where it's at these days, and you can probably find more stuff there than here. I have another book to finish and who knows what new projects loom over the horizon. *ER* was fun and informative to edit, but I confess I'm getting burned-out: five years seems to have been its allotted lifespan (longer than most 'Zines).

I'll also admit that it will be a relief not to worry about the narc-gestapo kicking in my door at 2:00 AM -- it's supposed to be OK to deal in ideas, but things are deteriorating rapidly on the civil rights front. Anyone familiar with the Jim Hogshire case should be able to read the handwriting on the wall. Hogshire was blatantly persecuted for the stuff he wrote about opium: the authorities didn't even bother to disclaim it. (See the Summer, 1997 issue of *The Entheogen Law Reporter* for the Orwellian details.) The infamous "domino theory," used to justify the Vietnam war was often criticized as unfounded, but there is no denying that once a process gets started it seems to escalate: the war on drugs has now transcended all reason, and public paranoia has reached the point where it actually supports trashing the Bill of Rights. Even communists in the days of the Cold War recieved more justice in court than someone busted today for growing a couple of cannabis plants. You'll recall that in 1932 Hitler was regarded by most Germans as a rabble-rousing kook -- then through political happenstance he came to power in '33, and the rest is history. Not only *can* it happen here, it *is* happening here: watch it unfold on the nightly news.

Since the next issue will be the last one, let's see how good we can make it. All you readers who've been meaning to send in astounding new data but have been putting it off, please do so now. I love material like the tropane article leading off this issue: new ways of using old plants, new plants, simple extraction procedures, etc. Don't hold back: if I really like something, even if it's more outrageous than the stuff I usually print, it has a good shot at being included. Let's send ole *ER* off with a bang: a Big Bang. -- *Jim DeKorne*

**AYAHUASCA ANTHOLOGY  
NOW IN PRINT!**

**THE ENTHEOGEN REVIEW  
MONOGRAPH SERIES NUMBER 1:**

**AYAHUASCA ANALOGS AND PLANT--  
BASED TRYPTAMINES --  
THE BEST OF THE ENTHEOGEN REVIEW,  
1992-1996**

The best and latest information from *ER's* first four years of publication. Including: Ayahuasca Analog data, MAO inhibitors, Mushroom Ayahuasca, *Phalaris* grass, Smokable Tryptamines from Plants, Other Tryptamine--containing species, plus DMT and 5-MeO-DMT. This information-packed monograph has been edited so that all the data is compiled into easily referenced chapters. Instead of paging through past *ERs* looking for that special article, find it here under one cover. \$20.00 Postpaid (\$25.00 outside U.S.)

# THE ENTHEOGEN REVIEW

A QUARTERLY ETHNOBOTANICAL UPDATE

---

---

**VOL 6, NO. 4, Winter Solstice, 1997**

ISSN 1066-1913 Copyright © 1997, All Rights Reserved Subscription: \$20.00/Year, \$30.00 Outside U.S.A.  
P.O. Box 750, El Rito, NM 87530 Editor: Jim DeKorne

This newsletter is a clearinghouse for current data about the use of psychotropic plants. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction and ritual usage of entheogens. All communications are kept in strictest confidence -- published material is identified only by the author's initials and state of residence. The mailing list is not for sale, rent or loan to anyone for any reason.

---

---

### *Disclaimer*

The information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. As editor, my role is to collate and present these data, opinions and beliefs as is my right under the First Amendment to the Constitution of the United States.

Being a mere human, subject to the same frailties as others of my species, I cannot guarantee the accuracy of any of the data presented here, nor do I advocate that anyone do anything except read it. Portions of this material may relate to subjects which are legally questionable. Although I am neither a law-maker nor a policeman, it is my understanding that while plants can apparently be declared illegal, facts of nature and human ideas about them (correct or incorrect) are currently exempt from such classification.

Anyone has the existential freedom to do what they choose with what they've read, but that has no connection with what I or others may have written in these pages. Readers who act on any information found in this publication do so of their own free choice and

must accept full responsibility for such decisions.

### *Subscriptions*

*The Entheogen Review* is not intended to be a mass circulation publication -- it is available by subscription only. On all quarterly (mass) mailings there will be a code after your name. F97 means that the Fall, 1997 issue will be your last. W stands for Winter Solstice, V stands for Spring (Vernal) Equinox and S for Summer Solstice. I make a great effort to get the newsletter out on time, and third class mail sometimes gets lost -- if you don't receive your copy within three weeks of a solstice or equinox, please let me know. Third class mail is not forwarded by the Post Office, so always inform me of address changes.

### *Submissions*

Your input is what keeps this network alive -- don't hesitate to share your experiences, inspirations and questions. (Confidentiality rules -- after transcription, all correspondence is burned.) Though I often have to edit for brevity, please keep those fascinating letters coming in. I am especially interested in receiving Entity contact experiences induced by entheogens.

-- Jim DeKorne

# THE ENTHEOGEN REVIEW LIVES!

In the Fall, 1997 *Entheogen Review*, I announced that it would cease publication with the Winter, 1997 issue (the one you're now reading). A lot has happened since then, most notably that two respected experts in the field have chosen to assume responsibility for the newsletter's continued existence. This was a great relief to me: I really didn't want *ER* to die, but personal matters have made it impossible for me to continue on as editor. For now, the new editors must remain anonymous (for many very good reasons), but you can rest assured that *ER* is in very capable hands.

## ER'S NEW ADDRESS

All editorial and business matters should now be addressed to:

### *The Entheogen Review*

564 Mission St.

Box 808

San Francisco, CA 94105-2918

New subscriptions are \$25.00 per year domestic, and \$35.00 per year outside the U.S.A. All current subscriptions remain valid until their expiration date, at which point the new rates apply.

All mail sent to the old New Mexico address will be forwarded unopened to San Francisco. Please don't send mail addressed to me personally if it pertains to your subscription, as I then just have to put it in an envelope, pay for postage, and forward it anyway. I'm happy to answer questions or whatever if you enclose a self-addressed, stamped envelope (PLEASE!), but *Entheogen Review* stuff should always go to the new address.

## BOOKS AND BACK ISSUE ORDERS

I will continue to sell my book, *Psychedelic Shamanism* (\$22.00 U.S., \$30.00 foreign postpaid), *Ayahuasca Analogs and Plant-based Tryptamines* (\$20.00 U.S., \$25.00 foreign postpaid), and *ER's* first year of publication book (\$20.00 U.S., \$30.00 foreign postpaid). Back issues of *ER* up to and including the Winter, 1997 issue sell for \$5.00 each, domestic, and \$8.00 each for addresses outside the U.S.A. All back issues are currently available but probably won't remain so indefinitely: it's mostly a courtesy, as

short-run reprints are expensive to keep in stock.

**Please address all book and back issue orders to me personally:** Jim DeKorne, POB 750, El Rito, NM 87530, USA. (If it says *Entheogen Review* or *ER* on the envelope, it will get forwarded, then have to be sent back, as the new editors are not handling these specific books or back issue orders.) I will be abroad for most of December, 1997 and part of January, 1998, so be patient if you don't get a response to your orders right away.

## WHAT IS THE "REAL" REASON FOR ER'S "DEMISE" ?

1. *The Entheogen Law Reporter* informs us why the Supreme Court invalidated The Religious Freedom Restoration Act. But despite this devastating news, *TLER* will continue publishing, but using a different strategy. Then you took a hit and lost your ambition to continue. I understand your reasoning. I hope you find inspiration to continue writing your thoughts and adventures. -- *Mica Man, FL*

2. (I am experiencing) reverent paranoia that you may have been contacted by "the authorities" and have been "persuaded" to discontinue *ER* -- perhaps even providing you with a "cover" excuse. -- *RS, WA*

[Well, *ER* isn't over by a long shot, and the reasons I gave for bowing out as editor in the Fall, '97 issue are the real ones (no DEA pressure, folks)! I'm into other projects now, and subscriptions were falling off to the point of "bankruptcy." The new editors are more in the entheogenic mainstream than this old hermit cares to enter, and they will make it a better publication. Don't judge me too harshly: my geographical isolation keeps me from being in the center of this burgeoning movement, and my personal inner work has been leading away from entheogens for a couple of years now. Now that solid contact has been made with hyperspace, I can enter it easier without the catalysts which were essential at first. Not that they aren't valuable, just that (in my case at least), they are no longer necessary. Don't make more out of it than that: everyone's path is unique and the landscape of any journey changes over time. -- *Ed.*]

# NETWORK FEEDBACK

---

## BELLADONNA WARNING

I would like to point out an apparent error in the Belladonna-Henbane article in the Fall '97 *ER*. The author took 13 drops of a vinegar tincture which consisted of "1.5 pints" (i.e. 3 cups) of apple cider vinegar in which "30 fresh Belladonna berries" were steeped, and it clearly was of adequate strength, but you're recommending readers make a vinegar tincture consisting of "one part plant" to "two parts vinegar," which is a much stronger preparation than he took. As Belladonna is potentially lethal, I'd discourage readers from making such a strong preparation.

How much stronger? Belladonna berries are smaller than cultivated blueberries, so 30 fresh berries was probably a lot less than one ounce fresh weight. Since 1.5 pints of vinegar is 3 cups at 8 fluid ounces per cup, or 24 ounces, the author took a fresh tincture much feebler than 1:24 in strength. With that in mind, advising your readers to use a 1:2 tincture seems decidedly unwise. Nor did you mention whether you were advising the reader to use fresh or dried material to make said tincture, an important distinction.

For readers not familiar with herbal medicine, the proportions normally used in American tinctures are one part FRESH, not dried, plant by weight (i.e., one ounce) and two parts menstrum (i.e., solvent: vinegar in this case) by volume, i.e., two fluid ounces or one-quarter cup. For dried plant material, the solvent is normally diluted to 50 percent with water and the proportions of plant to solvent are one to five. In cases where the herb is a strong poison, however, weaker tinctures (such as 1:10) were sometimes used. It would be worth using a very weak tincture when experimenting with Belladonna. -- *BD, CA*

*[My comments at the end of the Belladonna/Henbane article were intended to clarify the information in the sidebar: pointing out how the standard 1:2 ratio*

*for herbal tinctures is determined by weight. The sidebar was reprinted from another journal, and essentially gives the 1:2 formula. It also provides essential dosage instructions: "Always start with one drop and wait 24 hours to note the effects before increasing the dose." I repeated that warning in my comments, and hope that no reader would confuse the author's separate experiment with the sidebar information. For the record: I don't "advise" anyone to mess with Belladonna at all! -- Ed.]*

## SALVIA "FLYPAPER"

I am still trying to integrate my first encounter with *Salvia divinorum*, which was the most bizarre happening of my life. Has anyone experienced a huge "bionosphere" -- approximately 25 feet in diameter, like a big bubble that tries to suck you into itself? I panicked big time: the gluey, magnetic pull (a greenish transparent force-field), which appeared to come from outside of myself, felt like trying to remove myself from fly paper. I became paranoid until I entered the center of the sphere. Whenever I tried to move away from center in any direction, it immediately sucked me back. Good thing it only lasted a few minutes. I have lots of theories, but no conclusions!  
-- *RM, DE*

## SALVIA EXTRACT

On May 19, 1997, I ordered *Salvia divinorum* extract from Bert Marco Schuldes in Germany (4 units: \$32.00) and paid in advance with a postal money order. I have sent two letters regarding this order, but to date, no reply. Is he still in business? Is there any other source for the extract? -- *Mr. Toad*

*[I've received other queries about this source of Salvia extract: some say that their order was eventually filled. The last letter I received from Bert (over a year ago) mentioned that he has been overwhelmed*

with *Salvia* orders, has rented some property to erect a greenhouse for growing it, and seems to be suffering from too much success too soon. I've been told that he has contacted *Salvia* growers in the U.S. for wholesale purchases to keep up with the demand. My own dealings with Bert have always been satisfactory. I have no more information than that. Can anyone add to this? Regarding the extract: the formula seems to be a proprietary secret. I have no idea of how it is made. That would be very interesting information if we could get it. -- Ed.]

### PROPER DOSE OF SALVINORIN-A

I'm considering a salvinorin-A experience. How many mikes are considered a good starting point, bearing in mind that I would much prefer an underdose as opposed to an overdose! -- *Psilonaut, SC*

[According to conventional wisdom, 200 to 500 micrograms, (i.e., between about one quarter to one half of a milligram), is enough for a full experience. Daniel Siebert, the first human to discover its effects, is said to have initially taken 2 mg: a whopping overdose. Obviously, when dealing with amounts this small, one needs scales capable of measuring in fractions of a milligram: not easily come by unless you have access to a well-equipped laboratory. -- Ed.]

### FEEDBACK ON

#### 2,6-DICHLORMESCALINE

*ER* has received several letters questioning the Spring, '97 article "First known human voyage on DCM -- 2,6 dichlormescaline." Most correspondents suspect a hoax. As all *ER* readers know, I am not a chemist and have no way of evaluating some of the articles that come my way. I will only say that the author of that article, whom I've corresponded with occasionally over the years, seems to me to be a straight-up guy. Other than that, I really can't comment on the article, since I have no personal experience with either the extraction method or the resulting product. Hopefully, someone who knows the chemistry can set us straight. -- Ed.

### AN INTERESTING IDEA ON DCM EXTRACTION

The earliest reference to dichlormescaline that I could find was in *Lloydia*, Vol. 40, No. 6: Nov-Dec 1977, Pgs 585- 587. The article mentions that mescaline hydrochloride treated with chlorine gas dissolved in chloroform was readily converted to 2,6-dichlormescaline as crystalline hydrochlorides. It also states that, using the principles of additivity, the calculated log P (octanol-water) for this substance is 2.20; this value is well within the range where high psychoactivity would be expected. For example, the log P for the highly potent DOM ("STP") is reported to be 2.08 (23).

I am no chemist, so I am not sure what this all means. What would happen if dehydrated and powdered San Pedro (*Trichocereus pachanoi*) were soaked in a mixture of chlorine and chloroform? If one could convert organic mescaline in the crude plant material, then it would take only a "tiny" sample of the dried powder (now possibly containing DCM) to have a strong psychoactive effect. A single 500 mg dose of mescaline would become 100 doses of DCM at 5 mg per dose. Who wants to try this? -- *B. Green*

### WHERE ARE ALL THE EXPERTS?

I am surprised that some of the incognito cognoscenti have not made more contributions to *ER* on technical data. I know the information is out there, but after most of us have finished with the rest of reality and tended our gardens, we don't necessarily have the time to research all the ins and outs of these matters in obscure journals. We need someone to translate these experiments into something that ordinary people can understand. -- *Anonymous*

[I've often wondered the same thing. Often, the procedures are too complex for anyone but an expert with specialized equipment to pull off, but I still hope somebody out there could take the trouble at least to explain if, when and why we're barking up the wrong tree. -- Ed.]

### GHB

GHB, gamma hydroxy butyrate, is an excellent natural "feel good" nutrient. Be careful not to eat too

much, as nausea and possibly instant sleep will occur. It's an excellent supplement to take with psychoactive brews! -- **BW, MI**

### *METHYLENE CHLORIDE SEPARATION FROM PAINT STRIPPER*

Re: separation of methylene chloride from methanol with water (Fall '97 *ER*) -- it sounds like it should work. I would expect some methanol to remain in the final product, thus requiring fractional distillation or drying. Magnesium sulphate, epsom salts, dried in an oven to an amorphous mass can be used to soak small amounts of excess water from your solvents. When using commercial products as a source of solvents, beware that some manufacturers list ingredients by CAS numbers. No problem! The *Merck Index* has a listing of CAS numbers referenced to the compounds.

-- **Coy Dog**

### *HIGH ALKALOID PLANT VARIETIES*

Locating high alkaloid varieties of known plants, especially *Phalaris* and *Desmanthus* is something that still needs to be resolved. I am growing *Desmanthus* from two sources and will hopefully soon determine potency variances. Since potency seems to vary from field to field, it would be good if people finding high-yielding strains would present them to our favorite seed distributors. What soil conditions or time of harvest are conducive to high alkaloid content? Do you have any recent *Desmanthus* data? -- **Anonymous**

[Not really. I confess I gave up on *Desmanthus* once I discovered the potent strains of *Phalaris*: it's easier to trim the same grass plants year after year than to uproot and kill a *Desmanthus* "bush." *Allies* (POB 2422, Sebastopol, CA 95473) sells the same Turkey Red and Yugoslavian Fresh Cut *Phalaris* varieties that Johnny Appleseed gave me back in 1993. These are proven to be potent. Wild *Phalaris* grows everywhere, but why mess with an unknown strain (unless you're a dedicated ethnobotanist) when you know what already works? -- **Ed.**]

### *CANADIAN PLANT SOURCE*

Being Canadian, it has been very difficult to obtain

live plants -- no U.S. companies seem to be willing to ship across borders. There is only one Canadian company that I know of that carries plants of interest to us:

Western Biologicals Ltd.  
POB 283  
Aldergrove, BC  
Canada V4W 2T8  
Tel/fax 604-856-3339

They are a mushroom spawn/equipment supplier also and their prices are very reasonable.

### *OTHER SOURCES*

Someone mentioned a smart drug, Hydergine, in the last issue. A good source for it and other Nootropics is:

Cosmic Sales and Mkt., Inc.  
POB 1364  
Lawrenceville, GA 30246  
1-800-359-9896

*WA* of Austria mentioned a source for *Psilocybe tampanensis* in the last issue. Here is another:

Pacific Exotic Spora  
POB 11611  
Honolulu, HI 96828  
(Catalog: \$2.00)

-- **Psilonaut, SC**

### *KETAMINE GNOSIS*

On one cc of Ketamine: Out of complete darkness and unconsciousness I became aware of the sensation of flying. "I" did not really exist, there was only disembodied awareness. I flew over a coastal area and slowly realized that I was being accompanied by someone. This was my guide and the landscape below seemed to be ancient Hawaii. The natives emerged from their huts, apparently aware of our presence above them. My guide didn't speak, but somehow his thoughts entered my mind. He explained that these creatures were not very advanced, that they were hopelessly attached to their bodies and governed by the

most basic appetites and desires. My mind was flooded with images of eating, fighting and sexuality. I felt pity for them but wondered why we were in their presence. My guide sent the thought that: "You've been chosen to live among these people to teach them the proper path for sentient beings." I began to scream: "Noooo!" and desperately fought the idea of being abandoned among such chaos and sorrow. Resistance was futile. Without pride or self-consciousness, I knew what enlightenment was. For a while I was totally centered and at peace: the meaning of existence was clear and precise. I had somehow stumbled onto the edge of the blade of awareness.

In the sober light of day I often reflect on that vision and the possible meanings. I now feel that all of us have the capacity for enlightenment and that it's a lot closer than we suspect. After all, the Buddha was an ordinary man who only claimed to be awake, and little more.

A little history of ketamine: back in the '70s Groff was touring the nation educating nurses and doctors on the benefits of using K with cancer patients to assist them in the dying process. He was right: ketamine would be useful in helping the terminally ill. I've personally used it to help fight an addiction to "Ice," or crystal methamphetamine. I feel it could help other drug addicts as well. K is disassociative and enables one to view one's situation objectively. It helped me see the path out of my addiction and psilocybin gave me the strength to complete the journey.

### MUSHROOM MATTERS

When ingesting entheogenic mushrooms it's important to get as many of the alkaloids (and as few contaminants) into your system as quickly as possible. A preparation of tea using dried mushrooms is the most effective and safe way of doing this that I've found. Analysis of many wild and domesticated edible and medicinal varieties have shown that they contain methyl and/or phenyl-hydrazines: both toxic carcinogens. Cooking neutralizes them, and so does drying. I'm not sure that entheogenic varieties contain these as well, but I say better be safe than sorry. Dried mushrooms are easier to work with anyway.

Usually mushroom alkaloids, from fresh or dried

material, enter the system within about 45 minutes. The quantity of alkaloids may be reduced as much as 35 percent through the action of gastric acids. This can be minimized if they are thoroughly chewed before swallowing: not an appetizing thought. Making tea solves many problems. Psilocin and psilocybin are both soluble in boiling water, the tea is easier to ingest and one can always eat the leftover mushrooms: I do. The warmth of the tea expands the mucous membranes of the mouth, acting like a sponge that absorbs the alkaloids directly into the system. The results are that first effects are felt within 15 minutes, with only nominal amounts of alkaloids being negated in the gut. With teas, one can also add herbs, spices, etc. according to taste or discipline. I always use fresh peppermint leaves and lavender blossoms. The mint hides the somewhat "dirty" flavor of the tea and acts as an anti-nauseant. Lavender has been used for centuries by herbalists to relieve mental tension, accentuation of concentration and clarity of thought. It is also the color of the crown chakra: the thousand-petalled Lotus of consciousness. — *MVD, Amsterdam*

*[Conventional wisdom states that psilocin and psilocybin are degraded by boiling, so my guess is that one should bring the brew to a boil and then remove it from the fire quickly to avoid losing any more alkaloids than necessary. — Ed.]*

### ALKALOID STABILITY IN VARIOUS PSILOCYBE SPECIES

Re: Potency in 12 year-old specimens of *P. baeocystis* (Fall '97 *ER*). It is known that some species maintain a high alkaloid stability in dried mushrooms from various genera. In 1981 and 1983, Norwegian and Finnish researchers found that *P. semilanceata* kept its potency from 15 to over 100 years!

Chloroform can't extract the polar psilocybin, but works with the unpolar psilocin. Most cultivated *P. cubensis* contains psilocin, but *P. semilanceata* contains only psilocybin and no psilocin at all. (See: J. Gartz, *Magic Mushrooms Around the World*, LIS Publications, LA 1996)

Extraction of psilocybin and psilocin is simple with polar solvents like methanol and dilute acetic acid (5-10 percent). It is always best to remove the fat from

the dried, powdered mushroom tissue first with lighter fluid (petroleum naphtha, Coleman fuel), acetone or methylene chloride. For the extraction itself, in a ratio of 1g mushroom to 20ml acidified methanol, stir 12 hours then evaporate in a warm place.

— *Sam Lanceata, Germany*

### MUSHROOM CULTIVATION TIPS

I played around with growing *P. azurescens* and *cyanescens* this spring and have a couple of growing tips. When the jars of grain spawn are ready to transfer to sawdust I place a garbage bag in the bottom of a large plastic tray. I soak the sawdust for a couple of hours, drain off excess water and place about one to one and a half inches of it into the bag: covering the bottom of the tray. I shake the grain over the sawdust and close the bag. Let it recover for a few days and then cover with more wet sawdust. Don't mix the grain into the sawdust or it will readily contaminate. When this is fully permeated I add sawdust and woodchips in a 50:50 ratio to further expand the mass. Generally, one part permeated to five parts fresh material. This can be expanded indefinitely, or transferred to the garden. Once in the garden, placing a few inches of leaves on top really helps to reduce the need to water. They should be removed in the Fall. Make sure you isolate several strains.

It's essential to get the right kind of sawdust. The sort that really works well is called "wood-flour." Companies sell this wood-flour to mushroom growers. It's also used to smoke meat. It costs about \$5 per 35 lb. bag. I use #8 wood flour: the largest size. The best source for free woodchips is a place that makes hardwood flooring. (Show up with your own containers.) Their chips are of the desired size and they don't contaminate easily: chipped wood from living trees often does. Mine have been primarily Maple, but Oak is also supposed to be good. — *Anonymous*

### GROWCO MUSHROOM CASING

I would like to inform readers of a product called Growco, which is advertised as "the world's most advanced organic growing medium." It is a dried, compressed, 100 percent organic vegetable-based growing medium used in hydroponics. As an experiment, I used Growco as a mushroom casing layer and had

phenomenal results! It puts an end to messy casing recipes and tedious sterilization procedures. Additionally, Growco offers the following benefits to mycologists. From the label:

*"Excellent water holding capacity while maintaining porosity. No added chemicals. Free from weed seeds and pathogens. pH range 5.4 to 6.8. High lignin content (70%). Neutral substrate [i.e. casing] maintains beneficial microlife."*

To use this product, simply add water and the brick expands to a volume of nine liters (that is plenty of casing). Growco is a very clean product and robust enough to support mycelium while hindering contaminants. The mycelial "leap off" happened at record speed: results could be seen overnight. Growco can be obtained through hydroponic sources. I paid \$1.79 for a brick of Growco from Albuquerque Hydroponics and Lighting, 1051 San Mateo SE, Albuquerque, NM 87108 (phone: 1-800-753-4617).

I've experimented with Growco on dung-loving mushrooms and the fruiting was prolific for many weeks. I will experiment with the wood-loving species next and anticipate similar results, if not better. I've used many combinations of casing over the years, and Growco is now my casing of choice. — *Hershey, NM*

### MIMOSA HOSTILIS

*Mimosa hostilis* root bark is a definite hit. Boil with a little lime juice, 3-4 times, 1 hour each time. Filter, let the cloudy sediment settle, pour off liquid and drink. Or store as ice cubes for later use. This is not a toy. My first dose was from 7 grams: comparable to a 120mg hit of pure DMT. The experience might have been unbearable had I not previously been there. The *Mimosa* seems toxic for about an hour. Intense yawning and anxiety -- but not every time, so I'm not sure it's the plant or me. Mine was drop-shipped from Mexico and labelled as a topical antiseptic. Testing it without an MAOI, I noticed no side effects. — *PJ. MT*

*[You don't mention the MAOI used in the initial dose: I'm assuming it was **Peganum harmala**, as that's the one used by most people. Since you noticed no side effects without an MAOI (and presumably no entheogenic effects either), that confirms most people's experience of **P. harmala** as the culprit in somatic*

*discomfort. From what I'm hearing, M. hostilis is becoming the preferred ayahuasca analogue among experienced psychonauts. As mentioned in a previous issue, it covers hundreds of square miles in certain parts of Mexico and has long been used as an herbal medicine there. -- Ed.]*

### SEEKING ENTITY CONTACT REPORTS

This reader in France is doing entity contact research. If you have any stories to relate, please write:

Dr. F. Taylor  
c/o Demerliac  
11, rue cherche-Midi  
75006 Paris, France

### A LETTER FROM JOHNNY APPLESEED

It is a privilege to appear in this, the last issue of my esteemed friend's tenure as editor of *The Entheogen Review*. This publication has been a seminal catalyst in the long, strange journey of consciousness that we are witnessing at the beginning of a new millennium: a unique point in the history of this planet.

In a very short period of time historically speaking, the use of shamanic plant teachers and their derivatives has become one of the preferred methods of personal, philosophical and religious questing around the globe. This thirst for gnosis is perhaps the defining characteristic of our species -- certainly for the best and brightest among us. It is only a matter of time before these aspects of our humanity will come into open conflict with the industrial tyrants now ruling the world. This conflict will not be won by force of arms, but by individuals conquering their own fears and being who they really are. Life is short, and we do not know if we may pass this way again. Let us all be smart survivors, but let us all contribute to the evolution of consciousness in whatever way we can.

The use of entheogens is a religious freedom issue, pure and simple. Since the Reformation the principle of the individual's right to pursue his or her own path to Spirit has been affirmed. Because there are no more powerful tools for this investigation than the

deliberate, shamanic use of entheogens, their prohibition is an act of blatant oppression by the death forces controlling our planet.

As for the cutting edge of entheogen research, we are now past the age of private psychological investigations, and into an era of group energetic interdependence. This is the time of transpersonal, mental and psychospiritual connection: where groups link together into temporary energetic beings, with properties transcending individual egos. As Ken Wilbur says, this is the process of evolution: taking parts of the universe and combining them into more novel, complex and conscious wholes. Group work with entheogens is the new frontier and will soon be documented. Those working in this area are a whole sub-culture, as yet invisible to society at large. For the present, perhaps that is as it should be. Those who are not known are still able to work unhindered.

Jim, no matter where your travels take you, know that you have performed an immensely useful and creative piece of work. History will not forget: I predict that good quality bound volumes of the *ER* will command quite high prices in the years to come.

-- *Johnny Appleseed*

*[Long time ER readers know Johnny Appleseed as the author of many valuable articles in this newsletter from its inception. I first met him at the 1993 BPC conference on Maui. We hit it off right away and have stayed in close touch throughout our respective quests. Johnny has personally researched the alkaloidal content of the Phalaris genus of grasses more than anyone I know of: over a thousand different varieties. This is the equivalent of one dedicated individual doing a sophisticated University study, except without any institution to support him or any PhD as a reward. The fact that his graduate degree is in transpersonal psychology and not chemistry makes this achievement even more impressive. He taught me all I know about Phalaris and about alkaloidal extraction procedures. I consider it both an honor and a delight to know this anonymous psychonaut and cutting edge explorer: reread his next-to-last paragraph -- there's a lot of content there for those who are ready for it. -- Ed.]*

### SANTA'S LITTLE HELPER

According to Dr. Patrick Harding, a fungi expert from England's Sheffield University, Santa is a stoner. Dr. Harding says images such as flying reindeer are directly linked to ancient rituals involving the potent hallucinogenic mushroom *Amanita muscaria*. Before the introduction of vodka, the fly agaric mushroom was used widely by village holy men in northern Europe. While tripping, they would bestow blessings from the spirit world upon their community (Santa's presents). Harding thinks Santa's outfit is inspired by the toadstool's red-and-white pattern, and his jolly "ho-ho-ho" mimes the laugh of someone who is spaced on the drug. Also, shamans entered yurts through a smoke hole in the roof. In Lapland, reindeer even grew fond of yellow snow that contained a distilled form of the drug. After a few Slurpers, reindeer start flying -- hopping and prancing about. As for Rudolph's red nose, may we suggest a study of imagery from more southern climes -- say, Columbia?

**Playboy** -- no date on photocopy.

[Yet another mushroom theory! I love it -- it seems like everyone has an hypothesis for how mushrooms are responsible for everything from Santa Claus to the origin of human consciousness. Who knows? I have no theories, but I find them all fascinating. -- Ed.]

### EASY VAPORIZOR PIPE FROM OLD LIGHT-BULB

I took a clear, burned out light bulb and with a pair of needlenose pliers I pried the metal tip off of the socket. Then I carefully broke out the thick blue glass under the tip. Below that was a small glass tube with two small wires going into it. I carefully snapped the tube with the pliers, causing a small "pop," which equalized the pressure in the bulb. After that, I simply gutted and washed out the light bulb. Next, I drilled a small hole into the side of the aluminum socket, careful not to hit any glass. This provided a vent that acts like a supercharger hole on a bong. I took a holed cork (that fits into the socket of the bulb) and a six inch length of quarter-inch glass tubing. Put the tubing into the cork and the cork into the socket-hole of the bulb, with the tube extending to about the middle: approximately where the former filament was. I had a vaporizer pipe!

Put the material to be vaporized into the bulb, replace the tube and cork. Heat the bulb with a lighter or alcohol lamp right under the material. Vapor fills the bulb and you inhale through the tube, the vent hole providing fresh air into the bulb. Awesome!

-- Inner Frontiersman

## SHAMANISM -- PSYCHEDELIC AND OTHERWISE: USING ENTHEOGENS FOR INNER WORK

*A discussion of personal experiences with the use of entheogens in furthering spiritual practice. Shamanism and Alchemy as models for the intentional navigation of hyperspace. How entheogens can help or hinder this quest, and a hypothesis for the creation of a "neo-shamanism" specific to the unique problems of our time. Excerpts from a talk given at the Mind States conference, Berkeley, California on November 23, 1997*

---

### PSYCHEDELICS AND ALCHEMY

I believe that shamanism is based upon a gnosis that most humans have forgotten. This gnosis is that we are eternal, multidimensional entities living an illusory mortal existence in three-dimensional space. The human birthright is to regain this gnosis and learn how to function fully in both physical and metaphysical realms -- for our own good, that of our species and of the planet itself. Powerful forces are now pushing those of us ready for it to a full realization of these powers.

Mircea Eliade has said that shamanism dependent upon psychotropic substances is a decadent form; Terence McKenna asserts that psychedelic shamanism is the only legitimate kind. I want to offer an integration which honors the truth of both positions. Psychedelics, or entheogens, are extremely valuable tools in the Work, but they are often abused by those who don't understand how to use them. I think the reason our culture has such substance abuse problems can be directly traced to the fact that we have forgotten our shamanic roots: not only do we lack contemporary models for the use of consciousness-altering catalysts, but we have a taboo against knowing ourselves. We no longer even possess clear structures for *how* to know ourselves. Let's begin by looking at that.

Psychedelics have the capacity to both unify and fragment consciousness. Most people who have experimented with these substances with any frequency know that the highest gnosis that psychedelics offer is that "we are all one." Our consciousness has been unified: we know the whole. This is the state of awareness variously called "satori," "samadhi," "nirvana," etc. in Eastern religions. The gurus tell us that anything less than this state of unified awareness is illusion.

The opposite of wholeness of course, is separation from the whole: we see component parts rather than their integration. Such perception on psychedelics typically evokes a fear response: awareness sees itself as a discrete entity surrounded by other entities regarded as "other," as "not-me." The "wholeness" of the observer is challenged because that which is "not-me" is always a potential enemy. This stems from our life-long experience as differentiated beings living in a multiverse of other differentiated beings: fear of others is a legitimate response for any organism living on a planet where predator and prey relationships determine survival.

Both realities are true: we *are* all one but we are also all separate. Nevertheless, the first gnosis is a good deal more pleasant than the second. This unique quality of psychedelic drugs to reveal both realities of existence suggests a comparison with one of the fundamental secrets of Alchemy:

*Solve et coagula, et habebis magisterium.* (Dissolve and bind, and you will have the magistry.)

*A magistry (a masterpiece) is an alchemically exalted preparation which is always prepared from a whole, e.g., a medicinal plant. The preparation first requires the separation of specific constituents, after which they are purified and again combined.*

-- Manfred Junius, *The Practical Handbook of Plant Alchemy*, Healing Arts Press, Rochester, VT 1979, 1985, 1993

Anyone who has studied alchemy knows that the true goal of the Work was not the literal transmutation of "lead into gold" of popular folklore, but the transformation of the alchemist's consciousness into a state of enlightenment, which is to say, a state of unified

perception. The "dissolve and bind" formula, when applied to human awareness, means that one differentiates (dissolves, separates) all the disparate aspects of one's personality, purifies them, then recombines them into a "masterpiece," a transcendent state of consciousness. This is an exact formula for the attainment of enlightenment, and knowing that, we can use psychedelics consciously as catalysts for inner work.

In psychological terms, one *analyzes (solve)* one's complexes, then recombines and *synthesizes* them (*coagula*) into a harmonious whole. In typical practice, you begin by coming to terms with your early childhood; then you recognize how your complexes inhibit your freedom; having navigated those labyrinths, you get a handle on your life work: you contact your essence and reconcile your ego illusions with the intent of your authentic self, your essence. And so on.

Unfortunately, many people get no further than blaming mom and dad for their dysfunctions. That's just the beginning of the journey. Until you can authentically purify (which is to say, reconcile and integrate) those forces in your psyche, you're still stuck in the first phase of the Work.

Analysis and synthesis then, is a universal formula for completing the Great Work of Transformation. It goes without saying that this formula is deceptively easy to understand, but extremely difficult to accomplish. (That's why they call it the "Work" -- it *is* work: it is the heaviest labor you'll ever undertake!) In plain English, the alchemical canon says: take it apart, purify the parts, then put them back together again. If you succeed at this, the final whole will be a *totally different substance* from the whole with which you started.

I am reminded of a Zen proverb:

*Before I was enlightened, mountains were mountains and rivers were rivers.*

*While on the path to enlightenment, mountains were no longer mountains and rivers were no longer rivers.*

*After I was enlightened, mountains were again mountains and rivers were again rivers.*

This is just another way of describing the *solve et coagula* formula of alchemy. First you deconstruct the mountains and rivers (which is to say, your everyday reality) to know them in their substance, then you put them back together again, purified of illusion. Actually, "you" don't do this; your essence does it for you -- all that is required of the ego is disciplined cooperation, which is to say, devotion to the Work.

Another example: In 1846, when Henry Thoreau was at Walden pond there were millions of humans on the planet who lived lives as simple as he did. In those days, any peasant in what today we call the "third world" lived outwardly no differently than Thoreau did. An anthropologist from another planet comparing only their outward lifestyles would see no differences between them: they both chopped wood, they both carried water. Yet Thoreau was living in a much different reality than, say, the average Russian peasant. For both of them, mountains were mountains and rivers were rivers, but Thoreau's mountains and rivers were of a different order of beingness. That's because he had attained gnosis: he understood both the forest *and* the trees which made it up.

A verse from the *Tao Te Ching* illustrates this idea perfectly:

*Oftentimes, one strips oneself of passion  
In order to see the Secret of Life;  
Oftentimes, one regards life with passion,  
In order to see its manifest forms.*

The "Secret of Life" mentioned here is the gnosis that we are all one, that the highest reality is unitive. In alchemical terms, we cannot really know that unity, we cannot have true gnosis, until we have experienced all the "manifest forms" -- only then can we claim to truly know the whole. The simple peasant, living in a state of nature, can be said to know a kind of wholeness, but it is an innocent, an unconscious state. To know any whole completely it must be fragmented so that its component parts can be understood. During this phase of the Work, by definition, mountains and rivers cannot be whole entities.

Psychedelics, because of their capacity to fragment

and unify the psyche, are extremely useful tools for furthering the Work, but like anything else in spiritual practice they can be dangerous in the hands of anyone who does not understand how to use them. Indeed, they can be dangerous in the hands of those who *do* understand how to use them: The path grows more treacherous the closer one gets to the goal. History records that there were lots of alchemists, but few adepts. The situation is no different today: Many a bleached bone is found only three feet from paradise.

In my own experience, I eventually reached a point where psychedelics had to be left behind: continued reliance upon them inhibited rather than furthered my development. That doesn't mean that I never ingest entheogens, it means that I no longer rely on them for my most serious work: at this phase of my journey they usually obstruct more than they enlighten.

Megadose blasts into hyperspace are useful for two reasons: they will convince you of the reality of other worlds and if you're lucky they will introduce you to your essence. In time, however, you will come to realize that most shamans work with "homeopathic" doses: doses which enable them to do work in the space in which they find themselves. A fully informed ego is essential to the Work, and when you relinquish shamanic control, you leave yourself open to cosmic tricksters whose sole agenda is to hinder your spiritual growth. Don't worry, anyone who walks their path with will and intent will recognize this fork in the road if and when they come to it.

But in the beginning, psychedelics were crucial to my inner development. I often wonder where I would be now if I'd never had the revelations that these substances offered me. In my case, the *solve et coagula* formula came backwards: my first psychedelic experience, 300 micrograms of LSD, was one of complete harmonic unity: my journey began with the *coagula* portion of the equation. I know now that my essence was giving me an experience of the goal of the Work: at that time of my life I had no concept at all of what it was that I was seeking. Essence knew that once I'd experienced this state of awareness I would never rest in this lifetime until I'd attained it permanently. (I still haven't attained it, by the way.) I quote from my

book, *Psychedelic Shamanism*:

*I began to experience what can only be described as samadhi: "the final stage in the practice of Yoga, in which individuality is given up while merging with the object of meditation." For the first, and alas, to date the only time in my life, I was "allowed" to experience the unspeakable bliss of total unity and integration. Subject and object became one -- there were no questions because all that existed was a pristine "answer" in and of itself: perfectly related to everything else in seamless unity. There was no good or evil, no right or wrong, only perfection in and of itself.*

While under the influence of the entheogen, mountains were mountains and rivers were rivers, but in a way I'd never dreamed possible. When I returned to consensus reality eight hours later, mountains were no longer mountains and rivers were no longer rivers: the world from which I'd started my trip was changed forever. You can't go home again after an experience like that. It goes without saying that I had a rough time reconciling the two realities. I've never met anyone on any path who claims that it's easy. Thus begins the Great Work of Transformation.

My second acid trip showed me the *solve* half of the alchemical equation. It was one of the most terrifying experiences of fragmented awareness that I've ever known. My world was torn asunder, and nothing my ego could do could put it back together again. Again I quote from my book:

*I, strange as it seems now, actually became afraid of myself! Not only afraid of myself, but afraid of everything around me -- the walls, the floor, the bookcase, my hand, my shoes -- everything became a total threat to "myself," of whom I was also afraid and who besides that didn't exist anyway -- an appalling enough thought in its own right! Talk about double and triple binds! I was drifting in a confused sea of pure terror without any ego-structure to hold onto for reference. Only someone who has had a bad acid trip can understand what I'm trying to describe here.*

My greedy ego was seeking the total samadhi of my

first LSD experience, but my essence had another lesson in mind. Mountains were definitely not mountains, and rivers were definitely not rivers: nothing, absolutely nothing in my environment was what it had been before. It was an experience of the total deconstruction of reality. At that time I had no concept at all of the alchemist's *solve et coagula* equation. Those first two acid trips could not have been more opposite in nature. Though I didn't realize it yet, I'd been given a koan to solve.

It was in trying to reconcile those two experiences that, years later, I came to understand their relationship to the alchemical secret of inner development: the solution to the koan. It was also my first inkling that essence is a very demanding teacher. To paraphrase Lao Tze: "Essence is unkind: he treats the ego and its complexes like sacrificial straw dogs." (It is my understanding that in ancient China, little dogs were woven out of straw to be ritually thrown into a fire as burnt offerings.) Essence is indeed unkind: if, once the Work has begun, the ego can't or won't keep up with him, he'll burn you up and start over. Beware! Beware! Once you make the choice, you can't *not* do the Work: one of my best friends tried to cop out of it and died within a year of cancer.

Essence is that portion of our awareness residing in the unconscious psyche. For me, "essence" is synonymous with Jung's concept of the "self." Your essence is the immortal portion of your awareness, quite distinct from the mortal ego, which will not last longer than this earthly incarnation. When Jim DeKorne dies, he will disappear from this planet and his life experience will be absorbed into his essence, a much larger identity in hyperspace. The attainment of this relatively simple gnosis is one of the most crucial phases of the work because the ego has transcended the illusion that it is the center of the psyche. Suddenly, usually painfully, one *knows* that mountains aren't mountains and rivers aren't rivers. Not until ego and self become integrated will they reassume their identities on a much higher level of awareness. That level of integration is relatively rare during physical incarnation because it implies a transcendence to god-consciousness: we can experience it sometimes on psychedelics, but seldom do we operate from such consciousness all day every

day.

I met my essence on an acid trip. It's worth quoting at length:

*On the morning of February 18, 1979 I took LSD again after a gap of about three years. As I sat in my easy chair waiting for the effects of the drug to begin, I felt a sudden impulse to get up, go into the next room, and remove an antique Mexican machete from where it had been hanging on the wall for at least a decade. Like many items used only for decoration, this one had by now become so familiar as to be invisible -- I don't recall having paid any real attention to for it for years. Indeed, it was shamefully covered with dust.*

*I'd purchased this machete in 1965 at the Toluca Market outside of Mexico City. It was hanging in the back of a stall operated by a used tool and parts vendor who sold battered hammers, bent screwdrivers, grease-caked Crescent wrenches, rusty motorcycle chains -- that sort of thing. The machete is obviously fairly old (I estimate early 20th Century -- sometime around the Mexican Revolution), and well used, with many nicks and scratches and a splintered handle. There is a "dicho," or proverb engraved on the blade: **Nada del mundo es verdad por lo que mi ojos ven.** In English we would translate it: "Nothing in the world is true that meets the eye," or, more freely: "Everything is an illusion." It's a curious saying: I've never thought of it as a typically Mexican Catholic sentiment -- if anything, it sounds Buddhist.*

*For some reason I wanted to hold this machete, and as the LSD began to alter my consciousness I held it tighter and tighter ... it was beginning to manifest the energies of a "power object." Soon it felt like the machete was some kind of psychic lightning rod for forces to enter my body -- at that point I don't think I could have let go of it if I'd wanted to.*

*Now the drug was coming on strong and I was suddenly very, very stoned. The machete vibrated with authority and seemed to pull me from my chair, across the room and out the door into the yard, where I was forcibly thrown to my knees on the ground. For*

*the first, and so far the only, time in my life I heard a distinctly clear voice speaking to me from within my own head. The voice was nothing that I could identify with as "me" or even a portion of "me." It was totally Other, and it asked a question:*

*"Do you take responsibility?"*

*I didn't really know what that meant -- take responsibility for what? Yet I knew that it was important to say yes -- taking responsibility was certainly a "responsible" thing to do, and I've always believed in being responsible.*

*"Yes."*

*The energy level of the voice increased one full octave:*

*"Do you take responsibility!"*

*"Uh -- sure. Yes." I was deeply intoxicated, and quite confused by the repetition of the question.*

*Now the numinousity and power of the voice doubled again, becoming suddenly very, very scary: What was I dealing with here?*

*"Do you take responsibility!!!"*

*"Yes! I take responsibility!" I had no idea of what I was taking responsibility for, but I knew that I must be equal to it, whatever "it" was.*

*Now we crossed the line into "something else" -- these goddamned acid trips! Why did I continue to do this to myself? Flashback replays of my second voyage into LSD terror ... It was now nothing less than the voice of God demanding:*

*"DO YOU TAKE RESPONSIBILITY!!!!"*

*I was no longer sure that I wanted that much responsibility, yet somehow I felt certain that if I'd said "no," I would have dropped dead on the spot: the voice's unstated implication was: "take responsibility or die!" In that state of consciousness I really be-*

*lieved it.*

*"YES! YES! I TAKE RESPONSIBILITY!"*

*The voice fell silent. After a while I got to my feet and stumbled back into the house. The rest of the trip was relatively uneventful ... By late afternoon I'd drifted back into normal awareness again -- I was very glad to be back.*

*That night I went to bed somewhat washed-out from the acid, but fully recovered and in consensus reality again. I'd been down for several hours, in fact.*

*I had a dream:*

*My machete was in front of me, hanging suspended in a pure void of infinite darkness. Etched on the blade were Hebrew letters in living fire. I am not Jewish, and I don't know Hebrew, but I can recognize those letters and differentiate them from Sanskrit or Greek characters, for example. The machete disappeared and only the fiery letters remained suspended in the void: then they began to move and re-form themselves in the Roman alphabet to spell: SEPHIROTH, in fire. Then they disappeared and only the void was left.*

*I awoke, my heart pounding anxiously. (Why was I afraid?) I got up and walked around the house -- what did "sephiroth" mean? I looked it up in Webster's Third New International Dictionary -- no such word. This was the most powerful dream I've ever had -- a once-in-a-lifetime kind of dream. (It was a bonafide dream and not an out of body experience, which is quite different.) It was easily as numinous as my encounter with the voice, but unfortunately I didn't know what it meant any more than I knew what it was that I'd taken responsibility for. It was to be at least two weeks before I got a clue ...*

*... I was aimlessly browsing in a Santa Fe book store. I saw a book with a title like: **Dictionary of Occult and Mystical terms** -- something like that. Ah ha! Maybe here I can find out what "Sephiroth" means. I turned to the proper page: "Sephiroth: The ten emanations of God in the Jewish Kabbalah." I was stunned: I had heard of the Kabbalah, and knew*

*it was some kind of Jewish mystical system, but that was as far as my knowledge went. How could my unconscious psyche come up with information that I had never consciously encountered in my life?*

*Needless to say, I obtained some books about the subject: I forget the reading sequence now, but Dion Fortune's *The Mystical Qabalah* and Gareth Knight's *A Practical Guide to Qabalistic Symbolism* stand out in my mind as particularly seminal texts... It was in Knight's book, over a year later, that I encountered the final synchronicity for this experience.*

*Without trying to explain the intricacies of kabbalistic philosophy, of which there are many (to say the least!), I discovered that my machete/voice adventure corresponded to the "17th path on the Tree of Life." This path is called: "A path of choice, the crossroads of life meet here." (e.g. "Do you take responsibility?") The Tarot arcanum symbolically connected with this path is *The Lovers*, and the Hebrew word-letter for *The Lovers* is "zayin," which means "Sword." (A machete is certainly a kind of sword). The drug ergot is also closely associated with this path, and LSD, of course, is an ergot derivative.*

*That's a fair amount of synchronicity compressed into an event which is still not totally clear to me, but I am apparently in good company: years after my "kabbalah trip" I found this observation concerning LSD therapy in Stanislav Grof's book, *Realms of the Human Unconscious*. He is describing here how others under the influence of LSD have had experiences similar to my own:*

*Individuals unfamiliar with the Kabbalah have had experiences described in the *Zohar* and *Sepher Yetzirah* [two classical kabbalistic texts] and have demonstrated a surprising familiarity with kabbalistic symbols.*

I want to emphasize that I am sharing my personal experiences of the Work with you -- there are as many paths as there are humans on the planet, so I'm not claiming that the kabbalah is for everyone. Although it works for me, you might find it unacceptable: that's OK -- such contradictions are superficial. That's be-

cause there is a primordial gestalten operating within the human unconscious: Harner calls it "core shamanism," Leibniz, Huxley and others called it the "Perennial Philosophy." Whatever you call it, it's the foundation of every legitimate spiritual tradition in the world. We get so caught up in our own experience that we usually do not realize that the forces driving our beliefs are pretty much universal: from Buddhism to Islam to Christianity and beyond, the core symbols have their roots in the same truth. That's why there are so many legitimate paths that seem so different from the outside. Don't be fooled: when followed with shamanic will and intent they all lead to the top of the mountain.

But don't be fooled again: fighting a war to defend your God is the biggest illusion going, as well as the shortest road to hell -- not every inner voice has your best interests at heart. We live in a multidimensional multiverse of competing powers. Nevertheless, as human egos incarnated in three-dimensional space, we have one power that the gods, the demons and the angels do not have: the power of choice. It is up to us to sort out what makes sense and then live out those choices in the world.

There are three rules of thumb that I would like to leave with you: The first is that any choice that does not lead to ultimate integration and unity, leads to hell.

The second is that in making choices you must be ruthless in the service of your truth. If the truth hurts, then for enlightenment's sake you must bear the pain. Any other option destroys the Work. You will constantly be offered choices that lead to superficial integrations that are dead-end streets. Your essence will always tell you what to do: the secret lies in serving that advice. It's never easy to do: that's why they call it the Work.

Finally, drugs are not a substitute for doing the Work. Entheogen use outside of a disciplined, dedicated spiritual practice is recreational drug use. Recreation, certainly, is essential to our well-being, but when it becomes escapist it insults the Work. Substance abuse of any kind is self-abuse. And although it

can be extremely useful to take an occasional helicopter ride to the mountaintop (if nothing else you'll get a bird's-eye view of where you're going and where you've been), you won't be allowed to stay there: for that you'll have to hike the perilous path up from the bottom. Though I suppose it's possible, I've never heard of anyone who attained permanent enlightenment by using psychedelics.

A few words about "shamanism." The shaman is a master of altered states of consciousness -- in the classical definition, he or she travels to "other worlds" to heal the ills of the tribe. What other worlds, and how does one travel to them? Are we talking about out-of-body states here, or something else? First of all, these other worlds are literally dimensions of consciousness: they aren't "out there" someplace, they're "in here." This is almost impossible for scientifically oriented Westerners to accept, but nevertheless it's true. One doesn't have to be a master of the classical out-of-body experience, like Robert Monroe, to travel to the shamanic realms. Anybody with a little focused intent can do it.

Jungian active imagination, kabbalistic path--working and Harner-method shamanic journeying are all separate names for the same basic technique: different symbols -- same experience. That's why I have trouble with some of the New Age shamans I encounter -- the ones who pretend to be "Native Americans." First of all, "shamanism," in the sense I define it, is not the exclusive province of tribal peoples, it's the legacy of all humankind. Second, anyone born on this land is a Native American, and the American earth shapes our beliefs: the European, African or Asian ancestors can no longer claim our full allegiance. But neither are most of us Aboriginal Americans, and even if we were, time moves in only one direction: the days of living in tipis with the buffalo are gone forever.

To adopt whole-cloth the mythology of aboriginal tribes is to unwittingly disrespect both them and ourselves. If I were a Sioux I would find it bitterly ironic that the newcomers who altered my ancestral homeland adopted our world-view only after its context had been destroyed. Happy myths don't sprout from reservation shacks, and past glories curse the present when

we reject the challenges of our own day. Instead of ripping off Aboriginal American spirituality, it would be more useful for us to show our respect for its wisdom by becoming the true sons and daughters of this American earth. Not a nation of immigrants, but real native peoples.

That means we go inside of ourselves, into the shamanic realm, to find what is authentically our own, in this time and in this place, and bring it forth to live out in the world. If there is truth in the idea of reincarnation, then we are our ancestors both past and future. To honor "them," we must honor ourselves in the present. Part of this involves making room for the emergence of new myths. (Egos can't create myths, but they can allow them to come forth.) As Neo-Native American myth-facilitators, we are obliged to take the best of the past and apply it to the reality of the present to create something worthy of respect in the future.

Within each of us is an essence or god-self seeking to express its myth. The goal of the Work is to create a context for our myth-making essence to manifest: we must become our essences. American myths (native, imported and derived) are dying all around us: the people cry out for new myths to live by. Dare I say that as the ancestors of future generations we no longer have the leisure to ignore this obligation?

-- *Jim DeKorne*

### *A FAREWELL POSTSCRIPT*

The English translation of the proverb on the cover of this issue is: "*Life is short, death is certain.*" It is about the most existential motto I can think of. Whatever form your inner work may take, live it fully in the world. The Death Forces destroying this planet are an awesome adversary: live your life to the limit, knowing that the fear of death is death itself. *That doesn't mean to be foolhardy, it means to be very, very clever!* The bastards are powerful, but they are also usually pretty stupid. Here's a shamanic discipline which I offer you: make a righteous distinction between "immoral" and "illegal," then never let a day go by in which you don't *consciously* break at least one of their immoral laws.

Blessed be. -- *Jim*

# SOURCES

---

Welcome to the first installment of SOURCES, a new feature that highlights companies of interest to *ER* readers. This is a joint effort between Jon Hanna, author of the *Psychedelic Resource List*, and myself, Will Beifuss, author of the *Psychedelic Sourcebook*. After years of competition and backbiting, we have decided to collaborate on this column, because two heads (even if one of them is Jon's) are better than one. For the most part we will be listing new businesses that do not appear in either one of our books. However, we will also be updating you on new products or services offered by established companies and organizations. So without further ado, I will turn things over to my fellow investigator and esteemed colleague, Jon Hanna...

Will summed it up fine. On to the "sources." — Jon

**THE ONES THAT STAIN BLUE**  
**POB 11167 (DEPT. ER)**  
**Spring, TX 77391-1167**  
**mushcaps@stainblue.com**  
**<http://www.stainblue.com/>**

This company's main product is *Psilocybe cubensis* spore prints taken from mushrooms collected in 16 different locations around Texas and 9 locations in Mexico. See their web site for the complete list. Each print is \$30 (not sent to California). They also offer the following:

**Mushroom Kits:** Includes agar, spore loop, scalpel, plastic petri dishes, the McKenna brother's book *Magic Mushroom Grower's Guide* and a *P. cubensis* spore print. Kit — \$55 (not sent to California).

**Mugs:** 1. María Sabina / *Psilocybe caerulea*; 2. Albert Hofmann / psilocybin molecule; 3. *Psilocybe cubensis* / *Psilocybe subcubensis*; 4. Quanah Parker / peyote cactus. Mugs are \$10.50 + \$3 S/H.

As well as mugs, they've got t-shirts, mousepads, and caps—all emblazoned with images of mushrooms, peyote, and María Sabina.

Will and I couldn't help but feel that all this merchandise is a bit crass; revered personalities and sacraments twisted into mass-produced kistch. What's next, peyote paperweights?

## DALLIN CLEGG

**1586 W. Springwater Dr. (DEPT. ER)**  
**Orem, UT 84058**

**lambo@aros.net**

**<http://www.aros.net/~lambo/cubensis/cubensis/.htm>**

It's not everyday you see *Erythroxylum coca* seeds offered for sale, and that's because they're illegal. However, a coca plant seems like a particularly nice addition to an entheogenic garden, so if you want to take the risk of ordering, here is a source. They offer some other seeds as well, listed below. These prices seem outrageously high to us, as does their mandatory \$10.00 S/H, which must be added onto all orders.

*Erythroxylum coca* — 20 seeds / \$15

*Ephedra nevadensis* — 40 seeds / \$25

*Papaver somniferum* — seeds \$25 / oz; \$50 / 4 oz;  
pods — \$20 / field bunch

*Hyoscyamus niger* — 20 seeds / \$15

*Atropa belladonna* — 10 seeds / \$15

*Cannabis sativa* sterile seeds — \$25 / oz; \$50 / 4 oz

*Psilocybe cubensis* spore syringe — \$15

## G. SANDERS

**Box 37, 199 W. Hastings (DEPT. ER)**  
**Vancouver, BC V6B 1H4**

**Canada**

**<http://www.hempbc.com/store/catalog/grow/america.html>**

G. Sanders sells viable *Cannabis* seeds from Marc Emery's seed catalog—part of the Hemp BC company, which lists hundreds of seeds. Hemp BC's seed list is available on the Internet (at <http://www.hempbc.com/seeds/seedindex.html>).

Seeds are offered in packs of 10 with a guaranteed 50% germination rate. Prices range from \$25 for the strain "Watermelon" to an outrageous \$450 for "Jack Herer."

Possession of viable *Cannabis* seeds is against federal law as well as state laws in most situations, so order these at your own risk. Cash only, no checks or money orders are accepted.

**GROWROOM**

**POB 20001 (DEPT. ER)**

**Indianapolis, IN 46220**

**spores@growroom.com**

**<http://www.growroom.com/shrooms.htm>**

We have no experience with this company, but the more spore vendors the better. Like most companies dealing in psilocybian mushroom spores, they will not ship to California. They sell spore prints for *Psilocybe cubensis*—Matias Romero strain (\$15); *P. cubensis*—Gulf Coast strain (\$15); and *P. azurescens* (\$35).

**PSYCHEDELIC BOOKSTORE**

**c/o TG Sweden AB**

**Tantogatan 9 (DEPT. ER)**

**S-118 67 Stockholm**

**Sweden**

**+46 8 720 18 65**

**order@psykedelbok.se**

**<http://www.psykedelbok.se/index.html>**

An excellent selection of books on psychedelics, *Cannabis*, and other drugs—well over 100 titles. They also carry back issues of *Psychedelic Illuminations* magazine, MAPS newsletters, *Integration* (issues 1-5) and *Eleusis* (issues 1-4). Unfortunately, they also have some of the highest prices on books and botanicals we have ever seen. Prices on their web site are listed in Swedish currency, but the exchange rate is \$1 = 7.5 SEK.

When Will e-mailed the company asking them for the exchange rate, they replied immediately. However, when he wrote back asking if their prices were so high simply because of the exchange rate, he never heard back. Nevertheless, this company is useful to our European subscribers, if for no other reason than the fact that they sell the *Psychedelic Resource List* and the *Psychedelic Sourcebook*, heh. They've also got:

*Artemisia absinthium* — 4 oz / \$23

*Banisteriopsis caapi*, dried vines — 5' / \$66.60

guarana — 4 oz / \$26.60

kava kava — 8 oz / \$33

*Salvia divinorum*, dried leaves — 7 gm / \$40

*Peganum harmala* (Syrian rue) viable seed pkt / \$10;

1 oz nonviable seeds / \$26.60

baby Hawaiian woodrose — 11 seeds / \$10; 50 / \$30.

*Psilocybe cubensis* spore syringe — \$26.60

**HAGENOW LABORATORIES**

**1302 Washington St. (DEPT. ER)**

**Manitowoc, WI 54220**

**(920) 683-3339**

Excellent prices on laboratory supplies—glassware, scales, chemicals, etc. For example, they carry essentially the same Soxhlet extraction apparatus for \$185 that Botanical Preservation Corps sells for \$300. They claim to have the lowest prices anywhere, so Will called up his local scientific supply store and sure enough, Hagenow was considerably cheaper on all the items he checked.

**GREEN METALS**

**POB 113 (DEPT. ER)**

**Kensington, Maryland 20895**

**srdsmith@erols.com**

**<http://www.erols.com/srdsmith/nosmoke.htm>**

Green Metals produces the Flash Evaporator, a very different kind of vaporizer. Unlike the majority of vaporizers currently on the market, which are based around a soldering iron as the heat source, the Flash Evaporator works using air drawn through heated metal. The unit is made of brass and mahogany, and plugs in with an AC adaptor.

Since Will doesn't smoke *Cannabis*, the road-test duty of this unit fell to me. (One might notice Will's bias against *Cannabis* echoed in his *Sourcebook*—which, focusing squarely on psychedelics, has hardly any mention of companies related to *Cannabis*—unlike my more comprehensive *Resource List*, which *does* report on *Cannabis* related companies.) The Flash Evaporator is a "one hit" style unit, and after three hits, the heating part has to be set back onto the base and recharged for five minutes. This delay will take some getting used to by folks who usually just pass a joint. However, I was quite amazed by how stoned I got from such a small amount of material. For some reason, this unit seems much more cost effective than other vaporizers. Perhaps, as it only holds a small amount, and it takes a while between hits to reload, by the time you are ready to partake again, you realize that you are already stoned and don't need to.

Truly, of all vaporizers I have seen, this one has the most class. An attorney friend who was helping me test the Flash Evaporator, agreed that it was the coolest design, and best looking model on the market, but pointed out that you could pick up a boxed CD set of the collected works of Pink Floyd for the price.

The Flash Evaporator is \$147.50 plus \$12.00 S/H (Maryland residents add 5% sales tax), and is shipped by UPS (which won't ship to POBs). Payment should be made out to Green Metals. Check out the web site for more information and pictures.

### **THE SALVIA DIVINORUM LIST**

**salvia-request@renaissoft.com**

This special interest e-mail list was created by Daniel Siebert—the first person to ingest refined salvinorin A back in 1993 (details of his harrowing experience can be found on his web site at <http://www.geocities.com/Paris/1074/salvexpe.htm>). The posts on this new e-mail list run the gamut (as with most lists), from succinct and informative, to long-winded theoretical gibberish. Herein find cultivation tips, consumption tips, trip reports, and philosophical rants, centered mainly on *Salvia divinorum* (but occasionally straying into discussions of other *Salvia* species or other plants altogether). The posts that we have enjoyed most so far have come straight from Siebert himself—wherein he has related information about tests results that show the high variability of salvinorin A content amongst plants, reported that salvinorin A appears to be a fairly stable chemical, and related different methods of drying the leaves.

Indeed, Will and I had a bit of a heated argument over what exactly *is* the best method of drying the leaves. My original position was that a slow dry, pressed flat between paper towels, and placed under something heavy, was the best manner to dry these leaves—as it didn't expose them to heat. However, after experimenting a bit, and hearing what Siebert and others have had to say, I have changed my thoughts on this matter. I now agree with Will that a quick dry in a food dehydrator set at the high setting (about 145 degrees) is the best. Salvinorin A apparently can take the heat and won't degrade. The 145 degree heat allows the leaves to keep more of their green color than if they are dried at a lower temperature.

To join The *Salvia divinorum* List, just send an e-mail to **salvia-request@renaissoft.com**, with the word "subscribe" as the subject of your mail; the body of the message is ignored. Traffic is currently moderate—perhaps ten messages a day or so.

### **KIFARU PRODUCTIONS**

**23852 Pacific Coast Hwy., #766 (DEPT. ER)**

**Malibu, CA 90265**

**(800) 400-VIDEO**

**<http://www.kifaru.com>**

Kifaru Productions offers VHS cassettes of *The Peyote Road* for \$29.95 + \$4 S/H (\$12 foreign). This is an excellent documentary that addresses the United States Supreme Court "Smith" decision, which denied protection of 1st Amendment religious liberty to the sacramental use of Peyote for indigenous people. Includes interviews with Reuben Snake, Al Smith, Huston Smith, Mrs. Cardenas, Dr. Vine DeLoria, and many others.

### **THINKING ALLOWED**

**2560 Ninth Street, STE. 123 (DEPT. ER)**

**Berkeley, CA 94710**

**(800) 999-4415 — orders**

**(510) 548-4275 — FAX**

**thinking@thinking-allowed.com**

**<http://www.thinking-allowed.com>**

This is a public television series with an extensive video library. Thinking Allowed has aired on public television since 1987. Their video collection has more than 200 titles. For descriptions of all of their video tapes, visit their web site. Titles include Terence McKenna's *A Magical Journey* (\$49.95) and *Aliens and Archetypes* (\$29.95), John Lilly's *From Here to Alternity* (\$49.95), Stanislav Grof's *The Adventure of Self-Discovery* (\$49.95), and *A New Paradigm of the Unconscious* (\$29.95), Ralph Metzner's *Metaphors of Transformation* (\$29.95), Charles Tart's *Self-Observation* (\$29.95), and Rupert Sheldrake's *The Universal Organism* (\$29.95).

### **MAPS FORUM**

**majordomo@maps.org**

Another e-mail list, this time run by the good folks at MAPS. This list has a maximum of five messages selected for posting each day by the moderator. Recent discussions have focused on the importance of amateur research. To subscribe to maps-forum, send e-mail to the address listed above as follows:

"subscribe maps-forum Your Name <youraddress>" without the quotes, in the first line. Make sure your e-mail address is enclosed within the < > as shown. Leave the subject line and all other lines blank. Subscriptions to MAPS Forum are free to MAPS members, and free to non-members for a 90-day trial period. Memberships, which include a subscription to the quarterly *MAPS Bulletin*, are available for \$35 (non-USA: \$50) for General Members, and \$20 (non-USA: \$35) for student/low income. Donations above the minimum amount are encouraged because they help directly support research efforts.

*Weighing in at 72 smallish pages, Will Beifuss' Psychedelic Sourcebook lists 111 companies and is \$12.95 postpaid (available from Rosetta, POB 4611, Berkeley, CA 94704).*

*Hanna—insisting that his Psychedelic Resource List is a better bang for the buck—charges \$22.95 postpaid for 120 large pages, listing 245 companies (available from Soma Graphics, POB 19820, Sacramento, CA 95819). "That's less than 10¢ per listing... as opposed to Beifuss' nearly 12¢ per listing," said Hanna.*

*Beifuss was last heard mumbling something about "quantity versus quality."*

*SALVIA DIVINORUM*

Finest quality air-dried leaves:  
\$25.00 quarter-ounce, \$45.00  
half-ounce, \$85.00 one ounce,  
plus \$2.00 shipping and handling.

Also:

Quality Kava products,  
Live *Psychotria viridis* plants  
and seeds.

*MUSHROOM MAGIC*

Magic is a catalog/newsletter from the under-ground. In it we tell you about our products and growing methods we share from experience. Everything we sell we use ourselves. Every book we sell we have read and decided that it has information you need. Every product is selected because it offers the best value for the money. Many of the things we sell are unique and hard to find. You told us you haven't always liked the things you bought elsewhere and are hesitant about buying by mail. We promise that our products are better than we tell you, that you will be happy with everything or you can return them for a full refund. You told us you want your things quickly so we ship within 24 hours of receiving your order. We don't sell or trade your name either. Thanks for ordering from us and tell your friends about us too. If you have questions call our free hotline: (847) 259-2457

**Sacred Mushrooms  
and the Law**

**JUST RELEASED — SUMMER 1995**

WRITTEN FOR SHAMANIC USERS OF TEONANÁCATL

- ♦ All the federal and state laws concerning *Psilocybe* mushrooms and their chemical constituents are discussed and explained.
- ♦ Easy to read charts and tables display potential punishment under the federal sentencing guidelines.
- ♦ An up-to-date and complete state-by-state chart displaying the various state punishments for possessing and cultivating mushrooms.
- ♦ The legality/illegality of *Psilocybe* spore prints, mycelium, and culture, and the California laws concerning same.
- ♦ The legal status of *Amanita muscaria*.
- ♦ The religious defense to criminal charges.
- ♦ The mushroom versus substance debate: is nature illegal for naturally producing controlled substances?

WRITTEN BY RICHARD GLEN BOIRE, ESQ.  
Editor of *The Entheogen Law Reporter*  
and author of *MARIJUANA LAW*.

AVAILABLE BY MAIL ONLY  
\$5 plus \$1.50 s/h  
(California purchasers please add 50 cents for tax.)

Box 73401 Davis CA 95617-3401

# INDEX

1. A given reference may not be the last *ER* word on the subject. (It may not, in fact, even be correct.) For example, much of the early material on the dangers of MAOI from *Peganum harmala* was later conceded to be largely overblown (which is, of course, better than the opposite possibility). In other cases, specific numbers are corrected in later issues (such as “30%” turning out to be “3%” in a recipe). Conversely, it should be noted that not all “corrections” offered by correspondents are themselves correct.
2. When the term “mushrooms” is used generically with reference to entheogens, it is assumed that psilocybin-containing mushrooms are meant unless there are indications otherwise.
3. Cross-referencing is not perfect.
4. In most cases, the scientific names of entheogenic plants are used as the primary reference, even if not used by the correspondent. (On the other hand, common herbs such as gotu kola are referenced under their common names, and common chemicals like 2C-B or 5-MeO-DMT are referenced by their familiar acronyms.) Nonetheless, for convenience some common names are referenced as well...but the fullest coverage will typically be under the scientific name. This might avoid uncomfortable experiences such as mistaking “large” or “giant” Hawai’ian woodrose (*Ipomoea tuberosa*) for “baby” Hawai’ian woodrose (*Argyrea nervosa*) as in II.2:17. (There are cases, such as “morning glories,” where a writer might mean *I. violacea*, *R. corymbosa*, or both; in this case, there virtually has to be a reference to “morning glories.”) The best advice is to check all possibilities.
5. In cases where there are two competing names (e.g. *Psilocybe cubensis* = *Stropharia cubensis*) the reference used is that of the writer. If the writer merely said “cubensis,” then the compiler felt free to index it under the more common form (in this case, “*Psilocybe cubensis*”). I have not adopted the proposed reclassification of *Trichocereus* into *Echinopsis*—trichos are still trichos here.
6. Pseudonyms are not treated as formal names, and therefore are listed like businesses, books, or Internet handles; you won’t see the “last name” first. Thus, you will find “INNER FRONTIERSMAN,” not “FRONTIERSMAN, INNER.” In addition, to simplify use of the index, initials used as pseudonyms are treated as a single, condensed word. For example, “P.L.” is indexed as if it were the word “pl” and thus appears just before the entry “plant.” Pseudonyms beginning with “Dr.” are spelled out (since the practice varied on the page); thus, DOCTOR POPPYSEED. Note also that there may be more than one person with the same initials, so not all listings under one name are necessarily from the same pen. (I feel that this makes a good argument in favor of pseudonyms, to avoid such confusion. In addition, pseudonyms are often amusing, while initials generally are not.)
7. Writings by the editor (Jim DeKorne) in *ER* itself are not referenced by author (although the content is indexed by subject matter); writings by the editor outside *ER* are referenced by the editor’s name. This is to resolve the problem that at some points Jim DeKorne signed his commentary by name, sometimes signed as “- Ed.”, and sometimes did not sign at all.
8. Queries about plants or substances are usually not indexed unless there is at least some tiny bit of information attached, either in the query or in the answer. There are simply too many communications that are nothing more than a letter asking if anyone knows how to use a long laundry list of plants (see II.3:15, for example, where the editor doesn’t even bother to print the whole list). My guess is that no user of this index wants to look up *Pachycereus pecten-aboriginum* just to find a letter asking “Does anybody know anything about *Pachycereus pecten-aboriginum*?” (with no answer). I also assume that no one wants to see a reference every time water is used as a solvent, or every time a passing mention is made to an extraction, or to queries that are simply non-informative. Presumably no one would want “I used PineSol and a quart of yogurt in this extraction and it came out gloppy—should I have used chloroform?” or “I can’t find any chloroform” to generate a reference to “chloroform.” If I’m wrong about this, then I apologize.
9. Full names are given in references where known, but in many cases these are limited to last names cited by correspondents. When multiple authors are cited, the references are only under the name of the senior author unless the junior authors are also known or referenced with respect to other works. (For example, a citation of SCHULTES & HOFMANN will generate “SCHULTES, RICHARD EVANS” as well as “HOFMANN, ALBERT,” but TURNER & MERLIS will only generate “TURNER and MERLIS.”)
10. Some readers may view “ayahuasca” and “ayahuasca analogues” as any combination of an MAOI with another psychoactive substance. I have taken a narrower view. I treat “ayahuasca” as the use of traditional jungle plant combinations; it is also referenced when people talk generally about ayahuasca experiences without specifying the substances involved. I use “ayahuasca analogues” to refer only to cases where non-*Banisteriopsis* plants or substances are ingested for their MAOI action to potentiate otherwise inactive substances. This means that I do not list the use of harmala alkaloids with mescaline or psilocybin under “ayahuasca analogues.” (They are still indexed: Check under the MAOI, such as “*Peganum harmala*,” or under the name of the plant/chemical being potentiated, such as “*Psilocybe cubensis*.”) I am not prejudiced against the use of MAOI drugs with substances that are normally orally active; indeed, it is a fascinating area of research. However, I think that referring to these sorts of procedures as “ayahuasca analogues” confuses the principles involved in the ancient technologies of the Amazon.
11. Not every reference to a plant generates a reference to its active component. For example, a description of a *Trichocereus* experience probably does not generate an index reference for “mescaline.” References to chemical components (which are not always the only psychoactive ingredients in entheogenic plants) are restricted to cases where the writer is talking about the isolated substance or cases where the pharmacology or chemistry of the substance is discussed in a more general sense.

References are given as **Volume#.Issue#:Page#**. (V.I:P). For convenience, here is a concordance of volume/issue numbers and issue dates:

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled, or incinerated. Though we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to the address listed to the lower left. Please notify us if your address changes.

**BACK-ISSUES:** Single copies of *The Entheogen Review* from VOL. VII, No. 1, VERNAL EQUINOX 1998 to the present are available from our address to the left for \$6.00 (USA), \$9.00 (foreign). Single copies of *The Entheogen Review* prior to VOL. VII, No. 1, VERNAL EQUINOX 1998 are available for \$5.00 (USA), \$8.00 (foreign) from: JIM DEKORNE, POB 750, El Rito, NM 87530. Also available from JIM DEKORNE is the book *Psychedelic Shamanism* for \$22.00 (USA), \$30.00 (foreign); *Ayahuasca Analogs and Plant-based Tryptamines* for \$20.00 (USA), \$25.00 (foreign); and *The Entheogen Review's* first year of publication (bound) for \$20.00 (USA), \$30.00 (foreign).

**WELCOME** to the latest incarnation of *The Entheogen Review*. My name is DAVID AARDVARK, and I have assumed the challenging-yet-rewarding duty of editing and publishing *ER*. I've enlisted the help of technical editor K. TROUT, and together we will strive to present accurate information and do our best to answer the questions asked by *ER* subscribers. Whenever possible, to back our comments we will cite references (included in each issue's bibliography). As founding editor JIM DEKORNE stated in the first issue of *ER*, our goal is to continue to "shed a little light on [the] topic [of entheogens] and separate a few facts from what appears to be a limitless mythology."

Of course, we can't possibly have answers to all of the questions that are posed in *ER*. We heartily encourage readers to write in with their own experiences. This is your journal, and we need your input!

One subscriber, writing to "JIM, or future editors" remarked:

Congratulations and a big thank you for being at the forefront of the fight for freedom. You are right in saying that the Internet is it [referring here to DEKORNE'S comment that "The internet is where it's at these days, and you can probably find more stuff there than here." (DEKORNE 1997)], but I believe *ER* has a very special role to fill. First, many people feel uneasy about posting things on the 'net, especially if they are incriminating. Second, it is hard to keep up-to-date with the latest developments. Popping in on 100 addresses just to see if there's something new becomes tedious and expensive. *ER* has become a little boring though, as a lot of it is mere dope tales which are repetitive and in any case subjective. Most of us psychonauts have done or heard it before (and that includes *Salvia divinorum*). Give us what the 'net doesn't and I'm sure *ER* will prosper. — DISTORTED, Australia

While there certainly *is* some very good information available via the Internet, our main complaint about this medium is the frequent lack of references. Due to this, it is sometimes hard to know what to believe and often impossible to find out for sure. Because virtually anyone with a computer can post anything they want (without the benefit of editors or peer review), information found on the Internet is suspect by nature. For this reason, we feel that there will always be a place for *The Entheogen Review*. And while we have no intention of publishing a journal which is *merely* "dope tales," we *do* appreciate the subjective nature of the entheogenic experience. These accounts—"hyperspatial maps," "trip stories," or "dope tales" (if you must)—are quite important to share, as they can provide a common framework for understanding the states of consciousness that entheogens produce, and allow us to learn through the experiences of others. Hopefully with *ER*, we can successfully balance subjective experiences and the objective botanical and chemical information; this is our goal. — DAVID AARDVARK

# HYPERSPATIAL MAPS

## MESCALYSERGIC VISIONS

Recently the great spirit has blessed me with the opportunity to begin working with what has become my most special entheogenic ally—mescaline sulfate. My first two experiences (at 400 and 500 mg respectively) with this material have easily surpassed my experiences with other “traditional” psychedelics. It is much gentler than LSD, more lucid, and euphoric, without the abrasive psychoanalytical edge that often irritates me on high dose acid trips. I find its energizing qualities preferable to the drowsy, dreamy trance I usually experience with mushrooms. I would also stress that this is far and away the most healing entheogen that I have ever encountered, both physically and psychologically. One hour into my first journey, it was inescapably clear to me why the Indians say that peyote is first and foremost a medicine. I emerged from both trips feeling as though I had productively worked through a substantial amount of psychodynamic baggage, and was physically rejuvenated to boot!

In any event, after these trips I was inspired to start learning as much as I could about my new-found ally. In the impressively thorough “SAN PEDRO FANATIC FAQ” (<http://www.lycaenum.org/~iamklaus/sanpedro.htm>), I read that LSD and mescaline could be combined to yield a trip that was longer-lasting and smoother than either alone. When I recently came across a hit of fresh, relatively potent (150–200 mcg) acid, I decided to test this hypothesis, hoping the LSD would function as an amplifier, allowing me to get more mileage out of the frustratingly rare, delicate, needlelike crystals of mescaline. As it turned out, I was in no way disappointed. At approximately 9:00 pm I consumed the LSD and 225 mg of mescaline simultaneously. Initial effects were felt at the forty-five minute point, building to a plateau around the fourth hour, with residual effects persisting well into the following afternoon. My theory about the LSD acting essentially as a potentiator turned out to be correct; the mescaline’s warm, earthy signature was dominant throughout, while the experience felt stronger than my 500 mg mescaline-only trip.

At the peak of this journey I had a totally paradigm-shattering experience that I am at a loss to interpret. I was lying on my bed, incense and ceremonial candles alight, meditating. The air grew thick, as though pregnant with energy—like a

thundercloud about to burst. My visual acuity sharpened at the same time. I looked at my hand and began to make out tiny iridescent curlicues that were superimposed as if upon a clear scrim on top of everything that I saw. Then, automatically—as if by instinct, I began to manipulate my eye muscles in a manner similar to the technique used to view those “magic eye” 3-D images (where you unfocus your eyes and attempt to look through the gibberish image to see the real picture). When I did this, the curlicues suddenly sprang into strong three-dimensional relief, and they were revealed to be translucent, iridescent tentacles or tendrils of some sort that looked like they were formed out of ectoplasm. The room was electric with a sense of presence, and I followed the line of these tendrils away from my hand to their source. I was utterly unprepared for what I saw when I did this.

Floating in the corner of my room was an enormous, shimmering, translucent, opalescent, octopod/jellyfish-like creature from which the tentacles protruded! My initial reaction was one of disbelief, mixed with a substantial degree of fear. However, the thing immediately began to caress me with its tendrils—as if to reassure me, and my apprehension completely melted away. Amazingly, I actually perceived a gentle, soothing pressure against my skin as it caressed me like a child! As it touched me I felt its consciousness partially merge with mine, and I was then flooded with a sense of love unlike I have ever experienced before, or even imagined to be possible. Comparing any experience of transcendence that I have previously had to this experience is like trying to compare a candle to the sun. I had the sense that this was a guardian angel or something similar who was always with me, watching over me, and it was absolutely overjoyed that I could finally perceive and communicate with it directly. I was so moved by this that I wept openly with joy for a large portion of the time. I lay there soaking up its affection for nearly half an hour before it eventually vanished. The trip began to gradually, gently decline shortly afterwards.

I have had plenty of entity contacts in the disembodied domain of DMT, but this thing tangibly coexisted in the same physical space/time as my body and the rest of reality, which is a new one on me! I am really baffled as to how to interpret and integrate this. Input from anyone who may have had similar experiences would be gratefully welcomed. — TREY

## SALVIA DIVINORUM ENTITIES

I just recently had the opportunity to try *Salvia divinorum*, and have found it to be the only entheogen that consistently propels me into entity-contact experiences after smoking.

FIRST ATTEMPT: Drank two quarts of kava drink (about a 1/2 cup powdered *waka*-grade root). I decided that the relaxed state would be a good launchpad for the *Salvia divinorum*. I tried to smoke 1.75 grams of dried leaf in a gravity-type bong (bucket bong). The bong was too much trouble to operate smoothly enough to smoke the *S. divinorum* effectively, but I caught a glimpse of the experience.

Three entities, maybe more. One was a woman, and the others don't stand out as well. They said my name and then something like, "What are you doing here? You're not supposed to be here (now?)." Then they were like, "Oh well, let's just do it!" and they began pulling and stretching me into three sheets of color, side-by-side; red, orange, and yellow. There was a unique vibration as it came on, and during the experience.

SECOND ATTEMPT: Used a water pipe, trying to consume and hold as much smoke as possible. There was no pins-and-needles feeling like the first time. I felt two helping hands, two separate human-like (African American?) entities laid me down and helped lay the pipe and lighter down. They knew me and my name. There were also these entities (not human?) made of color doing something together and pushing me away from the area—like I wasn't supposed to be there or see what I was seeing. They kept trying to convince me to not pay attention (I felt as if something important was going on and I was being made to sit back in the corner so I wouldn't see too much).

Second bowl: Immediately after coming out of the trance. I'm in a different world and body, not clear. There is a woman in the room with me who is talking, but I can't remember her words. The whole place just starts spinning (gyroscopically?); spinning and turning inside-out, always at 90 degree angles to each other.

Doors open into rooms into more doors into more rooms; insanity—pure madness!!!! Will I ever get back to where I was? The room is alive; things that are inanimate and flat take on life. Two dimensional life—DISNEY-like where a whole house is a living being made up of lots of separate living parts.

I came out of the trance still unsure where I was or who I was and flung my bedroom door open screaming out loud, "Is this it? Is this the real room?" I thought the whole place was going to turn inside-out again, but soon realized I was back in my usual mind-set and coming down very fast as one does from a good hit of smoked *Salvia divinorum*. — N.E.

## ABANDONING THE SHIP!

I will stop here. Entheogens have brought me too far, too fast. At these heights, it's just too incommensurably lonely for me for now. I just don't have the physical, mental, or spiritual strength to bear it, for now.

So I burned all my plants, all my books—even *Psychedelic Shamanism* (sorry, no bad thoughts in this). I will start again, from the very beginning. No more sorcerer plants until I'm myself a sorcerer. I will learn from more humble ones, learning directly from them; tomatoes, pumpkins, mint, parsley that are growing in my garden.

I'm now facing the second enemy of the man of knowledge: *clarity*. And it's even worse than *fear*. Effectively, *fear* left so immediately, I could feel it. I fought it for years and, one afternoon, I realized how I was afraid all of my life—how it has always been here. It took me then just one more fight... and she left.

But believe me, *clarity* is worse. I see everything—the meaning and the possible consequences of all words, all actions. But, as these possible consequences are infinite and—more often than not—contradictory, I just don't know what to do. Acting when I should wait, waiting when I should act. I have to be strong, that's all.

So farewell to you all, brothers and sisters. Farewell to you: INNER FRONTIERSMAN, THE GNOSTIC, JOHNNY APPLESEED, TOAD and HATTER, DR. POPPYSEED. My path turns from here. Farewell and remember: most of us will leave the road, some of us will die on the road. I hope (I know) that a few of us will succeed. Good luck to us all. Bye. — S.H., France

P.S. Could you send me the address of MERCURY BOOKS so that I can order VOLUME 2 of *Pharmako/Poeia*. These are the only books about sorcerer plants that I want to keep. Poets are always right. Thank you.

## MORE PHARMAKO/POEIA?

I'm waiting for the second volume of *Pharmako/Poeia*—do you have any news? — M.B., Italy

*Pharmako/Poeia* by DALE PENDELL is published by MERCURY HOUSE (785 Market Street, STE. 1500, San Francisco, CA 94103). Though this book was out-of-print for quite some time, we've heard that it was being reprinted in February, and so it should be available soon (if it isn't already). \$16.95 (CA residents add 8% sales tax), plus \$3.00 S/H. We asked Mr. PENDELL about the status of his second volume, *Pharmako/Gnosis*, and he replied:

*P/Gnosis*, already longer than *P/Poeia* and with quite a few plants and substances not yet covered, may fission into two books—thus the whole work into a trilogy... The never-ending book, it seems.

We're happy to hear that things are progressing well enough to consider three volumes in the *Pharmako* series, and we'll let ER readers know when the second volume is available.

## NETWORK FEEDBACK

---

---

### MAO INHIBITION AND DOSING

I have two friends, "Andy" and "Bob," who used to take between three and six times as much (respectively) of any substance as me to get to the same level, and they still had a much flatter peak. We are all about the same size and weight, and lead similar life-styles. One day we were all going to partake in an ayahuasca experience. A double dose of *Peganum harmala* (just to be sure) and 30 mg DMT each. Bob got a few rushes and other physical sensations, but very little visually. Andy and I had the most amazing and scary time of our lives. (This was about a year ago.) Since then we have tried many other substances in minute quantities—like half a tablet of MDMA, LSD, mushrooms, etc.—but always with our MAO fully inhibited. For the time the MAO is inhibited, we have equal amounts of the substance to give each one of us equal effects. Even Bob is now on the same drug dosage; his problem was that even the double *P. harmala* dose was not enough. We now use MOCLOBEMIDE, which is much gentler on the stomach, and easier to dose accurately. CAUTION: with MAO fully inhibited, one MDMA tablet equals about

8–10. It's worth mentioning that the comedown is equivalent to slightly more than the actual amount of drug taken, not equivalent to a comedown that would be expected from the experienced effects. — DISTORTED, Australia

*These comments regarding MAOIs and MDMA are interesting observations. One psychonaut we know of has tried the combination of moclobemide and MDMA "four to five times without any favorable results." We've also heard one report of severe adverse effects with this combination. It has been suggested that the order of consumption can dramatically effect the results experienced. However, there is evidence for a disparity of response based on many factors besides individual variation of MAO production. Frame of mind, physical condition, and environment can also play a part. K. TROUT responds to this idea of combining MAOIs with MDMA:*

It seems prudent to suggest preadministration of the MAOI and cutting the MDMA dosage to 10-20% of normal (i.e. 7–20 mg) if people are crazy enough to actually want to mix the two. The problem with making such suggestions is the automatic accusations that this potentially risky behavior is being advocated. Unfortunately some people may indeed try this after hearing about it; in one sense I really am being irresponsible to 'enable' something that I **have never and would never try nor ever recommend**. I do think it more important to help people minimize possible problems through education and awareness. I'll bet money that these two drugs have been mixed far more than has ever been reported. I certainly don't advocate the mixture, but if people are already planning on taking the mix they should know elements that might help them avoid adverse effects.

*Know your MAOIs! MAO-A is inhibited by harmaline (OTT 1994) and moclobemide (ROCHE). While there is evidence that MAO-B inhibitors (and mixed MAO-A & MAO-B inhibitors) may be dangerous in combination with amphetamines (and possibly phenethylamines), we know of no evidence that either amphetamines or phenethylamines are contraindicated with MAO-A inhibitors. This does not mean that this combination is safe—only that we aren't aware of it being shown unsafe. Mescaline and 2C-B have both been combined with MAO-A inhibitors by a handful of psychonauts, and we are not aware of any problems or deaths associated with this practice. Moclobemide has shown a minimal potential for interaction with tyramine, yet hypertensive persons are still advised to avoid large quantities of tyramine-rich foods in their diets while taking moclobemide. We are interested in hearing from anyone who has combined MAO-A inhibitors with phenethylamines (or amphetamines).*

*For further thoughts on individual variation of response to different drugs, we recommend the chapter "Idiosyncrasy and Pharmacophilia" in OTT's latest book *Pharmacophilia* or, the *Natural Paradises* (see review on page 22).*

## SALVIA DIVINORUM: STRUCTURES, SOLUBILITY, STORAGE & SYNTHESIS

Does anyone have documentation on the chemistry of *Salvia divinorum*? I'm looking for structures, solubility information, storage and synthesis data. — COY DOG

**STRUCTURE:** The structure of salvinorin A is  $C_{23}H_{28}O_8$  (ORTEGA et al. 1982). With regard to structure, the following comments made by Dr. ALEXANDER SHULGIN at the MIND STATES conference in November of 1997 should be taken into account:

The material in *Salvia divinorum* is not a diterpene. [This] is a misnomer. Terpenes are a very definite molecular repetitive structure; isoprene taken four times. That structure is not in [*Salvia divinorum*]. But it is 20 carbons, and diterpenes have 20 carbons, and it's often referred to as diterpenoid, which is a cop out. [...] It is [in] a family of materials that are known in several—in fact, one was mentioned, the [*Salvia splendens*] was mentioned a moment ago in talking to TERENCE—there are fully six or eight *Salvia* or sage-like materials that have these 20-carbon compounds in them... different structures, different locations of esters, different locations of hydroxy groups (SHULGIN 1997).

After hearing Dr. SHULGIN's comments about "diterpene," we checked the primary literature and determined that it is possible that ORTEGA (who first worked out the structure of salvinorin A) is responsible for hanging the misnomer "diterpene" onto salvinorin A—actually calling it a trans-neoclerodane diterpene—(ORTEGA et al. 1982), as a previous paper reporting the isolation of salviarin from *Salvia splendens* (Savona et al. 1978) referred to it as "diterpenoid" (i.e. not a diterpenes but resembling a diterpene). The improper use of the term "diterpene" has now been repeated in much of the current literature on salvinorin A (OTT 1993; SIEBERT 1994a; SIEBERT 1994b; VALDÉS 1994; OTT 1995; PENDELL 1995; OTT 1996a; OTT 1996b; TURNER 1996; BEIFUSS 1997), including numerous earlier issues of The Entheogen Review.

**SOLUBILITY:** Salvinorin A is soluble in alcohol (methanol and ethanol have been used, as has 90% aqueous methanol), as well as being soluble in ether or chloroform. However, OTT reported that "salvinorin A is not sufficiently soluble [in ethanol, for sublingual application]," and he found that acetone and DMSO were more effective vehicles for sublingual application of salvinorin A (OTT 1995). This suggests that acetone would be a better solvent than ethanol for use in kitchen extractions of salvinorin A. A previous ER correspondent didn't have any luck with an extraction performed with pure ethanol (see ER's SUMMER SOLSTICE 1997, page 2), but we have had some success using 99% isopropyl alcohol. Salvinorin A is insoluble in nonpolar solvents like petroleum ether or hexane.

**SYNTHESIS:** We've been unable to find a "from scratch" synthesis published for salvinorin A; OTT states that there has been "none reported" (OTT 1996). Nevertheless, the structure has been elucidated using spectroscopy and x-ray crystallography. And, there has been a published synthesis using salvinorin B as the starting material (VALDÉS et al 1984).

**STORAGE:** Salvinorin A has been reported to be fairly stable (SIEBERT 1997). Still, it would seem prudent to keep it tightly closed, away from heat and moisture. We are unaware if it is light sensitive, but it can't hurt to store it in an opaque container. We called SOLID PHASE SCIENCE (the products division of BIOSEARCH TECHNOLOGIES, INC.), as they offer salvinorin A for research purposes. While SPS lists salvinorin A at the hefty price of \$50.00 per mg (S-1000-1) or \$400.00 per 10 mg (S-1000-10), they've been out-of-stock for months. When in stock, they store salvinorin A in their freezer, at minus 5° C.

## ENTHEOGENIC BEERS?

Now that we have beaten the absinthe issue to death, how about a dialog on the production of antique beers? As I have come to understand, beer was primarily a medicinal, and often tropane-containing plants were used in brewing. I have read something about Greek beers intentionally brewed with ergot infected rye. I gather that when the HOLY ROMAN CATHOLIC CHURCH conquered Europe and helped establish the Dark Ages, one target was medicinal beer. Seems we can't have people seeing God when a major religion is preaching faith. At any rate, I gather that hops were the only acceptable substitute for power plants. I spoke with a couple of amateur brewers but they had never heard about brewing with psychoactive plants other than hops. Both of them expressed interest in trying a couple batches of these "antique brews." — COY DOG

Those interested in "antique brews" should check out Christian Rättsch's 1996 book *Urbock: Bier Jenseits von Hopfen und Malz* (Urbock: Beer Beyond Hops and Malt). Though in German, it is the only book we know of that deals directly with various beer additives "other than hops." We've heard rumors that there may be an English translation forthcoming at some point, but don't know for certain that this is the case.

Cannabis beer is popular among some circles of home-brewers, and is said to be tasty and effective. You might look for a book titled *Marijuana Beer: How to Make Your Own Hi-Brew* by Ed ROSENTHAL and THE UNKNOWN BREWER, which first appeared in the early 1980s, and was reprinted in 1996 by QUICK AMERICAN ARCHIVES. A southwest Home Brewing and Microbrewery news magazine ran a recipe for Cannabis beer a few months ago. They got some letters of thanks, but they also got some absolutely outraged and indignant letters, including those who claimed in their protest that they were both

*liberal and tolerant, but demanded that their subscriptions be cancelled because the use of Cannabis in beer associated home-brewing with criminality and also made alcohol appear to be a drug, or somehow linked it with drugs, a concept they had been valiantly battling to dispel for some time!*

## TRICHOCEREUS PERUVIANUS

Regarding *T. peruvianus*. The reason I believe that there are such a wide variety of reports regarding *T. peruvianus* is because many people are simply mistaking other *Trichocereus* species for *T. peruvianus* (and I bet that many different species are being sold as *T. peruvianus*, knowingly or not).

An excellent, authoritative book, *Cactus Lexicon* (I don't recollect the author's name) states:

*Trichocereus pachanoi*: ...transverse depressions over the areoles... spines... are mostly completely absent on cultivated plants.

*Trichocereus peruvianus*: Its body is erect in its early years and then becomes arching or even prostrate... frosted bluish-green color... V-shaped notch over the areoles... The spines are honey-colored below and darker above.

*T. peruvianus* is a separate species from *T. pachanoi* for two very simple and obvious reasons: 1) Its spines are much longer, and 2) As its columns age, they lean, ultimately becoming prostrate. No other "*T. pachanoi*-type" cactus does this. *T. pachanoi* spines aren't even close to the length of *T. peruvianus*. And *T. pachanoi*'s branches are very strong and will not lean with age.

I've done many bioassays with the *T. peruvianus* specimens that I've sent pictures of and have no reason to present disinformation regarding bioactivity. I have many *T. pachanoi* and other species of *Trichocereus* to compare. I know *T. peruvianus* because it is my main sacrament. — D.D., CA

*While it is true that T. peruvianus has a much greater tendency to become prostrate, we have also seen this occur with T. pachanoi in cultivation. While not the norm, it certainly doesn't appear to be a truly abnormal thing for the plant. They will root where (and if) they can touch soil, often form adventurous root buds on horizontal or elevated sections, and still appear quite solid and healthy. They tend to stay thinner than other sections, send out new branches from unusual places—usually mechanical stress points—and are very potent—perhaps due to their age, perhaps due to the greater relative proportion of cortical vascular tissues.*

*In most cases T. pachanoi does have smaller spines than T. peruvianus. However, we've seen a few examples of T. pachanoi with spines that are quite long. This predominantly occurs on seed-grown T. pachanoi, which seem to show a greater variation in their morphology than most cuttings that are available (which likely arose from a single clone). Nevertheless, it is true that if one measures the longest spines on a T. pachanoi and compares these to the longest spines on a T. peruvianus, the later will always have longer spines.*

*Cactus Lexicon is by CURT BACKEBERG; it originally appeared in 1966, written in German and titled Kakteenlexikon. There is also a 1977 English version (translated by LOIS GLASS).*

*Ironically, Trichocereus pachanoi was, at one time in Ecuador, called Cereus peruvianus (BRITTON and ROSE 1920)! (No relation to the cactus currently given this name.)*

*A number of photos were sent in by "D.D., CA." The cacti pictured did indeed look like T. peruvianus, and one picture showed an example of the "prostrate" expression of the plant that D.D. described. A photo showing a good example of a T. peruvianus expressing this curious characteristic can be seen in VOLUME II of BACKEBERG'S Die Cactaceae: Handbuch der Kakteenkunde (a six volume set published 1958-62). Though in German, these books contain many more photos of entheogenic Trichocerei than Cactus Lexicon, and they are worth taking a look at.*

*For more on the topic of T. peruvianus, see "Trichocereus peruvianus?" by K. TROUT on page 17.*

## WILD CUCUMBER?

I have heard secondhand reports that the wild cucumber or man-root (*Marah* species) is entheogenic. My informant claims to have made a tea from the root many times, and says it produces an effect very similar to psilocybian mushrooms. *Marah* species are abundant from Southern California to Washington. — B.K., CA

*Marah fabaceus is apparently also known as Echinocystis lobata. The only reference for "wild cucumber" as a visionary plant that we're aware of speaks of using the seeds, not the roots. This information comes from Herbal Highs by MARY JANE SUPERWEED. Overall, this is an inaccurate little booklet, which discusses smoking tobacco through rotten green peppers, smoking banana peels, and smoking dill weed with monosodium glutamate. I'd take any information presented in this booklet with a big grain of... uh, monosodium glutamate. Published in 1970, it states:*

*WILD CUCUMBER (Echinocystis lobata). In the early 1960s several children in Ojai, California, began conversing with nonexistent persons and showing other symp-*

toms of severe hallucination. Later it was learned that they had been nibbling on the seeds of wild cucumbers. This low crawling vine of the melon family can be found growing among thickets along the coastal slopes of California, Washington and Oregon, as well as in many other places throughout the U.S. It has greenish-white flowers and a spiny, green, oblong fruit containing four large seeds. There is no information available at the present time as to the exact chemical nature of the hallucinogens in wild cucumber (possibly lysergic acid amides), but they are most effective when the seed is not quite ripe, around middle or late spring. One seed should be a good experimental starting dose. Birds eat the seed for food without any harmful results, but since its chemistry is still unknown so are its possible dangers. The trip lasts for eight to ten hours and no harmful side effects have been noted.

*From the "conversing with nonexistent persons" comment, we would suspect that belladonna-type alkaloids are present. From the time-frame of the effects reported, it would seem more like ergot-type alkaloids (though this time-frame would also apply to lower doses of belladonna-type alkaloids). Toxic and/or medicinal alkaloids are known from a variety of cucurbits, but neither belladonna- or ergot-type alkaloids have been reported as far as we know. This report of the root being used (instead of the seeds), and of it being mushroom-like, is the first that we have heard. We suggest that someone with access to this plant do an extract and send it to DRUG DETECTION LABORATORIES (or whoever else does qualitative analysis of street drugs).*

## MUSHROOM AYAHUASCA

Into one liter of pineapple juice (used to hasten the conversion of psilocybin to psilocin), I combined five grams (dried and powdered) *Psilocybe cubensis* and five grams (dried and powdered) *Banisteriopsis caapi* leaves. (With all of the literature that I had encountered citing the stems as the primary component containing harmala alkaloids, I felt that using the leaves would offer a mild MAOI effect; assumptions can get you nowhere and everywhere). I refrigerated this overnight. Seven travelers gathered, divided the brew equally, and cruised. The effects were rapid, beginning in about fifteen minutes, rising to a dramatic height and gradually tapering after two hours. None of us were prepared for the intensity, and our focus was not maintained as we had planned. There was a greater internal visionary display than with mushrooms alone, which was more in the green and brown range (more organic) than the blues and red that I usually experience. I also encountered some plant communion with the *B. caapi* growing in an adjacent room (vining, twining, search-

ing, green), although this was an experience only felt by me and none of the other participants. There was some mild GI upset, and pronounced [sweating], but overall the experience was wonderful. — ORION, CO.

*Five grams of dried, powdered B. caapi leaves would at most provide 95 milligrams of total combined β-carbolines if the leaves used were comparable to the strongest reported so far (RIVIER and LINDGREN 1972; MCKENNA et al. 1984). In ayahuasca, this wouldn't provide enough MAO inhibition to orally activate DMT for one person (OTT 1994). It is certainly possible that a greater quantity of B. caapi leaves could be used (rather than stem) as the MAOI in ayahuasca, and—while liana production is outside the reach of all but a few individuals with greenhouses, who might produce enough material for themselves and a couple of friends—growing ayahuasca for leaf and new growth production is well within the capabilities of most people. Nevertheless, we vaguely recall hearing that the natives don't use the leaves as they cause much more nausea than the stem bark (perhaps the leaves contain flavonoids, tannins, or other toxic materials). Regardless, it seems unlikely that the small amount of B. caapi leaves added to this brew had much to do with the apparently increased potency, though we are at a loss to explain why less than 3/4 of a gram of mushrooms per person would have such pronounced effects.*

*Not familiar with the idea that adding pineapple juice to ground psilocybian mushrooms will "hasten the conversion of psilocybin to psilocin," we asked Dr. ALEXANDER SHULGIN if he thought that this would occur. He responded:*

Lordy, I have no idea. I kinda doubt it. Fresh pineapple (especially unripe pineapple) contains a rather potent protein hydrolysis enzyme called [bromelain] which is pretty effective at tenderizing raw meat (and is why there is no such thing as fresh pineapple Jell-O, since gelatin is also a protein). But there is no protein-like bond in psilocybin. And why would one want to do such a conversion anyway? Recent Swiss trials have demonstrated that psilocybin metabolizes to psilocin (and to 4-hydroxy-indoleacetic acid) in the human body. And for storage purposes psilocybin is the more stable compound.

*Indeed, it may be that the antioxidant quality of any vitamin C contained in pineapple juice actually reduces the conversion of psilocybin to psilocin. See "Internet Mushroom Info" on page 8 for more on this idea. On the unrelated topic of possible mechanisms for "potentiation," we've seen speculation on the Internet that the use of white grapefruit juice may "potentiate" specific visionary drugs (DXM was mentioned as one possibility), due to this juice containing "naringenin, which inhibits the P450-1A2 and 3A4 liver enzymes." As well, we've heard Internet rumblings that 5-hydroxytryptophan has been used successfully with MDMA "100 mg just before the peak, or on the way down, seems to greatly enhance the entactogenic/empathogenic qualities without causing an in-*

*crease in muscle tension, gitters, etc.” Finally, one last Internet-reported experiment: “Mildly positive” results have been touted from taking three grams of Ca/Mg supplement over one hour prior to ingesting MDMA. (This practice is based on the idea that amphetamines are more easily absorbed in an alkaline gut.) Apparently the Ca/Mg reduces “jaw clench.”*

## INTERNET MUSHROOM INFO

I know how some readers feel about the validity of Internet information on entheogens, but sometimes I find something that seems legitimate. The LYCAEUM has certainly helped to pool some creative, knowledgeable thinkers. Anyway, I offer the attached web page. *[As the link for this page is no longer active, we’ve summarized the information from this page below.]*

The “blueing” reaction of mushrooms is a result of psilocin being converted into diquinone. Hence, the bluer the mushroom is, the less psychoactive it will be. Eating fresh mushrooms is said to be bad, as some of the psilocin is said to convert to diquinone. Effects of diquinone are said to be anticoagulant (at high doses leading to internal bleeding), and can cause tinnitus, dizziness, nervousness, and nausea. Two processes are related to “get rid of” diquinone: “steam” and “vitamin C” treatments.

Steam-treating is only to be done on previously dried mushrooms. They are supposed to be placed in a vegetable steamer for five minutes or longer, until all of the bluish color is gone, and then the mushrooms should be immediately eaten or redried. The claim made is that steam-treatment causes the diquinone to be converted (hydrolyzed) back into psilocin. This is said to also improve the taste, as diquinone is said to taste horrible. The steam treatment is said to destroy the enzyme that converts the psilocin into diquinone, so after this process is done—if the mushrooms aren’t eaten immediately—they can be redried without worry of future reconversion of psilocin into diquinone. Psilocin is said to still degrade over time through oxidation, but not through the enzymatic conversion into diquinone.

The claim is made that vitamin C, acting as an antioxidant, can “deoxidize old weak psilocin back into its original form.” An experiment is presented wherein one puts a small amount of dried mushrooms in a glass of water, and allows it to oxidize for 30 minutes (or until the mushroom turns really bluish), and then adds 100 mg of powdered vitamin C to the water, mixing it in and allowing it to sit for 30 minutes. The blue-staining diquinone is said to be deoxidized back into psilocin.

I have tried the experiment and sure enough, psilocin-containing mushrooms turn white. I also tried the steam treatment, and dissolved a vitamin C tablet in the water. After a second drying, which required only a few hours on desiccant, the mushrooms returned to their natural white color, with a wood-colored cap. A bioassay produced a much cleaner, clearer feeling, with a substantially accelerated onset. This has become my preferred method of preparation, and I encourage others to try this method for themselves and contribute their results. I would also like to know if anyone can substantiate the claims made on this web page. Are the chemical reactions occurring as the [web page] author contends? — RHOMPUS (formerly HERSHEY), NM

*As is typical with the Internet, information is posted without any references given. What is true? What isn’t? How do you know? We checked on some of the above information in a series of articles titled “THE MUSHROOM ENTHEOGEN” by C. B. GOLD, which appeared serialized in Psychedelic Monographs and Essays, Volumes 1, 2, 4, 5, and 6. According to GOLD:*

[The bluing of psilocybin mushrooms] is an enzymatic oxidation of the various indole-containing molecules in the mushroom tissue, such as tryptophane [*sic*] or psilocin. This bluing reaction breaks down psilocin and psilocybin to inactive compounds. It is also possible that these breakdown products may be toxic.

Psilocybin is the first naturally occurring indole which has a phosphate (PO<sub>4</sub>) group. The phosphate group acts to protect the psilocybin molecule from degradation by potential chemical reactants. In the bluing reaction the psilocybin in the mushroom is first stripped of its phosphate radical to psilocin by a phosphatase enzyme. Then it too is oxidized. The psilocin is then quickly oxidized by metalloproteins, like cytochrome, to a blue product. There is evidence to support that the blue product is a quinone. [...]

Vitamin C apparently inhibits the bluing reaction and the degradation of tryptamines. [...] Vitamin C reduces the bluing color, but *does not reverse the colored product back to an active tryptamine* (GOLD 1985). [Emphasis added.]

*GOLD came to these conclusions through reading the literature, as well as through running his own colorimetric (light absorption) and bioassay tests. GOLD further commented:*

I have indirect evidence that the bluing reaction may in fact be an important step to one who wishes to reduce potential side effects in the mushroom experience. Bluing may oxidize some tryptamine analogs of psilocin to

easily excreted metabolites. This could account for some reduced side effects for those who have a toxic reaction to those tryptamine analogs.

When I have reduced the bluing effects by denaturing the enzymes involved or by chemical means, the subjective experience has always included an increase of restlessness and sometimes even worse side effects, such as headaches or long-term headaches or fogginess of the experience (GOLD 1985).

*GOLD contradicts the above comment a bit, in a later installment:*

The subjective results of using vitamin C as a pretreatment included a more mentally clear trip when compared with air dried mushroom, especially when coming down. Also, vitamin C reduced the headaches somewhat. But it increased the gas, cramps and nausea (GOLD 1987).

*Through numerous experiments, GOLD determined that the most potent mushrooms with the least amount of side-effects are created by vacuum drying them (without a vitamin C additive). Anyone seriously interested in the topics of drying, storing, and maximizing potency of mushrooms should read this series of articles. PM&E is available through ROSETTA.*

*We e-mailed DR. ALEXANDER SHULGIN for his thoughts regarding the idea presented on the Internet that steam treatment or vitamin C treatment could cause "the diquinone to be converted (hydrolyzed) back into psilocin," or "deoxidize old weak oxidized psilocin back into its original form." He commented:*

I have received your mailings regarding psilocybin and psilocin, and I am afraid that they raise more questions in me, than answers.

Does steam treatment or vitamin C treatment of dried psilocybian mushrooms convert the diquinone back into psilocin?

Here again I plead ignorance. I had not heard of any enzymatic process that converts psilocin into a diquinone, and in fact I have not heard of a diquinone. I would love to get reprints of any related publications and, with them in hand, I might be able to make an educated guess. I just now completed a keyword search for both psilocin and psilocybin in both CURRENT CONTENTS and MEDLINE, and scanned the downloaded mass for the word quinon# and there were no hits. This should have picked up quinone, diquinone, quinonic, etc. The chemistry as to why some of these mushrooms turn blue upon bruising may well be worked out, but I do not have any references to them.

I am afraid I haven't been much help. Good luck to you on *The Entheogen Review* adventure. — SASHA

**ER:** *Hi Sasha, thanks for your thoughts. In checking around on this, I did find one reference on this in an article titled "The Mushroom Entheogen:"*

In the bluing reaction the psilocybin in the mushroom is first stripped of its phosphate radical to psilocin by a phosphatase enzyme. Then it too is oxidized. The psilocin is quickly oxidized by metalloproteins, like cytochrome, to a blue product. (9) (14) There is evidence to support that the blue product is a quinone. (3) (16)

*The references given in parenthesis above are:*

(9) DUFFY, THOMAS J., M.D. and VERGEER, PAUL P. California Toxic Fungi. *Mycological Society of San Francisco, 1977.*

(14) OSS, O.T. and OERIC, O.N. Psilocybin: Magic Mushroom Grower's Guide. *Berkeley, California: And/Or Press, 1976.*

(3) BOCKS, SHEILA M. "Fungal Metabolism IV: The Oxidation of Psilocin by p-Diphenol Oxidase (Laccase)," *Phytochemistry, Vol. 6 (1967), 1629- 1631.*

(16) POLLOCK, STEVEN H. Magic Mushroom Cultivation. *San Antonio, TX: Herbal Medicine Research Foundation, 1977.*

*Reference #3 looks the most promising for an answer, and we're gonna try to track it down.*

*Does it strike you that—if what is being claimed is true (that is, if psilocin is converted to diquinone), that it is feasible that either a simple steam treatment or a reaction to vitamin C might reverse this conversion changing the diquinone back into psilocin; or does this strike you as being an unlikely statement within the realm of chemical reactions? Christ, if all it took was adding a little vitamin C or steam to diquinone to create psilocin, this might be the easiest way in the world to create this entheogen. It couldn't be true, could it? — ER*

**DR. SHULGIN:** That reference #3 sounds like the winner. It has the earliest date of the four of them, and just might be the source for the others. I was totally unaware of it, and the next time I am at the MED SCHOOL library over in San Francisco, I will get it.

The term that I got hung up on, was diquinone. If there is really a quinone involved, there must require the introduction of a second oxygen atom. If that indeed occurs, then no simple reduction will remove it, thus making a return to psilocin most unlikely. However if the "diquinone" term is being used in a loose sense, it might be that the oxidation removes the two easily available hydrogen atoms, one from the 4-hydroxy group and the other from the indolic 1-position nitrogen. The result of

that action would be to produce a double bond extended conjugation system of five double bonds across the two rings with the loss of aromaticity of the benzene ring. This product would certainly be highly colored but, as no C-C or C-O bonds have been formed, its reduction back to psilocin would be quite easy. Steam may not have the capability, but there would be any number of gentle reducing agents that could do the job. Is vitamin C an actual reducing agent, or is it just an antioxidant?

Fascinating concept. That *Phytochemistry* paper is essential, and just might be a treasure. — SASHA

We also asked K. TROUT for his thoughts on the above. He responded:

About the claim that adding vitamin C to a blue solution of mushrooms and seeing the blue disappear means that the psilocin reforms. This reaction represents no proof that psilocin reforms. One would have to prepare two identical glasses and decolorize only one and assay both of them. While it would be easy to tell if the decolorized solution is active, I know that “blue” solutions of mushrooms are potent as well. The bioassay result is intriguing; this should certainly be looked at further. If the presence of the blue color adds to discomfort, this may be a good thing to pursue. Off the top of my head I suspect that, if the first reaction actually occurred as described, the reaction would go one way only, and psilocin would be an extremely unlikely product if said mysterious *diquinone* was subsequently broken apart.

I would also like to know where and how it was finally determined that bluing was directly related to psilocin converting to “*diquinone*.” Or even that bluing was *proven* to be directly related to psilocin? Reported studies by BIGWOOD (mentioned by OTT) suggested that bluing may not be dependent on the presence of psilocybin or psilocin—so more work is clearly needed.

For example, it is a known fact that a few very effective mushrooms (like some *Panaeolus*) do not always turn blue, yet apparently contain psilocybin and/or psilocin. There are also mushrooms that blue which contain no psilocybin or psilocin.

GOLD’s comment that there is evidence (???) to suggest the blue product is a quinone does not suggest the product of the breakdown of psilocin was determined to be *diquinone*. (It would be good to eliminate quinones if they were present.) To be a quinone (and, by extrapolation, whatever the fuck a *diquinone* is), there would have to be serious modification of the molecule. This is unlikely to be reversed by heating, vitamin C, or use of an

acid (or any simple procedure for that matter). It is also unlikely that psilocin could be converted to a quinone by any single enzyme, or that natural psilocybin enzymatic pathways even exist that would go that route. SASHA’s comment on the word *diquinone* is a good one; I cannot locate this word either so far, and I find it highly suspect.

One question I do have about all of this: When cooking mushrooms out with lime juice and water (fast: two low-volume extractions heated in a small pan with the juice of half a lime each and a maximum of 1/4 cup of water each, for 12–15 minutes) the difference in effects between the resulting mushroom/lime-tea and eating dried mushrooms is quite similar to what is described in the Internet information, as is the reduction of coloration (to a very pale greyish tawny cast). I don’t experience this same difference when I drink non-acidified tea that has been simmered for prolonged periods. I’ve always assumed the difference was simply due to inactivation (via acid hydrolysis) of a bacteria that caused intestinal distress. I need to re-examine this belief in light of the current discussion.

If simple enzymatic inactivation is all that is being accomplished, this is also performed effectively on most enzymes by heating them to a high enough temperature to denature the protein (this is what would occur with steaming, if inactivation of an enzyme is all that is happening; most enzymes are denatured below 200° F), or by exposing it to a concentrated form of alcohol like vodka or Everclear (i.e. 50–95% ethanol), or by exposing it to an acidic solution (unless said enzyme is designed to handle acids). I have heard that sprinkling vitamin C powder on mushrooms prior to storage will help them keep for long periods of time, but I have not tried it.

After reading a copy of the BOCKS’ *Phytochemistry* paper, a few points immediately jumped out:

1) The enzyme they used was extracted from *Polyporus versicolor*, which doesn’t produce psilocybin or psilocin. That the *p*-diphenol oxidase even occurs in *Psilocybe* species, was apparently never determined or even attempted to be determined (if so, it was not mentioned); only that another enzyme (ceruloplasmin) had shown a similar substrate specificity to *p*-diphenol oxidase from other sources, and was shown (elsewhere) to be able to catalyze “the oxidation of hydroxyindoles such as psilocin.”

2) The blue product formed when they exposed psilocin to their enzyme was found to be similar in color and UV spectrum to the blue product obtained by reacting psilo-

cin with the oxidizing agent ferric chloride. At no point did they isolate it, much less attempt to determine its structure. They did not even directly compare it to the blue color observed in mushrooms or attempt to determine what is actually blue in psilocybian mushrooms.

3) Psilocybin was found to be entirely unaffected by their enzyme. As psilocybin is often more abundant than psilocin, and at least some commonly used psilocybian mushrooms apparently lack psilocin altogether (yet still “blue”), the assertion of decreased potency cannot be considered a blanket statement—only one that might relate to psilocin-containing mushrooms.

That a phosphatase might readily convert psilocybin to psilocin and enhance this deterioration may well be true, and I suspect this factors into the disparity OTT discussed when mentioning that psilocybin/psilocin mushrooms must be kept frozen and do not keep for long, while psilocybin-containing mushrooms with *no* psilocin will keep well at room temperature for fairly long periods of time. Perhaps lack of said phosphatase is involved?

4) The only conjecture that was made about the structure of the blue product was that it was “probably quinonoid in nature.” At no point did they state it was a quinone.

5) The article mentions dimeric quinones (*not* diquinones, but perhaps this is where the author of the web page derived that word) being formed by the experimental oxidation of two different phenols. While psilocin is also a phenol, it contains an additional indole ring and a side chain lacking in both other far simpler phenolic compounds. To get a quinone, serious modification of the structure would have to occur and, as SASHA pointed out, a second oxygen would have to be introduced from somewhere. Obviously the starting compound is not going to be regenerated by any type of simple reduction.

6) While the reduction with ascorbic acid or sodium dithionate eliminated the blue color, there was never any suggestion that psilocin was reformed or generated.

While this may not answer the question of what the blue color is, or how (and if) it actually relates to psilocybin/psilocin, one point is very clear: the referenceless web page author drew some unlikely conclusions that are not supported at all by what we can find so far. It is amazing that people can present such statements, and not be bothered to include supportive references! Additionally, I am puzzled as to how GOLD reached the conclusion that “There is evidence to support that the blue product is a

quinone,” as it is not supported by the primary research paper that *he* cited.

*We are once again left feeling as though, in some cases, the Internet is not “where it’s at” with regard to information on entheogens.*

## BORAMETZ BULLSHIT

On page 14 of the 1997 AUTUMNAL EQUINOX issue of *ER*, “G.A., KY” describes an interesting “Borametz Meditation.” Editor JIM DEKORNE follows this with the comment that, “Borametz extract, in the form of an oil available from herbalists, comes from the leaf of the Borametz tree, an evergreen native to Russia.” This information is incorrect. What’s being sold as “Borametz” has not been extracted from plants. These “plant extract” claims were first presented to me from the person/company that I purchased a bottle from—GEORGE ANGELIDIS in Kentucky. Similar claims have been presented by other companies selling this product. I’ve had two samples of “Borametz” tested by GC/MS (thanks go out to chemist ‘5-HT’ for these analyses). Both samples had the “ANGELIDIS” product label on them, but one came from ANGELIDIS and one came from another company, SHAMANIC TONICS. Chemist ‘5-HT’ comments on the results of the first GC/MS test:

There was one major peak representing 93.67% of the total material and having a retention time of 4.85 minutes. MS showed it to be consistent with 1,4-butanediol. There was a second minor peak being 6.33% and having a retention time of 5.50 minutes. The library suggests this is 1,2,3,4-butanetetrol (maybe a starting material or breakdown product?). And that’s it. No more peaks. The claim that the product contained natural extracts is almost certainly false as one would expect a forest of peaks. This is tech-grade chemical, in my opinion.

The second GC/MS test (from a different bottle of “Borametz”) showed “a mixture of 1,4-butanediol and glycerin (w/ 1,4-butanediol as the main ingredient). NMR confirms alkyl peaks of 1,4-butanediol as well as others that *may* be glycerin.”

ANGELIDIS no longer sells “Borametz,” as he says that his supplier went out-of-business. However, he apparently now sells a similar, *admittedly* synthetic product, labeled as a “Leather Nourisher,” and sold “not for human consumption.” I had this product tested by GC/MS, and it appears to contain 1,3-butanediol and 1,4-butanediol.

I also had a sample of 99% 1,4-butanediol tested by GC/MS, as a comparison. For this test, a kilogram of 1,4-butanediol was obtained from ALDRICH for about \$20.00. I mention the price from ALDRICH, as ANGELIDIS was selling "Borametz" for \$30.00 per ounce. With about 35 ounces in a kilogram, this represents an *obscene* \$1030.00 net profit from a \$20.00 investment! I have no idea where ANGELIDIS obtained his "Borametz," or for what price, but it is quite obvious that somebody somewhere was/is getting rich from this deception. I don't know what ANGELIDIS is charging for his "Leather Nourisher," but I would *hope* that it is substantially less.

Again, "Borametz" doesn't come from plants. The main active ingredient, 1,4-butanediol, is converted by the human body into GHB. For more information on effects from consumption, toxicity information, and sources for 1,4-butanediol, see "The Borametz Scam" in issue No. 2 of *The Resonance Project*. Or, for an unedited and updated version of this article (including GC/MS printouts for "Borametz," "Leather Nourisher," and 99% 1,4-butanediol), send \$5.00 to: SOMA GRAPHICS, POB 19820, (Dept. ER), Sacramento, CA 95819. — JON HANNA, CA

## CORRECTION:

On page 9 of the 1997 WINTER SOLSTICE ER, the "Easy Vaporizer Pipe From Old Light-Bulb" plans were attributed to INNER FRONTIERSMAN. This was incorrect; the plans actually came from PRAIRIE DRAGON. We apologize for the confusion. — Ed.

## GROW YOUR OWN *Salvia divinorum!*

ENTHEOGENESIS offers you an opportunity to cultivate the wondrous DIVINER'S SAGE, "hidden pearl" of power plants.

"This plant is the great secret of our tradition."  
— DALE PENDELL, *Pharmako/Poeia*

*The Salvia Divinorum Grower's Guide*  
plus one fresh unrooted stem cutting  
shipped overnight via Express Mail:  
\$29.95 (CA residents add \$2.25 tax).  
Add \$10.00 for each additional cutting.

## TERENCE MCKENNA SPEAKS...

Transcribed from a video broadcast at the MIND STATES conference, November 23, 1997.

I know that whenever the tribe gathers, whenever the psychedelic community comes together in one place, the issue of our status with regard to the rest of society, and the issue of the status of these substances about which we care so much is discussed. Should we expend political, capital, and social energy to make these things legal? If we did, would many more people who don't today take these things feel free to explore them? Or, in a way, is this wish to legitimize our activities by having them brought in under the umbrella of legality... in a sense, it's a very unpsychedelic impulse. It is an effort to somehow make peace between cultural values; constricted Christianity-driven Calvinistic and the untrammelled wild wilderness of the psychedelic experience. I admire the people who have worked for medical marijuana, the chemists who have given expert testimony in an attempt to help out members of the community who have run afoul of the law, as they say. But I wonder, really, if the psychedelic agenda is to be satisfied by simply gaining legal legitimacy?

We have a very interesting plant now working its way into our midst—*Salvia divinorum*. *Salvia divinorum* is not illegal, it's easily grown throughout the civilized world, it does not have to be administered in some potentially damaging way—in other words, it doesn't have to be shot; it can be smoked, it can be chewed. And it is without question, extremely powerful and effective. It's amazing to me that this plant could appear in our midst, with these qualities, and be accepted with such lack of fanfare. In other words, this is truly big news. In a sense, Nature has stepped into the drug legalization issue—the psychedelic legalization issue—with a *deus ex machina*. I don't believe the establishment is interested in demonizing and criminalizing a new easily grown, widely available psychoactive plant. I don't think the establishment needs a new *Cannabis*. [...] Late in the dialogue about psychedelics, who would have thought that [nearly sixty] years after the invention of LSD and the flurry of psychedelic excitement among the botanists of the '60s and the '70s, that not only an entirely new substance would be discovered, but a substance in a chemical category previously unsuspected of psychoactivity. So in a sense, this is a wild card in the deck, and if we—the psychedelic community—play it to our advantage, we can perhaps transcend the them/us dualism of [drug repression/drug advocacy]. Well, how is that

to be done? The answer I think, is *responsibly*, with attention. Let us not generate emergency room entries and drug casualties based around *Salvia divinorum*—this is the raw material out of which our enemies will fashion our nemesis.

In the past, the psychedelic community has too often been influenced by those who, I think, didn't have its best interests in mind. And by that I mean people who saw psychedelics as somehow a fuel for the popularization of a certain musical agenda, or a certain political agenda, or a certain commercial agenda. I think that if we insist that these things are to be taken—and taken seriously, and taken in shamanic settings—that at this point in the struggle over psychedelics, the establishment is so demoralized, spread so thin, so exhausted, that they will simply decide to leave this particular compound alone. And that will indicate, to me at least, the turning of the tide.

You know, with these new techniques of liquid CO<sub>2</sub> distillation of plant materials, *nanogram* quantities of material that was previously destroyed by high temperature extraction is being gotten out and characterized. And, as you might have predicted, the revelation is that *alpha*-salvinorin, the active ingredient in *Salvia [divinorum]* is very probably only one of an entirely new family of psychoactive drugs. What these drugs eventually will do in terms of the experience they elicit, we don't know. We may be looking at new tranquilizers, new stimulants, new psychedelics, potential memory enhancing drugs, potential learning enhancing drugs, we don't know. This is a cornucopia of new psychedelic possibilities.

At this point, the average man and woman on the street has never heard of *Salvia divinorum*. If the community acts responsibly, they *will not* hear about it for some time. This is an opportunity for us, for the first time in our lives to take, advocate, synthesize, extract, explore [and] do therapy with a psychoactive compound that is *not* illegal. We have not been in this position since 1967, that's more than the lifetime of many of you. So let's take this opportunity, and this plant, and attempt to use it as a model for bringing it and other potential psychedelics into ordinary human usage and put them to the purpose of reconnecting ourselves to the values of the earth, and reconnecting ourselves to each other. ✧

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold new book exploring the legal substrate underlying shamanic mushrooms and their active principles. \$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL INDUSTRIES

Box 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is editor of *The Entheogen Law Reporter (TELRL)*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL INDUSTRIES, POB 73401 (DEPT. ER), Davis, CA 95617-3401.

Questions for possible inclusion in this column can be sent to Mr. BOIRE in care of *ER* at: PHARMACO PROHIBITA, c/o *The Entheogen Review*, 564 Mission Street, Box 808, San Francisco, CA 94105-2918.

# PHARMACO PROHIBITA

BY RICHARD GLEN BOIRE

**Q:** Is CHEMICAL RESALE OF SANTA BARBARA (CRSB) a DEA cover?

**A:** The DEA has been known to set up fake chemical supply companies aimed at attracting and then busting manufacturers of controlled substances. For example, in 1982 the DEA operated a company called UNIVERSAL SOLVENTS OF AMERICA, and advertised the company in "drug oriented" magazines. Similarly, the DEA ran a bogus laboratory equipment and chemical company called GEO-DATA CHEMICALS in Boise, Idaho. Both fronts led to arrests and convictions.

h  
By all indications (including reports from people who received orders), CRSB sold chemicals and glassware to the general public. The company's "we deal with anyone" manner, combined with their product line, and odd payment policy (some transactions had to be paid with a personal check), has led to speculation that they might be a DEA front. Orders could be placed via CRSB's web site, which was well-indexed on all the major search engines. I have only seen a partial list of the chemicals sold by CRSB. While all appeared legal themselves, some could be used in the manufacture of controlled substances.

h  
While I doubt that CRSB was a DEA front organization, it is possible that the DEA now has the names and addresses of anyone who ordered from CRSB. In July of 1997, TOM KASPER, CRSB's owner (known as "wirehead" on the CRSB web site), assaulted a flight attendant while on a Continental Airlines flight from Houston to Los Angeles. Evidently, he blew his top when the airline refused to upgrade him to first class. Enraged, he grabbed a scalding pot of coffee and poured it on one of the stewardesses, causing severe burns on her hand. He then tried to open one of the airplane doors as it was landing. Kasper was arrested for interfering with a flight crew during flight (REUTERS 1998).

No doubt, from the time of his arrest, KASPER was the target of intense federal investigation and certainly the investigators must have learned of his chemical resale business. In late 1997 and early 1998 there were rumors on an online discussion forum that the DEA *did* shut down CRSB for selling GHB precursor chemicals; I was unable to confirm these rumors. On January 12, 1998, KASPER pled guilty to the federal charge of disrupting the flight and currently faces a maximum sentence of life in prison. Sentencing is set for April 27, 1998.

CRSB's web site is no longer accessible; I suspect that the company is defunct. Of course, a man who faces life in prison has a great incentive to cooperate with the authorities. I wouldn't be surprised if the feds take an interest in CRSB and, one way or another, obtain information about CRSB's former customers, or those people who now contact the company via mail. On the other hand, the government has evidently chosen not to maintain the CRSB web site or transform it into an information-gathering front; a move they would logically have taken if they believed it would lead them to underground chemists. ✱

## AMAZON JAUNT

POB 190 (Dept. ER)

Makawao, HI 96768

(888) 777-5981

axiom@aloha.net

<http://www.aloha.net/~axiom/amazonreg.html>

PETER GORMAN, executive editor of *High Times* magazine, will lead three two-week expeditions to the upper Amazon in and around Iquitos, Peru. The trips focus on ayahuasca shamanism and include lessons in plant collecting and jungle survival. The first trip was March 7–20. Additional trips are April 4–17 and August 15–28 and cost \$2,200.00 each. GORMAN has made almost two dozen trips to the Amazon to study indigenous cultures, shamanism, ethnopharmacology, and rain forest destruction.

These expeditions are expensive, and we're not big fans of ayahuasca tourism. However, GORMAN would be a good guide and a lot could be learned. The trips include four evening ayahuasca ceremonies. Remember, all ayahuasca is not created equal; we suspect that it may be common on these types of trips to serve ayahuasca that is quite mild to avoid potential problems that might arise from people who have little experience with entheogens getting in over their head.

A one week trip is offered to Machu Picchu, which includes a San Pedro ritual and a mushroom ritual (\$1,300.00). There's also a one week trip offered to several villages located along the Ampayacho river, which does not offer any ayahuasca or other entheogenic rituals (\$950.00).

## THE BASEMENT SHAMAN

POB 1255 (Dept. ER)

Elgin, IL 60121

(847) 695-2447

bshaman@interaccess.com

<http://www.entheogen.com/shaman/#table>

THE BASEMENT SHAMAN now has a web site and several new products, including:

ABSINTHE MAKING KIT: "We've researched many sources to find one of the finest authentic absinthe recipes. We've assembled all the necessary herb and spice ingredients (you'll provide your own spirit of choice) along with a detailed and illustrated instruction guide. You'll learn how simple it is to master the fine art of distillation using a few kitchen gadgets and some common items obtained from the local hardware store. This kit contains enough botanical ingredients to produce four liters of premium absinthe." Kit is \$28.00.

CALEA DREAMS: "The obscure dream herb, *Calea zacatechichi*, is married with over a dozen herbs, pure flower and plant essences chosen for their ability to promote vivid and lucid dreaming. Contains *Calea zacatechichi*, *Mimosa pudica*, poppy flowers & over twelve other rare plants and botanical essences." One ounce is \$15.00.

## DAN AFRICAN ETHNOBOTANICALS

POB 55033 (Dept. ER)

Northlands 2116

South Africa

+2788 125 2095 2788 (voice mail)

[ethnobotany@iafrica.com](mailto:ethnobotany@iafrica.com)

A supplier of *Tabernanthe iboga* seeds and root-bark. Other African entheogens on request, when available. To place an order, inquire by e-mail (preferred), post or voice mail. Prices vary—you will receive a reply detailing current costs and payment procedures. We only know of one person who has placed an order, but he received it with no problem.

We've recently heard the claim that ten grams of *T. iboga* root-bark is an adequate dose. However, OTT lists the threshold dose of twenty grams as being "thought to contain about 75–125 mg of ibogaine" (OTT 1996). In *The Secret Chief*, the dose for ibogaine is given as 225–300 mg (STOLAROFF 1997). This puts a dose of root-bark at about 36–80 grams, depending on actual alkaloid content. Anyway you slice it, *T. iboga* is going to be an expensive trip.

## D.M.TURNER'S BOOKS ON-LINE

*The Essential Psychedelic Guide*

<http://www.geocities.com/HotSprings/Spa/4558/>

*Salvinorin: The Psychedelic Essence of Salvia Divinorum*

<http://squeaker.cat.net/~donut/scov.html>

**HANS-JOACHIM SCHULTZ**

Theodorstr. 362 (Dept. ER)  
40472 Düsseldorf  
Germany  
0211-652663 PHONE & FAX

A small-but-good selection of plants, seeds, and herbs: *Acorus calamus*, *Anadenanthera colubrina*, *Argyrea nervosa*, *Corynanthe yohimbe*, *Ephedra* species, *Ipomoea tricolor*, *Mimosa hostilis*, *Mucuna pruriens*, *Peganum harmala*, *Phalaris arundinacea*, *P. aquatica*, *Piper methysticum*, *Psychotria viridis*, *Salvia divinorum*, *Stipa robusta*, *Tabernanthe iboga*, *Trichocereus peruvianus*, and *Voacanga africana*. Most interesting to us is the *T. iboga*, which is generally hard-to-find. All prices are in deustch marks; send for a current price list.

**HERBAL-SHAMAN**

POB 8892 (Dept. ER)  
Wichita, KS 67208  
(316) 685-9199 (voice mail)  
shaman@herbal-shaman.com  
<http://www.herbal-shaman.com/hshome.htm>

This company offers eleven different live *Trichocereus* species! These are small plants, offered in 4" clay pots, ranging in price from \$7.50 to \$9.00 each. Other plants and seeds include: *Acorus calamus*, *A. gramineus*, *Anadenanthera colubrina*, *Argyrea nervosa*, *Atropa belladonna*, *Catha edulis*, *Datura stramonium*, *Desmanthus illinoensis*, *Papaver somniferum*, *Peganum harmala*, *Rivea corymbosa*, *Salvia divinorum* (two plant clones, dried leaves, and leaf extract), *Turnera diffusa*, and *Voacanga africana*. Their prices are very reasonable.

Their web site has an archive of extensive information on cactus cultivation and grafting. The archive will eventually have cultivation info. on all the plants offered, but right now it is largely under construction. Their print catalog is free.

**THE HERBEN SHAMAN**

(920) 699-5650  
herben\_shaman@usa.net  
<http://ayahuasca.lycaeam.org/Herben-Shaman.htm>

Very inexpensive *Peganum harmala* seeds: \$3.00/oz, \$5.00/3 oz, \$20.00/lb, \$35.00/kg. Other companies charge between \$8.00 and \$20.00 per ounce! They also have *P. harmala* extract resin: \$1.00/gm, \$20.00/oz; and dried *Salvia divinorum* leaves: \$2.50/gm. Call or e-mail to place an order.

**JODY HORD**

1430 Willamette Street, #4 (Dept. ER)  
Eugene, OR 97401

JODY HORD's main product is a "5x" extraction of *Salvia divinorum* leaves. HORD makes the following claim: "The active principle from five grams of dried *S. divinorum* leaves is extracted and applied to one gram of dried leaf." Both WILL and I have tried this extract, and found it to be quite effective. I've had a hard time feeling any effects from numerous preparations of *S. divinorum*. My most intense effects to date have been from using this extract. \$18.00 per gram plus \$2.00 S/H (orders for three or more grams are shipped free). HORD also sells dried *S. divinorum* leaves, organically grown in Hawaii; \$20.00/7 gm, \$30.00/14 gm, \$55.00/oz—postpaid. Payment must be made with cash or a money order with the "pay to" space left blank (no checks are accepted).

**NEW MILLENNIUM INSTITUTE**

POB 958, (Dept. ER)  
Kamuela, HI 96743  
(808) 885-2181  
(808) 885-5570 FAX  
nmi@aloha.net  
<http://www.planet-hawaii.com/nmi>

The NMI is again offering one of their seminars with TERENCE MCKENNA, from May 24–30, 1998. This educational retreat will be held in the comfort and privacy of a magnificent home designed by FRANK LLOYD WRIGHT on the Big Island of Hawaii. Enrollment is limited to 20 participants. Tuition (\$1,575.00) includes airport transfers, ground transportation, six nights shared accommodations, breakfast and lunch daily, three evening meals, cultural tours, rain forest hikes, yoga classes, and a daily lecture and discussion. Payment is due in full by April 10, 1998. Call or e-mail for a brochure.

WILL BEIFUSS is the author of the *Psychedelic Sourcebook*. He is the founder of the TRANS-NEOCLERODANE CHURCH and lives along a remote section of the Deschutes River in Oregon.

JON HANNA is the author of the *Psychedelic Resource List*. He is a free-lance editor, writer, and artist. In his spare time he teaches a class on visionary plants and drugs at the UNIVERSITY OF CALIFORNIA AT DAVIS.

# TRICHOCEREUS PERUVIANUS ?

BY K. TROUT

A lot of questions keep coming up about what is or isn't *Trichocereus peruvianus*. To begin with it should be made clear that *T. peruvianus* is not the same cactus known as *Cereus peruvianus*. *C. peruvianus* is a common cactus that does contain phenethylamines, but none that are entheogenic. It is stout, fast-growing, and readily available. *Trichocereus peruvianus* is a very different plant.

## CACTACEAE TAXONOMY

There have been questions concerning the identity of the *T. peruvianus* sold by at least two speciality mail-order plant companies: **LEGENDARY ETHNOBOTANICAL RESOURCES** and **WILDFLOWERS OF HEAVEN**. The basis for this questioning, in both cases, is due to lack of entheogenic effects and nonstandard morphology. While on the surface it might seem that the cacti sold by these companies are not *T. peruvianus*, things are not so cut-and-dried for several reasons.

Great variability exists within most cactus species, and hybrid *Trichocereus* species exist and likely may be found in the horticultural market. It is not at all clear what is what, as nobody has carefully surveyed those cacti currently available. Many of these cacti have been in propagation for decades now—centuries, if you count Pedros in Peru and perhaps *bridgesii* in Bolivia. *T. peruvianus* and *T. pachanoi* are believed by some experts to be variants within the same species; with examples of all degrees of intergrades existing. It has been proposed that *T. bridgesii*, *T. cuzcoensis*, *T. macrogonus*, and a handful of other *Trichocereus* (most not chemically analyzed yet) might also be part of this complex. There are several other *Trichocereus* species that look very similar to *T. pachanoi*, but have larger areoles.

All of the horticultural cultivars currently available are in desperate need of a systematic evaluation that is unlikely to happen. If resources allow, we hope to shed some light on this subject in the next few years. Certainly a great many people are now growing verifiable *T. peruvianus* from seed, and increasingly from cuttings. It should be possible to better gauge the entheogenic usefulness of this species and get the most potent strains into the hands of more people for intensive propagation, but a concerted effort is required.

## LEGENDARY ETHNOBOTANICAL RESOURCES

The morphology of L.E.R.'s *Trichocereus peruvianus* [FIGURE 1] is fairly consistent with the description given in *The Cactaceae*, Vol. 2 (BRITTON and ROSE 1920). (See page 21 for the original description, and our commentary on those aspects of L.E.R.'s cactus that *don't* fit this description.) While we don't know anyone personally who has bioassayed L.E.R.'s *T. peruvianus*, a letter printed in the *Psychedelic Resource List Supplement #7* stated, "My order from L.E.R. contained \$100.00 of *Trichocereus peruvianus*. We ate it all, dried & fresh in huge amounts with absolutely no effects." This statement is too vague to be useful. L.E.R.'s *T. peruvianus* costs around \$45.00 (with S/H), so we assume that two cuttings were ordered. Each of these cuttings (if they are similar to the one that we have) can be estimated to weigh more than a pound but definitely less than a kilo. (Our cutting was nearly a foot long and 2 3/4 inches in diameter.) This gives a ballpark figure of around 2–3 pounds of material consumed by two or more people. (We should mention that L.E.R.'s catalog describes their offering as one foot long and 3–4 inches in diameter, and we do know of one person who received a cutting this size. If this was the size of the cutting sent to the person who complained in the *PRL*, then the weight should be increased by at least 1/4 or more.) They also state that they "ate it all, dried & fresh in huge amounts." Does this mean that they dried part of it and ate this with fresh material, or that dried and fresh material were eaten at different times? As for "huge amounts," if it was *T. pachanoi*, three pounds would *not* be a huge amount even for two people. Since their statement may imply multiple ingestions, the amount sampled is unclear. Don't people weigh things they ingest?! Post Office scales will weigh accurately within one ounce (plenty close enough when dosing fresh cacti). Unless some meaningful measurement of dose and source is provided, subjective accounts have little value to anyone who might try to duplicate the results reported. The *actual* number of participants is also hardly a point to omit—"We" is too vague. Hence, it is hard to extrapolate much of anything about the activity of L.E.R.'s cacti from this report.

## WILDFLOWERS OF HEAVEN

One of the two individuals who originally mentioned that W.O.H.'s *T. peruvianus* [FIGURE 2] were inactive (published in *PRL Supplement #4*), had the plants examined by a number of people familiar with *Trichocereus* cacti, including the late D. M. TURNER, who on February 21, 1995 commented:

*I examined the cactus cutting you sent, and also brought it to someone with a large Trichocereus collection to*

assist in the identification. [...] The cutting is definitely not a *T. peruvianus*, as can easily be seen by a visual comparison between the two. The most easily identifiable difference is the spines. *T. peruvianus* has long, thick, dark colored spikes, for both the central and radial spines, which are much larger and darker than on the piece you sent me. [...] The "age" of the cactus has little effect on the appearance of the spines, as even fresh shoots and cuttings off the *T. peruvianus* have the larger spines. It would actually be difficult to pick up a cutting of *T. peruvianus* the size [...] you gave me without gloves, as it's so spiny there would be no place where you could put your fingers.

As a reference for *T. peruvianus*, an acquaintance of mine has put together what is probably the largest *Trichocereus* collection in California. He has a couple hundred tricho's consisting of at least a dozen [species], focussing on [species] with a reported mescaline content. He has managed to obtain 6 mother plants of *T. peruvianus*, nearly the entire batch that was first introduced to the [USA] by JIM DANIEL in the 1950s.

As a second reference [the W.O.H. cutting] was compared to the specimens of *T. peruvianus* that are located in the U.C. BERKELEY botanical gardens [FIGURE 5], and are clearly labeled as such. Although there is some variation among the different *T. peruvianus* specimens, they are all quite similar, with none of them appearing like the sample you sent. Your cutting did not show any of the bluish hue that is common with *T. peruvianus*, and had thicker skin, which seems much closer to a *T. pachanoi*. [...]

Your not getting any effects from eating an identical sample is also evidence of its not being a *T. peruvianus*. I have taken *T. peruvianus* and found that a 4" length, 4 1/2" outside diameter, will provide a very full experience the equivalent of about 500 mg. of mescaline sulfate. I've found *T. peruvianus* to be a good 50% more powerful than *T. macrogonus*, and probably triple the potency of *T. pachanoi*. [...] [My method of consumption] for *T. peruvianus* and others is to cut off the skin along with 1/4" of flesh. I put this in a blender with some water and liquefy. This is then boiled down, the pulp strained out, and the remaining liquid drunk [...].

*Best of Journeys*, — D. M. TURNER (TURNER 1995)

Since the two original negative bioassays were presented to the PRL, two additional (unrelated) negative bioassays were reported. The PRL also received letters noting four positive bioassays of W.O.H.'s cacti! Concerned that these cacti might not be authentic—based on their morphology only, as these cacti are not sold for consumption—W.O.H.'s owner asked his supplier, KAREL KNIZE, about their identity. In a letter from Lima, Peru, dated June 26, 1996, cactus dealer KNIZE commented that deciding what is or isn't a *T. peruvianus* is a highly sub-

## MESCALINE CONTENT ?

Counterculture literature found on the Internet and **ELSEWHERE** claims that *T. peruvianus* rivals *Lophophora williamsii* in potency. This apparently arises from an "applied" interpretation of a comment made in the sole paper reporting mescaline in this species (PARDANANI *et al.* 1977). While they found 0.817% mescaline to be present in *T. peruvianus*, they compared it with the 0.3+% found reported from *T. pachanoi*—the lowest recovery published for this species (CROSBY and McLAUGHLIN 1973). 0.817% does indeed approach the 0.9% reported by F. E. KELSEY (KELSEY 1959), and some others, for *L. williamsii*. On the other hand, mescaline concentrations of up to 6.3% have been reported from *L. williamsii* (HEFFTER 1896)—though most specimens have been reported in the 1 to 2% range—and *T. pachanoi* has had 2% mescaline isolated from it (POISSON 1960). (All alkaloid percentages by dry weight.)

This not only indicates that the *T. peruvianus* that was analyzed was weaker than most *L. williamsii* specimens, but also that in the one published analysis in which mescaline was found, it was less than half-as-strong as the strongest reported *T. pachanoi*! While many reports of various alkaloid levels exist for *L. williamsii* and also for *T. pachanoi*, only a single published analysis of *T. peruvianus* has found mescaline present. At least two other researchers reported no mescaline when they analyzed this species (AGURELL 1969; DJERASSI *et al.* 1955—though DJERASSI's assay for mescaline was flawed procedurally). Additionally, a friend who analyzed 1.5-year-old seedlings of *T. peruvianus* also detected no mescaline

PARDANANI's supplier supposedly used KK 242 as their source for propagation. Whether-or-not this is an aberrant mescaline-producing strain is unknown. Sources were not reported for the other *T. peruvianus* tested (separately) that did not produce mescaline; AGURELL used European nursery-grown cacti while DJERASSI apparently used field-grown cacti. Source information was also unavailable to my friend who tested his seedlings.

In the case of the 1.5-year-old *T. peruvianus* analyzed, their age may have been a factor. In *T. pachanoi*, bioassay experience suggests that older plants are stronger than young ones. With *L. williamsii* it takes around five years before mescaline appears in any decent amounts, and almost double that long before they get potent. The lone published bioassay of grafted *L. williamsii* has also indicated low alkaloid content, and we suspect it is for the same reason; their bioassay used 1 3/4 inch plants that were grown in 3.5 months by grafting (MERCADO *et al.* 1996). In spite of the large size of these young buttons, their lack of strength is not surprising due to their age.

On the other hand, we cannot ignore the fact that numerous bioassays of *T. peruvianus* do indicate that its entheogenic effects are subjectively stronger than *T. pachanoi*. Anecdotal reports from several psychonauts indicate that *T. macrogonus* is also stronger than *T. pachanoi*—a fact that the single published analysis of the species (AGURELL 1969) suggests is unlikely (again underscoring the need for analyzing a broader selection of material).

Presently, the basis for this disparity remains a mystery. Perhaps some varieties or strains contain mescaline, and other do not. (It has been conjectured by one psychonaut that the blue forms of the cacti might prove highest in mescaline.) We are in the process of growing out a few different ‘varieties,’ and plan to do a comparative assay once size allows. In many other species, closely related varieties often show a different expression of alkaloids and sometimes differ as to whether alkaloids are present or not (SHULGIN and SHULGIN 1997)!

Those people selling purported but erroneous *T. peruvianus* are—for the most part—not cactus dealers; they are rare plant dealers who offer a few cactus species. *We do not suggest or suspect any deliberate deception on their part.* The stock that actual cactus dealers have is usually correctly identified, but errors can and do occur.

In recent years, *T. peruvianus* is increasingly difficult to find, as entheogen aficionados who encounter this cactus for sale will purchase all of the stock they come across. We personally know of two separate instances where the purchaser bought out the entire inventory of large cactus suppliers. CACTUS UNLIMITED (in Cupertino, CA) recently mentioned that they had a waiting list for this species! *T. peruvianus* seeds, on the other hand, are readily available.

## WHAT NOW?

It is clear that at least two mail order sources are selling cacti that *may* not be what they are representing them to be. Yet, as indicated earlier, it is not certain that even authentic *T. peruvianus* is always going to be psychoactive. We are interested in collecting more data on this topic, to try to sort things out a bit better. We would love to hear more about *your* personal experiences—what worked and what didn’t. Points to include when possible:

- 1) What is the body weight of the person who ate the cacti?
- 2) How much was consumed? (List dry or fresh weight when known.)
- 3) What part of the cacti was consumed?
- 4) How was it consumed?
- 5) What was the source of the cacti?  
(Why were they believed to be *T. peruvianus*?  
Is a varietal name or other identifier known?)
- 6) How old were the cacti?
- 7) What time of year was the cacti harvested?
- 8) How many ribs did the cacti have?
- 9) What effects (or lack of effects) did it have?

Photographs, especially with clear shots of the spines and areoles, are appreciated. If you’d like your photos returned, please note this and include a SASE. Please use a pseudonym on all correspondence. Send to: **T. PERUVIANUS PROJECT**, c/o *The Entheogen Review*, 564 Mission Street, Box 808, San Francisco, CA 94105-2918. Thanks! ✧

jective problem, because there isn’t any clear definition of the species. He noted that, “The cuts we sent to you [are] genuine, local species from the original locality and reproduced by parts (no seeds). We [are aware of] 3-5 forms and I collected all forms” (KNIZE 1996).

KNIZE’s comment that there are between three and five different forms of *Trichocereus peruvianus* (that he sells wholesale) is interesting, as it might explain why some psychonauts who consumed cacti from W.O.H. experienced no effects, while others reported these cacti to be entheogenic. It is worth noting that the *one* strain that tested positive for mescaline, KK 242, originated from KAREL KNIZE!

W.O.H. no longer buys *T. peruvianus* from KAREL KNIZE, as they have found another supplier. This points out something that might not be immediately obvious; the wholesale source for cacti retailers may change without any notice to the consumer. Hence, a company that at one time sold entheogenic cacti, may now be selling inactive cacti (and visa versa).

We viewed the cacti that W.O.H. had for sale at the MIND STATES conference, and noticed a great deal of variation among what was being offered. Many of these cacti had smaller spines, looking similar to the cacti that W.O.H. had obtained from KAREL KNIZE. Despite this morphological disparity, these cacti have been reported to be entheogenic.

## ELSEWHERE

A recent example of this claim appears in *Peyote and Other Psychoactive Cacti* by ADAM GOTTLIEB. Republished in 1997 by RONIN PUBLISHING, INC. (an “update” of the 1977 booklet), this book states: “*T. peruvianus* is purported to contain ten times the mescaline content of San Pedro (i.e. approximately the same content as peyote).” It seems likely that the 1977 version of this book may have been the origin of the urban legend that *T. peruvianus* is “ten times” as potent as *T. pachanoi*, and it is unfortunate that GOTTLIEB (and now RONIN) continue to propagate this misleading information.

K. TROUT is a scholar, independent researcher, and author of *Sacred Cacti and Some Selected Succulents*. He also offers TROUT’S NOTES—an information abstraction and annotation service related to entheobotany. For a current listing of available TROUT’S NOTES, see page 12.

**FIGURE 5.** An adult *Trichocereus peruvianus* grown in full sun.

**“*Trichocereus peruvianus* sp. nov.**

“Plant 2 to 4 meters high with numerous erect or ascending, stout branches, 15 to 20 cm. in diameter, glaucous when young; ribs 6 to 8, broad and rounded, areoles large, 2 to 2.5 cm. apart, brown-felted; spines brown from the first, about 10, unequal, some of them 4 cm. long, rigid and stout, not at all swollen at base; areoles on ovary and flower-tube hairy; mature flowers not seen but evidently large and probably white.

“Collected by Dr. and Mrs. ROSE near Matucana, Peru, altitude 2,100 meters, July 9, 1914 (No 18658). This species resembles *T. bridgesii* but has stouter and darker spines. It is found on the western slopes of the Andes at a much lower altitude than that species.” [From page 136 of *The Cactaceae* by BRITTON and ROSE 1920.]

**“*T. peruvianus* BR. & R. (1)**

“**Bo.** erect at first, then arching over or even prostrate, to 7 m lg., bluish-green, frosted; **St.** to 20 cm Ø; **Ri.** 6–8, broadly rounded, with a V-shaped notch over the Ar.; **Ar.** large, brown-woolly; **Rsp.** 6–8, to 1 cm lg.; **Csp.** mostly 1, to 4 cm lg.; **Sp.** honey-coloured below, darker above; **Fl.** very large, white.—Peru (near and above Matucana, on the Central Peruvian Andean railway).” [From page 496 of *Cactus Lexicon* by BACKEBERG 1977.]

**FIGURE 1:**

Large brown woolly areoles and no more than eight ribs are described for *T. peruvianus*. The L.E.R.’s cacti that we’ve examined does not have large or brown woolly areoles, and at least one specimen had nine ribs. They do have the characteristic V-shaped groove above each areole, but this is a feature that also shows up in other *Trichocereus* (for example, it is occasionally present on *T. bridgesii*).

**FIGURE 2:**

W.O.H. cactus have much shorter spines (consistently) than are described for *T. peruvianus*. Indeed, they do appear to be a hybrid of *T. pachanoi* and *T. peruvianus*, as they also lack the bluish tint of the latter, appearing closer in color to the former. While D. M. TURNER opined that the “age of the cactus has little effect on the appearance of the spines, as even fresh shoots and cuttings off the *T. peruvianus* have the larger spines,” it has been our experience that the spines on the growing tip of the cactus (perhaps the top six inches) frequently have smaller spines than the main body of the cactus. *T. peruvianus* spines appear to increase in length, the older the cactus gets (see description below of FIGURE 4), and they also may take on a greyish tint with age. This isn’t true with the samples of W.O.H. cacti that we’ve seen—the spines have been uniformly small (though larger than *T. pachanoi*) for the entire length of the cacti.

**FIGURE 3:**

A *T. peruvianus* that is about three years old, grown from seed obtained from the now defunct mail-order botanical company ...OF THE JUNGLE. This plant matches the description for *T. peruvianus* fairly well, though the areoles aren’t brown.

**FIGURE 4:**

An example of the KK 242 *T. peruvianus* strain that tested positive for mescaline.

**FIGURE 5:**

The cacti in residence at the U.C. BERKELEY BOTANICAL GARDENS are some of the largest that we’ve seen. Their *T. peruvianus* is no exception. It is hard to compare growing shoots that are only a few years old and which have never seen full sun to these monsters, as there are differences that are due to age and environment. The spines on these older cactus grown in full sun are quite a bit longer, and they appear to become gray with age. These cacti are very similar in appearance to the adult/full sun-grown *T. peruvianus* in cultivation alongside a fence at THE PEYOTE FOUNDATION.

# BOOK REVIEWS

## PHARMACOPHILIA OR, THE NATURAL PARADISES

Reviewed by Jon Hanna

JONATHAN OTT's latest book kicks off with a poem. In reviewing this, it would be unfair to both the reader and to Mr. OTT, if I didn't make it clear that—in general—I am not a fan of poetry. With that noted, I can say that I almost wasn't able to read "Phytomphalos" in its entirety. OTT's poem is heavily inspired by various influences, which he references in the first endnote, "So as not to lame the music with citations and quotation marks." While OTT has chosen his influences well, frequently paying tribute to THOREAU and BLAKE, I believe that OTT's *overwhelming* penchant for alliteration pays unmentioned tribute to another "great" of poetry—THEODOR S. GEISEL. Unfortunately, the massive alliteration that inundates OTT's opening poem also leaks into the text of *Pharmacophilia*. And, while occasionally amusing, it is more often than not an irritating side effect—causing the reader to seek out some *less* "artificial paradise." Quite aware that poetry is off-putting to some, OTT admits that there is only "a small minority of human animals in principle transportable to the artificial paradises of poetry," but then remarks that "alliterative word-music poetry [...] is capable of stirring the souls of even those who do not apprehend or comprehend its words," citing the "artificially-constructed linguistic system" of JAMES JOYCE's *Finnegans Wake*. However, OTT's "linguistic system" is too similar to English. By using words that are semi-recognizable, OTT "lames the music" of his poem by causing the reader to repeatedly consult the dictionary throughout the reading! I am hopeful that the *Lorax of Ludibund Lozenges* will, in the future, stick to well-written prose (which is certainly his forte), and part from the "paradise" of poetry—which, like so much *artificial* sweetener, leaves a bad aftertaste.

Poetry aside, *Pharmacophilia* is excellent. OTT argues that the "paradises" drugs can trigger in humans are completely *natural*. OTT challenges 1800s French poet CHARLES BAUDELAIRE's terminology of these states of consciousness—*Les Paradis Artificiels* (*artificial paradises*)—and through a number of examples shows that BAUDELAIRE was even likely aware that these are paradises of *natural* construct.

Presenting commentary on the history of the "celestial pharmaceuticals"—entheogens such as *Amanita muscaria*, *Lophophora williamsii*, and psilocybian mushrooms—OTT convincingly argues that these genuine sacraments were likely the root of religious thought. Idiosyncratic responses to various drugs are reported; genetic and neurochemical variations are cited as possible reasons for these experiential differences. The "self-medication" theory is presented and lent credence by pharmacological studies. Beneficial directions for psychopharmacological engineering to take are espoused. As to be expected, all topics are blended together skillfully with OTT's impeccable logic, humor and scathing political commentary, as the following quote testifies to:

Spinelessly submitting to the tyranny of unelected 'Drug Tsars,' citizens of the United States consent to degrading assaults on human dignity—urinalysis on the job, 'body-cavity searches' in customs—debased and demeaned, not by drugs, but by our obsequiousness. True to form, it's now become fashionable for cancerous smokers to pursue lawsuits against the tobacco companies, as 'though they had been forced to ingest tobacco products like so many helpless laboratory animals—the macho 'Marlboro Man' pathetically transmogrified into whimpering weakling, powerless to resist the siren songs of smokes!

To a small extent, *Pharmacophilia* can be seen as a much-expanded redux of "The Etiology of Religion: A History of Hallucinogen Use," and "The Biochemistry of Emotion;" two chapters from OTT's 1976 book *Hallucinogenic Plants of North America*. A number of themes that run through these chapters also appear in *Pharmacophilia*—replete with the same quotes as examples! It is interesting to compare these two works, noting the point OTT was at a couple of decades ago, and the direction that his writing has taken. His current book presents a well-researched multidisciplinary approach to the study of drug use, throughout the text and the endnotes.

*Pharmacophilia* is heavily annotated (over half of the text appears in the "Notes"), presenting scientific evidence to back the theories that OTT proposes. Unfortunately, OTT oddly omitted a bibliography in *Pharmacophilia*, instead including all of the works cited in these endnotes. This makes it much more difficult to look up references—one must pains-

takingly scan the Notes to find what one is looking for, rather than easily check an alphabetized bibliography.

Even *with* the poetry (yech) and *sans* bibliography (sigh), I can heartily recommend *Pharmacophilia*—my copy of which is already heavily dog-eared. Available for \$18.00 softcover, or \$36.00 hardcover, plus \$3.00 S/H per book from: JONATHAN OTT BOOKS, POB 1251 (Dept. ER), Occidental, CA 95465.

## THE SECRET CHIEF

### Conversations with a Pioneer of the Underground Psychedelic Therapy Movement

Reviewed by Will Beifuss

*The Secret Chief* is the transcribed talks between MYRON STOLAROFF and "JACOB," the pseudonym given to the Jungian psychologist who pioneered the use of psychedelics as an adjunct to therapy throughout the '60s and '70s. Nicknamed "the Secret Chief" by his friend TERENCE MCKENNA, he also appears in the SHULGIN'S book *PIHKAL* under the pseudonym "ADAM FISHER." These interviews were conducted in 1981 when JACOB was 70, six years before his death.

JACOB was responsible for introducing nearly 3000 people (clients and other therapists) to the benefits of psychedelics for personal growth. He was one of a small coterie of therapists who continued to use this medicine even after the repressive laws of the mid-sixties ground all research to a halt. After a lifetime of service to others, JACOB had the admiration and respect of all those who were fortunate enough to know him. MYRON sums it up best:

JACOB was a man who brought new life and opportunity to many hundreds of individuals, often in total life-transforming ways. He was dearly loved. This was not because of his elegant expression or professional training. It was because he was blessed with an abundance of heart, the most necessary prerequisite for someone accompanying others into the depths of their very souls.

*The Secret Chief* is an excellent book that pays homage to a man who richly deserves the recognition for bringing so much clarity and insight into the lives of so many people. Available for \$10.95 plus \$3.00 S/H from: MAPS, 2121 Commonwealth Avenue, Suite 220 (Dept. ER), Charlotte, NC 28205. All profits from the sale of *The Secret Chief* will be devoted to psychedelic psychotherapy research.

Mind Books offers over 250 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

- Philosophy & Pioneers (32 titles)
- History & Stories (24 titles)
- Public Policy & Law (15 titles)
- Psychology & Empathy (26 titles)
- Religion & Spirit (17 titles)
- Practical Guides (19 titles)
- Traditional Cultures (67 titles)
- Plants & Compounds (28 titles)
- Chemistry & Neuroscience (23 titles)

We offer our free print catalog; fast and discrete service around the world; and easy ordering by mail, phone, email, or fax. For a free catalog, send your address to:

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

IBOGAINE

## A GUIDED IBOGAINÉ EXPERIENCE

I was introduced to ibogaine by a dedicated individual named ERIC TAUB, who has now become a good friend. About a month before the experience, ERIC suggested that I begin working on an intent. Such an intent, he proposed, would help guide the experience. My initial primary intent was simply to successfully survive the experience. As such, I meditated on and prayed for courage, and to remember to be grateful, to surrender, to forgive myself and others, to smile and to breath.

As I knew ibogaine was a powerful addiction interrupter, I knew too that my attachment to smoking *Cannabis* might be effected—an unlikely outcome, given my long-standing love affair with this herb. Even so, I figured there was nothing to lose. My reasoning was this: for something to interrupt my desire to connect with the very enjoyable state of mind that *Cannabis* afforded me, that something would itself have to create a sustained physiological state that was at least as satisfying. Interestingly, as the day of the ibogaine journey approached, my desire to smoke *Cannabis* started tapering off.

The day arrived when I checked into the hotel suite where I would open myself to the unknown. Having had some shamanic training, I invoked the assistance and protection of my power animals and other beings to help me with what I knew would probably be a challenging journey. ERIC was my sitter, and his calm demeanor gave me a level of comfort that I was glad for.

At 8:30 am, he suggested that I take two dramamine to help quell the nausea that often accompanies the ibogaine experience. At 9:00 am I ingested 860 mgs of 99.8% pure ibogaine hydrochloride that had been extracted from *Tabernanthe iboga* root (and was taken in capsule form). I laid down quietly in bed. ERIC advised me to lay as still as possible, and said that if I did have to move, I should do so slowly and deliberately—to move as if the room was filled with honey. I soon found the wisdom of this advice. About a half hour into the experience, I reached forward to adjust my covers a little too fast. A small wave of nausea hit, then gradually receded. At about the 45-minute mark I had to pee. ERIC escorted me to the bathroom. I found my coordination definitely off, as my feet inched towards the apparently receding bathroom door. I got back to bed, laid down and concentrated on being as still as possible. I kept reminding myself of THICH NHAT HANH's breathing meditation: "Breathing in, I relax my body; breathing out, I smile."

I became aware of a slight buzzing in my head and tingling in my fingertips. As the journey progressed, the buzzing and tingling persisted and increased a little, but not to the point of discomfort or annoyance. As I lay quietly, I saw a

clean white dog inside a car, and a dirty white dog outside it, wanting to get in. The image slipped inside my visual field so smoothly that it only dawned on me a few moments later that this was my first vision.

Over the course of the next 7–8 hours an enormous amount of material was presented—most of it visual imagery of scenes involving myself, other people and events. Other material was presented in auditory form. Looking back, it seems that the ibogaine triggered in my psyche a process of intensive introspective psychoanalytic renewal—all of the images and impressions working to deconstruct stagnant or debilitating ego-formations through shedding light on the circumstances around which they initially congealed; this then ultimately creating new awareness, new insight, and an underlying feeling of my psyche being deeply and luxuriously nourished.

Unfortunately, the overwhelming majority of the impressions were lost in the cyclonic wake of the experience. I tried hard to recollect but mostly just couldn't. Those memories that did come back were fragmented and non-sequential, but I have documented them as follows, nonetheless:

▼ I saw the three capsules I had ingested going down my throat, into my stomach, dissolving, allowing the ibogaine to be released into my system. I saw that the ibogaine had intention—intention to check everything out in this strange new environment and to begin its healing work on my psyche without delay by moving straight to the appropriate neuronal receptor sites throughout my body.

▼ As the level of the experience grew increasingly intense, I remember repeating over and over, “I surrender my old self; I am born again continuously with each new breath.”

▼ I saw a series of cataclysmic events; buildings being blown to pieces by the force of wind or shock waves (reminiscent of DEPARTMENT OF DEFENSE nuclear blast footage); continents and coastlines altered. I remember thinking that the only thing that could cause such destruction would be a massive space-borne object slamming into the earth.

▼ I was traveling contentedly and fearlessly through twisting curving tubes—like the tubes at waterslide parks. I remember my witness thinking, “What if I meet something scary around the bend?” It then occurred to me that I was in such a relaxed and centered head space, that nothing would likely be able to throw me off. Later on in the journey I was

still traveling through the tubes but now the tubes were incompletely formed, with gaping portions missing. Through the openings the underlying grid-like superstructure of the tube was revealed. Toward the end of the journey it felt like I was still traveling along at a healthy clip, but by now the tubes were no longer in evidence. Instead, I was traveling on curvy, winding train tracks.

▼ I remember seeing a frisbee made of concrete. I wondered what this was. Then I chuckled as I understood the pun: “disk” + “crete.” Discrete. Then I was made to understand the importance of discretion. That the faculty of discretion is such an indispensable, valuable tool in handling some of the tricky situations that often come up in life; that it's so very important to learn the art of knowing when to keep my mouth shut. That “blabbing” unskilled; that discretion requires presence of mind and vigilance.

▼ I went back to my birth. I saw myself pressed tightly in my mother's womb in the final stage of expulsion. There didn't seem to be much of an emotional charge with this material, maybe because of prior work I'd done in this area through the modality of holotropic breathwork; maybe also because most of what I recollect viewing under the influence of the ibogaine was through the filter of my emotionally detached witness.

▼ One more recollection. About an hour into the experience (or so it seemed to me), I heard ERIC exclaim, “Wow! Did you feel that wave?!” I was pretty well immobilized by then, but I made a mental note to ask him about this later. When I did, he was surprised because the exclamation was made at a session *following mine in another room*. His exclamation was brought on by his sensitivity to the ibogaine vibe/“wave” as it was coming on in the person he was sitting for.

By 5:00 pm the peak of the rush had subsided, and my coordination was starting to come back. I drank some juice and rested until about 2:00 am, when I fell asleep. I woke up at about 5:00 am, filled with a transformative mixture of profound inner peace, spiritual rebirth, and intense aliveness.

Three weeks after the experience, and virtually all my interest in and appetite for *Cannabis* has dwindled to near non-existent levels—and it hasn't been a question of will power either. I just feel so full, so satiated, and alive, that any notion of getting high or high-er, is just totally irrelevant. There's also this parallel sense or feeling of wanting to protect and nurture this pristine state.

Where this will lead to from here, there's no way of knowing. What *can* be said is that the resultant deep, quiet clarity born of this experience is daily opening in me new levels of centeredness and creative expression. All in all, I'm very grateful for having had this opportunity and would encourage anyone interested in entheogenic self-exploration to seriously consider this experience. — D.L., NV

For more information on guided ibogaine sessions write to: ERIC TAUB, 116 NW 13th St #152 (DEPT. ER), Gainesville, FL 32601. Or visit TAUB's web page at <http://www.ibeginagain.org>

## VOACANGA AFRICANA

*Voacanga africana* seeds are now available from many sources. In animal experiments, the ibogaine-like compounds found in relatives of *Tabernanthe iboga* have shown properties similar to ibogaine—the chemical responsible for *T. iboga*'s stimulant and visionary properties (OTT 1993 citing BERT *et al.* 1988; ZETLER *et al.* 1968). In addition to *V. africana* seeds, JLF has had, as of October 1997, added *Tabernaemontana sananho*: 90 grams of roots for \$50.00, or 120 grams of stems for \$40.00. This plant is also mentioned as having chemical constituents similar to *T. iboga* (OTT 1993). It would be nice to know how many grams is effective at what level, and also what amount might cause one to take a permanent vacation.

L.E.R. sells a hundred *V. africana* seeds for \$35.00 (about 7–8 grams), and JLF sells thirty grams for \$25.00. I purchased L.E.R.'s seeds, and have eaten seven seeds, crushed into a powder, and swallowed in a single gel-cap. After two hours or so, remarkably noticeable effects began, which reminded me of mescaline, with a +2.5 on the SHULGIN SCALE. I was going to eat fifteen seeds, and I am glad that I didn't, because I was barely prepared for what happened from only seven seeds. I saw swirling patterns, while lightly floating in a fuzzy sphere about me. My peripheral vision was dramatically increased. My body felt numb at times, and my limbs were tingling. My mind kept drifting or transcending off on deep daydreams, which would close off with a snap and I'd be back in my chair, startled at how far away my dreams seemed to have taken me. Regarding *V. africana*, the defunct ...OF THE JUNGLE catalog stated: "Although the rootbark is employed in folk medicine as a stimulant and heart strengthener, the seeds themselves are reserved for visionary use among the elders." The BOTANICAL PRESERVATION CORPS sells *V. africana* plant-extract in one ounce bottles for \$22.00 with the statement,

"The indigenous healers who collect this material for us prefer *Voacanga* to the other more famous African sacred plant ally." In a prior experiment, one half a bottle of their tincture produced an interesting, non-nauseating +1, with little or no visuals. I dare not take a large amount of seeds for fear of experiencing the terrifying tales told in an excellent summary of *T. iboga* and ibogaine in the *Psychedelics Encyclopedia*, where bioassays enabled dreamers to soar as birds above intricately detailed cities, meet dead relatives who warn them to return, and have other disturbing visions (STAFFORD 1992). People also experienced extreme nausea and some African Bwiti cult members in Gabon have died from ingesting *T. iboga* root in large quantities (FERNANDEZ 1972). THKAL notes that an ibogaine dose requires from hundreds of milligrams to up to a gram or more. While it does not mention *V. africana* by name, it does mention that many plants contain iboga-type alkaloids; in particular *V. schweinfurthii* var. *puberula* contains ten alkaloids. The major one being tabersonine, is present in the seeds "at a rather remarkable 3.5%." Ibogaine is also present in the root-bark as a minor constituent, at a concentration of 0.02% (SHULGIN & SHULGIN 1997). This leads me to find L.E.R.'s *V. africana* seeds as a major legal entheogen source, which is far easier to prepare than ayahuasca, with as few as seven crushed seeds fitting easily into a single gelatin capsule! — TENGU, Japan

K. TROUT responds:

Yes, there are several alkaloids in most *Voacanga* species and in a few *Tabernaemontana* species that are "similar" to ibogaine. These include: ibogaline, ibogamine, iboxygaine, isovoacangine, tabernanthine, voacangine, and voacristine. Any and all evaluation of these compounds used lab animals and apparently none have seen a proper pharmacological evaluation in humans. As far as I can presently determine, these are suspected—not proven—to have an action similar to ibogaine. It should be noted that most workers were comparing them with the stimulant properties of ibogaine rather than its visionary effects.

The experience reported by TENGU does not resemble what others have reported from low doses of ibogaine. Despite this, the experience certainly sounds interesting and worth looking into. This also needs further evaluation as doses of what is presently being sold as *Tabernanthe iboga* on the streets were reported by friends to show powerful effects at much lower than expected doses. The actual identity of this material needs to be confirmed, as the active doses were less than half what is generally given as a normal entry level dose of *T. iboga*.

Two of the *Voacanga africana* alkaloids—voacamine and voacorine—have been reported as cardiac stimulants; the first stimulating the heart muscles but not slowing the rhythm, and the second resembling digitalis in its action on the heart. Both, however, are reported as being far less toxic than digitalis (QUEVAUVILLER & BLANPIN 1957). Despite similar reports by others, apparently this activity has failed to be demonstrated reliably (FISH *et al.* 1960).

Voacangine, (ibogaine with a carbomethoxy group added), has been said to show only weak CNS stimulating properties (TAYLOR 1965 citing ZETTLER & UNNA 1959) or psychoactive effects like *T. iboga* (OTT 1993 citing ZETTLER 1968). R.C. RATHBUN at LILLY RESEARCH LABORATORIES found them to have different pharmacological activity with voacangine lacking the stimulant properties of ibogaine (GORMAN *et al.* 1960). Voacangine can be converted to ibogaine chemically (see PERCHERON *et al.* 1957).

While *Voacanga* alkaloids have been considered to be fairly nontoxic and rapidly eliminated (VOGEL & UEBEL 1961; TAYLOR 1965), it should be stressed that many of the *Tabernaemontana* species contain a multitude of alkaloids, not just the desired compound(s). Psychonauts interested in experimenting with *Tabernaemontana* species should review their alkaloid pharmacology, distribution and ethnopharmacological uses. In the few cases when *seeds* were analyzed, there were considerable differences from the stems or roots, and often significant differences between the stem and roots themselves (see VAN BEEK *et al.* 1984).

Death from the *Voacanga* and *Tabernaemontana* alkaloids appears to be due to respiratory paralysis. Symptoms after being given lethal doses via intraperitoneal injection include paralysis of skeletal muscles, irregular breathing, cyanosis, asphyxia, tremor, clonic convulsions, coma and death within 8–25 minutes (TAESOTIKUL *et al.* 1989).

While no *Tabernaemontana* species is regarded as extremely toxic by native users, caution and common sense should be used in exploring this area. Respiratory depression, following the initial stimulation, temporary leucopenia (abnormally low white blood cell count) and abnormally low blood pressure are among the negative side-effects reported in animals studies.

One apparently common after-effect that has been reported by the handful of people I know of who have tried *Voacanga* and *Tabernaemontana* species is mild incontinence (“urinary dribbling”). While fairly minor— not lasting for more than a couple of days—and obvi-

ously not life threatening, this is an annoying side-effect that has caused myself and those few others I know with experience in this area to limit, or in some cases even abandon, bioassays. For more on the activity and toxicity of the alkaloids present in these species, see TABLE 1.

The *Tabernaemontana sananho* extracts I have sampled to date have been limited to two different preparations of “tsicta.” Both have produced a state of sharpened awareness but no type of visionary effects beyond slight after-images, at the levels sampled. The two preparations were distinctly different from each other in taste, strength and appearance. One (the better of the two) was turbid (claimed to have been produced by a native healer), while the other was produced by Soxhlet extraction, almost clear and contained excessive amounts of ethanol. The maximum amount of either that was ingested was half a bottle.

I have smoked *Voacanga africana* seeds several times but thus far have only evaluated them up to the six seed level. So far, there has been no visionary effects beyond mild tracers behind moving objects and slightly defined colored contours around images at the highest level sampled.

However, to generate a ball-park feel for this, let’s assume, for argument’s sake, that the seeds somehow tested out at a whopping 5% for ibogaine or whatever. If 100 seeds weighed 7–8 grams (lets call it 7.5 grams) then each seed would be around 75 mg. Multiply this by seven seeds and we have 525 mg of material. Times 5% and we have a maximum of 26.25 mg of ibogaine or whatever per seven seeds. As we do not know what is actually in these seeds, it should be clear that if said seeds are as potent as described, either the seeds would have to contain in excess of 14% ibogaine or whatever (extremely unlikely) or else an active entheogenic alkaloid that was many times stronger than ibogaine, just to produce threshold effects by ingesting seven of them. Remember, virtually all of these estimations are far stronger than will be encountered in reality and most reported effective dosages are much higher than the 75 mg of ibogaine we used to calculate the threshold level. The dosage for ibogaine is considered by some to be 3 mg per kg (USDIN & EFRON 1979).

I have not been able to obtain any work on the alkaloid content of the seeds other than the mention of tabersonine (OLIVER-BEVER 1967, 1982, 1983, 1986). Tabersonine has been described as a mild hypotensive with a quarter the activity of reserpine (VAN BEEK *et al.* 1984 citing ZETTLER 1963). Regarding TENGU’s comments (citing SHULGIN & SHULGIN 1997) on *Voacanga*

**TABLE 1: Activity and Toxicity of some Apocynaceae alkaloids:**

**COLUMN A:** Relative activity for "nonamphetamine central stimulation" by some *Voacanga* and *Tabernaemontana* alkaloids; ibogaine is set as 1—the highest potency listed. The relationship between these values is inversely linear (*i.e.* a value of 10 means that ibogaine is 10 times stronger as a CNS stimulant). This may or may not reflect visionary activity. All values are rounded to nearest hundredth. (Modified from BERT *et al.* 1988)

**COLUMN B:** LD<sub>50</sub> values. All values as mg/ kg of body weight. The lower the number; the more toxic the substance.

COMPOUND	A	B
Ibogaine	1	275 mg/kg/ sc/ mouse (PARIS & VAIREL 1949) 42 mg/ kg/ iv/ mouse (ZETLER 1964 citing ZETLER & UNNA 1959)
Conopharyngine	46.15	145 mg/ kg/ iv/ mouse (ZETLER 1964)
Coronaridine	81.76	Not listed
Ibogaline	Not listed	46 mg/ kg/ iv/ mouse (ZETLER 1964)
Ibogamine	Not listed	Not listed
Iboxygaine	Not listed	42 mg/ kg/ iv/ mouse (ZETLER 1964)
Isovoacangine	Not listed	75 mg/ kg/ iv/ mouse (ZETLER 1964) 82 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)
O-Acetylvoacanginol	1.98	Not listed
Perivine	39.67	Not listed
Tabernamine	86.59	Not listed
Tabernanthine	22.75	38 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)
Tabersonine	Not listed	Not listed
Voacamine	2.18	360 mg/ kg (No further details included; LA BARRE 1960)
Voacangine	23.30	54 mg/ kg/ iv/ mouse (ZETLER 1964 citing ZETLER & UNNA 1959) 41-42 mg/ kg/ iv/ mouse (OLIVER-BEVER 1986)
Voacanginol	2.31	61 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)
Voacorine	Not listed	30 mg/ kg/ iv/ mouse (QUEVAUVILLER & BLANPIN 1957)
Voacristine	Not listed	77 mg/ kg/ iv/ mouse (ZETLER 1964)
Vobasine	3.86	58 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)
Vobasinol	1.01	51 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)
Vobtussine	Not listed	33.75 mg/ kg/ iv/ mouse (QUEVAUVILLER <i>et al.</i> 1965)
Dregamine	Not listed	25 mg/ kg/ iv/ mouse (ZETLER 1964 citing THEOBALD 1963)

Voacamine and voacangine are said to be hypotensive and cardiac stimulants.

Voacangine also shows anaesthetic and analgesic properties.

Vobtussine is said to be a sedative.

Tabersonine (from seeds) is a hypotensive with 25% the potency of reserpine.

(OLIVER-BEVER 1967, 1982, 1983, 1986)

#### IN ANIMALS:

Voacangine was found to be orally active as a sedative at 16.5 mg/ kg but the mixed alkaloids of *V. africana* were two to three times as potent.

#### OTHER EFFECTS SHOWN BY THE TOTAL ALKALOID FRACTION OF *V. AFRICANA*:

Lacked hypnotic action.

Markedly reduced spontaneous activity.

Antagonistic towards amphetamines and caffeine.

Large doses increased effects of hexobarbitol.

Increased the effects of morphine.

Showed dosage-dependant reduction of body temperature.

Showed 30% as much spasmolytic activity as papaverine.

Combination with harmine radically increased the toxicity.

(VOGEL & UEBEL 1961)

While not explicitly stated, I would surmise that alcohol should not be combined with these alkaloids due to their tendency to produce respiratory depression.

*schweinfurthii* var. *puberula* containing 3.5% tabersonine. This is quite a high value (3.5 grams per 100 grams of seeds) but I have no idea what activity this alkaloid has besides lowering the blood pressure. The 0.02% ibogaine represents 20 mg per 100 grams of root-bark. It is worth noting that one botanist, SCHUMANN, has described *Voacanga africana* as *Voacanga schweinfurthii* var. *parviflora* Schum.

While overall of similar chemistry, substantial variations exist not only between different species of *Voacanga* and different parts of a given plant but also within a single species when examined by different researchers. Whether this reflects variability between individual populations, or whether it is a result of the ease that ibogaine and similar compounds auto-oxidize into related compounds during extraction and purification efforts, is not apparent from the published accounts (see THOMAS & BIEMANN 1968).

Major alkaloids reported from *Voacanga africana* stem-bark include: voacamine (7.2%), voacangine (5.6%), voacristine (4.0%), voacoline (3.7%), and vobasine (1.6%) (THOMAS & BIEMANN 1968). Percentages are of the total alkaloids present; total crude alkaloid content was 0.2% by weight. Other researchers have found total crude alkaloid contents of stem-bark as high as 3.5% (JANOT & GOUTAREL 1955).

The best way to determine the appropriate dosage would be to start slow and use a series of bioassays with gradually increasing amounts until the desired level was determined. I have heard of no one doing this for either *T. sananho* stem or roots yet. As they show no cumulative poisoning and are apparently fairly non-toxic at therapeutic levels, there does not appear to be any serious risks posed by cautious bioassays.

*In an attempt to get to the bottom of this first hand, our intrepid technical editor K. TROUT determined that a bioassay was in order. It should be noted that the seeds he used were three years old, and not obtained from L.E.R.*

16 JUNE 1998: I took seven seeds of *Voacanga africana* and ground them as finely as a mortar and pestle would allow. They weighed almost exactly 1/2 a gram. They were smaller and their shape was different than *T. iboga* but the appearance and surface textures were very similar. They had a strong pleasant smell that reminded me of something I could not put my finger on. Almost like a *Ligusticum* root. My mental state was alert but tired and recovering from being a bit overheated from high temperatures outdoors during the first half of the day.

3:36 pm: Threw the powder on my tongue and found the same taste. Not at all unpleasant; not particularly bitter. Mild anesthetic feeling in lips and palate beginning within two minutes fading by 3:45 pm.

3:45 pm: I am becoming more aware of my heart beat; it seems to be increasing but not racing. Whether this pharmacological or from anticipation I do not know. There seems to be some perceptual enhancement.

3:46 pm: A feeling of tension is beginning around my eyes similar to LSD or mushrooms. There is tension at base of skull, and I'm growing slightly tired.

3:51 pm: Pulse felt fine and strong, going at a steady normal rate until I realized that it was almost exactly 120 bpm. (I later realized that I was in error reading my pulse, and that it never reached 120 bpm. I was in an altered enough state that I wasn't aware of this mis-perception during the bioassay.)

3:56 pm: Simple tasks seem difficult. My mind seems clear. I laid down till 4:06 pm: I'm now at almost +1. Mild tracers are present. Tension in brow. Heavy limbs.

4:31 pm: Situation unchanged. Mild perceptual disturbances, especially if I am moving or I am looking at something moving, but nothing more intense developed. My mind is clear but movement and temporal judgment is somewhat impeded.

4:48 pm: More stimulated, but no more intense visually.

6:48 pm: After a light reverie-filled less-than-sleep it is still the same. After this point I was distracted by other things and did not follow the remainder of the course.

Effects were pretty much the same as experienced with tsicta or smoking *V. africana* seeds. While no overt visionary action was noted, there were promising hints that suggested that a higher level should be evaluated. I plan to repeat the experiment with 15 seeds at some point, but I suspect that an even higher level will be required. (Once I get more seeds, I plan 30, 60, 90, 120 as intervals for evaluation.)

If TENGU's report of the activity of L.E.R.'s seeds is confirmed it would be quite interesting, but the first question needs to be what is causing these effects at this dosage range.

## MORE ENTITIES IN HYPERSPACE

I had taken *Psilocybe semilanceata*. I was outside at night in the little playground of my neighborhood, slowly coming down while watching the stars and trees—nothing special. Then I noticed my cat, who was my best partner in mushroom experiments, staring at something. I gave a look, and saw a sparkle of light. I thought that it was the eye of a mouse, when the light moved, and I saw that it was a sphinx! It was small—at the best the size of a German shepherd. But strangely, he was transparent—I could only see his outline. Then I noticed that there were sphinxes everywhere. They weren't moving, but I had the feeling that they held great power, just like when you see a tiger sitting at a zoo. The movement of the first one that I saw was distinctly feline. They were very beautiful, not threatening, and they seemed to be made out of the purest of crystal. I don't remember if their faces were feline, canine, or ovine—a combination of all three perhaps? (Their faces were not human, fortunately; that would have been scary.) I didn't try to communicate with them; they were there minding their own business, and so was I. I soon thought of something else, and they disappeared. —S.H., France

## VISIONARY ANTIDEPRESSANTS?

I am writing from a maximum security cell in the UTAH STATE PRISON—one of the many P.O.W.s in the United States brought down by America's "War on Drugs." I am currently serving a one-to-fifteen-year prison sentence for possession of a stolen car. Yes, that's right, fifteen years for possessing a car that didn't belong to me.

I've had many experiences with LSD and mushrooms, but there is one experience that I had with a psychotropic drug called Zoloft® (sertraline hydrochloride).

A friend of mine in here has a prescription for Zoloft® and one day he gave me a couple of them because they have a kind of "speed" effect to them. When I ate them, I got extremely wired. It was unlike any kind of amphetamine high though. One of the effects that I noticed was that I felt as if I was about to start tripping on LSD. It was a very subtle feeling. Over the course of one week I increased my dosage until about the seventh day I consumed 19 pills in that one day. And yes, I reached a psychedelic level. It is very hard to explain how it was, but I will try.

The patterns, auras, and "trails" associated with LSD were all present in this trip, but it was as if they were all manufactured by a computer. (All of the geometric patterns in my vision seemed as if they were constructed of very tiny neon lights.)

I reached a state that I've never reached on LSD or mushrooms. When I laid down in my bed and shut my eyes, I was able to see very clearly with my Ajna Chakra all that surrounded me. (My prison cell and some other dimensions.)

Tiny people that resembled very small gnomes (I guess that's the best way to describe them) ran up to my face and stood on my chest—peered right at me—and started to talk to me. I telepathically "spoke" with them for about five minutes. Then I opened my eyes and realized that I had been having a conversation with a very small being standing on my chest, and said to myself, "Wow!" I thought at first that I was just hallucinating the whole experience. As soon as I shut my eyes, my mind's eye would automatically open up, and bam! The little people would run back up to my face and resume the conversation with me.

I can not remember any of the specifics of the conversation, but I do remember that the conversations were based on the subject of Zoloft®. —J.C.E., UTAH STATE PRISON

*We've heard that a "psychedelic" response to various antidepressants is not uncommon. Regardless, it seems like a bad idea to increase the dosage of Zoloft® so dramatically. Zoloft® comes in 25 mg, 50 mg, and 100 mg scored tablets. The standard dosage is 50 mg once daily. The maximum recommended dose is 200 mg. Other than "19 pills," J.C.E. made no mention of the dosage. This could be 475 mg, 950 mg, or 1900 mgs. In 1992 there were 28 nonfatal acute overdoses involving only Zoloft®; these overdoses were in the range of 500 mg to 6000 mg. (There were 79 total Zoloft® overdoses reported in this year, meaning that 51 of these were a combination of Zoloft® and other drugs and/or alcohol.) As well, there have been four known deaths from overdoses of Zoloft® combined with other drugs and/or alcohol. MAOIs are contraindicated with Zoloft®. Caution must be taken by patients using Zoloft® who have liver disease; high doses are to be avoided for those with impaired liver functioning (MEDICAL ECONOMICS COMPANY 1998). It strikes us that Zoloft® is best left as an antidepressant; its use in high doses as a visionary agent may not be too safe.*

## ANTIDEPRESSANTS NIX ENTHEOGENS?

I am currently taking the antidepressant Effexor® (venlafaxine hydrochloride). I seem to have no luck with mushrooms or LSD, and my medication precludes any MAO inhibitors. I'd be curious if:

- 1) Anyone has experienced similar disappointment with entheogens while on antidepressants?
- 2) Whether anyone has found anything that does work?
- 3) Whether anyone knows if antidepressants and entheogens affect the same neuroreceptors? — H.G., NY

*Effexor® is a structurally novel antidepressant for oral administration. It is chemically unrelated to tricyclic, tetracyclic, or other available antidepressant agents (MEDICAL ECONOMICS COMPANY 1998). We can locate no solid information on this point concerning Effexor®, but many tranquilizers and antidepressants will reduce or even eliminate the effects of numerous visionary plants and drugs including psilocybian mushrooms and LSD. One option may be to increase the dosage of LSD to the point at which it does have effects. However, we don't know whether or not this will work or what the character of the experience would be like if successful. Overcoming the lack of entheogenic effects may require discontinuing the medication long enough for one's biochemistry to return to normal (this may or may not be an acceptable risk depending on the type and severity of the depression). In the case of Effexor®, a gradual discontinuation over the course of two weeks is recommended to avoid withdrawal symptoms (PSYCHIATRY ON-LINE).*

*In most cases entheogens and antidepressants do not act directly on the same receptors. However, there are some of the more recent 'atypical' antipsychotics that do have an affinity for 5-HT receptors (AGHAJANIAN 1994). It does not appear that Effexor® is one of them as it is believed to work by blocking reuptake of serotonin, noradrenaline and, to a lesser degree, dopamine (it is thought to bind to a protein involved with reuptake). In doing this however, Effexor® does create a situation where the nervous system is literally flooded with these neurotransmitters (UNIVERSITY OF MARYLAND DRUG INFORMATION SERVICE) and this saturation of receptors may well be interfering with the desired action of visionary plants and drugs like psilocybian mushrooms and LSD.*

*Another interesting point is that, in animals, mescaline, LSD and similar drugs decrease spontaneous activity in the locus coeruleus but in doing so, facilitate the activation of its neurons by sensory stimuli (AGHAJANIAN 1994). Effexor®, on the other hand, has been shown, also in animals, to inhibit neuronal activity in this portion of the brain. It was also noted that this may indicate that it affects yet other regions in the brain (UNIVERSITY OF MARYLAND DRUG INFORMATION SERVICE). As*

*visionary plants and drugs do not act directly on the locus coeruleus but are thought to act on pathways afferent to it (AGHAJANIAN 1994) and the UMDIS pointed out that Effexor's action on this part of the brain may indicate that it affects adjacent "non-therapeutic" areas, this might be an important point but one beyond our level of knowledge to adequately grasp the significance of. What it means, beyond a conflict in actions in this important cognitive region, is not clear to us.*

*A study conducted by KIT BONSON, Ph.D. of the NATIONAL INSTITUTE OF MENTAL HEALTH that researched the co-administration of antidepressants and entheogens was summarized in the MAPS Bulletin Vol 7, No. 3, 1997:*

*In people who had taken an SSRI or [a] MAOI for 3 weeks or more, there was a reduction or an abolishment of their response to LSD. In contrast, people who had been taking a tricyclic antidepressant or lithium for 3 weeks or more had a potentiated response to LSD, usually to an unpleasant degree. Actually, there were some reports of what happens once people had gone off their antidepressant and then took LSD—the change in response to LSD returned to normal after a couple of weeks off the medication. In addition, there was one person who reported on the effects of Prozac (fluoxetine) after only one week's administration and then taking LSD—there was a potentiation of the response (in a good way).*

*For more complete information on the interaction of entheogens and anti-depressants, we recommend looking at "Chronic administration of serotonergic antidepressants attenuates the subjective effects of LSD in humans" (BONSON et al. 1995) and "Alterations in response to LSD in humans associated with chronic administration of tricyclic antidepressants, monoamine oxidase inhibitors or lithium" (BONSON & MURPHY 1996). It should be noted that there was one report of the combination of MDMA with a MAOI that resulted in hypertensive crisis; the individual "collapsed for several hours" (BONSON 1994), and another reported adverse reaction from the combination of MDMA, a prescription MAOI, and alcohol (SMILKSTEIN et al. 1987). As well, the combination of SSRIs and other antidepressants are contraindicated with MAOIs (as noted by H.G., NY above).*

*Apparently, with MDMA or psilocybin, SSRIs decrease the response about 50% of the time, depending on the individual (BONSON 1998).*

*While on the subject of antidepressants, it seems worth noting that the simultaneous administration of Prozac and MDMA has been shown to completely block the neurotoxic properties of MDMA in rats (MAPS 1990), and this also worked when administering the Prozac up to six hours after the MDMA was administered (DOBLIN 1998).*

## ENTHEOGENIC AMANITAS

I have found through countless bioassays that both *Amanita muscaria* and *A. pantherina* are entheogenic. I've collected *A. muscaria* in New Mexico's Rockies and in Japan. The New Mexican variety from near Santa Fe was quite nauseating and caused me to use a box of tissues as I drooled profusely. The Japanese variety caused little drooling, and was stronger, but also had a lot of nausea. I won't do either again. The star is the *A. pantherina*. It is stronger, cleaner, and causes little or no nausea—perhaps due to lower concentrations of muscarine, a toxin in *A. muscaria* with the above-mentioned side-effects.

These mushrooms cause one to step into a world where the internal monologue is silenced. Vision appears as if one is scuba diving; the air appears thick, and size and distance is distorted. Usually, after about an hour, one falls asleep. It is best to set an alarm for one hour, and let it take you under. That dream-like sleep is interesting, though the right and left lobes of your brain seem to continually buzz loudly, pulsating from right to left as your heart beats. The buzzing increases until you wish to lay down. Don't fight it, just set the alarm. Upon waking the world is changed, like looking through a large aquarium. Mirrors are strange to gaze upon.

I recommend no more than two dried grams initially. I once foolishly ate eight grams of Japanese *A. pantherina* (found under aspens in September), which I boiled into a tea. I drank the tea at 4:00 pm. After two hours the effects were frighteningly strong, so I took two capsules of milk thistle (*Silybum marianum*) to rid the ibotenic acid from my liver. Next the power of the drug surged—possibly due to the milk thistle. It may have sent all of the stored toxins back into my blood, rather than expelling them. I recommend caution if experimenting with milk thistle and *A. pantherina*. It turned into a nightmare, as my brain throbbed, right and left. Soon I spun as one would with too much alcohol, but it then doubled, then tripled, then a million-fold. Then astronomically I spun; the room I was in no longer appeared. I clutched the only thing I could feel—a speaker. I remember holding the speaker soaring round and round through space. Recalling past LSD trips, ayahuasca, and other combinations—nothing had come near this distance from reality. Time was gone. For many hours it continued. I was convinced that I was in hell. I thought, shit! Why hell? I am not a bad person? I was convinced that I had died. I remembered *Pharmactheon* stated that *A. pantherina* weren't deadly (OTT 1993), though I feared

the milk thistle may have rendered it so. I was terrified. My body was not with me. Just a spirit among a thousand streaks of lightening surging through some fantastically large black-hole like abyss. The spinning non-world continued for what seemed as long as my entire 37 years of life, until 3:00 am when I regained more normal consciousness. I awoke to a ransacked house, food and books strewn about. Things were scribbled on paper. I remember none of that. A twelve-hour plus visit to hell. The next day I ran out in the yard and grabbed plants, hugged trees, and smiled at everyone I saw—happy to be alive. So, if you want to try Amanitas, try *A. pantherina* in small doses. — TENGU, Japan

*There has been some success using Silybum marianum to treat amatoxin poisoning (OTT 1993 citing DER MARDEROSIAN & LIBERTI 1988; and FOSTER 1991). However this wouldn't seem to relate to possible muscarinic reactions or overdoses of ibotenic acid/muscimol. And while atropine is used as an antidote to muscarine poisoning, it is contraindicated in cases where ibotenic acid/muscimol are involved (OTT 1993). We have no idea if the S. marianum contributed in any way to the strength of A. pantherina's effects in this case. For more information on human bioassays of these mushrooms we recommend reading "Psycho-Mycological Studies Of Amanita—From Ancient Sacrament To Modern Phobia" (OTT 1976).*

# NETWORK FEEDBACK

## AMANITA MUSCARIA ANCIENT HISTORY

In southern France stands a beautiful mountainous massif named the Maritimes Alps, the last one of the Alps chain just before it meets with the Mediterranean sea.

In the highest and most remote part of this area stands an ancient sacred mountain named BÉGO. This mountain is surrounded with thousands of prehistoric engravings. The core of these engravings have been dated from 2500 BC to 14 BC. It is one of the oldest and most important cultural sites of this type in Europe.

There are three impressive wild valleys conducting toward this mountain, which have been considered as being three different sacred paths. The valley that surrounds MOUNT BÉGO is named the “Valley of Wonders.” The higher part of this valley opens to the most important sites of engravings. At the top of it, just at the feet of the sacred mount, there is the most central and significant site—the “Altar Rock.”

It is a big red-purple rough rock standing on a large plaque of a different smooth rock covered with thousands of engravings. From a tiny hole in that plaque springs a small source of living waters. This rock stands like an altar right at the core of a gigantic natural cathedral.

Just before this magic spot, at the place where the valley narrows for a last time, stands a large plaque of a particular

PHOTO BY GIORGIO SAMORINI

**FIGURE 6.** The “Chief of the Tribe” and mushroom effigy of MOUNT BÉGO.

rock that has been carried, erected, and engraved there—which is a unique case in this context. This engraving is in many regards noteworthy. It is a very central one, and it stands on the sacred path of this valley exactly like the front on a medieval church. This site might then represent and summarize the central element of a very ancient cult.

This carving also has one of the fairly rare anthropomorphic figures of the site, and it has been named the “Chief of the Tribe.” Now look at the reproduction of it (see back cover), and it is even more obvious in a photograph (see FIGURE 6) or in life. This supposed “Chief of the Tribe” might rather be the representation of a shaman whose plant ally or plant of vision was the mythic mushroom *Amanita muscaria*. Exactly like with the Siberian or the Ojibway shamans for whom the power of the sacred *A. muscaria* was also closely linked with lightning (STAFFORD 1992); our “Chief of the Tribe” is enlightened (symbolized by the lightning bolt) with the power of the mushroom.

The other striking thing about this story is that there is, among scholars devoted to the study of this very important site, a school among which noted personalities for over a century and a half, have developed the thesis of an Indo-European origin and influence on this site, going back to the very beginning of the *Vedas*. Incredibly, none of them—as far as I know—has identified the small motif over the head of the lightning-stricken “Chief” as being a mushroom of the species *A. muscaria*. (It is worth noting that *A. muscaria* grow all over the foothills of these mountains.) Instead these scholars have developed all kinds of sophisticated interpretations about this so-called “abstract design.”

There was a very ancient cult, 4500-years-old, in the Maritimes Alps of southeast France. Its origins go back to the end of the Neolithic, 2500 BC, and it lasted all through the Bronze and Iron ages, up to the coming of the Romans in 14 BC. This cult of shamanic practices was linked with some kind of Vedic or pre-Vedic religious influence.

Now, if we accept that the motif is a representation of an *A. muscaria*, and also R. GORDON WASSON’S proposition that this mushroom was the principal original component of the Vedic Soma, then we have to conclude that both had in common the ritual use of the sacred Siberian mushroom for religious and shamanic purpose. Hey people, this is quite a finding!

In turn, if the scholars who suggest a Vedic influence on this neolithic European cult are right and the motif is an *A. muscaria*, this might then be the first archeological discovery able to prove R. GORDON WASSON’S proposition about identity of the Vedic Soma. — P.D., France

*After receiving the information above, ER contacted GIORGIO SAMORINI, editor of Eleusis (see page 49), and a noted expert on ancient mushroomic art. He kindly provided his additional thoughts, as well as the photograph (see FIGURE 6) and a related bibliography (included on page 55). We are grateful for his input.*

## FURTHER CONSIDERATIONS ON THE MUSHROOM EFFIGY OF MOUNT BEGO

I have been familiar with the rock art of MOUNT BEGO for many years and I always believed that the famous “Altar Rock” features an explicit representation of *Amanita muscaria*.

Apart from the mushroom images of Scandinavian rock art (KAPLAN 1975), this is the only other representation of the fly agaric in European prehistoric art discovered to date. The rock engravings of MOUNT BEGO are part of a larger group of rock art works in the Alpine arc dating from late Paleolithic to historic times. The largest concentration of rock engravings (more than 100,000 images) is in Valcamonica (Lombardy, Italy) and is the work of the Camuns people (cf. ANATI 1982). I noted in an earlier work that there were many psychoactive mushrooms, *Amanita* and *Psilocybe* in the area of the engraved rocks of Valcamonica and suggested that these mushrooms may have had a part to play in the cults and rituals of the Camuns (SAMORINI 1988). Furthermore, it should not be forgotten that all the rock art of the Camuns and Alpine rock art in general are closely associated with religious cults.

The second series of rock art works of major importance in the Alpine arc (over 30,000 images) is at MOUNT BEGO and the “Valley of Wonders.” Studies of this prehistoric site go back one hundred years (cf. BERNARDINI 1971; BLAIN 1976). The main peculiarity of this rock art is the altitude of the site (2000–2500 meters) and the significant—one might say obsessive—presence of horned zoomorphic images (essentially Bovidae). A further peculiarity is that practically all these horned figures are engraved in such a manner that the horns point toward the peak of the mountain. This is not a chance occurrence. It has been observed that MOUNT BEGO is one of the Maritime Alps mountains most frequently struck by lightning, and it has been hypothesized on more than one occasion that MOUNT BEGO was selected by prehistoric peoples as a “sanctuary” precisely because of this meteorological characteristic (cf. for example, MARRO 1945–46). In ancient times it was widely believed that the sacredness of certain localities could be derived from this characteristic. It is also worth noting the zigzag form of many of the MOUNT BEGO horns, reminiscent of lightning. A number of scholars have already pointed this out (cf. for example, MARRO 1944–45). We should now turn our attention to the “Altar Rock” with the engraved scene inappropriately called the “Tribal Chieftain,” about which I’ll make my own observations, adding these to the observations mentioned by P.D. in the previous article.

The anthropomorphic figure originally called “Tribal Chief” was then considered a sacrificial victim, due to the knife pointing toward the right of his head. Since there is a cow skull adorning the drape-like vestment of the anthropomorphic figure, for a long time it was thought that this was a scene associated with a Mithraic-style sacrificial act. How-

ever, according to the more precise dating techniques subsequently adopted by archeologists, these rock engravings date much further back than the Mithraic cult adopted by the Roman legions passing through this area, and this interpretation was therefore abandoned (DUFRENNE 1986). There is more justification for the interpretation offered by those researchers who see the figure as “adorant” or “officiant” (DUFRENNE 1985; MARINGER 1979).

My own opinion is that this scene presents shamanistic connotations due to the presence of the mushroom image and a stepladder—basic elements of the ritual of shamanistic initiation (ELIADE 1964; SAMORINI 1990). Researchers have noted surprising analogies between the prehistoric stones of Valcamonica and Valtellina (Italy) and Indo-European symbolic and religious concepts (ANATI 1977; PIANTELLI 1983). In the wake of this discovery, ROLAND DUFRENNE (1985, 1986) found even closer analogies between the symbolism of the rock art of MOUNT BEGO and that of the Indian *Vedas*. In Vedic sacrifice, we may note assimilation of sacred utterances and prayer on the one hand and, on the other, arrows or daggers pointing toward the head of the officiant and which reach his heart. This, according to DUFRENNE, is what we find in the MOUNT BEGO scene with the dagger touching the head of the adorant. The mushroom image is generally considered a stylized cow skull, a dagger or some other ritual arm—however difficult it is to see in it an arm of any kind. The way it thickens out at the “handle” or “blade” brings to mind the ring of the stalk of *A. muscaria*, and the engraved dots on the upper part of the figure are very similar to the punctiform spots on the cap of fly agaric. DUFRENNE notes seven dots and finds a correspondence between these and the seven mysterious powers sustaining the universe or the seven original prayers of Vedic cosmogony. However, we know that the number seven is also associated with Siberian shamanistic symbolism and the use of fly agaric. Lappish shamans, for example, consume *A. muscaria* mushrooms with seven spots (T. I. ITRONEN, see WASSON 1968: 279). —GIORGIO SAMORINI

## TRICHOCEREUS CONSUMPTION DETAILS

The following letter comes from the individual who was mentioned in K. TROUT's article titled *Trichocereus peruvianus?* in the last issue of ER (see VERNAL EQUINOX 1998, page 17). He is the correspondent who originally reported that L.E.R.'s *T. peruvianus* was inactive.

Thanks for your new and improved journal. I am impressed that you are trying to be more detailed and scientific. I have tried where possible to remember all facts regarding the extraction procedure; this is a much needed addition for accurate comparisons.

I purchased three feet of “*Trichocereus peruvianus*” from L.E.R. in July 1996 for \$135.00 (\$45.00 per foot). The diameter of the plants was 3.5 inches. I removed the spines, using gloves and pliers. In all cases, the cacti was consumed after extraction.

When extracting, I used just enough water to cover the cactus mass, adding a shot glass of lemon juice to acidify, and then heating slightly below a boil for two hours. This was then strained in a colander with a neckerchief as a filter. The pulp was then rung out by squeezing the neckerchief into a ball. The same extraction process was again repeated for another two hours with fresh water and lemon juice, then strained again. The combined fluids were then drunk, or dried into a tar and put into capsules, as described below.

EXPERIMENT ONE: With prior *T. pachanoi* bioassays in mind, and based on information from *Pharmacotheon*, which states that *T. peruvianus* is stronger (OTT 1993), I used only 1/2 foot of fresh L.E.R. “*T. peruvianus*.” This was pulverized in a blender, and extracted as described above. After drinking the tea, no effects were felt.

EXPERIMENT TWO: I then dried the remaining 2.5 feet (a lot of cacti!), which was about 125 grams dried—using 1/4 inch cuttings of the skin and pith, but not the center of the cactus. This was dried at about 90°F in an attic, then reduced to a powder in a blender. After being extracted as described above, the liquid was then heated (at the lowest setting) on a teflon frying pan, to reduce the amount of liquid. Finally, this was placed in a warm area, drying into a tar after two days. The tar was rolled into capsules, to avoid tasting the muck when swallowed. Teflon pans make it easy to roll up the tar! I split these capsules with a friend, and neither of us felt any activity.

I don't know how old the cacti were, though they were alive and had 1/4 inch roots sprouting from their bases. I didn't count the number of ribs on the plants, and I don't know at what time of the year they were harvested. In my opinion, the L.E.R. cactus is not the same *T. peruvianus* that OTT is talking about in *Pharmacotheon*.

PRIOR EXPERIMENTS USING *T. PACHANOI*: I purchased *T. pachanoi* from the now defunct ...OF THE JUNGLE. These were fresh cuttings, six to ten inches tall, and about 3.5 inches in diameter. The same processing was used as above (dried, not fresh). It was pleasantly active at 1 to 1.5 feet. These *T. pachanoi* weighed about 50 grams per foot, dried. Approximately three hours after ingestion, one foot of cacti provided a +2.25 on the SHULGIN SCALE, while 1.5 feet provided a solid +3 (or higher). The latter's effects lasted from 1:00 pm until I fell asleep at 11:00 pm. Visuals were mild but obvious with eyes closed. While walking in the forest, the trees felt vibrant, and far more "alive," as if I could see them pulsating and breathing. Three or four Japanese ravens followed overhead in the trees for an hour, cawing and staring. It was fantastic! I have also used 50 grams of dried *T. pachanoi* from JLF (using the same extraction procedure), with again, about a +2.25. As well, I have had fresh and dried *Lophophora williamsii*, so I am familiar with the cactus teachers. JLF now sells *T. peruvianus*: \$20.00 for a live three-pound cutting that is 13–15 inches in length. I haven't tried it. Their *T. pachanoi* is \$18.00 for a live three-pound cutting that is 13–15 inches in length, or the same amount and price dried at 50 grams. I imagine that if the JLF *T. peruvianus* was much stronger than

their *T. pachanoi*, they would be charging more for it, since most of their prices reflect activity. Hence, the effects are probably similar in these two species. JLF also just added *Pachycereus pectin-aboriginum* cactus to their newest catalog. A live six-inch rooted cactus (one pound) is \$15.00. I haven't tried this, and I don't know much about its phenethylamine activity or proper dosage. — TENGU, Japan

K. TROUT responds:

For the half foot extraction the amount of acid was a bit low—roughly twice as much acid (or more) should have been used. For the 2.5 foot extraction the amount of acid was extremely low. I would recommend the juice of a lemon or lime per pound (roughly 3.5 or 4 inches at this diameter) of fresh cactus (90% water by weight is a good approximation), per cooking; unless the fruits are small in which case two lemons or limes should be used. (For some reason people are overly worried about using or consuming too much citric acid.)

I usually freeze the fresh cactus to rupture the tissues, run it through a blender with the sour citrus juice and add no water, unless necessary; just the juice of the plant

usually proves adequate for liquid for the first cooking and a cup per pound is more than adequate for the second. (Volumes are not crucial; I just try to keep it as low as possible.)

The other point is the length of cooking. For a non-acidified tea two hours should be the minimum. For acidified tea cooking time can be reduced to 15–20 minutes per cooking. Longer cooking with acid will only hydrolyze the plant materials and will not enhance the yield.

I personally do not like reducing cactus extracts to a tar as this seems to maximize nausea and also may produce some degradation of alkaloids during the lengthy heating and air exposure. There have been several times when such prolonged processing has resulted in inactive tar despite the same cactus giving active lime tea. On the other hand, many times tar worked quite well. I have no idea what caused the disparity as the processing was the same.

TENGU provides the length and diameter of the cacti used, and from this we can approximate weights. In the first case a half foot of 3.5 inch material was used. I cut a

section off an 8-ribbed *Trichocereus pachanoi* that was exactly 3.5 inches in diameter. It weighed 132.14 grams per inch. (A 3.75 inch in diameter "Jules' Giant" *T. pachanoi* weighed 128.75 grams per inch. However, this was basal material trimmed off a healed cutting that had started to rot. The drying during healing may have decreased the water content in this material.). If his *T. peruvianus* weighed similarly to the *T. pachanoi*, this would put the half foot at around 793 grams. This half foot would dry to around 79 grams giving a potential mescaline equivalency of 687 milligrams, which clearly should have been active if the figures from the literature apply (PARDANANI *et al.* 1977).

The omission of the central part of the plant for the 2.5 feet leaves us unable to generate a comparative figure. AS TENGU was reducing this to tar, I wonder what the point in not including the central parts was? The vascular bundle itself may contain little alkaloid but the central parenchymal tissues are indicated to contain usable amounts of alkaloids. While the green part has been shown to be the most potent this certainly doesn't mean that the central parenchymal tissues don't contain usable alkaloid!

We do want to note that it isn't likely that the price JLF charges for their products has much to do with the products' strength or activity. Since JLF isn't selling these products for consumption, they probably don't care too much about the products' activity. Prices are likely based on what other vendors charge for similar specimens, and how well an item sells. When capitalism and entheogens meet, capitalism sits in the driver's seat. Companies will charge what the market allows—regardless of the activity of the items sold. After all, none of these companies are selling these cacti for consumption purposes!

## INDEX FOR BACK-ISSUES?

If the project ever succeeds, I would be very interested to get the index of *ER*! — P.D., France

A good cross-referenced index to back-issues of *ER* would be great. I hope to see one soon. — COY DOG

We are currently compiling an index to the back-issues of *ER*, which we will make available when it is complete. In the future, an index will appear in *WINTER SOLSTICE* issue of each year, which will address all four of that year's issues. With the current issue, we have begun using sequential page and image numbering, which will make using the index easier.
