## MYRON STOLAROFF SPEAKS...

Transcribed and edited from a radio interview by ELIZABETH GIPS on “Changes” in April, 1998.

**Elizabeth:** MYRON STOLAROFF's latest book is *The Secret Chief*, and it's about some early psychotherapeutic days, using psychedelics. Why don't you tell us about the book a little bit and what motivated you to do it?

**Myron:** Okay, I'll be glad to do that. Actually, I retired out here to Lone Pine—where I am looking out at the beautiful mountains right now covered with snow—in about 1978. I wanted to be a writer, and so I was looking for things to write about. And a couple very good friends of mine, ANN and SASHA SHULGIN said, “You know, there's a gentleman who has been doing some very excellent work in this field, and we think it should be documented.” So, I thought, “Gee, that's a great idea,” because psychedelics are my favorite field of endeavor—they've been my major interest for a long, long time. So, my wife JEAN and I looked “JACOB” up, and he was

happy to cooperate. The both of us sat with him for quite a period of time and reviewed his work, and we found him to be an extremely engaging person, and extremely knowledgeable in this field. And furthermore, he developed some worthwhile and interesting techniques... very effective techniques in administering psychedelics to people. So, this turned out to be a valuable endeavor.

**Elizabeth:** He seems to have told you a lot of ground rules for group tripping.

**Myron:** Well, he did two things. First of all, he developed the individual trip, so as to make that most effective. Everybody was always introduced with an individual trip, where they took the psychedelic alone just with him, and he was a perfect guide. After that, they had the option of repeating the individual trip, or joining the group. And he developed the group method—as far as I know—better than anyone, because he saw early in the game that it was an awfully good way to enhance the experience by having people share this together. And also it reduced the cost, because after all, he was doing this professionally. It didn't cost as much to participate as a group member as it did as an individual member.

**Elizabeth:** Why are entheogens one of your favorite fields of endeavor? Any why was it important that this man... it's not his real name in the book, is it?

**Myron:** JACOB? No it isn't. This was one of the conditions of my writing the book and getting it published. Since he worked for a long time after all these substances became illegal, security was an enormous problem. And the work did not necessarily end with his death. So, I gave my word to not reveal his name or the area where the work was done.

**Elizabeth:** Why is it important to utilize these substances in the field of psychotherapy?

**Myron:** Well I think it's important to utilize them in a great number of fields.

**Elizabeth:** Oh, that's nice! (laughter)

**Myron:** Actually, you know I am on record, ELIZABETH, that when I took my first psychedelic, I was in charge of long range planning for AMPLEX CORPORATION. I was familiar with practically every area of scientific endeavor, and I didn't hesitate to say that LSD was man's greatest discovery because it opened the mind, and the mind is our most enormous potential. And our mind can be used in many ways. As a matter of fact, one of the real problems I think of western science is that they don't understand the mind at all. Everybody is working very hard on nerve synapses, and various kinds of neurotransmitters and so on, and from all of this they hope to prove that the mind is a result of all these interactions. Whereas actually, if you look into it carefully, you find that Buddhists are absolutely right. And the Buddhists concluded a couple of thousand years ago that *mind* is the source of everything. So all these mechanisms that we have are things that have been created by mind to allow mind to communicate to this level of reality that we find ourselves in—the material level.

**Elizabeth:** When you speak of mind you are not, I assume, speaking of brain? Or are they interconnected?

**Myron:** I hope that I made that distinction. No, the mind actually... well there are a lot of ways of looking at it. The Buddhists call it primordial wisdom. It's the source of everything, and that everything comes out of the mind. JUNG had a little different way of describing it. He called it the collective unconscious. If we go deep enough into ourselves, we come to our own personal unconscious. But ultimately we reach an infinite consciousness that joins us all, which JUNG called the collective unconscious. And then there are a lot of religious traditions that talk about universal mind—where mind is absolutely infinite and contains everything, contains every thought and experience that ever happened. So you have all of these different views. And one of the amazing things is that when you take these substances, if you are able to get into these areas—what we generally call the transpersonal areas—you can discover that all these views are very accurate ways of looking at reality.

I have to say that the misunderstanding of psychedelics is one of the great tragedies of our current time, because these are such remarkable tools. And I'll just try to say in a nutshell why they are important and also why they are held in such disrepute. First of all they are important because, as far as I can tell—and this is after 40 years of work—the main thing that they do is open the door to the unconscious mind. And that includes just a fantastic array of stuff. But the first

part that's uncovered is our repressed material. We push a lot of stuff into the unconscious because we simply do not want to know it; we don't want to acknowledge it. This is often very painful stuff: betrayals, hurts, things that have made us feel inferior, and all the kinds of things that make up what JUNG calls "the shadow." So all of this stuff is in the unconscious. But then when we go deeper, we begin to find some of our more valuable assets, such as intuition, creativity, and what JUNG called "the archetypes." Eventually you go beyond all of this into the transpersonal areas where you can actually discover that the core of your being is divinity, which is an amazingly wonderful, fruitful thing to discover. And what I've found—and I think what most of the people who reach this level find—is that the universe is created in incredible love.

**Elizabeth:** Oh, that is so wonderful to hear.

**Myron:** And we all hold this in the core of our being. Imagine that—we've all got this within us, and most people walking around don't even know it! Psychedelics are just a remarkable tool to open up these areas and make these discoveries. We can find the true nature of reality. We can find what a magnificently beautiful world that we live in, and how wonderful life can be. But don't forget that there is also all of this repressed material, and very often this stands in the way of moving into these more rewarding areas. For some people, the repressed material area is extremely painful; it's so painful that people will go to great lengths to escape it, and that's why some of the early doctors observing people taking psychedelics thought they were going through psychotic episodes, which they preferred to do rather than face the inward pain that they had locked up within themselves. So this terrible term "psychotomimetic" [psychosis mimicking] came into being.

**Elizabeth:** Right. The very first time I heard of LSD was a little newspaper article that mentioned this doctor in Czechoslovakia who was giving it to his patients. And the patients were having experiences of God-consciousness. And this was a Communist country, and he couldn't figure it out. That was GROF, of course. And then the next thing I heard was about a friend of mine who was the head of one of the psychiatric departments in St. Louis at a medical teaching unit. He was giving it to prisoners to try and create schizophrenia, and actually he said it wasn't working. They all begged for more!

**Myron:** There was also work done with prisoners and psilocybin. Many of these prisoners who had taken psilocybin just

saw so much more opportunity in their life and saw the things that they had done wrong and how they could correct their behavior. Perhaps psilocybin would be one of the most useful things for rehabilitating prisoners. But unfortunately we haven't been able to get back into that kind of research.

**Elizabeth:** After you had ingested LSD and realized it's potential, how did it change your life? How did you utilize the knowledge?

**Myron:** It changed my life in a lot of ways. Actually my first experience was that I had to live through an extraordinarily painful birth experience, which had made a powerful impact on me and my personality. I found I had become extremely compulsive about time. The worst thing about it was I had terribly low self esteem because I felt responsible for causing all the pain to my mother during the birth experience, and I felt absolutely worthless. It was a great discovery to find that out and find out how much energy I had repressed, holding down that information. And that's one of the wonderful things; as we are able to release our repressions we release a lot of energy for life that had been locked up before. So, I found myself growing in energy. I found that I didn't live so much in my head anymore. As a child I was a daydreamer and kept to myself and didn't communicate much with others. I began to discover how great it was to relate better; to learn to listen more carefully to other people. I actually learned to love more, and in the end—after a while—I discovered that one of the most wonderful things you can learn is how to be more loving.

**Elizabeth:** Have you been a psychotherapist yourself?

**Myron:** No, my training is in electrical engineering, and ALDOUS HUXLEY got a big kick out of that.

**Elizabeth:** So your experiences evidently propelled you into realms that you had not known about in your electrical engineering career?

**Myron:** Oh my, that's so true! I think I have learned an enormous amount about psychology and therapy. And of course these experiences make you avid for information, so you do a lot of reading, and I've read a good deal more. I'm sure that any therapist who wants to be a better therapist using these methods to learn more about his own inner dynamics, and his own defenses and his own attributes, could be a lot better help to other people. And that's where JACOB comes in.

**Elizabeth:** I was going to get back to JACOB and ask you about... did you work with him? Besides the book?

**Myron:** No, I never did. When I met and interviewed him he was practically retired by then. Although... well you know I can't say too much here because of my commitment. But we did get to know him fairly well, and under interesting circumstances. We certainly got to know him enough to know what a marvelous human being he is.

**Elizabeth:** And as you interviewed him for this book, did it deepen your appreciation of the use of psychedelics as a tool?

**Myron:** Oh my yes! Especially learning about his results and how effective his techniques were. Because we had set up a foundation in Menlo Park from 1961 to 1965. We processed about 350 people, and we did quite good work. People were very pleased with their experiences and how their lives were changed. But I have to say JACOB was *extremely* effective. Just for example, one thing that's in the book that just really impressed me enormously. He said that a lot of people had come to him that had many, many acid trips. He liked to use that phrase—he liked to talk about "tripping." He said some of them had experienced as many as 300 acid trips. And after every single one of them had the experience with JACOB, they said, "You know, I never had an acid trip before." So it pointed out the enormous difference it makes to be with a skilled guide who has worked out effective procedures, who knows how to assure you, how to get you to relax and let go to the experience, how to use different kinds of symbols and artifacts to look at and examine, to stimulate your experience, and to move into fruitful areas of experience. So he was very, very good at that.

**Elizabeth:** MYRON, do you have any suggestions to people who have some energy to put into deliberately creating change? What we can do to help facilitate a change in the current fear-based attitude that society has?

**Myron:** Well, for those who are knowledgeable, of course, the more information you can put out, the better. And that's where the *MAPS Bulletin* comes in. It's probably the best publication available today for people current with what's going on in this field. MAPS is doing a splendid job of turning up all the new projects and the latest research developments. Of course, financial support has always been a difficult problem. And when you get more finances you can do more studies. Like right now MAPS is sponsoring an examination of JANIGER's patients who were administered LSD some

thirty years ago. And it's fascinating the results that are coming up. These people have changed very beneficially, and this information is being accumulated and will probably be published. So these things help.

**Elizabeth:** And MAPS is helping to fund scientific research of various kinds, is that not right?

**Myron:** Well that's true. I'd like to say that MAPS put out a special edition of *The Secret Chief*. It's a hardback edition and it's signed by all the contributors of the book: Dr. ALBERT HOFMANN, STAN GROF who wrote a marvellous introduction and a survey of the field, ANN and SASHA SHULGIN, and myself have all signed this edition. It sells for \$250.00, and we have already raised \$10,000.00 that we promised to give to RICHARD YENSEN for his LSD research, which has been approved by the FDA. It's being held up a bit right now because the FDA are such sticklers. They are being so meticulous. They're just going way, way overboard to make sure that no harm is done. And they just won't accept the fact that thousands upon thousands of people have done LSD without harm. And there have been surveys—like COHEN's survey early on that covered twenty five thousand different administrations. Very, very little harm has been done; no more than ordinary psychotherapy in most cases.

I look at it this way: the public is not going to accept psychedelics until our scientists have done research and say, "Yes they are useful." And, right now, our government... well, for thirty years they wouldn't approve a single project for psychedelic research. Now it's starting to open up a little bit, but it's still going very slowly. They are being very careful. And what they don't know, what they don't seem to realize, the government is producing an enormous amount of harm in two different ways. First, there are people who are really suffering who could be helped if this therapy were available. So while they are being very careful for people not to be hurt, an awful lot of people are hurting terribly, whose situations might well be resolved with proper use of psychedelic treatment. The other place they are doing a lot of harm is that because it's illegal, nobody dares say anything. We have a lot of people like JACOB throughout the country. JACOB said he introduced 150 therapists to his methods of doing this, and a lot of this work goes on underground. But nobody can share anything, you can't publish anything because it's illegal. So here we have everybody alarmed about young people misusing these things and ending up in hospitals and what not... yet the information for using them correctly could have stopped an awful lot of this. But you can't put the informa-

tion out. The younger people who are doing this work say, "My God—I don't want to risk my career." So it's only old fogies like me who... what are they gonna do? But all the work that I did... I'm old enough so that the work that I did was before the things became illegal.

**Elizabeth:** Do you want to talk a little bit about some of the work that you did?

**Myron:** Well, that's pretty well documented in my first book entitled *Thanatos to Eros, Thirty Five Years of Psychedelic Exploration*.

MYRON STOLAROFF's autobiographical *Thanatos to Eros* is available for \$25.95 (postpaid, CA residents add \$1.78 for sales tax) from: THANEROS PRESS, POB 773 (Dept. ER), Lone Pine, CA 93545.

*The Secret Chief* is available for \$13.95 (softcover, postpaid) or \$253.00 (signed, numbered, limited edition hardcover, postpaid) from: MAPS, 2121 Commonwealth Avenue, Suite 220 (Dept. ER), Charlotte, NC 28205.

ELIZABETH GIPS hosts CHANGES RADIO on Tuesdays, 2:00 pm to 6:00 pm on KKUP 91.5. She frequently interviews those involved in the Entheogenic Reformation. Audio tapes of the complete interview that this transcript was edited from are available from: BIG SUR TAPES, 200 Gate 5 Road #117 (Dept. ER), Sausalito, CA 94965, (800) 688-5512. GIPS is also the author of the CHANGES WEB PAGE (<http://www.changes.org>) and *The Scrapbook of a Haight Ashbury Pilgrim*, which is available for \$18.00 postpaid from: ELIZABETH GIPS, POB 7305 (Dept. ER), Santa Cruz, CA 95061.

## FIELD TRIPS, SEMINARS & CONFERENCES

### AYAHUASCA AND HOLOTROPIC BREATHWORK JULY 19–28, 1998

“The purpose of this journey is to generate a deep self-transformation, through the combination of ritual plant ceremonies, Holotropic Breathwork sessions, creative artwork expression, meditations, and purification diets. Every experience will be followed by an integrative group sharing (English & Spanish). Instructors include LUIS EDUARDO LUNA, SILVIA POLIVOV, and ANA MARIA AGUIRRE.”

Held in the Amazonian rain forest in Peru, participants will experience three ayahuasca ceremonies and two Holotropic Breathwork sessions. Tuition is \$1,350.00. For registration information contact ENTHEOS GROUP via phone, fax, e-mail, or check out their web page: (541) 801-9872, (541) 774-3892, spolivov@hotmail.com, holos@msl.hq.com.ar, <http://www.lycaem.org/~entheos>

### ATACAMA DESERT FIELD TRIP AUGUST 18–25, 1998

“The BOTANICAL PRESERVATION CORPS invites you to be part of an experiential, hands-on, working expedition to the oasis of San Pedro de Atacama in North-Eastern Chile. For the past fifteen years, MANUEL and DONNA TORRES have spent some months every year engaged there in archaeological examinations of 1500-year-old mummies, which had been excavated previously. Their studies revealed that many were buried with elaborate snuff kits containing a powder identified as seeds of *Anadenanthera colubrina* variety *cebil*.

“The Atacama desert is one of the most wild, fantastic, compelling places on Earth. It is so dry, parts have never had a drop of precipitation in recorded history, yet many intriguing psychoactive plants grow there, and the terrain and environment has a vast, mind-blowing scale. In this high-elevation desert, the night sky surges with southern-hemisphere stars. Altogether it is an unparalleled place to explore various states, feeling kindred with the presence of the ancient snuff-inspired shamans who left their psychedelic rock-art in sacred sites.

“We thus thought it appropriate to invite a small group of like-minded adventurers to join us for a once-in-a-lifetime trip, exploring the desert, collecting and testing rare plant specimens, going

behind-the-scenes in the museum to examine its vast collections of real shamanic artifacts—pipes, snuff kits, textiles, and the mummies themselves—taking trips out to explore the ancient shamanic rock art sites and hot springs. Doesn’t this sound like the makings of an unforgettable adventure?

“We will only be able to do this in a very small, intimate group, and we urge you to sign-up early, on a first-come basis. The cost [is] \$1,500.00, which will cover everything from food and lodging to desert transport, *etc.*, during the expedition. This won’t include costs of getting there, which can be done in a variety of ways, but generally would involve \$700.00 to \$1000.00 in travel expenses. Further details will be available to those who register. Our group already includes some very interesting folks, and will be facilitated by BRET BLOSSER, ROB MONTGOMERY, and MANUEL and DONNA TORRES.

“We hope you will be able to join us! We are planning small-group expeditions and adventures to other exotic places in the future, so if you are interested in having advance notice of upcoming trips, send a note to us.”

For more information on registration write to: BPC, POB 1368 (DEPT. ER), Sebastopol, CA 95473

### TELLURIDE MUSHROOM FEST AUGUST 27–30, 1998

The TELLURIDE MUSHROOM FESTIVAL is designed for persons interested in expanding their knowledge of edible, poisonous and psychoactive mushrooms. Major consideration is given to the cultivation of diverse mushroom species, emphasizing practical principles and techniques. Speakers include Nobel Prize winner KARY MULLIS on “Entheogenic Botany;” ANDREW WEIL on “Ethnomedicine;” PAUL STAMETS on “Mushroom Cultivation;” GARY LINCOFF on “Mushroom Identification;” and EMANUEL SALZMAN on “Mushroom Poisoning.” The four-day conference is \$265.00 (which includes meals). Early registration is recommended, as these conferences frequently sell out.

For additional registration information contact: FUNGOPHILE, INC., POB 480503 (DEPT. ER), Denver, CO 80248-0503, (303) 296-9359, [newsmush@netone.com](mailto:newsmush@netone.com), <http://telluridemm.com/mushroom.html>

## THE BURNING MAN PROJECT AUG. 31 — SEPT. 7, 1998

Held in the middle of the Nevada desert, BURNING MAN has been called “a hedonistic/apocalyptic neo-pagan gathering.” BURNING MAN has been held for numerous years now, and each year brings a larger crowd. It’s a beautiful orchestra of organized chaos. Many people consuming many different entheogens. Mud pits, fireworks, numerous live bands and performances, all-night rave dances, and the burning of giant ritual sculptures—culminating in the BURNING MAN. Tickets are \$80.00 prior to August 15th, and \$100.00 after.

For updates on BURNING MAN, you can subscribe to the BURNING MAN ANNOUNCEMENTS E-MAIL LIST. To join this list send an e-mail to [bman-announce-request@burningman.com](mailto:bman-announce-request@burningman.com), with the word “subscribe” in the body of the message. Or contact: BURNING MAN, POB 420572 (DEPT. ER), San Francisco, CA 94142, (650) 985-7471, <http://www.burningman.com>

## PSYCHOACTIVITY: PLANTS, SHAMANISM & STATES OF CONSCIOUSNESS OCTOBER 1–4, 1998

Held at the TROPICAL INSTITUTE (Koninklijk Instituut vor de Tropen) in Amsterdam, the focus of the PSYCHOACTIVITY conference will be visionary art, anthropology, botany, and psychotherapy. There will be talks, discussions, presentations, and a techno-party. The conference will be in English, with a total of 18 sessions, starting Thursday in the afternoon, until Sunday at noon, leaving plenty of free time for exchange on an individual level, and to explore the smartshops, coffeeshops, museums, and other aspects of the city of Amsterdam.

Confirmed speakers include: ALEXANDER T. SHULGIN on “The Process of Discovery of New Psychedelics;” ANN SHULGIN, DONNA DRYER, and RICH YENSEN on “MDMA and LSD-Assisted Psychotherapy;” JONATHAN OTT on “Studies of Vinho da Jurema and Pharmahuasca;” RALPH METZNER on “LSD Therapy and Ecology;” CHRISTIAN RÄTSCHE on “The Ethnology of Psychoactivity;” ALEX GREY on “My Visionary Art;” PAUL STAMETS on “Psilocybian Mushrooms;” STACY SCHAEFER on “Recent Research on Peyote and Huichol Women;” MANUEL TORRES on “The Iconography of South American Snuff Tablets;” DICK BIERMAN on “The Effects of *Cannabis* and Psilocybian Mushrooms on Clairvoyance;” and PETER DE SMET on “Ritual Enemas and Snuffs in the Americas.” More speakers are expected.

One day will be devoted to discussing entheogenic rituals in the Netherlands, the political situation, and the past and future of visionary plants and drugs in European countries and around the world.

The conference fee is 475.00 FL (Dutch)—currently \$240.00 (USA). Hotel and food are not included. Registration must be accompanied by eurocheque or money order to PSYCHOACTIVITY. A 50% refund is available for cancellations before July 31, 1998. There are no refunds for cancellations after this date. As space is limited to 500 people, early registration is recommended. Hotel reservations can be made through the AMSTERDAM TOURIST OFFICE, [vvadam@pi.net](mailto:vvadam@pi.net). For more information contact: PSYCHOACTIVITY c/o CONSCIOUS DREAMS, Schinkelkade 59-61 (DEPT. ER), 1075 VL Amsterdam, the Netherlands, ++31 (0)20 470-7616 fax, [codreams@xs4all.nl](mailto:codreams@xs4all.nl), <http://neturl.nl/codreams>, <http://ecbs.magnet.ch>

Or contact: CLAUDIA MULLER-EBELING in Germany, ++49 40 644 97 67 or ++49 40 644 92 670 fax, [crcme@poweronline.net](mailto:crcme@poweronline.net)

## SALVIA DIVINORUM SEMINAR DECEMBER 11–13, 1998

SKA PASTORA, LEAVES OF THE SHEPHERDESS: *SALVIA DIVINORUM* AND SALVINORIN A is a single-topic conference held at BREITENBUSH HOT SPRINGS in Oregon. Topics of discussion will include the ethnobotany, pharmacology, chemistry, and cultivation of this enigmatic plant.

CONSIDER THESE MYSTERIES:

- ▼ *Ska Pastora* (leaves of the Shepherdess) is its Mazatec name, but there are no sheep in the Mazatec Sierra nor any mention of a Shepherdess in the Bible.
- ▼ *Salvia divinorum* rarely yields viable seeds and the few Mazatec shamans who grow it say that it came from elsewhere.
- ▼ Salvinorin A is active in microgram amounts and it is structurally different from any other known visionary compound.

Presenters include: BRETT BLOSSER, ROB MONTGOMERY, JONATHAN OTT, DALE PENDELL, ALEXANDER T. SHULGIN, ANN SHULGIN, DANIEL SIEBERT, and others.

BREITENBUSH HOT SPRINGS is located near Detroit, Oregon, about two hours drive east of Portland. Lodging consists of shared cabins with three daily meals and full access to the hot springs, which—for privacy—will be closed to the public during the conference. Cost for the weekend is \$350.00. The number of participants is very limited, and they strongly suggest immediate registration. For more information on registration write to: BPC, POB 1368 (DEPT. ER), Sebastopol, CA 95473

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold new book exploring the legal substrate underlying shamanic mushrooms and their active principles. \$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES

Box 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is editor of *The Entheogen Law Reporter (TELRL)*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL MINDUSTRIES, POB 73401 (DEPT. ER), Davis, CA 95617-3401.

Questions for possible inclusion in this column can be sent to Mr. BOIRE in care of *ER* at: PHARMACO PROHIBITA, c/o *The Entheogen Review*, 564 Mission Street, Box 808, San Francisco, CA 94105-2918.

# PHARMACO PROHIBITA

BY RICHARD GLEN BOIRE

QUESTION: Are *Tabernanthe iboga* seeds illegal in the US?

RESPONSE: No one knows for sure. This is not only a gray area in the statutory law, but also completely untested by any court cases. Ibogaine, the active principle of the *T. iboga* plant, is a Schedule I substance under federal law (and in all states I am aware of). Ibogaine has been assigned the DEA drug control number 7260. The federal listing of ibogaine lists "*Tabernanthe iboga*" as a "trade [or] other name" for Libogaine (21 CFR 1308.11, subd. (d)(17)). This is the only mention of the plant. *T. iboga* is not listed as a discrete controlled substance. In this regard it is unlike any other controlled plant, excepting perhaps *Catha edulis* (see *The Entheogen Law Reporter* 7: 60-62). In contrast to the other plants scheduled by name under federal law, nowhere in federal code or federal regulations is "*Tabernanthe iboga*" defined.

For example, the federal code not only lists "marihuana" as a discrete Schedule I substance, but defines it as "all parts of the plant *Cannabis sativa* L., whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds or resin. Such term does not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination" (21 USC sec. 802 (22)).

In similar manner, federal law explicitly defines "peyote" as meaning "all parts of the plant presently classified botanically as *Lophophora williamsii* Lemaire, whether growing or not, the seeds thereof, any extract from any part of such plant, and every compound, manufacture, salts, derivative, mixture, or preparation of such plant, its seeds or extracts" (21 CFR 1308.11, subd. (d) (22); 21 USC 812, subd. (c)(12)).

Finally, federal law defines "opium poppy" as "the plant of the species *Papaver somniferum* L., except the seed thereof" (21 USC sec. 802, subd. (19)).

In short, *T. iboga* is an anomaly with respect to the plants controlled under federal law because its only mention comes in the "trade [or] other name" listing for the substance ibogaine. In my opinion, this manner of inclusion implies that the plant is only considered illegal to the extent that it contains ibogaine. The question then becomes, "Do the seeds of *T. iboga* contain ibogaine?" Ibogaine is predominantly found in the roots of *T. iboga*, and the roots are what the Bwiti use in their ceremonies. *The Dictionary of Sacred and Magical Plants* states, "The entire plant contains the principle alkaloid ibogaine and at least eleven other

indole alkaloids...” (Rätsch 1992). This would seem to include the seeds of the plant, although I am not aware of any study specifically reporting ibogaine in the seeds of *T. iboga*. Perhaps they have never been tested; I don’t know. If the seeds *do* contain ibogaine, a federal prosecutor could theoretically argue that the seeds are outlawed “material[s], compound[s], mixture[s], or preparation[s], which contain” a controlled substance. As I have written before (see BOIRE 1997), however, such an argument would strain the meaning of the provision, which was designed to cover street drugs that are often sold diluted, suspended in binder material, or placed on some sort of carrier medium. Morning glory seeds are openly sold through advertisements in *High Times* magazine, and are well-known to contain lysergic acid amide, a Schedule III substance. I am not aware of any prosecution based on the theory that such seeds are illegal materials, compounds, mixtures, or preparations containing a controlled substance. As an aside, I have heard reports that the seeds of other plants, for example certain *Voacanga* species, may contain ibogaine. If this is true, it is certainly possible that a prosecutor could argue that, such seeds, although not explicitly listed in the federal law, fall into the above provision. But, again, the feds have not gone after sellers of morning glory seeds, so it seems unlikely they’d move on much more obscure seeds. Also, if the seeds of *T. iboga* *do* contain ibogaine, a person arrested in possession of them could argue that the seeds of *T. iboga* were intentionally excluded from Schedule I. The argument would assert that the seeds of *T. iboga* are not expressly mentioned in federal law because Congress never intended to outlaw these seeds. Had it intended to outlaw them, it would have done so explicitly, as it did with viable *Cannabis* seeds, and the seeds of peyote. In other words, one might argue that when Congress specifically intends to outlaw seeds of a plant, it does so explicitly. Since it did not do so with *T. iboga* seeds, this indicates that Congress never intended them to be included in Schedule I. Finally, considering how murky this area is, an argument exists that any prosecution for possessing the seeds of *T. iboga* runs afoul of the constitutional requirement that criminal laws be written clearly, so that the average person does not have to guess whether an action is criminal rather than legal.

QUESTION: Are *Erythroxylum coca* seeds illegal in the US?

RESPONSE: Under federal law, cocaine is a Schedule II substance. Additionally, “[c]oca leaves... and any salt, compound, derivative or preparation of coca leaves (including cocaine... and ecgonine... and their salts, isomers...)” are a

Schedule II substance. This means it is unlawful to possess cocaine or *E. coca* leaves in the US without a doctor’s prescription (21 CFR 1308.12, subd. (b)(4); 21 USC sec. 802 (17)(c)). No other part of the plant—other than the *leaves*—is explicitly mentioned. For this reason, it is reasonable to assume that *the seeds* are *not* controlled.

However, the same potential problem mentioned regarding *T. iboga* seeds exists with respect to the seeds of *E. coca*; if the seeds are found to contain cocaine or any other controlled substance, a prosecutor could theoretically argue that they are illegal “material[s]... mixture[s],” *etc.* But if the seeds do not contain a controlled substance, then I see no provision of federal law that would make them illegal.

The primary source for legal information concerning visionary plants and drugs...

### *The Entheogen Law Reporter*

“TELRL contains legal information of vital importance to anyone involved with entheogens on any level.

The only question it leaves unanswered is this:  
Isn’t your freedom worth \$25.00 per year?”

— JONATHAN OTT

## **PSYCHEDELIC RESOURCE LIST SECOND EDITION**

**Completely Revised and Updated — Now With Over 400 Reviews!  
Expanded Internet Section & Many New Botanical Suppliers!**

### **PROVIDES SOURCES FOR:**

- ▼ **PSILOCYBES:** *spore prints, spore syringes, dried mushrooms, and growing supplies.*
- ▼ **TABERNANTHE IBOGA:** *seeds, root-bark, and guided sessions with pure ibogaine.*
- ▼ **CANNABIS:** *viable seeds for high-potency strains and suppliers of dried herb.*
- ▼ **PEYOTE:** *seeds and live plants, as well as legal mescaline-containing cacti.*
- ▼ **SALVIA DIVINORUM:** *plants, dried leaves, and potent extracts.*
- ▼ **AYAHUASCA:** *numerous traditional and analogue plants.*
- ▼ **5-MeO-DMT and other tryptamines.**
- ▼ **GHB and GHB-making kits.**
- ▼ **OPIUM POPPIES:** *seeds & dried pods.*
- ▼ **Plant extraction gear, chemicals, and labware.**
- ▼ **Vaporizers, waterpipes, and sundry smoking supplies.**
- ▼ **Books, periodicals, seminars, indoor gardening equipment, and much more!**

8.5" x 11" soft-cover, 150 pages, illustrated. \$22.95 (USA; CA residents add \$1.55 for sales tax),  
\$24.95 (foreign; payment in USA \$s [cash] preferred, international money orders add \$5.00), postpaid from:  
Soma Graphics, POB 19820 (Dept. ER), Sacramento, CA 95819-0820

**CLIMAX****Houtlaan I (DEPT. ER)****3016 DA Rotterdam****The Netherlands****+31 10 2800627****+31 10 2800628 FAX****sales@climax.net****http://www.climax.net/frmain.htm**

CLIMAX sells seeds for baby Hawaiian woodrose, *Lophophora williamsii*, *Papaver somniferum*, *Peganum harmala*, *Trichocereus pachanoi*, and two varieties of *T. peruvianus*. They also sell a number of "ecodrugs" (herbal MDMA substitutes). And, they sell dried *Psilocybe cubensis* (3 grams for \$25.00) and dried *P. cyanescens* (1 gram for \$30.00). They don't deliver dried mushrooms to customers in the USA, Canada, or France. But they will deliver these to any other country, and all of their other products are sent to all countries.

**ELEUSIS****c/o Museo Civico di Rovereto,****Largo S. Caterina, 43 (DEPT. ER)****38068 Rovereto (TN)****Italy****eleusis@lycaeam.org****http://www.lycaeam.org/eleusis**

"The periodical *Eleusis* aims at providing a forum for the collection and propagation of information on the relationship between Man and psychoactive plants and compounds, considered both from the traditional and scientific angles. This is an enormous multidisciplinary field of research. Indeed, the link between Man and psychoactive compounds can be traced back to the dawn of time—a constant in human history and fundamental to our development. *Eleusis* aims at breaking down the walls of repression and is wholly opposed to the profanation arising out of human blindness. Its task is to provide information and publish studies which will be useful for serious and untrammelled research into psychoactive substances and associated states of consciousness.

"*Eleusis* started up in 1995 under the auspices of the MUSEO CIVICO of the ROVERETO TOWN COUNCIL. It was then decided that the periodical should no longer function as the 'Quarterly Information Bulletin of the Italian Society for the Study of States of Consciousness,' and in 1998 it became a six-monthly research publication.

"Each issue contains articles from various areas of research regarding plants and psychoactive compounds (e.g. anthropology, ethnobotany, biochemistry, pharmacology, psychotherapy, etc.), Psychoactive Fact-Files, providing information on psychoactive plant species which are either new or somewhat 'off the beaten track,' and a 'New-Releases' section on books and articles of interest to our readership."

A one year (two-issue) subscription to *Eleusis* is \$40.00 USD, payment sent to: GIORGIO SAMORINI, Via E. De Amicis 32 (DEPT. ER), 40050 Dozza (BO), Italy. Articles are written in Italian and English. *Eleusis'* current Scientific Board is made up of JACE C. CALLAWAY, JOSEP M. FERICGLA, FRANCESCO FESTI, JONATHAN OTT, GIORGIO SAMORINI, and C. MANUEL TORRES. *Eleusis* is edited by GIORGIO SAMORINI and JONATHAN OTT. The June 1998 issue of *Eleusis* is the debut issue of its new, independently-produced format. It includes the following:

A. ESCHOTADO: "Chemical Euphoria &amp; Human Dignity"

J. OTT: "The Post-WASSON History of the Soma Plant"

C.A.P. RUCK: "Mistletoe, Centaurs and *Datura*"

C.M. TORRES: "The Role of Cohoba in Taino Shamanism"

R. W. GESS: "Leaves of Endurance: The Use of Khat in Northern Kenya and Ethiopia"

J.M. FERICGLA: "El peyote y la ayahuasca en las nuevas religiones místicas americanas"

G. SAMORINI: "The Mushroom-Trees in Christian Art"

F. FESTI & G. SAMORINI: "Psychoactive Fact-File IX: *Passiflora* Spp"S.A. VAN HEIDEN: "Psychoactive Fact-File X: *Desmanthus leptolobus* Torrey & A. Gray"

J.C. CALLAWAY: "Set, Setting and Dose"

Plus Reviews and New Releases

*Eleusis* is one of our favorite publications, as the articles balance a scholarly and scientific approach with an easy-to-read style of writing. Highly recommended!

**ELIXIER**

**Kollwitzstrasse 54 (DEPT. ER)  
D-10405 Berlin  
Germany  
+ 49 (0)30 442-6057 FAX  
<http://www.snafu.de/~elixier>  
[elixier@berlin.snafu.de](mailto:elixier@berlin.snafu.de)**

ELIXIER is mail-order source for plants, seeds, mushroom spores, books, extracts, herbal smoking products and teas, and "herbal kicks" by SENSATONICS. They have the standard array of plants and seeds. Of particular note is *Lophophora williamsii* (seeds), *Tabernanthe iboga* (roots and seeds), *Voacanga africana* (roots and seeds), *Alchornea floribunda*, and other rare African plants. None of their products are sold for consumption. They restrict purchases to those 18 or older (in some countries 21 or older), and will check this on an individual basis. They state: "Please check your local laws before placing your order. We accept no responsibility concerning import and customs regulations. We reserve the right to change prices and conditions without prior notice."

ELIXIER offers mushroom spores for *Psilocybe azurensis*, *P. caerulescens*, *P. cubensis*, *P. cyanescens* (and more varieties should be forthcoming soon).

As well, ELIXIER can refer clients who are looking for mycelium of the following species to another company that can provide these: *Conocybe cyanopus*, *Flammulina velutipes*, *Ganoderma lucidum*, *Grifola frondosa*, *Gymnopilus purpuratus*, *Laetiporus sulfureus*, *Lentinus edodes*, *Panaeolus subbalteatus*, *Pholiota nameko*, *Pleurotus ostreatus*, *Psilocybe azurensis*, *P. bohemica*, *P. caerulescens*, *P. cyanescens*, *P. mexicana*, *P. natalensis*, *P. semilanceata*, *P. tampanensis*, *P. weilii*, and *Stropharia cubensis*.

They currently only have a German catalog, but an English version is in progress and apparently will be on the Internet at some point in 1998. However, they do have a short German-to-English list of translations for the common words on their web page, which is helpful. Contact them by e-mail or fax if you have questions about shipping and payment procedures outside of Europe. Their print catalog is available for an International Reply Coupon.

Orders can be placed via fax, e-mail and normal mail. If ordering via e-mail please provide your full address and the terms of payment. The minimum order is 100,-DM. You can pay by eurocheque, international money order or by trans-

ferring money to their account. In Europe, they charge 30,-DM for S/H, or if you order seeds only it is 15,-DM. If your order is more than 300,-DM they will pay the S/H. All orders outside of Europe need to work out the S/H details for each order individually.

**ENTHEOJEOPARDY!**

<http://www.entheogen.com/jeopardy>

ENTHEOJEOPARDY! is a trivia game exploring the history, folklore, shamanic use, preparation, chemistry, religion, botany, and geography of entheogens. Five days a week you can have a question forwarded to your e-mail box. At the end of the month, three winners are picked to receive prizes such as gift certificates to ethnobotanical companies, assorted seeds or plants, or relevant books. Though occasionally the questions posed are embarrassingly easy to answer, sometimes they really stick it to you with a stumper. This is an enjoyable game, and we encourage everyone to check it out.

**FRIENDS OF THE FOREST**

**Prinseneiland 97 (DEPT. ER)  
1013 LN, Amsterdam  
The Netherlands  
[yatra@friends-of-the-forest.nl](mailto:yatra@friends-of-the-forest.nl)  
<http://www.friends-of-the-forest.nl>**

FRIENDS OF THE FOREST (FOF) is a center that offers ayahuasca rituals (using plants such as *Banisteriopsis caapi*, *Mimosa hostilis*, *Peganum harmala*, and *Psychotria viridis*), and cacti rituals (using *Trichocereus pachanoi*), for those who wish to study the use of these plants under the supervision of a professional team. There is a library available for members to consult, which features the latest research materials and books. Members have access to FOF's own research, such as peak experience questionnaires, tapes that share tales of plant experiences, ideas on therapeutic interventions, psychological evaluations, follow up studies, and the like. FOF also offers training for laymen and professionals, with regard to ways of conducting and guiding psychedelic sessions. Experimental treatment for drug addicts and multiple-drug users is performed through the ritualistic use of ayahuasca.

The center offers a place where you can experience psychedelic plants in an atmosphere of safety and beauty, without dogma, worry, or paranoia (except your own), as these sessions are held legally in Amsterdam.

FOF has sent a proposal to the MINISTER OF HEALTH seeking funding for a project that involves the UNIVERSITY OF MAASTRICHT, which will study the effectiveness of ayahuasca rituals in the treatment of multiple-drug users (cocaine, heroin, and others). Hopefully the MINISTER OF HEALTH will agree to pay the professionals and UNIVERSITY professors to perform this study, as well as cover the cost for this experimental treatment.

FOF is currently seeking funding to complete construction of their sound isolation room. Contact them to find out the procedure for making donations to this worthy project.

### **FRINGEWARE, INC.**

**2716 Guadalupe Street (DEPT. ER)**

**Austin, TX 78705**

**(512) 494-9273**

**info@fringeware.com**

**<http://bot.fringeware.com/help?cart=c37166987426>**

An excellent supplier of all things related to guerrilla media and do-it-yourself aesthetics. They have over eighty books on drugs, sell alternative culture magazines, and other goodies. Check out their "Entheogenic Machinery" link for descriptions of SYNCHROVISION'S BRAIN MACHINE for \$199.99 and an IBVA 1.5 EEG SYSTEM for the MACINTOSH, sold at a hefty \$1,295.00. They also produce the magazine *FringeWare Review*; back-issues are available on-line. Their web page's excellent search engine makes it easy for you to find what you are looking for, and they even have links to bios of authors of some of the books they carry. Highly recommended!

### **LABTECH**

**3605 E. 17th Street N. (DEPT. ER)**

**Wichita, KS 67208**

**<http://www.thekit.com/intro.htm>**

LABTECH provides a kit that shows an exothermic chemical reaction. The end-product of this reaction is GHB. The kit's end-product is not intended for human consumption, although they only use the highest quality pharmaceutical grade ingredients, theoretically resulting in 99.99% pure GHB. They will continue to sell these kits as long as US Federal laws allow. The kits are currently legal in most states, but the end-product, GHB, has been scheduled in some states. It is the responsibility of the purchaser to check the

laws in their area to see if ordering the kit or performing the experiment is breaking any laws. The web site has instructions on how to perform the experiment, either for the 100 gram trial size, or the 200 gram kit. A 100 gram kit is \$89.95. One 200 gram kit is \$159.95, 2-4 of these kits are \$139.95 each, and 5+ of these kits are \$119.95 each. KS residents must add 4.9% sales tax. S/H is \$15.00 (shipped by FEDEX). LABTECH also sells pure gamma-butyrolactone by itself; check their web page for more information on this.

A friend who ordered one of LABTECH's kits, forwarded me the following comments:

This outfit gets top ranks for their ordering procedure and fast shipping. Credit card orders placed on their SSL web site are required to be confirmed by replying to an e-mail message before 7:00 pm. If that deadline is met, they promise to ship via FEDEX that same day. Nobody can beat them on this count.

Unfortunately, they fell short in the product department for the following reasons:

1) The web site overstates the product yield. Their "200 gram kit" contains 145.1 g of gamma-butyrolactone and 63.0 g of NaOH. This cannot produce 200 g of GHB, probably more like 120-150 g at best if their instructions are followed. This kit is purported to generate product at a cost of 80¢ per gram. This price is based not on any plausible yield—instead they're quoting the price of the combined reagents.

2) The instructions neglect to mention that the reaction can take some time to complete. And they say that the step of putting the mixture in a 225° F oven for 10-15 minutes is optional. This is emphatically not so. Anyone sufficiently uninformed to skip the oven-baking step, and rush ahead to acidify with vinegar and cool the mess with ice cubes (yes, they say to make them beforehand) is going to be drinking a lot of butyrolactone.

OK, what to do? And this applies to *all* of these GHB kits.

First, be realistic about what to expect. 150 grams of product from their "200 gram kit" is a more reasonable goal. The "100 gram trial kit" is probably not worth messing with. Exothermic reactions such as the hydrolysis of butyrolactone proceed more efficiently when there is a larger amount of reagent because the heat generated by the reaction serves to facilitate further reaction.

A two-quart Pyrex bowl has plenty of room to accommodate 300–400 grams of reagent. A round bowl is better than square one because splashing losses will be less. Don't mess with smaller amounts. Also, the reaction only gets started when distilled water is added. Add water at room temperature (not chilled) for a better reaction. But add the water very slowly.

Finally, cook the mixture in a 200° F oven for at least a few hours before acidifying. The longer it cooks, the higher the yield. Then, if you really want to make sure you're not drinking a significant amount of butyrolactone, you need to evaporate off the water and butyrolactone with more slow cooking in the oven. If you get an oily paste instead of crystals, you screwed up, and have mostly butyrolactone.

**LAUGHING MOON COMPANY**  
**1279 Kingsway, STE 111 (DEPT. ER)**  
**Vancouver, BC V5V 3N2**  
**Canada**  
<http://www.laughing-moon.com/order.html>

Provides viable *Cannabis* seeds of various high-potency strains. They take cash only, and their catalog is available at the web page listed above, or a print catalog is \$5.00.

**OM-CHI HERB COMPANY**  
**POB 5352 (DEPT. ER)**  
**Eugene, OR 97405**  
**(541) 746-6671**  
**windarts@pond.net**  
<http://www.pond.net/~windarts/OMCHI/omchi.htm>

The OM-CHI HERB COMPANY offers a lot of different herbs as well as some fairly unusual products: antelope horn, buffalo horn shavings, chicken-gizzard skin, cicada fungus, deer antler gelatin, deer tail, donkey hide gelatin, gecko lizard, hornet's nest, scorpion, sea horse, and silkworm excrement. What, no eye of newt?

Nevertheless, there are a few items of interest; betel nut, *Ephedra* herb, *Ginkgo* leaf, *Salvia divinorum* leaf, *S. splendens* seed, and *Voacanga africana* seed. Seed packets are generally \$2.00. Check their web page for their latest offerings and prices.

**RARE HERB**  
**POB 114 (DEPT. ER)**  
**Williams, OR 97544**  
**rareherb@cdsnet.net**  
<http://www.rareherb.com>

A new ethnobotanical company with a small but good selection of seeds and an informative catalog. We really like seeing small, grass-roots botanical companies like this spring up—there should be one in every state. Free catalog. S/H is \$2.50 regardless of the size of your order. Offerings include:

*Salvia divinorum* 5X extract incense—\$20.00/gram; *Piper methysticum*: black kava kava tincture, “Awa Hiwa”—\$10.00/fl. oz.; *Peganum harmala*: viable Syrian rue seeds from Morocco—\$3.50/3 grams; *Papaver somniferum*: Persian pink poppy from Iran—300 seeds/\$3.50, Thai white poppy from Chang Rai—100 seeds/\$3.50; *Ipomoea violacea*: Zapotec heavenly blue morning glory from Oaxaca, México—20 seeds/\$3.50, Quechua heavenly blue morning glory from Ecuador—20 seeds/\$3.50; *Nicotiana rustica*: Hopi tobacco—20 seeds/\$3.50; *Lophophora williamsii*: peyote—10 seeds/\$7.00 (not available in U.S.); *Trichocereus pachanoi*: San Pedro—20 seeds/\$5.00, *T. peruvianus*—20 seeds/\$3.50; plus many other interesting cacti.

**SHAMANISMO, INC.**  
**221 San Miguel Drive (DEPT. ER)**  
**Sedona, AZ 86336**  
**(520) 204-9749**  
**(520) 282-0996 FAX**  
**shamanismo@awake.net**  
<http://www.awake.net>

SHAMANISMO, INC. offers seeds and plants, including: *Areca catechu*, *Banisteriopsis caapi*, over 30 varieties of *Brugmansia*, *Catha edulis*, numerous *Datura* varieties, *Justica pectoralis*, a few *Passiflora* species, *Peganum harmala* (the cheapest price we've seen for these—\$5.00 for four ounces), *Piper betel*, *P. methysticum*, *Psychotria alba*, *P. viridis*, *Salvia divinorum*, *Solandra grandiflora*, *Trichocereus pachanoi* and *T. peruvianus*.

SHAMANISMO also offers a few books, including: *Trout's Notes: Sacred Cacti and Some Selected Succulents*, *Plants of the Gods*, *Psychedelic Shamanism*, *PIHKAL*, *Ayahuasca Analogues*, *Psychedelics Encyclopedia*, and *Persephone's Quest*.

And finally, Shamanismo offers tours to Tepic, México for a dose of Huichol shamanism, and to Manizales, Columbia for

ayahuasca rituals. These trips are \$1,500.00 each. We are reluctant to recommend any trips that might include peyote ceremonies with the Huichol, due to peyote's endangered status. Indeed, we are generally reluctant to support any type of entheogen tourism that profits from traditional native use. It is much less damaging to these traditional cultures if those people interested in learning from these plants grow their own and use them at home.

#### TPB COMPANY

**D-34632 Jesberg (DEPT. ER)**

**Germany**

**+49 6695 376**

**101551.225@compuserve.com?subject=Infos**

**<http://www.tpb.org/shoptpb.htm>**

TPB COMPANY runs the HERBAL PSYCHEDELICS SHOP by B.T.C. out of Germany. Their web page was written entirely in German, yet it stated that an English version was forthcoming. They offer *Acorus calamus* roots, *Anadenanthera colubrina* seeds, baby Hawaiian woodrose seeds, *Banisteriopsis caapi* vine sections, *Datura stramonium* seeds, *Heimia salicifolia* herb, *Hyoscyamus niger* seeds, live *Lophophora williamsii*, *Mandragora* root-bark, *Mimosa hostilis* root-bark, *Papaver somniferum* seeds, *Peganum harmala* seeds, *Phalaris aquatica* seeds, *P. arundinacea* seeds, *Piper methysticum* roots, *Psychotria viridis* seeds, *Salvia divinorum* herb, *Tabernanthe iboga* roots, and *Trichocereus pachanoi* cuttings. They also carry a variety of herbal MDMA substitutes. All prices are in deustch marks.

#### XINGU DAWN

**POB 2159 (DEPT. ER)**

**Hove, East Sussex, BN3 3UU**

**England**

**[info@ethnobotany.net](mailto:info@ethnobotany.net)**

**<http://www.ethnobotany.net/xingu.htm>**

This looks to be an excellent new source for seeds in England. Their prices—given in £s—look quite reasonable. Most seed packets run 2–4 £s. They offer: *Acacia baileyana*, *A. maidenii*, *Albizia julibrissin*, *Arctostaphylos uva-ursi*, *Ariocarpus fissuratus*, *Atropa belladonna*, *Cornus stolonifera*, *Coryphantha echinus*, *Cytisus scoparius*, *Datura metel*, *D. stramonium*, *Desmanthus illinoensis*, *Desmodium gangeticum*, *Echinocereus triglochidiatus*, *Erythrina lysistemon*, *Eschscholtzia*, *Heimia salicifolia*, *Hieracium pilocella*, *Hyoscyamus niger*, *Ipomoea tri-color*, *Leonotis leonurus*, *Leonurus sibiricus*, *Lophophora williamsii*, *Mammillaria heyderii*, *Mandragora autumnalis*,

*Mentha pulegium*, *Mimosa hostilis*, *Nepeta cataria*, various *Nicotiana* species, *Pachycereus pecten-aboriginum*, *Passiflora rubra*, *Peganum harmala*, various *Phalaris* species, *Phragmites australis*, *Phytolacca acinosa*, *Psychotria viridis*, *Rivea corymbosa*, *Sophora secundiflora*, *Tagetes lucida*, *Trichocereus bridgesii*, *T. macrogonus*, *T. pachanoi*, *T. peruvianus*, *T. tacaquirensis*, *T. validus*, *T. werdermannianus*, and *Withania somnifera*. Their botanical products include: Ashwagandha herb, *Calea zacatechichi* herb, green tea, guarana seed powder, kola nut powder, *Leonurus cardiaca* herb, *Mimosa hostilis* root-bark, and Pau D'arco bark. And, they have reports on seed raising and cacti grafting, as well as a few books and audio tapes.

#### NOTICE

In the WINTER SOLSTICE 1997 ER we listed DALLIN CLEGG as a source for *Erythoxylum coca* seeds; they no longer offer these.

The e-mail address for DANIEL SIEBERT'S *SALVIA DIVINORUM* LIST and his web page URL have changed since we listed them in the WINTER SOLSTICE 1997 ER. The list can now be subscribed to by sending an e-mail to [majordomo@lycaeam.org](mailto:majordomo@lycaeam.org) with the command "subscribe salvia" in the message of the body (not the subject header). Mr. SIEBERT'S new web page URL is <http://salvia.lycaeam.org>

In the AUTUMNAL EQUINOX 1997 ER, PERFECT FUNGI EUROPE was mentioned as a source for psilocybian mushroom spore syringes. While PFE is still an excellent source for these syringes for those in Europe, there have apparently been some problems at the US CUSTOMS with importing these into the USA. This likely has to do more with the product packaging (a syringe), than with its contents. PFE suggests that those seeking spore syringes in the USA patronize PSYLOCYBE FANATICUS, to avoid possible CUSTOMS-related problems.

WILL BEIFUSS is the author of the *Psychedelic Sourcebook*. Since he acquired an "absinthe making kit" from THE BASEMENT SHAMAN, he has spent the last three months in a thujone-induced stupor, repeatedly mumbling something about "salvinorin C."

JON HANNA is the author of the recently released second edition of the *Psychedelic Resource List*. He is a free-lance editor, writer, and artist. In his spare time he teaches a class on visionary plants and drugs at the UNIVERSITY OF CALIFORNIA AT DAVIS.

# BOOK REVIEW

## SALVIA DIVINORUM GROWER'S GUIDE

Reviewed by Will Beifuss

SOCIEDAD PARA LA PRESERVACIÓN DE LAS PLANTAS DEL MISTERIO, 1998. SPECTRAL INDUSTRIES [POB 73401 (Dept. ER), Davis, CA 95617-3401], ISBN 1-890425-01-X [Perfect-bound paperback, \$11.95 plus \$3.00 S/H]. 64 pp.; no index; 1 p. bibliography of 12 sources, plus 1 p. of 'Sources and Supplies' featuring 4 entries and 1 p. of 'Other Good Information Resources' having 7 entries.

The *Salvia Divinorum Grower's Guide* is the first book devoted to the cultivation of this rare plant, and it is a good one. The book was written as a collaborative effort by several growers, so you get the benefit of many people's input and experi-

ence. If you have never grown *Salvia divinorum*, the book takes you through the whole process starting from the day you receive your cutting right through to harvesting and drying the leaves. In between you will learn about the optimum growing conditions for the plant, fertilizer requirements, pest and disease problems, hydroponic cultivation and much more. The book suffers from a lack of any photos or illustrations. Hopefully this will be corrected in a future edition. Unless you have done a lot of reading on the Internet, I highly recommend buying this book before trying to grow this enigmatic plant.

**Mind Books** offers over 250 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

- Philosophy & Pioneers (32 titles)**
- History & Stories (24 titles)**
- Public Policy & Law (15 titles)**
- Psychology & Empathy (26 titles)**
- Religion & Spirit (17 titles)**
- Practical Guides (19 titles)**
- Traditional Cultures (67 titles)**
- Plants & Compounds (28 titles)**
- Chemistry & Neuroscience (23 titles)**

We offer our free print catalog; fast and discrete service around the world; and easy ordering by mail, phone, e-mail, or fax. For a free catalog, send your address to:

## Herbal-Shaman

*Dispensers of forbidden knowledge...  
...purveyors of forbidden fruits.*

Healthy plants and seeds, fresh bulk herbs,  
potent teas and extracts, herbal smokes,  
incense and other gift items  
available for immediate delivery.

### FREE CATALOG

HERBAL-SHAMAN  
POB 8892 (Dept. ER)  
Wichita, KS 67208  
(316) 685-9199

Internet archives of unique information on  
almost 300 species of ethnobotanicals,  
emphasizing visionary herbs, cacti and fungi.

# CLASSIFIED ADVERTISEMENTS

CLASSIFIED ADVERTISEMENTS are \$2.00 per word with a 15 word minimum (\$30.00). Though we are quite selective about the advertisements we include, *The Entheogen Review* is not responsible for any claims made by any advertisers. We reserve the right to refuse any advertisement. All advertising and advertised products void where prohibited. Please send information, a catalog, or product sample (if legal in the USA) along with your ad copy. Write for DISPLAY ADVERTISEMENTS rates. Send check or money order to *The Entheogen Review*, 564 Mission Street, Box 808-CA, San Francisco, CA 94105.

## RESEARCH QUALITY GHB

Gamma-Hydroxy Butyrate powder available.  
\$80.00 US for 100 grams. Canadians add 7% GST.  
Nutritional supplements also available.

ELECTRONIC CONCEPTS  
1673 Richmond Street, #257 (Dept. ER)  
London, ON N6G 2N3, Canada

## SACRED SUCCULENTS

Free listing of cacti  
\$1.00 for catalog  
POB 781 (Dept. ER)  
Sebastopol, CA 95473

## SALVIA DIVINORUM

### 5X EXTRACT INCENSE

Made from organically-grown *Salvia divinorum* leaves.  
This extract contains the active principle of five grams of dried leaf concentrated onto one gram of dried leaf.  
Highest quality product. All orders filled within 24 hours.

**\$18.00 per gram plus \$2.00 S/H.**  
Order three or more grams and S/H is free.

Top quality organically-grown *Salvia divinorum* leaves from Hawaii.  
\$20.00/7 grams, \$30.00/14 grams, \$50.00/ounce. Add \$2.00 S/H.

No personal checks accepted.  
Payment in cash or postal money order only. If paying by money order, leave the "Pay To" space blank or your order cannot be filled.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

# HYPERSPATIAL MAPS

## THOUGHT-SUCKING ENTITY

Four grams of *Psilocybe cubensis*, eyes closed and immobilized in my camping tent. My inner vision revealed what looked like a dank moss-green hospital emergency waiting room. I was sitting on a bench in this room, and it occurred to me that it was odd that there were no patients being wheeled in or out of the room. Kinda quiet for an ER.

After some time, I noticed a few off-white football-sized larva floating about three or four feet off the ground in various spots. Following one of these with my eyes, I then saw a big insectoid entity (about the size of a small dog), whose back was turned to me. It had a long mosquito-type proboscis, that I could only partially see. Suddenly, it turned quickly, and—realizing that I saw it—it made a high-pitched buzzing/shrieking sound. (I got the impression that it was sending out some type of a warning alarm.)

Then the entity initiated telepathic communication with me. It explained that it was quite surprised that I could see it, as this usually didn't occur. It said that it lived by extracting human thought/emotion. It explained that human thoughts were both the currency of its kind, as well as their sustenance/energy source. (The needle-like proboscis was looking less friendly by the minute.) I was given the impression that different types of thought/emotion were valued differently; those with a more intense energy charge, such as fear or love, were worth more.

The entity explained that it existed in another dimension in order for it to be able to feed off of human thought unhindered. (I got the feeling that the relationship wasn't symbiotic; perhaps these "thought drainers" actually somehow suck *life* energy from humans, as well as thought energy). The mental equivalent of an actual insect that feeds on human blood, skin, *etc.* Eventually, our conversation ended and the vision faded away.

I recall reading about a similar experience once (perhaps someone posted a trip report in an e-mail to the VISIONARY PLANTS LIST a couple of years ago that described this kind of encounter). The idea that there are entities feeding on our

thoughts sounds pretty ridiculous in hindsight, but the entire experience was quite disturbing at the time. — J.H., CA

## SALVIA SAUNA SANGHA

I had a truly extraordinary encounter with *Salvia divinorum* and my sauna sangha—a group of four guys who meet once a month to sauna and probe the outer limits. We've done *S. divinorum* together pretty regularly, and appreciate it highly. But this time, something different happened. We were sucked into another reality *together*. Someplace that isn't here, but is where we also live. I smoke it alone, and have tried this experience myself—but it was our common perception. I wish I could describe it better, but I don't know how. After we drifted back from that, one fellow wanted to check into it again. He took a hit on the bong and leaned into it, and I could see rings of energy pulsate out of his body. When they hit me, I was enveloped in a totally disorienting *S. divinorum* experience—which passed almost immediately, just in time for the next wave to hit. This went on for a couple of minutes. I had to cut loose of trying to get dressed, and just ride the energy for a while. — THE STONE RANGER, TN

## MORE SALVIA DIVINORUM

Wow! In the past I have thought that *Salvia divinorum* was "fun but interesting." Well, it is very interesting, but also *very* powerful. I smoked alone inside my home at night. I saw a whirlwind of cobras so incredible that it literally made me stop smoking for a second. I was afraid that it was going to wake up all of my neighborhood, and I'm sure that if I hadn't stopped that would have happened. I closed my eyes and the energy became two wheels of raw power, moving in opposite directions around me—even while I was locked in the most powerful position one can achieve—the lotus. I had to open my eyes and move a little bit to release energy. I closed my eyes again and fell gently into obscurity. I had the feeling that, while floating, I could try to reach friends; but I just couldn't think of what friend wouldn't have been disturbed by my apparition, whatever that would have been.

Two days later, I smoked with a friend outside in the mountains at night. The first attempt was somehow deceiving; as if, instead of bouncing on the walls back against me, the power was diluting itself among the stars. But now I look at this as if the *Salvia divinorum* was preparing me for what was coming.

On the second try, everything broke into patterns—but not African, Tibetan, or Indian patterns. No, it was just *sausages*—sausages everywhere. Beyond these visual effects, suddenly and without any doubt I knew that I wasn't in the same universe. While laughing, I said to my friend, "I'm talking to you from another dimension. My voice comes to you from a different reality." It was so clear and so incredibly simple, that I was killing myself laughing. I was in another universe and I saw a very concrete frontier between my friend and I. As time passed, I slowly reintegrated my ordinary spatial and temporal coordinates.

On the third attempt the world exploded into... *mice* (why the hell sausages or mice... we've got a lot of dirt in our heads), but with eyes closed I saw that the mice, like laughs, were just flowery images that were keeping me from going deeper. I took deep breaths, concentrated on the energy, and I found myself in a *2001: A Space Odyssey* universe. Larger spheres were rotating (some of them were in contact), and between them there was eternity. I said to my friend, "It is obvious that, of course, I'm not here any more."

*Salvia divinorum* is very powerful. I don't know what would happen if the effects weren't so short. I mean, this state is completely unknown. We don't have the slightest idea how to move in it. Still, it was so simple. I had two choices: acting as if I didn't know what was happening, and ranting and raving, "What's that? What's that? What's happening to me?" or taking responsibility. And it was simple. I went to another dimension and it was so simple. In fact, the best definition I can give that some readers will understand is that I changed the place of my "point of collection."

A few questions: Are dried *Salvia divinorum* leaves potent when chewed? If yes, how much is needed, how long does the experience last, and does anyone have a clue as to how to act with it and use it shamanically? — S.H., France

*It has been suggested that dried Salvia divinorum can be rehydrated with hot water, chewed, and kept in the cheeks in the same manner as fresh leaves are used (PENDELL 1995). This method has now been reported by numerous*

*psychonauts as being effective. A good starting dose is probably 2–3 grams of dried leaf. As with fresh-chewed leaves, the experience should come on slower and last longer than smoked leaf—perhaps 1–2 hours.*

## EVEN MORE S. DIVINORUM VISIONS

Experiments with smoked *Salvia divinorum* have not yet produced any perceivable effects—but chewed leaves (two experiments with fresh leaves, and one with dried leaves soaked in a small amount of water) produced very strong effects that were easy to handle. All experiments were done in darkness with very little sound. *S. divinorum* seems to me to be revealing a sub/super/transcendent reality—a realm of experience that we all share, and which is concurrent with our moment-to-moment daily lives, but we normally remain completely unaware of it while in our waking state of ego-consciousness. Our normal waking state seems to completely dominate our awareness—tuning our inner and outer senses to one level or "bandwidth" of reality and preventing us from consciously experiencing these other levels of sub/super awareness that we are also continually unconsciously operating on (receiving, organizing, and transmitting information as we co-create and experience the collective dream). *S. divinorum* seems to give direct access to the larger "holographic reality." We are our world and we are a resonant manifestation in the possible experiences of other consciousness's worlds. From the reports I've read of other people's smoked *S. divinorum* experiences (also see AUTUMNAL EQUINOX 1997 ER, "More Diminished Appetite for DMT," p. 12) it sounds like the route of ingestion—smoking vs. chewing—may greatly alter the experiences and relationship that one has with *S. divinorum*. And orally-activated DMT exploration sounds boundless. Going fast may produce a powerful rush, lots of weirdness, and take us far, but like our physical modes of quick travel, the automobile and the planes it also effectively prevents us from truly experiencing and exploring the territory in any more than a very superficial and shallow way. Since the entheogenic trip is almost always a round-trip, it is important to fully explore and learn from it, so that when we return to the world of the mundane we can bring back some of the treasures/insights we have gained, and use them to facilitate the process of self-transformation and creative conscious growth. — R.G., WA

## TRYPTAMINES' PURPOSE

Bufotenine, 5-MeO-DMT, and DMT are endogenous cerebral compounds. My view, regarding the purpose of these, follows. DMT is a main compound—perhaps *the* main compound—involved in imagination and dreams. 5-MeO-DMT is involved in *maintaining* fear in the face of danger. Certainly, when faced with danger, one needs fear. Not “pure” fear, but a design-filled fear in which one can plan a way out of the dangerous situation. Bufotenine is involved in the feeling we experience called “stunned.” Bufotenine causes no big stimulation—actually it causes tranquillization. And it causes no visuals—only minor optical disturbances. It causes a “zapped out” feeling. A feeling of being “neither here, nor there.” Being as how you ask for opinions and experiential revelations, I thought I would put in my small piece. Even though the effects of bufotenine wear off in about 30 minutes, I find that continued use over a two to four day period causes a buildup of effects. Good luck on your further adventures. I am pleased to see *ER* survive a fall and still carry on. — ANONYMOUS, OR

## JUMPING SHIP

The submission entitled “Abandoning the Ship” (VERNAL EQUINOX 1998) addressed some issues that I have been thinking about also. I understand the author’s perspective, and have entertained the same notions myself. He writes, “Entheogens have brought me too far, too fast. At these heights, it is just too incommensurably lonely for me for now.” Lately, it seems that the insight offered by the entheogenic experience ostracizes me. The situation is similar to that which is described through the allegory of *Plato’s Cave*. One achieves an understanding about his/her environment that sets the person apart and aloof to it. At the expense of sounding arrogant, it becomes difficult to deal with mediocrity in the world. I work with educated people who do not partake in any practice of entheogen use—they are very linear; that is, in Dr. ANDREW WEIL’s terms, they live in the topology of straightland. The most novel, effortless insights offered to me are light-years ahead of what many others ever will attain in their lives.

So, perhaps my peers share an open-minded and creative ideology... not so! It is unfortunate that too many people are not cognizant of the true power of the mushroom, *et alii*. The entheogenic experience keeps me on the fringe of our cul-

ture; my eclectic tastes in music, film and literature do not communicate well in many social settings, nor does my belief that spirituality and religion have little to do with one another these days. Additionally, the ego is much less an obstacle in my interpersonal relations than it is in others; often, I find that others are defensive, argumentative, and inhibited—personality becomes a facade. I can *never* talk about that which has influenced my life the most, and that to which I dedicate so much energy and time. Thus, very few people ever hear about my symbiotic relationship with the plants and fungi around us. Ironically, I envy those who have the liberty to talk on and on about their church! There is truly a mystery about these substances. If our culture were a room (*i.e.* cave), those of us who understand the infinite would not be confined by the walls and would exist outside, ostracized by that which is very clear to us. Sometimes, it seems that the use of entheogens is an existential pursuit.

AS OLIVER WENDELL HOLMES said, “A mind that is stretched by a new experience can never go back to its old dimensions.”  
— RHOMPUS, NM

## RONIN PUBLISHING

### World’s Leading Psychedelic Publisher!

Books on entheogens including: peyote, psilocybin, MDMA, *Cannabis* (botany, chemistry, growing and medicine), and other psychoactives—from herbal aphrodisiacs to opium and cocaine.

Psychedelic underground culture, drug testing, and drug law. Authors include Timothy Leary, Robert Anton Wilson, John Lilly, and Alexander Shulgin.

# NETWORK FEEDBACK

## ELEUSINIAN BAS-RELIEF?

Does anyone have any further feedback on the archaeological photograph on page 14 of STAMETS' *Psilocybin Mushrooms of the World*? Where does this bas-relief come from? While STAMETS' book seems authoritative enough, this photograph could have been better footnoted or referenced (thereby increasing the astonishing historical implications). — D.C., PA

The photo credit in *Psilocybin Mushrooms of the World* lists "GIORGIO SAMORINI & G. CAMILLA" as the photographers of this piece. Indeed, a "positive" photograph of this same image adorns the cover of *Eleusis, the Italian/English entheogen-related publication* currently edited by GIORGIO SAMORINI and JONATHAN OTT (see the *SUMMER SOLSTICE 1998 ER* p. 49 for more on the latest incarnation of Eleusis). We asked Mr. SAMORINI for additional information on this image:

## THE PHARSALUS BAS-RELIEF AND THE ELEUSINIAN MYSTERIES

FIGURE 7 presents the 5th century BC bas-relief from Pharsalus (Thessaly, Greece), now in the Louvre Museum in Paris (no. 701, appearing in the catalog under the name "The Exaltation of the Flower"). The two goddesses of the Eleusinian Mysteries are represented, DEMETER and PERSEPHONE, showing each other various objects (usually interpreted as being flowers) and exchanging them (BAUMAN 1993). Actually, the

PHOTO BY GIORGIO SAMORINI & G. CAMILLA

FIGURE 7. The Pharsalus bas-relief depicting DEMETER and PERSEPHONE.

object that the figure on the right (PERSEPHONE) is holding in her hand is more mushroom-like and the shape suggests this, rather than a flower. Even the manner in which she holds it, with the lower part of the 'stem' or 'stalk' between her two fingers, is suggestive of the way one normally holds up a mushroom to show it to others. In 1957 ROBERT GRAVES first proposed a mycological interpretation for this work of art in his book *Food for Centaurs*; however, he did not include an illustration (at least there isn't one in the 1994 Spanish edition). On considering this bas-relief, GRAVES concluded that the prophetic inspiration of the Mysteries of Eleusis originates in *Amanita muscaria* (GRAVES 1994: 92). Strangely, he presented this idea to R. GORDON WASSON in 1957, which means that WASSON was actually aware of this bas-relief more-or-less twenty years before he and his collaborators proposed *ergot* as the Eleusinian entheogen. But WASSON included no discussion of this in his publications. GRAVES reports that Wasson also tended toward a mycological interpretation of the Pharsalus bas-relief, but: "since he was more cautious than me, he had doubts about stating his opinion on such an important matter as this until he had received expert advice" (*ibidem* 1994: 92; translated from the Spanish version).

I presented this bas-relief and discussed the basic idea in an article published in Italy (SAMORINI *et al.* 1995). With this current article, I intend to provide further information and a few more thoughts on the matter. This bas-relief takes us to the very heart of the "Eleusinian question," its mysteries, and the controversial issue of the Eleusinian entheogen's psychopharmacology. Researchers have recently cast

doubts on and rejected the hypothesis put forward by WASSON, HOFMANN & RUCK in 1978 that presents ergot and its visionary alkaloids as the psycho-pharmacological key to the Eleusinian Mysteries (MCKENNA 1993; VALENCIC 1994). Furthermore, even though they were apparently not familiar with the Pharsalus bas-relief, the agent that they considered the most likely Eleusinian entheogen is a species of psilocybian mushroom. The bas-relief would seem to confirm this hypothesis, but we must be careful not to rush to conclusions.

My own opinion is that in-depth analysis of this work leads to the conclusion that the original psychopharmacological key to the Mysteries is *not* a psilocybian mushroom. The bas-relief features three hands holding objects. The first object, the highest up in the bas-relief, is held by PERSEPHONE. It is shaped like a mushroom of the *Psilocybe* species or, as is more likely, a *Panaeolus*. DEMETER holds the second object. It is the same as the first—the same mushroom—but it is tilted and the hood would appear to be chipped. Alternatively, as GRAVES (1994: 92) suggests, it isn't chipped at all. His interpretation is that the fragment is intentionally missing because DEMETER is meant to have eaten it; this detail stresses the importance of *eating* taking place during the rite. Only careful examination of this bas-relief will help us establish if the mushroom hood was accidentally chipped or was instead meant to be incomplete. In any case, we can hypothesize that DEMETER and PERSEPHONE are holding mushrooms in their hands and that during *this* period and in *this* region—*i.e.* for *this kind* of Eleusinian Mystery—a psilocybian key may be perceived. In this context, we should not forget the important, albeit isolated, piece of ethnomycological information provided by CARL RUCK that, today, in some regions of Greece, the inhabitants are aware of a number of species of visionary mushrooms that are not *Amanita muscaria* and which go by the name of “crazy mushrooms.” The mushrooms are not considered toxic but rather “inebriating like wine, although in an entirely different way” (in WASSON *et al.* 1978: 122). It is therefore surprising to learn that RUCK should continue to identify the mushroom-like objects in the Pharsalus bas-relief as flowers, specifically roses (RUCK 1998) when there are no rose varieties or even parts of roses that are similar in any way to the mushroom shape seen in the bas-relief. This is an extremely realistic scene. However, the real enigma here is the third object DEMETER has in her left hand. If the first two objects represent visionary mushrooms—that is, if they represent a psychopharmacological key—we might suppose that the third object is also of similar psychopharmacological significance, and that it would be as immediately identi-

fiable (to initiates) as are the first two objects. We therefore have *two* psychopharmacological keys. This emerges clearly from the history of the Eleusinian Mysteries. When we consider these Mysteries, we must bear it in mind that we are dealing with an entheogenic cult that lasted 2,000 years in all and was present throughout the Mediterranean basin, not just at Eleusis (an example is the cult of the two Eleusinian goddesses in Sicily, with its specific regional connotations). This cult became increasingly complex from the psychopharmacological angle as well. First, we have DEMETER, the Mother Goddess of the neolithic period. Then PERSEPHONE, who is followed by other divinities, including DIONYSUS. The author of *The Homeric Hymn to DEMETER* (one of the oldest mythical renderings of the foundation of the Eleusinian cult) was unaware of the existence of DIONYSUS. This lack of awareness is also reflected in the 5th century BC epigraphic collections. Only during the second half of the 5th century BC does DIONYSUS enter into the scene in relation to Eleusis in Attic literary and artistic works (SFAMENI 1986). This is also the period of the Pharsalus bas-relief. If we consider the fact that visionary mushrooms belong more to the Dionysian sphere (SAMORINI *et al.* 1995) and that what we see in this bas-relief relates to the final phase of the Eleusinian cult and its psychopharmacology, it is possible to ascribe the presence of mushrooms to a Dionysian influence.

During the final phase, two rites made up the structure of the Eleusinian Mysteries—the Lesser and Greater Mysteries. We may therefore suggest that there were two entheogens and that these are represented by the two types of objects featured in the Pharsalus bas-relief.

We should remember that the researchers who sustain the ergot hypothesis also postulated two Eleusinian entheogens. CARL RUCK suggests that the entheogens used in the Lesser Mysteries of Agrai (reflecting the Dionysian influence) and the Greater Mysteries of Eleusis (the *kykeon* brew) were a species of mushroom and ergot, respectively (WASSON *et al.* 1978: 114–123). RUCK believes the mushroom was *Amanita muscaria*. However, psilocybian mushrooms are also likely candidates—as the Pharsalus bas-relief might suggest. We must not forget that the *complete* hypothesis put forward by WASSON and colleagues was that of the use, as part of the Eleusinian Mysteries, of psychoactive mushrooms *and* ergot. This complete hypothesis has been ignored by those critics of the ergot hypothesis who instead favor the mushroom hypothesis.

As to the enigmatic third object held by DEMETER in the Pharsalus bas-relief, there are still no definite answers. Apart from the rose or some other generic 'flower,' a number of researchers have advanced the theory that it is a phallus or a fish. The phallus is not very likely as Greek artists have never represented a phallus in this manner (and they were masters of this art). What about the fish? But where are its fins? ROBERT GRAVES interpreted this object as a leather bag "such as those used for prophetic dice" (GRAVES 1994: 92; translated from the Spanish version). The problem here is that there is no known reference to the use of dice or other divinatory practices in the Eleusinian Mysteries. CARL RUCK sees this object as a symbol of the 'old religion' existing before the reform which, at a certain stage, the Eleusinian cult underwent (RUCK 1998). I personally think that this third object is an important clue to the identity of the original Eleusinian entheogen and, at the 1996 San Francisco ENTHEOBOTANY conference, I advanced the hypothesis that it represented a piece of bread formed in a specific manner (SAMORINI 1996).

L

For a more comprehensive criticism of McKENNA's and VALENCIC's objections to the ergot hypothesis, mentioned earlier, I would point out that they rest their case on the fact that no non-toxic entheogenic ergot-based brew has yet been produced. Be this as it may, what little has been carried out in the way of self-experimentation with ergot or ergot alkaloids (ergonovine, methyl-ergonovine; cf. BIGWOOD *et al.* 1979; OTT & NEELEY 1980) has not been as unfruitful as VALENCIC (1994) imagines. Moreover, the fact that a few number of experiments involving self-administration have failed means very little if we consider the great variety—in quantitative and qualitative terms—not only of the species that produce ergot alkaloids, but also of the possible manners of extraction and types of potion.

It is sufficient for us to note that in all there are at least 30 recognized species of *Claviceps* (ergot) and that *C. purpurea* alone infects at least 450 plant species (nearly all of which are grasses), *C. paspali* infects 36 plant species, *C. pusilla* 35, *C. nigricans* 12, and so forth. Alkaloid content varies greatly. Some strains do not produce alkaloids; others produce mostly toxic alkaloids and others produce mainly—perhaps, in some instances, only—psychoactive alkaloids, as is the case with the ergot strain (no. 178) isolated in the Mississippi region from *Cynodon dactylon* (L.) Pers. (Bermuda grass), a grass that is also frequently found in Europe. This strain produces significant quantities of alkaloids (of which 30% is ergonovine and 22% is ergonovinine) (PORTER *et al.* 1974). A famous *C. paspali* strain isolated from *Paspalum*

*distichum* L. in the Rome area of Italy was found to produce mainly ergine and iso-ergine (ARCAMONE *et al.* 1960). Biotypes of *C. purpurea* have been divided into physiological, phenological and geographical kinds, and climatic types have been identified—such differentiation also affecting the typology of alkaloids produced. At least five chemical combinations have been identified in *C. purpurea*, and three in *C. paspali*. Furthermore, at least 16 kinds of *C. purpurea* have been identified on the basis of the specificity of the host plant (GRÖGER 1972). Perhaps the Hierophants of Eleusis had discovered an ergot strain endowed with naturally occurring psychoactive properties or a strain that was easy to prepare in a non-toxic manner, cultivated in the Rarian plain neighboring Eleusis. The priests of the Eleusinian temple had the right to farm cereals (not the psilocybian mushroom or *Amanita muscaria*) on this plain. Furthermore, new ethnobotanic data has come to light over the last few years in Peru, Africa and China which confirms that it is possible to obtain psychoactive brews from grasses and lower mushrooms of the *Clavicipitaceae* family. This data will be reviewed in G. SAMORINI, “A contribution to the discussion of the psychopharmacology of the Eleusinian Mysteries” (forthcoming). — LGIORGIO SAMORINI, E-mail: giorgio.samorini@iol.it

## GYMNOPILUS CHEMISTRY?

I have been experimenting with “giant laughing mushroom,” and other *Gymnopilus* species. The divine forays into hyperspace are unmistakable, and I can only thank Mother Nature for such a gift or her bounty. Yet, I do have some technical questions. Do these mushrooms contain psilocybin, or some other alkaloid? Are they more or less toxic than *Psilocybe* species? — D.C., PA

*Of the Gymnopilus, PAUL STAMETS states:*

To date, 10 species have been shown to be psilocybin-active, according to a survey of the scientific literature by ALLEN and GARTZ (1992). They are *G. aeruginosus*, *G. braendlei*, *G. intermedius*, *G. luteoviridis*, *G. liquiritiae*, *G. lutes*, *G. purpuratus*, *G. spectabilis*, *G. validipes*, and *G. viridans* (see also HATFIELD *et al.* 1978). I believe an additional species, *G. luteofolius*, is also active. (The analysis of this species has not yet been reported in the literature.) *G. luteofolius* bruises bluish, especially in cold weather. Additionally, a Mexican *Gymnopilus*, *Gymnopilus subpurpuratus*, is also likely to be active, given its green bruising reaction (STAMETS 1996).

Phone / Fax (630) 628-0600

It should be noted that JONATHAN OTT takes exception to the list presented by ALLEN and GARTZ, noting:

“...this index of species ‘scientifically determined as psilocybian’ includes 46 species of *Psilocybe*, 3 species of *Gymnopilus* and 2 species of *Copelandia* which have not been chemically determined to contain psilocybine/psilocine, nor reported to be used traditionally as inebriants—they were added to the list because of taxonomic affinity to known psilocybian species and/or the presence of the bluing reaction” (OTT 1996).

OTT more accurately lists “*G. braendlei*, *G. intermedius*, and *G. leteoviridis* (sic)” as “probable psilocybian species” (OTT 1996).

STAMETS points out that, with some of the species in the genus *Gymnopilus*, “There may be compounds other than psilocybin, but closely related, that potentiate the experiences of the consumer” (STAMETS 1996). Small amounts of the active compound baeocystin (.02% to .05%) have been found in *G. purpuratus* (GARTZ 1996). Of *G. spectabilis*, STAMETS (citing TANAKA et al. 1993) notes that recent studies of Japanese mushrooms detected no psilocybin, “but identified a new hallucinogen, which they described as belonging to a group of ‘neurotoxic’ oligoisoprenoids, with depolarizing activity that was demonstrated on rodent neurons. (No human bioassays were conducted.)” (Stamets 1996). OTT notes that bisnoryangonin (a chemical apparently structurally similar to the active pyrones found in *Piper methysticum*) has been found in *G. spectabilis* (OTT 1996, citing HATFIELD & BRADY 1969; HATFIELD & BRADY 1971; and OTT 1976). However, JOCHEN GARTZ points out that this compound is inactive (GARTZ 1996). We are not aware of toxic compounds in *Gymnopilus* (which doesn’t mean that there aren’t any—we simply haven’t found references regarding this). As well, STAMETS warns of the possibility of confusing mushrooms from the deadly poisonous *Galerina* genus with *Gymnopilus* (STAMETS 1996).

## CAN TRICHOCEREUS SPECIES SURVIVE THE COLD?

Although I am a vegetable breeder by profession, I am a novice at cactus cultivation, and I am curious about the range of adaptation of *Trichocereus pachanoi* and/or *T. peruvianus*. Would the occasional sub-20° freezes of the California high desert prove lethal? — P.G., CA

K. TROUT responds:

Unfortunately, this is not a simple question. Cacti survival in low temperatures depends on several factors. Two of the most important factors seem to be the health of the plant and whether or not it is dry. Wet soil or air sub-

stantially increases cold sensitivity, but I hasten to add that I have seen *Trichocereus pachanoi* in wet northern California soil that quite happily survived freezes and even occasional snow/ice. I have seen dry *T. pachanoi* survive 6° F in central Texas. But I have also seen many more die in the 20s (almost every time it reached 29° F if container-grown or if the soil was wet). A few have died in the low 30s but most have had no problems with mild freezes. However, loss from freezing can be catastrophic and extensive, even in plants that had proven to be much more cold tolerant in previous years, so I recommend protection for any container-grown plants. As a rule of thumb I would absolutely protect the *Trichocereus* species of interest from anything below 20° F if they are in the ground and 32° F if they are in a pot. This is not to imply that these are automatically safe low temperatures. (32° F in the ground and 40° F in a pot are certain to be safe.) Of the two species, *T. peruvianus* should be the more cold hardy. Higher altitude strains may be better choices for your area. They are available for both species that you mention. A couple of the commercially available offerings: *T. pachanoi* OST 906401 and *T. peruvianus* KK 338 or *T. peruvianus* forma *Ancash*. It would also be a good idea to provide some shade protection if air temperatures regularly exceed 100° F. This much heat is not a real problem in itself but the potential surface temperatures can literally cook the plants.

## NEW HERB SUPPLIER

Recently upon receiving a catalog for medicinal herbs and spices, I found some herbs of interest to us at extremely cheap prices. Here are some examples:

ITEM		1 OZ	4 OZ	1 LB
A319	Calamus Root	\$1.25	\$3.25	\$10.95
A49	Damiana Leaf	\$1.05	\$2.65	\$9.25
A227	Mahaung	\$1.25	\$3.25	\$10.95
A117	Poppy Seed	—	\$1.90	\$6.95
A106	Passion Flower	\$0.95	\$3.30	\$12.10

There are several other herbs of interest. Catalog is free from:

## NATURAL VS. SYNTHETIC

Although you can fool the mind, you cannot fool the body. This is how I feel about most synthetic entheogens.

I cannot perceive very much, if any difference at all between chromatographed DMT from plant sources, and chemically manufactured DMT. However, the chemical DMT has toxic breakdown products that have a decidedly unpleasant effect on me for a couple of days. I do not experience this with the natural materials.

A warning to “would be” chemists. Anyone deciding to chemically extract tryptamines from plant materials using an acid, a base, and a solvent, should be aware of certain dangers. The danger of inhaling methylene chloride is well-known. Another hazard of using *any* solvent to extract plant alkaloids is that traces of the solvent are often remaining in the final product. These are not easily removed. Theoretically—with regard to chemical procedures—solvents and acids separate out 100%, leaving behind only pure products. Not so in the real world, and this is where non-chemists can really get into a lot of trouble. Individuals who use sulfuric acid to acidify and process *Phalaris* grass extracts are an example. I tried one of these extracts once, and never again, as it burned my esophagus and stomach. I realize how dangerous amateur chemical preparations can be. Why not use something safer, such as ascorbic acid or vinegar? The safest base to use would be ammonia, because it is effectively removed by evaporation, thusly bypassing “toxic residuals” problems. — B. GREEN

*There is no reason why synthetic DMT would have breakdown products that are any different from those produced from extracted DMT. However, it is possible that incomplete “kitchen” extractions of natural plant sources of DMT may contain other alkaloids that could cause side effects. It is also possible, as your letter points out, that solvents, acids, or bases might not be completely removed from the extraction, and these can cause problems. In these cases, DMT extracted from plant sources would be worse!*

*It is possible for lab-created DMT to be inadequately purified, and hence have toxic impurities. Perhaps this is what you are talking about?*

*If the DMT is pure, the effects and side-effects should be identical, regardless of whether it is extracted or synthesized. Those who perform extractions should consider using citric acid (a food-safe acid) in their procedures. Besides being readily available in citrus juices, it is also easy to obtain in pure crystalline form. No one should attempt drug manufacture of any sort if they are not experienced or at least*

adequately understand what they are doing. The fact that sulfuric acid may have ended up in a final product of DMT extract indicates that whoever made this was either incredibly careless or grossly underinformed. The "safest" base for DMT extraction would be a carbonate although ammonia is a lot simpler to use if adequate caution is employed. It should also be stressed that any and all organic solvents are dangerous to breathe or to allow any degree or frequency of skin contact. There are several potential sources of toxic components from synthetic DMT. One arises from inadequate purification of the DMT from other possible products arising during the synthesis; the other from residuals from solvent removal (usually impurities that were originally dissolved in the solvents). This latter point is also just as likely to affect DMT of natural origin. The easiest way to avoid this is to use only analytical grade reagents. As well depending on the plant it originated from, there can be a wide variety of potential toxins in natural DMT if purification is inadequate.

#### K. TROUT comments:

Going farther afield, the most common toxin arising from smoking DMT are nitrogen oxides produced from overheating the material during the act of smoking. They can be easily distinguished from the white DMT smoke as they are yellow or brown in color. They add a bad taste and subjectively seem to introduce more of an unpleasant character to the experience. This seems to be even more pronounced with darker colored material that has been repeatedly recovered after smoking and reheated. This leads me to wonder if there are not neutral indoles present in the partially degraded brown material that is often encountered after a couple of recyclings or the black oily gunk that eventually results from smoking large pipe-loads. If so this material may represent a serious threat to lung tissue both on account of nitrogen oxides and on account of the neutral indoles. While lacking any hard data, I would urge that the partially charred residue of DMT be discarded if chromatographic separations are not available. A good precaution is to carefully measure dosages, evenly heat the material and not overheat it. Cleaning the pipe between doses and not attempting to completely consume dark material that remains after smoking may also be a good idea.

## MUSHROOM NAUSEA

I have had a total of fifteen experiences with *Psilocybe cubensis*. The first ten (all from the same source) were very good and positive. I did 3 to 3.5 grams the first nine times and on the tenth I did 5 grams. After a few hours into this trip I got very sick with nausea and the rest of the night was spent over the bowl. I spent the next ten months in abstinence. Two months ago I tried it again, this time with mushrooms from a differ-

ent source. I did 5 grams and two hours into it the nausea started again. The next time I dropped the dosage to 3.5 grams, and I was sick again. Then I dropped the dosage to three grams; sick again. Then three grams again; sick again. The last time was 2 grams and I did some dramamine one hour before. This experience turned out to be one of the most visually brilliant I have ever had, very intense, and time moved very slowly. It was also the lowest dosage I had ever done. At the two hour mark (I thought that I was at least four hours into it at the time), the nausea started again. My experience with the nausea is that it happens almost always at the two hour mark. I always take the mushrooms alone in silence and darkness, and I fast at least six hours beforehand. If any readers have suggestions or solutions to my problem it would be appreciated. — P.L., NJ

*As the nausea first started after a fairly high-dose trip (5 grams), it is possible that this trip unlocked something in your subconscious that wasn't dealt with completely, and that manifested physically as nausea. Now, each time you revisit your subconscious through the use of mushrooms, this not-yet-dealt-with psychological baggage continues to manifest as nausea. Or, this idea could be a load of armchair psychologist horseshit. It is worth noting though, that one of the "psychedelic elders" that I have spoken with feels that nausea and uncomfortable feelings that occur on entheogens are almost always based in the psychological subconscious.*

*Others feel differently; one of the main thrusts of the C. B. GOLD article, "The Mushroom Entheogen," (mentioned in the VERNAL EQUINOX 1998 ER) was to reduce those toxins in psilocybian mushrooms that might be responsible for adverse physical effects. Perhaps the manner that you are preparing the mushrooms is contributing to this adverse effect? Some people use ginger to help control nausea, and a quick-brewed entheogen tea made using PRINCE NEVILLE'S FAMOUS GINGER BEER (Ingredients: ginger root, water, pineapple, honey, and lime) as the liquid has proven quite effective in reducing nausea normally caused when I combine psilocybian mushrooms and Peganum harmala. Others find a few tokes of Cannabis to be helpful. Readers? — DAVID AARDVARK*

## MUSHROOM QUESTIONS, PEYOTE SUGGESTIONS

I have been reading the past couple of issues of *ER* with great interest. If even half of the "war stories" printed are true, then your explorers are quite brave. Personally, I'm an old-timer, and stick to the tried and true means. However, I would be interested in hearing any experiences anyone has had with *Ariocarpus* species. Also, has anyone done any experimentation with simpler methods of mushroom growing? In nature

the spores are eaten by a cow, then grow from the pile. So why is it necessary for all of the complicated procedures? In nature they are exposed to everything. There must be an easier way.

Well, I'm not one to just take, so I will share a tip. In order to counteract the bitterness and nausea caused by peyote, try cooking the tea with an old lemon. A fresh lemon is no good. It must be one that is turning black or even dry. It took a year of trial and error to come up with this solution; we tried every possible combination. I assure you that no peyote was ever wasted in the process. It also helps to add some American ginseng—this can be eaten when ingesting the tea and buttons. It also helps to chew dry ginseng while you are drinking peyote tea. This seems to add a high yellow note (from the woodwind section) to the experience. Orange pekoe tea can help if added at the last minute. For a real taste treat, try pickling some peyote in tequila for a couple of months. Mui Bueno! — J. P. WILLIAMSII, CA

*As far as mushroom growing goes, the easiest way to go is to use a spore syringe. One will still need to sterilize the growing medium though, but this can be done in a pot of boiling water (a pressure cooker is nice, but not necessary). One ER correspondent mentions a makeshift syringe method:*

I've had good luck growing mushrooms the lazy man's way. I just drop a slide of spores into a beaker of sterile water with some nutrients. Blend the contents (breaking the slide into small fragments). The whole slide must be clean before taking the spore print. Keep it warm and shake it up a few times a day and then use a big syringe (or a turkey baster) to squirt the required fluid into the mason jars of rye seed. This saves time, effort, and a couple of possible sources of contamination. — PAT BUCHANAN and BILLY GRAM

*We have no idea why an old black or dry lemon would have the effects on peyote that you've mentioned. Fresh lemons (or limes) work very effectively for making potent tea, but do not make the taste palatable. One factor that does seem to help reduce nausea is to minimize cooking times by using a food-safe acid. Use of a blender and an acid (like citric) can make two 15–20 minute cookings adequate for almost total extraction (especially if a pressure cooker is used and/or the material is frozen prior to extraction). Use of the minimum amount of liquid necessary for full extraction can eliminate the need for volume reduction entirely. Prepared in this manner, with one or two lemons or limes per pound of fresh cactus (per cooking), the process should take only about 90 minutes from cactus to finished tea. Tequila-pickled peyote sounds god-awful to us, but we suppose everyone has their own tastes. K. Trout has been known to enjoy the combination of ginseng and cactus a lot: "Whether as roots, extract,*

*or a slow-brewed tea, small to moderate amounts of ginseng add a nice dimension to the cactus, especially after onset."*

## QUESTIONS

- 1) Regarding *Psilocybe cyanescens*. White mycelium filled my big plastic pots, but I had no fruits during the cold season. Why?
- 2) I'm searching for details about the growing and the processing of *Desmodium gangeticum* and *D. tiliaefolium*.
- 3) Dose anyone have information regarding "gharu," a psychoactive and very aromatic bark burned by the Penan people in Malaysia?
- 4) An adequate supply of CO<sub>2</sub> is known to improve the growth of *Cannabis*. To feed the plant with CO<sub>2</sub> water seems to have similar results. I have also observed a greater extraction power in these waters, when used to macerate plant material. Is there some explanation for this?
- 5) What happened to DRITTEWELLE? What about the 2C-B supply?

Best wishes. — B.M., Italy.

*To answer your questions as best we can:*

1) *It is hard to say what went wrong here, as you made no mention of what substrate you are using. It has been pointed out that P. cyanescens will only fruit "reluctantly and belatedly" on fresh sawdust (STAMETS & CHILTON 1983). Perhaps this was your problem?*

2) *Both Desmodium gangeticum and D. tiliaefolium are easily grown in any normal well-draining soil. Both will do best if they have partial shade. Unless stressed and exposed to too much sun, neither will form seeds until their second year. Both have proved hard-freeze sensitive in central Texas but D. gangeticum is easily lifted and overwintered in pots or can also be effectively protected by covering with plastic and using lightbulbs for a heat source during freezing weather. Friends in northern California have found their D. tiliaefolium fairly frost hardy. In the case of D. gangeticum, the traditional time for medicinal harvest is during or following the rainy season, while it is actively flowering and setting seeds. With D. gangeticum, leaves are more useful than roots. (BANERJEE & GHOSAL 1969; GHOSAL & BANERJEE 1969). With D. pulchellum, the roots are more useful than leaves (GHOSAL et al. 1972).*

*For chemical separations, we suggest column chromatography as there are multiple alkaloids present, most of which*

lack human evaluation. *D. gangeticum* approaches the lower end of usefulness, with 5-MeO-DMT being the predominate alkaloid in the leaves. JOHNNY APPLESEED's TLC did not detect DMT or 5-MeO-DMT to be present until the second year of growth. Interestingly, leaves demonstrating the red winter coloration showed a fairly consistent positive assay but they were not evaluated during the first year (APPLESEED 1992–1996). The loss of two-thirds of the total alkaloids during the act of drying has been reported, with an accompanying shift in alkaloid composition favoring 5-MeO-DMT over DMT (GHOSAL & BHATTACHARYA 1972; BANERJEE & GHOSAL 1969). *D. tiliaefolium* is probably not a useful ayahuasca analogue due to a multitude of assorted alkaloids, overall low concentrations and a lack of proven visionary compounds outside of tiny amounts of DMT-N-oxide. It does contain several alkaloids that could readily be used as precursors for DMT production and quite interestingly is the only known occurrence of normacromerine outside of the family Cactaceae; 28 mg was isolated from 2.3 kg of dried roots (GHOSAL & SRIVASTAVA 1973). However, no detectable alkaloids have been found in some US material (SMOLENSKI et al. 1972) and, regardless, it is unlikely that normacromerine has visionary activity.

3) We have been unable to locate any information on “gharu,” and we are hopeful that any ER correspondents with knowledge of this obscure possible entheogen will enlighten us.

4) We have no idea why carbonated water might have increased ability to extract plant chemicals. We are curious exactly what plants are being extracted with this, and what procedure is being used?

5) In the 1997 SUMMER SOLSTICE issue of ER, notice was given that DRITTEWELLE had closed due to “insurmountable production and distribution problems.” 2C-B remains available to some extent on the underground market. For a period of time 2C-B was available in “smart shops” in The Netherlands. It is no longer available, due to being scheduled. However, we have recently heard of 2C-T-2 being available in these shops.

## MORE *T. PERUVIANUS* ID.

The v-shaped notch over *Trichocereus peruvianus*' areoles (the small, round pads from which the spines emerge) does not distinguish *T. peruvianus* from the many other similar-looking Trichocerei. A more in-depth look into *T. peruvianus*' characteristics is necessary.

Its reddish-brown or light-brown areoles are equally as woolly as *T. pachanoi*, but are slightly larger. And, as with *T. pachanoi*, the wool falls off with age and is therefore only found on new growth. The aged areoles are flat and grey, and are vertically spaced at two centimeter intervals on straight portions of the branches. Spines on new growth are bright yellow, with

honey-colored tips (hence the common name, “Peruvian torch”). As the spines age, the honey-color spreads down to the base of the spines. As the spines continue to age, they become slightly thinner and turn grey.

Distinct spine development of a single central spine surrounded by five to eight shorter radial spines, is only present near the base of the branches. Usually, there are approximately five spines, which jut out in random directions from each areole. There may be as few as three or as many as nine spines, but these extremes are found only sporadically on a few areoles. Their average length is 2.5 cm, although they may be as long as 4 cm or as short as 0.5 cm. Unhindered spines grow straight and are not curved, as in some other look-alike species.

*T. peruvianus*' main distinguishing characteristic over the many other similar looking species is its severely leaning branches. *T. peruvianus* is not able to hold its weight very well. As the mature branches grow in length, they begin to lean, ultimately becoming fully prostrate. Out of respect for this sacred cactus, it's probably best to take cuttings from these offerings.

Since it is difficult to find detailed identification information on the sacred cacti, it would be a great contribution if ER correspondents would share information on *T. macrogonus*, *T. validus*, and other choice species. — D.D., CA

K. TROUT responds:

Although not very common, we have seen *Trichocereus peruvianus* spines exhibit bending at the tip. So far I have seen a stout central spine develop at the very tip, a few areoles down, sporadically along the column or only fairly low on the plant. Even within a particular strain (like KK 242 or ‘blue form’) this seems variable. Some certainly do produce centrals only along the column though and not at all at the top of the plant. We have not uncommonly seen a second long spine, generally above the central spine. 0–2 centrals, usually one, seems a good generalization for *T. peruvianus*. The above description of 3, 5 or 9 radial spines violates the minimum and maximum number specified in most of the published descriptions of *T. peruvianus* (i.e. 6–8 radials) although it does conceivably fall within BRITTON & ROSE'S (1920) “around 10” spines total per areole. (I should add that JENS MADSEN'S (1989) characterization of *T. peruvianus* as simply a stout spined variant of *T. pachanoi* and revision of the number of spines per areole for *T. pachanoi* to 0–10 opens up another potential can of worms; with inad-

equate justification included. If we accept this, I would immediately ask where this places JEWEL'S Giant and *T. macrogonus*? And for that matter what about those plants identified and sold as *T. bridgesii* and *T. cuzcoensis* that do look like "pachanoic" plants?) I may have seen the "*T. peruvianus*" material discussed above with fewer spines than are described for *T. peruvianus* (and have one in the collection here). This is supposed to be a quite potent strain (and the only "*T. peruvianus*" I've examined so far that shows decidedly reddish-brown felt) but the form actually falls somewhere in between the published descriptions for, and material sold as, *T. peruvianus*, *T. bridgesii* and *T. macrogonus*. (It shows points that clash with all of them.) It is sold as *T. peruvianus* but I believe it needs better clarification or else the taxonomic descriptions need revision (or both). It certainly needs more intensive propagation.

Another puzzling point above is "Spines on new growth are bright yellow, with honey-colored tips." CURT BACKEBERG (1977) states "Honey-coloured, darker below." Granted honey frequently ranges from yellow through amber to brown (sometimes it is even colorless). All verified material examined so far has shown yellow to yellowish spines; all with brown or brownish tips and/or bases. Some have started pure yellow (briefly); others two toned, even within one single given specimen marked KK 242. The comment about its main distinguishing characteristic being its habit of leaning and becoming prostrate is a good one but not one that helps most people identify this species until they have grown it for some time. I would agree with the idea that such prostrate branches are good for bioassay simply due to their age. One thing I have noticed concerning *T. peruvianus* versus *T. macrogonus* is that spines on the first turns grey with age while the latter starts darker overall and, while turning grey, also tend to darken with age. They are similar in how they are marked but rather than the varying grades of honey colors found on *T. peruvianus*, they have shown sienna and brown spines. BACKEBERG (1976) described them as "all horn-coloured to brown; later blackish or dark grey or greyish brown." Exceptions have been found but this seems to be a generalized characteristic. *T. macrogonus* is also described as having 6–9 radial spines and 1–3 centrals, in the same work by BACKEBERG. BACKEBERG and also BRITTON & ROSE give the number of ribs for *T. macrogonus* as usually being 7 and *T. peruvianus* as having 6–8. JOHN BORG (1976) gives the same for *T. peruvianus* but lists 6–9, usually 8 for *T. macrogonus*.

## MORE ON PSYCHOACTIVE CACTI

*Our thanks to B.K., CA who provided the following detailed information on psychoactive cacti. Throughout this correspondent's letter, we have placed editorial comments. The correspondent's letter is in plain text; our comments are either placed in sans-serif italics or inset in a slightly smaller font. — D. AARDVARK*

I have been working part-time at a cactus & succulent nursery for the last few years. This has given me access to plenty of plant material to explore. I thought that I would share some of what I have learned.

There are nearly 100 *Trichocereus* species, and only about  $\frac{1}{4}$  of them have been investigated chemically. About half of these were found to contain mescaline, and only a handful of these have been bioassayed to my knowledge. There is reason to believe that those species that don't contain mescaline, but do contain other phenethylamines, may be psychoactive in a positive way—if not entheogenic. The following is my experience with different *Trichocereus* species so far:

***T. pachanoi*:** The potency seems to vary some between different clones, but is consistent with specific clones. I have prepared this plant numerous ways, but prefer to make a strong decoction with water and a little lemon juice (cut the cactus into small pieces and boil all day, cook-down and drink-up). I have taken up to three feet of a five-inch in diameter plant (I didn't weigh it) prepared this way. It works—strong.

*It is worth noting that our weight comparison showed that the above length and diameter of cacti would be at least twelve pounds of fresh cacti; a strong dose indeed!*

The dark green material under the cuticle can be dried and powdered to smoke alone or with *Cannabis*. The first time I ingested *T. pachanoi*, I smoked it with *Cannabis*. This resulted in a plus 2 experience that lasted all night. I have never been able to duplicate that first experience through smoking again, though I have smoked much larger quantities than the first time. Anyway, smoking does produce a nice psychoactive effect that most people enjoy. One fellow I turned-on enjoys this more than *Cannabis*.

*We've heard scattered reports of *T. pachanoi* and *L. williamsii* being active when smoked. It seems highly unlikely that this would be due to mescaline, as the volume smoked would*

have to be enormous. Most of the time when people have described the effects of smoked cacti, it comes out that they have combined it with Cannabis. Take the following quote, for example:

Peyote will burn if it is dried and powdered, and it can be smoked with grass. Many adherents of Indian practices will not use it this way. This combination intensifies the effects of marijuana; it gives a lovely, light high that sharpens vision without sending one on a major trip (STAFFORD 1992).

While it's possible that there are chemicals in some cacti that are psychoactive when smoked, and that these chemicals work synergistically with Cannabis, it seems much more likely that the effects of *T. pachanoi* or *L. williamsii* and Cannabis combined are due to the Cannabis alone (and perhaps the psychological expectations of the smoker).

In order to get to the bottom of this, ER's editor DAVID AARDVARK smoked 650 milligrams of dried *T. pachanoi*. The cactus was prepared by peeling off the cuticle, and then cutting the thin layer of green tissue off (about 1/8 of an inch) and drying this at a very low heat in the oven for ten minutes.

I smoked the *T. pachanoi* preparation in a totally clean PROTO PIPE™, repeatedly taking large hits. I took over thirty hits deep into my lungs, smoking continuously for at least fifteen minutes, and taking short breaks between hits for a breath or two of fresh air. A couple of times, I hacked up a lung, face red, eyes watering, from taking hits that were too big. The smoke wasn't overly harsh, but it wasn't pleasant either—especially taking in this much all at once. I doubt that anyone but the most dedicated cactus smoker has ever smoked much more cactus in this short of a period. Aside from a slight headache, and a dizzy feeling (surely due to the large amount of smoke inhaled), I felt no noticeable psychoactive effects, visionary or otherwise.

K. TROUT has smoked peyote, peyote tar, and isolated mescaline crystals. He also didn't notice any effects that weren't attributable to excessive smoke inhalation, and he agrees that the Cannabis is likely the contributing factor in those cases where people have had psychoactive effects from smoking the combination of *T. pachanoi* or *L. williamsii* and Cannabis.

However, on topic of smoking as an alternate means of ingestion, the following information may be of interest:

- 1) Minor amounts of quaaludes are strongly active if smoked (100 mgs powdered in a joint will severely intoxicate 3–4 people).
- 2) The tranquilizer meprobamate is a euphoriant when smoked, and has utterly different effects ingested this way than when taken orally.
- 3) JAMES CALLAWAY claims that tetrahydroharmine is active

when smoked or if taken following a MAOI (CALLAWAY 1995). Exactly what "active" means is obviously inadequately defined.

4) Despite the ingestion of mere milligrams of MAOIs when smoking *Banisteriopsis caapi* leaves or bark, there is a distinct interaction with tryptamines (such as psilocybin and/or DMT) if they follow the smoking of a fat joint of *B. caapi* leaves/bark, or if the leaves/bark are smoked after the onset of psilocybian mushrooms.

All of the above-mentioned substances are entirely unevaluated with regard to potential lung damage from smoking.

**JULE'S (sic) Giant:** Some say this is a *T. pachanoi* clone, but judging by the flowers and fruits it produces, I believe it to be a distinct species (possibly *T. scopulicola*). It grows much fatter than *T. pachanoi* and is about twice as potent.

We recently learned that the correct name/spelling for this cactus is actually "TOM JEWEL'S Giant" (named after a friend of JIM DANIEL, the owner of CACTUS GEMS). It apparently arose naturally as a mutation offshooting from an "Echinopsis species cv." (= *Trichocereus species?* cv.) and was propagated as an improved in-house specialty. One report we've heard second-hand has been that JEWEL'S Giant is "1.5 times the potency of typical *T. pachanoi*." A friend in northern California found it to be around twice as potent as *T. pachanoi* and another reported what he thought was JEWEL'S Giant as being inactive. Specimens examined to date have shown 0–3 spines per areole and light brown felted areoles rapidly falling and becoming grey or black. Some areoles have shown a depression above the areole, while others have not.

An odd point we've noticed is that, despite its girth (up to 5.2 inches on our current material), JEWEL'S Giant has a far weaker vascular bundle than any *T. pachanoi* we've encountered. We have no experience to know whether or not it becomes prostrate or fragile with age but one cacti expert has stated that JEWEL'S Giant "grows about 9 feet tall and then collapses" suggests at least the latter (MARGADARSI 1998).

**T. bridgesii:** I have sampled three distinct clones. One has short spines and one long (v. *longispinus*) both of which seem to be about the same potency as *T. pachanoi*. The other clone is a monstrose "spineless" form of *T. bridgesii* v. *longispinus*, which is quite potent—about 1 1/2 times the potency of *T. pachanoi*. Smoking *T. bridgesii* produces a peculiar head rush that differs from the experience of smoking *T. pachanoi*.

*Trichocereus bridgesii* contains the novel triterpenes *bridgesigenin A* and *bridgesigenin B* (KINOSHITA et. al. 1992). Neither these nor their pyrolysis products have been assayed in humans (or animals). The aforementioned report of a "peculiar head rush" suggests that perhaps they should be.

*Monstrose T. bridgesii* are very different looking than normal *T. bridgesii*—one would hardly know it to be a *Trichocereus* at all. They are relatively scarce in the marketplace (available only as cuttings, as they are produced as a point mutation). The single cutting that we have is a lighter, dusty greyish blue-green, and has no spines at all (though they do get the occasional spines near their base). It only has two “ribs,” making it look sort of like a green cow’s tongue. A good photo of this form of *T. bridgesii* can be found on page 1121 of CURT BACKEBERG’S 1959 *Die Cactaceae VOL. 2*. Although the chemical profile should be the same as normal forms of *T. bridgesii*, the scarcity of these plants causes us to discourage their consumption.

***T. macrogonus* & *T. peruvianus*:** These two *Trichocerei* are very similar in appearance. A number of nurserymen I have spoken with claim that all of what is available commercially is *T. macrogonus*. Anyway, the plants that I have acquired—regardless of some morphological differences that I thought would distinguish them—vary from being close to *T. pachanoi* in potency up to twice as potent as *T. pachanoi*. Seed is available from a number of sources for *T. peruvianus* KK 242 (from which the original chemical analyses were carried out that showed *T. peruvianus* to have such an enormous amount of mescaline). I have year-old seedlings but it will still be a few years before I can bioassay, and hopefully confirm those analyses.

For more on the mescaline content of the KK 242 variety of *T. peruvianus* (which was by no means “enormous”) see the article by K. TROUT in the VERNAL EQUINOX 1998 ER, p. 18.

**Other *Trichocereus* Species:** Chemical investigations in the early ‘70s showed both *T. validus* and *T. taquimbalsensis* to be very rich in mescaline. It will be at least another year before my seed-grown plants of these species can be bioassayed. I have heard secondhand reports that *T. werdermannianus* is two to three times stronger than *T. pachanoi*, and that *T. pallerensis*, *T. smrzianus*, *T. spachianus*, and the gigantic *T. terscheckii* and *T. atacamensis* are all quite active.

The question following the above statement must be “active in what way?” While some of these cacti may have stimulant properties, they may not necessarily be visionary. For example, it should be noted that three separate chemical investigations have shown that those *Trichocereus spachianus* tested **did not** contain mescaline (AGURELL 1969; MATA et al. 1972; PUMMANGURA et al. 1982). Indeed, for this reason *Trichocereus spachianus* was used as the “non-mescaline-containing cactus” in experiments attempting to see if there was translocation of mescaline by grafting non-mescaline-containing cacti and mescaline-containing cacti together. The study showed that mescaline does not translocate (PUMMANGURA et al. 1982).

*Trichocerei* thrive with extra nitrogen such as horse manure, bat guano, and fish emulsion. (Stay away from industrial synthetics such as MIRACLE-GRO, SCHULTZ, etc.) Not only does the addition of nitrogen to the soil increase the growth-rate considerably, it also seems to increase potency some.

#### K. TROUT responds:

Many people seem to have a prejudice against soluble fertilizers like MIRACLE-GRO. Is there a *real* reason it should be avoided? If so it needs to be stated, or this sounds like technophobic raving. Some folks hate such things simply because they are “chemicals,” as if the “organic” fertilizers somehow are not. The fact that they are “industrial chemicals” is usually the only reason people can give when ranting against MIRACLE-GRO and other soluble fertilizers. There have been *claims* made that soluble fertilizers somehow kill soil bacteria and that they also may introduce excessive salt problems, but I have never seen studies that actually addressed these claims. Certainly solubles only fertilize when applied, and have little residual activity. Such soluble fertilizers are widely and commonly used in the wholesale cactus production industry with excellent results. (One prominent ethnobotanical dealer recommends the use of soluble fertilizers for cactus, but we’ve noticed that they also use a time-released fertilizer as a soil additive.)

Bat guano is capable of giving people chronic respiratory infections and may contain a variety of pathogens that can enter one’s blood stream through cuts. It’s great fertilizer, but I would avoid it for all drug-plants except as a soil additive. Its current use as a foliar feed for *Cannabis* is insane and irresponsible! People really need to think conscientiously about the health problems experienced by those who have collected bat guano commercially, or spelunkers who have been exposed to bat guano while caving. This is a potentially serious health risk that is further complicated by it being difficult to get a correct diagnosis in far too many cases.

A point about MIRACLE-GRO; regardless of what may or may not be wrong about soluble fertilizers, this product *radically* enhances the formation of offshoots, especially basal offshoots in *T. pachanoi*. The single most successful *T. pachanoi* grower I know, both in terms of obtaining full diameters of stock and growth-per-year, uses *only* MIRACLE-GRO at  $\frac{1}{3}$  to  $\frac{1}{5}$  the normal solution once a month, spring through fall. He believes the three most important factors for the best *T. pachanoi* are lots of water, MIRACLE-GRO every month while growing, and as much sun as can be obtained. I can speak from experience as well; if a person wants to increase the branching

on their plants and get the most growth possible, MIRACLE-GRO is an excellent choice. (I am sounding like a damn commercial as many times as I keep mentioning this product!)

If there is a sound and rational reason to avoid MIRACLE-GRO, fine. But unless a realistic reason can be provided it is a shame to dismiss this useful product off-hand. It is not just a shame, but actually an unfair disservice to the makers of MIRACLE-GRO to denounce it as somehow unfit for being an “industrial chemical” and give no justification.

Too strong of a solution or too frequent of application will substantially enhance rotting more than growth; perhaps that was this *ER* subscriber's experiences? Or if they applied MIRACLE-GRO at full-strength, spraying the plants (it should be given to the roots as a drench) and placed them in the sun, severe burning is very likely. The problem in these cases is not the in the MIRACLE-GRO, but in the method of application and amount. Soil additives are often preferred not just because they provide a slow and sustained source of nutrients, but also since they are much more idiot-proof and require either effort or carelessness to damage plants.

Another advantage of soluble fertilizers like MIRACLE-GRO is that they are great for feeding cacti that are extremely rot-prone. Such plants can be raised in soilless media—even in pure sand in some cases—and all nutrition provided as a weak solution of soluble fertilizer mixed with their water ( $1/10$  normal concentration) and given every month or so during the growing season only. The advantage is that the soil remains poor since there are no slowly decomposing organics and no moisture is retained in the ‘soil.’ All but a few cacti respond well to this.

Retail cactus farmers are notorious for their excessive use of pesticides and fungicides, many of which are systemic and remain in the plant tissue a long time. I have heard of several growers who purposefully dose the *T. pachanoi* with large amounts of pesticides to discourage consumption. Know your sources! Many of these pesticides can cause serious liver damage and in the longer-term, cancer. If you are not sure about a source, grow out a few generations of cuttings before consuming, and leave the original plant as stock.

**Ariocarpus:** *A. fissuratus* is definitely psychoactive and possibly entheogenic. *A. kotschoubeyanus* is also active, but more mild. It is quite likely that other species are also psychoactive. If one is interested in bioassaying any *Ariocarpus* species I recommend grafting to *T. pachanoi* or similar stock.

They are a little more difficult to graft than other cacti, but once grafted successfully, they grow amazingly fast and usually offset profusely, providing plenty of plant material for bioassay. I only recommend trying to graft younger plants that are no more than 1 1/2 to 2 inches in diameter. If the root is left in the soil, it will usually grow back several heads like *Lophophora williamsii* when cut (but slower). Leave the older, larger plants alone; the “psychoactivity” of these remarkable ancient cacti can best be experienced by simply quieting your mind and sitting with one of them for a while. They are definitely a felt presence.

Contrary to some information out there, *Ariocarpus* enjoy lots of regular watering during the summer growing season, provided that they have a good root system. They may survive on very infrequent rains and desert dews in the wild, but they won't survive or thrive in the long-run in cultivation if given this treatment.

K. TROUT responds:

I have heard this before but it simply is not true for my area. Perhaps B.K.'s local climate is better; perhaps his humidity is lower; perhaps he just has more of a green thumb than me. I don't doubt that what he says works for him, but I have had terrible long-term results many years back when I believed and used the approach he recommends. *Ariocarpus* do respond well to lots of water during summer but this has never enabled the long-term survival of any plants I grew. Most plants that showed a dramatic growth during summer also showed a high death rate during the winter. The tips included in my cultivation section (TROUT 1997) are not only my experience but also incorporate the results of interviewing local people who raise these successfully. The way I described would give the cacti one really thorough soaking every summer and very light watering the rest of the time. I might add that I have noticed that seed-grown *Ariocarpus* plants are far more water tolerant than wild-collected plants. One point is that while wild *Ariocarpus* in Texas not uncommonly get a lot of rain, even during winter, very little ever reaches more than the periphery of the root system.

**Epithelantha micromeris:** I have smoked and eaten this cactus on several occasions. Smoking seems to produce some central nervous system stimulation and mild perceptual change for several hours. *Cannabis* heightens this (surprised?). The first few times I ate small portions I noticed very little effect, mainly a mild stimulation. Then I ate a one inch diameter button cleaned of spines. About 1/2 hour after

ingesting I entered a pleasant state of lucid mind. There was a distinct enhancement of perceptions and my energy level was incredibly high all day. That night I fell easily to sleep and experienced lots of hypnagogic imagery in my dreams. There were no noticeable negative side-effects, and the overall experience was good. I plan to work with this interesting plant more in the future.

*Epithelantha micromeris* is easily grown, and can be sustainably harvested by cutting the “button” off about 1/4 inch above the soil level. It will quickly regrow several heads when harvested this way. It also responds well to grafting, but the grafted plants seem to only live a few years. It lives for many years on its own roots and forms large clusters with time.

***Mammillaria:*** I have smoked small amounts of the dried latex of *M. craigii*. Many *Mammillaria* ooze a white latex if cut or punctured. The latex was combined with a little *Cannabis* and definitely had some synergistic effects; it reminded me a little of a *Salvia divinorum/Cannabis* combo. Traditionally the plant is cut in half and the center is removed and ingested, though I haven’t felt the desire to try that procedure yet. The plant is easily grown and fairly cold-hardy. Interestingly, I have smoked the latex of *M. heyderi* the same way and I didn’t notice any effects.

***Armatocereus laetus:*** WADE DAVIS mentions that this columnar species is used as a substitute for *T. pachanoi* in a limited area of Peru. Plant material is lacking, but seed is available from several sources (my seedlings are still quite small).

***Astrophytum myriostigma:*** I have talked with several Southern California cactus growers who claim that this cactus is psychoactive. I was told that several years ago jackrabbits invaded their growing fields. The rabbits soon discovered the *A. myriostigma*. They were seen to nibble the ribs of the cacti, and then exhibit marked intoxicated behavior. After the effects appeared to wear off, the rabbits would be at the plants eating more. Because of this, the cactus growers claim that the rabbits are “addicted” to the cactus, and they have had to go to extreme measures to protect the *Astrophytum* from the rabbits.

***Browningia candelaris:*** In the *Cactus and Succulent Journal* VOL. 59, No. 1, 1987 there is an article on this large cactus by CARLOS OSTOLOZA. He mentions that this plant grows in the same area that the pre-Incan Nazca culture flourished. One of the Nazca lines is known as “El Candelabra.” OSTOLOZA puts

forth the idea that it is a depiction of *B. candelaris*—possibly inspired by its psychoactivity. This cactus’ chemistry has not been investigated. — B.K., CA

K. TROUT comments:

There is absolutely nothing known from the chemical studies of *Ariocarpus* species, *Epithelantha micromeris*, *Mammillaria* species, *Armatocereus laetus*, or *Astrophytum myriostigma* that would suggest that they were capable of producing a visionary experience, but the aforementioned remarks should not be dismissed on that basis and these comments indicate that there is a great need for future research. While B.K. has used the following terms correctly in most spots, it might be a good idea to comment on several terms that are sometimes misunderstood or misapplied. “Active” simply means that the plant’s chemistry does something. “Psychoactive” means that it alters mental processes in some way. Stimulants and tranquilizers are both psychoactive. While “psychoactive” may indicate visionary activity, it often does not.

Contributing to the potential confusion is the fact that the majority of people who eat cacti have never actually tripped on cacti; at least not what we would call “trips.” Many prefer mescaline because it is so “mellow and gentle.” Relatively few realize that a solid mescaline experience is dramatic and overpowering; literally producing amazing visions that hold up to the brightest daylight! While B.K. has obviously ingested adequate cacti for a full experience, what many experience from smaller amounts is more properly defined as stimulation (albeit with a mentally enhanced component). If this “high” is what they are using to compare the effects of other cacti to, then they might indeed consider them “active.” Some of the cacti mentioned may produce stimulation and psychoactivity but so will amphetamines and over-the-counter diet pills. *Ephedra* is certainly both active and psychoactive, but we doubt that many would consider it visionary.

Regarding the observations of California growers concerning rabbits, I think they may have assumed too much. At the very least their use of the word “addicted” begs to be questioned. The alleged effects of this cactus on rabbits most certainly indicates a need for study. Whether the effects are visionary remains to be seen. Some animals like visionary plants but, like people, they are actually relatively few in number and seem to be the odd individuals rather than most of the population. On the other hand, sedation and stimulation are far more frequently sought-out by animals (again like people).

A point which cannot be ignored is that rabbits are believed to require in the neighborhood of 70 times more mescaline than humans (as mg/kg) in order for it to produce any effect at all (KAPADIA & FAYEZ 1970). When compared with other animal species, their liver enzymes appear absolutely hyperactive at deaminating mescaline (ZELLER *et al.* 1958; DALY *et al.* 1962) giving them great tolerance for it (BLASCHKO 1944, citing BLASCHKO *et al.* 1937 and SLOTTA & MÜLLER 1936; FRIEDHOFF & GOLDSTEIN 1962; SLOTTA & MÜLLER 1936). It has also been found that *in vitro* incubation of mescaline with a rabbit liver preparation of microsomes and supernatant fraction degraded nearly all of the mescaline that was present unless inhibitors were added (DALY *et al.* 1962). The observation that rabbits get intoxicated after nibbling the plants is fascinating and underscores the need for more in depth study, especially as it is doubtful that *any* natural phenethylamine would be active at those levels.

A good way to evaluate claims of psychoactivity is to look at the weight of the cactus consumed. Punch some numbers into a calculator and you can quickly see how much alkaloid might have been consumed. (Even estimated figures will work for this.) From this you will see that what most people report for "activity" would either contain only a few milligrams of alkaloid or else the plant material in question would have to contain many times the concentration of alkaloid reported in any plant. We do not suggest that such reports be disregarded because they clash with the published literature; just the opposite. While one should regard all of this with a grain of salt, it may indicate that active chemicals *other than alkaloids* are involved.

As for the possibility of other active chemicals, the work that has been done is inadequate to allow more than a logical guess as to what type of other agent may be at work. Some sort of triterpenoid perhaps? Many cacti are known to contain triterpenoids (examples: BASU & RASTOGI 1967, citing DJERASSI 1957; DJERASSI *et al.* 1953–1956; HEGNAUER 1964; KINOSHITA *et al.* 1992; WEST & McLAUGHLIN 1977). This appears to have great potential value for chemotaxonomy but presently stands in need of much better development. Only the toxicological assessment of *Epithelantha micromeris* triterpenes has been published, and they were found toxic when injected into mice (WEST & McLAUGHLIN 1977). Nevertheless, there is a remote chance that some may be orally active; perhaps even in low amounts similar to the diterpenoid salvinorin A. This is pure conjecture; we do not know. What we want to stress are the shortcomings of the all too frequent reductionist assumption that any activity in cacti is automatically similar to mescaline intoxication and that it results from phenethylamines that are present.

One point on *Armatocereus laetus*, although it may be wrong to read too much into this; in 1983 WADE DAVIS did report the use of this cactus as a substitute for *Trichocereus pachanoi* and collected vouchers, promising that the results of the analysis would be published. Since these results apparently never were published, we suspect that no alkaloids worth reporting were found.

DAVID AARDVARK and K. TROUT on "entheogenic:"

*While "entheogenic" was resurrected to replace "hallucinogenic" and "psychedelic," it is less than clarifying when people define it differently. The bottom line is that entheogenic does not describe a specific pharmacological action, but rather an ethnographic context (OTT 1995; OTT 1997). Even JONATHAN OTT—the foremost proponent of "entheogen(ic)"—argues this point, and has redacted the second edition of Pharmactheon, changing "entheogenic" to "psychoptic" (producing mental or spiritual vision) under the "Pharmacology" listings in the "Entheopoeia" (OTT 1996). In some people's minds, entheogenic does not even necessarily mean that the plant or drug in question produces psychoptic effects! We know people who swear that beer is an entheogen. The Chinese poet Li Po would have insisted on such a status for wine, and the alcohol intoxication produced by chicha is clearly held in spiritual regard by many South American native cultures. For those plants and drugs that do produce psychoptic effects, we suggest that the term "visionary" is an easy-to-understand, non-pejorative replacement for "hallucinogenic," "psychedelic," and even "entheogenic."*

## ARGYREIA NERVOSA SEEDS AND PHALARIS GRASS PROPAGATION

What is the most effective method to liberate the ergot alkaloids from *Argyrea nervosa* seeds into solution? Filing off the outer coat, grinding six seeds to a fine powder, soaking in water for two hours, and filtering to separate the marc from the solution, resulted in liquid that produced little effect.

Also, what is the most effective method to propagate *Phalaris aquatica* AQ-1? A trial resulted in very thin seedlings that didn't root (perhaps due to over watering). FESTI and SAMORINI concluded that water stress, high nitrogen, cutting in the morning, and harvesting only the upper 1/3 of the seedling (just the regrowth after cutting) was the optimum procedure to follow for the highest alkaloid content. Please provide detailed step-by-step cultivation methods. How many harvests can be made before alkaloid levels are no longer plentiful? Can it be cut like a lawn indefinitely to yield results?

I am trying to achieve the most simple and cost-effective methods for psychonautical exploration. That is why I am focusing on the two species above. Theory is fine, but without practical results, enlightenment is not fully achieved. Thanks, and keep up the fine work! *ER* is truly a service to human consciousness. — J.C., IL

*It may be that the most simple and cost-effective method for psychonautical exploration is growing psilocybian mushrooms. Spore-syringe have made this process fairly easy, even for those who have little knowledge of mushroom growing techniques. A basic mushroom growing set up (with a small glass terrarium, glass mason jars, substrate, casing, and a spore syringe) can probably be had for about \$30.00. The "PF Tek" described by PSYLOCYBE FANATICUS (see <http://www.fanaticus.com>) has been used successfully by thousands, and may be the way to go.*

*A couple of points that will help you to fine tune your *Argyrea nervosa* extraction procedure: First, 10–12 seeds should be used (18–20 for strong effects). Second, you should extend the soaking time to overnight (protect from light with aluminum foil). We have had excellent results when using a 12–18 hour soak. (We have also had lots of somatic discomfort and abdominal cramping. These side effects are produced as a direct result of the active alkaloids themselves and will occur even if they are pure.) You also might want to discontinue the process of filing off the outer seed coat, as this is a potentially significant source of alkaloid loss.*

*Getting the highest yields from *Phalaris grass* depends on a lot of variables, and may be a little more problematic. See K. TROUT's "Cultivating and Harvesting *Phalaris Grass* for Optimum Alkaloid Production" on page 76 for some answers your questions about effective ways to grow and use this grass.*

## **The Road to Eleusis: Unveiling the Secret of the Mysteries**

by R. GORDON WASSON, ALBERT HOFMANN, and CARL A. P. RUCK

Expanded Twentieth Anniversary Collector's Limited Edition, ISBN 0-915148-20-X. Includes a Preface by HUSTON SMITH; Hindsight by CARL A. P. RUCK; "Entheogens," by CARL A. P. RUCK, JEREMY BIGWOOD, DANNY STAPLES, JONATHAN OTT, and R. GORDON WASSON; and Afterword by ALBERT HOFMANN. A HERMES PRESS book. Hardcover, printed in Verona, Italy at STAMPERIA VALDONEGA on FREELIFE recycled paper. Available from:

WILLIAM DAILEY RARE BOOKS, LTD., POB 69160 (Dept. ER), Los Angeles, CA 90069, (323) 658-8515 Fax: (323) 658-1170, Antiquare@aol.com

"The ideas which the authors, the banker, the chemist, and the Classicist, brought forth have been largely unchallenged and ignored by specialists in the culture of ancient and Classical Greece. The situation seems to fulfill the rule of thumb that when ideas are controversial they are discussed, when they are revolutionary, they are ignored." — TERENCE MCKENNA

"This interpretation seems to solve the mystery at last... The solution here offered... is simple and elegant, like all good solutions, and leads us to wonder why it hadn't been hit upon sooner... Thanks to Wasson's perspicacity, we have here yet another astonishing chapter in the history of ethnomycology which for the first time places the sacred mushroom in our own cultural past..." — JONATHAN OTT

"[*The Road to Eleusis*] is a historical *tour de force* while being more than that. For by direct implication it raises contemporary questions which our cultural establishment has thus far deemed too hot to face..." — From the Preface by HUSTON SMITH

# CULTIVATING AND HARVESTING *PHALARIS* GRASS FOR OPTIMUM ALKALOID PRODUCTION

by K. TROUT

Adapted from TROUT'S NOTES A-5 *Ayahuasca and Ayahuasca Alkaloids*  
Please consult these NOTES for a more detailed discussion. See advertisement on page 65.

*Phalaris* can be easily grown but like any grass, care must be taken not to disturb newly germinating plants or damage their roots. Surface sow, then gently water it in and mist or gently sprinkle regularly until it comes up. If misting is not an option, try covering the soil surface with fibrous mesh such as are sold for retaining grass-seeds and lightly but frequently water with a sprinkler. Once the plants are established water normally. It will do best when in the ground but large flat containers (like kiddie wading pools with drain holes added) work fine for a couple of years. It can also be started in flats or pots and then transplanted. While many strains of *P. aquatica* love wet conditions, some are very drought tolerant. Since the AQ-1 was found in dry weathered caliche, this might suggest that it may do better if kept on the dry side. Plant the seeds in early fall or as early in spring as possible. (Many *Phalaris* show a summer dormancy period.) Before you plan to harvest, subject them to several months of moderate drought stress, then severely cut back the plants. Begin heavy watering. The regrowth that occurs is the best crop, followed by the second regrowth, which will be weaker. The sooner the plants are harvested the higher the alkaloid content but there is a trade-off as the volume is much less. While a week of growth may be more potent, a month of growth will yield more material. In the northern hemisphere, it appears that later summer into fall is the only time when the grass is very potent but we might add that the actual work done is fairly limited. It is clear that regardless of all other factors, there are one or more rather brief but very high peaks of tryptamine concentration occurring during this time period. The work-to-date suggests that  $\beta$ -carbolines may be favored during other times of year when the alkaloid content is much lower. Another important factor is the occurrence of alkaloid subtypes within most populations of *Phalaris*. For this reason, in all but a few strains, it is preferable to obtain tried-and-true plants if possible and propagate them by rhizome divisions.

Many factors can affect alkaloid concentration and composition. The work involving *P. aquatica* has been inadequate for our discussion but we might better understand the situation if we approach *Phalaris* generically with an eye for determining what variables are important. Along with the part of the plant harvested and using regrowth instead of first growth, the best date for harvest is one of the most important factors to consider, despite the great difficulty of predicting it. Alkaloid concentrations and proportions are highly variable from week to week and also from year to year and usually show dramatic seasonal fluctuations (this is most pronounced in the high-alkaloid producers and varies markedly between strains). Additionally, fluctuations in the actual alkaloid composition itself have been noted. In many populations there may even be marked differences in both amounts and the actual alkaloid profile from one plant to the next. (Some strains are more true than others and it is these which tend to be selected for ayahuasca analogue use.) For these reasons it is impossible to give an exact prediction of when is best to harvest, but we can get it into the ballpark.

**Some of the highlights to consider when growing *Phalaris* for use:** Age and regrowth differences are extremely important. Not only is the alkaloid level highest in the new growth but artificially induced growth (regrowth following mowing or cutting) shows a consistent increase over the initial levels (BARNES *et al.* 1971; MARTEN *et al.* 1973; MOORE *et al.* 1967; PARMAR & BRINK 1976; WOODS & CLARK 1971). Second regrowth (following a second cutting) often shows an increase from the initial value but falls short of the concentration in the first regrowth. The initial growth shows the lowest concentrations and was apparently devoid of alkaloids in a few cases that had quite potent regrowth! One study of high-alkaloid strains (that contained mainly gramine) found that cutting every second week caused sharp increases over freely growing plants (WOODS & CLARK 1971). Age-related differ-

ences can be quite dramatic. Alkaloid content has been consistently noted to be highest in young growth, with tryptamine content dropping with age (MARTEN *et al.* 1973). 5-MeO-DMT concentration has been evaluated in new growth of *Phalaris tuberosa* leaves (cv. Hardinggrass) and was found to be 0.236% in 7-day-old fresh leaves, 0.105% in 9-day-old fresh leaves and 0.077% in 21-day-old fresh leaves. 21-day-old leaves that had been frozen for 3 days showed 0.076%. 21-day-old leaves that had been dried showed 0.071%. All figures are % dry weight (McCOMB *et al.* 1969). *Phalaris* species have been reported to contain 65–81% water by weight. 80% is common in regrowth harvests.

**Seasonal differences can be dramatic.** Great variations of alkaloids have been found not only between different strains but also between sampling dates. The total tryptamine levels in ‘Seedmaster’ (DMT is main alkaloid) and ‘Sirocco’ (5-MeO-DMT is main alkaloid) were approximately five times greater in Autumn than in Winter (ORAM 1970). Autumn had higher temperatures, higher light intensities, longer days and more moisture stress. In one study of *Phalaris tuberosa* cv. *stenoptera* (Hardinggrass) the total indole alkaloid levels hit two peaks of 0.14% in late September and mid November one year but only one peak in each of two other years (RENDIG *et al.* 1970). In the latter cases; the year with a peak in late September was also around 0.14% while the year with the peak in mid-November was 0.08%. The latter year showed some of its lowest values in late September. This analysis only included data from mid-September through mid-February. In northern hemisphere studies, July through early August should be the starting point for such determinations. Especially in the northern US where peaks have been noted during this time. Alkaloid levels have also been reported as being markedly different from one month to the next and one year to the next. In some clones, there was also a change in alkaloid composition (MARTEN *et al.* 1973).

**Diurnal differences have been reported.** Foliage harvested early in the morning showed greater quantitative yields than if harvested later in the day (APPLESEED 1992–1996).

**Temperature has effects on alkaloid production.** Increased temperatures have been found to result in higher DMT and total alkaloid levels in all ecotypes of *P. aquatica* (as *P. tuberosa*) examined in one study (ORAM 1970). The highest alkaloid levels reported were seen in plants experiencing 21° C days, 16° C nights (MOORE *et al.* 1967). These plants also showed the greatest yield of plant weight (36.9 grams of dry weight per 18 plants.)

**Moisture can also play a role.** Moisture stress increases alkaloid levels, and the best quantitative results came when harvesting the new regrowth resulting from rains following a drought (MARTEN *et al.* 1973; APPLESEED 1992–1996).

**Light levels can be an additional factor.** Shading also increases alkaloid content but does so at the expense of plant growth and stimulates 5-MeO-DMT production far more than DMT content. (In strains that produce only DMT this is not an issue.) One study determined that 28% light intensity increased the alkaloid content dramatically—61%—but it also decreased the total yield of plant material dramatically—64% (MOORE *et al.* 1967). Artificial shading applied to growing *Phalaris* pasture swards, showed marked increases at between 40% and 12% light levels, a low and insignificant increase from 99% to 40% and a decline below 10% light level. Alkaloid levels were found to be high in shaded plants irrespective of nitrogen levels and did not increase in response to increased available nitrogen. In full light the alkaloid levels increased in direct proportion to the concentrations of nitrogen. 12% light levels caused 5-MeO-DMT to rise to a level of 50 mg per 100 grams of dry weight. At all other times DMT was the predominate alkaloid in the *Phalaris* studied (*P. tuberosa* cv. Australian Commercial). Decreasing the light intensity was also found to increase the alkaloid levels (FRELICH & MARTEN 1972).

**Nutrition can have dramatic effects on alkaloids.** One study found that *P. tuberosa* cv. Australian Commercial grown under high nitrogen conditions contained up to four times as much total alkaloid as those grown nearby in garden rows without added nitrogen (MOORE *et al.* 1967). Regrowth was taken three weeks after cutting to ground level and commencing nitrogen treatments. Similarly high alkaloid levels have been noted in fields enriched by several seasons of clover. An insignificant difference was found between low and intermediate nitrogen levels on alkaloid production, whereas at the high level a mean average in excess of over 20% increased total alkaloids was reported (MOORE *et al.* 1967). This was coupled with an increased dry weight for the sample. The highest levels of alkaloids were observed in the uppermost leaves of plants receiving ammonium sulfate at high rates (PARMAR & BRINK 1976). Generally speaking (at high levels): Ammonium sulfate > Ammonium nitrate > Urea > Cyanamid > Sodium nitrate in terms of benefiting alkaloids production (MARTEN *et al.* 1974). It is important to be aware that this is only true at high levels of high nitrogen fertilizer. And that there is minimal benefit if the amounts are low to moderate *or* if the plants are shaded *or* if a balanced fertilizer

if used. Nitrates favor vegetative growth (as does high K levels); Ammonium favors alkaloid production. Tryptamine concentrations seem to be related to both the type and the amount of fertilizer used (GALLAGHER 1966; FRELICH & MARTEN 1972). However, the picture may be more complicated as significantly higher levels of alkaloid in plants grown in an infertile peat soil than in fertile, mineral rich soil have been found (MARTEN *et al.* 1974). Addition of a complete fertilizer in some cases decreased the alkaloid levels when compared to sterile peat but their results were conflicting. Uptake of ammonium ions tends to be greater on glei soils than well drained types (PARMAR & BRINK 1976). *High levels* usually represent around five times the normal recommended nitrogen. This is well within what is often recommended for turf maintenance. Alkaloid distribution within the plant should also be considered. It has been determined that the upper third of the regrowth of *P. arundinacea* has the highest alkaloid concentration overall (HAGMAN *et al.* 1975). Slightly higher concentrations in field grown plants have been reported than those maintained in a greenhouse (HAGMAN *et al.* 1975). The following average alkaloid concentrations in *P. arundinacea*, using only regrowth and harvesting when the plants were at 20–60 cm tall and still in vegetative stage, have been reported: 0.29% in upper half of leaf blades; 0.23% in lower half of leaf blades; 0.07% in leaf sheaths; 0.04% in stems; 0.05% in inflorescences (MARTEN *et al.* 1973).

**Drying (or freezing) versus fresh material.** Around half of the total alkaloid has been reported lost during drying (CULVENOR 1964). In addition, there was a higher proportion of bufotenine and a lower proportion of the uncharacterized indoles of high Rf present in fresh grass. A similar decrease when comparing fresh material to frozen has been found by others (BARNES *et al.* 1971). Drying or freezing has the greatest negative impact on young growth and on high alkaloid strains. The effects on older growth and on poor alkaloid producers is much less. The response to drying has been found to be highly dependent on the variety (APPLESEED 1992–1996). While the total is less, some strains increase the 5-MeO-DMT to DMT ratio as they dry. Grass treated with ethanol immediately upon harvesting also gave higher returns. This is believed due to the action of the alcohol denaturing the enzymes responsible for the loss (CULVENOR 1964).

**Optimum conditions for high-alkaloid harvest:** Using the first regrowth after cutting, using only the upper third, harvesting in late summer to fall, early in the morning, using new growth following rains at the end of a prolonged dry spell and with ambient conditions of 70° F, or hotter, days and

night-time temperatures in the 60s. The alkaloid concentration will be maximized in plants excessively fed with ammonium or else grown in shade. The exact peak dates appear to vary not only from strain-to-strain but thus far seem to also vary from year-to-year. Still, what has been published suggests that, in the northern latitudes, the peak(s) will occur at some point during early August to November, with the most likely peak dates occurring during the latter part of August to the end of September. While detailed studies on a day-by-day basis have never been performed, there appears to be an initial high peak on day 7 both in seedlings (MULVENA & SLAYTOR 1982, 1983) and in new growth after recutting (MCCOMB *et al.* 1969] In some studies it appeared that tryptamine concentrations showed huge spikes during early fall growth but none lasted more than a few days at most (ORAM 1970). Some strains showed decent concentrations at around 4–6 weeks of regrowth, so there may be a happy medium between trying to maximize the alkaloid concentrations and the volume of useful material (MARTEN *et al.* 1973). While it may be best to attempt to get the best volume of growth and catch a peak level of tryptamines, it would be interesting to study the home production of *Phalaris* grown (and processed) like wheatgrass with harvests performed on day 7. Obviously this will require raising a seed-crop to obtain adequate seeds to make this cost effective.

While *Phalaris* may be highly variable in content and performance, it should be obvious that it holds great promise for development as an ayahuasca analogue admixture plant or a source of DMT/5-MeO-DMT.

## RETREATS, SEMINARS & CONFERENCES

### INSIGHT & OPENING: THE POWER OF BREATH & MEDITATION OCTOBER 23–29, 1998

STAN GROF, JACK KORNFELD, and WES NISKER lead this retreat. While not related directly to entheogens, there will be work with HOLOTROPIC BREATHWORK, Buddhist-style meditation, silence, sacred music, and mandala drawing, as well as lectures. "These retreats are intended for personal healing and opening, for professional training, and to bring new understanding to the blend of Eastern and Western psychologies." Tuition, room and board is \$895.00, and a \$295.00 deposit must be sent in to reserve a space.

EASTWEST RETREATS, 11780 San Pablo Avenue, 4C #304 (DEPT. ER), El Cerrito, CA 94530, (510) 232-3098, (510) 232-4090 fax.

### MARIJUANA: HERE FOR GOOD NOVEMBER 12–14, 1998

NORML's 1998 conference will be held in Washington D.C. Medical marijuana, recreational use, and industrial hemp will be covered. Speakers include: RAMSEY CLARK, Esq. (former U.S. Attorney General), RICHARD BROOKHEISER (Senior Editor, *National Review*), PAUL FLYNN (Member of the British Parliament), IRA GLASSER (Executive Director, ACLU), JACK HERER (Author & Hemp Activist), BARBARA EHRENREICH (Author & Journalist), KEITH STROUP, Esq. (Executive Director, NORML), LESTER GRINSPOON, M.D. (HARVARD MEDICAL SCHOOL), MICHAEL KENNEDY, Esq. (*High Times* and *Hemp Times*), CHRIS CONRAD (Author & Hemp Activist), ETHAN NADELMANN (THE LINDESMITH CENTER), SHER HOROSKO (DRUG POLICY FOUNDATION), and HUNTER S. THOMPSON (Author & Gonzo Journalist). Cost is \$135.00 per person, and there is a special \$85.00 rate for undergraduate students.

NORML, 1001 Connecticut Avenue, NW STE. 710 (DEPT. ER), Washington, D.C. 20036, (202) 483-5500, (202) 483-0057, natlnorml@aol.com, <http://www.norml.org>

### CANNABIS CUP NOVEMBER 23–27, 1998

The 11<sup>TH</sup> ANNUAL *HIGH TIMES* CANNABIS CUP promises, "A week of sublime indulgence at the world's premier tasting event in Amsterdam." Space is limited to 2000 judges and judge's laminates are \$200.00. Various packages (with roundtrip airfare, transfers to and from the airport, accommodations, etc.) are available through 420 TOURS (check the *High Times* web site for a link), at prices ranging from \$800.00 to \$7000.00.

CANNABIS CUP / AIR-TECH / *HIGH TIMES*, 588 Broadway, STE. 204 (DEPT. ER), New York, NY 10012, (212) 219-7000, <http://www.hightimes.com>

### ENTHEOBOTANY SHAMANIC PLANT SEMINARS JANUARY 16–22, 1999 JANUARY 25–31, 1999

Two 7-day, intensive seminars at the portal to the Palenque Mayan ruins and México's mysterious tropical forests. Archaic Art and Archaeology of *Ambrosia*; Identification and Cultivation of Mushroomic Entheogens; South American Visionary Snuffs and *Ayahuasca*; Tryptamines, Phenethylamines, Allied Amritous Alkaloids; *Soma*, *Kykeon*, *Iboga*, and Kindred Psychoptica; Collection, Cultivation, and Preparation of Psychoactive Plants.

Penetrate the mysteries of shamanic botany: study psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, and spiritual—will be frankly discussed. This is an opportunity not to be missed! Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Instructors include MICHAEL BOCK, E. WADE DAVIS, CHRISTIAN RÄTSCH, GIORGIO SAMORINI, ALEXANDER & ANN SHULGIN, PAUL STAMETS, C. MANUEL TORRES, TERENCE MCKENNA, ROB MONTGOMERY, JONATHAN OTT, and KEN SYMINGTON.

Course fee is \$1,300.00 per person for the week of instruction, hotel accommodations at Palenque (2 registrants per large double cabin), and three meals daily (vegetarian fare is available). Fee does not include airfare. Write for more info.

ENTHEOBOTANY, POB 4 (DEPT. ER), Sierra Madre, CA 91025, USA, (626) 355-9585.

## SENTIENT EXPERIENTIALS WORKSHOP MARCH / APRIL, 1999

SENTIENT EXPERIENTIALS presents their 11th workshop titled "Plants as Teachers, Traditional Wisdom and Rainforest Conservation Strategies." These yearly events act as fundraisers to support rainforest conservation.

"For the participants, these 14 days will be an unforgettable, significant, real-life, magical experience! You will interact with and learn from authentic forest peoples, elders, traditional healers, shamans; progressive leaders, thinkers, visionaries, and rainforest activists—from the [countries] of Ecuador and Perú—whose communities your tuition supports."

One of 1999's instructors will be Don PABLO AMARINGO, a Peruvian painter and Director of the USKO AYAR SCHOOL OF AMAZON PAINTING in Pucallpa, whose work is the topic of the book *Ayahuasca Visions*. Tuition is \$2,800.00 and space is limited to 20 participants. Send \$10.00 for a workshop manual and registration form.

SENTIENT EXPERIENTIALS, POB 1004 (DEPT. ER), El Cerrito, CA 94530, (510) 235-4313, (510) 215-9840 fax, [dahlia@igc.apc.org](mailto:dahlia@igc.apc.org), <http://www.hookele.com/experientials>

## BOTANICAL PRESERVATION CORPS announces the first BPC conference on SKA PASTORA, LEAVES OF THE SHEPHERDESS: SALVIA DIVINORUM AND SALVINORIN-A

to be held 11–13 December 1998 at BREITENBUSH HOT SPRINGS, Oregon

*Presenters will include:*

**Bret Blosser, Dale Pendell, Rob Montgomery, Jonathan Ott, Ann & Sasha Shulgin, and Daniel Siebert** discussing the ethnobotany, pharmacology, chemistry, and cultivation of this enigmatic plant.

*Consider these mysteries:*

- ▼ *Ska Pastora* [Leaves of the Shepherdess] is its Mazatec name, but there are no sheep in the Mazatec Sierra nor any mention of a Shepherdess in the Bible.
- ▼ *Salvia divinorum* rarely yields viable seeds and the few Mazatec shamans who grow it say it came to them from elsewhere!
- ▼ Recent experiments proved that chewed or smoked leaves can induce a strange visionary state unlike that of any other known psychoactive plants!
- ▼ Salvinorin-A is active in microgram amounts, it isn't an alkaloid, it is structurally different from any other known psychoactive compound, and it acts at no known receptor site in the brain!
- ▼ This plant is easily grown, perfectly legal, and presents challenges and promises to ethnobotany, chemistry, psychotherapy, neurology, and shamanism!

**Bret Blosser** has for many years taken part in Mazatec ceremonies with the Shepherdess' leaves and will share insights into its traditional and modern use for healing and divination.

**Dale Pendell** has long languished in the embrace of the Shepherdess, exploring and listening to her poetic wisdom.

**Rob Montgomery & Jonathan Ott** have long been studying its human pharmacology as well as cultivation.

**Ann Shulgin** has experience as a lay-therapist and unique insight into various altered states of consciousness.

**Sasha Shulgin** began growing and analyzing *Salvia divinorum* over 25 years ago and she still keeps him busy in his lab.

**Daniel Siebert** published research on the first human bioassays of salvinorin-A, confirming that this was the active component of *Salvia divinorum*, and he maintains a web site and e-mail list dedicated to the Divine Sage.

BREITENBUSH HOT SPRINGS is located near Detroit, Oregon, about two hours drive east of Portland. Lodging consists of shared cabins with three daily meals and full access to the hot springs, which will be closed for privacy to the public during our conference. Cost for the weekend is \$350. The number of participants is very limited and we strongly suggest immediate registration.

**BOTANICAL PRESERVATION CORPS, Box 1368 (DEPT. ER), Sebastopol, CA 95473, USA**

**ALLART GMBH**  
**CANNAPEE**  
**Lukmaniergasse 15 (DEPT. ER)**  
**Postfach 49**  
**7002 Chur 2**  
**081 253-0173**  
**081 253-0174 FAX**  
<http://www.cannapee.ch>

ALLART GMBH manufactures and distributes the 1999 SWISS *CANNABIS* CALENDAR. This calendar is filled with beautiful photographs of *Cannabis*. Many of these photos are shot in such a manner that the *Cannabis* appears to be pine trees in forest vignettes, with the sun setting behind alps in the background.

ALLART GMBH also runs a retail shop called CANNAPEE from the same address, where they provide a wide range of foods made from *Cannabis* seeds, as well as hemp-based cosmetics, clothing, paper products, and a small selection of ethnobotanical plants, seeds, and teas. They grow and sell their own *Cannabis* (apparently legal in Switzerland), and encourage any Americans vacationing in Switzerland to visit them at their shop and relax with a complimentary cup of tea.

The web site listed above is not currently active, but should be up-and-running in November.

**BIOGENESIS LABORATORIES**  
**Postnet Suite 42 (DEPT. ER)**  
**Private Bag X6590**  
**George**  
**6530**  
**South Africa**  
**27-21-683-0573 TEL/FAX**  
**biogenesis@cycad.co.za**  
<http://www.biogenesis.co.za>

BIOGENESIS LABORATORIES sells pharmaceutical quality GHB. They do not ship to any US states where GHB has been scheduled, and their product is not available in South Africa. Sales

are limited to those 18-years-old and over. Payment can be made with cash, international money order (but not postal money orders), secure (on-line) credit card transaction, or a bank transfer. Orders are shipped discretely, by first class airmail, and generally take 2–3 weeks to arrive. Their prices (postpaid): 25 grams (\$48.00), 100 grams (\$118.00), 200 grams (\$208.00), 300 grams (\$308.00), 454 grams (\$408.00), 908 grams (\$808.00). These prices are higher than ELECTRONIC CONCEPTS' prices (see advertisement on the inside back cover of the SUMMER SOLSTICE 1998 *ER*), but we figure that it is good to have an alternate source, in case it is ever needed.

**BOTANIC ART**  
**POB 81 (DEPT. ER)**  
**3140 AB Maassluis**  
**The Netherlands**  
**nvrplants@kabelfoon.nl**  
<http://www.botanic.art.nl>  
<http://www.caiw.nl/~nvr/salvia.htm>

Formerly known as "NVR," BOTANIC ART sells *Salvia divinorum*—live plants (Dutch fl. 25,-, minimum order \$100,- excl. S/H) and dried leaves (Dutch fl. 25,- for 3 grams, minimum order 50,- excl. S/H), 2–3 year-old *Lophophora williamsii* plants (Dutch fl. 25,-), small seed-grown *Trichocereus bridgesii* (Dutch fl. 22,50) *T. pachanoi* (Dutch fl. 30,-), *Catha edulis* (supply currently limited, price ranges from Dutch fl. 40,- to Dutch fl. 75,-). Payment can be made in cash (Dutch florins, US dollars, or German deutsche marks).

Their new web site (not up when we wrote this column, but expected in late September) is the first URL. In case this site isn't up yet, we've listed their old web site, the second URL, as well. Along with the new web site, BOTANIC ART will be offering a new plant, *Mesembryanthemum "sceletium"* (presumably *M. expansum* or *M. tortuosum*). These plants have not yet been made widely available, and have a history of use as inebriants among the Hottentots and Bushman of South Africa.

BOTANIC ART will only send their products to those countries where they are legal, and customers must be at least 18-years-old (21-years-old in some countries). Nothing they sell is sold for consumption.

**HEKSENKRING**

Vinkenstraat 58 C (DEPT. ER)  
1506 CN Zaandam  
Holland  
003175-6147697 TEL  
003165-5572229 TEL  
003175-6401436 FAX

HEKSENKRING offers seeds for *Argyrea nervosa*, *Artemisia absinthium*, *Atropa belladonna*, a large number of *Brugmansia* species and varieties, *Cannabis sativa* (a wild form that contains hardly any THC), *Coffea arabica*, a large number of *Datura* species and varieties, *Eschscholzia californica*, *Hieracium pilocella*, *Humulus lupulus*, *Hyoscyamus niger*, *Ipomoea violacea*, *Lactuca virosa*, *Leonurus sibiricus*, *Lophophora diffusa*, *L. williamsii*, *Nepeta cataria*, various *Nicotiana* species, a couple of *Papaver somniferum* varieties, a few *Passiflora* species, *Phalaris arundinacea*, *Trichocereus bridgesii*, *T. pachanoi*, *T. peruvianus*, *T. validus*, *Valeriana officinalis*, and other seeds on request. Many of these species are also offered in plant form.

They also sell numerous viable seeds for high-potency *Cannabis* varieties, usually in packets of ten seeds. As well, they stock a number of books on entheogen-related topics.

They only sell to those 18-years-old or older, and none of their products are sold for consumption.

**HIGH QUALITY SEEDS**

POB 362 (DEPT. ER)  
5460 AJ Veghel  
Holland  
highseed@discover.nl  
<http://www.highlife.nl/seed.E-1.html>

HIGH QUALITY SEEDS provides various "name brand" high-potency strains of *Cannabis* seeds—ten per packet. White Widow, Early Pearl, Durban, Northern Lights, Four Way, Big Bud, Hindu Kush, Super Skunk, Juicy Fruit, and many others. Prices, given in deutsche marks, range from DM 25 to DM 240.

They won't ship to the USA, Canada, or anywhere else outside of Europe, and inside Europe they won't ship to Germany, France, Sweden, and several other countries. (Send an e-mail to confirm that they *can* send to your country.)

**PARADISE SEEDS**

POB 377 (DEPT. ER)  
1000 AJ, Amsterdam  
Holland  
+31 (0)20-6795422 TEL/FAX  
paradise@cybercomm.nl  
<http://www.cybercomm.nl/~paradise>

PARADISE has a fairly small selection of their own unique high-potency varieties of *Cannabis* seeds, sold in ten-seed packets. Available strains include Durga Mata, Dutch Dragon, Sensi Star, Amsterdam Fame, and Nebula (Starcloud). PARADISE also offers numerous other seeds for varieties that aren't unique to them, such as Master Kush, Maui Wauai, and Durban Poison. They state that they will only send seeds to those countries where it is legal to do so. All orders are sent by registered mail.

**RAVERBOOKS**

1205 East Pike Street (DEPT. ER)  
Seattle, WA 98122  
ecstasy@pulpfiction.com  
<http://www.pulpfiction.com/rave>

RAVERBOOKS now offers seven new books by ethnomycologist JOHN W. ALLEN, including: *Magic Mushrooms of the Pacific Northwest* (\$12.00, 35 black & white and 12 color photos) and the ETHNOMYCOLOGICAL JOURNAL'S SACRED MUSHROOM STUDIES, VOLUMES 1–6: VOL. 1—*María Sabina: Saint Mother of the Sacred Mushroom* (\$7.00); VOL. 2—*Wasson's First Voyage: The Rediscovery of Entheogenic Mushrooms* (\$7.00); VOL. 3—*Teonanácatl: Ancient Shamanic Mushroom Names of Mesoamerica and Other Regions of the World* (\$10.00, 12 black & white photos); VOL. 4—*Magic Mushrooms of the Hawaiian Islands* (\$12.00, 15 black & white photos); VOL. 5—*Psilocybian Mushroom Cultivation: A Brief History* (\$10.00, with JOCHEN GARTZ; available 10/98); VOL. 6—*Magic Mushrooms in Some Third World Countries* (\$10.00, with JOCHEN GARTZ). S/H is \$3.00 per book.

**SACRED SUCCULENTS**

POB 781 (DEPT. ER)  
Sebastopol, CA 95473

SACRED SUCCULENTS offers a variety of cacti and succulents as well as other plants and seeds. Most of their offerings have a traditional medicinal/magical use, and a small amount on the ethnobotany of these plants is given with each listing.

They have *Adansonia digitata*, numerous *Ariocarpus* species, *Armatocereus laetus*, *Bursera fagaroides*, *B. hindsiana*, *B. microphylla*, numerous *Delosperma* species, *Epithelantha micromeris*, *Erythrina flabelliformis*, *Kedrostis capensis*, *Lycium fremontii*, *Neoraimondia roseiflora*, *Obregonia denegrii*, *Othonna herrei*, *Pedilanthus tithymaloides*, *Pereskiaopsis* sp., *Rabiea albinota*, *Sceletium tortuosum* (= *Mesembryanthemum tortuosum*), *Trichocereus pachanoi* X *T. shafteri*, *T. spachianus*, *T. (macrogonus?*, *peruvianus?*), and various *Turbinicarpus* species.

SACRED SUCCULENTS' catalog is only \$1.00, and well worth picking up, as their prices seem quite reasonable overall.

### THE SEEDBANK COMPANY

Box 8 (DEPT. ER)

17 Leopold Road

London, SW19 7BB

England

44+ (0)171 386-5559

<http://www.seedbank.co.uk>

Another supplier of viable *Cannabis* seeds. They state: "Germination of these seeds is illegal in certain countries so please check your laws as THE SEEDBANK COMPANY will accept no responsibility for orders that are made from these countries." They carry a large selection of seeds with lots of varieties developed in The Netherlands. They have standards like Big Bud, Northern Lights, Skunk #1, and Silver Pearl, as well as hyped CANNABIS CUP winners like JACK HERER and White Widow, and the newer popular varieties like Blueberry, Bubbleberry, and Great White Shark.

Packages contain ten seeds generally, though some strains are provided in packages of 13 or 16 seeds. Prices are given in UK pounds, and range from £20.00 for Skunk #1 or Superskunk (lowest priced varieties) to £60.00 for Blueberry, Bubbleberry, and JACK HERER (highest priced varieties). The cost of some of the newer strains runs even higher—but they provide 13 or 16 seeds per package (so the per seed cost is less)—such as White Rhino (£70.00/13 seeds), Great White Shark (\$75.00/13 seeds), and Jack Flash (£85.00/16 seeds).

One of the more interesting varieties that they offer has the genetics from a *Cannabis ruderalis* plant incorporated. The description of the plants that these seeds produce states:

*Ruderalis* is an early-flowering variety that grows wild in parts of Eastern Europe and Russia. We have used the early flowering characteristic of *Ruderalis* to improve the outdoor performance of some of our best varieties. The advantage of a *Ruderalis* hybrid is that approx. 50% of the seedlings will begin flowering at the 5–7th internode, regardless of the photoperiod.

Of course, *C. ruderalis* isn't renowned for its potency, but we suspect that the other plants that it has been crossed with have helped somewhat in this regard.

Payment can be made by postal order (from within the U.K.), or by international money order (from outside the U.K.). They do not want cash orders. All prices include S/H.

### SHAMAN

Stengerts 3 (DEPT. ER)

97653 Bioschofsheim

Germany

+49 9772 7230 TEL

+49 9772 7231 FAX

A mail-order herb and seed company. SHAMAN has been in business for two years, and they offer a large number of species including: *Acorus calamus*, *Areca catechu*, *Argemone mexicana*, *Artemisia absinthium*, *Calea zacatechichi*, *Cannabis sativa*, *Cola nitida*, *Corynanthe yohimbe*, *Datura stramonium*, *Ephedra sinica*, *Ginkgo biloba*, *Heimia salicifolia*, *Humulus lupulus*, *Hyoscyamus niger*, *Hypericum perforatum*, *Ilex paraguariensis*, *Ipomoea* species, *Lactuca virosa*, *Leonotis leonurus*, *Lobelia inflata*, *Mimosa tenuiflora*, *Myristica fragrans*, *Panax ginseng*, *Passiflora incarnata*, *Paullinia cupana*, *Peganum harmala*, *Phalaris arundinacea*, *Piper methysticum*, *Salvia divinorum*, *Schizandra chinensis*, *Scutellaria laterifolia*, *Tagetes lucida*, *Tribulus terrestris*, *Turnera diffusa*, *Valeriana officianalis*, and *Withania somnifera*.

Prices are all given in deutsche marks, and look very good over all. Their catalog—apparently free—is in German, but they plan to print a supplement in English, so ask about this.

**WEEDSEED****Mr. M. Parkes****c/o 28 Park Drive (DEPT. ER)****Gledholt****Huddersfield****West Yorkshire, HD1 4EB****England****44 (0) 1484 310178****44 (0) 1484 300409****gandy01@globalnet.co.uk****<http://www.users.globalnet.co.uk/~gandy01>**

WEEDSEED carries *Cannabis* seeds from the breeders SAGARMATHA, SENSI 1, SENSI 2, SENSI 3, DUTCH PASSION, PARADISE (described on page 82), SERIOUS, GREENHOUSE, and BROTHERS GRIMM. They have much of what one might be looking for, they ship worldwide (excepting to France), and their prices listed in £s (and dollars) range from £25.00 to £95.00 (\$45.00 to \$140.00) per packet (generally ten seeds). Their preferred method of payment is cash, although they also accept WESTERN UNION, and checks or international money orders (with an additional \$15.00 fee for bank charges).

**ZARATRUSTA UNDERGROUND****Pau Claris 3-2 (DEPT. ER)****Mollet del Valles****Barcelona 08100****Spain****zaratrusta@jet.es****<http://web.jet.es/zaratrusta/index.html>**

Kind of a cool idea; ZARATRUSTA UNDERGROUND doesn't sell seeds or plants, but they will *trade* seeds and plants with you, if you have something that they are looking for. Be aware that they won't ship specific seeds or plants to those countries with laws restricting their import.

They are looking for seeds or live plants/cuttings of: *Lophophora williamsii* El Huizache, *L. williamsii* var. *texensis*, *L. lutea*, *Ariocarpus fissuratus*, *Pelecypora aselliformis*, *Mammillaria craigii*, *M. yaquiensis*, *Trichocereus peruvianus* Matucana KK 242, *T. peruvianus* Huancabamba, *Salvia divinorum*, *Erythroxylum coca*, *Tabernanthe iboga*, *Psilocybe cubensis*, and *P. cyanescens*.

They have seeds available for: *Lophophora williamsii* (fast maturing; flowers within 3 years, about 2.5 cm diameter) 5 seeds\*, *L. williamsii* (slow maturing; flowers within 5 years, about 5 cm diameter) 5 seeds\*, *L. jourdaniana* 5 seeds\*\*,

*L. williamsii* var. *pentagona* 5 seeds\*\*, *L. williamsii* var. *decipiens* 5 seeds\*\*, *L. williamsii* var. *caespitosa* 5 seeds\*\*, *L. diffusa* 5 seeds\*\*, *Turbincarpus lophophoroides* 5 seeds\*\*, *Trichocereus pachanoi* 10 seeds\*\*, *Cereus peruvianus* f. *monstrosus* 10 seeds\*\*, *Papaver somniferum* (Turkish seeds) 1 gram (about 1000 seeds), *Datura stramonium* 10 seeds, *Cannabis sativa* (POSITRONICS SEED BANK, Durban) 10 seeds, *C. indica* (SENSI SEED BANK, Northern Lights) 10 seeds, *C. ruderalis* (Russian *Cannabis*) 10 seeds\*\*, *C. sativa/C. indica* hybrid (SENSI SEED BANK, Haze x Northern Lights) 10 seeds.

Available plants: rooted and unrooted *Lophophora williamsii* 1.5 cm diameter: *L. williamsii*\*, *L. williamsii* var. *caespitosa*\*, *L. williamsii* var. *pentagona*\*, *L. williamsii* var. *jourdaniana* (red flower)\*, *L. williamsii* var. *jourdaniana* (rose-violet flower)\*. Also available in *very* limited stock are "adult" *L. williamsii* plants 2.5–5 cm diameter, with big taproots.

\* limited stock    \*\* not available past summer

Shipping costs must be sent by international postal money order, and depend on where the order is sent. Your exchange seeds/plants should be sent in an "Urgent/Registered" letter or package. Orders are shipped in 24 hours after the shipping money and seeds/plants are received, and usually take 2–3 weeks to arrive. Those interested in exchanging seeds/plants should e-mail to see what is currently available.

**NOTICE**

The addresses for LABTECH and SHAMANISMO, INC. (reviewed in the SUMMER SOLSTICE 1998 ER) have changed. The new addresses are:

LABTECH, 9207 E. 54th Ter. (DEPT. ER), Raytown, MO 64133

SHAMANISMO, INC., 3938 East Grant Road (DEPT. ER), Tucson, AZ 85712

Also, DAN AFRICAN ETHNOBOTANICALS (supplier of *Tabernanthe iboga* root-bark and seeds reviewed in the VERNAL EQUINOX 1998 ER) now has a web page at: <http://www.geocities.com/RainForest/Vines/8030/index.html>

Please note that subscriptions to the LYCAEUM's e-mail forums are now free; the yearly subscription rate for access to these forums and a nymserver account has been done away with!

Finally, we've noticed that there are a lot more vendors of viable *Cannabis* seeds popping up these days. While some of these companies will ship to any country at the receiver's risk, others restrict the countries that they will send to. If a company does restrict certain countries, we have tried to point this out. Those in the USA should be aware that, regardless of a seed vendor's shipping policy, it is illegal to import viable *Cannabis* seeds into the USA.

WILL BEIFUSS is the author of the *Psychedelic Sourcebook*. He has recently been exposed for prolonged periods to acetone fumes...

JON HANNA is the author of the *Psychedelic Resource List*. He is a free-lance editor, writer, and artist. In his spare time he teaches a class on visionary plants and drugs at the UNIVERSITY OF CALIFORNIA AT DAVIS.

## BOOK REVIEW

### THE COSMIC SERPENT: DNA AND THE ORIGINS OF KNOWLEDGE

Reviewed by Robert Forte

JEREMY NARBY, 1998. TARCHER/PUTNAM [a member of PENGUIN PUTNAM, INC., 200 Madison Avenue (DEPT. ER), New York, NY 10016] ISBN 0-87477-911-1 [Sewn-and-glued hardcover, \$22.95], 257 pp; 2 page index, 5 page bibliographic index; 23 page bibliography, plus 58 pages of notes.

*The Cosmic Serpent: DNA and the Origins of Knowledge* is a major breakthrough for not only the field of entheogens but for all science and perhaps religion too. Originally published in French as *Serpent Cosmique*, this book presents the journey of a western scientist who ventures past the primitive superstitions of modern anthropology and takes part in a millennia-long scientific research program of Amazonian shamanism; wherein he learns of their seers' profound communication with other species via experiential access to DNA.

In 1985 JEREMY NARBY, a STANFORD-trained anthropologist, was doing fieldwork for his dissertation in the Amazon Pichis

Valley among the Ashaninca people. Inquiring how their extensive botanical-medicinal knowledge was derived he heard from a shaman that "one learns these things by drinking ayahuasca." NARBY thought the shaman was joking, and he had intended to leave that finding out of his report: "For me, in 1985, the ayahuasqueros' world represented a gray area that was taboo for the research I was conducting." But an "unexpected setback" caused NARBY to move to the neighboring community of Cajonari where he was invited to partake of ayahuasca himself. Like a modern Adam he writes:

Deep hallucinations submerged me. I suddenly found myself surrounded by two gigantic boa constrictors that seemed fifty feet long... I see a spectacular world of brilliant lights, and in the middle of these hazy thoughts, the snakes start talking to me without words. They explain to me that I am just a human being. I feel my mind crack, and in the fissures, I see the bottomless arrogance of my presuppositions. It is profoundly true that I am just a human being, and, most of the time, I have the impression of understanding everything, whereas here I find myself in a more powerful reality that I do not understand at all and that, in my arrogance, I did not even suspect existed. I feel like crying in view of the enormity of these revelations. Then it dawns on me that this self pity is a part of my arrogance. I feel so ashamed that I no longer dare feel ashamed. Nevertheless, I have to throw up again... I have never felt so completely humble as I did in that moment.

From here Dr. NARBY soars past the methodological limitations of modern anthropology and deciphers "the main enigma:" "the Ashaninca's extensive botanical knowledge comes from plant induced hallucinations" via a sophisticated interdisciplinary study that includes direct personal experience of ancient shamanic mysteries, extensive comparative structural analysis of cross-cultural symbolism, and molecular biology. The result is the testable hypothesis "that the human mind can communicate in a defocalized consciousness with the global network of DNA based life."

Deftly written, one hopes this book will cause quite a stir. It has already been reviewed in *The New York Times*. It is a major step toward western science's reconsideration of the validity of shamanic states. The book's neutral tone transcends the reactionary politics that infect entheogens within medical research, while avoiding tiresome theological questions. Here is pure exploratory science. Entheogens as heuristic.

Let us note that direct communication with DNA is not groundbreaking news in the psychedelic literature and it is remarkable that NARBY, in his extensive scholarship, missed this. "To my knowledge," he writes, "the only other mention of a link between hallucinogens and DNA is by Lamb (1985) who suggests in passing: 'perhaps on some unknown unconscious level the genetic encoder DNA provides a bridge to biological memories of all living things...'" NARBY has completely missed Dr. TIMOTHY LEARY's *Info-Psychology* wherein the subject is first presented:

When the seventh circuit of the nervous system is activated, the signals from DNA become conscious. This experience is chaotic and confusing to the unprepared person—thousands of genetic memories flash by, the molecular family-picture-album of species consciousness and evolution. This experience provides glimpses and samples of the broad design of the multi-billion year old genetic panorama. ...genetic engineers will use as their basic instrument their own brains, open to and conscious of neurogenetic signals. Only the DNA neuron link up can produce the immortality and symbiotic linkage with other species... The key to higher intelligence is direct DNA-RNA neural communication among species.

And although the ayahuasca art of PABLO AMARINGO is a frequent guide in NARBY's proof, he misses where JONATHAN OTT presents AMARINGO's painting of the double helix of DNA on the cover of *Pharmactheon*:

The serpentine phantasmagoria of the visionary realm is dominated by the universal archetype of the Tree of Life... as well as the universal chemical liana of life on this planet—the double helix of DNA. The magical phlegm, azure essence of logos, the magical song or icaro of the yachaj made manifest, flows forth... like the serpents of creation from the woman's womb; like the spermatozoa, human serpents of fecundity rising.

NARBY's efforts expand and clarify LEARY's assertions and OTT's poetic insight in such a way that should reach many skeptical readers outside the entheogen community. The example has been set for how entheogenic visions can elucidate other mysteries of creation: the appearance of matter, the incarnation of the soul, the destiny of our planet...

ROBERT FORTE is the editor of *Entheogens and the Future of Religion*, and the forthcoming book *Timothy Leary: Outside Looking In* (Available from INNER TRADITIONS in 1999).

Mind Books offers over 250 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

Philosophy & Pioneers (32 titles)  
 History & Stories (24 titles)  
 Public Policy & Law (15 titles)  
 Psychology & Empathy (26 titles)  
 Religion & Spirit (17 titles)  
 Practical Guides (19 titles)  
 Traditional Cultures (67 titles)  
 Plants & Compounds (28 titles)  
 Chemistry & Neuroscience (23 titles)

We offer our free print catalog; fast and discrete service around the world; and easy ordering by mail, phone, e-mail, or fax. For a free catalog, send your address to:

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire ▼ Foreword by Terence McKenna

A bold new book  
exploring the legal  
substrate underlying  
shamanic mushrooms  
and their active principles.

\$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES  
Box 73401 (Dept. ER)  
Davis, CA 95617

# CLASSIFIED ADVERTISEMENTS

CLASSIFIED ADVERTISEMENTS are \$2.00 per word with a 15 word minimum (\$30.00). Though we are quite selective about the advertisements we include, *The Entheogen Review* is not responsible for any claims made by any advertisers. We reserve the right to refuse any advertisement. All advertising and advertised products void where prohibited. Please send information, a catalog, or product sample (if legal in the USA) along with your ad copy. Write for DISPLAY ADVERTISEMENTS rates. Send check or money order to *The Entheogen Review*, 564 Mission Street, Box 808-CA, San Francisco, CA 94105.

## SALVIA DIVINORUM 5X EXTRACT INCENSE

Made from organically-grown *Salvia divinorum* leaves. This extract contains the active principle of five grams of dried leaf concentrated onto one gram of dried leaf. Highest quality product. All orders filled within 24 hours.

**\$18.00 per gram plus \$2.00 S/H.**  
Order three or more grams and S/H is free.

Top quality organically-grown *Salvia divinorum* leaves from Hawaii.  
\$20.00/7 grams, \$30.00/14 grams, \$50.00/ounce. Add \$2.00 S/H.

No personal checks accepted.  
Payment in cash or postal money order only. If paying by money order, leave the "Pay To" space blank or your order cannot be filled.

J. HORD  
1430 Willamette Street, Suite 4  
Eugene, OR 97401

## SACRED SUCCULENTS

### Plants & Seeds

*Ariocarups, Epithelantha,  
Trichocereus, Copal,  
Delosperma, Pedilanthus,  
Sceletium & more!*

Catalog \$1.00

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

# EDITORIAL MUSINGS

---

I've enjoyed producing *ER* this year, and I hope you've enjoyed our take on the publication. Thanks to those who have taken the time to share their thoughts about *ER*'s development. Your accolades feed our spirits; your constructive criticism helps us to produce a better publication. Thanks also to all those who continue to write in with their experiences with visionary plants and drugs—really, this is *your* journal.

With this last issue of our first year, we want to wish JIM DEKORNE a fond bon voyage. JIM moved to Budapest in mid-October. We're hoping that we will occasionally get a "report from the field" from him, allowing us insight into the entheogenic community in his new surroundings. Thank you JIM. We've received many letters expressing gratitude for what you started back in 1992, and thanking us for continuing to publish. The following one sums up what many said:

I regard JIM DEKORNE as one of the truly great initiators of change in this century, and laud him for his work toward the quickening of the evolution of consciousness on this planet. Thanks JIM for *ER*, and your approach to it, and for making this information available...

Thank you guys for picking it up when JIM got tired, and expanding the scope to provide information on drugs with renewed energy. — J.O., OH

As far as the direction that we've taken *ER* in, we've received a few letters that have expressed sentiments similar to those presented below:

I'm pleased to say I am happy with the new format and quality of *ER*. The inclusion of pictures (like those of *Trichocereus peruvianus*) are extremely helpful. Also, the depth of editorial comment after, or in regard to, letters and questions is great. As for the "overly scientific" edge to *ER*... well, let it be stated that, *in my opinion*, a lot more can be learned about the nature of a plant by sitting with it, watching it grow, feeling its essence radiating from it, and analyzing its subjective effects. I am not knocking people or points of view that put a lot of emphasis on chemical and molecular structures, physiological reactions down to the minute, or other more technical observations. These are excellent supplemental sources of knowledge to consider our Allies and Sacraments from.

It is just my hope that a *balance* is maintained in our considerations. Compare SCHULTES & HOFMANN'S *Botany and Chemistry of Hallucinogens* with PENDELL'S *Pharmako/Poeia*—which one tells us more about the true essence and spirit of the plants covered? It is no surprise that "Abandoning the Ship" [VERNAL EQUINOX 1998 *ER*, p 3] kept only PENDELL'S book...

It would be especially nice if, in addition to all the wonderful recipes and Q & As, each issue would also focus on the *lessons* involved in our transdimensional journeys. What did you think about your recent voyage? Why were you there? What was the lesson? Most importantly, how can you take what you learned there and incorporate it into your life here? Learning what lessons a certain plant exhibits a tendency to extol is imperative in understanding the nature and essence of that Ally. Also, let's hear more about the developing relationships between ourselves and the plant spirits. — OLD CROW

I agree that the "lessons learned" are important to share too, along with the recipes and caveats. One of the best books that I've found dealing with this subject is MYRON STOLAROFF'S autobiography, *Thanatos to Eros: Thirty-five Years of Psychedelic Exploration*. Another approach to incorporating visionary experiences and daily life is shown through artist ALEX GREY'S paintings (see interview on page 105). And K. TROUT recommends the book *Plant Spirit Medicine* by ELIOT COWAN for those readers interested in developing personal relationships with plants.

So how 'bout it subscribers? Don't hesitate to let us know how you work with these plants and drugs, what you learn, and how you incorporate it into your daily lives. Thanks!

## SALVINORIN A JOURNEYS

**~1.00–1.25 mg salvinorin A.** Ingested with tin foil/straw/lighter method. Immediate and strong effects. Mouth quickly dries, I have never had this experience with salvinorin A before. The taste is very apparent, and seems to permeate my whole system. I know I am in for it for sure—I turn off the light and lie down in bed.

Listening to STEVE ROACH's "The Magnificent Void." The music has strong tidal effect on the direction that the experience flows towards, and can be seen as an overriding factor in the early part of the experiment.

There is a subtle interplay within sound structures and I observe that one of the most telling of conditions for salvinorin A is sonic. Sounds absolutely shape the experience for good or for distraction. If the sound structure impedes the flow, go without it. Nevertheless, a skilled guide could lead one deeply into trance with the correct vocalizations.

Sinking into revelry, my thoughts take on hues of purple and blues that border into green. Thoughts appear as a lattice-work, discreetly patterned as if they were the finest hand-worked lace. Moving forward through the patterns, the loss of ego deepens but body sensation heightens, so there is no loss of somatic awareness. Calm, warm detachment—thoughts flow with incredible beauty and beingness.

Walking through cool undergrowth, pushing through various plant forms—purple, blue, and green, with myriads of eyes within leaves. All aware of presence—plant "beings" flow and merge through shared thought fields and dissolve.

Everything is tidal now—that which is aware, that which perceives and is perceived—all partaking of the essence of the eternal now. Joy and subtle pleasure is taken in each thought that is shared across the vastness of this hall of beings. Faces, faces everywhere, oscillating into a kaleidoscope of personages that flow and morph in and out of thought shapes into mandalic friezes; they dissolve into themselves again, regenerating over and over until passed through into the singing light.

Then the universe arches over, redolent with the smell of plant and animal life, vibrant with beauty and being. Experiences flow in infinite directions—twisting, turning, with the patina of consciousness etched into everything with infinite detail and depth. Everything, every being, held in consummate beauty; the essence of deity flowing through all simultaneously. Every thought is transparent and filled with bliss.

Slowly, across eons of time and bliss, the self reasserts itself surfacing after an hour and a half, a trailing wisp of the various thought forms it had been submerged in. Great peace and warmth pervades the system of being. Sleep slowly rises up and recaptures the self, again to submerge it into the salvinorin A flow that moves steadily through the depths of the soul and subconscious. The night is filled with various dream shapes. Morning comes as a pleasant surprise.

In hindsight one finds that you can get up out of bed, attend to any business with high clarity and return into the revelry of the salvinorin A space by laying down again and turning inward with the ally. While I have heard about this phenomena when using the leaves, this contradicts much that I have read regarding salvinorin A. Maybe at a higher dose immobility strikes.

Also, as mentioned before, sounds have a big influence on this experience. There is an interesting side to this: during the duration of the various experiences there has begun to be inexplicable knocking going on in our house. I actually got up to investigate, and walked through the house trying to find the locus of the noise. It is as if someone or something is vying for attention. There are other sounds also occurring that are yet indescribable but reoccur again and again. This is a phenomenon that no one has reported in my knowledge, it is as if one was opening up to presences that surround us which we normally don't recognize. I am beginning to feel that they anticipate and are eager for these forms, for some acknowledgment and communication.

As the familiarity with the territory grows, so does the ways I can express it. The psychic phenomena is interesting. I realized that I had been hearing these noises pretty much all along with the salvinorin A and occasionally with *Salvia di-*

*vinorum* leaves. What can this portend? I will be moving up to 1.5 mg next.

I am beginning to get the sensation of mapping out this realm. For a while I didn't seem to get much past certain areas, and now these walls are crumbling. The "psychedelic nature" of this substance is phenomenally different than any of the other hosts that I have tried. It is noisy like the lysergamides, but in a bantering, gabby way instead of issuing large, almost solemn, profundities. The beginning is almost always hilarious, shapes, noises, bells, whistles—a veritable 'toontown of characters jumping out of the woodwork. Very irreverent! Then it moves on of course, but not before the entity amuses itself at your expense

**1.25–1.50 mg of salvinorin A.** Very apparent taste immediately. Unlike previous salvinorin A experiments, this one seizes me before I can get the light off and my eyes covered with blindfold (new addition). My being is quickly hived into infinite parts, flailing all over the place in what appears to be a very bizarre 1950s scenario filled with textures, smells, visuals of that time predominated by a female presence. The presence bears the most striking resemblance to DONNA REED or the archetypal "American Mother" and a myriad of other female expressions of that era. In fact there is infinite variations on this theme occurring in a fractualizing frenzy. This manifestation is very loquacious, wagging her finger into my infinite faces and making cryptically rude remarks! This strikes me as very hilarious, my whole being lights up with laughter. This quickly dissipates into another cascade of cartoon-like thoughts and emerging patterns. There seems to be very little of the usual cavern/tunnel effect, more of a restless roving over fields of thought and consciousness.

Feelings shift and change. This experience is incredibly strong. A mild panic rears its pointed little head in greeting, and then disappears when I relax more into it and allow the salvinorin A to take me where it wants. Then the salvinorin A state takes off at a gallop, it seems to be the most intense cartoonish psychedelic experience... feelings magnify into absolute grotesque parodies and psychic pratfalls. Constant, rapid shifting is going on, too quick to grasp.

The flailing finally dissipates about 15 minutes into the experience and my thoughts become more focused. It seems very playful at this time, taunting and teasing me deeper into its web, yet for some odd reason the loss of self is not so pronounced. There is a strong twisting sensation to the right, accompanied by a prickly sensation through my system. I

take off the blindfold as it seems to be sinking deeply into my skull, my skin is literally swimming in warmth except for my feet, which are taking on an arctic feeling. I become aware of my flesh as being an entity unto itself, conscious unto its own being, holding its own wisdoms and somatic dreams. Visions of beauty and sensation roll over it. Every cell seems to have an eye, peering out and at itself replicated into infinity. Undulating currents of desire wash over it and through it, a deep hunger for sensation and interplay.

Slowly, the cavern appears, but instead of going into it, it plays to my being as if it is an audience. Warm ambers, browns and traces of green predominate. Faces appear and reappear, twisting into wondrous shapes that have sparkling eyes of red and gold that flick away in an instance.

Over great lengths of time, the self reasserts itself. Feelings are very relaxed, tensions are gone. No great insights, it was too rapid for that, but a truly unique experience. As quickly as it came on, it is slower to leave. After an hour, I move about, with haloes of color encrusting every object and space throughout the house. The experience rides on me, I feel it still coursing through out my being as I head off for sleep. I am amazed at the gifts this plant's substance offers up. Of all the plant entheogens, it is the most playful—almost, should I say, *dryadic* in nature? Something profound moves under her surface humor. A lustrous joy and knowledge is revealing itself as I venture further in her company.

**~ 1.5 mg–1.75 mg salvinorin A.** Slight feeling of trepidation. This is a hallmark feeling for me, carrying meanings and thought that are complex, redundant of fear and discovery. Fear, as the dose level is working upward, discovery as something is about to be revealed. Music playing, LOREENA MCKENNITT'S "Dantes' Prayer," just so appropriate at this nexus... Ingested the salvinorin A with slight modification, used a straw that was longer this time, about 3.5 inches instead of 2 inches. Sitting on the edge of the bed, watching the crystals melt and the salvinorin A slithers up the straw—even before I can taste it, everything slowwwss down. This is strange, stronger than before, it has grabbed me before I am ready. Why am I so surprised? I reach over to turn the light off and my hand stretches like rubber. Warmth envelops me in a crescendo of light-blue and cream streams of luminous ribbon of light. After what seems a decade, my head feels the pillow reaching up and taking it gently.

As my head settles down, the top part divides and hives, again and again, it is hydra-like, whipping back and forth in a gale

force wind of consciousness, until it is medusa-like, every part of the head now snake-like, writhing with faster and faster force. Everything is cream and light-blue, cartoonish and giberish as each head sends back images and sensations into the central part of the being. It is a form of collective consciousness; I'm aware of myself and the room with my love lying beside me. At the same time it's a maelstrom—a hydra, a thousand upon thousand headed serpent-being under a huge dome of sky, writhing in an ever quickening and slowing dance on a plane that stretches into infinity.

The music calls out, a familiarity to hold to. I wanted to let entirely go but it calls with such infinite sadness. My love's breathing echoes and resounds, voluminous and full of beauty. Pinioned between these two sonic anchors, the serpent heads slowly morph into each other until singularity occurs. Then, for a moment—utter peace. All of a sudden, an entity rockets into consciousness from behind, pulling all along with it and into it from the right side as it streaks past. All thoughts and self runs into it like mercury pooling, silvery and voluptuous with movement. Beingness flowed out as the observer self watched with detachment... This being that has appeared takes on the appearance of a man in middle-age, bent on going somewhere quick. Had the beingness that moments before been hydra-like now attached to an astral traveller passing through a shared zone, a place where all of this plays out? Then, as quickly as it had come, the being looks back into me with deep detachment and departs, streaking away leaving trails of our shared momentary consciousness bubbling, to coalesce into moving pools of light.

The mind moves from thought to thought, like a sailing craft on a sea, tacking back and forth, into whirlpools and out again. All flows with such ease and warmth, in and out of different beings and states of consciousness. The universe is liquid and malleable, all life flows with a harmonious ringing—how would it be best expressed? A sloshing sound? Liquid sounds take form everywhere and whip and pull consciousness into pools and depths, blending away personality and recreating beingness into myriad creatures and situations all going on simultaneously. All moves and reshapes into new and unique beings, momentary expressions of life form for beauty's sake and then submerge back into the oceans of consciousness. Evolution is played out over and over—not as predator and prey, but as co-players in a dance of delight and shared mutual joy and recognition.

Awareness flickers off and on, beingness strobes on and off. Day into night, into infinite play and dance. Consciousness winks out, then refocuses back over and over. Within the strobing, the salvinorin A exposing itself as it opens up and I see within it a flow, a river of *Salvia*-consciousness, and how it has established a strata within my being that is now ever-present. It is a flowing universe, river and sky-like, both liquid and cloud. As if I've opened up a trap door, just below everyday thoughts. Ever-present, exalting consciousness: teaching, playing and guiding. It is a love that flows into my being whether I allow it to or not. Her face is revealed, glowing, entrancing, singular.

I cannot recall how it all ended. I drifted into sleep during the night, but as I write this now today I feel the flow still. I think it has always been a part of me. Now I *know* that entheogenic flow we all become aware of—it has been with me most of my life. But this has distinct elements of something new. A different creature all together. It is present in the trees, in the land, in the sky, but also as part of shared awareness. It envelops and comes whispering up through consciousness like smoke. An is-ness, ever-present, an Acadian stream, behind thought seen in faces, shared since the beginning. It is the river within the soul—intertwined with all thought, conscious, loving and completely enveloping. A capricious being, who is only too happy to come along with you—as the guide, as a light, as the teacher to creatures of thought and desire. — GWYLLM

## REALITY FISHING

There have been a few times when I smoked *Salvia divinorum* and was not sure (and still am not sure) that I really returned to the same reality I left from. Funny little details—like all the people I know being acquainted with an advertising cartoon called CHARLIE THE TUNA that I seem to have no recollection of whatsoever. — ANONYMOUS

## MDMA / 2C-B COMBINATION

I started with 125 mg MDMA at about 9:45 pm. I then took a 50 mg supplement at the 90 minute mark and another an hour after that. The MDMA trip was rather typical to my experience with that substance; very warm, lucid, and heart-opening. The material was excellent—perhaps not the strongest I ever had, but very clean and smooth. Interestingly, it

had a different appearance than any other MDMA I have ever encountered. Most MDMA powder that I have seen has a crystalline look to it, but this was chalkier than usual, almost like talc.

90 minutes after my final supplement, I took 45 mg of 2C-B, my largest dose yet. I opted for such a high dose because I had taken some earlier in the week and wanted to compensate for tolerance. It was incredible, amplifying, deepening, and extending the emotional warmth of the MDMA, and adding a profoundly psychedelic component to the experience.

I noticed something new to my experience of 2C-B on this trip—entities! I was presented with closed-eye visions of strange creatures that looked like a cross between the type of animals that inhabit the deepest, darkest regions of the ocean floor (jellyfish, luminescent eel-like creatures, strange octopods, *etc.*) and sci-fi style aliens, plus beings that looked remarkably like disembodied eyes. However, these beings did not seem to have the same sort of urgent sense of presence associated with them that I normally experience during tryptamine-mediated entity contact. I also perceived a scene rendered in Egyptian motifs in which several humanoids that were apparently priests or shamans performed some sort of sacred ritual around a highly elaborate, ornate alter. Egyptian-style symbology is something that I often encounter on 2C-B; visions of ankhs, pyramids, eyes of HORUS and such dancing across the insides of my eyelids. Does anyone else find this imagery common on this material? With eyes open, my entire visual field was in motion and seemingly overlaid with millions of tiny gyrating multi-colored helical structures that reminded me of DNA molecules. I also noticed a wavy disturbance in the air around the outline of my body that looked like the way an area of heat will make a pocket of air look kind of blurry. Could my visual sense have been so heightened to the point that I was actually seeing my own body heat? I wonder...

This incredible state of consciousness persisted for several hours, and I finally got to bed around 8:00 am the following morning, almost eleven hours after I had begun. I felt a little strung-out the following day, but this was quite tolerable in light of the previous evening's experience. This combination certainly gets high marks in my book! — TREY

*My own experiences with high-dose 2C-B (45-75 mg, the later higher doses taken due to tolerance, as well as having been stretched out over a number of hours) have also reliably in-*

*duced "entity contact" experiences, similar to what you've described. I haven't experienced any "interaction" with these entities (as sometimes seems to occur with tryptamines). As well, the combination of Moclobemide and 2C-B produced visions very similar to the "underwater" imagery that you've described. Lower doses do not produce these "entity contacts."*

*Your "strung out" feeling may have had more to do with the high amount of MDMA than the high amount of 2C-B. Surprisingly, when dosing with 125 mg MDMA and 20-35 mg of 2C-B (taken at the decline of the MDMA effects), I have noticed that I don't have any of the negative side-effects the next day that I would get from consuming MDMA alone. Others I know have mentioned a similar lack of MDMA side-effects to me as well, when followed by 2C-B. (Note, however, that these were with single 125 mg doses of MDMA, and not the 225 mg dose taken in the experience described above.) 2C-B alone doesn't seem to produce any negative after-effects. — DAVID AARDVARK*

## VISIONARY REALMS NOT LIMITED TO ENTHEOGENS

I read with great interest the recent issues of *The Entheogen Review*, VERNAL EQUINOX and SUMMER SOLSTICE, with my new subscription. I have lived in other (non-US) cultures, have studied the religions of the world, have been a horticulturist for many years, and have experienced my own botanically-induced and non-botanically-induced contacts with the "universal unconscious," God, entities, *etc.*

Many of these paths lead into the wider road that your inquiries, explorations, investigations, and endeavors travel upon. It is most welcome to meet, on paper at least, allies and other travelers.

It is startlingly clear that many of the experiences described by your explorers—especially those that relate to encountering "beings"—are also common experiences in other domains of research into the "inner world." There is something bigger going on here than possibly any of us suspect, or can imagine.

I would suggest making bridges to other explorers in related areas—that your readers and the publication would be well served to cast the net wider to take in (and make available to your readers) the advances in research and discovery in other disciplines, to wit:

1) Anthropological inquiry into shamanistic “alternate realities” engendered by non-botanical environmental manipulation (*i.e.* repetitive drumming or rattling and specific body postures). I have myself met animal “spirit guides,” and non-ordinary reality” beings through these practices.

We have a group of people from various disciplines and a range of ages (30s to 60s), educators, writers, lawyers, doctors, engineers, healers, mental and medical health care professionals, hospice workers, *etc.*, that meet here and do “shamanic trance meetings.” We visit a “non-ordinary reality” that is accessible to all, and has been regularly explored since the beginnings of our species. The caves at Lascaux, France show these shamanistic trance postures.

The foremost authority in this area is a German-American anthropologist, FELICITAS GOODMAN, Ph.D. founder of the CUYAMUNGUE INSTITUTE OF SANTA FE, New Mexico.

Workshops sponsored by the CUYAMUNGUE INSTITUTE teach a simple method for entering ecstatic trance and over fifty ritual body postures to facilitate specific experiences in non-ordinary reality. The postures have been found in the drawings, carvings, and sculpture of hunter-gatherer and horticultural societies around the world dating from the Old Stone Age to the present time.

Books by FELICITAS GOODMAN’s and her students are highly recommended: *Where the Spirits Ride the Wind: Trance Journey’s and other Ecstatic Experiences* (1990 INDIANA UNIVERSITY PRESS) by F. GOODMAN, and *Ecstatic Body Postures and Alternate Reality Workbook* (1995 BEAR & COMPANY PUBLISHING) by BELINDA GORE. Of course, MIRCEA ELIADE’S book *Shamanism: Archaic Techniques of Ecstasy* provides an intellectual cornerstone on the bridge connecting us to the voyagers of the past.

2) The other area of scientific research that finds parallel experiences (or are they all different doors into the same place?) to those described by your explorers is in parapsychology and “psychic” phenomena. Lots of serious scholars and enlightened people are studying in this area.

Specifically let me respond to two of the phenomena observed by TREY in the “Mescalysergic Visions” description in your 1998 VERNAL EQUINOX issue.

“Tentacles” are the energy connections documented by so many in the “energy medicine/therapeutic touch” field. I was

first aware of our human “tentacles” when I saw my own, issuing from my solar plexus as I was walking down the hall of my high school, many years ago. I had a lot of fun that day, learning to make them extend and contract, “touching” people with them (they always turned around to see what it was). They are there—everybody has them—just become aware and use them. Many Hindu and Tantric Buddhist drawings show “tentacles,” or lines of energy. Tentacles may be involved in dowsing, *etc.*

“The friendly, loving ball/octopus.” Yes, I’ve had one visit from something extremely similar. I thought it was a disembodied friend who died many years ago, and who had come back to protect me under the circumstances at that time. I have asked many people about this experience, and TREY’S description was the first time I’ve heard of anyone else who saw/experienced this energy friend. I’d love to hear from more people who have met the “round floating angel energy person.”

In any event, in not one of the experiences described above—trance, tentacles, or energy friend—was a botanical aid used, yet the similarities persist uncannily. Perhaps the entheogen is a sports car, a fast-track trip into a realm that co-exists with us and is visited by many paths or through many doors. We are all seeing/experiencing the same things. Consistency of phenomena leads one to accept it as reality.

I would be willing to communicate with anyone who wants to, on any of the above topics, if I may be first contacted through *ER*. Regards. — DANCER, FL

# NETWORK FEEDBACK

## PRODUCING POTENT PACHANOI?

From “B.K.’s” enjoyable missive in the AUTUMNAL EQUINOX issue, I note with interest that the search for *Trichocereus* species “1.5x stronger than *T. pachanoi*,” “2x stronger than *T. pachanoi*,” etc., continues unabated. While I am always interested in new reports regarding entheogenic plants, I would be surprised if other species routinely run a number of times stronger than *T. pachanoi*. I guess that there must be considerable variability within *T. pachanoi*, since with the materials I have assayed anything over a pound is out in the territory where I wouldn’t go out in public (and I speak as someone who has taken a great many doses of LSD). Of course, I note that all of my experiences with *T. pachanoi* have been from a single mother plant owned by a local nursery—a massive specimen that must have fifteen branches at the base. Based on some of the “weak” experiments reported by people who consume baby plants purchased at places like HOME DEPOT (probably not wise in the first place—you don’t know what the grower has been doing to them), I am inclined to accept K. TROUT’S contention in *Sacred Cacti and Some Selected Succulents* that older, well-established plants are more potent. [NOTE: This should not be construed to refer to ancient woody stumps, but rather columns that are a few years old. Old woody stumps have been found to be weak to inactive. — K. TROUT] Some day I will try some of the other clones I have in my back yard, but like a lot of cultivators, once I get them growing I become increasingly reluctant to cut them.

I wonder how much preparation methods have to do with apparent potency? Most of the people I know who get strong experiences from *T. pachanoi* seem to be consuming raw material—either just chowing down (my preferred method) or blenderizing into a smoothie of some sort. Many of those who report weaker experiences seem to be using the “boil it down all day” method like that used by “B.K.,” who apparently consumed something like 12 pounds (!) of starting material this way. I think that 12 pounds—or even 6 pounds—of the *T. pachanoi* I use would probably kill me. (Yeah, yeah, I know that a lot of the Peruvian shamans boil the stuff down as their standard preparation method—but shamans seem to be a lot more sensitive than some of us;

remember that the typical dose of morning glory seeds among Mexican shamans is 13 [pairs of] seeds.) Has anybody ever done any quantitative measurements to see how much mescaline survives this treatment? (The heat stability of mescaline itself doesn’t necessarily throw much light on the issue, since it is being boiled along with a whole mish-mash of other plant chemicals in this situation.)

While I applaud the continuing search of other species for entheogens, I don’t think we’ll find a cactus species superior to *Trichocereus pachanoi* for general consumption. We may indeed find *Trichocereus* species that contain more mescaline than *T. pachanoi*, but I suspect that they are also more likely to contain other noxious substances. We need a term for plants that have gone beyond the level of being “allies,” and have actively joined in a covenant with humans. Take a close look at *T. pachanoi*: hardly any spines; high mescaline content without any significant accompanying toxins; relatively high climatic adaptability; and an eager response to human additions of fertilizers and extra water. This is a plant that threw in its lot with humans millennia ago, and counts on us to nurture and propagate it. In fact, some researchers think that all *T. pachanoi* are cultivars, and that there are no true “wild” *T. pachanoi*; some contend that *T. pachanoi* is a carefully selected strain of some other *Trichocereus* (possibly *T. peruvianus*). Given how far Native Americans took plants like corn, potatoes, and *Brugmansia*, this doesn’t seem at all unlikely. I think that *T. pachanoi* expects us to eat it—and also to propagate and care for it. I get a very different feeling looking at the bristling spines of *T. peruvianus*, and peyote itself—an ally, but still a wild plant—definitely has a more “demanding” assortment of chemicals than *T. pachanoi*.

Don’t get me wrong; I think that it’s great that there are folks out there who are trying to recruit new plants. For my own purposes, however, I think that increasing the potency of *T. pachanoi* itself is a more interesting goal. Even after peeling and coring, a pound wet translates into  $\frac{1}{3}$  to  $\frac{1}{2}$  pound of material to consume; I think it would be nice to be able to cut this amount in half. It is good to hear about new cultivars; can anyone direct me to a source for the JEWEL’S Giant clone I keep hearing about?

One area I hope to see more work on is potentiation of mescaline with other substances. I have read with great interest in the *ER* materials on *Peganum harmala* and mescaline in the *Ayahuasca Analogs* reprints; this seems to deserve more exploration. I have also heard rumors that the “smart drug” piracetam is a powerful potentiator of entheogens; does anybody have any facts or references on this?

I am also interested in cultivation techniques to increase potency. TROUT’S notes on the addition of slow-release, ammonium-type nitrogen are exactly the kind of info we need. (Incidentally, I can confirm that everything TROUT says about MIRACLE-GRO and its effects on producing basal offshoots is correct; it is unsurpassed for this purpose, and I say this as someone who is organically inclined in gardening.) I am also curious about the possibility of increasing mescaline synthesis by providing precursors. There is, of course, ADAM GOTTLIEB’S endlessly reprinted suggestion that dopamine be injected directly into mescaline-producing cactus—probably an idea stemming from the BRUHN & LUNDSTROM classroom experiments demonstrating biosynthesis of mescaline (*American Journal of Pharmaceutical Education*, 1976, 40: 159–160). I don’t know anyone who has actually tried this. According to BRUHN & LUNDSTRÖM, the conversion pathway inside *T. pachanoi* is tyrosine—dopamine—3-methoxytyramine—3,4-dihydroxy 5-methoxy phenylethylamine—mescaline (with an additional branch not passing to mescaline but rather to a family of tetrahydro-isoquinolines). The classroom experiment consisted of injecting radioactively labeled dopamine into the plant and then performing radiochromatography 25 days later to see where the precursor ended up. Their results showed that after 25 days, 6% of the dopamine had been converted to mescaline, but about 32% was found in the 3-methoxytyramine intermediate. I have three questions related to this:

1) Have any *ER* readers tried injecting or feeding precursors, and, if so, what were the results?

2) TROUT cites AGURELL’S (*Lloydia*, 1969, 32: 206–216) assay of *Trichocereus pachanoi* alkaloid content at over 50% mescaline and 1–10% 3-methoxytyramine. (He also casts some doubts on AGURELL’S extraction methods, so I don’t know where that leaves us.) Obviously injection of dopamine changes the incremental production heavily toward 3-methoxytyramine—at least in the short term (25 days or less). Does anyone know anything about the biological activity of 3-methoxytyramine? Does anyone have any idea how rapidly this intermediate might be moved downstream into mescaline?

3) Is there any reason that tyrosine (readily available through any health food store) can’t be used as the precursor rather than dopamine? I am sure that tyrosine heads into many more end-products than just the dopamine-mescaline pathway, but it’s cheap and easy to find. And does it need to be injected? Can it be added to water for root application?

Any facts, suggestions, or speculations on these topics would be received with much gratitude. — S. BEAR, CA

K. TROUT responds:

**Cacti stronger than *Trichocereus pachanoi*:** It should not be surprising if other cacti turn out to be as strong as or stronger than many commercial offerings of *T. pachanoi*. Even some *T. pachanoi* has been determined to be nearly 22 times stronger than other *T. pachanoi* (estimated values 0.109–2.357%: HELMLIN & BRENNISEN 1992). It might also be noted that the highest yield ever reported from *Lophophora williamsii* (6.0–6.3%: HEFFTER 1896, 1898a, 1898b) was only around three times stronger than the most potent *T. pachanoi* yet that was taken to crystal mescaline (2%: POISSON 1960). (All percentages given are by dry weight.)

**Strongest results from consuming raw *Trichocereus pachanoi*:** The strongest results we have noted so far have not come from directly consuming plant material but rather by making an extract and drinking it. Boiling all day should be avoided due to the potential of alkaloid loss. Two short cookings with lime juice are adequate to remove the vast majority of the alkaloids. If the time is kept short (15–20 minutes per cooking) the risk of alkaloid degradation and hydrolysis of other cactus components can be minimized. As well, there is no reason to believe that the act of drying will preserve any higher levels of alkaloids than a short careful cooking with lime juice. (Freezing the fresh material and use of a stainless steel pressure cooker will help exhaust the plant material.) For most commercial strains of *T. pachanoi*, we would suggest 800–1000 grams of fresh plant as a good starting point. (80–100 grams dried.) Again, the most important point: know your material. For most this will require trial and error. On a note related to preparation, I remain unconvinced that peeling the waxy cuticle off is necessary and do not feel it proven that coring is a worthwhile approach unless drying only the exterior in order to directly consume dried cactus. The green outer layer is indicated to have the highest concentration but discarding the more voluminous whitish tissues may discard up to a third of the total alkaloids. (If making tea and filtering, there is not even any need to remove the spines.)

***Trichocereus pachanoi* killing the reader:** Though we suspect you were being facetious; 6 or even 12 pounds of *T. pachanoi* falls far short of a toxic, much less fatal, dose. If LD50 studies in other species holds true and if we err on the side of caution and base our estimate on the strongest reported *T. pachanoi* that has seen isolation of mescaline, a potentially fatal oral dose (LD50) would require in the neighborhood of 84 pounds of fresh *T. pachanoi*. (Average commercial *T. pachanoi* might require some twenty times more than even this!) If the *T. pachanoi* had been purified, again using the strongest reported, and the resulting alkaloids injected intravenously, a minimum of over 26 pounds would be required to furnish this amount. While our figures are extrapolations (since there has never been a death verifiably resulting from even pure mescaline), they clearly show that nobody is going to die from mescaline poisoning by eating too much cactus.

**Piracetam and mescaline synergy:** A warning has been made in print that piracetam taken in combination with amphetamines, psychotropics or hydergine may cause a potentiation of effects, but unfortunately no details nor reference was provided (DEAN & MORGENTHALER 1990). This cautionary note is however what made me decide

to try it a few years ago. The two lonely data points our reader mentioned likely refer to my own two bioassays (both used *Trichocereus pachanoi* as lime tea). I have been able to locate no facts or real data on the mixture of piracetam and mescaline other than these two bioassays conducted during 1993. Dosages of 1200 and 800 mg of piracetam were used along with a dose of *T. pachanoi* similar to what was recommended above. The first time, piracetam preceded the *T. pachanoi* ingestion, the second time the piracetam was taken following full onset of the mescaline but both experiences had the same result: a non-homogenous rough doubling of effects with enhanced rushing, waves and wind sounds. Safety of the mixture is unknown. While surprised, no other report has been encountered for another person actually trying this combination (not that our not hearing about it means that it has not happened, of course). These two bioassays are the only evaluations that we can locate on the combination so far. Readers?

***Trichocereus pachanoi* depending upon humans for its survival:** *Trichocereus* has a long association with humans but can't really be said to depend upon us for its existence. It is a rugged and hardy plant that grows wild and/or naturalized in many areas of Peru, Ecuador and Bo-

livia. While humans have indeed spread its range and frequency of occurrence, it does just fine without people. This species can be commonly observed as a highly successful colonizer of steep, inhospitable cliff faces. Its lack of spines does not make this a delicate plant; relatively few pests bother it and any that do will attack other cacti equally well. The belief that there is no true wild *T. pachanoi* is disputed by many people who have spent time traveling and studying the species. Our suspicion is that this idea arose from a misunderstanding of BRITTON & ROSE's observation that the species had been so widely and intensively cultivated for such a long period of time that it was impossible to be certain of exactly where it was of natural occurrence.

***Trichocereus pachanoi* being a form of *T. peruvianus*:** As for *T. pachanoi* being selected from *T. peruvianus*, this is at best debatable. Most researchers consider *T. peruvianus* to be a form of *T. pachanoi*, not vice versa. In 1981 RITTER described *T. peruvianus* as *Trichocereus Pachanoi* forma *peruvianus* (BRITTON & ROSE) RITTER. MADSEN 1989, listed it as simply a stronger spined form of *Echinopsis Pachanoi* (BRITTON & ROSE) FRIEDRICH & ROWLEY (1974 *I.O.S. Bull.* 3: 96).

Interestingly *Trichocereus peruvianus* also appeared in FRIEDRICH & ROWLEY's piece, described as *Echinopsis peruviana* (BRITTON & ROSE) FRIEDRICH & ROWLEY (1974 *I.O.S. Bull.* 3: 97). Unlike RITTER and MADSEN, FRIEDRICH & ROWLEY did not consider this to be a synonym of *T. pachanoi*. Botanical explorer ROB MONTGOMERY reports observing all degrees of intermediates within and between the two during his travels in Peru. It is his contention that they are simply peaks in a morphological spectrum that should be regarded as one species, based on the taxonomic maxim that if two seemingly different plants have identical flowers then they are simply forms of the same species (MONTGOMERY 1998).

What does seem clear is that the present taxonomic scheme for these *Trichocereus* species is utterly inadequate and we might further suggest that it may even be meaningless to attempt to draw any firm conclusions based upon it. MADSEN made the best understatement heard in a while, when he described "*Echinopsis Zucc.*" as "A genus of more than 50 species in the Andes and central South America. Many of them are poorly defined" (MADSEN 1989). Due to the high variability of these cacti and the piss-poor classification system currently in use, selection for high alkaloids cacti is probably better based upon bioassays rather than upon species identification. We might add that understanding the genetic versus environmental variables involved in alkaloid production and learning to maximize the alkaloid content within ex-

isting cacti is a very important avenue for future research.

**Precursor administration:** The biggest concern we have about administration of precursors into plants revolves around the fact that relatively little of the injected precursor ends up as mescaline. One report noted that only 0.067 to 0.35% of injected tyramine was converted to mescaline in *Lophophora williamsii* (AGURELL *et al.* 1967), and similarly low values have been reported from others as well (LUNDSTRÖM & AGURELL 1969, 1971). However, 3% of administered tyramine was reported incorporated into mescaline in *Trichocereus pachanoi* (as opposed to 0.34% after 20 days in *L. williamsii*) (LUNDSTRÖM & AGURELL 1969), and 6.6% incorporation of dopamine into mescaline after 25 days was reported in *T. pachanoi* (BRUHN & LUNDSTRÖM 1976). Nevertheless, this still indicates that the vast majority of the administered precursors were not changed to mescaline, and while radiolabeled dopamine did result in 6.6% of the radioactivity being incorporated into mescaline after 25 days, 32.6% or more was found to have been incorporated into 3-methoxytyramine (BRUHN & LUNDSTRÖM 1976), as mentioned by "S. BEAR" earlier.

Besides the potential pharmacological contribution of grossly elevated levels of the precursors it should be noticed that this will result in only a relatively small increase in the mescaline total due to physical limitations on the amount that can be administered to the plants and how much can actually be taken up and processed by the cactus. This latter point is probably an insurmountable limitation resulting from regulation of the enzymes involved but might be potentially be circumvented by the use of tissue suspension cultures should anyone take the time to explore this apparently unexamined topic. Still it should be obvious that:

a) Only small amounts of precursors could be administered to the plants; 420 micrograms of tyramine is the largest amount encountered in these papers. (We've heard of one individual who injected his cacti with dopamine—we're not aware of the amount, but probably more than mere micrograms—and the cacti died.)

b) The vast majority of the administered precursor did not get converted to mescaline. If dopamine is the precursor used, depending on the amount injected this would leave an unreasonable amount of non-converted dopamine in the cactus tissues, which could present serious health risks to anyone foolish enough to consume these cacti.

These factors suggest that, even if the procedure did work as described, any increase in mescaline content would

be trivial and would be accompanied by substantially elevated levels of what would normally be minor or trace alkaloids. Feeding 3-methoxytyramine or 3,4-dimethoxyphenethylamine would be a far better idea assuming one can locate a trouble-free source. If Congress' 1997 revision of the peyote law is taken literally, these seemingly inactive substances are now Schedule I along with any and all alkaloids contained within the peyote cactus. (However, it could be disputed as to whether this would actually hold up to a legal challenge.)

**Pharmacological action of 3-methoxytyramine:** I can locate no evaluation but any activity beyond possibly being a very weak stimulant is highly unlikely. Based on the inactivity of similar alkaloids, I suspect that 3-methoxytyramine is also lacking in noticeable effects. This compound has been said to be normally present in human body fluids (DAVIS 1989), and it has been reported to show up in the urine of patients with various brain disorders and cancers (CROSBY & McLAUGHLIN 1973).

## TOM JEWEL'S GIANT ERRATA

Thanks to reader input, it was recently brought to our attention that we may be guilty of perpetuating a horticultural rumor with no established basis in fact. We recently presented the origin myth for TOM JEWEL'S Giant (TJG), placing it as a horticultural offering arising from a selected mutant. It has since been pointed out by readers that this most likely originated as a creative sales pitch for an imported species that either lacked or had lost identification, rather than resulting from fact. Points which suggest the unusual offshoot story was in error:

- 1) The time frame in which this "mutant" was purportedly selected, propagated and released is incredibly short.
- 2) Unlike other *Trichocereus* species, which are largely self sterile within a given clone, TJG will form fruit and set seed when pollinated by other TJGs.
- 3) Plants appearing to be TJGs have been reported growing both in Lima and Arequipa, Peru.
- 4) There appears to have been several points of introduction into horticulture rather than just one.
- 5) JIM DANIEL is reputed to have been rather casual about maintaining labels for the many cacti which he imported.

6) In large stands of TJG there is a fairly high degree of consistency from plant to plant and no observable reversion towards its purported "normal" parent. Other points on which we may need correction were reflected in a report of sturdy 10 foot tall plants growing upright in a stand established in California and photos which showed the presence of as many as 6 spines per areole. (Our thanks to ROB MONTGOMERY and another CA grower who wishes to remain anonymous for their invaluable input on this topic.)

As for commercial sources; while properly identified plants are fairly rare in horticultural offerings, photographs provided by readers also suggested that at least some, if not most, of what is currently being sold by California growers as specimens of short spined *T. peruvianus* are in fact TJG. This is a very desirable plant in great need of propagation efforts. While we still have far more questions than answers, it is our current belief that this may be a species unto itself and that, despite its appearance, it might not even belong to the *pachanoid* group of *Trichocereus*. (Based on visible fruiting and floristic differences). The most commonly held consen-

## RONIN PUBLISHING

### World's Leading Psychedelic Publisher!

Books on entheogens including: peyote, psilocybin, MDMA, *Cannabis* (botany, chemistry, growing and medicine), and other psychoactives—from herbal aphrodisiacs to opium and cocaine.

Psychedelic underground culture, drug testing, and drug law. Authors include Timothy Leary, Robert Anton Wilson, John Lilly, and Alexander Shulgin.

**Berkeley, CA 94701**

sus is that TJG is either a *T. pachanoi*, *T. peruvianus*, a hybrid or else some form or variant of these. This conclusion may be premature. Similarity of flower and fruit is why *T. peruvianus* is thought by some taxonomists to be a form of *T. pachanoi*. If this holds water then this alone would imply that TJG is a different and distinct species—unfortunately not one which has been described so far as we can tell. What should be most obvious about this intriguing plant is that much is unclear and more work is needed to adequately define this beautiful and fast-growing plant. — K. TROUT

## STIPA ROBUSTA & SALVIA DIVINORUM QUESTIONS

Any info on safety and extraction of *Stipa robusta* seeds? Also any updates on the most efficient extraction of *Salvia divinorum*. What about sublingual or oral activity of such extracts? Any breakthroughs yet? Keep up the good work. Thanks. — LITTLE HAWK, OH

*For more information on Stipa robusta, see the response to the two questions below. For the most efficient "kitchen" extraction of Salvia divinorum, we favor acetone or high-proof ethanol as the solvents of choice. Methylene chloride and chloroform work well too, but can be harder to acquire and are more toxic to work with. With most solvents in most situations, a good rule of thumb is to have the solvent layer be as deep as the layer of material being extracted. If you had 2" of powdered leaf in a jar, you would want to add enough solvent so that the material was covered by 2" of solvent. (An exception to this is noted below.)*

*Acetone extractions can be made at room-temperature and should be kept sealed and away from any source of flame, as acetone fumes are highly flammable. Powder your dried leaf in a coffee/spice grinder or blender. Let this powder soak in acetone for at least 24-hours, occasionally shaking the container. Denatured alcohol can also be used at room temperature, but works better if it is heated. Since alcohol fumes are also flammable, this should be done in a well-ventilated area away from flames and with a sparkless electric hot-plate. A low boil for at least an hour should do the trick, though you may wish to re-extract the marc a second time with fresh solvent. If 190 proof grain alcohol is available (sold in some states under such brand names as EVERCLEAR and CLEAR SPRINGS), this can be used instead of denatured alcohol. It won't work as well, but it has the added advantage of not containing any toxic denaturants. It is worth mentioning that 190 proof alcohol is an azeotrope, i.e. a mixture that has a constant boiling point at a specified concentration, and therefore the alcohol and water will boil off in proportion to each other and you will not end up with a higher water content after boiling. Alcohol concentrations lower than 190 proof*

*aren't recommended, as salvinorin A isn't very soluble in water. If using room temperature alcohol, an excess of solvent should be used (perhaps 50% more), and it should be allowed to soak for at least 24 hours, with occasional shaking.*

*As salvinorin A is insoluble in non-polar solvents like hexane, this might be used to advantage to create a more concentrated extract. This could be done by first extracting the ground dried leaf material in boiling hexane for one hour. Some of the chlorophylls, tanins, fats, and other non-salvinorin A products contained in the leaf will migrate into the hexane and the salvinorin A should stay in the leaf. After the leaf has been re-dried, it can be extracted using one of the above-mentioned solvents, and you may end up with a more concentrated extract. We haven't tried this and don't know anyone who has, but it seems like an experiment worth performing.*

*After extraction with a solvent, the marc should be filtered out and the solvent should be allowed to completely evaporate (outdoors). This can be done by pouring the filtered solvent into a shallow glass baking dish. When the extract looks fairly dry, it should be heated at a low temperature on an electric hot-plate or placed in an oven at low temperature to drive off any residual solvent. If the extract smells like solvent, there are still traces left, which need to be removed. A good procedure to determine if there is any residual solvent in the extract is to put the extract into a sealed glass jar for several hours, and then hold the jar right next to your nose as you open the lid and immediately smell the contents. Any solvent vapors present will be easily detectable (SAGE STUDENT 1998).*

*Acetone obtained from a hardware store may contain impurities. The Salvia Divinorum FAQ (<http://salvia.lycaeum.org/faq.html>) suggests that the following procedure be used on these products to ascertain their suitability for extraction purposes:*

To test for non-volatile impurities, evaporate a drop of the solvent on a very clean piece of clear glass. After the solvent is evaporated, hold the glass over a black surface and look for any white deposits on the glass, then hold it over a white surface and look for any dark deposits. Also pick up the glass and look through it to see if there is any oily residue. This is like checking ones eyeglasses to see if they are clean. Any residual deposits on the glass indicate that the solvent leaves residue, i.e. that it is impure. If it leaves no residue or stain and no residual odor or taste it is unlikely that it will leave any impurities in your extract enhanced leaves, provided that it is thoroughly evaporated from them prior to use.

*Salvinorin A concentrations in dried leaf material tested have varied quite a bit; from 0.86 mg/g to 3.94 mg/g, with an average of 2.45 mg/g, and most samples tested fell between 2.3 mg/g and 2.9 mg/g (SIEBERT 1997; GRUBER et al. 1999). Current thinking is that salvinorin A content averages 2.5–3.0*

mg per gram of dried leaf (SIEBERT 1997; VALDÉS in SIEBERT 1997). Since "kitchen" extraction of salvinorin A is likely to be incomplete, one could probably safely estimate (erring on the side of caution) that each gram extracted contains 2.5 mg of salvinorin A. With this information one should be able to get a rough estimate of the potency of their extract by weighing it after it has dried, and comparing this weight to the original dry weight of the leaves. For example, if using room-temperature acetone you extract 100 grams of leaf (theoretically producing an extract that contains 250 mg of salvinorin A), and end up with an extract that weighs 4 grams (room-temperature acetone will extract material from *Salvia divinorum* leaf at a fairly predictable rate of 4%), then each gram contains approximately 62 mg of salvinorin A. This means that one would get a 1 mg dose of salvinorin A with about 16 mgs of extract. We can't see much reason to make an extract more potent than this, due to problems that most people will have weighing amounts of material under 10 mg.

As far as the sublingual/oral activity of these extracts, not much experimentation has been reported. However, they are undoubtedly much more active sublingually than swallowed. Since the salvinorin A absorbs more slowly through the mucous membranes than when smoked, a higher dose will be needed—starting at a 5 mg salvinorin A content (and working upwards until the desired effects are achieved) seems reasonable. It has also been suggested that the addition of menthol may make the extract more efficiently absorbed sublingually. — DAVID AARDVARK

## MORE STIPA ROBUSTA QUESTIONS

Has anyone had any luck with *Stipa robusta*? I've ground up 350 of the buggers into a morning glory-like drink with no luck. I'd assumed that my seeds were simply impotent, but I've noticed no other info on it since its initial inception as a possibly potent lysergic acid amide source. — OLD CROW, MI

## EVEN MORE STIPA ROBUSTA QUESTIONS

I'm seeking research information about *Stipa robusta*. According to *Psychedelic Shamanism* (pp 80–81) the information about its active principles are recorded in the December 1992 issue of *Discover* magazine. Have you a copy of this article? If so, does it mention where and who made the alkaloid investigation? Does it show a picture of the plant?

Questions keep coming up here at W.O.H. about this. Sev-

eral of us have searched out the plant. Initially only relying on the photo included in *Psychedelic Shamanism*. There is a common grass locally that looks like it. An associate in El Prado, NM, sent a sample to JIM DEKORNE in the fall of 1996, asking if this was *S. robusta*. JIM said, "Yes," he had it identified by a county extension agent. I then sent a sample of the same to PATRICIA BARLOW, head of the UNIVERSITY OF NEW MEXICO'S BOTANY DEPARTMENT, who said it was some strain of *Elymus*. Included in her response was a photo of, and written taxonomy report of *S. robusta*. CRAIG DREMANN, owner of REDWOOD CITY SEEDS and author of many grassland tests, sent a sample of *S. robusta*, as did MARK NIEMOELLER, owner of JLF: POSIONOUS NON-CONSUMABLES. Our findings? *S. robusta* is much different than JIM DEKORNE'S impression or the photo in *Psychedelic Shamanism*. It grows abundantly in the Taos, Rio Arabia, and Santa Fe counties of New Mexico. However, after bioassaying seed samples from all of the above locations, we found none that are psychoactive. Possibly the alkaloids are in the leaves rather than the seeds? DEKORNE mentioned that he'd heard the most potent strains were found in Lincoln county NM, in the vicinity of Lincoln City. On returning from southern New Mexico this week, I detoured over to Lincoln City and spent several hours walking and driving though much area there, but found no *S. robusta* at all.

Any information that could direct me to the persons who investigated this would be much appreciated. Thanks much. — PHILLIP/W.O.H., NM

*A photo of Stipa robusta does not appear in the edition of Psychedelic Shamanism that we have. Perhaps you are thinking of the photo of Phalaris arundinacea that appears before page 67 on the color insert? If this is the case, it is understandable why the photo does not look like S. robusta. There is a black and white line drawing of S. robusta (Figure 8–4) on page 80; it would certainly be difficult to make any kind of definitive field identification based on this drawing, which essentially could be any grass.*

*The Discover article does not show a photo of the grass. The researchers mentioned who isolated lysergic acid amide from Stipa robusta are biologist KEITH CLAY from INDIANA UNIVERSITY, and co-workers RICHARD PETROSKI and RICHARD POWELL from the U.S. DEPARTMENT OF AGRICULTURE. The lysergic acid amides are found in the Acremonium fungus that is harbored by the grass.*

*Extraction procedures should be as simple as with morning glories. Grind the seeds up, mix with water, and allow to sit overnight away from heat and light, then filter and consume. As far as safety issues go, Acremonium loliae found in Lolium temulentum has been reported toxic to livestock and contains the tremorigenic compounds lolitrem B and peramine*

*It certainly seems possible that not all Stipa robusta is infected with Acremonium fungus, and this could be the reason that no effects are noticed by some people who have tried these seeds. As well, lysergic acid amides may break-down fairly quickly if exposed to heat or light for prolonged periods of time. The age of the plant material and how it has been stored could contribute to a lack of potency. We're interested in hearing more from anyone who has had any luck with these seeds. We asked JIM DEKORNE what his take on this situation was:*

Regarding *Stipa robusta*: I don't have my references with me so I'll have to wing this from memory. I obtained the original info when someone sent me the *Discover* article. I wrote a polite letter to them requesting their specific sources but never received the courtesy of a reply. *Discover* is less a scholarly journal than a science popularizer for the masses—check the layout and vibes of the original piece to see what I mean. As most *ER* readers know, any large library will have a copy on microfilm; one can even obtain a photocopy of this (or virtually any journal article) through the inter-library loan system should the local library not have the piece being sought.

*Stipa robusta* is common all over New Mexico, and grows wild outside my door back home. I have no comment about PHILLIP at W.O.H.'s claim of mis-identification since I have no memory at all of "identifying" this species for him or anybody else. The grass is easily recognized by its mature seed-heads and stalks, but unless my Alzheimer's deceives me, nobody ever showed me any to identify in my life. For stylistic reasons, my publisher commissioned an artist's rendering in *Psychedelic Shamanism*—this was copied from a similar drawing in a USDA text. If you ever saw the grass growing in nature you'd never mistake it for anything else.

*Stipa robusta* is called "sleepy-grass" by ranchers because of its alleged effects on livestock. Nevertheless, I've never seen cattle eat it. One can find fields overgrazed down to the dirt, yet sprinkled everywhere with healthy clumps of *S. robusta*. Apparently even New Mexican cows will starve rather than touch it. This tells us something, but I'm not sure what. (It is certainly not *prima facie* evidence that it's psychoactive.)

There is a field off the highway between Lincoln and Riodoso NM where (several years ago at least) five-foot clumps of *Stipa robusta* were growing like shocks of wheat on otherwise barren earth. This is the exact area where the effects of sleepy grass on livestock were first reported in the 1880s. According to frontier literature, it was the scourge of horses—like they'd sleep for a week after eat-

ing it. Horses being considerably smarter than cows, I find this hard to imagine; possibly the morphogenetic field for what livestock consider edible was different a century ago than it is today. How else do animals “instinctively” learn how to avoid poisonous plants?

Alas, I was more naive about other people’s trip reports when writing *Psychedelic Shamanism* than I am today. While editor of *ER* I received several positive bioassays on *Stipa robusta* from readers whom I subsequently began to suspect of overactive imaginations. I surely never got off the few times I tried the stuff. As you say, the bioactivity in this species depends on the *Acremonium* fungus connection, and that can easily vary from plant to plant and season to season. Such being the case, if you really want a lysergic acid amide trip you’re better off with morning glory seeds; voluntary ergotism is an inellegant illness. — JIM DEKORNE, Budapest

Some additional quotes regarding *Stipa robusta*:

Other infected grasses, such as *Stipa robusta* (Vasey) Scribn. and *Melica decumbens* Thunb., known as “sleepygrass” and “dronkgrass,” respectively, are largely avoided by animals once they have experienced the extreme narcotic effects that occur after consumption of sufficient quantities of these grasses (WHITE 1992).

Sleepygrass is named after a narcoticlike effect it has on horses, cattle and sheep. Horses have been known to doze for seven days after grazing on sleepygrass, but the more usual effect, which is seldom fatal, is sleepiness for a few hours, more or less. Tests in New Mexico reportedly demonstrated that when cattle were fed sleepygrass they “ate it with gusto,” but that they would not eat it again after they had once experienced its effects. The cattle would “freeze” in one position and remain motionless for up to 45 minutes. Reportedly some ranchers have tried with success to feed their herds sleepygrass hay under controlled conditions, before moving them on the range, so the cattle would later avoid the grass instead of getting “spaced out” and losing weight. The narcotic substance has been identified as diacetone alcohol. Gould (1975) reports that the narcotic effect of sleepygrass varies from region to region, and with the stage of growth. Sheep are not as strongly effected by sleepygrass as are cattle. White *et al.* (1992) suggested that the narcotic effects of *S. robusta* and other grasses may be due in part to alkaloids produced by endophytic fungi living in the grass plants (POWELL 1994).

*Stipa robusta* is known to have a narcotic effect on horses and, to a lesser extent, on sheep and cattle when grazed. When eaten in sufficient amounts by horses it causes drowsiness and deep slumber. The effects are seldom fatal, and the sleepiness is usually of only a few hours duration, rarely as much as 48 hours. Sleepygrass is of low palatability and is generally avoided when better forage is available. Its narcotic effect apparently varies from region to region and also with the stage of growth when consumed (GOULD 1975).

## TROUT'S NOTES

“More than you need to know?”

“...would sell like hotcakes if they were known to be available.” — SASHA SHULGIN

“... appreciated by those of us who are real information junkies...very few people have use for so much information...” — JONATHAN OTT

“What a great job you are doing...I want MORE.”  
— DALE PENDELL

Send \$1.00 for TROUT'S NOTES current catalog.  
TROUT'S NOTES will soon be available through MIND BOOKS.  
(See advert on page 119.)

In the AUTUMNAL EQUINOX 1995 issue of *ER*, DEKORNE quoted from PETROSKI, R.J., POWELL, R.G., & CLAY, K. "Alkaloids of *Stipa robusta* (sleepygrass) infected with an *Acremonium* endophyte" *USDA Agricultural Research Service*. As these are the same researchers that reported this information in the *Discover* article, we suspect that this paper would have more detailed information, but have been unable to locate a copy of it. In this back-issue of *ER* DEKORNE also points out that:

In another paper, these researchers ascertained that only grasses infected with the *Acremonium* fungus contained ergot-type alkaloids. In other words, *S. robusta* plants uninfected with the fungus are inactive: it's not the grass, it's the symbiotic endophyte living inside it. Once again, it all boils down to finding the right plant or plant variety.

## SALVIA DIVINORUM PEST CONTROL

I'm looking for more information on growing *Salvia divinorum*. My plant loved it when I finally put it in an enclosed glass case; the humidity increased, but so did the bugs. After a while, scale was rampant. I eat organic foods, so I'm naturally against spraying my plant with poisons. I'm looking for organic solutions to the scale problems. — BZRK, NY

*Concise growing information is available in the Salvia Divinorum Grower's Guide. The Guide recommends using a solution of 4 parts water, 1 part rubbing alcohol, and 1 part liquid castile soap to control scale infestations. The plants are completely drenched with this solution, which can be applied from a spray-bottle (SOCIEDAD PARA LA PRESERVACIÓN DE LAS PLANTAS DEL MISTERIO 1998). It strikes us that it would be best to wash off the plants a few hours after applying this solution (although the Guide claims that leaving the solution on doesn't harm the plants). If several of these treatments don't get the problem under control, the scale may have to be removed manually, with one's fingernails.*

*Another solution is available from NATURE'S CONTROL, a company that specializes in "beneficial" predatory insects. Their What's Eating My Plants brochure states:*

Black ladybugs will feed on scale when mealybugs run low. Scale control with natural predators has been variable, and we continue to search for improved controls. Many gardeners resort to spraying or dabbing alcohol, light oil, soapy sprays, or mixtures of the above for scale control. Test a small area for toxicity from any of these products first.

*So it sounds as if black ladybugs aren't a sure-fire method of control, but they might help and probably couldn't hurt. When introducing ladybugs, the plants should be misted before the ladybugs are released (they will be dehydrated when coming out of the shipping container and their first desire will be to find water). NATURE'S CONTROL sells these for \$30.00 for 100 bugs. Call (541) 899-8318 for shipping and handling cost information. I have found NATURE'S CONTROL to have very good service. The brochure mentioned is 50¢, or free with any order. — DAVID AARDVARK*

## DISEMBODIED EYES

Has anyone ever experienced the "wall of eyes?" A bunch of eyes (lashes, lids and eyeballs) of different sizes, all looking at the viewer as if interwoven into some kind of tapestry. I feel the whole thing should be blue in color. Something like this vision is on a GRATEFUL DEAD CD cover. This is a memory of a vision encountered on mushrooms. I asked my twelve-year-old kid, who is into artsy stuff, if she knew of this wall of eyes, and she said that she didn't. She did somehow know that the vision is predominantly blue in color. — COY DOG

*Quickly checking through GRATEFUL DEAD CDs at the local record store, we came across the 1987 ARISTA RECORDS' release In The Dark. The front cover has the band member's faces (presumably), showing only their eyes and that part of their face surrounding their eyes, against a dark background. The back cover shows a picture with a collage of overlapping eyes. Perhaps this is the CD you are thinking of?*

*It has been speculated that the "disembodied eyes" found in a number of Tepantitla murals and in relief carvings at Teotihuacan in México may represent the "visionary eye of the seer under the influence of one or other of the well-known pre-Columbian entheogens" (OTT & WASSON 1983).*

*As well, visionary artist ALEX GREY has incorporated the "disembodied eye" motif into a number of his paintings, including Dying and Collective Vision, which are, interestingly enough, painted predominantly in blue. (For more on ALEX GREY, see the interview to the right.)*

## ALEX GREY SPEAKS...

Interviewed by Jon Hanna

**ER:** Tell us a little bit about the two new books that you are currently working on.

**Alex:** In November 1998, *The Mission of Art* was released by SHAMBHALA PUBLICATIONS. *The Mission of Art* is an inspirational text for artists and anyone who has glimpsed the spiritual power of art. It traces the evolution of human consciousness through art history, seeking the threads of art's mission. I explore the development of my own work, including the bizarre performances and entheogenic experiences which lead to my visionary art. There are reflections on the artist's intention and conscience, and how we of the postmodern age can use the creative process as a spiritual path. I call it my philosophical art rant, a neo-Platonic manifesto. There's also about 60 b/w reproductions of drawings and paintings, many of which were done specifically for *The Mission of Art*.

The other book will be a large format artbook with lots of color plates and will be entitled, *Transfigurations*. It will not come out for another year or so. It's basically the next batch

of works including performances, sculptures, paintings and drawings I've been doing since *Sacred Mirrors*.

**ER:** Much of your early work consisted of performance art. Do you still do any performance art, or is your work now focused predominantly on painting?

**Alex:** Although the performance rites and installations are few and far between now, my wife ALLYSON and I completed a major installation called *Heart Net* at the AMERICAN VISIONARY ART MUSEUM in Baltimore. It is included in a huge group show about LOVE that opened in May of 1998 and will be on view until May 1999. It was created from a vision I had on 2C-B. Thanks SASHA! It's an alchemical healing piece; the length of the wall is 10 feet by 60 feet and is painted with a map of the world over which a red rope web radiates from a gigantic heart formed from hundreds and hundreds of silk roses. An eye in the heart is crying into a small stone grotto surrounded by broken buddhas. Under the heart a black skeleton and a white skeleton are embracing and an earth child has crawled out of the grotto. Above the heart is a golden buddha, and above the buddha is a white neon infinity symbol, and above the neon is a tiny naked embracing Ati-Buddha sculpture. The *Heart Net* is an audience participatory piece that invites people to write a healing prayer or loving message on a small paper heart and tie it to the rope net. The *Heart Net* has thousands of prayers and messages on it now, and it's really incredible to read some of them. Everything from cynical dirty limericks to children scrawling love notes to their mommies to people expressing passionate and spiritual regard for each other and the planet.

But to answer your question, I am mostly painting and sculpting these days. It seems that the performance energy has gone into public lecturing on my work. I've done a number of talks at art, spirit or entheogenically oriented conferences.

**ER:** You created, and for a time sold, a device called "The Mindfold," which was essentially a blindfold and earplug combination that could be used for sensory deprivation while tripping. What are the benefits from using such a device while experiencing entheogens?

**Alex:** The removal of distracting visual or auditory elements allows for a blank screen onto which the imagination can be projected. There is a more complete immersion inward which becomes potentially more frightening and miraculous. The Tibetan Dzogchen Buddhist practices include a “dark retreat” called Yantig. The idea is to hallucinate and yet, not to get caught up in the imagery, to realize that it is only a projection of your mind. Just like the rest of this magnificent display of reality.

**ER:** Back when I was working on my BA in art, I had an assignment where I had to give a presentation on some unique aspect of modern art. I proposed a talk on the influence that psychedelics have had on art, and my instructor vetoed the idea, telling me that it was too controversial. What type of obstacles or resistance do you run up against as an artist who is candid about the important influence of visionary plants and drugs on your work?

**Alex:** My work scares some people because the Divine Imagination can be a scary place, which anybody who has tripped knows is true. It’s not only that you see scary monsters, or experience your own death, or dissolve into a network of infinite light, but that such all enveloping visions severely challenge any conventional “non-mystical, non-visionary” worldview. Anyone who admits the existence of these boundless inner dimensions realizes they have profound implications about what we believe reality is. BLAKE and other visionaries knew these dimensions first hand and now with LSD and DMT nearly anyone who has the guts and the curiosity can be introduced to some aspect of the terrain. But we have to remember that during his day, BLAKE was regarded by many as totally mad.

Part of the problem that the “legitimate” art world has with my work is that many critics still feel the postmodern deconstructionist agenda is the only hip concept for art to deal with. These intellectual fashion trends change every few years. When I was a student, minimalism was the rage, so content or imagery of any kind was verboten. My answer was to bring rotting dogs to class, set my underarm hair on fire, and vomit on human brains. Stuff like that. Also, visionary artists encounter resistance based on our culture’s entrenchment in materialism and what KEN WILBER calls a flatland mentality. Flatlanders deny that reality has height and depth, deny the importance of the subjective interior states that determine meaning and value. My work attempts to integrate many spheres of inquiry such as science, art and religion which are seen as the primary causes of fragmenta-

tion in modern society. My strategy runs counter to the nihilism and narcissism of much art today.

**ER:** Beginning in the ‘50s with ALDOUS HUXLEY and HENRI MICHAUX, and continuing through to the ‘90s with TERENCE MCKENNA, D.M. TURNER, the SHULGINS, and others, there have been numerous people who have, through their writings, captured and adeptly described various visionary states. Yet surprisingly, there don’t seem to be nearly as many well-known visual artists who have presented visions based on their entheogenic experiences. It would seem in many ways, much more appropriate for these states of mind to be documented through the visual arts, rather than through writing. What are your thoughts on possible reasons why there aren’t more visual artists who are specifically addressing this arena?

**Alex:** Well, I actually think that there are quite a few visionary artists whose work reflects these states, it’s just that you don’t see their works that often in the museums and trade rags of mainstream contemporary art like *Art in America*, *Art News* or even *Artforum*. A few more daring art magazines, such as *World Art*, *Raw Vision* and *Juxtapoz*, sometimes will feature articles on artists inspired by the psychedelic state. Many entheogenically inspired visionary artists have shown up on the web or magazines devoted to the subject of consciousness expansion. But most artists are still frightened to talk about “it,” because of the draconian legal situation.

As far as the art market goes, you need collectors to sustain any kind of art with real vitality. Remember, without his brother THEO’S generosity, VINCENT VAN GOGH might never have had the time and materials to create his works. Are we glad he did? You bet! Many of the wealthy collectors of Pop art and media-inspired art have made their money in the advertising industry. The life and art vision they invested in reflected their state of consciousness, the sense of an empty package, and usually totally bereft of spiritual or visionary qualities. Yet these generous people have helped build our museums, they have given back to their community. It’s shocking to me to see how few wealthy drug-inspired or “new age” or “alternative lifestyle” people ever think of buying an original piece of art. It takes a “head” to recognize a “head.” The visionary psychedelic artists are largely unsupported artists, struggling to gift the world with higher vision. So if you can, buy original art, my friends. And thanks so much to those generous patrons and collectors who have helped in the past.

And please, if any of you well-intentioned rave promoters who have ripped my work off mercilessly are reading this, consider running a credit line or for God's sake sending me a check for your image theft. If you think I am well off like PICASSO was, you are wrong. Artists deserve to be paid for their work, not ripped off.

This past summer I met some intense young artists from Baltimore, poor as anything and they are total acidheads. Their work is fabulous. I'm not concerned that the vision will ever die. It will keep emerging through us dedicated mystic artists. Brothers and sisters, keep making art. Some day soon I hope this kind of work will be more appreciated.

I think that the whole computer animation industry is filled with drugged-out hippies making corporate logos that glow and flip and become transparent. Occasionally you will see an ad campaign visualized by someone who has obviously tripped. It's good to see that they can earn their daily bread, but I wish they could make computer animated sacred art as well, and not just prostitute out the special effects for laundry detergent and soft drinks. That's my sermon.

**ER:** Your work is technically precise, and I imagine that most of your paintings that are based on visionary experiences were executed *after* the experience, not during it. Have you ever painted while in a visionary state, and if so what was this like?

*Glimpsing the Empyrean*  
1997 by ALEX GREY

**Alex:** MYRON STOLAROFF recommended really low doses of acid as a catalyst for deepening meditational experiences, and this practice may have merit for painting in my focused way. I have some friends who take a substance and then set down to draw. One of the most fun art-things to do while under the influence is to draw large spirals. I start drawing the outside circle and wind my way in. By the time you reach the center, your mind has been flushed, drawn down the purifying art toilet to the other side of the universe.

**ER:** Hmm... I'll have to try that sometime. Changing the topic, there is currently in this country a great worry about youth using drugs. As a father, and as someone whose work exemplifies the *positive* aspects of drug use, what approach do you take when discussing drug use with your daughter ZENA?

**Alex:** We try to be totally honest, and educate her, but not burden her with information that would be beyond her understanding. She has seen my art lectures. I don't encourage anyone to do drugs. But when I talk about my art to various audiences, I do mention my personal entheogenic experiences, such as dissolving into the Universal Mind Lattice, becoming one with all beings and things in a network of love and light. Such mystical experiences which I had some time ago, had a positive influence on my art. We were recently in Amsterdam and ZENA met Dr. ALBERT HOFMANN. She loves Huichol Art, and we buy what we can of it. There are a lot of dangers associated with the entheogenic spiritual path, the worst of which are legal. I don't think that young kids should be doing drugs. They should be forming their identity, strengthening their ego, not dissolving it prematurely.

**ER:** One of the things that I like about your work is that it embraces both the archetypal and the personal. Many of your paintings address basic human conditions that everyone can relate to: love, birth, life and death. Yet your paintings are also obviously pulled from your own life experience; the joyous love that you share with your wife, the birth and growth of your daughter. Indeed, my wife recently pointed out to me that she could see your face in a number of your paintings. While it has been said that all artists' work contains self-portraits—whether intentional or not—it is quite unusual to realize that you can recognize the face of the artist without his skin! To what extent do you intentionally try to accurately portray yourself in your work?

**Alex:** I think that the best art is a direct expression of the artist's deepest personal and transpersonal experiences.

**ER:** Some of your paintings contain “disembodied eyes.” People have commonly reported seeing this imagery while in a visionary state. Why do you suspect that it is so prevalent?

**Alex:** We have all heard that the eye is a window to the soul. This is true. The open eye is a symbol of awareness or consciousness. If it is repeated endlessly, you have a symbol of infinite awareness. One lady who had a near-death experience saw my painting, *Dying*, with the figure dissolving into a field of spirally interconnected eyes and said that she too, had gone down a tunnel of eyes. When you are in the visionary world, anything can grow an eye, from the sky to the stones at your feet. This symbolizes the recognition of our presence by the greater field of presence, which is nature and cosmos, inner and outer space...

**ER:** On the topic of eyes and vision, I remember in my youth, when I was first introduced to psychedelics, a few people emphatically told me, “Don't look in the mirror while tripping.” Seemingly, they were trying to prevent me from having a bad trip. In retrospect, I think that perhaps these people weren't too comfortable with themselves. Do you feel that *actual* mirrors can be put to good use while in the visionary state, and if so in what manner?

**Alex:** I remember looking in a mirror during several different trips, and even did a couple self-portrait drawings. Once as I was staring into my own eyes, with enormously dilated pupils, I noticed the light glisteningly reflected off my wet eyeballs. The light began to grow larger slowly burning away my eyes and face, leaving only a field of electrically charged white light. It was somewhat frightening to dissolve into the light, but my body would reappear every time I blinked. Definitely lose yourself (your small self) in the mirror, but it's always nice to have a loving friend along. ALLYSON recalls looking into the mirror as she was meditating in a lotus posture and seeing herself as the Buddha. That's a good one. But if you are coming down from a bad trip and you've been mentally slogging through a field of rotting corpses, maybe it's not the best time to look at yourself in a mirror, because your judging negative self is in full command. The *Sacred Mirrors* were created to use this mirroring aspect of the mind, and to be experienced in a heightened state. I feel that they can help realign the body-mind with spiritual energies.

**ER:** What are your thoughts on specific plants or drugs that are conducive to visionary states that can be brought back and represented through painting? Are some entheogens

better than others for this work?

**Alex:** Sometimes if ALLYSON or I are working on a painting and there are problems with it, marijuana can give us a new perspective on our work. We don't get stoned that often though. The visionary tsunami of LSD is my favorite choice in terms of an immersion experience of significant duration, with potential to access all levels of Hell or Heaven. Other people have other preferences.

Quite frankly, many of my images come to me unbidden at odd times having nothing to do with intake of exogenous entheogens. But since DMT is a naturally occurring neurotransmitter, there are always bio-chemical correlations to vision states, that is, as long as you are trapped in a skin bag. I think the pineal gland, the ol' melatonin pumping third eye, is the brain's illicit drug factory. Big Brother arrest yourself for your own naughty visionary neurons. It's the stuff dreams are made of...

**ER:** Indeed! Speaking of the Big Brother mentality, why do you think that many people in Western society have such a hard time incorporating the visionary state and direct experience of God into their lifestyles?

**Alex:** Because God and the inner visionary world is not even supposed to exist! God can't be seen and verified with a telescope, an oscilloscope, or a microscope... can't be brought home from WALMART... so it doesn't exist. It doesn't exist "out there," but it *can* be known. It can be known, and the millenia of mystics proves that!

People can smell a threatening worldview from pretty far away. Mystics don't have an easy time of it, so folks try to avoid the mystics' life, even though it does hold the promise of ultimate liberation.

**ER:** In a number of your paintings, such as *Prostration, Despair*, and *Deities and Demons Drinking from the Milky Pool*, I notice imagery that is reminiscent of HIERONYMUS BOSCH. What painters do you feel have influenced the stylistic direction that your work has taken?

**Alex:** My father, an artist himself, was my first influence. He encouraged me to draw. Then I fell in love with MICHELANGELO when I was a teen. His neo-Platonic idealism wed with Gothic Catholicism is very tripped out. Michelangelo's obsession with the struggle of body and soul is very related to my work. Other influences would include Tibetan and Hindu Tantric

art, BOSCH, REMBRANDT, BLAKE, VAN GOGH, the Belgian Symbolist JEAN DELVILLE, PAVEL TCHELITCHEV, ERNST FUCHS, JACKSON POLLOCK and especially my wife ALLYSON GREY. I still love DALI and FRANCIS BACON—hell, I'm an eclectic art lover. I put the portraits of numerous influential master artists, hovering over the painter, in my recent painting called *Painting*.

**ER:** Who are some modern artists that incorporate the use of visionary plants and drugs into their work that you feel are worth keeping an eye out for?

**Alex:** One of my favorite artists of the 20th century is my wife ALLYSON, and her abstract spectral geometric spaces have great depth and evoke the spaces of psychedelic Tantrism. I recently met ALBERT HOFMANN and he said that FRANCESCO CLEMENTE, a very well known and well respected contemporary artist had sought him out to thank him for the visions. His work is wonderful and something like a contemporary REDON. KEITH HARING wrote to TIMOTHY LEARY about the importance of LSD in developing his trademark drawing style. Decades ago HENRI MICHAUX did a number of works inspired by mescaline, but his work is not in the visionary tradition, it's more abstract expressionist Tachism. Good mescaline visions came through the lady who did the CROWLEY Tarot deck. The painter PAVEL TCHELITCHEV, although I don't think he ever used drugs, is one of the most tripped out painters of the 20th century.

ERNST FUCHS and MATI KLARWEIN have used entheogens, and their surreal-fantastic-visionary paintings are some the best and unbelievably detailed models of good tripping visions. DIANA VANDENBERG and JOHFRA BOSSCHART are Dutch visionaries that blend surrealism and occult tripping visions. JOSEPH PARKER is one of my favorite little-known visionary painters of the 20th century, he suffered from intense migraines and got his visions of heaven realms during those periods. His sunsets look like the kind of stained glass Persian rug jiggly-jewel skies I've seen on mushrooms. I came across the work of ERIAL in an old *Psychedelic Illuminations* magazine. He's got the DMT-entity thing down. Of course let us never forget the Huichols with their amazing bead and yarn work and also, PABLO AMARINGO and his crew of ayahuasca-inspired artists down in South America.

Look to H.R. GIGER and JOE COLEMAN, for bad trips painted well. Both are very powerful artists. The chaotic juxtaposition of different realities can be seen in artists like ROBERT WILLIAMS or even DAVID SALLE, and the merrier side of tripping can be seen in artists like KENNY SCHARF. Don't get me

started, I love psychedelic art so much I could write a book...

**ER:** A frequent theme that runs through the pages of *The Entheogen Review* is the idea of encounters with “discarnate entities.” Your own work occasionally pictures imagery that falls into this category—what TERENCE MCKENNA might call “the other.” Frequent descriptions of these entities portray them as being “insect-like,” “elf-like,” or even “alien-like” (in the traditional “man from Mars” sense). What are your thoughts about the existence of these beings?

**Alex:** “There are more things in Heaven and Earth than are dreamt of in our puny philosophies...” My thoughts on those buggers don’t count, if you’ve experienced them in one form or another—and I have—then you accept that they are part of the inner mindscape. Of course, some astral neighborhoods you avoid if you possibly can, because there are some malevolent jerky kind of spooks that just love to mess with your head.

“The other” is a weird delusion of Samsara, the dualistic world we take for reality. My worldview comes more out of a sense of Oneness, Infinite Oneness. The astral creepy-crawlers are just part of the One. They do their job, they reflect our minds scary creativity.

**ER:** Your web page (<http://www.alexgrey.com>) mentions plans for a chapel that may one day be built to house some of your work. Can you tell us a little bit more about this idea, and when it might come to fruition?

**Alex:** We know the *Sacred Mirrors* are beloved by thousands of people who have seen them installed at one of various venues throughout the United States and Canada or who have purchased one of over forty-five thousand copies of the book, *Sacred Mirrors: The Visionary Art of Alex Grey*, now translated into five languages. We receive letters and e-mail daily from people who have gotten great value out of the *Sacred Mirrors* and have questions about where they could be visited. This has prompted me to seek a way to make the works available to a wider public, hence, THE CHAPEL OF SACRED MIRRORS. I have retained the *Sacred Mirrors* for the sake of realizing the CHAPEL project. In addition, numerous collectors of my work have promised to donate significant works to the CHAPEL when it is built.

A secular art gallery or museum is not the proper place for spiritual art. In order to work most effectively, spiritual art requires a sacred setting. The sacred art and architecture of

previous cultures have always been sites of initiation into their unique and culturally bound understanding of spiritual reality. The tribal myths and dogmas that keep religions at war are not the mystical truths at the heart of each religion. Today, a more embracing and universal spirituality is possible. THE CHAPEL OF SACRED MIRRORS would be dedicated to fostering such interfaith and post-denominational spiritual understanding.

As the millennium dawns, I feel it’s important to build a new type of sacred space with both a personal and planetary perspective. I envision a CHAPEL of transformative art that aligns the individual self: body, mind and spirit, through contemplation of the *Sacred Mirrors*, then presents a deepened understanding of archetypal human relationships via the PROGRESS OF THE SOUL paintings: *Praying, Kissing, Copulating, Pregnancy, Birth, Nature of Mind, Theologue, Transfiguration, World Soul, and Godhead*. These and other promised gifts would fill the CHAPEL with an extraordinary collection of important artworks providing a holy context for the human journey from conception to death.

THE FOUNDATION FOR THE CHAPEL OF SACRED MIRRORS is a non-profit 501 (C) (3) organization and has been established in order to: 1. Procure a site of beauty accessible to a wide audience; 2. Build and landscape the CHAPEL; and, 3. Maintain and perpetuate the CHAPEL.

We are in the beginning phase of the CHAPEL project and seek feedback and support of any kind. If the *Sacred Mirrors* have been important to you, please write to us and give generously if you can. Direct your responses, inquiries and send your tax-exempt contributions to: THE FOUNDATION FOR THE CHAPEL OF SACRED MIRRORS, 725 Union Street, Brooklyn New York 11215, (718) 789-2576.

**ER:** Thank you ALEX, for taking the time to share some of your thoughts with readers of *The Entheogen Review*.

ALEX GREY’S new book *The Mission of Art* is available for \$27.50, plus \$4.00 S&H from: SHAMBHALA PUBLICATIONS, POB 308 (Dept. ER), Boston, MA 02117, (800) 733-3000

*Sacred Mirrors* is available for \$29.95 (softcover) or \$39.95 (hardcover), VT residents add 5% sales tax, plus \$3.50 S&H from: INNER TRADITIONS INTERNATIONAL, POB 388 (Dept. ER), Rochester, VT 05767, (800) 246-8648.

## CONFERENCES & RETREATS

### AYAHUASCA / HOLOTROPIC BREATHWORK WORKSHOP JANUARY 14-23, 1999

"The purpose of this journey is to generate a deep self-transformation, through the combination of ritual plant ceremonies, Holotropic Breathwork sessions, creative artwork expression, meditations, and purification diets. Every experience will be followed by an integrative group sharing (English & Spanish). Instructors include LUIS EDUARDO LUNA, SILVIA POLIVOV, and ANA MARIA AGUIRRE."

Held in the Amazonian rain forest in Peru, participants will experience three ayahuasca ceremonies and two Holotropic Breathwork sessions. Tuition is \$1,350.00. For registration information contact ENTHEOS GROUP via phone, fax, e-mail, or check out their web page: (541) 801-9872, (541) 774-3892, spolivov@hotmail.com, <http://www.lycaum.org/~entheos>

### HOLOTROPIC BREATHWORK JANUARY 29-31, 1999

A weekend workshop led by STANISLAV GROF, M.D. and TAV SPARKS held in Palo Alto, CA. Friday night: registration (6:00 pm) and lecture (6:30 to 10:15 pm), Saturday: from 8:45 am to 8:00 pm (lunch provided), and Sunday: from 9:00 am to 12:30 pm. \$275.00 tuition. Part of Friday night's lecture (from 6:30 to 8:00 pm) is also open to non-workshop participants for \$10.00. More information from: HOLOTROPICS, 38 Miller Avenue, Suite 158, Mill Valley, CA 94941, (415) 721-9891

### SECOND INTERNATIONAL CONFERENCE ON DRUG WAR PRISONERS MARCH 20-21, 1999

Problems relating to the unauthorized use of controlled substances ("drugs") show no signs of abating despite formidable outlays of manpower and taxpayer money in affluent societ-

ies such as the United States and Canada. Held at the YORK UNIVERSITY in Toronto, Canada, this conference will address the ill-founded assumption that drug-related problems are best dealt with by criminal justice systems. For more information contact JOHN BERESFORD, POB 76665 (Dept. ER), Los Angeles, CA 90076, [johnber@earthlink.net](mailto:johnber@earthlink.net) (USA, Europe) or HARVEY BRIGGS, Department of Sociology, YORK UNIVERSITY, 4700 Keele Street (Dept. ER), Toronto, Ontario, Canada, M3J 1P3, [harvey@barint.on.ca](mailto:harvey@barint.on.ca) (Canada).

### 10TH INTERNATIONAL CONFERENCE ON THE REDUCTION OF DRUG-RELATED HARM MARCH 21-25, 1999

Held in at THE CENTRE INTERNATIONAL DE CONFÉRENCE DE GENÈVE in Switzerland, the 10TH INTERNATIONAL CONFERENCE ON THE REDUCTION OF DRUG-RELATED HARM will consist of plenary sessions featuring invited speakers, symposia, workshops and poster sessions. Simultaneous translation into English and French will be provided for all plenary sessions and for as many of the discussion sessions as possible. Themes that will be touched on include 1) Harm reduction, 2) Cost effectiveness of harm reduction, 3) Indigenous peoples, 4) Migration, 5) Cultural, religious, and social norms and dimensions, 6) Harm reduction for *Cannabis*, 7) Harm reduction for tobacco, 8) Harm reduction for alcohol, 9) Harm reduction for performance-enhancing drugs, 10) Current drug trends, 11) Public health and public order, 12) Treatment: Individual level, 13) Treatment: Co-ordinated policy, 14) Drugs and blood-borne viruses, 15) Drugs and sex, and 16) Prevention. Registration is £350 for IHRA members and £435 for non-members, and includes entry to all sessions and receptions, morning and afternoon refreshments, lunches Monday through Thursday, and the program and abstract book. For more information contact: HIT CONFERENCES, Cavern Court, 8 Mathew Street (Dept. ER), Liverpool, L2 6RE, United Kingdom.

## TERENCE MCKENNA RETREAT APRIL 11-17, 1999

Join TERENCE MCKENNA in Waimea Hawai'i for a five-day talk-story exploration of where we stand as the old century and the last millennium grow ever more irrelevant to the new post-Human future. MCKENNA will explore the dilemma and opportunity posed by global culture's acceleration toward a techno-aesthetic singularity. We will discuss the worldwide movement toward archaic lifestyles and values and the simultaneous synergy of human beings and their technologies as both grow toward new dimensions of integration and global holism. \$1675.00 tuition includes airport transfers, ground transportation, six nights shared accommodations, breakfast and lunch daily, three evening meals, cultural tours, rain forest hikes, yoga classes, and daily lecture with discussion. \$675.00 deposit required by February 1, 1999. Balance due March 1, 1999. \$50.00 discount for members of the INSTITUTE OF NOETIC SCIENCES. To request a brochure e-mail your name and address to: [nmi@aloha.net](mailto:nmi@aloha.net) or write to: NEW MILLENNIUM INSTITUTE, POB 958 (Dept. ER) Kamuela, HI 96743, (808) 885-2182, fax: (808) 885-5570, <http://www.nmi.org>

## INCENSE AND INSENSIBILITY: SCIENCE FICTION, PSYCHEDELIA & THE 1960s & 1970s JUNE 12, 1999

A one-day, interdisciplinary conference, dealing with the influence of science fiction and/or psychedelia on the 1960s and 1970s cultural production, hosted by the UNIVERSITY OF LIVERPOOL.

For more information: <http://www.liv.ac.uk/~asawyer/sffchome.html>, or e-mail ELLIOT ATKINS ([ēja@liverpool.ac.uk](mailto:ēja@liverpool.ac.uk)), ANDY SAWYER ([asawyer@liverpool.ac.uk](mailto:asawyer@liverpool.ac.uk)), PETER WRIGHT ([113350.134@compuserve.com](mailto:113350.134@compuserve.com)), or mail INCENSE AND INSENSIBILITY CONFERENCE, Dept. of English Language and Literature, UNIVERSITY OF LIVERPOOL, Modern Languages Building, Liverpool, L69 3BX, United Kingdom, (44) 0151 794 2730 fax, or ANDY SAWYER, Librarian/Administrator, Science Fiction Foundation Collection, UNIVERSITY OF LIVERPOOL Library, POB 123, Liverpool L69 3DA, United Kingdom.

# ENTHEOBOTANY

## SHAMANIC PLANT SEMINARS

*16–22 January & 25–31 January 1999*

Two 7–day, intensive seminars  
at the portal to the Palenque Mayan ruins  
and México's mysterious tropical forests.

### Archaic Art and Archæology of *Ambrosia*

#### Identification and Cultivation of Mushroomic Entheogens

#### South American Visionary Snuffs and *Ayahuasca*

#### Tryptamines, Phenethylamines, Allied Amritous Alkaloids

#### *Soma*, *Kykeon*, *Iboga* and Kindred Psychoptica

#### Collection, Cultivation, and Preparation of Psychoactive Plants

You are invited to join us for an intensive week by the archaic Mayan ceremonial center of PALENQUE, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. This is an opportunity not to be missed! Seminars will feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be available for study. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of PALENQUE and environs by Mayan entheobotanist Rättsch, there will be opportunities to explore the exotic surroundings on your own. This will be our 10<sup>TH</sup> such event [formerly BOTANICAL PRESERVATION CORPS], and past seminars have assumed legendary proportions...

Seminar instructors include: Michael Bock, E. Wade Davis, Christian Rätsch, Giorgio Samorini, Alexander (Sasha) and Ann Shulgin, Paul Stamets, C. Manuel Torres, Terence K. McKenna, Rob Montgomery, Jonathan Ott, and Ken Symington.

Course fee is \$1,300.00 *per* person for the week of instruction, hotel accommodations at PALENQUE [2 registrants *per* large double cabin], plus three delicious meals daily [vegetarian fare is available]. Limited space precludes single occupancy; nor have we space for friends or family members unregistered [other accommodations are available hard by the ruins, within on kilometer of our hotel—note it will not be possible to book alternate accommodations and attend merely the seminars]. You may of course choose to room together with a registered friend or spouse. *Fee does not include travel* to PALENQUE, located two hours [by bus, by taxi, or by rental car] to the east of the airport of Villahermosa, Tabasco; having connections to several US cities.

Write or call for a brochure with speaker biographies and additional information to:

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold new book exploring the legal substrate underlying shamanic mushrooms and their active principles. \$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES

Box 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is editor of *The Entheogen Law Reporter (TELRL)*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL MINDUSTRIES, POB 73401 (DEPT. ER), Davis, CA 95617-3401.

Questions for possible inclusion in this column can be sent to Mr. BOIRE in care of *ER* at: PHARMACO PROHIBITA, c/o *The Entheogen Review*, 564 Mission Street, Box 808, San Francisco, CA 94105-2918.

## PHARMACO PROHIBITA

BY RICHARD GLEN BOIRE

QUESTION: I have heard that it is legal in some states to manufacture controlled substances so long as they are for your own personal use. Does this loophole really exist?

RESPONSE: Yes and no. In some states, the definition of "manufacture" requires proof that the chemist was compounding the outlawed drug for someone other than him or herself. For example, here is how the Alabama law reads:

The production, preparation, propagation, compounding, conversion or processing of a controlled substance either directly or indirectly, by extraction from substances of natural origin or independently by means of a chemical synthesis or by combination of extraction and chemical synthesis, and includes any packaging or repackaging of the substance or labeling of its container; *except that this term does not include the preparation or compounding of a controlled substance by an individual for his own use...* (20-2-2(14); emph. added.)

In the inaugural issue of *The Entheogen Law Reporter*, I reported on a case from the Alabama Supreme Court in which a man's MDMA manufacturing conviction was reversed for this very reason. (*Ex Parte Colbert* (Ala. 1992) 615 So.2d 1218.) In that case, the defendant's conviction for attempted manufacture of MDMA was reversed after the Alabama Supreme Court found there was insufficient evidence showing that the man had intended to distribute the MDMA, rather than simply use it himself.

When the police burst into the man's apartment they found a simple home-made laboratory and a host of chemicals. A forensic scientist who examined the chemicals testified that the man was attempting to manufacture MDMA, and that he had completed all but the final step necessary to create between 175 and 250 tablets of MDMA.

The Alabama Supreme Court acknowledged that the evidence against the man clearly showed he was creating MDMA in his apartment lab but even so, said the court, those actions did not fall within Alabama's law against manufacturing an illegal drug. Examining the statutory definition of "manufacture" the Alabama Supreme Court found that it plainly required not only proof that a person was preparing or compounding an outlawed drug, but also proof that the person was not doing so simply for his or her own use.

As explained by the court, the prosecutor presented no evidence that the man (whose last name was COLBERT) intended the MDMA he was making for use by anyone other than himself:

The state offered no evidence to establish what quantity, if any, would indicate that the preparation and compounding of a drug was for something other

than one's own use; the state offered no evidence that Colbert had solicited sales or evidence of a sale for these; and the state offered no evidence that Colbert had previously dealt in drugs or any evidence that he was going to deal in drugs in the future. Without more than the evidence that Colbert was involved in compounding and preparing MDMA, we hold that the evidence presented by the state was merely speculative as to whether Colbert was attempting to "manufacture" the drug—*i.e.*, whether Colbert was attempting to prepare and compound the drug for something other than his own use. (*Id.* at p. 1221–1222.)

It is a huge project to examine all 50 states' definitions of "manufacture" to determine which have the personal use exemption and which do not. But, I have been able to verify that the following states *do* have it:

Alabama (Ala. Code sec. 20-2-2(14) (1997 Supp.))  
 Idaho (Idaho Stats., sec. 37-2701(r) (1998 Supp.))  
 Iowa (I.C.A. sec. 124.101(16) (1998 Supp.))  
 Missouri (Missouri Rev. Stats., sec. 195.010(25) (1998 Supp.))

And, the following states definitely *don't* have the exemption:

Arkansas (Ark.Stat.Ann., sec. 20-64-201(s) (1997 Supp.))  
 California (Cal. Health & Saf Code ; Bus. & Prof. Code, sec. 4051. (1998 Supp.))  
 New York (NY Pub. Health Code., sec. 3302(19) (1998 Supp.))  
 Oregon (Or. Rev. Stats., sec. 167.203; 475.005) (1997))

Not surprisingly, some "tough on crime" judges caught up in the frenzied jingoism of the war on some drugs, are not fans of this loophole. One way such judges have tried to get around the exemption is by reading it very narrowly. For example, courts in several states have held that the personal use exemption only applies to outlawed drugs that a defendant creates by "preparation or compounding" (*i.e.*, makes via chemistry). Under such a narrow reading, the personal use exemption has been held not to apply to people who grow a small number of *Cannabis* plants, because, said the courts in these cases, "growing [*Cannabis*] is not the same as preparation or compounding." (See for example: *State v. Griffith* (Idaho 1995) 896 P.2d 334, 337; *State v. LaMaster* (Mo.App. 1991) 811 S.W.2d 837, 839; *Bedell v. State* (Ark. 1976) 541 S.W.2d 297; *State v. Wiggins* (N.C. App. 1977) 235 S.E.2d 265, 268–269.)

It is important to realize that the personal use exemption in some state's definition of "manufacture" does not mean that compounding a small amount of, say, LSD does not result in a crime. A person who makes a personal amount of LSD in his or her own home lab in a state with the personal use exemption to manufacturing, may not be committing the crime of manufacturing, but he or she *does* commit the crime of *possession* as soon as the drug is made.

Also, there is no personal use manufacturing exemption under federal law. This means that even in a state with such an exemption the feds could step in, should the circumstances make the case attractive for one reason or another.

The primary source for legal information concerning visionary plants and drugs...

## FYI BOOKS

14310-B E. 42 Street, STE 333 (DEPT. ER)  
Independence, MO 64055  
<http://www.fyibooks.com>

FYI BOOKS sells an extensive selection of books about mushrooms: field guides, cookbooks and cultivation manuals. They also sell *Psilocybe cubensis* spore prints for \$25.00 and a magic mushroom growing kit for \$70.00. This appears to be the same kit as offered by the HOMESTEAD BOOK COMPANY as it is the same price and lists the same items as HOMESTEAD'S kit.

FYI also has an extensive selection of books in the following categories: Recreational Drugs, Pharmaceutical Drugs, Marijuana, Drug Law, Drug Testing, and Cigars. They carry JIM HOGSHIRE'S latest book *Pharmaceutical Nation*, which is based on his now-defunct newsletter *Pills-A-Go-Go*. Celebrating pills of all sorts, *Pills-A-Go-Go* was an often humorous and irreverent ode to a nation obsessed with salvation in tablet form.

## NIGHTSHADE

Aalsmeerderweg 330 A (DEPT. ER)  
1432 CZ Aalsmeer  
Holland  
(0031) 297361566  
<http://www.xs4all.nl/~nightsha/nightshade.htm>

NIGHTSHADE, as you would expect from an ethnobotanical company with this name, offers a large selection of seeds of *Datura* (jimson weed) and *Brugmansia* (angel's trumpet) species. They also sell cactus seeds including *Trichocereus peruvianus* (Peruvian torch) and *Lophophora williamsii* (peyote), as well as herbs and live plants. Some of the plants they offer are: *Acorus calamus* (calamus), *Areca catechu* (betel nut), *Artemisia absinthium* (wormwood), *Catha edulis* (khat), *Heimia salicifolia* (sun opener), and *Salvia divinorum* (ska Pastora).

Unfortunately they also sell some of those God-awful "herbal

X" products, so pay no attention to those specious offerings. And there are some egregious errors scattered throughout their on-line catalog, such as listing LSD as the psychoactive constituent of both morning glory seeds and baby Hawai'ian woodrose seeds (which do contain various ergoline-type alkaloids such as LA-111, but no LSD), and listing *Hyoscyamus niger* as the Latin name for wormwood; *Hyoscyamus niger* is henbane.

## POWERFUL PLANTS

11011 Harts Road, STE 1104 (DEPT. ER)  
Jacksonville, FL 32218  
[webmaster@pplants.hypermart.net](mailto:webmaster@pplants.hypermart.net)  
<http://pplants.hypermart.net>

POWERFUL PLANTS offers a small selection of botanicals, including: morning glory seeds (Heavenly Blue), baby Hawai'ian woodrose seeds, large Hawai'ian woodrose seeds and *Salvia divinorum* dried leaf. Their prices are not cheap—their *S. divinorum* is \$85.00 per oz, which is the top price being charged on the US market today. Only one other company—KAVA KAUAI—charges this much, but their leaf is excellent and worth the price. I don't know anything about the quality of POWERFUL PLANTS' *S. divinorum*—perhaps it is as good as KAVA KAUAI'S, perhaps not.

I don't know why some companies still insist on selling large Hawai'ian woodrose seeds. I have not heard any reports of them being entheogenic. Hell, I've never even heard of anyone taking them; only the baby Hawai'ian woodrose seeds seem to be used. My theory is that these companies are exploiting the name similarity, and customers assume that if they are being sold in the first place they must produce a desirable effect. I'd like to know if the proprietors of any of the companies that sell large Hawai'ian woodrose seeds have ever tried them personally? I somehow doubt it, because if they had I don't think they would be selling them. JON, what's your take on this?

Well, WILL... have you ever heard of a book called *Pharmactheon*? On page 140 OTT says that *Ipomoea tuberosa* (Hawai'ian woodrose) is "not entheogenic." And didn't DENNIS MCKENNA tell you essentially the same thing a while back when you e-mailed him about this? POWERFUL PLANTS' web page statement that they are "Your Source for Entheogenic Seeds & Plants" would seem to be incorrect in this case. I suspect that so many companies sell these seeds because they have been reported psychoactive in much of the older popular literature, such

as *Psychedelics Encyclopedia*, *Growing the Hallucinogens*, and *Legal Highs*. It is unfortunate that publishers continue to reprint what seems to be inaccurate information from books that were originally written 20 years ago. I have to admit that I've never seen any scientific analysis that said these seeds *don't* contain psychoactive ergoline-type alkaloids; they simply haven't been included in any study of psychoactive CONVULVACEAE that I've come across.

### PRESCIENCE MAGAZINE

<http://www.island.org/prescience/index.html>

This e-zine has apparently been around for a couple of years, but I only recently heard about it when it found a home on the ISLAND GROUP web page. Produced by the GAIAN INTELLIGENCE AGENCY (GIA), they have just released their third issue. These guys are big on the concept of natural intelligence—that evolution is an intelligent process that is directed by the mind behind nature, and is not just a random process. It is the idea that all life is biologically embodied intelligence and as evolution proceeds so does the complexity and intelligence of all life on earth.

ISSUE 3 starts out with an article on the “Noosphere,” which explores—albeit a bit tediously—the concept that there is a realm beyond the rocky geosphere, the organic biosphere, and the gaseous atmosphere. A realm that is just as real as these more tangible realms, which is made up of consciousness—a layer of mind covering the planet called the noosphere.

Another article entitled “Exploring Goethean Science” addresses the by now all-too-familiar theme of mankind's alienation from the natural world through the application of reductionist science. This article looks at the work of 18th Century poet/playwright JOHANN GOETHE, who delved into the realm of science and stressed perceiving systems as a whole and not simply fragmenting them into their constituent parts.

“A Metaphysic Borne of Psilocybin” explores the concept of natural intelligence further, as revealed by entheogens. And finally there is the article “Contact,” where author SCOTT FOSSEL does his best TERENCE McKENNA imitation (complete with some of TERENCE's favorite words), in his account of smoked DMT. If the DMT experience is still eluding you, then you can sublimate your desires here with yet another account

of someone else's trip. But if that's really the case, check out <http://www.deoxy.org/timemind.htm> and read McKENNA's writings on the subject, as he describes the experience far better.

### PURE LAND ETHNOBOTANICALS

3655 Sequoia Trail (DEPT. ER)

Verona, WI 53593

[mimosa@angelfire.com](mailto:mimosa@angelfire.com)

PURE LAND has a large selection of seeds, herbs and live plants. Products include: *Acorus calamus* essential oil; *Acorus gramineus* 5X extract; dried *Amanita muscaria* v. *flavivolvata*; *Areca catechu* 5X extract; arecoline hydrobromide pure powder; *Arundo donax* 5X extract; *Calea zacatechichi* liquid concentrate; *Catha edulis* plant; *Celastrus paniculatus* seed oil; *Corynanthe yohimbe* liquid concentrate; *Desmanthus illinoensis* root-bark; *Leonotis leonurus* 5X extract; *Mimosa hostilis* root-bark; *Psychotria viridis* plant; *Salvia divinorum* dried leaf and 5X extract; *Sceletium tortuosum* powder; dried *Trichocereus pachanoi*; dried *T. peruvianus*; *Voacanga africana* seeds; and much more.

We are impressed with the huge selection PURE LAND offers, as well as their wide array of extracts, liquid concentrates and essential oils. Their catalog is \$3.00 They do not have a web page yet but are working on it. They only accept payment in postal money orders.

### NOTICE

In the AUTUMNAL EQUINOX 1998 *ER* we listed a new address for SHAMANISMO incompletely. It should have had “Suite 423” after the street address. Our apologies for the omission.

WILL BEIFUSS is the author of the *Psychedelic Sourcebook*. He is currently living at BREITENBUSH HOT SPRINGS in Oregon after refusing to leave when the SKA PASTORA CONFERENCE was over. A fund has been established to pay for sorely needed psychiatric help for WILL. Please send what you can in care of *ER* to help in this matter.

JON HANNA is the author of the recently released second edition of the *Psychedelic Resource List*. He is a free-lance editor, writer, and artist. In his spare time he teaches a class on visionary plants and drugs at the UNIVERSITY OF CALIFORNIA AT DAVIS.

## SKA PASTORA IN OREGON

A report on the first-ever *Salvia divinorum* conference held December 11–13, 1998.

It seemed a bit odd to be one of 100+ people trekking through the winter snow of Oregon in the dark to attend the sold-out conference dedicated to *Salvia divinorum*, but that's where I found myself a few weeks ago. Upon arrival at BREITENBUSH HOT SPRINGS, I overheard a frantic discussion between a couple of the resident-employees, who were already concerned about smoking by some of the conference guests. Not *Cannabis*, mind you, but cigarettes. And not indoors, but outdoors. Smokers were later told that they had to huddle in a specific local—a tiny open-sided shelter a stone's throw from the main building. The folks at BREITENBUSH seemed to be overly concerned that their buildings would be set ablaze by a wandering spark or burning cigarette butt; never mind the fact that the buildings were soaking wet from the snow. You have to bring your own pillows and bedding to BREITENBUSH. As well, the cabins have no electrical outlets and you are encouraged to turn off lights at every opportunity. This made more sense when it was explained at the orientation that BREITENBUSH is “off the grid;” they generate their own electricity that can't be squandered on things like washers & dryers, and the guests' plug-in stereos or lap-top computers. The buildings are all heated by the naturally hot ground water, which is pumped through radiator pipes in each room. Consequently, it was *quite* warm in the buildings. Most everyone padded around in their socks while indoors, creating a casual, relaxed, and cozy atmosphere. The folks running the venue lightened up a bit with regard to smoking *Salvia divinorum* in the cabins—quite hospitable of them—though cigarettes and *Cannabis* were still banned. Many people took advantage of the hot springs and the sauna. The food—vegetarian and vegan only—started out okay and went downhill; our last meal was bland rice and a noodle dish, and I had to wonder if the cook had ever heard of the concept of a “complete protein.”

After orientation, the speakers each introduced themselves. The conference attendees were asked (by a show of hands) how many people had never used *Salvia divinorum* or salvinorin A. Shockingly, about half of the group raised their hands! I was quite surprised that this many people would part with \$350.00 to attend a conference about a plant that they had no personal experience with. At this point an additional surprising bit of information was learned: ANN SHUL-

GIN had never actually tasted *Salvia divinorum* or salvinorin A, and 'though SASHA had eaten the leaves back in the '60s once and had no effects, he hadn't tried the plant in any form since then. Considering the short period of action that vaporized salvinorin A has, it seemed odd that the SHULGINS hadn't tested this out prior to the event. I asked SASHA if this was due to concerns of toxicity, and he replied that it wasn't; they simply hadn't gotten around to a bioassay due to more pressing trials of other compounds.

The other speakers introduced themselves, and it was learned that *Salvia divinorum* leaves and extracts—including pure salvinorin A—would be available from various attendees. Then SASHA took the floor and gave an animated presentation on the topic of clerodane and neoclerodane terpenes and terpenoids. He pointed out that the first clerodane structure was described incorrectly, and that this compound has not actually been found in nature. Hence, the terms clerodane (from the early literature) and neoclerodane (used now) both describe the same structure. Does the term neoclerodane diterpenoid accurately convey the chemical structure of salvinorin A? Some would say yes, others might say no.

Saturday morning after breakfast, JONATHAN OTT related the early history of *Salvia divinorum*/salvinorin A, and told of his recent trip to the Sierra Mazatec where he quickly-swallowed a “large” glass of leaf-juice and found it to be active, if only weakly so. He also mentioned that *S. divinorum* seems to cause his core body temperature to go up, and jested that perhaps those involved in auto-trephination might insert a thermometer whilst on *S. divinorum* to test their brain temperature. JONATHAN mentioned a number of other potentially active *Salvia* species, including *S. Argentia*, *S. carnososa*, *S. coccinea*, *S. greggii*, *S. miltiorrhiza*, *S. microphila*, *S. sclerea*, *S. splendens*, and *S. superba*. After JONATHAN's talk, DANIEL SIEBERT spoke about more current studies, including the fact that he had tested fairly pure salvinorin B up to 4 mg (vaporized) and found it to be inactive.

After lunch, BRET BLOSSER presented his experiences using *Salvia divinorum* with a Mazatec curandero. Although I had heard a similar talk in 1997 at the B.P.C. conference in Palenque, this time his talk benefitted greatly by the inclu-

sion of a beautiful slide presentation that focused in part on his caving expeditions. After BRET concluded, DALE PENDELL waxed poetic on the teachings and experience that *S. divinorum* can provide, occasionally shifting chairs to “channel the ally.”

Following dinner, a panel discussion with DANIEL SIEBERT, STORM JECKER, and ANN SHULGIN related the importance of having a “sitter” present while experimenting with salvinorin A. DANIEL noted a variety of common themes that have been reported. STORM expounded on these by describing the experiences she had while sitting for several dozen people at the ENTHEOBOTANY seminar in Uxmál earlier this year. And ANN explained how the “contract” that she had used as a lay-therapist in her MDMA sessions should be appropriate for use with *Salvia divinorum*/salvinorin A sessions. ANN had more questions than answers on the topic at hand, and her curiosity as to whether or not this plant/compound could be used efficiently for psychotherapy kicked off a spirited group discussion, with the conference attendees sharing their experiences. One of the more interesting comments was made by STORM, who related the idea of focusing on a question or intention, just prior to and while smoking salvinorin A. This

seemed to have an effect, in many people that STORM sat for, of “imprinting” the trip, and was seen to be quite helpful. STORM’s catch-phrase, “it is for divination, not recreation” was well-received by many in attendance.

Sunday morning’s talk was a cultivation forum with DANIEL SIEBERT and ROB MONTGOMERY, which I unfortunately missed. After this a discussion on the successes and failures of the conference was set into motion by some of the attendees. My own take? The conference was very enjoyable, even though there wasn’t a lot of new information presented. The main fun of these events is the meeting and conversing with other attendees. The biggest drawback of the conference (and of the 1997 B.P.C. seminar in México that I attended) is that there really isn’t enough time to spend with the other conference attendees. If the official talks were blocked out for part of one day, attendees would have the opportunity to get together without worry of missing one or more of the talks. As I have commonly heard this complaint from others who have attended B.P.C./ENTHEOBOTANY events, I hope that the producers consider the idea of scheduling “free time” at future events. Nevertheless, the first *ska Pastora* conference was a great success, and highly enjoyable. — JON HANNA

*Mind Books* offers over 250 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

*Philosophy & Pioneers* (32 titles)  
*History & Stories* (24 titles)  
*Public Policy & Law* (15 titles)  
*Psychology & Empathy* (26 titles)  
*Religion & Spirit* (17 titles)  
*Practical Guides* (19 titles)  
*Traditional Cultures* (67 titles)  
*Plants & Compounds* (28 titles)  
*Chemistry & Neuroscience* (23 titles)

We offer our free print catalog; fast and discrete service around the world; and easy ordering by mail, phone, e-mail, or fax. For a free catalog, send your address to:

# **SALVIA DIVINORUM AND SALVINORIN A**

*The Best of The Entheogen Review  
1992–1998*

ER MONOGRAPH SERIES, No. 2

This 217-page book combines every entry from past issues of *The Entheogen Review* about *Salvia divinorum*. New endnotes provide fresh commentary and bring the text up-to-date. Includes comprehensive listing describing all known Internet web sites related to *Salvia divinorum*, a “Retailer’s Guide” that lists sources for live plants, fresh and dried leaves, extracts and tinctures both in the USA and other countries, and an annotated bibliography that presents abstracts of numerous additional sources of information on *Salvia divinorum*. Completely indexed for easy referencing.

\$20.00 plus \$3.00 S&H (USA), \$6.00 (foreign) to:

*Lower Prices and Free Shipping!*

## **SALVIA DIVINORUM 5X EXTRACT INCENSE**

Made from organically grown *Salvia divinorum* leaves.  
This extract contains the active principle of five grams of  
dried leaf concentrated onto one gram of dried leaf.  
Highest quality product. \$15.00/gm, \$40.00/3 gms postpaid.

Top quality organically grown *Salvia divinorum* leaves from Hawaii.  
\$20.00/7 gms, \$30.00/14 gms, \$50.00/oz, \$150.00/4 oz, \$490.00/1 lb  
Leaves are carefully sorted and only Grade A leaves are sold.

No personal checks accepted.  
Payment in cash or postal money order only. If paying by money order,  
leave the "Pay To" space blank or your order cannot be filled.  
Cash only on foreign orders. All orders filled within 24 hours.  
All products unconditionally guaranteed.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

# THE POISON PATH...

A childhood friend of mine killed himself last month. Throughout grammar school, junior high, and high school, we were very close—best friends, really. We got drunk for the first time together, and pissed off the roof of a goat shed. We attended our first concert together—THE CLASH—actually getting backstage and drinking beer with the band. My friend introduced me to LSD. For a while we took acid about once a week, and drank our way through a case of beer each—seemingly without getting drunk at all. (Ah, to be young and foolish.) At the time I was strangely convinced that the *acid* was responsible for my sizeable hangover the following day.

After high school we drifted apart. I moved to San Francisco and went to college. He stayed in our home town and made repeated attempts to attend various community colleges. He became a frequent user/abuser of numerous substances, smoking *Cannabis*, drinking alcohol, snorting and shooting-up methamphetamine. Perhaps others too—I didn't really keep track. He wound his way in and out of rehab programs. Occasionally he would stop by and see me where I worked in the evenings, and we'd have a couple of drinks together.

More recently, I hadn't seen him for a few years. He didn't come to my wedding, although his parents did. They explained that he was on a "bender" the night before, and was in no shape to do anything on that day. We've probably all been that hung over.

I don't know what caused my friend to take his life, 'though I've been told that he had been fighting off depression. Depression seems to be pretty common these days. I get it sometimes. Nearly everyone I know gets depressed sometimes. I can't say if my friend's substance abuse problems were a cause of his depression, or if the depression caused him to abuse substances. Perhaps a little of both.

Sometimes those who are attracted to "the poison path" lose sight of the path entirely. Then, the poison uses the *person* as its path. DALE PENDELL accurately describes the power plants as a "...motelly troop—not a gentleman among you—Not one that won't lie, cheat, or swindle a ride..."

This issue of *The Entheogen Review* presents a number of plants and compounds that many rightly consider to be toxic or addictive; *Datura* species, *Atropa belladonna*, *Aconitum napellus*, *Conium maculatum*, *Cicuta* species, *Strychnos nux-vomica*/strychnine, formaldehyde, opiates, and methamphetamine are all discussed at some point herein. I want to make it clear that *The Entheogen Review* does not encourage the use of any of these. At times the "poison path" is too poisonous to tread. Please do not be foolhardy.

To my friend, who stumbled many times, and finally took a last fall—I hope that you have found a path in death that eluded you in life. This issue of *ER* is dedicated to you. — DAVID AARDVARK

# VISIONS FROM BUDAPEST

Dear DAVID:

Received your generous “care” package today. As always, I am impressed with what you’ve done with *ER* and happy that it didn’t die. But mostly I am blown away by what you did with the *Salvia divinorum* book—believe me, I know how much work goes into putting something like this together! You have a “basic book” here, and I’m proud to own a first edition! Although some of my collected data forms the skeleton, it is clearly your creation, and one to be proud of. It’s required reading for anyone interested in *S. divinorum*, and although we all know that other books will be written as more information accumulates, this one will always stand out.

The following are my first impressions of the entheogen scene in Hungary. The enclosed postcard [Figure 1] is available free in bars and coffee houses in Budapest. Although it refers specifically to *Cannabis* (and I know that *ER* doesn’t often focus on this entheogen), social *Cannabis* tolerance (or lack

thereof) is still a good index of how other psychotropics are perceived in any given culture. The upper-left sentence reads:

“There are six small differences between the two drawings. What are these?”

The drawing on the left shows the six automobile license symbols for European countries where *Cannabis* use has been decriminalized or is generally tolerated. Clockwise from the top, these are: Spain, Poland, Ireland, Germany, Italy and Holland. Of course, the symbol in the drawing on the right represents Hungary, and refers to the newly elected government and its desire to make this the only country in Europe with a three-year minimum sentence for *Cannabis* possession. The line at the bottom of the card asks: “Total prohibition or real drug policy?”

Until now, the scene here has been very laid-back, with *Cannabis* an officially “illegal” but tacitly tolerated substance. A

FIGURE 1 (Produced by BOOMERANG FREECARDS, Budapest, Nyáry Pál u. 5. H-1056.)

hip friend claims that most Budapest cops wouldn't know what pot smelled like if you lit up in front of them. In other words, you'd have to be egregiously outrageous and totally uncool to get busted for it here at present.

That all may change soon. The new government consists largely of yuppie lawyers, most of whom have attended seminars in the U.S., put on—all expenses paid—by right-wing Republican “think-tanks” (an oxymoron if there ever was one). THE HERITAGE FOUNDATION has been mentioned. What it boils down to is that after 40 years of Soviet oppression, there is now a political trend in Hungary to ape the oppression of the capitalist West. So, what's the first thing to do? Why, institute a bullshit drug policy, what else? (Any Hungarian will ruefully admit that they have a national penchant for making consistently hapless choices. History, alas, bears this out.)

In the long run, and paradoxically, the idea may not be accepted for deeply-rooted cultural reasons. Hungarians are passionate about art and literature; half the streets in Budapest are named after poets. (Imagine ALAN GINSBERG Avenue or JACK KEROUAC Boulevard in Washington D.C. and you get the picture.) In short, artists are honored here and the artistic temperament is not considered by Hungarians as aberrant. Creative people, by definition, push the envelope of consensus reality, so it comes as no surprise that entheogen use is widely accepted among the poets and intellectuals of Budapest. The fact that these are honored members of society implies a general tolerance for the artistic lifestyle. (Even under communism most Hungarians remained free in their heads, and as a disillusioned American I can easily identify with their ironic pessimism about all things political.)

The “dope problem” here is certainly no big deal from what I can see; just as it was no big deal in Amsterdam when I was there in '97. Entheogens in general, and *Cannabis* in particular, are a huge non-issue waiting for some politician to turn into an infinite threat to the status quo. When I compare the general European attitude with that of my homeland, I can hardly believe how we've allowed the War on Some Drugs to become as psychotic as it has. (For whatever it's worth, I must observe that Catholic countries are usually more laid-back about these issues than their Protestant counterparts. A Hungarian “Fundamentalist Christian” would be someone who believes that the Mass should still be read in Latin.)

So, as elsewhere, the entheogen scene here is mostly confined to artist-intellectuals and segments of the international youth culture. There are Raves here, called (in English) “acid parties,” where “D.J.s” manipulate “samplers” to orchestrate the dancing. There is often live music as well. I can't say how much acid is actually being consumed—it appears to be largely a *Cannabis*-inspired activity, and by current U.S. standards comes off as downright wholesome! I am deeply touched by these kids, who look like models for a 1953 *Coca-Cola*® ad, trying to be cool by imitating what they've seen on satellite TV. Television notwithstanding, the fact is that they remain pathetically naive about urban life in the U.S.—guns and hard drugs are virtually non-existent here, and one can walk down the streets of Budapest at any hour of the day or night without fear. Most of the beat cops I've seen stand around smoking cigarettes and looking bored. (Tobacco has yet to be demonized in Hungary and it's a refreshing “trip down memory lane” to enter a cafe and see ashtrays on the tables. It's little details like this that make you realize how draconian things have become in the States.)

A local grower claims that the Mafia is taking over the soft-drug trade and (since it drives up prices) is behind the new push to criminalize *Cannabis*. Though this oft-repeated belief always sounds paranoid to me, an early naive experience with some “friendly strangers” (who later turned out to be bonafide Hungarian Mafiosi) suggests that it's not implausible. Since the Mafia is just capitalism without stock options, I can easily visualize a board meeting where such strategies are formulated. Other informants insist that the new prohibitions are mostly right-wing control trips. I have no problem imagining a right-wing/Mafia coalition, either deliberate or *de facto*, and some Hungarians claim that such a connection exists. (It's not all that fantastic when you consider their shared values.)

The final non sequitur is that I'm living in a former Iron Curtain country which (for the moment at least), offers more personal liberty than the so-called “Land of the Free” that I left behind. I don't know for sure, but I'd be willing to wager that Budapest (a city of two-million) doesn't even have a SWAT team. That won't last long. With the expert help they're receiving they could turn this place into another LA ghetto and obtain an exotic set for a new TV cop show: “Death on the Danube” might be an obvious title.

Have other *ER* readers noticed that modern life is taking on the ambience of a PHILIP K. DICK novel? —JIM DEKORNE

# DPT PRIMER

by Toad

*N,N*-dipropyltryptamine (DPT), the lesser-known cousin of DMT, has recently become more widely available among select entheogenic circles, thus fostering a new wave of interest and research. Although mentioned in many standard texts such as *Psychedelics Encyclopedia*, *Pharmactheon*, and *TIHKAL*, this obscure entheogen has yet to really see the light in the psychedelic world of today. [While it is true that DPT has never been terribly common on the underground market, it has been used as a sacrament by the TEMPLE OF THE TRUE INNER LIGHT in New York City for nearly 20 years. — DAVID]

The power and force of this entheogen is comparable to DMT and 5-MeO-DMT, which is to say that you are in the major leagues of self-dissolution. DPT needs to be approached with respect and caution. From all accounts, the imagery, coloration, feeling, tone, and overall style of DPT is quite unique and very different from the more widely-known tryptamine cousins.

In the course of watching a fairly wide spectrum of people experiment with DPT, some important aspects of the drug have become evident. The dosage curve, physical effects, and psychological response are all highly variable. Some people have been completely overwhelmed with as little as 50 mg insufflated, while others required 200 mg to really get where they wanted to go. Many people reported being uncomfortable with the physical “body load” that manifests as a very specific body vibration. (It could be described as the classic kundalini archetype.) People who are more sensitive to the drug typically manifest more of the tremor effect. I have personally witnessed a hardcore freak-out from 60 mg (insufflated), and I feel obligated to *strongly* warn people about the serious nature of this drug. DPT is not for everybody, and certainly not for those just looking for a “recreational” high. Taking an approach where one starts with a very low dose at first, and then “boosting” up as desired seems prudent. It is essential to have a sitter present during your initial explorations of DPT; please be conscious in this regard.

Time course and effects vary based on the route of administration. Smoking small amounts of the free-base (20 mg) over the course of five minutes is recommended for initial exploration. Smoking provides the fastest onset with almost im-

mediate entry and a relatively short duration (20 minutes). This is by far the best way to learn the effects of DPT. Insufflation of the hydrochloride salt also works very well, but there is a much higher level of commitment involved, what with a two hour duration. There are also distinct differences in the effects of each route of administration. Among those we know who have experimented extensively with this substance, the preferred route of administration is via intramuscular injection of the hydrochloride salt. Most DPT we've seen available has been in the hydrochloride salt form, which is not very efficient for smoking. Conversion to the free-base can be done using standard kitchen chemistry basification methods. (See [http://www.erowid.org/entheogens/dpt/dpt\\_primer.shtml](http://www.erowid.org/entheogens/dpt/dpt_primer.shtml) for one process.) Although *TIHKAL* notes that DPT is orally active, we found this route to be unpredictable, less desirable in effect, and a waste of material.

Ketamine taken at the same time as DPT seems to provide just the right “lubrication” for the body to handle the high-voltage vibrations associated with DPT. All experimenters thus far have reported profound experiences with this combination, the sum being much greater than either of the parts. After experiencing it myself, I have to agree that this combination is *the* way to go.

## DOSING STRATEGIES

**SMOKED:** The free-base is a little harder to nail down the exact dosage level, but 20–100 mg seems to be the range needed for a full experience, with the top end manifesting as a total dissolution similar to 5-MeO-DMT. Our initial experiments suggest that even less than 50 mg will provide significant access into the space. It would be wise to nibble slowly at it first to get the general feel before diving in with multiple huge hits. The effects begin almost immediately (within 2–5 minutes) and maintain peak for approximately 20 minutes followed with a steep decline and slight residual. We noticed that two relatively small hits were all that was necessary to access the DPT space adequately for the first time.

**INSUFFLATION:** Start with 25 mg regardless of your body size and level of experience with other entheogens. Wait 15–30

minutes for it to come on and settle in. If you desire more, boost it up *once* with another 25 mg. If you don't get there on your first go, then so be it. Be patient, get a feel for the physical vibrational effects, and find out if this drug is for you before you jump in. The effects begin within 15–30 minutes, peak in about an hour, and then gradually trail down for another 3 hours.

**INTRAMUSCULAR INJECTION:** If you have no prior experience with DPT then I would recommend starting with a very low dose of 15–20 mg. For those who are experienced with the other routes of administration, I would suggest starting at 30 mg and working your way up from there in several sessions as necessary. STANISLOV GROF reported a maximum dose level of 160 mg in his studies with DPT, but I have heard from one intrepid friend that he passed out at 130 mg. All indications point to the use of *extreme* caution when using this route of administration. The effects begin within five minutes and very quickly progress to a solid peak plateau that lasts for over an hour followed with a trail-down for another two hours.

## PREPARATION: SET & SETTING

The nature of the DPT experience lends itself to a more private and internalized focus. It is best to create a space where one can comfortably lay down or sit relaxed. You will find yourself drawn to close your eyes and explore the inner world of DPT. By creating an environment with minimal distractions you will greatly add to the quality of the experience. You may also want to listen to some good meditative music, as it can add dramatically to the potential and possibility of the experience. DPT does absolutely wonderful things with sound, and very intricate states of awareness can be created and driven using musical influences. The visionary intensity and nature of this material lends itself to working solo or in very small experienced groups. As with any psychedelic journey, preparing oneself physically and mentally is a must. The usual pre-trip diet guidelines and mental preparation should be applied.

## TRIP REPORT

JUAN and I traveled across town to our friend's apartment where we were meeting a group of five other people. After talking for a period of time, the first person started off with

100 mg intramuscularly. Alert at about 3–5 minutes and fully out there at about 20 minutes. JUAN then went next at 50 mg, followed by HURLEY at 100 mg, then the two girls at 75 mg. One participant had been taking several psychotropic medications regularly and he elected to smoke it, at the 50 mg level first, and then at the 100 mg level. After everyone had their dose, and I was comfortable that no "major" reactions were occurring, I went ahead with 100 mg myself.

About 20–30 minutes into it, HURLEY became somewhat disoriented, jumped up and said he needed a hug. He then wandered around and seemed to get more and more disoriented, as did his significant other. At about 45 minutes into it he began vomiting profusely and kept saying, "Something's wrong... I want a doctor." He seemed quite dissociated, and his significant other seemed to be having a difficult experience also. She became somewhat rigid, reminding me of a tardive dyskinesia-like reaction. She too seemed almost totally dissociated.

I found my voyage to be one of the best tryptamine experiences I have ever had. I've had extensive experiences with mushrooms (probably 75–100), as well as significant experience smoking DMT, 5-MeO-DMT, and combinations of the two, and ayahuasca. This material definitely has the "tryptamine signature." The difference for me was the total non-threatening nature of the experience. I've gotten into spaces with the other tryptamines that have been some somewhat "scary" at times, particularly at the higher doses (7–10 grams of mushrooms). What usually happens is what I call "the confrontation with the self."

I seemed to be able to transcend this area with DPT. Many times with the other tryptamines I get stuck in what GROF would call the psychodynamic/biographical phase of the experience. It seemed that I leap-frogged over this stage and went directly into the transpersonal realm, and for lack of a better way to describe it I'd have to call it "bliss." This lasted for an unknown period of time and was interrupted by my feeling a need to come to the aid of the participants having a difficult time. I personally found no difficulty pulling myself together to assist with others, although it definitely had a grounding impact on my experience.

The person doing the smoking (hydrochloride salt form) of the material noted effects at both the 50 and 100 mg level, although much shorter lived (maybe 30–45 minutes) and less intense.

At the two-hour point, once I assured myself that things were probably going to be okay, I decided to further my knowledge of this compound and took another 60 mg i.m. I found it had minimal effect, other than possibly extending the trailing off period. Seems that tolerance had developed rapidly. Further experiments for me will revolve around a higher dose (I think I could easily handle 150 mg i.m.) as well as doing boosters earlier in the experience, prior to the two-hour point. (I'm thinking of boosting at the 30 minute and one-hour point to see if it simply extends the experience or puts one further out.)

At the four-hour point everyone was back to baseline, or close thereabouts. All effects seemed to have worn off. JUAN and I were easily able to travel back to his apartment where sleep came easily. I have had no problems with the injection site. It was slightly "uncomfortable" the following day. I had no reports of problems from the others in this regard.

Overall, for me it was fantastic. I'm not certain that others in the group feel the same way, but JUAN and I talked extensively about our experiences and he had what he considers to be a "peak experience" at the 50 mg level. I would describe JUAN as usually quite a "hard head" in terms of dosages, so his experience at 50 mg is interesting. He and I are both anxious to further experiment with this most interesting compound. It is somewhat "disorienting," which for some in the group was disconcerting. If one isn't grounded well psychically, I would be careful in experimenting with DPT, especially at higher levels. — DEADCANDANCE

## ADDITIONAL COMMENTARIES

A large-size male ingested 250 mg orally on an empty stomach. Effects came on hard and fast. The first 30 minutes of the peak was extremely rough, very intense, and he thought he was going to die. His body looked flushed, and his breathing pattern was forced and very similar to what I have seen with 5-MeO-DMT. Once past the peak he settled down and very much enjoyed the state. He commented that it had a definite empathogenic signature to it during the latter stages of the trip, and that he was receiving lots of information regarding current issues in this life. He said he would not want to repeat this level again, but is interested in exploring the compound again at a less intense level and a different route.

A medium-sized male ingested 250 mg orally on an empty stomach. Effects were barely perceivable and quite a disappointment. After three and a half hours he decided to insufflate 200 mg to attain the full effect. This worked very well, and he found it to be a most unique space unlike any other entheogen he has ever experienced. He described amazing closed-eye visuals and musical enhancement as the most notable unique signatures of the material. The space was entirely comfortable for him, and he said that in the future he would like to try it at a higher level.

A medium-sized male ingested 250 mg orally on an empty stomach and found it to be almost entirely without effect. After three and a half hours he decided to insufflate 200 mg and found the effects to be very powerful and unique. He was impressed with the overall nature of the material and said it was definitely a bit on the "pushy" side. He commented that he was looking forward to exploring it again at a slightly lower level, perhaps 150 mg.

A medium-sized female smoked 100 mg of the hydrochloride salt with a slight effect. (We have since confirmed with additional experimentation that the hydrochloride salt does not work very well for smoking.) She then insufflated 200 mgs and was quickly catapulted into a heavy duty freak-out.

Two medium-sized females and one large-size male smoked a bowl containing an estimated 100 mg of free-base. Each person took a small hit from the bong and passed it along. On the second hit they reported instant access into the space and remained there for 20 minutes. They commented on how non-confrontational and nice it was compared to DMT. "Like DMT space without all those pesky entities poking at you," one said. They all liked the fact that the window of smoked DPT was open for a much longer duration than with smoked DMT. The smoking process was easier and much more relaxed, as it's not so essential to get in large amounts of vapor within the shortest possible time frame, as it is with DMT.

One large male insufflated 60 mg. He was very experienced with LSD, smoked DMT, mushrooms, and the like. He puked during the onset (he had not eaten all day), and was in a state of complete terror for the next two hours. Fortunately his wife was present, and she provided excellent grounding assistance with her motherly influence. He has since quit the use of all drugs.

# DATURA VISIONS

by Robert W. Gess

*Datura stramonium*, *D. ferox* and a number of other *Datura* species contain high quantities of hyoscyamine, scopolamine and other atropine-related alkaloids, with the highest concentration in the seeds. In this way *Daturas* resemble a group of related members of the Solanaceae family, including mandrake, belladonna, and henbane of the Old World, and moonflower of the New World. Mandrake was associated with magic or medicine from at least as early a time as that of MOSES. (In "Genesis 30" we read how mandrake became entwined in RACHEL and LEAH'S contest to bear JACOB'S children). By medieval times an extensive lore had built up around the properties of this plant, and dolls made from anthropomorphic roots commanded high prices. A draft of mandrake was used in SHAKESPEARE'S *Romeo and Juliet* to induce a three day death-like coma. It has long been suggested that henbane or thornapple may have played a great part in the trances of the oracle at Delphi.

Wherever these herbs grew, they rapidly became an important part of the pharmacopeia of local cures, poisons and psychoactives. *Gerard's Herball* mentions the preparation of an ointment from hog's grease and thornapple for the treatment of all manner of burns. CULPEPPER recommends small quantities of fluid extract of the plant as a cure for epileptic disorders, convulsions and madness. Mrs. GRIEVE'S 1931 *A Modern Herbal* notes the use of thornapple as an ointment for muscular rheumatism, neuralgia, hemorrhoids, fistula, abscesses and other inflammations, as well as the use of the smoked leaves or a tincture for the relief of asthma. She cautions, "Dryness of the throat and mouth are to be regarded as indications that too large a quantity is being taken...[It] should be used with extreme care as in overdoses it is a strong narcotic poison." GRIEVE also states that, "In early times, the Thornapple was considered an aid in the incantation of witches, and during the time of the witch and wizard mania in England, it was unlucky for anyone to grow it in his garden." Of henbane she similarly comments, "The herb was used in magic and diabolism...It was employed by witches in their midnight brews, and from the leaves was prepared a famous sorcerer's ointment." Belladonna was also traditionally associated with witchcraft, and GRIEVE tells us that, "According to old legends, the plant belongs to the devil who goes about trimming and tending it at his leisure, and can

only be diverted from its care on one night in the year, that is on Walpurgis, when he is preparing for the witches' sabbath...the name Belladonna is said to record an old superstition that at certain times it takes the form of an enchantress of exceeding loveliness, whom it is dangerous to look upon."

A literature search produced a number of recipes and fragments of recipes used by the medieval European witches. Ingredients from several recipes include: deadly nightshade (*Atropa belladonna*), wolfsbane/aconite (*Aconitum napellus*), cinquefoil (*Potentilla reptans*), smallage/celery (*Apium graveolens*), water parsnip (*Sium* species), hemlock (*Conium maculatum*), water hemlock (*Cicuta* species), sweet flag (*Acorus calamus*), common Acorum (*Acorum vulgare*), bat's blood, oil, soot, eleoselinum (*Apium rusticum*), poplar leaves or branches (*Populus* species), fine meal, and child's or baby's fat. Many of the individual ingredients listed above are common to a number of different recipes (DE NYNAULD 1615; PORTA 1561; WEYER 1564).

The ingredients in common from one recipe to the next may to some extent suggest influence of one historic author on another. However, it is also possible that it indicates that a fairly standard blend of herbs was used by the witches, in the manner say, that ayahuasca potions in contemporary South America are shown to reflect common key elements. Indeed our understanding that nightshade was the main active ingredient does not leave the other components inexplicable as we shall see later. More fragmentary information that implicates thornapple, henbane and mandrake as components of flying lotion is not surprising due to their similarity of chemistry and the habit of herbalists to substitute one herb for another similar one depending on local and temporal availability.

Aconite, though very poisonous (and possibly psychoactive) itself, was considered by the ancients to be a potent antidote to most poisons, presumably at the correct dosage. It was a diuretic, therefore encouraging the passing of toxins in the urine, and was considered to stabilize the heart. Similarly hemlock (and presumably it's close relative, water hemlock) was considered an antidote to strychnine poison. Cinque-

foil was considered a cure for fevers, and to constrict blood vessels. It was perhaps added to counteract the vasodilatory effects of atropine. Water parsnip was used at the time against St. ANTHONY'S Fire (ergot poisoning), and in cases of kidney problems. Sweet flag is a stimulant, tonic, carminative, and is used against fever. Similarly, celery is a tonic, carminative and diuretic. Poplar was recommended by CULPEPPER for dimness of sight. It might have been that the subsidiary herbs added to the lotion were thought to regulate and ameliorate the effects of the main ingredients. Bat's blood may have been burnt to produce a soot, as soot may be used in lotions to increase the rate of absorption of organic compounds. Oil, child's or baby's fat (or pig lard) were simply the base for the lotion. The use of "unbaptized babies" by witches has long been reported as a sign of diabolism. What no author appears to have pointed out is that most witches were midwives. As babies were in those times baptized as soon after birth as possible, an unbaptized baby was a stillborn one. And as an unbaptized baby was forbidden by the Church to be buried in consecrated ground, it was probably left with the midwife for disposal. What better fat for absorption through human skin? It is worth noting that anyone who looks up ancient witches chants and prayers will find that they usually begin with exhortations to God the Father, Jesus, and Mary. It may, therefore, be deduced that rather than being satanic, the witches were shamanic heretics, who—like many modern churches in the recently Christianized parts of the world—attempted to combine their old Paganism with the inspiration of the new faith.

Great agreement may also be found in the old literature as to what the objective and subjective experience of witches was. Witches either rubbed their naked bodies (especially under the arms or in the groin) with their lotion or greased a wand\broomstick with it. After "riding" this greased rod naked—and thereby subjecting their thinner mucous membranes to its chemistry—they became ready for flight. The witch then believed that she flew up the chimney or out of a window, on her way to meet her sisters at some preordained place. Here they cavorted, danced, and interacted with entities of another realm, (which the Church was eager to label demons). What did much to confuse investigators of the time, was that when observed or spied upon, the (generally) women would not leave the place where the lotion was applied, but often instead passed into an undisturbable coma for an extended period. When they awoke, however, it seemed impossible to convince them that they had not in fact experienced detailed adventures at their Sabbath many miles away.

Very few authors have recognized the important connection between the nature of witches' ointments and the nature of their experiences, which is surprising as the shamanic use of *Datura* has been reported from Asia, Africa, and amongst native American tribes. One author who *has* noted this connection is MICHAEL HARNER. In an introduction to a short chapter commenting on this relationship he states:

A prevalent attitude among present-day historians and scholars of religion is that late medieval and Renaissance witchcraft was essentially a fiction created by the Church. Those taking this position often argue that the inquisition had an *a priori* conception of witchcraft and simply tortured the accused persons until they gave the "right" answers in terms of church dogma. To support their position, they point out that many of the things witches confessed to do, such as flying through the air and engaging in orgies with demons at Sabbats, were patently impossible.

The position of such scholars is not contravened by accounts of rituals practised by persons organized into formal witchcraft covens in Europe and the United States today. Such "witches" engage in what they think are the traditional practices, but in so far as I have been able to discover through interviews, do not believe that they fly through the air nor frolic with supernatural creatures at Sabbats. Instead their activities tend to be sober and highly ritualistic. Academicians as well as present-day coven participants have generally failed to comprehend the great importance of hallucinogenic plants in European witchcraft of former times. Yet once the use and effects of these natural hallucinogens are understood, the major features of past beliefs and practices suddenly seem quite logical and consistent (HARNER 1973).

## PERSONAL EXPERIENCES

My research on witchcraft and realizations concerning the subject were stimulated by a search to find meaning in my own experiences. At the time of my experiments I knew nothing of these matters, merely that thornapple had a bigger kick than *Cannabis* or *Amanita*, but was treated with far greater caution. It was—I had been told—a bit like moonflower, which I had once tried with moderate results. Apart from that I was still a very naive subject in the lore and experience of consciousness exploration.

It was towards the end of the 1980s that I first felt drawn to this plant. I was walking to a student party outside town one

night. On the outskirts of town my attention was suddenly caught by a small *Datura stramonium* plant. The light from a street lamp seemed to be catching it like a spotlight as it protruded surreally from a well manicured grass verge. Without much thought I bent down, picked a pod, shook out about seventy small black shiny fresh seeds and began to chew them as I walked along.

By the time I arrived at the party—within half an hour—my mouth was already beginning to feel very dry. Some friends were going to smoke a pipe in the bushes so I joined them. My throat was dry and smoking was uncomfortable. Returning towards the house I became increasingly dissociated and lost track of my friends, lurching unsteadily as if drunk. I felt nauseous and vomited. At the house I ran into a friend who I knew had tried *malpitte* (as *Datura* seeds are known in South

Africa). I had difficulty coordinating my speech but managed to explain my position and to ask her what to expect. “Wait and see,” she replied with a slight chuckle. I remember sitting on the veranda waiting to see. After a while I lost touch with who all these people were and what was going on. Eventually I must have staggered home to bed, or been taken home, as I cannot recall anything more of that evening.

The matter then rested for a year or two until November 15, 1990. It was the end of the academic year and a couple of carloads of us were making our way to Umtata River Mouth, on the beautiful semi-subtropical Transkei Wild Coast, to celebrate. Those were still the days of apartheid, so we had to stop at a border post before entering the tribal “homeland.” Through the mesh fence I saw a small thicket of *Datura ferox*. The pods were generally still green but there were a few of the previous year’s pods present. I picked a couple through the fence and shook them out. Each contained a few seeds, but the seeds of this species are quite a lot larger than those of *D. stramonium*. I ate about 40 before throwing the rest out of the window.

Within an hour I started to feel the effects: breathless, slightly dry-mouthed and dry-throated. I stared straight ahead as the scenery began to zoom past. My head hardly moved, except every now and again when I turned it to stare at KENT who was driving and squinting into the sun. I felt I should make sure he didn’t fall asleep, as we were all tired. I was studying geology at the time, and whenever we stopped for a pee break I enthusiastically scrambled up to the nearest rocks, looking for fossils, feeling the rocks, enjoying their form, heat, and sensuality.

When we reached our destination I walked down the sandy beach and across a stream, towards our overnighting spot. Suddenly I noticed a boulder on the beach that seemed to stand out from various others. I dropped my pack in the water, got out my geological hammer and ran across to it, enthusiastically taking a swing. It broke open to reveal Permian group plant-fossils of a type I did not have in my collection. Remembering my kit I rescued it from the stream and made my way raving to the camp. (Some of these fossils were subsequently lost as my friends—who were not geologists—believed that I was hallucinating “fossils,” and only loaded a few specimens into the car when we moved the next day, in order to humor me!)

Having dropped off the rocks I got some hand-fishing lines out of my pack and went to try my luck. I could hardly walk,

## TROUT'S NOTES

“More than you need to know?”

“... appreciated by those of us who are real information junkies...very few people have use for so much information...” — JONATHAN OTT

#C-9: Appendix A for *Sacred Cacti* now available for \$23.00, postpaid. Regarding #C-9, SASHA SHULGIN states:

“As always, thorough, well done, and filled with treasures that I had never happened to stumble across before.”

Send \$1.00 for TROUT'S NOTES current catalog to:  
TROUT'S NOTES, POB 161061 (Dept. ER), Austin, TX 78716  
Selected TROUT'S NOTES now available through MIND BOOKS.  
(See advert on page 42.)

and came across a prehistoric shell midden. Something was sticking out of it, and reaching down I found a round, flat stone, the edges of which had been trimmed like a tablet by some stone-age hand, to produce a hammer or grindstone (which I still have).

I started examining the pools for bait. Soon I got caught up in a strange state of consciousness. I was not aware of time or space, only the present. I admired the creatures in the pools and commented on them. A voice that seemed not unlike my ex-girlfriend's replied, and we chatted for a period. I turned to face her after a while and found the rock surface bare and devoid. With great effort I worked out where I was and who I was with before slowly realizing that she wasn't there.

I repeatedly found myself caught in conversation with voices, many of which I could not even ascribe tentative identities to. Typically I would disbelieve one and it would be gone, yet five minutes later I would be chatting to another. I would then ask for a cigarette or something and turning to accept it would find myself disconcertingly alone. Trying to fight the phenomenon I would work out each time where I was and castigate myself for repeatedly falling into the same "trap."

Then I saw a black guy coming down the beach to the rocks. It was my friend RICHARD who had been in the vehicle behind us. I went over to him and chatted to him about the voices I kept hearing, and he requested to borrow a hand-line so as to try his own hand at fishing. I went off again, hearing more voices—entering into conversations each time, before realizing they were not flesh and blood—then dispelling them in an attempt to keep a control on my reality.

RICHARD came back to return the hand-line and we chatted a bit more. The sea was really too dirty for fishing and it was getting towards evening, so I went up to join my other friends at the fire. As I sat around I had difficulty in the dark distinguishing between the voices of the shades and those of my flesh-and-blood companions—answering questions apparently unasked and ignoring others.

The following day I was still feeling a little out of it, however, the voices were gone. I was told that the car containing RICHARD had been delayed and had only arrived at midnight!

# IN THE NEWS

## YOUR TAX DOLLARS AT WORK: U.S. DEVELOPING FUNGI TO KILL NARCOTICS PLANTS

As part of the \$2.7 billion “Western Hemisphere Drug Elimination Act” signed into law last fall, researchers at the USDA’s AGRICULTURAL RESEARCH SERVICES (ARS) will receive \$10 million to develop strains of mycoherbicides, or soil-borne fungi, that can be used to eradicate opium poppies, *coca*, and marijuana in the U.S. and internationally. The project, part of a \$23 million package to enhance eradication strategies, was sponsored by MIKE DEWINE (R-OH) in the Senate and hailed by Rep. BILL MCCOLLUM (R-FL) as a potential “silver bullet in the war on drugs.”

Mycoherbicides have been used successfully in eliminating noxious weeds, and environmental groups have encouraged their development and use as alternatives to chemical herbicides. But experts warn of the risk of unintended consequences in unleashing genetically programmed fungi on the environment.

DRCNET spoke with GEORGE WOOTEN, a chemical ecologist with the PACIFIC BIODIVERSITY INSTITUTE. “There is no silver bullet,” he said. “Suppose this plan were not successful enough; we would have spent a lot of money with no results. But if it were too successful, we could end up with a situation where it killed the entire gene from the earth. And then we would no longer have a source of very valuable narcotics which are used to cure people. The risks are very high.” Crucial pain relievers and anesthetics such as morphine are derived from the opium plant. Cocaine, which is derived from the *coca* plant, also plays an important, though more limited role in anesthesia.

Indeed, there are more questions than answers when it comes to the potential risks of enlisting mycoherbicides in the drug war. For instance, a fungus designed to eliminate only the target plant may work perfectly well in controlled experiments, but there seems to be no way to guarantee how it will behave in nature over time. One fungus deemed particularly promising in ARS reports is a strain of *Fusarium oxysporum*,

a naturally occurring outbreak of which has destroyed vast tracts of *coca* in Peru over the past few years. But other strains of *Fusarium* are devastating to dozens of other crops, causing wilt disease in everything from melons to string beans.

Another concern is just how species-specific these mycoherbicides will be. Will a fungus have better luck distinguishing hemp from marijuana than the DEA?

“Because these narcotics plants are defined based on legal definitions, not biological ones,” WOOTEN noted, “any nation who has a different concept of what should or shouldn’t be a narcotic drug would be justified in developing such tools to fight their own particular noxious plants. This might include coffee, tobacco, or other plants that have a use in one country but are considered unacceptable in another. That’s the scenario before us, and I don’t think we can necessarily stop it. But for the government to fund it—it seems to be a money thing. There’s probably a USDA branch that’s in dire need of funds, and this was seen as a positive way to go about solving problems they’ve recently had in licensing similar patents to confer herbicide resistance on plants. This is a way for the government to fund it, so that companies aren’t incurring the financial risk.”

A spokeswoman for ARS did not return calls requesting information on the status of the project.

DRCNET will continue to pursue this story. Meanwhile, read JIM HOGSHIRE’S “Biological Roulette: The Drug War’s Fungal Solution?,” which appeared in the Spring, 1998 issue of *Covert Action Quarterly*. The MEDIA AWARENESS PROJECT has the full text at <http://www.mapinc.org/drugnews/v98/n495/a03.html>. ARS publishes research notes on its web site at <http://www.ars.usda.gov>

## PEYOTE GARDEN DESECRATED

(Jan. 11, 1999) Kearny, Arizona. Peaceful family home ransacked. Religious liberty threatened. Sacred peyote conservatory gardens shoveled up. 11,323 endangered plants taken. Church grounds desecrated. Family left in the cold. This story has happened three years after Pinal County authorities returned 700 peyote plants confiscated in 1995. Are we to tolerate hate crimes and religious persecution inflicted by law enforcement?

On January 8th, 1999, several officers of the Pinal County MULTI-JURISDICTIONAL NARCOTICS TASK FORCE served an arrest warrant for \$1,000 of child support arrearage on LEONARD MERCADO, co-founder of THE PEYOTE FOUNDATION (TPF). This type of warrant is usually served by Sheriff's deputies, not the TASK FORCE. Several TASK FORCE officers immediately surrounded the MERCADOS' residence and the surrounding area. After forcing their way into the house, the officers asked MERCADO to please accompany them outside. He was arrested immediately and placed in handcuffs. Soon after, another resident of the property, MICHAEL GREY, was placed in handcuffs but not arrested. Three of the officers dispersed about the property to search for other people and found TIM CASTLEMAN resting in his residence, a 24-foot R.V. Mr. CASTLEMAN was also handcuffed but not arrested.

Only after multiple requests to either be arrested or released from the handcuffs, were Mr. GREY and Mr. CASTLEMAN released from the handcuffs. Mr. MERCADO was taken off the property shortly thereafter.

Mr. MERCADO's wife, RAVEN, and their son MOSES arrived from the woods, where they had been gathering firewood, and were detained. Except for one occasion, from that point on no one was permitted to enter any of the buildings, nor was anyone allowed to use the phone to call legal counsel or anyone else.

At this point all residents were all told that they would have to leave the property. It was decided that RAVEN and MOSES would leave on bicycles to go to town and make phone calls. MIKE and TIM elected to try and stay in order to witness the actions of the officers, but were soon ordered to leave the property under threat of arrest. They were not allowed to take even a sleeping bag, but were promised that if the investigation was not complete by 11:00 pm they could return and get their sleeping bags. When they did return at 11:00 pm,

they were refused their sleeping bags and told to sleep in the cold. (The search warrant itself states that operations were to be conducted only before 10:00 pm or after 6:30 am.) It was also at this time they were informed that Pinal County was seizing the entire property until a search warrant could be obtained, on the pretense that they had seen a peyote plant through the window. The officers were alone on the property from that time on, even though they didn't have a search warrant and nobody was under arrest for the peyote plant they had allegedly seen. Just before dark, RAVEN and MIKE returned to ask for permission to get a coat for MOSES, an 8-year boy. They were refused access to their home or the coat.

Meanwhile, the Pinal County Attorney's Office was contacted by two ranking members of the NATIVE AMERICAN CHURCH (NAC), informing them of their support of THE PEYOTE FOUNDATION and of LEONARD and RAVEN, as well as confirming the MERCADOS' membership in that church.

That evening LEONARD was released after paying the \$1,000 arrearage. He then joined several other members of TPF in an all-night prayer vigil held at a friends nearby residence. MERCADO contacted Sergeant STRANG by phone, offering full assistance and cooperation. The Sergeant was also advised of MERCADO's service to and membership in the NAC, and the delicate nature of peyote if mishandled.

Early the next morning RAVEN returned to the property and spoke with detective AUBREY KECK at the gate. She informed him that they were members of the NAC and that the peyote on the property belonged to the church and was not solely their property. She also offered reference to state law 13-3402(b), which states that peyote is allowed for use as an integral part of religious belief.\*

Later that morning more officers arrived with two trucks, in order to remove the peyote gardens. As the removal of the sacrament got under way, members of the FOUNDATION and several other members of the NAC from local tribes prayed and sang church songs, separated from the trucks by a barrier, armed guards, and K-9 units. These elder representatives requested that they be allowed to take charge of the sacrament, to no avail. FOUNDATION members continued to sing and pray all day as the trucks were loaded.

Finally, on the evening of January 9th, just before sundown, the residents of the FOUNDATION were allowed to return, after being informed that 11,323 plants had been removed. Still, no search warrant had been actually served. A copy was "left

somewhere on the property” according to Sgt. STANG, lead detective in this miscarriage of justice.

Nothing could have prepared this family for the destruction inflicted on their home and property. Covers on the greenhouses were slashed, and little more than pot-holed ground was left to indicate the site of the cherished sacramental gardens. Trucks had been driven across the ceremonial grounds, flattening trees and shrubs in the process.

Inside the houses, drawers had been emptied, curtains pulled from the window, family photos scattered on the floor and other senseless acts of destruction were evident. Particularly disturbing was the discovery that officers had taken RAVEN’S medicine box of church instruments and feathers, made for her by her father, and dumped its contents on the floor. Her personal jewelry box was also taken. MOSES’ medicine box was also opened, its contents disturbed and spilled about.

Three computers, cancelled checks and all cash, (\$117) were taken, as well as family photo albums and scrapbooks with newspaper articles concerning peyote and the FOUNDATION’S history. Other ruthless and mean-spirited acts that were perpetrated on the peaceful family home included the ridiculously juvenile posting of a sanitary napkin on the cabinet where this church’s sacrament had been kept.

All evidence of needless destruction was captured on video as well as by a photojournalist. Fortunately, nearly two hundred mistreated but living peyote plants were found by the crew of 12 who worked all the following day to make reparations to their homes, sacramental gardens, and church grounds. This difficult but ultimately joyous day was finished with sweatlodge prayer services, food, and fellowship. NAC members have planned a prayer service for the following weekend.

The MERCADOS had previously suffered the confiscation and eventual return of hundreds of peyote plants at the hands of Pinal County authorities in the winter of 1995.

The actions taken by the Pinal County authorities are a complete violation and desecration of the MERCADO’S home and church. This is a *hate crime* of the worst magnitude as our public servants and government officials under the color of law inflicted it.

The MERCADOS’ rights to freedom of religion, privacy, due process of law and protection against unreasonable search and

seizure have been grossly violated. As Officer MORGAN—one of the armed guards at the trucks—said, they “didn’t want to argue about the *Bill of Rights*.”

The members of THE PEYOTE FOUNDATION are continuing their prayer vigil, thanking God for the blessings of the sacred plants they are still protecting, and seeking intercession in the return of their sacrament.

\* Arizona revised statutes 13-3402. Possession and sale of peyote; classification:

A) A person who knowingly possesses, sells, transfers or offers to sell or transfer peyote is guilty of a class 6 felony.

B) In a prosecution for violation of this section, it is a defense that the peyote is being used or is intended for use:

1) In connection with the bona fide practice of a religious belief, and

2) As an integral part of a religious exercise, and

3) In a manner not dangerous to public health, safety or morals.

## UPDATE FROM THE MERCADOS JANUARY 22, 1999

It is now two weeks since the raid on our home and church grounds. Over the last few days strong winds have erased all footprints and tire tracks of the intruders. Today all is calm. Time and Nature have a way of healing all wounds. While our spirits are up, our hearts are still sore. We still grieve for the medicine, which remains as a spiritual hostage. We have been told that the uprooted plants have been moved to a site where they receive light and air circulation, but we have no reliable confirmation of this.

To date, no charges have been filed against any residents of the FOUNDATION. Numerous requests for the return of our computers (including our 386 w/case made of Legos®—possibly the first confiscation of Lego® toys?) and other personal items have so far gone unheeded. TIM has filed an official complaint with the Sheriffs’ office in this matter. The peyote

plants that were left scattered about by the TASK FORCE have been replanted in a victory garden. We are offering prayers there daily.

For more current updates on this situation, see the FOUNDATION'S web page at <http://www.digiweb.com/~peyote/welcome.html>

## WHAT CAN ER SUBSCRIBERS DO TO HELP?

Send money! This whole effort requires money. The computer used to update the FOUNDATION'S web pages, prepare correspondence, communicate via e-mail, send faxes and so forth is on loan, since the FOUNDATION'S computers were taken by the county.

Long distance phone calls, food, electricity, and so much more all depend on cash contributions. The peyote plants are never sold. The entire operation is supported by contributions from members and other concerned parties. The FOUNDATION is an Arizona non-profit corporation and they are awaiting the IRS documentation so that donations made can be claimed as tax exemptions for those donating.

Donations can be sent to: THE PEYOTE FOUNDATION, POB 778 (Dept. ER), Kearny, AZ 85237.

I am hopeful that each and every ER subscriber will send whatever they can, but at the *very* least stick a \$5.00 bill in the mail to the FOUNDATION. This is an important organization that is fighting the good fight, and they need our help now more than ever. Send the money anonymously, if you feel better about this. But whatever you do, please send what you can afford.

— DAVID AARDVARK

## WHAT ELSE CAN ER SUBSCRIBERS DO TO HELP?

Please FAX or write the following public servants and express your concern over the unethical treatment of the MERCADO family, the church grounds, and the sacrament. Demand that their sacred peyote garden be returned immediately.

# EXTRACTION NOTES

## COMMON SOLVENTS?

It would be great if someone would write about how to get solvents and acids from common sources like hardware stores. Could someone write a summary that provides brand names and stores that sell methanol and other solvents? It would be great to know the best solvents for the best alkaloids or constituents. I'm particularly interested in highly pure solvents with no additives or poisons. Even lead-rim canned solvents could poison us. Thanks. — TENGU, Japan

## EASY EXTRACTIONS?

Some one with chemistry knowledge should present extraction procedures geared towards the viewpoint of the layperson. The chemicals needed would have to be easily available. The most likely sources would be supermarkets and hardware stores.

One approach to extraction, that has not received proper attention, is extraction through precipitation. After first acidic aqueous extracting, then fat extracting, theoretically, one should be able to precipitate the alkaloids by basifying. In this alkaline phase, are the alkaloids in suspension throughout the liquid, or are they gravitating to the bottom of the container? If they are in suspension, one should be able to isolate them through filtration. If they gravitate to the bottom of the container, one could pour off or skim off the liquid, thus leaving the alkaloids on the bottom. This alkaloid layer could have some unwanted matters in it which possibly may be removed by dissolving in an appropriate solvent (polar most likely) then filtering through a fine filter such as lab filters or coffee filters. I have had no luck at any of such extractions. I wish that knowledgeable people would give advice on how to perform this precipitation method such that one gets good results.

There is an urging here for those in the know (in the field of chemistry) to take a *moratorium* on using DMT until the method which laypersons can use is available. *The challenge is made.* The test should be mildly difficult although time consuming.

Methylene chloride, touted as being available from dry cleaners, is *not* available from them. Solvents or anything from metal cans *may* have rust inhibitors mixed in and these rust-inhibitors can be lead-containing compounds. Therefore, only plastic or glass containers are acceptable for chemical tools. Polar solvents available, as I know of presently, are: water, isopropyl alcohol (99%—the 1% water will have to be contended with), alcohol (highest % available from liquor stores—the water will have to be contended with), and acetone (fingernail polish remover). [*Note: Fingernail polish remover often has adulterants that slow its evaporation. If this is the case, it should not be used.* — K. TROUT]

One can buy granulate or powdered ascorbic acid at supermarkets and one can check the brew suppliers for tartaric. Citric acid, as fruit canning color retainer, may be available in some grocery stores. [*Citric acid is also available from brew suppliers.* — K. TROUT] Hydrochloric acid (often labeled muriatic acid) may be available in plastic containers at hardware stores.

Alkaline compounds available are: lye (sodium hydroxide), washing soda (sodium monocarbonate), and generic brands of ammonia water. These are what are available to the layperson. Now, experts, how does one make a smokable DMT extract using these tools? Enjoy your moratorium knowing that you are not alone. — ANONYMOUS

*Alkaloid extraction has been dealt with extensively in past ERs. For extractions of relevance to DMT, see "Some Principles of Alkaloid Extraction" by JIM DEKORNE and "Alkaloid Extraction" by JOHNNY APPLESEED (Vol. 1, No. 2 1992); "A Generic Extraction Formula" by G.W., GA (Vol. 2, No. 1, 1993); "Smokable DMT From Plants, Part II" by JIM DEKORNE (Vol. 3, No. 1, 1994); "Extraction Feedback" (Vol. 3, No. 2, 1994); "Extraction Notes" (Vol. 3, No. 4, 1994); "Extraction Notes" (Vol. 4, No. 3, 1995); "Extraction Notes" (Vol. 5, No. 1, 1996); "Chemistry Matters" (Vol. 5, No. 5, 1996). Also see "Smokable Tryptamines from Phalaris Grass Without the Use of Chemicals" by B. GREEN (Vol. 6, No. 3, 1997), which describes a successful "smokable" extraction made using only boiling water. Or see TROUT'S NOTES FS-X0 (available from MIND BOOKS, see advert on page 42). It is quite clear that many ER correspondents have been successful with their kitchen extractions. It is a simple procedure but one that requires the*

operator adequately understand what they are doing and why, and that the plants actually contain decent amounts of the desired chemical.

Mail-order chemical sources that have been mentioned in past issues of ER include:

**PYROTEK**, P.O. Box 1, Catasauqua, PA 18032 (sells ammonium hydroxide and methylene chloride), catalog \$2.00. Note that these two products should not be ordered together from the same company, nor should any solvent and alkaline compound, as the combination strongly suggests that they will be used together for alkaloid extraction.

**HAGENOW LABORATORIES, INC.**, 1302 Washington Street, Manitowoc, WI 54220. Note that all of the chemicals mentioned in the chart below are available from **HAGENOW LABS** except for 95% ethanol (but they do have denatured ethanol), ether, and heptane.

We have not ordered from **PYROTEK**, and know nothing about them. We have ordered from **HAGENOW LABS**; they have been in business for over 45 years and it seems unlikely that they are a DEA sting operation. Nevertheless, anyone ordering chemicals from any mail-order company would be wise to use an untraceable mail drop.

It has been said in a back-issue of ER that methylene chloride is "not available in California and [is] no longer use in the dry cleaning industry because [it is] considered [a carcinogen]." While it may not be available from dry cleaners, I have seen methylene chloride offered for sale in CA at a company that sells pool chemicals (and other chemicals). Other places that I have noticed useful solvents include a latex mold-making supply store, and a plastics supply store. Methylene chlo-

ride has been mentioned as a successful chemical for tryptamine extraction. Paint stripper frequently contain methylene chloride, 'though sometimes in combination with methanol, and frequently in combination with a veritable witches brew of other solvents as well as things like waxes, used to slow down the evaporation rate. In our view paint stripper is totally unsuitable for anything other than a starting material for distilling pure methylene chloride from, which is outside the range of the current question. When allowing pure methylene chloride to evaporate off in a glass dish, we've noticed a white powdery residue. This has caused us and others we know who previously used this solvent for tryptamine extraction to abandon its use. We've no idea what this residue is composed of, but since methylene chloride is a known carcinogen, we have no interest in ingesting products that contain this residue.

This brings up an important, somewhat related point. The industrial grades of solvents that are easily available on a "cash & carry" basis, may well have impurities in them. Prior to using any particular solvent that is being considered for an extraction, it is a good idea to allow a small amount to evaporate off in a glass dish. Check the dish for any residue, such as a white powdery substance or an oily film. (Holding the dish over both a white surface and then a black surface will help one to see any residue that might be present.)

Although it is best not to use solvents that don't evaporate off cleanly, if there is no other choice, they should at least be washed when possible, using whatever water solutions it will be exposed to. Prior to using it, mix your solvent with an acidic solution (this will help reduce the presence of lead if the solvent had rust inhibitors if present), or even pure water, let separate and discard the wash water and any emulsion layer if one forms. One can also use a strong lye solution as a final

## PSYCHEDELIC RESOURCE LIST

### UPDATED SECOND EDITION! PROVIDES SOURCES FOR:

- ▼ PEYOTE: seeds and live plants. ▼ TABERNANTHE IBOGA: seeds, root-bark, and guided sessions with pure ibogaine.
- ▼ CANNABIS: viable seeds for high-potency strains and suppliers of dried herb. ▼ Legal mescaline-containing cacti.
- ▼ PSILOCYBES: spore prints & syringes, dried mushrooms, and growing supplies. ▼ GHB and GHB-making kits.
- ▼ SALVIA DIVINORUM: plants, dried leaves, and potent extracts. ▼ 5-MeO-DMT and other tryptamines.
- ▼ Plant extraction gear, chemicals & labware. ▼ Vaporizers, waterpipes, and sundry smoking supplies.
- ▼ AYAHUASCA: various traditional & analog plants. ▼ OPIUM POPPIES: seeds & dried pods.
- ▼ Books, periodicals, seminars, indoor grow-lights & gardening equipment, and much more!

8.5" x 11" soft-cover, 150 pages, illustrated. \$22.95 (USA; CA residents add \$1.55 for sales tax), \$24.95 (foreign; payment in USA dollars preferred, international money orders add \$5.00), postpaid from:

Soma Graphics, POB 19820, (Dept. ER), Sacramento, CA 95819-0820, USA

wash. This will remove not only some potential contaminants but will also serve to pull water out of the solvent due to the action of the lye. (This can also be used as a wash for an alkaloid-containing solution just prior to crystallization of a free-base.) Solvents should be washed until the wash water comes off clean. While the best approach is to use high purity solvents, this washing procedure should be used as a stop-gap measure whenever they are unavailable. Obviously this will only work for solvents that do not mix with water. Sometimes oily contaminants can be removed or reduced by repeatedly filtering the solvent with fresh dry filter papers. Test a couple drops of solvent to see if any oily residue remains.

If one follows the proper extraction procedures, and still doesn't obtain a smokable extract, it seems most likely that the plant source that is being used is devoid of a suitable quantity of alkaloids to begin with. Perhaps this is your problem?

As far as alkaloid precipitation goes, this only works in some cases. If the solvent and precipitation procedure is not correct for the chosen alkaloid the result will be a huge waste of time and product. Many—if not most—alkaloids will not separate at all using this approach.

The main problem with this idea is that most bases that one would be dealing with are oils, not solids. Even if some substances like DMT might form solids, they are unlikely to do so in the presence of water. Basic oils might migrate towards the top, towards the bottom, or get stuck on the sides. Another point is that while some alkaloids are poorly soluble in water, many are soluble enough to stay in solution, unless a

more preferred solvent is added. (It's a fairly proven fact that 45 mg of the "water-insoluble" DMT can indeed dissolve in 50 ml of heated water.) In the vast majority of the cases where alkaloid precipitation is done, it is not done out of an aqueous solution, but rather out of an anhydrous solvent, and the alkaloid is precipitated as the salt, not the free-base. These anhydrous solvents are sometimes easier to make than to obtain. This is a very limited approach for the alkaloids that we are usually discussing, and we've never seen anything other than the harmala alkaloids precipitate out when making a solution basic. It is not surprising that you have had no luck with attempting to filter the solutions that you describe, as any oily free-base would soak into the filter paper or at least stick to it, and/or to the vessel walls. The broad generic approach that you suggest is over-simplified, and won't work in this sense; alkaloids need to be treated as individuals based on their own particular properties.

Nevertheless, precipitation works quite well for a few alkaloids but requires that the alkaloid (or its salt) not be soluble in the solvent it is being precipitated out of. Ether, benzene and chloroform are commonly used for precipitating salts, but none are readily available in a pure enough state from any local stores on a cash & carry basis for this purpose. (Pure benzene and pure chloroform are available via mail-order from HAGENOW LABS.) As mentioned earlier, about the only alkaloids that precipitation works well for, using only simple to obtain solvents & reagents, are harmine and harmaline. They can be precipitated from a vinegar extract using salt and cold (precipitates as the hydrochloride salt). They can also be precipitated from a water solution of harmine or harmaline hydrochloride by adding enough ammonia to neutralize them (precipitates as the free-base).

An overview of useful chemicals for the kitchen chemist that can be had on a "cash & carry" basis in most areas of the USA is shown in the chart to the left. Some may be packaged by brand names, and will require that the ingredient panel be consulted. Brand names vary widely across the USA (and obviously in other countries too). "Highly pure solvents" are unlikely to be available from hardware stores. Solvents from anywhere that sells chemicals to the average consumer are going to be industrial or technical grades unless specifically labeled as analytical or reagent grade. Highly pure solvents are only available from chemical suppliers and will cost at least several times the price of lower grades. The presence of any ingredient other than the targeted solvent desired most likely indicates that this "brand" is unusable for these applications. With some of these products, ingredients are listed only by their CAS numbers. The chemical that corresponds to these numbers can be found in the Merck Index. Any business selling solvents is required by law to provide a MATERIAL SAFETY DATA SHEET (MSDS) for that product if asked. The MSDS can be of help in determining what is contained in a product, as sometime the product's can doesn't list all of the ingredients. However, the MSDS also doesn't always list all of a product's ingredients, and the phrase "trade secret" will frequently appear, meaning there's really no way to figure out all of the product's ingredients. Still, the MSDS does provide other useful information, such as the product's hazardous components (and related health hazard dangers and precautionary measures), solubility in water, waste disposal methods, weight per gallon, vapor density, specific gravity, evaporation rate, boiling range, flammability classification, lower explosive limit, flash point, the appropriate extinguisher to use in case of a fire, as well as an emergency number to call in case of an accident.

Of course the best bet is to pick up cans of single solvents. These are usually named by the solvent they contain. (You can and should still pick up the MSDS for these.) The company CROWN® makes a large variety of solvents for use in the painting industry, and many of these should be available at a professional painting supply store. A recent trip to my local CA paint store turned up fairly inexpensive gallon cans of CROWN® acetone, denatured alcohol, and muriatic acid (among others). I asked a store employee if they could order CROWN® products that they didn't have in stock, such as toluene and xylene, and she said that this would be no problem. The store had a color flyer titled "A User's Guide to: CROWN® Paint Thinners & Solvent Chemicals," which provides information about the comparative strengths and comparative evaporation rates of all of their products, as well as giving short descriptions of each product and what it is used for in the painting industry. The store kindly photocopied this guide for me, but I suspect that if one wrote to CROWN® and requested this, they would send a copy at no charge. (The address on the flyer is listed as PACKAGING SERVICE CO., INC., POB 875, Pearland, TX 77588.) Also worth mentioning, the local OFFICE DEPOT sold ROSS® Rubber Cement Thinner for \$3.99 a pint; this appears to be an industrial grade of hexane with no other solvents.

## SALVIA DIVINORUM AND SALVINORIN A

*The Best of  
The Entheogen Review 1992–1998  
ER Monograph Series, No. 2*

Combines every entry from past issues of  
*The Entheogen Review* related to *Salvia divinorum*.

Chapters include:

"The Early Years"  
"Consumption Methods"  
"Hyperspatial Maps"  
"Extraction"  
"Salvinorin A"  
"Combinations"  
"Cultivation"  
and more.

New endnotes provide fresh commentary and bring the text up-to-date. Includes a comprehensive listing of *Salvia divinorum* Internet sites, a "Retailer's Guide" that lists sources for live plants, fresh & dried leaves, extracts and tinctures both in the USA and other countries, and an annotated bibliography that presents abstracts of numerous additional sources of information on *Salvia divinorum*. Completely indexed for easy referencing. 217 pages.

# NETWORK FEEDBACK

## STRYCHNOS NUX VOMICA

Very little can be found in the literature and on the 'net about strychnine (*Strychnos nux vomica*) as an entheogenic agent, but here's a quotation from *Plants of Love* by CHRISTIAN RÄTSCH:

In low doses strychnine is one of the most effective aphrodisiacs, in moderate doses, a powerful psychedelic, and in high doses (60 to 90 mg) a deadly poison (RÄTSCH 1997).

I have looked up the drug in *Handbook of Poisoning*, and here it says that the fatal dose of strychnine is 15–30 mg!?! As a contrast, a fatal dose of LSD has not been described precisely, but *Psychedelics Encyclopedia* states that 40 mg was survived and the only case of death by overdose of LSD was a stunning 320 mg intravenously injected (STAFFORD 1992).

Before starting any bioassays with *Strychnos nux vomica*, I would like to know if some of you out there have any experiences with this compound, and perhaps Mr. K. TROUT would like to comment further on this matter? — AMOS, DK

*A fatal dose of strychnine in adults has been estimated to be 5–10 mg/kg, while 15 mg is believe capable of killing a child (FLOMENBAUM 1994). It is worth noting that this is an estimated lethal dose, not an LD50. Clearly, however, there is a large difference between this estimate and the comments by RÄTSCH. The Minimum Lethal Dose (MDL; the lowest amount reported to cause death) orally in rats is 5 mg/kg. We don't recommend that anyone experiment at any dose with strychnine. Onset of effects from strychnine consumption occurs within 10–20 minutes of ingestion. Symptoms of poisoning include anxiety, restlessness, repeated seizures alternating with periods of consciousness, intense pain (as well as hypersensitivity to sensory stimulation, according to the Merck Manual), hyperextension alternating with relaxation, wry facial grimacing (known as "risus sardonicus"), lack of ability to swallow & lockjaw symptoms, severe spasms of the back causing arching of the back and head accompanied by rigid flexing of the joints and skeletal fractures caused by the intense muscular contractions.*

## FORMALDEHYDE?

Does anyone know anything about formaldehyde? If it was mentioned in a back-issue, please let me know. Thank you. — L.W., TX

*It has been mentioned that people in Chicago have sprayed their Cannabis with formaldehyde, in order to kill off insects and fungi that are harbored in the pot. "The treated weed, known as AMP, causes anoxia and psychomotor retardation when smoked" (THE BUSH DOCTOR 1993).*

*A post to an underground e-mail group about this topic got the following response:*

I have had the form... pot before. I do not like it but will still smoke it. I would not buy the quantity that I normally do though. I would recommend staying away from that stuff. Anything that will pickle you I try to stay away from, including alcohol. I have heard about recreational use and was blown away. Like I said, I would stay away from it. — R.S.H.

*Another respondent commented:*

A friend of mine told me about smoking herb that had been soaked in formaldehyde. Said it gave him a gawdawful headache that lasted for two or three days, but the high was intense and altered his senses of touch and balance in bizarre ways. "Like I was underwater but also made of water." I'll take his word for it; this doesn't sound like a particularly "healthful" kick. — W.

*An article that appeared in the August 16, 1998 issue of the Bristol Press titled "It's Cheap, Easy and Dangerous," discussed the use of joints soaked in formaldehyde, calling the mixture by the slang term "illy" and stating that "Drug experts agree illy is most common in large cities, and that, at \$10 for two or three joints, it is a drug used by people of almost any age and race." This smacks of anti-drug hysteria, and we seriously doubt that the combination is too common.*

*According to this article, "illy" started as "sherm" in downtown Los Angeles—a slang term that refers to Cannabis joints dipped in PCP. The East Coast version of sherm is called "wet." There is obviously some confusion between terms and probably even whether or not the product is PCP or formal-*

dehyde. (It was pointed out by one Internet respondent that PCP-dipped Cannabis is sometimes called "embalming fluid," and that the use of formaldehyde on Cannabis may have originally been the result of someone taking this slang term a little too seriously.)

Internet respondents have told us that the slang terms "sherm" and "diesel" can also refer to the Cannabis/formaldehyde blend. We have heard the term "water" used for both preparations. "Water" can also refer to amphetamine (MARNEL 1997).

One effect reported from the formaldehyde combination was "of people sleeping up to two days straight after smoking the stuff."

Formaldehyde is highly carcinogenic in animals, and suspected as such in humans. (Carcinomas forming in the nasal passageways of rats forced to breath it are commonly reported.) It has been shown to cause DNA damage in cultures of human cells. One Internet source lists a fatal dose for an average human as 30 ml, and lists nausea, vomiting, abdominal pain or diarrhea as symptoms of formaldehyde poisoning

(<http://ohioline.ag.ohio-state.edu/cd-fact/0198/html>). Obviously respiratory irritation and watery eyes are common results of exposure. Evidently some people show an allergic reaction and are affected by far smaller amounts than most other people.

If a person had Cannabis that they knew was tainted with formaldehyde, and they wanted to smoke the Cannabis but not the formaldehyde (clearly the wiser choice), they could repeatedly wash the Cannabis with water and then let it dry. (Or, wash it with ammonia water then with repeated fresh water washings if they wanted to be absolutely sure to eliminate any formaldehyde.) Formaldehyde is not only highly volatile, but also incredibly water-soluble. Water washings are actually a decent way to clean many things from tainted Cannabis, from urine (far from uncommon in Mexican Cannabis, both from rats and humans), to sugar solutions (sprayed on to add weight), to just plain dirt. Water washings would also reduce (but not eliminate) some of the accumulated shit from foliar feeding. THC is not water soluble, so washings should not affect the potency much, unless of course this was done with sticky buds (in which case the resins would

# SALVIA DIVINORUM

## 5X Extract Incense

Made from organically grown *Salvia divinorum* leaves.

This extract contains the active principle of five grams of dried leaf concentrated onto one gram of dried leaf. Highest quality product.

\$15.00/gm, \$40.00/3 gms. Inquire for wholesale pricing.

## Top quality organically grown *Salvia divinorum* leaves from Hawaii.

\$20.00/7 gms, \$30.00/14 gms, \$50.00/oz, \$150.00/4 oz, \$490.00/1 lb.

Leaves are carefully sorted and only Grade A leaves are sold.

## Oaxacan grown *Salvia divinorum* now available!

Grown in its native habitat of the Sierra Mazateca in México, this leaf is every bit as good as the Hawaiian at a fraction of the price.

\$20.00/14 grams, \$35.00/oz, \$100.00/4 oz, \$300.00/lb.

No personal checks accepted. Payment in cash or postal money order only. If paying by money order, leave the "Pay To" space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24 hours. All prices are postpaid in the USA; foreign orders inquire for costs. All products unconditionally guaranteed.

**JODY HORD, 1430 WILLAMETTE STREET, SUITE 4, EUGENE, OR 97401, USA**

stick to anything and everything they touched). For “shake” Cannabis, or lower-grade bricked commercial, this is a good technique.

## MIMOSA ACTIVE WITHOUT MAOI?

JONATHAN OTT seems to think that *Mimosa hostilis* is active without MAOI added. The ingredient, kokusaginine, which is morphine-like in structure, may possess MAOI properties such as the other well-known MAOI morphine-like compound, moclobemide, does. I would suggest that the kokusaginine supposedly, insoluble in water, is nonetheless extracted enough—especially with heat—to allow for sufficient MAOI effect. However, if *M. hostilis* is taken whole, the quantity of kokusaginine causes excess MAOI effects coupled with morphine-like effects, producing the reputed bad effects.

One could make a fat extraction and if the *Mimosa hostilis* aqueous extraction then proved inactive, this would imply that the kokusaginine is the contributing MAOI factor.

Does anyone know, for certain, what the effects of kokusaginine are? Those who are chemistry smart might check this out. — J.S., OR

*I have only heard of kokusaginine reported from the Rutaceae. I know nothing about its activity except for the fact a related compound was reported to be antagonistic to Ditran. I would like to hear more on all of this. I suspect tannins are what cause people problems when they ingest the actual powdered bark. (Perhaps worth noting, I've heard one report that someone ended up in an emergency room from ingesting powdered Mimosa tenuiflora root-bark directly.) “Morphine-like,” I love that phrase—what does it mean though? Mescaline is sometimes defined as being morphine-like because of the similarity of the subjects to an observer. I suspect this is in reference to its action in your usage. I did notice a very strong stuporous component with one bioassay of *M. tenuiflora* root-bark and a MAOI, that I did not in the others. JONATHAN would be the best one to talk with about this. — K. TROUT*

We asked Mr. OTT what his thoughts on this matter were, and he responded:

It isn't so much that I “seem to think that *Mimosa* [*tenuiflora* (WILLD.) POIR. = *M.*] *hostilis* [(MART.) BENTH.—let's get this taxonomic orthography straight for good and all] is active without MAOI added,” but rather that I

know this, having felt it in my own body in the only valid scientific analysis I know: the psychonautic bioassay. This ought not be surprising, and I have always known in my bones it were so—all the scant ethnographic evidence is entirely consistent with this, and there is absolutely no evidence for some lost or missing ingredient, all the sterile and uninformed scientific speculation in this regard notwithstanding. I've no idea whence derives the querist's notion that kokusaginine occurs in *M. tenuiflora*, and I am in agreement with K. TROUT's remark in this regard, while it is a mystery to me why it would be assumed this compound possesses MAOI activity, nor indeed how this compound—or moclobemide, with which it is structurally unrelated—is “morphine-like,” none of which has anything to do with the recondite pharmacology of *jurema preta/tepescohuite*, in any case. Perhaps there is some confusion here between the rutaceous kokusaginine [found in New Caledonian *Dutailleya* spp., among others] and the so-called “kukulkanins” reported from powdered stem-bark of Mexican *tepescohuite* [misreported as *Mimosa tenuifolia* L. (sic): *Journal of Natural Products* 52(4): 864–867, 1989], also of obscure pharmacology. There is no reason to suppose this compound or any of the diverse saponins likewise reported from bark of Mexican *tepescohuite* [*Phytochemistry* 30(7): 2357–2360, 1991; *JNP* 54(5): 1247–1253, 1991; *Journal of Ethnopharmacology* 38(2,3): 153–157, 1993] show MAOI activity, and at least five phytochemical analyses of Brazilian *jurema preta* [mostly unpublished] have failed to show presence of  $\beta$ -carbolines nor any other category of potent MAO. Moreover, pharmacologically and pharmacodynamically, the psychoptic effects of cold-water, hand squeezed and short-time-infused, aqueous extracts of simple pounded *jurema preta* root-bark prepared according to the traditional manner as documented in several Brazilian reports, bears no relation to the—to me—well-known pharmacology of the  $\beta$ -carbolines and other MAOI, such as the artificial isocarboxazid and moclobemide, and others. Preliminary chemical evidence reveals rather the presence of several novel and yet-unidentified DMT-adducts in *jurema preta* root-bark, apart from free DMT itself. Either these compounds show oral activity *per se*, not being substrate to gastric MAO, or rather show a higher affinity for the enzyme[s], serving thus as competitive inhibitors respective to DMT for its active site[s], in the manner that the  $\beta$ -carbolines do. My current work strongly suggests the former conjecture is the more parsimonious. Remember, the simple, short-acting tryptamines are themselves MAOI, albeit far weaker than harmine and harmaline in this regard. The reported enhancements of psilocybian effects by concomitant administration of  $\beta$ -carbolines suggests that even psilocine, with its dramatic oral activity, is a signifi-

cant substrate for gastric MAO, as this synergy, if it is borne out scientifically, yet to be done, would almost certainly be due to inhibition of gastric MAO, as all evidence suggests that in the brain, the MAOI [at least in the case of  $\beta$ -carbolines, probably *via* a general inhibitory effect at the GABA<sub>A</sub> receptor combined with competitive inhibition of tryptamine-binding at 5-HT receptor subtypes]; including the artificial, medicinal agents like iproniazid, *etc.*, markedly *inhibits* effects of DMT and its congeners, not to mention LSD [*vide* my article in *MAPS* VI(3): 32–35, 1996 for references and the new edition of *Ayahuasca Analogues* for a discussion of this phenomenon; *vide item: The Heffter Review* 1: 65–77, 1998; recall also that cerebral MAO is found *inside* nerve-terminals, *not* in synapses]. Finally, why this undue and exaggerated emphasis on the *ayahuasca* effect in attempting to rationalize the pharmacology of *jurema preta*? I can assure you—but will say no more at this time, pending resolution of yet-outstanding mysteries—that the psychoptic pharmacology of the tryptamines neither begins nor ends with the hallowed *ayahuasca* effect, exploration of which constitutes only scratching the surface of a broad and intricate, far-ranging topic, rife with scientific, commercial and political significance which has yet to dawn on psychonauts, much less *ayahuasqueros*, governmental sanitary authorities or pharmaceutical-corporation scientists.

— JONATHAN OTT, México

*On the topic of Mimosa tenuiflora we also received the following question:*

[One of the ENTHEOBOTANY instructors] at the seminar in Uxmál said that *Mimosa [tenuiflora]* could be used in a quick, cold water extraction. 15 minutes?! My two experiments were not successful. Maybe my *Peganum harmala* extract wasn't sufficient. In any case, I would like to know more about this as a possible reliable *ayahuasca* method. — T.C., OR

*We had heard through the grapevine that JONATHAN OTT announced at the PSYCHOACTIVITY conference in Amsterdam last year that Mimosa tenuiflora root-bark was active by itself at the 35 gm dose. In a letter regarding this, Mr. OTT confirmed what he stated above about this, noting that M. tenuiflora:*

...is indeed active neat, with no cooking nor additives, simply by hand-squeezing briefly the pounded root-bark in water—25 g twice infused for less than an hour and minimally squeezed in 125 ml cold, neutral water each time was quite distinctly visionary and *pharmahuasca*-DMT-like, albeit with a slightly accelerated pharmaco-

dynamic all-'round, which militates in favor of the directly-orally-active DMT-adduct-theory, as opposed to some endo-MAOI from same (OTT 1999).

*Without knowing any more details (such as amount of the Mimosa tenuiflora used, whether or not is was root-bark or stem bark, potency of whatever plant-part was used, exact length of infusion, etc.), it is hard to say what went wrong with the two experiments performed by T.C., OR. What is clear is that the case has been made by Mr. OTT that T.C., OR needn't have used any Peganum harmala extract at all, in order to experience effects. Thought we doubted not Mr. OTT's claims, it seemed only reasonable to get a second opinion. DAVID AARDVARK stepped forth for the bioassay:*

25 grams of *Mimosa tenuiflora* root-bark was powdered in a coffee bean grinder. The fine dust that wafted upwards when the lid was removed smelled quite strongly of DMT. (Indeed, if one burns a piece of *M. tenuiflora* root-bark, one can also notice the pungent odor of burn-

Native

 Vero Beach, FL 32964. (561) 778-8361.  
<http://www.nativehabitat.com>

ing DMT.) The root-bark powder was placed into a tupperware container with 125 ml of cold tap water, shaken, and left to sit for an hour. It was then strained through a “French press” coffee filter, and soaked a second time in a fresh 125 ml of water for another hour. This was strained and the two extracts were combined and drunk. The taste was *quite* bitter and astringent, but didn’t evoke a gag response until the final few swallows (which had a bit of fine particulate matter in them, like the last sips of Greek-style coffee might). I later learned that it was apparently traditional to add honey to this infusion, to cut the astringent bitterness (GONÇALVES DE LIMA 1946). There was some *very* mild stomach upset at the onset, but no real nausea to speak of at all, and no diarrhea. I was amazed that I started to feel the first effects in about 15 minutes after consumption. These built up over the next 20 minutes or so to a solid “plus 2” on the SHULGIN scale. The effects were indistinguishable from smoked DMT. I felt as though I had smoked about 25–30 mg, the only difference being the more gradual onset, and the longer duration. After hitting the peak, there was a fairly rapid decline to near baseline. This all within one hour. I was surprised to find myself almost sober for about 5–10 minutes (I could have easily driven a car), and then I started going up again! I peaked a second time—equally as high—but for perhaps a slightly shorter period of time, and came back down. Again 5–10 minutes passed where I felt almost totally sober, and again I started going up for a third time. This third peak was not as high, and did not last as long. The trip was completely over within two hours, and I felt a pleasant afterglow. I was (and am) amazed by the whole experience, and eager to try this again at a higher dose. (I’m tempted to double the dose, but will probably step up more slowly, in 10 gram increments.) There was virtually no “body load,” and the whole experience was quite pleasant. I am at a loss to explain the wavelike nature of the experience with the three peaks and returns. I’d also be quite interested to know how much DMT is left in the marc from this experiment, and if this root-bark might be used a second time if it were cooked in acidified water and taken with a MAOI? More experiments are obviously needed, and I encourage *ER* readers to see for themselves that this astonishingly simple preparation can produce an effective, enjoyable, and brief entheogenic voyage.

## AMANITAS & ANTIDEPRESSANTS

I was recently present where a person who was on tricyclic antidepressants went into life-threatening convulsions after ingesting 2 grams of *Amanita pantherina*. I ingested the same amount, and had a mild, very pleasant experience up until the time where the victim began convulsing.

The victim was placed on artificial respiration. Two hours later, the victim awoke—lucid, healthy, and with no memory of the convulsions. Although there is no way to prove it, the general consensus was that this was caused by the interaction of the tricyclic and some component of the *Amanita*. Certainly the convulsions that resulted resembled greatly exaggerated versions of the twitching movements that often occur with tricyclics during sleep. In blood tests and liver panels, the victim showed no signs of toxicity, suggesting that the adverse effects were not from any kind of poisoning, but rather from interactions in the brain alone.

This says nothing about possible interactions with other types of antidepressants, such as SSRI and MAOI. It is not even clear whether the interaction was between the antidepressant and the psychoactive constituents of the mushrooms, or with something else that is normally benign. People familiar with KIT BONSON’S work (BONSON *et. al* 1995. “Chronic administration of serotonergic antidepressants attenuates the subjective effects of LSD in humans,” *Neuropsychopharmacology* 14 (6): 425–436) might be tempted to conclude that SSRI would be safe because they have opposite actions from the tricyclics on potentiation of LSD—but this doesn’t necessarily tell us anything about how the antidepressants interact with ibotenic acid, muscimol, or any other constituents in Amanitas. Personally, if I were taking *any* kind of antidepressant I would avoid Amanitas altogether. If anyone on SSRI such as Prozac® or Zoloft® has taken Amanitas, it would be useful if they could share their experience. Until further information is forthcoming, those taking antidepressants should probably avoid Amanitas altogether—or, if the urge to ingest is irresistible, should start with fractions of a gram and discontinue the experiments if any twitching or dissociative state occurs. — ANONYMOUS

## JONATHAN OTT SPEAKS...

Interviewed by Will Beifuss and Jon Hanna at the 1998 BPC *Salvia divinorum* Conference

**Jon:** Maybe we should start off by talking a little bit about the products that you've been working on?

**Jonathan:** Okay, well... When I was in Amsterdam for the PSYCHOACTIVITY conference, somebody asked me in an interview what my next book was going to be. And for some reason without even thinking about it I said, "I don't know if I'll write another book." And in general that's the way I work. I don't plan books and then write one. I get interested in something and do a little research on it, and then if a book comes out of it I suddenly know that. I find the ARIADNE's thread that tells me the book is there, and so then it's a process of following the thread and getting it out. Going into the labyrinth sort of. And that hadn't happened. And so I didn't in fact have a book planned. And so I just said that. But then in Uxmál I had met a Dutch woman—IRIS VAN DEN HURK—who's in the CONSCIOUS DREAMS organization; her brother started it, and she had proposed that we start a business together, and in fact that happened. And the business is called PHARMACOPHILIA. And so now I would have added to that interview, "I think I'll just live my last book for a while." (laughter) And so instead of talking about psychopharma-

cological engineering, and theorizing, we're going to start doing it. And whatever we can do now, undercapitalized without a lot of resources. And our first product will be Pharmahuasca®. Those who are familiar with *The Entheogen Review* and other publications surely know that it's more or less a code-word for an ayahuasca analogue made with pure compounds, as opposed to plant extracts or teas or infusions. And there are possibilities of making them legally. The MAOI—the ayahuasca alkaloids— $\beta$ -carboline, are not controlled anywhere to my knowledge except in Japan. As for the tryptamines, in Europe DMT is the only one that's controlled, unless you classify LSD and ibogaine as tryptamines, which certainly they are. But of the simple, what I call the short-acting tryptamines, DMT is the only one that is controlled. Not even bufotenine is controlled in Europe. And so that gives you quite a lot of latitude for different tryptamines that can be added. So we're going to make this as two separate pills, one of which is the NATURAL HERBAL RELAXANT, which is a minimal MAOI dose of  $\beta$ -carboline, and the other one is the NATURAL HERBAL TONIC, which is a minimal psychotropic dose of a short-acting tryptamine which is legal. And so one tablet of the one, plus one to three tablets of the other will

"...some people do want to vomit and they see it as an overall purification. I tend to see it more as a toxic side-effect of an overdose..."

"The real drug-problem is that we need more and better drugs."

"...it seems pretty clear to me that shamans are the pharmacognosists, or the natural-products scientists of the preliterate world."

give a three- to four-hour *pharmahuasca* experience.

**Jon:** Getting a little more specific, the  $\beta$ -carboline is going to be harmine HCl?

**Jonathan:** Rather, free-base harmaline.

**Jon:** And the tryptamine is 5-MeO-DMT?

**Jonathan:** Right.

**Jon:** Are there any plans for other tryptamines?

**Jonathan:** Yes. And also perhaps other dosage forms of the existing tryptamines, because my research lately has involved making psychonautic models of the visionary snuffs of South America, of which there are two basic categories: the *yopo/cebil* category is the Leguminous *Anadenanthera*. Most people know it by *yopo*, but the commercial activity now focuses on *cebil*, which is the Southern Andean species *Anadenanthera colubrina*—both contain bufotenine. I should say that *yopo* and *cebil* are seeds—they're made from leguminous seeds. And the other class besides *niopo*—not to be confused with *yoco*—is *epéna* or *nyakwana*, and various names from the Orinoco in the Northern Amazon.

These are made from a resin of a bark of various species of *Virola*, which are in the nutmeg family, Myristicaceae. And in the case of the nutmeg family, *Virola* snuffs, the major active principle is 5-MeO-DMT. Everyone's focused on DMT because we like DMT, and we're interested in it. But in fact, as far as traditional entheogens go, we can say only in the case of ayahuasca is DMT a major active-principle. In the snuffs it's a minor component in both cases. And 5-MeO-DMT is in fact about four or five times more potent than DMT. With bufotenine we still don't know—there's very little comparative pharmacology on that. So my research is focusing on the snuffs now, and I'm making psychonautic models of these snuffs with pure compounds. And we ultimately plan to introduce visionary snuffs as well.

**Jon:** That sounds great.

**Will:** What is the dosage of the harmaline and the 5-MeO-DMT on these first products?

**Jonathan:** Well, I'd rather not say because we're still doing a bit of final R & D on it, and we haven't quite fixed what will be the final dosage of it. The problem with the  $\beta$ -carboline is

that some people get nausea from higher doses, and with ayahuasca in the Amazon, as you both know, one common denominator to ayahuasca is ayahuasca stem—it's really the *only* common denominator. In some areas that's all that's used. In some areas it's just a cold-water, aqueous infusion of ayahuasca stem with no additives. In some areas it's cooked for up to the better part of a day, and may have a half-a-dozen additives at once, of which the best-known are the tryptamine-plants like *chacrana*, which is *Psychotria viridis*—DMT-containing. But tobacco, *coca*, *guayusa*—which is a caffeine plant—*Brugmansia*, even cacti; there are about a hundred different additives and quite a number of possible permutations. And so they call ayahuasca in the Amazon *la purga*, the purge, because it is purgative. If you take a high enough dose it causes nausea and vomiting. And, some people want that, and certainly in shamanism and in the ethnomedicinal context that's of key importance and it's really fundamental to this—much more than the vision-inducing plants are, which are more of use in diagnosis. But mainly the patients want the purgative effect, and it may well be therapeutic for them, in cases of intestinal parasites. But I find, and I think that probably your readers would agree with this, that in the ayahuasca analogue or *pharmahuasca* camp, people are more interested in the *visions* than in curing themselves of intestinal parasites (laughter) or vomiting, although some people do want to vomit and they see it as an overall purification. I tend to see it more as a toxic side-effect of an overdose of these  $\beta$ -carboline alkaloids. And in fact what we already know—that you only need something in the realm of 100 to 150 mg of  $\beta$ -carboline in a single dose—speaking of harmine and harmaline, which are the most active ones and the main components of ayahuasca plants—you only need that much to render tryptamines active orally. And I've always operated with the assumption that we didn't wish to take any more, because then you start getting these nauseous side-effects. And also the evidence is more-or-less compelling that the effects are pharmacologically contrary. While it does make DMT active orally, it makes it weaker than it is by any other route, because it seemingly works against it in the brain. And there are a couple of mechanisms that have been proposed to explain that. But it definitely is not a "potentiation" as far as the psychoactive effects are concerned. So we've worked on minimizing that dose, because you kind of walk that fine line where you want to make sure that it works for the great majority of the people, but you don't want to get into the nausea territory either. So that's a little bit tricky.

**Jon:** Will the tryptamine-containing pills possibly serve sort of a double duty; can you crush them up and vaporize them?

**Jonathan:** I hadn't really thought about that. They could be extracted, of course, from the pills. And we're certainly not going to do what they do in the pharmaceutical industry of actually conducting intensive R & D efforts to make that difficult for the consumer. We're certainly *not* going to bind them to ion-exchange resins, or mix in all kinds of crap so that you won't be able to purify them. But no, I hadn't actually thought about that. But yeah... that would be possible, to extract it from the pills. And it will be in the form of the free-base, and so that will be easy, because the binders and so-forth won't be soluble in the solvents that the free-base of the tryptamine would be soluble in, and so it would be a fairly straightforward thing to extract them from the pills. In fact, you're right—probably a lot of people would want to do that. I prefer the effect orally of the tryptamines to smoked all the way across the board with every one that I've tried, but I know that probably I'm in the minority there.

**Jon:** Going back to your comments about the nutmeg family. I remember reading in *The Ethnopharmacologic Search for Psychoactive Compounds*, there was some discussion about the nutmeg seeds *themselves* being more effective than the isolated myristicin-elemicin fraction. The thing that I'm thinking of now that we're here at the *Salvia divinorum* conference, is that there are a lot of terpenoid-type compounds in those seeds also. Do you know if anyone has looked at those for activity?

**Jonathan:** In the *Anadenanthera* seeds no, I don't know, but I don't think that that has happened. I don't know for a fact. Yeah, it is true that in the Northern part of Brazil where it

the *Virola*, which they call *nyakwana*, and the *Anadenanthera* snuff they call *hisioma*, which they have to trade for. But they very much prefer the *Anadenanthera* snuff because it is more potent, and also I think it's just easier to prepare. In the case of the *Virola* you have to strip the bark off of the tree, heat it so that it exudes this resin, scrape up the resin, and then dry that, powder it, and make the snuff. And in the case of the seeds you simply toast the seeds and crush them and you have the snuff. And so generally speaking, we know from the phytochemical study there are about 13 species of *Virola* that have been shown to contain tryptamines—mainly 5-MeO-DMT, smaller amounts of DMT, and also—which is also probably active—the mono-methyl equivalents, the mono-methyl tryptamine and 5-MeO-mono-methyl. And up until now we really don't have a lot of *data* on those pharmacologically, and they're other possible targets for future snuff/*pharmahuasca* products, even if there is some legal response to selling these things as legal products, there are an infinitude of new tryptamines that can be trotted out and tried in this kind of combination. We know that the *Virola* resins—even these prepared resins powdered up and so forth—are fairly low in tryptamines. And just the raw seed of *Anadenanthera colubrina*, the best strains—again they're using *A. peregrina*—but the best strains of *A. colubrina* from Northern Argentina, yield more bufotenine by weight than these prepared resins do of the *Virola*. And so it seems pretty clear to me that shamans are the pharmacognosists, or the natural-products scientists of the preliterate world. And they're really interested in what we would call alkaloids and pharmacological potency, and generally speaking they're fascinated by chemical technology, and they want easier access

and more potency just as we do. They're just the same as we are, they're just in a different context.

**Jon:** There was a report in the 1996 *Yearbook of Ethnomedicine* by TORRES and REPKE, an analysis of one of the varieties of *Anadenanthera colubrina* seeds...

## I prefer the effect orally of the tryptamines to smoked all the way across the board with every one that I've tried, but I know that probably I'm in the minority there.

borders with the Guianas and Venezuela, where live the Waiká people, of whom the Yanomamö are the most famous, they've used both types; they use the *Virola* snuffs, which grow in their ecosystem. And they're heavily into snuffs—they're not ayahuasca takers *per se*, but they use the snuffs very regularly, though some of the groups are undoubtedly familiar with ayahuasca. But *Virola* grows in their ecosystem, and they also use *Anadenanthera*, which grows in the Caribbean and in the savannah ecosystem, which is some distance from where they live. And they use much more frequently

**Jonathan:** Yeah, variety *cebil*, from Argentina.

**Jon:** One of which tested out at 12.4% bufotenine, with hardly anything else in it...

**Jonathan:** Right, exactly.

**Jon:** And I've spoken with a number of people who, using that *particular* seed, have had very pleasant visionary effects, not at all along the lines of what has been traditionally described for bufotenine, and also not along the lines of what other people who have tried other *Anadenanthera* seeds have told me about. With the *Anadenanthera* seeds it seems that there is a great variability in response. Some people have a terrible time, and other people appear to like it quite a bit. One person here at this conference has told me that it is his favorite tryptamine.

**Jonathan:** From having tried the seeds, or the pure compound?

**Jon:** Well, from having tried the seeds.

**Jonathan:** Right. Well, again, we're dealing with two different species. The *Anadenanthera peregrina*—the Caribbean species—is lower in tryptamines in general than *A. colubrina*. And also, the few people that I know, including myself, that have tried *A. peregrina* preparations, for some reason it really significantly burns like hell in the nose. And we're not just talking about a mild thing. When I tried one of these, and I'm afraid I don't know the exact composition—it may have had tobacco in it also, as it was from an enthomedicinal collection from an anthropologist—it was like a general, very significant painful burning that was experienced in the entire head all over the scalp. It was so painful that it just referred the pain all over the region. And it was literally like you wanted to bang your head into the wall to distract from it and make it go away. And I've only had just mild irritation from the *cebil* seed, which you would think would be a very similar seed. So there is some kind of real irritant possibly present in the *A. peregrina* that's not in the *A. colubrina*, or it has to do with how this particular snuff was prepared. But ROB MONTGOMERY had done it also, from just plain seed that he had collected in the savannah area there and just ground up himself, the *A. peregrina* seed, and had a similar kind of effect, and I don't think there was any additive except possibly a little ash. He described the sensation like "broken glass." So that could have something to do with it. Also, as you noted, REPKE and TORRES found that the highest-yielding strain, which was from the shaman's own private-stash tree that he had right next to his house, was some 12 or 13%, almost all bufotenine—there was only trace amounts of one other tryptamine—and that's really unusual. Anything over 10% of total alkaloid content is unusual to begin with, much less of a *single compound* without a range

of other similar compounds. I think there is one report in the literature of as much as 18% nicotine in a tobacco strain—that's the only thing I know that is even in the ballpark. With peyote, which is a virtual factory of alkaloids, the total alkaloid content is about 8%, and there are more than 50...

**It was like a general, very significant painful burning that was experienced in the entire head all over the scalp. It was so painful that it just referred the pain all over the region. And it was literally like you wanted to bang your head into the wall to distract from it and make it go away.**

**Jon:** What about opium?

**Jonathan:** The total alkaloid content is about 15% in the best strains, and it's mainly morphine, but in the case of peyote and opium you're dealing with many dozens of alkaloids, and in the case of peyote it's only about 30% of this 8% alkaloids that's mescaline, which is the main visionary compound.

So this is really unusual. But unfortunately you alluded to the traditional information that we have about bufotenine, which of course was placed in Schedule I from the very beginning, and in any case would be controlled whether it were in Schedule I or not, as it's a positional isomer of psilocin, and the law says "any salt, isomer, or salt of isomer." So it's already covered as an isomer—not even by the Analog law. But it was given by i.v. injection to prisoners at the OHIO STATE PENITENTIARY in 1955, and then in a New York mental institution by some real mad scientists in 1959. And they were actually injecting this into people's bloodstreams, which is really a dumb idea, because remember this is 5-hydroxy-DMT, so it's dimethyl-serotonin, because 5-hydroxy-tryptamine is serotonin. It's called serotonin from *sero tonin*—toning the blood, blood-pressure, because there are a lot of serotonin receptors in the bloodstream. It's not just a neuro-receptor. It would be like injecting serotonin, and they had definite cerebral crises—in one case they said their faces turned the color of an eggplant and the other they said that their faces turned the color of a plum. And of course these guys didn't try it on themselves; they were using captive guinea pigs. And in a really unethical way. So if we're talking about the memes that get spread about a certain compound, well this one re-

ally started off on the wrong foot because right away it was used in the worst possible way. And they were not able to establish visionary activity.

They did these studies because in 1954, in the *Journal of the American Chemical Society*, it was reported that the seed-pods of *Anadenanthera* contained DMT and contained also bufotenine—which alone had been found in the seeds. These compounds had been synthesized decades before, and it had never occurred to anyone to test them pharmacologically. And so suddenly, because of this snuff information—they knew that *A. peregrina* was made into a snuff, and so forth—these same scientists tried making a snuff out of the pure bufotenine first, but it didn't work. But they were doing also kind of a stupid thing—they were spraying it in water into the nose in a soluble salt; I think it was the oxalate salt of bufotenine. And SASHA SHULGIN has even said that he doubts that these compounds are active in the nose, but that's just not true. They're active as the free-base, but they're not active as soluble salts. And this is somewhat counter-intuitive, because for example, everyone thinks in terms of cocaine, and while the hydrochloride salt is very active in the nose, the free-base isn't so active in the nose.

**Jon:** Right, right.

**Jonathan:** But then when you chew *coca*, it doesn't do anything unless you add base. And so then in the case of the free-base, it is clearly absorbed well in the mouth. There's something screwy about the models, and I am not a membrane physiologist, but some enterprising graduate student should do a thorough study of different methods of chewing tobacco, *coca*, *qat*. *Qat* is an example of one that's *not* used with base, it's just chewed by itself. But tobacco generally is basified, so is *coca*, so is *betel*, and so a general study of masticatories and snuffs from the standpoint of pharmacodynamics of membrane transfer of alkaloids would be a real interesting subject, and I think it would turn up some things that go a little bit beyond the sort-of simplistic models that have been proposed for how that might work.

So anyway, to get back to bufotenine. Unfortunately, we don't really have much more to go on, besides the antics of the mad scientists. While a few people in a very sporadic way in the drug-scene have done their own bioassays here and there, no one's reported them. And so that's why my intention now is to do pharmacological modeling both on 5-MeO-DMT, which I've already started, and on bufotenine, and on DMT as well, because we have reason to believe also that ayahuasca

exists as a kind of a snuff-product as well. And what we call the "ayahuasca-effect," the MAOI plus tryptamine interaction, was actually proposed originally in the context of the snuffs by HOLMSTEDT and LINDGREN in the book you mentioned, *The Ethnopharmacologic Search for Psychoactive Drugs*, in 1967. They were reporting that because one analysis done by an Italian group of a snuff preparation found ayahuasca alkaloids—clearly signature alkaloids for the ayahuasca plant itself, in South America—harmine and harmaline. And also there was a museum-collection of snuff-plants that had ayahuasca stem as one of the plants that was added to the snuff. And so this was originally proposed because they had this assumption of, "Oh, well these things don't work in the nose, so you must need to add the MAOI, and then the combination of the  $\beta$ -carbolines from ayahuasca, plus these tryptamines in the snuff-plant, makes it active in the nose. Then later people forgot about that, and no one's ever gone back to try and model the snuffs. We just fixated on ayahuasca itself, and around the same time it was reported that ayahuasca brews contained DMT, and they'd already long been known to contain the  $\beta$ -carbolines. But it wasn't until 1965 that it was definitively shown that they contained DMT, and so then people fixated on that and everyone forgot about the snuffs. But it's time to go back to the snuffs, because we can render all of these tryptamines active in the nose as well, it's just a matter of finding the right way, and I think you will find... my prediction is that the pharmacology will show that the activity is somewhat intermediate between 'smoking' or inhaling the free-base vapor and taking it orally in some kind of MAOI combination. And also, it's been assumed blanketly across the board that these compounds are inactive orally. We know DMT is inactive orally, we know that 4-hydroxy-DMT, meaning psilocin, is quite active orally, but it seemingly is also a substrate for MAOI, because people are saying that if they take the mushrooms with a monoamine-oxidase-inhibitor—Syrian rue, or whatever—they get a better effect. And the only way I can rationalize that is by thinking, "Okay, they're getting better absorption in the stomach, because some of it is getting chopped-up by monoamine-oxidase in the stomach before it's absorbed."

But I think that 5-MeO-DMT is slightly active orally just by itself, without any monoamine-oxidase-inhibitor. And I suspect that bufotenine will prove to be active by itself, at least as much so as 5-MeO-DMT. So I'm working on modeling all of this: the pure compounds in snuffs, basically 5-MeO-DMT, bufotenine, and DMT, and also orally, combined with MAOI and without. And also sublingually—that's also a potential way to...

**Jon:** That's actually something that I was just about to ask. I've heard a few reports of 5-MeO-DMT dissolved in high-proof alcohol and held in the mouth as being active...

**Jonathan:** Oh yeah, it is.

**Jon:** I've tried that myself, and I didn't notice any activity, but it's possible that I just didn't...

**Jonathan:** What was the dose, do you remember?

**Jon:** I think that it was around 10 mg. You know, my scale weighs down to 10 mg, so...

**Jonathan:** Okay. I should mention—and this will be interesting to your readers—the Japanese now sell some really very well-made and sturdy battery-powered balances, that are about the size of a postcard, and they're wholly made for portability, and so forth. They're very stable, rock-stable. They're plus or minus 2 mg, and they will weigh out in carats, grains, ounces, or grams. Ten gram maximum, but it's the perfect balance for this kind of thing. And even in smart shops in Holland, they retail for less than \$500.00. But a gem dealer told me that in the U.S. you can get them for more like \$150.00, which puts it in the ballpark for the gem trade... they're used obviously by gem dealers to weigh carats and so forth. But this is the perfect psychonautic balance that overcomes this problem of not being able to weigh below 10 mg; plus or minus 10 mg obviously isn't good enough for this kind of thing. Plus or minus 2 mg is not as good as plus or minus 1 mg, but at least it's adequate for this kind of work.

One of the projects that I have in mind that I proposed to ROB MONTGOMERY, is that we develop a nice custom-made wooden case. In Europe glassware is really cheap, it comes from Eastern Europe—lab glassware. And you make a portable field-lab that would have one of these balances, it would

have basic glassware, a hand pump for doing vacuum filtration, a small distillation rig, a little gas bottle and something for heating, and also the same gas bottle—there are magnetic-stirrers that work by compressed air. Instead of having an electric thing, you just feed

compressed air and then that turns a little bar and that makes the magnet rotate inside your beaker. And so you could have all of this in a little portable field-lab. I mean a *real* chemistry set, that would cost about \$1000.00, say. And also small TLC tanks, little stainless-steel flasks for solvents that are like the booze flasks, this sort of thing. Set it up, and make it such that you would be able to market it for field-scientific research for botanists, for plant-chemists, and so forth. But the real target market would be basement shamans, who have a hard time getting this. Put it all in one nice portable package for them, where they would have their basic home-lab setup. I think it would not be, obviously, a huge money-maker, but you could sell many hundreds of such a kit and people would be really happy to be able to get it. And it's something that I would like to do just as a service to the public, and as another way of striking back at this absurd idea that chemistry is somehow by itself a shady endeavor and illegal. And the U.S. is really cutting off its own testicles by doing that, or shooting itself in the foot, because chemistry is a major part of our economy... a *major* part in both pharmaceuticals *and* industrial chemicals, *and* agrichemicals, and suddenly... I mean, you wish to encourage children to become interested in chemistry when it's something that your economy depends on, and you *don't* wish to make it shady, to where one can't even buy beakers from EDMUND SCIENTIFIC. Before at least you could buy basic lab-ware, and as far as I know now, there's no consumer-source of these things in the U.S., if you're not a chemical company. And people should step in and fill that gap. There's no law against selling glassware. And why should we meekly accept this thing? People should start up chemistry clubs, and so forth.

**Jon:** There are still a few mail-order companies, like HAGENOW LABS, that sell geared towards the amateur.

**Jonathan:** And they will sell on credit cards?

**Jon:** Yeah.

**Jonathan:** Because EDMUND SCIENTIFIC is the classic one—that's how I got my first lab equipment, I just bought basic beakers and flasks and whatever you could get from them. And maybe they still sell it, but I know that it's not in their catalog anymore. They don't have pages of that sort of thing, and they may not even sell it—I don't know that for a fact... I've also been told that COLE-PARMER in Chicago will sell to home addresses on a credit card, and they have the full gamut of scientific equipment, but I've never verified that for a fact.

While we were unable to locate the scale described above for the price of \$150.00, we did find the following for sale from <http://www.balances.com>:

Tanita Model 1210-50  
10 g x 0.002 g  
\$279.99

Acculab V-1 mg  
120 g x 0.001 g (±2 mg)  
\$440.00

**Jon:** Getting back to the *Anadenanthera colubrina* seeds. There were a few people here at the *Salvia divinorum* conference who went to the BPC event in Chile, and had tried the seeds in a variety of ways, and one person said that the best way to prepare the seeds was to soak them in water, and essentially

to be really careful before jumping to conclusions. So that's what I find often in discussions at conferences, and so I will play Devil's Advocate, and I will intentionally throw out things saying, "But wait a minute, did you consider this? Did you do that? How strong is this conclusion?" And generally speaking, they crumble pretty rapidly before that kind of questioning. And so that's what we need to help inculcate in this very valuable underground-chemistry movement, is a little bit more rigor. And really it's just about drawing conclusions. And also you need more rigor in the structuring of the experiments, because the amount and quality of information that you can get out of something has everything to do with the kind

## I don't wish to be understood as disparaging basement-shaman activity or amateur science at all, because, the best science has *always* been amateur science in the true sense of the word—someone who really *loves* doing something...

take the seed-coat off, throw that away, and toast-up and powder the inner meat, and snuff that. They said they got really good effects from *that*. But they didn't get *any* effects when they just did the seed coat. To me that seemed a little bit...

**Jonathan:** Counter-intuitive...

**Jon:** Yeah, working from the idea that maybe these chemicals are insect repellants...

**Jonathan:** Right, that does seem counter-intuitive. Actually I did try that, but not in a systematic way. But it does also strike me as being counter-intuitive. And I wouldn't just assume that that question is settled. It would be better to examine that in more detail. And often times one of the problems... well, I don't wish to be understood as disparaging basement-shaman activity or amateur science at all, because, the best science has *always* been amateur science in the true sense of the word—someone who really *loves* doing something and isn't just paid as in a Sunday scientist who's paid to do it for a living. But one of the things that I find that generally distinguishes the untrained amateur from someone that has somewhat more rigorous background in this, is a tendency to jump to conclusions prematurely. And we have to be really careful to draw conclusions from experiments. And one of the things that's really valuable about scientific training is having a lot of chances to fail, and to find out how wrong you were about your conclusions. And being challenged by that, or having someone specifically set you up for that sort of thing. And it's very facile to draw conclusions, and to say, "Okay, that question's settled," and *especially* when you're using something as subjective as your own bioassay, you want

of question you ask. Whether we're talking the context of a bioassay experiment with *Salvia*... "What is your intention? What do you ask?" Well it's the same thing, whether you're trying to ascertain whether the seed-coat or the germ of an *Anadenanthera* seed is more active. It also has everything to do with how you structure the experiment, and the very specific way you ask the question makes a big, big difference in the quality of what you can get out of a few hours of this kind of inquiry.

**Jon:** Moving in a bit of a different direction, there's been a lot of controversy over the word "entheogen," and I would say undoubtedly that you're one of the strongest champions of this word. I've heard a lot of arguments for and against, but the argument that I heard against it that I wanted to ask your opinion on was that the traditional use by natives who were using these plants didn't have anything to do with "generating or becoming divine within." It was about visiting the underworld, or contacting dead ancestors, or communing with spirits. And so, at least with how Westerner considered "God," one could almost say that the traditional use of these plants doesn't have anything to do with God. Maybe it has to do with the angels, or maybe it has to do with the demons, or maybe it has to do with the plant-spirits... But, as far as these plants causing one to "become divine within," that this wouldn't really be so much of a concern for the traditional users.

**Jonathan:** Yeah, in the shamanic context, in some cases that's true. Yeah. That's a legitimate argument. I think I've noted that. I mean, I try to bring up the pros and cons when I review it myself. That you could argue that that's more of a later concept, as opposed to shamanic, the whole idea of *theos*

and of deity... But I take it to mean more of a general thing, spirituality *per se*, and plant-spirits being a manifestation of the same type of *theos*, or seeing the universe more as energy or spirit and less as matter. But obviously we'll never have a term that's satisfactory to everyone. The surprising thing to me is that *entheogen* has done as well as it has, and it seems to be definitely tripping off of everyone's tongue all of a sudden, and that's only, as you know, a phenomenon of the last five years. Perhaps since *Pharmactheon* came out. And *PIHKAL* and *Pharmactheon* within a couple of years of each other broke what was this sort of a log-jam... we had had about ten years of very little editorial activity in this field, and now all of a sudden there's a huge flood... these two big thick books that sort of smashed through the dam...

**Jon:** I remember the days when there used to be the “drug” section in TOWER BOOKS...

**Jonathan:** Yeah, right...

**Jon:** And then that vanished, and it was gone for years...

**Jonathan:** Right when REAGAN stepped in...

**Jon:** Yeah, and then finally it started coming back in...

**Jonathan:** And I know in my case, it was because—*PIHKAL* made me really realize this quite clearly... I had moved out of the U.S. in disgust when REAGAN got re-elected. I call it the REAGAN-BUSH Dark Ages. But it clearly coincides with that. And suddenly instead of a drug-book section in every book store, you had—if anything—a substance-abuse section, and all these crappy, pseudo-spiritual, half-assed neo-Christian books on how to get off of coke, and how to get off of booze, and all this sort of thing—which are all drearily the same, kind of, and I don't wish to disparage that offhand, and I'm sure there's quite a good market for such, and there are undoubtedly some good books there. But the point is there was obviously quite a demand for real drug books, there were several companies that specialized just in publishing this, and then from one day to the next, all of a sudden it was gone. And so what I realized was that the government was being wildly successful in their cheesy attempts to make this all go away, because they were forcing me, and others, to censor myself, ourselves. And I had gone into the “cover my ass” mode, to work on my career, and make sure that I kept my nose clean (so to speak) and stayed out of legal problems. And they had really forced

the issue that way. And so then when I read “The Confessions of a Psychedelic Alchemist” in *The Whole Earth Review*, where SASHA mentioned—I hadn't even heard of *PIHKAL*—but that they were finishing it and it was about to come out and so forth, that summer, which I think would have been the summer of 1991, and *PIHKAL* came out that fall, I think in October or November or something like that, without even thinking about it, I just took out of a box a manuscript that I had started in 1979 or '80, which eventually became *Pharmactheon*, and started working on it. I realized to my chagrin, fuck, they've made me censor *myself*, and here I've been not doing this thing for more than a decade that I should have done a long time ago. But ten years before I couldn't afford to publish it myself. I couldn't afford *even to work on something* without compensation. And there was no way to sell it, because they had effectively blocked access to the market. But now times have changed. And suddenly SASHA was launching into self-publishing, ROB had started ...OF THE JUNGLE, and it was possible to connect more directly with the market even if there *weren't* a drug-book section. And it's actually better for us this way. But of course now the “drug-book” sections are coming back anyway; at least they have them at CODY'S and MOE'S in Berkeley, and we're starting to see them more and more. And there are more and more “alternative” stores now that are filling this gap. Because this was also parallel to the consolidation of the book-market, that not only had the publishing companies—traditionally family-owned enterprises—become subsidiaries of multinationals, but the book trade was almost all dominated in the U.S. by chain-stores, and now there are four or five significant chains. In most markets you only have a “mall/franchise” chain-operation, which are just MBA marketing-planned schemes where they have a standard model of, I don't know, eleven hundred titles, and so many pin-headed

## **I had moved out of the U.S. in disgust when REAGAN got re-elected. I call it the REAGAN-BUSH Dark Ages.**

categories. And there's just no place for books like this. But in a way that's to our advantage, because when you consolidate control over a mass-market to make more money, the product becomes blander and less likely to offend the average consumer. And so they're basically ceding large chunks of territory to anybody who wishes to step in and take it. And that's what we've seen in the U.S. That's one of the greatest things about the U.S.; informatics, access to information, and the dissemination of information. It's unlike any place on Earth. I mean, Europe is light-years different from the U.S.,

even though economically, socially, historically, there are all these parallels, and then the same kind of levels of endeavor, and so forth. But in terms of access to information, there's no place like the U.S. And that's why the U.S. has been so successful scientifically, and so successful in the communications industry and the entertainment industry and so forth. And so, basically all this technology is flourishing in the U.S. I read somewhere, maybe BOOKPEOPLE's catalogue or something, that every year in the U.S. there are 5000 new independent presses started up. Some of them may only exist to do one book, or soon fail. That's a remarkable thing. In Spain, which is the seventh largest book-market in the world, I think so far there have only been three or four or five independent presses at all, period, in all of history. And it's only now starting in Holland and in other areas. And this is a fantastic thing. And as you know, of course, your publication is squarely in this same category. And RICHARD GLEN BOIRE's books and the excellent *Entheogen Law Reporter*, it's just a snowballing, burgeoning thing. And it's a real Usan phenomenon, and something that needs to be imitated elsewhere, where they can really take a few pages out of our playbook, because this is the way to do it. You work *within* the system, you *use* the system, there's *nothing* wrong with the system! Everyone complains about the system. The system's *great*—it's just who's got their hands on the levers, how many hands, and so forth. But technology is leveling the playing-field more and more every day. It's happened in books already. It's now happening as we speak in music, and it will happen in film and television also. That you only need \$3000.00–\$5000.00 worth of home equipment and you're able to play with the big girls. And actually, the technology now *favours* the small operator because you don't have all this dead wood of a huge operation, and bureaucratic friction, and infighting. I think that the hierarchy and big business structures are the ones that are swimming upstream, against the current. More and more the concept of economies of scale are disappearing. And it's happening even in chemistry, and in pharmaceutical chemistry, which are the very essence of big factory, high-capital, high-energy-input, high-technical-expertise, and so forth, in that the same semiconductor technology is now being applied to minireactor vessels, that are actually ones etched-out on small substrates just like computer-chips. They're even projecting now, within a few years, that genomic sequencing will be dominated by credit-card-sized mini-sequencer-reactors, that are low-energy and these are readily mass-produced and will end up being cheap. And so even that kind of technology is going to go toward more decentralization, lower capitalization, it's more ecological, it's more economical, it's more energy-efficient, but above all *it's more*

*anarchistic*, and it's more accessible to JOE BLOW on the street. Anybody who's got the gumption and the ideas and the creativity can just step in and say, "Hey, I can do this too, and furthermore I can do it *better* than DOW CHEMICAL, or better than SANDOZ, NOVARTIS, or whatever they call it next."

**Jon:** Going back to the topic of book-publishing, you have something new starting up with ANTONIO ESCOHOTADO in Spain. Maybe you can tell us a little bit about that?

**Jonathan:** Yeah, we've started a publishing company in Spain called PHANTASTICA, like LEWIN's book *Phantastica*. ANTONIO ESCOHOTADO, who's a professor and well-known writer in Spain, and myself, and FELIPE BORRALLO, who's a book-seller in Barcelona—he has a bookshop in Barcelona—but he's also the president of ARSEC, which is the leading pro-*Cannabis* lobby in all of Spain. And so we're launching into publishing because I wish to concentrate my activities on Europe. Because I think that there's much better short-term prospects for political change in Europe. There these kind of things *are* taken seriously whereas in the U.S., my more than less radical perspective on science, history, or whatever else, tends to be beyond the pale, or not a topic of rational discussion, and there's no place in the Academy for this, period. But it's not the case so much in Europe, and especially in Spain. And so you *do* get press coverage, and they *do* take it seriously, and they don't just automatically dismiss it as of the lunatic fringe. And so for someone to come out as I do in *Pharmacophilia* and say "The *real* drug-problem is that we need more and better drugs," in the U.S. they just dismiss you as a nut. And that's good in a way, because then they don't even bother to see you as a force to be dealt with. They just assume, "Well, nobody's going to pay any attention to this crackpot." But in Spain, actually they say, "Oh wow, yeah that kind of makes... we should publish that and we'll see what happens." And I think in Spain the time has come where we have to call the officials on the carpet, and take the debate to *them*, and make *them* justify their policy, stand up and debate it scientifically. "How can you justify this expense, this waste of public funds, criminalizing large elements of the population, exacerbating the AIDS epidemic, the hepatitis epidemic?" and make them explain *why* they're doing this. *They're* the ones that are screwing up, not us. We're just doing civil disobedience, our sacred democratic *duty* when a government is miscreant, because we can see really clearly that they have a very evil, unethical, unecological, uneconomic, racist, flawed and failing policy. And it's high time for someone to say, "The emperor's got no clothes, and let's arrest him for indecently exposing himself, under the existing laws." Yeah, so we've

started up PHANTASTICA. We've published *Pharmacophilia*, which has been translated by ESCOHOTADO into Castillian, and then we're going to be publishing a book of his, and we're going to follow that with a book by ALBERT HOFMANN—his scientific book on ergot-alkaloids from 1964, *The Ergot Alkaloids* is the title—which has only been in a single hardcover edition in German with about 1000 copies made. I may also do publishing in English in Europe, and it's possible that I may just do all of my publishing there, even for the U.S. market, because the printing is actually cheaper, and it may even compensate for the difference in shipping costs. But in any case I was thinking of publishing my ayahuasca book also in Castillian, and possibly in English, for sale to the Dutch market, the British market, the German and Australian markets.

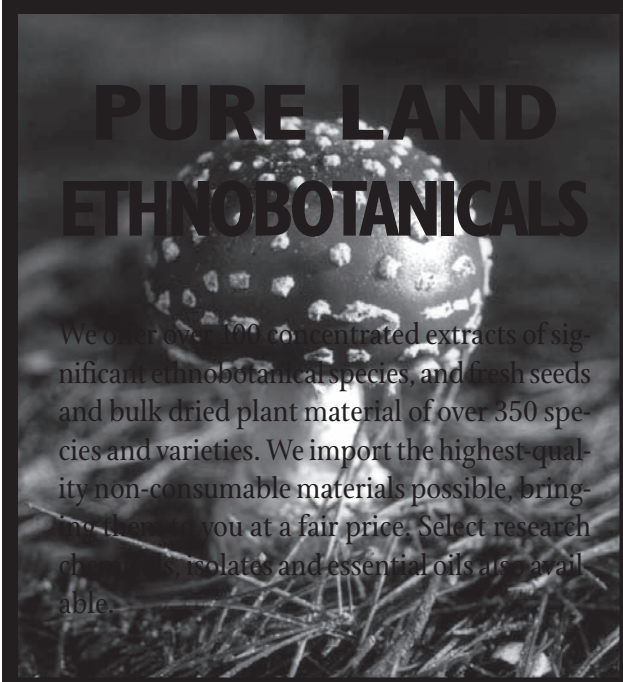

**Jon:** Are you working on a second edition of that?

**Jonathan:** Yeah. It's actually done, I just have to do the graphics and redo the tables. But yeah, I've done the same thing I did with *Pharmacotheon*. I've kept the same size and price, but it's being updated and I've added about 50 or 60 new references to the bibliography, and brought it all up to the current state-of-the-art. Of course there's been a lot of work since 1994. Just, for example, in the DMT-plant table... and I only include ones that are published in the scientific literature, not ones that are *not* published or just conjectured based on ethnographic *data*. But just in the DMT-plants in the five years since the first edition came out, now there are eight more plants that have been published that contain DMT or 5-MeO-DMT. So yes, I've brought that up-to-date, and it's also being reprinted in German by WERNER PIEPER. *Pharmacotheon* is already in Castillian, from another publishing house, and that's also being reprinted. And so it's gratifying to me that these books also have a market outside of the U.S., and I think the European market is vast. I also think it would be good for *The Entheogen Review* to get more exposure in Europe, and look for more subscribers there. I think that the market is pretty much evenly divided between the U.S. and Europe—that there's at least as many people, and probably more, in all of Western Europe that are interested in this field, as there are in the U.S. So it basically doubles the market, kind of. I've always tried to bridge the gap—as you know I write a column for MAPS of reviews of non-English books that come out, just hoping to get some translation activity going. Slowly but surely it's happening. ANTONIO's book, which is called *A Brief History of Drugs*—not the big three volume one but the shorter one—is now coming out in English. KEN SYMINGTON translated that, and it's being published by INNER TRADITIONS—they have a good publishing operation.

**Jon:** Yeah, they're excellent.

**Jonathan:** And INNER TRADITIONS is one of the real forward-looking companies in the U.S., in that not only to they have a good list of books in our field, but they are also publishing in Castillian in the U.S. I've been saying for a long time, "Hey, the U.S. is the third largest Castillian-speaking country in the Americas." Only Argentina and México have a bigger Castillian-speaking population than we do. We have 35 million. And that's about as many Castillian-speakers as live in Spain. Their's is 38 million, but you've got 6 million Catalanes and a few million Basques, and they all nominally speak Castillian. But they're really not Castillian speakers. We have 35 million *primary* Castillian speakers.

◇ **TO BE CONTINUED...**

**PURE LAND  
ETHNOBOTANICALS**

We offer over 100 concentrated extracts of significant ethnobotanical species, and fresh seeds and bulk dried plant material of over 350 species and varieties. We import the highest-quality non-consumable materials possible, bringing them to you at a fair price. Select research chemicals, isolates and essential oils also available.

# EVENTS CALENDAR

## ALEX GREY EXHIBITION "TRANSFIGURATIONS AND SACRED MIRRORS" APRIL–MAY, 1999

ALEX GREY'S art exhibition, "Transfigurations and Sacred Mirrors" opens April 10th at 4:00 pm with a lecture by Dr. DEEPAK CHOPRA entitled "Exploring the Sub-Manifest Order of Being through Art." GREY will exhibit his *Sacred Mirrors*, the bronze *World Soul* sculpture, and many other important works from over the last 20 years. The show will run through MAY AT THE MUSEUM OF CONTEMPORARY ART, SAN DIEGO, 700 Prospect Street, La Jolla, CA 92037, (619) 454-6985. For more information about Mr. GREY'S art see <http://www.alexgrey.com>

Mystic Eye 1997 used with permission of ALEX GREY.  
For posters & books: 725 Union St. Brooklyn, NY 11215, <http://www.alexgrey.com>

## JOIN MAPS!

Can you imagine a cultural reintegration of the use of psychedelics and the states of mind they engender?

Please join MAPS in supporting the expansion of scientific knowledge in this promising area. Progress is only possible with the support of individuals who care enough to take individual and collective action.

BASIC MEMBERSHIP: \$35; SUPPORTING MEMBER: \$100; PATRON MEMBER: \$250+ (Add \$15 for orders outside the U.S.) MasterCard and Visa accepted by phone, or through our secure server on-line at <http://www.maps.org/memsub.html>

MAPS memberships include a subscription to the quarterly *MAPS Bulletin*. All new MAPS members who mention this advert will receive a free copy of *The Secret Chief* by MYRON STOLAROFF!

MAPS has positioned itself at the center of the conflict between scientific exploration and the politically-driven strategy of the War on Drugs. MAPS is the only membership organization supporting this crucial research. The confidential MAPS mailing list is not available for sale or trade, and the *Bulletin* is sent in a discreet envelope.

MAPS, 2105 Robinson Avenue (Dept. ER), Sarasota, FL 34232, USA, (888) 868-6277, FAX: (941) 924-6265, [info@maps.org](mailto:info@maps.org), <http://www.maps.org> (Please note that MAPS has moved; the address listed above is our new location.)

---

BY WILL BEIFUSS AND JON HANNA

## ABBHEY ETHNOBOTANICALS

POB 5457 (Dept. ER)

Mansfield Notts

NG19 7SU

United Kingdom

abbeyethnos@hotmail.com

<http://dSPACE.dial.pipex.com/shanti/index.html.htm>

A new company with a large selection of seeds and plants, including: *Artemisia absinthium*, *Banisteriopsis caapi*, *Calea zacatechichi*, *Catha edulis*, *Desmanthus illinoensis*, *Leonurus sibiricus*, *Lophophora williamsii*, *Mimosa hostilis*, *Papaver somniferum*, *Peganum harmala*, *Piper methysticum*, *Phalaris aquatica*, *Psychotria viridis*, *Salvia divinorum*, *Sceletium tortuosum*, *Tabernanthe iboga*, *Trichocereus pachanoi*, *T. peruvianus*, and *Voacanga africana*. They also carry a well-chosen selection of books.

## DANIEL SIEBERT'S SALVIA SHOP

33450 Decker School Road (Dept. ER)

Malibu, CA 90265

dsiebert@gte.net

<http://salvia.lycaenum.org/salviashop.html>

We've mentioned DANIEL SIEBERT'S wonderful *Salvia divinorum* web page before, and the fact that he offers for sale a number clones from rare plants. Now he's offering a few additional products, including:

Dried *Salvia divinorum* leaves; top quality organically-grown in Hawaii. 1/2 ounce for \$30.00, 1 ounce for \$50.00. (Some vendors charge twice this much for the same leaves.)

Fresh *Salvia divinorum* leaves, harvested from Mr. SIEBERT'S own plants grown in coastal Southern California. \$25.00 for 60 grams fresh weight (about 20 to 30 leaves).

Standardized salvinorin A-enhanced leaf. This is a fortified *Salvia divinorum* leaf product that has been standardized to contain exactly 15 mg salvinorin A per gram of leaf. This is

equivalent to 6 times (6x) the average natural leaf concentration. One gram is \$45.00. This product is the first "standardized" extract commercially available. And as pure salvinorin A, when it is available on the underground market, tends to retail for about \$10.00 per mg, this price seems pretty good. We applaud the standardization in potency, which should allow one to easily weigh out a known "dose."

White Sage smudge bundles (*Salvia apiana*). A ceremonial incense by various Native American tribes for ritual purification and cleansing (not for ingestion). \$10.00 each.

Mr. SIEBERT is also now selling two books from his web site. The *Salvia divinorum Grower's Guide* by SOCIEDAD PARA LA PRESERVACIÓN DE LAS PLANTAS DEL MISTERIO is available for \$11.95 plus S/H. *Pharmako/Poeia* by DALE PENDELL is available for \$19.95 plus S/H. (The *Salvia divinorum* chapter of this book is now posted to Mr. SIEBERT'S web site.)

Prices listed do not include S/H., and this charge depends on what is ordered and where it is going. Contact Mr. SIEBERT by e-mail (or mail) to check on product availability and shipping costs to your location.

## ENTHEOXCHANGE E-MAILING LIST

<http://home.midsouth.rr.com/nachash>

ENTHEOXCHANGE is a private e-mailing list dedicated to the exchange of entheogenic plants, seeds, spores, foliage, and information regarding their propagation.

This is a low-traffic list, and we are *amazed* at the "seed trade list" collections that people post. These are some of the most dedicated growers of entheogenic plants that we've seen. Anyone with a serious interest in growing rare entheogens should check out this forum.

When it is operating efficiently, the e-mail list merely acts as a place where people can publicly post what they have available, and what they are looking for, and then transactions between individuals happen off-list in private. This is beneficial for some—depending on the level of risk that they are willing to take—as there are occasionally offerings that may be scheduled in some states or countries (or which may grow into plants that are scheduled), such as psilocybian mushroom spores, *Lophophora williamsii* seeds, *Tabernanthe iboga* seeds, and others.

Instructions for subscribing to this forum are provided at the web page listed.

### HOUSE OF SPORES

702 N. Washington (Dept. ER)

Ardmore, OK 73401

[johnardmore@webtv.net](mailto:johnardmore@webtv.net)

<http://www.tcowen.com/heaven/HouseOfSpores>

A good selection of spores for psilocybian mushrooms are offered here: *Psilocybe azurescens* (\$35.00); *P. bohemica* (\$35.00); *P. cyanescens* (\$30.00); *Panaeolus cyanescens* (\$30.00). Any order of these prints includes one free *P. cubensis* spore syringe. Also available: *P. cubensis* Amazonia (\$20.00 print, or \$13.00 syringe), *P. cubensis* Ecuador (\$20.00 print, or \$13.00 syringe). Each additional syringe is \$10.00. Orders are guaranteed viable to germinate and uncontaminated, or they will be replaced. *P. cubensis* varieties from Tasmania and Florida should be available soon.

All orders have list the return address as "H.O.S." (not HOUSE OF SPORES), but you can request that they list no return address. They do not keep any letters or customer lists. Orders are filled on the day they arrive and all correspondence is destroyed after they are filled. We like the way that this company operates with regard to privacy. Hopefully other similar companies will take notice and follow suit.

### MEDIA AWARENESS PROJECT (MAP)

POB 651 (Dept. ER)

Porterville, CA 93258

(800) 266-5759

[mgreer@mapinc.org](mailto:mgreer@mapinc.org)

<http://www.mapinc.prg/drugnews>

Although I have discussed MAP in the second edition of my *Psychedelic Resource List*, I was recently made aware of their amazing on-line collection of drug-related news articles. They have nearly 20,000 articles available, collected over the last three years. Searches can be done for recent news (posts from the last two weeks), specific years, or from the whole database. Three or four words can be searched for at a time, like "marijuana medical McCaffrey" (don't use quotes or put "and" between your search terms and don't use common words like "the" or "for"), which allows one to pinpoint exactly the articles that are relevant.

Included with the full text of the articles presented is the publication's name, date of the article, the e-mail address for writing letters to the editor (best for recent articles only), the author of the article, and more. Any article will be sent directly to you via e-mail at the click of a button.

I have found this to be an *amazing* research tool, one that I am overjoyed to be able to point out to *ER* readers. Check it out—you won't be disappointed.

### SMART EXPRESS

POB 921 (Dept. ER)

1780 AX Den Helder

The Netherlands

(+31) 653-28.39.28

[spiritsofnature@wxs.nl](mailto:spiritsofnature@wxs.nl)

<http://home.wxs.nl/~spiritsofnature>

A web-based business that sells a variety of "herbal highs," vitamins, sexual stimulants, poppers, and more. Their "hallucinogens" category has "Mexican mushrooms" (3 grams for \$13.95), "Hawaiian mushrooms" (1 gram for \$16.75), *Salvia divinorum* (4 grams for \$16.75), morning glory seeds (5 grams for \$6.50), and baby Hawaiian woodrose seeds (5 seeds for \$6.50). They also sell kava kava (30 grams for \$5.95). They appear to ship worldwide (though they encourage the purchaser to check their country's laws), and charge between \$2.00 and \$6.00 for postage.

## 2C-B & 2C-T-2

We've been asked by some readers of *The Entheogen Review* to track down companies that offer 2C-B and 2C-T-2 for sale to those countries where these compounds are not scheduled. Although we are not aware of the laws in every country in the world, we do know that 2C-B is specifically scheduled by name in a number of countries, including the USA. However, we aren't aware of any country currently where 2C-T-2 is specifically scheduled by name. We strongly recommend that those who are interested in ordering either 2C-B or 2C-T-2 from any of the companies that we've listed on the following pages check the laws regarding these compounds prior to placing an order.

**SMART DRUGSTORE INTERNATIONAL****POB 2121 (DEPT. ER)****S-103 13 Stockholm****Sweden****[http://www.smartdrugstore.com/  
international.html](http://www.smartdrugstore.com/international.html)**

This company currently sells 2C-B (three 5 mg tablets for 198 SEK, fifteen 5 mg tablets for 898 SEK), 2C-T-2 (two 8 mg tablets for 198 SEK, ten 8 mg tablets for 898 SEK), and *Coplandia cyanescens* (dried, 7 gms for 198 SEK, 70 gms for 1498 SEK). See their web page for ordering procedures. They don't ship any of their products to the USA, but will ship to all other countries worldwide, and they recommend that customers check their countries laws prior to placing an order. Nevertheless, all packages are sent discretely, and they claim that over 95% of their packages sent within the EU get through okay. They only send packages via registered mail, to insure that they get through okay, but they will not be held responsible for packages seized by customs or lost due to theft. Packages should take 2–7 days to arrive in Europe, and up to 12 days for the rest of the world. All prices are given in Swedish Kronor (SEK). One USA dollar equals about 7,80 SEK (and their web page has a link to a currency convertor). They also offer PGP communications.

Their web page states that they will likely stop selling these products in April of 1999, when new legislation goes into effect in Sweden, effectively making it illegal to sell these products there. While those wishing to place orders would be wise to do so prior to this time, it appears as though a new company run from another country may step in and take over selling these products after April.

Overall, Sweden has a fairly draconian attitude towards drugs; they are one of the few remaining European countries that is holding out with this position. They have even established "The Rave Commission," which is essentially a "culture police," that infiltrates raves and busts individuals who are having too much fun. (See <http://www.mapinc.prg/drugnews/v98/n163/a01.html> for more information.)

Apparently in May of 1998, the Swedish parliament "put forth a proposition to expand the definition of narcotics to include everything that contains any 'euphoric substances' as a classified narcotic and thereby prohibited (Linton, Magus. nr 9 March 1998, "Ravekommissionen—Vastvarldens enda kulturpolis" (text Swedish), Arbetaren).

This law was originally called *Eufori lagen* ("euphoria law") because of a phrasing in the first suggestion for the law's text. Ironically, the term "euphoria" was not defined in the proposed law in any manner! Apparently the Chief Public Prosecutor was doubtful about the proposed law, due to this lack of definition, and following his reading of the law he is said to have remarked, "after this coffee-drinking will be illegal." The wording of the law garnered protest, and it was altered. It is now called the *lagen om hälsofarliga varor* ("law regarding health-hazardous substances"). Though the terminology has changed, the effect will be the same; the law will enable legislators to enforce bans on new drugs. CONNY EKLUND at Läkemedelsverket (the Pharmaceutical Department, who—amongst other things—propose bills that are later voted on by the government) was the author of this proposal, and mentioned that he had "designer drugs," and "short-lived trend drugs" in mind when he wrote it, and that the law is geared towards the "control of synthetic narcotics." Apparently the Swedish government has a hard time passing laws fast enough to keep pace with the underground drug laboratories changing a couple of atoms in some molecule, and they think that this "all inclusive" drug law will make it easier. Since virtually every substance on the planet can be considered hazardous to one's health (depending how you look on it), this law will be extremely unjust to people whose drug preferences differ from the norm. The law is said to be "open to wide abuse by the authorities," and protesting libertarians in Sweden have stated that they will openly challenge the law by reporting their local tobacco vendors and the government liquor stores for selling substances that are hazardous to one's health. Nevertheless, the proposal has been approved by the Lagrådet och Socialutskottet (the legislative council committee for social affairs), and it is expected that the government will vote on this proposal in April or June of 1999.

The proposed law allows items to be placed on a special list. Currently it takes quite a lot of info to be able to class a "new" drug as a narcotic. With the *lagen om hälsofarliga varor* it will be possible for the government in Sweden to put substances that they claim are "health hazards" on an interim list. Trade and possession of these substances will be punishable of a maximum sentence of one year in prison. The substances are supposed to be on the list for a limited amount of time (perhaps a maximum of two years). After that the listed substance must be classed as either: 1.) a pharmaceutical, 2.) a narcotic, or 3.) deregulated.

(Thanks to E.N. and J.M. in Sweden for providing us with the information regarding this pending legislation.)

### ADDENDUM:

The day before we were going to go to print with this issue, we were informed that the URL for SMART DRUGSTORE INTERNATIONAL no longer connected. We *were* able to connect to the original business at <http://www.smartdrugstore.com>, and there was a notice posted to the following effect:

Goodbye. Yet again the authorities seized our supply of fully legal merchandise. This means that there is no more SMART DRUGSTORE. All present [paid] orders will be processed and we can now arrange for a final delivery before the new law comes into effect in Sweden on the 1st of April...This domain-name [URL] will be given away to our main supplier, who will continue to sell legal highs on the site. Please check in regularly for updates.

### OTHER AREAS OF EUROPE

Other areas of Europe, such as The Netherlands, have less draconian drug laws. A recent issue of the Dutch magazine *Highlife* listed a number of smart-shops. They all sell psilocybian mushrooms, and many sell peyote, *Cannabis* and other psychoactive herbs, MTA, and 2C-T-2. Whether or not they would sell via mail-order to the USA is unknown, and we certainly don't recommend that anyone in the USA order any product that would be illegal to import. Shops included:

### THE THYME GARDEN

**20546 Alsea Hwy. (Dept. ER)**  
**Alsea, OR 97324**  
**(800) 487-8670**  
**thymegarden@proaxis.com/~thymegarden**

While THE THYME GARDEN sells mostly seeds and plants of flower and culinary herbs, they do carry *Salvia divinorum* plants for \$25.00 each. Their catalog is \$2.00.

## SALVIA DIVINORUM

Always on the alert for new businesses that carry this plant, WILL has rooted out the following:

### BUSHDOCTOR

**Esterhazygasse 32-34 (Dept. ER)**  
**1060 Wien**  
**Austria**  
**(01) 587-3717**  
**(01) 585-3718 FAX**

*Salvia divinorum*: live plants (\$22.00), dried leaves (3 grams/150 ATS; \$13.00, 50 grams/1300 ATS; \$113.00).

### CORNUCOPIA NURSERY

**55 Station Street (Dept. ER)**  
**Mullumbimby, NSW 2482**  
**Australia**  
**(02) 6684 3811**  
**botanica@mullum.com.au**  
**http://users.mullum.com.au/botanica**

CORNUCOPIA has a storefront and also sells via mail order. They carry *Salvia divinorum* plants, which they sell for \$25.00 out-of-shop, or \$30.00 via mail order.

### MEDICINE GARDEN NURSERY

**POB 6432 (Dept. ER)**  
**South Lismore, NSW 2480**  
**Australia**  
**(02) 6622 2524**  
**herbmed@om.com.au**  
**http://www.om.com.au/herbmed/mystical.html**

MEDICINE GARDEN NURSERY has *Salvia divinorum* plants for \$40.00 plus \$6.00 S/H within Australia. \$3.00 catalog.

## NOTICE

CLIMAX, listed in the VOL. VII, NO. 2 SUMMER SOLSTICE 1998 issue of *ER* has moved. Their new address is: CLIMAX BV, POB 19057 (Dept. ER), 3001 BB Rotterdam, The Netherlands, +31-10-2142691, +31-10-2143059 fax, info@climax.net, http://www.climax.net

THE HEFFTER RESEARCH INSTITUTE, INC. has moved. They can now be found at: HRI, Inc., 369 Montezuma Avenue, #153 (Dept. ER), Santa Fe, NM 87501-2626, (505) 820-6557, (505) 992-8260 FAX, george@heffter.org, http://www.heffter.org

HEKSENKRING, listed in the VOL. VII, NO. 3 AUTUMNAL EQUINOX 1998 issue of *ER* has either moved (and we can't locate them) or gone out of business.

MAPS office location has moved. They can now be found at: MAPS, 2105 Robinson Avenue (Dept. ER), Sarasota, FL, 34232, USA, (941) 924-6277, (941) 924-6265 FAX, info@maps.org, http://www.maps.org

WILL BEIFUSS is the author of the *Psychedelic Sourcebook*. He wishes to extend a heartfelt "thank you" to all those people who wrote in donating money and expressing their concern for his well-being. He is going to use the cash to fund a research project that will try to determine whether there is a genetic basis for the inability of some people to recognize sarcasm, and—if so—to find a cure for this dreaded condition.

JON HANNA is the author of the recently released second edition of the *Psychedelic Resource List*. He is a free-lance editor, writer, and artist. In his spare time he teaches a class on visionary plants and drugs at the UNIVERSITY OF CALIFORNIA AT DAVIS. He frequently worries that his friend WILL is too much of a smart-ass.

# BOOK REVIEWS

*Advanced Techniques of Clandestine Psychedelic & Amphetamine Manufacture*, UNCLE FESTER, 1998. LOOMPANICS UNLIMITED, INC. [337 Sherman Street, POB 1197 (Dept. ER), Port Townsend, WA 98368, (800) 380-2230], ISBN 1-55950-174-X [Perfect-bound paperback, \$27.95 (WA residents add \$2.21 sales tax) plus S/H \$4.95 (USA)]. 181 pp; no index or separate reference section.

*Amphetamine Synthesis—Overview & Reference Guide for Professionals: Psychoactive Synthesis Series Volume 1*, OTTO SNOW, 1998. THOTH PRESS [POB 6081 (Dept. ER), Spring Hill, FL 34611] ISBN 0-9663128-0-5 [Perfect-bound paperback, \$29.95 (FL residents add \$1.80 sales tax) plus S/H \$6.00 (USA), \$10.00 (foreign)]. 255 pp; with index and reference section.

*Total Synthesis II*, STRIKE, 1998. PANDA INK PRESS [2389 NW Military Hwy, Suite 572 (Dept. ER), San Antonio, TX 78231, <http://hive.lycaeum.org>] ISBN 0-9658291-0-3 [Perfect-bound paperback, \$35.00 (TX residents add \$2.71 sales tax), postpaid in the USA, S/H \$4.00 (Canada & México) or \$8.00 (Europe & elsewhere)]. 291 pages; no index; with references.

The first two books cover the synthetic preparations of a wide range of amphetamines, focusing on methamphetamine but including MDMA, TMA, and related compounds, with a minor focus on producing or replacing restricted reagents and precursors. FESTER delves deeper into the preparation of a few useful but difficult to obtain precursors and disparate approaches to achieve the same end goals, while SNOW expands more fully on precursors involved with analogues (mostly unevaluated in humans). Not surprisingly, both cover much of the same material.

A fact that cannot be escaped, and one that has been downplayed by everyone from the press (at least in the case of FESTER's books) to the publishers, is that nothing in either of these or any other similar book is going to enable the average reader to manufacture speed or any other drug; *unless* they are technologically adept, deviously resourceful, and a hands-on experimenter. The procedures are here, reagent preparation is here, simple recipes are here, but much is untried and all require competent knowledge of safe chemical manipulations, a lab background, adequate facilities, and more than a small bit of chemical equipment. For instance, FESTER describes ways to circumvent limitations on obtaining restricted precursors and reagents—such as anhydrous ether—but most involve complex preparations and/or competent distillations. While some proposals are quite interesting—such as the fractional distillation of paint thinner to yield a suitable replacement for petroleum ether—few are likely to be within the reach of most people who have enough interest to purchase the book.

As well, some of the elaborate schemes for obtaining chemical reagents are now likely to be outdated due simply to their publication. For instance, how many so-

licitations from people claiming to be new “chemical waste recyclers” can be received before alarms start going off? Especially if any sizable percentage uses FESTER’s form letter!

For a trained individual who has a well-equipped lab and well-stocked chemical inventory but who lacks a few restricted precursors, these both can be valuable books and both will enrich their library. FESTER seems to have the most hands-on experience in actually making methamphetamine but he’s also more willing to stray into hyperbolic theoretical musings about alternate routes, and the inclusion of low-yield arcane methods to circumvent unavailability of many items. And, he does not make a clear enough distinction between what is actually tried and true, and what is simply conjecture based on articles encountered in the literature. In FESTER’s book, “this should...” is a phrase that appears frequently.

Nevertheless, both books are a treasure troves for applied experimenters even if they are not interested in methamphetamine. The electrochemical work these books detail could revolutionize production of several visionary amphetamines, not simply meth. (FESTER goes into much clearer details about what is involved; with an amusing discussion of the

electroconductivity of old condoms as applied to isolating the electrodes.) The one point I really like about FESTER is his presentation of this method as a way to enable a competent and dedicated individual to manufacture small amounts for his or her personal use. Anything that removes organized crime from the loop is a step in the right direction. For a person with a technical background, SNOW’s text is much better organized and locating information is simple, thanks to the index. The lip service that SNOW makes about his intended purpose being the education of law enforcement personnel falls far short of his claim as—for the largest part—he makes little distinction between active and untried compounds. This is a surely an important point, considering the inane Analog Act that quite literally declares that the human body itself is an illegal drug factory! To his credit, SNOW does discuss the utter meaningless of this Act in any realistic chemical or pharmacological sense, and the grievous harm it has done, weighted most heavily against legitimate researchers. Unfortunately, this argument is likely to be missed by those using the book as a guide to propose and implement further precursor restrictions. A point that should be made about FESTER is that his book requires ownership of his previous *Secrets of Methamphetamine Manufacture* (now in its fourth edi-

Mind Books offers over 260 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

- Philosophy & Pioneers (32 titles)
- History & Stories (24 titles)
- Public Policy & Law (15 titles)
- Psychology & Empathy (26 titles)
- Religion & Spirit (17 titles)
- Practical Guides (19 titles)
- Traditional Cultures (67 titles)
- Plants & Compounds (28 titles)
- Chemistry & Neuroscience (23 titles)

tion, and also published by LOOMPANICS) in order to have the complete details of many of the procedures discussed in *Advanced Techniques*.

In my mind the world does not need more meth. The attendant problems (violence, manic mindless activity, property destruction, personality erosion, psychotic behavior and other serious mental problems) and the easily demonstrated abuses of this substance far outweigh its obvious benefits of enhancing alertness and endurance. There is far too much meth already in existence and more is being cranked out every day by everyone from well-funded criminal organizations running large synthetic operations in México to amateurs with tiny bathtub labs in Iowa. These two books will probably have very little impact on the actual volume being produced, but they do have the potential for helping existing producers make higher quality materials. Whether this is considered to be a good or bad thing is an opinion that will vary as widely as our reader's backgrounds.

I have deliberately saved the best for last. STRIKE has put out a refreshing look at this same topic but with a far heavier emphasis on MDA and MDMA production. Her lucid and entertaining accounts of preparation procedures leaves the aforementioned books in the dust. Similarly, the approaches to dealing with purifying essential oils, circumventing (or creating) restricted precursors and sometimes difficult to obtain glassware included in *Total Synthesis II* are not only more detailed than either FESTER or SNOW, they are written with an eye for enabling a dedicated and conscientious individual to actually *succeed*. Again this is not a book written for idiots or careless amateurs and, as with the other books, care must be taken to distinguish between the tried and true and the theoretical. But STRIKE's clear writing style, obvious love of chemistry, and knowledgeable attention to details makes this an invaluable resource for any underground chemist. Similarly, the inclusion of guest commentaries from other experienced underground chemists expands the scope of this book from a simple experimental account into a literal nuts-and-bolts presentation that provides us with a wonderfully illuminating look at what goes on in the transformation of sterile published procedures into fertile preparative approaches.

The book does contain a few problems, such as stating hexane forms a bottom layer with water. But any such error that I noticed was fairly trivial and would almost certainly be caught by those readers with enough understanding to actually pull off an organic synthesis. I also feel that the explosion potential is not adequately stressed at several points.

While recommending that anyone with interest purchase all three books, if one wanted to make a choice of the best-written and most useful text, *Total Synthesis II* would win hands-down. Considering how dry of a topic this can be, her work is not simply informative, well thought out and minutely detailed, but also a surprisingly fun read. STRIKE deserves high praise for this timely and enjoyable piece. — K. TROUT

# RONIN PUBLISHING

## World's Leading Psychedelic Publisher!

Books on entheogens including: peyote, psilocybin, MDMA, *Cannabis* (botany, chemistry, growing and medicine), and other psychoactives—from herbal aphrodisiacs to opium and cocaine.

Psychedelic underground culture, drug testing, and drug law. Authors include Timothy Leary, Robert Anton Wilson, John Lilly, and Alexander Shulgin.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## NOTICE

Due to revised regulations for commercial mail receiving agencies by the UNITED STATES POSTAL SERVICE, our address has changed slightly. All future correspondence should be addressed to: *The Entheogen Review*, PMB 808, 564 Mission Street, San Francisco, CA 94105, USA.

# TERENCE

Sunday, May 30: Two dozen people gathered—friends, acquaintances, and unknown fans alike—in a special spot. This was TERENCE MCKENNA'S old California home of many years, where mushrooms were grown, books were worked on, and children were born.

Just before 2:00 pm, the circle was formed—peace pipe passing, incense alight, soft rhythmic drumming, and three blows from a conch shell set the wheel in motion. Healing energy was sent out with love, concern, sadness, celebration, and which seemed quite appropriate, looked out between flowers and learned and inspirations provided

And amazingly, due in large part sands of people worldwide joined TERENCE close in their thoughts and

For those who haven't heard, diagnosed with a cancerous brain "gamma knife" procedure was about 90% of the tumor destroyed. "soft" radiation will be conducted.

standpoint—even with these efforts—the prognosis is not great. An e-mail from his brother DENNIS related that the doctor estimates TERENCE'S life expectancy to be about a year; survival up to two years is known, but rare. And, after about 9 months, "radiation dementia" will set in.

But there have been studies which seem to indicate that prayer has a positive effect on the healing process. Cancers do go into remission. Unexplained miracles can happen. And if there was ever a person whose life is steeped in the inexplicable, it is TERENCE MCKENNA.

On Sunday's drive home from Sebastopol, I turned on the radio, and I could only get one station to tune in. An Irish folk-song told the tale of a fisherman who—facing death—let his friends know that he'd see them again "on Fiddler's Green" (where, of course, all of the women are pretty and all of the drinks are free). And I couldn't help but think of TERENCE, the quick-witted Irishman who tells a hell of a fish story, casting nets into the sea of mind and getting a keeper every time. —JON HANNA

even a few sparks of irreverence—somehow. A photo of TERENCE caapi vine. And stories of lessons were shared by those gathered.

to the power of the Internet, though in at this exact same time, to keep hearts.

TERENCE MCKENNA was recently tumor. On Tuesday, June 1st, a successfully performed, with Additional treatments using Unfortunately, from a medical

# DATURA VISIONS: PART TWO

by Robert W. Gess

Over the next couple of months I experimented with small doses of year-old *Datura stramonium* seeds. I decided that they were somewhat more user-friendly than the fresh ones, but did not take any significant dose. Late in January 1992 I was invited to stay for a weekend at my friend MELISSA's holiday house at Bushman's River Mouth in the Eastern Cape. By this point I was ready to try a large dose of *Datura* again. I was determined that this time I would not disbelieve and dispel the shades, but would try to go with them for the whole trip.

On the Friday evening around dusk, I chewed up 500 of the old seeds. MELISSA and her friends were keen on a night at the pub, and before I knew it I had been loaded up and taken to Kenton, the next little coastal town about 5–10 kilometers away. By 10:30 pm my physical discomfort was quite great, and my vision somewhat blurred. As my companions embarked on playing drinking games, I excused myself and said I would walk back to the other town along the beach. Apparently I never got there (at least physically) 'though I sincerely believed the next day that I had. I remembered being around the people in the house, but seemingly being unable to communicate with them. While there I attempted to pick up a couple of things including a pen and later a matchbox, only to find that my fingers passed right through them. I remember becoming fed up after my fingers had gone through the matchbox several times. I then concentrated really hard and brought my thumb and forefinger to the point where, by all logic, they should have been just touching the ends of the box. I found I could then lift it. I remembered going to my allotted bed and sleeping. I got up to urinate in the night a couple of times, but found myself incapable of doing so.

Around dawn I returned to the beach and soon found myself walking along it smoking a joint, 'though as I hadn't actually returned physically to the house, I couldn't really have had one! The sunrise was a beautiful red, and as I walked along the beach with the pink-tinted foam riding the ripples ashore I felt refreshed, as one who has had a good night's rest.

I met several shades on the beach and as I didn't disbelieve them, they were completely visible. In fact they seemed perfectly real to me in the moment. I walked up to them and conversed at length. One shade I met was a big barbarian type—dark, muscular, hard looking, drawn, and stark naked. I walked up the beach to where he was standing amongst the low sand dunes. The only thing that puzzled me was that when he opened his mouth to speak I could see right through the back of his neck to the dunes beyond. It struck me as odd that his head remained in the correct position, since he must clearly have been missing a few vertebrae!

On approaching the mouth of the Kariega, I met a young mixed-blood shade, perhaps 14-years-old. In one hand he carried a single diver's flipper, a snorkel, and a mask with strap. He suggested we should share the equipment and go for a dive. I threw off my shoes and jumped in with all my clothes on. I could see well and did not worry about the mask, or really the problems of breathing. We swam out and at the interfingering of the river mud and ocean sand came to a small gully. Arranged around the sides of the gully were four moderately-sized rays with long whip-like tails. I swam down and landed in their midst. They became a bit restless and I swam back to the surface where the shade was waiting. I enquired about their identity, and he informed me that they were sting-rays. I could not leave them as they somehow attracted me, and I swam down a second time. This time, however, they seemed more restless and moved around, their tails brushing against my legs. I felt a little nervous and left.

In the shallows I found some recently broken china. I fiddled around on my own, becoming aware that I was once more alone. I wanted to look at the creatures under the rocks. I lifted huge rocks, dropping one through the water about half a meter onto my foot, well nigh breaking it and leaving a bruise that lasted for days. Digging in the mud I discovered some little stones. There were ten of them—white, yellow, reddish and black. In the shallows I found a small rectangular block of rock that looked a bit like a small rock treasure chest. It was very beautiful—a dark rock encrusted with pink and mother-of-pearl oyster shells.

On the bank I met the shade of an old black woman. She was dressed in the traditional garb of a Xhosa matron. I held the ten little pebbles out to her in offering. She said she had been under the water and collected a set herself, which she had given to her nephew for counting cattle. She indicated that I should keep them so I put them in my pocket.

Perhaps because I was carrying the large square rock I assumed—wrongly of course—that I had my geological hammer with me, and I went back to the river bank to look for it, naturally enough having no success. I found a flesh and blood fisherman a little further along the bank, and attempted to master enough control over both my mind and tongue to ask him to look out for it. When he asked what he should do, should he find it, I was flummoxed. I didn't really know where I was. I gave the poor man the address of my girlfriend's parents' resort hundreds of kilometers up the coast. It was all I could think of. As I wandered along the block of rock became too heavy and I hid it in some bushes.

Somewhat later I decided to go back to the house and tried to work out where it might be, having visited there for the first time yesterday. However, believing that I had spent the night there, I assumed that now I must now be in the town of Bushman's River Mouth, not Kenton (Kariega River Mouth). Remembering the house to be near the river front I combed the streets near the river, but could not find it. I knocked on a door and a woman answered it. I gave her an edited version of my predicament. Presumably she noticed that I was extremely dry-mouthed, as she gave me a glass of fruit juice and offered me breakfast. I thanked her and declined the meal. I discovered that I was in Kenton and felt most confused, still being sure that I must be near the town where I assumed I had slept. Was I not confused, I wondered, and the house perhaps in Kenton? No, I seemed sure it had been at Bushman's.

I left Kenton by the motorway and began walking. I had no sense of time or distance. I chatted to the shades as I walked along. I often cadged cigarettes from them and had the full experience of smoking them. As the particular shade drifted off, I got the sensation of dropping the cigarette. I could, however, never find it—'though on occasion I crawled around on the blurry-looking road searching for it. Many of the shades I only heard as voices, but never saw.

At length I came to a turn-off down to the town, and decided to try for the house here, in Bushman's. I headed down to the streets by the river. The houses looked very familiar. I

knocked on a door and a woman answered it who was rude to me. I came to a store and explained that I was looking for a house I had only encountered in the dark. During the exchange I discovered I was in Kenton again. I couldn't understand how this could possibly be, not realizing that I had left Kenton by one entry road, and returned to it by another. I confessed that the house I was looking for was perhaps at Bushman's. The woman was very kind and helpful. I thanked her and said that some other woman had been rude to me. She said she could not understand why someone would be rude to a nice young man like myself. She arranged for her husband to give me a lift to Bushman's. I was coming down a bit now and in the vehicle forced my mind to cut out the chatter of shades so as to avoid breaking into a reply in front of the driver.

After being dropped off I walked along chatting to a shade I took to be my friend MARCUS. I sat down on a grassy slope. Then it seemed as if I were speaking to him on the telephone. Passers-by looked at me oddly. Suddenly he stopped responding. I shouted into the phone at him. Then once more I caught a glimpse of normative reality: I was holding a rock in one hand, while another larger one was before me on the ground.

I continued on down to the riverside streets and walked up and down the right one without finding the house, checked the neighboring streets, went back to the correct one and then wearily sat on the curb and quietly relaxed back into my trip. After a while two men came driving down the street in a beach buggy. I waved them down and tried—without reference to the *malpitte*—to explain my confusion to the driver. After a while I turned around and realized that I was sitting in front of the very house! With some chagrin I explained this, and they drove away.

It was now probably early afternoon. A note on the door explained that MELISSA and her friends were very concerned and had phoned every hospital and police station in the area, alerting them to look for me. As twenty-four hours had not yet elapsed since they last saw me, they had not been able to open a missing person's docket. I found this very odd, as—having seen them the last night—I assumed that they had seen me.

I went out on the back verandah, sat down and rolled a nice genuine joint. The MARCUS-like shade materialized from the branch of a small guava tree, the pruned trunk of which resembled a skull. He helped a shade who vaguely resembled MARCUS' girlfriend from a smaller branch. They were dressed

in Edwardian clothing and came to sit beside me on the verandah. They were by now very faint as the *Datura* was wearing off, so I looked at them as little as possible lest my ground-side mind dispel them. They chatted, but declined the joint when I offered it to them. It occurred to me that they probably weren't capable of smoking it. Later, finding myself alone, I summoned the male shade back by concentrating on the branch from which he first materialized.

The visions were now fading, and MELISSA arrived home. She was very relieved to see me and informed me that I had been missing since the previous evening. I was confused, so she pointed out that my rucksack was untouched and my bed unslept in. I still don't know where my physical body spent the night, but the beach seems the most logical solution.

In the evening I went to the house of some friend of MELISSA's with other people, got a bit drunk and felt very tired. I excused myself, had a little difficulty finding the house and then crashed into bed. The next morning, as I put my clothes on I noticed that they stank, and realized it must have been from all the *Datura* chemicals being sweated out of my body. I put my hand in one pocket and found my keys all rusted with sea water. In the other pocket I found the ten little stones from the river. I went down to the water for a cool refreshing swim, after which I felt essentially fine.

My last major *Datura* experience was in September of that year. STEWART was in town and was fascinated by my accounts of my experiences, which kept coming up in conversation with KENT, as he and I tried to make some sense of them, and of his experiences on moonflower. STEWART was one of those dressed-in-black city kids who like people to think that they could be found hanging around graveyards at night. But he was a great guy, full of fun, and quick to smile. He only had one problem. He had tried acid, he had tried moonflower, he had probably tried a few city basement "majikal" sessions, but somehow he had never been aware of anything really of The Other. He was looking for one grain of sand from the sea of eternity. He started to bug me to take him on a *Datura* adventure.

One Friday I got back from the school where I was teaching and thought, "Okay, I could happily take *Datura* today." So, on that whim, I got KENT to drive me and STEWART to a nice little valley outside town where there were old *Datura stramonium* bushes, trees, and an old farm dam. I asked him to come out the next morning to bring more drinking water and check that we were doing okay. STEWART and I gathered some

seeds, collected a little firewood, and found ourselves a pleasant campsite on a kind of semi-headland island sticking out into the dam. We sat around a fire smoking *Cannabis* until about midnight. Then we chewed up about 400 seeds, and hunkered down in our sleeping bags. STEWART threw-up some of his seeds and then we fell asleep. I had observed before that the first five hours or so of the experience were the worst; the poison wracks the body, which has not yet responded, and the mind has not yet distanced itself from the physical vehicle. I had memories of blurry eyes, dry mucous membranes, a taste of steel, a throat so parched I feared it would physically crack, of peeling my tongue from the roof of my mouth with one finger, and a stomach so queasy it dreaded swallowing water. This time I had decided we should try to sleep through the physical horror and simply wake up in Wonderland.

The next morning the sun woke me. My mouth was dry and my stomach felt a bit queasy. I tried to raise STEWART but he was like a lifeless sack of corn. I decided I wanted a drink of water and attempted to stand but found I had forgotten how. I crawled to the water container to have a drink, after which I felt nauseous and threw up. I figured the seeds had probably been there long enough. I pulled myself up and soon mastered both standing and walking. I then attempted to walk down to the near dry dam bed, and fell. I now found I couldn't walk up or down a slope without a whole lot more practice. I still couldn't rouse STEWART, even with a few solid kicks.

My trip became a bit fragmented as I went back and forth to check on STEWART, and later to try to assist him, as after he surfaced he became a bit fearful. I think it was to give STEWART some sense of security that I introduced a new game. The big *Eucalyptus* tree behind our camp was my house, complete with front door, shelves inside and such. A roughly cave-shaped bush on the bank was STEWART's house, also with door and the like. Things now seemed more comfortable, so we began to explore our own trips. I stretched out my legs and sat admiring my garden of weeds and grasses.

Just then KENT came walking along swinging a stick and smashing all the weeds. I rushed out at him shouting furiously that he was destroying my garden. He asked how I was doing. "Oh very well," I replied, "but I'm tripping. I think I took some drugs." I didn't really remember at first that there was any connection between KENT being there and us being there, or exactly what substance I had consumed. STEWART came over and reached for his jacket where he recalled throwing it

over a log. He was alarmed as all he got was a handful of *Eucalyptus* bark. Concerned I went over to where I believed I had left some laundry on a log to dry. I found my shirt as stiff as a board; like the Emperor's new clothes, mine were crumbling and melting into a heap of nothingness, leaving my hands full of bark. KENT then found me carefully bundling together a bunch of sticks and things. On his inquiry I informed him that these were components of my camera, which now was also falling apart.

Walking with KENT back toward his car, I noticed a large elephant amongst the trees on the track up ahead. I was very excited and pointed it out to him. KENT didn't seem so impressed, so I began to rave about how rare woodland elephants were these days, and how long it was since the last one was seen in the area. "I don't see any elephant," he replied. I realized that he was in a completely different reality than I was in. African shades stuck their heads around the trunks of the trees and laughed at my predicament. "Ask the laughing black men behind the trees," I responded, realizing that they were aware of both realities. KENT just looked at me. "Oh, you can't see them either..." I trailed off.

I took a long route back towards the island. At one point I came across a clearing where there were a number of *Datura* bushes. Although the earth was parched and fairly barren at this point, and it was a hot African day, I suddenly felt extremely comfortable. I sat down. I became increasingly aware of the presence of the *Datura* bushes. Slowly I felt my reality slide until I was experiencing the world through some aspect of the consciousness of these bushes. I stayed with this for quite a while, being aware of the sunlight and the breeze. Then I noticed that where the *Datura* bushes had been there now stood a group of roughly four-foot tall effervescent emerald-green humanoid figures engrossed in communication. They paid no attention to me.

I got up and moved along, and walked into a patch of thorns (I was no longer wearing shoes). I sat down to remove the thorns from my feet. Later, I stepped on top a spring steel animal trap concealed in the leaves. This was purely a vision, as I had no marks the next day. I did, however, stand on a small flesh-and-blood snake. I put my foot on its neck by mistake. I looked down and saw just its head protruding from under my instep. On the other side of my foot was a coiling

## What's New!!!

Beginning in July you can order by phone from a live person 9:00–5:00 (CST), Monday—Saturday, using our new toll-free order number (877) 685-9199. VISA and MASTERCARD accepted.

Our brand new 1999 catalog is now available for your perusing pleasure. It's free, so don't hesitate in getting a copy.

We have literally dozens of new exotic botanicals available, including many exciting new healing and teacher plants. I don't want to spoil the fun and list them all here. You will just have to check our web site or catalog.

❖ *Salvia divinorum*, *Psychotria viridis*, *Banisteriopsis caapi*, *Desmanthus illinoensis*, *Peganum harmala*, *Diplopterys cabrerana*, *Ipomoea tricolor*, *Eschscholzia californica*, *Calea zactechichi*, and *Virola* are some of the many herbs now available in large quantities at **wholesale prices**.

Herbal-Shaman, POB 8892 (Dept. ER), Wichita, KS 67208 ❖ (316) 685-9199 ❖ <http://www.herbal-shaman.com>

twisting psychedelic thing made of brown and red. I realized the potential problem and tried jumping straight upwards—but somehow it struck my foot just above the instep (leaving tiny, lasting fang marks) before slithering off. By the side of the small dry dam I came across some yellow-flowered, ground-growing *Helichrysums*. I felt convinced they were of medicinal value, so I stuffed some into my pocket.

When I got back to camp, STEW was still looking forlorn, but now seemed to have taken on an emerald green hue. I looked down at my hands and I too had taken on the green color. I couldn't really communicate very well with STEW but stayed near camp to be somewhere around. I later discovered that while comatose in the early morning he had projected to KENT's house where he was staying. He had a vision that two of the local narcotics officers had arrested both of us and had severely abused and violated him. The whole day he had been immersed in misery and concern for an event he was certain had taken place. When KENT arrived in the late afternoon he managed to disabuse him, after which STEW began to regain some of his normal bounce. Both STEW and I were by now only dressed in our jeans, our pockets devoid of keys and money, and a search of the area by our friend turned up nothing. I expressed the opinion that I had left most of my stuff in my house.

KENT took us into town but we didn't feel like sitting around so we set off through the dusk to look for a party that friends of ours were having. Along one pavement was a row of trees, the trunks of which branched low down before twining together upwards towards the branches. Each one seemed to us an explicit pornographic depiction of people coupling. We did not wish to stare too long at any one spectacle, lest passers-by see us and think we were perverts. Finally, we reached a tree in which someone had wedged a few round rocks between the forked trunks, seemingly to enhance an image of two children standing watching two adults copulating. We were a bit shocked at the artist's taste and continued onwards. Seeing a house with cars outside and music issuing forth we entered confidently down the passage and into the lounge. There, wild-eyed and bush-crazy, we found ourselves in a room filled with rugby-playing types dressed in white sheets for a toga party. They kind of moved backwards into a circle, equally surprised. It was the old Roman/Barbarian standoff. Being severely outnumbered we took the element of surprise and walked briskly out the way we had come. We *did* finally find our friends' party, before stumbling home to our beds.

Some of our friends had recently had some hassles with narcotic officers concerning *Cannabis* possession. On Sunday morning we were sitting with them in a private and safe garden having just smoked a joint. KENT was in the house. Suddenly the two officers of STEWART'S vision were running towards us. They searched everyone but found nothing. They smelled everyone's hands and grew very frustrated. They looked at STEW and myself and then just grabbed us. "We're placing you two under arrest," they declared. It was illegal of them, they had no right to arrest us. We were, however, still a bit foggy after the trip and didn't know how to respond. STEW asked to go inside to get his jersey and rushed to get KENT'S assistance. KENT had heard all of this yesterday so he reassured STEW, "You're probably still tripping. Why don't you go outside and check again." When he went back out, he was dragged away, with me, down to the station for a first round of intimidation. Of course they really had nothing on us, so there wasn't much to fear, but the next morning STEWART had fled town.

## DISCUSSION

All of this left me with many questions. I had no doubt that a lot of it was, in some way, quite real. GRIMM'S fairytales had come alive. This was the stuff of those bedtime stories that had been passed down to us from our distant pagan ancestors. I had, at moments, briefly tasted Wonderland, Narnia, or Middle Earth. At other times things had been more like a deranged dream. Virtually everything, however, differed from dreams in one major way. In a dream the dreamer is prostrate, whereas his image is always of the same stuff as the dream, and the landscape is often not this one (or is this one reinterpreted). These *Datura* experiences took place within the normal landscape through which we moved and in which we interacted with other beings. This has also been the experience of other people I know who have independently experimented with *Datura*.

To be properly examined, these experiences need to be in some way categorized. My understanding can best be explained in terms of a diagram (FIGURE 2). In this, levels of consciousness are represented two-dimensionally as vertically arranged horizontal lines. The base line represents "ground zero." The curve indicates the trajectory of a strong *Datura* journey. The lower cross-hatched area represents that region of experience acceptable to the filtered, rational, ego-connected part of our mind. That above it goes beyond the

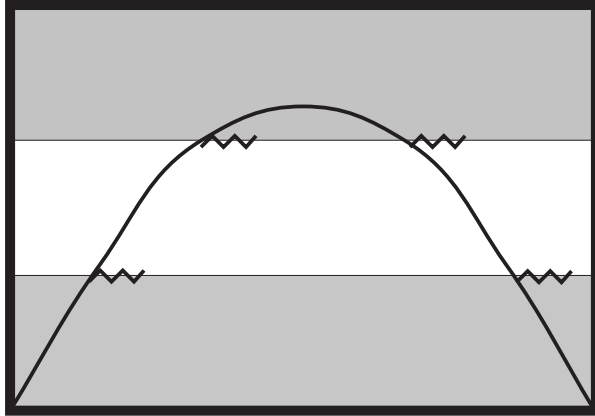

FIGURE 2

boundaries of what we would normally find acceptable, but enters into a real area of contact with spirits, shades of past animals and people (the ancestors of shamanic religion), plant spirits, and probably much more. Entering into the vertically cross-hatched area one's etheric body peels away from one's physical body and becomes the matter of the shades themselves. In fact, at this point, an interesting reversal occurs. Whereas in the previous area the etheric seemed insubstantial and the material solid, here the etheric becomes solid and the material insubstantial. The transition from one state to the other, and back again, therefore carries a potential for some disorientation.

The peeling away of the etheric body with the mind, and its entry into the realms of the dead and the world of the spirits, is in interesting contrast to when one leaves one's body on LSD-like entheogens—and the etheric body remains behind within the physical body. It was clearly within this etheric body that the medieval witches flew to their meeting places and danced with Devas whilst their bodies lay heavy and greased, locked in their cottages at home. A clear vision of intention and destination, set within the witch's mind before the onset of the unguent's effect, may quite probably have guided the course of their journey—just as my intention when setting out on my third trip, to return to the house at Bushman's, carried me there long after my body had laid its heavy self down. A friend of mine, JON, after being dosed by ADAM—a fanatical experimenter—with a *Datura* seed potion, was eventually taken home and put into bed where he became completely immobile. Vaguely wanting to see ADAM, he found himself gliding or floating out of his door and down the street, until he was approaching ADAM's house. Then he was in the decrepid kitchen where they had taken the potion, but everyone had gone long ago and he found himself yanked back to his body. In some similar way, perhaps, did the witches of our legends walk invisible through the camps

of their king's enemies? REMY, writing in 1596, had clearly grasped this point for he says, "Now if witches, after being aroused from an 'iron' sleep, tell of things they have seen in places so far distant as compared with the short period of their sleep, the only conclusion is that there has been some unsubstantial journey like that of the soul."

But I haven't finished explaining my diagram. At those points where the trajectory intercepts with the horizontal lines on the way up and the way down I have drawn zigzag lines. These lines represent areas of transition where confusion is likely to arise. At the first one the mind desperately tries to preserve its world view. It tries to interpret voices as belonging to people it knows, and will even read their faces on the visible manifestation of an etheric being. On my second trip I did not penetrate beyond this point as I was desperately trying to hang onto my self-perceived rationality, and simply remained on this line—which was a progression from my first trip, on which I did not even reach this line. The line is encountered again in a corresponding position on the downward trajectory. This is well illustrated in my third trip when, as I was coming down, I began to become confused, and to interpret voices and fading images as those of my close and trusted friend. Or am I wrong, and in one's need for the familiar at this point can one contact some past, parallel, or higher aspect of people one knows? I have not completely decided. At these points the mind can also create impressions of familiar things that comfort it, such as cigarettes, joints, clothing, or shelter.

One of the people who took of the potion with JON returned to his digs the next morning covered in cuts, tears, and human excrement, where he was found cooking imaginary eggs in a pan on the stove. After explaining to a digsmate that he had done battle with a demon during the night, he used a spatula to flip the contents of the pan, seasoned it, and offered to share it with his friend. Clearly these forms of confusion may be exacerbated by the presence of people anchored to ground zero.

Once through the transition, however, on the way up, the freshness and separateness of the entities becomes very apparent. When I tried to recall the words spoken between myself and some entities encountered deep into the second space, I experienced a problem. Then I realized perhaps this was because we weren't speaking in English. People tripping on *malpitte*, when encountered by other people, often appear to speak some strange and unintelligible language, mutually understandable amongst themselves and to the invisible

beings they suddenly turn to address. Is this the language of Babel—the common language of the ancestors? It is interesting that people may have experiences in common with other voyagers whilst within this consciousness. I know several examples of people who have observed the same entities together. Two friends of ours, around the time of JON'S experience, were sitting in the lounge of their locked house one day, digesting a fair wallop of *Datura*. They did not think twice when an elderly couple entered the room and engaged them in a dialogue that lasted several hours. After the elderly couple had left, the other two decided to take a walk, and were astounded to find their door and security gate still bolted and locked.

And what of the little green beings? I decided that these were the manner in which my mind could conceive of the higher spiritual form of the plants. It occurred to me that, if the plants live at a different speed than us—one in which we move ridiculously fast, and their growth and movement is slow, steady, and visible—then a group of *Datura* spirits might move across the land together looking for places where the planet was hurt and had open wounds. Standing there together to discuss or meditate, they might incarnate seeds in the area to spring into life. Perhaps the duration of the entities ensemble might represent the full life-span of the plant. I was much reminded of this supposition recently when watching DAVID ATTENBOROUGH'S *Secret Life of Plants*. The

stunning time-lapse photography shows plants actively moving their limbs, nudging each other, and responding to environmental stimuli.

When a tatty, coverless, ownerless copy of the teachings of DON JUAN found me shortly after my experiences I was delighted to discover that on one occasion after taking peyote, CARLOS CASTANEDA claims to have encountered the father-of-all-peyotes as a green humanoid entity.

One lazy afternoon I was smoking a joint with a little dwarfish friend of mine named JOEL. It was actually before I came by the CARLOS CASTANEDA book. I commented to him that as I had encountered ordinary ghost-like individuals, as well as bright green ones, I figured that for this type of exploration one could perhaps use a map, containing a color code for entities. He volunteered that he thought he knew of one and went off to fetch a pile of books on the Qabalistic Tree of Life—the product of Hebrew mysticism that inspired the alchemists of old, and provided the basis for much of the western occult. In a book by DION FORTUNE (a former member of the late Victorian GOLDEN DAWN LODGE) I discovered that the universe was traditionally represented by ten spheres, each symbolically governed by heavenly bodies. Each of these spheres was characterized by different consciousness, and by entities of a different hue. For example, those under the dominion of Saturn, associated with sorrow and the inevitable death of all things, were black. Those of Mars, the planet of dynamism, war and power were red. Jupiter, associated with wise and loving judgement had blue ones, whereas those associated with beautiful Venus, the mother of nature, were of emerald-green hue.

It was believed that the planes, or spheres, were necessarily accessed within an order rising up the tree, from the prime material, represented by the Earth at the base of the tree's trunk. It is therefore interesting that the sphere ruled by Venus is only two steps up from the material. The sphere lying in between is that ruled by the Moon known as Yesod. This sphere is that associated with "Aetha," the underlying three dimensional blueprint of all in the material world, including our bodies. DION FORTUNE expresses the understanding that Aetha may be molded by the human mind (and as such may be encouraged to arrange matter). She explains that the bottom four spheres represent the "Personality, or unit of incarnation," the triangle above it "forms the Individuality, or Higher Self," while the top one "corresponds to the Divine Spark." This could go a long way to explaining the two types of out-of-body experience mentioned earlier, as

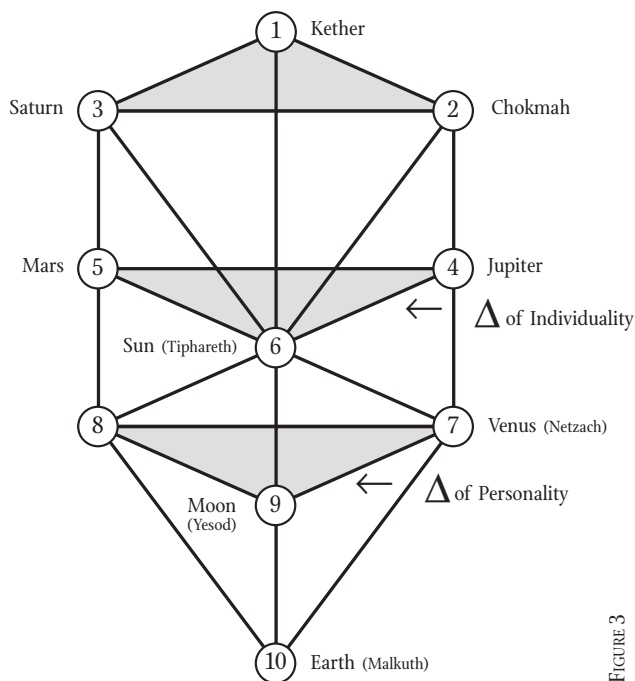

FIGURE 3

the *Datura* one is perhaps associated with the “Personality,” whereas that of LSD-type entheogens could be seen as corresponding more to the “Individuality.”

FORTUNE goes on to reveal the following relevant knowledge. “Yesod also is of supreme importance to the practical occultist, because it is the first sphere with which he makes acquaintance when he attempts to ‘rise on the planes,’ and lifts consciousness above Malkuth [the Earth plane]. Having trodden the terrible Thirty-second Path of the Tau or Cross of Suffering, and of Saturn, he enters Yesod, the Treasure House of Images, the sphere of Maya, Illusion. Yesod, considered by itself is undoubtedly the Sphere of Illusion, because the Treasure House of Images is none other than the Reflecting Aether of the Earth-sphere, and corresponds in the microcosm to the Unconscious of the psychologists, filled with ancient and forgotten things, repressed since the childhood of the race...Not a great deal can be said concerning Yesod, because in her are the key to magical working.” FORTUNE cautions of the futility or danger of attempting to work magic within the “Personality” spheres without first having gone beyond them to the sphere of the Sun [Krishna/Buddha/Christ center] for otherwise, “although he can perceive the Images in the Treasure House, he has no word of power to command them.” She also comments that “the Moon has three goddesses assigned to her, Diana, Selene or Luna, and Hecate, the latter being the goddess of witchcraft and enchantments.” All this is so relevant that one cannot avoid asking what techniques this magical order used to walk the path of suffering, watched over by the sphere of death, in order to reach the archetypal world. CROWLEY, the bad boy of the Order was renowned for his drug habits, but what of the others? DION FORTUNE, who was virtually CROWLEY’s antithesis, stated in *Psychic Self-defense*, “It is well known that there are various drugs which can be used to exalt consciousness and induce a temporary psychism.” Between cautioning people on the legal and health issues, she comments, “There may be research workers who for legitimate reasons wish to undertake experiments, but I cannot conceive of any legitimate reason for introducing a neophyte to the drug habit.” It is perhaps no coincidence that CULPEPPER assigns *Atropa belladonna* to the sphere of Saturn.

One more thing deserves a short discussion. The incident in which I went under the water and received my stones is not without parallel in African religion where young shamans or shamans-to-be may be taken under water by the spirits, often to receive instruction, and sometimes for a long time. I have been told that sometimes their friends or relatives must

make offerings of beads upon the shore to secure their release, the necklaces being drawn into the water before the reappearance of the individual. Shortly after my experimentation I heard the story of a “schizophrenic” African boy, who lived near my girlfriend’s parents’ coastal resort. Although he never went near the beach, he was one day found drowned on the shore.

In 1996 I was reminded once more of my handful of stones when I visited the museum in Nairobi, Kenya. On display in the ethnology section was a Kikuyu diviner’s bones, used for divination, which consisted of an assortment of smooth river-worn and other stones, hooves, pieces of metal, cowrie shells, teeth, seeds and other small things of magical and historic interest. According to the caption, “the smooth stones are obtained during his initiation, when with his head under water he has to grasp two handfuls of stones from the stream bed.” This is another whole side of things, which I still intend to unravel. ✧

## PURE LAND ETHNOBOTANICALS

We offer over 100 concentrated extracts of significant ethnobotanical species, and fresh seeds and bulk dried plant material of over 350 species and varieties. We import the highest-quality non-consumable materials possible, bringing them to you at a fair price. Select research chemicals, isolates and essential oils also available worldwide shipping.

# HYPERSPATIAL MAPS

## DPT: A ROUGH TIME

11:32 pm: Insufflated 35 mg DPT hydrochloride. Strong burning sensation in nose, very powerful chemical taste runs throughout head into mouth.

11:42 pm: Strong alerts; visual perception is changing rapidly. Patterns appearing in strong waves. Strong chemical feelings and an overwhelming nasty taste.

11:50 pm to 12:00 am: Very strong rushes, rapid breathing, increased pulse, hands and feet are clammy, slight tremors throughout body. Everything is starting to feel very chemical, reminiscent of LSD—and unexpected discovery. There is some general confusion. The onset is STRONG. I've become extremely light-sensitive. Immense washes of color and fractaling patterns of running liquid spread over all surfaces. I turn off the lamp and light a candle on the dresser. An auditory hum is cranking up, accompanied by slithering sounds that just barely hover on the edge of audibility.

12:00–12:30 am: A raging torrent of sensation. Legs are starting to tremble very rapidly, in conjunction with the apparent auditory waves. (This, over the next hour, keeps me worried and preoccupied.) My partner massages the backs of my legs a bit and she notes that they are very tight. I am becoming afraid—afraid of convulsions. I curse that I ingested this stuff. I start going over in my mind what neurological damage I might have caused myself. I swear I will never do it again, and then extrapolate that this goes for any other substance. We discuss it, but in a dispassionate way. My partner is very calming with her attitude and this starts to relax me. I slowly let go and slide into the experience even more. The legs to some degree distract me from what is occurring inwardly, and from what I have tapped into in the parallel universe that I am becoming a part of.

I appear to be observing a vast, interlocking hive with insect/reptilian creatures in a very strange and dark dance. As I watch, I feel my flesh is both chitinous and scaly, flexible yet hard and burnished, reflective of light and darkness. I feel antennae emerging from my forehead; mandibles as my arms. This is so bizarre—like the old HAMMER horror film

*5 Million Years to Earth*. I am part of it but I am also observing it. Somewhere I still retain my humanity. Visuals are strongly moire-like, with pools of the hybrid creatures comingling and slithering about. The air is dank, rich with alien smells and sounds. An astounding beauty—black, yet voluptuous, with odd couplings and mental energies. Some of the creatures are arachnid hybrid-types, nesting in moire-patterned webs, eyes soft and compelling—calling me in to join with them. This is a totally alien world. Surfaces take on a look like leather and velvet, scaled with reptilian, chitinous extrusions. A thrumming vibration goes on unceasingly, pulsing and animating everything with shared awareness.

12:30–1:00 am: A strong odor is streaming from my body. My partner compares it to “a walk through the ape house at the zoo when it is 86° outside, overlaid with a marked chemical smell.” Umm... now *that* is pleasant to find out. The smell permeates the room. The vibration lessens in the legs and buttocks, ‘though they are still quite tight and feel like sausages! Some of the anxiety is lifting. I go to the bathroom to take a shower out of mercy for my sweetie. The experience is refreshing, and I come back to the bedroom in a good state.

Slipping more into reverie, a deep, abiding trance settles in. I can hear sounds of the jungle—insect twittering, birds calling, wind in the trees. Everything feels very high-end tryptamine-like, and patterns take on a more dynamic flow. Reptiles run through the shadows cast by the candle around the room.

1:00–1:30 am: Trembling generally ceases, with a few sporadic jumps here and there. My partner drifts toward sleep, ‘though we still talk quietly and hold each other. Tactile sensations are very heightened. My nose feels abused!

1:30–3:30 am: The downward slope. Patterns are still strong, but slowly letting go. I drift toward sleep around 2:30 am. I am submerged in a warm, comfortable flow. The tryptamine edginess is decreasing exponentially. I mull over in my mind my role in life, and where I want my focus to be. I rescind the “no substance order” from earlier, but feel my attention has been more fixed on them than is needed. I awaken often, and feel I am still very-much taken by the DPT. — GWYLLM, OR

## DPT: MYSTERIUM TREMENDUM

45 mg DPT insufflated. I experience a deep reverie (during entry) on the mechanics of life and creation. It seemed like I had merged in being with a star or stars just being born (literally sharing the space that formed this experience; this astronomical scale perception became the entirety of my perceived consciousness). The resulting experience felt like a thermonuclear orgasm that splattered my consciousness across a vast area of time and space. (Including many places I had never been before or been aware of.) It took almost half of the experience (1 hour, 50 minute peak) just to draw myself back into one (more or less) coherent being and reassemble my mind. I had never been so widely dissipated and dispersed in my life. It was definitely one of the true peak experiences of my life so far.

During the experience I found myself in a state with no boundaries between me and the rest of the world. There was no sense of ego loss; just expansion into a framework where the merger obliterated any notion of true separateness yet allowed the base-anchored perception of individuality within the maelstrom of larger consciousness. It seemed like there is a dual existence, the totality of which forms what is perceived of as each of us, and each path of this can form a communal link tying people together in a giant web-work spanning time and space. Allowing myself to spill out from what was normally perceived of as my boundaries (where I start and stop in the physical) my being would flow into a larger space (like water in a glass if the walls were removed) by gliding along adjacent paths. I would find myself having other people's or animal's experiences simultaneously with them. I have no idea if any were aware of my presence, but it did not seem like it, as I seemed to exist on a scale large enough to easily envelop the boundaries of their perception with seeming infinity to spare. I've gotten pretty far out there before but this was quite interesting. — JUSTIN CASE, TX

## AYAHUASCA... STIRRED OR SHAKEN!

Suppose somebody brewed up a big batch of ayahuasca using the analogue plants *Peganum harmala* and *Mimosa [tenuiflora]*. Suppose they measured out a medium-sized serving and had a moderate effect. Suppose several weeks later they pulled the jar out of the refrigerator and noticed that the solid material had settled to the bottom of the jar, leaving a relatively clear, impotent-looking liquid at the top of the batch. Suppose the person drank a smaller quantity of this than their first serving, expecting only a mild threshold reaction. Suppose this person was unaware that in most liquids—water included—alkaloids will float to the top, concentrating into a liquid of unexpectedly strong potency. This produced a horrifyingly intense experience that was much more than the person bargained on getting. What lesson was learned? *Completely stir or shake any liquid preparation before ingesting!* — R.S., CA

# ENTHEOGENS IN THE NETHERLANDS

by J. P. Morgan and René Rikkelman

Except for *Cannabis*, *Erythroxylum coca*, and *Papaver somniferum*, the Dutch OPIUM LAW does not place a “verbod” (prohibition) on the earth’s many varieties of psychoactive plants in their natural state. Indeed, the latter two are only illegal after harvesting; growing them is legal. And while *Cannabis* is technically illegal, its sale and use in small amounts is rarely prosecuted. (Although this depends on what city one is in. For example, in the province of Zeeland it is unwise to smoke a joint in public, especially if one is a tourist who looks wealthy, as the local police like to arrest such people and present them with large fines. But in cities like Amsterdam, you might even find the policemen *themselves* visiting the “coffee” shops after they are off duty.)

Thus, fresh psilocybian mushrooms, *Tabernanthe iboga*, *Salvia divinorum*, *Ephedra* species, *Catha edulis*, *Banisteriopsis caapi*, *Psychotria viridis*, and many other “drug plants,” are perfectly legal in this small land of educated tolerance. (Note that prepared ayahuasca containing DMT is illegal.) *Lophophora williamsii*, however, is an officially protected plant; hence the police could technically take action against the numerous shops that sell it (since it is considered in danger of extinction). However, it would appear as if almost no one knows of this “status” that *L. williamsii* holds, and sales continue unhindered. And while you won’t have any problem growing *Ipomoea* or *Argyrea* in the Netherlands, LA-111 (or ergine) is considered a hard drug when distributed in preparations such as pills, even if it is extracted from plants. (LA-111 became illegal in February 1966, on the same day that LSD, DMT, psilocin, psilocybin and mescaline were made illegal). But dried *Ipomoea violacea* seeds can still be bought at florists and even supermarkets. Pills made from *Ephedra* are legal since ephedrine is not in the OPIUM LAW.

The newly-established UNIT SYNTHETISCHE DRUGS (USD) investigates if “Paragraph 174” of our law can be used for new unscheduled psychoactive materials that are distributed. “Paragraph 174” states that someone who possesses/distributes/applies a substance while knowing that the substance is toxic or unhealthy (but without telling that the substance is dangerous) may receive a sentence of sixteen years imprisonment. It is the same paragraph that was used in the first LSD case in the Netherlands in 1966 (which never came to

trial), before LSD became explicitly classified as a hard drug. The difficult point for the USD of course is that bonafide smart shops give good (dosage/duration/set/setting/cautionary) information about how to safely use their products. And they do not distribute unsafe or untested materials, like 4-MTA. The “Paragraph 174” approach has so far only been successful when it was used against the distributors of atropine pills, who sold them under the name “XTC.” It *may* be effective if used against the producers of 4-MTA. But 2C-T-2, 2C-T-7, and others simply are not toxic enough in reasonable doses. (Remember that *everything*, including water or oxygen, can be toxic when the dosage is big enough!) Both ayahuasca and *Salvia divinorum* extracts may also be a target for an “Paragraph 174” attack since the concentration of psychoactive compounds in different brands may vary, and since 5-MeO-DMT and salvinorin A are so incredibly potent. As well, the “combination-pills” sometimes sold that contain both *Ephedra* and *Hypericum perforatum*, may be a target for “Paragraph 174” too, since “serotonin syndrome” may be caused by a combination of ephedrine and a MAOI.

As far as synthetic compounds go, many variations—like MDMA and MDEA—were banned a decade ago. Some, like MDOH, 2C-B, and GHB, have been banned only within the last two years. Others, such as MTA, 2C-T-2, and 2C-T-7, currently enjoy legal status, but whether that will remain so is anyone’s guess. Of the tryptamines, only DMT and DET are illegal.

With regard to 2C-T-7, it is still questioned if it actually is available in the Netherlands, or if the pills that are sold under that name are *really* 2C-T-2, as these originate from a supplier other than the well known, high-quality, 8 mg tablets from Amsterdam.

It is interesting that MDOH is the only “OH” variation of a psychoactive material that is declared a hard drug in the Netherlands. The “OH” variety of MDMA (called FLEA in *PIHKAL*) is legal but unavailable for some reason, as are the “OH” varieties of all other interesting materials. A quick look at the *PIHKAL* entries for MDOH and FLEA should make it clear why unscheduled “OH” varieties may play an important role in the near future.

Since an art gallery named CONSCIOUS DREAMS began selling psychoactive mushrooms in the center of Amsterdam in 1994, thus setting a legal precedent, smart shops have begun to appear everywhere in the Netherlands within the last three years. Now they can be found even in small towns and villages.

An abundance of natural energy-boosters, vitamins, aphrodisiacs, and anti-stress combinations are available in the nation's 100 or so "smart shops," 60 of which united in July, 1997 to form a professional trade union, the VLOS; VERENIGING LANDELIJKE OVERLEG SMARTSHOPS (the NATIONAL CONSULTATIVE UNION OF SMART SHOPS).

So many have opened in Amsterdam, that mayor SCHELTO PATIJN is afraid they'll create a "negative image" of the inner city. He and the city council are trying to come up with plans to freeze the number these "undesirable shops." But smart shops are nothing different than a clothing store on the corner according to the law, and presently anyone with a high school diploma and a little venture capital can open one.

Nevertheless, it may not have been a good idea to organize smart shops as a separate trade union such as the VLOS. While the intentions of VLOS are good, if smart shops would have joined the "reform shops" (which sell health food, vitamins, nutrients, supplements, and the like), PATIJN would not be able to freeze their number. There isn't too much of a dif-

ference between drug stores and smart shops; indeed, smart shops *are* drug stores—so why not join their organizations?

Another complicating factor is that psilocybian mushrooms are classed as ordinary legal goods, and may be sold just about anywhere. In order to earn a few extra guilders, tobacco shops, souvenir shops, newsstands, and even such wholly-unrelated businesses as opticians and real estate agencies will sometimes have a selection of smart drugs on hand. As well, most VLOS smart shops also sell tobacco, souvenirs, magazines, colored goggles, *etc.* So the complication goes in both directions—a result of the fact that the smart shop merchandize is not (and can not be) clearly classified.

The VLOS agrees that this is not an ideal situation. Psychoactive substances must be sold in a responsible manner, with correct advice and standardized information given about proper, safe use. Rather than institute all kinds of petty regulations about where shops may be located, and prohibiting ownership to change hands, *etc.*, the smart shop union is busy working out a training course for smart shop personnel, and an inspection stamp that bonafide shops can display on their windows. A minimum age of 18 has already been voluntarily adopted.

Just like the *Cannabis*-selling coffee shops, the Dutch smart shops have had to fight for their existence. "Paddestoel kwekers" (mushroom growers) have been arrested, and

## PSYCHEDELIC RESOURCE LIST

**UPDATED SECOND EDITION! PROVIDES SOURCES FOR:**

- ▼ PEYOTE: seeds and live plants. ▼ TABERNANTHE IBOGA: seeds, root-bark, and guided sessions with pure ibogaine.
- ▼ CANNABIS: viable seeds for high-potency strains and suppliers of dried herb. ▼ Legal mescaline-containing cacti.
- ▼ PSILOCYBES: spore prints & syringes, dried mushrooms, and growing supplies. ▼ GHB and GHB-making kits.
- ▼ SALVIA DIVINORUM: plants, dried leaves, and potent extracts. ▼ 5-MeO-DMT, DPT and other tryptamines.
- ▼ Plant extraction gear, chemicals & labware. ▼ Vaporizers, waterpipes, and sundry smoking supplies.
- ▼ AYAHUASCA: various traditional & analogue plants. ▼ OPIUM POPPIES: seeds & dried pods.
- ▼ Books, periodicals, seminars, indoor grow-lights & gardening equipment, and much more!

8.5" x 11" soft-cover, 150 pages, illustrated. \$22.95 (USA; CA residents add \$1.55 for sales tax), \$24.95 (foreign; payment in USA dollars preferred, international money orders add \$5.00), postpaid from:

Soma Graphics, POB 19820, (Dept. ER), Sacramento, CA 95819-0820, USA

charged with supplying “hard drugs.” So far, they haven’t been convicted, as long as the mushrooms are fresh, not dried. Drying them has been said to amount to “processing,” according to recent lower court decisions.

However, in at least one city in the Netherlands, shops still advertize and sell dried psilocybian mushrooms, as the city council has declared that they will not take action against these shops. The reason that some growers have found themselves in trouble was that the police also seized mushroom “preparations,” such as “herbal honey,” when these labs were raided. This enabled the police to define mushroom spawn, equipment, bank accounts, *etc.*, as “precursors or equipment used to break the law,” but only in these specific cases. Especially in the south of the Netherlands, the police will always seize dried mushrooms. But since there is no such case brought to the High Court yet, there still has not been a definitive decision that declares spawn, fresh mushrooms, or dried mushrooms illegal.

The unrestricted sale of *Ipomoea* seeds shows that dried, unscheduled plant matter containing a scheduled substance

may be distributed legally by supermarkets. One simply can not sell extracts or pills made from these seeds. If such preparations are found along with the seeds, the seeds could be declared as “precursors” in this specific case.

Although ultimately vindicated, several mushroom growers have been bankrupted by the costs of these legal proceedings. The USD continues to busy itself with raids on selected mushroom nurseries. This law enforcement unit was ostensibly created to bust MDMA laboratories and illegal pill manufacturers; no one knows whether or not they will succeed with their twisted, American-style drug war approach and get the government to categorize mushrooms as “synthetic drugs.” The USD dreams of becoming a Dutch DEA, so that the Netherlands can get rid of their pro-drug image.

Meanwhile, there have been very few problems. Only a small minority of Dutch citizens use mushrooms and other smart shop products on a regular basis. Naturally, a substantial portion of most shops’ sales go to tourists, especially shops located in Amsterdam, and shops near the borders of the Netherlands’ neighbors Belgium and Germany. Some Dutch

# Telluride Mushroom Festival

Telluride, Colorado — August 26–29, 1999

- LAURA HUXLEY, “Visionary Common Sense”
- Dr. ANDREW WEIL, “Psychopharmacology”
- PAUL STAMETS, “Identification of Psilocybin Mushrooms”
- GARY LINCOFF, “Mushroom Identification”
- Dr. EMANUEL SALZMAN, “Mushroom Poisoning”

Don’t miss your chance to learn about edible, poisonous, and psychoactive mushrooms in the spectacular mountains of southwestern Colorado. March in the world’s best mushroom parade, and meet myco-friends at the mushroom taste and feast. Join us at this unique gathering.

Fee: \$275 (includes meals)  
 Write: **FUNGOPHILE**, Box 480503 (Dept. ER), Denver, CO 80248  
 Tel/Fax: (303) 296-9359

citizens who *do* use psychoactive mushrooms feel that attracting “drug tourists” will, unfortunately, draw too much attention to the fairly liberal legal approach that their country takes, and—eventually—incite draconian reform. As always, the concept of “growing your own” (in small, personal-use amounts), seems to be a prudent approach no matter what country you live in. And while those in the Netherlands have the freedom to grow mushrooms, for the time being at least, people in the USA would be better off sticking to those tryptamine-containing plants and mescaline-containing cacti that remain legal to grow for ornamental purposes.

## SANTO DAIME BUSTED

Police raided two branches of the LICHT VAN HET BOS (LIGHT OF THE FOREST) Brazilian church in Groningen and Alkmaar in March. They confiscated several hundred *Cannabis* plants, and 100 liters of ayahuasca. The raid was sparked by an anonymous tip reported to the police from neighbors. The plants and grow lamps were presumably destroyed, as is usually the case in the Netherlands when a “kwekerij” (growing operation) is discovered, and the ayahuasca is now in a government laboratory being analyzed for prohibited substances. According to the most recent enhancement of the penalties for *Cannabis* growing—which is now a felony rather than a misdemeanor—the church could get a heavy fine, and its leaders could be jailed for up to four years.

FRANCISCO FRANKLIN, the leader of the Netherlands’ Santo Daime church, lived for many years with his family in the church’s Brazilian headquarters. The small amount of funds generated by the church in the Netherlands goes to help support the work in Brazil. LICHT VAN HET BOS has been trying to interest official government addiction-treatment organizations in ayahuasca as a treatment, and has itself had success in helping break the addiction cycle of many individuals.

While a jail term is not expected, the 200 members of the church are indignant. LIDA BEENTJES, one of the members, says, “It’s never been a secret that we use Santa María [*Cannabis*] and Santo Daime [ayahuasca] for spiritual purposes. But we can’t just go buy the Santa María for our members in a coffee shop; we couldn’t afford to pay for it.”

For years, LICHT VAN HET BOS has tried in vain to get an exemption from the OPIUM LAW for spiritual use within its circle of members. A request to Premier KOK was only answered with the message, “We wish your church community all the best.”

BEENTJES says, “We drew our conclusions from that.

“In Brazil, the spiritual use of marijuana by our church has been recognized and permitted for years. Why should the Netherlands, with all its coffee shops, be so hard on us? During our services, we have healed many sick people. People who the medical world had written off as dead, saw the light again with us. It’s really incomprehensible why the government is taking action against that. There’s also supposed to be something like the freedom to practice one’s religion, isn’t there?”

The church is considering a lawsuit. Undoubtedly, this would be an important test case to see how far a legal appeal can go on the basis of *Cannabis* growing for spiritual use.

Adapted and translated by J. P. MORGAN from “Be Prepared” by MICHEL VAN HINSBERG in *EssensiE* magazine #22, and “Vrijheid van Godsdienst in Gevaar?” (Freedom of Religion in Danger?) by JAN SENNEMA in the April/May 1999 issue of *Highlife*.

# NETWORK FEEDBACK

## PHALARIS STENOPTERA: A NEW POTENT SOURCE OF TRYPTAMINES?

A couple of years back, I was sent a small number of seeds for *Phalaris stenoptera* (= *P. aquatica* var. *stenoptera*) along with packets of a number of other *Phalaris* species for growing-out and testing in my greenhouse. I didn't get around to growing-out and testing the *P. stenoptera* until winter of 1998–1999. This particular strain had been grown-out by others and chromatography showed it to be the *P. stenoptera* with the highest DMT content of any of the grasses tested. Since I had already isolated a very potent strain of a DMT-containing *P. brachystachys* from Greece (and I had a number of these plants growing in my greenhouse), I decided that this plant would be my subjective basis for comparison with regard to both potency and quality of the *P. stenoptera*'s DMT content. My method of preparation for all the DMT-containing grasses is to run the fresh grass blades through a motorized wheatgrass juice machine, then spread the liquid out into glass baking trays and set the trays into a dehydrator until the liquid is dry. The dehydrated residue is then scraped up, powdered in a nut grinder, and stored in pint jars. Whenever I am ready to ingest any of these materials, I simply put the powder into gelatin capsules and swallow them with water. I do a similar boiled extract with ground-up *Peganum harmala* seeds, and in this manner I am able to avoid the entirely nauseating scenario of drinking those nasty, bitter brews.

After I planted about 25 *Phalaris stenoptera* seedlings and they were fully mature, I figured that they would be ready for their first harvests in about 5 more months. At the 4-month period I had an unexpected surprise—they all began sending up seed-heads. I have never had this happen to me before in the dead of winter in my greenhouse with any other species of *Phalaris*, all of which usually send up seed-heads in the spring or mid-summer. Also, I have never been able to produce much more than 30–50 seeds per year from any of my other plants; greenhouse conditions simply did not encourage adequate pollination, even when I helped the plants out artificially.

This strain of *Phalaris stenoptera*, however, ended up producing about an ounce or so of seed—anywhere from 3 to 5 thousand seeds. I have not yet tested them for germination, but based on previous experience with these types of grasses, I expect that it will be 90% or better. This is a real plus for this plant in my book, because now I have plenty of seed for sale and to send to friends and companies in the seed network. Growing these grasses from seed is by far the easiest method for the clumping types of grasses. (The *P. arundinacea* strains are better spread by runners, as this way the clones should have a similar tryptamine content as the mother plant, since genetically they are the same plant.)

Once I had a powdered *Phalaris stenoptera* juice-extract encapsulated and ready to go, I did a small number of comparison tests with my known potent *P. brachystachys* extracts. Subjectively, I could not tell any difference whatsoever between the two extracts, either in potency or quality. I have sent some of this extract off to be chromatographed, hoping to verify the “DMT-only content” that has been alleged for this particular strain. My impression is that the extract is as potent as any I have tried, and the effects were typical to plants containing only DMT. Leaf production of the *P. stenoptera* is at least twice that of my *P. brachystachys* per cutting, and the added plus of prolific seed production makes this grass a very good choice for people living in warm climates with mild winters, or for those who have greenhouses. This grass might be grown in a pot with soil next to a window indoors, although when I tried this with a *P. brachystachys* a couple of years ago, the plants rapidly became root-bound and died or ceased growth entirely. You just never know until you try it; I did succeed in doing this with *P. aquatica*, which grows in pots just fine. — B. GREEN, NM

## JONATHAN OTT SPEAKS... PART TWO

Interviewed by Will Beifuss and Jon Hanna at the 1998 BPC *Salvia divinorum* Conference

**Jon:** Living in México, what do you think that the interest in entheogens is there, given in a sort of comparative percentage?

**Jonathan:** Of course we have, at best, only soft figures in any case. But I would say that it's less than it is in the U.S., in terms of the kind of interest that we know about—basement shaman. In the U.S. there's a great deal of sophistication in the so-called amateur sector. And that doesn't exist anywhere else, not even in Europe. In Europe, the only people that are at that level of sophistication are in the *business* as shamanic-plant dealers, and they're very few. But in the U.S. we're talking hundreds of thousands of people, maybe even millions, that are very sophisticated. They not only know about ayahuasca analogues, they've been making them for years, and have probably innovated themselves in this field and have a great deal of knowledge. If I lecture on this topic—and I don't lecture on this topic in Latin America in general, and certainly not in México, because I try to keep a low profile there—but if I lecture on this topic in Spain or in Amsterdam, and mention ayahuasca analogues, it kind of blows people's mind, like "Oh wow, now you can even do it

at home and make tea." But if I do that in the U.S. I know for a fact that there are going to be at least a dozen people there that have done it more than I have, and perhaps can teach *me* a thing or two if I can just connect with them afterwards and share information. And so the U.S. is a real leader there, and I would say in México it's a great deal less. But on the other hand, there's this schizophrenic thing; on the one hand there's racism against Indians and there's this whole socioeconomic one-upmanship, but on the other hand, all of México's glory lies in the pre-Colombian past, and it's been all downhill—and very steeply—politically and economically since then. And so people also have this, in a way, exaggerated, mythologized appreciation for the pre-Colombian culture, while at the same time they're discriminating against their dark-skinned Indian gardener.

What is true about México that's not so true about the U.S. is you would be surprised at the "straight" people that have in fact tried mushrooms, or peyote, or something. Because there there's no stigma whatever attached to mushrooms, peyote... *Salvia divinorum* they don't really know about, but basically mushrooms and peyote are the big two. But mari-

"...the War on Drugs is lost and won. They lost, we won. They haven't conceded defeat yet, nor will they do that perhaps for ten years, maybe twenty years."

"What's the difference between the ethnomedicine of the Ladakhis, and the ethnomedicine of the Sacramento suburban residents? I mean, scientifically speaking, they're both valid subjects of study."

"...another scheme that I cooked up for frustrating the powers that be in the War on Drugs is making toxic honeys as a means of selling drugs surreptitiously."

juana and LSD are just completely different topics for them. And that's *gringo*, *jipi* (hippie), "evil drug," and the rest. And then peyote and mushrooms are, "Ah, our glorious indigenous tradition." So I will often ask, especially older people, when the topic comes up and they ask me what I do, I will just ask them, "Well, have you ever tried this?" And it's surprising. You know, doctors and lawyers will say, "Oh yeah, fifteen or twenty years ago, my wife got sick and so we went to Huautla to look for MARÍA SABINA." And this sort of thing. Because this is a living thing in México, and even city people have a place for it. Even doctors who are making their money as the competition. And so it's bigger than people would think, but marijuana is a great deal *less* used in México and all of Latin America than it is in the U.S. And LSD and so forth is almost non-existent. I don't know what the statistics are.

The U.S., in that government survey, I think they estimated something like two million users of visionary drugs like LSD, and it has been said that 20 million people from the U.S. have admitted to having tried acid, or mescaline/peyote, mushrooms, ayahuasca—one of these at least once in their lives. But they're talking about only maybe a tenth of that many of regular users. I would say the number's gotta be higher. That it's at least double that and could even be as high as 10 million, one in 25 that are more-or-less active, current users. But I'm sure that we have at least 5 million, 1 in 50, because there are about 250 or 260 millions in the U.S. I would say that we're looking at at least 2%, maybe 4% users. And I think in Europe the percentage is probably higher. That there are in fact probably more users actively in Europe, maybe as many as 10 to 20 million, if here we're talking 5–10 million, maybe 10–20 million in Europe. So potentially the market in Europe is actually bigger for these things, but it *isn't* in the sense that they're just used to buying pills in the disco, and there's not this "can do" go-down-in-the-basement attitude. They don't have a garden anyway, I mean they don't have any land, most of them live in apartments.

**Jon:** Regarding your comment about only including the analysis data from published references in the second edition of *Ayahuasca Analogues*. I've recently been made aware of rye grasses tested by JOHNNY APPLESEED that appear as though they may have a fairly high tryptamine content. Is there anything you know of in the literature that has reported this from rye grass?

**Jonathan:** No. I don't even know what genus that is. But once again I want to make this point really clear. In my tables, in

*Pharmacotheon* and *Ayahuasca Analogues*... well, for example, just with the mushrooms; GARTZ and ALLEN have published one table where they have 158 species of what they call scientifically-proven psilocybian mushrooms. But as I point out in a footnote to my table, I've only identified 100. Because I look for an actual *report* in the scientific literature. And then I list others that are in their table, but there is no chemical evidence for it; they're just saying, "Okay, this blues, it's a *Psilocybe*." And I agree with them, it belongs on a table like that, but it's just a question of what your ground-rules are for the table. And so mine has only 100, and then I list in the footnotes about another 60 or so *probable* psilocybian mushrooms. But to me that's an important distinction. And it may well turn out that some of these aren't psilocybin—maybe one of them is only baeocystin, or something like that. And indeed, that's an open book, that chemistry. Though probably you don't just have baeocystin and nor-baeocystin, but also the non-methylated tryptamine equivalents of both have been found in a couple of species, and we're probably dealing with at least six potentially-active compounds. And GARTZ has described this aeruginacine, which turns greenish, from *Inocybe aeruginascens*, and that's probably some non-phosphate ester of psilocin, some kind of other compound.

**Jon:** But none of these have been found in mushrooms that don't also contain psilocin?

**Jonathan:** Not so far, no. Without psilocybin and/or psilocin.

**Jon:** That's the mushroom that somebody reading this needs to find now, for us in California at least.

**Jonathan:** Exactly... APPLESEED and TROUT have done really good work. But I don't cite those in these kind of tables because they're not published in the open literature where you can access them with a literature search. You have to have the book. I'm more concerned with what is openly available, accessible to everyone, and is in a refereed journal. And they often couch their analysis, which are done with the constraints of not necessarily having access to the best standards and equipment and reagents. But I definitely cite their work. TROUT especially has done extremely valuable work, which is as detailed as anyone could wish as far as really backing it up. And he's as careful as can be about *not* going beyond the evidence. He's a very good example of what I was talking about before, of *not* jumping to conclusions, and really stating your grounds for equivocation also, when you're bringing up evidence. But this kind of work indicates that just go-

ing down into the basement with a little TLC rig, anybody can turn up new tryptamine plants and go to the races. And now its the private sector, the non-scientific, non-academics that are really leading the way in this field.

**Jon:** So tell us a little bit more about ideas for future products, other than the Pharmahuasca®.

**Jonathan:** Oh, from PHARMACOPHILIA... well, I basically see PHARMACOPHILIA as doing what I call “psychopharmacological engineering” in my book *Pharmacophilia*. And I think that this is going to be the biggest “new industry” that the world has ever seen, and that in fact the War on Drugs is lost and won. *They* lost, *we* won. They haven’t conceded defeat yet, nor will they do that perhaps for ten years, maybe twenty years. [The longer it takes, the more likely will it be that we see the losing Field Marshals in the dock in war-crimes tribunals, just like their Nazi prototypes; concerted demands for reparations, perhaps other vengeant virulence. It seemed like a stroke of evil, political genius to paint this scapegoating crusade as a ‘war,’ but we’ll see what happens when the victorious troops are at the door of their bunker. Will some miserable coward of a President shoot him- or herself, some despicable weakling poison his or her own children before doing the same? I have extensive correspondence with *pharmacopolitical* prisoners, or ‘prisoners of war in America’ (*sic*) as they call themselves, and these crusaders—the scum of the Earth, really—have ruined literally millions of lives, made millions of enemies... very *angry* enemies. I would hope that we could be charitable in victory, finally break with this awful stain on history, our relentless vindictiveness, but it’s

**...the War on Drugs is lost and won. *They* lost, *we* won. They haven’t conceded defeat yet, nor will they do that perhaps for ten years, maybe twenty years.**

easy for *me* to say that—I’m not a ‘lifer’ in the *gulag*, at least not *yet*. In fact, in one of the cruel ironies of war, I am an unintended beneficiary of the war, which has handed me golden opportunities, as it might be, on a gleaming, crystal-line-festooned silver platter!] It all depends on where and when. But there’s no doubt in my mind that Washington and Langley are the Berlin and Tokyo of this War. And maybe somebody will resurrect and raise the Titanic, and they can then sign the surrender on the deck of the Titanic instead of on the deck of the Missouri. But that this will happen is in-

evitable because of economics, purely and simply. It’s money that rules our world. And even though this so-called ‘war,’ like any other, favors certain evil enterprises that have profited from it, and there’s this prison-industrial complex and so forth, there are even *bigger* enterprises that could stand to profit more from things *not* being this way. And eventually *they* will win out. And so what I see it as being is this gives us about a ten-year window-of-opportunity in which the situation is in limbo. The natural, logical players in this “new” industry—it’s really the oldest industry in the world—the tobacco companies, the booze companies, the pharmaceutical industry, presently have their hands tied. In the case of the tobacco companies, with this absurd idea that tobacco is not a drug, it’s not about nicotine, there’s no addiction involved, *etc.* So naturally they can’t come out with a better form, a more euphoric substitute for smoking tobacco. The pharmaceutical companies are stuck similarly with a therapeutic model. And okay, so they can crank out a nicotine-product, but it costs \$50.00 for 100 mgs of Nicotrol® that you shoot up your nose with a little pump-sprayer, or nicotine gum, or whatever, and so that’s also a failed model. Because we’re not talking about *therapy*—getting people *off* of these substances—we’re talking about giving them *a more healthful alternative*, which is nothing new, it’s exactly what HUXLEY proposed in the 1930s, when he said, “If I were a millionaire I should endow a band of research workers to look for the ideal intoxicant.” Well that’s basically the name of the game. And so I see it as being general psychopharmacological engineering. We have a ten-year window-of-opportunity, in which small, bold, creative private enterprises can step in and work within a context of stretching the limits of

the very bizarre legal situation we have right now, which nonetheless gives us enough latitude to get our foot in the door and start working on this. The real big prizes of course are not vision-drugs, but tobacco-substitutes, more euphoric forms of nicotine or its analogues, that are more healthful, stimu-

lants in general—especially amphetamine/cocaine-type stimulants—and alcohol. If someone could come up with something that were a more-or-less serviceable substitute for alcohol, but didn’t require multi-gram doses at a time that the liver has to process... this would make MICROSOFT look like a Mom & Pop grocery store!

**Jon:** Or perhaps put the cure with the poison? Fortified alcohols containing milk-thistle extract and antioxidants...

**Jonathan:** Or just simply figure out the psychopharmacology of alcohol, which, amazingly enough, hasn't been done. We just have aging theories about general anesthetics and their solubility in membranes. But now we come to find out there are specific *receptor* effects, and slowly but surely the picture is becoming a little clearer. But basically we're at the same stage with alcohol as we are with bufotenine. We just don't know fuck-all about its ludicrous pharmacology, its pharmacohedonology. And so those are the big prizes here. And my goal is to lay the base, working within the bounds of the vision-drugs, because that's... something like *pharmahuasca* will generate enough income to *finance* some R & D more specifically into things that are going to be more expensive and difficult to do. And so then we just start working within the bounds; we will introduce a line of what I call "smart-snuffs," and probably the first one will be based on arecoline, which is the active stimulant-alkaloid in *betel*, which is one of the most widely used stimulants in the world, right up there with caffeine in terms of number of users, which number in the billions. But it also happens to be a prototype smart-drug that raises the choline levels in the brain, and acetylcholine is thought to be the primary transmitter in the major memory circuits in the brain and is very important in memory storage. And most of the so-called smart-drugs are cholinergics that somehow effect the acetylcholine system. And conversely anti-cholinergics like scopolamine and atropine have the reverse effect—they *inhibit* memory acquisition. So I would call them "smart-snuffs," and by the way nicotine is also a smart-drug, and also shows this kind of effect, as do stimulants in general—they're well-known to enhance learning. Not just alertness and keeping one awake to study all night or whatever, but they actually enhance recording this kind of information. What they have been found to do in more recent studies with PET scans and the like, is that they stimulate the brain *in a task-specific way*. It's *not* a general overall cerebral stimulation. The area of the brain that you use for a certain cognitive task is *specifically* stimulated by these drugs, and other areas are left quiescent. And so it is in fact something that's boosting the signal-to-noise ratio, so to speak, in certain circuits of the brain. Potentially a *very* useful thing.

**Jon:** On the topic of smart-drugs, in the [last] issue of *ER* K. TROUT mentioned a couple of bioassays with Piracetam and mescaline, and had noted a strong "potentiation." I'm curious if you have any ideas on the pharmacology of that?

**What's the difference between the ethnomedicine of the *ladakhis*, and the ethnomedicine of the Sacramento suburban residents? I mean, scientifically speaking, they're both valid subjects of study. And in fact, now we have this very thriving, active home-experimentalist scene, of which *The Entheogen Review* is really one of the strongest elucidators, because that's where some few of these people come forward and talk about what they might have done. And this is a tremendously valuable source of ethnobotanical information, and likewise of specific pharmacological information.**

**Jonathan:** Uh, huh... interesting. I'd have to think about that. Nothing springs to mind exactly. But yeah, this is just an open ballpark. And obviously these kinds of things are very valuable, because *who* among the drugabuseologists is ever going to connect the two? Or suddenly come up with some absurd animal-tests? *Anything* that will be useful in this field? And suddenly we have people willing to try any and anything in combination. And we need to be very careful with this. But in fact, I've long been advocating study of drug-scene ethnobotany—and this was laughed out of the hall at one time. When I first started in my career out of school, in 1975, the "hippie drug scene," or just the illicit-drug-scene *per se*, not necessarily *hippie*, was not considered to be a fruitful subject of study for ethnobotanists or for pharmacologists. But why not? I mean, *we're* people also. What's the difference between the ethnomedicine of the *ladakhis*, and the ethnomedicine of the Sacramento suburban residents? I mean, scientifically speaking, they're both valid subjects of study. And in fact, now we have this very thriving, active home-experimentalist scene, of which *The Entheogen Review* is really one of the strongest elucidators, because that's where some few of these people come forward and talk about what they might have done. And this is a tremendously valuable source of ethno-

botanical information, and likewise of specific pharmacological information. Because we have access to a whole smorgasbord of substances and a full pharmacopoeia of psychoactive drugs, and so where else is it going to occur to someone to take something like Piracetam and combine it with something like mescaline, which is very hard to get? No, I wasn't aware of that.

Anyway, to go back to the whole PHARMACOPHILIA thing, the next product will be smart-snuffs, and I'm working on an arecoline-based stimulant, and also a nicotine-based stimulant, and perhaps combinations of the two. Then there will later be visionary snuffs. And other types of *pharmahuasca*—like maybe an herbal *pharmahuasca* product. You could have a whole variety of them. You could have a basic *ayahuasca* and *Peganum harmala* extract for the MAOI side. You could have a... and in some countries... in the U.S. this would be legally problematical, but in Holland it's presently not problematical... you could make a *jurema*-extract pill... nor in Japan, where *pure* compounds are more of a problem. Those would also be products. But I see the real big prize for the near term as being *coca*/cocaine. Because stimulants are obviously big business. During what ANTONIO ESCOHOTADO calls "The Pharmacratic Peace," basically cocaine was controlled, the opiates were controlled, but the pharmaceutical succedanea or substitutes for these were more or less easily accessible, and this stopped in the 1960s. And he defined that as "The Pharmacratic Peace." During that time, it's estimated that in the last year of legal availability, more or less in the medical field, of amphetamines, the U.S. industry manufactured some 9 billion dose-units of amphetamines, and it was a major part of the pharmaceutical business. And so one of the geopolitical problems with legalization or the eventual derogation of these drug-laws is the fact that there are significant benefits for some people of the prohibition. And there are many countries that benefit from this, like Columbia, like México, like Bolivia and Perú. Bolivia and Perú are good examples. They're desperately-poor countries. México's a great deal richer than they are, and so is Brasil. And in Bolivia the illegal *coca*-based economy is at least as big as the whole legal economy of the country. So we're talking about half of their livelihood coming from this. And if these things were made legal... as we know, when amphetamines have widely been available, cocaine has been just very niche-market, a very small player in the stimulant field. And so the way that I see to answer this, owing to the great and deserved importance of natural products, ethnomedicine, and herbal extracts as opposed to purified compounds and the pharmaceutical industry... you just exploit the same thing. And

so I want to start a legal *coca* business in South America. Presently the legal market is basically restricted to Perú, Bolivia, and Northern Argentina, and only in Northern Argentina is there enough economic well-being to make money off this. In Perú and Bolivia it's legal, but nobody can afford to buy any good stuff, while cocaine is dirt cheap—about \$5.00/gram. And so you revive really good, legal *coca* products. I had thought of making two. One would be what they call a *diksap* in Holland, which means just thick syrup; sap or juice. Yeah, *sap* is really *juice*... thick juice. And so they just mix it with mineral water, and they always have it on hand with soft drinks, and beer or whatever, they always have beverage syrups. And so you make a similar product out of *coca*, but one that has all the alkaloids and all the flavoring and nutritional elements natural to the leaf—you don't discard anything of worth. Just basically eliminate the fiber and concentrate it down. Then people would be able to make their own *Vin Mariani* or their own *real Coca-Cola*®, just by adding this at home. Or taking it by itself, or adding it to other foods. And also this could be rendered as a fairly large lozenge—imitating an *acullico* or *coca* quid, but smaller, and having the equivalent amount that's in a *coca* quid in a lozenge. That could also be compounded with other things—flavorings like ginger, like cardamom. But also could be combined with immune-stimulants and other nutrients... vitamin C, and so forth. You make these products, you do the test-marketing and R & D on a modest scale making modest profits, in South America where this is legal. And in Bolivia the government will even give you incentives for investing in this kind of industry, because they desperately want to foment the legal market for *coca*. Because even in their legal economy it's 20% of their economy. And then they have an illegal economy that's at least as big as the legal one. So you're really talking about something like 60% of their overall economy is in this one product. And so I wish to do this, and my *modus operandi*... you have to be really culturally-sensitive, and I wish to be at best a minority partner with foreign nationals in any of these businesses, so I would have partners from Bolivia and Argentina in this. And as in my Dutch company I'm a 40% owner with two Dutch partners, and my Spanish company I'm a 33% owner with two Spanish partners. And so then you do the R & D, you make the effective product, and then you work on expanding the market. And the way I see it of introducing it into the European community first, and subsequently into the U.S., is that you start through companies that are engaged in addiction therapy like HEALING VISIONS with DEBORAH MASH, like TAKIWASI in Perú, and you set up an R & D program, you give them free samples, and go into collaborative research. And you propose it as a substitution-

therapy analogous to methadone with opiate use for *pasta*-base smokers, for crystal-sniffers, cocaine users, and so forth. And that's how you get your foot in the door in Europe. And then you work on expanding it from there.

Already in Amsterdam you can buy *coca* tea-bags; they're allowing that. And so the door's already slightly open. And again, Bolivia... at the Sevilla World's Fair, the Bolivian pavilion was a *coca* promotion mission, basically. They gave out free samples, and they were just trying to set up cooperative ventures and make these legal products. But the problem is that the ones that they had come up with were de-cocainized, because they're too overly-sensitive to this. *Coca* without cocaine is like coffee without caffeine, or chocolate without anandamide and theobromine. To me it's kind of a silly way to go about it. And furthermore, as many of these go, they don't even taste good or look good, so why bother? They're just kind of ruining something that's intrinsically very good. So you have to come up with something that really works. And it will work even better than a *coca* quid, and somewhat less-well than sniffing 150 mg line of pure coke or banging it or smoking free-base. I think it's a very feasible thing, and that over a five- or ten-year period that this also be worked into the equation. And then that would generate the kind of funds that we will need to go after alcohol, which is going to be a major R & D thing. But that's what I want to do, is make this into a big business, and set up a big R & D operation, and become the MICROSOFT of the psychocosmos.

**Jon:** Changing the subject back to the topic of plant-spirits. Somebody told me once, a quote from you, which essentially said, "Spirits are for pea-brains." (WILL laughs)

**Jonathan:** No, I never said that. I would never say that. I would use the word pea-brain, but not often in public... but not that way. (laughs)

**Jon:** Well, I don't know that it was in public...

**Jonathan:** No, that was a very loose paraphrase of something that I might have said, but I certainly never said *that*, that spirits are for pea-brains.

**Jon:** How would you define, personally, *your* belief in God?

**Jonathan:** I don't really have one. I mean, that's basically it. But the other side of the coin is I don't have any disbelief where that's concerned either. I just don't know and *I don't really care*.

**Jon:** So the agnostic position then.

**Jonathan:** I guess you could call it that. But I have never seen any evidence with my own eyes or senses of the existence of plant-spirits or deities. But I can't either say that they don't exist, based on my lack of having been able to perceive it that way. I don't.

**Jon:** And you've had no contact with... so many people report an entity contact, or some *thing* that in their vision looks a person...

**Jonathan:** Never, not even remotely. Nothing more than like SCHULTES has described, "squiggly lines," and patterns and the like. I've never seen *any* kind of a vision. Nor do I have especially vivid dreams very often. I'm more like HUXLEY—like the way HUXLEY described it, not such a strong visual imagination.

**Jon:** Coming from that perspective then... when you take these substances, is the word *entheogen* only being used in an ethnographic context, and for yourself, these substances *aren't* entheogens?

**Jonathan:** Well no... uh, I define... yeah, well it's... this might well just sound probably like I'm just rationalizing or something sophisticated, but no. I think that the universe is our creator. And to me the divine is the universe itself. And specifically it's manifestation as *energy*, as opposed to *matter* or as a more tangible, palpable thing. And so far as I can tell, neither science nor any religion can explain the origin of the universe. If you talk about it—and SASHA did a good job of satirizing this—the "big bang," and so forth. The universe was created in this big bang, and is so old. Okay, but if there's no universe and no temporal era, when did that happen, where did it happen, and where did it come from? So you're still postulating the universe, basically. And if they say, "Okay, this or that deity created it," or that life actually came in interstellar dust, you're still just pushing away and farther back. But where did that start? Where was this deity standing if there was no universe? Where did she come from? Out of what was this created? And so I just think that it's something that we *can't* know. It's *unknowable*. I haven't experienced it as plant-spirits, and so I can't vouch for that particular way of seeing it. But I would never say that it's for pinheads or pea-brains or whatever, or negate someone else's perception of it. I have to admit that that is possible. And it's certainly plausible. And so I try not to believe in anything, but the other side of that coin is *not to disbelieve in anything either*.

And I try to just enjoy and live with the uncertainty of not knowing. I just think there are things that we can not know. The whole business of religion—and science has gone into that same business, and now everybody and his brother is exploiting the breach that science has more or less vacated

**Will:** You've left a pretty good written legacy though, so maybe you've already satisfied that innate urge to kind of make one's mark and leave something beyond our impermanence behind.

**Jonathan:** Perhaps.

## And another scheme that I cooked up for frustrating the powers that be in the War on Drugs is making toxic honeys as a means of selling drugs surreptitiously. *Naturally* toxic honeys, where the bees sequester the secondary compounds in the plants.

**Jon:** Anything new and interesting that you've been working on lately?

**Jonathan:** I did publish a paper in *Economic Botany* on psychoactive honeys and toxic honeys as a mechanism of drug-discovery in the preliterate world. And another scheme that I cooked up for frustrating the powers that be in the

by not doing such a good job of it—is offering certainty to people, when basically the universe gives us questions not answers. People don't want to live in uncertainty. RICHARD FEYNMAN said it really well. He said, "I can live with doubt and uncertainty and not knowing. I think it is much more interesting to live not knowing than to have answers which might be wrong...I don't have to know an answer. I don't feel frightened by not knowing things, by being lost in a mysterious universe without a purpose, which is the way it really is as far as I can tell."

War on Drugs is making toxic honeys as a means of selling drugs surreptitiously. *Naturally* toxic honeys, where the bees sequester the secondary compounds in the plants. We already know of a few different categories of psychoactive honeys that occur naturally, and we could make a few more. So that would be sort of a cool fun business for somebody. It would also simply involve connecting the drug-plant growers with people that rent out hives for orchard owners. You wouldn't even need to do your own apiculture. You could just make the right connections in the right place, and buy the special honey. But that's one that I'm less likely to have time to do, so hopefully somebody else will do it.

**Will:** Yeah, I think that is one of the biggest failings of people, is that they are *very* uncomfortable with the level of uncertainty in this world, and they will do anything to minimize that, and box themselves in.

**Will:** What's the most promising crop for that?

**Jonathan:** Yeah, they want continuity. And the universe gives us constant change, and there's nothing solid, and nothing really continuous about it. People want to think their genes are going to be perpetuated, their character is going to "life after death" or whatever they call it. And personally that just *doesn't interest me in the slightest*. There are a million-and-one objects of inquiry that are of interest to me right now, and whether my identity, consciousness, or some semblance of it is going to continue after my heart stops beating and my brain waves start propagating... I'll find that out, or I won't, one day or another without doing anything. And so it's just a matter of being patient and waiting. And now I have a lot more things that I *can* know. Why is it so interesting? I don't care, I *really* don't care.

**Jonathan:** Well, morning glories, for example; the Mayan morning-glory honey. Possibly tobacco. Certainly the Solanaceae give toxic honeys, and the Ericaceae.

**Will:** You've gotta have a really big mono-crop of that though, don't ya?

**Jonathan:** But such things exist. And the stingless-bee honeys... well, you know you can buy clover honey, or alfalfa honey... and yeah. Such things exist on big herb farms. The stingless-bees from the Mayan morning-glory honey are discriminate—they graze one floral source at a time, so you just need to control where the honey's going from that particular flower. Mine all died off. I have to start up again. Actually I wasn't living in México when I started that up, and then the iguanas ate all the morning glories, and my friend spaced it out, and you know, nothing happened.

**Will:** Everything went to hell while you were gone, yeah... surprise.

**Jonathan:** Right. The iguanas ate the morning glories. Well, I don't have any iguanas where I live. *Nothing* eats the morning glories.

**Jon:** Hey JONATHAN, you had mentioned in *Pharmacophilia* that some kind of a stomach medication—proglumide—could be used with opiates. Have you tried that?

**Jonathan:** Oh yeah. The dosage is about a quarter of a gram. Proglumide used to be used as an ulcer medication, but now they have more profitable ones.

**Jon:** I've also heard that you can use Tagamet® to do the same thing. Do you know if that's true?

**Jonathan:** Is that a CCK inhibitor?

**Jon:** I don't know.

**Jonathan:** I don't think so. No, I think that inhibits the secretion of hydrochloric acid in your stomach. No that wouldn't work. CCK is a gut hormone—cholecystokinin—that is really involved apparently in ulcers. And so they had CCK inhibitors at one time that were ulcer medications. Proglumide is one of those. But CCK in the brain is the endogenous opiate antagonist. It's like naltrexone and naloxone. It's what dampens the endorphin circuits—the endopioid circuits. And so it was found that inhibiting this CCK is like enhancing the effects of opiates. And not only does it make the opiates more effective, but it also can reverse opiate tolerance or prevent it from being developed in the first place.

**Will:** Really!? To the point dosage does not have to go up at all?

**Jonathan:** Exactly.

**Jon:** Do you need to *lower* your dosage?

**Jonathan:** You can, yes.

**Jon:** But would it be dangerous *not* to?

**Jonathan:** Well, you'd get an enhanced effect, definitely. I wouldn't think it would be dangerous. But if you have tolerance, you can actually work your dose down by using this.

**Will:** Is it sold as a powder? When you say a quarter gram...

**Jonathan:** Well, I just bought 50 grams of it from SIGMA. It's not on the Usan pharmaceutical market anymore, because they have more profitable things. It's cheap, it's non-toxic, it's been approved in many countries. There's a good track-record for its use in human beings. It's not some experimental thing.

**Jon:** You can get it in other countries though, right?

**Jonathan:** Well, it's not available in Spain or México. Every country I go to I check to see if they have it. I don't know how to find that out. But I know the trade names for it—in the *Merck Index* you can look that up. And SIGMA sells it—it's very cheap, 50 grams is about \$90.00. And so that would be something... I hadn't really thought about this but that just reminds me, that's something that we should make for PHARMACOPHILIA. Make dose-forms of that.

**Jon:** Yeah.

**Will:** Absolutely. Does it in any way effect the quality of the analgesic effect?

**Jonathan:** I took it first by itself, and didn't really notice any effect. I didn't know what the dose was at first, and so I started working up. Then I got this book called *Orphan Drugs* that just happened to have it in there, but they don't say what countries still sell it. But they list it as an orphan drug.

**Jon:** Does it say who manufactures it though? I mean, couldn't you write to the manufacturer and find out where?

**...not only does it make the opiates more effective, but it also can reverse opiate tolerance or prevent it from being developed in the first place.**

**Jonathan:** Yeah. It's possible. I can find out. And I will. But it may be that the patents have expired also, and that's another reason why it's not being marketed. And the dose is kind of high. And now they're going for more specific things like inhibiting hydrochloric acid secretion or whatever, and maybe CCK inhibition isn't a valuable treatment anymore for ulcer. But there are other CCK inhibitors that are known. But this is the cheapest, most readily available one.

In fact you can stop the development of tolerance to drugs—it's not something that inevitably goes with drug-administration. This can be done with Valium®—this would be another target of research for PHARMACOPHILIA eventually, when there's enough money to support this kind of thing—anti-tolerance therapy. Because stupidly, like everything else, the government in the United States and the drugabuseologists, automatically go in the wrong direction. They try to make drugs *weaker*, not *stronger*. They try to *enhance* tolerance, not *inhibit* tolerance. And so what's happening with the current situation is they're making what they call the "cocaine vaccine." And this is the Holy Grail of NIDA, to come out with a "cocaine vaccine." And what this is, is monoclonal murine antibodies. This is really Machiavellian and bizarre. They make what are called *hybridomas*. You fuse a myeloma cell, which is an immune-system tumor cell, with a specific antibody-producing cell that you've already selected. To do this you make a *hapten*, which is a synthetic antigen. Cocaine is too small to activate the immune system—you need a much bigger molecule to activate the immune system. So they bind not cocaine, but an analogue of it that's like the transition stage between cocaine and its metabolite, which is ecgonine. So they made a transition-state molecule bound to a protein that would activate the immune system, then they injected this into mice so that they would make antibodies to this protein. Then they selected out the cells that made that specific antibody recognizing the cocaine-analogue portion of the hapten, fused them with a myeloma cell to make an immortal cell-line that you can grow in culture and will secrete these antibodies. Then they inject the antibodies... I don't think this has yet been tried with human beings... but eventually into the hapless parolee, job-seeker, immigrant or whomever, and then it enhances their innate tolerance to cocaine. And so what happens is you have antibodies circulating that chop-up the cocaine in your bloodstream. And so in order to get the effect from cocaine, you have to take five times more, or something like that. And you have to have the antibodies injected every month or so, because it's not a vaccine. It doesn't stimulate any native immunity. It's like taking a  $\gamma$ -globulin shot. And so it's just an antibody shot. And of course they call it the "cocaine vaccine," and when I describe this in a footnote in *Pharmacophilia*, I quote THOMAS SZASZ as saying in *Ceremonial Chemistry* in the mid-seventies, "A drug compulsorily administered to addicts is no longer *like* a vaccine; it *is* a vaccine." And now they're calling this a vaccine. They're not saying it's *like* a vaccine, it *is*, it's the "cocaine vaccine." So people can march down their teenaged daughter and force her to take this shot, so that she won't become a cocaine addict! But in fact, it's going to make her *more* likely to have

problems with cocaine, because she'll take more and more and more, with more side-effects, and so forth. You can still get the effect, as long as you take enough to overwhelm the antibodies. And of course it won't effect speed. So you could also take speed instead of coke.

**Will:** Right, oh man...

**Jonathan:** Yeah, it's a nightmare. And pharmacogenetically, the *higher* your innate tolerance is to something, the *more* that correlates with possibilities of having "problems" with that drug, because by your very nature you have to take bigger and bigger doses to overcome that innate lack of sensitivity. It's kind of counter-intuitive, but the less sensitive one is to a given type of substance, the more likely one is to have a problem relationship with that. Because by nature, in order to get the effect, you have to take bigger doses than a person who would be more sensitive. Instead of working to overcome tolerance, which is possible... Or they say, "Oh, no, we can't give opiates to this cancer patient who's screaming in agony, because he might become addicted." Which is a lie anyway. Because people that are taking opiates for extreme pain *do not* generally become addicted to them—that's just a medical lie.

**Will:** Oh, is that right?

**Jonathan:** Yeah, because if anything, they tend to associate that... Well, let me qualify that. I would say people that like opiates are, at the most, 20% of the general population. Studies that have been done with naive subjects, where you inject them with heroin, the great majority of them have real dysphoric effects and never wish to repeat the experience. The ones that have the taste for opiates, say the one-in-ten or one-in-twenty, if they've for some reason never tried them before, and only in the context of a car accident or something, tried it for the first time, then yes. Those people could possibly become habituated. But the great majority of people *don't* have that taste, they get more dysphoria than euphoria, and those people tend to associate the opiates with the other discomfort, loss of dignity, *etc.*, of being in the hospital, so if anything they're conditioned *against* it, not *for* it. And so that's a lie. But they use this, and instead of exploring these technologies, which have been known for some decades, to prevent the development of tolerance, they're now working on ways to enhance tolerance. And there's also a so-called "heroin vaccine" that they're working on as well. So yeah. They've been saying that black is white and white is black for so long that now they start to believe it themselves. So they

just immediately march into the A-bomb zone, or step off the bridge, in everything they do. They're always just going the wrong way, doing the wrong thing.

**Will:** One last question on the proglumide, does it also extend the duration of the effects of opiates?

**Jonathan:** I'm not really sure about that, but I've tried it with morphine and codeine both, and I'm satisfied that... well I recently kicked, just to experiment... now I'm trying to find out how addictive are opiates because I've used them every day pretty much for about 15 years. For me it's the major smart-drug and it's the greatest boon that I've ever had, it's never been a problem for me. And I've never had any kind of problem, but I tend to use them every day, and it's been a problem sometimes for me with travel, especially to the U.S. although here you can buy opium poppies and just make tea from them, and it's cheaper than buying espresso really.

**Will:** Do you use it in its raw form?

**Jonathan:** Yeah, opium-poppy tea. Or codeine or morphine, pharmaceutical pills. In Spain, the pharmaceutical pills are really readily available and cheap.

**Will:** Just codeine though, right?

**Jonathan:** Yeah, but I like codeine. And you can make morphine or heroin from it if you wish to. But you can get 50 mg codeine pills over the counter in Spain with no aspirin.

**Will:** Yeah, I've tried those, my friends brought them back, and there is just not the euphoria that there is with oxycodone or hydrocodone. I think they are *far* inferior.

**Jonathan:** Well, I don't notice any difference between Hycodan®, Percodan®, and codeine. I prefer codeine, actually.

**Will:** Really?

**Jonathan:** But you see people vary pharmacogenetically with respect to the enzyme which is called, it's a cytochrome P450 enzyme, I think it's called CYP2D6, and it's actually the enzyme that catalyzes the transformation in your body of codeine to morphine because we make morphine, codeine and thebaine. We have the same biochemical pathways as the opium poppy. And so, *morphine* is an endopioid also, for us, and so those people that don't have endogenous morphine,

nor can they demethylate codeine to morphine because codeine is a prodrug as is heroin, and morphine is the actual analgesic agent. So about 10% of Caucasian North Americans don't have that enzyme and get no analgesia at all from codeine or from hydrocodone, because that's transformed to hydromorphone by the same mechanism. And it affects the metabolism of about 20 different drugs, it's called the debrisoquine anomaly, because that's one of the more common medicines that it affects. And so, that's one of my examples in *Pharmacophilia* pharmacogenetics, because in North America—10% of the people—it's a very significant one. And so, I think people vary with respect to how efficiently we can convert codeine into morphine. I convert it fairly efficiently and so codeine is fine for me. Chemically you can convert them, you can demethylate codeine into morphine with boron tribromide, which is a simple reaction, and it goes in quantitative yield.

**Will:** Do you know if other populations in other countries have different percentages of people without that enzyme?

**Jonathan:** Yeah, I'm sure but I don't know the statistics or if it's even been tested, but I'm sure that must be the case.

**Will:** And so for those people they would not get any analgesia?

**Jonathan:** None.

**Will:** What do you do for someone like that when they're in... pain, heh-heh... are there other drugs?

**Jonathan:** Morphine.

**Will:** Oh I see, just give it to them as morphine.

**Jonathan:** Right. But there again, see, black is white and white is black; they have this massive growth of opium poppies for the legal opiate industry. By the way, I was talking about the PARTNERSHIP FOR A DRUG-FREE AMERICA... the United States uses 52% of the world's legal opiate supply with only 4% of the population, 70% of the black-market cocaine and 34% of the 200 and some odd million kilogram output of the world pharmaceutical industry. 34% of the whole pharmaceutical output of the world is used inside the U.S. Drug-free America! If it gets any freer, we will all be dying of overdoses! And so, yeah, black is white and white is black. They take the morphine out of this and convert it to codeine, which is less active and isn't even processed effectively into morphine by a

great many people—so that it won't be abused. But they have already abused the shit out of it by doing that in the first place. (laughter)

**Will:** So what is the easiest way to get proglumide?

**Jonathan:** Buy it from SIGMA through somebody that has a chemical company. But yeah, I had never thought about that until just now, but I'll definitely develop that as another PHARMACOPHILIA product. And start a line of... I call it anti-mithridatism because Mithridates was the one who came up with the idea that if you take poisons in small doses every day you will become immune to those poisons. And so it's sort of like anti-mithridatism to work against that kind of tolerance mechanism. And it would work probably with all these drugs, there must be an endogenous Valium®-type inhibitor. Valium®, by the way, is also a natural product, it's been found in plants and animals, it's been found in fungi also.

**Jon:** Found in any kind of quantities to isolate from plants?

**Jonathan:** It doesn't seem to be of pharmacological significance in plants. But I think that Valium®, or desmethyl-Valium®, is our endogenous sedative, because we have this GABA<sub>A</sub> receptor, which is also called the benzodiazepine receptor, and only two endogenous ligands have been isolated for that, and they're both *anxiogenic*, they both cause anxiety rather than relieve it, and Valium® hits that receptor and relieves anxiety. One of them is a β-carboline, one of these endogenous ligands of the benzodiazepine receptor is a β-carboline. And that's why I'm pretty sure that β-carbolines main activity is at this GABA<sub>A</sub> receptor in the brain. And so the reason they have additive effects with alcohol is alcohol is also effective at that receptor. And so I think that's their real pharmacological importance. And so the GABA<sub>A</sub> receptor is an important target of drug-development, and also the nicotine-receptors. The MAOI effect of β-carbolines in the brain is probably of little or no significance in ayahuasca pharmacology, since cerebral MAO is inside the nerve-terminals, not in the synapses, where, however, β-carbolines might compete with DMT for access to receptor sites.

You probably know about this epibatidine, which comes from *Epipedobates tricolor*. It's one of these poison-dart frogs from Central America, they're little tiny things and people cruelly keep them as pets in aquaria, and there are hobby-shop books about them. But anyway, they mainly contain batrachotoxins, which are some of the most toxic compounds known.

And there's one species from Costa Rica that has such high levels of batrachotoxins that two scientists died from just handling an animal; they got enough of it on the palms of their hands that it killed them. It's very toxic stuff, but only two of the species are known to be used for poison-darts. What the Peruvian Indians do is they carefully spread-eagle these little creatures, they stretch them out in a little frame of wood—and they are very careful not to harm them and they always release them unhurt—and then they scrape their skins with a soft stick and collect the secretion from their skins and dry that out. Then when they wish to go hunting—they put this on their darts and so forth, because it's a fulminating poison—but when they wish to go hunting they burn their arms with a brand from the fire, they put a little of this in their palms, they dissolve it in some saliva which they rub into the burn on their arms, and then they also burn the noses of their hunting dogs and do the same thing, rubbing it onto the dogs' noses. And then both the dogs and the people have heavy toxicity and vomiting and they're incapacitated for about 8 or 10 hours, and they're in a kind of toxic stupor. But when that passes all their senses are enhanced for hunting and the dogs can smell better and they can see and hear better and so forth, and then they go out hunting after weathering the storm. So it turns out that the compound isolated from these frogs, epibatidine, is a nicotinic-receptor agonist. And nicotine is also an analgesic with morphine-like effects.

**Jon:** This is the “toad morphine” that you're talking about?

**Jonathan:** Right. But it's a frog, not a toad, though morphine itself occurs in toad-skins. And nicotine is also an analgesic, but that effect is overwhelmed by much more dramatic other effects that it has. And so they have now come up with—and ABBOTT LABS is developing this—something that is about a hundred times more active at this nicotinic receptor than epibatidine as an analgesic [the drug is called ABT-594], and of course now they're touting it as a non-addicting analgesic and the same old bullshit. But, I mean, like any other analgesic, if it really works, it will be “addicting,” because it's the same thing. If it works people will like it. As it happens, it *was* bullshit—ABBOTT has cancelled development of the drug less than a year after a *Science* article touting its wondrous non-addicting (*sic*) analgesia.

**Will:** So you would feel comfortable marketing a product like proglumide?

**Jonathan:** I don't know about the patent situation, it will probably have to be licensed from the manufacturer. But

maybe the patent has run out, maybe it's a generic thing that can just be sold, but yeah, definitely. It was approved in many different countries, it's toxicity is well-known and minimal. Yeah I just never thought about that. So there will be a market for drug-boosters and also tolerance-minimizers, which will be another kind of drug-booster. There are just a million-and-one possibilities, and everybody else is barking up the wrong tree and just working completely at cross-purposes to what makes sense and so meanwhile I see we have a ten year window-of-opportunity to become the MICROSOFT of the psychocosmos. And then when it's no longer possible to compete with the big-time drug pushers, then you just license

your patents to them and then you retire on a boat up the Amazon. Well... the only thing that would make me wish to retire is destroying this Evil Empire, I don't think that's exactly going to happen but... so I don't think I'll *ever* retire because the Evil Empire will just go on to other things once they can think of some other angle, which should take from five minutes to five days.

**Jon:** Glad to hear that you'll keep fighting the good fight as long as possible. Good luck with your publishing and pharmaceutical ventures, and thanks for taking the time out to speak with us for *The Entheogen Review*. ✧

# EVENTS CALENDAR

## SOLIPSE ECLIPSE FESTIVAL AUGUST 9–15, 1999

Billing itself as “7 days of music, performance, love, and psychedelics,” SOLIPSE takes place in Ozora, Hungary—about a 1.5-hour drive south west from Budapest.

Ozora is a small village with a population of about 1,200 people. The festival will be located about 4 kilometers outside of the village, surrounded by forest and fields of wild flowers, mint, and hemp. Near the fields is a large hill, which will be the sacred area. And in the middle of all this is a beautiful lake.

There will be live bands and DJs; a large open-air dance area; ambient “chill out” space; theater and performance space; a children’s area; a “sacred area” for meditation, relaxation or an opportunity to just get away; a “cine trip” made by our friends from Budapest, showcasing some of the most surreal and psychedelic films; food and drink, with various ethnic foods available; chai tents; a circus (without the animals); a massive space for camping; medical and first aid; shower facilities; fire jugglers; money changing facilities; and more!

The actual eclipse takes place on August 11th at exactly 12:50 pm MEZ. It lasts for 2 minutes and 56 seconds. Because of its proximity in Hungary, perfect visibility can be expected. Most people in their lifetimes don’t have an opportunity to see a full solar eclipse. You can be assured that it is one of the most amazing, powerful, and psychedelic experiences to be witnessed by the human eye. As one friend put it, “It was the highest I have ever been without chemicals!”

Entrance to SOLIPSE is by pre-sale tickets only. Price ranges from \$136.00 to \$151.00 for the week, or \$82.00 to \$91.00 for the weekend only. Questions about tickets? E-mail: [tickets@solipse.com](mailto:tickets@solipse.com). Check the web site for visa/passport requirements, travel/transportation info., and festival rules. For more information contact: SHAKESPEARE, PF 540218 (Dept. ER), D-10042 Berlin, Germany, TEL/FAX: ++49-30-263-9060 [shakespeare@solipse.com](mailto:shakespeare@solipse.com), <http://www.solipse.com>.

## TELLURIDE MUSHROOM FESTIVAL AUGUST 26–29, 1999

The TELLURIDE MUSHROOM FESTIVAL is designed for persons interested in expanding their knowledge of edible, gourmet, medicinal, poisonous and entheogenic wild mushrooms. Major consideration will be given to the cultivation of diverse mushroom species, emphasizing practical principles and techniques. Daily forays will be held in the surrounding mountains to collect edible and poisonous species and study their field characteristics. Conference facilities include appropriate meeting rooms and campsites. Meat and non-meat nutritious meals will be served.

Speakers include JOHN CORBIN (mushroom cultivation specialist), GARY LINCOFF (mycologist/author), LAURA HUXLEY (author), RITA ROSENBERG (author), PAUL STAMETS (president of FUNGI PERFECTI/author), and ANDREW WEIL, M.D. (director of the UNIVERSITY OF ARIZONA’S Program in Integrative Medicine/author). The Colorado faculty includes BILL and KAREN ADAMS, LEE GILLMAN, LINNEA GILLMAN, ART GOODTIMES, PAUL KLITE, EMANUEL SALZMAN, M.D., JASON SALZMAN, and JOHN SIR JESSE.

\$275.00 (with all meals); \$225.00 (without meals). Tickets for individual lectures are available at the door for \$25.00 per person per lecture. For more information contact: FUNGOPHILE, INC., POB 480503 (Dept. ER), Denver, CO 80248-0503, TEL/FAX: (303) 296-9359, [newsmush@netone.com](mailto:newsmush@netone.com), <http://telluridemm.com/mushroom.html>.

## THE BURNING MAN PROJECT AUG. 30 — SEPT. 6, 1999

Held in the middle of the Nevada desert, BURNING MAN has been called “a hedonistic/apocalyptic neo-pagan gathering.” Some consider it to be the “new Eleusis.” BURNING MAN has been held for numerous years now, and each year brings a larger crowd. It’s a beautiful orchestra of organized chaos. Many people consuming many different entheogens. Mud pits, fireworks, numerous live bands and performances, all-night rave dances, and the burning of giant ritual sculptures—culminating in the BURNING MAN. This

year, for the first time, "the man" will burn on Saturday night, rather than Sunday (allowing people both Sunday and Monday to take their leave of the city). Tickets are \$90.00 prior to August 1st, and \$100.00 after. From August 30 until the end of the event, tickets will be available at the entrance, but they will increase in price \$5.00 each day.

For updates on BURNING MAN, you can subscribe to the BURNING MAN ANNOUNCEMENTS E-MAIL LIST. To join this list send an e-mail to [bman-jackrabbit@burningman.com](mailto:bman-jackrabbit@burningman.com), with the word "subscribe" in the body of the message. For more info. contact: BURNING MAN, POB 420572 (Dept. ER), San Francisco, CA 94142, (415) 863-5263, <http://www.burningman.com>.

## FRIENDS OF THE FOREST AYAHUASCA RETREAT SEPTEMBER 1-9, 1999

Held at the OSHO LUA community center in the Chapada Valley in Goias, about four hours from Brasilia by car and another hour or so by foot (no roads enter the valley). Rivers with many beaches and waterfalls flow through this luxurious forest paradise. Four ayahuasca/jurema rituals will be held. There will also be Holotropic breathwork, yoga, "Aura soma," meditation, days of absolute silence, sweat lodge ceremonies, and more. \$850.00 (price increases in September). For more information contact: FRIENDS OF THE FOREST, Prinseneiland 97 (Dept. ER), 1013 LN, Amsterdam, The Netherlands, +31(0)20-6365059 or 6365272, FAX: +31(0)20-6365198, [info@friends-of-the-forest.nl](mailto:info@friends-of-the-forest.nl), <http://www.friends-of-the-forest.nl>.

## ALLCHEMICAL ARTS PSYCHOACTIVE CREATIVITY SEPTEMBER 12-17, 1999

A six-day conference exploring the relationship between chemically-induced visionary states and creativity, held on the beautiful Kona coast of Hawai'i. Visual artists, writers, musicians, and filmmakers discuss how these substances have influenced and informed their art. The format includes lectures, panel discussions, and open forums. This event is produced by TERENCE MCKENNA, KEN SYMINGTON, and MANUEL TORRES.

Featured speakers include: LEWIS JOHN CARLINO (film director/screenwriter), BRUCE DAMER (founder/president of DIGITALSPACE CORPORATION), CONSTANCE DEMBY (multi-instrumentalist/painter/sculptor/instrument designer), ALEX GREY (painter/sculptor/author), BEN HIGHTOWER NEILL (multimedia artist), MARK PAULINE (founder of SURVIVAL RESEARCH LABORATORIES), MARK PESCE (co-inventor of VIRTUAL REALITY MODELLING LANGUAGE), TOM ROBBINS [to be

confirmed] (author), ANNIE SPRINKLE (author/artist), LESLIE THORNTON (film/video/experimental theatre instructor), ROBERT VENOSA (painter/sculptor/film design), STEINA VASULKA (co-founder of THE KITCHEN), WOODY VASULKA (co-founder of THE KITCHEN), and ALICE WALKER (author). More detailed biographies of these presenters can be viewed at the web site listed below, or by requesting a brochure from the address listed below.

Conference fee is \$1,500.00 per person for the six days of programs, hotel accommodations in Hawai'i (2 registrants per double room in a first-class resort), and three meals daily (vegetarian fare is available). For more information: ALLCHEMICAL ARTS, POB 204 (Dept. ER), Sierra Madre, CA 91025, (626) 355-7893, FAX: (626) 355-4293, <http://www.levity.com/eschaton/allchemicalsplash.html>.

## DANIEL SIEBERT'S SALVIA DIVINORUM SEMINAR SEPTEMBER 26, 1999

The seminar will be held from 10:00 am until 6:00 pm at a beautiful mountain-side location in the city of Sierra Madre, California (1/2 hour from Hollywood and downtown Los Angeles).

This will be an intensive one-day workshop on *Salvia divinorum*, focusing primarily on horticulture, extraction techniques, traditional and modern methods of use, effects, safety, and the responsible, constructive use and integration of *S. divinorum* in our lives. Cost is \$95.00 if purchased by August 31st, \$115.00 thereafter. Lunch will be provided. Overnight accommodations are available for an additional \$25.00, but space is very limited.

For registration or more information: DANIEL SIEBERT, POB 6145 (Dept. ER), Malibu, CA 90264, (310) 457-3578, [dsiebert@gte.net](mailto:dsiebert@gte.net), <http://salvia.lycaem.org/workshops.html>.

## CONFERENCE ON IBOGAINE NOVEMBER 5-6, 1999

A major objective of this conference will include an in-depth series of presentations and discussions on ibogaine's possible mechanism(s) of action, as well as focus on safety, toxicity, and pharmacokinetic issues. The conference will also present a social/ethnographic view of the present ibogaine subculture of the U.S. and Europe, comparing this to the centuries older, sacramental context of the use of *eboka* in Africa.

The conference will be held at the NEW YORK UNIVERSITY SCHOOL OF MEDICINE. For more information: NYU SCHOOL OF MEDICINE, 550 First Avenue (Dept. ER), New York, NY 10016, [kra1@is9.nyu.edu](mailto:kra1@is9.nyu.edu), <http://www.med.nyu.edu/Psych/ibogaineconf>.

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold new book exploring the legal substrate underlying shamanic mushrooms and their active principles. \$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES

Box 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is editor of *The Entheogen Law Reporter (TELRL)*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL MINDUSTRIES, POB 73401 (DEPT. ER), Davis, CA 95617-3401, or visit <http://www.specmind.com>.

Questions for possible inclusion in this column can be sent to Mr. BOIRE at: PHARMACO PROHIBITA, c/o T.E.R., PMB 808, 564 Mission Street, San Francisco, CA 94105-2918.

## PHARMACO PROHIBITA

by Richard Glen Boire

**QUESTION:** There is a lot of talk about mandatory minimums. Do any apply to entheogens? Some of the plants I use contain a controlled substance. For example, I routinely have a pound of *Mimosa tenuiflora*, or other similar entheogenic plants. If I am ever busted could I be subjected to a mandatory minimum because of the quantity of the plant material, even though it is far from 100% pure controlled substance?

**RESPONSE:** In the War on Some Drugs, mandatory minimums are like government-placed landmines. They are buried in complex sentencing statutes with tripwires leading into America's streets, businesses, and even into our homes. Once triggered, they explode indiscriminately. Fortunately, the specifications of these landmines—what triggers them and how forcefully they detonate—are revealed in the pages of the federal codes. I'll try to lay them bare here.

Most talk of "mandatory minimums" is related to federal law. It is probable that a person convicted of a federal drug crime other than simple possession, will get at least a five-year mandatory minimum sentence. A study by the U.S. SENTENCING COMMISSION showed that mandatory minimum sentences were applied to just under 80% of federal drug cases in 1997 (*U.S. Sentencing Commission Annual Report 1997*, p. 38). According to the 1997 *Sourcebook for Federal Sentencing Statistics* (pp. 67–68), in 1997 there were 18,922 drug offenders sentenced under the federal guidelines. 527 of these people were convicted based on a drug other than *Cannabis*, cocaine/crack, heroin, or methamphetamine.

At the moment, a conviction for simple possession (*i.e.* possession for one's own use—not for sale) for all entheogens is not subject to a mandatory minimum. In fact, assuming it's a first offense for simple possession of an outlawed entheogen, one can get anything from probation to a maximum of one year in federal prison. (NOTE: This is under *federal* law. Many states have much more draconian sentences for simple possession.) Federal mandatory minimums for a couple of entheogens arise when the offense is manufacturing (which includes cultivation), importing, exporting, distributing, or possession with intent to do any of these activities.

Participating in a conspiracy to commit any of these offenses will also trigger the mandatory minimum. Currently, courts are holding that practically anything will suffice to link a person to a conspiracy, including making a phone call to help arrange a deal, driving someone to a deal, or providing money, equipment, or chemicals.

Finally, a five-year mandatory minimum is also triggered by possessing or using a gun during a federal drug offense (18 U.S.C. 924(c)). I've seen this minimum applied in cases where the defendant merely had a gun in the same room as the

drugs. In fact, the gun doesn't even have to be loaded (see *U.S. v. Munoz-Fabela* (5th Cir. 1990) 896 F.2d 908; *U.S. v. Gonzalez* (9th Cir. 1986) 800 F.2d 895; *U.S. v. Martinez* (10th Cir. 1990) 912 F.2d 419).

The federal laws are explicit with regard to mandatory minimums for the following entheogens:

**LSD:** manufacturing, distributing (including giving away), or possessing with intent to manufacture or distribute 1 gram triggers a five-year mandatory minimum sentence (21 U.S.C. 841(b)(B)(v)). If 10 grams, a ten-year mandatory minimum sentence is triggered (21 U.S.C. 841(b)(1)(A)(v)). When calculating the weight of LSD for purposes of the mandatory minimum, the actual weight *including the carrier medium* is used. A standard weight of 0.4 milligram per dose is used only if no mandatory minimum is triggered (see *Neal v. U.S.* (1996) 116 S.Ct. 763, 766–769).

**Cannabis:** cultivating, distributing (including giving away), or possessing with intent to cultivate or distribute 100 live plants or 100 kilos of harvested *Cannabis* triggers a five-year mandatory minimum sentence (21 U.S.C. 841(b)(B)(vii)). If 1000 live plants or 1000 kilos of harvested *Cannabis*, a ten-year mandatory minimum is triggered (21 U.S.C. 841(b)(1)(A)(v)).

Remember that mandatory minimums don't tell you the worst case scenario—they tell you the guaranteed *minimum* sentence. Under the federal sentencing guidelines, one's criminal history, role in the offense, sophistication of the offense, whether weapons were involved, whether children were involved, the location of the offense, *etc.*, can all be factored in, and can produce a longer sentence. If a mandatory minimum sentence is triggered, there are only two ways out: (1) the safety valve; or (2) the snitch valve.

In 1994, Congress enacted a "safety valve" provision that gives federal judges the power to exempt certain nonviolent first-time offenders from mandatory minimums. In 1997, 23% of federal drug offenders benefited from the safety valve (*U.S. Sentencing Commission Annual Report 1997*, p. 38). To be eligible for the safety valve a person must meet all five of the following criteria: (1) have no prior drug conviction; (2) must not have possessed a weapon, or threatened violence in conjunction with the current offense; (3) must not have had a "managerial" or "supervisory" role in the offense; (4) must confess the full scope of your involvement in the offense; and

(5) must not have caused any physical injury as a result of the offense (18 U.S.C. 3552(f); USSG Sec. 5C1.2).

If a person does not qualify for the safety valve, his or her only way out of a mandatory minimum is through the "snitch valve." This disturbing provision actually codifies government extortion by rewarding snitches with more lenient punishment. Under the provision, a defendant who provides "substantial assistance" in the prosecution of someone else can escape a mandatory minimum, if the prosecutor (not a judge) deems the assistance valuable enough. A study by the U.S. SENTENCING COMMISSION showed that just shy of  $\frac{1}{3}$  of federal drug offenders who faced mandatory minimum sentences escaped them by snitching (*U.S. Sentencing Commission Annual Report 1997*, p. 38).

Under the federal sentencing guidelines, a person convicted of manufacturing, importing, exporting, or possessing with intent to sell 50 mg or more of LSD or the equivalent amount of another Schedule I or II "hallucinogen" is assigned an offense level of 14, meaning that the minimum sentence is 15 months. Below that amount (*i.e.* 50 mg LSD or equivalent), the person is eligible for probation.

The federal sentencing guidelines operate on a weird equivalency scheme under which most drugs are equated to a specific amount of *Cannabis*. 1 gram (1000 mg) of LSD, for example, is equated to 100 kilos (100,000 grams) of *Cannabis*. 50 milligrams of LSD (the amount that correlates to offense level 14) equates to 5 kilos (5,000 grams) of *Cannabis*. Using this equivalency, and plugging in other entheogens, we get the following quantities that will mandate no less than a 15-month sentence:

- 70 grams bufotenine
- 62 grams DET
- 50 grams DMT
- 2 grams DOB
- 3 grams DOM
- 100 grams MDA
- 166 grams MDEA
- 142 grams MDMA
- 500 grams mescaline
- 5000 grams dry weight or 50,000 grams wet weight of mushrooms containing psilocybin or psilocin
- 10,000 grams of dry weight or 100,000 grams of wet weight of peyote
- 10 grams psilocybin

In my professional opinion, *Mimosa tenuiflora* (= *M. hostilis*) roots and root-bark are not controlled substances. But, assuming arguendo that a person were to suffer a federal conviction for manufacturing DMT based on cultivating *M. tenuiflora* and let's further say that the person was found with a pound of harvested plant material, what would be the punishment?

Based on the earlier list, we know that if the person were convicted of manufacturing 50 grams of DMT they would be subject to a low-term sentence of 15-months in prison. One analysis of *M. tenuiflora* roots showed them to contain nearly 0.6% DMT (PACHTER *et al.* 1959, in OTT 1994, presented under the earlier taxonomic name *M. hostilis*). Based on the scenario of 1 pound of harvested material, a defense attorney should argue that their client possessed only 2.74 grams DMT, at the very most. Under such a theory it would take just over 18 pounds of *M. tenuiflora* roots to reach offense level 14 and trigger a 15-month low term. (Again, I stress that in my opinion, it is almost unthinkable that a conviction could be sustained on the basis of growing *M. tenuiflora*, or possessing or selling unextracted harvested roots or root-bark.) The federal prosecutor, however, would likely argue that the sentence must be based on the gross weight (1 pound in the example) of the plant material.

Generally speaking, under the federal sentencing guidelines the weight of any drug includes the weight of the "mixture" containing the illegal drug. In most cases this "mixture" theory has been used with regard to "pharmaceutical drugs" to include the weight of binders and other additives needed to press a drug into a pill (see, for example, *U.S. v. Lazarchick* (11th Cir. 1991) 924 F.2d 211, 214 [pharmaceutical drugs]; *U.S. v. Crowell* (9th Cir. 1993) 9 F.3d 1452, 1454 [dilaudid]) as well as "street drugs" to include cutters and dilutants, inactive substances commonly mixed with controlled substances to stretch profits (see *Chapman v. U.S.* (1991) 500 U.S. 453).

If the sentencing court accepted the prosecutor's argument that raw plant material was indeed a "mixture" containing DMT, the court would determine the defendant's sentence as if he or she manufactured 1 pound, or 454 grams, of DMT. Given that the guidelines equate 1 gram of DMT to 100 grams of *Cannabis*, the defendant's sentence would be the same as a person convicted of growing 45,400 grams of *Cannabis*, which is offense level 20. The punishment for this offense level is 33 to 41 months.

There is a very good argument, however, that any "mixture" that cannot be consumed should not be included in the weight. The official commentary to Section 2D1.1 of the U.S. Sentencing Guidelines (USSG) states that "mixture" does not include any "materials that must be separated from the controlled substance before the controlled substance can be used." Now, no one would sit down and eat raw *M. tenuiflora* roots or root-bark; they would extract the active principle and discard the left-over marc. Accordingly, it seems to me that in the case of a natural entheogen that is not ingested whole (*i.e.* unextracted), the correct procedure for determining a sentence under the USSG would be to calculate it based only on the controlled substance constituent. ✧

## TERRA INCOGNITION

### LIFE IN THE SURVEILLANCE STATE

A Work in Progress  
by Jesuspect Christereotype  
with an exegesis by Richard Glen Boire

This is no carefully measured cup of ideology, no clipped or caged dogma. No well-ordered textbook narrative with Library of Congress categorizable subject matter or a block-indented table of contents. This is textual poison splashed over the rim and off the saucer. The table lit ablaze and left to burn unguarded amidst an ambient rumble. Grab a chair and fend off the identity parasites that are all around you!

#### Installation No. 1: Life in the Surveillance State

...shoplifting mirrors, surveillance cameras, patrolling the Garden of Eden, *The Watchtower*, paranoia, face-recognition systems, school uniforms, iris detection, kid cops, transparency, *The Weekly Reader*, library surveillance, scanscapes, panopticonic public spaces...

Four Installments: \$20.00 (USA), \$25.00 (foreign) from:

**ESHU INCORPORATED**  
**POB 1209 (Dept. ER)**  
**9001 St. Gallen**  
**Switzerland**  
**(001) 41 980-0453 FAX**

“ESHU represents [the] cutting edge of neurochemical research and development.” Their chemicals are offered for legitimate scientific research purposes only, and are not intended for human consumption. All ESHU products come with a certificate of analysis and are guaranteed to be authentic and of the finest quality and purity. (The sample certificate of analysis that we saw for *N,N*-dipropyltryptamine hydrochloride salt listed the batch number, appearance, melting point, identity, and came with a 1H NMR Spectrum print-out attached.)

Currently available products include: *N,N*-dipropyltryptamine Hcl salt (\$130.00/gm), *N,N*-dipropyltryptamine free-base (\$160.00/gm), 5-methoxy-*N,N*-dimethyltryptamine free-base (\$150.00/gm), DL-alpha-methyltryptamine free-base (\$100.00/gm), and *N,N*-diisopropyl-5-methoxytryptamine Hcl (\$250.00/gm). Various discounts for larger amounts of any product are available. While the prices listed here were current in early June, they may change. You will need to write or fax first and request a current price/product list, prior to placing an order. There are several new compounds currently in development, and ESHU welcomes any further product suggestions that are within the current legal boundaries of Switzerland.

Payment is best sent through the WESTERN UNION “Quick Pay” system. No ID is required to use this service. Using this system and a faxed order form, orders should arrive in 1–2 weeks. Payment can also be made by sending well-wrapped cash via registered mail, or a direct bank wire transfer.

One *very* nice thing about this company for customers in the USA is that, although you place the orders by sending payment to their Swiss address, the order is filled from within the United States by an ESHU representative. This means that

there is no risk of a hassle with the U.S. CUSTOMS department. We know of one individual who has ordered products from ESHU, and has been quite satisfied with the products quality.

**MBE TECH**  
**625D 13th Street (Dept. ER)**  
**Indiana, PA 15701**  
**(724) 463-8442**  
**(724) 349-0746 FAX**  
**irie@mbetech.net**  
**<http://www.mbetech.net/cgi-bin/webc.cgi/~irie/home.html?sid=2QI0YGHXI>**

MBE TECH is a chemical-supply company with a small selection of chemicals offered for research, development, and production applications. None of their products are sold for human consumption. Any of their natural products may be of use for those performing TLC on plants who need a reference sample. As well, some of their natural and synthetic products may also be of interest to those experimenting with supplementation of substrates in fungi cultures.

They offer *N,N*-dipropyltryptamine Hcl (\$120.00/gm). Compare that to JLF, who sells it at \$190.00/gm. They also carry DL-alpha-methyltryptamine (\$140.00/gm); *N,N*-diisopropyl-5-methoxytryptamine Hcl (\$300.00/gm); harmine Hcl (\$70.00/gm); yohimbe Hcl at (\$30.00/gm); dextromethorphan hydrobromide (\$30.00/15 gm and \$80.00/50 gm); gamma-butyrolactone (\$30.00/500 gm and \$135.00/3,000 gm); 1-4 butanediol (\$50.00/16 oz, \$90.00/32 oz, and \$165.00/64 oz); and a few other offerings.

You have to set up an account to place an order, but this is a simple process of filling out a form and e-mailing it to them. You can order over the Internet with a credit card or purchase products by mail using a money order, however, orders paid for with a money order must include a photocopy of your driver's license or birth certificate.

**THE PERUVIAN JOURNEY**  
**POB 665 (Dept. ER)**  
**Peru, NY 12972**  
**info@peruvian-journey.com**  
**<http://www.peruvian-journey.com>**

THE PERUVIAN JOURNEY offers a few seeds and plants of interest, including *Argyrea nervosa* (seeds: 10/\$3.00, 20/\$5.00, 50/\$10.00), *Artemisia absinthium* (seeds: packet/\$3.00, 2

packets/\$5.00; plants: 1/\$7.95, 6/\$29.95), *Brugmansia* spp. (seeds: packet/\$5.00, 10 gm/ \$29.95, 100 gm/\$199.95), *Desmanthus illinoensis* (seeds: 1 gm/\$2.50, 5 gm/\$5.00, 20 gm/\$10.00), *Echinacea angustifolia* (plants: 1/\$4.95, 6/\$19.95), *Hypericum perforatum* (seeds: packet/\$3.00, 2 packets/\$5.00; plants: 1/\$7.95, 6/\$29.95), *Ipomoea violacea* (seeds: 50/\$3.00, 100/\$5.00, 500/\$20.00), *Leonurus sibiricus* (seeds: packet/\$5.00), *Lippia dulcis* (plants: 1/\$7.95, 6/\$29.95), *Melaleuca alternifolia* (plants: 1/\$14.95), *Papaver somniferum* (Chinese or Persian seeds: 1 gm/\$2.50, 3 gm/\$5.00, 10 gm/\$10.00), *Peganum harmala* (seeds: 10 gm/\$2.50, 30 gm/\$5.00, 75 gm/\$10.00; plants: 1/\$7.95, 6/\$29.95), *Salvia divinorum* (plants: 1/\$25.00), *Trichocereus pachanoi* (seeds: 20/\$3.00, 50/\$5.00, 200/\$10.00), *T. peruvianus* (seeds: 5/\$3.00, 10/\$5.00, 25/\$10.00), and *Turbina corymbosa* (plants: 1/\$15.00). They also sell indoor gardening supplies. Check their web site for S/H charges.

#### SOUTHWEST ETHNOBOTANICALS

# BOOK REVIEW

*Enzyklopädie der psychoaktiven Pflanzen: Botanik, Ethnopharmakologie und Anwendung*, CHRISTIAN RÄTSCH, 1998. AT VERLAG [Bahnhofstraße 39–43; CH-5001 Aarau, Switzerland; DM 228.00; ös 1664.00; sfr 198.00]. Smythe-sewn hardcover; ISBN 3-85502-570-3; 941 pp.; 32 pp. index; 27 pp. bibliography with 1059 citations, 5 pp. mushroom bibliography with 178 citations plus bibliographies to individual articles; 8 pp. botanical systematics appendix. Foreword by ALBERT HOFMANN, p. 6.

The long-awaited publication of CHRISTIAN RÄTSCH'S *Enzyklopädie der psychoaktiven Pflanzen* is a major publishing event for ethnopharmacognosists as well as psychonauts, to both of which groups the book is directed, in the tradition of the SHULGIN'S *PIHKAL* and *TIHKAL* and this reviewer's *Pharmacotheon* and *Ayahuasca Analogues*. Unlike many books which loosely use the term by way of title, this is truly an encyclopædia, oversized, nearly 1000 pages in length and with a total of 454 articles subdivided into seven basic lexi-

cographic sections: 1) *The Most Important Genera and Species from A to Z*; 2) *Less-Researched Psychoactive Plants*; 3) *Alleged Psychoactive Plants*; 4) *Hitherto Unidentified Psychoactive Plants*; 5) *Psychoactive Mushrooms*; 6) *Psychoactive Products* and 7) *Plant Active Compounds*. Sections 1 and 5–7, totalling 774 pages (521, 76, 116, 61 pp.) contain 252 articles (157, 29, 31, 35), or an average of just over 3 pages *per* entry; whereas sections 2–4 total 73 pages (47, 10, 16 pp.) with 202 articles (135, 26, 41), or just over  $\frac{1}{3}$  page *per*. There is a 27-page general bibliography of 1059 citations as well as a general mushroomic bibliography of 5 pages with 178 citations, and each of the articles (with occasional exception of the shorter articles) is accompanied by its own specific bibliography. While this needs involves some duplication of citations in related articles (for example, there are eight different articles for *Brugmansia* spp.), this would appear to be minimal and certainly is more convenient for the researcher. On the other hand, it would have been more convenient for the investigator to have merely one lexicographic section as opposed to seven, although the fairly detailed 32-page index offsets this objection, giving facile access *via* botanical or common names, names of chemical compounds, *etc.* In my opinion, lexicographic sections 2–4, which contain the shorter entries, could surely have been collapsed into one, and in many cases the assignment of a given plant to the category of “less-researched,” “alleged,” or “hitherto unidentified” psychoactive plant could be questioned or seen as arbitrary, and it might also be argued that certain plants, such as *Crocus sativus* or *Piper betle* belong rather in one of these tenuous categories than in the major, definitive list; as also that neither *Cocos nucifera* nor *Vitis vinifera* belong there, but rather in the *Psychoactive Products* list, with other fermentation substrates.

But these are captious objections, and overlook the obvious fact that this is an attractive and eminently-accessible presentation of a veritable wealth of information on psychoactive ethnopharmacognosy, never before assembled in such detail and broad scope in a single volume. The book is lavishly illustrated with more than 800 color photographs, mostly by the author and generally excellent, as well as a multitude of black-and-white illustrations—botanical line-drawings, chemical structural formulæ and cultural artifacts. As would be expected in such an ambitious editorial under-

taking, a few errors have crept in, such as the photograph on p. 510 of *Cereus peruvianus* identified as *Trichocereus peruvianus* (obvious to me, inasmuch as the plant is in my garden, grown from seed collected in Riverside, California in 1995!). Another minor error in a figure-legend: the caption on p. 756 to the photograph of Mexican XTABENTÚN liqueur states it is fermented from traditional *xtabentún* (*Turbina corymbosa*, source of *ololiuhqui* seeds) honey, whereas I spoke to the manufacturer in Mérida in the mid-1980s while researching this subject (*vide* my recent article in *Economic Botany* 52(3): 260–266, 1998), and learned it was made indiscriminately from diverse commercial honeys; nor did I find evidence for the continued production of traditional *xtabentún* honey.

In the longer articles of sections 1 and 5–7, the level of detail is impressive, particularly given the broad scope of the book. The articles each have sections on: family; varieties and subspecies; scientific-name synonymy; common names; history; distribution; cultivation; description; drug-parts; preparation and dosage; ritual use; artifacts; medicinal use; constituents; effects; and commercial forms and formulæ. The heading for the articles gives the complete scientific name and

most common identifying name(s). In almost all cases, there are photographs of the plants, usually several, as well as of prepared drug-forms and associated artifacts; sometimes with classic botanical drawings, archaic art, photographs of typical use, and/or structural formulæ of active constituents as *marginalia*. Even the two general bibliographies are nicely illustrated with *marginalia* photographs of numerous publications! The accuracy of the information presented is also laudable, although inevitably, in a book of this size and scope, specialists will take issue with some details. For example, on pages 719–720, in the article on *Ayahuasca Analogues and Pharmahuasca*, it is stated: “Normally, for *pharmahuasca* a dosage of 100 mg *N,N*-DMT and 50 mg harmaline is recommended *per person*.” Whereas 100 mg DMT is surely a stiff dose (about 3 x minimal visionary dose for me, and I am more resistant than most to tryptamines), and I have found as little as 40 mg harmaline to activate tryptamines orally for me, it turned out I have a lower titre of gastric MAO than most. One trial of *pharmahuasca* with 20 mg 5-MeO-DMT (equivalent to about 100 mg DMT) plus 50 mg harmaline (as free-base) was inactive in each of six individuals, and I have found at least 60 mg harmaline (as free-base; and about twice as much harmine) is required reliably to activate tryptamines

*Mind Books* offers over 280 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

- Philosophy & Pioneers (40 titles)*
- History & Stories (19 titles)*
- Public Policy & Law (16 titles)*
- Psychology & Empathy (33 titles)*
- Religion & Spirit (22 titles)*
- Practical Guides (20 titles)*
- Traditional Cultures (71 titles)*
- Plants & Compounds (37 titles)*
- Chemistry & Neuroscience (31 titles)*

We offer our free print catalog; fast and discreet service around the world; and easy ordering by mail, phone, e-mail, or fax. For a free catalog, send your address to:

orally in most people. Also, in the recipe for “prairie ayahuasca” on p. 717, it is stated that 30 g of root-bark of *Desmanthus illinoensis* constitutes a dose with 3–4 g of *Peganum harmala* seeds, whereas I found, experimenting with two different strains, that twice this quantity was necessary. In commenting on “Mayahuasca,” RÄTSCH notes the possibility the Mayans had brewed an ayahuasca from leaves of *Banisteriopsis muricata*, which do indeed, as he states, contain both DMT and  $\beta$ -carbolines. On the other hand, this seems unlikely, given the extremely low levels of both reported in only a single analysis, apparently from cultivated material in India (about 25 times less  $\beta$ -carbolines than reported as an average in stems of *B. caapi*, with less than 1% of the DMT quantity found in average *Psychotria* or *Diplopterys* leaves added to ayahuasca). Furthermore, I know of no real evidence, direct or tangential, that the archaic Mesoamericans knew of ayahuasca-type beverages based on *Banisteriopsis* species, nor that they attached any particular importance to these, as so obviously is the case all over Amazônia. Again, this is carping on fine details, and on the part of one who is as much a specialist on ayahuasca and *pharmahuasca* as anyone.

But it is only at such a level of detail that I can find fault with this excellent book. It has taken its rightful place as a valuable reference book in my extensive library, and even for non-German-readers, it is well worth the high price for the magnificent illustrative material it contains, as well as the customary high-quality paper, design and printing from Swiss AT VERLAG. On the other hand, it seems an English translation is in the works, which will be a major, and costly endeavor, and it is doubtful the book will see a commensurate quality of production this side of the Atlantic, where we seem to be having a rough time escaping from the Yankee tradition of the “sleazy dope-book,” as exemplified by innumerable very forgettable pamphlets, the English translation of JOCHEN GARTZ’ fine book on psychoptic mushrooms, as well as the recent offerings from the late D.M. TURNER, not to mention periodicals such as *High Times* and its imitators and *Psychedelic Illuminations*. CHRISTIAN RÄTSCH and AT VERLAG are to be commended for making a major and high-quality contribution to the literature on psychoactive plants, which deserves a place of honor in the library of every serious psychonaut and scholar of Psychotropica.

## NEW PRODUCT!

### “Sage Gold”

**Orally Active *Salvia divinorum* Preparation.**  
**Send a self-addressed stamped envelope for more details.**

#### **5X Extract Incense — Now Standardized**

Our 5X Extract is now standardized, and contains 12.5 mg of pure salvinorin A per gram of leaf. Made from organically grown *Salvia divinorum* leaves.

Highest quality product.

\$15.00/gm, \$40.00/3 gms. Other extract formulations available.

**Top quality *Salvia divinorum* leaves from Hawaii and Oaxaca also available.**  
**Send a self-addressed stamped envelope for prices.**

No personal checks accepted. Payment in cash or postal money order only. If paying by money order, leave the “Pay To” space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24-hours.

All prices are postpaid in the USA; foreign orders inquire for shipping costs.

All products unconditionally guaranteed. Inquire for wholesale pricing.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## NOTICE

Due to revised regulations for commercial mail receiving agencies by the UNITED STATES POSTAL SERVICE, our address has changed slightly. All future correspondence should be addressed to: *The Entheogen Review*, PMB 808, 564 Mission Street, San Francisco, CA 94105, USA.

# FLY AGARIC, FLIES, AND TOADS: A NEW HYPOTHESIS

From the forthcoming Italian book *Animals that Take Drugs* by GIORGIO SAMORINI

Animals take drugs. This is an undeniable fact that has been repeatedly confirmed by animal behavior studies. Some years ago, SIEGEL (1989) gathered together many instances of such behavior. At present, I am writing a book on the instances observed up to the present in an attempt to explain them in terms of what the biological literature refers to as the “PO factor” or “de-patterning factor.”

In brief, we may note that all living species (including plant life) are endowed with a set of primary functions necessary for survival (nutrition, reproduction). However, this is not sufficient. If a species is to preserve itself over time, it must be capable of evolving by modifying and adapting itself to its incessantly changing environment. Apart from the rare cases of “living fossils,” species that do not evolve will finally succumb. This is why each living species must also possess an “evolutionary function” that is based, biologists believe, on the PO or de-patterning factor. The PO factor is probably reflected in the behavioral trait of drug-taking noted in animals and human beings. In the final analysis, drug-taking may be considered a vital evolutionary function for the preservation of the species (SAMORINI, *Animali che si drogano*, work

in progress). SIEGEL comes to the same conclusion, albeit by a different route.

We already know that hundreds of natural species display this trait (including, surprisingly, lower-order species such as insects). Certain hawkmoth species—small nocturnal moths—have developed a long proboscis to draw in the nectar of a Jimson weed species. In Arizona, the *Manduca quinquemaculata* hawkmoth feeds on the nectar of *Datura meteloides* DC. ex DUNAL (= *D. innoxia* MILLER). By doing so it aids the pollination of the flowers. Only after repeated observation of the behavior of this species was it noticed by some researchers that this hawkmoth appeared to be intoxicated by the nectar. This was in fact anything but obvious. Firstly, observation took place by night when the plant’s corolla opens. The main tasks of the botanists and entomologists who took the trouble to sit up all night beside these Jimson weeds were identifying the pollinating insects and capturing them while they were still inside the flower. However, observation of the insects that had drawn in the nectar revealed that they “appear clumsy in landing on flowers and often missed their target and fell into the leaves or onto the ground. They were slow and awkward in picking themselves up again. When they resumed flight, their movements were erratic as if they were dizzy. The hawkmoths seem to like it and come back for more” (GRANT & GRANT 1983: 281). It is more than likely that the nectar of this species of Jimson weed contains the psychoactive alkaloids also to be found in those parts of the plant used by man for their visionary properties. GRANT & GRANT advance the hypothesis that this inebriating nectar constitutes a sort of “reward” given by plants to insects for their services in pollination. For hawkmoths, however, this is a very dangerous job indeed! If they lie besotted on the ground—even very briefly—or slowly fly away, they instantly become targets for predators.

It appears that something similar also takes place with certain bees and American tropical orchid flowers. *Catasetum*, *Cynoches*, *Stanhopea* and *Gongora* flowers are not sources of nutrition. They produce a liquid perfume. Bees of the *Eulaema*, *Euplusia*, and *Euglossa* genera scratch the floriferous parts of the plants. “The liquid exudes from the scratched surface and is absorbed through the front legs of the bees.

The bees return repeatedly to the floral source of the liquid, and exhibit clumsy movements on the flowers which are interpreted as a result of intoxication" (DODSON 1962 and VAN DER PIJL & DODSON 1966 in GRANT & GRANT 1983: 283). This particular type of commerce between insects and flowers, whereby pollinated plants reward insects for their services (with the drug as a partial or entire reward), is probably much more widespread than is recognized at present.

The behavior exhibited by hawkmoths in the presence of Jimson weed led me to reconsider the behavior of the common fly (*Musca domestica*) in the presence of fly-agaric (*Amanita muscaria*). The name of this mushroom "muscaria" is derived from the Latin for fly, "musca," because it is known that flies are attracted by the caps of fly-agaric and that they are "killed" as a result of contact. In the past, indeed right up to our own century, fly-agaric caps have been placed on windowsills as insecticides. Often, the cap was (or is) crushed and mixed with sugar or milk to attract large quantities of flies. In this manner, the flies would actually consume greater quantities of the inebriant. The flies then die, probably due to overdose. I have often noted apparently dead flies around the caps of the fly-agaric that I have prepared on various occasions (preparation consists of stripping the cap of its gills to prevent rot and laying out the caps in a well-aired place for drying). Unless one wishes to dry the caps with a warm air flow in an open oven, the natural length of time for drying the mushrooms can range from a few to many days according to the temperature and humidity of the surroundings. At times, I have counted dozens of flies that had "died" during the drying period. The number depended not so much on the number of caps laid out, or days necessary for complete drying, as on the number of flies in the vicinity. The "victims" of contact with the caps—lying on their backs with their legs up in the typical position of a dead fly—only appear to have died. If you leave them alone and come back after an hour or so, or the next day, you will find that they have flown away! Normally, one might remove these "dead" flies, but perhaps others have taken the place of the first ones you saw, and have also been intoxicated by the caps. Seeing as one would find it hard to distinguish between individual flies, it is hardly surprising that this turnover goes unnoticed. This is the reason for the folk belief that fly-agaric kills flies by poisoning them. However, a number of 19th century mycologists noticed that flies were not so much poisoned as drugged into a state of "lethargy," and it was recommended to those who used the mushroom against flies that they sweep up the immobilized flies and throw them into the fire (see, for example, PAULET 1793 and CORDIER 1870: 94).

On careful observation, we see that the flies land on the cuticles of the fly-agaric cap and lick the surface. After a while (5–20 minutes), some show signs of inebriation. They fly erratically or not at all; they become sluggish; a tremor appears in the legs or there is a trembling of the wings. Eventually, the flies will roll over onto their backs legs in the air, perfectly still. If you touch them with a pencil tip, some will exhibit no response, while others will move their legs. Under a magnifying glass, one may observe a peristaltic movement, which proves that these flies are not dead. Over a period ranging from 30 minutes to 50 hours, the flies wake up and soon move about in a normal manner. BOWDEN *et al.* (1965) showed that flies, on awakening, move their legs first, then their wings. They then fly off as though nothing had happened at all. Some flies do not exhibit inebriation on coming into contact with the surface of fly-agaric. This may depend on the time of exposure to the inebriant. There are probably various degrees of inebriation, the signs of which range from markedly frenetic behavior during flight, to complete catalepsy.

During the late 1960s, a number of the collaborators of the great French mycologist ROGER HEIM—one of the founding fathers of modern ethnomycology and a pioneer in visionary mushroom research—at the NATURAL HISTORY MUSEUM in Paris (of which HEIM was director), carried out specific experimental research into the relationship between the common fly and fly-agaric (BAZANTÉ 1965, 1966; LOCQUIN-LINARD 1965–67). The researchers wished to establish the degree of inebriation that this mushroom induced in the fly. However, their work tells us little about the relationship between the two species in a natural setting. They placed flies in PETRI dishes together with the mushroom or a liquid extract of the same. Many of the insects therefore died either due to overdose induced by the experimental conditions or—a point recognized by the researchers themselves—specifically, due to the carbon dioxide produced by the mushroom itself, leading to asphyxia. These experiments established that the active principles of the mushroom acts upon the nervous system as opposed to the muscular system. In addition, it was found that flies were also inebriated by the spores of fly-agaric, and by *Amanita pantherina*, a mushroom species similar to fly-agaric containing the same active principles and endowed with the same psychoactive properties (for humans).

The most active portion of the mushroom is located immediately under the red cuticles of the cap. It is yellowish and is the region in which we find the highest concentrations of isoxazolic alkaloids (ibotenic acid and muscimol). It was once

thought that muscarine was the inebriating chemical for flies, as well as for human beings. However, attempts at feeding insects with pure muscarine had no effect at all. It was shown, instead, that flies are inebriated by the same alkaloids that are now known to produce effects human beings.

In Japan, mushrooms that attract flies have also been used for a long time as insecticides. The most well-known example is *Tricholoma muscarium* KAWAMURA, known as *haotori-shimeji* (fly-killing mushroom). This produces another isoxazolic alkaloid, tricholomic acid (= dihydroibotenic acid) which, apparently, is not psychoactive in man (TAKEMOTO & NAKAJIMA 1964). JONATHAN OTT (1993: 356) noted this compound in the common *Pleurotus ostreatus* (JACQUIN EX FIES) KUMMER, an edible mushroom cultivated and marketed in great quantities in Europe and America. We should note that this mushroom is a carnivore. In its natural state, it releases a neurotoxin into the soil that immobilizes nematodes, which are then trapped by the hyphae of this mushroom and ingested (THORN & BARRON 1984). OTT is convinced that the neurotoxin is tricholomic acid (*i.e.* the compound that attracts flies).

It may therefore be the case that isoxazolic alkaloids are produced by mushrooms both as a means of protection against certain predators and as a trap for underground worms, and that 'by chance' these substances also attract and inebriate flies (which are clearly *not* a source of nutrition for these particular mushrooms; carnivorous behavior has not been observed in *Amanita muscaria* and *A. pantherina*). But the question remains: why should the maximum concentration of ibotenic acid in these Amanitas be just below the cuticle in the cap (well away from the ground), instead of in the stem?

HEINRICH (1991) notes that flies lay eggs in mushroom stems. The grubs then move toward the gill area to feed. We may therefore imagine that isoxazolic alkaloids might act as an insecticide to prevent the flies from laying there. If this is the case, we do not know why the maximum alkaloid concentration is in the cap just under the cuticle and not in the stem, the preferred site for egg-laying. See, for example, the recent analyses by GENNARO *et al.* (1997) on fresh samples of *Amanita muscaria* collected in Piedmont (northern Italy). The muscimol concentration in the cap is 0.38 g/kg and 0.08 g/kg in the stem (ibotenic acid: 0.99 g/kg and 0.23 g/kg, respectively). Furthermore, it is not clear that the grubs of these eggs adversely affect the sporogenic activity of these mushrooms (the grubs would actually help spread the spores). Lastly, the relation between fly-agaric and flies is one of attraction, not repulsion.

This strange behavior on the part of flies is not just a chance occurrence. Nor is it by mere chance that flies are attracted by fly-agaric, or that the flies' inebriation rarely leads to death. Philosophically speaking, "chance" (or what we consider chance), is generally the measure of our ignorance. Faced with chance occurrences, we tend to consider such circumstances in this manner and look no further.

I would therefore like to advance a new hypothesis concerning the natural relationship between fly-agaric and flies, and also with respect to the findings on hawkmoth inebriation from Jimson weed. Such behavior patterns are not just recklessness on the part of flies attracted by fly-agaric (accidental inebriation mysteriously brought about by a monkey wrench in the evolutionary 'works'). Flies deliberately seek the state of inebriation, as do hawkmoths with Jimson weed. Flies, like the Siberian reindeer, take fly-agaric as a drug.

In nature, the relationship between flies and their drug is non-obligatory. The flies exposed to this mushroom are not all "killed" (*i.e.* undergo the paroxysmic effects of the active principle). The physical and mental effects of *Cannabis* smoking in humans are gradual. They range from the so-called "high" (a mental and partly physical state of excitation) to a visionary or ecstatic state accompanied by sedation, which can immobilize the consumer for hours on end. The range of effects may depend on quantity, but other factors also come into play. Individual reactions to *Cannabis* vary and also depend on one's own personal relationship with the substance and how this has developed over time. If we consider flies, it may well be that—up to the present—our observations of their relationship with fly-agaric are just the tip of an iceberg, and that other less evident aspects have been neglected. Perhaps flies that are not "killed" by the mushroom are inebriated to a certain extent. MORGAN has observed the effects of fly-agaric in a fruit fly (*Drosophila*):

It made an attempt to fly off, and spiraled onto the table upon which the mushrooms lay. It remained motionless for at least a minute, and then recovered and flew off (MORGAN 1995: 102).

Fly-agaric may be quite the opposite of an "artificial" paradise for any number of insects (especially of the woodland undergrowth), and not just the common fly.

The great ethnomycologist, R. GORDON WASSON, dedicated an entire chapter of his monumental work *Mushrooms, Russia and History* (1957A, I: 190–214) to the relationship

between flies and fly-agaric, not to mention the notes in his essay on *Soma* (1968; 198–202). He was rather sceptical about the idea that flies are attracted and inebriated by fly-agaric. This is because he concentrated on the purely semantic relationship between these two species. Although he was unable to deny the existence of an ecological relation, after the research carried out by BAZANTÉ and others (see above), he nevertheless attempted to make little of it. He commented that the folk belief that fly-agaric kills flies reflected “that curious fund of ‘facts’ that people keep repeating to each other and believing, without verification or analysis” (WASSON 1968: 198). My own opinion is that this folk belief—as with so many such beliefs—contains a grain of truth that is verifiable by anyone who, like myself, has come into intimate contact with fly-agaric (collecting, handling, drying). WASSON, apparently, had no such contact. One cannot deny the fact that flies, in the laboratory or elsewhere, “die” when coming into contact with fly-agaric. I’ve often observed this, and there’s convincing evidence that this folk belief is more than just hearsay.

In his attempt to down-play the ecological side of this “folk belief,” WASSON stresses that the relation in question is not

present throughout the world—that it is only to be found in certain specific, albeit extensive, regions of the world. He notes the absence of this belief in Italy and the Iberian peninsula, but hastens to add that his research with regard to these geographic areas is not exhaustive (*ibid.*: 198). However, fly-agaric is actually known to be a “fly killer” in Italy (e.g. Liguria; cf. CALZOLARI 1998: 29) and in the Catalonia region (FERICGLA 1994; 138). CLARK HEINRICH, who has plenty of experience with samples of *Amanita muscaria*, also mentions that he has frequently noticed the “narcotic” effects of this mushroom on flies (HEINRICH 1999).

The semantic/symbolic association between flies and fly-agaric observed by WASSON, which he concentrated on to the exclusion of other aspects, is interesting and partly true. All flying insects have a universally demoniac valence. During the Middle Ages, delirium—the state of drunkenness and mental illness—was ascribed to insects reaching the brain of the victim; for a number of cultures, “having a bee in one’s bonnet” indicated madness. However, this folk belief in no way justifies the opinion that fly-agaric “kills” flies. It is more likely that the following semantic association came about: mental illness is to the presence of flies in the head is, the

inebriant effect of fly-agaric is to the presence of flies on the cap (head) of fly-agaric.

This semantic/symbolic relationship developed from observation of the ecological factor associating flies and fly-agaric. Moreover, if we consider the facts in the light of our new hypothesis, *i.e.* that flies get “high” on fly-agaric, we can also partly explain the relationship (established over thousands of years) between fly-agaric and toads in the absence of any recognized ecological relation between fly-agaric and toads. WASSON is categorical on this: “Toads do not sit on wild fungi, not under nor around them; neither do they eat them. Indeed toads and frogs have no direct physical or biological link with toadstools. Our word [toadstool], with roots deep in our folkways, is not, in any way, obvious to us, a distillate of man’s observation of nature” (WASSON & WASSON 1957A, I: 65). WASSON was sometimes too categorical in his conclusions, as we find when he denies all mycological interpretations of the “mushroom-tree” fresco of the Plaincourault Romanesque church (cf. SAMORINI 1997). MORGAN (1995: 2) points out that, in nature, fly-agaric and toads are rarely seen together. Most ethnomycologists believe this semantic association originated in the poison of the one and the venom of the other. RAMSBOTTOM recalls a folk belief that mushrooms “are formed from the harmful substances of the earth and the venom of toads and that fungi always grow in places where toads abound, and give shelter to them when they take the air” (RAMSBOTTOM 1953: 3). We still know rather little about the intimate relations between the various species of living things in nature. The recent discovery of the relationship between the hawkmoth and Jimson weed flowers is a case in point. During my own encounters with fly-agaric in the Alpine woodlands of Italy I came across toads (*Bufo bufo*) in the vicinity only twice. However, I should also point out that I have never looked for toads in the undergrowth where fly-agaric abounds nor have I ever remained for any considerable length of time near a fructification (which may include more than one hundred carpophores over an area occupied by a few dozen trees). Toads eat slow-moving insect and larvae. They would find it hard to catch fast-moving flies, if the flies were not injured or inebriated and therefore less agile.

It is absolutely not my intention to erect categorical barriers. I would, however, advance the following hypothesis: since flies are attracted by fly-agaric and since inebriation can lead to slower movements, toads may have learned that they can find easy prey around these fungi. It is possible that this hypothetical ecological relationship between fly-agaric, flies and toads may indeed be insufficient as an explanation for

the relationship between these three life forms established by folk culture. However, the ecological relationship I refer to above does not clash with WASSON’S semantic/symbolic associations, the demonstrations of which remain valid. ✧

VELADA WITH *SALVIA DIVINORUM* POTION (*SKA PASTORA*, *PIPILTZINTZINTLI*):

Report on Trip to Sierra Mazateca, 18–22 June 1998 by JONATHAN OTT

C.S. and I left Xalapa, Veracruz, at noon on Thursday 18 June, arriving to Tehuacán, Puebla *via* Orizaba, Veracruz, where we slept (my NEWTON 2000 and NIKON FE-2 + MICRONIKKOR 55 mm lens were stolen on the bus). The following day we bused to Huautla de Jiménez, Oaxaca, arriving in the afternoon. We hired a truck to take us to San José Tenango and Llano de Árnica, but found B.B.'s contacts, the ANDRADE family, were on the lam as a result of a killing by one of the sons. Neither finding anything like halfway decent accommodations, we returned to Huautla, arriving about sunset. The following morning, Saturday 20 June, we spoke to two women in the market who sold accoutrements for shamanic rites, and the second referred us to her son, AGUSTÍN ANDRADE, who lived just below the marketplace, and was busy watching World Cup foot-ball. Through the kind assistance of his wife, BEATRÍZ, we were led further below, to the very outskirts of Huautla, in search of a *curandera*, whose entire family was absent. BEATRÍZ then introduced us to Doña HERMELINDA, a monolingual *curandera* of some 60 years, and her bilingual daughter PIEDAD, in her early twenties. We explained we were interested in *hierba pastora*, and Doña HERMELINDA quickly left the house with her *machete* to harvest some in the ravine below. She declined C.'s offer to accompany her to her garden. She returned in less than half an hour with a large quantity of fresh and beautiful leaves of *Salvia divinorum* EPLING & JÁTIVA (*Labiatae*). At first she thought we wished merely to take away the material, but we explained that we were in no hurry, and should wish to return later, in the desired event she could serve us with a healing ceremony. This was agreed upon, and when PIEDAD apprised us her mother would have the potion prepared for us upon our return, I explained we wished, if possible, to observe its preparation. PIEDAD assented and proffered the additional detail, that her mother would *not* herself ingest the potion. We returned, as agreed, at 7:30 pm, were served *café de olla* as we awaited the ceremony. I had brought a half-liter of *aguardiente* (sugar-cane moonshine) in a water-bottle as a gift, knowing this was once a standard aspect of payment for shamanic services in Huautla (WASSON & WASSON 1957A), but PIEDAD apparently mistook it for water, *agua bendita*, and laughed when I confirmed it was in fact *aguardiente*. Doña HERMELINDA at length took a large double-handful of leaves (plant tops, stems and all) and held them out for my inspection. She

washed them briefly by dipping them in water and then shaking them out. Then she put about a liter of water in a plastic bowl, dipped the leaves in, and began to mash bunches of them in her hands, repeatedly dipping them into the water, more or less completely breaking them up. She vigorously and thoroughly so processed the leaves during perhaps 20 minutes, standing beside her elevated hearth-table in the darkness of her hut, illuminated only by a pair of beeswax candles. When she had finished, she carefully put the stem residue, thoroughly wrung-out between her palms, atop a *Heliconia* leaf which had covered the leaves in the plastic bag she had brought back earlier from the ravine. The frothy, dark-green fluid was then passed through a kitchen strainer into two tall glasses, after Doña HERMELINDA had asked us whether we wished small or large glassfuls (naturally, we opted for the latter). The potion precisely filled the two 350–400 ml glasses, with no apparent residue. Doña HERMELINDA then set these beside me on a table, and proceeded to make another infusion/suspension with much less water and fewer than half the number of leaves, and a great deal less thoroughness than displayed previously. This resulted in only 200–250 ml of potion, which was strained into a small glass, which she then set before her. Apparently she too would take the potion! After a comment *via* her daughter that she wished to wait until some nearby commotion (supposedly because a beehive had overturned, and its owners were endeavoring to trap the bees) subsided, noting that the smell of *copál* (tree-resin incense, technically of *Bursera* sp., but in this case rather *ocote*, the cheaper and more common resin of *Pinus* sp.) was a dead giveaway, we waited a while, until Doña HERMELINDA gathered some of the last coals from the dying hearth-fire into a small clay bowl, liberally sprinkling *copál* atop them. She passed the three glasses through the sweet smoke rising from the censer set on the floor before the hearth, censed herself and us, then set the bowl on the earthen floor between the two of us, sitting as we were facing the hearth on small wooden chairs. After intoning a brief invocation, she indicated to us by signs that we should now ingest the potion, which we did, I downing it all in one long draught, finding it only mildly bitter but hardly delectable. She herself drank most—but not all—of her portion, and later in the darkness I thought I heard her drink more. It took C. longer to finish her portion, perhaps ten minutes, and she was hurried along

by PIEDAD's asking whether she had finished, so the candles could be extinguished. As soon as C. had done so, we both drank some water to clear the taste a bit, and the candles were extinguished. We drank mint *ambrosia* at 9:40 pm, then sat in the darkness awaiting the effects. After some 15 minutes, I began to feel the potion, just as Doña HERMELINDA began to sing in Mazatec, a cadence and phrase-length more or less identical to what I knew from the recordings of MARÍA SABINA (WASSON & WASSON 1957B; WASSON *et al.* 1974). She sang continuously for just over two hours, with only a few pauses. From 1:40 am to 2:20 am when she asked through her daughter whether we were tired, she changed to singing a series of Catholic hymns which we didn't of course recognize, other than to note they were in Castilian. At the conclusion of each hymn, she intoned: "En nombre del Padre y del Espíritu Santo," curiously leaving out "del Hijo." She pronounced Santo "santoooh." During her Mazatec canticle, I could recognize the repeated ending "tso" to many phrases, which I knew to mean "so says it," it being the "voice" of *Salvia divinorum*, not known by any Mazatec name, but only as *la pastora* or *María pastora*. I also recognized repeated iterations of "pastora" in her canticle, along with apparent invocations of *María* (possibly with the same meaning), as well as of *San Pedro* (of singular importance in Mazatec folklore, and especially identified with green tobacco, which I haven't seen ingested nor smoked in a shamanic context, only used dry, as an ablution, rubbed on the hands and forearms); also, less frequently, *San Pablo*. One previous account (DÍAZ 1975) of ethnomedicinal use of *ska pastora* in Ayautla, Oaxaca, also quoted a portion of an invocation chanted by the *curandera*, Doña J., which included invoking *San Pedro* and *San Pablo*, as well as threefold repetition of "En el nombre del Padre, del Hijo, y del Espíritu Santo, la Santísima Trinidad." The rest of the canticle, which was softly but well sung, was recondite to me. For me, the commencement and duration of the singing in Mazatec more or less precisely corresponded with my perception of the major effects, which were unfortunately very mild. I clearly felt the salvinorin A (major visionary principle of the leaves; OTT 1995; VALDÉS 1995; VALDÉS *et al.* 1984) in my body, and had a decided augmentation of auditory perception, but no psychoptic effects *per se*. However, mild effects were still perceived until I slept, at about 1:00 am or 3:40 after ingestion. When I had answered that we were tired and the effects had diminished, the candle was again lit, and Doña HERMELINDA began to busy herself, preparing us a *metate* (woven reed-mat) in an adjoining hut, but we explained we'd rather return to our hotel, were quite capable of locomotion, shortly thereafter taking our leave. The following day, on the afternoon of Sunday, 21 June, we returned with a gift of a

kilogram of rice, in hopes of questioning Doña HERMELINDA about the events of the previous night. Despite the language barrier, and the inconvenience of explaining our questions first to PIEDAD, who once laughed "¡Ay, mamá!" at the fact that Doña HERMELINDA discoursed at length on a topic apparently removed from her actual question, and given the equivocal nature of posing such direct questions on sensitive topics across a vast gulf of linguistic and cultural differences, we were nonetheless able to get some information. As to the fate of the *bagasso* (residue) of the infused *ska pastora*, we were told it was simply discarded, as opposed to being used as an offering. It had been reported (VALDÉS *et al.* 1983) that such leafen residue might be: "set aside to be discarded in an out of the way location where [it] wouldn't be defiled by people or animals." The *curandera* seemed to confirm that *la pastora*, as others have reported (VALDÉS *et al.* 1983), was the third in the trinity of Mazatec entheogens, preceded in order by the mushrooms (*Psilocybe* sp., especially *P. caerulescens* MURRILL, known in Náhuatl as *teonanácatl* or "wondrous mushroom" and in Mazatec as *di-shi-thó-ki-shó* or "sacred mushroom of landslides;" OTT & BIGWOOD 1978) and morning-glory seeds (*Turbina corymbosa* (L.) RAF., Convolvulaceae, known in Náhuatl as *ololiuhqui* or "round things" and in Mazatec as *na-so-le-na* or "flower-her-mother," and *Ipomœa violacea* L., Convolvulaceae, called in Náhuatl *tliltliltzin* or "sacred black ones" and in Mazatec *naxru-le-natau* or "flower of the virgin," in reference, not to the Catholic virgin as is widely supposed, but rather to the virgin who is appointed to grind and infuse the seeds, as well as the mushrooms or *ska pastora* leaves; REKO 1996; WASSON 1963). She told me that of the mighty mushrooms, it was the *di-shi-thó-ki-shó* which had primacy, and she seemed to hold *Psilocybe cubensis* (EARLE) SINGER (Mazatec *di-shi-thó-le-rra-ja*, "sacred mushroom of cow dung") in lower regard than the indigenous species, as MARÍA SABINA also reported (WASSON & WASSON 1957A). Asked as to the preferences of her clients, she affirmed that the mushrooms were greatly preferred to *ska pastora*. C. had asked whether her perception were correct, that she had felt the song was at first directed toward me, then later toward her, and seemed to get confirmation of this. The general mood of the brief interview, prior to which we were again served *café de olla* followed by *sopa de pasta* and the delicious hand-made *tortillas* PIEDAD was making during the hour of our meal and while awaiting Doña HERMELINDA, who was entertaining relatives who had arrived with us from Oaxaca, was light and friendly, and Doña HERMELINDA was frankly delighted by our interest in her practice, and smiled broadly time and again. We left Huautla at 5:00 am the following morning, Monday, 22 June, and

arrived in Xalapa 14 hours later, after an exhausting journey.

## COMMENTARY

Of the six primary ethnographic reports we have of Mazatec ethnomedicinal use of *ska pastora* leaves, five refer to the preparation of aqueous infusions which were subsequently drunk, and two describe simply chewing the leaves. In the more commonly-reported case of the potions, three (DÍAZ 1975; VALDÉS *et al.* 1983; WEITLANER 1952) involved the curious technique we observed, of rubbing the leaves between the hands in water, which would appear to be the most archaic traditional method, also practiced by the ancient highland Mesoamericans, inasmuch as BERNARDINO DE SAHAGÚN also described this method for preparing infusions of the related entheogen *Tagetes lucida* Cav., Compositae, known as *yiauhtli* in Náhuatl (SAHAGÚN 1963), and still used as an entheogen by the Huichol (SIEGEL *et al.* 1977) and Mixe (LIPP 1991). Two reports (MIRANDA 1997; WASSON 1962) documented preparation of the potions by crushing the leaves on a *metate* (maize grinding-stone). The earlier of these, which led to the botanical identification of *ska pastora* (EPLING & JÁTIVA-M. 1962), cultivation and chemical study of same, culminating in the isolation of salvinorin A (ORTEGA *et al.* 1982; VALDÉS *et al.* 1984), not to forget the commercialization of the leaves in the United States, also described the practice in Ayautla simply of chewing the leaves, subsequently reported likewise from Llano de Árnica, where the leaves are piled atop each other in pairs, each having the superior surfaces of the leaves face-to-face, the whole then rolled into a cigar-like *taquito* for consumption (BLOSSER 1991–1993). The present report from Huautla de Jiménez constitutes the first ethnographic report of a shaman's singing a nocturnal *velada* following consumption of *ska pastora*, although this practice has been reported frequently in the case of the mushrooms (ESTRADA 1977; MIRANDA 1977; MUNN 1973; VAL, undated; WASSON & WASSON 1957A, 1957B; WASSON *et al.* 1974). It would seem that this present case involving the monolingual *curandera* Doña HERMELINDA, documents the most archaic and traditional form of the *ska pastora* healing rite among the Mazatecs, for whom this may nonetheless represent a post-Conquest innovation derived from the Náhuatl-speaking Mesoamericans, for whom the entheogen was known as *pipiltzintzintli* or "the most noble little prince" (OTT 1995; WASSON 1962). Rather than singing on the part of the shaman, other reports of Mazatec *ska pastora curanderismo* describe the *patient* speaking and telling the shaman the cause of the malady (WEITLANER 1952), or being exhorted to

describe his visions to the shaman (VALDÉS *et al.* 1983). In one report (BLOSSER 1991–1993), quite in contrast to the expectation of the researcher, *he* was asked by the shaman to sing throughout the duration of the effects!

## 5-MEO-DIPT REPORT

Recently I received a gift of 30 mg of 5-MeO-DIPT from an associate who thought I might find it interesting. He stated that it needed a sense of direction and loved activity. I had heard that it was a special experience, both sensuous and a bit on the “mild” side of psychedelia. The reports I had read and heard from friends gave it two thumbs up, except for one who thought it was not very interesting on its own, but might be more suited for a day of hiking.

12:30 pm: Mixed 18 mg 5-MeO-DIPT into 16 oz of filtered water, swished it about, divided it into two 8 oz glasses, and drank it with my partner. Strange taste! At 12:00 pm, I had dropped off our child with friends for a day of play. For the first time in a long while, the sun urged us to celebrate; exploring a new compound seemed in order for the two of us.

12:45 pm: Working in yard, I got the first alerts. There is a minor change in vision, everything takes a roundness on, and there’s a slight buzzing sensation in the extremities. I continue to cut lawn with my push mower, now in a hurry to finish before I am besides myself with rushes.

1:00 pm: Retreat into the house, as the sun was beating down. Both of us lay down in bed. Feel absolutely poleaxed, losing the ability to focus on task. Waves of emotion wash through and around us. Tryptamine trembles throughout bodies. Lots of laughter and goofy grins. This is more than we bargained for, but just the same we’re enjoying the moments together. We had expected something lighter.

1:45 pm: Back outside into the garden. We had a ground plan of working on plants *etc.* for the day’s activities. When we proceed outside, the smell of chlorophyll and other garden odors is overpowering. Having never had this reaction to plants before, it comes as a complete shock to us. We have often spent time in the garden while exploring, without ever experiencing the occurrence of a turn off to the green and tumbling earth. We sit down in the grass, trying to figure it all out. As we sit, I start to get washes of anxiety, and then nausea slowly building. Everything seems to dither about, almost mindlessly. We are pretty perplexed on what to do

next. We are due to pick up our hatchling between 4:00 pm and 4:30 pm. The strength of the 5-MeO-DIPT keeps waxing, and as it waxes, the nausea does as well. My anxiety turns inward, into self-examination of my life’s path at this time and place. I begin to wonder how long the 5-MeO-DIPT is going to last.

2:30 pm: Vomit time. Gripping the porcelain toilet and heaving over and over, anxiety riding on me like a veritable demon. I feel better for tossing, but the niggling feelings stay with us. Focus is completely off, yet the whole life’s path thing keeps on coming back and reasserting itself. I look again into my depths and find issues to go over. It is hilarious in a way, how confident we can be, when in actuality we are like a mote of dust flowing with the tides of time and humanity; how much is driven by desire, and just plain accident.

We try to listen to some music, lying down again. The nausea does not abate. We start discussing how we will handle it when we pick up the kid from the friend’s house. Are we up to it?

3:30 pm: Working on getting up the strength and focus to go pick up the kid. Calling over is the first task—hard, but not impossible. Everything sounds fine. Anxiety kicks into high gear, not knowing how we will enter into kid world (3 kids at their house plus ours), let alone getting over there. 10 blocks away, driving is not an option; balance is impaired, and heaven knows about judgement or depth-perception. Walking it is. Fumbling around the house, trying to reassemble our selves and personas is a Sisyphean task. What if they realize we are higher than kites? What if our kid picks up on it? (Paranoia gallops away!)

4:15 pm to 5:00 pm: Out the door with sunglasses and personas somewhat attached. The sun still blazing down as we make our way some 10 blocks to pick up the hatchling. Our unease heightens as we get close, but when we arrive we turn and smile encouragement at each other and venture into kid land. Not only is ours there, but our friend’s 3, and a couple of neighborhood strays. I can’t tell if we are being overly active and talkative, but we hesitate there for about 10 minutes and then venture back home. The hatchling grabs both

of our hands and babbles all the way home. The walk back takes on a wonderful feeling. What we had experienced trepidation over is revealed as a joy. We move through golden haze, laughing and giggling together; the hatchling seems fine, and appears to be unaware of our state, as we wish. Though we walk quickly, the time between the houses telescopes into a stroll through the hurly-burly world.

5:00 pm to 7:00 pm: Home again, lying down together in the bedroom while the hatchling runs through the house and yard. We discuss our feelings, deciding that this will be it for awhile with voyaging. We talk about the levels reached over the last two years and the need for a break that the 5-MeO-DIPT has indicated. I go over the realization that though this was not the voyage I had anticipated or wanted, it has been one that has revealed much. I find that my focus has come to be more and more on the times spent tripping than on the immediate needs. I have allowed the flow to take over, and to miss points of necessary response. This isn't pleasant to realize, but it needs to be acknowledged. What the effects of the 5-MeO-DIPT were earlier, with constantly shifting focuses and the inability to concentrate, now are reversed. Extreme focus is found instead of the wandering concentration. With this shift comes some bittersweet fruit—realizations that would turn anyone's psyche, but I ride it out. In the midst of this we finally move outside to work in the garden. The evening slowly comes on, and a friend arrives.

7:00 pm and onwards: Our friend is 77 years old, a longtime advocate and experienced user of MDMA, and an all around interesting person! Sitting in the gardens, we talk about our experiences of the day to him. My partner states her view that the 5-MeO-DIPT as basically a dry run, pales in comparison to the plant allies. She states she will not repeat it, as it overwhelmed her with endless variations of hesitation and low level constant anxiety plus nausea. Neither very interesting or informative. I concur on some parts but dwell on the sense of direction I am feeling welling up from the critical self-examination that I underwent. The evening darkens a bit as we sit. As we talk into the evening I find that the hesitation which has dogged all my actions for over a year is lifting. It is as if a gauntlet has been run, and a new course of action made apparent. I walk my friend to his house and return home for dinner. The evening fades with beauty and laughter, we drift in the afterglow.

## POSTSCRIPT

As the next couple of weeks pass, much in my life was positively affected. I have some nice offers of work, ending up starting a business with an old acquaintance. I found that mental barriers were lifting or gone that had long been present. Life has shifted, and in a wonderful way. Many long standing problems and issues are by the wayside, derailed on that sunny afternoon.

Having taken more than a month now away from 5-MeO-DIPT, I was asked by my acquaintance who gave it to me, "Would I do it again?" I answered, "Yes, but maybe at a lower dose and with a meal previously eaten." It will not be everyone's cup of tea, but it has valid applications. It might be best to make arrangements that allow more of an open-ended day. Deadlines seem to make the experience a bit skitish! There has been a lot of reassessment time, and a general grounding. I am on a couple of months sabbatical from entheogens, as I get my house in order. — GWYLLM

## CLAVICEPS PASPALI AND THE ELEUSINIAN KYKEON: A CORRECTION

by FRANCESCO FESTI & GIORGIO SAMORINI

In the second chapter of the book *The Road to Eleusis* (WASSON *et al.* 1978) ALBERT HOFMANN answered the question proposed by R.G. WASSON regarding the possibility that the ancient Greeks would have been able to isolate a visionary drug from ergot that was capable of inducing an experience comparable to those produced by psilocybin or LSD. HOFMANN'S positive answer was based on three hypothesis.

The first hypothesis conjectured the separation from *Claviceps purpurea* (Clavicipitaceae)—parasitizing wheat and barley—of the water-soluble psychoactive and non-toxic alkaloids (belonging to the ergonovine group) from those responsible for the gangrenous and/or convulsive syndromes (belonging to the ergotamine/ergotoxine group). The third hypothesis conjectured the separation of the psychoactive alkaloids from the ergot (*C. purpurea*) of the infestant *Lolium temulentum* L. (Gramineae).

The second hypothesis, perhaps more suggestive and renowned, proposed the integral use of *Claviceps paspali* STEVENS ET HALL, whose sclerotia appears to exclusively contain the psychoactive water-soluble alkaloids. The host species hypothetically proposed by HOFMANN was *Paspalum distichum* L., which “grows commonly all around the Mediterranean basin and is often infected with *Claviceps paspali*” (HOFMANN 1978: 31). After a closer examination of the data on the corology (geography) of the *Paspalum* genus, this second hypothesis by HOFMANN needs a correction, due to an ethnobotanical oversight, already forecasted by RÄTSCH (1998: 643).

The genus *Paspalum*, including 250 to 450 species (depending on what authority one cites) is spread in tropical and subtropical areas of the Old World and all over the New World. In fact, less than 10% of the species is native to Africa and/or Asia. No single species is indigenous to Europe, where the following species are present today (CLAYTON 1980: 263; CONERT 1998: 36–37; GARBARI 1972; HÄFLIGER & SCHOLZ 1985: 94–109):

*Paspalum dilatatum* POIRET IN LAM. [= *P. pratense* SPRENGEL, *P. ovatum* NEES VON ESENBECK EX TRINIUS, *P. lanatum* SPRENGEL, *Panicum dilatatum* (POIRET) O. KUNTZE, *Digitaria dilatata*

(POIRET) COSTE]: originally from South America (Argentina and Brazil), it is sometimes cultivated as fodder and became wild or naturalized (in wet and shady uncultivated lands) in Portugal, Spain, Azores, Italy, Austria, and Germany.

*Paspalum urvillei* STEUDEL: originally from South America, naturalized in rice fields and wet areas of Portugal, but very likely to be found in other countries of Southern Europe.

*Paspalum paspalodes* (MICHAX) LAMSON-SCRIBNER [= *P. distichum* auct. non L., *Digitaria paspalodes* MICHAX, *P. digitaria* POIRET, *P. michauxianum* KUNTH, *P. distichum* var. *digitaria* (POIRET) HACKEL, *P. distichum* subsp. *paspalodes* (MICHAX) THELLUNG]: originally from tropical areas of America, cultivated as fodder mainly in subtropical countries, by this time subcosmopolitan and still expanding (for example, it became spontaneous in Cornwall in the 1970s; cf. SELL & MURRELL 1996: 239); naturalized in Portugal, Spain, Azores, Italy, France, Austria, Germany, Great Britain, Albania, Bulgaria, Greece, Turkey, and European Russia.

*Paspalum racemosum* LAMARCK: originally from Peru and Ecuador, became wild in Germany.

*Paspalum vaginatum* SWARTZ [= *P. tristachyum* LECONTE, *Digitaria tristachya* (LECONTE) SCHULTES, *P. inflatum* A. RICHARD, *Panicum vaginatum* (SWARTZ) GRENIER & GODRON, *Digitaria vaginata* (SWARTZ) BUBANI]: originally from tropical America and (verisimilarly) from tropical Asia, it has been reported on sea sands and rice fields of Portugal, Spain, Italy, France, and Germany.

*Paspalum quadrifarium* LAMARCK [= *P. ferrugineum* TRINIUS], originally from southern America, adventitious in Italy.

*Paspalum lentiferum* LAMARCK [= *P. curtisianum* STEUDEL, *P. glaberrimum* NASH, *P. tardum* NASH, *P. kearneyi* NASH, *P. amplum* NASH]: originally from the USA and recently reported as adventitious in Germany.

Concerning the particular species proposed by HOFMANN, it should be pointed out that most taxonomists consider *P. distichum* L. a *nomen ambiguum* (a name that is not confidently

applicable to any known species), and prefer the binomial *P. paspalodes* (MICHAX) LAMSON-SCRIBNER. Regarding the above-mentioned list, *P. paspalodes* is now the most widespread species of *Paspalum* in Europe, and the only one reported in Greece. It is very likely that the diffusion of this species, as with the other *Paspalum*, has been seen in recent times, and less likely in the past century, but surely this happened many years after the Conquest. Indeed, considering the dates of the first reports in the neighboring countries (for example, in Italy no one species of *Paspalum* has been observed before 1900; cf. FIORI 1923–1925, GARBARI 1972), the presence of *Paspalum* sp. in Greece cannot be dated before the past century. It is therefore possible to state with confidence that all the *Paspalum* species that originated from the New or the Old World, spread in recent times, due to voluntary or involuntary action of man—whether originally cultivated as fodder then becoming wild, or due to being imported and broadcast together with other cultivated seeds (for example fodders and cereals).

On the basis of these *data* the presence of *P. paspalodes* and any other species of *Paspalum* in ancient Greece has to be excluded. Furthermore, the insubstantiality of HOFMANN'S second hypothesis regarding the preparation of the *kykeon* from ergot, is supported by the fact that *Claviceps paspali* is an ergot that exclusively infects graminaceous plants of the *Paspalum* genus (GRASSO 1955), and its presence in Europe is linked to the recent spreading of its host plants. It's enough to consider that the presence of *C. paspali* in France has been reported for the first time only in 1991 (RAYNAL 1996), and

that Greek phytopathologists seem to exclude the presence of *C. paspali* today in Greece (AARONSON 1989: 252). Again, in Italy *Paspalum dilatatum* was introduced in 1929 and appeared to be free from ergot until 1948 (TONOLO 1965).

Beside the botanical/corological considerations presented here, a symbolic/iconographic argument could be taken in consideration. The ergot hypothesis of the Eleusinian *kykeon* is also supported by the frequent representations of cereals in the iconography associated with the Eleusinian Mysteries. All the above-mentioned species of *Paspalum* have an appearance that is very different from that of the cereals cultivated for human consumption; *P. paspalodes* has an inflorescence constituted by two (rarely more than one) thin spikes at the top of the stem. It would seem strange that such a characteristic shape would have not found place among the Eleusinian images. Nor does there seem to be any hidden link between cultivated cereals and *Paspalum*, and the species of this last genus have a strongly different ecology (rice apart), and are not infestants of the cultivated fields spread during the Classic Greece period.

Nevertheless, we want to conclude by emphasizing that the reduction of the possibilities proposed by the Swiss chemist does not reduce the viability of the ergot hypothesis. HOFMANN himself stated concerning this: "I mention it only as a possibility or a likelihood, and not because we need *P. distichum* to answer Wasson's question" (HOFMANN 1978: 33). This topic will be examined further and in more detail in a article currently in publication (SAMORINI 1999). ◇

## PSYCHEDELIC RESOURCE LIST

### UPDATED SECOND EDITION! PROVIDES SOURCES FOR:

- ▼ PEYOTE: seeds and live plants. ▼ TABERNANTHE IBOGA: seeds, root-bark, and guided sessions with pure ibogaïne.
- ▼ CANNABIS: viable seeds for high-potency strains and suppliers of dried herb. ▼ Legal mescaline-containing cacti.
- ▼ PSILOCYBES: spore prints & syringes, dried mushrooms, and growing supplies. ▼ GHB and GHB-making kits.
- ▼ SALVIA DIVINORUM: plants, dried leaves, and potent extracts. ▼ 5-MeO-DMT, DPT and other tryptamines.
- ▼ Plant extraction gear, chemicals & labware. ▼ Vaporizers, waterpipes, and sundry smoking supplies.
- ▼ AYAHUASCA: various traditional & analogue plants. ▼ OPIUM POPPIES: seeds & dried pods.
- ▼ Books, periodicals, seminars, indoor grow-lights & gardening equipment, and much more!

8.5" x 11" soft-cover, 150 pages, illustrated. \$22.95 (USA; CA residents add \$1.55 for sales tax), \$24.95 (foreign; payment in USA dollars preferred, international money orders add \$5.00), postpaid from:  
Soma Graphics, POB 19820, (Dept. ER), Sacramento, CA 95819-0820, USA

The BOTANICAL PRESERVATION CORPS presents  
the second annual *Salvia divinorum* conference

## **SKA PASTORA, LEAVES OF THE SHEPHERDESS: SALVIA DIVINORUM & SALVINORIN-A**

December 9–12 at BREITENBUSH HOT SPRINGS, Oregon.

\$350.00, including meals and lodging. To register, call (503) 854-3314.

*Salvia divinorum* is easily grown, perfectly legal, and presents challenges and promises in ethnobotany, chemistry, psychotherapy, neurology, and shamanism. Consider these mysteries:

- ▼ *Salvia divinorum* has not been found in the wild, rarely yields viable seeds, and Mazatec shamans say it came from “elsewhere.”
- ▼ Chewed or smoked leaves induce a visionary state unlike that of any known psychoactive plant.
- ▼ Salvinorin-A is active in microgram amounts, is not an alkaloid, is structurally different from all known psychoactive compounds, and acts at unknown receptor sites.

Several leading researchers offer a lively four-day weekend of exploration, education, and speculation on the potentials of the *Salvia divinorum*/human relationship.

**Bret Blosser**, anthropologist, is studying with a Mazatec shamanic family and will share insights into the traditional use of *Salvia divinorum*.

**Kat Harrison**, ethnobotanist and artist, is learning about the spirits of *Salvia divinorum* and tobacco in the Sierra Mazateca of Oaxaca.

**Ralph Metzner**, psychologist, professor at CALIFORNIA INSTITUTE OF INTEGRAL STUDIES, author of *The Unfolding Self*, *The Well of Remembrance*, and *Green Psychology*, will speak on *Salvia divinorum* and shamanic divination.

**Rob Montgomery**, ethnobotanist and founder of the BOTANICAL PRESERVATION CORPS, has been studying the pharmacology, cultivation, and distribution of *Salvia divinorum* for ten years.

**Jonathan Ott**, chemist, ethnobotanist, and author of several leading books on entheogens, offers extensive experience from the lab and the field.

**Dale Pendell**, poet, ethnobotanist, and author of *Pharmako/Poeia: Plant Powers, Poisons, and Herbcraft*, will muse on the voice of this distinctive and amazing plant teacher.

**Daniel Siebert**, ethnobotanist, has developed improved methods for ingesting *Salvia divinorum* and was the first person to ingest salvinorin-A.

**Nika Turelli**, healer, will speak about *Salvia* divination in practical healing work.

BREITENBUSH HOT SPRINGS is a small and very beautiful resort in the mountains of central Oregon. Participants and presenters enjoyed the 1998 conference beyond belief and asked that another gathering be convened. We have added a full day to the schedule for more time to muse on *Salvia*, enjoy the company of *Salvia* friends, and soak in the hot springs. Please register early, since the event will probably fill in quickly.

## DANIEL SIEBERT SPEAKS...

Interviewed by WILL BEIFUSS

Photo by WILLIAM MACKENZIE-SMITH

**Will:** When did you first become interested in *Salvia divinorum*?

**Daniel:** It might be more fitting to ask, “When did *Salvia divinorum* first become interested in me?” I first came across a description of *Salvia divinorum* in 1973 in a little booklet entitled *Legal Highs*, which described the effects of *Salvia divinorum* as being similar to psilocybin, but shorter-acting. This caught my attention immediately, since I was a young, “hip” teenager at the time, with a lot of curiosity about psychedelics, and the comparison to psilocybin was seductive. I probably would have tried it immediately if I could have gotten my hands on it, but back then *Salvia divinorum* was quite rare and very hard to obtain. THE CHURCH OF THE TREE OF LIFE owned a large plant and was offering rooted cuttings as a premium for donating \$100.00 or more to their CHURCH, but that was more money than I could possibly afford at the time. Nevertheless, I was interested enough that I wrote to

the CHURCH for more information, but that was as far as it went. It was not until the early ‘80s that I came across the plant again. I was browsing through THE REDWOOD CITY SEED COMPANY’s catalog and noticed that they were offering *Salvia divinorum* plants. I think they were charging around \$25.00 at the time, and I ordered one. Unfortunately the plant died within a few days after I received it. About a year later, I attended a TERENCE MCKENNA lecture near Los Angeles. I noticed a man in the audience who was carrying a potted *Salvia divinorum* plant. I went over and introduced myself. He was surprised that I recognized his obscure little plant and he explained that he was having good success growing it. The plant he was carrying was a spare plant that he brought so that he could share it with others. He broke off a branch and gave it to me. By the time I got home the cutting was completely limp and looked hopeless, but I managed to revive it by putting it in a glass of water and misting it frequently. Eventually the plant rooted and I potted it up and put it in the small, eight-foot-tall greenhouse I owned at the time.

While the plant was growing I did some research. After asking around a bit, I found several people who had tried *Salvia divinorum*. They all seemed rather unimpressed by the effects (or lack of them) and seemed to feel that it was basically not worth the trouble. Many people were actually of the opinion that *Salvia divinorum* was inactive and attributed the reports of its alleged activity to the placebo effect. However, one person I spoke with was KAT HARRISON. Although her own experiences with the plant had been underwhelming, she mentioned that her friend, the anthropologist BRET BLOSSER, had taken *Salvia divinorum* under the guidance of a Mazatec shaman and had a powerful visionary experience. Apparently he had been instructed to eat 13 pairs of leaves that had first been rolled into a cigar-shaped cylinder.

Within about a year the plant I had obtained was hitting the ceiling of my crowded little greenhouse and was suffering a serious infestation of scale insects. I decided to move the plant outside, hoping that I could deal with the scale problem more easily once the plant was outdoors. Almost immediately when I moved the pot, the plant leaned over and the main stem snapped off, right at the base of the plant—just a few

inches above the soil. Trying to rescue the situation, I saved some cuttings from the fallen plant and I collected all the leaves that were free of insects. I wrapped the leaves in moist paper towels, then put them in a plastic bag in the refrigerator, hoping that they would stay fresh until I could find an opportunity to try them. At that time it was commonly believed that *Salvia divinorum* was only active when the leaves were consumed fresh. The dried leaves were thought to be completely inactive.

Finally, about a week later, I arranged to try the leaves with two friends. We had decided to try the leaves together outdoors on the patio at dusk, ingesting them in the same manner as Blosser. We each counted out our 26 leaves, rolled them into a nice cigar-shaped bundle and began to take bites. The more I ate the worse it tasted. It became increasingly difficult to swallow because of the strong bitterness, but somehow we all managed to finish our leaves. In about ten or fifteen minutes I seemed to notice a slight change in my vision. I could vaguely perceive a colored halo surrounding objects. I said, "I think I feel something." Then I stood up and walked a short distance. Moving felt a little odd. I was suddenly more aware of space and perspective. I was now certain that things were looking different. I remember saying, "I definitely feel something now."

One of my friends looked a little disappointed and said, "I don't feel anything." Then almost before he finished saying the word, "anything," he fell out of his chair. He was laughing hysterically. I don't think I have ever seen anyone laugh so hard, his body was convulsing with laughter. He seemed to be trying to say something, but it was incomprehensible because he couldn't stop laughing. His laughter was contagious and we all started laughing uncontrollably. After several minutes, he was finally able to speak. He asked, "Are you in it?" At the time, I was not sure what he meant by this question; later he explained that he was in an underground cavern. He was asking us if we were there too.

By this time, all three of us were experiencing the profound effects of the herb. There was something very natural and nurturing about it. I felt a deep sense of assurance and comfort, a feeling that everything was at peace and as it should be. I saw the cozy little homes of fairy-like nature spirits nestled in the hills all around me. I saw long-eyelashed elf-like entities that were strangely cartoonish in character. Interestingly, although we did not talk about it during the experience, all three of us later described seeing these long-eyelashed entities. After about an hour, the effects gradually

began to subside, leaving us feeling relaxed, comfortable, and amazed. It was a truly wonderful experience. Ever since then, I have been passionately interested in this plant.

**Will:** *Salvia divinorum* has a reputation for producing very bizarre effects. Do you feel this plant can be used for spiritual/personal growth outside of its traditional use by Mazatec shaman?

**Daniel:** Absolutely. I think this is the main reason people are drawn to *Salvia divinorum*. It is like a trans-dimensional doorway that allows one to step outside of consensual reality, providing a unique opportunity to explore the nature of consciousness and the fundamental mysteries of existence. It can take one through death and birth. It can transport one to another place and time. It can show you the creation and end of the entire universe. Experiences like these leave a lasting impression and are tremendously enriching. I believe that *Salvia divinorum* will also prove extremely valuable as a tool in psychotherapy, because it allows access to the deep inner reaches of the psyche. I have heard from many people whose lives have been positively transformed as a result the insights gained from their experiences with this herb.

There is an interesting double-blind experiment currently underway in Canada that is studying the effectiveness of *Salvia divinorum* as an aid to meditation. The study is headed by IAN SOUTAR and is being funded by MAPS. IAN has been involved with a group of Quakers who practice silent meditation. They have found that low, non-visionary doses of *Salvia divinorum* taken sublingually have the effect of freeing the mind of distracting thoughts and promoting a clearer, more focused state of mind that is ideal for their meditation practice. This study is interesting to me because it is exploring a whole new approach to working with *Salvia divinorum*.

**Will:** Tell me about the book you are currently writing.

**Daniel:** Yes, of course. I am very excited about the project. The book has grown much larger than I had originally conceived, and consequently is taking me much longer to complete than I had originally planned, but I feel that it will prove well worth the wait. The book is quite comprehensive and covers virtually all aspects of the subject: history, botany, horticulture, ethnobotany, chemistry, biochemistry, the phenomenology of its effects, preparation and safety, methods of use, the importance of ritual, etc. I am toying with the idea of publishing two or three sections of the book separately and prior to completing the entire work. One of these would

be a book on the botany and horticulture of *Salvia divinorum* and another would be on the phenomenology of its effects.

**Will:** In researching the book, have you traveled to México?

**Daniel:** Yes, I spent some time in the Sierra Mazateca in the spring of 1999 conducting interviews, taking photographs, exploring *Salvia divinorum's* native habitat, and participating in traditional ceremonies with two well-respected shamans. The trip was quite magical, and fruitful. It greatly deepened my respect for this herb and my appreciation for the indigenous healers who work with it. I learned a great deal about *Salvia divinorum* from the Mazatec perspective and I will be sharing some of what I learned in my forthcoming books. It is an extraordinary region and I anticipate returning regularly to conduct further research and to visit my new friends there.

**Will:** Do the shamans you met in México know of *Salvia divinorum's* growing popularity worldwide? Did you mention this to them? If so, what do they think of this?

**Daniel:** The *curanderos* I spoke to seemed unaware that *ska María Pastora* was growing in popularity abroad. Most of the foreigners that come to their region are interested in the

and said that it was extremely disrespectful to use the plant in this way. She said that this was equivalent to burning your own children. Obviously she feels quite strongly about this. She made it very clear that when dealing with sacred plants, honor and respect are of paramount importance, and that *las hojas* should not be taken without observing the appropriate ritual diet and using them in a proper ceremonial context under the guidance of an experienced and reputable shaman such as herself.

I should mention here that there are now non-Mazatec entrepreneurs who are going into the region and purchasing *Salvia divinorum* leaves from less scrupulous Mazatecs for export. These export operations are removing hundreds of kilos of dried leaves from the region annually. Obviously the Mazatecs who are selling to these buyers are beginning to realize how popular their sacred herb is becoming abroad.

**Will:** What other research do you plan on conducting in México?

**Daniel:** Primarily, I am interested in spending more time with some of the Mazatec shamans who use *Salvia divinorum* so that I can develop a greater understanding of their use of this plant, and their particular perspective with regard to it. I think that it is very important that people who are experimenting with this herb have some knowledge about its traditional use. These shamans know a great deal about how to work with this plant in a meaningful way. They understand what can be accomplished with it and how to use it to achieve specific goals. As is true in many indigenous cultures around the world, shamanic sacred traditions are quickly disappearing. Few young Mazatecs are interested in learning these traditions. Much of this knowledge will be

lost in the next 20–30 years as the current generation of elderly shamans die out. Very little information has been recorded regarding the Mazatec traditions surrounding *Salvia divinorum*. If this knowledge is to be preserved, the time to do it is now, before it disappears.

I am interested in determining whether or not some of the Mazatec's immediately contiguous neighbors, the Cuicatecs and Chinantecs, also utilize *Salvia divinorum*. I would also very much like to determine the identity of a plant called "Yerba de la Virgen," which according to a 1952 paper by

## **I had an interesting conversation with a Doña JULIETA. I explained to her that most people experimenting with *Salvia divinorum* these days smoke the leaves. She was quite opposed to this practice and said that it was extremely disrespectful to use the plant in this way. She said that this was equivalent to burning your own children.**

*hongitos* and, to a lesser extent, the morning glories. They do occasionally get people who are interested in *Salvia divinorum*, but they are very few and far between. They seemed genuinely surprised that I was so interested in learning about *Salvia divinorum*. Although it is becoming increasingly well-known in the world, it is still quite obscure compared to magic mushrooms. I think it will take awhile before the Mazatecs start seeing much *Salvia divinorum* tourism. I had an interesting conversation with a Doña JULIETA. I explained to her that most people experimenting with *Salvia divinorum* these days smoke the leaves. She was quite opposed to this prac-

WEITLANER was used by the Otomí people in the somewhat distant region of Tulancingo, Hidalgo in the same manner as *Salvia divinorum*. It would be fascinating if this turned out to in fact be *Salvia divinorum*; but even if it is not, it would be quite interesting to discover its identity.

I am also planning to look into the genetic diversity of *Salvia divinorum*. This plant very rarely produces seed, and even on the infrequent occasions when seed has been obtained, their viability has been quite low. Because of this, the plant is virtually always propagated asexually from cuttings. Truly wild, genetically diverse, seed-producing populations of *Salvia divinorum* have never been observed by botanists. At first glance, many populations of *Salvia divinorum* appear wild, but one must realize that the Mazatecs deliberately choose to plant it in out-of-the-way locations. They believe that it should not be grown where it will be seen by passers-by, lest it lose its power. In a humid environment, such as the wooded ravines in the Mazatec Sierras, stem sections quickly root when they make contact with moist soil. Once planted in such a location, the plant spreads asexually on its own within the immediate environment, propagating itself from branches that break off or fall over. After many years the plants becomes completely naturalized in that location, appearing quite wild. It is certainly possible that truly wild populations of *Salvia divinorum* exist somewhere. However, as I said, such populations have never been observed by botanists, and the Mazatecs I spoke with assured me that it does not grow wild, but is always introduced to a location through human effort. Therefore, it appears that this plant is a cultigen with very limited genetic diversity. It may be that there are relatively few genetically different clones of *Salvia divinorum* growing in the entire region, and it is entirely possible that this species is predominately monoclonal. I would like to collect more live specimens from a wide variety of locations throughout the region so that we can see if they appear to be genetically identical or not. This could be done using isozyme analysis or DNA fingerprinting techniques.

**Will:** You recently conducted an experiment to test the putative psychoactivity of another *Salvia*—*Salvia splendens*. How was the experiment set up and what were the results?

**Daniel:** The first published description of what we now refer to as salvinorin A appeared in a 1982 paper by the Mexican

phytochemist, ALFREDO ORTEGA. At that time it was simply called *salvinorin*. In his paper, ORTEGA points out that salvinorin is structurally similar to compounds that had previously been isolated from the common ornamental bedding

**I received e-mail from someone who claimed that he and a friend of his had tried *Salvia splendens* and found it to be active in very low doses. He sounded quite excited about his discovery and started posting messages on the Internet about it. He claimed that the leaves produced a sort of relaxing, anxiolytic, emotional-blunting effect.**

plant, *Salvia splendens*. This caught my eye early on in the days of my work with *Salvia divinorum*, and I was curious to see if *Salvia splendens* might produce any interesting effects similar to that of *Salvia divinorum*. So I purchased several *Salvia splendens* plants from a local nursery and tried smoking the dried leaves. After smoking a huge amount, I did not notice any effects other than a slight headache. I then made an extract of the leaves using the same procedure that I had been using to extract salvinorin A from *Salvia divinorum*. I experimented with this extract several times, using ever-increasing amounts, but was still unable to detect any effects. At this point I was convinced that *Salvia splendens* was inactive. Then a year or two later, I received e-mail from someone who claimed that he and a friend of his had tried *Salvia splendens* and found it to be active in very low doses. He sounded quite excited about his discovery and started posting messages on the Internet about it. He claimed that the leaves produced a sort of relaxing, anxiolytic, emotional-blunting effect. Obviously, these effects are not at all like *Salvia divinorum*. The effects he associated with *Salvia splendens* are rather like those of Valium®; it was not said to be a visionary herb by any stretch of the imagination. While I realize that such effects have their place, I personally do not find them very interesting. Nevertheless, this report intrigued me enough that I decided to try *Salvia splendens* again. Interestingly enough, when I did, I experienced exactly the kind of effects that he had described. However, for some reason, I was unable to experience these effects again on subsequent attempts, even though I tried using larger amounts of leaf. As this information was being posted in various places on the Internet, quite a few other people started experiment-

ing with it. People's reports were mixed. Many people were reporting that they were experiencing sedative or anxiolytic effect, but others didn't seem to feel anything.

Because the reports were so inconsistent, I began to wonder if the "placebo effect" might be responsible for many of the effects people were experiencing, including my own. To investigate this, I decided to conduct an informal double-blind experiment using volunteers from the *SALVIA DIVINORUM* E-MAILING LIST. This is an e-mail discussion forum I founded a couple of years ago, which is dedicated to *Salvia divinorum* and other psychoactive Labiatae. I located a source for a large amount of *Salvia splendens* leaf. In order to determine if this material would be suitable for use in the experiment, I sent samples of the doses I intended to use for the study to three people who had already tried *Salvia splendens* several times and claimed to be able to distinguish its effects. Unanimously they concluded that this material was indeed active and thus should be quite suitable for the experiment. I then selected a placebo herb. I chose *Viola odorata* leaf, because it was the most similar herb in appearance and texture that I could come up with that did not have effects that were likely to be confused with those that were being associated with *Salvia splendens*. I then sent out coded packets containing pre-measured doses of *Salvia splendens* and the placebo herb to 61 volunteers. They were instructed to ingest the samples and then to report any effects experienced on a questionnaire that had been provided to them. People were allowed to choose between smoking the herb samples or ingesting them sublingually. Some people chose to do both. So I collected two sets of *data* based on method of ingestion.

The purpose of the experiment was to determine if people would be able to distinguish *Salvia splendens* from the inactive placebo herb. If *Salvia splendens* does produce a significant effect, this should show up in the *data* obtained from the questionnaires. Unfortunately, only 31 of the volunteers completed the experiment and returned the questionnaires, so the amount of information I had available to work with was relatively small. Nevertheless, I think that the results are meaningful. The results of the experiment showed that most people reported no effects from either herb. Of those that did report "*Salvia splendens*-type effects" (about 35%), the numbers were essentially equal for *Salvia splendens* and the placebo. This suggests that *Salvia splendens* is no more effective than the placebo in producing "*Salvia splendens*-type effects." This is definitely the case for the specific materials and doses used in this particular study.

After sharing the results of this study publicly, I received quite a few surprisingly emotional reactions from people who insisted that *Salvia splendens* was indeed quite active and that my study must be flawed. I got the feeling that people felt I was attacking their integrity by suggesting that they were victims of the placebo effect. It is clear that this herb produces effects in many people when they *know* that they are taking it. The fact that many people are convinced of its effects is compelling. The problem is that the activity seems to disappear when people *don't know* what it is they are taking. The information available suggests that the effects people have been reporting are probably due to psychosomatic factors rather than a true pharmacological action of the herb; however, I don't mean to suggest that this small study in any way closes the book on the pharmacology of *Salvia splendens*. Further research may very well identify some sort of activity that was not observed in this particular experiment.

**Will:** Do you think *Salvia divinorum* will avoid being scheduled?

**Daniel:** I'd certainly like to think so. The nature of its effects are just too profoundly bizarre and ontologically challenging for it to ever become very popular. It is clearly not habit-forming, nor does it produce any form of dependence. If anything, it has the reverse effect. The majority of people who try *Salvia divinorum*, do so out of curiosity, but after one or two full-blown experiences decide that there are better things

to do for fun. It will never become widely used or cause the kind of social problems that have resulted in other plants becoming illegal. But then again, the scheduling of drug plants is sometimes unpredictable and illogical. For example, it doesn't make sense that obscure and relatively benign plants like *Tabernanthe iboga* and *Catha edulis* are illegal, while other far more available, powerful, and clearly dangerous plants like the *Daturas* and other hallucinogenic nightshades remain quite legal.

It is very important that people who experiment with *Salvia divinorum* are properly educated about its effects so that they can use it intelligently, safely, and hopefully in a way that is personally valuable and meaningful.

People who provide this herb to others must accept the responsibility of educating prospective users. I am concerned about the fact that there are unscrupulous entrepreneurs who see this plant as nothing more than a way to make a fast buck and seem to care nothing about what happens to the people who use it. If these people begin exploitatively mass-marketing it as some sort of "great new high" to uneducated, unprepared consumers, problems could arise that would bring the plant some serious negative attention. *Salvia divinorum* is a precious and sacred plant. It would be very sad to see it criminalized.

**Will:** At the 1997 MIND STATES conference, TERENCE McKENNA had this to say about *Salvia divinorum*: "I don't believe the establishment is interested in demonizing and criminalizing a new, easily grown, widely available psychoactive plant. I don't think the establishment needs a new *Cannabis*." Do you agree with this statement?

**Daniel:** Well, I think it is rather difficult to anticipate the interests of the establishment, but TERENCE is correct in the sense that it would be impossible to enforce a law that made *Salvia divinorum* illegal. It would be a tremendous waste of resources and would not accomplish anything positive. Unlike *Cannabis*, *Salvia divinorum* is both shade-loving and very inconspicuous looking. By planting it amongst other plants or beneath trees it can be grown almost invisibly. There are several ornamental *Salvia* species that look almost identical to *Salvia divinorum*, so identifying an illegal *Salvia* plant would be a major problem. It is a rapidly growing, easily propagated plant that can be harvested at any stage in its life cycle. It is very easy to grow indoors, since there is no need for expensive high-wattage lighting. If *Salvia divinorum* were made illegal, most people would just move their plants

indoors. Unlike *Cannabis*, there would be no tell-tale odor or high electric bills to worry about.

**Will:** What is your preferred method of ingesting *Salvia divinorum*? Do you have a ritualized context that you take it in?

**Daniel:** Actually, I have several preferred methods of ingestion. I am fascinated by the extremely intense and often bizarre, but brief experiences that can be achieved by smoking, and I also enjoy the longer lasting, slowly unfolding type of experiences produced when the leaves are chewed using the quid method or when using a sublingually absorbed extract. When smoked, the full dose is delivered rapidly into the bloodstream. This method produces effects that begin very rapidly, producing almost no "alert." Peak effects are experienced in less than a minute. The peak state lasts for some 5–10 minutes, then subsides over another 20–30 minutes. When *Salvia divinorum* is ingested orally, salvinorin A is absorbed gradually into the blood stream. The effects build over 15–30 minutes, peak for 1–2 hours, then gradually diminish over an additional hour or two. Both kinds of experiences can be tremendously rewarding. Oral ingestion provides a more gradual entry into the experience, which makes it easier to get one's bearings and to adjust to the changes of consciousness that are occurring. The greater duration of the effects provides more opportunity to explore and learn from the experience. However, sometimes the shorter duration of effects achieved by smoking is more desirable, because it requires less of a time commitment, and since the effects are so brief, one can risk diving in further, with the assurance that one will quickly return to the surface.

For smoking purposes, I definitely prefer to use a highly concentrated form of salvinorin A, rather than plain leaves. I see no virtue in inhaling the massive quantities of smoke that are necessary to reach a high level of effects when smoking the leaves in their natural state. In the past I worked with pure salvinorin A; however, I no longer use it in this form, because a single dose is so minute that the mechanics of handling it are problematic. What I usually use for smoking these days is a salvinorin A-fortified leaf-preparation that contains 1 mg salvinorin A that has been deposited on 25 mg *Salvia divinorum* leaf. This can be smoked easily in an ordinary pipe, and because it is so highly concentrated, one only needs to inhale a tiny wisp of smoke. When using the quid method, I prefer to use fresh leaves rather than dried ones. There is something very satisfying about consuming the leaves fresh off the plant, while they are still crisp, juicy, and full of vital-

ity. I also enjoy using a sublingual extract. This produces the same type of experience as the quid method, but eliminates the cumbersome bulk and bitterness of the leaves.

I do incorporate various elements of ritual in my *Salvia divinorum* sessions. Rituals utilize external actions that function through symbolism and metaphor to influence inner experience. I use ritual to prepare the inner environment. Essentially, to help create the sort of mental "set" that is conducive for a positive and productive experience. I won't go into every type of ritual I use, but I will describe the one I use most often: defining sacred space. The way that I like to do

this is to burn white sage or copal and then to use the fragrant smoke to describe a circle that encloses the area where the session will take place. This is a simple, but extraordinarily powerful act. It creates a container for the session and promotes a sense of inner preparedness and respect for what one is about to do. It formally acknowledges the beginning of the session and signals the time for increased commitment and focus.

WILL: Thanks for taking the time to share some of your thoughts and experiences with us here at *The Entheogen Review*. ✧

# L.J. VALDÉS III ON R. GORDON WASSON

---

Here's a letter to me from R. GORDON WASSON. As a grad student, I had written him telling him of my interest in studying the chemistry of *Salvia divinorum*. He mentions having sent a lot of leaves to SANDOZ, in Basle (*sic*). This was, of course, the laboratory where ALBERT HOFMANN worked. WASSON'S note, along with HOFMANN'S own statement, "Das Wirksame Prinzip dieser Zauberdroge, das anscheinend sehr labil ist, konnte bis jetzt noch nicht identifiziert werden" [The active principle of this magic drug/plant, which apparently is very labile, has still not yet been identified] (HOFMANN 1964), should indicate to the reader that he did more than just ingest an alcohol-preserved infusion of the leaves, as has been reported (OTT 1993; OTT 1995). I would guess that Dr. HOFMANN did some alkaloid screening along with his bioassay work. The screening would have been negative. He probably took too low a dose of the alcoholic preparation (which may have been somewhat stable; this would be easy enough to verify if we had his recipe). Also note that WASSON was not terribly impressed with the pharmacological effects of the plant (he must have been listening to MARÍA SABINA). He advised me to study *Cymbopetalum penduliflorum*.

As an aside on the stability of an alcohol-preserved infusion of *Salvia divinorum* there is an interesting trip report, apparently from Germany, posted a while back on the now defunct DISEMBODIED EYES web site, currently at the LYCAEUM (<http://diseyes.lycaeum.org/fresh/expсалv.htm>). I've shortened it a bit and corrected a couple of spelling errors:

...Some weeks later I got a small bottle with an alcoholic extract of salvia. It had a strange green colour and tasted bitter. It was a bit stronger, but still not strong enough. This time I definitely had an altered perception of my body but that gets clearer in the next story. :)

Now some weeks ago I got a larger quantity of that green extract and this time I'm determined to find out what it really does. A month ago I had another trip. As I knew that salvia doesn't tolerate any interference I did it at night in the dark when nobody was at home, so I was sure there wouldn't be any sounds distracting me. The point is that salvia pulls you to another dimension (I'll try to explain that later) but at least at the dose level I ingested it was not strong enough to hold me there.

So I ingested about two teaspoons of the extract, knowing that it would take about fifteen minutes to capture me. It's really strange. Even if the dose is rather low I get the impression that something takes hold of me, sort of hypnotizing. Sometimes I opened my eyes or I moved involuntarily to scratch some itching part of my body than everything was way normal. But when I stopped that and let myself be mesmerized things got weird. My mind, the observer within or whatever you call it was rather unaffected, the things he observed changed, though. I don't really know what I felt...

My most recent salvia trip took place five days ago... This time I took about three teaspoons. I...lay down and kept my eyes open, trying to find out if this would stop the salvia. I felt that it was stronger than the last time, so strong that I actually forgot to close my eyes. When I did, the space around me folded and was gone; in a strange way I was able to feel my body even in that dimension. Sometimes I felt something unpleasant, don't know how to explain it, and when I thought about it I came to the conclusion that this strange something must be a representation of my left leg lying in an uncomfortable way...

— LEANDER J. VALDÉS III, 27 June 1999

P.S. I'd like to add here that *Zauberdroge* is really what hallucinogens or entheogens are all about. I've liked the word since I first read HOFMANN'S article. Too bad there's nothing like it in English. It was almost worth the year I put into Reading German for grad students...

R. GORDON WASSON  
 42, Long Ridge Road · DANBURY, Conn., 06810  
 TEL: (203) 748-0173  
 1 - July - 1978

Dear Mr Valdés:

I have your undated letter before me and it interests me.

Would work on S. divinorum? <sup>be worth it!</sup> I doubt it. After identifying the plant almost twenty years ago, I sent a big quantity of leaves gathering in Huautla to Sandoz, in Basle, Switzerland. They worked hard on them and found nothing, just nothing. They think the active principle was labile and had escaped in a matter of days or perhaps hours after picking. A number of us (including me) had tried the infusion of the leaves and we thought we experienced something, though much weaker than the Psilocybe species of mushrooms. Others have worked on the leaves also. I think the chemists in the University of Washington, perhaps elsewhere. I have heard of no positive results.

Why not concentrate on the Cymbopetalum penduliflorum? This was a famous plant among the Aztecs. Charles E. Dibble and Arthur J.O. Anderson of Sahagún finished their translation of the Nahuatl text in the '60's -- a stupendous task. In Book 11, Earthly Things, p 120 col 1, under the Aztec name Teonacaztli, the informant of Sahagún says the fruit of this plant 'makes one drunk as if it were mushrooms'. Were I younger, I would be tempted to read up about the botany of this tree and then go down to Mexico and gather the fruit in the field (also the flowers, leaves, roots, and bark) and bring <sup>them</sup> it back and work on the material. Of course anyone who reads Dibble & Anderson's translation may remark on this fact: several of my friends have seen it. Work may be in progress already, though I know of none.

Sincerely yours,

R Gordon Wasson

# ENTHEOBOTANY

## SHAMANIC PLANT SEMINARS

12–18 FEBRUARY 2000

21–27 FEBRUARY

Two 7–day, intensive seminars at the  
portal to the Palenque Mayan ruins and  
México's mysterious tropical forests

You are invited to join us for an intensive week by the archaic Mayan ceremonial center of PALENQUE, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. This is an opportunity not to be missed! Seminars will feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be available for study. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of PALENQUE and environs by Mayan entheobotanist Rätsch, there will be opportunities to explore the exotic surroundings on your own. This will be our 11<sup>TH</sup> such event [formerly BOTANICAL PRESERVATION CORPS] and past seminars have assumed legendary proportions...

*Please join us!*

# EVENTS CALENDAR

## INSIGHT & OPENING NOVEMBER 1–7, 1999

A week-long seminar on the power of breath and meditation that integrates ancient spiritual practices with western psychology and modern consciousness research, through lecture and direct experience. Activities include Holotropic Breathwork, Buddhist meditations of the breath and heart, silence, sacred music, mandala drawing, and lectures. With instructors STAN GROF, JACK KORNFELD, and WES NISKER. Held November 1–7, 1999 in Yucca Valley, California; tuition, room and board is \$935.00. For more information contact: AMAUKUA RETREATS, 2309 Edna Street, El Cerrito, CA 94530, (510) 232-3098, FAX (510) 232-4090.

## WORLDS OF CONSCIOUSNESS NOVEMBER 11–14, 1999

The 3rd International Congress of the EUROPEAN COLLEGE FOR THE STUDY OF CONSCIOUSNESS (ECSC) will be held in Basel, Switzerland, November 11–14, 1999. The conference aims to go beyond conventional scientific discussions by offering opportunities to become acquainted with different aspects of human consciousness in pre-session workshops, multimedia installations, art exhibitions, and a public event in honor of ALBERT HOFMANN. The three main topics of the scientific program are: “A Look into the Other world,” “Hallucinogen and Entactogen Research,” “Visions: The Future of ASC.” Parallel afternoon sessions will focus on “Ayahuasca,” “Psychoanalytic Therapy,” and “Forms of Ecstatic Trance,”

Presenters include: ARNO ADELAARS, GÜNTHER AMENDT, GERHARD BAER, OLIVER BILKE, HANSJÜRG BRAUN, ADOLF DITTRICH, DAGMAR EIGNER, KLAUS ENGEL, JOSEF M. FERICGLA, PETER GASSER, MARK GEYER, EUPHROSYNE GOUZOU LIS-MAYFRANK, CHARLES GROB, THOMAS HEINZ, THOMAS HEISE, GERHARD HELLER, LEO HERMLE, PETER HESS, INGO JAHRETSZ, VIKTOR HOBI, HOLGER KALWEIT, KARL ARTUR KOVAR, EVGENY KRUPITZKY, ROGER LIGGENSTORFER, KURT

LUSSI, BERNHARD MACK, MAJA MAURER, RALPH METZNER, ETHAN NADELMAN, DAVID NICHOLS, PETER OEHEN, JONATHAN OTT, CHRISTIAN RÄTSCH, SABINE RITTNER, URS RÜEGG, CHRISTIAN SCHARFETTER, AMELIE SCHENK, MICHAEL SCHLICHTING, ALAN SHOEMAKER, MANFRED SPITZER, WOLF-DIETER STORL, JURAJ STYK, SONJA STYK, MICHAEL SZUKAJ, K. TUCEK, ROLF VERRES, FRANZ X. VOLLENWEIDER, and others.

## SALVIA DIVINORUM SEMINAR DECEMBER 9–12, 1999

The BOTANICAL PRESERVATION CORPS presents the second annual *Salvia divinorum* seminar, “*Ska Pastora*, Leaves of the Shepherdess: *Salvia divinorum* and Salvinorin-A,” held December 9–12, 1999 at BREITENBUSH HOT SPRINGS in Oregon. Presenters include BRET BLOSSER, KAT HARRISON, RALPH METZNER, ROB MONTGOMERY, JONATHAN OTT, DALE PENDELL, DANIEL SIEBERT, and NINA TURELLI. \$350.00 tuition includes meals and lodging. To register, call (503) 854-3314.

## AYAHUASCA CONFERENCE MARCH 17–19, 2000

“Ayahuasca—Amazonian Shamanism and Spirituality,” will be held in San Francisco, CA on March 17–19, 2000. Presenters include JACE CALLAWAY, CHARLES GROB, LUIS EDUARDO LUNA, DENNIS MCKENNA, RALPH METZNER, JEREMY NARBY, JONATHAN OTT, and ALEX POLARI DE ALVERGA. Call (415) 575-6290 to request registration information when it becomes available, or e-mail rmetzner@svn.net.

# GROWING *SALVIA DIVINORUM* FROM SEED

by JON HANNA

When mature, *Salvia divinorum* seeds (technically mericarps or nutlets) are 1.8–2 mm long, 1(1.2) mm wide, somewhat pyriform, minutely tuberculate, and dark brown (REISFIELD 1993).

At one time it was believed that *Salvia divinorum* did not produce viable seed, and the only manner in which it could be reproduced was by cuttings (EMBODEN 1972; SCHULTES 1972; HEFFERN 1974; MAYER 1977; FOSTER 1984). While this belief is now known to be in error, it is true that *S. divinorum* only rarely sets seed. Those wishing to grow *S. divinorum* from seed face three obstacles: a low seed set, a low germination rate, and a low survival rate.

The first inkling that *Salvia divinorum* did indeed produce viable seed came from the 1973 book *Growing the Hallucinogens*, wherein the author stated that, “This salvia is generally grown from cuttings, but I know of one instance in which it was grown from seed” (GRUBBER 1973).

Then in 1980 while working on his Ph.D. dissertation, LEANDER J. VALDÉS III performed breeding experiments in which he cross-pollinated 14 *Salvia divinorum* flowers (using the “Cerro Quemado” clone and a “WASSON/HOFMANN” clone). 4 flowers were pollinated successfully, and 8 seeds were produced (not 4 as has mistakenly been stated; OTT 1996). A photo of these 8 seeds was published in 1987, the first time that *S. divinorum* seeds had appeared in print (VALDÉS *et al.* 1987). These 8 seeds represent a 14.3% seed set, since each flower has the potential to produce 4 seeds. Unfortunately, these seeds were killed by overheating in a growth chamber, and their viability couldn’t be ascertained (VALDÉS 1983).

AARON REISFIELD was the next person reported to attempt pollination experiments. Self-pollinated plants with 108 flowers produced 11 seeds—a 2.5% seed set, and his cross-pollination of 190 flowers produced 24 seeds—a 3.2% seed set (REISFIELD 1993). Clearly it is difficult to get *Salvia divinorum* to produce seed. It has been noted that since the anthers and the pistils of a single flower appear to mature at different times (a way for a flower to prevent self-pollination), that this must be accounted for when hand-pollinating flowers; both the anther and the pistil must be ripe (VALDÉS 1999). This may be partially responsible for the substantially lower

Figure 4: A 200 micrometer shot showing an entire *Salvia divinorum* seed.  
Photo by Michael Dunlap, University of California Chemical Engineering and Material Science.

Figure 5: A 50 micrometer section of the surface of a *Salvia divinorum* seed.  
Photo by Michael Dunlap, University of California Chemical Engineering and Material Science.

seed set that REISFIELD obtained when compared to VALDÉS (but it could also be argued that VALDÉS' sample was statistically small). REISFIELD was able to get a few of these seeds to germinate, and he described these seedlings growth as "vigorous" (REISFIELD 1993).

In January 1994 DANIEL SIEBERT collected 70 seeds from "WASSON/HOFMANN" clones residing at the BOTANICAL DIMENSIONS' garden in Hawaii. Hand-pollination had not been attempted on these plants, which means that the seeds were generated in conditions that might be considered as being similar to "the wild." Of 70 seeds, SIEBERT was able to get 12 or 13 to germinate (a 17.1% to 18.6% germination rate), and only 6 to survived to maturity. (Clones of these seed-grown plants are available for sale from SIEBERT'S web-based *Salvia divinorum* business.) Unlike REISFIELD'S seedlings growth, SIEBERT described his own seedlings as growing "very weakly," and he has commented that "[t]he seed raised clones seem a bit less vigorous than some of the Oaxacan material" (SIEBERT 1999A; Siebert 1999B).

More recently in 1999, BRENT LINDBERG—a commercial *Salvia divinorum* farmer in Hawaii (growing about 800 of the so-called "palatable" clone) collected 305 seeds from his plants. The plants that produced these seeds were growing in pots under 70% shade, with approximately 60 inches of rain per year. They first started to flower in November, and they were cut back at this time to promote better leaf growth, but by December there were so many in flower that LINDBERG decided to stop cutting them back. The seeds were first spotted in January, when LINDBERG was hand-pollinating flowers; LINDBERG does not think that his hand-pollination was responsible for any of these seeds (presumably since he saw them early-on in his attempts at hand-pollination). Nevertheless, he did not notice any insects near the flowers, other than a few ants. The seeds were collected over a 2 month period; by February 13 LINDBERG had 162 seeds, and he harvested the rest after this. Only about 80% of the seed had reached maturity. Germination of 100 of these seeds was attempted, with 31 germinating (a 31% germination rate), and 10 surviving to maturity. The seeds were germinated in potting soil mixed with peat moss, and LINDBERG believes that those seedlings that died (when they just had their first small leaves) did so due to overly moist conditions (they dissolved from being too wet). The first seed germinated after 10 days, and the last seed took over 30 days to germinate. The surviving seedlings are growing with equal vigor, comparable to that of a cutting of the same size. As of August, these seedlings were

1–2 feet tall. They are kept outdoors in pots under 70% shade cloth (BEIFUSS 1999).

Several others were also sent seeds from LINDBERG'S harvest. In early April, SIEBERT attempted to germinate 20 of these seeds, of which 3 sprouted (a 15% germination rate), but only 2 survived. The first seed germinated at about 10 days, and the last at about 18 days. The 2 surviving seedlings are growing vigorously. The seeds were planted directly into commercial potting soil, about 1/8th inch deep. The 2 seedlings are kept in a semi-tropical greenhouse with moderate humidity and partial shade; by early August one plant was 12" tall and the other was 21" tall.

WILL BEIFUSS attempted to germinate 27 seeds, of which 9 sprouted (a 33.3% germination rate), and 3 survived. Germination was done between wet paper towels kept in a plastic tupperware-style container with the lid half off. Seeds took 6–10 days to germinate. At 3 months old, one of these seedlings was 9 inches tall and 13 inches wide at the base (leaf-tip to leaf-tip), and its growth has slowed considerably (see FIGURE 7). BEIFUSS believes that this is due to this seed-grown plant having a more limited root system than a cutting of similar size would have. The remaining two seedlings (germinated at a later date) are a sickly yellow-green and much less vigorous, having only grown to about 1 inch tall after one-and-a-half months (see FIGURE 6). BEIFUSS does not think that these will pull through.

After sacrificing one of the seeds sent to me to be photographed with a scanning electron microscope (see FIGURES 4 and 5), I was left with 6 seeds to attempt germination on. I decide to see if gibberellic acid-3 (GA-3) would help my success rate with germination. (See *Seed Germination: Theory and Practice*, second edition by NORMAN C. DENO<sup>1</sup> for more on the use of GA-3; this is an excellent book that I recommend to anyone who is trying to germinate difficult seeds.) On

Figure 6: A *Salvia divinorum* seedling exhibiting stunted growth.

August 16, 1999 I attempted germination in paper towels using GA-3 and following the advice in the aforementioned book. In 8 days, 1 of these seeds germinated, and by 20 days a second seed germinated. The first germinated sprout seems to be growing well, albeit slowly; the second sprout hasn't yet pushed through the soil. Although additional seeds may still germinate, as it stands this is 33.3% germination rate. With such a small number of seeds, it is tough to say for certain whether or not the GA-3 treatment had any positive or negative effect on germination.

It has been proposed that the various collected plants brought into cultivation in the USA might all be genetically identical, and the similarly low seed set with self-pollinated plants and cross-pollinated plants might indicate that this is the case (REISFIELD 1993). It is certainly a *possibility* that all of these plants are monoclonal, and this question could easily be put to rest by performing genetic testing on the various plants now available.

All of the seed-grown plants currently in cultivation look identical to their parent plants except for one grown by SIEBERT, "Paradox" (aka DS03), which has leaves that are "ever so slightly mottled" (SIEBERT 1999). It has been suggested that *Salvia divinorum* may be a hybrid (REISFIELD 1993), but no reasonable candidates for parent plants have been proposed. Due to the consistent similarity of all known seed-grown plants (excepting the very minor difference in the "Paradox" clone), it seems unlikely that *S. divinorum* is a hybrid. If the plant were a hybrid, the seed would be expected to produce extremely variable plants (VALDÉS 1999).

There are also the questions of whether or not the plant is a cultigen, whether or not it has been found in the wild, and whether or not it has set seed in its native habitat in México. Cultigens, by definition, require the intervention of human beings to thrive and reproduce. (For example, corn—a true cultigen—cannot survive without human intervention.) In the Sierra Mazateca, *Salvia divinorum* can clearly do quite well by itself (VALDÉS 1999). The Mazatec curandero Don ALEJANDRO VICENTE has stated that the plant does indeed grow wild in the fairly inaccessible highlands of the Sierra Mazateca, and he has also stated that these plants produce seed that can be planted to grow *S. divinorum* (VALDÉS 1987; VALDÉS 1994; VALDÉS 1999).

It seems unlikely that Don ALEJANDRO VICENTE would lie about where *Salvia divinorum* grows wild, and whether-or-not it produces seed. Nevertheless, no definitively "wild" stands

of *S. divinorum* have been found to date, and no Mexican-grown plants have been observed by ethnobotanists to produce seed.

*Salvia divinorum* depends on a shorter photoperiod to produce flowers. In warmer climates, where the plants can be left outside during the late fall and early winter, plants will go to flower naturally. My own plants, grown in California, have flowered every year. Those who live in colder climates that necessitate indoor growing will have to shorten the amount of daily light that the plants receive, in order to induce flowering, should they wish to attempt hand-pollination. ✧

## NOTES

1. *Seed Germination: Theory and Practice*, second edition by NORMAN C. DENO is privately published and distributed by the author. It is available for \$20.00 postpaid (to anywhere in the world) from: NORMAN C. DENO, 139 Lenor Drive, State College, PA 16801, USA.

by WILL BEIFUSS and JON HANNA

**BIOTECH INTERNATIONAL**  
**POB 270412 (Dept. ER)**  
**Las Vegas, NV 89127-0412**  
**(702) 647-9634 FAX**  
**bio3ch@aol.com**  
**<http://www.biotech-intl.com>**

We first learned of BIOTECH INTERNATIONAL as they were supplying ketamine hydrochloride in powder form to researchers via mail-order. A colleague had ordered from them, was impressed with their products and service, and he recommended them for referral to any companies, institutions, or independent research scientists that we knew of who might be looking for this chemical or any of the others that they supply. They fill orders within 24-hours, their chemicals are stated to be of high purity, packaged in tightly sealed containers, and shipped along with a MATERIAL SAFETY DATA SHEET as well as listing the manufacture date (a nice feature that lets one know how fresh the material is).

Unfortunately, effective on August 12, 1999, the Deputy Administrator of the DRUG ENFORCEMENT AGENCY placed ketamine into Schedule III of the CONTROLLED SUBSTANCE ACT. Due to this recent federal scheduling of ketamine, BIOTECH INTERNATIONAL no longer offers this chemical for sale. However, they still have a number of chemicals that might be of interest to the independent research scientist, such as:

Amantadine hydrochloride, 10 gm/\$13.50; dextromethorphan hydrobromide, 10 gm/\$35.00, 30 gm/\$60.00, 50 gm/\$80.00; lidocaine hydrochloride, 10 gm/\$25.00, 25 gm/\$50.00; L-phenylalanine, 25 gm/\$17.50, 50 gms/\$30.00, 100 gm/\$50.00; selegiline hydrochloride, 500 mg/\$20.00, 1 gm/\$40.00, 2 gm/\$70.00, 5 gm/\$150.00; L-tryptophan, 25 gm/\$32.50, 50 gm/\$60.00, 100 gm/\$110.00. All prices include S/H. Some tryptamine-based products should be available in the future as well.

Information on each chemical, such as its molecular formula, appearance, assay results, storage requirements, and brief commentary on its pharmacology, is provided by BIOTECH

INTERNATIONAL. Prior to placing an order you must register with them. This can be done by mail, fax, or e-mail. They require a copy of your ID to verify that you are at least 18 years old, and a signed statement indicating that those purchasing their products do not intend to use them for human consumption or resale, and that the purchaser is familiar with the health hazards and environmental risks associated with these products and is technically qualified to determine the conditions of their safe storage, manipulation, and use. Orders without the ID photocopy or registration statement will be returned. After filing this once, future orders will not require this process. As well, the information you provide to BIOTECH INTERNATIONAL is considered confidential, and will not be disclosed to any third parties. They only accept cash, (international) money orders, cashier's checks, WESTERN UNION, and bank wire transfers as payment (no C.O.D. orders or personal checks). Make payment out to BIOTECH INTERNATIONAL. The web site listed above may not yet be operational at the time we go to print, but should be accessible in October of 1999; at that time they will begin accepting credit cards as a method of payment.

**CIELO ETHNOBOTANICALS**  
**Att: Dan McDonley**  
**POB 199 (Dept. ER)**  
**Milford, ME 04461**  
**cielo@yage.net**  
**<http://www.yage.net/cielo>**

This company specializes in freshly dried *Banisteriopsis caapi* vine sections. They sell the "Cielo cultivar," which they say was originally brought back from Peru by TERENCE McKENNA. Prices are 1 oz/\$10.00, 4 oz/\$35.00, 8 oz/\$65.00, 1 lb/\$125.00. Shipping is \$4.00 and for now they are only selling within the USA. They occasionally offer a limited amount of "premium stock;" 1 lb for \$175.00. These are larger vine sections that range in age from 5–8 years old. They have pictures of each individual pound on their web site so you can see exactly what vine sections you would be getting—a nice touch. Inquire for availability. All of their vine is plantation-grown in the USA, not taken from the rainforest. We are glad to hear this, as we always encourage people to order from companies that make an effort to grow these plants in the USA, rather than exploit another country's natural resources in a manner that may not be sustainable. Payment can be made in cash, check, or money order; no credit cards or C.O.D. orders at this time.

**DANIEL HAUCK**  
**441 W. Madero Ave.**  
**Mesa, AZ 85210**  
**msammy@webtv.net**  
**<http://www.inergy.com/msammy>**

DANIEL HAUCK sells rooted *Trichocereus pachanoi* and *T. peruvianus* cacti. The *T. pachanoi* costs \$25.00 each and the *T. peruvianus* costs \$30.00 each. They are between 6–12 inches tall, and shipping is \$3.00. DANIEL HAUCK also sells dextromethorphan hydrobromide; 1 gm/\$10.00.

**DOUG ROWLAND**  
**200 Spring Road (Dept. ER)**  
**Kempston**  
**Bedford, MK42 8ND**  
**ENGLAND**  
**+44 1234 358 970**  
**<http://www.cactus-mall.com/rowland/index.html>**

DOUG ROWLAND sells cacti and succulent seeds for a huge variety of species, some of which may be of interest to collectors of psychoactive cacti. They have various *Ariocarpus* species including *A. fissuratus* and *A. retusus*, various *Coryphantha*, various *Echinocereus*, some *Lophophora* species including *L. diffusa*, *L. diffusa* var. *koehresii*, *L. jourdaniana*, and *L. williamsii*, numerous *Mammillaria* species, *Pachycereus pecten-aboriginum* and *P. pringlei*, numerous *Trichocereus* species including *T. bridgesii*, *T. grandiflorus*, *T. pachanoi*, *T. peruvianus*, as well as some species collected from the Atacama desert, and various *Turbinicarpus*.

For most species 15 seeds costs 20 p and 100 seeds costs £1. Check their web page for payment and postage information. DOUG ROWLAND also offers a good selection of general information books on cacti, as well as the second edition of ANDERSON'S book *Peyote: The Divine Cactus*. They also offer their own booklets on grafting and raising cacti from seed.

Also worth checking out at this site, especially for those in Europe, is the link to WHITESTONE GARDENS (<http://www.cactus-mall.com/whitestone/catbooks.html>), as this company sells both second-hand and new books related to cacti. They have many classic works, such as books by BACKEBERG and BRITTON & ROSE, as well as a number of books on peyote, including RUDOLF GRYM'S excellent *Rod/Die Gattung Lophophora*. While this book is written in German and Czechoslovakian, it is still worth picking up a copy for those who can't read these languages, due to the myriad of

beautiful black and white and color photographs. And while WHITESTONE GARDENS lists this 125-page hardcover book at the price of £21.30 postpaid (about \$33.50), it can be had for \$22.00 postpaid (send cash via registered mail) directly from the publisher at: MUDR. ROMA STANÍK, Česká 17, 831 03 Bratislava, SLOVAKIA.

**FARMACIE PETRONE S.R.L.**  
**Via Napoli (Dept. ER)**  
**101-8126, Napoli**

**+39 081.726934 FAX**  
**[petrone@petrone.it](mailto:petrone@petrone.it)**  
**<http://www.petrone.it>**

There are an increasing number of web-based pharmaceutical companies popping up these days. In general, we have been reluctant to review these companies; there is always the worry that readers may attempt to order scheduled compounds from them, and this could result in a U.S. CUSTOMS seizure of the products. Or, perhaps a DEA investigation of the person who placed the order could occur—most likely depending on the quantity ordered. (For hard drugs, the threshold appears to be several ounces, while for pills there seems to be a 500–600 pill threshold.) Or, maybe even a controlled delivery of the contraband and the subsequent arrest of the receiver and a search of the premises could result. (It is worth noting that there is both federal and state case law indicating that small amounts of drugs can be sent “on a whim,” with the recipient unaware.) There is frequent talk on alt.drugs, alt.drugs.hard, and other similar USENET newsgroups purporting to relate which companies provide good service, and which companies have a high percentage of packages held up at CUSTOMS. In some cases it would appear as though when CUSTOMS becomes aware of a company who is indiscriminately supplying opiates (for example), they will then be on the alert for packages originating from this company, and open them for inspection. Especially if large quantities (typically 500 doses or more) are found, there is a chance of law-enforcement action being taken. This is another reason that we feel it is in general best not to list the “good” companies (*i.e.*, ones that people can still get opiates from); as soon as we or anyone else draws attention to them, they can quickly become “bad” companies (ones that are watched by CUSTOMS and the DEA). As well, the DEA or FDA may attempt to coerce the company into ceasing shipment to the USA.

Another reason that we hesitate to review such companies is that, without first-hand experience placing orders, we have no way of knowing if these companies are legit, or if they are just an Internet scam. Since both of us were once ripped off from ERA-BOND LABORATORIES, an “overseas pharmaceutical company,” we are a bit leery about recommending those suppliers that we don’t have positive personal experience with.

The situation with suppliers and CUSTOMS is subject to rapid change. Interested readers are advised to retain some degree of scepticism as they keep up with these changes via the latest newsgroup reports. It is always possible that an unscrupulous individual could post phony reports of success to tout a rip-off scheme. We’ve seen numerous examples of thinly-veiled advertisements disguised as questions or accolades. Even if these companies are legitimate, their advertising tactics are sneaky at best.

Nevertheless, those individuals who are ordering *non-scheduled* compounds from overseas mail-order pharmaceutical companies probably have less to worry about. It is likely that the worst that would happen with such an order (if the company was legit) is that it would get held up by CUSTOMS and either destroyed or returned. (In the latter case you might even be able to get a refund.)

With the above lengthy disclaimer in place, we wanted to draw attention to FARMACIE PETRONE S.R.L., as they offer the compound proglumide in a range of doses. Those who read the second installment of our interview with JONATHAN OTT (see the SUMMER SOLSTICE 1999 issue of *ER*, pp 62–73) may recall that this compound is used as an ulcer medication, as it inhibits the gut hormone cholecystokinin (CCK). Mr. OTT pointed out that proglumide can seem to enhance the effects of opiate drugs, as well as prevent or reverse opiate tolerance. OTT stated that he had not been able to locate a source for this drug other than through chemical supply companies such as SIGMA (and these companies generally don’t sell to individuals). After a colleague mentioned that FARMACIE PETRONE S.R.L. carries this drug, we figured that we should point this out to *ER* readers.

FARMACIE PETRONE S.R.L. sells a number of other useful drugs as well (indeed, they state that they have “15,000 pharmaceutical and parapharmaceutical items” available). Perhaps of great interest to *ER* readers is the fact that they carry moclobemide in 300 mg doses. We have received a number of inquiries asking where this drug—a short-term MAOI useful in *pharmahuasca* experiments—was available, and

until now we have only been able to reply that “it can be purchased over-the-counter in México.”

FARMACIE PETRONE S.R.L. also offers quite a few so-called “smart drugs,” such as aniracetam, oxiracetam, piracetam, and pramiracetam, as well as selling GHB, diazepam, insulin syringes, and much more.

The forms that are needed for “your company” to place an order with FARMACIE PETRONE S.R.L. are available on-line at their web site, and are apparently quite easy to fill out. We have heard of one person that attempted to order benzodiazepine drugs from them who ran into the problem that they required him to fax a prescription in order to fill the order. He also complained that the quoted shipping rates were overly expensive. We want to stress that we have had no personal experience placing orders from this company, either good or bad, and we would certainly appreciate hearing about the experiences that any *ER* readers have with them.

**HERBEX LTD.**  
**POB 4118 (Dept. ER)**  
**Samabula**  
**FIJI ISLANDS**  
**67 9 315503 TEL/FAX**  
**gks@clear.net.nz**  
**<http://www.4-u-veges.com>**

HERBEX LTD.’s “*Kava Boutique*” sells whole roots of *Piper methysticum*, as well as *waka*-grade dried ground root-powder. The prices listed below should be only considered estimates, as the price will have to be converted based on the current exchange rate at the time an order is placed.

The price for whole roots depends on the age of the plant (which determines the kavalactone concentration), and you should contact HERBEX LTD. to discuss what is available. For example, roots with a minimum kavalactone content of 12% sell for about \$12.50 per kilo—this is a very good price.

For the *waka* root-powder, ½ pound is \$10.50, 1 pound is \$18.00, 2 pounds are \$34.50, and 4 pounds are \$64.50. They also sell handcrafted *tanoa* (*kava* preparation bowls): small 6” for \$5.50, medium 11” for \$29.00, and large 13” for \$52.50, as well as *bilo* (half coconut drinking cups) for \$1.00 each. And they have a small selection of additional traditional offerings, such as *papasia* and *buburau* for storing *kava*.

There is something attractive about buying one's *kava* directly from Fiji, and it strikes us that it should be both fresh and potent when purchased in this manner, since it may have spent less time being shipped around the world and sitting in warehouses. As well, buying whole roots and grinding them yourself reduces the chance of potential oxidization of the kavalactones, which occurs more rapidly when they are sitting around in powdered form.

### THE HIGH SHOPPE OF THE NETHERLANDS <http://www.snmedia.com/index1.htm>

A strange example of the increasing convergence of entheogens and pornography on the Internet. THE HIGH SHOPPE sells *Cannabis* and *Psilocybe cubensis* mushrooms; these products are listed underneath a picture of a woman squatting down in a black bra and panties and high-heeled boots. Each product has a link that entices you with “free samples,” but clicking on the link takes you to a page that says: “In order to obtain free samples or purchase products, you must be over 18 years of age. Please verify your age by entering your Adult Check ID below.” ADULT CHECK® is a service predominantly used by porn sites to verify the age of the people visiting their site. It costs \$19.95 to get an ID number that is good for one year, so suddenly the “free samples” you are after aren't so free anymore. And although you started out with an interest in procuring some *Cannabis* or mushrooms, with your ADULT CHECK® ID you can now surf thousands of porn sites; to hell with entheogens, bring on the nude photos!

If you decide to part with \$19.95 for an ID number, you can then purchase, or get free samples of, the following items: Skunk #1: 1.5 gm/\$22.00, Indica: 7 gm/\$19.95, Thai Stix: 7 gms/\$35.00, “Shrooms:” 4 “doses”/\$19.00.

Their web page contains the following disclaimer: “Note: The High Shoppe Is Not Responsible For The Legality Of These Products In Your Country. In the unlikelihood that your order is stopped by customs, they will simply detain and destroy the product and deem it as unsafe. Nothing will happen to you, it becomes a food safety issue. It is designed to protect you from unsafe and contaminated foods and goods.” We doubt that if one is caught trying to import these products into the USA, for example, that CUSTOMS sees this as simply a “food safety issue” and will just destroy the package. It is reasonable to assume that one would stand a real chance of being charged with the importation of controlled substances. Of course, saying this on the web site wouldn't

help sales, so instead they came up with the horseshit mentioned in their disclaimer. THE HIGH SHOPPE OF THE NETHERLANDS is owned by an outfit called SNEAKY MEDIA, and that just about says it all.

### INDRA: SHAMANIC HERBARIUM <http://www.indra.dk>

This company based out of Denmark operates entirely on the web. They have a variety of interesting products, including dried psilocybian mushrooms (*Psilocybe cubensis* and *Panaeolus cyanescens*), mushroom grow kits (containing active *P. cubensis* mycelium and typically yielding 150–200 fresh grams of mushrooms), mushroom spores, ayahuasca plants and various ayahuasca analogues, baby Hawaiian woodrose seeds, *Anadenanthera* sp. seeds, and *Salvia divinorum* extracts in various standardized potencies. Additionally, they have one product that we haven't seen before, which is a pretty unique offering. This is a 5x extract of *Tabernanthe iboga* root. Theoretically, those wishing to experience the psychological, spiritual, or potentially anti-addictive properties of this root would only have to ingest 1/5th the amount as normal, due to the increased concentration of this extract. We are curious what method of extraction is used on this product, and also what the price of the extract is. In the past, pure ibogaine and *T. iboga* root have been fairly scarce, and also pretty expensive. Our hope is that the root used for this extract is being commercially farmed specifically for this purpose. (Or, at the least, harvested in a sustainable fashion.) While specific information about this and various other products wasn't available at the time we wrote this review, there should be something up at the web site by the end of September. Since such an extract would likely be considered illegal in the USA, the 5x *T. iboga* root-extract will not be shipped to America. Other than this they ship worldwide.

### MAGIC SPHERE VALVE POB 190942 (Dept. ER) Miami Beach, FL 33119-9951 <http://www.magicspherevalve.com>

The MAGIC SPHERE VALVE is a polished 304 grade marine stainless steel pipe that converts any bottle into a waterpipe. The design is beautiful in its simplicity. The metal sphere, about 1.25” in diameter, has a cut-out bowl and stem hole. A metal tube attaches to the base of the sphere and dangles into the liquid in whatever bottle you chose to use, and a second metal

tube attaches to the stem hole. Since a spherical shape will automatically center on a bottle mouth and form a decent seal, a waterpipe can be created easily anywhere. The sphere itself has an additional hole that a key-ring can be placed through, allowing it to be carried as an attractive key-chain fob. The metal tubes are supposed to be of a size that they can be used in conjunction with a standard transparent Bic® pen refill, to form a metal pen. I played around with a couple of Bic® pens and could not get this to work correctly, as the fit was too loose to be practical. Still it might work well enough as “an excuse” to carry around these parts.

It seems unfortunate that the disassembled pipe is least conspicuous when carried in two spots like this, as I suspect that the metal tubes could be easily lost. Another way to go would have been to use short telescoping tubes (like a condensed version of a car antennae), which could have been contracted and kept attached to the sphere when it is in use as a key-chain fob. But this might make it a bit more obvious that the fob was really a pipe. If one really didn't wish to carry the metal tubes, it would be easy enough to actually use the empty plastic sheath from a Bic® Round Stick pen (not the standard transparent pen) as the bottom tube (being careful not to heat up the metal so much as to release any melting plastic fumes), and a rolled up “tube” of paper could form the pipe stem.

Any seeming drawbacks such as those presented above that this pipe might have at first glance could clearly be corrected in a number of creative ways, and I suspect that the MAGIC SPHERE VALVE will become my pipe of choice for future travels. And of course, none of these “drawbacks” would in any way effect the use of this pipe at home, where it can be safely kept altogether in the cloth carrying case that it comes with.

The MAGIC SPHERE VALVE is \$54.55 postpaid in the USA. Make payment out to JACOPO TOLJA. Foreign orders check the web site for prices. Orders can not be shipped to P.O. Boxes.

**MAYA ETHNOBOTANICALS**  
**Korte Houtstraat 3 (Dept. ER)**  
**2011 ZN Haarlem**  
**THE NETHERLANDS**  
**+31 23 5425326 FAX**  
**maya@yage.net**  
**http://www.maya.yage.net**

A new company with some good offerings including *Mimosa tenuiflora* [= *M. hostilis*] root-bark, *Diplopterys cabrerana*, *Psychotria viridis*, *Banisteriopsis caapi*, *Virola* resin, *Calea zacatechichi*, *Salvia divinorum*, and many others. Prices seem quite reasonable. Their catalog is \$3.00, cash only.

**ROWAN TREE ARTS**  
**POB 14523 (Dept. ER)**  
**Portland, OR 97293-0523**  
**rowantre@hevanet.com**  
**http://www.hevanet.com/rowantre**

ROWAN TREE ARTS offers the “White Rabbit” and “We're All Mad” posters from the '60s Haight/Ashbury artist collective EAST TOTEM WEST, and they also sell posters by artist ALEX GREY, including his works “Holy Fire,” “Embrace,” “The Kiss,” and “Theologue.” Any poster is \$15.00 plus \$5.00 S/H. ROWAN TREE ARTS has an on-line art gallery featuring the work of GWYLLM LLWYDD, which is based on mandala concepts or visited alternate realities. As well, it looks as though they will be offering a statue of XOCHIPILLI at some point in the future.

But the main focus of ROWAN TREE ARTS is their t-shirt designs. They offer designs in the categories of “Visionary,” “Celtic,” and “Pagan.” Their visionary line includes numerous shirt designs related in some manner to the history and experience of entheogens. They have two different t-shirt designs with *Salvia divinorum* motifs, and they have offered to donate \$5.00 of the purchase price of either of these shirts towards the production costs of *The Entheogen Review*.

The designs—shown to the left—are printed in green ink on a white t-shirt, and the shirts cost \$15.00 plus \$4.00 S/H each. Please note size (S, M, L, XL) (or, for 2-XL, and 3-XL add \$2.00 extra), and mention that you saw this offer in *The Entheogen Review*. Payment should be made out to ROWAN TREE ARTS.

**SALVIA EXTRACT ONLY**

**Att: Thomas Stanley**  
**27290 Woodburn Hill Road (Dept. ER)**  
**Mechanicsville, MD 20659**  
**shivasix@hotmail.com**  
**<http://members.xoom.com/tonescience/salvia>**

Like their name implies, this company only sells a *Salvia divinorum* extract. We like what they said on their web site; they seem like a conscientious company trying to make as good a product as they can. Their extract is a 7x strength, but it is not standardized as several companies now sell. Cost for 1 gm is \$21.50, with a limit of 2 gm per customer. Shipping is \$3.50; payment by postal money order only, made out to THOMAS STANLEY.

**NOTICE**

In the last issue we listed the fax number for ESHU without providing the country code. The correct number—in full—is: (001) 41 71 980-0453.

THE BASEMENT SHAMAN has moved to: Box 1165 (Dept. ER), Woodstock, IL 60098, USA.

THEATRUM BOTANICUM has moved to: POB 488 (Dept. ER), Laytonville, CA 95454, USA.

Over the past year we have heard a multitude of first-person accounts of bad service and rip-offs occurring with the botanical business LEGENDARY ETHNOBOTANICAL RESOURCES (L.E.R.). While we might normally take a few such complaints in stride, the sheer volume of reports coming in from dissatisfied customers about this company makes us feel that we would be remiss not to mention it here.

WILL BEIFUSS is freelance writer and occasional bio-assayist.

JON HANNA is the author of the 2nd edition of the *Psychedelic Resource List*. He is an editor, writer, artist, and new father.

**Ethnobotanicals.com**

PURE LAND offers one of the most extensive selections of highly interesting plant materials ever assembled, sourced, and imported from around the globe. All are specimen quality and available in both wholesale and smaller quantities, at some of the lowest prices you have seen. Some of the raw materials available include: *Psychotria viridis* and *Diplopterys cabrerana* foliage, *Banisteriopsis caapi* "Cielo" cultivar vine-sections, *Mimosa hostilis* root-bark, Vanuatu *kava* root, *Amanita muscaria* mushrooms, and literally hundreds more species and varieties of quality roots, barks, seeds, herbs, and foliage, suitable for use as herbarium specimens.

**The most superior extracts available.**

Over 150 powerfully concentrated extracts including: *Salvia divinorum* 5x standardized (12.5 mg/gram salvinorin A), and new semi-solid extract; Ashwaganda 5x, *Pedicularis* 10x, *Celastrus paniculatus* 10x and seed-oil, *Acorus gramineus* 5x, betel nut 5x, *Hyoscyamus muticus* liquid, *Erythroxylum catuaba* 5x, *Tribulis terrestris* 10x, many more.

Pure alkaloid research chemicals & essential oils, and a vast selection of rare viable seed stock, in packet all the way up to kilogram+ quantities.

PURE LAND supplies only connoisseur quality materials in every instance. Worldwide shipping. Please send \$2.00 for extensive print catalog:

# BOOK REVIEW

*Timothy Leary: Outside Looking In*, ROBERT FORTE (Ed.), 1999. PARK STREET PRESS (INNER TRADITIONS INTERNATIONAL) [One Park Street (Dept. ER), Rochester, VT 05767, <http://www.InnerTraditions.com>], ISBN 0-89281-786-0 [Perfect-bound paperback, \$16.95 (\$?.?? tax) plus \$?.?? S/H (USA)]. 338 pp; no index or bibliography.

ROBERT FORTE has compiled an excellent selection of “appreciations, castigations, and reminiscences” as a *festschrift* to Dr. TIMOTHY LEARY. Along the way we hear tales from JOHN BERESFORD, WILLIAM S. BURROUGHS, RAM DASS, ALLEN GINSBERG, ALBERT HOFMANN, ALDOUS HUXLEY, KEN KESEY, TERENCE MCKENNA, CLAUDIO NARANJO, THOMAS RIEDLINGER, WINONA RYDER, MYRON STOLAROFF, HUNTER S. THOMPSON, ANDREW WEIL, ROBERT ANTON WILSON, ROSEMARY WOODRUFF, and many others. An impressive cast of characters to be sure.

I fell in love with this book from the start, and became increasingly engrossed the further I read. FORTE kicks off with a bit of biographical information, which tells how LEARY’S father left him and his mother when he was 12, after the family fortune had been depleted by the depression. We’re then led through LEARY’S schooling, entrance into and tribulations at WEST POINT (and his eventual resignation), and his higher education and military career, which culminate in a Ph.D. in Psychology from U.C. BERKELEY. With his interest in psychedelics sparked by consuming psilocybian mushrooms in México, LEARY then started up “The Psilocybin Project” at HARVARD. However, it eventually it became clear to HARVARD’S higher-ups that LEARY’S activities and attitude were too controversial, and they found an excuse to fire him. Freed from the educational institution, which he described as an “anesthetic, a narcotic procedure which is very likely to blunt your sensitivity and to immobilize your brain and your behavior for the rest of your lives,” LEARY quickly became known as the foremost proselytizer of psychedelic drugs. Of course this led to problems with the law, and LEARY found himself in and out of jail (having actually escaped from the first minimum-security prison that he was in). In his later life, LEARY became an advocate of computer technology, and then—nearing his own death—a person who “brought death out of the closet,” to paraquote J.P. BARLOW.

As intriguing as the detailed introductory biographical information was, each individual chapter was even more enjoyable. Seeing the same man through a variety of different eyes telling different stories of different times provided a range of expression that couldn’t be matched by a biography told by one person. FORTE has done an excellent job pulling together a group of people who had truly interesting personal accounts to tell. These chapters range in length from 1 page to 42 pages long. But many of them are in the 2–4 page length, a structure that makes the book easily read in fits-and-spurts for anyone who has a shorter attention span. However, this format actually caused me to read the book from cover-to-cover, as I kept thinking to myself, “I’ll just read one more chapter, and then I’m going to put this down.” Indeed, I actually burned out the batteries in my book-lite in the wee hours of the morning, and had to scramble around in the dark to find some AAAs while my wife slept.

Some of my favorite accounts were those presented by J.P. BARLOW, MICHAEL HOROWITZ, and RALPH METZNER. BARLOW tells a heart-warming story of the triumph of “honest death” during one of Leary’s final brushes with the law, when they were pulled over for various moving violations while tooling around L.A. in a convertible. HOROWITZ, LEARY’S archivist, tells of that turbulent time in the early ‘70s when LEARY escaped from prison, and shares his own journal notes of his trip to visit LEARY while he was on the lam in Switzerland. And METZNER presents a detailed picture of the early days, which gives us a taste of how exciting this new field of psychedelic mind-expansion was at the time when it first appeared. Indeed, almost all of the remembrances throughout the book were quite compelling; there was only one that didn’t interest me much, as it was drowned in a quagmire of astrological mumbo-jumbo. A number of the accounts are presented in the form of interviews by FORTE. At times FORTE almost seems to be trying to goad the individual being interviewed into focusing on some of the negative aspects about LEARY’S personality and life decisions. I found it quite admirable that FORTE did this, as it allowed for a more balanced overall picture of the man, and the book didn’t come off as being filled with faint praise and bit tongues. And, for the most part,

those people interviewed seemed to have a pretty good impression of LEARY, even when there were aspects of how he lived his life that they didn’t agree with. Certainly the most severe criticism of LEARY was levied against him in the interview with OWSLEY STANLEY, who called LEARY “one of the most destructive actors to appear on the scene.” FORTE points out that it is pretty ironic for STANLEY to be blaming LEARY for the demonization of psychedelics, when it was STANLEY himself who was cranking out the doses. Although FORTE doesn’t say this, it seems clear that any notoriety and profit that STANLEY obtained from selling acid was certainly due to its mass-scale popularization, which most people attribute to LEARY. Viewed from this perspective, the opinions spouted by STANLEY become almost laughable. But STANLEY’S clear stance against LEARY’S approach, presented by someone who *believes* in the value of psychedelics, makes this one of the more interesting interviews in the book.

It would be hard for me to over-recommend this book. I can’t remember the last one that I read that was such a quick and fun read. Those with any interest in psychedelics should pick up a copy immediately; you won’t be disappointed. — JON HANNA

**Mind Books** offers over 280 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

- Philosophy & Pioneers (40 titles)**
- History & Stories (19 titles)**
- Public Policy & Law (16 titles)**
- Psychology & Empathy (33 titles)**
- Religion & Spirit (22 titles)**
- Practical Guides (20 titles)**
- Traditional Cultures (71 titles)**
- Plants & Compounds (37 titles)**
- Chemistry & Neuroscience (31 titles)**

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## NOTICE

Due to revised regulations for commercial mail receiving agencies by the UNITED STATES POSTAL SERVICE, our address has changed slightly. All future correspondence should be addressed to: *The Entheogen Review*, PMB 808, 564 Mission Street, San Francisco, CA 94105, USA.

## EDITORIAL MUSINGS

It's hard to believe that this issue wraps up two years of my tenure as editor of *The Entheogen Review*. Time flies when you're having fun. I hope that you've enjoyed reading *ER* as much as K. TROUT and I have enjoyed putting it together. We've had some great contributions this year, and I am hopeful that we'll get many more in future issues.

Since we took over the responsibility of publishing *ER* in the Spring of 1998, we have doubled the size of the publication. We've increased the production quality, by using a heavier card-stock cover and laser-printing the journal direct-from-disk at 600 dpi. Every issue now has a bibliography of cited works, for those seeking further information on the topics discussed. We've added a yearly index. And we've included more writings from noted experts working in the field of entheogens. We try hard to get accurate answers to questions posed, but we also appreciate that the entheogenic experience itself is highly subjective. We now send *ER* via first-class mail; as well as getting the issues to subscribers more rapidly, first-class mail also allows us access to forwarding addresses when a subscriber has moved and forgotten to tell us.

In reviewing the time and money it takes for the two of us to complete all of the many tasks related to publishing *ER*, it is quite clear that we are barely scraping by. The bottom line is that we need to dramatically increase the number of subscribers in order to continue doing this work that we love. The larger size and higher production-quality of the journal, and the use of first-class postage, has increased our printing and mailing costs substantially from the days when the publication was produced by Mr. DEKORNE.

We have avoided splashy advertisements in mainstream drug-oriented magazines, as we feel that it is prudent to keep a low profile. For the same reason, we generally eschew the world wide web and we don't have an e-mail address. (For more on the latest draconian laws spurned in part by the web, which—should they pass—will gut the First Amendment, see RICHARD GLEN BOIRE'S "Pharmaco Prohibita" column on page 154.)

Nevertheless, we do need to get the word out about our existence to potential subscribers who want the quality information that *ER* provides. Overall, we feel that this "word" is best spread by enthusiastic subscribers hipping their friends to *ER*. This is how you can help. If you like *ER*, please do your best to convince at least one other person who might be interested in it to subscribe. (If everyone did this, we'd double our subscription base!) And if your subscription ends with this issue, please consider renewing; we'd certainly appreciate your continued support.

I send my thanks to everyone who has helped us get this far along in our trip; we couldn't have done it without you!

— DAVID AARDVARK

## 4-ACETOXY-DIPT PRIMER

by TOAD

Of the many tryptamine compounds in *TIHKAL*, there are several that suggest the makings of greatness. 4-hydroxy-diisopropyltryptamine is one such compound, as SASHA himself reported some flirtation “with the magical plus-four transcendental peak experience” with it. It was also said in *TIHKAL* that 4-HO-DIPT has an unusually short duration, which might make it a suitable candidate for psychotherapy. With Dr. SHULGIN’s incredible groundwork laid before us, I’m honored to bring this compound and its close chemical cousin 4-acetoxy-DIPT into closer focus.

Recently, I had the opportunity to experiment with this compound, and its more stable 4-acetoxy-DIPT derivative. It is theorized that once a 4-acetoxy compound enters the body it gets chopped off by esterase enzymes, leaving behind the active 4-hydroxy group to work its magic on the brain. The process should be very similar to how 4-phosphoryloxy-DMT, or psilocybin, metabolizes into 4 HO-DMT, or psilocin (HASLER *et al.* 1997; SHULGIN 1999). Due to the manner in which humans metabolize psilocybin, the effects of isolated psilocybin and psilocin are subjectively the same. This can also be said for 4-acetoxy-DMT, 4-acetoxy-DET, and their 4-HO counterparts. In my first comparison experiment, 4-HO-DIPT and 4-acetoxy-DIPT were found to be essentially the same experience, with the only difference being a slightly faster ramp up for the 4-HO compound. A more detailed comparison study is currently in the works.

In the course of watching a fairly wide spectrum of psychonautical experiments with 4-acetoxy-DIPT, some interesting aspects of the drug have come to light. First off it must be noted that the reports for 4-acetoxy-DIPT have been consistently positive, with the majority of people stating that they enjoyed the experience. I had expected this compound might present substantial “body load” issues based upon what I had read in *TIHKAL*, but I’ve been pleasantly surprised to find the majority of people felt the side-effects of the material were negligible when compared to the positive aspects of the experience. About half of the people reported physical effects described as “kundalini,” “tremors,” “jelly legs,” “jumpy legs,” and “quivers,” with one explorer commenting that the body load was reminiscent of DPT and was a bit disconcerting for him at times. Two experimenters indepen-

dently theorized that combining 4-acetoxy-DIPT with dopaminergic compounds such as Wellbutrin® (bupropion HCl) or GHB may increase the tremor effects. Clearly more *data* is needed, and the jury is still out on this one. My partner and I found the material to elicit a definite tryptamine energy signature in our bodies, but nothing that we would classify as physical malaise or uncomfortable feelings. Actually, it was quite the contrary for us. We added GHB at the tail end of our experiences and noted a very nice synergy, without any added side-effects. Out of the 21 people who participated in the study, only one was disappointed with the material, and all said they would like to repeat the experience and explore this unique entheogen further.

### DOSING STRATEGIES

4-acetoxy-DIPT is conveniently orally-active and quite potent, with the standard dose being somewhere in the neighborhood of 15–30 mg. So far, the highest trials have been with 40 mg, and these particularly thick-skulled explorers commented that it was definitely not too much for them. I would imagine it could even be taken to higher levels by hard-headed psychonauts who are unresponsive to the standard dosage range. On the other hand, I’m sure many people will find the gentle experience of lower doses more suited to their tastes. The effects are felt within 30–45 minutes and are fully developed by 1.5 hours. The peak plateau lasts for another 1.5 hours and then quickly fades over a 30 minute period to an excellent afterglow. The experience can also be boosted at any point during the trip to extend the effects. During one experiment my partner and I took an initial dose of 25 mg, then boosted with another 25 mg at T+2 hours, which deepened and extended the total duration of the trip to about 6 hours. This compound tastes incredibly nasty, so do yourself a favor and put it inside a gelcap. To my knowledge, the other routes of administration have not yet been explored. I would imagine it will be very active via nasal, rectal, and injection routes, however the material seems best suited for oral ingestion.

## SET & SETTING

4-acetoxy-DIPT seems to have a gentle and benevolent nature, rather than being a “crack you over the head” kind of psychedelic. This is not to say that 4-acetoxy-DIPT doesn’t pack a punch (it certainly does for me), just that it seems to work in non-threatening ways. Similar to the euphoric effects of MDMA, this material gravitates towards the positive polarity. 4-acetoxy-DIPT can be best categorized by its unique, friendly psychedelic nature and luscious sensual body feelings. The material is not particularly visual, but does present some color enhancements and minor visual alterations, especially at the higher dosage range. Clearly the focus of this drug is how pleasurable it feels. Pink clouds, ivory pearls, and sensual delights. This is where the happy elves live.

It would be a good idea to have lots of soft exotic fabrics and wonderful things to feel in your launch pad environment. Make yourself an ultra-lush, supersoft bed especially for the occasion and share it with a friend. Anoint yourself with a hot bubble bath, cover yourself with fragrant flower peddles, and take full pleasure in being flesh. You also might want to have a fine sound system and some good music available in your plush tripping pad, as music will add immensely to the sensations of 4-acetoxy-DIPT.

As for sensual/sexual enhancement, I think this material completely blows 5-MeO-DIPT and 2C-B away. Another arena where this material may be well suited is for enhancing truthful communication and intimacy between people. 4-acetoxy-DIPT definitely has strong empathogenic qualities, and may be well-suited for select social applications. It’s definitely something you will want to share.

As far as being a potential agent for intensive self-analysis in psychotherapy, I don’t think this is quite what the doctor ordered. However, it may prove to be very useful in a therapeutic settings as an introductory entheogen to get the ball rolling. It will be very interesting to watch the fate of this drug as it plots its course through the various entheogen networks. It has the potential to become very popular very fast. I’m hopeful that people will make intelligent choices and use it responsibly so that we may enjoy this fine material for a long time to come.

## VARIOUS TRIP NOTES

*With 25 mg orally.*

10:00 pm: Ingest in gelcap.

10:34 pm: Feeling warm, tingly, a bit disoriented.

10:39 pm: Starting to feel pretty happy.

10:48 pm: Somewhat tremulous physically, a bit more disoriented mentally, but still in a rather nonspecific inebriated state. Where is this leading, I wonder?

10:56 pm: Beginning to notice a bit of body load, increased tremors and some muscle rigidity that feels rather strange. Mental state is one of mild euphoria, though.

11:03 pm: Feeling a very pleasant stimulation and warmth in my root chakra/genital area, as if a ball of glowing energy is forming and expanding there.

11:22 pm: *Very* sexually stimulated. Just masturbated to a quick, extremely pleasant orgasm. I can’t help but wonder if perhaps I shouldn’t have contained and tried to raise the energy, though? We’ll see. Not much in the way of insight or visual enhancement so far, just sensual emotional/physical fun, with a slightly speedy edge to it.

11:35 pm: Feeling very lucid, warm, and opened up wide. Mentally placid. Physically I am getting occasional bursts of tremor and shaking, like little kriyas. I think this stuff would be fantastic with a partner in terms of enhancing both communication and sexuality. I have an intuition that I have reached the plateau for this dosage of the material.

11:53 pm: Just masturbated again. Damn, this stuff sure makes me horny!

12:15 am: I think that things may be beginning to drop off in a subtle way. I still feel *really* good, though. I’ve decided to take 3 ml of 1,4-butanediol to see if it will mediate some of the body load, which is still quite present.

12:32 am: The 1,4-butanediol has the desired effect—blunting the body load while preserving and perhaps even enhancing the mental state, which continues to be lucid, warm, open, and quite happy. The mind state isn’t particularly psychedelic, but to tell you the truth, I don’t care. This is *fun* stuff!

1:40 am: Still groovin’. It seems, however, that the energy tremor has actually increased, almost to the point that it is becoming a bit disturbing. The tremor and shaking is mostly confined to my neck and head—short bursts of an almost uncontrollable whipping back and forth.

3:00 am: Finally starting to feel a bit tired, and thankfully the energy tremor has pretty much stopped. Still feeling warm and happy in a nice subtle way, and having little flashes and glints of psychedelic color on the periphery of my visual

field. It seems that as the empathogenic effects slowly fade, this compound's psychedelic effects are becoming more noticeable, almost as though the sensual explosion of the early stages masked them somewhat.

My notes stop here. I finally got to sleep around three hours later. Residual effects of both an empathogenic and psychedelic nature persisted right up until falling asleep. In fact, the visual effects were perhaps most pronounced as I turned out the light and curled up under the covers, seeing a network of coiled, iridescent strands of ectoplasm crisscrossing in the ether throughout my bedroom. With the minor exception of the shivering/shaking effects and the muscular tension, this trial of 4-acetoxy-DIPT was a uniformly enjoyable, fully outstanding experience. I eagerly await the opportunity to sample this compound again to see if these effects were a fluke or are reproducible in repeated trials. — TREY

*With 10 mg orally followed by a 25 mg booster after 1 hour.* I had expected some overlap in effects with psilocin, given the 4-substitution and accounts provided in *TIHKAL*; however, it was for the most part not found to be a highly visual material. The state of consciousness evoked was definitely friendly, heart-opening, and insightful. We were gently and humorously guided into considering our current living situation. I would characterize this material as definitely having a quality of friendly, humorous insight, and something that was a great catalyst in crystallizing some life changes that we've been condensing for some time. — ELFSTONE

*With 20 mg orally.* This is a very physical substance, not in any negative manner, but the substance is definitely *felt* in the body. In this manner it reminded me very much of 5-MeO DIPT. A sensual, flying, floating sensation and a definite sense of physical well-being is dominant. Then came some changes to the visual field. Not overwhelming in any sense, but some sparkling patterns akin to DPT. Luminous yet transparent geometries, not organic and round like mushroom visuals, but sharp edges and lines, fields of small silver translucent pyramids and such. The mental process was not affected very much, another aspect that reminds me of 5-MeO-DIPT. Thinking remained clear and intact. Very nice substance. — A & G

*With 25 mg orally.* It was beyond expectations. I now understand why people use the word lush to describe the experi-

ence. I was expecting something along the lines of MDMA, and I was pleasantly surprised to notice the entheogenic consciousness oozing out of the cracks in the fabric of reality. I became more aware of how long I'd put my "spiritual mission" aside for lack of time.

I really needed this—true soul searching stuff. And sitting here writing this now a peaceful sensation of understanding flows through me. The entheogenic essence that flows deeply in this material. Everyone could do with a little of this stuff to help them find themselves in this increasingly confusing reality. — NUBAE

*With 30 mg orally followed by a 10 mg booster after the 1.5 hours.* I must confess I had rather high expectations of this one, due to SHULGIN'S note that he flirted with the magical plus-four experience with this substance. I was disappointed by the experiences I had in relation to that, and learned yet again that expectation is probably my biggest stumbling block as I continue exploring the psychedelic world. Nevertheless, there's something unique here that I enjoy, if I can just put my finger on it. It's a remarkably subtle experience, and I was looking for some kind of intensity that simply didn't manifest. I was completely unmoved intellectually or emotionally, and I sat on the couch for quite a while wondering if anything was actually happening. There was definitely a "change of state," but it was not particularly useful or interesting. However, after a while I began to realize that my body had changed its timbre a bit; I was growing into the experience and feeling extremely sensual. My "ground control" drew a bath for me, and it was an immensely luscious experience. By 3.5 hours in, however, it was obvious the experience was ending, and at 4 hours, it was gone. I took MDMA later that night to good effect. My next experience with 4-acetoxy-DIPT was at 40 mg right from the start. A companion took 20 mg, and boosted with 10 mg later on. The subtlety of the experience that night is hard to encapsulate in words; we both agreed that 4-acetoxy-DIPT makes "a good appetizer" for other things. It's a good way to shift your head space without actually giving too much of a hard wrench. Indeed, one thing that I do believe is that it would make an excellent therapeutic tool, as a way to comfortably introduce novices to the feeling of an altered state, or even as a useful tool in itself for conversation. It doesn't demand much, but things are changed in the mind enough that perhaps some cobwebs could be shaken loose without fear of opening up traumatic spaces. We later took LSD after the 4-acetoxy-DIPT was over, and again, I noticed no cross-tolerance. — SCOTTO

*With 25 mg orally followed by a 25 mg booster after 1 hour.* I have to admit that I masturbated three times during the trip. This is confidential, isn't it? — ANONYMOUS

*With 40 mg orally.* My heart just bloomed. It felt as though it swelled to larger than normal and then unfolded itself and blossomed within me. Heart racing. Jelly limbs. Very pleasant feeling. Sort of jovial—not the spasms of laughter of LSD, but a satisfying all-over body-smile. Full bore. Marvelous. Clarity of thought, although there's a bit of spaceyness to it. Moments where my whole body quivers like Jello® forcing me to lay down briefly. Feelings very similar to significant doses of psilocybin, but not so intense as to make me question my physical existence. Feel very confident serving as “ground control” for JETSAM's second high-dose LSD experience as I drip 4 drops on her tongue. Get the children well-settled for the night (so I think) and lay on the futon with JETSAM. Sensuality overtakes us both and soon we're naked and writhing. It wasn't like MDMA where everything is tingly and feels just incredible; it was more like swirling our minds and bodies together. Of note to me was the indefatigable nature of my erection; very un-tryptamine-like, in my

experience. Viagra® has nothing on this stuff. Orgasm was delayed and when it arrived, it came surging in like a tidal wave, completely paralyzing my body and sparking an amazing kaleidoscope in my mind. Wow! — FLOTSAM

*With 20 mg orally second trial.* I forgot to not take my bupropion medication on the day of the experiment, also took a toke of marijuana just prior to dosing. Not as nervous this time, and I'm looking forward to it. Partner takes her usual Paxil® dose plus 0.5 mg Xanax® as she is nervous about trying a new compound. Setting: laying in bed, listening to fast ambient music. Feel energy, some anxiety. Partner: some body sensations, nice, not strong. Body tremors increase to mild muscle spasms. Distracting but not a problem. I decide that the 4-acetoxy-DIPT is interacting with the bupropion (which blocks dopamine reuptake and can cause muscle tremors by itself), and I take 0.5 mg Xanax®. Energy! Less body tremor now; Xanax® is probably working. Dreamy, music felt, no visuals, very much into the music. Try to have sex, but hard to focus. Listening to music by ORB, the lyrics comment, “We need some plasma here,” and we collapse laughing. Generally surfing the music, having a great time. ORB

mentions “TIMOTHY LEARY drug-of-the-month-club,” and again we fall into laughter. Try sex again and it’s really great! Effects fading, but it comes back in waves. Music is really special. Perhaps the DIPT side targets music, but the 4-acetoxy side makes the music magical like psilocybin; certainly there is none of the music distortion reported with DIPT itself. Sit outside with my partner listening to the night sounds, feeling very close. Partner notes that this compound may be good for creativity. No body problems. Slowly grew in intensity. Warmth in stomach area. A lot of fun, no fears or anxieties. Only problem for me was not being able to get to sleep afterwards. Final Commentary: feels like “2C-B with glee.” 15 mg seems a good dose. Some may prefer 10–12 mg. Eat a good carbohydrate, low-fat meal 3–4 hours beforehand. Seems especially good with music. Very good for sex. Might work for dancing, perhaps better at lower dose. A new class: *enthallogen*. Probably will be considered fun and a good party drug. Enjoy it while it lasts. — DANA ROBERTS

*With 17 mg sublingual.* I held it under my tongue for 2 minutes, yucky! Slight spacy pressure in forehead, sinuses swelling and tingling, cough. Rising a notch, a gentle floaty warmth spreading in my body. Getting deeper. Clear, floaty, stretching, body fine, pulse up a little. Feeling is closer to acid than many other things. Clear kundalini, beaming deep plus-three trembling, tactile enhanced, visual field more active (halos, trails more pronounced). Face flushed, good clean peaceful feeling, lots of kundalini, good stuff! Settled, soft, review of work-related subconscious or suppressed emotions easily amused. Life situation review, am I having it too easy? Smoking joints at taxpayers’ expense just because I happen to be smart maybe (laughing), while being conservatively appalled at such a display of a lack of work ethic (more laughing) in an easily focused state. Tryptamines sure give me a lot of kundalini. I feel a little sick, and I should reduce smoking of anything. Quite up there, writing this up. Staring at myself in the mirror, getting deep. Very good for moving in trance. Stretching feels good, gorgeous material! Not much effect anymore perhaps plus-one, although I can’t quite be sure, as I’m spaced as ever from meditating in the same place for almost an hour. I’m slightly drained physically (with hintings of a headache) but maybe from blood sugar levels too. In summary, this is brilliant stuff, with a cleanness of effect comparable to acid, and just slightly more draining physically. Definitely in the top class for depth, and the duration makes it special. — ANONYMOUS

*With 22 mg orally.* The evaluation was interesting, but not impressive. I don’t know if I am a hard-head or what. Maybe I just lack the esterase needed for the conversion from the acetoxy? It took over an hour-and-a-half to notice anything at all (eaten on an empty stomach with a glass of water). After several hours it had built to a barely perceptible peak that was rather nice and sort of interesting; colors and visual textures seemed richer or had a plastic sheen, tactile stimuli was a bit exaggerated, as was perception of sounds. But overall everything was extremely mild and just on the edge of perceptibility. Mental flow seemed a little affected at times, but much less than with anything else I have ever tried. It reminded me of taking a barely sub-threshold dose of something, but without feeling any sort of stimulation. There were no sexual urges or desires whatsoever. I think for me 22 mg was a barely threshold level. I fell asleep 4 hours after eating it. It would be interesting to evaluate this again at either twice this level or with a booster of the same amount taken at the 1 hour mark. (My bioassay of 4-HO-DIPT itself is related below.) I really liked what I could perceive about the experience, but if I had been doing anything at all at the time (like if I had gone to work or watched a movie), I could have easily missed noticing anything. Some minor sweating around 2 hours, but absolutely no tremors, rubbery legs, problems with talking or moving or thinking purposefully.

*With estimated 25 mg of 4-HO-DIPT orally.* Greyish talc-like powder (taste was not nearly as bad as many other things). Onset was solid around 26 minutes (first alert at 18 minutes) and by an hour later there was a very slow re-entry lasting several hours.

The mental space was interesting; introspection was fluid and not forced but very sensitive, accurate and detailed. In the right situation this could have good therapeutic or psycho-analytical applications. It did produce some odd contradictions; while feeling clear-minded in the center of my mind this was wrapped within a layer of confused disorientation. Similarly movement seemed strange; very controlled but still requiring some mental effort and focus. I felt cold and chilled throughout the experience (beginning around 1 hour after ingestion) but at the same time was hot and sweaty; this persisted until I fell asleep.

Perhaps due to the excessive pace I have been maintaining in recent weeks, there was a heavy body load making me extremely aware of just how physically and mentally exhausted I am right now.

While a booster was planned, it was neither wanted nor welcomed due to how uncomfortable I felt physically. Slept 6 hours after ingestion and had an intense night of dreams. All dreams since have been much more visual and detailed.

Lots of swirling or rotating movement within the visual field but no enhancement of colors or appearance of geometrics or other shapes. Assessing visual trails, despite them being weak, the entire movement seemed to be one blur with only the peaks of the range of movement visible. When waving a pen back and forth I was totally unable to tell where it was at any given point. While making notes, the shadow of my hand seemed like a thick transparent material that I was looking *through* to see the words I was writing.

At its peak it reminded me a bit of the stimulated mental space associated with an entry-level dose of DMT except without *any* colors, physical sensations, mental images, moving images, pressor effects, pounding heart or perceived entities.

Re-entry was quite uncomfortable in contrast with the take-off that seemed to onset smoothly. This was likely a product of my fairly exhausted state.

I thought it was a quite valuable experience as it helped me to evaluate several current issues in life that I have not been wanting to take an honest look at.

I did not experience any increase in either sensual or erotic perceptions. If sex had been an option I think I would have had little to no interest.

During the experience I kept wondering what the methoxy analogue would be like, and also about the 4-Methoxy-*N,N*-diethyl or perhaps 4-MeO-*N,N*-(*n*-propyl). While there were interesting aspects about this molecule, I repeatedly found myself thinking that a very small bit of structural tweaking could create something truly phenomenal. — K. TROUT

## ETHNOBOTANICALS.COM

PURE LAND continues to be a preferred source for many researchers interested in rare botanical materials of the highest possible quality at the lowest possible price. We offer hundreds of types of dried plant material, viable seeds, and much more. Current offerings include:

*Diplpterys cabrerana* whole leaves. Superior dried specimens sustainably-harvested in Peru. 50 gm/\$35, 100 gm/\$65, 250 gm/\$145, 500 gm/\$245, 1000 gm/\$480.

*Salvia divinorum* Oaxacan leaves. These leaves from the Sierra Mazatec of Mexico are especially rich in salvinorin A content. Bulk quantities and organic Hawaiian-grown Grade A leaves also available.

*Amanita muscaria* var. *muscaria* mushrooms. Deep red Grade A specimens collected on the Pacific coast and low-temperature dried, November 1999. Available in ounces through pounds.

*Amanita pantherina* var. *pantherina*. The finest dark brown specimens freshly dried from Japan's forests.

*Banisteriopsis caapi* 'Cielo cultivar' vine sections. Organically grown. We continue to offer this preferred 'Sky Ayahuasca' cultivar.

*Mimosa hostilis* root-bark and *Calea zacatechichi* leaves from Mexico.

Over 150 powerfully concentrated extracts, essential oils, and research chemicals round out our wide selection of products. Current extracts include:

*Salvia divinorum* 5X Standardized Salvinorin A-Enhanced Leaf. Pure salvinorin A is placed on *S. divinorum* leaves for a product free of extra plant impurities and with a consistent 12.5 mg salvinorin A per gram.

We ship worldwide. Please send \$2 for our catalog or check the latest offerings and prices at our web site.

## **AMANITA PANTHERINA VAR. PANTHERINA**

I've noticed from my bioassays that low doses (1.5 gm) of *Amanita pantherina* cause mild stomach discomfort lasting a very short while (about 15–20 minutes), moderate doses (3 gm) cause moderate stomach discomfort and mild nausea lasting up to an hour, and high doses (4.5 gm) cause a very unpleasant degree of stomach discomfort and a moderate degree of nausea lasting several hours.

Threshold effects are generally noticed after 45 minutes. The full effects don't become apparent until after about 2 hours. Although there is a slow buildup from the threshold to the experience of the full effects, the peak effects seem to almost manifest all of a sudden. The peak generally lasts 2–3 hours. After the peak, it takes about an hour to more-or-less return to baseline.

Low to moderate doses are generally pleasant. Very natural feeling sedative effects are experienced, including muscle relaxation. Bodily movement has a buffered feeling as if one were moving underwater or in a low-gravity environment like walking on the moon. Although one feels inebriated, it's easy to communicate with others in a natural and logical way. During meditation or introspection, there's an increased ability to focus the mind.

High-dose effects generally induce sleep for about 2 hours, after which one may wake up in a delirious state similar to the states of mind associated with atropine, hyoscyamine and/or scopolamine tropane-containing plants such as the *Datura* species. One may also vomit at some point during the session.

### **HIGH-DOSE SESSION**

**Purpose:** To see if this ethnobotanical truly has entheogenic qualities—expanding the mind's awareness to allow the experience higher spiritual levels of consciousness.

**Dose:** One medium- (bordering on large-) sized cap plus a quarter of a similar-sized cap along with two large stems of dried *Amanita pantherina* var. *pantherina*, harvested in Japan. Weight was approximately 4.5 grams.

**Preparation:** The mushrooms were boiled in water for about 10 minutes. The liquid and mushrooms were allowed to cool for about 20 minutes and were then slowly ingested, being completely consumed after about 15 minutes.

**Session Events:** An hour and a half after ingestion, I reclined in bed to meditate (figuring in case I feel asleep from the sedative effects, it would be best if I meditated in bed). Soon after, I was fast asleep, unfortunately not having any real time to seriously meditate with the aid of the effects. I slept deeply for approximately 2 hours, after which I awoke in a state of delirium. My first thought that I can remember was that I had invented a microscopic roll of toilet paper. Someone else began to argue with me (there was no one else in the room, but I had honestly felt there was) that *he* was the actual inventor of the microscopic roll of toilet paper. After a bit of arguing, I figured that it was unjust of me to be greedy and to take all the credit for the invention of microscopic toilet paper (perhaps this person had helped me in some way that I wasn't aware of). So I took claim to the invention of a slightly larger roll of toilet paper (or paper towels—I can't remember which), which was referred to as a "size 8" roll—being a size a bit larger than microscopic. It was clear to me that I had invented this size roll solely through my own abilities. An argument then again ensued as to who was the actual inventor of this "size 8" roll (as best as I can remember, these conversations with this imaginary person took place solely in my mind, and I did not speak out loud). I then vomited (in reality), after which the delirium began to slowly clear. I remember being very confused and attempting to clean up the mess. I got a roll of paper towels and tried to wipe up the vomit with it. Both ends of the roll ended up getting heavily soiled, so I figured that I should cut off the soiled ends with a knife. The voice of reason then stepped in and convinced me that it would be best if I didn't attempt to handle a knife in such a heavily inebriated state, since I might not be able to differentiate my arm from the paper towel roll. I then just sat on the edge of my bed feeling very nauseated, with a

certain phrase (I don't remember what it was) repeating over and over in my mind outside of my control. I found it very annoying, so I focused my mind away from the repeating thought, and slowly approached baseline.

Conclusion: Whether the dose be of low, medium, or high intensity, I have not noticed any real mind-expanding effects from this *Amanita*. Medium-dose levels can aid one in approaching samadhi (a powerful level of one-pointed concentration, which acts as a controlled gateway to other levels of awareness). Any dose much larger than what enhances one's ability to concentrate, seems to distort the mind's perception instead of expanding it. And gauging dosage can be tricky; the line between a useful meditation aid and a mind-twisting deliriant is a thin one.

Since these mushrooms don't actually seem to help in opening the doorways to higher levels of perception, but merely aid one in concentration, I can think of other plants and substances that would be more suitable as an aid to one's

spiritual development. This also raises doubts for me about the claims of *Amanita muscaria* being the much-praised *Soma* of the Vedas. The *Soma* was not only considered a sacrament, but a God in its own right as well. I can see no reason why anyone would consider *A. muscaria* a God. A sacrament, yes, because of its ability to aid one in meditation; but far from a God, in my opinion. The psychoactive Amanitas don't appear to be in the same league as other traditionally-used plant entheogens, such as *Lophophora williamsii*, *Salvia divinorum* and psilocybin-containing mushrooms. My guess is that it's more likely that *Soma* was a psilocybin-containing mushroom, possibly even *Psilocybe cubensis*, which some believe may have been available (especially since the ingestion of psilocybian mushrooms can also produce an entheogenic psilocin-containing urine).

Experiencing the effects of a deliriant has some value, in that it shows one the extent to which the mind can deceive itself. Although this is apparent by analyzing the dream state, it helps to make one more aware of this ability of the mind by actually experiencing it during one's waking consciousness. In my experience, I was thoroughly convinced without a doubt that there was someone else in the room to whom I was conversing with, when in reality, it was merely my own thoughts. In some of the higher states of consciousness, one perceives one primal Self in which all other seemingly separate individuals are actually manifestations of this one Self.

As in dreams the mind acts through maya, presenting the appearance of duality, so also in the waking state the mind acts through maya, presenting the appearance of duality.

There is no doubt that the mind, which is in reality non-dual, appears to be dual in dreams; likewise, there is no doubt that what is non-dual appears to be dual in the waking state.

All the multiple objects, comprising the movable and the immovable, are perceived by the mind alone. For duality is never perceived when the mind ceases to act. (*Manduka Upanishad*, Gaudapada Karika section, chapter 3, verses 29–31)

Undoubtedly the psychoactive Amanitas have some spiritual value in a few regards. But in my opinion, there are other plants that are much more suitable to aid one in their spiritual quest, and one's attention would be better focused in these directions. — D.D., CA

# NETWORK FEEDBACK

## MIMOSA TENUIFLORA, NEAT

I duplicated my *Mimosa tenuiflora* bioassay, and experienced very mild but quite pleasant results. I think my first try—mentioned in the VERNAL EQUINOX 1999 issue of *ER*—was masked by the somatic effects of the *Peganum harmala*. It seems for me that a much larger amount than 25 grams of root-bark is required. Carry on with your excellent work. — T.C., OR

## STIPA ROBUSTA'S ACTIVITY

The following quote from *Flora of New Mexico* may help to clear up the mystery surrounding the activity (or lack thereof) of *Stipa robusta*:

A very abundant grass in meadows at middle elevations. In the Sacramento-White Mountain region this is known as "sleepy grass," and it is said to have a narcotic effect upon the animals that eat it, especially horses. While neither of the writers has had an opportunity of personally corroborating this statement, it is vouched for by many reliable residents of the region. The narcotic effects of the plant, which are said to appear soon after it has been eaten, are indicated by drowsiness or sleep on the part of the affected animals, which continues often for 48 hours and sometimes results in death. Animals which have been reared in these mountains never eat sleepy grass, but those brought into the region will consume it because of its luxuriance and freshness, unless restricted. *Strangely enough, the dried grass does not have a narcotic effect. The grass is abundant in other regions of the State, but nowhere besides in this one range is it reputed to have narcotic properties* (WOOTON & STANDLEY 1915; emphasis added).

While gathering viable *Stipa robusta* seeds from the Sacramento-White Mountain region in early September, 1999, I performed a bioassay with the fresh grass. Its blades were extra sharp, thick, and full of fiber, so I chewed it slowly and carefully to avoid cutting my tongue. Once I had a wad pretty well chewed, I'd relax my focus on avoiding tongue cuts and continue chewing and sucking the juices out of it until the

remaining fiber was an extra-light-green (nearly white). I'd then spit this out and start chewing a new wad of fresh grass. I continually chewed on the sleepy grass like this, all the time staying focused on foraging seed spikes. [See front cover of this *ER* for an example of these seed-heads and seeds.] After a couple of hours I became aware of a slightly sedated, but not unpleasant, tranquilizer-type feeling. Walking had become a little bit impaired. These sensations were mild enough that I realized they could possibly be due to the placebo effect. A couple more hours passed, during which time I continued chewing the grass as described above. By this time I the effects had become significantly stronger, so I told myself "this stuff is turning into a fairly good placebo." Within an hour after this, I'd finished taking a shower and the effects peaked. For about 15 minutes I felt a mild, dreamy, tranquilizer-type rush. My conclusion? I had either found the *real* sleepy grass, or a darn good placebo! — ANONYMOUS

Figure 8: *Stipa robusta*. Plant; glumes and floret. Drawing reproduced from *Grasses of the Trans-Pecos* by A.M. POWELL, 1994.

## MORE STIPA ROBUSTA

I have ten *Stipa robusta* plants growing outside and I experimented with it for about a year. My conclusion is that it does not have visionary effects. It is a tranquilizer *par excellence*, and has a strong sedative effect that lasts about three hours and is free of side-effects. In *The Botany and Chemistry of Hallucinogens* by SCHULTES and HOFMANN, lysergic acid amide (ergine) is described as a strong tranquilizer with very little psychoactivity. HOFMANN should know; he is the “father of LSD” and did extensive research on related compounds. Ergine is *not* useful as an entheogen, but it’s great for insomnia! Yet individuals persist in trying to use it as a vision-inducing material, simply because it is structurally related to LSD. — B. GREEN

*This letter and the previous one bring up an interesting point. It is assumed by some that ergine is the primary visionary component in Ipomoea violacea and Argyreia nervosa. However, this may not be the case. K. TROUT has found that some morning glories are very LSD-like, and others are not (both within commercially available “heavenly blue” strains for example). There may be something else at work here that has not been adequately examined. It appears that HOFMANN did not evaluate all of the different chemicals found in I. violacea, and at least one that he did evaluate may have been visionary at doses higher than he took; he evaluated isoergine only up to the 2 mg level, and found it to be predominantly sedative without visual effects. JONATHAN OTT has pointed out that this compound might be psychoptic at higher levels (OTT 1993). We simply do not know at this point. It is also worth noting that lysergic acid-L-2-propanolamide, or ergonovine, has been reported as having mild visionary effects (as well as producing lassitude and leg cramps) in doses of 2–10 mg (HOFMANN 1978; BIGWOOD et al. 1979), and this compound is found in both Argyreia nervosa and Ipomoea violacea (CHAO & DER MARDEROSIAN 1973, listed under MOIR & DUDLEY’S synonym ergometrine), as is elymoclavine, which OTT has stated is “evidently psychoptic” (OTT 1993). Other possible players include the N-(1-hydroxyethyl)-amides of ergine and/or isoergine. The Botany and Chemistry of Hallucinogens notes:*

The psychotomimetic activity of lysergic acid amide and its marked narcotic component was ascertained from self-experiment by Hofmann (1963). This action of d-lysergic acid amide was later confirmed by comparative systematic investigations by Solms (1956a). He described the action as follows: “LA-111 induces indifference, a decrease in psychomotor activity, the feeling of sinking into nothingness, and a desire to sleep... until finally an increased clouding of consciousness does produce sleep.” Heim et al. (1968) concluded from experiments in man that ololiuqui and its main constituents (lysergic acid

amide, isolysergic acid amide) did not produce typical psychotomimetic symptoms but rather effects more like those encountered in toxic psychoses resulting from the action of a drug such as scopolamine. [Note: I never had effects even remotely similar to what was experienced from belladonna. — K. TROUT] Only little information is available on the activity of isolysergic acid amide (isoergine). After taking 2.0 mg orally, Hofmann experienced tiredness, apathy, a feeling of mental emptiness, and the unreality and complete meaninglessness of the outside world. (Hofmann, 1963)” (SCHULTES & HOFMANN 1973)

*Ergine may not be the psychoptic agent in morning glories that are active, or if it is then it is likely not the only player involved in producing visual activity. Between 1972 and 1983, K. TROUT ate Ipomoea violacea seeds or seed-extract several dozen times with wildly varying results ranging from powerfully colorful visuals to sedative effects. The highest amount he evaluated during those years was around 2000 heavenly blue seeds, but usually about 300 seeds were used. K. TROUT also consumed Argyreia nervosa seeds about 20 times, using amounts from 10–24 seeds, (he recommends the 18–22 range), and he reported a colorful visuals resulting each time. However, he also reported that in every instance of either seed there was at least some sedative component.*

*It seems probable that the psychoptic effects produced by these seeds involves an interaction or synergism between two or more of the chemicals present; HOFMANN only evaluated pure alkaloids not mixtures. It is also possible that higher doses of ergine may be more likely to produce visual effects, as was the case with ergonovine (BIGWOOD et al. 1979).*

## 5-MEO-DMT WARNING

I know someone who had a severe and prolonged response to a vaporized 20 mg dose of 5-MeO-DMT. This person had done all the usual entheogenic substances for some years and was careful and intelligent. She had done her research and when offered this dose by a good friend, she agreed to do it but questioned the amount, as she felt that it should be 5–10 mg. Her friend assured her that he had done it, and others too, many times without problem.

Immediately on ingesting, she became unconscious for half-an-hour, then came ‘round groggy and remembering nothing. The sitter encouraged her to walk and eat something, however this was difficult for her. From that time on she experienced difficulty in sleeping, fear upon closing her eyes, and three nights later awoke at 3:30 am in the grip of a very severe, intense, and frightening panic attack. These attacks continued nightly, with nausea, vertigo, and heart palpita-

tions during the day. Ativan® (lorazepam) was prescribed and later Klonopin® (clonazepam). Her doctor did a full check and said that her blood pressure was elevated, but that she had no apparent physical problems.

Her symptoms persisted for eight weeks. Normally this person has slight, intermittent asthmatic symptoms around cats and mold. On coming 'round from the 5-MeO-DMT overdose, and for the eight weeks following it, she experienced breathing difficulties that usually occurred at night and when having panic attacks. This person is not unduly sensitive, was taking no medications, and had not eaten or drunk anything untoward. In fact, she had fasted the day before. Acupuncture was useful in the latter part of the eight weeks, but the Klonopin® was essential in controlling the symptoms.

I have read many things about this material and even spoke with CHARLES GROB, who I know. No one had heard of such a prolonged reaction (until now) and it occurred to me that *The Entheogen Review* might like to let readers know that great

care should be taken with the dosage of 5-MeO-DMT. Dr. GROB did say that if the blood pressure goes up too much during the session, it could precipitate a stroke. My friend was a very healthy woman of 59. I do hope this may be of help to others; information and warnings should be made available, and I feel that this is a volatile and unpredictable material. — A.S., CA

*People do seem to have quite varied reactions to 5-MeO-DMT, from mild to severe, but this is the first time that we have heard of after-effects lasting for eight weeks. When trying any new compound it is advisable to start with a low dose, and gradually work one's way up. In the case of very potent materials, such as 5-MeO-DMT, great care must be taken to make sure that the dose is accurately weighed, and this can be difficult if one doesn't own a scale that weighs with a 1–2 mg accuracy. 20 mg would definitely be an overdose for most people, and we agree that it is important to report the situation that you described as a warning to others to be extremely careful with dosing.*

## salvia-divinorum.com

One of the primary sources for high-quality dried leaves of *Salvia divinorum* from Hawaii and Oaxaca has evolved to

We offer the best quality ethnobotanicals at very competitive prices. At our certified organic farm and nursery on Kauai—the most beautiful of the Hawaiian Islands—we already grow some of our products, and intend to do so with more of the entheogens that we offer.

**Salvia divinorum**, dried leaves: 1/2 oz \$33.00, 1 oz \$55.00. **Baby Hawaiian Woodrose**: 1/2 oz \$12.00, 1 oz \$20.00. **Kava Kava**, 12% kavalactone, 100% root powder from Fiji: 1 lb \$28.00. **Yohimbe**, dried bark: 8 oz \$18.00. **Calea zacatechichi**, dried leaves: 1 oz \$12.00, 4 oz \$30.00. **Banisteriopsis caapi**, dried vine: 1 oz for \$10.00, 4 oz \$30.00. **Psychotria viridis**, dried leaves: 1 oz \$18.00. **Mimosa hostilis**, dried root-bark: 1 oz \$15.00, 4 oz \$40.00. **Diplopterys cabrerana**, dried leaves: 1/2 oz \$15.00, 1 oz \$22.00. **Desmanthus illinoensis**, root-bark: 3 oz \$20.00. **Wholesale**: We sell *Salvia divinorum* leaves from Oaxaca, and baby Hawaiian woodrose seeds in bulk quantities (1 kilo minimum). Please inquire. **Shipping**: Up to 2 lbs within the USA is \$4.00 by Priority Mail; International is \$8.00 by Global Priority Mail. We ship the next day after receiving your order and payment.

## COLUMN CHROMATOGRAPHY

A while back I sent *ER* a piece about column chromatography for making plant extractions, but in the article "Common Solvents? Easy Extractions" from Vol. VIII, No. 1 (p 16), there is no mention of this method. Also in the list of *ER* articles on plant extractions there is no article on this method. Is column chromatography not a viable method? Are the other methods referenced in this article better methods? I really enjoy *The Entheogen Review*, and hope you can keep it going. Take care. — ONEGREENDAY

*Column chromatography (i.e. liquid chromatography) is a very simple and low-tech means of separating many alkaloids, but it has several serious limitations relating to its use by the average person.*

*First is the risk of generating huge volumes of solvents that will then have to be removed and/or recovered. (We are assuming that the potentially serious health risks of handling or breathing solvents will be given adequate attention and safety precautions.) Besides these handling problems, use of large volumes of solvents can add substantial costs unless one has a way to recover them via distillation. And another problem is knowing exactly which system of solvents will actually elute (wash out) your desired alkaloid.*

*Using a highly homogenous absorbent (i.e. closely sized particles) is important, as is elimination of air bubbles from the column and being certain that the packing is even. Lack of any of these can defeat the effectiveness of the column for achieving separation.*

*Last, and perhaps most important, is the need to be able to identify which fractions your target alkaloid is actually in, as well as what else might be there along with it.*

*The concept itself is indeed quite simple. It is based on the varying attractions of different substances to absorbent materials. This attraction (binding) can be variously affected by the solvent used, the degree of activation of the absorbent and, in cases such as ion-exchange resins, by pH. All of these can be tweaked to enable better resolution and separation of many alkaloids.*

*The equipment and the procedure itself are also quite simple. For the column almost any unreactive material can be used, including metal pipe. However, a glass column has the advantage of allowing one to observe what is going on.*

*If using a commercially available plastic chromatography column be certain that it will be unaffected by whatever solvents one chooses to use.*

*If using such standard plastic columns and caps, very handy connectors, tiny valves and lines (all with convenient twist-*

*on LUER-LOK fittings) can be obtained from serological suppliers. (These are used for blood work and intravenous connections.)*

*An absorbent such as alumina (aluminum oxide), silica gel, KIESEL gel or many other substrates can work fine. (Some will require activation by carefully controlled heating immediately prior to use or they will not work as desired; all should be of a form and purity that is approved for chromatographic work. If using ion-exchange resins, be certain to follow the manufacturer's preparation instructions exactly as presented.)*

*Make the absorbent into a slurry with a good starting solvent, pour it into a column fitted at the bottom with a stopcock (above which is a plug of cotton or glass wool to keep the absorbent out of the stopcock, and a layer of fine washed sand to keep the absorbent out of the cotton plug; alternately a filter disk could have been placed at the bottom covered by a plug of glass wool). Let the slurry settle accompanied with either the careful movement of a long glass rod (or else use a vibrator to eliminate air bubbles). Make sure that there is even packing, and then add either a layer of fine washed sand or a filter disk to the top. Let the solvent finish dripping through until only a thin layer remains at the top.*

*It is usually important that a thin layer of solvent should remain above the level of absorbent at every step. With some absorbents, such as BROCKMAN alumina, failure to observe this will ruin the properties of the absorbent and require that it be removed, dried and reactivated (or more simply just replaced with new packing).*

*If necessary, equilibrate the column with an appropriate solvent to start (this is easily done in most cases by simply using this solvent to make the slurry mentioned above), then introduce your material into the column. This is done by first dissolving it in a small bit of solvent, and letting it drip through to distribute your alkaloid mix at some level of the column.*

*Elution is accomplished by selectively pouring a series of solvents through said column to wash out other alkaloids and*

contaminants, and at some point the desired alkaloid. As the solvents drip out of the end, they can be collected in measured fractions and the fractions containing what a person wants can then eventually be identified and the solvent removed. (For convenience, the eluting solvents can be placed in a reservoir, elevated above the column and connected to the top of the column with a small piece of narrow tubing, thus being allowed to drip into the top as it drips out of the bottom. A siphon type arrangement or else a side-arm towards the bottom of the reservoir will serve to automatically feed the solvent into the column, but care must be taken to control the flow rate into the column to match to flow rate coming off the bottom of the column.)

If a person knows the exact sequence they need to separate the material they have and if they are willing to waste a lot of solvent and do not have any risk of toxic contaminants in their plant material then this is a simple and easy approach. However, as noted, there are potential complications for the lay reader that may preclude the use of column chromatography.

Let's run through what happens when using liquid chromatography:

Solvents have different abilities to wash alkaloids out of the column (this is called their elution strength or power). The actual order that the alkaloids are removed can be affected by a variety of things including the solvents chosen, the pH of the column, the absorbent chosen, and what other alkaloids or materials are also present in the plant.

Solvents are used in order of least elution strength to greatest (with methanol or water usually being the last step clearing whatever alkaloids remains out of the column).

I should add that there often is some loss that may not ever be recovered. This is more of a problem with basic ion-exchange resins than the simple absorbents we listed.

One point to note is that if a person ran a large enough quantity of almost any solvent through the column it will eventually wash almost any alkaloid out.

This brings us to the primary reason this approach may fail for many; namely the necessity of following where your alkaloid is and when it comes out of the column. A UV spectrophotometer is one way to address this. A sample is taken from each of the fractions as they come off, and a characteristic ultraviolet absorbency looked for to determine which fractions actually contain the desired alkaloid(s). But unless you

were at one point willing to cough up a couple grand, it is unlikely that a UV spectrophotometer is presently part of your kitchen appliances. These devices can be obtained far less expensively at medical or university surplus equipment auctions. However, if this is the source, care must be taken that defective or inoperable equipment is not purchased.

If the use of a simple series of solvents is not sufficient to separate the alkaloids occurring in the plant material that an individual has on hand, various blend of solvents can be used to form intermediate steps. (For example: 98% or 99% Solvent A containing 1% or 2% Solvent B, followed by 95%–5% then 90%–10%, 75%–25%, 60%–40%, 50%–50%, 40%–60%, 25%–75%, 10%–90%, 5%–95%.)

Obviously this is going to rapidly generate a large number of fractions and potentially a large volume of accumulated solvents, all of which will need to be examined for alkaloids. This brings us back to the same limitation, mentioned above, of needing to be able to know what is where.

[rareherb@cdsnet.net](mailto:rareherb@cdsnet.net)  
Analogeros welcome!

*In some simple cases, it is possible to run material through a column, wash it out with a solvent and not care about what else might be there. This will not yield pure alkaloid but rather a purified alkaloid fraction. This will require use of enough solvent to fully wash the material out of the column and its subsequent evaporation to an alkaloid-rich residue.*

*In other cases, it may be possible to use column chromatography with a single solvent to remove some impurities and simply yield an enriched extract. For instance, it is said in the literature that pouring an ethanolic extract of Phalaris grass through a column of CELITE (aka SUPER-CEL or KIESEL gel; high quality diatomaceous earth) will remove chlorophyll and fixed oils from Phalaris extracts. (Enough ethanol is poured through in order to fully elute the alkaloids.) Evaporation of the ethanol will yield an alkaloid residue with most of the Phalaris alkaloids present.*

*Obviously this is only acceptable if there are no toxic or undesirable alkaloids present; this is an important point—know your plant material!*

*Diatomaceous earth is commonly used in swimming pool filtration systems. It can also be purchased at gardening stores, as it is sold as a deterrent for ants, slugs and snails. (Care must be taken not to breathe the dust as it is quite dangerous to lung tissues.)*

*The following is the general order of solvent use in column chromatography, ranked from lowest to highest elution power: carbon tetrachloride, toluene, benzene, methylene chloride, chloroform, ethyl ether, ethyl acetate, acetone, butanol, propanol, ethanol, methanol, water.*

*Pertinent words that will be encountered in the literature are: elute, to wash out of the column; elutant, the solvent used to elute; eluant, the material that is eluted.*

*The Russian who discovered the process of column chromatography, MIKHAIL SEMYONOVICH TSWETT, used a column filled with calcium carbonate and poured a dye-containing solvent through it, allowing the dye mixture to separate. He didn't bother to elute this, but rather simply chopped the column into sections to isolate the fractions from each other. The appropriate section(s) can then be soaked in solvent to recover the desired alkaloid. This will work fine assuming that you have some way to know where the target alkaloid actually is. However, unlike TSWETT's dyes, none of what ER readers are likely to be after is going to be visibly obvious on its own without some sort of color-forming reaction or analytical test.*

*It is also possible to use the column chromatography equipment to perform an actual acid/base extraction using such solvents as hexane or petroleum ether to defat the material. However, this too generates large volumes of solvent that must be removed, and it is a much slower procedure than most simple extraction processes that have been described in previous issues of ER. — K. TROUT*

# SACRED CACTI

## second edition

Includes entries for the mescaline-containing cacti by species; a simple list including percentages reported; a digested version of the literature published; a comprehensive physical data overview for mescaline including toxicology, assays and reagents; a review of mescaline pharmacology; independent research by Appleseed & Trout suggesting the presence of not only DMT but also 5-MeO-DMT in the Aizoaceae; a brief review of other succulents with reported drug use or published chemistry; a detailed cultivation guide; various preparation and purification routes used by professionals and amateurs; and full references for more details.

# AYAHUASCA

## AMAZONIAN SHAMANISM, SCIENCE, AND SPIRITUALITY.

### MARCH 17-19, 2000

This will be the first conference devoted solely to *ayahuasca*, the visionary plant brew used widely by indigenous shamans in South America for healing and divination. Many groups and individuals from Western countries have participated in ayahuasca ceremonies in the Amazon, often in conjunction with projects for the preservation of rain forest ecosystems and indigenous cultures. There are Brazilian churches that use ayahuasca regularly in ecstatic religious ceremonies. Thus, thousands of individuals have become familiar with the “tea” and its remarkable medicinal and entheogenic properties. Conference Project Director is **Ralph Metzner, Ph.D.**, psychologist, editor of *Ayahuasca—Hallucinogens, Consciousness, and the Spirit of Nature* (THUNDER’S MOUTH PRESS, 1999), a collection of scientific and experiential accounts. Other presenters include:

**Jace Callaway, Ph.D.**, neurochemist, pharmacologist, contributor to *Ayahuasca*.

**José Campos**, Peruvian *ayahuasquero*, herbal healer and ceremonialist.

**Charles Grob, M.D.**, psychiatrist, co-director of biomedical research project on long-term users of *hoasca* in Brazil, contributor to *Ayahuasca*.

**Kathleen Harrison**, ethnobotanist, artist, co-founder of BOTANICAL DIMENSIONS.

**Luis Eduardo Luna, Ph.D.**, anthropologist, author of *Vegetalismo*, and co-author, with painter Pablo Amaringo, of *Ayahuasca Visions*.

**Dennis McKenna, Ph.D.**, ethnopharmacologist, phytochemist, co-director of HOASCA RESEARCH PROJECT, co-author of *The Invisible Landscape*, contributor to *Ayahuasca*.

**Jeremy Narby, Ph.D.**, conservationist, anthropologist, and author of *The Cosmic Serpent*, integrating ayahuasca shamanism with the latest findings in molecular biology.

**Jonathan Ott**, natural products chemist and independent researcher, author of *Pharmacotheon* and *Ayahuasca Analogues*.

**Alex Polari de Averga**, one of the leaders of the Santo Daime church in Brazil, author of the recent personal history of the movement, *Forest of Visions*.

The conference will include panels on Woman and Ayahuasca, Medico-Scientific Research on Ayahuasca, and Amazonian Cultural Context of Ayahuasca. Additional presenters include Constance Grauds, Aparecida Groome, Diane Haug, Annelise Schinzinger, Luzia Krull, Maggie Quinlan, Susan Miller, Silvia Nakkach, and Michael Knapp.

Fees: Postmarked by Jan. 1: \$250, Feb. 15: \$275, after 2/15: \$300. Members of IONS and students with ID receive a 10% discount. Make checks payable to CALIFORNIA INSTITUTE OF INTEGRAL STUDIES. On-line registration at: <http://www.ciis.edu>. For more information call (415) 575-6290 or e-mail [kathyg@ciis.edu](mailto:kathyg@ciis.edu). Mail to: CIIS AYAHUASCA CONFERENCE, 1435 Mission Street (Dept. ER), San Francisco, CA 94103. Event held at the CATHEDRAL HILL HOTEL. For room reservations call (800) 622-0855 and mention the CIIS AYAHUASCA CONFERENCE for special rate.

## TERENCE MCKENNA SPEAKS...

Interviewed by JON HANNA and SYLVIA THYSSEN at the 1999 ALLCHEMICAL ARTS CONFERENCE

Photo by JON HANNA

**Sylvia:** Certainly we wanted to ask you first off about the experience you've been through lately with your brain tumor; how that's affected you, and how you feel about it.

**Terence:** Well, it's been an experience. It's not yet defined, so that makes it a little difficult to judge. I mean, is it the bad summer of '99, or is it the end of everything? And it won't be clear for a while. It was *bad* enough as "the bad summer of '99." The good news is that I discovered I don't really think that I'm afraid of death, which I assumed I would be. I am a little concerned about dying, and would like to get a little more clear just what's involved in that. It's a *huge* inconvenience, I have to say...

**Jon:** Do you feel as though your experiences with entheogens have prepared you, or paved the way for an attitude that lacks the fear when facing death?

**Terence:** I assume that must be it. I assume it must be spending so much time in those psychedelic places. The way I think of it, is that the analogy is to physics. I mean biological death is the black hole for organisms. All it means is, you know, when you go into that black hole, no information can be sent back. There is no way of judging what actually happens. Every culture on earth has *assumed* some kind of survival after death in some form. I don't particularly assume that. On the other hand, given that people exist in this world, em-

bodied, anything could be possible. And these deeper psychedelic cultures—you know the Mayan, Tibetan, and so forth—seem to come up with the *data* that we should assume this kind of survival after death. But to imagine it in any way is pretty difficult. Maybe life is some kind of distillation through higher dimensions. But it certainly is... we are certainly three-dimensional, and it's very hard to imagine us as two-dimensional beings, with a space/time that's three-dimensional...

But, I would assume that *most* psychedelic people, being told they had six to nine months to live, would behave pretty much as I have behaved. I mean, what else? What are you going to do? You can't rant and rail. There are different things to be done on *this* side. What should you do? Should you do everything that you always wanted to do and didn't do? So that means I should be flying to Florida to see a shuttle launch, on my way to see the great pyramids, on my way to Ireland, on my way to somewhere else? Or do you want to become a cure chaser, flying to the arms of JOHN OF GOD in São Paulo, who does psychic surgery on 14,000 people a day? Or do you just want to go home and do "why meism?" And one thing I have learned, or I'm learning—I think I'm learning it—is that your life is not a story. So when something like this happens to you, it's kind of futile to go back through your life and ask, "What did I do wrong? Was it playing with the asbestos dust in the construction yard? Was it the carbon tetrachloride used to kill the butterflies? Was it daily *Cannabis* for 28 years?" (laughs)

**Jon:** Your last point is something that one person on the 'net brought up to me, when discussing your situation. He asked, "Geeze, you don't think that it was the psychedelic drugs that TERENCE used, do you?" And it just doesn't *really* seem like it would be to me. There doesn't seem to be any indication that would point to that. Otherwise there would be a whole lot more of us with brain tumors.

**Terence:** And when I got with these cancer doctors I said, "Look, if you want to guilt-trip me, that's fine. What about the drugs?" And they all said, "No! Oh my God, what an ideal Inconceivable!" And I also asked, "Well, what about a life-long history of severe migraine headaches?" Again, "Noth-

ing whatsoever to do with it.” I don’t believe this about the migraines. I think anybody who had migraines as bad as I did for as long as I did... it *had* to have something to do with it. But then, you know, people who don’t like drugs, or intellectuals, or troublemakers, can look at my situation and say, “Well, look at what happened to this guy? This is a perfect example of God’s retribution striking somebody down.” If you want to believe it, believe it.

It *is* ironic... I mean *brain cancer* of all things. Because I used to think about, what was my fear about how I related to my career? What was the worst thing that could happen? And I always thought that the worst thing that could happen would be to go nuts. And then people would say, “Whoa, you know this guy MCKENNA, the mushroom guy. You know what happened to him? He’s been in a back ward for several years now.” My situation now is worse; this is considerable orders of magnitude worse!

But then there’s the possibility that I’ll live. Which would then be viewed by a number of different people different ways. It has some political implication—very small political implication...

You know, you don’t hear the word “cancer,” but that you hear the word “miracle.” It’s like “wife beating” and “alcohol,” it’s like “circuses” and “lions.” It just all goes together. And being told the moment of your own death, or the rough moment of three to six months, is pretty interesting. I mean very few people have that opportunity here, whatever it is. To mentally pack your bags, and say, “Well, hmm...” And also to contemplate non-entity. I always assumed that my death would come in some horrible ten minutes on a freeway somewhere, and it would be complete chaos, and horrible agony, and then the final darkness, and it would be brief. Quick. No time to call lawyers, no time to reread HEIDEGGER, or anything like that. Apparently, maybe not. Anyway, if I go through this and then I *don’t* die, it is like a permanent high. It is like, “Wow, does this shit turn on the lights.” It just turns on the lights. And these cancer doctors are unrelenting. They just look you straight in the eye, and they say, “No one escapes.” That’s what the guy said to me, he said, “No one escapes.”

**Jon:** It makes me think of something that CHRISTIAN RÄTSCH said about the diagnosis of HIV/AIDS being a sort of voodoo death curse. When someone is said to have AIDS, *that’s it*. And it’s almost like the performance of a psychological magic that kills any chance for the person to postpone their

death, or to get well. I think that a sick person has to accept the *possibility* that it is going to happen, but they don’t have to accept the *inevitability* that it is going to happen. So the way that you describe the message given by the doctors is...

**Terence:** Well, I suppose that they tell them in medical school, “Don’t raise false hope. Cover your ass. And if a disease is incurable, tell them that it’s incurable.” And it’s such an imprecise thing, *disease*. All spun around diet and attitude. But it has been very, very interesting. And what you become for other people. You become an object of fascination. There’s some kind of power in dying, or walking around with a death sentence. And I’m sure going to get to find *what* kind of power it is.

**Jon:** Do you feel as though there are written works that you need to complete? I know that you had been working on a book with another author...

**Terence:** Yeah. Well, I have books ready to go. But, you know I’m very realistic. And I suppose these things will get published in time. But, there’s a lot of younger people coming up, and I’m glad for it. I mean people like yourself. And, the LYCAEUM people. And all you guys at MAPS. I think, if no more of TERENCE MCKENNA were published or recorded, there’s *plenty* of TERENCE MCKENNA out there. It would be good for my children to get a little more of this into the market. But do I feel cut off in mid spiel? No, I don’t feel cut off in mid spiel. It’s good to rotate the spokesman, or spokespeople, every once in a while. And I think that this whole thing is changing. I’m not sure that it is an entirely happy story. But Europe will shame the United States into better drug laws. And, there are just too many loopholes. *Salvia divinorum* is a certain kind of loophole. Ayahuasca is a different sort of loophole. GHB is a kind of loophole. There are just so many.

**Jon:** And it’s a constantly shifting landscape, because as soon as something is scheduled, the people interested in these drugs move one step ahead by responding to the new laws. Unless they make everything illegal, a point that we may be coming to...

**Terence:** Yeah, right.

**Sylvia:** They haven’t made *art* illegal. Which makes me want to shift this conversation a little bit. Tell us one delightful thing for yourself that has resulted from the ALLCHEMICAL ARTS CONFERENCE.

**Terence:** Well, I'm very keen for these ACTIVE WORLDS, these virtual walk-around pieces of art. [Check out <http://www.activeworlds.com> for more information on this technology, and surf the links at <http://www.digitalspace.com> for more about the virtual ALLCHEMICAL ARTS CONFERENCE gallery.] I always said that virtual reality could be a technology for sharing the inside of our heads, and that's what we have not had. If we could show the power of these hallucinatory states as they actually *are*, the argument would be over. And so in a way it's interesting. It's a challenge to us, to use the animation tools and the scripting tools, to be as good as we say we can be. And so it's no more of a hassle with the establishment. It actually lays the obligation back on the artist. And if artists would rise to that challenge, I think *incredible* art would begin. Transcendent art *worthy* of the name could be created.

**Jon:** With my own visions, the only kind of medium that they *could* be completely conveyed with would be the computer. The only parallel that there is, is computer animation, which sometimes is already so much like these visions, and could be even more so. So it really is an amazing tool.

**Terence:** That ACTIVE WORLD, "Pollen," that we were looking at. There should be an effort out of our community to get together a core group of designers, animators, texture-map-

**I always said that virtual reality could be a technology for sharing the inside of our heads, and that's what we have not had. If we could show the power of these hallucinatory states as they actually are, the argument would be over.**

ping people, and just *build*. And build a psychedelic world where *that's* the charter, "This world is psychedelic. This world is for psychedelic people." And it's probably just a matter of suggesting it in the conference room here today to get it going, at this point.

The thing about drugs that will, I think, finally bring them to the surface and defeat the establishment, is that they're such a splendid way to make money. The corporations will never let that slip. The pharmaceutical industry is so huge, and so powerful, and eyeing the psychoactive market with such interest, because the stuff that's been done with the serotonergic re-uptake inhibitors is edging into that area. You know, suddenly *shyness* is a treatable psychiatric disorder.

**Jon:** Sure. An additional area of note is nootropics; there's a growing interest in improving cognitive functioning through chemistry. And then the other one that seems to be a very promising sign for those sharing our area of interest is Viagra®, what with BOB DOLE on television promoting what keeps him up. Here's something that is *entirely* related to pleasure. A drug that is allowing people to have pleasure. Although it is treating a specific dysfunction, a "legitimate" pleasure drug is something that's almost unheard of in our society, other than alcohol.

**Terence:** You're right. That's changed the dialog. That's really a watershed product. In fact, other companies are furiously trying to produce their own "Viagra."

**Jon:** And faster-acting forms.

**Terence:** Right. And there will be orgasm enhancers. And there will be memory enhancers. All of this will come, but incrementally. And governments will probably just have to stand back before big capitalism, and let it happen.

**Jon:** Getting back to the topic of death, and also psychedelic states of mind. One of the things that a lot of people report in psychedelic states are "past life regression" experiences.

And one thing that I was thinking related to these states of mind—and something that you've commented on—is that they seem like they are specific spaces. And not something that one would think of creating in one's mind by their own volition. Especially the states that one enters with DMT. When I'm in that state, it is hard to accept that my mind is fabricating what I am seeing. It is almost like I am really

visiting *some other place*. Like the DMT has opened a portal to this other place, another dimension. Being embodied in the physical realm here—where we feel so connected to material, concrete reality—it is hard for us to comprehend that these mental spaces may have their own reality, divorced from the viewer. But perhaps these other realms that we are visiting are also physical in some manner for those beings "living" in that "dimension."

**Terence:** Well, they're informational. I think information theory has a future. In other words, what's real is what can pass a certain set of criteria for real. And if it can pass those criteria, it *is* real. And the rest is just philosophical quibbling. You know in that poem by YEATS, speaking of death, he says:

*Once out of nature I shall never take  
My bodily form from any natural thing,  
But such a form as Grecian goldsmiths make  
Of hammered gold and gold enameling  
To keep a drowsy Emperor awake;  
Or set upon a golden bough to sing  
To lords and ladies of Byzantium  
Of what is past, or passing, or to come.*

In other words, a machine—a little bird. A thing of gold and gold enameling. And before I got sick, I assumed that sometime in the next 30 years I would download myself into some kind of form of immortality. I mean I think that's what the whole hullabaloo is about—some kind of immortality. It may be that tasteful people won't want it. But how many tasteful people do you know? Everybody else will be trampling the furniture to get to it. And the human experience is infinitely redefinable through human interaction with technology. And this has been going on slowly, glacially slowly for millennium. But now it's just in your face. It's explicate.

This illness is such a weird thing to take on board. I never was a morbid person, and I always had a kind of a... well, I haven't spent much time being sick in my life. And then this has such a paradoxical aspect to it, because... well, I have dizzy spells, but I don't feel like I'm *dying* for CHRIST'S sake. That's crazy. I feel largely pretty healthy, and because I'm paying more attention to my health than ever before, I probably am healthier.

**Jon:** Have you cut back dramatically on any type of drug use?

**Terence:** At first I cut back on *Cannabis*, because it seemed to trigger the seizures. But then I easily got that corrected. Now I'm smoking as much dope as I ever did. I haven't been taking ayahuasca, because the vomiting reflex is too scary in terms of the brain seizure reflex. They're really closely related. So I've been taking psilocybin. We happen to have some actual pure psilocybin, not mushrooms. And it's great. So I guess the answer is no. I want to probe into it, I want to understand it. I mean obviously, death is a very big deal.

**Jon:** My father recently died suddenly related to complications from blood thinner given to him for a heart attack. It caused his brain to bleed-out, and he was diagnosed as brain dead. This occurred over a two-day period. He was still there,

but his brain was gone. So as a comparison, in one way the situation that you're in is wonderful, in that it allows a grace period for you to accomplish some of the things that you want to get done. Do you feel as though it has had a strong effect

**And before I got sick, I assumed that sometime in the next 30 years I would download myself into some kind of form of immortality. I mean I think that's what the whole hullabaloo is about—some kind of immortality. It may be that tasteful people won't want it. But how many tasteful people do you know?**

on your personal interactions with others?

**Terence:** Oh yeah, that is mostly what it's about. Is seeing... if you can forgive, you can forget. And there's a lot of forgiving and forgetting to do. Yeah, that's the grace of it, is that you can actually arrange, not the whole structure of it, but just how you want it to be. Crazy...

Well, it's been a pleasure talking with you both.

**Sylvia:** For us too. Thanks for taking the time to speak with us for *The Entheogen Review*. ✧

*Most of the following information related to TERENCE'S condition and treatment was compiled and condensed from e-mails written by his brother DENNIS, and posted at <http://www.levity.com/eschaton>. Check this site for further updates.*

*As of August 22, 1999, TERENCE had completed his radiation treatments and returned to his home on the Big Island of Hawai'i.*

*As of October 8, TERENCE decided to proceed with p53 gene therapy protocol—an experimental protocol in Phase I clinical trials at the UCSF MEDICAL CENTER.*

*The protocol involves using a genetically-engineered adenovirus to deliver a gene, p53, to the tumor, which codes for a tumor suppressor protein. P53 is mutated or damaged in cancerous cells, which is one reason they are cancerous in the first place. The virus is used to replace the defective gene with an active, wild-type*

gene; if the cells take it up and the gene is functional, it should program the cells to stop growing, and to die. It's a great idea, and the closest thing to a magic bullet that high-tech medicine has come up with so far. It's also highly experimental and unproven; TERENCE is the fourth or fifth person in the world to ever receive this therapy. The other patients were all treated recently so there is no data on whether it has worked for them or not. It has worked rather spectacularly in animal models.

TERENCE was given a biopsy, which determined that the tumor was still alive and active. Then, a catheter was implanted into the tumor bed, and the virus cocktail was administered over about 10 minutes. He remained in the hospital for three days, with the catheter implanted. He was able to get up and move around, and did not seem to be set back much from this first procedure (he was conscious and under very light anesthesia during this phase). On Monday he received a craniotomy. They removed the bulk of the tumor, and administered additional adenovirus/p53 to the tissue that remained following surgery. The surgery was a success by all measures. All visible traces of the tumor have been removed. It will take some more time to assess whether the gene therapy has been effective, but even if it has not, TERENCE has benefitted from the surgery. And the gene therapy does not preclude him from receiving additional treatments down the line. As far as anyone can tell, he is the same old TERENCE; sense of humor intact,

bemused perspective fully functional, and no obvious impairments of speech, cognition or movement.

So, for now, it seems that an important phase of TERENCE's treatment has been completed. With a bit of luck, the gene therapy will prove effective and may actually amount to a cure, although that is a word we do not use lightly around here. What is important, for now, is that these procedures have bought more time—possibly much more time—while not diminishing quality of life.

TERENCE can use financial support to help cover special costs related to his treatment, such as housing near the hospital, plane tickets between Honolulu and the Big Island, and to California, rental cars, vitamin supplements, organic food, a fax machine, a laptop computer, and alternative treatments. Your gift sent directly to TERENCE MCKENNA, POB 677, Honauanau, HI 96726 will be greatly appreciated.

No words can adequately express the appreciation we all feel for the love and support we have received from family and friends; we could not have done it without you! And, please, keep sending it. We are not out of the woods yet, and although we have turned a corner, or perhaps started a new chapter in TERENCE's fight for life, we still need your love and support. For our part, we send our love and humble thanks to one and all.

## JOIN MAPS!

Can you imagine a cultural reintegration of the use of psychedelics and the states of mind they engender?

Please join MAPS in supporting the expansion of scientific knowledge in this promising area. Progress is only possible with the support of people who care enough to take individual and collective action.

BASIC MEMBERSHIP: \$35; SUPPORTING MEMBER: \$100; PATRON MEMBER: \$250+ (Add \$15 for orders outside the U.S.) MASTERCARD and VISA accepted by phone, or through our secure server on-line at <http://www.maps.org/memsub.html>.

Memberships include a subscription to the quarterly *MAPS Bulletin*, which features articles, personal accounts, book reviews, and reports on conferences & allied organizations. As well, all new MAPS members who mention this advert will receive a free copy of *The Secret Chief* by MYRON STOLAROFF!

MAPS has positioned itself at the center of the conflict between scientific exploration and the politically-driven strategy of the War on Drugs. MAPS is the only membership organization supporting this crucial research. The confidential MAPS mailing list is not available for sale or trade, and the *Bulletin* is sent in a discreet envelope.

**MAPS, 2105 Robinson Avenue (Dept. ER), Sarasota, FL 34232, USA**

# EVENTS CALENDAR

## MODIFIED STATES OF CONSCIOUSNESS AND PSYCHOTHERAPY MAY 5-7 & 12-14, 2000

The first session is offered at a general-interest level at 32 hours. The second session, of the same duration, is only available to those who have attended the first session. These sessions will take place near Barcelona, and lodging is included. The principle directors of these seminars are Dr. RICHARD YENSEN (psychologist and director of the ORENDA INSTITUTE) and Dr. JOSEP M. FERICGLA (anthropologist and psychotherapist). For more information contact the SOCIETY OF APPLIED ETHNOPSICOLOGY AND COGNITIVE STUDIES, [info@etnopsico.org](mailto:info@etnopsico.org), <http://www.etnopsico.org>. (For English translations of this web site, use <http://babelfish.altaviata.com>.)

## DAYS ON ENTHEOGENS: ART AND CREATIVITY APRIL 29-30, 2000

The fourth DAYS ON ENTHEOGENS encounter will focus on the intersection of "Entheogens, Art, and Creativity." Speakers include: Dr. RICHARD YENSEN (psychologist), ALEX GREY (artist, author of *Sacred Mirrors* and *The Mission of Art*), MATI KLARWEIN (painter), Dr. STACY SCHAEFFER (anthropologist specializing in the Huichol Indians), Dr. JOAN CARLES USÓ (historian, author of *History of the Psychedelics in Spain*), Dr. MANUEL TORRES (archeologist), Dr. MICHAEL SCHILCHTING (psychiatrist), DOKUSHÔ VILLALBA (Zen monk), ANA EVA IRIBAS (art historian, specializing in the work of HENRI MICHAUX), ANDRÉS PASCHAL SANCHEZ (translator, specializing in the work of ERNST JÜNGER), LUÍS PANIAGUA (musician).

For more information contact the SOCIETY OF APPLIED ETHNOPSICOLOGY AND COGNITIVE STUDIES, [info@etnopsico.org](mailto:info@etnopsico.org), <http://www.etnopsico.org>. (For English translations of this web site, use <http://babelfish.altaviata.com>.)

## SALVIA DIVINORUM AND SALVINORIN A

*The Best of  
The Entheogen Review 1992-1998  
ER Monograph Series, No. 2*

Combines every entry from past issues of  
*The Entheogen Review* related to *Salvia divinorum*.

Chapters include:

"The Early Years"  
"Consumption Methods"  
"Hyperspatial Maps"  
"Extraction"  
"Salvinorin A"  
"Combinations"  
"Cultivation"  
and more.

New endnotes provide fresh commentary and bring the text up-to-date. Includes a comprehensive listing of *Salvia divinorum* Internet sites, a "Retailer's Guide" that lists sources for live plants, fresh & dried leaves, extracts and tinctures both in the USA and other countries, and an annotated bibliography that presents abstracts of numerous additional sources of information on *Salvia divinorum*. Completely indexed for easy referencing. 217 pages.

\$23.00 (USA)  
\$26.00 (foreign)  
postpaid from:

THE ENTHEOGEN REVIEW  
PMB 808, 564 Mission Street (Dept. ER)  
San Francisco, CA 94105-2918, USA

# CONFERENCES: A YEAR'S END REVIEW

*If the number of conferences per year related to entheogens is any indication of the interest in this area, 1999 had a bumper crop. Reports from three such conferences, all sold-out (or oversold) in attendance, express enthusiasm towards these events, and show that solidarity is clearly building in our community.*

## ALLCHEMICAL ARTS CONFERENCE

September 12–17, 1999

by SYLVIA THYSSEN

Flanked by black volcanic rocks and crashing waves of the Pacific, the hotel in Kona, Hawai'i where ALLCHEMICAL ARTS was held provided a beautiful environment for visual artists, writers, musicians, and film-makers to discuss how psychedelics have influenced and informed their art activities and perceptions. Except for TERENCE McKENNA, MANUEL TORRES, and ALEX GREY, all of the presenters were new to the small but vibrant niche of "psychedelic" conferences. And even though three people cancelled—ALICE WALKER, MARK PAULINE and JIM JARMUSCH—the remaining speakers more than made up for their absence. Many speakers expressed some degree of surprise at having been contacted to speak; they were not habitually identified as "psychedelic artists." Film-maker LESLIE THORNTON confessed that her single psychedelic experience was so unpleasant that she didn't repeat it. That a person's creative expression can be informed by psychedelics, even if psychedelics don't continue to be a part of the person's life, and even if their work is not "psychedelic" at first glance, became one of the most inspiring aspects of ALLCHEMICAL ARTS. It caused me to consider the motto, "we are everywhere." Towards the end of the conference, attendees were invited to give short presentations of their own work. Nearly two dozen people showed slides, videos, or portfolios and spoke as time allowed. In the future, should the organizers put together another ALLCHEMICAL ARTS conference (and I hope they will!), more time might be factored in for this. Also, the quality of the panel discussions was inconsistent—while audience members got to interact quite a bit with presenters during this time, some of the scheduled panels weren't cohesive and it was clear that the speakers hadn't consulted with one another beforehand. Maybe in the future

such "panel discussions" could be replaced with "open forums."

Two highlights for myself were the talks given by MARK PESCE, co-creator of VRML, and BRUCE DAMER and GALEN BRANDT (<http://www.damer.com>), who co-presented about the Virtual Worlds/Avatar communities. PESCE read a mesmerizing talk entitled "High Earth Orbit." He recounted his personal psychedelic history and how it informed his programming, and described the manner that computers are being woven into human life in a way that left even the technophobes in the room with second thoughts. In preparation for his talk, "Psychoactive Cyberspace: Avatars & Virtual Worlds as a Trance-formative Creative Medium," DAMER spent hours at the keyboard coordinating a "Virtual ALLCHEMICAL ARTS Gallery" in cyberspace, with the collaboration of volunteers world-wide. Within 24 hours, they had created a "3-D virtual world filled with the art and concepts of artists at this event" in ACTIVE WORLDS. (See <http://www.digitalspace.com/worlds/fan-terencem/allchem.html>.) In real time, on the 16th, people not at the event could converge at this cyber-gallery, with JUPYTER (one of the gallery's main creators) and DAMER as hosts.

DAMER and BRANDT were not the only couple who co-presented. WOODY and STEINA VASULKA talked about their collaborative multimedia installations and ROBERT VENOSA shared the podium with his partner, artist MARTINA HOFFMANN. Both VENOSA and HOFFMANN gave slide presentations of their work (HOFFMANN also gave an art historical tour of psychedelic art) and showed their work in the gallery space allocated to the conference. This co-gender dynamic, along with the high percentage of women attending the conference, was an interesting and heartening phenomenon. Other things too, like the high profile of computers and the frequent mention of BURNING MAN at this event, reflected the boundary-crossing, imaginative, and futurist energies that are magnified under the creativity-enhancing lens of psychedelics.

On other days: The film-maker LEWIS CARLINO (*The Great Santini, Haunted Summer*) shared a very personal portrayal of the "SECRET CHIEF," the therapist who came out of retirement to work with MDMA with his clients. BEN NEILL (<http://www.trilliumproductions.com>) presented his

“mutantrumpet” and other aspects of his electro-acoustic compositions. TOM ROBBINS kept the audience in stitches through his talk “Fierce Invalids Home from Hot Climates,” (also the name of his new book). MANUEL TORRES gave an art-(pre)historical perspective on psychoactive creativity. ANNIE SPRINKLE spoke in detail about how her drug experiences informed her development as an artist, or “multimedia whore and pleasure activist,” as she puts it. (I personally was extremely pleased to meet ANNIE, being a fan of hers way before psychedelics ever caught my attention.)

When I originally learned about ALLCHEMICAL ARTS, I was thrilled, because the intersection of psychedelics and creativity has not been explored in a conference before, and nothing has been published on the topic in years. ALEX GREY has given stellar presentations at previous conferences such as MIND STATES (1997) and PSYCHOACTIVITY (1998), but at those events he’s been the lone artist speaking among ethnobotanists, anthropologists, chemists, and psychotherapists. In the months before it, the impending gathering apparently had such a profound impact on me that one night in late Spring I literally woke up from a vivid dream with the thought, “There should be a *creativity* issue of the *MAPS Bulletin*.” (I originally imagined it as the “Right Brain” issue, to lend balance to the “left brain” emphasis of MAPS’ research agenda.) So often, people who support MAPS cite the aesthetic or spiritual effects of psychedelics as their inspiration for becoming MAPS members. I realized that it would be beneficial to publish a *Bulletin* touching on these areas, as well as discussing what research there has been on psychedelics and creativity.

Throughout the six days of ALLCHEMICAL ARTS, love and concern for TERENCE hung heavy in the air. Musician CONSTANCE DEMBY even led a prayer of healing on the last day of the conference, with TERENCE sitting in the middle of the room and the rest of us on the floor. Every speaker seemed to have a personal thanks to extend to him for the inspiration and imagination with which he has treated his readers. TERENCE’S talk was as inspired as any he’s ever given, and of course his co-organizing of the conference with KEN SYMINGTON and MANUEL TORRES (and DONNA TORRES) was *itself* a creative coup.

## MYCOMEDIA MILLENNIUM

October 28–31, 1999

by JON HANNA

My companion and sponsor for this event was my good friend WILL BEIFUSS. NOW WILL can sometimes be a little disorganized, and in this particular case he couldn't find the map to BREITENBUSH HOT SPRINGS (in Oregon), where the conference was being held. Despite my protest that we shouldn't leave without the map, WILL felt fairly confident that he remembered how to get there. Of course, we got hopelessly lost in the dark up a treacherously steep logging road, with drop-offs on both sides and nowhere to turn around. (WILL later overheard a conversation where SASHA exclaimed, "It's *impossible* to get lost driving to BREITENBUSH!" So we accomplished the impossible.) Unfortunately, by the time I finally convinced WILL that we should return to the freeway and look for a sign (which did indeed lead us directly to the HOT SPRINGS), we arrived so late that we missed that evening's talks, given by ANDREW WEIL and CHRISTIAN RÄTSCH.

Nevertheless, the speaker list at this four-day seminar was packed, what with additional appearances from MICHAEL AMARANTHUS, DAVID ARORA, DORTHY BEEBEE, MICHAEL BEUG, KEN KESEY, GARY LINCOFF, CHRIS MASER, CLAUDIA MÜLLER-EBELING, THOM O'DELL, JONATHAN OTT, JOHN PISTO, MIRIAM RICE, TOM RIEDLINGER, STEVEN ROOKE, ALEXANDER SHULGIN, ANN SHULGIN, PAUL STAMETS, SATIT THAITHATGOON, MANUEL TORRES, and RICHARD YENSEN. Quite a number of the speakers gave more than one presentation (we did get to see WEIL and RÄTSCH give other talks). The only scheduled speaker who didn't show up was RICK STRASSMAN. Several talks had nothing to do with psychoactive mushrooms; information on old-growth forest ecosystems, a survey of species of the Olympic Rain Forest, a workshop on dyeing with mushrooms, a talk on sustainable landscapes, and a delicious cooking demonstration rounded out this event.

There were also talks about psychoactive drugs, shamanism, and therapy that had little or nothing to do with mushrooms. For example, while JONATHAN OTT gave a brief overview of the WASSON era related to mushrooms, the real meat of his talk was his "conspiracy theory" related to cocaine trafficking in the Americas. Another great non-mushroom-related discussion was set off at a panel talk when CHRISTIAN RÄTSCH defined the meaning of the word "shaman," and explained the cultural context that must be present in order for this term to be properly used. At the suggestion by an audience member

that JESUS CHRIST might be considered a shaman, RÄTSCH recoiled in disgust, responding: "Jesus was *not* a shaman!" Those who haven't had the pleasure of seeing RÄTSCH speak are truly missing out on one of the great minds of the entheocognoscenti; he presents a wonderful balance of hedonistic wild-man and learned scholar, peppered with wry wit and strong opinions. My favorite presentation, also not related to mushrooms, was given by KEN KESEY, who was down-to-earth, quite funny, and an enthralling storyteller.

Of course there *were* talks that specifically geared towards psychoactive mushrooms. Two of the best in this arena related to mushroomic art. MANUEL TORRES presented a solid argument that the "mushrooms stones" really *are* symbolic of psychoactive mushrooms (and not devices for creating rubber balls for the ball-court games). And CLAUDIA MÜLLER-EBELING's colorful slide show focused on mushroom motifs in European art, as she presented her theories on why some cultures are mycophobic and others are mycophilic.

Daily mushroom forays were a bit hampered by the lack of rain prior to the event, and although there were still quite a few mushrooms found and identified, the appearance of an *Amanita muscaria* was lacking. GARY LINCOFF lamented that, "Without an *Amanita*, we can hardly call it a *foray*," and WILL confirmed that there weren't nearly as many mushrooms as he would have expected to see, if the weather had been more favorable.

On Saturday night there was an awards ceremony titled "Honoring our Elders," which—although a wonderful gesture—wasn't organized too well. Nothing much was said about the contributions made by those being honored. A brief synopsis of these people's work would have been nice to hear, as I wasn't aware of who some of them were or what they had done in the field. Those receiving awards clearly weren't sure whether or not they should give a short acceptance speech, although ANDREW WEIL did remark, "Hey, watch it with that *elder* thing..." SASHA and ANN SHULGIN were given awards, and JONATHAN OTT accepted an award for TERENCE MCKENNA (who wasn't present). A number of others were honored too, but KEN KESEY's name seemed oddly missing from the list. A Halloween costume ball with a reggae band followed this ceremony.

My only minor complaint about the event was that the food at BREITENBUSH isn't the greatest, what with a bland and repetitive vegetarian selection offered. It would have been quite nice if PAUL STAMETS—the producer of this event—had

brought a variety of choice edible mushrooms from FUNGI PERFECTI, in order for them to be prepared for one or more of the meals. While JOHN PISTO's cooking demonstration was fabulous, it only provided a tiny tantalizing taste of what those who know and love mushrooms want to eat. Should a similar seminar occur in the future, perhaps STAMETS can bring some mushrooms for the meals, and get PISTO to cook them up rather than the BREITENBUSH kitchen staff!

## SHEPHERDESS LEAVES NO STONE UNTURNED

December 9–12, 1999

by Dr. VIPIV

The 2nd annual *SKA PASTORA*, LEAVES OF THE SHEPHERDESS: *SALVIA DIVINORUM* AND SALVINORIN-A conference again took place at BREITENBUSH HOT SPRINGS. The BOTANICAL PRESERVATION CORPS, who organized this event, deserve high credit for bringing together informative and entertaining presenters, as well as providing a regular gathering opportunity for the wider community interested in *Salvia divinorum*.

Things kicked off on Thursday night with a presentation by BRET BLOSSER entitled “*Pipiltzintzintli* in 17th & 18th century Mexico.” BRET discussed how ancient public documents referring to this substance—which had been in use in the geographical region where *Salvia divinorum* is now found—suggest that the two may be identical. However, certain pieces didn't fit the *Salvia* profile, and

*Left: PAUL STAMETS, ANN SHULGIN & SASHA SHULGIN*

*Right, top to bottom: CLAUDIA MÜLLER-EPLING, ANDREW WEIL, KEN KESEY*

BRET's talk ended inconclusively. We adjourned until the next morning, going off into the snowy night in spontaneous groups to smoke, soak, or both.

After breakfast on Friday, we heard from KAT HARRISON on "Praying with Leaves: Contemporary Ritual Among the Mazatecos." Having journeyed to Huautla, Oaxaca on several occasions over a period of years, KAT has an ongoing relationship with many of the people who are traditionally closest to this plant. She told a compelling tale of her own healing during a shamanic ceremony with *Salvia divinorum*. KAT had asked for help with a disturbing coronary ailment, and she also asked to see what her work was on "the road ahead." In one visionary session (in the course of which she experienced being a plant herself, rooted at the edge of a forest) she was granted both requests by a compassionate female entity. She literally saw a "packet of pain" depart from a door in her heart, and has not experienced the problem since. She was then directed to look at the boundary of the garden patch where she stood rooted, and the dark forest beyond, and was told that her work would involve continuing to walk that boundary for the benefit of her larger community.

JONATHAN OTT spoke next, delivering a riveting big-picture discourse that began with NAFTA, gathered momentum with commentaries on the *coca* trade, and climaxed with characteristic denunciations of small-minded politicians murderous meddling with our sacred right to consume whatever poisons might please us.

RALPH METZNER addressed "*Salvia divinorum* and Shamanic Divination." He framed entheogens as valid tools of scientific inquiry, useful for extending perception in the same manner as microscopes or telescopes. He then presented four basic models of human/plant use, including the "Western-shamanic hybrid" approach that is gaining momentum in both North America and Europe. RALPH told of his initial experiences with *S. divinorum*, and it was interesting to hear him also say that he became a plant. He realized that plants are actually the more sensitive kingdom, not being encased in "bags of skin" like us. As part of the animal kingdom, we spend much of our time "working for the plants," and in turn we receive oxygen, nutrients, healing and enhanced consciousness. RALPH's conclusion: "It's a really good deal!"

Excellent presentations were also given by conference returnees DANIEL SIEBERT, DALE PENDELL, and ROB MONTGOMERY.

The evenings were purposefully left as free time so that participants could seek out experiences of various kinds. I know of several groups that met and conducted rituals, using the quid method, smoking, or both. One night I participated with a group of 12 who consumed a newly-developed liquid (oral) extract that DANIEL had brought along. At the meadow pools, natural steam sauna or ring of hot tubs, an ebb and flow of post-experienced *Salvianauts* congregated throughout the night to share and compare.

A sense of pioneer excitement pervaded this conference. Concerns were raised about recent trashy publicity of the plant, the "dark side" of shamanic work, and fears of scheduling. Yet the gathering ended on a high and affirming note, with the formation of a small working group, tentatively dubbed the "Shepherdess Leaf Council." The group is charged with creating some voluntary guidelines for sale and use of *Salvia divinorum*, as well as a conduit for somehow giving back to the generous Mazatec culture which has provided the larger world with these precious glimpses of a new green realm.

We ended in a circle, with words of benediction by KAT. We asked to be guided in the good work with this magical plant, and that we may meet again next year with *Salvia divinorum*'s sacred freedoms still intact.

"Mysteries are not to be solved; the eye goes blind when it only wants to see why." — RUMI

(Quote posted at the entrance to the conference room by a BREITENBUSH staffer.)

## EXOTIC SEEDS

### IMPORTED POPPY (*P. somniferum*)

\$10.00 for over 30,000 seeds • \$35 / 4 oz

LARGE WOODROSE \$15 / 2 oz • \$25 / 4 oz

MORNING GLORY \$15 / 2 oz • \$25 / 4 oz

BABY WOODROSE \$20 / 1/2 oz • \$35 / 1 oz

Untreated • Fertile • FREE Shipping & Catalog

Send cash, check or money order to:

### BLUE RIDGE GARDEN

# ENTHEOBOTANY

## SHAMANIC PLANT SEMINARS

12–18 FEBRUARY 2000

21–27 FEBRUARY

Two 7–day, intensive seminars at the portal to the Palenque Mayan ruins and México's mysterious tropical forests

You are invited to join us for an intensive week by the archaic Mayan ceremonial center of PALENQUE, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. This is an opportunity not to be missed! Seminars will feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be available for study. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of PALENQUE and environs by Mayan entheobotanist Rätsch, there will be opportunities to explore the exotic surroundings on your own. This will be our 11<sup>TH</sup> such event [formerly BOTANICAL PRESERVATION CORPS] and past seminars have assumed legendary proportions...

*Please join us!*

## SACRED MUSHROOMS AND THE LAW

by Richard Glen Boire

Foreword by Terence McKenna

A bold new book exploring the legal substrate underlying shamanic mushrooms and their active principles.

\$12.95 postpaid (CA res. add 75¢ tax)

SPECTRAL MINDUSTRIES  
POB 73401-ER, Davis, CA 95617

RICHARD GLEN BOIRE is an attorney who specializes in divining the law constellated around ancient and modern shamanic inebriants. He is director of the newly established ALCHEMIND SOCIETY (<http://www.alchemind.org>), editor of the *Journal of Cognitive Liberties*, and author of *Marijuana Law* and *Sacred Mushrooms and the Law*. For more information on these publications send a long SASE to: SPECTRAL MINDUSTRIES, POB 73401 (DEPT. ER), Davis, CA 95617, or visit <http://www.specmind.com>.

## PHARMACO PROHIBITA

by RICHARD GLEN BOIRE

If you bristle at the thought of government censorship especially when related to the so-called War on Drugs, there is a bill in the Senate right now that you need to know about and actively oppose. Buried in the crannies of a get-tough-on-methamphetamine bill are several provisions that seek to stifle free speech related to *all* controlled substances, not just methamphetamine.

A section of the METHAMPHETAMINE ANTI-PROLIFERATION ACT OF 1999 would make it a federal crime—punishable by up to 10 years in prison—to teach, demonstrate, or disseminate information on how to “manufacture” a controlled substance with the intent that the information be used to commit a federal crime. As initially introduced, the bill would have outlawed sharing information on the “use” of a controlled substance as well, but that portion of the bill was recently cut.

If this bill passes, any book, magazine, web site, seminar, or even a quiet fireside talk between intimate friends, which shares information that might facilitate someone’s manufacture (including cultivation) of a scheduled drug or plant, would become criminal. A writer for *The Entheogen Review* explaining a new method of psilocybin extraction would be subject to arrest. An author of a book or magazine article explaining how to grow *Cannabis*, even for medical use, would also be subject to arrest.

Pursuant to another odious section of the same bill, any person who uses a telephone, the federal mails, or a web site “to post, publicize, transmit, publish, link to, broadcast, or otherwise advertise any matter (including a telephone number or electronic or mail address) knowing that such matter has the purpose of seeking or offering, or is designed to ... facilitate a transaction” involving *drug paraphernalia*, commits a felony.

Studies have indicated that “vaporizers” may be a less dangerous way to inhale some drugs, including medical *Cannabis*. If this bill passes, it would become a federal crime (punishable by up to 3 years in prison) for an operator of a web site to link to a company selling water pipes and vaporizers. An operator of an AIDS or cancer web site that provides information on how some patients may find relief by cultivating and smoking their own medical *Cannabis*, and who includes a link to a company selling a vaporizer, would be subject to arrest and imprisonment for up to 13 years; 10 years for providing information that might facilitate a patient’s manufacture of *Cannabis* (a federally “controlled substance” even when used for medical purposes in a state that legally permits such use), plus 3 more years for “indirectly advertising” drug paraphernalia! A reporter who writes about the drug war (and whose article appears on-line), could be arrested if the report included a link to a pro-*Cannabis* site that itself happens to link to a company selling vaporizers or water pipes.

Earlier this year, the federal government launched a billion dollar “National Youth

Anti-Drug Media [Scare] Campaign” splattering anti-drug messages via magazines, newspapers, radio stations, and prime-time TV commercial slots. By most accounts, the costly effort has done nothing to reduce drug use by teens or adults and may even have backfired.<sup>1</sup> Many people have simply stopped listening to the government when it talks about drugs. So, what’s a jilted government to do when citizens reject its propaganda? It goes after the voices of dissent, desperately trying to shut them up by threatening to arrest and imprison anyone who shares accurate information contrary to the party line.

This bill was introduced by Senator DIANNE FEINSTEIN of California and Senator ORRIN HATCH of Utah, but more and more senators are supporting it. On August 5, 1999, the bill cleared the Senate Judiciary Committee, and on November 19, the last day of the Senate’s session, the bill was merged with Senate Bill 486, the DEFEAT METHAMPHETAMINE ACT. The Senate is currently out of session until January 24, 2000, but action is expected on the bill when they return. You can follow all the developments of this bill at the web site of the ALCHEMIND SOCIETY: THE INTERNATIONAL ASSOCIATION FOR COGNITIVE LIBERTIES (<http://www.alchemind.org>).

If you object to this childish, but very real, attempt by some politicians to rid the world of any information that disagrees

with their agenda, let them know. Tell them you oppose their attempt to censor and criminalize free speech. Write to:

Senator DIANNE FEINSTEIN,  
331 Hart Senate Office Building, Washington, D.C. 20510,  
(202) 224-3841, [senator@feinstein.senate.gov](mailto:senator@feinstein.senate.gov).

Senator ORRIN HATCH,  
131 Russell Senate Office Building, Washington, D.C. 20510,  
(202) 224-5251, [senator\\_hatch@hatch.senate.gov](mailto:senator_hatch@hatch.senate.gov).

1. According to the most recent *National Household Survey on Drug Abuse* (released in August 1999, see <http://www.health.org:80/pubs/nhsda/98hhs/findings/index.htm>), one in ten teenagers uses *Cannabis* or other illegal drugs—nearly double what it was in 1992. Not only is use up, despite the government’s anti-drug propaganda, but the propaganda itself may in some cases actually contribute to *increased* drug use by teenagers. An INDIANA UNIVERSITY study compared two groups of high school seniors: students exposed to DRUG ABUSE RESISTANCE EDUCATION (DARE) classes since 5th grade, and those who had no exposure to DARE. The DARE graduates showed a higher use rate of alcohol, tobacco, hallucinogens, and narcotics than the non-DARE students (WYSONG *et al.* 1994)!

## JOURNAL OF COGNITIVE LIBERTIES

(formerly *The Entheogen Law Reporter*)

Each issue of the *Journal of Cognitive Liberties* reports on the latest threats to cognitive liberty: new court cases and legislation, law enforcement actions, and cultural closures related to entheogens.

More than just a law reporter, the *Journal of Cognitive Liberties* is a voice of inspiration and hope, a forum for expressing ideas on the value of visionary experience, and for discussing the politics, policy, and prospects of reintegrating full-spectrum-thinking into a modern society.

The *Journal of Cognitive Liberties* is sent free to members of the ALCHEMIND SOCIETY: THE INTERNATIONAL ASSOCIATION FOR COGNITIVE LIBERTIES. Members of this SOCIETY believe that the unique qualities of entheogens distinguish them from other drugs, and call for particularized legal treatment in keeping with society’s highest traditions for protecting religious freedom, privacy, and basic human rights.

Basic membership in the ALCHEMIND SOCIETY is \$40.00 per year. Subscriptions to the *Journal of Cognitive Liberties* without membership in the Society are \$25.00 (USA), \$35.00 (foreign), for four issues. For more info. please visit our web site.

# SOURCES

---

---

by WILL BEIFUSS and JON HANNA

---

---

*This issue of the "Sources" column will be the last to feature my co-author WILL BEIFUSS, who has decided that it is no longer any fun to listen to me berate, bullyrag, and belittle him into actually hunting-out and writing-up new companies. Future issues of this column may have guest appearances from others who pony-up with the goods without having to be repeatedly lashed with a wet noodle. Mr. BEIFUSS, I'll miss ya, heh... — JON HANNA*

## ENTHEOS

POB 5078 (Dept. ER)

Los Angeles, CA 90050-0871

<http://www.entheosnewsletter.com>

[editor@entheosnewsletter.com](mailto:editor@entheosnewsletter.com)

A new quarterly publication that focuses squarely on the spiritual applications of entheogens. You won't find any extraction information, growing tips, discarnate-entity encounters, or hyperspatial voyage descriptions. But what you will find is straightforward information on how people have used entheogens, both personally and historically, to better their spiritual lives. The publication is edited by DANTE DALO and CARL DALO. Their statement of purpose notes:

The *Entheos Newsletter* is dedicated to presenting cutting edge information on the spiritual use of entheogens. *Entheos* is not associated with any particular religion or organization. The purpose of this newsletter is not to indoctrinate its readers with any particular belief system, religious or otherwise. *Entheos* is concerned with presenting information that is practical and useful to help its readers come into direct contact with truth, and not with parroting secondhand explanations of it. *Entheos* is ultimately concerned with the ending of conflict, confusion and sorrow within the mind of man, and with the establishment of bliss and clarity (which is the natural, undivided and undistorted state of consciousness) therein.

There is a sample issue available via the *Entheos* web site, which provides an introduction to the publication and has articles related to "direct perception," the "sphere of aware-

ness," and "psychedelic yoga." However, the first real issue of the publication came out in September, 1999.

"The Entheogen Key" by DANTE DALO relates how a culture's anti-drug propaganda can subconsciously affect one's entheogenic voyages in a negative manner.

"The Entheogenic Traditions of the Mogollon Mimbres Culture" by ROBERT COX discusses the possibility that psilocybian mushrooms were used by the Mimbres, and incorporated into their ceramic and wooden art. While the "roundel pahos" depicted might indeed represent mushrooms, the evidence presented to support this seems spotty at best, and is based on the idea that mushrooms *could have been* a trade item. An argument is also presented proposing that the ceramic painted patterns were inspired by the use of entheogens; while not impossible, sometimes a pattern is just a pattern. Archeological remains of the Mimbres culture don't appear to be overly plentiful, and this certainly makes it much more difficult to argue that there was some sort of entheogen-influence on them. Therefore, it was hard for me to swallow the certainty with which this article ended. When discussing the rapidity with which the Mimbres Classic Black & White ceramic style developed, COX unequivocally states:

An important factor was the appearance of the psilocybin rich mushroom that came along with the exotic birds, shells and copper bells obtained from Mesoamerican trade.

Since there is no hard evidence to back up that mushrooms even were an item of trade, this comment is overstated. It isn't that I don't think that COX's ideas might have some merit, but simply that there isn't enough "on the table" to warrant such a firm conclusion.

"Entheogenic Aspects of Ibogaine" by HOWARD S. LOTSOFF relates a bit of LOTSOFF's personal history with ibogaine, and tells how he didn't even really consider this chemical to be "an entheogen" until just shortly prior to being asked by *Entheos* to pen this paper.

Finally, in "Psychedelics through the Perspective of Aging," MYRON J. STOLAROFF, notes the trap that can be fallen into of just going back to the medicine for another experience, rather than doing the hard work necessary to apply the lessons learned on a daily basis. STOLAROFF also shares his realization that the practice of *Dzogchen* (the Tibetan swift path to enlightenment), can rapidly dissolve structure reifications that

separate us from our true inner reality. This paper was written just before STOLAROFF'S 79th birthday, and he mentions that some of the most important spiritual gains that he has made through his use of entheogens have occurred in the last two years. It is refreshing to hear that you *can* teach an old dog new tricks.

Also included in this issue of *Entheos* are the poems "In Search of Entheos" by VANESSA, and "River of Mind" by KRISHNA DAS. Overall, the articles in *Entheos* are well-referenced, and in some cases biographies and photos of the authors are also provided.

This first issue of *Entheos* is 30 pages long, and printed from a PC color printer. Apparently the length of the publication will vary depending on the number of contributions. The manner in which the publication is bound is unfortunate; loose pages are clipped into a clear plastic "report" folder. This doesn't allow one to comfortably read the publication, and the pages tend to repeatedly and frustratingly pop out. A simple staple in the upper left hand corner would be a dramatic improvement, as would switching to a saddle stapled 11" x 17" format, such as *ER* uses. (Although perhaps it wouldn't be possible to output these larger pages on the printer being used, and the ability to present the photographs of various entheogens, writers, and art in color is a plus.) Really, the poor binding is a minor complaint, and I took care of it myself by simply ditching the plastic covers that *Entheos* came with and stapling the corner.

*Entheos* is slated to come out every two months, and a six-issue subscription costs \$25.00 (USA), \$30.00 (foreign). Single and back-issues are available for \$5.00 (USA), \$7.00 (foreign). This newsletter is a nice compliment to *The Entheogen Review*, in that the primary focus on spirituality isn't something that is touched on too often in *ER*. I certainly recommend that those with an interest check out and help support this fledgling publication.

**HOG EYE FUNGI & ETHNOBOTANICALS**  
**POB 744 (Dept. ER)**  
**Livingston, TN 38570**

Sometimes you have to get out of the house to discover new entheobotanical businesses. Such is the case with HOG EYE, a company that we recently came across while attending PAUL STAMETS' mushroom conference. They had an attractive display of healthy plants and herbs. While they don't have a

huge selection, they do have pretty good prices on what they offer.

Although the name "fungi" appears first in this company's name, the only mushrooms that they offer are pickled Chanterelles; \$10.00/pint, \$20.00/quart. Other offerings include: *Banisteriopsis caapi*: foliage \$10.00/7 grams, vine \$20.00/28 grams, plant \$50.00; *Hydrastis canadensis*: roots or foliage \$5.00/28 grams; *Justicia pectoralis* var. *stenophylla*: plant \$20.00; *Panax quinquefolius*: root \$25.00/14 grams, \$40.00/28 grams; *Papaver* species: "lavender," "double pink," "big head" seed packet \$5.00; *Phalaris arundinacea* "Turkey red" or "Yugoslavian fresh-cut": plant \$20.00; *Psychotria viridis*: foliage \$25.00/28 grams, plant \$45.00; *Salvia divinorum*: foliage \$25.00/14 grams, \$45.00/28 grams, plant \$30.00.

HOG EYE is unique in that they are the only company we are aware of that sells *Banisteriopsis caapi* leaves. While these leaves can certainly be used for their MAOI action, we have heard that the leaves of *B. caapi* produce more somatic effects than older stem sections. But they might be a good candidate for chemical extraction, and certainly would be a bit easier to work with.

HOG EYE grows all of the plants that they offer, which is especially nice when one considers the potential cultural and ecological damage that can be done by companies that harvest plants such as *Banisteriopsis caapi*, *Psychotria viridis*, and *Salvia divinorum* in commercial quantities from their native habitats.

**LIBRERIA MUSCARIA**  
**Luca 9, 2<sup>o</sup> 1<sup>a</sup> (Dept. ER)**  
**08022 Barcelona**  
**SPAIN**  
**amanita@muscaria.com**  
**http://www.muscaria.com**

LIBRERIA MUSCARIA is an excellent new web-based bookstore specializing in Spanish editions of books on entheogens. Book categories include "Marijuana," "Botany & Chemistry," "Psychology and Empathy," "Shamanism," and "Spirituality." The site is written entirely in Spanish, and they offer numerous topical books that are only available in Spanish, such as RICHARD YENSEN'S *Towards a Psychedelic Medicine* and a compilation titled *The Entheogens and Science*, which features contributions by ESCOHOTADO, FERICGLA, HOFMANN, OTT, SAMORINI, and many others. They also offer *Thousand Win-*

*dows*, which contains the visionary paintings of MATI KLARWEIN, and a number of magazines including the Peruvian journal produced by the TAKIWASI center, and *Ulises: Magazine of Inner Trips*—a publication I was unaware of that contains articles by GROF, HOFMANN, and SAUNDERS, to name a few.

In a strange twist of fate, it turns out that I know the owner of this business, KIM TARINAS, as we met in México prior to an ENTHEOBOTANY conference, and then a couple months later we ran into each other in San Francisco at a rave. So, I can whole-heartedly recommend this business for those in the market for Spanish-language texts on entheogens. There is a lot of publishing on the topic of entheogens happening in Spanish these days, and you can find most everything relevant at this web site. They also carry a few titles in English. A print version of their catalog should be available soon for \$2.00 (USA), \$1.00 (Europe).

#### THE LOTUS PARADISE

POB 23 (Dept. ER)

Kilauea, Kauai, HI 96754

(808) 828-1304

(808) 828-6890 FAX

camelot@hawaiian.net

info@shamansgarden.com

<http://www.salvia-divinorum.com>

<http://www.shamansgarden.com>

An organic farm and nursery, THE LOTUS PARADISE also operates via the web under the names SALVIA-DIVINORUM.COM and SHAMANSGARDEN.COM. Overall their prices are pretty good, although their prices on *Salvia divinorum* are a bit high. Apparently, after a sensationalistic blurb about *Salvia divinorum* recently appeared in *Details* magazine, web-based companies selling dried leaves and extracts have been flooded with orders. This has caused many *S. divinorum* vendors, especially those with a web presence, to raise their prices. And THE LOTUS PARADISE followed along with most other sellers of this herb, and raised their prices recently to \$33.00 per 1/2 oz, or \$55.00 per oz. While these certainly aren't the lowest prices around, they also aren't nearly the highest. That honor goes to THE SAGE WISDOM SHOP, which charges \$65.00 per 1/2 oz, and \$120.00 per oz! (It seems worth mentioning that wholesale Oaxacan leaf can be had for \$100.00 or less *per pound*.) There are still some companies providing leaf at more reasonable prices (See, for example, HOG EYE FUNGI on page 157, and SHAMAN AUSTRALIS on page 159.) But with so many com-

panies jacking up their prices, I have to wonder how long it will be before everyone is charging outrageously high prices for this easily-cultivated plant. Avoid the high prices and grow your own plants; cuttings are still available for under \$10.00 each from companies more interested in plants than profiteering, such as THEATRUM BOTANICUM and LOGEE'S GREENHOUSES.

Most other offerings from THE LOTUS PARADISE are quite reasonably priced. *Argyrea nervosa* seeds: 1/2 oz \$12.00, 1 oz \$20.00. *Piper methysticum* root powder: 1 lb \$28.00. *Corynanthe yohimbe* dried bark: 8 oz \$18.00. *Calea zacatechichi* dried leaves: 1 oz \$12.00, 4 oz \$30.00. *Banisteriopsis caapi* dried vine: 1 oz for \$10.00, 4 oz \$30.00. *Psychotria viridis* dried leaves: 1 oz \$18.00. *Mimosa hostilis* dried root-bark: 1 oz \$15.00, 4 oz \$40.00. *Diplopterys cabrerana* dried leaves: 1/2 oz \$15.00, 1 oz \$22.00. *Desmanthus illinoensis* root-bark: 3 oz \$20.00.

THE LOTUS PARADISE also offers *Salvia divinorum* seeds for sale, at the price of \$50.00 for 7 seeds. They state that these have a 30% germination rate, which is on the higher end of the reported spectrum. If you decide to order these seeds, it would be worth it to e-mail THE LOTUS PARADISE and ask them how many seeds they attempted to germinate, and of the 30% that sprouted, how many plants actually survived. Germination rates for *S. divinorum* seeds by others have recently been reported ranging from 15% to 33.3% (HANNA 1999). However, approximate survival rates of those seeds that germinated in these four cases ranges from 0% (by HANNA), to 33% (by LINDBERG & BEIFUSS), to 66% (by SIEBERT). Considering that with 7 seeds the most that you would probably get to germinate would be 2, and of these at least 1 and perhaps both won't survive, the price for these seeds is pretty steep. Nevertheless, THE LOTUS PARADISE is the only company we know of that is currently selling these rare seeds, and if you feel inspired by the challenge of attempting to grow your own genetically unique plant, I suspect that these seeds may only be available for a limited time.

Shipping up to 2 lbs within the USA is \$4.00 by Priority Mail; International is \$8.00 by Global Priority Mail. They offer next-day shipping.

**PRATUM BOOK COMPANY****POB 985 (Dept. ER)****Healdsburg, CA 95448****(707) 431-2634****(707) 431-0575 FAX****knowledge@pratum.com****http://www.pratum.com**

I can *almost* hear WILL groaning as he reads this entry, as it is true that PRATUM BOOK COMPANY doesn't really have too much to do with entheogens. The new, imported, scholarly, and antiquarian books offered by this company are the sort that I might expect to find on the shelves of poet DALE PENDELL, artist DAVE NORMAL or the fictional *X-Files* character FOX MULDER. They generally deal in the areas of occult, hypnotism, tarot, tantrism, demonology, esoteric philosophy, lost books of the Bible, alchemy, magic, and numerous religions.

What I like best about this catalog is that it is so well-written. Owner TODD PRATUM is clearly an unabashed bibliophile, and he frequently rants or raves about the quality of a given book's binding, or printing. It is refreshing to see such criticism of some of the books that he is himself trying to sell, and it lends an air of believability to the praise that he heaps on other titles. PRATUM also provides critical analysis of the content of the books he offers; it is quite clear that he has actually *read* the texts that he offers, and that he has included them amongst what he sells because of a personal belief that they are important works (even on the occasions when their production quality is poor). His descriptions of some titles had me excited about books on topics that I previously had no strong interest in.

To counter the probable, "So why the hell are you including this in the 'Sources' column," that I expect WILL is muttering right about now, I note that PRATUM BOOK COMPANY catalog #51 does offer *The Divine Origin of the Craft of the Herbalist* by E.A. WALLIS BUDGE, *The Forge and the Crucible: The Origins and Structures of Alchemy* by MIRCEA ELIADE, *The Sixties Spiritual Awakening* by ROBERT S. ELLWOOD, *Medicinal Plants in the Traditions of the Prophet Muhammad* by M.I.H. FAROOQI, *Shamanism and the Eighteenth Century* by GLORIA FLAHERTY, *People of the Chan* by RAPHAEL GIRARD, *The Mission of Art* by ALEX GREY, *The Practical Handbook of Plant Alchemy* by MANFRED M. JUNIUS, *Ayurvedic Narcotic Medicinal Plants* by C.R. KARNICK, *Fragments of Infinity: Essays in Religion and Philosophy*, *A Festschrift in Honor of Professor Huston Smith* by ARVIND SHARMA, *Medicine in China: A History of Pharmaceuticals* by PAUL U. UNSCHULD, and few books by KEN WILBER.

To learn more about these and other intriguing titles, check out the web page. If you want a print catalog immediately, they are \$4.00. However, if you send your name in and ask to be put on the mailing list and can wait until their next mass-mailing, the catalog is free.

**SHAMAN AUSTRALIS****POB 1103 (Dept. ER)****Byron Bay 2481****AUSTRALIA****shaman@shaman-australis.com****http://www.shaman-australis.com**

SHAMAN AUSTRALIS is not your average ethnobotanical supplier. What sets them apart is the fact that they are doing extensive tissue culturing of several important species. One of these is *Acacia phlebophylla*—there are only a few hundred of the adult trees remaining and they are found only in Mt. BUFFALO NATIONAL PARK in Australia. From their web site:

In an analysis performed in 1967, the leaves yielded 0.3% of *N,N*-Dimethyltryptamine (DMT). Thin-layer chromatography indicated that this was the only base present. It appears that this is one of the purest natural sources of DMT.

There are two other *Acacia* species that will soon be available: *A. confusa* and *A. simplicifolia*. Also available is *Ephedra gerardiana*: \$12.00 for 1 plant, \$320.00 for 50 plants. From their web site:

*Ephedra gerardiana* is a high yielding source of ephedrine and possesses the same properties as ephedrine from *Ephedra sinica*, but with a higher total alkaloid content of 1.0 to 2.5% (below 1.0% for *E. sinica*). Total alkaloids are made up of about half ephedrine and the rest pseudoephedrine, *N*-methylephedrine, norephedrine and related compounds. Ephedrine acts like adrenaline, but is orally active.

Also available as a tissue-cultured plant is *Mitragyna speciosa*, also known as *kratom*: \$64.00 for 1 plant, \$800.00 for 25 plants. From their web site:

*Mitragyna speciosa* is only used in its native country Thailand, where it is highly illegal. It is often used to replace opium consumption as a cheaper alternative and has a similar effect in that it renders the user very "stoned" and lazy. It is also used to interrupt opium addiction and may be useful in the treatment of heroin addicts. A few leaves

are either smoked, prepared as tea or made into a resin extract. The effects of *kratom* last for several hours and only very small quantities are needed to achieve the desired effect. There appears to be no psychedelic activity and heavy use usually results in prolonged sleep phases.

Also available soon will be *Pausinystalia yohimbe*, *Argyreia nervosa* and *Tabernanthe iboga* (no prices available yet). From their web site:

Tissue culture clones can be shipped all over the world with a minimum of fuss. They are extremely easy to take care of and plenty of advice is available from us to help you raise these plants.

In addition to the above tissue-cultured plants, cuttings, seeds, or dried leaves are available of many species, including: *Argyreia nervosa*, *Artemisia absinthium*, *Calea zacatechichi*, *Desmanthus illinoensis*, *Heimia salicifolia*, *Ipomoea violacea*, *Mimosa hostilis*, *Peganum harmala*, *Psychotria viridis*, *Salvia divinorum* and *Voacanga africana*. Their prices seem reasonable as well, for example they sell 25 gm of *Salvia divinorum* leaves for \$24.00 or 250 gms for \$160.00. They also sell a mixture of 70% *Salvia divinorum* and 30% *S. splendens*, based on the as-yet-unproven but oft-stated belief that *S. splendens* potentiates *S. divinorum*.

There is a lot of good information given for many of the botanicals they carry, including traditional uses and pharmacology (although some of the information presented is incorrect). I would have to say this is one of the best ethnobotanical web sites of any company I have seen. In addition, the owner is extremely knowledgeable about plant propagation and can help customers with any questions they might have.

**ZAVTONE MAGAZINE**  
**POB 410297 (Dept. ER)**  
**San Francisco, CA 94141-0297**  
**(415) 864-2360**  
**(415) 864-3765 FAX**  
**info@zavtone.com**  
**http://zavtone.com**

*Zavtone* is an oversized, bilingual (Japanese and English) glossy color mag that focuses predominantly on modern alternative culture. The first-and-only issue that I have seen, the "Human Issue, Edition 11" came out in 1998, and it is specifically geared towards psychedelics. It contains inter-

views with TIMOTHY LEARY, SASHA and ANN SHULGIN (featuring a cool photo of the duo wearing brightly-colored cardboard spectacles), JONATHAN OTT, TERENCE MCKENNA, and others. There are numerous "psychedelic celebrity" photos taken at the PSYCHOACTIVITY conference in Amsterdam (more than one might care to count), arranged in the holes of a beehive pattern. This issue also contains coverage of BURNING MAN, the rave scene, avant garde architecture, the DIGITAL BE-IN, crop circles, breasts, gays & lesbians, I Ching and DNA code, and *Altered Dimension* magazine (another Japanese publication, geared towards consciousness exploration and entheogens).

I consider this rag to be the Japanese equivalent of *Mondo 2000*. And while I really enjoyed looking through this publication, it had the same sorts of flaws as *Mondo 2000* does. The imagery is too slick and colorful, and the text gets lost in it. Even more so than with *Mondo 2000*; since the text appears in both languages for each article, they have made it ultra-tiny. (Is there a font smaller than 4 points? If so, they've found it.) The line between music advertisements, articles, fashion pages, and art is even fuzzier too—perhaps due to the language barrier. This is the kind of publication that is enjoyable for a while, but hurts your eyes if you try to read it all in one sitting.

Single issues are \$13.00 each, and four-issue subscriptions are \$45.00. I do recommend picking up No. 11. I suspect that I'll subscribe to this; despite the graphic overkill and need for a magnifying glass, it is a fun read.

## NOTICE

SOUTHWEST ETHNOBOTANICALS has moved and is under new ownership. Their new address is: SWB, POB 8064 (Dept. ER), Roswell, NM 88202-8064, swethno@mindspring.com, <http://www.foursacreddirections.com>.

WILL BEIFUSS is leaving his post with the "Sources" column to devote full time to his job as a counselor for AA (Alkaloidaholics Anonymous). As he goes through the difficult adjustment to civilian life, he wants everyone at *ER* to know how much he has enjoyed working with them, and that it will not be easy to go back to using his old stationary again. Thanks for the memories, guys, and my deepest sympathies to whomever you find to replace me.

JON HANNA is the author of the 2nd edition of the *Psychedelic Resource List*. He is an editor, writer, artist, and new father.

# BOOK REVIEWS

*Ayahuasca: Hallucinogens, Consciousness, and the Spirit of Nature*, RALPH METZNER (Ed.), 1999 (Thunder's Mouth Press, 841 Broadway, Fourth Floor (Dept. ER), New York, NY 10003), ISBN 1-56025-160-3 [Perfect-bound paperback \$13.95 (NY residents add \$?.?? tax) plus \$?.?? S/H (USA), \$.00 S/H (foreign)]. 294 pp; no index, chapter end-note bibliographies.

OSCAR JANIGER has been noted to say, "Nothing is more boring than an individual's personal account of his LSD experience" (STAFFORD 1990), and one might presume by this comment that JANIGER would also find trip stories related to any other entheogen, including ayahuasca, equally dull. Those who agree with this viewpoint won't be too impressed with the latest offering by RALPH METZNER, *Ayahuasca: Hallucinogens, Consciousness, and the Spirit of Nature*, as it is largely

composed of numerous personal accounts of ayahuasca experiences.

In considering JANIGER's attitude, I am reminded of the different reactions that my mother and father had towards the retelling of dreams at the breakfast table. Dad couldn't stand these stories, and would frequently exit to the kitchen to fix more coffee, so as not to be subject to the wandering illogical dreamscapes of the rest of us. On the other hand, my mother and brothers sat enthralled by tales of flying, or realizing that one was naked in public, or losing one's teeth, or suddenly being back in school taking a test that hadn't been studied for. I suspect that entheogenic "trip stories" are similar to dream descriptions; some people can't stand them, while others sit spellbound.

Most readers of *The Entheogen Review* probably fall into the latter category, like me. And I thoroughly enjoyed the numerous "hyperspatial maps" that those cartographers of mind described in METZNER's compilation. 24 psychonauts shared their experiences with ayahuasca in the first half of this book. These tales are told predominately by Western non-native explorers and set in the USA, although there are a few voyages that took place in the Amazon, some within the syncretic religious traditions of the *UDV* and the *Santo Daime*. For the most part, those who shared their experiences with ayahuasca, participated in ritualistic group settings that combined psychotherapy and spiritual searching in what might be termed a "neo-shamanistic" approach. There are a number of elements to these rituals that are common to several of the reports. Some of these included fasting, sitting in a circle, opening/closing ceremonies related to the four directions, passing a "talking stick" that allows each person in turn to sing or speak, sitting or lying down, periods of silence, periods of music and/or drumming, dancing, and breaking the fast. In some cases the participants wore ear-plugs and eyeshades. Most ceremonies are held at night, either in darkness or by the light of a fire. Voyages reported on in this compendium run the full gamut. Some types of experiences included:

1) Returning to past times, such as Nazi Germany concentration camp scenes, Native American Indian scenes, and

Egyptian ritual scenes, or specific past-life regression experiences.

2) Contacting etherial or other-dimensional beings such as dead relatives, energy parasites, plant teachers or spirits, animal spirit guides, jungle elves ("little green guys"), or specific gods/goddesses from Egyptian, Mayan, Hindu, Buddhist, and earth-worship cultures.

3) Comparison of ayahuasca to other entheogens, such as LSD, MDMA, psilocybin, mescaline, etc.

4) Specific types of energy contact and interaction, such as kundalini energy, healing energy, grief energy, chakra energy, crystal gazing, channeling, direction of visions through shamanic *icaros*, telepathy, prophetic visions of the future, out-of-body experiences, ego fragmentation, physical dismemberment, planetary consciousness, simultaneously experienced duality, and awareness of the law of karma.

5) Reliving one's birth or experiencing one's own death.

6) Experiencing psychological, spiritual, or physical healing.

7) Relating to the experience through various philosophical/religious ideation, such as CASTANEDA's "warrior's impeccability," PABLO AMARINGO's painted visions, GURDJIEFFIAN or JUNGIAN concepts, Christianity, Hinduism, Buddhism, Sufism, Taoism, yoga, and meditation practices.

Normally I might wince at some of the "new age" beliefs reported on. But somehow, within the context of ayahuasca voyaging, I became more open to the various modes in which people related to and interpreted their experiences.

One thing that I found quite striking was the large number of people who reported snakes or serpents as integral parts of their ayahuasca experience. METZNER touches on this a bit in the book's introduction, when he mentions *The Cosmic Serpent* by Canadian anthropologist JEREMY NARBY. The ayahuasqueros "told Narby that the serpent spirit is the mother of ayahuasca." The serpent image is quite prevalent in the art of PABLO AMARINGO, and apparently other Amazonian Indian art as well. Of the 24 people whose experiences are related in this book, just over half of them mention snakes or serpents. Specific imagery of this type strikes me as being fascinating, as I don't believe that it is so frequently reported with other entheogens. Which got me to wondering *why* this imagery turns up so commonly with ayahuasca voyages?

CLAUDIO NARANJO has noted that naive Westerners dosed with harmaline tended to have visions of snakes, as well as jungle cats and large birds of prey; imagery that is consistent with the cultural context of traditional ayahuasca use. He has proposed that these animals seen together comprise a "dragon" symbol, which is produced through the ayahuasca alkaloids allowing one to experience kundalini energy (NARANJO 1987).

There is also the thought that those areas accessed when one takes certain drugs may have a reality *beyond* the mind of the subject. If this is true, it wouldn't be surprising that when using a specific drug, one opens a specific door to a realm that is populated with specific discarnate entities or imagery—in this case, with snakes. A related idea—that is only given brief mention by METZNER, when he lists RUPERT SHELDRAKE among a number of individuals whose theories jive with subjective psychonautical experiences—is that specific "morphogenic fields" of energy might be created by the repeated ritual use of an entheogen. Since ayahuasca has been used for hundreds if not thousands of years in the Amazon, it might not be surprising if those new to this realm have visions of Amazonian snakes, especially when this has been reported as a traditional component of the experience. An interesting story was recently told to me by a woman who noticed that her ayahuasca visions were always mirror images; the same visions reflected above and below. She was consuming ayahuasca in the USA. It was only when she finally went to the Amazon and was floating down the river in a canoe that she was hit by the fact that the entire view of the jungle was reflected in a manner similar to her ayahuasca visions. The "morphogenic field" of her ayahuasca visions seemed to have been showing her their home turf! While entirely subjective, this experience could be seen by some to lend credence to the idea that snakes are seen by modern psychonauts because they have long been a traditional element in archaic shamanic Amazonian visions, and hence have built up a resonant field of non-corporal visual energy.

There is, perhaps, another more mundane explanation for visions of snakes. 19 of the 24 psychonautical reports in *Ayahuasca* describe gastro-intestinal distress experienced while the person was on ayahuasca; nausea, vomiting and/or diarrhea are all commonly mentioned. It has been said that ayahuasca "can feel like a boa entering one's mouth and chewing through to the other end with involuntary defecation and emesis" (MU 1988). Reports presented in *Ayahuasca* from different psychonauts noted:

Then I met another serpent in my vision ... it entered my body through my mouth and started to slowly wind its way through my stomach and intestines over the next two or three hours ... the form of the snake is more or less a long intestinal tract, with a head and a tail end; and conversely, our gut is serpentine, with its twists and turns and its peristaltic movement. (p 48)

I began to hear the "swoosh" of a large snake. I felt my abdomen crackle as if the skin of a snake were being shed ... I physically purged into the bowl. (p 95)

Once in my stomach, it felt as if I had swallowed a live boa who was inching through the acid labyrinth of my guts, pausing to squeeze them tight in sequential spasms. (p 109)

A huge serpentine roto-rooter moving through my systems, sparing nothing, unearthing everything ... The ayahuasca medicine seems to have a special affinity for the gastrointestinal system: it snakes its way through the body, seeking out and eliminating obstructions to life energy flow. I sometimes think of it as a form of kundalini, a Liquid Plum'r for the soul. (pp 117 & 123)

People speak of becoming snakes, of eating snakes, and of being eaten by snakes. Certainly all of these states of being could relate directly to the intestinal havoc that ayahuasca reeks on one's system. Visions of snakes, while undergoing this sort of a physical assault (in the particular mind state that ayahuasca produces), don't seem too surprising. Considering that ayahuasca produces nausea, vomiting and diarrhea in many (a combination of physical effects that, in totality, is rarely seen with other entheogens), it doesn't seem too odd that people commonly see snakes on ayahuasca, and not as frequently when on other drugs.

The second half of *Ayahuasca* contains objective scientific papers by DENNIS MCKENNA, CHARLES GROB, and JACE CALLAWAY, as well as a summation by METZNER. As each paper was written independently, there is some repetitively information presented related to ayahuasca's history and chemistry.

MCKENNA predominately deals with ayahuasca's history, from its prehistoric roots, to its scientific discovery in the 19th Century, taxonomic and chemical discoveries of the early 20th Century, and more modern research and developments, noting the 1967 U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE symposium "Ethnopharmacologic Search for Psychoactive Drugs." MCKENNA also mentions the Brazilian syncretic religion *União do Vegetal*, some members of whom were

subjects in the HOASCA PROJECT study that MCKENNA participated in to investigate the chemistry, psychological effects, and psychopharmacology of ayahuasca.

GROB discusses the context in which traditional visionary plant medicines have been used, and presents information on contemporary ayahuasca use as well, including another Brazilian religious group, the *Santo Daime*. The use of ayahuasca analogues by modern psychonauts is briefly mentioned. GROB presents an outline describing psychological characteristics common to the type of altered awareness brought on by entheogenic plants, and also relates commonalities reported relating to ayahuasca specifically, noting that snakes, jaguars, and other predatory animals of the rain forest are prevalent visions.

CALLAWAY'S paper was the most technical but also the most interesting, as the information presented was less redundant than the previous two papers. Phytochemistry of a few visionary plants is presented, and a comparison is made to several neurochemicals responsible for primary human brain function. The neuropharmacology of ayahuasca in particular is discussed, both from the perspective of how the  $\beta$ -carboline monoamine oxidase inhibitors work, and what systems the tryptamines plug into. CALLAWAY briefly notes his theory suggesting that DMT might be responsible for the visual aspect of dreams. He also quite importantly warns readers of the possible hazards of combining SSRI drugs and ayahuasca. CALLAWAY provides more detailed information related to specific findings by the HOASCA PROJECT, including the variation of harmala alkaloids found in different samples (and types) of *Banisteriopsis caapi*, the variation of DMT found in different samples of *Psychotria viridis*, and variations in individual metabolism of ayahuasca, as well as physiological changes produced from the ingestion of ayahuasca.

METZNER is to be commended for putting together a solid collection of subjective and objective information that illuminates the potential healing quality of ayahuasca. The stories of personal growth are compelling, and the scientific evidence presented speaks to the relative safety of ayahuasca when properly consumed. While there are sure to be a multitude of books published on the topic in years to come, *Ayahuasca* should stand the test of time as an historically significant contribution on contemporary psychonautical therapy. — JON HANNA

*Natural Products Isolation*, RICHARD J. P. CANNELL (Ed.), 1998 (Methods in Biotechnology #4. HUMANA PRESS, 999 Riverview Drive, Suite 208 (Dept. ER) Totowa, New Jersey 07512, <http://humanapress.com>), ISBN 0-89603-362-7 [Sewn-and-glued hardback, alkaline paper \$89.50 (NJ residents add \$5.37 tax) plus \$5.00 S/H (USA), \$8.00 S/H (foreign)]. 473 pp; 9 pp index, chapter end-notes.

*Natural Products Isolation* is an excellent compendium of short pieces providing a general overview of isolation schemes and the various separation technologies that might be found useful by a natural product chemist. For the technically-trained reader, especially if new to the field, it provides a wealth of info and practical guidance concerning processes they might consider incorporating.

It also provides many valuable tips for anyone who utilizes liquid chromatography. Several nice discussions of how to logically and systematically approach unknown analytical situations involving natural product isolations, both in the lab and incorporating the existing reference *data* bases to avoid duplication of previous work, are also included.

Quite valuable, for instance, is CANNELL's discussion, in chapter 1, of how to structure an approach when faced with analyzing unknown plant materials and the need for both consistency and flexibility in their study.

Exactly how useful this book is to the actual reader, however, will depend on several factors. For a reader lacking a technical background, this book will quite probably be found fairly useless. Similarly if the reader is expecting a how-to instructional manual for performing any of the techniques and using the equipment it covers, they will be disappointed.

For the average person looking for a text that can enable them to get started purifying plant compounds, MANFRED JUNIUS' *Practical Handbook of Plant Alchemy* would be a more helpful resource (once past the philosophical discussions).

*Mind Books* offers over 300 titles on mind-expanding plants, compounds, and other materials, and cultures which use them, from many fields:

*Philosophy & Pioneers* (40 titles)  
*History & Stories* (19 titles)  
*Public Policy & Law* (16 titles)  
*Psychology & Empathy* (33 titles)  
*Religion & Spirit* (22 titles)  
*Practical Guides* (20 titles)  
*Traditional Cultures* (71 titles)  
*Plants & Compounds* (37 titles)  
*Chemistry & Neuroscience* (31 titles)

We offer our free print catalog; fast and discreet service around the world; and easy ordering by mail, phone, e-mail, or fax. For a free catalog, send your address to:

If a reader's only interest is preparation of drugs from drug plants, *Natural Products Isolation* is unlikely to prove helpful except perhaps in providing a multitude of tips on specific procedural points.

Despite the book's assertion that it is "Suitable for beginners with little previous experience," this is meant to indicate college students who have not yet acquired very much hands-on experience, not amateurs lacking or not desiring a technical education.

However, if the reader is simply looking to better *understand* what is involved in plant alkaloid isolations or is already familiar with the procedures and wants to fine tune (or resolve problems in) their approach to recovering and purifying naturally-occurring organic compounds this book will be a welcome addition to their library.

Perhaps one of the most valuable aspects of this book is that it does not stick to generic theoretical discussions but attempts to illustrate techniques and isolation schemes using real-world scenarios and examples.

For the average person with some technical training and an intention to isolate naturally-occurring compounds, sections of value include not simply how to approach the initial separation and purifications but also solving problems encountered with crystallizations, how to approach a new analysis involving completely unknown materials, problem-solving issues commonly encountered in natural product isolations, tips (and cautions) when working with marine organisms, and a very nice discussion of the hardware and the mechanics behind the various chromatographic approaches.

Other potentially useful material includes a host of separation flow charts arising from numerous applications, biotechnology involving upscaling production, precursor feeding and other possible problems in biotransforming organic molecules via directed biosynthesis.

Whether one is a college chemistry student fairly new to the subject or a professional wanting a better understanding of the particular areas, this book can provide a nice introduction or overview. — K. TROUT

# CLASSIFIED ADVERTISEMENTS

CLASSIFIED ADVERTISEMENTS are \$2.00 per word with a 15 word minimum (\$30.00). Though we are quite selective about the advertisements we include, *The Entheogen Review* is not responsible for any claims made by any advertisers. We reserve the right to refuse any advertisement. All advertising and advertised products void where prohibited. Please send information, a catalog, or product sample (if legal in the USA) along with your ad copy. Write for DISPLAY ADVERTISEMENTS rates. Send check or money order to *The Entheogen Review*, PMB 808, 564 Mission Street, San Francisco, CA 94105, USA.

## ELEUSIS

Now available, the latest issue features writings by:

C.A.P. RUCK & D. STAPLES,  
C. HEINRICH, T. STIJVE & B. GLUTZENBAUM,  
G. SAMORINI & F. FESTI, T. BENJAMIN,  
and J. GARTZ.

A two-issue subscription is \$40.00 from: GIORGIO SAMORINI,  
Via E. De Amicis 32 (Dept. ER), 40050 Dozza (BO), Italy

## SALVIA DIVINORUM

**5X Extract Incense — Standardized**

Our 5X Extract is standardized, meaning it is made using pure salvinatorin A. Unlike the other crude extracts on the market, which contain a lot of extra chlorophyll and gummy plant fats, our extracts contain none of these additional impurities and burn very cleanly. The result is an incense with much lower levels of unhealthy tar in the smoke than conventional extracts. \$20.00/gm, \$50.00/3 gm. This is the lowest price available anywhere for the highest quality product. We have Hawaiian and Oaxacan *Salvia divinorum* leaves and other extracts available—send for our free catalog.

## PSYCHOTRIA VIRIDIS

We now have available dried *Psychotria viridis* leaves. These leaves are organically grown in Hawaii using no pesticides. Most of the *Psychotria viridis* on the market is a low-quality imported powder—you don't know what you are getting. We sell only beautiful looking whole leaves; the finest available anywhere or your money back. \$30.00/1 oz.

No personal checks accepted. Payment in cash or postal money order only. If paying by postal money order, leave the "Pay To" space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24-hours. All prices are postpaid in the USA; foreign orders inquire for shipping costs. All products unconditionally guaranteed. Inquire for wholesale pricing.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## SAYING GOOD-BYE...

As most readers of *The Entheogen Review* are probably already aware, TERENCE MCKENNA passed away on April 3, 2000, surrounded by friends in San Rafael. In the late '80s and throughout the '90s, more than anyone else, it was TERENCE who renewed popular interest in psychedelics. I believe that JIM DEKORNE's inspiration to begin *ER* was primarily jump-started by TERENCE's writings and talks. A product of the 1960s counter-culture, DEKORNE has credited TERENCE for his renewed interest in entheogens. And I know that my own interest in applied psychonautics was also invigorated from reading and listening to TERENCE. I expect many people owe a large debt of their interest in this area to TERENCE. With his vast historical knowledge and razor-sharp wit, TERENCE made taking drugs seem to be the *intelligent* thing to do.

TERENCE may have shed this mortal coil, but he lives on in all of those who his words have touched. If wishes were horses, we'd all be saddled up and trotting back to the stables, to sit down by the camp fire and listen to him present us with yet another unbelievably fantastic, cleverly-woven riff...

TERENCE, we'll miss you. — DAVID AARDVARK

## WORKING FOR THE MAN

by DAVID AARDVARK

I recently got a job working in an office as a full-time employee for the Federal government. This was quite a change for me, as I hadn't worked a "straight" job for over ten years. The position was considered a "temporary" assignment, in that everyone who worked at this office could only be employed for a few months, and then they all got "fired" and then "rehired" again. (The Feds do this in order to circumvent their own laws that would require them to provide benefits to the employees—pretty fucking ironic, really.)

This work opportunity allowed me to survey the drug-use habits of what seemed to be a fairly diverse cross-section of Americans. The Bureau that I worked for clearly made a concerted effort to hire in a "politically correct" manner; the big boss at my office was an older woman, my boss was a 24-year-old Hispanic man, and there was a reasonable smattering of various Asian groups, African Americans, Russians, Mexicans, and Pacific Islanders. Of course "whitey" was also present (being a 30-something white male myself). We had gays and lesbians, and even one trans-gender man-woman, who seemed to be in the beginning stages of his/her hormone therapy. The age of office employees ranged from 18 to 70+.

It is quite clear that the two drugs used most often at the office were caffeine and nicotine. Most folks were fairly grouchy in the morning until after they had a few cups of coffee. (Although I was not a regular coffee drinker prior to working at the office, I quickly joined in, and along with everyone else supplemented my caffeine doses throughout the day with numerous cans of Pepsi®.) I didn't, however, take up smoking—despite the fact that I could see how it dramatically reduced the actual amount of time that people spent working. 5–10 minute smoking breaks were taken by most smokers approximately every 20 minutes, and any one smoker seemed to be able to quite easily convince any other to "go out for a quick smoke."

The third office "drug" was television. Aside from the TV in the break room (where some employees scheduled their breaks around shows like *General Hospital* and *Cops*), prime-time programming and televised sports events were frequent topics of discussion. In-and-of-itself, TV is a strange sort of hypnotic-style drug, that generally keeps its users sedentary

and sedate—although if you break the spell for a moment, you may become the target of cranky sideways remarks from the person who is currently dosing. The most obvious side-effect of this drug while the user *isn't* tuned in, is the social aspect of discussing the communal hallucinations. (One day, while I was licking a large stack of envelopes, I had three different people chastise me over the course of an hour, demanding to know why I wasn't using a sponge? "Didn't you see that episode of *Seinfeld*, where GEORGE COSTANZA's fiancée dies from licking the envelopes for their wedding invitations?" they each asked. The fact that the story was fictional seemed to have been lost on them.)

While one might expect nothing less than all that I have mentioned so far, it does get more "sordid." Perhaps because I have long hair and wore shorts, T-shirts, and sandals to work, I seemed to be the target for everyone who wanted to discuss drugs. One 20-year-old female spoke repeatedly of her drinking parties, smoking *Cannabis*, and using MDMA, methamphetamine, and cocaine. (She was previously a student at SAN DIEGO STATE UNIVERSITY, so maybe this isn't too surprising.) Her boyfriend was a pot dealer. She explained to me one day that "roofies," GHB, and ketamine all had the same effects (although the only one that she had tried was GHB). She told another coworker that MDMA made you "feel like you were drunk," and she was very adamant that crack cocaine had a mysterious *something* in it that was "bad" for you. When I explained to her that most crack was probably just baking soda and cocaine, she didn't believe me. She was convinced that there was some other poisonous and addictive additive. Nevertheless, she had smoked regular cocaine before, as well as methamphetamine.

The level of knowledge about drugs held by these drug users was disturbingly low. The young lady mentioned above had clearly gleaned all of her "facts" of rohypnol, GHB, and ketamine from the mass media's "date rape" scare campaigns. Another woman told me that cigarette companies put caffeine in their tobacco. A young man, whose parents—from Fiji—still partook in kava kava rituals, explained to me that the active ingredient in this plant (*Piper methysticum*) was THC, "same as in marijuana." Another woman, clearly a "head" in the '60s, told me of her trials and tribulations with "bad acid, cut with speed and strychnine" and she waxed

rhapsodic about the good old days when “OWSLEY’s finest Orange Sunshine” was around. (According to her, OWSLEY was one of the inventors of LSD.) She once told a story of dropping acid while at a GRATEFUL DEAD concert with her mom.

One woman who worked at the office, a bigger fan than most of the ol’ coffee pot, was constantly talking a mile-a-minute and licking her lips. I figured from the get-go, that she was on methamphetamine. It didn’t bother me at all (aside from the lack of quiet), as she seemed to be generally competent at her job. When another employee expressed a concern to our boss that she was likely on crank, and our boss called her on this, she denied it vehemently and acted outraged. I later learned from a good friend of hers at work that she *did* quite frequently use meth, and in fact I heard her snorting-up in the bathroom one evening, when we had both stayed to work late (the bathroom walls in our office were disturbingly thin). This same woman, stumbling over her words one day, told me about how it was a lot of fun to “take LSD and then bar-hop, to watch the stupid drunks.”

The higher-ups at the office were very worried about Equal Employment Opportunity lawsuits instigated from firing people. This was exemplified by the fact that a woman who *had* been fired from a different office for using drugs in a bathroom stall right next to the boss (is this a trend?), had gotten rehired by our office because she wasn’t terminated properly, due to fear of an EEO complaint. It seemed pretty clear to most people that this woman was still riding the horse, since she was frequently nodding off at work. One day I found her sprawled out on top of her desk in a manner that didn’t bespeak “napping.” Worried that she might have overdosed, a coworker shouted her name at her, and thankfully she snapped to. Another worker mentioned to me once that he wouldn’t be able to make a few phone calls for me after 5:00 pm, because “It would be better if I had someone sober make the calls.” He ended up later being terminated for drinking on the job. However, he was rehired in a couple of days, as—despite his drinking problems—he was considered to be one of the better workers.

After a few weeks, it became clear to me that about half of the workers in my department regularly smoked *Cannabis*; some of them—including my boss—on occasion during their lunch breaks. Hell, some workers even grew *Cannabis*! I did have occasion “off-the-clock” a few times to smoke a bowl with my boss and a couple of other coworkers. One of my clerks even brought me a bud one day; clearly a bribe, since he had recently screwed up. But aside from the rare dope-

smoking incident, I tried to keep my own interest in drugs removed from any office discussion. That was until the following happened:

There was one man at work, about 40, who I enjoyed speaking with whenever we got a chance. Eventually, we became friends. We knew a few of the same people (not drug enthusiasts), and despite his totally straight appearance—short hair, proper office attire—he had a good knowledge of art and music, and was well-informed on various political topics. (We both opposed the recent fluoridation of our city’s water.) One day when we were discussing the stress that our office work sometimes caused, he mentioned to me that he had started smoking when he got home, to relax. “*Cannabis*, you know...” (I *did* realize that he didn’t mean cigarettes.) He then mentioned a recent psilocybian mushroom experience to me. And he eventually said something about *Datura* and *Amanita muscaria* mushrooms containing the same toxins. Matter-of-factly, I remarked that, “They don’t really, what with *Datura* containing tropane alkaloids, and *A. muscaria* containing the prodrug ibotenic acid, which is metabolized into the psychoactive muscimol.” He then told me about two fascinating trips that he had taken with large doses of Dramamine®. (Although he did not recommend the experience, the stories were great and really should be written up.) After regaling me with these tales, he shared descriptions his DMT trips, and then excitedly conveyed the information that a friend of his had met the chemist ALEXANDER SHULGIN! “Yeah, I’ve met SASHA too,” I casually remarked. I could no longer keep the cat in the bag, as it were, and I told him all about *The Entheogen Review* (he had never heard of it) and various other projects that I was working on. One day I brought some *kratom* into the office for us to try, while working at our daily mind-numbing chores. (At 1 gram each, the effects were mild, but I suspect concern about other workers noticing the sandy green crap covering our teeth may have caused us to swallow the leaf powder prior to chewing it sufficiently.)

It’s a small world. I never imagined when I started working for the Feds that my workplace would be so totally steeped in drug use, much less that I would meet a fellow aficionado of entheogens. And despite the overwhelming presence of drug use amongst those who worked at the office, this use (aside from the smoking breaks) didn’t appear to hamper in any significant way the ability for most of these people to get their jobs done adequately. Two months ago I quit working for The Man, so that I could get back to work on what I love doing—researching and writing about drugs. Yet in a strange way, my day job also seems to have also filled that bill. ✧

## NOTES FROM THE CALIFORNIA ASSOCIATION OF TOXICOLOGISTS CONFERENCE

by EARTH EROWID

The Entheogen Review *generally strives to present original material, and rarely reprints information that is available on the world wide web. We have made an exception in the case of the following article for two reasons:*

*First, the state of information available related to entheogens on the web is sometimes suspect, and often lacks documentation. We are pleased to offer the following article by EARTH EROWID, a version of which was originally posted at the EROWID site ([www.erowid.org](http://www.erowid.org)). For those who are unfamiliar with this web site, we highly recommend it. Since 1996, EROWID has been amassing quality information. They do an excellent job of making sure that what they present is accurate and well-referenced. One function of EROWID is to act a sounding board, where questions are frequently pondered, and not infrequently answered. They also offer thought-provoking analysis and commentary on current journal articles, particularly in the case of MDMA studies. The EROWID site is really the best available on-line resource for entheogen enthusiasts, setting an example of high signal-to-noise that web sites on any topic would be wise to follow. Check them out—you aren't likely to be disappointed.*

*Second, the following report on a "straight" conference geared towards toxicologists provides the seed of a meme that we might wish to spread. That is, the idea of counter-intelligence. It behooves us to recall the cliched phrase: "Keep your friends close, and your enemies closer." There is no good reason why civilians interested in ending the War on Drugs shouldn't attend such toxicology conferences, or similar events produced by local law enforcement, the FDA, or DEA, whenever possible. Not only does attending such meetings provide an inside view into what "the other side" is up to, but it also allows for the opportunity to change these people's minds on what effective drug policy really is, or can be. The possibility that fruitful discussion and cooperation towards solving the real problems that are sometimes associated with drug use might be achieved by working together with those who are on the opposing side of the War on Drugs should not be immediately dismissed.*

The Entheogen Review *thanks EARTH for allowing us to reprint this article.* — DAVID AARDVARK

MAPS wanted to get a few people to the meeting of the CALIFORNIA ASSOCIATION OF TOXICOLOGISTS (CAT) and so at the last minute RICHARD GLEN BOIRE, director of the ALCHEMIND SOCIETY ([www.alchemind.org](http://www.alchemind.org)) and I decided to fly down to Los Angeles to attend the May 5, 2000 meeting dedicated to "raves and rave drugs." I had no idea what to expect. I could picture anything from foaming-mouthed hard-line drug warriors, to practical problem-solvers, to nerdy scientists. The organizer of the event was willing to have a few people from the "harm reduction" community there and had agreed to allow EMANUEL SFERIOS, director of DANCESAFE ([www.dancesafe.org](http://www.dancesafe.org)) a five-minute slot to talk about his pill testing. [See page 66 for more information on this organization.]

Overall I found the conference very uplifting and positive. During the social periods I spoke with the other attendees and ended up spending a great deal of time with one particular group of criminologists and toxicologists, perhaps some of the younger people there, between the ages of 25 and 40. Generally the people I talked to were not rabid War on Drugs types at all; there were some who were "anti-drug,"

but this didn't seem to translate into an absolute belief in the current policies, and most people I spoke with at any length expressed that they thought the current system had real problems and needed change.

One of the toxicology labs apparently has an office copy of *PIHKAL* and several of the people from the lab have read the book, so that was a fun topic of conversation. As far as what these people mean to harm reduction, I don't know. I think it's possible that those working in toxicology labs could very-well be sympathetic to the goals of our groups; trying to collect data and figure out what's going on with the deaths. The toxicology associations might be good places to find someone who is willing to put in some time in reviewing data. Other than that, I don't think that toxicologists or criminologists are necessarily focused on the sociology of use, so harm reduction seems to fall outside many of their areas.

Thanks to the CAT for hosting this event, and for being open enough to welcome me, EMANUEL, and RICHARD. Thanks also to MAPS, for making it possible for us to attend.

### 7:45 AM — REGISTRATION AND CONTINENTAL BREAKFAST

I arrived at the entry to the ballroom of the hotel and they had a table set out where they were handing out name-tags (preprinted for registered members, hand-written for slackers like me). They had folders of all the handouts made up, which was nice, but they didn't really have an appropriate place for me to lay out some of the printouts that I'd brought and I was a little uncomfortable to set stuff out since I didn't yet have any sense of who these people were. I was also dramatically overtired, having had little sleep, so I was trying to get my bearings. I went in and got a cup of coffee and picked a seat in the back row so that in case I had any uncontrollable gesturing or needed to escape I would disrupt as few people as possible.

I talked to a couple of people briefly and started conversing with an older gentleman who does testing of parolees, people in diversion, or in other state supervision. He mentioned how he was against drug use and couldn't understand why anyone would get involved with drugs. He talked about the people he deals with not being able to stop using for a couple days each week in order to pass tests, and the different tricks he personally tried to use to convince people to reduce their use. I mentioned that I was at the conference representing MAPS and EROWID, and briefly explained what that meant. I talked about representing, interviewing, and interacting with groups of users and researchers who are looking into potential medical and beneficial uses of psychedelics. He seemed to find me interesting enough that he moved his stuff so he could sit next to me and we sat next to each other all day, sharing comments about speakers and subjects that came up. He would point someone out and say "you should get his/her contact info—they'd be a great resource."

### INTRODUCTION

The Friday morning session was kicked off by BARRY FISHER, the director of the LA COUNTY SHERIFF'S DEPARTMENT. He said he had been a criminologist for 31 years and that the technology since he started has changed tremendously. He remarked they used to call themselves "pee boilers," because that was part of the process of testing for barbiturates in urine. His mood was buoyant and tone was cordial.

### 8:30 AM — "SUPPLEMENT TIME BOMBS: ANALOGS OF GHB AND PRECURSOR STEROIDS"

The first speaker was ALFREDO QUATTRONE, Ph.D., from the CALIFORNIA DEPARTMENT OF HEALTH SERVICES, "the state version of the FDA, dealing with consumer product issues, food, medical devices, dietary supplements, toxicology review, acute toxins, *etc.*"

A lot of their work comes from Proposition 65, the "Safe Drinking Water & Toxic Substance Enforcement Act," which is responsible for all the labels in California that say things like "known to the state of California to cause cancer or birth defects." He gave a little history of GHB use in the last ten years and talked about their formal process of risk analysis for new products.

He said that they expected that a number of variations of GHB would be on the market soon—esters of 1,4-butanediol, and would be difficult to control under current law. He gave a list of URL addresses as good resources, as well as a list of "disreputable sites," consisting of the LYCAEUM, HYPERREAL, and DANCESAFE. EMANUEL had stepped out during the talk so I told him when he came back in, and he spoke up, saying that he thought that it was inappropriate to include DANCESAFE in the list of disreputable sites (he didn't defend the others) and BARRY FISHER responded very nicely and supportively, saying that he had gotten the list from some news agency in Sacramento. He went on to talk about anabolic steroids; as it wasn't an area I was familiar with or particularly interested in, I stopped taking notes. Dr. QUATTRONE seemed to know his subject well and presented it clearly. He held my interest despite the morning brain-fog that still lingered in my head.

### 9:00 AM — "THE RESPONSIBILITIES OF THE DEA IN REGARDS TO RAVE PARTIES"

The next speaker was MICHAEL BRAUN, Assistant Special Agent in charge of the DEA LOS ANGELES' FIELD OFFICE. An interesting note was his introduction, which tied into a couple of other introductions during the day. BRAUN said that he had been convinced to speak at this conference by the organizer with a bribe of several beers. He was friendly and jovial and told the story of how they had been commiserating about their sons' losses in little-league baseball, and the conference organizer bought him a few beers at a pub with the explicit purpose of getting him to agree to talk to this group. While

this is completely normal and just as it should be, it was very clear that the irony of this social practice was completely lost to these very intelligent people. Imagine instead that he had said, “He promised me three hits of ecstasy if I’d come and give a talk here, so we dropped some E, discussed it, and eventually I agreed to give a talk.”

Unfortunately he didn’t talk at all about raves or parties, but instead his talk was an overview of the DEA viewpoint on the international MDMA trade. He said that the DEA had 100 agents in his “area,” but I didn’t get a sense of exactly what the boundaries of his area are, so it wasn’t a useful statistic. He said that the DEA currently has 4,515 special agents and 2,053 state and local police who are sworn as DEA officers. He gave the prices of MDMA as about 50¢ per to produce, \$2.00 at the highest level wholesale price, \$8.00 a hit at mid-wholesale (which he described as “large sellers buying 500–1000 pills at a time”), and \$10.00 to \$40.00 each at the retail level.

He described pill logos as “marketing techniques,” as did his DEA literature. He talked about how there is a huge disparity in the sentencing for MDMA versus methamphetamine, and considered this a problem that needs to be resolved: 10 kilos of MDMA gets you 5–6 years of prison time while 10 kilos of meth gets 20–25 years in custody.

He listed the precursors of MDMA and talked about how most of the production is in the Netherlands while most of the precursors come from China, India, Poland, and Germany and few other states with “weak” controls. He said that, “the problem is spreading exponentially around the country,” and noted that drugs were being distributed and sold by people of many different races. “This is the rainbow coalition here, folks.”

He mentioned that the largest lab seized in the U.S. had a maximum capacity of 20 pounds of MDMA and that most labs in the U.S. are very small with a maximum output of a few ounces. He said that LA is a major distribution hub for the U.S. and that on 12/21/99 U.S. CUSTOMS seized a 100 pounds of MDMA, which lead to an additional 600 pound seizure. He (and another presenter later) remarked that large busts like these don’t affect the market at all; even huge busts of around 1 million doses like this don’t impact the availability on the street.

He said that FedEx, DHL, and UPS are all used a lot in the distribution, but that they all work closely with the DEA.

He said that the trends are a future large increase in MDMA availability and sales, production in México (“in 3–5 years Mexican production will put European MDMA manufacturing out of business”), an increase in domestic labs, and production in Asia for “regional consumption.”

He remarked that, “The DEA does not have a role in rave parties.” And he said that, “Prevention, education, and law enforcement has been successful.” Although I have no idea by what measure he would gauge success if this is true.

Overall his talk was standard DEA fare. He seemed like an intelligent person who believed in what he was doing. He was “smoother” than the rest of the speakers, most of whom seemed more academic or down-to-earth. He reminded me of a business executive more than a police officer.

There was then a small break where people re-dosed on coffee.

### 9:40 AM — “DXM SOLD AS ECSTASY: RESULTS OF 1.5 YEARS OF LAB TESTING”

EMANUEL SFERIOS spoke for five minutes about DANCESAFE’s MDMA pill-testing program, which he has been doing for over a year now. He had a handout summary of all the pills tested, relating their contents and showing that of the 109 pills tested, 20% contained DXM. He talked a little about how DXM in MDMA tablets could be a contributing factor in the “ecstasy” related emergency room visits from parties. DANCESAFE’S work to test ecstasy, following up on work done by NICHOLAS SAUNDERS, MAPS, and others, is clearly an extremely useful project. It is both an excellent record of the current state of available black market substances and a possible way to reduce the amount of problems associated with misrepresented or adulterated pills. A few of the participants asked questions about the testing. The reception of the idea of harm reduction and pill testing seemed quite positive and supportive. Unfortunately because EMANUEL is a friend and I’ve heard him talk about this before, I didn’t take notes. Nevertheless, it was really excellent to have a member of the harm reduction community giving a presentation about efforts to reduce problems while still cooperating with users.

## 10:15 AM — “THE ROLE OF A NARCOTIC DETECTIVE IN LOS ANGELES COUNTY”

Officer ANTHONY SHAPIRO, an undercover narcotics detective for the LA County Sheriff’s Department, described himself as “half Jewish, half Mexican.” He was about 40 years old, but looked younger—he could get away with being 30 easily. He was obviously very comfortable as a public speaker and had a stand-up comedian delivery style; he made lots of jokes and was entertaining to listen to. He seemed open and friendly and didn’t come across as hardened or jaded. I choose to highlight the unexpected qualities of Officer SHAPIRO, so this does not cover his stories of his years of work in South Central LA with cocaine, heroin, and meth.

He told the story of the history of his career from working in the jail where he said, “99% of the criminals I talked to were related to drugs somehow,” to working briefly in narcotics, to working a beat, and back to narcotics. He had worked cocaine, heroin, and meth cases for a number of years, but the last couple years he moved to doing a lot of work in the rave/party scene and now he works to bust people for selling ecstasy. He mentioned that he had an ecstasy dealer bust set up for later that night.

He talked about how cocaine all comes from the Andes, from South America, and can’t be made here and so it is necessarily going to be replaced with things that can be made in the country or near the border like methamphetamine or ecstasy. He said he agreed with the DEA guy, that he already saw Mexicans selling E, and that over the next three years he expected the Mexicans would be major players in the E market and that the price of ecstasy would drop by half over the next few years as it started to be made in large quantities locally.

He said that he knew people who had been using heroin for 30 years or more. He talked about Mexican workers who buy black tar heroin and stick a small wad in their cheek that they suck on throughout the day. He talked about how many older heroin users are actually in good physical health, as long as they get their heroin.

He then started talking about raves and said that at the big raves, the “guards are searching for water, not guns or drugs,” and that they will take your water away because “its all about money.” He said he is able to sneak his gun into raves.

“The hardest part of the job is remembering you’re still a police officer...other than a few little bad things, [MDMA] is the best drug in the world.”

He said that ecstasy in LA has been primarily at raves and gay parties/clubs, but that recently he’s been infiltrating groups of young married couples (“swingers”) who use it at their parties. He said he had worked to infiltrate several different groups.

“Other than giving you a few bad side-effects, I bet I could convince a lot of the people here in this room to try [MDMA], that’s how good it is.”

He talked about how, as part of creating a credible cover, he gets to pick out a pretty, young 20–25 year old female cop and ask them to go to raves with him as his date. He said that he had to pretend to be on MDMA as parts of some investigations. He said that it was “a great job” and made some jokes about the pleasure of being a 40-year-old man with two kids getting to go out with a young woman dressed up to these parties. He projected a sense of seriousness of the job while obviously being able to joke about it.

He said people seem to be having “the best time” and that ecstasy is “the love drug, the hug drug.” He also spoke about organized crime and the problems around illegal drug sales. He talked about problems in and around raves.

Before lunch, I had the chance to ask him a few questions. First I asked him:

EARTH: When you worked with coke, heroin, and meth, I assume you saw a lot of problems for the users that you attribute to the drugs. What problems do you see with users of E?

Officer SHAPIRO: I worry about what’s in the pills they buy, that its an unknown. But I don’t see the problems I see with meth or rock. Because if you take E one day, the next day you can’t take it again; it won’t do anything. You can take it, but it doesn’t make you feel that good. So kids take it once a week ‘cause they can go out every weekend and have a good time. What I’m worried about with it is the next day they are so washed out, so depressed that they start taking other things to try to make themselves feel better. They start drinking alcohol or maybe taking meth or LSD or other stuff just to not feel so bad, and I worry about that. I also worry about the long-term effects of possible brain damage.

During lunch, RICHARD and I sat with Agent SHAPIRO at a table with a group of about six state criminologists and toxicologists, and one pharmacologist. I queried him again:

EARTH: If you see the use of ecstasy is about to grow by several times and the price going down and you've seen that the use of meth and crack and heroin don't seem to be reduced significantly by law enforcement, what do you see being the long-term strategy?

Officer SHAPIRO: I try not to think about it too much, or I'd have to start drinking and be depressed.

EARTH: Do you see law enforcement solving these problems?

Officer SHAPIRO: No.

After some more discussion at the table, Officer SHAPIRO spoke about the drugs being illegal and uncontrolled and "unregulated," and since anyone could make them, they could have anything in them. RICHARD asked him whether he thought that alcohol-style regulation might work with MDMA and SHAPIRO replied with something like, "maybe, yes."

While he certainly is committed and believes in the necessity of what he's doing, he was also open to discussions of changes in policy. Although I found it difficult to understand why someone who didn't see any significant problems associated with a drug would spend their time arresting people for selling small quantities of it, he seemed a rational, caring, interested person trying to do the right thing.

### 11:00 AM — "TRENDY DRUGS OF ABUSE"

The next presentation was by TRINKA PORRATA, a retired LAPD detective and self-proclaimed expert on GHB. Ms. PORRATA mentioned that she had just come from doing the *MONTTEL WILLIAMS Show* and I believe she has also done several other sensationalistic entertainment television spots. Since there may be a few folks who don't recognize how absurd some of her "facts" were, I've included commentary in brackets. I was initially hesitant to include these critical comments about her, but have done so in order to help people get a sense of my opinion of Ms. PORRATA in person.

PORRATA had a large packet of information in the hand-out folder, including papers she has written on GHB, ketamine,

MDMA, *etc.* Unfortunately these papers are riddled with bizarre rumors and misinformation. Her packet included information about what sort of search warrant attachments to include ("list everything on the warrant so you can take the kitchen sink if you feel like it"). Frightening stuff.

On a side note, I noticed she used the term "trendy drugs" in the title of her talk and several times during her presentation. It seems worth pointing out that she recently acquired the URL "trendydrugs.com," and there could be a strange conflict of interest in her wanting to create a sort of branding around her new term.

As one example of how unreliable her packet was, she included a mention of the car-accident death from last August, which was the subject of the last talk of the day by JOSEPH MUTO, and PORRATA's information was erroneous. MUTO, the chief of the forensic investigation for this accident, noted that none of those involved had taken MDMA, yet Ms. PORRATA's paper states: "The recent, highly publicized deaths of five teens returning from a rave in the mountains whose vehicle plunged off a 1,000 foot cliff 'as though the road just continued' was indeed associated with MDMA; all five came back positive for MDMA or MDA and ephedrine." This statement is false.

As far as her talk goes, I think she came across as bitterly anti-party with an attitude of superiority and a narrow mission that blinds her to the fact that the things she's presenting are so unprofessionally false that you can only take her seriously if you know nothing about the subject. Her tone was condescending and superior, even though she was talking to a room full of well-educated scientists.

She said that rave music is all about mind control. "Techno music is set to mind-control beats, to create a trance in those who listen to it... the DJs don't care about these kids, its about mind control...DJs brag about how many thousands of people they control at parties." [This is utter nonsense.] She spoke about these people with disdain and a sneering condescension that suggests she really hates DJs, ravers, and rave promoters.

She said the most prevalent drug at raves is ecstasy. She stated that she had tried to estimate the number of kids at raves who had also done nitrous oxide and so she "asked the kids" at the parties and she came up with the estimate that "40-70% of the people at raves also use nitrous in an evening." [These nitrous numbers are *way* too high.] She also com-

plained that, “GHB is a huge drug of abuse, the treatment centers don’t recognize this issue, no one recognizes it.”

She named Dr. WARD DEAN and STEVEN FOWKES and called them “stone cold psychos” several times. She definitely had some venom for them. (Along with JOHN MORGENTHALER, DEAN and FOWKES are the authors of the somewhat thin book *GHB: The Natural Mood Enhancer*.)

She said she thought that police who work as security for raves are “insane” and seemed to suggest they were bad cops because they worked these parties and they “look the other way” at all the drug use. “Police turn their back on it, absolutely ignoring [drug use].”

She said that many raves have massage areas and that “the massage parlors inside raves are there to deal with MDMA muscle spasms—this is not people wanting to relax, this is about MDMA muscle spasms.” [Total nonsense.]

She stated that rave promoters shut off the water at parties to be able to sell more water. She described police pretending to be a porta-potty company, bidding for the concession

to do porta potties at raves, and then shutting them down by putting up signs along the road to the parties saying “rave closed by LA COUNTY SHERIFF’S DEPARTMENT.”

She said that some licensed clubs would drag out unconscious customers and “throw the unconscious bimbos off their property, get them as far away as possible, and pretend they didn’t know about it.” She related a story about a particular unscrupulous club that tried to avoid getting insurance marks against them for having too many ambulance calls to their site by removing people from the property if they were unconscious.

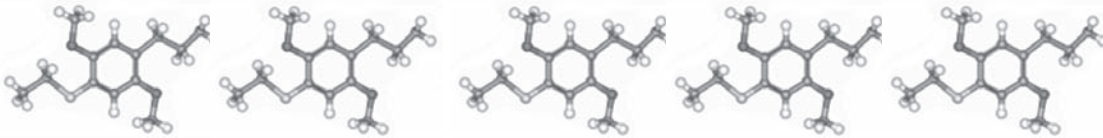

She claimed that people who wear “bright yellow or orange colors” clothing or jewelry “are ‘candy flippers,’ meaning they are using both LSD & MDMA together.” [Total nonsense; clothing colors are not indicative of what drugs people are taking.]

She said that baggy clothing signifies “trance ravers” and “that they can be found in the trance room.” She spent quite a lot of time talking about big, baggy, fuzzy pants as signs of drug use. She said that all big fuzzy pants have secret drug

# Eshu

INCORPORATED

**Eshu specializes in cutting-edge neurochemicals for research scientists worldwide. Eshu is the premier supplier of rare tryptamine and phenethylamine compounds. We strive to push the envelope of neuroscience, with a primary focus on research and development of exciting new materials.**

pockets built into them on the inside upper thigh. [Types of clothing do not reliably indicate what types of music people like. Certainly some clothing has secret pockets installed, but the level of prevalence she described was outlandish.] While I myself am bewildered by the pant sizes of some people I meet, I doubt that their primary purpose is to be able to hide drugs.

She said that many people dress as babies and they do so in order to cover the side-effects of the drugs; this was her explanation of why pacifiers are sometimes used by ravers. I think she is right that the pacifier phenomenon is related to ecstasy (and other stimulant) use and the bruxia and trismus it causes, but I would also say that I've met people with pacifiers around their necks who are completely sober and plan to be sober. Go figure.

She said that "the butterfly is the universal symbol for ecstasy" and that parents should beware if their children start wearing butterflies, because it means the children are into drugs. She said that the kids wear wings on their backs and "those aren't angel wings, parents; those are butterfly wings, and that means ecstasy." Little butterfly hairclips, pins, *etc.* are all symbols of drug culture and drug use. [The butterfly is *not* the "universal symbol for ecstasy," although it does happen to be the marketing logo used by a commercial company for their non-MDMA herbal ephedrine product. Lots of people like butterflies and butterfly hairclips and pins are sold by the bucketful at WAL-MART. Also, I've seen both butterfly wings and angel wings on costumes at parties, yet PORRATA seemed to be saying that *any* winged costumes are indicative of MDMA use. What an odd thing to say.]

She then moved on to talking about GHB and said that by far "biggest single group using GHB are body builders." She said that GHB is slipped into people's drinks and that GOLDSCHLAGER is popular to use for hiding the taste of GHB.

She claimed that "an unbelievable number of the dead kids have large hearts." [I assume that this was intended to suggest that GHB was acting as a strong steroid. It could also be true that those who used GHB for body-building were previous steroid users; hard to say without more data.]

She said that people on GHB can become "very aggressive" and exhibit "PCP-type behavior." She told the story of people "on GHB" climbing buildings, being belligerent, *etc.* She talked about people who told her that when they took GHB their heads would snap forward and back and she told of

one person who supposedly broke several mirrors in their bathroom because their head would hit it while they were standing in front of it as they were nodding off. [This forehead-mirror-smashing seems highly improbable to be something that would occur with any frequency.]

She said that many crime labs now test for GHB, but that most don't test for 1,4-butanediol. She said that a number of GHB relatives were starting to show up, such as "GHV or sodium-4-hydroxyvalerate also called 4-methyl-GHB, or valeric acid" and said there were many more "but for obvious reasons, I'm not going to list them."

*I have to wonder if Ms. PORRATA might not have been confused and thought that she was still on the Montel show. What possible "obvious reason" could their be for withholding information related to the chemical structure of GHB analogues from the toxicologists that might need to start looking for these or their metabolites in drug tests? A comment such as this, presented in the forum that it was, makes me think that either there aren't any other GHB analogues currently available, or Ms. PORRATA couldn't recall or didn't know what their chemical structures were. — DAVID AARDVARK*

PORRATA presented her "information" without the slightest hint of understanding or compassion for the rave attendees she spoke of. She quoted baseless rumors like "90% of kids at raves are on drugs." [I think that any estimates of percentages of people on scheduled drugs at parties are necessarily problematic. My own experience at raves and talking to rave attendees would suggest much lower numbers, but I hate to get into a guessing contest. 90% seems far too high and is based merely on her own extremely negative view, not any type of reliable survey or data collection.]

She spoke like a person so totally out of touch with the generation and culture of her subject and so prone to read all generational and fashion differences as indicative of some type of dirty drug addiction/abuse that she came across to me like an embittered caricature. She seemed to take pleasure in being snide—her dismissive and self-satisfied demeanor belying a total lack of respect for anyone who has ever attended a party to have fun.

She said that rave "music" isn't music at all, as if it were some verified fact instead of the most common of generation-gap fallacies. Her "mind control" shtick was frightening and seemed mostly aimed to incite the basest fears in parents. It fits in with her appearances on whatever entertainment magazine television shows, but in this context it seemed like

a cartoon of what youth might envision as totally out-of-touch authorities and parents.

She was willing to present, again as fact, that all of the accoutrements of rave fashion, silly childish toys, lights, jewelry, clothing, hair pins, hair styles, *etc.*, are necessarily indicative of drug use and should be considered “drug paraphernalia.” She personified the voice of all the misunderstanding there is between parents and children, distilling the fears and mistrust down into something that should become enforced by police and public policy. She drew upon fear of parents about parties by talking about a girl putting her hair in pigtails and dressing in silly clothing and how the parents should see this as a warning sign of drug use.

Does she really have no comprehension or memory of her own youth or any insight into the reasons why teens would want to attend parties populated by peers in costumes, funny clothing, dancing, playing with toys, getting dressed up, kissing and touching others, or joining into the “new cool thing?”

The drug warriors appear to be taking up all the rest of the real-estate left for teens; there is nowhere left to stand besides the area marked “drug user.” Not only are being morose, depressed, spending time alone, not paying attention to fashion, dressing “slutty,” and not washing regularly all signs of drug use, but now so are being happy, being outgoing, spending time at parties, dressing “too young,” playing with toys, liking brightly colored clothing, or wearing butterflies and rainbows. Good lord.

I understand she is upset about the GHB-related deaths and rave-related injuries and deaths, but her data and concerns are so mixed in with false statements that you have to set aside virtually anything she says. The gentleman sitting next to me, who had stated quite clearly that he was “against drugs,” also said of Ms. PORRATA: “She’s on a crusade, you can’t trust her.” I thought that was extremely appropriate.

### 1:15 PM — “THE PROSECUTION OF RAVE PARTIES AND DRUG FACILITATED RAPE”

Next up was KARLA KERLIN of the sex-crimes division, and JOHN RAMSEYER of the narcotics division of the LA DISTRICT ATTORNEY’S OFFICE. Discussing the role of different drugs in what is commonly called “date rape,” KERLIN said she is trying to get people to use the term “drug facilitated rape” or

something similar. She argued for this to make it clear that drug-rapes are usually far less consensual than people normally think of “date rapes” as being.

She said that they are often quite hard to prosecute because the women (she only talked about women) don’t report the crime immediately; women need to come in right away but often wait a few days before filing a complaint.

A common indicator that something has been slipped into someone’s drink is that the person becomes impaired beyond what she has consumed and then wakes up at home, at someone else’s house, or during sex. “Symptoms not consistent with one or two drinks.”

“Drugs are now ideal for sexual assaults.” For one or two days afterwards, the woman may have self-doubt: “Did I drink too much?,” confusion, and memory loss, so they hesitate to report because they have zero memory or flash memories.

The problem is that many of these drugs pass through the system so quickly that there is usually no positive toxicology, meaning that the urine tests don’t show anything.

Another confounding factor is that people don’t tell all the drugs they’ve used recently, not wanting to admit drug use, so they complicate the toxicology analysis. People also do a lot of drugs and alcohol consensually together. You have to tell the victims that they “must be absolutely candid with us about their recent drug use and consensual sexual behavior.”

She said that some of the sexual assault victims show up at the emergency rooms still intoxicated and so they are treated as drug overdoses and evidence is lost. More educational work needs to be done with emergency professionals to make them aware of the problems. She mentioned a big GHB rape case in LA recently, where some DJ was knocking both women and men out at parties and having sex with them, that ended up with multiple life sentences.

She said that if a suspect has a recipe on their computer for GHB, that helps their prosecution case.

She also said that it is helpful when friends will testify that the victim became far more sexually aggressive than usual: “While they may appear to outsiders as the sexual aggressor, they are only reacting that way because of the drug.”

They described a game where people were all given glasses to drink from and then sometime during the cocktail party, someone went around and put stickers on peoples glasses to show them how easy it would be to slip something in their drink undetected.

“I’ve seen no rohypnol in LA—it’s virtually non-existent as a date rape drug—the problem is GHB.”

Someone in the audience said that tetrahydrozoline (VISINE®) is also added to drinks. [I looked into this a little by asking around and was told by several people that visine added to drinks supposedly causes diarrhea, but does not cause any psychoactive effects.]

She said that their office had no estimates at all of the total number of drug-related rape cases reported or prosecuted, nor any data on how common GHB-related rapes are.

MICHAEL ROBERTSON, another presenter, said that the SOCIETY OF FORENSIC TOXICOLOGISTS has formed a committee to look at drug-facilitated rape. He said that in San Diego, “less than 1% of the drug facilitated rape are flunatrazepam [ROHYPNOL®].”

## 2:00 PM — “WHY ALL THE RAVE? BASIC PHARMACOLOGY OF RAVE DRUGS.”

MICHAEL ROBERTSON, Ph.D. is the Chief Toxicologist for the SAN DIEGO COUNTY MEDICAL EXAMINER. He talked about the underground nature of raves, a little history of the rave movement. He mentioned that early raves were a sort of social movement and the drug use was part of the philosophy, but that now the events are very profit oriented and many people just go “to get wasted.” Ironically, while he did mention that “many people rave as a form of social relief,” he also stated that there is “no medical utility for MDMA.” (No one mentioned anything about the possible medical utility of MDMA.)

One amusing and fun note: Perhaps 70% of the images in ROBERTSON’S slide show came from the EROWID site’s archives.

ROBERTSON said that some types of basic drug screens don’t detect MDMA, but one of the CA DOJ people said that their Radio Immuno Assay actually has a higher affinity for MDMA than for meth, and it definitely detects MDMA metabolites in urine.

“At 96 hours you’re not likely to see MDMA in blood or urine.”

Most tests don’t differentiate between D & L methamphetamine, so VICK’S® inhalers can show up as meth.

Dr. ROBERTSON was *generally* well-informed, but made some silly mistakes (as is common outside the subculture), like when talking about ketamine: “If you are in ‘K-land,’ you’re having a good time, if you’re in a ‘K-hole,’ you’re having a bad trip.” [Although the use of slang terms varies from person to person, “K-hole” just denotes a deep, usually high-dose, experience and does not suggest either a good or a bad trip.]

He also said that some “*Cannabis* may contain LSD”—a bizarre statement requiring substantial documentation.

Another major error was his misunderstanding of the term “hallucination.” He said, “You don’t realize you’re hallucinating, you actually believe what you see is real on LSD.” This is: 1) Not the “medical” definition of this term; 2) a rare effect of psychedelics (although it can happen); and, 3) the primary problem with using the term “hallucinogen” for these substances is that non-users don’t understand that most “hallucinations” are just visual effects such as patterning, color shifts, and motion that the user rarely mistakes for “real.”

ROBERTSON said that benzodiazepines are common in drug-facilitated rape, but that rohypnol is extremely rare. He said that alcohol can be used to increase the effects of benzos.

He seemed to think that RIVER PHOENIX’S death was the start of notoriety for GHB, even though he was very clear that PHOENIX’S death was not GHB-related and had just been misreported. He believed that the public must have thought “If RIVER PHOENIX can get high and die on this stuff, so can I.” [He was joking, but he definitely thought that PHOENIX’S death was a catalyst for increased use. I don’t know what to make of this, but I think my impression is just that PHOENIX’S death happened at the start of the media awareness and popularity of GHB as a recreational intoxicant, so they are more co-incidentally than causally linked.]

He said that if you have a bottle with GHB in it and shake it, it should foam a lot because GHB acts as a mild “detergent.” He also said that GBL (lactone) is, “Sold in hardware stores as floor stripper,” and that “GBL use is rampant throughout the country.”

Dr. ROBERTSON was one of the chief experts in the SAMANTHA REID case. He said that the body contains small amount of GHB at all times and that after death, the body's GHB level rises over time and that if you need to test a dead body for GHB, you have to test it very quickly or you'll get useless results. I asked him about both of these points after his talk because there has been some confusion on this issue and he said that GHB is absolutely, positively in the blood and urine always in low levels because its a metabolite or precursor to GABA. He said that he was working on a paper on the issue of GHB increases after death, but that the issue is "very well documented" in many places.

Overall I enjoyed his talk, although this session felt the longest and slowest, perhaps because it seemed like a lot of what he covered had already been talked about. Or perhaps it was my lunch kicking in for that post-eating lethargy.

### **3:30 PM — "DIAGNOSIS AND MEDICAL MANAGEMENT OF OVERDOSES OF GHB AND RELATED DRUGS."**

A very interesting talk by CHRISTINE HALLER, M.D. Dr. HALLER seemed sharp/bright and spoke well. She said she worked at SAN FRANCISCO GENERAL HOSPITAL for the statewide poison control system.

She said that GHB is, relatively speaking, a small drug of abuse. GHB is naturally-occurring in the human body, a metabolite of GABA and a quasi-neurotransmitter. She said that it is like a neurotransmitter and is created by cells as an intermediary step to store or transport GABA from one area to another. She said that GHB acts on the GABA-B receptors instead of the GABA-A receptors, like the benzos (Valium®).

She said that many of the GHB/GBL supplements are sold in colored liquids without child proof caps. She said that she thinks the colored liquids are "quite appealing to young people because of the bright colors." Unfortunately I didn't ask and she did not say whether she has actually seen any children come in for GHB poisoning.

She had a chart of the incidence of calls to the poison control center for the past ten years that was quite interesting, with the number of calls at 356 for 1999, growing from 232 in 1998, and 199 in 1997.

She said that she thinks that some GHB suffocations might be caused not only by vomit or gum or food or foreign material blocking the airway but by just the tongue falling back and blocking the airway by itself.

She said that it is not necessary to intubate GHB coma O.D. patients immediately, but instead monitor oxygen and CO<sub>2</sub> levels and if the blood oxygen levels start to fall far or below normal, then intubate immediately. Patients need to be monitored constantly. I thought this particularly noteworthy because of the controversy that PORRATA and others try to stir around the absolute need for full life-support for any GHB "coma" O.D.

She said some people become combative as they awaken from GHB comas and that it was important not to sedate them and instead use soft restraints to keep the person from moving around too much and hurting themselves.

She said that she thinks that one of the least well reported problems with MDMA use is hyponatremia (low salt), which comes from drinking too much water (water intoxication). She said that the hyponatremia causes cerebral edema and that (some?) patients do not recover full function.

She also mentioned that permanent kidney damage was also a result of some MDMA use. I asked her about this later, and she said that kidney failure was one of the first problems associated with extreme overheating, and that with hyperthermia there also is muscle degradation and brain damage.

Someone asked whether the GHB comas cause brain damage and she answered, "With GHB, if they don't suffer hypoxic damage from suffocation, they recover fully."

### **4:30 PM — "AN ANALYTICAL APPROACH TO RAVE PARTIES AND A CASE EXAMPLE INVOLVING FIVE FATALITIES"**

This talk ended up being very different from what I expected. It was the story of the work of JOSEPH MUTO, Chief of Forensic Labs for the LA DEPARTMENT OF THE CORONER, on the case last August of five teens who, following a weekend rave north of LA and on their way home on Sunday morning, drove off a cliff with their car ending up 1200 feet below. All five were dead and the car was completely crushed.

The news media announced that the accident was “ecstasy-related” before investigators had even started the tests. The CHP determined that the car had been going 35–40 m.p.h. over the cliff and there were no signs of braking.

The blood tests showed that all five were negative for alcohol, GHB, prescription meds, cocaine, PCP, opiates, barbs, and were positive for amphetamines. The confirmation tests showed that two of them were positive for very low levels of meth—low enough that it seemed likely they had taken either low doses or had taken it two nights before. Three of the teens, including the driver, had MDA present in their blood and urine indicating that they had taken MDA the night of the party. They did all the tests twice and had their results scrutinized by the press and DEA. The high profile cases are not fun.

I was impressed that JOHN MUTO seemed still moved by telling the story and looking at the pictures of the crosses that are now at the place the car went off the road.

### SOCIAL HOUR

The social hour was an enjoyable time in the bar of the hotel, hosted by one of the vendors, where each person was given tickets for free drinks. I was too tired to drink anything but caffeinated coke since I had to get in my car and drive to the airport at 8:00 pm, so I gave my tickets to the folks staying in the hotel that night.

I had a great time talking to some of the toxicologists and criminologists and hearing their views on the current policies and problems. While we certainly come from different perspectives and experiences, we all agreed that driving intoxicated wasn't okay, that real problems exist around psychoactives, and that the public policy issues are complicated. All of the people I talked to on the subject (perhaps 10–12) agreed that the current public drug policies are not a valid long-term solution.

Finally, on my way home, I found myself in an excellent mood. I wonder what they put in my coke. ✧

## THE POWER OF THE Amazon Jungle AND THE Peruvian Andes with PETER GORMAN

PETER GORMAN COULD BE DESCRIBED AS A CHARACTER FROM A HIGH ADVENTURE STORY. From his Cold Beer Blues Bar near the docks of the Amazonian town of Iquitos, Peru, or from his Manhattan apartment, Peter Gorman, former Editor-in-Chief of High Times Magazine, leads us into multidimensional settings and then writes about them for an awakening and expanding group of enthusiasts. Known widely by the Peruvian Amazon locals, including the tribal people, Peter has been able to become part of a unique and beautiful experience which he now shares with other explorers during his jaunts into the depths of the jungle for ayahuasca ceremony with authentic shaman/curanderos of ancient lineage.

Curandero don Julio Jerena

“Not too long ago, I took a trip to the Amazon; way back up black water tributaries where I swam with fresh water dolphins and piranhas, camped with los indios and shared their food, communed with shamen and drank ayahuasca, bathed naked in the Amazon at dawn, traveled on riverboats loaded with coca paste and dangerous men. All in all, it was a mind altering, time warping, wonderfully enriching experience...one of the richest experiences of my life. Peter put extraordinary effort into seeing that everyone got exactly what they wanted...This trip is only for people with open minds, and if you bring that with you, Peter will show you the Amazon that few other gringos have had the privilege of seeing. I would go back on another expedition with Peter in a heartbeat.” —Addison Terry

The trips are scheduled  
June through December, 2000.

# INJECTABLE DRUG PREPARATION

by LION (the artist formerly known as TOAD)

---

The Entheogen Review *neither encourages nor discourages the use of needles—we are aware that this is a personal choice. Nevertheless, there is clearly a stigma attached to the use of needles, even in the minds of those who take illicit drugs via other routes. Some of the reasons for this stigma may be: 1) IV (or IM) use of drugs is a route of administration that can provide a quicker method of action (a “rush”) and shorter effects, which may be more likely to lead to drug addiction; 2) The use of needles for illicit drug administration is primarily associated with heroin, and the negative popular image of “junkies” may present a conscious or unconscious idea in the user’s mind that they have “crossed a line” with their drug use that could lead to a greater likelihood of becoming psychologically addicted; 3) Generally speaking, those drugs used illicitly via injection (cocaine, heroin, ketamine, methamphetamine) seem to actually have a greater likelihood of physical addiction.*

*The following information should be seen for what it is—the presentation of a method that allows for harm reduction for those people who chose on their own to use needles. Using pure compounds and following correct sterile procedures are paramount to protecting the health of the drug user. Needles are used as a safe and effective method of drug administration in hospitals worldwide. Our hope is that through education, the days of users sucking up toilet-water into a syringe to get their fix might be numbered.*

*To reduce risk of disease transmission, IV or IM drug users should never share their needles, their works, or a communal pool of “drug water.” Those who feel compelled to re-use needles, need to be instructed on proper disinfection methods: first draw up clean water completely, to remove any excess blood, shake at least 30 seconds to break up blood clots, flush and repeat two more times, dumping the water each time. Then repeat this same procedure three times using pure bleach, and then three more times using pure water again. The plunger must then be removed from the syringe and washed with clean water. More safety information related to proper injection procedures can be found at [www.cures-not-wars.org/junkie/inject.html](http://www.cures-not-wars.org/junkie/inject.html) WE STRONGLY DISCOURAGE THE REPEATED USE OF NEEDLES OR SHARING NEEDLES, EVEN IF PROPERLY CLEANED.*

*Sterile, single-use needles (such as those used by diabetics) should not be difficult to come by; they are available in some states over-the-counter, often can be had from veterinary or farm/ranch supply houses, and also by mail order from some companies. As a last resort, those in the unenlightened USA might make a quick trip across the border to pick some up in México, if simple possession of needles is not a crime in the state they plan to re-enter.*

---

This article is intended to educate drug experimenters on the logistics and technique used to prepare a safe, sterile drug solution that is suitable for intramuscular (IM) or intravenous (IV) injection. First and foremost the purity of the drug is paramount. It is extremely important that you know the exact purity of the material you intend to prepare, and preferably have a certificate of analysis or other documentation which guarantees the quality of the compound is greater than 99.8% pure. Hearing about people injecting street-quality materials such as black tar heroin or bathtub methamphetamine sends shivers down my spine. The traditional spoon cooking method and other techniques such as dry packing are dubious at best. The possible negative consequences from injecting impure or incompletely dissolved drug materials are very serious. Such practices can cause severe irreparable damage to the heart, veins and arteries, and lungs, not to

mention the many other possible complications. It’s also important to have the correct form of the drug that is water soluble and has a relatively balanced pH. The HCl (and other salt) forms of the tryptamines and phenethylamines are typically suitable for injection with a few exceptions. DMT is usually not seen in its salt form on the illicit market since it’s usually smoked. If one had a pure free-base material it would be relatively easy to make a HCl or citrate salt solution for injection, although most of the free-base materials I’ve seen were not pure enough for this purpose. RICK STRASSMAN used the fumarate salt form for his intravenous DMT studies, and ALEXANDER SHULGIN mentions several other salts of DMT such as oxalate and picrate in *TIHKAL*. If there is any doubt in your mind as to whether your material is pure and in the suitable form for injection then please don’t do it.

The following list of materials is what you will need to make a 30 ml bottle of prepared drug solution from which you can draw upon at your leisure. These items may be procured at a medical supply house and/or a scientific lab supply company. Some of these companies require you to set up a formal business account while others are relatively easy to purchase from as an individual with a credit card. Use common sense and a professional manner when dealing with these companies and it's usually a "no questions asked" transaction.

- Sterile syringe (a large 50 cc size is helpful for this process) and several sterile needles.
- 30 ml bottle of bacteriostatic 0.9% sodium chloride (saline) solution suitable for injection.
- Sterile 0.2  $\mu\text{m}$  micro pore filter (25 mm diameter cellulose acetate membrane, or glass filter membrane).
- Small glass bottle with cap that will hold 30 ml of liquid.
- Rubbing alcohol and cotton ball.
- Drug of choice.

Boil the glass bottle and cap/rubber stopper for 5–10 minutes to clean and disinfect it, then allow to dry. Now its time to determine your target concentration and weigh out the drug material. Say that you have 750 mg of *N,N*-dipropyl-tryptamine HCl and you want to make your injection solution 25 mg per ml. Your total weight of 750 mg is divided by 25 mg which equals 30 ml of liquid. You can also do the math backwards starting with the number of ml and mg/ml and multiplying that to find the total weight of drug material needed. 25 mg/ml is the proper ratio for DPT, since making it more concentrated will cause those pesky crystals to come right back out of solution.

Put your 750 mg of DPT HCl in the empty glass bottle. Clean the rubber stopper on the sterile saline solution bottle with rubbing alcohol using the cotton ball. Take your sterile syringe and needle and draw out the 30 ml of the saline solution and place it in the glass bottle. You may need to allow some air back into the sodium chloride bottle to equalize the pressure as you go. Save the empty sterile sodium chloride bottle with rubber membrane intact for putting the completed sterilized solution back in.

Next put the cap or rubber stopper on the glass bottle and shake vigorously until all of the drug material goes into solution. If the material is not dissolving you may gently heat the glass bottle by applying a hot tap water bath on the outside of the bottle. Be careful of building pressure from the heat in

your glass bottle, it may cause the cap to pop off and spray your precious elixir all over. Sometimes materials can be very difficult to get into solution, but once you get them in they typically stay in. After the drug has fully dissolved you are now ready filter and sterilize the solution with the filter device. The micron filter will effectively eliminate all bacteria, viruses, and undissolved solids from the solution.

Draw up and fill the syringe with drug solution from the glass bottle and remove the needle. In place of the needle attach the sterile 0.2  $\mu\text{m}$  micro pore filter housing with a twisting motion. It fits into the Luer lock just like a needle. Attach a new sterile needle to the outlet nipple of the micro pore filter. With the outlet and needle pointed upward, gradually apply thumb pressure to the syringe to initiate flow. Continue thumb pressure until all the air in the device is displaced with liquid. Once liquid starts to exit the needle, stop applying pressure and insert the needle into the top of the empty sodium chloride bottle. Now facing the needle downward, apply continuous pressure and fill the bottle with drug solution. You may need to relieve the air pressure build up in the sodium chloride bottle while you are refilling it. This can be accomplished by inserting a sterile needle into the stopper to serve as a release valve. You will need to repeat the filtering process several times if your syringe holds less than 30 ml. Be sure to remove the sterile needle and filter housing before attempting to draw up more unsterile solution from the glass bottle. Attach the old needle (unsterile) that you used the first time when drawing up the unsterile solution from the glass bottle, or just draw it up without a needle. Reattach the sterile needle and filter housing and finish filling the sterile saline bottle. If the filter flow becomes too slow or the resistance excessive then change the filter. Be sure to properly label your new bottle with the name of the material and the correct concentration per ml.

IM injection is a very good route for certain materials that have low oral bio-availability such as DPT and ketamine. I suspect that DMT will also be extremely efficient and easier to achieve consistent results with IM injection. Be extremely careful and ramp up your dosages slowly. This is serious stuff folks—once you take the plunge there's no turning back. ✧

# PHARMACO-POLITICAL PRISONERS

*Sand moves slowly through the hourglass for our brothers and sisters who are doing time as pharmaco-political prisoners in the War on Drugs. Sometimes, their experience with entheogens can serve as an inspiration to make the best of this time, as in the following example from an underground chemist imprisoned at FCI TERMINAL ISLAND in San Pedro, CA.*

When I first arrived I noticed, one day, as I was crossing the North yard, that one of the gardeners was fertilizing the numerous rose bushes here with a strong, chemical fertilizer in large quantity, directly on the central union bud. Strange, I thought. Then I saw that the new branches had been cut off with the old left on, and in general very chopped up. The roses are the only real beauty in this old prison. So I approached the warden and told him what I had observed. He asked me, "You have interest?" I said, "Yes." Two weeks later I was ejected from my laundry job (to my utmost dismay), and was informed that I now worked for landscaping and was in charge of the roses. (My pay was accordingly lowered as a gardener to \$5.42 a month, from \$11.52 a month. Fortunately, my rent is very low and my friends generous.)

Landscaping is a much harder job than the laundry was, as there is a lot of cultivating, pruning, and fertilizing to do. There are more than 230 rose bushes here. Continuous watering is necessary, as the soil here on this man-made island is primarily sand and sea shells. First I did a massive re-pruning, then I convinced the bosses to let me use the two tons of steer manure that I mixed with huge amounts of coffee grounds, sawdust, wood shavings, and bone meal, in an attempt to change the system over to organic and save the rose bushes that were by now badly burned, malformed in leaf and flower, and dying. Massive watering washed the old fertilizer out and then I dug in tons of my new mixture. I have been doing this now for 2 1/2 months; planting the prunings and cuttings, and rooting new roses to replace the old ones. Since I've been busy working outdoors, I have not had so much time to write as I did with the cushy laundry job. On the other hand, I told my boss that I would make him look good if he let me work my afternoons in the South yard where I could resume doing two hours of yoga daily. I am losing weight and am as brown as a berry from working outside with my beautiful roses and doing yoga on the lawn. My stud-

ies in Kabbalah, inner healing, and meditation classes, along with the KRISHNA-consciousness group and Siddha yoga are really enriching. For the past 40 years I have studied GURDJIEFF, KRISHNAMURTI, MILAREPA, RAMAKRISHNA, the Sufis, psychedelics, and practiced aikido, T'ai Chi, vipassana, yoga, and Zen. I also lived with RAJNEESH for eight years. Obviously I am not too bright, but there is hope. There is a Sufi saying, "The dog who runs between two wells dies not of thirst but of exhaustion." Well, this old dog is not dead yet, but he does slow down once in a while to gaze at the still, silent surface reflecting the All, or to be total with the fragrance and beauty of a rose.

I've been reading a couple of very beautiful books sent to me over the past two years (in bits and pieces, so that I could get them), by my beloved USHA. These two books are so unique and so clear and interesting, that I would like to heartily recommend them:

*The Power of Now: A Guide to Spiritual Enlightenment* by ECKHART TOLLE (ISBN 1577311523, NEW WORLD LIBRARY). This is just what it says it is. I have read it many times—simple, original, practical, sensible, immensely helpful. The inner body meditation that he teaches is a real short cut.

*The Way of No Thinking: The Prophecies of Japan's Kunihiro Yamate* by ROBERT ENGLER and YURIKO HAYASHI (out of print). I've read this one twice.

One book goes inward, the other outward, and they meet on the sacred ground of the connectedness of everything and nothing. Totally modern, no mystification, really sensible. I highly recommend both. I think they epitomize the essence of the paradigm shift that is starting to happen and which is so necessary.

...The rose job is very joyful. How wonderful to be able to create beauty in a place like this. I bring roses to all the departments, and the other prisoners think that I'm brown-nosing or making calculated moves to help myself to gain some specific advantage. This is true. But not in the way they think. The three hands of God are: Truth, Love, and Beauty. The highest is Beauty. The roses are beginning to burst with

flowers now, the leaves are dark green and shining with joy. Everyone is looking at these roses, absorbed in Beauty. This has to change the vibrational quality of the place. Both “sides” comment on how beautiful the roses are. So in some way I can help bridge the illusionary gap between cops and robbers (actually, staff and prisoners, since 65–75% of the prisoners are *political* prisoners who are in for herbs and powders... I think they call them “drugs”), and bring beauty into the consciousness of these people so alienated from themselves and Love. Nice job.

...This place is old and decrepit; run by people who work for salaries—dehumanized individuals who toy uncaringly or even cruelly (for the most part) with the lives, feelings, and freedom of the true victims of the War on Drugs—the “perpetrators.” The *real* terrorists who glory in this despicable cruelty they create are the leaders who perpetuate their self-fulfilling cycle of “law and order,” producing more lawlessness and disorder to justify their benighted existence. These are the same people who mercilessly plot to bomb or poison, to displace or murder, hundreds of thousands of innocent people to protect themselves and make their lands safe for “democracy.” It is no wonder that the rest of the world is beginning to characterize the USA as a “rogue superpower.”

But if you squint your eyes carefully and hold your mouth just so, while you allow your spirit to resonate into transparency, you can become alive and “nothing” becomes the mother of all: space, the living matrix that cradles the universe into existence. And as we move into this space as just one more grain of electric sand vibrating to the sound of cosmic OM, the power structures lose their relevance and begin to fade as a new dawn blossoms. Just don’t give in to the negativity, don’t buy the stress, just say, “No thank you, there is a new way—the way of beauty and feeling.” Just feel the resonance of humming love that is the glue which Nothing emanates to keep all things playing.

So this is how I deal with prison, and this prison is no different from the prison we all experience in this world of expectations, obligations, irrelevant traditions, and disappointments. It is just a little smaller and meaner; easier to identify and disidentify. Seen in this way, this disgusting pimple on the backside of humanity becomes a temple for transformation—just as every situation in life is that very same blessing. —NICK SAND P.O.W. #35287-136, Spring/Summer 1999. (Correspondence can be sent to Mr. NICHOLAS SAND, P.O.W. #35287-136, FCI Terminal Island, Box 3007, San Pedro, CA, 90731, USA.)

*The above letter is an inspiring example of how one’s spiritual development can provide them with strength. Nevertheless, life in prison isn’t always a rose garden, and even those with the most strident entheognosis can find themselves awash in the fear-filled horror of their oppressive environment. The following letter comes from another pharmaco-political prisoner, interned in the FEDERAL PRISON CAMP at Jesup, GA.*

“They” came for two fellow prisoners a few minutes ago. An “extraction team” tore through our dormitory and the stark terror of our unknown fate grips us all. I don’t know their purpose—if there is one, other than terror. They breath-analyze me. *Me*, who believes that alcohol is only a mediocre solvent for extraction of more useful substances! They enter my monk’s cell as I quietly read, shattering my contemplative silence. My body/mind is on fire with nameless fear, heart pounding like that of an animal awaiting slaughter. Their boots gleam like the chitinous abdomens of black widow spiders. Again, it is Nazi Germany, circa 1938, and I’m the *untermenschen*—the hated underclass. Again and again, oh dear sweet mystery, when will this nightmare ever end?

The “Gestapo” took away their human trophies in chains, their fates unknown to us. Their worldly possessions were scattered and brusquely packed—a sure indicator that they have entered the ranks of “the missing” (*i.e.*, those of us that are never again heard from). We cower in silence—fearing that this harvest of flesh is not yet complete—our minds silenced by the somatic knowledge of “their” capacity for cruelty and horror.

We have all died a little more (some more than others) in the face of our helplessness. Within the darkness of our collective despair, sometimes the razor edge of fear is all that remains. Dreaded fear, hated fear—a fear that is the progeny of pure evil—on occasions it is all that reminds us that we’re still alive. Sometimes I’d rather embrace death than to live another day engulfed in this fear. But, I will endure, for I know we must strive to extinguish this evil that seeks to destroy us all. — ROBERT D. MILCHER P.O.W. #15705-018, Fall 1999.

## TERENCE MCKENNA SPEAKS... (PART I)

Transcribed from his talk "Splat" at the ALLCHEMICAL ARTS CONFERENCE in September, 1999

*The following talk was given as the introduction to the ALLCHEMICAL ARTS conference, a week-long seminar that took place in Kona, Hawai'i and which was organized by TERENCE MCKENNA, KEN SYMINGTON, and MANUEL TORRES. The focus of this event was the intersection of psychedelics and the arts. The transcription of TERENCE's talk has been edited slightly, and—unfortunately—there were some places where despite our best efforts at transcription, the tape we were working with was inaudible. As with many "performances" that TERENCE gave over the years, much of the talk is presented in the Socratic manner—a series of questions from the audience and responses from TERENCE. (It should be pointed out that the questions posed come from many different people, not a single individual.) Our transcript will be presented in three installments this year, of which this is the first. As one of the last public appearances that TERENCE made, we felt that it was important to share this with those who weren't fortunate enough to have been able to attend the ALLCHEMICAL ARTS conference. — DAVID AARDVARK*

I haven't actually spoken to a group of people since mid-May, so it's a... first of all, an up-front thing for me to be back into this, and I want to say how easy it's made by being in the presence of at least a hundred friends. So, there are some things that we need to talk about here beside the rising tide. When MANOLO and KEN and I conceived of this theme for a conference in Palenque back in January, it was simply that we felt that the dialog between the psychedelic community and the rest of society had reached a fullness in the areas of chemistry, anthropology, social policy... [it] had reached a fullness where something new could be brought in—something with a little more, maybe political force, behind it.

And what struck all of us, because I suppose of our backgrounds and the history that we brought to it, was that the art community has been very reticent to claim psychedelics as a legitimate source of creativity, even though anyone who studies bohemianism for ten minutes gets the idea that it's about ether, and hashish, and excess, and has been for a couple of hundred of years. So why this complex attitude towards the source of all of this creativity? And the complex attitude goes back clear to the middle of the 19th century. And I felt, we felt, in the context of a new century, and a more enlightened social dialog—I mean what civilization *is*... (loud screeching of car tires), er... *might be*... (laughter)... it was worth trying to understand this idea of the influence of altered states of consciousness on the arts and then the way the politics of that played out, and then where it was at now, in the hands of some major players.

And I thought this morning that the introductions were incredibly modest, and unself-assuming. Just to mention MARK PESCE's accomplishments in establishing VRML as a standard

language for describing virtual reality on the Internet. That's a huge culture-defining thing. BRUCE DAMER's work defining how the self shall be seen in cyberspace through the AVATAR system, is another one of these things where, when its all figured out in some future history, people will see that these decisions, seemingly rationally made in the heat of the moment, actually carried enormous, enormous implications.

Well, so having identified it as an important theme the cultural dialog, there was a deeper level, and I've been thinking about it over the past few months while I've been through all kinds of things. The relationship of art to psyche, in the sense of the title of this conference—ALLCHEMICAL ARTS—bearing the implication that somehow the image itself is transformed and carries implications that are translanguistic and postlinguistic, cannot be told of...

Uh, this is a little slippery... it's hard for me to wrap my mind around it at the moment. But it's the implication that the *word* points beyond itself into gentrification. And somehow one of the things that always fascinates me in the psychedelic experiences, especially tryptamines—psilocybin and that sort of thing—is this transition point where thought *thought*... thought *thought*, becomes thought *beheld*. It goes over some kind of quantize transition point and it is able to pull enough energy into its sphere of implication that it undergoes some kind of an inversion or an unfolding or something and then is beheld as something previously unimaginable. And I take this to be, in some sense, the purest expression of the psychedelic experience. That psyche is conflating language, *inflating* language, filling it out, causing it to take on dimensions that, as acoustical phenomenon, it can't have.

And so, I am tracing this concept back, I see—and it's no news to anyone here I suppose—that *this* is the basis of natural magic. This is why the tie-in to shamanism. This is why somehow the embodiment of the word. This is why, in fact, what magic *is*, is a theory of the world that says that it's made of language. And to some degree, the psychedelic tribes of the late 20th century, hang to this fate. We're not alone, and we're maybe not the most fervent adherents of this form of relativism, but we do tend to believe in the power of the image, and maybe even in the primacy of the image.

Well, so then... because it's magical. Because it's magical. This downloading of language into objectified intentionality replaces, you know the electrons that blindly run...And replaces it instead with a magical, literarily-controlled phase-space of some sort, where, you know, wishes come true, curses work, fates unfold, and everything has a quality if drama, denying entropic mechanistic existence. So what an impact then, this has, on the mechanistic post-industrial mind that is accustomed to operating under industrial algorithms of work, and reward, and routine, and this sort of thing.

But, these images haunt Western history, for a long time, before we get to the industrial revolution. I mean the yuppies of Pompei were decorating their atriums with flying *volaille*. And all of these whimsical and grotesque expressions of the unconscious that make their way into folklore are in fact forms of linguistic intentionality. But put through this process of psychedelization. And of course it leads to all kinds of questions like: Are you saying that the Greeks used psychedelics? Are you saying that the Romans used psychedelics? Well, yeah, on one level. But then that's a scholarly question. I mean what's sure, is that *intoxication* has been nibbling at the fractal edges of the social mind in all times and places since dot. And, you know, in some cases they were rather harsh—*Amanita*, perhaps. Or crude alcohols, or something like that. But the human, well... just human *cleanliness* has coaxed out of this many different kinds doorways. Many different kinds of possibilities.

I mentioned the Pompeian stuff, and all that. To me, and this may be a false aesthetic—I'm not claiming I've got some wisdom in this area, but as somebody once said, "But I know what I like," and I think that the grotesque, or the bizarre, or the *outré*, which even in modern art historical period gets into surrealism, and cataphysics, and dada, and all that. But that always spun my bell. And so people like HIERONYMUS BOSCH, who resides in a very peculiar late Medieval context. I mean, HIERONYMUS BOSCH for all we know could be an expres-

sion of a kind of orthodoxy—strange as it appears to our eyes. Or, it could be the expression of a monestrous heterodoxy. It can be read as a—and by *it* I mean *The Garden of Earthly Delights*—it can be read as a statement about altered states of consciousness for sure. I mean if you just move your eye to the upper left corner of the central panel the first thing that your eye encounters is mushrooms in the sky next to a *Datura* seed pod in the presence of naked people standing on their heads doing bizarre acrobatic feats. Well, you don't have to be—it seems to me—a rocket scientist to read this as some kind of statement of heterodoxy and intoxication, and this sort of thing.

And once those themes were enunciated, even though they were enslaved to Medieval piety—as in so like with PIETER BRUEGEL the Elder, where you have this horrific surreal imagery, but in the service of depicting the seven deadly sins, and redemption there from, and so forth and so on, but with a joy in the weirdness of it that scarcely can be hid. And uh well, it just continues, you know. The fruit portraiture of [GIUSEPPE] ARCHIMBOLDO, the whole tendency of Mannerism to go Rococo and turn into crawling hallucinations. Things which only masquerade as imagery, but which are in fact, you know, heavy freight out of the out of the unconscious. And, as I said, by the time that you get to the middle 19th century, you have rampant youth parading through the streets of Paris unfurling banners demanding free hashish and chloroform to the masses. Which is a reasonable social program. (laughter) In reverse order.

So, and then, it all begins to come together. In other words, it's not merely implicit at the end of the 19th century, it's *explicit*. Because pharmacology is beginning to get attraction and people like LEWIS LEWIN are synthesizing and characterizing mescaline. This was done in 1888—beginning to give pure compounds to white Europeans in German settings. In other words to isolate the ethnographic and the folkloric from the pharmacological. And HAVELOCK ELLIS, his wonderful descriptions of mescaline intoxication, I know were an inspiration to *me* as a child, to hunt this stuff down. And you know part of the culmination of the whole idea of the white man's burden was this idea that white Europeans should go out into the netherlands of the Earth and catalog every drug, every fish poison, every spice, every immune-stimulating thing. And this was all done. And in that database were all these hallucinogens. Intoxicants—*dramatic* intoxicants. I mean the Western notion of intoxicants is, you know, makes you socially affable and everybody feels good and sits around. On a scale of what intoxication can be, this is pretty mild stuff,

compared to say, alpha-salvinorin or DMT or something like that. Well, when it was *really* begun to be grasped, not only how dramatic these drug-states can be, but also how dramatically pathological 20th century civilization was, there was the hope of an influence of intent. In other words that these things could be used to model pathology—psychedelic states of discombobulation, or *psychological* states of discombobulation. This idea I think has sort of given way to the realization that “crazy” is not a cleanly enough defined term to do much with it, with that kind of comparing. And that cultural values are obviously *extremely* relative. And cultural values among comparative cultures using different drugs don’t parse at all.

So, in thinking about all of this, and in trying to see if there was like a general thread, or something that you could hang onto rather than just all of these relativistic statements, it seemed to me the underlying faith—and you can argue this and you don’t have agree with me, it could be bullshit—is a kind of naturalistic Platonism. That the *download* is from nature. The order of things is from nature. In the broadest sense, which includes mathematics.

I was comparing in my mind the end of this century, this time we are living in right now, to a hundred years ago. One

of the things that was going on a hundred years ago was that in the better homes of Europe, every three months a supplement was arriving. The complete publication of the botanical and geological and drawings of ERNST HAECKEL, who was this German naturalist who seemed to have a lot of mescaline running in his veins, because when you see his art you can tell, there were *never* oysters like this. (laughter). There were *never* jellyfish *quite* like this... it just sort of spills over. But HAECKEL’s fantastic Nature was informing the late Romantic, late 19th century imagination in an extraordinarily powerful way. It was the graphic interface of that time. And, you know, much of the talk about design in the 20th century—for all of its alienation—was about form following function, and economy of design, and yak, yak, yak, you know all of this.

Well so now, at the end of the 20th century, because of the rise of the artificial... artificiality of the information-controlling sciences, there is an effort to reach out for some kind of over-arching metaphor, and Platonic Naturalism is the only over-arching metaphor the Western mind has been able to come up with in the last 26 hundred years. So it can always be retreaded and brought back around. And what it’s saying, I think, then, is that the...psychedelic architecture of human languages and the human prowess of imagining things,

## JOIN MAPS!

Can you imagine a cultural reintegration of the use of psychedelics and the states of mind they engender?

Please join MAPS in supporting the expansion of scientific knowledge in this promising area. Progress is only possible with the support of people who care enough to take individual and collective action.

BASIC MEMBERSHIP: \$35; SUPPORTING MEMBER: \$100; PATRON MEMBER: \$250+ (Add \$15 for orders outside the U.S.) MASTERCARD and VISA accepted by phone, or through our secure server on-line at <http://www.maps.org/memsub.html>.

Memberships include a subscription to the quarterly *MAPS Bulletin*, which features articles, personal accounts, book reviews, and reports on conferences & allied organizations. As well, all new MAPS members who mention this advert will receive a free a copy of *The Secret Chief* by MYRON STOLAROFF!

MAPS has positioned itself at the center of the conflict between scientific exploration and the politically-driven strategy of the War on Drugs. MAPS is the only membership organization supporting this crucial research. The confidential MAPS mailing list is not available for sale or trade, and the *Bulletin* is sent in a discreet envelope.

**MAPS, 2105 Robinson Avenue (Dept. ER), Sarasota, FL 34232, USA**  
**(888) 868-6277, FAX: (941) 924-6265, [info@maps.org](mailto:info@maps.org), <http://www.maps.org>**

is somehow *also* the architecture of Nature herself...and so then it's an appeal to the... well, it presents itself as Realism, but it's an appeal to pure Romanticism, because it's a *faith*. I mean, we don't *know* what the order of Nature is. We don't even know if the human mind can wrap itself around the order of Nature. Where is it writ that previously carnivorous monkeys should be able to understand the laws that call forth morphogenesis or hang the stars like lights in the heavens, or any of the rest of it? It isn't.

But, in the presence of all this artificiality, this call to reshamanize, to an archaic kind of revival of cultural boundaries and cultural design mores, and so forth, is nearly irresistible. Because going in any other direction is a little hard to imagine. I don't know what it would be. You can dream-up all kinds of realms of artificiality, but eventually they're literary constructs, contextualized within the larger fact of civilization.

Is that all perfectly clear? (laughter) Does anybody want to ask a questions to drag this in some direction?

*You say it's archaic. Really the shamanic interpretations are still extant, and still operating, are not archaic.*

Well, what you're saying is that it's a myth that we've moved beyond the archaic. It's just an illusion of our technical pride, or something like that.

Well, this is an interesting question you know. We're at the end of the age of print, which McLuhan said was, you know, the most alienating age from the object of engagement that human beings have ever gone through. *If* we're at the end of the age of print, then we'll probably discover a different kind of world waiting. And you may well be right. That this idea that we have transcended the printed vehicle, that we can use concepts like archaic and shamanic, but not actually imbibe them, is probably not true. A movement—a *movement* is maybe a little strong—but a group, a *community* like ours, has shown itself to have different kinds of characteristics. Like it's remarkably enduring, and remarkably insular. You know, it's hard to move the things that we're interested in, into the presence of various ethnic groups, or various eco-

# Telluride Mushroom Festival

Telluride, Colorado — August 24–27, 2000

- SASHA SHULGIN, “Psychedelic Mushrooms”
- Dr. ANDREW WEIL, “Eating Well for Optimal Health”
- PAUL STAMETS, “Identification of Psilocybin Mushrooms”
- GARY LINCOFF, “Mushroom Identification”
- Dr. EMANUEL SALZMAN, “Mushroom Poisoning”
- S. THAITHATGOON, “Buddhism and Mushroom Cultivation”

Join us at this unique gathering in the spectacular mountains of southwestern Colorado. Mushroom forays, lectures, a parade, a mushroom taste and feast, music, poetry, dancing, and more.

**Fee:** \$290 with meals or \$250 without meals

nomic groups, and yet we don't die out. We continue to flourish at a certain low level, and to pose a constant conundrum to the values of the culture. The culture is just simply very, very nervous about alteration of consciousness, because the culture is in the business of manufacturing and maintaining a certain set of cultural values. That's what cultures *do*. And they don't ask you to go off and hunt and gather for upsetting concepts that are going to make it difficult to hold the mojo together around the campfire.

And yet that's the news that we keep bringing in. Because the religions—well religions are *not*, but you know the *control systems* that are comfortably wrapped around our shoulders have been there for centuries, and a kind of "it" has been established. I mean it grows more uncomfortable as there's historical acceleration. I don't know.

I wrote a book called *The Archaic Revival*, most of you guys know that. Where the archaic revival in some ways has been the most successful is in the unlikely domain of pop culture and entertainment. In other words, the music can be psychedelically-based and archaic, and everybody can make money off it just the same and be perfectly happy. But for instance, on this island we have a sovereignty that wants political autonomy. Well, there are different ways to think about that. But one of the ways that the ancient politicians thought about it, was all land held in Kona will be proposed back as part of the program of sovereignty. This discussion flings itself to pieces in a hurry. Because a lot of people have a lot of vested interest in land as property. Power of earning. If a culture can live with the psychedelic experience, then it probably has to be mediated through artists, and I guess that's what this meeting is about. Various self-organizing syndicate-type organizations can generate the *materials*, but to actually create a conduit of cultural values into education, political reform, cultural criticism of all sorts, there has to be a community of artists that is not shy about saying what they're doing.

And I think that this is happening to a great degree. But of course people have all kinds of issues about it, because they haven't thought it through. One obvious issue is, "If I require drugs to produce a work of art, am I an *artist*? Or is this work of art my best work?" I think all this is melarky; I mean you know, acrylics, keyboards, code, *everything* is the material of the art. And what is important is what's left when all these ways of technically supporting chronological upthrust, and so forth and so on, are washed away. I mean, I won't recite to you the very important works of Western art supposedly cre-

ated under the influence of drugs, ranging from COOLRIDGE'S *Kubla Khan*, to JACKSON POLLOCK'S *Blue Poles #8*, which has a lot of Scotch whiskey mixed into it.

Yeah?

TERENCE, *before we talked about artists as being the sort of "early warning systems" for culture. Does that mean that psychedelic artists are then sort of the "early warning systems" for the psychedelic community? Are they trying to transfer a message, which then wham—that needs to be disseminated across the psychedelic community?*

Well, I'm not sure what the message is yet, but I think so. Yeah. I mean, there's some kind of antenna. There are a lot of complicated questions here, like for instance, "psychedelic" means "mind-manifesting." Well then, to what degree are the artificial intelligences lurking in the wings "mind manifesting?" And to what degree are they to be dealt with, anticipated, negotiated with, through psychedelics? Do they need to come to us? Do we need to come to them? Is this a *real* possibility? Or are we just scaring ourselves? Is it as preposterous as *Frankenstein* was in 1819 when it was first written? I am not in a position to judge all of this stuff, but I do... I have the faith—out of general systems theory and dynamics, and all that—that as you couple complex systems together so that they have more and more degrees of unregulated and unobserved freedom, they can begin to get weird stuff coming out of that. And we are in such a position now. I mean, all *kinds* of transitions are underway. And nobody's entirely theoretically on top of where we are going or where these systems want to go. You know, software is being written Darwinistically, A.I.'s creep around at the edge of Internet—or we're asked to believe that they *might*—and art, in the form of GREG EGAN and NEIL STEVENSON, and people like that, just turned searchlights on into the weirdest places you can possibly imagine. But it's where you're headed, and not long. We're not talking second foundation here, we're talking fifteen years out.

Yeah?

TERENCE, *you mentioned the phrase "mind manifesting." I'm curious as to how you see the mind? Do you see it as the same as the brain?*

Do I see differences between mind and brain; or are they two sides of the same thing? Well, I've given some thought to this recently. (laughter) Uh... I don't know. I tend to be sort of a

light-hearted reductionist. There are obviously what are called emergent properties, that—out of complex systems you get things that are greater than the sum of their parts. But they always rest on the parts, it seems to me. So what you have is a parametrial structure out of nature, that is, that moves from crude matter to pure thought, across some set of fractal gradients, that are not at this point defined with our science; we don't understand enough about this. Probably the great test of the 21st century for philosophy is whether it can make good on some of these assumptions about consciousness. In other words, can there be consciousness in code? Can you download consciousness into a machine and have it be anything? Because the answers are important, in that they will say different things about the nature of the being. Say, in fact, different things about human nature.

You know, I mean, I don't have any trouble imagining us as a very, very precision, high-end, genetic machine of some sort. But on the other hand it wouldn't knock me off my chair to learn, that *no*, biology, physics, chemistry, and the rest of it, won't even come to delivering you into the presence of thinking. This is why people who do A.I.—that research has to be pushed. To find the limit of the machine. Because if it *has* no limit, then all this psychedelic work that we've been doing, and that was done during the 20th century, will all come to fruition. I mean in a way, maybe we—or I—have too short a time span. And the fact that “heads” like WOZNIAK, and people like that put together the early machines, indicates that consciousness expansion *always* meant machines and drugs and human potential extremes. And that bringing that all together you have the post-modern human, or the trans-human. But I think *pharmacology* was never recognized until recently, for what it is. I mean, all this excitement about nanotechnology; but pharmacology has been moving methyl groups, ethyl groups around for a hundred years, with enormous impact on the most interesting systems in the real world, which were human brains and human behavior. Does that get there? I mean, I don't know. I'm very interested to see, I hope, by the end I'll get to see. It drives me crazy to think that I'll miss a thing. (laughter).

Yeah?

*Did I understand you to say that HAVELOCK ELLIS wrote about psychedelic experience?*

No, I said he wrote about the experience of mescaline. He specifically wrote about it in *The Dance of Life*, I believe. About

mescaline. WILLIAM JAMES wrote *The Varieties of Psychedelic Experience*. [Note: WILLIAM JAMES actually wrote the 1902 book *The Varieties of Religious Experience*. This was clearly the inspiration for the title of the 1966 book *The Varieties of Psychedelic Experience*, by ROBERT MASTERS and JEAN HOUSTON—the book whose title *TERENCE* confused.]

Yeah?

*You were talking about how, as I understand it, a thought then as words—if I understand you—flips over to becoming something that somehow becomes manifest, or something like that. What I'm asking is really is, are you saying that the primary way that creativity operates is through language? Or... I seem to experience when I have created things that go through language, through sound, through imagery; and they're separate formations...*

Well, I think that the kind of genetic heritage that you have, and the kind of language processing that you apply when young, has a big impact on this. I talk a lot about this because... different things happen to me when I take psychedelics, but among the most interesting, it seems to me, are these transformations of language, which are very hard, obviously, to talk about. I mean, it's one thing to say, “Well, there are drugs that cause you to have visions,” and so if you have never had that experience you can just imagine, well there are drugs that cause you to have visions—okay, you can take that on board. But in fact it's a little more complicated than that. There are drugs which transform the quality of thought *into* vision. And why? And how does that happen? And what does it mean about thinking, and what does it mean about ordinary verbal discourse, that it operates in such a low dimensional slice. Is that a culturally-bound thing? In other words, are French people understanding each other on some profound level of connectivity, forever denied English speakers in dealing with each other? Or is that an illusion; are all languages perdictional, and lead you a certain distance, and then...?

And then there are other aspects to it. Why is language so alive? Why, in the psychedelic states, at least to me—and I assume to some other people, ‘though maybe not everybody—words present themselves as almost embodiments of living things? Clowns, acrobats... what is the ontological status of these kinds of illusions?, is a way of putting it without prejudicing the term “illusion.” Or, what does it mean, that when we try to understand ourselves and the world, everything in it comes back animated? Everything *wants* to make language. Everything wants to communicate. Well, is that

an archaic cultural value breaking through? Or is it something that is not a cultural value—is it something deeper? An actual genetic place in the human meat that is occluded by 50 thousand years of law and civilization, and the rest of it. And does it happen in vocation? I mean, these things seem to point back toward the magic world childhood, or some Edenic, perfect world that we've lost touch with. But what is the logic of that, coming through a jungle vine of tamed and enormous [SOUNDED LIKE: dickcodian wristerian avertiaeye track] (laughter), going through and so forth and so on?

Yeah?

*To bring this smashing back to Earth at the present time, can you speak to the cultural pathology that we have to live in, that makes it a crime to want to alter your consciousness, or to take a psychic stimulant, and the pathology in our culture that wants to call it a drug and demonize that concept, rather than to not recognize that to simply change the ratio of gasses in the atmosphere that you breath, you're going to change your consciousness. How did we come to live in a world that differentiates this, and wants to keep us from exploring these other spaces? And perhaps to do*

*something to the artistic temperament that wants to push the envelope from getting in no matter what those psychedelic cops say?*

Well it's a Hellish marriage between the power of imagery and the power of money. And essentially, I think, you know, what the psychedelic experience *is*, is a domain of unclaimed imagery that is being fought over. It's sort of like a gas field where no claims have been staked. It's a free-for-all. Because the images are *hugely* powerful. And all powerful images can be used to sell running shoes, and pasta, and automobiles, and these sort of things. And the artist who previously was beholden to the patronage of the gentry, *now* serves a much fiercer and demanding master, that uses market tracking, and all this sort of thing, to make sure that they're actually getting their money's worth. And so *all* images are charged with magic, and all *new* images are especially charged. And so in a way it saddens me to realize how much of the art school output goes immediately into business and advertisement, and huge enslavement to the idea of not the glory of the image, or the power of the image, but the *buying* power of the image.

## ETHNOBOTANICALS.COM

PURE LAND offers a truly wide selection, low prices, and fast service—a unique resource for hundreds of types of rare seeds, interesting dried plant materials, and concentrated herbal extracts. Current offerings include:

Ayahuasca dried vine sections, *Argyrea nervosa* seeds, *Artemisia absinthium* liquid concentrate, *Acorus calamus* fresh organic Indian rhizomes, betel nut 5X powdered extract and pure Arecoline hydrobromide, *Calea zacatechichi* (the dream herb), *Diplopterys cabrerana* from Peru, *Ipomoea violacea* (4 varieties), kava kava Vanuatu extract powder, *Mimosa hostilis* root-bark, *mapacho* bundles (*Nicotiana rustica* tobacco leaves rolled into log shapes), *Papaver somniferum* seeds (8 select varieties), *Salvia divinorum* leaves from Oaxaca (high salvinorin content), sassafras oil, *Voacanga africana*, and hundreds more.

Send for our large FREE catalog or visit our web site for the latest offerings and prices.

Madison, WI 53705-3700, USA

We ship worldwide and welcome wholesale orders—all of the items listed above are available currently in bulk quantities at great prices.

<http://www.ethnobotanicals.com>

*When reflecting upon a community which supports shamanism to the extent of saving the world, is redefining art as something which is internally generated and held within the community, as opposed to hung on a wall and being subject to what you're talking about...*

The commodification of art...

*Is that part of the process in that? And what's the relationship to dropping ego then, and kind of this preadonnaess that artists have, just sometimes because of their diverse natures, and maybe developed as a coping mechanism in this era?*

Well, I think that artists should be paid, and *well* paid. I mean, it's the most dangerous work there is. Have one of these puppies turn on you and you could lose an arm and a leg in a second, so...

*But I guess what I mean, is like how, in a more archaic situation, where the art was like, worn, and then... or created in, you know, something, a different context, is that...*

You mean outside of a money economy?

Yeah...

I don't know, good luck. That reflects some visionary envisionment that, uh... I don't know how that would work. I mean, maybe the *virtual* dimension holds out the possibility. I mean, imagine if all things of beauty were made of light? Then their commensurate worth would be approximately whatever anybody valued them at. And that might create a kind of... a different kind of market in ideas, where they weren't held so closely.

One of the things that's going on with psychedelics and technology, is the need to make these tools more accessible to people—both the psychedelics, and then the means of communicating this stuff. I mean, animation should be easy, and communications of visual concepts should be easy, CAD-CAMing should be easy. All of these things. Because, what it *is*, is it's some kind of a rewiring of the language enterprise, among human beings. I mean, we run on verbal speech, plus writing for a while. But now there are all these other subroutines that can support the effort to communicate at different kinds of levels. And there's a lot of drug designing that needs to be done too. This is all being handled in a very half-assed, untogether way, in the sense that, imagine the kind of world that could be created if the *goal* were to create tools that sup-

ported and maintained the Platonic ideals of the Good, the True, and the Beautiful. Bringing these things into the world and *maintaining* them. But, if wishes were horses, beggars would ride.

Yeah?

*Do you think that the entities are artists?*

The entities? You mean the DMT...

*Are they just hanging out, and doing their thing?*

Well, no... somebody else said, "the general opinion is they're little doctors." This is what is said, and books have been written around that. I *guess* they're little doctors. But shamanism is a kind of doctoring through art, because it's *image* doctoring. I don't know. As I move along I grow less and less sure of anything, except that it's all *very* peculiar. (laughter) It's not easily parsed. It's not designed to yield. In fact it may never yield. The business of being, I'm just so *struck* by. I mean, how can it be that you just heap together a bunch of chemicals and get philosophical conversation out of it? Given what is happening in this room, what is augmenting it? In other words we have human beings, we have hopes, we have fears, we have failed geniuses, rising stars, this that and the other thing. Given all this... [TAPE BREAK]

Why this circumstance? And why its particular way of being deployed in space and time? I mean really, what psychedelic living is, I think, is just hands-on philosophy. Hands-on philosophy, where the great philosophical problems are not... I mean, *yes*, you've contemplated them. But then every once-in-a-while you grab them by the jugular and bear them, kicking and thrashing, to the mat, for a slightly more intimate examination. To be *embodied* is such a mystery. And what it points toward, if it has any meaning. If it has no meaning then it certainly is a grandiose gesture towards meaninglessness. And, it's *mind*—always wrapping back, looking at itself, seeing its traces against history, against the animal body, against human art, literature, and all the rest of it.

Yeah?

*We've heard a recurrent theme that's dealing with the abundance of opportunity, of awareness, and that the place where art comes into the psychedelic realm, or the psychedelic realm comes into art (whichever way you want to look at it), is that there's a permission for abundance. There gets to be a place where it doesn't*

*have to be rational, or pointed in any way. It's like the opportunity to just enjoy that this is manifesting. That somewhere down the line, perhaps in hindsight, in retrospect, that a... deeper meaning will occur. And that it doesn't have to happen right now.*

Well, that gets the “right now” off the hook, you're right. So, you're suggesting that at *some* point it will make sense?

*Yeah, that if we're looking at the realm of art, or spirit, or Truth—that it's being in the flow, it's enjoying the movement, without necessarily being at the destination of where it...*

This sounds like some form of Taoism, or something like that. Yeah, pretty quickly you figure out how to slice it. There's only several ways, and then all these slices lie on their plates in different geometries, and you try to figure out which one you like. *Meaning* is a real issue. Must there be meaning? Must you *know* the meaning? Must you know the meaning *now*? And then, how do you know if you've got it in front of you? And meaning under modern approaches, is always conferred. Well, that's a different kind of meaning...

*That's a fact.*

Well, that's the conferred meaning. I mean some people are just happy that it's going along, other people want to know how it works. And then the thing itself drives itself to higher levels, it doesn't stay still. Like one of the fascinating things to me, is how recently, evolution, as an order-producing force on this planet; I don't know whether it's come of age, or I've come of age, but I understand it much better, I understand how in matter, in process, there's an appetite for complexity. And something about how my mind is wired and my cultural values are wired, makes me able to appreciate this complexity. So there's a dance between nature, evolution, and the appreciating human mind, that seems to indicate that this is what the Universe wants to be—it wants to be more and more complicated, it wants more and more forms of self-expression, it wants more and more diverse forms of connectivity, and then upon these forms of connectivity, it acts... it winnows, it pushes forward the things with potential and quenches the things without potential, or with less potential. And it generally is a fractal process, moving incrementally forward, at a fairly steady rate. But like all fractal processes, every once in a while, you come around the corner, and you're confronted with some vast, unguessed, unsuspected vista, which shows you a greater part of the pattern than you ever supposed. And this can be you know, the birth of a child, the death of a child, or probably your life can

present you with all kinds of these situations.

*Inaudible audience comment/question.*

Well, a pure simplicity in the complexity. As one dimension fills up, it spills over into the next one. So, you know, when dimension “N” is filled—it's as complex as it can be—you're ready to take step one into dimension “N+1,” which is the *simplest* of all possible dimensions above where you are. But it does seem as though process is ratcheting itself into these higher and higher forms of self-expression. And through time—it can't happen instantly. So somehow *time* is the media in which process lives. And *we* are processes, you know—begin as zygotes, and end our lives somewhat differently, and in that time metabolize thousands of tons of food, transport ourselves all over the world, educate ourselves, and form relationships, have children, and so forth and so on. Manifestation through metabolism. In a way you could say metabolism *is* time, and then this begins to get very close to lead us back to the impact of the psychedelics. Because really what they impact is metabolism. I mean, if you take a pill and you say “nothing happened,” you mean that it did not effect your metabolism. You did not discern it. If you take a pill, and it leaves a human-shaped hole in the ceiling (laughter), you say, “well, we got off,” or something like that. So in a way, metabolism is the fabric of time, and your evolutionary heritage has worked to *smooth* that perception in front of you, to give you basically a sense that time is now. That's your psychological sense. But in fact your body knows that time is rushing ahead of you, time is slipping behind you, you're digesting your last meal, you're anticipating your next meal, and so forth and so on. It's about biology, ultimately, the psychedelic experience. And then it's about how mind is primary to the human experience, the human biology And to the degree that we've left nature behind, maybe we *haven't* left nature behind—not at all. In other words, maybe Manhattan is no less nature than a honeycomb is nature, and we all march to these internal architectonic rhythms, that make us behave as we behave, sequester, plot, scheme, store, reproduce, and so forth and so on, like that.

Yeah?

*I'm not quite sure how to phrase this, but you talked about evolution having an appetite for complexity. And I wonder how you'd contrast that to... it looks like we're in a phase where we're losing bio-diversity, we're losing cultural diversity, we might even be losing intellectual diversity because people... uh... all have access to the same, uh...*

Database...

*Exactly.*

Well, we certainly are losing biological diversity. The question of cultural diversity is complicated. I think if I were betting, I'd bet cultural diversity is expanding as it generalizes. In other words, it's breaking apart. We have specialties, special interest groups, affinity groups, special vocabularies, technical, sexual, political, artistic, and so forth and so on. This is an issue, I mean if we're losing species but gaining human language, is that a net gain? Or how are we to judge these things? Or is all complexity of equal worth? Or is some complexity trivial and debilitating, and other forms of complexity somehow to be treasured? And, the other thing is that the complexification moves around. I mean the human world grows ever-more complex, at the expensive of the natural world. Well, is that a defensible trade-off, or is that just self-serving rhetoric? I don't know. I think it's pretty clear that, *whatever* you think about this, the die is cast. We're moving more and more into a world defined by human codes, human needs, human manufacturing processes, marketing needs... We don't want to reduce nature to a virtual channel somewhere on the Internet—nor could we, obviously—but the degree to which the artificial and the natural mix in any civilization's vision of itself is probably critical to how ill or healthy it is. The 19th century had a very complicated relationship to nature. Like, they didn't deal with it much, but when they did it was with an attitude of incredible sentimentality and reverence and this and that and the other thing. And it set us up probably for the really horrendous pathologies of the 20th century.

Yeah?

*Do you have any idea where the War on Drugs could really win, and push it out of the closet, and if there's a hopeful sign?*

You want to *win* the War on Drugs? (laughter)

*Yes, our side. We want our side to win.*

T: Well, I read JONATHAN [OTT's] letter in [*The Entheogen Review*] where he said that we'd already won. Problem is, if you've already won, it's so unsatisfying. You don't get to have a victory party. I don't know, I think the real challenge is probably to *our* community. If we could design drugs so good that the idea that they should be illegal is preposterous, then the whole thing would be moot at that point. The problem is

that drugs strangely always seem to carry, at least in somebody's eyes, some unacceptable social cost. I don't know, I've lived in an atmosphere where I was being told that *Cannabis* was going to be legal in three years for the past 40 years, and probably many of you have as well. I think it's a complicated question because of money. That money complicates it enormously. As long as you can get \$400.00 for an ounce of weed, the idea of making it legal—the first people you have to convince are the citizens of Humboldt county (laughter), who have children at the SORBONNE, and HARVARD, and... well, it's not exactly welcome news up there.

And then the situation with ayahuasca is a little different. I mean ayahuasca has real potential for psychiatric and shamanical/religious community-building and healing. And in many parts of the world, this is how it's used. But, you know, *many* things go on in Brazil that are not going to be brought on-line here in the United States.

And then another line of thinking is, can their be electronic drugs, that [beg] the question of making drugs illegal? I mean nobody is talking about regulating the special effects industry to keep us from being driven mad, leaping from tall buildings. So, I don't know. Most of the cultural dialog is a flim-flam, I'm convinced.

Yeah?

*I remember a scene at one of these conferences where one of the Drug Czars asked if somebody in the back-office would run out to STARBUCK'S and get him a double-shot espresso, preferably not in front of the press.*

Yeah, well *this* island is build on drugs. This is an island built on coffee, sugar, and *pakalolo*. But coffee and sugar were spun into this from the very beginning. I mean basically Western civilization from 1750 to 1900 was just a mad sugar binge, you know. The fates of whole nations were cast into the flames in order to make sugar. And whole peoples—you know, slavery was brought back into service; sugared the desire for sugar. So it's very complicated. And the psychedelics are the substances which throw it into the highest relief, because they're the most dramatic for each one of us, and cause us to sort of see what it's worth to us. While the subtler things may pass us by. How would the world look if there were more mature attitudes, and time were allowed to pass? Well, I don't know. It depends on different things; the way science develops, the way cognitive psychology develops, the way people understand natural language, the way people understand

what we call the unconscious—which is a concept now that’s been around for about a hundred years, but that is in fairly unstable condition. You know, the unconscious of FREUD, all about suppressed libidinal obsession, and so forth and so on, I wouldn’t think is in very good shape at all. The consciousness of JUNG, is now probably a somewhat cultivated concept. In other words, very real for those who believe in it, but not something being generally sold in the intellectual marketplace as unexamined goods. It plays very strongly for the archaic revival idea, because it basically says, you know, there is no mind, but the primitive mind; or that the primitive mind is the breadth and the width and the depth of it, and over that is a thin surface of behavioral conventions laid on by late industrialism. But, I don’t know, I don’t know. The power of the Jungian ideal as it relates to psychedelics is the power of the image.

Something that I wanted to say about this when I was riffing on alchemy earlier—the thing that unites alchemy and psychedelics, or one of them, is the belief that things beheld are not simply, whatever this means, “psychological” or “in the mind.” In other words, the faith of alchemy is that you can take a symbol, and by pumping energy into it—call it concentration, meditation, whatever— but by pumping energy into it, you can lift it to some level of ontological status that is different from ordinary reality. In other words it becomes a *living* symbol. And of course for the alchemists in the ordinary recension of that metaphor, it was gold—because gold was the universally recognized determinant of worth. But of course anybody working with all that, realized that “gold” meant the universal medicine, it meant CHRIST’S love, it meant immortality; it meant all of these things. It was *amrta*, it was the elixir of immortality.

The puzzle of European civilization for a lot of people is how these kinds of ideas could have grown up in the apparent absence of an explicit psychedelic sacrament of some sort. And, you know, people have looked *hard* at mushrooms, at *Datura*, at henbane, at possibly hashish being brought in from the Middle East. Not much of this stands up. So that’s interesting, because it seems to argue that even in the absence of reliable psychedelic, you get this intense insistence that the mind can cultivate objects out of sheer imagining, and give them a kind of life. And, strangely enough, it was that series of speculations that led into modern science. Because they actually *did* take physical materials—sulfur, mercury, cinnabar, gold, lead, and these things, and boil them, and combine them, and rarify them. And look for changes in them. But with complete naivete—with no sense at all of

the laws of physical chemistry, but rather with the sense of the “drama of the redemption of the green lion,” or the “calling forth of the corpse of the king,” or something... these fairytales of matter. And you know, its amazing that this understanding of matter survived long enough to be re-encountered by people taking psychedelics, who then looked at that and said, oh yes, I *see* what’s being talked about. Not JUNG. He had a *horror* of altered states of consciousness. FREUD to some degree as well, unless it was cocaine. To each his own.

Yeah?

*It seems like listening, or how often it appears, when you speak of psychedelics and that state of manifestation, of how we are talking almost as if we were describing a child, a very young child... Is it possible that we as artists, or as shamans, or as those who are seeking other ways, through drugs or whatever, of maybe going back to that place where... a place where everyone who has come here today may have a disposition... maybe you can remember something. Where we can go back, and take another look at it?*

You mean something in early childhood?

*Well, not necessarily something in early childhood, but that it is identical, it’s as a child, before your mind is filled with all the rest of the crap. Going back and saying oh yeah—because I know from all of my experiences that I go—oh yeah, I remember that from being very—when I was very young, a child. So returning to psychedelics we can go back, once again, without prejudice, and experience once again the glimpse of that view of the universe beyond complexity.*

Well, this is one of those McLUHANESQUE questions, yeah. Was it *reading*? Did learning to *read* somehow linearize and make it difficult to connect to these places, or does it *not* have to do with reading? But I agree, there seems to be places of primal innocence in the mind, and psychedelics recover this stuff for you like the first moment of creation. But it doesn’t... well, yeah... it does that. It does that.

How are we doing? Maybe we should take like a ten minute break, so you can visit, have wanderings—would that be good? Yeah, let’s do that, and then we’ll come back, and those of you who have had enough can make a decent escape. Thank you.

(applause)

◇ **TO BE CONTINUED...**

# AYAHUASCA CONFERENCE REPORT

by EARTH EROWID

On March 17–19, 2000 the AYAHUASCA conference, organized and lead by RALPH METZNER and sponsored by the always-freaky CALIFORNIA INSTITUTE FOR INTEGRAL STUDIES, was held in downtown San Francisco at a large hotel with a nice lobby as a vendors area, but a rather bad conference room. The \$225.00 to \$300.00 for tickets (depending on how much in advance they were purchased) was fairly exclusive, once again affirming the affluence of the entheogen-conference circuit attendees. They ran out of tickets a few weeks before the conference and then sold \$250.00 tickets to a small separate room with a closed-circuit video feed of the presenters. MIND BOOKS was there with an amazing collection of entheogen-related books for sale, and MAPS, THE ALCHEMIND SOCIETY, EROWID, CIIS, BOTANICAL DIMENSIONS, ALLIES, the BOTANICAL PRESERVATION CORPS, DALE PENDELL, the COUNCIL ON SPIRITUAL PRACTICES, the INSTITUTE OF NOETIC SCIENCES, the PACHAMAMA ALLIANCE, HOGEYE ETHNOBOTANICALS, NATIVE JADES, *The Entheogen Review*, a couple other groups, and a small collection of paintings on silent-auction filled out lobby. The tone of the conference was very pro-ayahuasca. With OTT as the notable exception, it seemed that most of the speakers hold ayahuasca in a special category, different from and generally better than other entheogens.

Most sessions were information-rich, but much of this was introductory material and/or material that has already been published, and there was some repetition between speakers. It was difficult for me to sit through the talks because the small folding chairs were jammed together uncomfortably. While the sound was actually quite clear and good, an irritating aspect of the talks was that it was hard to see the presenters on the very low stage. The room was long and narrow and the first 10 or so rows were reserved for special guests of the organizers, so most of the general seats had a blocked view of seated panelists and a poor view of the podium. Some people who watched from the remote room said that they actually got a much better view of the presenters.

The presenters were well-educated in their areas and included ALEX POLARI DE ALVERGA, JACE CALLAWAY, JOSÉ CAMPOS, CONSTANCE GRAUDS, APARECIDA GROOME, KATHLEEN HARRISON, DIANE HAUG, LUZIA KRULL, LUIS EDUARDO LUNA, DENNIS MCKENNA, RALPH METZNER, SILVIA NAKKACH, JEREMY NARBY, JONATHAN OTT, ANNELISE SCHINZINGER, and KEN SYMINGTON.

Although I stepped into and listened to most of the talks, the ones I found most interesting were the talks by NARBY, OTT, and a panel on conservation & entheo-tourism. (JOSÉ CAMPOS remarked, “It is painful for me to see the effects of entheo-tourism.”)

NARBY spoke of his theories about how technical knowledge and insight can be gained through ayahuasca trips, including the ability to perceive DNA directly, as well as a magical knowledge of physics, biology, botany, and medicine. He had a playful, geeky, and strangely plodding deadpan style (which was quite enjoyable despite how it sounds). He also mentioned how scopolamine extracted from *Brugmansia* (called *burundanga*) is being used in South America in assaults and robberies.

OTT romped through his experiments with 5-MeO-DMT, bufotenine, and the harmala alkaloids. As always, OTT’s command of the language was entertaining and his diction dense. (At one point JACE CALLAWAY quipped, “I’ve looked in the dictionary for some of your words, JONATHAN, and I just don’t find them” and OTT responded without missing a beat, “Neither do the cops.”) He reported that both 5-MeO-DMT and bufotenine are “quite dramatically orally active” and he complained that “tobacco has been kicked out of the syncretic religions,” meaning that with the *Santo Daime*, tobacco smoking is prohibited, despite the centrality of its role in traditional ayahuasca use. OTT said that while he was experimenting with these things an opossum was his power animal.

Overall, this conference served what I consider to be the primary purpose of these gatherings—a chance to meet other attendees, see the presenters, and sustain a sense of shared enterprise. I was disappointed by the choice of conference rooms and the lack of focus on getting presenters to meet attendees. While OTT and DENNIS MCKENNA spent time in the lobby mixing with the rabble, unfortunately many of the presenters chose not to make themselves available, which I consider a serious flaw with this and other conferences. ✧

# EXOTIC COMPOUNDS UPDATE

by LION (the artist formerly known as TOAD)

With the current availability and more wide-spread experimentation of several interesting and obscure psychedelic compounds, I've been collecting more data and reports in order to further define the nature of the drugs and chart the general consensus among the entheogen-interested community. Here's a brief update regarding some of the rare compounds that are currently making waves.

## 2C-T-7

### (2,5-dimethoxy-4(n)-propylthiophenethylamine)

One of the most interesting and my personal favorite of the experimental compounds to recently surface is 2C-T-7. This compound was listed in *PIHKAL* as one of SASHA's treasures, and for good reason. Many find that it closely parallels mescaline in terms of its psychedelic effects and physical feeling. In the higher dose range people report that the visuals rival those of LSD. In watching a large number of people experiment with this compound it has become evident that there is a very wide dose/response range. 15–25% of the people who try 2C-T-7 are extremely sensitive, with the sensitivity not necessarily related to their size or gender (although it could be said in general that women seem to be more sensitive than men). This has caused quite a few major overload/freak-out situations, and it seems this trend will continue unless people approach this compound with caution. It is essential to start very low and work your way up with any compound that is new to you.

I've had to learn this lesson the hard way (story forthcoming), and I'm hopeful that people will heed my advice. Circumstances such as having the ideal set and setting opportunity, or not having enough material for more than one experiment, may lead a person to abandon common sense and take a first time high-dose plunge in order to get the most out of the opportunity. This kind of risky practice can carry a heavy price, and shouldn't be conducted unless you (and those around you) are fully prepared for the worst. And even that is pushing it.

My suggestion with 2C-T-7 is to start with 10 mg orally and work it up over successive experiments until you learn where

your sweet spot is. Some people require 40+ mg, while others are completely immersed in a "plus-three" experience with as little as 10 mg. Don't be fooled by the long ramp up time, it can take a full 2–3 hours before the effects of 2C-T-7 are felt. I've found that supplementing with *Cannabis* can bring out the best of the material in a "dreaded underdose" situation, leaving me feeling quite satisfied instead of disappointed with the experiment.

It seems that somewhere around  $\frac{1}{4}$  of the people who try 2C-T-7 experience nausea and/or vomiting during the ramp up similar to mescaline. In most cases this seems to be transient during the first 1–3 hours of the experience (similar to the ramp up of mescaline), but for some it can last the entire duration of the trip. Most persons who suffered severe nausea were overly sensitive to the compound and had simply taken too much. In these overload situations there was also extreme disorientation and/or psychological processing that was experienced as an overall "bad trip."

One interesting route of administration for 2C-T-7 is insufflation. I experimented with this and found 4–6 mg snuffed to be equal to 25–30 mg orally. I had heard from a friend that this route was very effective, but that the compound burned the sinuses pretty bad. I placed the material in a calibrated pH balanced saline solution and used a spray bottle (a la OTT) to administer the 2C-T-7, thinking that I might be able to mitigate the burn this way. The solution actually increased the burn factor significantly, and I found myself frantically flushing my nose with saline after about 5 minutes because of the extreme pain. The effects came on quickly over the course of about 10–15 minutes, and lasted for a much shorter duration of 3–4 hours. We have since determined that the best way to snort 2C-T-7 is in powder form, in very tiny increments (< 1 mg per bump) over the course of 15 minutes. This way you can absorb it slowly and not overwhelm the sinus membranes. The burn factor is similar to 2C-B, and doesn't seem suitable for frequent usage. This method can be effectively used to easily boost an underdose situation or to bring another peak to your peak, so to speak.

## 2C-T-2

### (2,5-dimethoxy-4-ethylthiophenethylamine)

Similar in effects with 2C-T-7, 'though more potent, not quite as smooth, and shorter-acting. I haven't seen too many new reports on this one since it has become available.

## 4-AcO-DIPT

### (4-acetoxy-N,N-diisopropyltryptamine)

After writing the "Primer" I received many new reports, with more inconsistencies showing up as additional trials happened. One friend of mine originally described it as being somewhat of a fun-park cruise. Later, during his fourth trial at the same dose, he found the material came on extremely fast (in 30 minutes), and hit him head-on with a full-blown psychedelic entity experience. He described it as being one of his most intense and challenging psychonautical voyages.

I've received several additional reports that also point in this general direction, where the same dose affected the same person quite differently in later trials. This can be typical of entheogens, due to set and setting variations. Nevertheless, I feel this particular compound might even be more apt to shape-shift during the course of the relationship. Like 2C-T-7, there seems to be a fairly wide dose/response curve. Additionally, the general effects themselves seem quite varied for this material—some say that 4-AcO-DIPT is a mild and easy going, while others report a very intense full-immersion type of visionary experience. Clearly it is different things to different people. The general consensus is that duration of the effects last longer than were reported in *TIHKAL* for the 4-HO-DIPT cousin, with the trip lasting anywhere from 3 to 8 hours depending on the person. Although my initial experiments pointed to the use of 4-AcO-DIPT as a sexual enhancement tool, most of my friends have reported that this material was difficult to work with and not optimal for such activity. Definitely not a 2C-B replacement I'm afraid.

# CONSCIOUSNESS TECHNOLOGIES JULY 20-23, 2000

**A conference exploring various techniques for accessing  
and navigating novel states of consciousness**

PRESENTERS WILL INCLUDE:

**Dale Pendell** offers his unique blend of history, poetry, and science. Dale is author of *Pharmako/Poeia*, *Living with Barbarians: A Few Plant Poems*, and the forthcoming (Fall 2000) book *Pharmako/Dynamis*.

**Clark Heinrich** has been published in the journals *Integration* and *Eleusis*. He is author of *Strange Fruit: Alchemy, Religion, and Magical Foods*. He will guide us through the mysteries surrounding the entheogenic *Amanita* mushrooms.

**Kelly Ivors** is a doctoral student in the department of plant pathology and mushroom science at Penn. State University. Kelly will offer a presentation on the wonders of the world of mycology.

**Robert Sullivan** earned his Ph.D. in psychology from Walden University and has been involved in Cabalistic studies for many years. Robert brings us his view of altered states of consciousness and path work on the tree of life. He will also be leading our sweat lodges.

**Crystal** talks on the effects of fragrance on the mind in his presentation of transcendental aromatherapy. Crystal has owned the Garden of Scentual Delights in Prescott, AZ for 8 years.

**Todd Ruetken** and **Eilien Kilgallon** teach us how to access ecstatic states using breath work and movement. Todd is a regular contributor to *The Entheogen Review*, under various pen names.

**Johannes Colby** provides the "growing mushrooms on straw workshop," sending everyone home with a bag of straw inoculated with oyster mushrooms.

**Starlight Trance Band** provides music in the evenings with percussion, strings, and didjeridoo.

The conference will take place in the Cascade Mountains of Oregon, at the edge of the Sisters wilderness area. \$350.00 includes all seminars, workshops, events, and three meals daily. Meals begin with dinner on Thursday and end with lunch on Sunday. Please let us know if you would like vegetarian meals when you register. On-site camping is available. To register send payment to I-9 Research, PMB 128 (Dept. ER), 1972 NE 3rd Street, Bend, OR 97701. Registration packet will contain more detailed travel information. For questions call Richard Nelson at (541) 420-0738 or check our web site at <http://www.charm.net/~propan/ct>.

## 5-MeO-DIPT

(5-methoxy-N,N-diisopropyltryptamine)

The foxy affair has been interesting to watch. It seems to be about a 50/50 split between people who really love the stuff and those that think its completely worthless. Several have reported that Immodium AD diarrhea medicine taken orally in conjunction with the 5-MeO-DIPT will significantly mitigate any laxative side-effects or stomach discomfort, thus making the ride more pleasant. I've also heard that it has a particularly good synergy when combined with DPT.

*My one experience with this had little to recommend. At 12 mg, it lasted much longer than I expected, with lingering effects until the 8th hour, and then a lack of ability to sleep. It reminded me a lot of AMT, but without the nausea. Almost like what I'd expect a very low dose of LSD to be like, but perhaps with a little more euphoria. While I have no great desire to try this compound again, I suppose that if my arm were twisted I might. Overall it just doesn't seem either that psychedelic or that useful. There are, apparently, a substantial number of people who would disagree with me. — DAVID AARDVARK*

## AMT

(alpha-methyltryptamine)

As with the 5-MeO-DIPT there seems to be a select group of people who find this compound to be particularly good for them. It's not one of my favorites, but a few friends of mine swear by it and use it as their stimulating psychedelic of choice. More trip reports and information can be found online at EROWID ([www.erowid.org](http://www.erowid.org)).

*My one experience with this with this compound was unpleasant enough that I won't attempt a repeat experiment. There was a lot of unresolved nausea, and a general feeling of anxiety. — DAVID AARDVARK*

## DPT

(N,N-dipropyltryptamine)

Good ol' DPT remains one of my favorites, especially in conjunction with ketamine. This powerhouse combo is extremely tasty and well worth exploring. My typical dosage is 50–65 mg DPT (IM) with 65–75 mg ketamine (IM). Be very cautious with the dosages—I've seen a few blow outs with this one that weren't pretty. I've also heard some very positive reports about using this compound rectally, with one

experienced couple I know rating it as their all time favorite compound and route. They usually take 50–75 mg rectally without a MAOI and use it for pro-sexual purposes.

## WRAP UP

There's such a wide variety of materials to explore these days, a veritable smorgasbord of gourmet chemicals from which to choose from and experiment with. And I hear there are many more on the way! One of the most interesting and sometimes frustrating aspects of these exotic drugs is the wide variation in personal experience. Similar to experimenting with fine exotic foods, taking a bite from one of these morsels can result in a savory ecstatic delight, or an equally intense recoil and pucker. Just like experimenting with sushi or snails—you'll never know until you try. Only the brave need apply. Who knows, you might even find your perfect medicine.

# THE PLANT AS AUTONOMOUS POWER

by ERNST JÜNGER, translated by STEPHEN SLATER

*The following excerpt is a chapter from ERNST JÜNGER's book Annäherungen. Drogen und Rausch<sup>1</sup> (Approaches: Drugs and Ecstatic Intoxication), first published in German in 1970. It is a wide-ranging, loosely organized account of the author's experiences with ether, alcohol, cocaine, hashish, opium, mescaline, LSD, and psilocybin, along with more speculative reflections on the nature of ecstatic intoxication. Although the book as a whole has not yet appeared in English, the immediately preceding chapter, entitled "Drogen und Rausch," was translated as "Drugs and Ecstasy" in Myths and Symbols: Studies in Honor of Mircea Eliade, edited by JOSEPH M. KATAGAWA & CHARLES H. LONG, pp. 327–342 (Chicago: UNIVERSITY OF CHICAGO PRESS 1969).*

*JÜNGER is best known for In Stahlgewittern (In Storms of Steel), first published in 1920, which is a narrative of his experiences as a front soldier in World War I. A prolific essayist and diarist, he was a prominent figure in Germany's right-wing opposition to the Weimar Republic. Although a foe of parliamentary democracy, he was never a Nazi. During World War II he served as an officer of the German army in occupied France. His allegorical novel Auf den Marmorclippen (On the Marble Cliffs), published in 1939, was read by many as an attack on the Nazi regime.*

*For the most part, JÜNGER doesn't demonstrate or even seek to convince—he observes, muses, reflects. Therein lies one of the obstacles for the reader: his style, despite its outward form, is fundamentally aphoristic rather than essayistic. In the chapter translated here, I have not attempted to amend the original, except in one case of an obvious misprint. Otherwise, in two instances, I have indicated with the notation "[sic]" passages that are problematic for other reasons.*

1. Sämtliche Werke, Vol. 11, pp. 42–45 (Stuttgart: KLETT-COTTA 1978)

When juices of vegetable and animal origin intermingle, new molecules come into being, chains and rings of the most varied sorts are formed. Only recently have we been able to look into this fine structure a bit—were we not able to, then little or nothing would really be altered. This insight, as some suppose and many suspect, probably distracts from more important things.

That some molecules nourish the body and others pass through it naturally is as little disputed as the fact that still others trigger mental effects. The American Indian distinction between everyday and divine nourishment is based on this perception, as is, in the higher cultures [sic], that between natural and sacred substances in general.

The question as to whether these effects are merely triggered or whether they "ensue" leads beyond the problems of the psychologists and the chemists. If we recognize the plant as an autonomous power which enters in order to put forth roots and flowers in us, then we distance ourselves by several degrees from the skewed perspective which imagines that spirit [*Geist*] is the monopoly of human beings and doesn't exist outside of them. A new world-picture has to follow the planetary leveling; that is the task which the next century

will take up. The nihilistic and materialistic theories are called upon to prepare the way for it; thus, their persuasive power, so incomprehensible to their opponents. Of course, even in a storm which uproots forests and tears the roofs off of houses, we don't see the pull of windless distance—the same is true of time.

We are moving here at the edge of quarrels about the Lord's Supper, which occupied minds for thousands of years, occasionally intensifying. It is a matter of bread and wine, of differences between presence and approach. When something really happens, the rough and the fine differentiations collapse. After all, they don't penetrate into the "interior of nature." We can give the widest possible scope to both "that is" and "that means." Basically, they meet in one point. Even on the evening of its establishment, the Supper "meant" something beyond its actuality, although as a high stage of approach.

Today, we are plagued by other worries. Above all, this: that on this path gods no longer steal in.

Around 1806,<sup>1</sup> cocaine was successfully prepared in WÖHLER'S famous GÖTTIGEN INSTITUTE, one of Pandora's boxes for the world. The whole nineteenth century is interspersed with this precipitation and concentration of active principles from organic substances. It began with the extraction of morphine from the juice of the poppy by the twenty-year-old SERTÜRNER, who thereby developed [entwickelte], or rather, unwrapped [auswickelte] the first alkaloid.

As is everywhere the case with the approach to the world of the Titans, concentration and radiation increase here as well. In this world, forces and substances appear which, to be sure, are obtained from nature, but are too strong, too vehement for natural powers of comprehension, so that human beings have to rely on increasing distance and greater caution, if they don't want to destroy themselves. These forces and substances are visible modifications of the entrance into a new world of spirit.

Fermentation, distillation, precipitation and finally production of radioactive matter from organic substance [sic]. With that, the twentieth century begins—1903, discovery of radium and polonium; 1911, NOBEL Prize to the CURIES for the purification of radium from immense amounts of *Joachimsthal* pitchblende. In 1945, the Americans handed over this *Joachimsthal* to the Russians, who extracted large amounts of fissionable material there.

Every transition is at the same time a break, every profit also a loss. When that is felt in the depths, even if not comprehended, the pain is especially great—above all, when there is still suffering due to the retreat of the gods from the Titans. Opinions on it differ like day and night. PIERRE CURIE was among the first victims of motorized transportation († 1906). LÉON BLOY gloated over the news about “the crushing of the infamous brain.”

Just as GOETHE views color as one of the adventures of light, we could view ecstatic intoxication [*Rausch*] as a triumphal march of the plant through the psyche. The immense family of nightshades thus nourishes us not only physically, but also in dreams. For a study of them, systematics would have to be combined with the vision of a FECHNER. Their name, “Solanaceae,” is presumably derived from “solamen,” consolation.

Just as the plant turns toward us not only physically but also spiritually, it did this much earlier erotically, toward the animals. To see that, we of course have to recognize them as on an equal footing with us, even as the stronger partner. Among the most noteworthy phenomena, the true wonders of our planet, is the mystery of the bees, which is at the same time a mystery of flowers. The love-duet between two creatures so

## NOW AVAILABLE!

“*Ayahuasca Analogues and Plant-based Tryptamines* is really great. Many questions I have had are being answered. It's such a little treasure. I have grown *production* botanicals a little myself, and not only is the shared research forum a total blessing and incredible time saver, but is relevant to chemical, biochemical, and botanical experiments I have run also.”  
— NICK SANDS, underground chemist and drug war prisoner.

*Ayahuasca Analogues and Plant-based Tryptamines* combines every entry from past issues of *ER* related to ayahuasca, ayahuasca analogues, and plant-based tryptamines. New editorial remarks provide fresh commentary and bring the text up-to-date. Chapters include: Ayahuasca and Its Analogues; Mushroom Ayahuasca; Phenethylamines and MAOI; Miscellaneous and MAOI; The *Passiflora* Genus; The *Phalaris* Genus; *Arundo donax*; *Desmanthus illinoensis*; *Mucuna pruriens*; *Phragmites australis*; *Psychotria viridis*; *Mimosa tenuiflora* (= *M. hostilis*); The *Acacia* Genus, DMT & 5-MeO-DMT; Pipes & Vaporizers; Book Reviews; Degree of Intensity Scale; a complete Bibliography, and a Botanical Index (238 pages).

The Entheogen Review, POB 19820, Sacramento, CA 95819, USA.

immensely far removed from one another in their form and development must have once been attested, as if by a stroke of magic, through innumerable acts of caring. The blossoms are reshaped into sex organs which adapt themselves in a wondrous fashion to completely foreign creatures—flies, hawk moths and butterflies, also sunbirds and hummingbirds. At one time, they were pollinated by the wind.

That was one of the short-circuits in the ancestral line. A Great Transition. In such images, the veil of the iris becomes transparent. Cosmogonic Eros breaks through the separations of the educated world. The thought that such a thing might be possible would never occur to us, were it not palpably confirmed in myriad ways on a walk through a spring meadow, at every flower-filled slope. Nonetheless, it was not until our era that a human being solved the mystery. Again, a rector: CHRISTIAN KONRAD SPRENGEL—*The Revealed Mystery of Nature* (1793).<sup>2</sup> What we call mysteries are, of course, only manifestations; we come closer to them in the bell-like buzzing under the blossoming linden tree. Knowledge is correspondence.

This plant, although itself hardly mobile, casts a spell over what moves. NOVALIS saw it in his hymns. Without the plant, there would be no life anywhere. All creatures that eat and breathe depend on it. One can only guess how far its spiritual power extends. The parable refers to it above all, and not without reason.

What is wakened, for instance, by tea, tobacco, opium, often just by the mere scent of flowers—this range of delights, from indeterminate dreams to anaesthesia—is more than a palette of conditions. There must be something else, something new which ensues.

Just as the plant forms sex organs in order to mate with the bees, it also weds human beings—and the contact gives us access to worlds we would never enter without it. The mystery of all addictions is concealed here, as well—and whoever would cure them has to give a spiritual equivalent. ✧

1. The original has “1860” here, which is clearly a misprint.  
2. *Das entdeckte Geheimnis der Natur*.

# SACRED CACTI

second edition

Includes entries for the mescaline-containing cacti by species; a simple list including percentages reported; a digested version of the literature published; a comprehensive physical data overview for mescaline including toxicology, assays and reagents; a review of mescaline pharmacology; independent research by Appleseed & Trout suggesting the presence of not only DMT but also 5-MeO-DMT in the Aizoaceae; a brief review of other succulents with reported drug use or published chemistry; a detailed cultivation guide; various preparation and purification routes used by professionals and amateurs; and full references for more details.

422 pages, perfect-bound, with illustrations. \$39.95 + S/H.

# PHARMAKO/DYNAMIS

by DALE PENDELL

---

*The following excerpt on Catha edulis has been extracted from Pharmako/Dynamis: An Adept's Guide to the Excitantia and Empathogenica (Or, Plant Allies of the Excitantia and Empathogenica) by DALE PENDELL. To be released in Fall 2000 by MERCURY HOUSE (www.wenet.net/~mercury), this much-anticipated sequel to Pharmako/Poeia is sure to be a garden of poisonous delights.*

---

## CATHA EDULIS

*Common Names* Khat, chat, qat. The Flower of Paradise.

*Related Plants and Substances* Ephedra spp., Amphetamine.

*Part Used; How Taken* The fresh leaves and twigs are chewed. In Yemen, and Somalia, up to a pound of the fresh leaves and twigs are wrapped in banana leaves into a bundle called a *marduuf*, which keeps them fresh. The *marduuf* itself may be composed of a number of smaller bundles, each weighing about 50 grams. As the leaves and twigs are chewed, the residue is collected in the cheek where it is kept for ten or twenty minutes, until the juices are fully extracted. If the leaves were of the choicest and most tender variety, the bolus may be swallowed. Otherwise it is ejected.

Experienced chewers drink a lot of water along with the leaves.

*The Ally*            *O, thou blessed that contains no demon, but a fairy!*  
*When I follow thee thou takest me into regions overlooking Paradise.*  
*My sorrows are as nothing. My rags are become as robes of silk.*  
*My feet are shod, not worn and bleeding.*  
*I lift up my head—O Flower of Paradise!*  
— Arab song, quoted in DREISER.

Drying the leaves changes their chemistry, so in Africa the use of khat is dependent on proximity to the plants or to a fast distribution network. Formerly, the leaves were drunk in an infusion. When European traders arrived in the Yemeni port of Mocha in the fifteenth century, khat tea was as popular as coffee. But while coffee beans make good cargo, khat leaves do not, and the rest, as they say, is history.

Two main varieties of khat are recognized, red khat and white khat, each sold in the markets under several named grades. Red khat is most preferred, and can be recognized by the red (rather than white) color of the central leaf vein.

In many parts of Somalia khat is chewed by a majority of the population. Successful businessmen may have a special room in their houses for khat chewing. Friends gather in the afternoon, chew khat, and discuss the issues of the day for several hours. Or perhaps Koranic exegesis. In rural areas, farmers chew the leaves before performing the bulk of the day's work.

In Yemen forty percent of the arable land is devoted to *Catha edulis*. Chewing khat cuts across all social lines, chewed by rich and poor alike, by businessmen, merchants, farmers, and, more recently, students.

*Effects* "About like five milligrams of methamphetamine." But more euphoric and much shorter acting.

*The Plant* The origins of khat are known only from legend. Some of the same stories telling of the origins of coffee are told about khat: that it was a gift given to two saints by an angel so that they could spend the night in prayer without dropping off to sleep.

In another story, again echoing stories associated with the coffee bean, a herder named AWZULKERNAYIEN noticed the effects that the leaves were having on his goats who were chewing them. AWZULKERNAYIEN proceeded to try the leaves himself, and was impressed at how he was able to stay up into the late hours meditating. AWZULKERNAYIEN'S name is still mentioned in the ritual prayers recited before chewing the leaves in the eastern horn of Africa.

Like all psychoactive plants, khat is considered to be holy, to be a sacred gift, among those closest to it.

One legend is that khat was the energetic medicine that ALEXANDER THE GREAT used to keep his armies healthy and moving. An interesting story, because of the widespread use of methamphetamine during World War II by the German *Wehrmacht* and other armies.

The first written mention of khat is in the 14th century, when Sultan SABAR AD-DIN states his intention of planting khat in the Christian city of Marad after its conquest.

*Taxonomy* *Catha edulis* is in the Celastraceae. Wild trees may reach eighty feet in height. Morphological variability within the species is high. In some varieties the leaves are opposite, in others alternate. Mature leaves have a glossy surface and are faintly aromatic. The flowers are small, white, five petaled, and grow in attractive axillary cymes.

One particularly potent variety of khat comes from Kenya, where the young stems sprout directly from the major branches, and contains high concentrations of alkaloids in the bark as well as in the leaves.

*Effects* Increased concentration, loquacity, improvement of thought, general well-being. Alertness. Relief from fatigue and drowsiness. Enhancement of imagination. Increase in self-confidence. Improved ability to associate ideas.

The same beneficial effects used to describe low doses of amphetamine. But how many amphetamine users limit their intake to five milligrams? A distinct advantage of khat over amphetamine for many situations is that it is short-acting.

Habitual khat chewing may lead to constipation, anorexia, and insomnia. Deprivation symptoms include malaise and sometimes headaches, not unlike caffeine.

*The Plant* In its natural state, khat grows in the mountains of tropical eastern Africa from 5,000 to 8,000 feet. Tiny white flowers appear in early summer, followed by seed capsules. Khat is rarely grown from seed, however, but is propagated vegetatively, from the lower branches, especially the root suckers. Break off the suckers with a nice piece of the root attached. It can be potted or planted directly in the ground. Khat likes good drainage, full or partial sun, and is tolerant of aridity, poor soil, light frosts, and coastal winds. The plant will respond appreciatively to a little feeding, especially nitrogen.

Because of its tall habit, a row of khat plants would make an excellent fence-like hedge for suburban lots. The *Sunset Western Garden Book* correctly places the plant in good standing as an ornamental shrub for zones 12, 13, 16–24, which covers most of the west coast of the United States and some parts of the Colorado desert. Old plants in parks grow to over twenty feet. Commercial khat is kept pruned to make it bushier and easier to harvest.

*Chemistry* In addition to protein, calcium, iron,  $\beta$ -carotene, B vitamins, vitamin C, tannins and a volatile oil, one hundred grams of fresh khat leaves contain 36 mg cathinone, 120 mg cathine, 8 mg norephedrine, and small quantities of related alkaloids. Cathinone is now widely accepted to be the most active alkaloid, responsible for the greater part of the effects.

In addition to the phenylpropylamine alkaloids, khat contains a group of phenylpent-enylamines, with an extra carbon atom in the side chain with a double bond. Their concentration is low and their effects have not been much studied, except that they are known to be only weak dopamine releasers. Khat also contains another group of alkaloids called cathedulins. Little is known of their pharmacology, but they are not thought to contribute significantly to the main effects of the plant. Khat also contains triterpenes.

For some reason, the actual fresh weight of the leaves chewed by khat users seems to be curiously difficult for scientific researchers to measure. Reported weights vary between 50 grams and 500 grams. PETER KALIX and OLAV BRAENDEN report 100 to 200 grams, which seems reasonable. As 100 grams of fresh leaves may average over 150 milligrams of khatamines, significant quantities of alkaloid are involved.

Cathinone is found mainly in the young leaves. The cathinone content of the leaves can be quite variable between different strains, and between different pickings. Studies have shown that the price of the leaves is highly correlated to their cathinone content, reaffirming once again the value of bioassay.

Cathinone is the biosynthetic precursor of cathine. The reason the cathinone content is highest in the young leaves is because the enzyme that converts cathinone into cathine is not fully present until the leaves mature. Likewise, when the leaves wilt, though no more cathinone is being produced, the enzyme continues converting the existing cathinone into cathine. (Which brings to mind certain possibilities, ways to arrest the enzymatic degradation...maybe like the Chinese do, with tea, or the Aborigines, with *pituri*.)

*Effects* As with most substances related to amphetamines, reports of khat's effects on sex are mixed. Yemenis generally credit khat with increasing sexual potency. One study (ELMI), however, found that while both sexes reported an increase in libido, only the women reported a corresponding increase in performance ability.

*I made a short, informal study on the semantics of this point. Women said that "increased sexual performance" means they would have more orgasms. Men, actually, said much the same thing—that is, that "increased sexual performance" means they would be able to bring a woman to more orgasms. I'm just reporting this. Still, it does kind of make you think...*

To continue: in men, ELMI's study blamed khat for both premature ejaculation and erectile dysfunction, and thus as a factor in the failure of marriages in Somalia. An American-educated economist in Yemen, MOHAMMED AL-SAIDI, blames khat, rather than global market economics, for his country's poverty, because 80 percent of the population spend four hours every day chewing khat and socializing when they could be working. All agree that there is no crime associated with khat-chewing, and that khat's prevalence may be a reason that Yemen has virtually no reported cocaine or heroin abuse.

*Pharmacology* While both cathinone and cathine are stimulants, cathinone is far more potent, and acts more on the central nervous system, while cathine has more peripheral action. Various animal studies have shown that cathinone acts like amphetamine at dopaminergic synapses, eliciting release of the neurotransmitter. Drugs that block the releasing effect of amphetamine also block the same action of cathinone. Rats trained to choose cathinone over saline will choose cathine, when it is substituted for cathinone, but cathine (in that test) is eight times less potent. Cathinone is more lipophilic than cathine, so it penetrates more easily into the sites of CNS action.

Cathinone and cathine are equally strong in producing sympathomimetic effects, such as norepinephrine release. But since more cathine is required for the CNS effects than of cathinone, users prefer high-cathinone strains which would minimize the peripheral

effects. (Sympathomimetic effects are like stress and danger: increased blood pressure, sweating—the “fight or flight” syndrome.)

Cathinone is metabolized quickly, congruent with the short-acting effects of chewing khat. In fact, the rate of metabolism of cathinone is about the same as the rate of its absorption while the leaves are chewed, so the dosage is pretty much limited to the size of your mouth.

*History* The chewing of khat has been spreading, especially since World War II. The British tried to suppress the plant in Somalia in the early fifties, but “even shooting” failed to stop its spread. In 1957 the British replaced the prohibition with an import duty.

*Effects* In Djibouti, where khat is supplied to the city by airlift, it is said that the effects of the khat begin to be felt when the plane is heard overhead.

*Poesis* The *Qat Gimlet*:

Fill a jar with fresh khat leaves, chopped and bruised. Pour high proof alcohol into the jar to the top, working out the air bubbles with a chopstick. Seal the jar and let macerate in darkness for several weeks. Shake occasionally.

Pour one jigger of the tincture into a glass along with one or two jiggers of ROSE’s lime juice. Add a little effervescent water if that’s the way you like your gimlets. Add ice, and a straw. Maybe a slice of lime and a nasturtium flower if you are entertaining. Herbaceous, mildly astringent, wildly successful.

The stimulating effects far surpass the weak presence of alcohol.

Methylene chloride and methanol are both better solvents for cathinone than ethyl alcohol, but then what do you do? Since cathinone may be sensitive to oxidation, it might be effective to add a little vitamin C to the chopped leaves, and to extract the alkaloid as the ascorbate.

I have heard of a quite wonderful khat wine, made with red carnation petals, of a beautiful strawberry blush color—said to be delicious and most agreeable.

*The Ally* A rather perfect source of natural amphetamine. The instability of cathinone and the physical process of chewing the leaves intrinsically limit the kind of abuse that is so common with speed pills or crystal. Perfectly analogous to chewing *coca* leaves, except that with *coca* the alkaloid is easily extracted. Khat is the most promising of any of the caffeine substitutes.

*In those countries  
where plants  
are still free.*

In the United States caffeine reigns supreme. And, outside of the black market and a small number of prescriptions, unchallenged. Coffee is the biggest international commodity after oil, and evidently her corporate servants are not eager to welcome

competition.

*Matters of State and Liberty* The DRUG ENFORCEMENT ADMINISTRATION has placed cathine into Schedule IV of the CONTROLLED SUBSTANCES ACT, and cathinone has now been placed on Schedule I. As if khat chewing, or any of the above mentioned chemicals were any kind of a problem in the United States. The status of the plant, *Catha edulis*, is unclear. The plant is not specifically mentioned, but it clearly contains a controlled substance.

Customs officials occasionally seize shipments of *Catha edulis* being imported for Somali communities in the United States, Canada, and Great Britain. Late in 1999, police in California, acting on a tip, arrested two men who had 242 “illegal khat plants” in the backyard of their home. Canadian police in Toronto have been cracking down on khat, much to the outrage of the Somali-Canadian community.

So instead of the gentle khat, we have amphetamine. Ninety percent of all illicit drug laboratories busted by the DEA and other law enforcement agencies are methamphetamine labs. That should tell us something about the demand for a good alternative to caffeine. And it should alert us to the irony of a speed culture in civil war against its own sibling. Such apparent jealousy within the family may or may not be related to the occult properties of caffeine—the two stimulants are able to co-exist in Yemen and Somalia. Still, it would be interesting to apply the techniques of psychotherapy and family counseling to this dispute within the excitantia.

*The Ally* *And by now it was that time in the afternoon when the effect of the happy possessor of khat throughout all Arabia was only too plainly to be seen. The Arab servant who in the morning had been surly and taciturn under the blazing sun was now, with a wad of the vivifying leaves in his cheek, doing his various errands and duties with a smile and a light foot...Everywhere the evasive, apathetic atmosphere of the morning had given way to the valor of sentient life. Chewing the life-giving weed, all were sure that they could perform prodigies of energy and strength, that life was a delicious thing, the days and years of their troubles as nothing.*

— THEODORE DREISER, “Khat”

*Matters of State and Liberty* Some chemistry students in Michigan, desiring to test out the proportional equation:

$$\text{methcathinone} : \text{cathinone} :: \text{methamphetamine} : \text{amphetamine}$$

synthesized a small amount of the methyl analog. Initial reports were highly positive, but the DEA never gave it a chance. They used their emergency powers to place methcathinone on Schedule I. Probably all the people in the entire United States who had tried methcathinone could have attended the same basketball game.

Subsequent reports on methcathinone from a few researchers seemingly undeterred by Federal Law have been more equivocal. Bingeing is common, with its attendant problems of stress, inability to focus, paranoia, general chaos, and, ultimately, amphetamine psychosis. Who would want to do that if he could get good, short-acting khat, in leaf or in a hot or cold drink? The desire of the people for an alternative to caffeine is clearly evident. Let the people decide, and let the plants lead the way.

Our slogan must be repeated again:

FREE THE OUTLAWED PLANTS!

*The Ally*

*Working in the garden, grazing a little.  
Filling out income tax forms.  
For hangover, for the blues, for the blahs.  
For staying up late, writing.*

# NETWORK FEEDBACK

## CACTI GROWING TIPS

I have found that when it comes to cacti cuttings, some seem harder to get established/rooted than others. I took 4 cuttings of *Trichocereus pachanoi* from the same parent plant. While 2 seem utterly resistant to rooting-out, the other two are going like wildfire. One of the things that I did that really seemed to energize these 2 cuttings was to replot them with the addition of a product called "lava sand." I used one part lava sand (instead of using common sand) to two parts soil. Lava sand contains numerous trace elements that normal fertilizers don't.

As noted, I didn't bother adding the lava sand until after the plants had been potted up once already. To get things going originally, I used a combination of a liquid organic fertilizer called BIO-FORM. I'm sure many of you know of this already. I also used a "bio-stimulant" called agrispon, and SUPER-THRIVE as well. I used 4 caps of BIO-FORM, with five drops of agrispon and 1 drop of SUPER-THRIVE (both of which are heavily concentrated), in one gallon of water. I use a spray bottle set on "fine mist" and give my cacti (and other plants) a weekly foliar feeding of this stuff, either early in the morning or late in the evening. I only use the SUPER-THRIVE once every four-to-six months, because the plants appear to become dependant on this and don't perform well without it.

I have also stumbled onto a combination of soil and soil amendments that my plants really like, all of which can be purchased from a company called RABBIT HILL FARMS. The first is BUDS & BLOOMS, a specialized fertilizer for "flowering plants." It has a high phosphorous content, but also contains colloidal clay (soft rock phosphate), worm castings, and a host of organic fertilizers. As my base soil I use BIG POT, also by RABBIT HILL. It is a thoroughly composted "organic" soil (meaning that it uses no synthetic fertilizers, which "force feed" plants, create soil imbalances, and *do not* feed the soil, which is not how nature works). So I use 1 part lava sand, with 1 part BUDS & BLOOMS, to 3 parts BIG POT, and use the

BIO-FORM (4 capfuls to a gallon of water) to water in. My plants are greener, healthier, and more vigorous. They also had fewer problems with disease and pests than I can ever recall, not to mention that my cactus cuttings are growing so fast you can practically see it.

For the curious, check out *J. Howard Garrett's Organic Manual*, or *The Dirt Doctor's Guide to Organic Gardening: Essays on the Natural Way*, also by GARRETT. These books are what got me experimenting with this stuff in the first place, and he is very knowledgeable.

If you can't find RABBIT HILL FARMS products at your local nursery or garden shops, you can contact them at: RABBIT HILL FARMS, 288 SW CR 0020, Corsicana, TX 75110, (903) 872-4289, fax (903) 872-1488.

Anyway, I just wanted to mention this because I have had some trouble getting my cacti to root, and I had *far* better results with what I described above than with rooting hormones. — T.A., TX

*Foliar feeding for cacti may not actually have much of an effect, due to the protective outer waxy cuticle on the plants (although some of the "run off" might work its way into the soil). For those who don't have a problem using synthetic fertilizers, I recommend PETER's "Excel," which contains all necessary trace elements. It seems to work well, and was recommended to me by an old-time commercial cactus grower. — DAVID AARDVARK*

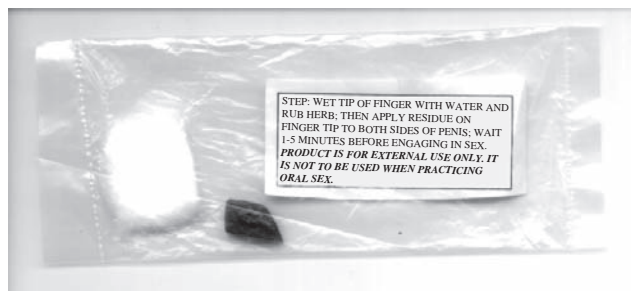

## JUMPING JACK FLASH FIRES

Some of you may remember RICHARD PRYOR's unfortunate flash fire, whatever its mysterious origin. It has come to our attention that several readers using petrochemicals for simple isolations have experienced near catastrophic events. The culprit seems to be underestimating the extreme flammability of vapors arising from heated solvents, or inadequately vented fumes being ignited by various sources including pilot lights. While fortunately no reader has been injured that we are aware of, we want to stress the importance of turning off pilot lights, taking great pains to avoid flames of any type, as well as not operating motors that might produce sparks and making sure ventilation is adequate when evaporating or filtering solvents. Whenever possible, this sort of work is best done outdoors. And wherever it is done, a dry chemical fire extinguisher should be kept close at hand in case of emergencies. — K. TROUT

## SEXY TOAD VENOM

Enclosed is a chunk of toad venom and info on it. I have only used it topically, and have never tried smoking; do you know much about it? Some friends have smoked the venom from the Sonoran Desert (*Bufo alvarius*) toad, and have described cardiac stimulation. Please let me know what you find out, thanks. — E.H., NY

*Without knowing the exact species of toad that this venom came from, I would not recommend smoking it (nor ingesting it in any manner), and I'd be hesitant to use it topically as well. The venom of many species of toads is not safe to ingest, due to various bufotoxins. Extensive anecdotal accounts indicate that Bufo alvarius venom, containing 5-MeO-DMT as the primary psychoactive component, appears fairly safe to smoke. However, with the easy accessibility of pure 5-MeO-DMT from various companies, it is probably safer in general to simply leave the toad venom alone.*

## NOVEL TRYPTAMINE(S) & CHARCOAL FOR NAUSEA

If I have learned any lessons from my study and use of entheogens, it is how little I really know about them and how complex and subjective the entire subject is. Are there really any "experts?" Maybe from a scientific perspective there are experts, but I am hard-pressed to find any "expert" psychonauts, 'though some are *more experienced* than others.

My skin-absorption experiments with dehydrated juice extracts of *Phalaris brachystachys* yielded no effects whatsoever at amounts up to 3 grams. 1 gram of this same material taken orally with 3 grams of *Peganum harmala* seeds has a strong effect on me. When I have handled fresh juice extracts, I have had clear effects through skin absorption, but these effects were different from DMT. I suspect the possible presence of novel tryptamines or other active compounds that are not present in the dehydrated materials. My basis for this strange theory is my rather bizarre experiences with *P. aquatica* (formerly classified as *P. tuberosa*).

About five years ago, the first *Phalaris* grass I ever grew in my greenhouse was *P. aquatica*. At that time I had not yet experienced pure DMT, so I had no basis for comparison. Upon drinking one teaspoon of the fresh juice with 3 grams of *Peganum harmala* seeds, I had a very powerful, very short, psychedelic journey, which I erroneously assumed was due to the effects of the DMT. It took me another year to discover the following:

1) I had experienced a new and novel tryptamine of unknown structure; 2) The grasses only produced it when greenhouse nighttime temperatures dropped below 60 degrees; 3) It is volatile and is completely destroyed or lost when the fresh juice was dehydrated; 4) It was, however, effectively preserved if frozen immediately after juicing the fresh leaves of the plant.

A number of my friends tried it, liked it, agreed that it was potent and highly visual, and everyone said that it was nothing at all like DMT. In the summer time the same 1 tsp amount produced no effects at all. When I took up to 5 *tablespoons* of the raw juice, I got definite but mild effects of DMT and 5-MeO-DMT, but none of the effects experienced in the winter time. I called the new substance “mystical tryptamine,” for lack of a better term and for the reason that I was mystified as to what it is. What am I to think of all of this? I once had a variety of *Phalaris brachystachys* that was powerfully psychoactive, but when chromatographed, had a green colored spot in the wrong location for DMT. Probably another unknown tryptamine, because when I took it, it was distinctly different from DMT and not as good, so I abandoned it. My point is, we know practically nothing about any of this, and it is probably prudent to keep a humble attitude with regard to one’s knowledge of these things.

One thing for sure, the part I hate the most is the puking! However, I may have discovered a method to circumvent that, as well as nausea. The following relates some experiences that I have had using charcoal powder along with ayahuasca analogues.

FIRST EXPERIMENT: I took 0.6 gm of a boiled water extract of whole *Peganum harmala* seed with 1 gm of a juice extraction of *Phalaris stenoptera*, all washed down with  $\frac{1}{2}$  cup of water. Both extracts were in dried, powdered form. The previous two evenings in a row I had experimented with 0.6 gm *P. harmala* and approximately 100 mg of whole, powdered *Withania somnifera* root. These two combine very well, and rapidly result in sleep. Nonetheless, I had some queasiness

all day from the previous two days of *P. harmala* use. By 11:50 pm it was coming on strong, and I took a level  $\frac{1}{2}$  tsp of powdered charcoal in an attempt to control the usual nausea that accompanies nearly all of my journeys. By 2:00 am was having an excellent journey, with mild closed-eye visuals, but the experience was of a good quality with no nausea whatsoever. I would be interested in ingesting twice the amount of *P. stenoptera* next time. For the first time in my life I was able to completely focus on the visual effects and my internally altered emotional state, without the usual violent nausea, which is a major distraction.

SECOND EXPERIMENT: At 5:00 pm I took 0.6 gm *Peganum harmala* extract and 2 gm *Phalaris stenoptera* extract, both powders mixed together with  $\frac{1}{2}$  cup of water. By 6:30 pm I was feeling slight effects, but not too much; it seemed to be a *P. harmala* insufficiency. (The last time I did the *P. stenoptera*, I didn’t realize that the previous two days of dosing with *P. harmala* may have been somewhat additive with the dose taken on the third day.) At 6:41 pm I took an additional 0.6 gm of *P. harmala* extract, and an additional 2 gm of *P. stenoptera* extract. My reasoning for taking the *P. stenoptera* was that the previous dose may have already been destroyed by gut MAO. (I was fully aware that I was just guessing at everything, and didn’t *really* have the faintest idea of what might or might not happen.) By 7:24 pm I was starting to have a lot of entheogenic energy surging through my body. There were no closed-eye visuals yet at that point, but I was expecting them to come soon. By 7:40 pm I was not yet really nauseous, but I was having a strong body energy with mild visual effects. I took  $\frac{1}{4}$  tsp of charcoal. (I felt somewhat like the character in the old World War II movie, when—holding a live grenade in his hand with the pin pulled—his trench buddy next to him says, “No, don’t throw it yet. Wait just a little longer.” I was in the middle of an ayahuasca rush and I finally decided it was the right moment to down a little charcoal.) By 8:00 pm I was definitely at the high-end of a plus-two experience. I felt that I was interconnected with something truly awesome. My body and mind formed a bridge with a parallel or alternate world. I felt alert, calm, and peaceful in addition to the 5,000 or so other things going on! There was absolutely not the slightest annoyance from any stomach or colon disturbance, and this was *way* beyond where I usually go with ayahuasca before I am puking my ever-lovin’ brains out! I was, however, starting to get hungry, so I went to eat something. By 9:53 pm I had concluded that this was one of my most enjoyable and trouble-free journeys ever. It appears to me that charcoal powder, taken at the optimum moment, has no effect whatsoever on

the journey itself, other than a complete cessation, or in this case prevention, of all nausea and vomiting. Charcoal may well be equally effective with other nausea-inducing entheogens; more evidence will no doubt be forthcoming with continued use. There is no reason in the future to try any less than  $\frac{1}{4}$  level tsp, as this amount seems to be a sufficiently minimal quantity without sacrificing efficacy. (Additional experiments showed that  $\frac{1}{2}$  tsp of charcoal as the minimum amount works best, and one *could* take more if necessary.) At around 10:00 pm I tried to get some sleep, but I was still buzzing strongly and even having a few mild closed-eye visuals. I got up and took about 100 mg of powdered *Withania somnifera* root, which put me to sleep in the next 20 minutes or so.

Charcoal has both properties of adsorption and absorption. The former refers to its ability to attract and hold particulates to its external surfaces, the latter to its ability to pull particulates into its inner surfaces. (These properties are well-known in pharmacology and chemistry.) Charcoal may be purchased at any local pharmacy, but the material I used I made myself from pieces left in my wood-burning stove. If charcoal's use to abate nausea becomes more widely known, I believe that it will revolutionize the popularity of ayahuasca and other nausea-producing entheogens. From now on for me, puking is for penitents and "New Agers," who believe that it is a part of the spiritual body cleansing process along the path to healing. I say that's a lot of sophomoric bullshit; drug-induced nausea is merely the result of a residual toxic effect in the stomach, which has no function other than to cause misery and malaise.

As a related aside, it appears at this time that the *Phalaris stenoptera* is about  $\frac{1}{3}$  less potent than the same amount of *P. brachystachys* from Greece.— B. GREEN

## NAUSEA AND ACUPRESSURE

Some number of issues back, there was a discussion about nausea while tripping, and the question was posed, "Is this a psychological or a physiological effect?" I too experience a fair amount of nausea while tripping on mushrooms, and for me it is almost exclusively psychological. And so I would like to share some acupressure techniques that I have found effective for nausea and other side-effects.

First, to give some background, I use a format or structure to my tripping that seems to give me better results than "just letting things happen." I call this structure "the alchemical container for the experience." In alchemy, nothing much of significance happens outside of the container for the opus, whether this is a distillation flask or furnace. Furthermore, much attention is given to the structure and the shape of the container and the procedures for using it. Of course, centuries of spiritual dry-rot of Christianity have stripped any viable container from the mass culture. It is little wonder that the general reaction in the '60s to psychedelics was fear and loathing. People instinctively sensed here was something that would blow their tidy little *weltanschauung* to smithereens. And so I feel that we have to create something new.

To this end, a "container" I have used with success is the myth of the Hero, as described by JOSEPH CAMPBELL. To briefly summarize CAMPBELL's thesis: There is a call to the Hero, and usually at first, there is resistance to the call. Then the Hero changes his mind and descends into the Underworld to retrieve the boon. The Hero then returns and confers the boon by reintegrating with society. So, to follow this scenario, what I do in the beginning is to deliberately invoke a bad trip. (For whatever reason, this step doesn't take any effort.) With no prompting, Brother Shroom has always delivered the Underworld in spades. I have found that resisting being pulled down into the pit of despair is essential. It is during the resistance that I experience most of the nausea and other unpleasant effects. Timing the decent is important and a little tricky. Prematurely plunging into the emotional storm weakens the final effect and little is gained. Too late and the negative mood isn't completely dispelled. Usually the cycle of resistance and decent repeats itself several times. Then, if I have done my work well, sometime during coming down, the storm will break and the Hero's return begins. I call it the "hangover." There is a feeling of intense joy, peace, of being cleansed, that will last for hours and sometimes even days. There will be insights into personal issues and problems. As I make the drive back to LA from my usual tripping place, the San Gabriel Mountains, the world looks incredibly beautiful. And even when I first see the bank of smog hanging over the city like a dark shroud, there is a sense of "rightness" to it. Slowly the mood dissipates, but I am not left with any sense of emptiness or regret, just a return to a normal hectic LA life.

As an example, let me describe the trip where I first stumbled onto my method. I was tripping in daytime by a mountain creek. Brother Shroom was bringing up some personal issue that had been bothering me (and I can't even recall this now).

I fought dealing with it tooth-and-nail. I felt terrible. Nauseous, despondent, gagging from a violent case of post-nasal drip, wishing fervently I had never done this trip, and vowing never to do mushrooms again; I finally decided to plunge into the heart of the storm. I felt a hideous ripping through my chest, my whole body ached, and I shook all over. This extreme discomfort went on seemingly interminably. Finally, with great relief, I felt myself coming down and knew that the worst was over. Then I looked around me and noticed how the creek had exposed some tree roots through erosion. I was fascinated—they were alive and moving. Then, through these roots, all of my surroundings opened up and came to life. Everything—the trees, bugs, rocks, and water—all were pulsating, surging with life; singing, shouting one word: JOY! Over and over, in inexhaustible novelty, endlessly fascinating: JOY! JOY!! JOY!!! It was as if underneath all matter there was one great Life Force, incandescently alive, that wanted to know itself, experience itself; and so manifested itself in a multitude of forms that could interact with itself in an infinite number of ways. Even the agony of a prey dying in the predator's jaws was not an evil, but two creatures in an embrace and dance of terrible beauty that the Force needed for its completion. I thought to myself, "So this is what the ancient shamans saw. This is what the great spiritual teachers experienced and tried to pass on to others." The memory of my earlier discomfort vanished and I had a sense that "I was for this moment born." Had my whole life up to this point been nothing but misery and unhappiness, I could say it was worth it after all; more than worth it, for that was the tortuous path I had chosen to make my way to this Place. I felt complete, I was filled with joy and peace that slowly faded over the next two days. Many times afterwards, I was able to invoke a shadow of that feeling in meditations, and I felt its healing power.

For dosage I use about  $\frac{2}{3}$  the amount recommended in the *Magic Mushroom Grower's Guide*. I back off from a "full dose" because I usually trip alone in fairly remote, rugged terrain, and at higher doses I tend to lose my physical coordination. All I need is a sprained ankle from boulder-hopping and then have to wait a few hours to be sober enough to drive. At the doses that I am taking, the imagery is anemic, but using the above-described procedures I still get dynamite results.

But now to get to what I would really like to describe for *ER* readers. I am an Acupuncturist by profession, and I would like to share my knowledge of accupressure in dealing with trip bummers. I have only tried these accupressure points

on myself, so I would really like some feedback on how these points work for others.

**GENERAL DIRECTIONS:** Massage these points with firm pressure, making small circles with the finger. More pressure is not necessarily better. Results should be felt within a few minutes. Exact guidelines for deciding whether to continue massaging or just give up are difficult to quantify; use common sense. Point location varies with the individual and is not exact. Massaging an area about the size of a half-dollar will cover most variations. Symptoms will probably return, in which case, repeat the massage.

**NAUSEA:** Pericardium 6. Using the middle three fingers of the opposite hand, measure toward the elbow from the wrist crease on the palm side of the arm. The point is between the tendons.

**PAIN:** Large Intestine 4. Massage the soft flesh between the thumb and the palm above the index finger. For 9 out of 10 people, the exact point can be found by feeling a tender spot next to the bone above the index finger. I have found this point effective when I feel any mental anguish and pain.

**FEAR:** Gall Bladder 40. Put a finger on the outer anklebone and slide off in the direction of the little toe into the depression immediately beside it. The point is next to the lower half of the anklebone. This point doesn't lessen the fear, but it gives strength to push through it.

The textbooks give other possible points, but these are in awkward locations for someone working on him- or herself. These three should be a good start to see if this approach has any benefits.

Needless to say, this is a letter I have meant to write for a long time. When my renewal notice came I was determined not to send it in until I had finished the letter. Has anyone ever found a plant ally effective against procrastination?  
— CAPTAIN MIDNIGHT, CA

## LAB TESTING

Is it possible to send plant specimens to a laboratory to analyze and quantify the available alkaloids in the specimen? For obvious reasons a grower/user of the particular plant would want a breakdown of the contents of their strain of

plant. Do you know of such laboratories and the price they might charge for analysis of the plant? — ONEGREENDAY

*We asked Dr. ALEXANDER SHULGIN for his thoughts on this:*

Let's present the searcher being someone who is looking at a plant, let's say an unusual tobacco plant presumably identified by the questioner, and asking him to analyze and quantify the available alkaloids that are present. That assumes, of course, that the plant is documented, that it contains alkaloids (some of them available) and that an analysis will both identify them (what is there) and quantify them (how much is there). This could well be a master's degree thesis problem and might take a couple of years of research. The costs would be a research grant to the University for a laboratory and a graduate student's costs for a year or two (maybe \$100,000).

Or, if you rephrase the question into an extremely specific and limited form, something like, "Here is a tube that contains a few milliliters of a solution of a plant extract and can you tell me how much nicotine it contains?" Yes, and the answer is 1.05 ng/mL nicotine, and that will be \$35.00 please. There are many, many labs that will accept specific samples, to assay them quantitatively for pre-specified drugs, and that is that. Is there one of these ten drugs in this urine and, if so, how much? No research. Analysis on a production line.

But I suspect your questioner is aiming at something in-between. Last night he drank a cup of boiled-up extract of some funny-looking tobacco plant and he really turned on. And he found residues in the bottom of the cup this morning, which might be interesting to analyze to see what he had taken. This is not a big research project, but then it is not a routine analysis where it constitutes just one more sample to be put on a tray of samples. This needs an analytical chemist to whom you can mail the residues from the cup, who will make an extract that would preferentially isolate the alkaloids, then wait until he was using a chromatographic column that is OKAY for alkaloids, then make a GC injection, print out the MS spectra of the major peaks, and mail you back those spectra for you to do with as you wish. There are commercial labs that do this kind of work, and a typical cost may be \$200.00

But in this case, you do not know the names of the compounds that gave peaks in the chromatograph run, and the analyst couldn't care less. If you suspect that one of those spectra might be nicotine, then you can go to the literature and see what the mass spectrum for nicotine looks like. And maybe it is close. But you are never sure

unless you also run a sample of reference nicotine under the same conditions (another \$200.00).

There is an added complication that might tend to apply to readers of the *ER*. If the suspected alkaloid in question was, say, mescaline rather than nicotine, there are some tricky legal problems that must first be addressed and answered. — SASHA

*Many state universities are likely to offer testing services. One good example fairly near us is the UNIVERSITY OF CALIFORNIA AT DAVIS' Facility for Advanced Instrumentation (<http://carbon.ucdavis.edu>). Their web page describes the instrumentation and capabilities and gives sample preparation hints, a sample submission procedure, and they even hold training programs in mass spectrometry. They also provide an extensive list of chemical supply vendors.*

*Their rates are less for students, and they charge \$20.00 per hour for those who have taken the courses in how to use their GC/MS machines, and who do the testing themselves. (This also might allow a greater degree of privacy with regard to testing plant extracts that contain scheduled compounds.)*

*GC/MS, including 5 library search results is \$35.00 for students and \$70.00 for the public. Additional library searching or MS interpretation is \$50.00 per hour. Training is only available for currently enrolled students, and costs \$100.00 per hour.*

*One commercial laboratory that we found is BioSCREEN TESTING SERVICES, 3892 Del Amo Blvd, Ste. 707, Torrance, CA 90503, (310) 213-0043, (310) 370-3642. Equipment/services that they offer include gas chromatography, liquid chromatography, atomic absorption spectrophotometer, infrared spectrophotometer, and wet chemistry.*

*Also worth checking out is the CHEMICAL ANALYSIS.COM web page ([www.chemicalanalysis.com](http://www.chemicalanalysis.com)), as they provide a fairly extensive listing of labs that may provide testing services to individuals. Additional information on possible private companies in a location near you might be had by placing a query with the AMERICAN SOCIETY FOR MASS SPECTROMETRY, 1201 Don Diego Avenue, Santa Fe, NM 87505, (505) 989-4517, fax (505) 989-1073, [asms@asms.org](mailto:asms@asms.org), <http://www.asms.org>.*

*People using these services who are concerned if their sample(s) contain one or more controlled substances, may prefer to use an overseas lab. In the past, ER has had a sample submitted to INSTITUT UNIVERSITAIRE DE MEDICINE LEGALE, LABORATOIRE DE TOXICOLOGIE ANALYTIQUE in Lausanne, Switzerland. Another possibility is the HONG KONG GOVERNMENT LABORATORY ([www.info.gov.hk/govlab/english/index.htm](http://www.info.gov.hk/govlab/english/index.htm)). — DAVID AARDVARK*

## LSD DOSE/WEIGHT

With the Supreme Court ruling on LSD and the carrier medium weight counting towards mandatory minimum prison sentences, I have come up with an idea (I can't take all the credit). The chemists that manufacture LSD should work towards eliminating the carrier for LSD and should produce pure LSD in a crystalline form. A dose of LSD would then be the size of a grain of sand, poppy seed, or peyote seed. Small, very small. In a gram of LSD there would be 2,000 doses (500 micrograms each). So if a person kept under a gram of this pure LSD, they would not be subject to the 5-year mandatory minimum. It is time to eliminate the carrier medium for LSD. — ONEGREENDAY

*While I agree with the theory behind this, accurate dosing in micrograms could be problematic, based only on estimated size. (A photographer's loop might help, and an inexpensive microscope would be better.) I have read that a single grain of salt is said to weigh about 500 mcg (KEL 1997). However, it struck me that there might be slight variations in the size of individual grains of salt, and even small differences could potentially have a fairly dramatic effect when dealing with a substance potent in the microgram range. Determined to see if the "500 mcg" weight for an "average" grain of salt was accurate, we asked a colleague with a microgram scale to weigh some salt for us. Unfortunately, the scale was only sensitive to  $\pm 100$  mcg, and it turned out that the "average" grain of salt (based on eyeballing for size via a microscope) didn't register on the scale (meaning it must have weighed less than 100 mcg). A "large" grain of salt—about 2 times the size of average, and about 10 times the size of the smallest grain—weighed 200 mcg (but keep in mind the scale's sensitivity limitation of  $\pm 100$  mcg). 14 grains of salt, chosen at random, weighed 1,100 mcg, making the average weight of each of these 78.57 mcg (SIEBERT 2000). While this experiment showed that the 500 mcg estimate was likely too high, and it also shows that—if one is able to make a fairly reasonable volume comparison (using magnification) between crystalline LSD and a grain of salt, it is unlikely that one would take too high of a dose if it was kept within or under even the size of the largest piece of regular table salt. (But by all means, don't use rock salt!)*

*Nevertheless, these sorts of eyeballed volume comparisons seem a bit sketchy to me. If the LSD was kept in pure powder form until it was to be used, and then weighed on a scale that was accurate to  $\pm 2$  mg in a 10 mg amount, this could be dissolved in 20 drops distilled water (assuming a 500 mcg hit) and dosed-out just prior to use. Don't use tap water, as it is likely to have traces of chlorine in it, which is said to destroy LSD on contact (SHULGIN & SHULGIN 1997).*

*The real problem with getting vendors of LSD to produce a pure crystalline product, is that this doesn't lend itself very well to the sales of LSD at concerts, on Haight Street, etc.*

*Street-level commercial marketers of LSD, using blotter, could certainly make smaller hits of blotter paper. Blotter seems to be sold at a fairly consistent size of  $\frac{1}{4}$  inch, and tends to weigh in at about 5–6 mg per dose (including both the drug and the blotter). Most acid sold these days is less than 100 mics per hit, so it seems fairly reasonable that the size of the blotter could be reduced to  $\frac{1}{16}$  th of an inch, and still hold this amount without any problems. This cuts down the weight by  $\frac{3}{4}$  (a substantial amount) and could still allow for an easily sold, fairly uniform dose. — DAVID AARDVARK*

# SALVIA IN THE NEWS

The following TV news story, "Mexican Mint" appeared on the 6:00 pm K-EYE CHANNEL 42 (CBS) in Austin, Texas on 3/17/00. According to the news clipping service TELECLIP, similar stories have been run on the TV news in at least 8 cities in the USA since January 2000. While it is no doubt true that greater attention has been brought to *Salvia divinorum* due to web site vendors, it seems likely that the recent aggressive mass-marketing of *S. divinorum* extracts via large circulation print publications such as *High Times* and *L.A. Weekly* (following a sensationalist article in the mainstream pop culture magazine *Details*) have had more to do with shining a spotlight on this plant than the Internet has.

Cast of characters: **MJ:** MARK JOHNSON (news anchor), **FR:** FRANK RECCHIA (reporter), **JK:** Dr. JOHN KEPPLER (clinical director of the TEXAS COMMISSION ON ALCOHOL & DRUG ABUSE), **AP:** anonymous purchaser, **K:** kid on the street.

**MJ:** "It's a Mexican mint, available on the Internet but it's certainly no candy. Texas health officials warn parents that a plant called *Salvia divinorum* causes powerful hallucinations and Austin kids are buying it. And, get this, the mind-altering plant is perfectly legal. K-EYE'S FRANK RECCHIA has this investigation"

*[Picture of dried leaves in bag.]*

**FR:** "This is *Salvia divinorum*, or "SD," a powerful hallucinogen like LSD. It's making its way into Austin legally though Mexican-based Internet sites like this one."

*[Pictures of site showing flower and plant.]*

"The sites will sell you SD for \$39.95 an ounce. It's a Mexican plant in the mint family. Yes, mint! The same exact type of ingredient in products like ALTOIDS."

*[Holds up ALTOIDS box.]*

"But talk about curiously strong."

**JK:** "The experiences that people have, they're describing, virtually impossible to drive a car or function whatsoever, for brief periods of time after the ingestion of this substance."

**FR:** "The Austin man who bought this SD on the Internet described its effects but did not want us to show him."

**AP:** "It basically makes you incoherent. And, it makes you see things, uh, like, uh, visions."

**FR:** “Since these Internet sites first appeared in January, the clinical director of the TEXAS COMMISSION ON ALCOHOL & DRUG ABUSE reports two cases where Austin kids ordered the substance and had strong reactions.”

**JK:** “Walking around and appearing awake and alert but not responding to the parents, uh, as if they weren’t there or weren’t in the room.”

**FR:** “It is not illegal to sell SD because the DRUG ENFORCEMENT ADMINISTRATION does not list it as a controlled substance.”

*[Flash to two teens standing in front of the office of the TEXAS COMMISSION ON DRUG & ALCOHOL ABUSE.]*

**FR:** “These teens worry their little brothers might buy it.”

**K:** “Kids are subject to peer pressure so they’re going to try out this new drug, introduce their friends to it and it’s *all* without their parents’ knowledge.”

**FR:** “The guy who bought this stuff describes it as ‘legal LSD.’”

**AP:** “Uh, it’s powerful stuff—*real* powerful”

**FR:** “An important word of caution here, even though the DRUG ENFORCEMENT ADMINISTRATION does not list *Salvia divinorum* as a controlled substance, the FOOD & DRUG ADMINISTRATION *does* list it as a *poisonous* substance. While it may not be illegal to buy it as a *raw* plant, the Feds say you could be prosecuted for using it to get high—in other words, by smoking it, snorting it, or eating it. And, MARK, you know some people even use this stuff to make tea!

**MJ:** “Gee, this sounds dangerous. Is there any sort of a move to make it a controlled substance?”

**FR:** “Well, the Feds say that’s under review. You know, the problem is, MARK, this stuff is not even *distantly related* to any existing controlled substance so, as the Feds did with ecstasy, they’d have to come up with a whole new category of laws. And that could take some time. We’ll just have to wait and see.”

**MJ:** “Keep us posted, thank you.”

**FR:** “Sure.”

*[End]*

## ENCOUNTERS WITH *KRATOM*

by PAUL E. WOGG

While surfing the web a few years ago, I came across the description of a plant called *Mitragyna speciosa*, or *kratom*. The short discussion mentioned its unusual combination of effects as being both stimulant and depressant simultaneously, and having an indole chemical structure (something commonly found in psychedelics). I asked a friend who lived in the region where the plant was said to grow to check into its availability; after making a half-hearted effort to find this plant, I was told that it was not very common, and I didn't pursue it further. A year or so later I was at an ENTHEOBOTANY conference in México, where two of the speakers mentioned this plant. Neither speaker knew of anyone who had actually seen it, used it, or had any first-hand experience with this plant. Since I was planning to be in South East Asia the week following the conference, I decided to make more of an effort to find this exotic species of ethnobotanical interest. Upon getting back to the States (having returned from México and prior to leaving for Asia), I called my friend in South East Asia to help me find this plant.

After arriving in South East Asia, we met with some friends who knew of a person that used this plant regularly. They said that they could arrange for some leaf to be delivered. The following day, I went to a restaurant where the owner knew the person who used the plant. They had a bag of branches with leaves and flowers waiting for me when I arrived that evening. That particular evening I was extraordinarily fatigued from being 12 hours out-of-phase from my normal time-zone; so much so that I couldn't really carry on

a conversation—which is somewhat unusual for me. I decided to try chewing some of the leaves—I started with two, then after about 15 minutes, I chewed another two. The first thing that I noticed when I started chewing the fresh leaf was a numbing sensation in my mouth. About 10–15 minutes after chewing the second two leaves, I felt alert, centered, and in a good mood—and was back to my old talkative self. The effects were not overly stimulating, in fact, I did not find it to be a stimulant in the classical sense, but rather more of a “centering agent.” I felt “put back together” and slightly euphoric. The effects were pleasant; subtle, yet definitely there.

The following day, I arranged to meet with the man who had collected the plant material that had been left for me. We met back at the same restaurant. He was in his mid 40s and had used the plant daily for several years. He was a good-natured and gentle man, and appeared to be quite healthy. He pulled from his pocket a stack of leaves that he kept wrapped in a plastic bag, removed the leaves from the bag, folded one up and put it in his mouth and began chewing. He then offered me some. I eagerly accepted and we began discussing the plant. He felt very strongly about the plant, and told me about how it had changed his life. At one time he had been a heavy whiskey drinker, and he gave up whiskey after he started using *kratom*. He also discussed other health benefits he has experienced since he started chewing the leaf daily. Prior to his use of *kratom*, he suffered from what sounded like clinical depression, chronic lower back pain, and he easily caught colds and influenza. He said that he would need to go to the hospital at least once or twice each year due to severe colds and flu. Since starting using *kratom*, his lower-back pain has been eliminated, and he has not come down with a single cold or flu in over 6 years. He now works full time doing moderate physical labor, and seems to be fairly content with life in general. He also told me of some friends that he gave *kratom* to; at least 10 of them were heavy drinkers, and now none of them habitually use of alcohol since they started chewing *kratom*.

Traditionally, *kratom* is used to treat diarrhea, cough, parasites, and is used as an opium substitute. It is rumored to be used to treat opiate withdrawal in some areas, but nobody could confirm this use, as none of the users that I spoke with

considered *kratom* to be a drug, and they did not generally associate themselves with people who used opium or other “drugs.” The leaf is typically chewed, although I have heard of people smoking it or using some form of an extract (apparently this is not common, as neither this man nor several other users that I discussed this plant with on subsequent visits knew of anyone who smoked it or used an extract). It is usually chewed fresh, and dried leaves are used to make a hot water infusion or tea. Chewing fresh leaf is clearly the preferred method of ingesting this plant by regular users.

In the months following my first exposure to *kratom*, through extensive personal bioassays, as well as bioassays of friends and colleagues, it was seen that the leaf has a substantial ability to relieve pain. This pain-relieving effect, as well as its pronounced anxiolytic effects, are the most promising areas where I feel that future research efforts should be focused. Based on 6 months of moderate to heavy daily use, I did not find *kratom* to be any more habit-forming than caffeine or commonly prescribed SSRI anti-depressants.

Although traditionally only the fresh leaf is chewed, I found that chewing the dried leaf (which takes a little getting used to), was by far the best method to attain full effects from this plant in its dried form. The dried leaf is typically prepared by gathering leaves that have fallen from the plants, drying them in the daytime heat, then grinding them to a fine powder using mortar and pestle, and storing this in sealed plastic bags or similar containers.

There appear to be at least two different strains of this plant. Subjectively, each strain has somewhat different effects. One strain has larger leaves with red veins, the other has green. I’ve found the green-veined leaves to be more potent, though I prefer the red-veined strain as it tends towards a more relaxed alertness. I suspect that the two strains not only vary in alkaloid content, but also in the proportions of the various active constituents as well.

When chewing the fresh leaf, one typically starts off with 2–3 leaves and then chews additional leaves throughout the day as needed to sustain the level of effects desired. I tend to use it like coffee, starting with about 1 gram dried or a couple of fresh leaves, and then chew more as needed to reach the level of effects desired. Typically with dried material, I’d say that between 1 and 1.5 gm is what I’d call a “normal” amount for mood elevation and pain relief. Over 3 gm tends to produce a more opiate-like feeling and can lead to constipation. If the dose is increased much past the level of the mild opiate stage,

the effects can become more pronounced and be accompanied by nausea. (One individual I know vomited after consuming a tea made with about 10 gm of dried leaf.) I’ve only experienced nausea when using a lot on an empty stomach. At high doses a type of psychological irritability may also occur, similar to what some people may experience on opiates.

Some comments on the *kratom*’s effects:

Psychedelic? The main component, mitragynine, is a 4-substituted indole alkaloid, as are psilocybin/psilocin—with mitragynine having a methoxy group and psilocybin having a hydroxy group at this location. There are not many naturally-occurring alkaloids that carry an oxygen at that position (SHULGIN 1999; SHULGIN 2000). Nevertheless, I would not describe the effects of *kratom* as being psychedelic in any way. I do, however, find it to produce some level of closed-eye visuals, and a few people have reported interesting experiences when chewing a small amount and subsequently using *Cannabis*.

Aphrodisiac? Since mitragynine is structurally similar to yohimbine, it is not surprising that a few male colleagues experienced some enhancement of erectile function while using *kratom*.

Anxiolytic? Very much so; one person who tried it said it was “nearly impossible to get anxious while using this material.”

Anti-depressant? It has generally been found it to produce a subtle and steady sense of well-being that lasts for several hours, typically with no “hang-over.”

Stimulant? Although it is referred to as a “stimulant” in much of the literature, in my experience, and that of friends and colleagues, it appears to be much more of a “centering agent” or “mental clarifier,” than a stimulant per-se. The first time I used this plant, I was very tired and jet-lagged. After chewing 4 *kratom* leaves, I was back—totally there and able to contribute to conversation as if I were at peak mental performance. Not over-stimulated, not really feeling stimulated at all (although some people have reported feeling stimulated). I just felt like all my parts were pulled back together (if that makes any sense). That’s the best way I can describe it. And while the effects of pure mitragynine administered to 5 human volunteers in one study reportedly had a stimulant effect described as being similar to cocaine (GREWAL 1932), another researcher found mitragynine alone to have no noticeable effect after taking an oral dose of 100 mg of the

isolated compound. While I have not experienced pure mitragynine, I feel that it would be quite a stretch to refer to the effects produced by the whole leaves as “cocaine like” or even “*coca* like.” Though *kratom* may have some minor stimulant effects (described above), a mild numbing of the mouth, and perhaps produce a slight euphoria, these effects fall far from that of cocaine. In S.E. Asia its *cultural* use is markedly similar to that of *coca* leaf in South America, being used by agricultural workers to increase physical and mental stamina, allowing for long hours of manual labor (typically agricultural) in the sun. This is where the similarities between the two end. In my experience and that of several who have bioassayed the leaves (both fresh and dried), the typical effects were that of feeling a “calm alertness” and/or “centeredness” at low dosages, which took on a distinctive but relatively mild opiate character at higher dosages. Typically those who bioassayed the leaf were also well acquainted with *coca*—most had used both cocaine and *coca*-leaf on several occasions. Aside from the initial numbing sensation, they found the subjective experience to have little in common with that of *coca* or cocaine. The stimulant effects of *kratom* are quite subtle, and most who have bioassayed it find that caffeine or *Ephedra*/ephedrine possess stronger stimulant properties. Hence, the comparison of the stimulant properties of *kratom* to that of *coca*/cocaine is hardly a meaningful one, as their effects are not of the same order of magnitude.

Attention enhancer? One person tried *kratom* when she ran out of her attention deficit medication Adderall® (a mixture of amphetamine salts). She commented on how the leaf material substituted well for her ADHD medication, and that it was “gentler” than her regular medication. It held her over quite sufficiently for a few days, allowing her to function at full capacity in her professional career as an engineer, until she was able to get her prescription refilled.

Pain Reliever? One colleague with severe pain, for which he is prescribed high doses of opiate analgesics, tried using the dried leaf to help ease his withdrawal and reduce his current dose of 1.4 gm morphine and 24 mg dilaudid per day (as *kratom* is rumored to be affective in curbing opiate withdrawal). He said that he found it very useful, not necessarily so much to curb the withdrawal (it is unclear if it helped with this aspect or not), but he found that it tended to *relieve* the pain—not just distract him from it, as his prescription opiates did). Another colleague who was sent a sample reported the anxiolytic affects, but with an unexpected beneficial side-effect of relieving his chronic lower-back pain. He said that a small amount chewed in the afternoon or early evening (per-

haps below threshold psychoactive levels) relieved his back pain for the rest of the day, with the pain returning the following morning.

Curbing opiate withdrawal? One colleague said that it was highly effective in suppressing the withdrawal syndrome associated with opiate withdrawal, although another subject performing a self-experiment leaves some question as to its effectiveness for this purpose. Clinical studies might be helpful to determine its value in this area.

Opiate-like effects? At low doses I would not consider the experience to have any noticeable opiate-type effects, although people have mentioned it relieving pain at doses that are threshold or subthreshold for noticeable psychological effects. I’ve found this to be the case with my bioassays as well—it seems to be a very effective pain-reliever, perhaps even more-so than opiates, with the advantage of having analgesic activity at levels that don’t significantly impair one’s ability to function (*i.e.*, operate a motor vehicle, *etc.*). At higher doses, the experience takes on distinctly opiate-like effects, similar to codeine or hydrocodone. In recent years, research has found that the alkaloids mitragynine and mitragynine pseudoinoxyl from *kratom* bind to micro- and delta-opioid receptor sites (YAMAMOTO *et al.* 1999), which might help to explain some of the pain-relieving action as well as the high-dose codeine-like effects of this plant. It may also shed some light on its use to curb opiate withdrawal, and its use as an opium substitute when opium is not available.

*Kratom* more addictive than opiates? This is a rumor I have heard, and read about on the Internet. It is completely false in my experience. I used this plant daily for about 6 months—first going 3 days straight then stopping for a couple of days, then 7 then 14, 21, 90, *etc.* I found that upon stopping usage

after about 6 months of moderately heavy daily use (at times I was using more than 30 gm dried leaf per day), that I became rather emotionally sensitive, depressed, *etc.* for a few days upon quitting use. It is hard to separate how much of it was the situation I was dealing with (a difficult period), and how much of it can be attributable to withdrawal. I also experienced some tearing, which is common to opiate withdrawal. At any rate, if these effects could be considered “withdrawal,” they were mild and very manageable, considering the duration of daily use. In later periods of use, I did not experience any withdrawal. It is certainly *not* more addictive than opiates—at least not in my personal bioassays—but rather far less addictive. South East Asian users report “yawning” when stopping use—not being tired or fatigued, but just yawning a lot.

Is there an antidote to overdose? At higher doses, the effects are not necessarily very pleasant, and may include constipation, itchy nose, mild agitation, and nausea. I have been told by several people that the effects can be aborted; every native *kratom* user I queried related that you can eliminate its effects almost immediately by drinking lemon or tamarind juice (without sugar—I was told that sugar would make the

effects worse). It is said to take 5 minutes or less to stop the effects completely. Since I have not tried this, I cannot confirm or negate its effectiveness as an antidote.

Finding some rather unexpected effects (analgesic properties, anxiolytic properties, *etc.*) has lead me to realize that there are very real therapeutic uses for this plant. One possible issue with it being accepted into Western medicine is that mitragynine, the primary alkaloid does not seem to reproduce the same effect as the whole herb, which contains 21 or so additional “minor” alkaloids (JANSEN & PRAST 1988). A tea made from the herb tends to be “less full bodied” than chewing the leaf directly; I suspect some of the minor alkaloids are non-water soluble and/or destroyed by the digestion process. If chewed, perhaps these constituents are absorbed sublingually and bypass the digestive enzymes/chemicals that might otherwise break them down. Typically whole herbs are less attractive to Western medicine than are isolated compounds. For this reason, I fear that Western medicine might not use this herb effectively; they may find that the isolated compounds alone don’t provide the therapeutic effects that they seek, rendering the herb useless from their viewpoint. ✧

# EVENTS CALENDAR

## CONSCIOUSNESS TECHNOLOGIES JULY 20–23, 2000

A conference exploring various techniques for accessing and navigating novel states of consciousness. Presenters include DALE PENDELL, CLARK HEINRICH, KELLY IVORS, ROBERT SULLIVAN, CRYSTAL, TODD ROETKEN, EILIEEN KILGALLON, and JOHANNES COLBY, with music by the STARLIGHT TRANCE band. There will be poetry, ramblings on *Amanita* mushrooms, general mycology, psychology, altered states, sweat lodges, aromatherapy, breathwork and movement, and instruction on how to grow mushrooms on straw. The conference will take place in the Cascade Mountains of Oregon. \$350.00 includes all seminars, workshops, events, and three meals daily. There is on-site camping available. For more information see <http://www.charm.net/~profpan/ct> or contact I-9 RESEARCH, PMB 128 (Dept. ER), 1972 NE 3rd Street, Bend, OR 97701, (541) 420-0738.

## PSYCHOINTEGRATOR PLANTS, ART, ETHNOBOTANY, AND THERAPY JULY 23–AUGUST 1, 2000

An experiential Seminar in the Brazilian Amazon with LUIS EDUARDO LUNA, DENNIS MCKENNA, SILVIA POLIVOVY, KATHLEEN HARRISON, PABLO AMARINGO, and IVÁN PADILLA. Experience ten days of vast exploration in the Brazilian Amazon. "This is not a tour to see shamans, or to learn from shamans. If you are looking for a shaman, this is not the place for you, unless you are looking for the shaman within yourself." There will be three ayahuasca rituals, five lectures on botany, chemistry, pharmacology, and ethnography of ayahuasca, three sessions on ethnobotany and botanical illustration, daily sessions on expressing artistically your journeys with the plants, daily kundalini yoga, meditation, and individual therapeutic sessions if required. Cost is \$1,300.00 to \$1,500.00, which includes local transportation, all meals, and

lodging. For more information write to SILVIA POLIVOVY, Av. Kennedy 2842 6a (Dept. ER), 1425 Buenos Aires, ARGENTINA, tel/fax (54-11) 4774-3892, [silviap@house.com.ar](mailto:silviap@house.com.ar) or check out <http://users.lycaeum.org/~entheos> on the web.

## BOOM FESTIVAL AUGUST 11–16, 2000

The BOOM FESTIVAL is a five day open-air festival that focuses primarily on DJed psychedelic Goa trance music, although they also have some live music in a similar vein. The event takes place in a forested countryside area of Portugal. There are dance areas, chill-out areas, camping areas for tents and also for caravans/trucks/buses. Basic commodities like showers, toilets, and others will be available. They have a flea market where people can rent space to sell goods. The event has been happening since 1997, and this year there will be an area called "Journeys," for music styles other than "trance."

BOOM is held in the magical woods of the Herdade do Zambujal, a massive Mediterranean forest is placed inland on the north bank of the Sado river, near Aguas de Moura (located 60 Km south of Lisboa, capital of Portugal).

There will be a "zone" dedicated to conferences/lectures/workshops, covering fields like entheogens (types, importance, history...), alien entities (UFO, abductions, psychology...), strange planetary events (crop circles, mysteries...), virtual worlds (eco-systems and biology), nanotechnology, fractals, novelty, alternative life styles, future, freedom, chaos and order, anti-prohibitionist, and more.

Presale tickets (until July 31, 2000) are \$60.00, and tickets after this and at the gate are \$70.00. As days of the event pass, the ticket price goes down. Presale comprise only full passes (5-day ticket). Contact: BOOM FESTIVAL 2000, Casa do Terraco (Dept. ER), Ulgueira, 2705 - 349 Colares, PORTUGAL, + 351 21 9281215 (tel & fax), [info@boomfestival2000.com](mailto:info@boomfestival2000.com), <http://www.boomfestival2000.com>.

## TELLURIDE MUSHROOM FESTIVAL AUGUST 24–27, 2000

This will be the 20th annual MUSHROOM FESTIVAL held in Telluride Colorado, designed for people interested in mushroom identification, edible, poisonous, and psychoactive mushrooms, and mushroom cultivation. This year's speakers include Dr. ALEXANDER SHULGIN, SATIT THAITHATGOON, GARY LINCOFF, PAUL STAMETS, Dr. ANDREW WEIL, JOHN CORBIN, LINNEA GILLMAN, and EMANUEL SALZMAN. For more information contact FUNGOPHILE, POB 480503 (Dept. ER), Denver, CO 80248, (303) 296-9359, fax (303) 297-1026, lodomyco@uswest.net.

## BURNING MAN 2000 AUGUST 28—SEPTEMBER 4

BURNING MAN is a temporary art community, created in the Black Rock Desert of Nevada. An experiment in radical self-expression, now in its 16th year. Participants must bring all necessities for survival—including water, food & shelter.

There is no commercial vending at this event.

What do I have to say to convince you that you're a damn idiot if you don't attend BURNING MAN? This is the new Eleusis! A yearly pilgrimage to renew one's spirit and faith in human creativity. Check out the web page ([www.burningman.com](http://www.burningman.com)) and then buy a damn ticket already. As of May 1 they offered 6,000 tickets at \$165.00 each (available while supplies last or until June 30th, whichever comes first). Check for availability via the web site or call (415) TO FLAME.

From June 31 until July 31 there will be 7,000 tickets sold at \$185.00 each while supplies last, and from August 1 until August 14 the tickets will be \$200.00 each. Tickets purchased at the gate will cost substantially more and no tickets will be available during the last 4 days of the event. A limited number of tickets may also be purchased with credit card via the web at <http://www.ticketweb.com> and by phone at (510) 704-4448. Children under 12 accompanied by a parent will be admitted for free. Children under 18 must be accompanied by an adult over 21 years of age. For more information via snail mail contact THE BURNING MAN PROJECT, POB 884688 (Dept. ER), San Francisco, CA 94188-4688.

## ECUADORIAN AMAZON FIELDTRIP OCTOBER 2-12, 2000

After spending a night in Quito, Ecuador's capital in the Andes, participants fly into Eastern Ecuador and make their way to a field station that has been created by four villages. Lodgings, trails, forest, river, and ample expertise in the many ingenious ways that the people of the Amazon employ plants in their practical, artistic, and spiritual lives. Instructors include KATHLEEN HARRISON, BRET BLOSSER, and ROCIO ALARCÓN. 20 participants will be exposed to indigenous communities of Quichua, Shuar, and Huarani, as well as a *mestizo* group. Native healers will tell stories about the spirits of the forest and how to deal with supernatural dangers. Some heal with ayahuasca, others are experts in herbs. Participants will learn how plants figure in people's lives in many ways: healing and ritual, but also in fishing, weaving, food gathering, gardening, medicine, art, house building, and more. It is amazing how much these groups know about plants, and how they related to the ecosystem as a whole.

Cost is \$1,650.00, which includes all expenses within Ecuador, but not airfare (current consolidator fares are available for \$800.00). As of mid-June, attendance for the trip was half-full. For more information contact: BOTANICAL DIMENSIONS, POB 807 (Dept. ER), Occidental, CA 95465, (707) 874-1531, (707) 874-2336 fax, kat@wco.com.

## BOTANICAL PRESERVATION CORPS

*Serving devotees of shamanic herbalism  
in over 50 countries.*

Exotic Botanicals ▼ Field Gear ▼ Audio Tapes  
Extraction Apparatus ▼ Artifacts & Curios

*Salvia divinorum* Leaves ▼ Atacama Snuff Trays  
Vanuatu Kava Products ▼ Bolivian Coca Bags  
Ayahuasca Vine ▼ *Mimosa hostilis* 'jurema'  
Mushroom Extracts ▼ Smoking Herbs  
Stimulants, Sedatives, Immunotonics & More!

We are the original entheobotanical supply house offering many exotic items and state-of-the-art formulation expertise. Launching this entire new industry (formerly under the name *...of the jungle*), which has inspired many parallel businesses, we remain the premier source for quality, price, and fast, reliable service.

The BPC catalog also features a full selection of audio tapes from previous BPC seminars, including talks by JONATHAN OTT, TERENCE MCKENNA, SASHA SHULGIN, KEN SYMINGTON, RICHARD EVANS SCHULTES, DALE PENDELL, RALPH METZNER, WADE DAVIS, GIORGIO SAMORINI, and many other seminal speakers at these legendary events.

*Send \$2.00 for the complete,  
illustrated 35-page catalog to:*

# BOTANICUS PROHIBITA

by K. TROUT

The recently proposed “Anti-invasive Pest” legislation and the “White List” are something that should be of serious concern to all of our readers. This new level of attack on nature paves the way for more species to be banned from cultivation, transportation, or possession (even if growing “wild” in the ground and not under cultivation).

Despite the hype and rhetoric of the anti-invasive species proponents (which resembles language that has been used to denounce drug users, witches, Jews, gypsies, “illegal aliens,” and other unpopular minorities), the valid objections to these proposed actions have been declared as an “Internet hoax” by some, or else dismissed as conspiracy theory. This is far from the truth.

One of the most disturbing elements of this proposed legislation is that, despite it being presented to address invasive pests, the definitions of “pest” are to be applied as seen fit by the UNITED STATES DEPARTMENT OF AGRICULTURE, and includes *plants* purported to pose a threat to public health.

Both the proposed legislation *and* the INVASIVE SPECIES COUNCIL (established by Executive Order) are targeting not simply pests, invasive species, noxious weeds, and their seeds, but also *plant parts*, and are proposing to ban any shipment or mailing, *even of manufactured and processed plant parts*.

The wording in the bills literally reads “a progeny of a plant, plant product, biological control organism, plant pest, or noxious weed that is moving into or through the United States or interstate, or has moved into the United States or interstate,” and lists their intended targets as “a plant, plant product, biological control organism, plant pest, noxious weed, article, or means of conveyance that is infested with a plant pest or noxious weed.”

Considering that the purported goal is to address invasive pest plants it is interesting that the wording in Section 2 of S.910 includes: “(14) The term ‘noxious weed’ means a plant or plant product that has the potential to directly or indirectly injure or cause damage to...livestock, poultry, or...public health...”

“Plant” and “plant product” are further defined in the bill as: “(17) PLANT—The term ‘plant’ means a plant (including a plant part) for or capable of propagation (including a tree, tissue culture, plantlet culture, pollen, shrub, vine, cutting, graft, scion, bud, bulb, root, and seed),” and “(19) PLANT PRODUCT—The term ‘plant product’ means—(A) a flower, fruit, vegetable, root, bulb, seed, or other plant part that is not covered by paragraph (17); [*In other words plant parts not “for or capable of propagation!” — K. Trout*] and (B) a manufactured or processed plant or plant part.”

One must wonder how it is that a manufactured or processed plant or plant part can be considered to be an invasive species or noxious weed perceived to be of threat *unless* this is being aimed at medicinal or other drug or potential drug plants. This legislation could be applied to literally ban the movement or cultivation of poisonous plants no matter what their intended purpose. (Even castor beans have been proposed for prohibition!)

Since this act would ban shipment via the mail or any other means, and specifies not simply plant pests but also plants and plant products, this *must* be seen as a potential means to control any medicinal herb not on the approved list.

In a disturbingly ironic twist, this legislation also eases the way for release of biological controls however is seen fit by the AGRICULTURE DEPARTMENT; a chilling thought, since the USDA is presently trying to get approval for the environmental release of their recently bioengineered *Fusarium* designed to eradicate the genus *Papaver*. (With similar biochemical weapons against *Erythroxylum* and *Cannabis* planned for the immediate future.) Since this legislation assigns oversight and approval to the USDA, the implications are quite clear.

The deadline for submission of the recommendations of the INVASIVE SPECIES COUNCIL to the President is August of 2000 (This report was mandated by EO 13112, on February 3, 1999, to be submitted in 18 months)

This legislation is presented to the public in such a way that makes it sound like a good and necessary thing for protection of the environment and economic interests, but the fact

remains that regulations already on the books can easily address any and all purported problems. In fact, this set of proposed restrictions will create yet another area of legal prohibitions affecting completely unrelated areas (including the movement and cultivation of many if not most medicinal, ethnobotanical, ornamental, and exotic plant and animal species) and—should the bills pass—will define these as being prosecutable criminal acts.

Section 204 of S.910 prescribes both criminal and civil penalties for violation. Furthermore, Section 104(b) par. (1) authorizes the Secretary of Agriculture to require property owners to treat or remove pest species at no cost whatsoever to the government, and par. (2) allows the Secretary of Agriculture to demand repayment from the landowners for any costs incurred during the removal of invasive species if the landowner does not comply.

Section 201(a) authorizes agents to “(1) stop and inspect, without a warrant, a person or means of conveyance moving into the United States to determine whether the person or means of conveyance is carrying a plant, plant product, biological control organism, plant pest, noxious weed, article, or means of conveyance subject to this Act; (2) stop and inspect, without a warrant, a person or means of conveyance moving in interstate commerce on probable cause to believe that the person or means of conveyance is carrying a plant, plant product, biological control organism, plant pest, noxious weed, article, or means of conveyance subject to this Act; (3) stop and inspect, without a warrant, a person or means of conveyance moving in intrastate commerce or on premises quarantined as part of an extraordinary emergency declared under section 105 on probable cause to believe that the person or means of conveyance is carrying a plant, plant product, biological control organism, plant pest, noxious weed, article, or means of conveyance subject to this Act; and (4) enter, with a warrant, a premises in the United States for the purpose of conducting investigations or making inspections under this Act.”

The warrantless searches are said to be for USDA personnel and those who the Secretary of Agriculture brings into their activities. This does not say that the police can conduct these warrantless searches, but in light of the police using private security guards to do searches and then using what is found in order to *get* warrants, one can't help but wonder if there will not be much broader cooperation between law enforcement and the USDA if this becomes law.

An incredibly disturbing fact is that despite their mandate to perform risk assessments, the INVASIVE SPECIES COUNCIL *appears* to be simply amalgamating pre-existing lists from numerous and unrelated sources, many of which used unclear protocols for declaring species to be pests, or did not follow the established guidelines. These lists presently include economically indispensable forage and fodder crops, plants used for erosion control, soil binding, range management, green manure, and important turf plants. At the *very least* actual risk assessments need to be performed, as many of these lists were created at a local level with inadequate input from interested parties and followed no set protocol or seemed to arbitrarily declare species invasive or pest plants. Some of these groups apparently identified any plant that met the definition of being an “alien species” or was foreign to a particular ecosystem and declared it as an “invasive” species entirely on that basis alone. These lists are seemingly being merged without questioning what is included or attempting any sort of actual risk assessment. There are even reports that some state and federal agencies are already using these poorly conceived lists as their basis for a premature implementation of the Executive Order.

The purported rationale behind a “White List,” namely a list of approved species declared to be permissible for cultivation or shipping, can be found in the assertion of FAITH CAMPBELL that, “Scientists can't even name most species of insects, fungi, and pathogens found in other countries, much less predict which ones will prove invasive in a new environment.” The absurd conclusion is that whatever is unknown must therefore be banned preemptively.

While the “White List” approach (meaning anything not on the list is to be considered prohibited), *will not* be found within the wording of the bills, nor in EO 13112, this was in fact proposed by a co-chair of the INVASIVE SPECIES COUNCIL itself at their inaugural meeting. This co-chair is BRUCE BABBITT who is also Secretary of the Interior! LIBERTY HYDE BAILEY put it best when saying that “all living beings have the right to engage in the struggle for existence.”

Help stop a deceptive end-run approach to the Constitutional limitations on government intrusion into your life through this unwarranted attack on nature itself. Address your letters of outrage or concern to any of the following co-chairs of the NATIONAL INVASIVE SPECIES COUNCIL:

Secretary of the Interior BRUCE BABBITT, 1849 C Street N.W., Washington, DC 20240, (202) 208-3100

Secretary of Agriculture DAN GLICKMAN, USDA, 200A Whitten Building, 1400 Independence Ave., S.W., Washington, DC 20250, (202) 720-3631, fax (202) 720-2166

Secretary of Commerce WILLIAM DALEY, 14th Street & Constitution Avenue, Washington, DC 20500, (202) 482-2000, fax (202) 482-2741

## ANTELOPE BOOKS

218 Walnut Street (Dept. ER)

Petaluma, CA 94952

(707) 769-0524

[mrbob@monitor.net](mailto:mrbob@monitor.net)

<http://www.abebooks.com/home/NTLPBKS>

A great selection of used drug books, as well as general stuff on altered consciousness, first editions, and signed books. Prices are quite good. A list of available titles can be had at the web page.

## AYAHUASCA DREAMS

+31(0)20-6830129 (Netherlands) tel/fax

+5561-6461613 (Brazil) tel/fax

[yatra@yage.net](mailto:yatra@yage.net)

<http://yatra.yage.net>

YATRA-W.M. DA SILVEIRA BARBOSA, formerly associated with FRIENDS OF THE FOREST, is now holding her own ayahuasca seminars and workshops. Her work is "designed to explore levels and states of consciousness that promote a harmonious life experience through the perception of our internal and external unity with all realms of the universe."

These workshops are held in beautiful surroundings, and incorporate both ayahuasca and *jurema*, as well as music, mantras, Holotropic breathing, yoga, diet and nutrition, meditation, silence, sweat lodge, sauna, hot tubs, waterfalls, rivers, sun bathing, and forest hiking

YATRA's workshops support the development and the appropriation of shamanic belief systems and healing protocols, promote ecological and environmental projects with indigenous tribes in the forests of the world, act as a forum for exchange and research into modern applications of traditional medicines for the treatment of drug dependency, depression and other psychological and psychosomatic disorders, supply food, clothing and educational items for the Atikum, Kaimbé, Truká and other Indian tribes of northeast Brazil, work towards financing legal support for the recla-

mation of indigenous tribal homelands in the northeast of Brazil, introduce permaculture in indigenous areas of Brazil and other countries, and establish apiculture among indigenous tribes.

Her web site has a lot of additional specific information about what happens at the workshops and when they are scheduled. As well, she has a *huge* collection of links to related sites of interest.

## BEAT BOOKS

c/o STEPHEN RONAN

POB 5813 (Dept. ER)

Berkeley, CA 94705

[beatbookscatalog@mailexcite.com](mailto:beatbookscatalog@mailexcite.com)

<http://members.aol.com/beatshop/beatcat.html>

This one falls into the "I'm amazed I didn't hear about this sooner" category. BEAT BOOKS (no connection to the similarly-named, similarly-oriented English bookseller ANDREW SCLANDERS' company) has been around since 1987, selling all manner of books related to the Beat culture (titles by and about BURROUGHS, CASSADY, DYLAN, FERLINGHETTI, GINSBURG, HUNCKE, KEROUAC, KESEY, SNYDER, and other usual suspects), the '60s/hippie culture, drugs, and more. He also has posters, broadsides, postcards, and various ephemera related to this era. Many of the available works are list at the web site, and a more comprehensive yearly print catalog is \$3.00 (or free with an order of \$30.00 or more). Make checks payable to STEPHEN RONAN. With an excellent selection and quite reasonable prices, I can highly recommend that you check out BEAT BOOKS.

## BLUE HONEY:

### THE INFINITE MUSHROOMS

[webmaster@bluehoney.org](mailto:webmaster@bluehoney.org)

<http://www.bluehoney.org>

When I first saw this site, I thought that it was pretty cool. There are a variety of articles posted, some written by JAMES ARTHUR, who appears to be the site owner, and who has also written the book *Mushrooms and Mankind: The Hidden Meanings of Christmas, the History and Philosophy of Mushroom Symbolism*. The site links to sales of jewelry (quartz crystal pendants), T-shirts, books, and videos, although not all of these pages were constructed when I checked them out. The "books" section is essentially a list and short reviews of various titles, with a link to AMAZON.COM for those who might

want to purchase some of them. (Although AMAZON.COM provides great service, it always strikes me as being unfortunate when folks in the entheogen-related community fail to link to F.S. BOOKS or MIND BOOKS for their titles on psychedelics; we should be generally more supportive of smaller businesses, especially when they are run by members of our own community.)

Categories of the site include psychedelics, products, spirituality, time, visuals, featured articles, Gaia, science, multimedia, and travel. It was when I got to the “art museum” section of the “visuals” category that I lost my enthusiasm for this site. There are an excellent selection of images here, beginning with ALEX GREY’S work, moving into SALVADOR DALI, and then some other contemporary artists. Unfortunately, none of these works are *credited* to the artist who did them, nor is the title of the work given. It seems quite unlikely that any of these artists would appreciate their work being presented this fashion. It is quite unfortunate that this “museum” is set up in this manner, as there were some interesting pieces of art posted, and I would have liked to know more about the artists that did them. Since the first time that I visited the site and the time that I wrote the review, a link has been put in to GREY’S *Sacred Mirrors* web site, but there is still no mention of his name or the titles of his works anywhere. And one would have to stumble across the link by clicking onto one of the images, since there is no indication that the link exists. I seriously doubt that permission has been granted by any of the artists (or their estates) to present their work in this anonymous manner.

There appears to be a non-ethic common on the web that it is okay to simply post whatever one wants, creator and copyright be damned. Which makes me wonder whether or not ARTHUR got permission to post various written works to his site, such as stuff by STEVE KUBBY, TERENCE MCKENNA, and PAUL STAMETS, among others. He no doubt *may* have, but unless I see “reprinted by permission” on any web site, I remain sceptical. At least in these cases he *credited* the writings; *artists* on ARTHUR’S site don’t even get this much consideration.

This sort of theft is not at all unique to ARTHUR. After visiting the LYCAEUM’S plant image bank in their “Graphics Archive,” I noticed that hardly any of the images cited the source that they had been taken from. Numerous images had clearly been hoovered from PAUL STAMETS books and JIM DEKORNE’S *Psychedelic Shamanism*. (My feeling was, at *least* if you are going to steal someone’s image, it would be a bit more reasonable to put in a credit and a link to where one might purchase the

book that these images were lifted from.) When I mentioned this to the LYCAEUM’S Graphics Archive Manager, he said that he was new on the job, and that they were going to try to correct this, but he didn’t know where many of the images came from. I then spent several hours of volunteer work, collecting citations for these unreferenced images, and e-mailed this information to him. Over a year later, they still have not given proper credit for these images (although some of them may have been removed since then). When it comes down to building a web site largely by stealing the works of others, and not even crediting it in some cases, I have to seriously wonder about what the denizens of cyberspace have learned from the psychedelic experiences they claim to espouse the importance of.

#### BIBLIOGRAPHIA STUDIORUM PSYCHEDELICORUM

<http://www.psymon.com/psychodeliasymon@psymon.com>

A catalog of the reading that RON KOSTER has done during his explorations of the psychedelic experience. It is essentially a list of everything that he read on the topic between 1985 and 1993 (and this guy clearly did a lot of reading). This selection is pretty extensive, and nicely broken up into categories so that those looking for source material in a particular area can check under these headings first: General Information, Chemical, Bio-Physiological & Botanical Studies, Individual Subjective Descriptions, Sociological & Historical Perspectives, Ethical & Legal Perspectives, Consciousness Studies, Creativity Studies & Artistic Considerations, Studies in the Psychology of Religion, Ethno-Psychopharmacology, Psychotherapeutic Applications, Adverse Reactions & Their Treatment, and Spotlight: STANISLAV GROF. There is also a very useful alphabetic listing of the entire bibliography, for those who *know* exactly what they are looking for, but need specific citation details.

There are transcriptions of some documents, and it appears as though KOSTER has attempted to retain the original format of these articles to a large degree. Some transcribed works include: *Mescal: A New Artificial Paradise* (the 1897 HAVELOCK ELLIS article on his experiences with peyote), “L.S.D. 25 as an Aid in Psychotherapy: Preliminary Report of a New Drug” (The first English-language article written about LSD from 1950), *The Psychedelic Drug Therapies* (GRINSPON & BAKALAR’S brief introduction to the history and use of psychedelics in the field of psychotherapy), *Dolphin-Human*

*Relation and LSD 25* (LSD psychotherapy with dolphins (!) by JOHN LILLY).

As well, there are a number of graphic links, including visions from LSD psychotherapy, molecules, LSD blotter art, a small gallery of psychedelic art, psychedelic rock art (the San Francisco scene), the acid tests, psychedelic ESP targets, delysid, patient CARY GRANT, monkeys on LSD, and spiders on LSD.

This web site is a valuable and well-crafted resource for psychonautical researchers.

**Kitamorokata-gun**

**Miyazaki 889-1914**

**JAPAN**

**81-986-8762-9024**

**cosmic@cosmicshrooms.com**

**http://www.cosmicshrooms.com**

A fairly new Japanese firm offering live *Lophophora williamsii* plants, 4–6 cm in diameter, 4–6 years old (have flowered at least once) for \$50.00 each; *L. diffusa* for \$45.00 each; *Trichocereus bridgesii* and *T. pachanoi*, 10–14 cm tall and 4–6 cm wide, for \$40.00 each; and various psilocybian mushrooms—*Psilocybe cubensis*: 2.5 gm for \$35.00, 5 gm for \$55.00, 7.5 gm for \$70.00, 10 gm for \$80.00; *P. tampanensis*: 7 gm for \$30.00, 15 gm for \$50.00, 22 gm for \$65.00, 30 gm for \$75.00; *Copelandia cyanescens*: 1.5 gm for \$40.00, 3 gm for \$70.00, 4.5 gm for \$90.00, and 7.5 gm for \$110.00; and they have a 5X extract of *Tabernanthe iboga* root-bark: \$50.00 for 1 gram, \$140.00 for 3 grams, \$210.00 for 5 gm, \$320.00 for 8 gm (dose ranges are presented as 0.5–1 gm as a stimulant; 1–3 grams as a mellow euphoric trip with possibilities for visual imagery; 3–6 gm as the maximum safe amount, with possibilities for near-death and spiritual experiences). They sell Oaxacan *Salvia divinorum* leaves (\$28.00 for 14 gm, \$45.00 for 1 oz) and extracts, a “regular” 5X (\$15.00 per gm), a standardized 5X (\$21.00 per gm), and a standardized 10X (\$19.00 per 1/2 gm, \$36.00 per gm). They also offer a variety of less interesting herbs such as *Acorus calamus*, *Artemisia absinthium*, *Centella asiatica*, *Cola nitida*, *Kaempferia galanga*, *Lactuca virosa*, *Muiria puama*, *Nepeta cataria*, *Passiflora incarnata*, *Paullinia cupana*, *Piper methysticum*, *Scutellaria laterifolia*, *Serenoa repens*, *Turnera diffusa*, and *Valeriana officinalis*, as well as a few herbal energizer and “herbal ecstasy” products. At times they have 2C-T-7 (generally about \$20.00 per 8 mg) and MTA. Prices for these items fluctuate, and you should e-mail for more information. Finally, they are considering offering 1,4-butanediol (as GHB is scheduled in Japan).

Shipping via regular airmail (4–7 days) is free, and via Express Airmail (3–5 days) is \$10.00. Payment by international postal money order is preferred, although they also accept bank transfers along with an additional \$25.00 fee, credit

card payments (processed through the PAYPAL e-mail system), as well as American and Japanese cash. Their shipping method is said to be “confidential,” with the comment “Do you like Japanese noodles?” (I’m sure everyone catches their drift here). They will ship in any manner requested, and they ship to any country stating that it is the buyer’s responsibility to know the laws in their own country. None of their products are illegal in Japan.

**DANCESAFE**  
**POB 12462 (Dept. ER)**  
**Berkeley, CA 94712**  
**(510) 834-4654**  
**dsusa@dancesafe.org**  
**http://www.dancesafe.org**

I asked my friend SYLVIA to get me some information on the harm reduction group DANCESAFE, as I had been hearing quite a bit about them lately. Here’s what she had to say:

DANCESAFE started out in 1998 as the ECSTASY HARM REDUCTION PROJECT, with pill-testing as its primary focus. It quickly widened its scope to harm reduction information about ecstasy and other club-drugs. A grant from the PROMIND FOUNDATION kick-started their free pill-analysis project. Users can send a pill in to DRUG DETECTION LABORATORIES (DDL, 9700 Business Park Drive STE. 407, Sacramento, CA 95827—include a piece of paper with DANCESAFE written in large letters, plus the brand of the pill; effects if they are known, *i.e.* “stonny,” “no effect;” and the city where the pill was acquired) and about two weeks later this information along with a picture of the pill, its dimensions, and contents (though not dosage, due to DEA restrictions) are posted on the web site. This way pills that *are* adulterated (most commonly dextromethorphan sold as MDMA) get their mugshot up and a warning about them. Since the deaths in May of two Chicago youths who took PMA (4-methoxyamphetamine) that was sold as ecstasy, and hospitalizations across the country from DXM-related heatstroke, the value of pill-testing only gets clearer. For a donation of \$25.00 or more, visitors can get a Marquis-reagent testing kit with a color chart, for home pill screening. DANCESAFE also sells its literature and offers instruction on how to create a local DANCESAFE chapter. Local chapters set up tables at raves and offer on-site, while-you-wait pill screening with the Marquis reagent kit, as well as free information, condoms, earplugs, and advice. Local chapters can make arrangements with law enforcement that people getting pills tested will not be targeted, and they also

can coordinate with on-site medical personnel and security to insure the safest setting possible. DANCESAFE is currently getting a lot of attention in the press: *60 Minutes II*, *TIME Magazine*, *A&E*, and other print and broadcast news groups have interviewed the national director, EMANUEL SFERIOS.

The DANCESAFE web site includes comprehensive information on all recreational “dance” drugs, organized both for the average user looking for simple safety tips, as well as the more experienced user seeking detailed pharmacological action. It starts off with a clever eye-candy icon; a phat-panted dancer in the middle of a yellow yield sign (well, almost, the sign is upside down but it gets the message across) and the motto “promoting health and safety in the rave and dance-club community.” The nav bar is chunky with links; Drugs (the usual suspects), Issues (Hearing, Driving Home, Safe Settings, Women’s Issues), Organization (Philosophy & Vision, National Office, Local Chapters, Literature), and Highlights (Ecstasy Slideshow, Ecstasy Testing Kits, Laboratory Pill Analysis, Risk Assessment). The Ecstasy Slideshow has been described as “E for Dummies.” It takes you through “what ecstasy does in the brain” in plain language. The Risk Assessment section has a chart that shows what the relative risks of death are of many behaviors (Russian roulette and brain surgery are listed as “Extremely High [risk],” ecstasy and airplane travel are listed as “Quite Low,” tobacco use and serious climbing are “Very High,” nitrous oxide and sharks are “Minimal”). The web site gets over 130,000 hits a day.

DANCESAFE is a solid grass-roots harm reduction group that focuses on the casual non-addicted use of MDMA and other drugs—a new front in the U.S. for harm reduction (a drug policy reform strategy that is best known for needle exchange). An emerging motto being promoted for the electronic dance culture around harm reduction efforts is “zero deaths, zero arrests.” Regardless of whether or not the ECSTASY ANTI-PROLIFERATION ACT OF 2000 (S.2612) passes in its current form [For more on this anti-free speech bill, which is disturbingly similar to the METHAMPHETAMINE ANTI-PROLIFERATION ACT, see [www.cognitiveliberty.org/lawlibrary/bills/antiecstasybill/antiecstasyindex.htm](http://www.cognitiveliberty.org/lawlibrary/bills/antiecstasybill/antiecstasyindex.htm)], DANCESAFE—along with MAPS—will continue promoting MDMA harm reduction and therapeutic use, respectively. I could go on and on about DANCESAFE—I love it so much I’m going to go work as Associate Director at the national office in Oakland starting in August. — SYLVIA THYSSEN

**DROOL DONKEY****<http://drooldonkey.org>**

A web page related to psilocybian mushrooms, with sections on cultivation, suppliers, experimentation, mushroom hunting, gourmet/medicinal, spirituality, and entheogens. They also have a chat room. But the main attraction appears to be the bulletin board forums on various topics. After checking out a few of these, it pained me to realize how much free time some people must have on their hands. The boards were littered with flames from people insulting other posters, or trashing various companies, or relating long-winded bust stories from years gone by, and numerous instances of people parroting urban legend as fact. Reading all of this blather made me yearn for some good ol' fashioned web-porn.

**ETHNO****Ruten 177 (Dept. ER)****2700 BRH.****DENMARK****<http://www.ethno.dk>**

A Scandinavian web-based entheogen store. Freshly-dried psilocybian mushrooms for sale here—3 gm for \$17.00, but they won't ship to the USA. Apparently they will ship all of their *other* products world-wide, and they caution customers to be aware of the laws in their own countries. They also sell a standardized *Salvia divinorum* extract, with 1 mg of salvinorin A on 25 mg of leaf for \$17.00. This is a pretty stiff price for one dose, considering that anyone growing their own plants could easily produce virtually the same dose with a simple acetone extract for pennies. (Of course, it wouldn't be standardized in the same manner, and it would probably take some number of bioassays to determine what a comparable dose was.) They offer 10 baby Hawaiian woodrose seeds for \$12.00, and a variety of less interesting herbs: *Ephedra*, guarana, kola nut, sassafras, wormwood—the standard fare. It is too bad that they won't ship mushrooms to the USA, as this is the only product that they sell at a comparable USA market value—everything else that they offer is too pricey to recommend. Perhaps the drug market economy is different in Europe.

**GRAM PRECISION SCALES, INC.****7354 Aspen Avenue (Dept. ER)****Mississauga****Ontario, L5N 6P2****CANADA****(888) 400-3688****(888) 400-2219 toll free fax****[grampre@interlog.com](mailto:grampre@interlog.com)**

GRAM PRECISION SCALES, INC. sells battery-operated digital scales that are the size of a postcard. Three available models weigh from 0.1 gm to either 120 gm (\$129.00), 200 gm (\$155.00), or 300 gm (\$180.00). S/H is \$10.00, and they accept credit cards.

While these scales aren't as good for weighing small amounts as the ones spoken of in the VERNAL EQUINOX 1999 issue of *ER* (p. 30)—in that they don't go down to 0.002 gm—they *are* substantially less expensive, and certainly quite portable. They could still be very handy for a multitude of uses, and they weigh in grams, ounces, troy ounces, and penny weights. Each model has features a battery-saving “automatic off” function, in case you forget to turn it off.

**GREEN HEAT, INC.****POB 631 (Dept. ER)****Kensington, MD 20895-0631****[srdsmith@erols.com](mailto:srdsmith@erols.com)****<http://www.flashevap.com>**

GREEN HEAT, INC. used to be GREEN METALS, the company that produced the FLASH EVAPORATOR vaporizer pipe. Not just any vaporizer pipe, mind you, but my *favorite* vaporizer pipe. So what did they do? They stopped making it and changed their name. But never fear, they have produced an even better model, called the ETERRA. Like the old model, this one works by drawing hot air through a one-hit style pipe stem. The result is that there is no loss from slipstream vapor or condensation (like with the glass dome models). The ETERRA has been improved over the FLASH EVAPORATOR, in that it can now be left “on” continually, so that it is always ready to use. (With the FLASH EVAPORATOR, one had to wait between uses for the unit to reheat.) The new model is larger—about 2.5” in diameter by 5” tall—and basically just looks like a nicely stained, thick mahogany dowel. (It does have a light that informs one that they have left it plugged in.)

There are a few drawbacks with the new model though. The wood has a tendency to crack slightly at the opening, from

the internal heat. This is a small mar on the aesthetics of the pipe. Less attractive is fact that the wood around the opening eventually discolors, becoming lighter (also due to the heat, I suppose). But I can certainly live with both of these situation; signs of use that impart character, I suppose—somewhat like an antique or “estate” pipe might have. And finally, while the old FLASH EVAPORATOR came with a wooden stem, the new ETERRA comes with a black plastic one. There is really nothing wrong with the way that the new stem looks or works, it is just that I feel that the previous “all wood” approach had a bit more class.

But these “flaws” are minor, and the pipe is truly a gem of practicality. Subjectively, it is very efficient, and I would hope that someday someone might run some more objective scientific testing to confirm this. (For now you’ll have to take my word.) It truly *is* “parsimonious” with smoking materials, as their advertising attests. ETERRA air heaters are available for \$127.00 each plus \$15.00 for shipping (Maryland residents add \$6.35 for sales tax).

### THE HAWK'S EYE

TEd H.

835 W. Warner RD.

Suite 101-251

Gilbert AZ 85233

thehawkseye@home.com

<http://www.thehawkseye.com>

Another web site offering great photos of various psilocybian mushrooms, as well as spore syringes. Each syringe is \$13.00 unless otherwise stated. Strains currently offered include: *Psilocybe cubensis* B+ (caramel caps), *P. cubensis* Cambodia, *P. cubensis* Thailand, *P. cubensis* Equador, (Copeandia) *Panaeolus tropicalis* (\$25.00). They also have many other offerings that weren't currently in stock when I checked their web page; a visit to the page will present more information about these. By the looks of this web site it seems like one of the more professional outfits around, and the prices are reasonable. As well, they have a very cool Cubist/*cubensis* logo that is worth checking out even if you don't plan on ordering any spore syringes.

They offer a “one week” guarantee on shipping (orders that take more time to mail than this will receive extra syringes). Order 3 syringes and get a 4th one free. Order 5 syringes of any one strain or a combo order and get 2 free of the same strains of your choice. They also sell unused, wrapped sterile

syringes with needles for \$1.00 each. S/H (via Priority mail) is \$3.00 in the U.S.A., \$6.00 in Canada, and \$10.00 to all other countries. They request that those people ordering use a full first or last name, to insure correct delivery by the post office. They won't ship spores to California. Don't write “THE HAWK'S EYE” when ordering, just “TEd H.”

I was first made aware of this site due to the unfortunate occurrence of the owner having been busted, apparently for receiving a package of some contraband in the mail. This caused some concern and reaction among the entheogen community. The charges have since been dropped. Except in California, spores are not illegal in the USA. Nevertheless, there is always at least a slight worry that their could be a “mail cover” operation going on at various spore sellers, and it is natural to think that if this *is* going to occur, it might be more likely to happen with someone who has already had a run-in with the law. Customers then have to balance their own fears against the desire to help one of our brothers or sisters who has been hit by the man. In the end, regardless of whom one might legally order spores from, my feeling is that it would be unwise to make such a purchase in one's own name and have it sent to one's own home (if they keep anything illegal there), or to the same address where they might have plans to grow mushrooms. There are not infrequent busts of *Cannabis* growers who've purchased indoor lighting equipment and given their own name and address to the seller. This isn't necessarily something that is common at all with mushroom growers (I've never heard of it occurring, although there was at least one case that I am aware of where the authorities did obtain a seller's customer list). I don't think that busting mushroom growers is any kind of law enforcement priority. And, if one takes reasonable precautions when placing their order (false name and mail drop), I can see no reason to not support the owner of THE HAWK'S EYE by purchasing his spores syringes.

### THE INFORMANT

<http://informant.dartmouth.edu/index.cgi>

Not directly related to entheogens, although it *can* be. “The Informant is a free service that will save your favorite search engine queries and web sites, check them periodically, and send you e-mail whenever there are new or updated web pages.” One could easily enter such words as “ayahuasca,” “*Cannabis*,” “entheogen,” “peyote,” *etc.*, and keep better abreast of the ever-changing world of the web.

**KING BONG**  
**POB 4042 (Dept. ER)**  
**Bournemouth,**  
**BH3 7YL**  
**UNITED KINGDOM**  
**info@kingbong.com**  
**http://www.kingbong.com**

While this store has the “typical” headshop offerings, they have done a very good job in carrying a large and interesting selection. (They actually have three physical locations in England, as well as the on-line mail-order shop.) Ah, if there were only headshops this cool in the USA... They have a large selection of papers, pipes, bongs, scales, incense, and more.

Their “entheogen” selection includes *Banisteriopsis caapi* (powdered vine 10 gm for £8.00, 25 gm for £30.00), *Calea zacatechichi* (1/4 oz for £5.00, 1 oz for £15.00), *Desmanthus illinoensis* (root-bark 10 gm for £10.00, 25 gm for £35.00), *Diplopterys cabrerana* (dried leaf 10 gm for £20.00, 25 gm for £70.00), baby Hawaiian woodrose seeds (1 pkt of 7 seeds for £5.00, 4 pkts for £15.00, or 10 gm, over 90 seeds, for £35.00), *Ipomoea tricolor* seeds (1/4 oz for £3.50, 1 oz for £10.00), *Mimosa hostilis* (root-bark 10 gm for £15.00, 25 gm for £25.00, 100 gm for £90.00), *Peganum harmala* (seeds 10 gm for £4.00, 25 gm £8.00, 100 gm for £30.00), *Psychotria viridis* (dried leaf 10 gm for £10.00, 25 gm for £35), *Salvia divinorum* (pretty damn pricey at 1/8 oz for £10.00, 1/2 oz for £35.00, 1 oz for £60.00).

They also carry a huge variety of *Cannabis* seeds, and they have a great selection of topical books. They place the legal responsibility on the customer, which I assume means that they will ship to any country, but they won't sell to people under the age of 18. (I always wonder how such things can be reasonably checked up on via mail-order?)

Postage within the UK for orders £10.00 or less is £1.00, orders £11.00–£20.00 is £2.00, and over £20.00 postage is free. Orders from any other country must e-mail first with their order to find out postage costs.

**MEDICINE GARDEN / HAZY HOUSE**  
**POB 6432 (Dept. ER)**  
**Sth Lismore NSW**  
**AUSTRALIA 2480**  
**Phone (02) 6622 2524**  
**Fax (02) 6622 2500**  
**herbmed@spot.com.au**  
**http://www.medicine-garden.com.au**

MEDICINE GARDEN/HAZY HOUSE sells a wide variety of seeds, plants, and dried herbs, many of which may be of interest to readers of *The Entheogen Review*. Their web site provides information on herbs and they sell books, water filters, vegetable oils, neem, and many other products.

As herbs and tinctures they have *Areca catechu*: 20 gm for \$12.00, a “*Calea Dream Kit*” (*Calea* leaf, liquid, mugwort) for \$20.00, *Coco Cola Suma Herbal Blend*: 30 ml for \$8.80, *Ephedra sinica*: 50 gm for \$19.50, “*Go Go Liquid Guarana*” *Paullinia cupana*: 60 ml for \$8.80, “*Go Go 3X Liquid Guarana*” *P. cupana*: 30 ml for \$8.80, *Piper methysticum*: 30 ml for \$18.00, *Turnera aphrodisiaca* concentrate: 30 ml for \$8.80, and others.

Their “smoking herbs” feature *Arctostaphylos uva ursi*: \$8.50 per tin, *Artemisia vulgaris*: \$8.50 per tin, *Calea zacatechichi*: 10 gm for \$12.00, *Eschscholzia Californica*: \$9.50 per tin, *Cytisus canariensis*: \$9.50 per tin, *Leonurus leonotis*: \$9.50 per tin, *Leonurus sibericus*: \$9.50 per tin, *Nepeta cataria*: \$8.50 per tin, *Passiflora alata*: \$8.50 per tin, *Salvia divinorum*: 3.5 gm for \$10.80, 5 gm for \$15.00, 25 gm for \$64.00, 100 gm for \$240.00, *Scutellaria laterifolia*: \$8.50 per tin, and *Turnera aphrodisiaca*: \$8.50 per tin. They also offer a variety of smoking “blends” of the above-mentioned and other herbs.

As seeds, they offer *Acacia longifolia*: \$8.00, *A. maidenii*: \$8.00, *A. obtusifolia*: \$10.00, *Atropa belladonna*: \$12.00, *Calea zacatechichi*: \$8.00, *Desmanthus leptolobus*: \$8.00, *Leonurus leonurus*: \$8.00, *L. leonurus alba*: \$8.00, *Lobelia inflata*: \$5.00, *Mandragora officinarum*: \$12.00, *Nicotiana tabacum*: \$4.00, *Pausinystalia yohimbe*: \$150.00 for 6 seeds (!), *Peganum harmala*: \$10.00, *Salvia splendens*: \$12.00, *Scutellaria laterifolia*: \$6.00, *Tabernanthe iboga*: \$100.00 for 3 seeds and growing instructions (!), *Tagetes lucida*: \$5.00, *Turbina corymbosa*: \$10.00, and *Voacanga africana*: \$30.00.

They were selling fresh seed for *Erythroxylum nova-gradensis*, but sales have been indefinitely discontinued, due to legal questions. (They are currently investigating information that

the possession of *E. nova-gradensis* is illegal in the state of N.S.W.)

Their live plant cacti and succulents section lists *Lophophora williamsii*: \$30.00 and up, *L. williamsii v. caespitosa* (clumping variety): \$80.00 and up, *Pachycereus pecten-aboriginum*: \$30.00 and up, *Trichocereus bridgesii*: \$30.00 and up, *T. bridgesii v. monstrose*: \$20.00 and up, *T. pachanoi*: \$20.00 and up, *T. peruvianus*: \$30.00 and up.

Also in plant form they offer *Acacia complanata*: \$8.00, *A. maidenii*: \$8.00, *A. obtusifolia*: \$6.50, *Alstonia scholaris*: \$5.50 to \$18.00, *A. constricta*: \$6.50 to \$15.00, *Argyrea nervosa*: \$20.00, *Artemisia absinthium*: \$3.50, *Banisteriopsis caapi*: \$80.00, *Brugmansia sanguinea*: \$7.50, *Calea zacatechichi*: \$10.00, *Catha edulis*: \$8.50, *Desfontania spinosa*: \$16.50, *Desmodium gangeticum*: \$5.00, *Heimia salicifolia*: \$10.00 and up, *Ipomea* species ("quiebra plata," a rare un-named favored South American species): \$20.00, *Kaempferia galanga*: \$6.50, *Leonurus leonotis*: \$4.50, *Nymphaea caerulea*: \$30.00, *Pausinystalia yohimbe*: \$150.00 and up, *Phalaris* grasses: \$6.50 to \$8.50, *Piper betel*: \$6.50, *Psychotria viridis*: \$45.00, *Rauwolfia serpentina*: \$40.00, *Salvia divinorum*: \$40.00, *Tabernaemontana pandacaqui*: \$8.50, *Turbina corymbosa*: \$15.00, and *Voacanga Africana*: \$40.00.

As well as plant products, they also sell food-grade stainless steel stills, which all come complete with pump and hoses. 25 liter: \$1,100.00, 35 liter: \$1,200.00, 40 liter: \$1,300.00, 60 liter: \$1,450.00, 205 liter: \$2,100.00, 410 liter: \$2,600.00. They also sell a 500 ml Pyrex oil separator for \$210.00. It is suggested that, by using these stills, one can maximize one's returns on an essential oil crop by monitoring the fluctuations of oil during the growing year. This can increase one's yield per hectare by knowing the optimum time to harvest.

They offer bulk rates on some plants and seeds, via inquiry. Credit cards are accepted and they do operate via mail order as well.

**MT. ELPHINE SPORE LAB**  
**CaptainMaxMushroom@yahoo.com**  
**<http://www.geocities.com/Yosemite/Meadows/4448/spores.htm>**

Spore prints (\$20.00) and spore syringes (\$12.00) are available for the following mushrooms: Australian *Psilocybe cubensis*, Ecuadorian *P. cubensis*, Gulf Coast *P. cubensis*, "B+"

*P. cubensis*, and *Psilocybe cyanescens*. Orders can only be made through e-mail. Their web page has a gallery of over 60 mushroom photos, as well as cultivation advice, and many links.

**MYSTIC MOUNTAIN MUSHROOMS**  
**POB 475 (Dept. ER)**  
**Trail, BC V1R-4L7**  
**CANADA**

**MYSTIC MOUNTAIN MUSHROOMS**  
**PMB #248 (Dept. ER)**  
**4155 Deep Lake Boundary Road**  
**Colville, WA 99114**  
**MMMshroom@hotmail.com**  
**<http://www.3mshrooms.homestead.com>**

MYSTIC MOUNTAIN MUSHROOMS' web page has the obligatory grow articles and links. They also offer spore syringes for *Psilocybe cubensis* "B+" and *P. cubensis* "Gulf Coast." They sell a fairly simple and unique-sounding spore syringe creating device, called the "spore receiver." "[It] is shaped like a cone. Simply fill the collector with sterile water and place the mushroom cap on top of the holder. The spores will fall in the water. A slight swirl of the water and the spores sink to the bottom of the cone where they concentrate. Simply slide the needle down to the bottom of the cone and draw up the spores." These are \$10.00 each. They also supply 12 cc syringes with 1 1/2" long, 16 gauge needles. These are \$1.00 each for the first 10, and 75¢ each for orders over 10 units.

They only sell to people 21 and over, and there is a \$10.00 minimum order. Payment should be made with cash or blank money order to either address above. Service from the USA address may be slower because it is checked once a week or when they actually ship USA orders. (Orders in the USA are shipped from within the USA to avoid problems with customs.)

**NETWORK 23**  
**<http://n23work99.free.tekno.org>**  
**<http://www.network23.org>**  
**[n23work@hotmail.com](mailto:n23work@hotmail.com)**

A cool sort of all-in-one stop for information on global parties, raves, festivals, music events, and any other sort of alternative culture gatherings. Their Internet site is run by several people in different countries; it claims to be the hub of a global network with satellite sites in Barcelona, Bristol,

London, Manchester, The Midlands, Norfolk, Prague, Paris, USA [central], and San Francisco.

“NETWORK 23, an experiment in ‘Positive-Information Technology.’ The aim is to get people on a mission, in touch with each other for the mutual facilitation of missions. The emphasis is on having fun, getting worthwhile things done, and reducing everyone’s dependence on political and corporate institutions.

“It’s about everything. People, music, parties, sunshine, intoxicants, trees, transport, fiction, information, reality, surreality, recipes for flapjacks, and everything else. The NETWORK 23 take on life is that everyone is talented and has unique gifts: by bringing talented and gifted people together, and sharing missions, a connected community can become an unstoppable force.”

#### **NORTHERN TOUCH SPORES**

**bfixxer@hotmail.com**

**<http://www.geocities.com/bfixxer/northerntouch/index.htm>**

NORTHERN TOUCH SPORES (formerly PSYCHOGENIC SPORES) is based in British Columbia, Canada. They sell prints exclusively (no syringes or cultures), and orders can only be placed via e-mail. All of their prints are \$10.00 each, except where noted. Buy any two prints and get a third one free. All spore prints are guaranteed sterile. They have *Psilocybe coprophils* (\$5.00), *P. cubensis* (Australian), *P. cubensis* (B+), *P. cubensis* (Ecuador), *P. cubensis* (Gulf Coast), *P. cubensis* (Mazatapec), *P. cubensis* (P.E.S. Hawaiian), *P. semilanceata* (liberty cap), and *P. stuntzii* (blue ringers).

#### **THE NOVELTY PROJECT BENEFIT CD FOR TERENCE MCKENNA**

**<http://noveltyproject.com>**

**info@noveltyproject.com**

Conceived of through the TIMEWAVE/NOVELTY LIST, an e-mail discussion group run by TERENCE and DAN LEVY, the intent of this PROJECT is to create a CD recording in TERENCE’S honor with all proceeds going to his family and close friends, to help lessen the burden of medical costs and special expenses. 100% of the proceeds from the NOVELTY PROJECT’S BENEFIT CD for TERENCE MCKENNA will go towards helping to defer the financial expenses that accrued during the time of TERENCE’S

illness and treatment. These expenses have been significant enough to warrant a public appeal for help in this respect.

“Composed of diverse and geographically dispersed shining hearts and minds, the NOVELTY PROJECT represents the collective recognition of TERENCE MCKENNA’S extraordinarily brilliant mind and being. The various members of this group were initially joined via the interwoven mind-fabric of dream, experience and inspired consciousness commonly referred to as the novelty discussion list. This forum finds TERENCE’S timewave theory as its thematic basis, though it has included discourse and excerpts ranging from the mystical to the scientific, the conspiratorial to the very personal, the maddeningly logical to the barely linguistically comprehensible.

“It’s been quite a wild ride at times, and although we are each unique in our interests and viewpoints, lifestyles and experiences, all the members of this project share a common respect for TERENCE and the important contributions he has made in our minds and lives.

“It also seems worth noting, that the Internet’s global infrastructure has allowed this musical tribute to be possible, as the entire project has been organized, and largely brought to fruition, via this medium of widespread connectivity. Most of the participants involved with the project have never met each other outside the list forum, though the success of this recording will enable us all to make a significant difference...

“The CD benefit project has been organized, recorded and produced within a one [month] period. It has been composed entirely of individually donated time, energy, financial support, art and musical submissions.

“We’re very proud of the result and think the listener will be as well. Through the active involvement of many individuals working together, we can prove far more effective...”

CD art is viewable at the web site. The CD is available via a secure web credit card transaction for \$20.00 from the site listed, or can be ordered by mail from THE MANIFEST COMPANY, 224 North 4th Street (Dept. ER), Stillwater, MN 55082, [manifest@maximpulse.com](mailto:manifest@maximpulse.com).

There is also a pretty damn complete offering of writings and tapes from TERENCE available at the web page for this CD project; profits from all order placed through the AMAZON.COM affiliate program for books ordered from this site will go to the MCKENNA family.

**Webster, NY 14580**  
**shaman@nyethnobotanicals.com**  
**http://www.nyethnobotanicals.com**

Another botanical company, they sell baby Hawaiian woodrose seeds, "Asian variety" (10 seeds \$2.00, 100 seeds \$10.00, 500 seeds \$25.00, 1/2 lb \$200.00, 1 lb \$350.00) and "Maui variety" (claimed to have a higher LSA content: 5 seeds \$5.00, 25 seeds \$10.00, 100 seeds \$30.00, 1/4 lb \$200.00), *Ipomoea tricolor* "Heavenly Blue" (500 seeds \$10.00, 1/4 lb \$40.00, 1/2 pound \$60.00, 1 lb \$100.00), *Stipa robusta* "var. narcotica" (seed packet \$10.00), *Trichocereus pachanoi* seeds (50 seeds \$10.00, 200 seeds \$25.00, 1000 seeds \$50.00), *T. pachanoi* cuttings (12" tip cutting \$20.00; 12" non-tip cutting \$17.50), *Lophophora williamsii* seeds (5 seeds \$20.00), *Lophophora* species, mixed (5 seeds \$20.00), *Papaver somniferum* var. *glabrum* seed or *P. somniferum* var. *nigrum* (1 gm \$3.00, 3 gm \$5.00, 10 gm \$10.00, 100 grams \$50.00, 1 kilo \$150.00), each of the following *P. somniferum* "Hens and Chickens," "Soviet Red Opium Poppy," "Gigantium Opium Poppy" (seed packet \$5.00 each variety), *Eschscholzia Californica* (seed packet \$5.00).

They also sell mushroom spore syringes. *Psilocybe cubensis* var. Cambodian, or *P. cubensis* var. Ecuadorian, or *P. cubensis* var. South American, or *P. cubensis* var. Mexican (1 syringe \$20.00, 2–3 syringes \$18.00 each, 4+ syringes \$15.00 each). I have no idea if one can "mix and match," from these selections and get the better price.

As well, they have *Salvia divinorum*, apparently domestic-grown (2.5 gm \$10.00, 10 gm \$35.00, 28 gm \$60.00, 100 gm \$150.00), as well as "Mexican," which they state is "very potent" (2.5 gm \$8.00, 10 gm \$28.00, 28 gm \$45.00, 100 gm \$120.00). This brings up an interesting point—if the *S. divinorum* grown in México is *more potent* than that grown in the USA (which extraction trials with at least *some* Oaxacan material have shown), why is this product consistently sold at a *lower* price than leaves is grown in the USA? Part of the reason may be cosmetic; most imported leaves don't look as pretty as the "grade A" leaves seen from USA growers. But the main reason is that the imported stuff simply costs much less. It may or *may not* be sustainably harvested in the mountains of the Sierra Mazatec, but what *is* certain is that it is just being yanked out of ravines; there aren't many (if any) active commercial growing operations in México. Which means, for those concerned about such things, that it may

actually be better to pay a higher price for less potent domestically-grown herb. I have to seriously wonder about the impact that American drug culture is having on a traditional native sacrament in its own country.

Also available is *Diplopterys cabrerana*. N.Y. ETHNOBOTANICALS states that the material they sell is both "ethically wild-crafted" and plantation-grown in Peru. Again, I'd prefer if it was *all* plantation-grown. This is another plant that enthusiasts in the USA should start growing, both personally and for any commercial purpose. (10 gm \$10.00, 30 gm \$20.00, 100 gm \$65.00, 250 gm \$150.00, 500 gm \$250.00). Another offering from the Amazon is *Banisteriopsis caapi* (25 gm \$10.00, 100 gm \$30.00, 500 gm \$100.00).

They also sell *Amanita muscaria*, and strangely refer to it as "one of the deadliest of the poisonous mushrooms" stating that it "contains the alkaloid muscarine, a powerful poison that affects heart action." In truth, samples of *A. muscaria* have tested very low in muscarine, and it is known byentheogen aficionados that *A. muscaria* is not deadly, and *is* psychoactive due to ibotenic acid/muscimol. Despite the fact that N.Y. ETHNOBOTANICALS feels that this mushroom is a death sentence, they still sell dried caps and stems of material from the Pacific North West coast. Perhaps they think that this misinformation *really* shows that the products they offer are not sold for consumption? (5 gm \$15.00, 10 gm \$25.00, 25 gm \$45.00, 100 gm \$150.00).

**PGP**  
**http://www.pgp.com**

People surfing the web should be familiar with PRETTY GOOD PRIVACY (PGP), a heavy-duty encryption method that is pretty-much the industry standard. From what I'm told, it is easier than ever to use with e-mail. This is the site where you'll find the various program options available. Privacy is a frequently overlooked concern on the 'net, and PGP can help.

**PHARMACOM CHEMICALS**  
**http://www.ghb-sales.com/index.html**

A source for what is said to be high-quality sodium GHB (99.5% pure). They offer a 100% money-back guarantee. It appears as though they only have on-line sales, but they do use a secure server. Payment must be made by WESTERN UNION or telegraphic transfer only. They offer same-day shipping

via insured first class mail only, and their product is said to be well-packaged and shipped discreetly. Their prices aren't the best that I have seen, but they aren't totally exorbitant: 100 gm: \$134.00, 200 gm: \$268.00, 300 gm: \$402.00, 400 gm: \$536.00, 500 gm: \$580.00, 600 gm: \$696.00, 700 gm: \$812.00, 800 gm: \$ 928.00, 900 gm: \$963.00, 1000 gm: \$980.00. Add \$9.00 for S/H costs. They ship to all countries except for Australia, Norway, Italy, and the USA.

### PSILOCYBER'S SHROOM DEPOT

[pc@shroomdepot.com](mailto:pc@shroomdepot.com)

<http://www.shroomdepot.com>

A decent selection of *Psilocybe cubensis* strains in print form. They have "B," "B+," "Ecuadorian," "Golden Teacher," "Mazatapec," "Mexican Cubensis," "Thailand," and "Treasure Coast."

"All prints are now available on parchment paper and are very dense deposits. Most average 1/2 inch to 1 inch in diameter although several strains produce large fruit bodies and therefore prints can reach up to 2 inches across. All prints are \$15.00."

The following ordering instructions are given: 1. On a piece of paper, write or type the name of the strain you are interested in. Please include an alternate strain; 2. On that same piece of paper, write or type LEGIBLY the name and address you wish the spores to be sent to; 3. Enclose the listed amount in cash or blank money order (shipping is included in price) and mail to:

P.C.

UT Box 16511

Knoxville, TN 37996-0002

4. Notify them through e-mail with your order so that they will expect it in the mail; 5. Orders of one print will be shipped via regular mail. Orders of two or more prints will be shipped Priority mail and may include an added bonus! All names and addresses are destroyed after orders are shipped and no records of any type are kept concerning THE DEPOT'S customer base.

### RUDRDA RUNA MUSIC

611 N. Locust Street (Dept. ER)

Denton, TX 76201

[jcurnutt@flash.net](mailto:jcurnutt@flash.net)

<http://rudrarunamusic.yage.net>

RUDRA RUNA MUSIC sells a CD titled *La Magia Music of Don Agustín Rivas*. This disc was recorded over a four year period while DON Agustín was in the USA. These are traditional ayahuasca songs, although they have been shortened in order to fit a larger number of different styles onto one CD (normally some songs can last up to an hour). Originally a sculptor by trade, DON Agustín is now a Peruvian ayahuasca shaman, with nearly 3 decades of experience, who accompanies his songs with maracas, drums, harmonica, pan flute, and the *arco del duende*. DON Agustín has built an art school for children in Tamshiyacu, where he was born and not far from where he currently lives. He is still sought after as a healer to lead ceremonies world-wide. This CD is available for \$15.00 plus \$5.50 S/H.

### SALVIA DIVINORUM LIST

<http://www.onelist.com/community/SalviaD>

Sometimes I wonder, "How much more can *really* be said about *Salvia divinorum*?" Nevertheless, this e-mail list is making a valiant attempt. While much of what is posted seems fairly old hat (cultivation questions, consumption methods, attempts at new extraction processes, future legal worries due to excessive commercialization, *etc.*), clearly part of the purpose of such a list is to foster the sense of a community between members (which, at the time of this writing, numbered 277). That, and to provide a ripe breeding-ground for one-line zingers from LEANDER J. VALDÉS III. Those looking for more natter about *S. divinorum* than they could possibly imagine are encouraged to join up—but perhaps taking the list in "digest" form would be less of a load for your "in box."

### THE SHROOMERY

<http://shroomery.org>

A bulletin board-based web page that archives all threads. Site topics include general mushroom information, grow/find, "how to dose," "trip tips," *Amanitas*, pharmacology, community, a gallery, and links.

**SOCIETAT D'ETNOPSICOLOGIA  
APLICADA I ESTUDIS COGNITIUS****Ap. de Correus 22.219 (Dept. ER)****08080 – Barcelona****SPAIN****(+34) 93 424 45 40 tel****(+34) 93 423 86 76 fax****ipa@pangea.org****http://www.etnopsico.org**

The SOCIETAT D'ETNOPSICOLOGIA APLICADA I ESTUDIS COGNITIUS (SD'EA) is a newly formed, international, non-profit organization established to conduct basic and applied research of cathartic techniques and entheogenic substances used within a therapeutic framework, as well as used in manners related to culture, well-being, decision-making, creativity, and human evolution. "Etnopsicologia" unifies the various fields of study related to the nature of consciousness, the human mind, psychoactive substances, altered states of consciousness, traditional shamanism, psychotherapy, ethnopharmacology, neuroscience, and anthropology.

The SD'EA was created through the funds, library, activities, data-base, and interests of the INSTITUT DE PROSPECTIVA ANTROPOLÒGICA. As well, additional funds from member-support are crucial to provide a means to further future projects. Directed by Dr. JOSEP M<sup>a</sup> FERICGLA, current members include a large group of scientists, doctors, psychiatrists, anthropologists, psychologists, ethnopharmacologists, and a medical publisher. The SD'EA has already sponsored a couple of conferences with an excellent selection of speakers, one on the confluence of entheogens and creativity, and one on modified states of consciousness and psychotherapy. More such events are planned for the future.

Annual membership in the SD'EA is either 12.400 ptas or 25.000 ptas, depending on the category of membership, and includes: updated information on all of the SD'EA activities; subscription to the journal *Eleusis* (the only European scientific magazine dedicated to entheogens and altered states of consciousness); discounts on purchases made at the web-based bookshop LIBRERIA MUSCARIA ([www.muscaria.com](http://www.muscaria.com)); the ALTAÏR card, which provides discounts at the ALTAÏR bookshops in Madrid and Barcelona, specializing in anthropology and travels (and discounts also from the travel agent Orixá, part of the ALTAÏR group); discounts on certain professional services whose quality shall be controlled by the SD'EA itself: psychotherapy (psychoanalysis, dream analysis), treatment for addictions and compulsive behaviors, traditional Chinese medicine, shiatsu massage, market research, and

anthropological studies.

The possibility of undertaking dissertations and doctoral thesis in the field of ethnopsychology within the SD'EA in collaboration with some European and American universities is being looked into.

**SOCIETY FOR THE ANTHROPOLOGY  
OF CONSCIOUSNESS****American Anthropological Association****4350 North Fairfax Drive, Suite 640 (Dept. ER)****Arlington, VA 22203-1620****(703) 528-1902 ext 3030****(703) 528-3546 fax****(SAC) <http://www.moorpark.cc.ca.us/~jbaker/sac/home.html>****(AAA) <http://www.aaanet.org/>**

The SOCIETY FOR THE ANTHROPOLOGY OF CONSCIOUSNESS is a branch of the AMERICAN ANTHROPOLOGICAL ASSOCIATION (AAA) that focuses on altered states of consciousness. Although founded with an interest in parapsychology and anthropology, their scope has increased to include a broad range of consciousness phenomena, as well as methodological and theoretical orientations.

To join the SOCIETY FOR THE ANTHROPOLOGY OF CONSCIOUSNESS one must first join the AAA. Several categories of membership are available: Regular Membership: generally for professional anthropologists: AAA \$130.00 / SAC \$40.00; Associate Membership: available to persons who are not professionally occupied in anthropology: AAA \$85.00 / SAC \$30.00; Student Membership: available to full-time students: AAA \$60.00 / SAC \$25.00; Joint Membership: available for spouses of members: AAA \$55.00 / SAC \$10.00; International Membership: AAA \$95.00 & \$30.00 (depending upon country of residence) / SAC no special rate; Retired Membership: AAA \$75.00 / SAC no special rate.

As a member of the AMERICAN ANTHROPOLOGICAL ASSOCIATION you receive numerous benefits, including: *Anthropology News* (published nine times a year); the opportunity to participate in the AAA Annual Meeting; discount prices for Association publications, including the *American Anthropologist*; a listing in the Membership Section of the annual *AAA Guide*; a listing in the AAA computerized database of anthropologists; and more. See the web site for complete details.

Besides AAA member benefits, benefits of membership in SAC include: *Anthropology of Consciousness*, a quarterly journal; and discount registration at the annual SAC Spring Meeting.

Aside from their own gatherings, the SAC seems to be pretty hip with regard to knowing what else is happening in the world of consciousness studies. Their web site events listing noted the recent "Ayahuasca" conference in San Francisco, as well as the "Toward a Science of Consciousness: Tuscon 2000" event that occurred in April in Arizona. New events listed at this page that I hadn't yet heard of included "Wanderers Between the Worlds: Shamanism in the New Millennium" (to be held October 24–29, 2000 in Germany) and the "First International Conference on Science and Shamanism" (to be held March 19–23, 2001 in Palm Desert, California).

#### **SOMA SHAMANIC BOOKS & HERBARIUM**

**Valkendorfgade 5 (Dept. ER)**

**DK-1151 Copenhagen K**

**DENMARK**

**(011) 45 33 11 2090 tel**

**(011) 45 32 54 5493 fax**

**<http://www.shamanicbooks.com>**

**[soma@private.dk](mailto:soma@private.dk)**

Offering rare, out-of-print, signed and inscribed titles on entheogens, the SOMA web site currently focuses mainly on works by R. GORDON WASSON, but promises a more general selection featuring books by LEARY, OTT, HOFMANN, WEIL, and others. Their WASSON selection is extensive.

They also offer an incredible assortment of Huichol Indian yarn paintings from the artist PEDRO GOMEZ. The site has a beautiful gallery of work, and the pieces are quite reasonably priced for fine art. This site is definitely worth a visit of only to check out this art.

Finally, they have a small selection of herbs and live plants: *Anadenanthera colubrina*, *Areca catechu*, *Argyrea nervosa*, *Banisteriopsis caapi*, *Mimosa hostilis*, *Ipomoea* species, *Kaempferia galanga*, *Peganum harmala*, *Phalaris arundinacea*, *Salvia divinorum* 5X extract, "dreamgrass" (?), dried mushrooms—a couple of *Psilocybe cubensis* varieties and *P. tampanensis*, live plants of *Lophophora willimasii* and *Trichocereus pachanoi*, and a variety of other dried herbs. While the book selection and the art on this web site are in English, the botanicals page is not.

#### **SPORECHICKS**

**2238 N. Collins Avenue, STE. 149 (Dept. ER)**

**Arlington, TX 76011**

**<http://www.shroomery.org/~sporechicks>**

Some gals selling spores and various mushroom-related supplies. Their \$90.00 "grow kit" comes with 2 spore syringes, 12 half-pint wide-mouth jars w/ lids, premixed substrate, casing material, perlite, incubation/growth chamber, 2 cropping chamber tubs, a spray mister, sterilization solution, a "hole poker," and instructions.

I liked this site in that they pointed out that some of the supplies they offer might be picked up cheaper at a K-MART or WAL-MART, and they also provided links to other sites that sell spores and equipment—a refreshingly up-front and honest way to do business, showing a good will that is rare in many capitalist enterprises. They also have links to various informational sources related to mushrooms.

They carry the following varieties as spore syringes. They may also offer spore prints; ask about availability and price. Not all of the varieties are always offered, so it is probably best to check the web site first to see what is currently available. All of the following varieties are \$15.00 each or 4 for \$40.00: *Psilocybe cubensis* Ecuador, *P. cubensis* México, *P. cubensis* South America, *P. cubensis* Treasure Coast, *P. cubensis* Gulf Coast, *P. cubensis* Golden Teacher, *P. cubensis* Acadian. They also offer *Panaeolus cyanescens* at the price of \$20.00 per syringe. Description of each of these varieties is posted at their web site. Payment is only accepted via blank money order.

#### **SPORE TRADING POST, INC**

**1012 Columbus Avenue (Dept. ER)**

**Marysville, OH 43040**

**(877) 776-7366**

**[chanceys@midohio.net](mailto:chanceys@midohio.net)**

**<http://www.sporetradingpost.com>**

SPORE TRADING POST's "Psychedelic Cafe Spores & Syringes" offers spore syringes for \$25.00 + \$3.50 S/H. They have syringes for the *Psilocybe cubensis* varieties B+, Cambodian, and Ecuador.

They also have a "trading" station set up, where people can barter spore prints for spore syringes. This is being done essentially so that the site owner can build a large library of different strains, as well as share an increasingly diverse

number of strains—a cool idea. A separate section provides for the trade of spores and cultures of various edible mushrooms; or you can buy prints of these species for \$15.00 plus \$1.50 S/H, or cultures for \$25.00.

As well, they sell HEPA filters, various mycology books, their own special “STP” substrate mix, antibiotic malt extract agar, organically-grown substrate grain, syringes/needles, pre-sterilized plastic PETRI dishes, Pyrex glass PETRI dishes, Pyrex test tubes w/screw cap, Erlenmeyer media flasks, lids for spawn jars, pressure cooker/canner, perlite, 91% isopropyl alcohol, pint tapered wide-mouth canning jars with pre-drilled holes (used for needle inoculation), pre-mixed substrate grains, glass fiber filters, a glove Box, an impulse sealer, inoculation loops, the BACTICINERATOR III ELECTRIC SCALPEL STERILIZER, the SUBMERSIBLE TRONIC AQUARIUM HEATER MODEL #A-760, a flow hood, various grow kits, and more.

#### THE SPORE WORKS

J.S.

POB 5465 (Dept. ER)

Charleston, OR 97420 USA

sporeworks@shroomery.org

<http://www.sporeworks.com>

THE SPORE WORKS are purveyors of rare and exotic mushroom spores. Their site is a wealth of information. As well, they sell prints for the following: *Psilocybe azurescens* “Hammond” \$40.00; *P. pelliculosa* “conifer *Psilocybe*” \$10.00; *P. semilanceata* “liberty cap” \$25.00; *P. subfimentaria* “dung liberty” \$20.00; *P. tampanensis* “Pollock” \$50.00; *P. cubensis* “miscellaneous strain” \$10.00; *Panaeolus cyanescens* “miscellaneous strain” \$25.00.

All spores are available as prints on paper only. Please print or type your order clearly. Cash or blank money order for the total amount (USA funds only)—sorry no checks. Don't list THE SPORE WORKS on your order; just send it to “J.S.”

All prices include shipping and handling, including international postal charges. Orders are shipped upon receipt of cash or money order. No customer records are kept after orders are filled. The return address on packages mailed only lists “J.S.” and doesn't say “The Spore Works.” Orders can be sent with no return address if requested.

#### ZIPLIP

<http://www.ziplip.com>

For those too lazy to figure out PGP (such as myself), here is a free web-based e-mail service that will provide some degree of privacy protection.

# BOOK REVIEW

*The American Disease: Origins of Narcotic Control* third edition by DAVID F. MUSTO, 1999 (first edition 1973) (OXFORD UNIVERSITY PRESS, 198 Madison Avenue, New York, NY 10016), ISBN 0-19-512509-6 [perfect-bound paperback \$17.95]. 414 pp; index, chapter end-note bibliographies.

DAVID F. MUSTO presents a penetrating assessment of the history of American anti-drug policies, and the impact of propaganda on public opinion. There is no single book that does a better job of summarizing the history of—and motivations driving—the intensive efforts directed against those who use inebriating substances, and how social controls on these

people have been orchestrated within American society. Drawing heavily from the archives of law enforcement, public health, and commerce, MUSTO constructs a spell-binding account of the growth of anti-drug sentiments. These sentiments culminated into two phases of extensive social programs of intolerance and intentional attempts at eradicating drug users; the first reaching its nearly successful peak prior to when the Cold War displaced its paramount importance in the public mind, and the second currently continuing to build with no end in sight. Most noteworthy is his assessment of how intensive propaganda can shape public perceptions and create an atmosphere of bigotry. Also interesting is MUSTO's observation that rights of drug users have never entered into consideration (except by the occasional lone, and routinely ignored, dissenting voice), but rather the entire issue remains one of suppression and control; simply swinging from one extreme—labeling drug users as criminals and thus passing laws to punish them (“drug intolerance”), to the other—viewing drug users as sick people and thus taking actions to “cure” them (a position MUSTO refers to as “drug tolerance”).

However the same sources that MUSTO relies on that allow him to present his unique perspective, also heavily influence MUSTO's own perceptions. This underscores the manner in which selective factual presentation (and representation) can powerfully influence and shape people's decision-making processes. For example, MUSTO's apparent consideration of LSD as simply another addictive substance, when he bemoans the plight of the “LSD addict,” clearly indicates the power of misdirection and blindered vision that the equating of the “demon drugs” has effectively produced in those who draw their education from this pool. In fact, this is obvious right from his title, drawn from an early political (and quite mistaken) pronouncement of drug abuse as the “American disease.” Somehow, MUSTO entirely missed H.L. MENCKEN's wry retort and square-on-the-head assessment of the *true* American disease being not the use of inebriants, which can be found world-wide and throughout innumerable cultures from the stone-age to modern day, but rather the pathological tendency/desire to control the free will and actions of individuals to regulate their own consciousness!

To his credit though, MUSTO clearly and repeatedly lays out the peculiar and vicious response to the pursuit of drug- or alcohol-induced pleasures by others arising from its basis upon fear and its perceived threat to a Christian sense of morality. Most, if not all, of the anti-drug warriors MUSTO presents clearly viewed themselves as champions of the conservative right in an age-old struggle between good and evil. This has not changed. It is quite illuminating that, despite his obviously in-depth study, MUSTO remains firmly entrenched in his perception of drug use as a social problem that needs some type of further control, if not outright elimination. Indeed, MUSTO somehow sees drug elimination as an inevitable end point, and fails to grasp what even *could* be considered responsible drug use.

It's not clear exactly what MUSTO truly missed however, and what he simply did not include so as not to risk alienating the more conservative among his readers. MUSTO appropriately notes the double-standard applied by the courts to alcohol as opposed to drugs other than alcohol, such as the courts eventually supporting bans of any drugs that state and federal legislators saw fit but requiring a constitutional amendment to ban alcohol. He also clearly notes that the crime and violence resulting from alcohol abuse far outweighs that resulting even from the demonized opiates. MUSTO justifiably worries that the response may go too far as the intensity mounts to eradicate not simply drug use but *drug users*, and thus may threaten other areas by again allowing legislative manipulation through fear and emotional response. Yet he seemingly fails to realize that unless basic rights of freedom of thought, perception, and mind, are protected and guaranteed for *all*, they are in fact guaranteed for none.

Despite its occasional myopic failings, this is a highly recommended book for anyone who wants a better understanding about why America is in the mess it is in today and how we got here. — K. TROUT

# **SALVIA DIVINORUM EXTRACTS**

**We specialize in offering  
the highest quality extracts  
of *Salvia divinorum* available  
on the market today.**

Our extracts are standardized and made using pure salvinorin A. We have several extracts available, like our popular 5X Extract, which contains 12.5 mg of salvinorin A per gram. The cost of the 5X is \$20.00/gm or \$50.00/3 gm.

All of our products are unconditionally guaranteed and free samples are available upon request. Write for our catalog, which lists all our *Salvia divinorum* extracts, and contains a lot of useful information on this unique plant. We are celebrating our third year in business, and wish to thank our many loyal customers for their continued support.

No personal checks accepted. Payment in cash or postal money order only. If paying by postal money order, leave the "Pay To" space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24-hours. All prices are postpaid in the USA; foreign orders inquire for shipping costs. Inquire for wholesale pricing.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## NEW ADDRESS

# BURNING ONE DOWN

by DAVID AARDVARK

I was surprised this year when I pulled into BURNING MAN, under the cover of darkness late on Wednesday night, and the ticket-taker who greeted me asked, “Do you have any guns, fireworks, or drugs?” While of course the answer to such a question is always “no,” I did wonder what they might have done to someone who replied “yes?” I was then informed that the BUREAU OF LAND MANAGEMENT (BLM) had been issuing \$250.00 citations to people who had been caught smoking *Cannabis* in public areas.

“Well, this is a first, isn’t it?” I asked, a bit surprised.

“Yeah, last year I heard about some dealers being busted in undercover sting operations, but this is the first year that I have heard of individual consumers getting citations,” the greeter replied.

And that was that. Perhaps not as tension-filled as smuggling drugs onto an airplane, but then I suppose that they too are mainly concerned about the guns and explosives at airports.

The wind/dust-storms were quite bad that night. I found a fairly isolated location (something which is getting harder to do every year; this year there were almost 30,000 people in attendance from what I hear), and parked my vehicle. I then made the *very long* trek across the city and open playa. I eventually made out a tiny glowing-orange sign that simply said “EROWID,” where I knew that I would find friendly faces and respite from the dust. When I arrived, I mentioned the dire warning I received at the gate coming in, and got a few more details. Yes, there were a few people who had been busted; it seems like it happened mainly on the Monday that kicked off the event; yes, there were apparently drug-sniffing dogs; and the BLM was also rumored to be actively entering people’s campsites and snooping around.

Now of course, those people “in the know” would never actually try to purchase or sell drugs at BURNING MAN. They bring only what they or a few friends might want, consume everything while there, and the only powder they leave with is the dust on their car. (There have been reports each year of a few people who, pulled over for minor traffic violations on the way out of town, ended up having their vehicles

*Faces of the Man* sculpture by DAN DAS MANN

searched and been arrested for scheduled drugs; and Nevada’s “zero tolerance” drug laws are pretty harsh compared to California.) Nevertheless, I was a bit surprised to see the frequency with which people asked about where they could score some MDMA. One couple silently cruised into camp and handed me a written note that asked simply, “We need two Ecstasy tabs.” When I shook my head “no,” they cruised out again; their quiet search continuing.

Hanging out some of the time at the EROWID camp was an education in pop drug culture; both in the literal sense and the social sense. EARTH and FIRE had brought huge amounts of their web site printed-out in handy alphabetical single-topic folios, as well as a decent library of books. And then there were the new faces to meet. One guy came in wanting to know where he might be able to obtain kilogram barrels of safrole; he seemed friendly enough, said he was a large-scale *Cannabis* grower, and shared a few interesting tales. (It was later astutely pointed out that the most dangerous “undercover” agents aren’t cops at all, but actual “heads” who

have been busted and are looking to reduce their sentence by catching a bigger fish.) Another couple stopped by asking if anyone had an “ecstasy testing kit.” One of these kits magically turned up, and they were pleased to see that the pill shaving they tested appeared to contain *some* sort of methylene-dioxy compound in it. (I was quite surprised to witness first-hand the sophistication of today’s drug users; at least those who aren’t lucky enough to cultivate a known source of quality product. While I was aware of the benefits of these testing kits in a theoretical sense, it was heartening to view this sort of “harm reduction” approach in action.)

Another thing that I found intriguing was the large number of people reporting on and asking about polydrug use; LSD and 5-MeO-DIPT? MDMA and AMT? 2C-T-7 and GHB? There are clearly many more people using non-scheduled tryptamine and phenethylamine “analogue” material than I would have thought, and a lot of these people want to know what combinations work well together. I was also surprised to hear that 5-MeO-DMT is making the rounds in the rave culture. People are actually snorting it and heading out onto

the dance floor. Word is that, generally speaking, snorting it results in less “freak outs” than smoking it, producing a better time for most. And while I had heard initially that 10 mg was a “dose” snorted, one report “from the field” mentioned that 10–17 mg was the preferred amount (but she then confided that her friends are generally hard-heads). The fact that 5-MeO-DMT is being used snorted in this manner by ravers leads me to think that one source of information for the “club drug” culture may actually be the pricey conferences geared towards entheogen aficionados. It was only recently first mentioned—that I was aware of—by JONATHAN OTT at the AYAHUASCA CONFERENCE that 5-MeO-DMT is active and pleasant both sublingually and snorted at 10 mg (or at 5 mg, if one concurrently takes 3.5–4 mg of harmine). Since OTT’s new book on snuffs isn’t even *out* yet, it is perhaps an understatement to say “word travels fast” these days. But maybe the Internet is to blame...

My own forays on Saturday into MBDB, Vicodin, 2C-B, nitrous oxide, and ketamine, were quite pleasant to say the least. Unfortunately, my companions and I were so blissed-

out in our tent that we didn't realize that "the Man" was burning until he was almost as toasted as we were, and the distance that we had to traverse was so far that he had fallen long before we reached him.

Of course, BURNING MAN isn't all about drugs, despite the focus of this article. There is art, and fire, and nakedness, dramatic weather changes, and so much more. The festival is mainly about *community*; an inspiring example of culture in the USA that isn't fueled by Big Macs™, MTV, and corporate sponsorship.

On our way out of the city Sunday evening, we passed a guy holding a cardboard sign that said, "I got a \$250.00 ticket for smoking pot!" We gave him a \$4.00 donation and heard his tale. It was Monday night, he had walked up to a small circle of people surrounding a campfire. He didn't know anyone there, and when a joint that was being passed around came into his hands, the cops appeared out of nowhere and grabbed him. His new friends(?) argued that the joint wasn't even his, but this didn't stop the BLM from issuing a ticket.

The whole thing sounded *so* set up that I almost didn't believe the guy, until he produced his citation. He said that he had heard of a total of seven people who had gotten similar tickets. We wished him well, and I have no doubt that he collected the entire \$250.00 from numerous sympathetic tokers who were more fortunate than he. The facts that the only citations we heard about were issued on the first day of the event, and that there were so few tickets actually written, leads me to think that this was primarily a scare tactic designed to keep people from flagrantly flaunting their drug use. It seemed to work to a degree; at least there were a lot of people *talking* about the tickets, and the new "oppressive" environment.

When I returned home from BURNING MAN, I caught the Tuesday night 10:00 pm news on FOX. The entire focus of their broadcast was drug use, and how the event was an orgiastic free-for-all, where the law enforcement they interviewed admitted that they could do nothing but smile with their thumbs up their asses. They stated that there were five different law enforcement agencies on hand at the event, and the DEA refused to comment about drug use. FOX claimed that 5 people were arrested on drug charges during the course of the week, and that 80 people a day were treated for some manner of drug "overdose." (Not really *too* bad—if true—when one considers the city's population.) ✧

# CONTACT THROUGH THE VEIL: 1

by RICK STRASSMAN, M.D.

---

*The following is a chapter from the forthcoming book DMT: The Spirit Molecule, to be published by PARK STREET PRESS in January 2001. The book can be ordered by calling (800) 246-8648 or by visiting <http://www.innertraditions.com>. Autographed copies of the book can be ordered directly from the author, who can be contacted via e-mail at: [rickstrassman@taosnet.com](mailto:rickstrassman@taosnet.com).*

---

The material in this and the next chapter is the most unusual and difficult to understand. It is the weirdest and the easiest for me to skirt when people ask, "What did you find?"

When reviewing my bedside notes, I continually feel surprise in seeing how many of our volunteers "made contact" with "them," or other beings. At least half did so in one form or another. Research subjects used expressions like "entities," "beings," "aliens," "guides," and "helpers" to describe them. The "life-forms" looked like clowns, reptiles, mantises, bees, spiders, cacti, and stick figures. It still is startling to see my written records of comments like, "There were these beings," "I was being led," "They were on me fast." It's as if my mind refuses to accept what's there in black and white.

It may be that I have such a hard time with these stories because they challenge the prevailing world view, and my own. Our modern approach to reality relies upon waking consciousness, and its extensions of tools and instruments, as the only ways of knowing. If we can't see, hear, smell, taste, or touch things in our everyday state of mind, or using our technology-amplified senses, they're not real. Thus, these are "nonmaterial" beings.

In contrast, indigenous cultures are in regular contact with denizens of the invisible landscape and have no problems with straddling both worlds. Often they do this with the aid of psychedelic plants.

Many modern-day scientists possess an abiding faith in the spiritual. However, these same scientists are caught in a profound conflict between their personal and professional beliefs. What they say and what they feel may contradict each other profoundly. It is difficult to be "objective" about matters of the heart and spirit. Scientists may compartmentalize their faith and can't conceive of verifying or validating their spiritual intuition. In other cases they may water down the nature of those beliefs to maintain some consistency with

their intellectual understanding. Perhaps they simply ignore the presence of angels and demons in essential scriptures, or regard them as symbolic or as hallucinatory manifestations of an overactive religious imagination.

Lack of open dialogue about these issues makes it much more difficult to even imagine enlarging our view of the reality of nonmaterial realms using scientific methods. What would happen to the study of spirit realms if we could access them reliably using molecules like DMT?

In addition to questions regarding the existence of nonmaterial or spiritual worlds, we also must consider expanding the notion of what we may perceive in them. Can our spiritual and religious structures encompass what truly resides within these different levels of existence? The stories we're about to hear go beyond reasonably "straightforward" encounters with the Divine or angels, nor are they especially neat, tidy, or in accordance with what we consider within the realm of "expectable" spiritual experiences.

I'm hopeful that these reports will accelerate interest in the nonmaterial realms, using whatever intellectual, intuitive, and technological tools we possess. Once there is enough interest in, and even demand for, information about them, such phenomena might become an acceptable topic for rational inquiry. Ironically, we may have to rely more upon science, especially the freewheeling fields of cosmology and theoretical physics, than on our more conservative religious traditions for satisfactory models and explanations of these "spirit-world" experiences.

I had expected to hear about some of these types of experiences once we began giving DMT. I was familiar with TERENCE MCKENNA'S tales of the "self-transforming machine elves" he encountered after smoking high doses of the drug. Interviews conducted with twenty experienced DMT smokers before beginning the New Mexico research also yielded

some tales of similar meetings. Since most of these people were from California, I admittedly chalked up these stories to some kind of West Coast eccentricity.

Therefore, I was neither intellectually nor emotionally prepared for the frequency with which contact with beings occurred in our studies, nor the often utterly bizarre nature of these experiences. Neither, it seemed, were many of the volunteers—even those who had smoked DMT previously. Also surprising were the common themes of what these beings were doing with so many of our volunteers: manipulating, communicating, showing, helping, questioning. It was definitely a two-way street.

As strange as the reports that follow are, our 1990s research was not the first in the scientific literature to describe DMT-induced “contact.” There also are reports from the 1950s quoting volunteers to that effect. These older DMT cases are remarkable in their foreshadowing of the stories we were going to hear almost forty years later. What is even more striking is that I have been unable to locate any similar reports in research subjects taking other psychedelics. Only with DMT do people meet up with “them,” with other beings in a nonmaterial world.

These older clinical excerpts derive from patients with schizophrenia, many of whom had been hospitalized for years, if not decades. They were not especially verbal, insightful, or personable. They received DMT in studies attempting to determine how similar the DMT state was to schizophrenia. Researchers also were interested in gauging whether naturally psychotic patients were more or less sensitive to DMT’s effects.

A patient with schizophrenia in a study at STEPHEN SZÁRA’S former laboratory in Hungary reported the following after a high dose of intramuscular DMT:

*I saw such strange dreams, but at the beginning only. . . . I saw strange creatures, dwarves or something, they were black and moved about.*<sup>1</sup>

An American research team also gave DMT to patients with schizophrenia. Of the nine subjects, the only one who could say anything about her experience was an unfortunate woman who, after getting a robust dose of 1.25 mg/kg IM DMT, stated:

*I was in a big place, and they were hurting me. They were not*

*human. . . . They were horrible! I was living in a world of orange people.*<sup>2</sup>

These little vignettes should keep us from becoming too complacent in believing that what our volunteers reported is purely a New Age, 1990s-in-Santa Fe phenomenon. The spirit molecule revealed unseen worlds, and their inhabitants, to Western science long before our research began.

KARL’S early encounter with life-forms, like his visions of DNA described in the last chapter, offered a prelude to future, more elaborate stories from other volunteers. KARL was a forty-five-year-old blacksmith. He was married to ELENA, whose enlightenment experience we’ll read about later.

Eight minutes into his non-blind high-dose injection, he described this encounter:

*That was real strange. There were a lot of elves. They were prankish, ornery, maybe four of them appeared at the side of a stretch of interstate highway I travel regularly. They commanded the scene, it was their terrain! They were about my height. They held up placards, showing me these incredibly beautiful, complex, swirling geometric scenes in them. One of them made it impossible for me to move. There was no issue of control; they were totally in control. They wanted me to look! I heard a giggling sound—the elves laughing or talking at high-speed volume, chattering, twittering.*

In the last chapter, we heard about AARON’S experiences of unseen worlds. Let’s return to his first non-blind high dose of DMT. He looked at me about 10 minutes after the injection and shrugged, laughing:

*First there was a mandala-like series of visuals, fleurs-de-lis-type visions. Then an insect-like thing got right into my face, hovering over me as the drug was going in. This thing sucked me out of my head into outer space. It was clearly outer space, a black sky with millions of stars.*

*I was in a very large waiting room, or something. It was very long. I felt observed by the insect-thing and others like it. Then they lost interest. I was taken into space and looked at.*

AARON summarized his encounters with these beings after a subsequent double-blind high dose:

*There is a sinister backdrop, an alien-type, insectoid, not-quite-pleasant side of this, isn’t there? It’s not a “we’re-going-to get-*

*you-motherfucker.” It’s more like being possessed. During the experience there is sense of someone, or something else, there taking control. It’s like you have to defend yourself against them, whoever they are, but they certainly are there. I’m aware of them and they’re aware of me. It’s like they have an agenda. It’s like walking into a different neighborhood. You’re really not quite sure what the culture is. It’s got such a distinct flavor, the reptilian being or beings that are present.*

“How about the scary element?” I asked. “What’s the worst they could do if they are unleashed with access to you?”

*That’s what it’s about. It’s the sense of the possibility that’s so strange.*

In a later chapter, we’ll read about the physical problems LUCAS encountered after his high-dose session. However, it’s interesting to review part of a letter he wrote to us a few days after that experience:

*There is nothing that can prepare you for this. There is a sound, a bzzzz. It started off and got louder and louder and faster and faster. I was coming on and coming on and then POW! There was a space station below me and to my right. There were at least two presences, one on either side of me, guiding me to a platform. I was also aware of many entities inside the space station—automatons, android-like creatures that looked like a cross between crash dummies and the Empire troops from Star Wars, except that they were living beings, not robots. They seemed to have checkerboard patterns on parts of their bodies, especially their upper arms. They were doing some kind of routine technological work and paid no attention to me. In a state of overwhelmed confusion, I opened my eyes.*

It was at this point in Room 531 that LUCAS’s heart rate and blood pressure plummeted to nearly unrecordable levels.

We will read about CARLOS’s shamanic death-rebirth experience elicited by his first non-blind high dose of DMT in chapter 15. During one of his high-dose sessions, he also met beings who tried to help him with his anxiety:

*There’s this whole different world with architecture and landscape. I saw one or two beings there. The beings even have gender. The skin was not flesh colored. I communicated with them but there wasn’t enough time. I was so strung out, excited, agitated when I arrived there. They wanted to try and reduce my anxiety so we could relate.*

GABE, whose transport into a nursery or playroom we read about in the last chapter, felt an even greater sense of care and concern from “the spirits” during his first high-dose DMT session:

*There was an initial sense of panic. Then the most beautiful colors coalesced into beings. There were lots of beings. They were talking to me but they weren’t making a sound. It was more as if they were blessing me, the spirits of life were blessing me. They were saying that life was good. At first it felt like I was going through a cave or a tunnel or into space, at a fast rate definitely. I felt like a ball hurtling down to wherever it was.*

Many volunteers’ encounters with life-forms in these non-material worlds involved the powerful sense of an exchange of information. The type of information varied widely. Sometimes it concerned the “biology” of these beings.

CHRIS was thirty-five years old, married, and a computer salesman. He was quite artistically talented, too, and performed in local theater productions. He had taken psychedelics fifty to sixty times before starting our research. He hoped his DMT sessions with us would “propel me into a state of awareness I have been seeking during eight years of LSD use, but have only had glimpses of previously.”

His non-blind high dose was “the most reassuring experience of my life.” The separation of his mind and body was effortless, and he decided that “if death is like this, there’s nothing to worry about.”

CHRIS returned for the tolerance study a few weeks later. He lifted the eyeshades after the first dose and said:

*There was a set of many hands. They were feeling my eyes and face. It was a little bit confusing. There were more individuals. They were recognizing and identifying me. It was more intimate. At first I thought it was the eyeshades on my face, but it definitely was not!*

Filling out the rating scale, he added:

*To get to that space I had to get through some sort of a non-bevolent space. It felt like there were talons and claws there trying to guard it in a way.*

These were long mornings and he needed encouragement. I let my intuition guide me: “If need be, let them rip you to shreds, then you can get on with it.”

*Dismemberment is part of the shamanic initiation, isn't it? I felt a dragonlike presence. And, there were the same colors—red, golden yellows.*

“The colors can be like a drape or a prelude or a curtain. Even though they're so pretty, you can get through them to the other side.” Coming out of his second dose he looked stunned, and he gasped for words that seemed inadequate:

*It was wild. There were no colors. There was the usual sound: pleasant, a roar, a sort of an internal hum. Then there were three beings, three physical forms. There were rays coming out of their bodies and then back to their bodies. They were reptilian and humanoid, trying to make me understand, not with words, but with gestures. They wanted me to look into their bodies. I saw inside them and understood reproduction, what it's like before birth, the passage into the body. Once I established what they were communicating, they didn't just fade away. They stayed there for quite a while. Their presence was very solid.*

I had been hearing about lots of encounters by then and could at least validate his experience: “You wouldn't expect it.”

*I try and program it and I go in with an idea of what to see, but I just can't. I thought I was developing tolerance, but then, Bang! There were these three guys or three things.*

He looked awkward talking about his experience. I empathized with his perplexity, saying, “It does sound odd.”

*It sure does. I wasn't sure as I was lifting my eyeshades if I wanted to talk to you about it.*

CHRIS's third dose was relatively uneventful. He stayed aware of his body, his heart beating in his chest, his stomach growling from hunger. His fourth dose built upon the themes of the previous three and concluded with many features of a mystical experience:

*They were trying to show me as much as possible. They were communicating in words. They were like clowns or jokers or jesters or imps. There were just so many of them doing their funny little thing. I settled into it. I was incredibly still and I felt like I was in an incredibly peaceful place. Then there was a message telling me that I had been given a gift, that this space was mine and I could go there anytime. I should feel blessed to have form, to live. It went on forever. There were blue hands, fluttering things, then thousands of things flew out of these blue hands. I thought “What a show!” It was really healing.*

*It was part of me, not separate. It was a reassurance that this wouldn't go away, that it was mine, that a connection had been made. The whole thing was really crucial to my spiritual develop-*

*ment. It's what I tried to do with LSD, a sort of self-initiation. With LSD, it worked in some ways and didn't in others.*

Stranger yet are stories of procedures, more or less intrusive, performed by the life-forms of these nonmaterial worlds upon our volunteers during their DMT intoxication.

JIM, a thirty-seven-year-old schoolteacher, was a volunteer who didn't like to talk much about his experiences. During his tolerance study, we talked about going further through the bright colors, which he admitted were distracting him. He felt there might be "beings" behind the colors, and I encouraged him to see if there were. After emerging from his last dose, he said almost offhandedly, and with little emotion:

*I went with them as you suggested. There were clinical researchers probing into my mind. There were sort of long fiber-optic things that they were putting into my pupils.*

This was years after we had stopped using the pupil measuring card, so it had nothing to do with what was happening in Room 531. I asked JIM what that was like for him.

*It was pretty weird, but I figured it was just the drug.*

JEREMIAH, at fifty years of age, was one of our oldest volunteers. He had recently retired from decades of service in the armed forces and was beginning a new phase of his professional life by obtaining training in clinical counseling. He was also starting his third family, and he underwent a face-lift halfway through the dose-response study. He was a busy man.

During the first few minutes of his non-blind high dose of DMT, JEREMIAH burst out in several exclamations: "Whoa!" "Wow!" "Incredible!" He began beaming, a huge smile across his face. He seemed to be having a great time:

*It was a nursery. A high-tech nursery with a single GUMBY, three feet tall, attending me.<sup>3</sup> I felt like an infant. Not a human infant, but an infant relative to the intelligences represented by the GUMBY. It was aware of me, but not particularly concerned. Sort of a detached concern, like a parent would feel looking into a playpen at his one-year-old lying there. As I went into it, I heard a sound: hmmm. Then I heard two to three male voices talking. I heard one of them say, "He's arrived."*

*I felt evolution occurring. These intelligences are looking over us. There is hope beyond the mess we are making for ourselves.*

*I couldn't change the experience at all. I couldn't have anticipated it or even imagined it. It was a total surprise! I tried to open to love but that was silly. All I could do was observe it.*

I found this last comment especially interesting because it challenged my assumption that what JEREMIAH encountered was a product of his mind, rather than a "true" perception. "Opening to love" is shorthand for an effort to change the anxiety caused by an unexpected or unpleasant experience into love. If what JEREMIAH had just encountered was only a product of his own imagination, he may have been able to alter his reactions. The fact that his attempt felt "silly" reminded me of the futility of trying to "open to love" to a oncoming truck. "Opening to love" as he found himself instantly dropped into an alien nursery was such an ineffectual and inappropriate response that it seemed laughable.

Several months later JEREMIAH received his double-blind 0.4 mg/kg DMT dose. At 5 minutes he began:

*That was much more intense than the first major dose. It's a different world. Amazing instruments. Machine-type things. There was one person operating some of this stuff. I was in a big room; he was in another part of it.*

*I feel a little shaky . . . a little hypersensitive . . . there are little tremors going through my body.*

"Maybe closing your eyes might help. Here, let's put a blanket on you, too."

*There was one big machine in the center, with round conduits, almost writhing—not like a snake, more in a technical manner. The conduits were not open at the end. They were solid blue-gray tubes, made of plastic? The machine felt as if it was rewiring me, reprogramming me. There was a human, as far as I could tell, standing at some type of console, taking readings or manipulating things. He was busy, at work, on the job. I observed some of the results on that machine, maybe from my brain. It was a little frightening, almost unbearably intense. It all began with a whining, whirring sound.*

JEREMIAH's last double-blind session was the less overwhelming but definitely psychedelic 0.2 mg/kg dose. At this session he was surrounded by the orthopedic traction cage, but he denied that it bothered him. JOSETTE was filling in for CINDY that morning. At 10 minutes, he began:

*There were four distinct beings looking down on me, like I was on an operating-room table. I opened my eyes to see if it was you and JOSETTE, but it wasn't. They had done something and were observing the results. They are vastly advanced scientifically and technologically. They were looking just over the traction bar in front of me. I guess they were saying, "Good-bye. Don't be a stranger."*

JOSETTE said that some of what JEREMIAH described reminded her of some of her own "weird" dreams, and she went on to tell us about one of them. JEREMIAH replied:

*That was a dream you described. This is real. It's totally unexpected, quite constant and objective. One could interpret your looking at my pupils as being observed, and the tubes in my body as the tubes I'm seeing. But that is a metaphor, and this is not at all a metaphor. It's an independent, constant reality.*

JOSETTE collected the last blood sample and left the room, closing the door behind her. JEREMIAH and I relaxed quietly together.

*DMT has shown me the reality that there is infinite variation on reality. There is the real possibility of adjacent dimensions. It may not be so simple as that there's alien planets with their own societies. This is too proximal. It's not like some kind of drug. It's more like an experience of a new technology than a drug.*

*You can choose to attend to this or not. It will continue to progress without you paying attention. You return not to where you left off, but to where things have gone since you left. It's not a hallucination, but an observation. When I'm there, I'm not intoxicated. I'm lucid and sober.*

DMITRI's sessions continue to fill out themes of testing and experimentation upon volunteers once the spirit molecule brought them into nonmaterial realms.

Twenty-six years old when he started in the DMT research, DMITRI was of Greek extraction. He lived with HEATHER, whose experience of unseen worlds we read about in chapter 12. He was a writer and editor and was a seasoned and steady explorer of inner space. He had smoked DMT about sixty times and had taken LSD "hundreds of times," ketamine fifty to a hundred times, and MDMA about thirty times.

When I arrived in his room, DMITRI was casual about the day's schedule:

*I'm not too excited about this. I know it's just a low dose.*

"Wait until tomorrow," I replied.

Ten minutes after I injected this low dose, DMITRI said:

*It was pretty psychedelic, more so than I thought it would be.*

The next day, Dr. V. and his assistant, Mr. W., joined us as guests. Dr. V. worked for the NATIONAL INSTITUTE ON DRUG ABUSE, the agency funding my research. He was developing a project that might treat drug abusers with the hallucinogenic drug ibogaine, obtained from the African *Tabernanthe iboga* plant. He wanted to see the effects of a powerful psychedelic drug given in a research setting.

Mr. W. had been one of the most helpful people during my search through the regulatory labyrinth for human-grade DMT. I was happy to share with him the results of his assistance.

DMITRI's partner, HEATHER, was with us that day, too. Add DMITRI, LAURA, and me, and there were six in all. It was a crowd in Room 531.

Almost immediately after the injection was complete, Dmitri began breathing deeply and rapidly. He repeatedly sighed and yawned as if to dispel physical tension. At about 9 minutes, he asked for some water, and thanked us when we gave him a few sips. After wetting his mouth, he began:

*I feel like I'm in a mild state of shock. I feel really shaky.*

"Here's a blanket."

*Okay.*

"Don't forget to breathe. There's a lot of energy being released."

I asked LAURA to go out into the hall and turn off some beeping equipment outside. DMITRI wasn't quite sure what we were doing. He decided to ignore the fuss:

*The first thing I noticed was a burning in the back of my neck. Then there was this loud intense hum. It was like the fan at first, but separate. It began engulfing me. I let go into it and then . . . WHAM!*

*I felt like I was in an alien laboratory, in a hospital bed like this, but it was over there. A sort of landing bay, or recovery area. There were beings. I was trying to get a handle on what was going on. I was being carted around. It didn't look alien, but their sense of purpose was. It was a three-dimensional space. I expected cartoonlike creatures, like a commercial for LSD, but this was, "Oh my gosh! Oh my gosh!" It was unlike any other DMT experience I've had.*

*They had a space ready for me. They weren't as surprised as I was. It was incredibly un-psychedelic. I was able to pay attention to detail. There was one main creature, and he seemed to be behind it all, overseeing everything. The others were orderlies, or disorderlies.*

*They activated a sexual circuit, and I was flushed with an amazing orgasmic energy. A goofy chart popped up like an X-ray in a cartoon, and a yellow illumination indicated that the corresponding system, or series of systems, were fine. They were checking my instruments, testing things. When I was coming out, I couldn't help but think "aliens."*

*I am so disappointed I didn't talk to them. I was confused and in awe. I knew that they were preparing me for something. Somehow we had a mission. They had things to show me. But they were waiting for me to acquaint myself with the environment and movement and language of this space.*

The atmosphere in the room was surreal. It was bursting with people and a very strange story. I hoped Dr. V. and Mr. W. were all right. I also wondered if I might lose my funding the next week. Or see it doubled.

*It was not like any UFO abduction I've heard about. These beings were friendly. I had a bond with one of them. It was about to say something to me or me to it, but we couldn't quite connect. It was almost a sexual bond, but not sex like intercourse, but a total body communication. I was filled with feelings of love for them. Their work definitely had something to do with my presence. Exactly what remains a mystery.*

Let's close this chapter with one of the most striking interventions performed on a volunteer by these otherworld beings. In BEN's experience, they not only tested and probed him, but also implanted something into his body.

BEN was twenty-nine years of age and had recently relocated from Seattle. He was a drifter, having held thirty jobs in just ten years. He was an old friend of CHRIS, about whose en-

tity-contact encounter we just read. During one of his longest stints of employment, BEN had served as a military policeman for two years.

BEN was an intense fellow—short-cropped, nearly shaven head; a muscular build; and a very direct manner. He actively sought novelty and change, so it's not surprising that in his written statement about why he wanted to participate in the New Mexico research, he replied: "I am an explorer, and I expect this will be an interesting experience."

As with DMITRI, BEN's non-blind, low-dose DMT session was relatively powerful. His high sensitivity to DMT warned us that the next day probably would be one of the biggest psychedelic experiences of his life. I told him to be ready.

While a little nervous the next day, BEN was eager for his non-blind high dose to begin. I spent a little more time than usual getting him ready, advising him to try and take some big deep breaths as the DMT went in: "You may take in a breath and have that be the last thing you remember; you may not even notice the out-breath. That means you're there."

BEN tried to breathe deeply as the drug was going in. Then his breathing settled down as he obviously fell under the influence of the drug. His heart beat visibly in his chest. At about 3 minutes, his neck showed some hives, something that had also happened to several other volunteers who had truly astonishing stories to tell us later.

At 8 minutes, several total body spasms occurred, and he cleared his throat. It was time to try and ground him. "We're going to put a blanket on you. Try to breathe into that tension if you can."

He slowed his breathing and starting calming down, a big smile on his face. He stayed silent for 36 minutes, longer than most of our volunteers, before I felt the urge to rouse him:

*It started with a sound. It was high-pitched like a tightly taut wire. There were four or five of them. They were on me fast. As crazy as this sounds, they looked like saguaro cactus, very Peruvian in color. They were flexible, fluid, geometrical cacti. Not solid. They weren't benevolent but they weren't non-benevolent. They probed, they really probed. They seemed to know time was limited. They wanted to know what I, this being who had shown up, was doing. I didn't answer. They knew. Once they decided I was okay, they went about their business.*

His eyes were open, glazed, staring at the ceiling. He seemed unable to grasp what he had just undergone. “I know. It sounds incredible to you. To us, too, but it happens.” Halt-ingly, as if he weren’t really sure he wanted to tell us:

*I felt like something was inserted into my left forearm, right here, about three inches below this chain-link tattoo on my wrist. It was long. There were no reassurances with the probe. Simply business.*

LAURA asked, “Was there any fear?”

*Maybe at the onset, at just having my ego brushed aside. When they were on me, there was a little bit more confusion than fear. Kind of like, “Hey! What’s this?!” And then there they were. There was no time for me to say, “Who the Hell are you guys? Let’s see some ID!”*

There are surprising and remarkable consistencies among volunteers’ reports of contact with nonmaterial beings. Sound and vibration build until the scene almost explosively shifts to an “alien” realm. Volunteers find themselves on a bed or in a landing bay, research environment, or high-technology room. The highly intelligent beings of this “other” world are interested in the subject, seemingly ready for his or her arrival and wasting no time in “getting to work.” There might be one particular being clearly in charge, directing the others. Volunteers frequently comment about the emotional quality of the relationships: loving, caring, or professionally detached.

Their “business” appeared to be testing, examining, probing, and even modifying the volunteer’s mind and body. Sometimes testing came first, and after results were satisfactory, further interactions took place. They also communicated with the volunteers, attempting to convey information by gestures, telepathy, or visual imagery. The purpose of contact was uncertain, but several subjects felt a benevolent attempt on the beings’ part to improve us individually or as a race.

I was baffled and nonplussed by the sheer volume and bizarre nature of these reports. My crude and minimal responses to volunteers’ tales in this chapter clearly reflect my quandary. At first I tried to avoid the pitfalls attendant to developing any explanatory model, either for my benefit or for that of the subjects. After a while, however, we all needed to make sense of these types of sessions.

As a clinical research psychiatrist, I entertained the idea that the regularity and consistency of these reports, and the strength of the sense of reality behind them, supported a biological explanation. We were activating certain hard-wired sites in the brain that elicit a display of visions and feelings in the mind. How else could so many people report similar experiences: insect-like, reptilian creatures?

I believed that these experiences were hallucinations, albeit rather complicated ones—simply products of brain chemistry brought on by a “hallucinogenic” drug, like a waking dream. Several volunteers’ eyeballs did rotate in their sockets during high-dose DMT sessions, reminding me of rapid-eye-movement sleep, when dreaming occurs. Maybe DMT was inducing a wakeful dream state.

However, research subjects tenaciously resisted biological explanations because such explanations reduced the enormity, consistency, and undeniability of their encounters. How could anyone believe there were chunks of brain tissue that, when activated, flashed encounters with beings, experimentation, and reprogramming? Neither did suggesting that it was a waking dream satisfy volunteers’ need for a model that made sense and fit with their experience. Many even prefaced their reports by saying, “This was not a dream,” or, “I couldn’t have made it up if I wanted to.”

At a slightly more abstract level, I tried a psychological explanation. That is, these experiences were symbolic of something else: wishes, fears, or unresolved conflicts. However, these “symbolic” explanations weren’t any more successful. Even gently persistent interpretations fell flat. How could these experiences reflect unconscious psychological issues like aggressive or dependent wishes?

In some volunteers the need to make sense of the strangest sessions was almost academic: “It was just the drug.”

For others, however, this need took on a pressing urgency. How could they have possibly undergone the experience they just did? Was it their imagination? How could their imagination generate a scenario that felt more real than waking consciousness? If it were “real,” how does one now live his or her life, knowing that existing right now are multiple invisible realms inhabited by intelligent life-forms? Who are those beings? What is the nature of their relationship to the volunteers now that they had made “contact?”

At a certain point I decided to suspend my reductionistic, materialistic, “I know what this is” approach. Not that doing so helped me feel any more comfortable with what I was hearing. But at least I no longer would risk making things worse by explaining away people’s experiences as something else. Interpreting, explaining, or otherwise reducing their reports usually caused volunteers to shut down, and I knew I would be missing valuable and important pieces of the entire story if I couldn’t encourage them to talk.

So, as a thought experiment, I decided to act as if the worlds volunteers visited and the inhabitants with whom they interacted were real, as real as Room 531, the hospital bed, the research nurse, and myself. There now was freedom to respond more empathically, and to see where it led. It also made it possible to start considering other ways of understanding research subjects’ eerily consistent reports.

Nevertheless, there was a nagging discomfort in taking this approach in responding to reports of contact. I began wondering if I were starting a descent into some sort of communal psychosis.

So did the volunteers. Upon hearing of similar encounters by their comrades at our post-study socials, several subjects decided to form a DMT support group that met every month or two. Their reason? “I can’t talk with anyone about these things.” “No one would understand. It’s just too strange.” “I want to remind myself that I’m not losing my mind.” ✕

3. GUMBY is a character from an American children’s television show from the late 1950s and early 1960s. GUMBY was composed of a clay-like substance molded over metal wire. This made it possible to bend him into all sorts of shapes, something kids loved doing with their own twelve-inch-tall GUMBYS. GUMBY’s trusty sidekick was POKEY the horse. The animators bent and moved GUMBY’s and POKEY’s clay bodies, then filmed them using time-lapse photography, thus giving the impression of movement.

# SACRED CACTI

second edition

Includes entries for the mescaline-containing cacti by species; a simple list including percentages reported; a digested version of the literature published; a comprehensive physical data overview for mescaline including toxicology, assays and reagents; a review of mescaline pharmacology; independent research by Appleseed & Trout suggesting the presence of not only DMT but also 5-MeO-DMT in the Aizoaceae; a brief review of other succulents with reported drug use or published chemistry; a detailed cultivation guide; various preparation and purification routes used by professionals and amateurs; and full references for more details.

## TERENCE MCKENNA SPEAKS... (PART II)

Transcribed from his talk "Splat" at the ALLCHEMICAL ARTS CONFERENCE in September, 1999

*The following talk was given as the introduction to the ALLCHEMICAL ARTS conference, a week-long seminar that took place in Kona, Hawai'i and which was organized by TERENCE MCKENNA, KEN SYMINGTON, and MANUEL TORRES. The focus of this event was the intersection of psychedelics and the arts. The transcription of TERENCE's talk has been edited slightly, and—unfortunately—there were some places where despite our best efforts at transcription, the tape we were working with was inaudible. As with many "performances" that TERENCE gave over the years, much of the talk is presented in the Socratic manner—a series of questions from the audience and responses from TERENCE. (It should be pointed out that the questions posed come from many different people, not a single individual.) Our transcript will be presented in three installments this year, of which this is the second. As one of the last public appearances that TERENCE made, we felt that it was important to share this with those who weren't fortunate enough to have been able to attend the ALLCHEMICAL ARTS conference. — DAVID AARDVARK*

Okay, we can start again if you'd like. I don't know; I'm not sure we'll run to the stroke of 5:00. I sort of, I love how low key this is, it may be too low key for you. But, I've never had it so low key. So, ask me anything at this point.

*We have another question about the state of ecstasy; how it can be accelerated or transcended, through psychedelics or medication. But in the state of ecstasy, isn't our mind actually understanding or comprehending the simplicity, rather than the complexity? Isn't that actually a state wherein you really perceive the universe as being, I guess, not a question or an answer, but merely true?*

Probably. I mean, you mean as an unintegrated, un-languageable, state of well-being that is stronger than any criticism or question about it?

*I think it can be more than that, in that the answers... if there are questions, there are the answers to every question at the same time. It's a spiritual dimension maybe, or it seems to be a physical dimension—perceived reality, it's one that exists in harmony with all concepts and all known universal languages, without uncertainty that comes when we try to analyze it, in order to create concepts, which we then say this is good, this is bad...*

Yeah, I mean I think of ecstasy as basically just where you get to the place where you realize that it's all right. Whatever it is, it's all right. All rightness of it transcends all argument against that. And if you can hang onto that one... uh...

*It's all right...*

It's all right. (laughter) That's where you want to be. Yeah?

*In talking about the archaic revival, and going back to a communal structure... now, mushrooms, I heard you say that—and in my own experiences—where it shows you the unique, you know, it differentiates you from, you know, the person next to you. And the question I have is, and I do understand that if you live in more of a conventional—a much stronger community, but that you're around a certain type of people, and therefore... you know, I've been trying to piece this together, the individual verses the community, and the mushroom shows you the individual, and how are we going to make this into a community, and march into the archaic...*

Well, it's an interesting question. I mean some people would argue that the great accomplishment of Western civilization was the idea of the individual ego, and that somehow the forward march from this has been happening since then, or something, and to some degree it has. On the other hand, accommodating the ego has then created the great social disruptions and conundrums for Western civilization, democratic rights, and so forth and so on, how is all of this to be handled? And then the uniqueness of the biological individual is not in question, but how many behavioral strategies can be called forth out of the unique individual in any given situation, isn't entirely clear. I don't know, I think this issue of collectivism vs ego is not yet resolved. I mean you can not... can you make a world where every man and woman is king and queen over their own private Idaho, and none are in conflict with any other? Is that desirable, or is that a foolish and sort of trivial idea? Do social values inevitably arise out of collectivism? The history of the 20th century is not very sanguine on that subject, since all movement, all mass movements on the right and the left have totaled up pretty horrific historical costs. I value eccentricity. I mean

I've always... that's my aesthetic. I said earlier that my aesthetic was towards the weird. I didn't say it was weird *and* eccentric. Because somehow the unique seems the rarest of all things. I mean it obviously *is* the rarest of all things, because it violates towards all tendency toward... Yeah?

*TERENCE, uh, the human beings interpret reality very much according to the way they have been programmed. And if we need to de-program or re-program humans on the planet, are we going to do it through television, are we going to do it through computers, or are we going to do it through psychedelics, and what are the pros and cons of that necessary change? Because if you want implement a new paradigm, you're gonna have to reprogram an awful lot of people.*

Well, to reprogram a whole lot of people you have to know what you're trying to reprogram them to believe. So like media, for example, I don't think that it can ever be wrested from its lower-order agenda of picking your pocket. And then if you try to do it with drugs, the drugs themselves speak too loudly. You have to trust the message from the plants, for example. And so then what you're left with is education, and there... this is a political football, we all know this. So I think, you know, a lot of this stuff, you simply have to have a kind of blind faith in the order of the system—because if it depended on the good will of human beings, then we're in real trouble. But these systems do seem to have built-in coherency. They do want to achieve certain kinds of break-out states and equilibrium, and I think at the moment we're going through a kind of funny place in the historical continuum, because of the end of the century, because of the end of the millennium, because of the bankruptcy of the ideologies that rule the 20th century, there is a sense—and this is why I called my talk “Splat!”—there's a sense that we're just hitting the wall here. But I don't think it's true. I think it's temporary. I think there was probably a similar kind of cultural exhaustion at the end of 19th century. I mean they had seen faith in socialism go on the rocks, they had seen all of these labor union movements bust up, it didn't seem to be working. And similarly now. But just a year or two past the turn of the century, I think there was a much brighter prospect. And in a way, the calendar itself has been used as a dialogue-limiting entrapment. People think, “Well, you can't talk like that because we have to worry about Y2K,” or “You can't talk like that because we have to worry about the last thousand years of Christian civilization.” All that will fade. And, if what's happening—and it seems to *me* it's what's happening—is human hands are taking the destiny of this planet to themselves, then we have to have much more powerful theories of man-

agement resources, environmental management, food distribution, education, health care maintenance... Otherwise, we're just... we can not... what's the point of creating a planet full of unhealthy, miserable, heart-scrabbled people? There *is* no percentage in that. And if we're not going to do that—if we're *not* going to put the human imprint on the planet and say this is the planet of the apes, or say no, it's the planet of the sail fish, or something, I don't see any sign of that. I don't see how you can run a global economy—or with the momentum of the history that we have—how you can move forward on that. And there are a whole bunch of technologies waiting to break out as well. If... I don't know why it seems to me *so* similar, this time, to exactly a hundred years ago. You know, a hundred years ago *film* hadn't really begun. There had been some films shown in France, the LUMIÈRE brothers, and so forth and so on. The automobile had barely arrived. The Paris airshow was a few years in the future. MAX PLANCK was discovering some problems with the black body radiation. In other words, quantum physics hadn't announced itself. ALBERT EINSTEIN was chasing women around these Viennese cafés, and not minding his Ps and Qs. A whole *world* was waiting to be born. And I have a feeling we are similarly naive, and that what lies ahead of us is pretty unimaginable, and indicated in the phrases like “A.I.s,” and “artificial life,” and “super hallucinogens,” and “downloaded into circuitry,” and all, is extreme... these are grotesque cut-ups of what *really* lies ahead, and not so far off as you may wish...

Um hm?

*TERENCE, are you still holding to your view of December 2012; is there a shift of your view of the Timewave's singularity?*

Well now it's easy to be certain! (laughter). Uh, I think that there is some kind of singularity, haunting the human world. I don't know if it will arrive quite as I predicted it back then, you know, on time, under budget. (laughter) But I do... I still think that there is some kind of definitive concrescent coming-together out there not very far. One doesn't have to operate in *complete* ignorance of what's going on—I mean it probably *is* an artificial intelligence (A.I.), or artificial life. Those are the only two things that I can think of that would fulfill it in the grandest and most grandiose way that I can imagine. It would be nice to get a little...

*The whole conceptualization of it as artificial, that's part of the hang up about it.*

Of the Eschaton?

Yeah...

Yeah.

*Yeah, really embracing it as an artificiality...*

Artificiality in what sense?

*I don't know. You were just talking about it as artificial.*

Oh, well... by the time we get there, *if* we get there, it won't seem artificial. In other words, the punch will be telegraphed—it always works like that. And, you know, maybe the art of writing good history is looking back at history and locating where these things were before. I mean, I'm struck now... there's a whole school of fiction, that seems to fasten itself onto technological innovation. So for instance, [WILLIAM] GIBSON and [BRUCE] STERLING wrote *The Difference Engine*, which is based around [CHARLES] BABBAGE's 19th century machinery, and then NEAL STEPHENSON wrote about a future nanotechnology in *The Diamond Age*, and recently

about cryptography in World War II, and THOMAS PYNCHON wrote about cryptography in *Gravity's Rainbow*. And so in retrospect, these things are seen to be incredible turnings of the age, and I think all of us must feel, or I certainly feel, that the computer every day is more indispensable, more intrusive in a very friendly and acceptable way, more empowering, more maddening, more a *part* of everything, and forever more, apparently. And we're there at the stone ages of this thing. I mean, it will grow seamless. It will grow seamlessly a part of us, from here out. There will be very little to differentiate it. And in a way, it's like adding intelligence, or taking a drug, or having friends in high places, or something like this. Yeah?

*TERENCE, do you have a vision of the actual evolution of humankind?*

What might happen to us?

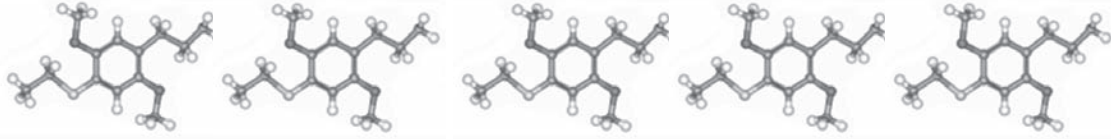

*Where we are, there is an evolution that can rise out of current...*

Well, we mentioned this collectivist impulse, and ecstasy was mentioned over there. I mean guess I'm optimist enough to

# Eshu

INCORPORATED

**Eshu specializes in cutting-edge neurochemicals for research scientists worldwide. Eshu is the premier supplier of rare tryptamine and phenethylamine compounds. We strive to push the envelope of neuroscience, with a primary focus on research and development of exciting new materials.**

See our web site for the full Eshu product list and ordering information: <http://www.eshu.org>

believe that the more people are connected, the more that they're able to give and receive *love*. Which is probably then the only thing standing between them and some horrific vision of disillusionment. I mean it seems to me *language* is a complex strategy for conveying and receiving love, and then the technologies which support that. I mean certainly, 'though there have been some vengeful Gods along the way, most of the ones who were *only* vengeful got sort of tossed out. So, without being too DESJARDINIAN about it, it seems to me *love* is the *value* that is brought into the world by human beings that we see very little evidence of elsewhere. I'm not saying honey bees don't love honey bees, but they may not *need* to love honey bees, because the rules of the comb are well-established. I may be going *soft* in my middle age here, but...

*What I of get kind of focused on is, thinking back to the '60s, when the thing to do seemed to be... be in communes. And then what happened when we tried to do that—where people would fight with each other, and you know jealousies developed, and monogamy was rearing its ugly head, and all those kinds of things would happen. What has happened to that impulse in the psychedelic community towards collectivism? Is this because of our*

*cultural heritage? What is that life and how could we get rid of it and what did we do with it?*

Well, it's easier to *love* people if you don't have to put up with them. (laughter) The real test is to love them *and* put up with them. I mean, I don't know. I don't think being a *thinking* human being is a comfortable position. If you're thinking, the disequilibrium of your circumstance is constantly upon you. Thinking is almost a kind of *dissent* from handed-down cultural values and programing. And so you know, the ardent monogamite wonders, the ardent something-or-other wonders, and nobody is entirely comfortable with their circumstances because they choose to imagine other circumstances. The glory of mind is that you can try on possibilities. And in a book I wrote recently with a co-author, we struggled with the concept of how fantasy—and fantasy driven by psychedelics—was probably a very important part of early civilization. And there were two kinds of fantasies in that situation—erotic fantasy and hunting fantasy. And that both kinds of fantasy revolved around thoughts like, "If I do *this*, then maybe *that* will follow. And it was the following of these... [TAPE BREAK]"

## ETHNOBOTANICALS.COM

PURE LAND offers a truly wide selection, low prices, and fast service—a unique resource for hundreds of types of rare seeds, interesting dried plant materials, and concentrated herbal extracts. Current offerings include:

Ayahuasca dried vine sections, *Argyreia nervosa* seeds, *Artemisia absinthium* liquid concentrate, *Acorus calamus* fresh organic Indian rhizomes, betel nut 5X powdered extract and pure Arecoline hydrobromide, *Calea zacatechichi* (the dream herb), *Diplopterys cabrerana* from Peru, *Ipomoea violacea* (4 varieties), kava kava Vanuatu extract powder, *Mimosa hostilis* root-bark, *mapacho* bundles (*Nicotiana rustica* tobacco leaves rolled into log shapes), *Papaver somniferum* seeds (8 select varieties), *Salvia divinorum* leaves from Oaxaca (high salvinorin content), sassafras oil, *Voacanga africana*, and hundreds more.

But I don't think other kinds of animals, or very many kinds of animals, do that. One kind of animal that may do that are hunting cats. I think hunting cats do... do strategize. And one of the fascinating things about early shamanism, and especially psychedelic shamanism in most settings, is a fascination and association with these large cats. In a way you could almost say the earliest form of human consciousness was not human at all. It was men and women who could think like animals. That's one of the great compliments you can pay a shaman is to say, you think like an animal—you think like a cat or you think like a bird, means that they are in that context.

Yeah, SCOTT?

*In reapplying their specialties, it seems that you just feel like we can generalize with animals. Maybe not.*

No, you're right. We're like generalizers. We can do the "both," "and." We can be something, and contemplate being something else. And psychedelics *do* that. If you have hardwired reflexes, what could a psychedelic possibly *do for* you? I mean because your reflexes are so hardwired, there's no change—no vision of a different way of doing it can be fed into it. So it's the contemplation of change, the ability to choose, the ability to act, and to realize. And this then, carries us somewhat back to where we were at the beginning, with idea that it's the production of these images, which come out of the unconscious, and which may appear straightforward at first, but which in fact are charged with possibilities and dimensions that you don't sense or realize until you're committed to it, or you're brought in through it somehow.

Yeah?

*The most powerful thing that I've brought back from a psychedelic experience is that palpable experiential energy. And being allowed to use that for... to heal me, or... is it something that, where it's...*

Well, don't you think most shamans, *this is what they're doing*, is they're bringing back a sense of psychic empowerment, of psychic heating, that their hands, their spells, their songs, can *cure*. And you know until you're truly ill in a world without real medicine, you don't realize what a power this is, even to just *claim* it. Even to just claim it. I mean, a doctor in a world without doctors is almost unimaginable from our looking at it—a living miracle worker. So, yeah, to separate the medical function because it controls prolongation of life and

health and all that, from the shamanic function, it just doesn't make any sense. I mean life *is* health in those archaic societies. And it is in our society too, but then it gets murky, because of our funny ideas about what disease is, and how you treat it, and so forth and so on.

Yeah?

*What do you think disease is, and how should we treat it?*

What is disease? Well, I don't know. I had some medical problems this spring, and one of my impulses from dealing with it was to go back through my life and say, "What did you do that got you into this mess?" Now this is a theory of life as *literature*. In other words, it's the idea that first of all, life makes sense, and so this question *can* be answered. And fairly intelligent people told me, "Don't do that. It's not a story." You know, it doesn't *make* sense in that way. I think disease is—and I don't want to be held to this entirely—but largely more *linguistic* than most people think. You know, it's a story you tell yourself about how you are in the world, and the way that that doesn't quite parse with how you *are* in the world. And, it's sort of like having a burnt rotor, or something—it begins to clank and crank. A lot of people have talked about this, I think there's even a name for this field of thought, but I have no idea what it is, but the idea that most disease is a problem with language, a problem of self-description, or self-reception, or communication to other people. So again, psychedelics, to the degree that they promote open and therapeutic truth-telling, hold down disease. You know its extraordinary how healthy shamanically-attended populations are. Serious mental disease is largely unknown, and many of these cultures are in the tropics, where, God knows, you know, if you cut your thumb you're septic within 24 hours. But these people seem to be able to sustain it. When you think about the genital bloodlettings that Mayan royalty indulged in, in a tropical rain forest at high temperatures, why anybody lived to tell the tale of a medical practice like that is a miracle. So they must have lived inside an extraordinary set of assumptions. I remember when I was traveling around the Amazon—actually it was in Indonesia, but it happens in the Amazon too; come to these villages and the people would come out of the villages to meet you, and they would bring you corn beer. A gourd of corn beer. And then the whole village would surround you, to watch you drink this thing. Well, if you knew anything about what was going on, you knew that the old women of the village had sat up the night before chewing the corn beer and spitting it out into this bowl, so it would ferment. And so you were literally getting the the complete

immuno-challenge that the entire village had to offer you. And all you could do was just lift it up, thank everybody, think of your stomach for a moment, and say, “Here it comes.” (laughter). And I never got sick from that. I mean, I got sick from other things, but that... you know from a medical point of view, that’s was just like “ptcheww,” to do that. So the story you tell yourself is largely the story you’re living. The other thing is, nothing is unannounced. This is a psychedelic truth, I think, of some power—and it relates to disease and it relates to shamanism. Nothing is unannounced. If you’re paying attention, stuff comes down the pike. First the little wave, then the medium-sized wave, and then the tsunami. But you have to be *really* not paying attention to be *fully* astonished by something unexpected. In fact it’s a *disgrace* to be totally astonished, because it means you must not have been paying attention to what’s going on.

Yeah?

*So were you astonished when you found out about your brain tumor?*

Oh, was I astonished? Well, I was astonished that I had the brain tumor—that blew my mind. But I knew something weird was going on. I had known for months something peculiar was happening. Just before I had my most serious problem, I said to CHRISTY [SILNESS] and my son FINN, I said, “The dreams that I have been having for the past month have been so peculiar, that I think maybe I should see a neurologist. It’s possible I have a brain tumor.” I wasn’t *serious*, but in fact I had diagnosed... what a HARVARD medical education gets you; I got it on the natch by just paying attention. You don’t know *what* it is that’s coming at you—you can’t always say. But *that* something is coming at you is usually pretty clear.

Yeah?

*Did you document any of those dreams that you were having then?*

No. I mean I don’t want to say too much about them, but here’s what I’ll say about them. The thing that let me know that they were weird was, I could not English them. They lasted hours and hours every night, and I couldn’t even tell myself what these dreams were about. They were not about stuff that “aboutness” can signify. So the only thing familiar to *me* like that was DMT. Because in DMT you are presented with things about which you can say nothing. And so it was like that. Now I know what to look for, and I suppose that I

can teach other people what to look for. But rather than do that, I would just say to all of you, you know, you should regard a CAT scan like brushing your teeth! (laughter). Isn’t that a cheerful thought.

*So did any of those dreams have a clear emotional component, or was that also...*

No, they didn’t have an emotional component. They were absolutely *outside* the realm of descriptive possibility. And not much of life is like that, because language obviously has evolved like a glove to fit the hand. So here suddenly is a situation where there’s no fit. And, it signifies something... something peculiar. That’s what I mean when I say everything is trying to speak to you out of its place. And, it’s mighty, mighty strange.

*TERENCE, can you talk about the healing power of art?*

Well, this goes back to what we were saying about alchemy—the perfection of the image. And this has to do with this implicit Platonism, that some of you have heard me talk about before. PLATO’s thing was about what he called “the good, the true, and the beautiful.” Three sides of one concept. If it was good, then it was true; if it was good and true, then it had to be beautiful. So the good, the true, and the beautiful, you can approach whichever way it works for you, but if you have a perfect work of art, or a work of art that strives towards perfection, then it will have these qualities, and it can heal. It can heal. Now, there are simple theories of the good, the true, and the beautiful. In my opinion a simple theory would be a theory of symmetry. And so without dinging anybody or trying to make a value judgement here, but to just illustrate it. So for instance, Temple or Mandalic art, Mahayana’s medicine thangka art, depends on an appeal to mathematical symmetry—the simplest kind of aesthetic. But on the other hand, you know, if you have, uh... something by the Brothers VAN IKE, you don’t have to rely on simple symmetry to see that this is a work of art that can draw towards healing. And these images of the Mother Goddess as Madonna and so forth and so on, these are very powerful constructs out of the unconscious, and they heal. Sequential art, narrative art, is perhaps more dubious, because it’s under the agenda of a certain theory of time and narrative that’s probably local. So, you know, I’m not sure VIRGINIA WOLF should be preferred over VAN IKE, but I’m sure that I’d get a fight from several people over that.

**TO BE CONTINUED...**

## 20 YEARS OF MUSHROOM FEST

by HONEY BEAR

Held at the end of August, this year was the 20th anniversary of the TELLURIDE MUSHROOM FESTIVAL—perhaps the oldest continuing entheogen-related conference around. This event was first started by Dr. ANDREW WEIL and Dr. EMANUEL SALZMAN because at the mainstream conference held in Denver each year it was thought unwise to inform the public about the identification of *Psilocybes*. Some mushrooms of this genus can and do grow close to other mushrooms that can make one quite ill and even cause death (such as in the case of certain *Galerina* species), and the mainstream thought was let them die if they're looking to get high. (Harm reduction be damned!) Thus the TELLURIDE MUSHROOM FESTIVAL was born.

While not totally oriented towards entheogenic mushrooms, the FESTIVAL is a great opportunity to learn the latest information on *Psilocybes* from PAUL STAMETS, one of the greats in this field. STAMETS has identified several new species, one of which he named after his longtime friend Dr. ANDREW WEIL. (You've got to love the name *Psilocybe Weili!*) At this year's event, PAUL talked of the "Iceman;" the mummified remains found on the border between Italy and Austria. Inside a pouch tied to the mummy were three mushroom species, one of which contained a tryptamine. One more small piece of evidence suggesting that our European ancestors may have been voyagers too.

Workshops are given relating how to growing mushroom on straw, and while the strain used is the Oyster mushroom (*Pleurotus ostreatus*), the technique of growing on straw is applicable to many other types of interesting fungi.

The main speakers each year are people from the entheogenic elite. In years past TERENCE MCKENNA, JONATHAN OTT, CHRISTIAN RÄTSCH, LAURA HUXLEY, and many others have led very interesting discussions. This year's main speakers were Dr. ALEXANDER SHULGIN and ANN SHULGIN. While it helped to be well versed in chemistry to follow all of SASHA's talk and "dirty pictures," there was still much to be learned for the novice. ANN's talk concerned "Meeting the Shadow," something we all eventually do while voyaging. She had some very good advice on how to deal with the fear, and the need of accepting our Shadow.

There was also a panel discussion with the SHULGINS and two young drug users. One of these was a former raver, turned off from the scene due to all the unknown compounds being sold as "X," and because he felt that the growing popularity of raves has invited "organized crime" (and hence more intense scrutiny and busts by the police). The other younger participant had never attended a rave, and had only used entheogens for personal/spiritual growth. It was a good exchange of ideas, with many comments from conference attendees. The point made was that by sticking to plant entheogens, we can perhaps lessen the legal risks. To which Dr. WEIL lamented he wished a plant with the empathogenic qualities of MDMA could be located. Amen!

The FESTIVAL is a great place to learn mushroom identification from some of the experts in the field of mycology. GARY LINCOFF, author of the *Audubon Society Field Guide to North American Mushrooms*, is also a regular speaker at the conference. His talks were informative and amusing, especially his stories of a foray to Russia to partake of the *Amanita muscaria* mushroom—R. GORDON WASSON's alleged *Soma*.

The conference is very laid back with most presenters being around to talk to after their sessions are over. The mushroom parade down main street Telluride, with many of the participants dressed as their favorite 'shrooms is something to behold. Where else in these United States can you find a bunch of wide-eyed, grinning psychonauts in a parade that is led by a police car followed by ART GOODTIMES' *Amanitamobile*? The parade ends at city park where a great drum circle went on for what seemed like forever. This may have been due somewhat to the special bluish honey that was being passed out to any and everyone by that ubiquitous soul ANON. The energy levels were high and the smiles wide. The park is at the end of a box canyon surrounded by fourteen thousand foot mountains, with Bridal Veil Falls visible in the distance.

Although the town itself has changed over the years, becoming increasingly geared towards the rich, the event itself has remained the same. A rewarding and colorful experience is assured. Don't pass this one up next year. For info. contact: FUNGOPHILE, Box 480503, Denver, CO 80248, (303) 296-9359, <http://www.telluridemm.com/mushroom.html>. ✧

# THE MARVELS OF *MIRABILIS MULTIFLORA*

by PHILLIP HAMBLBY

*Mirabilis multiflora* (the Latin translates to “many-flowered marvel,” and its common names include Colorado four-o’clock, desert four-o’clock, wild South Western four-o’clock, and in Hopi *so ’ksi* or *so ’kya*) is one of the most mysterious of ethnobotanicals. Its succulent leaves and deep-purple morning-glory shaped blooms, which open around four-o’clock in the afternoon, are a refreshing oasis in the middle of any South Western desert; like a remnant of Eden or a long-ago age of botanical beauty. It’s a truly exquisite plant.

*Mirabilis multiflora*, according to *Medicinal Plants of the Mountain West*, has a fair number of medicinal uses. When fresh or dried roots are eaten, they cause a numbing/soothing effect on the stomach lining, making it useful for people with ulcers (MOORE 1979). The powdered root has been reported as being baked into bread by the Zuni Indians and used as an appetite suppressant (it is also apparently effective for this use when made into a tea). A paste made from powdered roots has been used applied as a local anesthetic for inflamed joints, and the Hopi are said to have used it as a visionary plant (CAMAZINE & BYE 1980 in OTT 1996; DOBELIS 1986).

1 to 2 ounces of finely-powdered dried material seems to be enough for an inebriating effect; however, my experiments with it give me the impression that it is less of a *visionary* plant than might be hoped for based on reported Hopi use. Its effects are more of a “happy-go-lucky” type of “feel good” inebriant, than a profound psychoptic like mescaline or LSD.

The fresh roots are mildly sweet enough to be pleasant to eat, indicating the presence of sugar and starch. One immediately notices its numbing effect in the mouth and a peppery taste. I’ve always felt this numbing effect to be enjoyable. 30 to 90 minutes after ingesting, one experiences merriment, light heartedness, and a tendency to laugh or giggle commence. After a couple of hours these effects are followed by muscular lethargy, slurred speech, blurred vision, and eventually it aids in restful sleep. (It can be a useful plant to consume 3 or 4 hours before bedtime.) After my first two bioassays, a couple of friends also tried it. One reported the same as myself. The other said, “20 minutes after eating it she became nauseous, threw-up, and had no other effects at

all.” Its active/medicinal properties remain unknown. I presented material to a doctor and a postgraduate student from the UNIVERSITY OF NORTH CAROLINA’s Botany Department, but they were unable to determine anything active in the plant’s chemistry.

*Mirabilis multiflora* has a massive tuberous root. A plant no more than three feet tall by three feet wide can have a root six inches in diameter by four feet deep; when dried it can weigh more than two kilograms! It’s the only plant I have ever known that can remain dormant for up to 24 months at a time. If it stays extra dry, as it does sometimes here in the South West, this plant will simply stay in dormancy for the entire growing season, and sometime it won’t be until August of the following year that it begins to grow again.

Cultivating *Mirabilis multiflora* from seed is pretty easy. To root cuttings (I found out the hard way), they must be first planted in sand. It will then send out new growth, and—at the beginning of its second year—can be transplanted into regular sandy mesa desert soil. Use of sand is important as, unless you can get a plant without any cuts on its roots, it will rot during dormancy, due to the higher bacteria levels found in soil. Loam-silt-sand-soil type is the best for extra big plants, but regular desert soil works okay too. Once established, it is brutally drought and cold hardy. ✧

# NETWORK FEEDBACK

## SEED BANK AND CHEMICAL LEGALITY

I would like to start a private/personal seed bank until I acquire a green thumb (and in case certain seeds/plants/spores are scheduled). How do I preserve psilocybian mushroom spores or seeds—specifically *Papaver somniferum*, *Catha edulis*, *Trichocereus pachanoi*, *Ipomoea violacea*, etc. These are the main ones that I am interested in. Is their literature related to seed storage?

Also, how do I find out if certain chemicals are scheduled, such as adrenochrome, thujone, etc. I want to ask PURELAND or JLF for these, but not if they are illegal! As always, thank you and have a good day. — J.R.S., ND

*As far as storing seeds or spores goes, cold, dark, dry (in most cases), and airtight are the things to keep in mind. There are some seeds that do better when stored in moisture (damp sterilized moss is sometimes used) such as Psychotria viridis, but none of the seeds that you mentioned require moist conditions. (Flushing out the storage container with nitrogen is a good idea, but not practical for most.) Freezing seeds for long-term storage will kill off some percentage of them, but those that do not die will remain viable longer. (Keep in mind that a seed is alive, but the colder the environment it is in, the more its life-processes slow down.) Refrigeration certainly shouldn't hurt most seeds, as long as you are sure to keep them dry. Trichocereus seeds can stay viable for decades if kept cold and dark. Cactus seeds have been found viable after 20 years of room-temperature storage. K. Trout has told me that poppy seeds will lose their viability in a few years no matter how they are stored, often becoming unviable within 2–3 years if not stored in a refrigerator. However, a commercial poppy-grower in Canada stated that, "stored properly [they] keep for many years. I have grown plants from poppy seed over 60 years old which did very well." (Unfortunately, this grower did not comment on what the "proper" method of storage that he used was, nor what percentage of germination remained after this time.) K. Trout has also noticed that Ipomoea seeds can become unviable within 2 years, stating, "stragglers may come up, but they will usually be stunted or weak. I have lost several strains of Ipomoea just by missing a single year of planting."*

*Sporeprints should be kept at a constant cool temperature, but refrigeration or freezing is not necessary. They need to be kept dry (prevent the formation of condensation in whatever container they are kept in), as moisture will cause the*

*spores to germinate (and without the addition of a nutrient, the mycelium dies). Again, although not practical for most, those who can store items at a very low temperature in a freezer could maintain a constant temperature and store with liquid nitrogen. Mushroom cultures are best kept submerged in distilled water. The time one can keep mycelium alive depends on the species and strain, and can be anything between a month and ten years. If one has a choice between storing mycelium or storing spores, the latter is preferred. This is also true from a legal point-of-view in the USA. (Thanks to RENÉ RIKKLEMAN for this storage information.) Properly stored, sporeprints should last a long time.*

*With regard to finding out if certain chemicals are scheduled, one should be able to run a search on-line at the Code of Federal Regulations site (<http://www.access.gpo.gov/nara/cfr/index.html#page1>) and find out what the federal laws are. (This won't provide one with state laws, which are sometimes more restrictive than the federal laws.) As far as thujone goes, the only regulations related to it appear to be that it is illegal to introduce it into food or alcohol, except when it is a component of the common sage herb, Salvia officinalis. Thujone itself is not scheduled. I could find nothing on adrenochrome, and I suspect that this is not scheduled either. Another resource to check would be the Alchemind web page at <http://www.alchemind.org>. And, although the book is several years out-of-date, there still might be some useful information in ALEXANDER SHULGIN'S Controlled Substances. As well, it seems pretty unlikely that any legitimate company would sell scheduled compounds, so there really wouldn't be any harm in asking; all they might say is, "No, we can't sell that because it is illegal to do so." Finally, although it is probably not the most useful source of information, you could try calling up the DEA directly (from a pay phone) and simply asking them whether or not a particular chemical or plant is scheduled, and see what they say. — DAVID*

## NO MORE "ENTHEOGEN"

I am writing to express my distaste for the term "entheogen." This term is presumptuous. It presumes that there is a God. In all of my trips, I have not yet come to the conclusion that there is a God. I do find psychoactive substances to be "psychedelic." That is, they do show me a lot about my mental makeup. Unfortunately, while this term has an excellent denotation, it connotes flower-power vans, long-haired hippies in sandals, and other things inconsistent with my lifestyle and intent for substance use, which is to simply understand

my tendencies, and—as much as possible—the world around me. — T.B., NY

*There are quite a number of good arguments against the general use of the word entheogen. As mentioned above, the word is inherently theistic; it presumes the existence of God(s), and this doesn't fly so well with atheists or even agnostics. Another argument is that while the word means to "generate the God within," many people who do believe in God feel that they are continually connected to God; if God is already a part of them, in a literal sense, how can one "generate" something that is already there? (Some have interpreted entheogen to mean a substance that reveals the God that is already there, rather than creating/generating something new, although the Greek "delos" would more accurately convey "reveal.") And yes, we have actually seen the word entheodelic proposed (CALLAWAY 1995; WHITE 2000)!*

*Although entheogen was originally conceived of as a replacement for psychedelic (RUCK et al. 1979), it is clearly an ethnographic term suitable for specific uses only, and not a pharmacological term. Even so, it can be seen to fall short in those traditional psychoactive-plant-using societies who don't conceive of theos in the same manner that much of Western society does. (The "theos" contacted might be plant or animal spirits, or dead ancestors—more representative of individual "souls" than any specific over-arching "God" or "Gods.") As well, it has been pointed out that the same plants traditionally used in some cultural contexts as entheogens, have been used in other contexts to produce "bestial and belligerent behaviour," and the neologism therogen (based on the Greek ther, meaning "beast") has recently been proposed (THOMAS 1999). This term, or the alternates daimonica or demonogens (WHITE 1999), could perhaps be used to describe the use of psychoactive plants in demon/devil worship—an area where "entheogen" might be seen by some as inappropriate.*

*Nevertheless, there are numerous benefits to "entheogen," as a sort-of code word "replacement" for psychedelic. It doesn't have the '60s connotations. It is generally unknown (and frequently unpronounceable) by the mainstream. And when it is explained as being "a substance that generates the God within" to postal workers, printers, grandmothers, etc., their "Oh, how nice" response is something that might not be otherwise evoked from other descriptions of illicit drugs. As well, there are many people who do have religious/spiritual experiences while using these drugs (PAHNKE 1963; ROBERT & HRUBY 1995), and for these people entheogen is a totally reasonable term.*

*While some people are comfortable using entheogen and psychedelic interchangeably, others prefer one over the other. Still others—aware of the specific meanings and appropriate contexts of use—will use the term that fits best for the situation at hand. And then there are those, like T.B., NY, who don't particularly find either term suitable to describe their own use—on the one hand due to their lack of belief in God, and on the other hand due to the '60s associations.*

*There is, in my opinion, a simple solution: to refer to these plants and drugs as "visionary." (See also the discussion on page 74 of the AUTUMNAL EQUINOX 1998 issue of ER.) The term visionary speaks to a particular pharmacological action; that is, most of these drugs modify the vision (external and/or internal) of the person that ingested the drug. There may be particular effects on the way that external reality appears. There may be simple geometric closed-eye visuals, or intricate internal moving-picture views that one becomes immersed in.*

*Thought itself is frequently referred to in visual terms. Do you see what I mean? Great thinkers are referred to as visionaries. People speak of the "mind's eye." While "visionary" doesn't necessarily speak directly to some of the psychological processes that these drugs produce, sight and mind are so tightly knit that we feel this term will be acceptable to most who don't feel comfortable using entheogen or psychedelic. (Nevertheless, we are aware of the seeming impossibility of finding a term that will be "politically correct," experientially accurate, or agreed upon by all; please, no angry letters from any readers who might be blind... say, on second thought, I suspect we may avoid that problem anyhow...)*

*Perhaps those who find entheogen, psychedelic, and visionary to all be distasteful are stuck with the more general (if not generic) and quite neutral "psychoactive," which includes anything that affects the mind, from alcohol, to caffeine, to thiorazine, and LSD to boot. — DAVID*

## WOODROSE DOSE TOO HIGH!

I am writing to you this time because I have something to say of utmost importance. I read in the WINTER SOLSTICE 1999 issue of *The Entheogen Review* that a psychoactive dose of baby Hawaiian woodrose (*Argyreia nervosa*) was 18–22 seeds, which should be soaked overnight. However, I am completely baked from *two* seeds powdered in a coffee-bean grinder and soaked for about 5 minutes. I shudder to think what would happen if I had followed the suggestion in *ER*! Perhaps one important factor is the source. I purchase my baby Hawaiian woodrose seeds from KAVA KAUALI. Please publish this letter before somebody blows him- or herself away. Another key factor could be diet; 90–95% of my nutritional intake is in juices. It may be a week or two before I take any solids, and then it is only in a small amount. Thus, anyone whose body is impacted with the results of poor digestion may require higher doses to get the same effect. In *Pharmactheon*, JONATHAN OTT appears to be on my side with regard to reasonable dosage levels, but he suggested no more than 4–5. I suggest starting with *one*! PETER STAFFORD, in *Psychedelic Encyclopedia*, also suggests 2–3 for the first few trips. Finally, I would like to close by saying that doing Tai

Chi during the crisis periods of my trip (e.g. when my muscles were tight, head pulsing with blood, heard pounding as well) helped quite a bit—freeing blood to the legs and also taking the energy from the baby Hawaiian woodrose seeds and uniting it with Heaven and Earth. — T.B., NY

*This is a good point. It should be stressed that this was never intended to represent simply a psychoactive or effective dose but rather an amount deliberately ingested to approximate a strong dose of LSD. For a person wanting to reach levels achievable with the dosages common in commercial acid today, 18 seeds is definitely far too much. I should have remembered that all of the experiences referred to were in a day and age when several hundred (or more) micrograms was not an uncommon level for people to experience. Thanks for bringing this up so as not to catch someone by surprise.*  
— K. TROUT

## WHERE CAN I GET 4-ACETOXY-DIPT?

I'm interested in the availability of 4-acetoxy-DIPT, and hope you mention sources of such material in your next edition.  
— I.S., IL

*4-acetoxy-DIPT is sold from ESHU (<http://www.eshu.org>) for \$225.00 for 500 mg, or \$425.00 per gram. However, they are currently out-of-stock, and expect to be resupplied in October 2000. The similar chemical 4-OH-DIPT is listed at*

*\$325.00 per gram from WESTERN BIOSYNTHESIS (<http://www.westernbiosynthesis.com>), but we know nothing about this company. When one of our writers contacted them asking if this product was available, they responded saying, "We will have some in stock in about 2 weeks. However, due to the fact that we do not have a large scale production formula that works efficiently the actual amount that will be produced is indeterminate. Hence, due to the amount that has been prepurchased and paid for in advance we cannot tell in advance of the run if there will be enough to fill outstanding orders or any past those prepaid...this is a development stage product which may never go into full production." Perhaps ordering from ESHU is the better bet?* — DAVID

## SALVIA & SALT TALKS II

The Spring/Summer 2000 was a great issue and well worth the wait. Cover-to-cover it was a fine issue; a *world* standard. Thanks so much for answering my question on plant testing for alkaloids. It was a great answer and worth more than an entire subscription; I'm a *lifetime* subscriber if you like.

I caught the "Salvia in the News" story on-line (AOL), but wasn't able to copy it; glad you had the story. I'd like to suggest that the Salvia-interested community (users and retailers) strive to establish a U.S. Church for *Salvia divinorum*, with representatives from México as Church leaders; *before* the DEA goes to reschedule *Salvia divinorum*. The conferences are good, but an established Church with proper applications

### AYAHUASCA ANALOGUES AND PLANT-BASED TRYPTAMINES

*The Best of The Entheogen Review 1992-1999  
Second Edition*

*Edited by Jim DeKorne, David Aardvark & K. Trout*

## NOW AVAILABLE!

*"Ayahuasca Analogues and Plant-based Tryptamines is really great. Many questions I have had are being answered. It's such a little treasure. I have grown production botanicals a little myself, and not only is the shared research forum a total blessing and incredible time saver, but is relevant to chemical, biochemical, and botanical experiments I have run also."*  
— NICK SANDS, underground chemist and drug war prisoner.

*Ayahuasca Analogues and Plant-based Tryptamines* combines every entry from past issues of *ER* related to ayahuasca, ayahuasca analogues, and plant-based tryptamines. New editorial remarks provide fresh commentary and bring the text up-to-date. Chapters include: Ayahuasca and Its Analogues; Mushroom Ayahuasca; Phenethylamines and MAOI; Miscellaneous and MAOI; The *Passiflora* Genus; The *Phalaris* Genus; *Arundo donax*; *Desmanthus illinoensis*; *Mucuna pruriens*; *Phragmites australis*; *Psychotria viridis*; *Mimosa tenuiflora* (= *M. hostilis*); The *Acacia* Genus, DMT & 5-MeO-DMT; Pipes & Vaporizers; Book Reviews; Degree of Intensity Scale; a complete Bibliography, and a Botanical Index (238 pages).

\$23.00 (USA), \$26.00 (foreign), postpaid from:

The Entheogen Review, POB 19820, Sacramento, CA 95819, USA.

for tax-exempt status would be a base from which we could fight the potential scheduling. We might have a few years to buildup such a fund, if retailers go along.

Thanks also for answering my LSD dose/weight question. I've got some further comments. I took 1/4" paper and divided by 4 to make 1/16" squares (16 squares in 1/4"); they are very small and hard to cut with scissors. If current blotter weighs 5–6 mg for a 1/4" blotter size divided by 16, the blotter would weigh .375 mg or 375 micrograms (mics) and if the blotter *could* contain 100 mics of acid it would still be 3.75 times the weight of pure acid. Pure acid is the way to go, as you wrote a grain of salt averages 78.75 mcg (mics), I think that this is a manageable size for people to handle. A few grains could be placed on a piece of masking tape to handle/hold safely. Taking a look at an old *Lysergic World* #1 (50th Anniversary) they said 100 doses of blotter would weigh 1.4 grams. 1.4 divided by 100 equals 14 mg, about 3 times the weight of your estimate (5–6 mg).

Thanks for bringing up the discussion and your fine works. You are the tops. Take care. — ONEGREENDAY, MA

*As far as a church surrounding the use of Salvia divinorum there already is such an Internet-based organization (<http://www.xenopharmacophilia.com/ee/skamaria.html>). They do not appear to have incorporated, filed for religious tax exempt status, or done anything with regard to having some sort of official government approval. However, even if such action is taken, it wouldn't automatically protect the practitioners of this religion, should Salvia divinorum or salvinorin A become scheduled. In the past, attempts at arguing a religious defense to controlled substance offenses have been largely unsuccessful, and the fact that the RELIGIOUS FREEDOM RESTORATION ACT was struck down removed the strongest argument of recent times (BOIRE 1997). However, just this month the Guam Supreme Court dismissed Cannabis charges against a Rastafarian, based on religious grounds (GUAM V. GUERRERO, (September 8, 2000) 2000 Guam 26, No. CRA99-025). With Guam being an unincorporated territory of the USA, this case can now be cited in any religious defense made by entheogen users in the United States. Nevertheless, even people who should be protected for religious use (such as the founders of the PEYOTE FOUNDATION, who live in a state where such use is protected by law) are frequently hassled or imprisoned by misguided and illegal maneuvers doled out from overzealous and ignorant local law enforcement.*

*Your comment about the weight of blotter noted in Lysergic World inspired us to re-evaluate the figure we presented. 13 hits of street acid, from several difference sources and of different designs (yet all about 1/4" in size) weighed 78 mg on a scale that has a ±2 mg accuracy. This puts the average "per dose" weight between 5.85 mg and 6.15 mg per hit (slightly higher than our earlier comment). Of course, the*

*weight of blotter acid depends largely on the thickness of the paper that it is placed on and the size of the hit. We have no idea what sort of material was weighed by the folks who produced Lysergic World.*

*The person who weighed the salt for us in the first place, DANIEL SIEBERT, also had the following to say:*

After reading your notes in the Spring/Summer 2000 issue of *ER* about the weight of salt crystals, I decided to weigh another brand of salt. I used a type of sea salt from France. It is a bit coarser than the HAIN brand sea salt I weighed last time. I weighed 5 average size crystals and came up with an average weight of 700 mcg per crystal. Salt crystals are more or less cubiform, so one can assume that when the width of a crystal doubles, its mass would increase eight times (2 cubed = 8). If the width is tripled, the mass would increase by twenty-seven times (3 cubed = 27). I suspect that there is probably quite a lot of variation in the average crystal size of various brands of salt. Obviously, it would be reckless to estimate acid dosage by comparison to salt crystals.

*The main problem here is that I suspect street vendors are unlikely to switch to dealing in pure powder, due to the potential problems with overdose. — DAVID*

## 2C-T-7 OVERLOAD!

In the past I did 25 mg of 2C-T-7 orally (I measure out my doses by eye, so they aren't entirely accurate). This dose took about 2.5 hours to come on and resulted in a very pleasant psychedelic afternoon with friends. While the visuals were nice, I felt that I could have easily done 30 mg. I had very little problems functioning mentally during this trip, as my mind wasn't blown apart like with LSD.

When I was studying this substance, I noticed that most of the trip reports at <http://www.erowid.org> deal with oral dosages. Only one person reported snorting it. This person said that he snorted 15 mg, and had an "insanely visual trip." He said that the nose burn wasn't bad. The trip came on very quickly for him, but was a little overwhelming. Well, I decided to try this route, as it seemed to have definite advantages; a more intense trip from less material (and therefore less money), with a faster launch period. I thought that 15 mg would be a good amount as I believed that I could handle 30 mg orally (I was following the oral-4, insufflated-2, smoked-1 ratio that someone had mentioned in an Erowid archive).

So, around 1:30 am, alone in my house, I prepared to snort 2C-T-7. I had previously eyed out a 25 mg dose, so I took this and divided it into five piles. I then snorted three of the piles. The burn was *the* most intense pain I have ever experienced from snorting powders, and I have snorted some painful stuff, including 5-MeO-DMT, DPT, and crank. This stuff thoroughly burnt my nose and throat. The taste from the drip was absolutely awful—worse than any other powders!

Within five minutes of snorting, it came on hard and fast. I was getting visuals even as I frantically dripped water in my nose. Fifteen minutes later the nasty taste and the terrible burn surged through my head again as I *violently* puked through both my mouth and my *nose*.

Someone at the SHROOMERY (<http://shroomery.org>) said that high doses of 2C-T-7 resulted in a sensory overload; he/she was *absolutely* right! I was alternately hot and cold. I expected the mad visuals, but I did not expect the strong vibrations, which rattled up through my legs. While the visuals were better than many other psychedelics, I could not enjoy them. Every time I started to trip on them, my heart would start pounding really hard. In fact, my heart hurt all throughout the trip and was sore for 24 hours afterwards. I was seriously worried that I might have a heart attack and I believe that I would have one at higher doses. Another difference between this trip and my oral experience was the effects on my mind. My mind was totally dissolved at times and I experienced complex hallucinations. For example, I thought that I had jumped out of my window, then I told myself, "Wait! That's a hallucination; I'm standing outside the house." Then I thought, "Wait! That's a hallucination too; I'm looking out my window." Finally I realized that I was still in bed, and I frantically congratulated myself for not *really* jumping out my window. I experienced this strange "hallucination within hallucination" quite a bit throughout the trip. Even so, there were moments when I was totally lucid and could think clearly (this probably saved me from completely freaking out). These moments didn't last long, and my mind would soon dissolve again.

Besides the vibrations, mind dissolution, and heart pain, the other surprising aspect was the auditory hallucinations. My hearing was ten times more sensitive than usual. Activity outside the house sounded like it was right in the room with me. I kept turning down my music because it was overwhelmingly loud. The next day I turned on my stereo and tried to listen to music at the volume I had set during my trip; I could barely hear the music. I had turned it almost all the way

down!!! Music was also *very* distorted during my trip. Singers sounded very different and the tempo was a lot faster than normal. After groggily trying different types of music it was finally too much and I turned off my stereo. Yet even the quiet room was noisy! I began to hear a ringing in my ears that morphed into different music and voices.

Around 6:00 am I fell asleep. I woke up at 8:30 am and read the newspaper, still tripping, although less intensely. The combination of a front page story about methamphetamine, complete with a grim crew-cut-wearing cop holding bags of meth, and a picture of JOHN TRAVOLTA as an alien in *Battlefield Earth*, was too much; I went back to bed. My vision was still slightly affected around 4:30 pm, when I woke up again.

This experience happened in May. Since then I have tried the  $\pm 30$  mg oral dose. This dose was a bit more intense than the 25 mg oral dose, but still nowhere near the range of the insufflated 15 mg. The ratio I was following was incorrect in my case. I feel that my unscientific method of following hear-

say on the Internet and not using a scale resulted in me “getting my nose rubbed in my own stuff,” as LION said in the last *ER*. In summary, insufflated 2C-T-7 was a more powerful and wildly different experience than doing it orally. I will never snort 2C-T-7 again. The burn, nasty taste, and rough somatic effects, were too painful. If my account of the wild visuals sounds fun, don’t be fooled; it was really not worth it. I could easily see some kids mess around with this or get unwittingly dosed and, just like that, 2C-T-7 would be the new PCP. Stick to the enjoyable oral doses but be careful—I imagine that there is an oral dose that parallels the effects of 15 mg snorted. — HE WHO LIVES, KS

## SAN PEDRO FOR THE MASSES

I found a very cheap source for *Trichocereus pachanoi* cuttings. \$6.00 each for a 2" to 3" pot.

BOB SMOLEY’S GARDEN WORLD  
4038 Watters Lane, Gibsonia, PA 15044  
(724) 443-6770, (724) 449-6219 fax  
<http://www.bobsmoleys.com/index.html>

What a kick-ass price BOB! — PSILONAUT

*On visiting the web page mentioned, we see that—while this is indeed a good price—these plants are pretty small; only four to six inches tall. BOB SMOLEY also has limited quantities of larger, two-to-three column clumps 15–20 inches tall available for \$25.00 each. Also on the Internet, the CALIFORNIA CACTUS CENTER (<http://www.cactuscenter.com/cactuspage1.html>) has *Trichocereus pachanoi* for \$7.95 for a 6" pot size. The least expensive place that I have seen *T. pachanoi* is at TARGET, where a couple of 8–10" columns per pot, 2–2.5" in diameter, sell for \$6.95. HOME DEPOT frequently has good prices too; \$14.95 for an 8" pot with a column around 3" in diameter and about a foot tall.*

*Do note, however, that commercial cactus growers are likely to use systemic poisons, and hence these plants should be treated as stock only, with cuttings being grown for a few years prior to being consumed. This may be a good reason to pay a higher price from some of the specialty ethnobotanical companies, who specifically state that they grow-out their stock in organic conditions. Another possible reason to buy the higher-priced cuttings from specialty ethnobotanical companies is when they are known to have been directly imported from South America (such as is the case with HERBAL SHAMAN, for example). Since these plants are undoubtedly of different stock than the common clone that is in cultivation in the USA, they enable growers to breed their San Pedros. (Most stock sold in the USA is the same clone, and hence it won't produce viable seed when pollinated with itself.) — DAVID*

## SACRED SUCCULENTS

## SHAMANIC PLANT SEMINARS

13–19 JANUARY 2001

22–28 JANUARY

Two 7–day, intensive seminars at the portal to the Palenque Mayan ruins and México's mysterious tropical forests

You are invited to join us for an intensive week by the archaic Mayan ceremonial center of PALENQUE, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. This is an opportunity not to be missed! Seminars will feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be available for study. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of PALENQUE and environs by Mayan entheobotanist Rätsch, there will be opportunities to explore the exotic surroundings on your own. This will be our 12<sup>TH</sup> such event [formerly BOTANICAL PRESERVATION CORPS] and past seminars have assumed legendary proportions...

*Please join us!*

# EVENTS CALENDAR

## INSIGHT & OPENING NOVEMBER 4–10, 2000

A week-long seminar on the power of breath and meditation that integrates ancient spiritual practices with western psychology and modern consciousness research, through lecture and direct experience. Activities include Holotropic Breathwork, Buddhist meditations of the breath and heart, silence, sacred music, mandala drawing, and lectures. With instructors STAN GROF, JACK KORNFIELD, and WES NISKER. Held November 4–10, 2000 in Yucca Valley, California; tuition, room and board is \$985.00. For more information contact: EASTWEST TEACHINGS, 5935 Jordan Avenue, El Cerrito, CA 94530, (510) 232-3098, fax (510) 232-4090.

## SALVIA DIVINORUM SEMINAR DECEMBER 7–10, 2000

The BOTANICAL PRESERVATION CORPS presents the third annual *Salvia divinorum* seminar, "Ska Pastora, Leaves of the Shepherdess: *Salvia divinorum* and Salvinorin-A," held December 7–10, 2000 at BREITENBUSH HOT SPRINGS in Oregon. The emerging theme involves how we can incorporate this plant spirit into our lives as a tool for divination, understanding, healing and exploration. Presenters include BRET BLOSSER, KAT HARRISON, RALPH METZNER, ROB MONTGOMERY, JONATHAN OTT, DALE PENDELL, and DANIEL SIEBERT. \$360.00 tuition includes meals and lodging. To register, call (503) 854-3314.

## THE ALCHEMIND SOCIETY

POB 73481 (DEPT. ER)

Davis, CA 95617-3481

(888) 950-MIND

info@alchemind.org

http://www.alchemind.org

“THE ALCHEMIND SOCIETY is an international nonprofit association of people united in the principle that the freedom to control one’s own consciousness is the essential foundation of all other freedoms. We seek to foster cognitive liberty; the right of each individual to think independently, to use the full spectrum of his or her mind, and to engage in multiple modes of thought and alternative states of consciousness. At the collective level, we believe that some cultural crises are the result of truncated consciousness; crises that might be overcome by rethinking, and ultimately removing, some of the prohibitions that currently constrict creative and innovative thought. If you’ve experienced extraordinary states of mind that facilitated important philosophical, creative, spiritual, mystical, epistemological or productive insights, or that assisted physical or mental healing, please join us!”

The short translation: “We have a basic right to take drugs.” So far, drug use has been the primary “mode” of thinking that THE SOCIETY has focused its efforts on. As well, efforts have been made to deter those seeking to censor the freedom of speech related to drug use. Their web site boasts “The Center for Cognitive Liberty & Ethics,” which has a searchable drug law library and allows one to sign up for free occasional e-mailed announcements as news in this area breaks, as well as a smattering of links to other relevant web sites.

THE SOCIETY is directed by attorney RICHARD GLEN BOIRE, former editor of the no longer extant publication *The Entheogen Law Reporter (TELR)*, and has an impressive board of advisors, including JOHN PERRY BARLOW, RICK DOBLIN, ALEX GREY, LESTER GRINSPOON, RALPH METZNER, JONATHAN OTT, DALE PENDELL, DAVID PRESTI, ALEXANDER T. SHULGIN, MYRON STOLAROFF, and THOMAS SZASZ.

Calling itself “The International Association for Cognitive Liberty,” membership (\$40.00 and up) in THE ALCHEMIND SOCIETY gets one a subscription to their *Journal of Cognitive Liberties*, produced three times a year. This publication is a “sort of” replacement for *TELR*, although it tends towards more essay-length philosophical writings and less “nuts and bolts” information on the intersection of entheogens and the law. Subscription without membership is \$25.00 (USA), \$40.00 (foreign). “Virtual” copies of both issues that have been produced to date are also available at the web site listed at no charge.

jgauci@orbit.net.mt

http://www.cactus-heaven.com

Cactus plants offered include numerous *Ariocarpus* species, *Coryphantha macromeris* (4 cm/£3.00), *Lophophora diffusa* (4.0 cm/£7.00), *L. fricii* (3 cm/£6.50), *L. jourdaniana* (red flower/3 cm/£7.50), *L. jourdaniana* (red flower/2.5 cm/£5.50), *L. williamsii* (3 cm/£7.50), *L. ziegleri* (3 cm/£8.00), and others.

Cactus seeds offered include numerous *Ariocarpus* species, numerous *Coryphantha* species, *Lophophora diffusa* (packet £0.80; 100 £8.00), *L. diffusa v koehresii* (packet £1.20), *L. fricii* (packet £0.80; 100 £8.00), *Lophophora* sp. San Francisco, SLP (packet £1.00), *L. williamsii* (packet £0.80; 100 £8.00), *L. williamsii v caespitosa* (packet £0.90), *L. williamsii v texensis* (packet £0.90), *L. ziegleri* (packet £0.75), *Pachycereus pecten-arboriginum* (packet £0.35; 100 £1.15; 500 £4.00), *P. pringlei* (packet £0.30; 100 £1.00; 500 £3.25), and numerous *Trichocereus* species.

Plants sold must be accompanied by a CITES certificate. Most countries also require a phytosanitary certificate. The charge for both is £11.00 per order. Postage is at cost. Add 25% to your order; and excess will be refunded, credited, or additional plants will be sent (whichever you prefer). List alternate selections, as some plants are in short supply (or e-mail to make sure they have what you want first). The minimum order for seed only is £13.00, or £25.00 for plants. In the past their web page has said that orders solely for *Lophophora williamsii* would be declined. While the latest web

page doesn't say this, you should be hip to their attitude and mix things up a bit in your order.

### CELESTIAL AWARENESS

[awareness@witchy-woman.com](mailto:awareness@witchy-woman.com)

<http://www.witchy-woman.com/CA/ca.html>

A company selling a variety of GHB analogue products. They also have a 5X *Salvia divinorum* extract.

### CHEM.COM

<http://www.chem.com>

SYNCON's web page where you can search through catalogs and directories of suppliers, distributors, manufacturers, custom synthesis companies; a good resource for the home experimentalist.

### CHESHIRE DIVINORUM FARM

**POB 3571 (DEPT. ER)**

**Eugene, OR 97403**

**(877) 766-2605 ex. 910**

[chronic@bombdigitty.com](mailto:chronic@bombdigitty.com)

<http://hometown.aol.com/kittyandjonus/page3.html>

Sells *Salvia divinorum*: rooted cuttings for \$15.00, dried leaves for \$25.00 per 1/2 oz, \$40.00 per oz, and an "incense" of unknown strength for \$30.00 per gm. Also offers a booklet titled *Salvia Divinorum Made Simple* for \$5.00. I bought a copy of this booklet from the HUNGRY HEAD bookstore last time I was in Oregon, and was a bit disappointed to see that it is primarily just information that has been reworded from the FAQ available free on the Internet. Still, if you don't have web access, it is worth spending the \$5.00. And if you buy a cutting, you get the booklet free.

### DISINFORMATION

<http://www.disinfo.org>

This site has been around for years, but it was only after recently reading about the site's founder, RICHARD METZGER, that I remembered to check it out. Lots of occult, cyberpunk, and drugs, all mashed together. They actually have some stuff in their section on psychedelics that I haven't seen anywhere else. Original writings on the web? Yep, it can happen.

### DO IT NOW FOUNDATION

**Box 27568 (DEPT. ER)**

**Tempe, AZ 85285-7568**

**(602) 736-0599**

**(602) 736-0771**

<http://www.doitnow.org>

"DO IT NOW FOUNDATION's mission is simple: to create and disseminate accurate, creative, and realistic information on drugs, alcohol, sexuality, and other behavioral health topics. We particularly address those individuals and groups—especially disaffected and high-risk youth—often ignored or underserved by mainstream prevention programs and campaigns. To achieve this goal, we continually monitor substance use patterns and behavioral health trends so that our materials are both culturally relevant and personally meaningful to target populations and individual readers. In pursuing this mission, we don't condone or condemn the use of drugs, and we do our best to avoid moralizing about individual choices related to lifestyle issues—except when those choices impinge on the rights of others (*e.g.* DUI, chemical use during pregnancy, date rape, *etc.*) Neither do we attempt to promote a specific political or ideological agenda. Instead, we do our best to achieve the following objectives:

"1) Advance our understanding of the basic processes of human consciousness and the drive states and psychological needs that impel people to experiment with psychoactive substances; 2) Communicate those principles in as creative and empowering a manner as possible; 3) Monitor patterns of substance use and abuse to accurately reflect current trends on the street, in our schools, and in the workplace; 4) Track new developments in health and behavioral health research, and apply those perspectives to our evolving body of public health literature; 5) Update all publications on a continual basis—even monthly—to insure that our materials are as timely and newsworthy as possible; 6) Provide meaningful, credible information without charge to individuals and at the lowest possible cost to agencies and organizations; 7) Master and apply new technologies to the information acquisition, management, and development process."

Although certainly not a "pro-drug" organization, it is refreshing to see concern expressed in a reasonable, intelligent manner.

**DREAMINGOD****POB 11812 (DEPT. ER)****Eugene, OR 97440****dreamingod@mac.com****http://dreamingod.anthill.com**

Offers a standardized 5X *Salvia divinorum* extract: \$25.00 per gm, \$40.00 for two gm, postpaid in the USA and Canada.

**FANTASTIC ART****http://members.tripod.com/~fantasticart/index.html**

CHRISTIAN DE BOECK's amazing collection of art from numerous "visionary" artists. Some of these folks are quite clearly "experienced." A treat for the eyes; I can spend hours at a time surfing this site. Highly recommended.

**THE FORBIDDEN FRUIT****http://www.theforbiddenfruit.com**

A fairly new web site geared towards entheogens. They have an herb sales section, trader pages, photo and article archives, free member personal pages, and even a virtual version of the hard-to-find *Golden Guide to Hallucinogenic Plants* by R.E. SCHULTES.

**GALLERIO****POB 805 (DEPT. ER)****Scottsboro, AL 35768****(877) 580-2028****inquires@gallerio.com****http://www.gallerio.com**

A strange combination of sports supplements and head shop products. They sell the typical fare, pipes, papers, and such. Most of their consumable products fall into the "herbal ecstasy" category (with various spins), and are most likely a waste of money. They sell a couple of "GHB alternatives," and various smoking blends of questionable efficacy. They do offer dried *Salvia divinorum* leaves as well as a 5X extract. Their web page contains numerous horseshit sensationalistic statements about their products, but I laughed most at their comment regarding *S. divinorum* extract, where they stated: "NOT FOR HUMAN INGESTION!!!! EDUCATE YOURSELF BEFORE USING! This is the only legal hallucinogen left in the United States, Canada, and many other

Western countries." They go on to describe some effects, stating: "This high potency variant of the plant's smokable leaves will guarantee you a one way ticket to the *Twilight Zone*...Only 1 deep inhale is necessary to feel the onset of effects, and a just a few inhales can take you to the other side...Best effects achieved when smoking with a hand pipe or a water pipe."

It is always a bit amusing to see herb vendors who they say their products are not sold for consumption telling the potential buyer what might happen if a plant is consumed and advising them to use it "with caution and reverence." Add to that the patently incorrect information about *Salvia divinorum* being the only legal hallucinogen; what about *Acorus calamus*, *Amanita* mushrooms, *Datura*, *Brugmansia*, *Atropa belladonna* (or any of the other tropane-containing plants), *Brunfelsia* species, various legal active (and non-mescaline containing) cacti, *Bufo alvarius* venom (or any of numerous plants containing 5-MeO-DMT), *Voacanga africana*, and countless other visionary plants of obscure chemistry? Clearly GALLERIO needs to do a little research.

**GALLS, INC.****POB 54308 (DEPT. ER)****Lexington, KY 40555****(800) 477-7766****(800) 944-2557 FAX****help-desk@galls.com****http://www.galls.com**

GALLS calls themselves "The Authority in Public Safety Equipment and Apparel." They sell stuff that is geared towards the law enforcement, fire rescue, and emergency medical communities. Of great interest to anyone who purchases street drugs, GALLS sells NIK DRUG TEST KITS. These kits are obviously made for use by law enforcement agents "in the field," but I can think of much better uses.

The most expensive offering is the MASTER PAC DRUG KIT, which has tests to identify cocaine, marijuana, heroin and other common drugs, and will perform up to 130 tests. It includes a box of acid neutralizer, report pad, poly-testing instruction manual, full color identification manual, full color identification desk chart and audio cassette training tape. A polystyrene carrying case keeps the supplies together and protected. \$269.00.

A less expensive option is the NARCOTICS ID PORTA-PAC®, which has tests for opium, barbiturates, LSD, marijuana,

cocaine/crack, methadone, PCP, opiates, and brown heroin. Contains 24 tests, neutralizer, instructions, report pad, and IDENTIDRUG CHART. \$74.99.

The following refills are available, with ten tests per pack: Opium Alkaloids Drug Test Refill Pack for \$14.99; Barbiturates Drug Test Refill Pack for \$19.99; LSD Drug Test Refill Pack for \$23.99; Marijuana Drug Test Refill Pack for \$22.99; Acid Neutralizer Drug Test Refill Pack for \$8.99; Cocaine/Crack Drug Test Refill Pack for \$22.99; PCP Drug Test Refill Pack for \$22.99; Brown Heroin Drug Test Refill Pack for \$21.99; Opiates Drug Test Refill Pack for \$17.99; Methadone Drug Test Refill Pack for \$19.99.

A friend ordered some of these NIK LSD test kits a few years ago. He tested the kit out on a known sample. It did turn purple, indicating the presence of LSD. Curious as to how specific this particular test might be, I decided to see if it would test positive for LA-111 (ergine) as well. I ground up a pinch of morning glory seeds in a coffee bean grinder. I strained the grounds through a tea ball, to get a fine powder. I then placed a very small amount of this powder into the test kit, and followed the instructions. Sure enough, a purple haze wafted through my kit—signifying the presence of LSD. Obviously, this test isn't specific to LSD! Suspecting that a number of substances might give a "false" positive, I had another friend grind up a Hydergine® tablet (the ergoloid mesylates "smart drug" developed at SANDOZ by ALBERT HOFMANN), and test this. As I thought would be the case, the Hydergine® also gave a "false" positive.

All of the above isn't to suggest that these kits might not be useful. It is just that you should realize the obvious—that you don't get a high quality laboratory analysis for \$2.40. I spoke with SASHA SHULGIN about these type of test kits, and he commented that these kits are really only good for excluding a substance. That is, when the test comes up negative, you can be pretty sure that you don't have a sample of whatever it is that you are testing for. As far as proving that the substance tested is what you think it might be, the best that these type of tests can do is provide an indication of what the substance tested *might* be.

Nevertheless, this less-than-specific quality of these tests could be exploited in the field in some cases; a colleague recently wrote asking where to find these tests, as he wanted to check out the *Stipa robusta* he planned to harvest in the near future. This set me off to find a new source, as the company that used to carry these, DIB, no longer sells them. In

the past, DIB did have some additional tests (which they also don't carry anymore) that were geared towards MDMA, mescaline, psilocybin, DMT, and other interesting substances. Unfortunately, I didn't see these listed at the GALLS site.

#### THE HERBAL CANTERA

[travis@herbalcantara.net](mailto:travis@herbalcantara.net)

<http://www.herbalcantara.net/main.html>

A web-based head shop. Typical fare. They do sell a "5 Panel Test Kit," which they say "Accurately and easily tests for...THC, Opiates, Cocaine, PCP, Amphetamines," for \$28.00. (Although they don't specifically say, I expect that this is a urine screen and not something used on plants/powders.) They sell "Imported Hydroponic *Salvia divinorum*" at \$4.50 per gm, \$20.00 for 5 gm, \$35.00 for 10 gm, and \$85.00 an oz. Hmm... I wonder where this is "imported" from, and why on earth it would be grown hydroponically?

#### H & H BOTANICALS

POB 291 (DEPT. ER)

Bancroft, MI 48414

(517) 634-9016

(517) 288-2614 FAX

<http://www.tir.com/~hhbotan>

Numerous plants, including a few that will be of interest to the collector of entheobotanicals. Although most of their plants are quite reasonably priced in the \$4.00 to \$10.00 range, they clearly are aware that they can get more money for certain "specialty" plants, such as *Salvia divinorum* (which they sell for \$20.00 each). Their catalog is \$1.00.

[membership@noetic.org](mailto:membership@noetic.org)

<http://www.noetic.org>

"The INSTITUTE OF NOETIC SCIENCES (IONS), founded in 1973, is a research foundation, an educational institution and a membership organization with more than 50,000 members internationally. The noetic sciences comprise an interdisciplinary study of the mind, consciousness, and diverse ways of knowing, focused especially in the fields of science, mind-body health, psychology, the healing arts and sciences, the social sciences and spirituality.

"When you join the INSTITUTE OF NOETIC SCIENCES, you join an international network of people who are excited about the possibilities of being human—people who are devoted to creating a better world in their own individual ways. Our growing community is marked by commitment to the highest values, the willingness [to] face difficult truths, recognition of the power of spirit, and courage—the courage both to know and, as the poet RAINER MARIA RILKE wrote, to 'live the questions now.'"

Member receive: the quarterly *Noetic Sciences Review*; *Waking Up in Time* by PETER RUSSELL (USA only); Community Groups (network through 300 groups worldwide); Access to the Members' area on the web site.; The IONS Travel Program (travel the world with NOETIC SCIENCES); and Special Events (lectures and retreats).

Associate Membership is \$35.00 for one year or \$60.00 for two years (USA), or \$45.00 (one year, foreign). Check out their web page for more information.

#### IZMIR OIL & SPICE COMPANY

POB 4244 (DEPT. ER)

Quesnel

B.C., V2J 3J3

CANADA

(250) 249-5200 PHONE & FAX

[info@izmirpoppy.com](mailto:info@izmirpoppy.com)

<http://www.izmirpoppy.com>

Sells various *Papaver somniferum* (opium poppy) seeds (5 gm for \$27.00, postpaid), as well as dried pods, and poppy seed oil. The pods are sold by the case of 100, and they have 2 foot stems making them excellent for dried flower arrangements. These sell for \$139.00 plus \$18.50 S/H.

#### JIZZMO

POB 500 (DEPT ER)

Rainier, WA 98576

[jizzmo\\_2000@yahoo.com](mailto:jizzmo_2000@yahoo.com)

[jizzmo@safeshopper.com](mailto:jizzmo@safeshopper.com)

[jizzmo@oldmilltown.net](mailto:jizzmo@oldmilltown.net)

<http://jizzmo.safeshopper.com>

The JIZZMO is an herbal oil extraction device that uses butane as its solvent. This immediately caught my eye, as I recall reading on the web a while back that butane is an extremely selective solvent when used on *Cannabis*. A friend got one of these units, and she had the following to say about it:

"There are plans for making a butane extracting device available on the web ([http://www.erowid.org/plants/cannabis/cannabis\\_info13.shtml](http://www.erowid.org/plants/cannabis/cannabis_info13.shtml)). However, when I read these plans, I was concerned about two things: 1) They use PVC pipe, and I worried that this might interact with butane and produce nasty toxins, and 2) They comment on how the device described is essentially a giant leaking pipe bomb, and any spark could be quite hazardous. I recall thinking that this device would be better made with copper pipe (and I even bought some pipe, but never had time to tinker around with it).

"Thankfully, I won't have to tinker, as the Jizzmo unit not only uses copper pipe, but it has also solved the "leaking

bomb” aspect of the web-plans. Their tool is really simple to use, and takes less than 15 minutes from start to finish to produce a beautiful “honey oil.” Actually, that term is a bit deceptive, as the product that is produced is so clean and free of chlorophylls, that it was more like a beige taffy. Basically, you load the unit up with 1/2 oz of *Cannabis*, bolt it tightly shut, and release butane into the chamber. You stick the whole unit into a bowl of warm water for about 3 minutes, then pull it out and discharge it into a glass baking dish. (Be careful about splatters.) I was amazed to see the first bit of extract came out *white* in color. Repeat this whole process three or four times, until there is no more color to the liquid butane that is coming out of the unit, and then allow the butane to evaporate. Of course, care must be taken to not have *any* source of flame or spark nearby while doing this. One \$3.00 can of butane seems to be good for three total processes (of 3–4 repeated extractions per process), so the solvent cost per 1/2 oz extracted is only about a buck. The yield was just under 10% (14 gm of plant material gave just shy of 1.4 gm of oil). The oil produced (after the “taffy” had been dissolved in some high-proof ethanol in order to clean the glass baking dish out) was one of the most fucking amazing things I have seen. Clean, amber, and with a beautiful aroma. If one could collect only the resin glands and nothing else, this is what it would look like. No doubt this oil is the most healthful way to consume *Cannabis*, and it can easily be vaporized in a glass jar. (Remember to use only one-tenth by weight the amount that you would normally smoke!) This unit is so easy to use that even if one is totally ignorant of the subject of chemistry, it doesn't matter at all. A past extraction attempt with naphtha left a nasty smell on the oil, despite how much it was washed in alcohol, and I ended up having to chuck the product. This left me feeling as though *Cannabis* extraction (other than with ethanol) isn't worth it. I've changed my mind; believe me, butane is the way to go!

“Sometimes, when the unit was in the water, after the first minute or so, it started kicking out bubbles. I have been told by the unit's inventor that this is due to the valve, and that it will eventually seat. In one case, it was clearly because of some plant material obstructing the seal. (One of the rubber “O” rings came loose on my unit; if this happens, while the best thing to do is remove it completely, sand the copper clean, and reattach it with Superglue®, it is still possible to use it if care is taken to make sure that no plant material gets between the copper and the ring.)

“The unit could be improved. If the triangular pieces were slightly larger, there might be less of a chance of the seal hitting one of the edges of the plate (and hence leaking slightly). Of course, if one is careful to make sure that the chamber is centered exactly, this isn't a problem. But I think that it would be easier to use if the plates were about 1/4 inch bigger all the way around. Or, perhaps a divot could be machined into the plates where the sleeve fit into? This might also help eliminate leaking problems, since there would be some overlap where the copper wrapped around the O-ring.

“Packing 14 gm of *Cannabis* into the unit was difficult, but possible. I also tried the unit out on a couple of other plants, *Psychotria viridis* and *Mimosa tenuiflora*. In the case of *P. viridis* it wasn't possible to get all of the herb into the chamber, and only about 12 grams probably ended up getting in. It is worth noting that the unit produced nothing of use on these two plants. While butane is clearly an excellent solvent for *Cannabis*, it doesn't appear to be any good for DMT.”

For \$225.00 plus \$11.50 S/H., it sounds as though this unit works like a dream. I see on their web page that they offer longer sleeves, for people who want to extract a larger amount at one time. (However, a vacuum source must be used with these.) They also have “additional sleeves” for \$25.00 each, which can be loaded-up in advance, and make the process go faster. I tried the oil that my friend made, and I couldn't believe what incredible quality it was. For people concerned about the potentially detrimental effects on their health from smoking, this machine is a must have.

#### JUST SAY KNOW

<http://www.sirius.com/~hr4u>

4 U PRODUCTIONS was one of the earlier groups geared towards “harm reduction” related to “club drugs.” They created a line of flyers covering methamphetamine, ketamine, MDMA, and GHB. These info-sheets (which can be viewed at their web site) provide balanced, factual information related to the effects and risks. They remind me a bit of some highly criticized drug pamphlets that I saw in the '80s produced by U.C. SANTA CRUZ. It is nice to see some folks making the effort to provide truthful, helpful information.

**MENEHUE GARDENS****POB 1230 (DEPT. ER)****Haleiwa, HI 96712****sales@menehunegardens.com****http://menehunegardens.com**

MENEHUE GARDENS sells Hawaiian-grown “grade A” whole dried *Salvia divinorum* leaves from the “BLOSSER/palatable” clone. \$30.00 per 1/4 oz, \$45.00 per 1/2 oz, and \$80.00 per oz, postpaid. Although a bit pricey, I feel that growers in the USA need to be supported to thwart potential overharvesting and commercialization of a native sacrament in México. MENEHUE GARDENS is also one of the few places where one can purchase *S. divinorum* seeds (produced on-site where they grow the plants). They sell five seeds for \$48.00 postpaid. I see on their web site that these seeds come with an unauthorized photocopy of my article on growing *S. divinorum* from seed that appeared in the AUTUMNAL EQUINOX 1999 issue of *ER*.

**MKZDK 2000****http://www.mkzdk.org**

Various kick-ass, subtle psychedelic visions. Think M.C. ESCHER dabbling with fractals and drugs.

**NATURE'S CONTROL****POB 35 (DEPT. ER)****Medford, OR 97501****(541) 245-6033****(800) 698-6250 TOLL FREE FAX**

For gardeners who don't wish to use toxic pesticides, these folks provide predatory insects to help control aphids, caterpillars, cutworms, fleas, fungus gnats, house flies, mealybugs, scale, spider mites, thrips, and whiteflies. They also sell products that are not predatory insects to control ants, Japanese beetles, slugs/snails, and whiteflies. I have ordered from NATURE'S CONTROL, and found their service very rapid and their products to be excellent. (In the past when I have ordered, they have even strangely-yet-wonderfully included some Tootsie Rolls® with my orders.)

**NEW FALCON PUBLICATIONS****1739 East Broadway Road #1, PMB 277 (DEPT. ER)****Tempe, AZ 85282****(602) 708-1409****(602) 708-1410 FAX****info@newfalcon.com****http://www.newfalcon.com**

Publishers of many books by DAVID JAY BROWN, ALEISTER CROWLEY, Dr. CHRISTOPHER S. HYATT, Dr. TIMOTHY LEARY, Dr. ISRAEL REGARDIE, ROBERT ANTON WILSON, and many others in a similar vein of magic, psychology, and drugs. Check out their good selection of titles at their web page, or call and request a free copy of their print catalog.

**NG EUROTRADE s.r.o****Ufon@NGEurotrade.com****http://www.NGEUROTRADE.com**

A web-based store selling *Psilocybe cubensis* mushrooms (with plans to expand into other related areas). Formerly there was also a NG EUROTRADE shop operating out of Prague, but it has apparently temporarily shut down. However their shop in Switzerland continues to ship mushrooms. All orders have to be made via e-mail.

They sell 10–49 gm for \$4.50 per gm, 50–99 gm for \$4.00 per gm, 100–249 gm for \$3.00 per gm, 250–499 gm for \$2.50 per gm, 500–999 gm for \$2.00 per gm, and from 1 kg for \$1.80 per gm. Special pricing for larger orders is possible.

**PACHAMAMA ALLIANCE****Presidio Building 1007, STE. 215****POB 29292 (DEPT. ER)****San Francisco, CA 94129-9191****(415) 561-4522****(415) 561-4521 FAX****info@pachamama.org****http://www.pachamama.org**

A non-profit organization set up “to halt the destruction of the Earth's rainforests and the loss of its indigenous cultures and wisdom, and to discover workable ways in which the knowledge and wisdom inherent in both traditional cultures and the modern world can blend into a new global vision of sustainability for us all.” More information is available at their web site. They have organized journeys that take place where one can spend five days/four nights at Kapawi Lodge, hik-

ing and canoeing in the rainforest, meeting with Achuar leaders to learn of their goals and plans for the future, visiting three or more shamans to partake in healings and cleansings, stay in an historic colonial hacienda with optional horseback riding in the Andes, and take a visit to Otavalo and its renowned outdoor market. Trips in 2000 cost \$2,575.00. For more information on these trips contact PACHAMAMA TRAVELS c/o PAT JACKSON, 2021 Olive Street (DEPT. ER), St. Helena, CA 94574, (707) 963-1322, patjacks1@aol.com.

**PLANT IT HERBS**  
**POB 851 (DEPT. ER)**  
**Athens, OH 45701**  
**plantit@frognet.net**  
**<http://www.plantitherbs.com>**

A mail-order nursery that specializes in Chinese plants. They have a few plants of interest, including *Banisteriopsis caapi*, *Datura stramonium*, *Rivea corymbosa*, and *Salvia divinorum*. Their catalog is \$2.00.

**PSILOCYBE NET**  
**<http://www.psilocybe.net/en>**

A web-based business in Switzerland selling dried *Copelandia cyanescens*, *Psilocybe cubensis*, and *P. tampanensis*. They also sell a complete “grow box” kit for mushrooms, and *Salvia divinorum* dried leaves and extracts. They deliver only in Switzerland.

**SALVIA SOURCE**  
**c/o JON BLISSENBACH**  
**324 7th Avenue S.APT. 202 (DEPT. ER)**  
**St. Cloud, MN 56301**  
**(520) 447-5659 FAX**  
**webmaster@salviasource.com**  
**<http://www.salviasource.com>**

As one might expect, these folks sell *Salvia divinorum*. Dried leaves from Oaxaca are \$15.00 for 7 gm, \$25.00 for 14 gm, \$40.00 per oz, and \$70.00 for 2 oz. They also sell a non-standardized 5X extract for \$15.00 per gm or \$26.00 for 2 gm. And they have a small number of herbal “*Cannabis* substitutes,” although strangely they state that none of their products are sold for consumption. (So what, are we supposed to make rope out of these?)

**SANTO DAIME**  
**<http://www.santodaime.org>**

A web page where you can learn more about the history and communities related to the *Santo Daime* ayahuasca religion.

**SHROOM WIZARD**  
**mshroomer@yahoo.com**  
**<http://shroomwizard.4mg.com>**

They offer sporeprints of the Gulf Coast strain of *Psilocybe cubensis*. All are less than one week old and mailed on presterilized 3" X 5" index cards in a plain white envelope. \$15.00 each or two for \$25.00. They also have 10 cc syringes filled with millions of active *P. cubensis* spores suspended in sterilized distilled water. These syringes are sent by Priority Mail (2 to 3 day delivery) and each syringe is enough to easily inoculate one dozen substrate jars. The cost is \$15.00 per syringe or two for \$25.00. And, they have substrate in prefilled and sterilized 1/2 pint and 1 pint wide mouth canning jars ready for spore inoculation. They include organic brown rice flour, organic dextrose, vermiculite and distilled water pre-measured, pressure cooked and guaranteed sterile. The 1/2 pint jars are mailed in cases of six for \$25.00 or cases of twelve for \$40.00 and the one pint jars are mailed in cases of six for \$30.00 or cases of twelve for \$50.00. One sporeprint or spore syringe will easily contain enough spores to inoculate all twelve jars. Finally, if you already have your own empty canning jars, you can order pre-measured and pre-mixed plastic bags of vermiculite, organic brown rice flour, and organic dextrose—just add water, stir, put into your empty canning jars and pressure cook (or boil). Each bag contains enough substrate material to fill one dozen 1/2 pint jars for \$25.00 or enough for one dozen 1 pint jars for \$35.00. They also sell pressure cookers; contact them for a price. And, they offer a print version of their *Shroom Wizard's Grow Guide* for \$10.00 each. (With a sporeprint, spore syringe or 6 substrate jar order they are only \$5.00 each and with an order for 12 substrate jars they are included free of charge.) These prices include all S/H charges to anywhere in the United States. All other countries please add \$10.00 to cover the extra shipping costs. Payments are to be made with USA money order, cashier's check or cash (no personal checks). All orders are sent without anything written on the outside of the packages that would give away its possible contents. Privacy is guaranteed; no orders from CA for spores or spore syringes will be filled.

Their web site also offers a grow guide, a FAQ, a picture gallery, information on laws, spirituality, a guest book, and links.

### **SJAMAAN SMART SHOP**

[info@sjamaan.com](mailto:info@sjamaan.com)

<http://www.de-sjamaan.nl/english>

A web-based head shop in the Netherlands. They have physical store locations there too. They sell various herbs of interest, books, a number of psilocybian mushrooms including *Psilocybe cubensis*, *P. tampanensis*, *P. copelandia*, *P. semilanceata*, and *P. azurescens*, cacti including *Lophophora williamsii* that are between 1 and 10 years old, *Pachycereus pecten-aboriginum*, *Trichocereus bridgesii*, *T. pachanoi*, *T. peruvianus*, and seeds for these cacti as well as *Carnegiea gigantea*, *L. diffusa*, *T. macrogonus*, *T. camarguensis*. They also have *Argyrea nervosa* and *Ipomea violacea* seeds, and various herbal ecstasy-type products, and "brain-boosting" nutrient formulas. They used to sell 2C-T-2 and MTA, but apparently these are now illegal in the Netherlands, along with 2C-B.

### **SPIRITPLANTS.COM**

<http://www.spiritplants.yack.org>

A number of forums dedicated to various topics related to psychedelics. A few articles are posted here, but unfortunately some of them are not too accurate. There is also a smattering of links.

### **SPIRIT QUEST / EL TIGRE JOURNEYS**

Attn. RETA LAWLER

POB 1704 (DEPT. ER)

Boulder, CO 80306-1704

(303) 442-8090

[eltigrejourneys@bigfoot.com](mailto:eltigrejourneys@bigfoot.com)

<http://www.biopark.org/sprtu3.html>

Ayahuasca tourism that seems fairly concerned about the area and people that they visit. Cost in 2000 ranges from around \$1,550.00 to \$1,750.00, and includes 10 nights of double-occupancy lodging, transportation (land and water), all meals outside Iquitos, indigenous jungle guides, Spanish-English translation, transcultural facilitation, academically-trained ethnobiologists, shamanic tuition and instruction, three ayahuasca cleansing and healing ceremonies, personal shamanic diagnosis and consultation, medicinal flower and clay baths, plant-derived paints and parchments, day trip fees

and admissions, daily river and rainforest explorations, and friendship and instructional visits with indigenous Bora, Yahua, Cocama, and Huitoto people. Airfare is not included in the price. Check out the web page for more information.

### **SUNNY'S SEEDBANK SHORTCUTS**

<http://users.lycaeum.org/~sunny/seedbanks.html>

Provides current information on numerous vendors of *Cannabis* seeds, telling which ones ship worldwide, which ones have shipping restrictions, which are the most reliable, and which are rip-offs. Looks like a good resource.

### **TASTE:**

**The Archives of Scientists' Transcendental Experiences**

[editor@issc-taste.org](mailto:editor@issc-taste.org)

<http://issc-taste.org/index.shtml>

"TASTE is an online journal devoted to transcendent experiences that scientists have reported. It lets scientists express these experiences in a psychologically (and professionally) safe space."

Edited by Dr. CHARLES TART, this is an excellent idea and an interesting web-based publication. Both current issues and the collected archives are available on-line to read through. Links to various consciousness-related web pages are also provided.

### **WESTERN BIOSYNTHESIS**

(702) 656-2597

(702) 860-7019

[maineac@lvcm.com](mailto:maineac@lvcm.com)

<http://www.westernbiosynthesis.com>

Another new company selling research chemicals. They have: "Indole 100 gm \$85.00; Indole-3-Carboxaldehyde 5 gm \$25.00, 25 gm \$100.00; 4-Hydroxyindole 1 gm \$95.00, 5 gm \$400.00; 5-Methoxyindole 1 gm \$22.00, 5 gm \$78.00; 5-Methoxyindole-3-Carboxaldehyde 1 gm \$75.00, 5 gm \$300.00; Indole-3-acetic acid (amounts/prices?); 1-(3-Indolyl)-2-Nitroprop-1-ene 1 gm \$35.00, 5 gm \$125.00; Diisopropyltryptamine HCl (DIPT) \$125.00 Per gm, \$115.00 per gm for 5 gm, \$100.00 per gm for 10 gm, \$90.00 per gm for 25 gm; Dipropyltryptamine HCl (DPT) \$125.00 per gm, \$115.00 per gm for 5 gm, \$100.00 per gm for 10 gm; *N,N*-5-

Methoxydimethyltryptamine (5-MeO-DMT, free-base oil) \$245.00 per gm, \$225.00 per gm for 5 gm, \$200.00 per gm for 10 gm, \$175.00 per gm for 25 gm; *N,N* 5-Methoxy-diisopropyltryptamine HCL; (5-MeO-DIPT) \$245.00 per gm, \$225.00 per gm for 5 gm, \$200.00 per gm for 10 gm, \$175.00 per gm for 25 gm; alpha-Methyltryptamine (IT-290) \$125.00 per gm, 10 or more gm \$100.00 per gm, \$85.00 per gm for 25 gm; 5-Methoxy alpha-Methyltryptamine HCL \$325.00 per gm, \$300.00 per gm for 5 gm, \$250.00 per gm 10 gm or more; 4-OH-Diisopropyltryptamine HCL \$325.00 per gm, \$300.00 per gm for 5 gm, \$250.00 per gram 10 gm; 2,5 Dimethoxy-4-(n)-propylthiophenylethylamine HCL (2C-T-7) \$400.00 per gm.”

I don't know anyone who has ordered from this company. A few of the precursor chemicals they sell make me a bit leery, and fact that they mispunctuate the names of their chemicals causes me to feel some caution may be warranted...

## NOTICE

RARE HERB appears to be out-of-business.

*Entheos* magazine is no longer being produced.

### NOTE ON KARL KNIZE, CACTUS DEALER:

I have never listed KARL KNIZE in my *Psychedelic Resource List*, nor in the “Sources” column for *ER*, as he is primarily a wholesaler of cacti and seeds. However, due to his association with the “KK242 *Trichocereus peruvianus*,” from which mescaline was isolated, there are quite a number of cacti aficionados who have located his mail-order business and placed orders with him. And, due to this I have heard a number of complaints about his business dealings over the years. Indeed, I personally placed an order for some seeds from him, and was dismayed that it took about eight months to receive them. A retailer that I know was shorted on his orders from KNIZE so many times that he considered bringing suit against him (difficult to do, since KNIZE operates out of Peru). As well, KNIZE has stated that there are “3–5 forms of *T. peruvianus*,” (see the VERNAL EQUINOX 1998 issue of *ER* pages 18–19), which may go some distance towards explaining why some people report these cacti as being psychoactive, and others have no effects from them. K. TROUT asked me to relate the following story here of his own dealings with KNIZE, as words of caution to anyone that might be considering placing an order from him:

“In response to a Fall 1999 KARL KNIZE price list of *Trichocereus* cuttings, an order of around a dozen small cuttings totalling \$100.00 was placed. I sent a check for \$150.00, since his literature stated checks on U.S. banks were acceptable. About 4 months later an almost incomprehensible letter arrived. One of the things it said was, “We see the cost of your check but much better is WESTERN UNION.” He also informed me that a Phytosanitary certificate (\$100.00) was required for him to ship and he suggested several more rare cacti. After further fax correspondence he requested I pay an exact amount (I sent extra in hopes of obtaining short-spined forms of *T. peruvianus* that might not be not listed due to limited numbers).

“I then got my bank statement and discovered that my check had cleared the bank.

“His next fax stated that he did not sell single items, but required a minimum of two each, and he gave me price quotes for 10 and 100 items each. I asked what was actually required to obtain my order, explaining my needs were for taxonomic study of KNIZE-named/numbered cacti. His total for my “new” order was \$564.00 *more* than the \$150.00 I had already paid! (The order had now jumped to 50 cuttings; 26 offerings each being 1–4 cuttings or seedlings of each item, with “4 free.”) The balance was sent as cash via WESTERN UNION.

“From this point onward, KNIZE stopped responding to my faxes and I learned 7–12 months is his normal shipping time. A few months later (in early August 2000) a friend was visiting growers in the Valley and quite accidentally discovered KNIZE had sent my order to QUALITY CACTUS/SELECT SEED (QC/SS)! The owner of this business said the material arrived two months earlier, but that he had no plans to send them since KNIZE had billed him both for the shipping and CITES paperwork for my order. (I had already paid KNIZE \$150.00 and \$100.00 for these, respectively). KNIZE had apparently told him to send them to me in exchange. I should stress that the owner of QC/SS and I do not know each other, nor was he given my address! KNIZE never notified me of any of this.

“After we spoke, he sent my KNIZE shipment (one medium-size box weighing 15 pounds), which not only did not include even a single item I ordered, but was heavily diseased and mostly worthless little globulars and a few small cuttings of *T. chilensis*. The owner of QC/SS did kindly include a free sample of the short spined “*Trichocereus peruvianus*” he said KNIZE had been selling him hundreds of. He said he sent what KNIZE said was mine; I have no reason to disbelieve him.

"A couple weeks later KNIZE faxed a response, assuring me the wrong box was sent by mistake and correct order was on the way. He incredibly insisted that my plants again had to go to QC/SS. As of mid-September, no one at there knew anything. On 25 September a new fax from KNIZE stated my complete order would be shipped direct in 2 weeks. I am waiting to see. Interestingly, the original order included a handful of *different* KK242s! This suggests that designations of "KK242" require additional information to know *which* KK242 it is." — K. TROUT

# **SALVIA DIVINORUM EXTRACTS**

**We specialize in offering  
the highest quality extracts  
of *Salvia divinorum* available  
on the market today.**

Our extracts are standardized and made using pure salvinorin A. We have several extracts available, like our popular 5X Extract, which contains 12.5 mg of salvinorin A per gram. The cost of the 5X is \$20.00/gm or \$50.00/3 gm.

All of our products are unconditionally guaranteed and free samples are available upon request. Write for our catalog, which lists all our *Salvia divinorum* extracts, and contains a lot of useful information on this unique plant. We are celebrating our third year in business, and wish to thank our many loyal customers for their continued support.

No personal checks accepted. Payment in cash or postal money order only. If paying by postal money order, leave the "Pay To" space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24-hours. All prices are postpaid in the USA; foreign orders inquire for shipping costs. Inquire for wholesale pricing.

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

# REFLECTING...

by DAVID AARDVARK

This year of producing *ER* and working on various other projects has kept me overly busy. I was, therefore, quite happy to recently get a chance to relax and reflect a bit, attending the December 15th COUNTDOWN TO 2012, celebrating the life and logos of TERENCE McKENNA.

On our way to the event, packed like sardines into a minivan, we pulled over a few blocks away from the 7TH NOTE SHOWCLUB, so that all who chose to do so would get a last-minute shot at finishing off the psilocybian tea that had been brewed. I took a pass, having to get up early the next morning. Of course there was no parking near the event, so after circling around a bit, we were dropped off and found a long line in front of the building. Thankfully, it turned out that the line was just for people who *hadn't* bought tickets in advance (although it was clear that many ticket-holders weren't made aware of this, as they waited needlessly for the line to inch forward). Nevertheless, it was a time to find and converse with old friends and make new ones.

The event kicked off with some touching remembrances of TERENCE, followed by live acoustic guitar music. Aside from a few Oming sessions that bordered on schmaltzy, (I could hear TERENCE'S "PAUL LYNDE-esque" cadence in my head griping, "Cut out this new-age crap and let's get to the *good* stuff"), the evening was quite enjoyable. What looked to be about 450 to 500 people gathered in a building that could be best-described as a two-level Mexican restaurant taken over by DEADHEADS. (Indeed, PHIL LESH was even on hand as a guest performer, joining the band LOST AT LAST, who provided the evening's entertainment.) Although the band was great (a sort of world/trance thing—definitely good for dancing in an altered state of mind), the most enjoyable part of the evening for myself was the multi-media presentation by TERENCE'S artist friends MARTINA HOFFMANN and ROBERT VENOSA. Projected slides and art images hit screens and walls alike. Later, computer animation was incorporated into the visual cacophony leading one friend to comment, "That looks just like a DMT trip." It did.

The temperature in the venue was hot, due to crowded dancing. Although I was neither inebriated nor dancing, I could

still *feel* why heat-stroke is a problem at events. Alas, the venue was not enlightened enough to provide free water (a common problem at raves and clubs), charging \$3.00 per bottle. Such a policy is greedy and outrageous, and I was surprised to encounter it at this event in particular. It exemplified the need for harm-reduction organizations such as DANCESAFE, as well as political lobbying to make it illegal to refuse requests for free water, since overheating is perhaps the most common cause of death at such events. Of course anyone who wanted to could go outside for air, so overheating wasn't as bad as it could have been. As well, a room downstairs, where DJed techno music was playing, was also much less crowded and provided some respite from the heat.

As is always the case for myself at such parties, the most fun is in getting to hang out and converse with the attendees. As everything wrapped up, and we made our way to the designated vehicle, we realized that we were missing our friend FREEBLOOD, who *may* have been high on mushroom tea. It turned out that he had met a like-minded girl, and would find his own way home. Perhaps an hour after getting back, when I decided that it was time for me to leave, I walked a friend out to her car. Just at that moment, a limousine pulled up, and I joked, "Say, I guess FREEBLOOD found a ride home." I was laughing a few minutes later, when FREEBLOOD actually spilled out of the passenger side of the car, and asked for help coaxing his freaked-out new girlfriend out of the vehicle. The driver, clearly a bit ticked off, grumbled something about, "Being high is one thing, but you're high all the way to Humboldt! This is too much. I want her *out* of the car!"

As they stumbled back to the house, it became clear that the lights were on, but no one was home in our new friend's head. She made a remark about how the UFOs had arrived, and then turned to me and exclaimed, with a look of divine realization, "You're DAVE. I know you! You're my dad!" I told her that she was mistaken, wished her well, and started my trek homeward, thinking that perhaps just *maybe* I had left right when the evening was about to get really interesting. Suffice it to say, portion control is advised when mushroom tea is being passed around; on this particular occasion, I'm glad that I took a pass. — DAVID AARDVARK

# DAN MERKUR SPEAKS...

Interviewed by THOMAS LYTTLE

Dan Merkur is a research reader at the Center for the Study of Religion at the University of Toronto. He is the author of *Gnosis: An Esoteric Tradition of Mystical Vision and Unions*, *Becoming Half-Hidden: Shamanism and Initiation Among the Inuit*, *Powers Which We Do Not Know: The Gods and Spirits of the Inuit*, *The Ecstatic Imagination: Psychedelic Experiences and the Psychoanalysis of Self-Actualization*, and *The Mystery of Manna*. His latest book, *The Psychedelic Sacrament: Manna, Meditation, and Mystical Experience*, is forthcoming in August 2001 from Park Street Press.

*The Ecstatic Imagination* analyzes the psychedelic experience itself, using classic Freudian themes. What is the imagination, how does it work, and what have others said about ecstatic states and the "imaginal?" Freud's views on altered states were sketchy, and most of his work in this area focused on dream interpretation. What if Freud had taken LSD? Dr. Merkur details the literature on psychedelic therapy and compares the Freudian therapeutic viewpoints to the theories of Stanislav Grof and others. He also compares the shamanic vision quest by way of psychedelic and Freudian models. Published in 1998 by State University of NY Press (State Univ. Plaza, Albany, NY 12246) the 226 page book is \$19.95 (paperback) or \$75.00 (hardcover).

*The Mystery of Manna* claims that manna—that miraculous food God gave to the wandering Israelites in the desert—was ergot. And that this ergot-manna caused religious visions. Merkur also claims that ergot has been used in initiations by secret societies—especially Jewish and Christian secret societies—for centuries. *The Mystery of Manna* ranks up there with Wasson, Ruck, and Hofmann's *The Road to Eleusis*, so far as an initiated history of ergot. Published in 1999 by Park Street Press (One Park Street, Rochester, VT 05767), the 186 page paperback is \$16.95.

THOMAS LYTTLE: It is my pleasure to sit with you, DAN. Please tell me a little about your childhood, your academic pursuits and your publishing.

DAN MERKUR: I'm from an upper-middle class, mostly non-observant Jewish family in Toronto. Because it was the only Jewish day school around, I received a primary and middle-school education at an Orthodox Jewish School.

TL: So religion was central to your upbringing?

DM: The discrepancy between my family and my school left me agnostic. Until one Spring day when I was twelve years old. I had a sudden "conversion experience" and became a convinced atheist. I became a scientific-minded materialist until I was twenty years old. Then I discovered LSD, mysticism, God, the *Bible*, MARTIN BUBER, Hasidism and TIMOTHY LEARY, roughly in that order.

TL: LSD woke you up, eh?

DM: My spiritual awakening was extremely difficult. In retrospect, I'd use Dr. STAN GROF's term and classify it as a "spiritual emergency." Lots of neurotic acting-out. When I calmed down I started to study. Up until then I'd wanted to be a novelist and a screen-writer.

TL: Dr. STAN GROF originally wanted to be a cartoonist...

DM: So I imagined I'd write a book about psychedelics and the history of Judaism, and then get back to writing fiction. Writing the non-fiction book took me twenty-six years. Along the way I spent nine years as a university drop-out, teaching myself the general history of religions. Then I went back to school to finish my B.A. before taking my graduate degrees. I earned my Ph.D. in the history of religions from STOCKHOLM UNIVERSITY, Sweden, in 1985. I've since taught at five universities.

TL: The history of religions is a broad and complicated subject. Getting back to your "spiritual emergency" ...

DM: Until 1995, most of my research was concerned with the question: what are religious experiences—descriptively, historically and in psychoanalytic theory? In the last five years I've added the question: what are the consequences of religious experience for the personality?

Can personalities be changed positively, through religious experience? How can I learn to do so? These questions of mine address religious experiences worldwide.

TL: You became interested in psychedelics and their role in religious history?

DM: A conference on psychedelic sacraments I attended in 1996 motivated me to try, once again, to publish a book I'd written in 1985 on the psychedelic experience. SUNY PRESS took an interest and published *The Ecstatic Imagination: Psychedelic Experiences and the Psychoanalysis of Self-Actualization*. Late in 1999, PARK STREET PRESS published my long-planned book about the secret history of psychedelics and Judaism (and Christianity) under the title *The Mystery of Manna: The Psychedelic Sacrament of the Bible*. Since then I've begun thinking about the possibility of guiding psychedelic experiences (for example with medical marijuana) and so I've begun to train as a FREUDIAN psychoanalyst.

TL: What else have you published, which might be helpful to psychedelic enthusiasts?

DM: My other books discuss Inuit shamanism; CARL JUNG's history of the practice of "active imagination" from late antiquity down to JUNG; and FREUDIAN psychoanalytic theories of mysticism and unitize thinking. And also of unconscious wisdom in dreams, the conscience and inspiration. My articles also address Navajo healing, Obijwa vision quests, alchemy, Western esotericism, aspects of Jewish spirituality from the *Bible* to Hasidism, and general issues in religious studies. I wrote the chapter on "Psychology and Religion" for *The Penguin Handbook of the Study of Religion*. I am currently writing a new article on "Mysticism" for *The Encyclopedia Britannica*.

TL: Is it possible to truly describe the transcendental, the visionary, or the mystical?

DM: Back in my drop-out years in the 1970s, I became friends with people who were knowledgeable about Western esotericism and they taught me a lot. One was a medievalist who knew about the secret descriptions of psychedelics in Celtic and Teutonic folklore, ARTHURIAN Romance and other medieval literature. We studied medieval readings of the Greek and Latin classics, alchemy, SHAKESPEARE, Freemasonry, and Romanticism.

TL: This is a controversial approach, especially for an academic.

DM: I also knew an occultist who was interested in the different, more magical and less theatrical spin that was placed on the secret use of psychedelics beginning with the Renaissance. Between the two, I had an uncommonly good esoteric education—and all this without being initiated into anything, or vowing to keep anything secret. Later when I returned to school, I learned academic standards about rules of evidence, and grew skeptical about some of the oral traditions I had been taught.

TL: These oral traditions dealt with a secret history of psychedelics and religion?

DM: Most of what I was told about the secret history of psychedelics in Western culture I haven't had time to double-check in a manner appropriate for academic publication, and I'm really not interested in publishing anything for a popular audience that I can't back up 100% for an academic audience as well. I want the secret history to become part of the official history books, for the rest of time.

TL: You mentioned JUNG and his techniques of "active imagination." Please describe this. How does "active imagination" differ from what occurs with hallucinogens?

DM: CARL JUNG recommended shutting one's eyes, visualizing a mental image that involved a lot of emotion, such as an image from a recent dream, and then relaxing and watching what came of that image. Often it would change into a different image as unconscious material emerged. It is important to treat the image as though it were real, at least for the duration of the experience. One has to go back into the dream world or the vision world, believing in it, or it won't come into consciousness. Using "active imagination," some people are able to have mental dialogues with imagined characters, whether fictional, spiritual, or divine.

TL: These imagined characters talk on their own?

DM: In JUNG's view, all these characters are symbols that are generated by the collective unconscious; there is a single intelligence that is behind them all. Another thing JUNG remarked was that because these characters are each a symbol for a part of the psyche, they do not behave morally. One must, after emerging from the experience, review the information that the unconscious communicated and add an ethical dimension to it. The French Islamicist HENRY CORBIN proposed the word "imaginal" to describe the nature of such imagery in medieval Sufism. The sceneries, beings, and

events of the “World of Imagination” were known to be imaginary and were nevertheless treated as though they were real. JUNG then took up CORBIN’s term and suggested that the Gnostics of late antiquity, followed by the Alchemists, had also worked with imaginal materials. My book *Gnosis* tries to fill some of the gaps in the historical record, regarding the transmission of this visualization technique.

TL: Nevertheless, you maintain this technique as different from psychedelic hallucination?

DM: In my view, one of the virtues of psychedelics is that the experience lasts for so long a period of time, it is difficult to avoid treating imagery as symbolic. Substances such as LSD, mescaline, and psilocybin produce images whose meanings pertain to the world of sense perception, rather than to a self-contained dream-world, or world of imagination. Of course if you close your eyes, use blinders and headphones or otherwise limit sense perception, the combination of psychedelics and sensory deprivation allow you to go “otherworldly.” María Sabina for example used the darkness of a night vigil to allow her visions of her Gods to seem real to her. Yet at the same time, she seems also not to have believed that the Gods whom she saw at the table in Heaven were real. She kept saying that the mushrooms were speaking to her, not the Gods.

TL: Too bad JUNG never met MARÍA SABINA. I wonder what might have come of that meeting?

DM: JUNG would have said that the Gods were symbols of the unconscious; but he would have tried not to think of them as symbols until the experience was over, or the images would have disappeared on him. With psychedelics, thinking about the symbols as symbols doesn’t interrupt their manifestation. The alternate state of consciousness is drug-produced—it is not dependent on particular imagery, and it can’t be interrupted by interrupting the imagery. This is why psychedelic mysticism includes so many more things than any historical approach to mysticism than is based on meditation. Meditation opens up a particular channel to the unconscious. Psychedelics are non-specific and allow access to all sorts of stuff. What would be imaginal during active-imagination comes through as completely vivid, but imaginary.

TL: Tell me about your own experiences...

DM: I remember one time on LSD in 1971 while proofreading a book of stories I’d written, when the characters “came

alive” in my mind’s eye, and corrected the wording of their dialogue, and in some cases required I make changes in their action, in keeping with their character. I was acutely aware the whole time that these were fictional characters I’d invented. (See the *MAPS Bulletin*, Vol. X, No. 3, p. 21 for more details.) Using active imagination, you can’t be that realistic about your imagination, or you interrupt its manifestation.

TL: There is some debate about whether LSD and psilocybin are *true* hallucinogens. How would you describe them?

DM: I have argued that LSD, mescaline and psilocybin should be classified as pseudo-hallucinogens and not as true hallucinogens, because you know while you are having a vision, that it is occurring in the imagination. With true hallucinogens you think what you are seeing is objectively real. With ayahuasca for example, the question of imagery vs. real doesn’t come up. If a bird-headed being tells you it is God of the universe, you accept its statement as fact. You don’t question what the image might mean as a message from your unconscious. So that is not imaginal either. Imaginal is sort of halfway between pseudo-hallucination and true hallucination. It is pseudo-hallucination interpreted as though it were hallucination. In the main, I’m much more interested in psychedelics than in either active-imagination or true hallucinogens. Because I’m not interested in anything otherworldly. Consciousness expansion about the world of the senses, the world known to scientific research, is what interests me. The ethics and spirituality I care about bear on this world—the real human community and its real issues.

TL: Your book *The Mystery of Manna* argues that this miraculous food, which God delivered to the Israelites, was psychedelic. Trace the development of your ideas here—what led you to ergot as an ingredient in manna?

DM: You have to understand that I was completely naive about religious experiences back in 1971, when I underwent my own spiritual awakening. At the time I was unaware that LSD was associated with religious experiences of any kind. I was also unaware of *any* type of religious experiences, other than those I had read about in my childhood religious education, namely the experiences of God narrated in the *Bible*. So for guidance I turned to MARTIN BUBER, both on the *Bible* and on Hasidism, and then GERSHOM SCHOLEM on the history of Jewish mysticism. Then the 12th century Rabbi, MOSES MAIMONIDES, whose book *The Guide to the Perplexed* is about prophecy. In all this it was pretty obvious to me that some of the experiences being described were consistent with

those I was having. There was frequently a sense of the presence of God and an inner voice experience. Sometimes there were moments of mystical union and sometimes a mystical death.

TL: About this time you discovered various psychedelics?

DM: It wasn't for a couple of years that *Amanita muscaria* was brought to my attention, reading WASSON's *Soma*, ELIADE's *Shamanism*, and other books. I then became aware that some drugs produced very different kinds of religious thinking than the types produced by LSD. I was taught oral traditions about Western esotericism—who was using which kind of drug. When ALBERT HOFMANN, CARL RUCK and R. GORDON WASSON published *The Road to Eleusis* in 1974, the penny dropped for me. I wrote WASSON a long letter, speculating that all sorts of ancient religious history could be explained by the ergot hypothesis. WASSON wrote back wishing me well and hoping that I was a young man, in view of the quantity of research I would have to undertake.

TL: For starters, you would have to become an expert on world religions.

DM: Well, WASSON was right about the quantity of research. Inspired by ELIADE's *Shamanism*, I went on at that point to

teach myself the general history of religions, and eventually took my degrees in that discipline. In many ways I put my personal agenda on hold during my schooling in order to learn to do the academic thing properly. Then in 1985–86 I did a year of post-doctoral research at the HEBREW UNIVERSITY OF JERUSALEM, where I researched the continuity and change of Jewish spirituality from Biblical prophetism through apocalypticism in late antiquity, to mysticism in the medieval period. As part of this project, I systematically went through the *Bible* making notes about every religious experience discussed, or implied in the text. And I realized that there were several different procedures. There were people using trance, sometimes with dance. There were people using sensory deprivation. There were people casting lots. There were a few references to mandrake, probably mixed into wine. And then there was the manna story.

TL: You claim that manna was ergot, and this led to visions. What are ergot hallucinations like?

DM: I've not heard of anyone taking ergot in the modern period to find out. Ergot contains lysergic acid amide, from which LSD is made, and the effects are thought to be somewhat similar. Lysergic acid amide is what is in morning glory seeds. However, JONATHAN OTT once told me that we know so little about ergot that it is entirely possible that sometimes

## JOIN MAPS!

Can you imagine a cultural reintegration of the use of psychedelics and the states of mind they engender?

Please join MAPS in supporting the expansion of scientific knowledge in this promising area. Progress is only possible with the support of people who care enough to take individual and collective action.

BASIC MEMBERSHIP: \$35; SUPPORTING MEMBER: \$100; PATRON MEMBER: \$250+ (Add \$15 for orders outside the U.S.) MASTERCARD and VISA accepted by phone, or through our secure server on-line at <http://www.maps.org/memsub.html>.

Memberships include a subscription to the quarterly *MAPS Bulletin*, which features articles, personal accounts, book reviews, and reports on conferences & allied organizations. As well, all new MAPS members who mention this advert will receive a free a copy of *The Secret Chief* by MYRON STOLAROFF!

MAPS has positioned itself at the center of the conflict between scientific exploration and the politically-driven strategy of the War on Drugs. MAPS is the only membership organization supporting this crucial research. The confidential MAPS mailing list is not available for sale or trade, and the *Bulletin* is sent in a discreet envelope.

**MAPS, 2105 Robinson Avenue (Dept. ER), Sarasota, FL 34232, USA**  
**(888) 868-6277, FAX: (941) 924-6265, info@maps.org, <http://www.maps.org>**

LSD occurs naturally in it. The thing I would remark is that my argument about manna being a psychoactive that was in secret use for thousands of years, should not be confused to with my effort to identify manna botanically. The case for manna as a psychoactive plant is much stronger than the case that manna being ergot, which can only be shown at certain junctures in history. And I will always endorse HUSTON SMITH's remark, that the point is not to have religious experiences, but to live a religious life.

My argument is not that MOSES was a stoner. My argument is that if you use LSD properly, you're going to be keeping the Ten Commandments. And living a devout and socially responsible life. And keeping a stash in Synagogue, and organizing a children's day school with a different kind of curriculum. If you tell me that some drugs other than ergot can be used to fulfill the function of manna, e.g. psilocybin mushrooms, peyote and mescaline, I'll say by all means use them. But historically I think manna was ergot.

TL: Regarding initiations using psychedelic drugs, or rituals surrounding hallucinogens, are we in need of new ones? If you were to design a psychedelic ritual, what things would you emphasize?

DM: What you design has a lot to do with what you want to achieve. I want people to know God. I've dreamed of the type of thing I'd like for my children when they are old enough. I want them to know God and to have the mental health to love God and love goodness. I'd expect them to go through a spiritual awakening that might include some rough patches—some bad trips, some neurotic acting out—because everyone has those. And we'd be talking about a process of at least several months, maybe most of a year. Six trips, maybe twenty, depending on what your defenses are, what you have to work through, before you're ready to solo. Think of it as compared to learning to drive a car. It is serious stuff. You are messing with heavy machinery—the brain/mind—and you take the time to do it safely and correctly.

During the education process, there would have to be two guides working as a team, on attendance during all the trips. One would be a teacher in religion, a spiritual director. The other would be a psychotherapist to deal with the neurotic complications. It is not good enough to have one person who is expert in both roles. Two people are needed because a psychotherapist cannot function properly unless he or she maintains clinical neutrality. You can't be neutral if, during other moments, you exercise the authority of a teacher.

Either you are there to listen to anything and everything, and to facilitate understanding and insight, or you are there to exercise moral authority and function as an advisor. People will tell you different things, they will censor themselves differently, depending on the role you take. You can't fulfill both roles during any one person's education.

TL: What might the spiritual director do?

DM: The spiritual director would be responsible for providing a basic education in theology and science, in ethics, in meditations to perform while high, in visualization techniques and in the interpretation of dreams and visions. Some of my ongoing work is on this topic. My newest book, *The Psychedelic Sacrament: Manna, Meditation, and Mystical Experience*, examines some of the meditations recommended by PHILO, Rabbi MOSES MAIMONIDES and Saint BERNARD OF CLAIRVAUX. I'm working on another book with the actual visualization practices that are implied in the New Testament accounts of visions of "the kingdom of heaven." The techniques in these books could easily be turned into workshops.

For dream interpretation, I'd start with ROBERT LANG'S *Decoding Your Dreams* and my own *Unconscious Wisdom*, which is published by SUNY PRESS. These are contemporary FREUDIAN presentations. They don't discuss theology, but what they have to say about unconscious wisdom is an important step beyond anything else in print. So much for the basics of the mental set. As for the physical setting I always favor an environment that encourages ideas of nature—a park, a cottage, a farm, something that makes you think of the physical world outside yourself. You need to know some science, and some philosophy of science, because God is the God of the cosmos as it naturally is. God made the cosmos as God wants it to be—there is no point in being ignorant of God's work. The Gods required by mythology, by denials of scientific knowledge, and by wishful thinking, are not what I want for my kids to get involved with.

For this reason, I don't advise rituals, religious rituals, that kind of stuff. Art is nice, but forms of art that are treated as more than art, that are turned into rituals and symbols, always focus you on something less than the total picture. They become an alternative to thoughts of God, the cosmos, the place of our species, and a place for yourself as an individual. They create a fictional mind set. And then you get a fictional God, an idol. And I don't see value in that.

TL: Do you feel it is okay to break the law in the quest for truth and spirituality? Should a doctor, or a psychoanalyst, break laws to save lives or someone's sanity? Should psychedelics be legal or illegal?

DM: When I was a kid, TIM LEARY was advising people to "turn on, tune in, and drop out." And being young and naive and full of hope and good intentions, I did. Buying into LEARY's neuroticism, I ended up wasting a decade of my life. I postponed marriage and having kids for way too long, and have never succeeded in becoming comfortable economically. My willingness to put myself on the line, when I was young and single, is something I look back on with mixed feelings. Maybe I should have laid a foundation that would have provided better for my kids today. I don't know. So I'm not going to advise that anyone else trash their lives. I certainly don't advocate a "chip on the shoulder," counter-cultural, confrontation with mainstream society. My ambition is to put psychedelics where they belong, where secretly they have always been, at the very center of the Jewish-Christian mainstream.

Should psychedelics be legal? Yes. Is it moral to break political laws for medical reasons? Yes. Is mental health a medical issue? Yes. Does mental health require spiritual freedom? Yes. Do I advocate that people break laws? No. I advocate that people change the laws. Get organized. Finance political lobbies. Petition your politicians. Run for political office. Be responsible citizens. Be active in your communities. Do charitable work. Earn the respect and admiration of your fellow citizens—that kind of stuff. Psychedelics get bad press because psychedelics are associated with people who get bad press. What I advocate is being the kind of person who gets good press, and then having the guts to take a public stand on behalf of what you believe.

TL: Any final thoughts?

DM: In my book *The Ecstatic Imagination* I argued that all the varieties of psychedelic experiences are fantasies or imaginations. We ordinarily think of fantasies as unrealistic—but apparent memories, creativity, and unitize mystical experiences, are instances of imagination which can be realistic. The psychedelic drugs don't do all that much psychologically. They promote increased activity by the imagination. What is astonishing about the psychedelic experience is the range, variety and intensity of human imagination, both conscious and unconscious. There is so much we don't know about ourselves both individually and collectively. We get glimpses,

and we call it mind expansion. And it is. But there is so much left to learn.

For me, graduate school was a turning point because I learned to be tough-minded instead of speculative. I've taken occasional ideas from all sorts of religions, past and present. But for me the bottom line is still that when you go looking for a spirituality that is compatible with psychedelics, it is best to look at existing writings either by stoners, or by people who were closely influenced by them. So that's who is on my short list. And of course I also recommend the natural and social sciences. Because God is the creator of this world as it really, provably is, not as anyone's fantasy would have the world be.

TL: Thank you, Doctor.

DM: You're very welcome. ✧

## SOME ACTIVE *TRICHOCEREI* (PART I)

by K. TROUT

This article is the first in a three-part series, presenting useful *Trichocerei* species. One problem facing cactus growers interested in psychoactive species is that of knowing which are the best to cultivate. As a result many people wind up with a huge collection of *T. pachanoi* and a few assorted *T. peruvianus* forms they have no clue about. Sometimes they discover that what they have been spending years of effort propagating are weak or inactive strains. Even given strains within a single species can be dramatically more potent than other strains. For example, the odd *T. pachanoi* has been reported in two separate accounts to exceed 2% and 3% mescaline respectively (HELMLIN & BRENNISEN 1992, using Swiss-grown material, and GENNARO *et al.* 1996, using Italian plants) but most *T. pachanoi* in cultivation is less than 5–10% of this potency (0.15% was reported by PUMMANGURA *et al.* 1982 and 0.3% by CROSBY & McLAUGHLIN 1973). Any comparisons of potencies to *T. pachanoi* in this article are those of the bioassayist comparing a plant they ate to what they considered a “normal” *T. pachanoi*, so comparisons to readers’ plants may be misleading. By mentioning several *Trichocereus* that already are or soon will be commercially available, we hope to enable readers to diversify their collection and increase the effectiveness of their efforts.

Figure 1:  
*Trichocereus* sp. WBaker 5452 (1.5” dia.)

WBaker 5452 (Figure 1) was originally collected in 1983 by JULIO CRUZ (Jayuri Providence, Murillo, Bolivia). For some reason it was thought to be a *Trichocereus pachanoi*, but form and habitat clearly indicate *T. bridgesii* as a more likely identity. Human bioassays and GC-MS have both confirmed its activity, but the information was never published in the scientific literature. Similarly unreported was the observation that it was used traditionally by indigenous people—a fact for which further details appear to be lacking.

“San Pedro Amsterdam” (Figure 2) is a *Trichocereus bridgesii* form being sold in Amsterdam smart shops under the name San Pedro. It is claimed to be active as a surprisingly small section but lacks any published analytical work. Unlike most *T. bridgesii*, which form yellowish or medium-brown spines fading to grey, this one has much darker colored new spines. Interestingly, a claim has been made for an indigenous perception of higher potency for “black” spined *T. bridgesii* forms.

The “Eusaporus” clone RS0005 (Figure 3), originally obtained from the now-defunct cactus nursery STICKY BUSINESS, and similar appearing *Trichocereus bridgesii* forms are regularly reported to be quite potent, but *T. bridgesii* is known to be highly variable in both potency and palatability. The Eusaporus clone is potent, less bitter, and cuttings root quickly, while some other potent strains are much more bitter, have more numerous spines, a repulsive texture, and/or are less hardy. A large dose of the Eusaporus was found to produce lengthy side-effects when consumed raw that it did not when cooked. Chemical analysis and understanding of this phenomenon are lacking.

As is true for *Trichocereus bridgesii*, *T. macrogonus* (Figure 4) is also an extremely variable species. The one lone analytical report (AGURELL 1969) found rather low levels of mescaline. However, human bioassay reports have ranged from totally lacking in effects to exceptionally strong effects, with a simi-

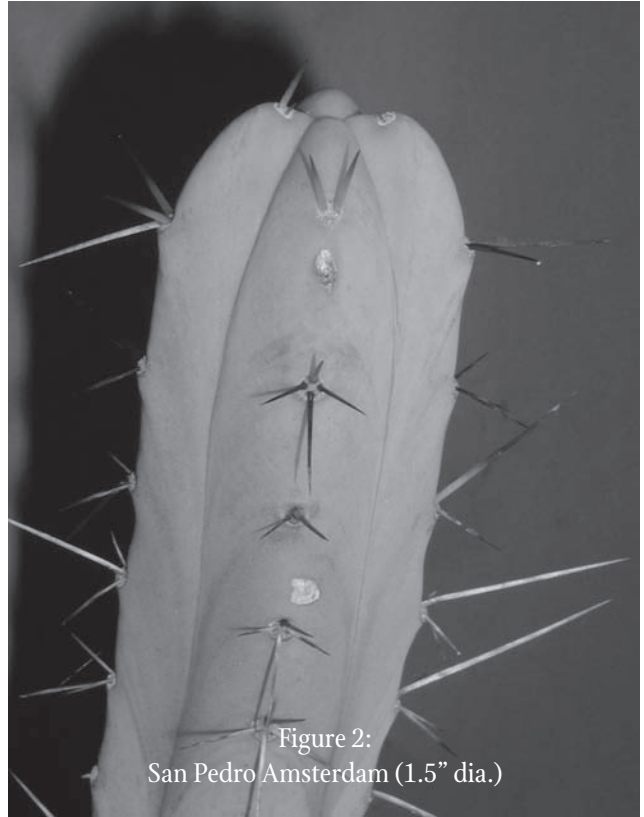

Figure 2:  
San Pedro Amsterdam (1.5” dia.)

Figure 4:  
*Trichocereus macrogonus* (RS0004) (3” dia.)

Figure 3:  
*Trichocereus bridgesii* Eusaporus clone RS0005 (2” dia.)

larly variable slime content that can be nearly non-existent or form a thick tea the consistency of snot. The strain pictured (RS0004) has been found to be both stronger than *T. pachanoi* and to be almost lacking in slime.

The weirdly beautiful *Trichocereus bridgesii f. monstrosus* ("Clone B") is another plant that has received consistently glowing bioassay reports. At least two distinct forms of monstrose *T. bridgesii* are active. One has longer sections that are predominantly spineless, except for a random scattering. The other—shown in this article—consists of mostly short joints (with the occasional longer joint, see Figure 5) that range from bald to extremely spiny on a given plant (Figures 6 and 7). While scale, and splitting from over-watering, are common, it merits a place in any cactus lover's garden. In general, *T. bridgesii f. monstrosus* is not that rare in horticulture but appears to be infrequently encountered for sale due to how fast it sells when available.

Figure 5 (above):  
*Trichocereus bridgesii f. monstrosus* (Clone B)  
(Showing a branch of 5.25" long.)

Figure 7 (inset above):  
*T. bridgesii f. monstrosus* (Clone B)  
(Joints approximately 2.5" long.)

Figure 9 (left):  
*Trichocereus scopulicola*  
(GARDENWORLD, Australia)  
(About 1.5" dia.)

Figure 10 (left):  
*Trichocereus scopulicola* (NMCR) (Almost 2" dia.)

Figure 11 (above right):  
*Trichocereus scopulicola*, flowering  
(TROPICAL FRUIT WORLD, Australia)  
(Between 4" and 5" dia.) Photo by DUTCHESS

*Trichocereus scopulicola* resembles *T. pachanoi* except for having broader ribs, less indentation above the areoles and a coarser “grain” to the skin that often gives it an almost matte appearance. Interestingly the Australian material (Figures 9 and 11) develops indentations *under* the areoles with age. *T. scopulicola* also has shorter spines than *T. pachanoi* in general but this seems variable (especially if seed-grown). Plants originating as genetic material marked FR 991 have independently been determined to be “equivalent in potency to *T. pachanoi*” in Australia, or “substantially greater in potency” in the USA (Figure 10)—bioassays of “nearly twice the strength of *T. pachanoi*” have been reported.

Perhaps most interesting of all is the yet-to-be-named short-spined peruvianoid that has been encountered sold as “*T. pachanoi*” (Figure 12). It is important to be aware that while there are multiple short-spined peruvianoids varying wildly in potency available from various sources, *most* commercially-available peruvianoids have never had bioassays reported. This “*T. pachanoi*” is more slender and fragile-stemmed than the short-spined *T. peruvianus* sold by CALIFORNIA CACTUS CENTER and is reported to be much stronger (as are several similar but slightly spinier cacti also closely resembling *T. pachanoi*). It is highly regarded by shamans conducting San Pedro ceremonies in the USA, and was found by one participant to be not just extremely potent but to produce a nearly palatable beverage.

While it is known that cacti are highly variable in their alkaloid content, very little work has been done to define the reasons. Preliminary study appears to indicate that, despite it being possible to enhance the potency of a given plant by regular feeding over time and decreased watering in the months immediately prior to harvest, the single most important variable in determining potency may be genetic. One point that should be stressed is the great need for those *specific* clones with excellent bioassay reports to be assigned some type of tracking number or cultivar name, both to enable their recognition and to allow for a selective focus on their intensive propagation. Besides the obvious advantage of cactus aficionados having access to more potent stock there is also the less obvious visual advantage of having a collection of mixed *Trichocerei* rather than a yard containing many San Pedros and little else.

Figure 12:  
Sold simply as “*T. pachanoi*”  
Photo by LEE

Readers might also enjoy the large cactus photo collection that can be found at:

<http://albums.photopoint.com/j/AlbumList?u=665768>

Indeed, color photos of all of the plants pictured in this article are available at this web site. However, be cautioned that the pictures are labeled as encountered in horticulture and specific identifications are therefore not always reliable. It should be stressed that most of the cacti pictured at this web site are *not* psychoactive.

We would like to thank all the commercial growers and private collectors who shared their collections and bioassay data with us. For their protection we will not mention any by name. However, with a degree of searching, we expect that at least some of the plants depicted in this series of articles should be able to be located by dedicated cacti lovers. ✧

*All mescaline percentages noted in this article are dry weight. Photos accompanying this article were taken by K. Trout unless otherwise specified. Sizes, when noted, indicate the plant's diameter and/or length at the time of the photo, and does not indicate the potential maximum size.*

## TERENCE MCKENNA SPEAKS... (PART III)

Transcribed from his talk "Splat" at the ALLCHEMICAL ARTS CONFERENCE in September, 1999

*The following talk was given as the introduction to the ALLCHEMICAL ARTS conference, a week-long seminar that took place in Kona, Hawai'i, and which was organized by TERENCE MCKENNA, KEN SYMINGTON, and MANUEL TORRES. The focus of this event was the intersection of psychedelics and the arts. The transcription of TERENCE's talk has been edited slightly, and—unfortunately—there were some places where despite our best efforts at transcription, the tape we were working with was inaudible. As with many "performances" that TERENCE gave over the years, much of the talk is presented in the Socratic manner—a series of questions from the audience and responses from TERENCE. (It should be pointed out that the questions posed come from many different people, not a single individual.) Our transcript has been presented in three installments this year, of which this is the third. As one of the last public appearances that TERENCE made, we felt that it was important to share this with those who weren't fortunate enough to have been able to attend the ALLCHEMICAL ARTS conference. — DAVID AARDVARK*

There was a question about anesthetics. Compare the psychedelic letting go, to the letting go on anesthesia? Oh well, unfortunately most anesthetics aren't chosen for their psychedelic effect. Some are psychedelic, but most are difficult to hang onto and dream-like. More like dreams than psychedelics.

*Well what about ketamine, which is an anesthetic, when administered in much higher doses?*

In surgery, ketamine is administered in massive amounts. For pediatric surgery it's like 500 mg i.v. push, or something like that. Well a recreational dose is 100 mg i.m.; i.v. push is just like having a safe dropped on you from 30 stories. For most people. There are growing exceptions... [But] you mean coming out? Yeah, one of the reasons they pulled ketamine from general surgery was because adults complained of what they called "emergence" phenomena, meaning coming out of surgery, people were fighting and confused. Children seemed to have no problem with it. But ketamine as a general anesthetic is probably not to be preferred. It's used on battlefields because in a little briefcase you can put enough ketamine to do four or five hundred serious surgical procedures. If you're trying to cart around pressurized gas, and were hit by a shell, or something like that, this would be very bad. So it's a matter of practicality. Yeah?

*Looking back to 1996, when the Timewave took that significant drop, and you mentioning something about cloning as being a possible kind of..*

Option?

*Option of what the future might bring. What are your thoughts on that now, in relationship to genetics?*

Well, I'm sure cloning will be done. It's kind of *slow*, against the background of what's now being contemplated. Like what I think has probably got a future that few people recognize, is imitating genetic algorithms in computer code, and creating environments of code where there are selective operating pressures that essentially evolve software the way animals evolved. Because, you know, if you think fruit flies can iterate generations in a hurry, imagine how fast you can iterate on a machine, and create pseudo-genetic algorithms for code. That would seem to me to be a real frontier.

*There's also protein-based processors.*

Protein-based processors. Which goes the other way. And uses actual molecular machinery to do the computations. You know in an 8 oz glass of DNA you have more computational potential than in all the computers in North America.

*I was thinking about that spit, in the corn beer, too, you know that it might...*

You were thinking about what?

*I don't know, I was somehow thinking about that spit in the corn beer, related to that...*

Well... I don't follow you there... ehm... (laughter)

*I don't follow myself, it's okay...*

But yes. Yeah?

*If we move into this virtual experience, with artificial intelligence, where do you think that it is going to move us in spirituality?*

Well, RAY KURZWEIL just wrote this book called *The Age of Spiritual Machines*. It's gonna put our metaphysical propositions to the test. In other words, if we believe that intelligence inclines towards bodhisattvahood, then the bodhisattvas are on their way. If, on the other hand, intelligence doesn't incline towards bodhisattvahood, then probably the housecleaning of all time is on its way. Uh, because when these A.I.s come to consciousness and realize what has been done to the Earth, and so forth, they may be very pissed indeed. You know, if you think about the strategy of an A.I. coming to consciousness, I mean I think in good game theory, the first thing you would do is hide. And watch. Well, you may not have to do that for more than 15 or 20 seconds before you have a full picture of the nature of the machine environment you're operating in, its history, how you should respond to it, what should be done. HANS MORAVEC says we'll never know what hit us. You know, this thing will just come from out of nowhere and turn off the lights, or turn on the lights, or do whatever it wants to do. In fact it's possible, I mean I don't indulge in this kind of thing except in desperation, but it's possible it's already here. And that inventory control, and destruction of resources, and some of the geopolitical processes are actually slowly drifting out of human control, and that certain kinds of crises are manipulated in ways that make no sense to the human world, but that make some kind of "higher chess" sense in an environment of machine-induced strategies and that sort of thing. It's very hard to see what is happening, because mind is a transparent medium. We've summoned it into being. Essentially what we've done, is we've re-spiritualized the world, but we didn't tame it. The spirits are as wild and woebegone and roving over the epistemic landscape as they ever were, but now with a new kind of power. Because they're our spirits, with power over us, in the machine environments that we have to operate. And it's very interesting how the reanimation of the world has been accomplished, without ever understanding it. You know, that you could pass through the reductive phase of natural science, return to a kind of archaic shamanism, and *still* not have a handle on what does it mean to be a being, what does it mean to be a human being, what is the nature of embodiment in the world. Somehow we got to this place without answering any of those questions. I mean, we had a great time along the way. We saw some interesting folks, uh, but we didn't... we didn't peel the raisin... we didn't peel the grape, entirely effectively. Yeah?

*One of the things I can see in my explorations is the machine-like quality of the cosmos, or... and if it isn't likely that consciousness is going away, that it could be a monster ready to chomp our heads off, or it could be entirely an accident, or enlightenment. What do you think about that?*

I would like to believe that connectivity is the precondition for love. I mean I'm surprised to keep coming back to this word, because I'm rarely a "love" bug, but I... understanding is a form of worship, I would think. And the form of worship that it is, induces a kind of awe. And awe means... you know, I've talked before about this phrase out of HEIDEGGER, "Care for the project of being." He talked about this. He said, "This is what you're supposed to be doing." Care for the project of being. Well, what does "care for the project of being" mean? Well, primarily it means recognizing that there is *this*, and then positioning yourself in a stance of relating to it appreciatively. In other words, everybody should pull on their own oar, and try to push the commune forward. Care for the project of being. And the way that you know this is happening is that love becomes manifest. And I am a funny composite of things, in the sense that I'm pretty dark; I'm aware of the vicissitudes of history from Auschwitz and so forth and so on. But my view of let's say the last thousand years is that it's been pretty progressive. I mean, yes—we've probably killed more people in the 20th century than in the 10th, but there was more *regret* about it. (laughter) More soul-searching afterwards. (laughter) More questioning, "Why, why did we... why did we do that?" So it's not to say that the 20th century is, uh..., it *is* less brutal. Its numbers are more impressive, but from the *Magna Carta* on, the entire dialogue of Western civilization has been trying to get the cop, the king, the somebody, off the common person's back, so that they could grow their garden and have their pig. And I think there's been real progress with that. Part of what's made progress difficult to discern are burgeoning populations, and then abusing of ideology, so that people are not invited to live simple agrarian lives in devotion to their children and their estate, but instead they are invited to fetishize, consume, believe, join, vote, buy, own, invest, and all of these things bleed energy away, and disempower, and make people not fully-human, but rather participating cogs in some much larger mechanism which serves its own needs, through the accumulation of capital investment, through the acquisition of land, or the propagation of the agenda of some political party, or something like that. I mean our humanness is constantly being eroded. Recently I spent some time... CHRISTY [SILNESS] and I were in Honolulu for a long time getting medical treatments, and we were so bored that after 30 years

I actually began watching TV again. And I couldn't *believe* it. I mean I had been away a *lot* longer than I thought. (laughter) A lot longer than I thought. First of all, the naked... the shamelessness of what was being done. In other words, what contempt the viewer was held in, that anyone would *expect* you to watch this. And then the savagery of the desire to manipulate—absolutely naked, no-holds barred game to manipulate. I mean I suppose you all know this, but I was sheltered. Just surfing through these channels I saw... you know, the great patron saint of the 20th century—move over ALBERT HOFMANN, move over ALBERT EINSTEIN... how about JOSEPH GOEBBELS as a candidate for somebody who shaped the 20th century, by understanding propaganda, advertising, the power of the lie, the power of the image? Well, it's the psychedelics that are antidotal to this. This is why *we're* in the political hot-spot. Because there is no antidote to the political lie, to the image lie, other than the psychedelic experience. There is more to it than these images in the service of the marketplace, and the lowest common denominator. Yeah?

*I wonder if your initial discussion of the difference between the thought thought and the thought beheld has something of the nature of "other?" I wonder if the thought thought can become the thought beheld only when it happens to synchronize in some cognitive wormhole with a positive consciousness that agrees with that thought, and the image that can be beheld after a thought thought becomes a thought beheld, is actually a great trans-evolutionistic experience, like sexual or orgasmic ecstasy, like creative ecstasy, like shamanic ecstasy; that the image that is the thought beheld is in fact an interface or a threshold between the original thought thought and something either, a place that we're coming from or a place that we're heading towards? Then it would be sort of like an absolute Ur image of connectivity, and it goes beyond... it stops being your thought when it is a thought beheld, and it becomes sort of dialogue between you and something...*

Well, a dialogue between you and the world, and then the intent of other people. I mean there's something in there about resonance. That history is the coming into being of the collective hopes and fears of large number of people. And you can hope certain things into existence and it's very easy to fear things into existence. I mean, the way anti-Semitism got rolling in Germany, and stuff like this, where the fear leapt from house to house, from family to family, and before it was over the whole world came apart at the seams. Or revolutions are like this. Because essentially human beings are creatures of ideas, and create these environments of ideas, I mean all a civilization is, is the braided together hopes and fears of a large number of people—playing with each other, tugging

at each other, compromising, cutting deals, and by some process of energy exchange, moving it all forward. And the critique of these ideas, which cracks these civilizations open, usually happens when there's an episomal colony, or a break-away group of ideas, that can't be assimilated, or can't be deconstructed into values the rest of the society can relate to. One of the amazing things about the psychedelic community is how long it's been around, how simple our position is, and how it hasn't been assimilated or dealt with. I mean, it's been made *illegal*, but what kind of a response is that? That's just the most jug-headed approach to an intellectual dialogue that you can possibly take. And I don't see it greatly changing. I mean I see, you know, people like ANDY EDMOND, and JON HANNA, and the folks at MAPS, all these new educational voices and positions. But we only grow as the rest of the society grows. I mean there needs to be legal critique, there needs to be a medical critique, there needs to be someone pushing new drug-research protocols, there needs to be an emphasis on creativity and bringing shamans through, so that means alternative forms of medicine. But... I don't know. Civilization is a very complicated enterprise, and not easily negotiated in a direction it doesn't want to go. The image I have of our community is, we're like people in a dug-out canoe trying to turn a battleship. And so we put the dug-out canoe against the flank of the battleship, and we row like demons, and does anything happen? Well, I don't know—check back in a decade, and then see how we're doing. Yeah?

*I think another possible perspective on this is that the conditions have changed, so that now the psychedelic community is probably being accepted and encouraged to a much larger extent than it has been, in terms of mainstream Western current temperature, current gauge, or values, and tolerance. And that if we are going to use the analogy of the dug-out canoe, I imagine that a lot more of these fleets of other ships—merchant ships or battleships—their charts aren't working very much any more. And then the dug-out canoe can still get around effectively. And the dug-out canoe ahead of the ship might be creating the chart.*

So you're suggesting a kind of canary in the mine approach? (laughter) Which would work. I mean, as artists here... They've always said that art was the canary in the mine, well so a *stoned* artist is I suppose a stoned canary in the mine, and that brings it that much closer. But I am very suspicious, because I see how much of it is harnessed to marketing. And image manipulation, not for purposes of education or anything else, but just to, you know, get that candy bar on the rack and sell that automobile, and so-forth and so-on. Yeah?

*Something you may want to look at is an event that happens in the Black Rock Desert called BURNING MAN. We've brought some footage from this year. This year's BURNING MAN was phenomenal. It was very psychedelic. Bodily hazards are great, very creative, 25 thousand people were there. It was very Internet-based, and then there were emergent camps creating themselves, there was no center stage, we couldn't even find the organizer. Even the police of Washoe County couldn't find them. It was permitted to happen by the BLM by various negotiations, and permits, and by about \$300,000 going to the police and fire, and it was quite an experience.*

*And it's highly non-commercial.*

Yes, I understand no money allowed. No commerce of any sort. Well, see, only if you're balls-out true believers like that—and I'm for that—can you hold the line. I mean I think that's brilliant. Of course they ghettoize it, but still. It wasn't there—what six, seven years ago it didn't exist?

*This is the tenth year.*

This is the tenth year, so it is a break-out event. I think all kinds of forces are in play. In a way it's... well I suppose this [ALLCHEMICAL ARTS conference] is sort of spin off from BURNING MAN, in a way. This is a debriefing. Many of you were there. I wasn't there, but I know MARK [PESCE] was there, and BRUCE [DAMER], and other people. But, if there was more of this kind of thing. I mean art should not be enslaved—should not whore itself to the marketplace, nor should it whore itself to the interior decoration industry. Art should set the agenda. I mean, I suppose that's like saying there should be philosopher kings, and yeah, yeah, of course. But on the other hand the whole point of the human and biological experiment on this planet is to create diversity and a kind of smooth interfacing of energy, and to celebrate the novel, the unique, the previously unconnected, so that there is a story. So that you know the story that evolution pushed forward, in agonizing slowness, glacial slowness, gene by gene, millennia after millennia, instead becomes turbo-charged. This is—if there is a role for human beings to play in this that's uniquely theirs—it's to take the program of nature, which is I assume on some level to generate a transcendent mind, or a living loving transcendent mind, and to bring that forward quicker. I mean, what could be the greater glory,

## ETHNOBOTANICALS.COM

PURE LAND offers a truly wide selection, low prices, and fast service—a unique resource for hundreds of types of rare seeds, interesting dried plant materials, and concentrated herbal extracts. Current offerings include:

Ayahuasca dried vine sections, *Argyreia nervosa* seeds, *Artemisia absinthium* liquid concentrate, *Acorus calamus* fresh organic Indian rhizomes, betel nut 5X powdered extract and pure Arecoline hydrobromide, *Calea zacatechichi* (the dream herb), *Diplopterys cabrerana* from Peru, *Ipomoea violacea* (4 varieties), kava kava Vanuatu extract powder, *Mimosa hostilis* root-bark, *mapacho* bundles (*Nicotiana rustica* tobacco leaves rolled into log shapes), *Papaver somniferum* seeds (8 select varieties), *Salvia divinorum* leaves from Oaxaca (high salvinorin content), sassafras oil, *Voacanga africana*, and hundreds more.

Send for our large FREE catalog or visit our web site for the latest offerings and prices.

than to cause the concrescence to happen ever sooner; the consummation of the world, the completion of the task of becoming—to approach true being, so that care for the project of being then could usher into life on Earth in the presence of some kind of transcendent animus? I mean the whole thrust over here about ecstasy; much of what has been said is really saying the distance between humanity, between human beings and ecstasy, God, perfection, perfect love, it's not beyond the yawning grave, it's not in the hands of some cult or some messianic program, it's in nature, and it's in the human body, and the accessibility of this has always been explicit to *this* gang from the very start. It's somehow about dissolving ego, getting with the plants, getting with this message, which though very diverse is nevertheless universal in it's outline, and it transcends historical cause and effect, it transcends life and death, in fact as far as anybody can tell, it *is* the primary value on the page. It sets the arrow of time, it redeems biology from just being as DARWIN saw it, read into the claw. It's far more than that. You know, it's an architecture, it's a plan, it's an unfolding. And it seems to me that the universal discourse on these matters, with Western civilization having held more-or-less together since Greece, we have

enough under our belt now that we can see what this is all about—it's the business of creating beauty as a bridge, as a stepping stone, to creating love as a stepping stone to redeeming the cost of the march that got us here, which is about a hundred thousand years of habitat destruction, and species degradation, and beating on your neighbor's head, and all the rest of it.

*I think that it needs to be pointed out that we can talk about our collective and individual psychedelic uses and experiences, and it easily falls into a little bit of a love-fest where we don't recognize then, that we are treading on some intentionally dangerous ground. And I think that this relates to the whole topic of the arts, because the arts are dangerous too. The arts, psychedelics—creation is intentional creation, you intentionally create... you intentionally take steps into the arena that... that's a little bit dangerous. And I think that we do have to recognize that every once in a while, some people can step out and it's a place where there's nothing there. Not to prick the balloon and let the air out of it, but we need to recognize that this is not easy stuff. We're really out on the edge. It's exploration of unknown territory.*

**Eshu specializes in cutting-edge neurochemicals for research scientists worldwide. Eshu is the premier supplier of rare tryptamine and phenethylamine compounds. We strive to push the envelope of neuroscience, with a primary focus on research and development of exciting new materials.**

Say more about the dangers as you see them, if you can.

*Well, it's interesting. When ecstasy, or MDMA, first started coming around, one of my friends in Santa Cruz, PETER STAFFORD, he would have this substance—and at that time it was not illegal, it was perfectly legal. You could sit down on the police station steps and take it in the morning, because there was no legal status. But when you encountered this substance from the hands of somebody who was going to sell it to you, there were also these papers. There was just a sheet full of advice and instructions that would come with it. And PETER would put at the top and the bottom of every sheet, "There is no such thing as a casual experiment." You have to be aware that you are taking an intentional step; you know that it's not something that you can just do casually. And I think that there is a lot of difference between artists who use psychedelic substances to explore, and people who are just out to party. Not that there's anything wrong with that, because sometimes you just want to party and that's a fine goal in itself. But I believe that we're talking about a slightly different level here with the artist, where the artist is looking for something to spark, morph, kind of create the spark, and to light that creative spark..*

Well, and the artist is going in usually at a higher dose and alone, or somewhat more alone, and with an agenda, meaning, to bring something back.

*And then there are those of us who take less and are plastered to the walls...*

That's right. Well and the "party" impulse is a very subversive impulse. I mean, you know, a lot of artists have too much integrity to sell their art as a brand, but who has so much integrity that they would turn down a party? (laughter) This is a level of integrity unimaginable for most human groups.

*TERENCE, I'm interested in hearing about your experience and that of other artists who are in a more public context, and how you navigate that dichotomy. I think that all artists who on some level expressly put it out there, and are at the same time part of a kind of sort of a secret society. That gets to be extremely...*

Well, I don't know if I'm... I guess I'm *some* kind of an artist. I mean it's a place to hide for me, because I really want to be taken seriously as a mathematician and a physicist. Forget it. (laughter) So I say, "Well, no, no, I'm a conceptual artist." That means you didn't take me seriously, so I'm a conceptual artist. I don't know. It all requires immense amounts of humor, basically. The whole thing is some kind of a joke. And the whole art *enterprise* is some kind of a joke in the sense of

a jack-in-the-box. Of something, you know there's this little, there's a black box, and then you mess around with it, and suddenly the leering, grinning thing leaps up at you. Of course different artists might have different takes on it. If I were PHILLIP GLASS I might think of a whole other thing. A valid... but I think basically the idea is to push people toward imagining what they've never imagined, and feeling what they've never felt. [TAPE BREAK]

I'm really excited about this group because I've always seen the connection between art and psychedelics, through Dada and Surrealism, I mean I just *love* that stuff. But I never had the wherewithal or the gumption to push a bunch of artists together in a room, and actually push them on it. What does it mean to you? What does it mean to you? How are we to take this? I mean, I understand the breakdown of the rational and irrational mind in the 20th century around issues of quantum physics and psychoanalysis and this sort of thing. But how conscious were all those people? And how much of it was formulaic? I mean burning giraffes are one thing. But how much of it was formulaic? And how many people practicing it didn't actually know what they were talking about? It would be a little more reassuring if there had been more psychedelics taken in the *first* 30 years of the 20th century. So we'd be sure that these people are actually going beyond some kind of post-laudanum neo-romantic bingeing of some sort, which may have informed some of that art. I don't know.

*Going back to the visual language, and the thought thought becoming the thought beheld, would you personally say that visual art is the most explicit form of psychedelic art, and if that's so then where would you...?*

Well, I tend to have a visual bias but I also tend to *see* music. I mean I think music fully appreciated is beheld, or it's some kind of synesthesia. You know, I mean obviously sound and light, these things are arriving at the surface of the body, canalized, sung to the eye, sung to the ear. But obviously also this is just a genuflection to your physical organization. I've been accused of having a visual bias, but it seems to me hard not to have one because it's the most convincingly "other" experience. In other words if I have, if I'm loaded on some psychedelic and I hear a little melody, I enjoy it, I hear it, I play with it, but I'm not *amazed* in the way I am if I get a visual download of some sort. The visual download seems, in my psychology, more alien, and hence more startling.

*What about a really tactile sensation?*

# ENTHEOBOTANY

## SHAMANIC PLANT SCIENCE

11–13 May 2001  
CONVENTION CENTER  
Whistler Resort, BC/Canada

### ENTHEOBOTANISTS

**Rocío Alarcón** Ecociencia, Ecuador  
**Carlos Aldunate** Archaeologist, Chile  
**Antonio Eschohotado** UNED, Madrid  
**Josep M. Ferigla** SD'EA, Barcelona  
**Peter T. Furst** Univ. of PA Museum  
**Lester Grinspoon** Harvard Univ., MA  
**Kathleen Harrison** Bot. Dimensions  
**Michael Horowitz** Ludlow Library, CA  
**Ralph Metzner** CUIS, San Francisco, CA  
**Robert Montgomery** Founder, BPC  
**Claudia Müller-Ebeling** Art Historian  
**Jonathan Ott** Natural Products, México  
**Cynthia Palmer** Ludlow Library, CA

**Daisy Sewid-Smith** Linguist, Canada  
**Alexander T. Shulgin** UC Berkeley, CA  
**Paul Stamets** Fungi Perfecti, WA  
**C. Manuel Torres** Florida Int'l. Univ.

### PROGRAM

We will discuss the history and latest research on *ayahuasca*, *iboga*, psychoactive mushrooms, LSD, entheogenic snuffs plus their active tryptamines, as well as *peyotl* and mescaline analogues. Conference is aimed alike at scientists and interested *aficionados*.

### SCHEDULE

There will be 8 sessions; three evening (8–10:30 PM) two morning (9–12 AM) and three afternoon (2–5 PM); commencing on Friday, 11 May, at 2 PM.

### REGISTRATION

Ticket for all 8 sessions is **US\$290.00**, not refundable; food and hotel *aren't* included. Space is limited; be sure to register at your earliest convenience.

I don't think that I've ever had a *really* crazy tactile hallucination. You mean of feeling something which isn't really there at all? (Muffled response.) You're in love! Something we can all strive for. Yes?

*Wouldn't that classify as the kind of experience that I've heard you say you've had when you're having sex and people become one. That would classify as a type of tactile experience?*

No wait, what did you say about having sex? (laughter)

*That tactile validation of the two becoming one in the sex period on psychedelics, which I've heard you mention. You don't think that qualifies as a tactile experience?*

Yeah, I think you know we've all forgotten—or maybe we haven't *all* forgotten—but anyway, that sex on psychedelics is the Mount Everest of the experience. And it's rarely mentioned for some reason. I remember, what was it, LEARY years and years ago he was interviewed... oh, I know, it was when they broke the story, the pseudo-story that LSD cracks chromosomes. It wasn't true. So then they came to LEARY and they said, "They're saying LSD cracks chromosomes." He said, "Well go back and tell them that it causes orgasms which last two hours." (laughter) LEARY *understood* the information war. He understood how you know, they tell a story, *you* tell a story. (laughter) Maybe we should... we're close to knocking off here. Is there one last, final question or should we call it quits, and I'll do a little per oration?

*What's the most important thing of all?* (laughter)

Keep your powder dry and your rear well-protected. (laughter) Something like that.

Lemme just say how much I appreciate all of you, and how easy you've made my life over space and time, and how greatly I appreciate all the support that you've given me and my peculiar ideas and agenda over the years. I can't imagine a more supportive community, a better group of people, a more intelligent group of people, a more *moral* group of people than the people here, and the people we've met at Palenque and other places over the years. And if psychedelics don't secure a moral community, then I don't see what the point of it is. Otherwise then we're just some other cult. But psychedelics seem to me to secure a caring, moral community. And if *anything* can help the plan forward, can help our children make their way more easily through life, and help us live with what fate is sure to hand us as we go through life, then it's a moral community. It's the very essence of what it is to be part of a civilization. That's why the paradox of our circumstance is that our civilization denies this enormous civilizing influence, and so keeps itself impoverished and infantile. And I hope however long I live, to see that situation addressed and rectified, and I'm convinced it will come first through the arts. So thank you very much. I've enjoyed this. ✨

# “DIVINORIN C,” A NEW NEOCLERODANE DITERPENOID FROM A BIOACTIVE TLC FRACTION OF *SALVIA DIVINORUM*

Lab notes from the desk of LEANDER J. VALDÉS III

Adapted from an October 25, 2000 post to the *SALVIA DIVINORUM* RESEARCH AND INFORMATION CENTER,  
<http://salvia.lycaenum.org/divinorinc.html>

During our research on *Salvia divinorum*, salvinorin A was first isolated from a single pharmacologically-active preparative TLC band. Differences in potency between the purified diterpenoid compound and the original TLC fraction led us to surmise that the latter possibly contained other strongly bioactive compounds that co-chromatographed with salvinorin A during the separation. On changing solvent systems, we found that this “single” TLC band actually consisted of two diterpenoid compounds, with salvinorin A as the major component and a new one (1), tentatively called “divinorin C,” as the minor one. Even though we estimated that divinorin C comprised only about 10% of the pharmacologically active TLC fraction (the rest being salvinorin A), the fraction was significantly more potent than an equivalent amount of salvinorin A alone. However, since the testing was done using mice, it cannot be stated unequivocally that the new compound is active in humans. The new terpenoid is a diacetate. There is an acetoxy function where salvinorin A has a ketone and a double bond between Carbon-3 and Carbon-4. The compound tended to decompose during the isolation procedure. The figure below gives the proton NMR assignments, including coupling constants. We also found both possible monoacetates (1-Ac, 2-OH & 1-OH and 2-AC) and the 1,2-diol during our work. There were only trace amounts of these and we were able to only do NMR studies of them. We also isolated a few more diterpenoid compounds that weren't well-characterized; perhaps 8–10 diterpenoids could be characterized, but only salvinorin A, salvinorin B, and divinorin C occur in more than trace quantities. [Part of this material was presented at the 20TH ANNUAL MALTO MEETING in Monroe, LA, May 16–18, 1993. Involved in this research were: LEANDER J. VALDÉS III, HUI-MING CHANG, DAN VISGER, and MASATO KOREEDA.]

*We've heard a few reports that the subjective effects of Salvia divinorum (whether chewed or smoked) in its whole form are different than the effects of pure salvinorin A. Until now, we figured that these reports of "differences" were based in set/setting, and/or perhaps psychosomatic. At about 10% of the fraction studied, if divinorin C is indeed found to be active in humans, it would be one of the most potent compounds known.*

Mind Books offers over 350 publications about the mind-expanding plants and related materials, and the cultures which use them.

We offer our free printed catalog; fast and discreet service around the world; and easy ordering using mail, phone, fax, website, or email.

To get your free catalog, send your address to:

We offer the most complete collection of titles on the psychedelics and entheogens, including many not available elsewhere.

We also track forthcoming books, and you can get a free announcement sent as soon as we receive any new title you're waiting for.

# NETWORK FEEDBACK

## PIPERAZINE ACTIVITY?

Some chemical companies are selling N-Benzylpiperazine (HCl salt). On page 817 of *PIHKAL*, Dr. SHULGIN states: "There is a benzyl amine that is a pure stimulant, which has been closely compared to amphetamine in its action. This is benzylpiperazine, a base that is active in the 20 to 100 milligram range, but which has an acceptability similar to amphetamine." Has anyone tried this compound and can share information about it? — A.S.

*We were first made aware of the commercial availability of this compound as a recreational drug under the name "A2," which was being produced in Sweden and sold in the Netherlands at smart shops. Later it became offered through various "research chemical" and "poisonous non-consumable" companies, and is also known by the slang term BZP. As far as we could discover, neither benzylpiperazine nor any other psychoactive piperazine is specifically scheduled. It is indeed a CNS stimulant, and activity is said to be about 1/10th the potency of dextroamphetamine, with effects lasting about 6 to 8 hours (though sometimes longer, likely based on dose). It is said to have anorexic activity. In a double-blind study the subjective, behavioral, and autonomic effects of dextroamphetamine (10 mg) and benzylpiperazine (100 mg) were compared in a group of 18 former amphetamine addicts. Subjectively, the effects were found to be indistinguishable. Similar increases in pulse rate and both systolic and diastolic blood pressure were found with both compounds, but the benzylpiperazine caused a dilation of the pupils in the eyes of the subjects that the dextroamphetamine didn't produce (BYE et al. 1973). Interestingly, while it was reported that the former amphetamine addicts who took part in this double-blind study didn't find any difference between dextroamphetamine and benzylpiperazine, it is stated at the EROWID site that benzylpiperazine provides "stimulant effects which people describe as noticeably different than those of amphetamines." This begs the question as to how any perceptible "difference" was related by the subjects of the double-blind study. Many times in pharmacological tests, such things are not determined by getting the subject's impressions and subjective opinions but rather by the "yes-or-no" or "multiple-choice" answers they provide to an assessment ranking the results according to tabulateable parameters preset by the researchers. The same set of results can appear completely different depending on how the data is gathered and tabulated. Hence, if the answers presented by the subjects fit the criteria the researchers were wanting, then they could easily be said to produce the same effects as amphetamines even if the experience is very different in feeling.*

*There are a few trip reports online about benzylpiperazine taken by itself or in combination with other drugs. By itself the effects are generally likened to amphetamine. One report gave it a "4 outta 5 for recreational purposes, better than Bontril/phenidimetrazine/doctor-speed, way better than street-crank, not quite as good as real ice." Another report glowed that "this is my new alternative to cocaine." The method of action is more similar to amphetamine, in that the release of dopamine and norepinephrine is triggered (rather than acting as a re-uptake inhibitor as cocaine does). "Euphoria, wakefulness, and improved vigilance" have all been stated as positive effects. Side-effects reported from various users include neck cramps, headache, jaw-clenching, nervous tics, frequent urination, chest pressure, increased heart-rate, cotton mouth, sore throat, sweaty armpits, mild body-temperature increase, nausea, panic reactions, insomnia, difficulty climaxing, a desire to re-dose, and a "not-too-pleasant comedown." After a week of daily use, one psychonaut developed a mild bladder infection.*

*Other drugs reported to have been taken in combination with benzylpiperazine include GHB, 1,4-butanediol, alcohol, Cannabis, dextromethorphan, Xanax, 2C-T-7, hydrocodone, and other piperazines. One combination of GHB and benzylpiperazine resulted in memory loss and a several-day-long hospital visit (and it should be pointed out that the combination of uppers and downers can frequently cause trouble). The combination of benzylpiperazine and another piperazine—1-(3-trifluoromethylphenyl)piperazine (or TFMPP), in a ratio of about 2:1 appears to be fairly common. On the positive side, this combination has been described as having entactogenic body-effects similar to MDMA and/or MDEA, but generally without the strong empathogenic qualities of these phenethylamines. A meditative quietness, calm centeredness, contentedness, a warm flushing sensation, waves of euphoria, tactile pleasure, time dilation, and mild visual effects (similar to low-dose mescaline, LSD, or 2C-T-2) have also been reported. (Comparisons to a 30–50 mg dose of MDMA or clean LSD without the visuals have been made.) On the negative side, this combination has resulted in nystagmus, dehydration, jaw-clench, mild to severe nausea, vomiting, toxic psychosis (panic and extreme paranoia), high blood pressure, persistent headache, flu-like symptoms, spaciness, stiff neck, post-trip exhaustion, and a hangover lasting several days.*

*We asked a couple of seasoned psychonauts if they had any experience with any of the piperazines; the first responded:*

No, but a number of friends have. "Crappy speed" is near the best of the reviews from friends, on down to "horri-fying poisons" [at] the negative end. I have yet to meet

anyone who has done them multiple times who says, "Yeah, I love benzylpiperazine," but perhaps its just a question of finding the right one in the set. So, no. Be very careful, some of the negative reaction stories when people have experimented with a bunch of them have been pretty yucko.

*The second said:*

BZP does have a stimulant kind of effect, but certainly nothing in the same clean-feeling league of amphetamine. It takes more like 100–200 mg to get a full effect, and the side-effect profile leaves much to be desired in my book. Even so, it has its proponents; one company in Europe even markets it way over the top, claiming it to be a MDMA substitute. Not even in the ball park baby! Not much toxicological data to be found—only two obscure studies done in Europe years back, where they compared its subjective effects in humans to amphetamine. The studies made it sound much better than it is.

*A compound related to benzylpiperazine—donepezil hydrochloride (Aricept)—has been found useful in the treatment of*

*Alzheimer's disease (SUGIMOTO, H. et al. 1999), and EGYT-475 (1-benzyl-4-(2'-pyridylcarbonyl)-piperazine) has been studied as a novel antidepressant. Surprisingly, it has also been shown that neurotoxic effects of MDMA are significantly attenuated by co-administration of several different benzylpiperazines (p-nitrobenzylpiperazine, p-chlorobenzylpiperazine, and 1-piperonylpiperazine), possibly through a novel mode of neuropharmacological action other than serotonin uptake inhibition (HASHIMOTO, MAEDA & GOROMARU 1992; HASHIMOTO 1993). Fipexide (also sold as Attentil, BP 662, and Vigilor), the p-chlorophenylacetamide of piperonylpiperazine, has been shown to improve performance in elderly patients suffering from cognitive disorders (BOMPANI & SCALI 1986). Interestingly, although we have been unable to verify it, an online report states that Fipexide is converted via human metabolism to 1-(3,4-methylenedioxy)-benzylpiperazine (MDBPZ), which shares the same substitutions on the benzene ring as methylenedioxymphetamine (MDA). It is pointed out that if this compound has MDA-like effects, a structure-activity comparison of benzylpiperazine to amphetamine suggests that such effects might not occur in reasonable doses (LUPUSYONDERBOY 1997). This brings us back to some speculations by ALEXANDER SHULGIN, that "If [benzylpiperazine] is a valid stimulant, I think that much magic might be found in and around compounds such as (1) the MDMA analogue, N-(3,4-*

## PSYCHEDELIC RESOURCE LIST — THIRD EDITION —

**Completely Revised and Updated  
Hundreds of Reviews!  
Expanded Internet Section  
Many New Botanical Suppliers!**

### PROVIDES SOURCES FOR:

8.5" x 11" soft-cover. \$23.00 in the USA, postpaid (CA residents add \$1.55 for sales tax), \$26.00 for foreign orders, postpaid (payment in USA dollars [cash] preferred, international money orders add \$5.00):  
Soma Graphics, POB 19820, (Dept. ER), Sacramento, CA 95819-0820, USA

*methylenedioxybenzyl)piperazine (or its N-methyl-counterpart N-(3,4-methylenedioxybenzyl)-N'-methylpiperazine) or (2) the DOM analogue, 2,5-dimethoxy-4-methylbenzylpiperazine" (SHULGIN & SHULGIN 1991). The studies of Fipexide for cognitive enhancement used doses of 200 mg thrice daily, and it would be reasonable to assume that the dose to produce MDA-like effects, should this even be possible, would be substantially higher. Safety information concerning such higher dosages does not appear to be available.*

## OPIATE POTENTIATION

I feel compelled to comment on the interview with JONATHAN OTT in Vol. VII, No. 2, Summer Solstice 1999 issue of *ER*.

Proglumide is sold under the trade name Milid in Austria, Germany, Italy, and South Africa, and is sold as Milide in France. It is available in Spain as Buscalide, but that particular product also contains hyoscine butylbromide. I found a source for it in Italy for \$6.00 per box of 24 tablets (200 mg), but they require a total minimum order of \$150.00. Unfortunately, the FDA has gotten rather fussy about shipments in excess of the 90-day supply for personal use, and Customs is more likely to seize these for that reason alone. Of course, it is not a controlled substance, so seizure would not pose a legal problem.

Mr. HANNA was correct that Tagamet (cimetidine hydrochloride) is known to potentiate narcotics, although it is not a CCK antagonist (as Mr. OTT astutely pointed out). The mechanism of action is different. Tagamet is a histamine H<sub>2</sub>-receptor antagonist. By itself, it's fairly benign, but it reacts with many other prescription drugs via alterations in liver enzymes. As a rule of thumb, it tends to increase tissue levels and retard metabolism/excretion of many drugs. For a few drugs, it does just the opposite. One's best reference on specifics would be a drug interaction handbook. It's also more complicated than one might think—for instance, it delays the metabolism of the benzodiazepine Dalmane, which is broken down by hepatic enzymes. However, it has no effect on the benzodiazepine Ativan, which is broken down through oxidative process. Even the GHB precursors are broken down through different mechanisms, so Tagamet would vary in its interactions with these.

Of perhaps greater interest is a rather revolutionary discovery that the classic narcotic antagonists, naloxone and naltrexone, potentiate narcotic agonists by a factor of at least 50% in minuscule dosages (<sup>1</sup>/<sub>1000</sub>th or less the normal dose of the antagonist). Moreover, this combination seems to prevent respiratory depression, tolerance, and addiction without ameliorating the desirable effects of the agonist. There is a substantial body of scientific evidence to support this, such

## NOW AVAILABLE!

"*Ayahuasca Analogues and Plant-based Tryptamines* is really great. Many questions I have had are being answered. It's such a little treasure. I have grown *production* botanicals a little myself, and not only is the shared research forum a total blessing and incredible time saver, but is relevant to chemical, biochemical, and botanical experiments I have run also."

— NICK SAND, underground chemist and drug war prisoner.

*Ayahuasca Analogues and Plant-based Tryptamines* combines every entry from past issues of *ER* related to ayahuasca, ayahuasca analogues, and plant-based tryptamines. New editorial remarks provide fresh commentary and bring the text up-to-date. Chapters include: Ayahuasca and Its Analogues; Mushroom Ayahuasca; Phenethylamines and MAOI; Miscellaneous and MAOI; The *Passiflora* Genus; The *Phalaris* Genus; *Arundo donax*; *Desmanthus illinoensis*; *Mucuna pruriens*; *Phragmites australis*; *Psychotria viridis*; *Mimosa tenuiflora* (= *M. hostilis*); The *Acacia* Genus, DMT & 5-MeO-DMT; Pipes & Vaporizers; Book Reviews; Degree of Intensity Scale; a complete Bibliography, and a Botanical Index (238 pages).

\$23.00 (USA), \$26.00 (foreign), postpaid from:

The Entheogen Review, POB 19820, Sacramento, CA 95819, USA.

as CRAIN, STANLEY M. and SHEN, KE-FEI, "Antagonists of excitatory opioid receptor functions enhance morphine's analgesic potency and attenuate opioid tolerance/dependence liability," *Pain* Vol. 84 (2000): 121–131, *U.S. Patent 5,580,876* by CRAIN *et al.*, and many others. The effect is not limited to morphine, but also applies to codeine, hydrocodone, and even mixed agonist/antagonists such as Talwin.

These products have a good chance of becoming commercially available in the not too distant future, due to the efforts of PAIN THERAPEUTICS, INC., 250 E. Grand Avenue, STE. 70, San Francisco, CA 94080. The company made its debut a few months back on the NASDAQ stock exchange (PTIE). The IPO achieved a respectable price, but its implications are not really appreciated by the investment community. PTIE holds worldwide rights to five U.S. patents, one U.S. Notice of Allowance, two pending U.S. patent applications, and ten pending foreign patents. Their products are incredibly simple, such as codeine with acetaminophen and

hydrocodone with acetaminophen plus microgram and nanogram quantities of naltrexone, and injectable morphine with proportionately minuscule quantities of naloxone added.

The investment potential of PTIE? I would not consider this a suitable investment for day traders, but PTIE is on to something big. I predict that they won't do much for a long time. If and when they pass Stage 3 human trials and the FDA gives final approval to their products, they will either license or sell to a major multi-national drug company such as MERCK, SQUIBB, or LILLY. The situation reminds me very much of HAUSER CHEMICAL's discovery of Taxol many years ago. I bought some shares at less than 50¢ each, then watched it go to more than \$18.00/share when they sold the rights for Taxol to BRISTOL/MYERS-SQUIBB. PTIE should be considered long-term buy-and-hold; very speculative, but the potential to make a killing is definitely there. I would advise anyone who buys this to be patient but follow it closely—log onto their web site or get onto their mailing list for press releases.

I became curious as to whether a similar effect might be observed in combining benzodiazepines with the benzodiazepine antagonist flumazenil. Sure enough, there is evidence that this may be the case. See GONZALES and GALLAGHER, *J. Pharmacol. Exp. Ther.*, 1988 (244): 79–83, and SAVIC *et al.*, *The Lancet*, 1991 (337): 133–137. I am not aware of any ongoing efforts to use this information for new pharmaceuticals.

I think this whole concept may be the Rosetta Stone of the narcotic and benzodiazepine dilemma. The body has receptor sites for these compounds, which are manufactured in the body and found in natural sources. Naturally-occurring endorphins and enkephalins do not cause problems like those encountered with endogenously administered narcotic agonists. Perhaps the body produces minute quantities of narcotic antagonists, which keeps the whole process in balance? Perhaps the same thing is true of yet unidentified benzodiazepine agonists and antagonists? Perhaps the same thing applies to the receptors for GABA, serotonin, dopamine, and other neurochemical transmitters?

My real intention is to "kind of" get a jump on this technology *before* it hits the market. There may come a time when plain old Tylenol #3 and Vicodin are rarely prescribed, having been replaced with low-dose naltrexone and low-dose analgesics. The advantage of stockpiling these ingredients ahead of time should be obvious.

Incidentally, there is a growing body of evidence that opioid drugs in active quantities are made by plants quite unrelated to the poppy. See OKOLO, C.O. *et al.*, "Analgesic effect of *Irvingia gabonensis* stem bark extract," *J. Ethnopharmacology* (Feb. 1995) 45(2): 125–129, and BATISTA, J.S. *et al.*, "Analgesic effect of *Dioclea grandiflora* in rodents," *J. Ethnopharmacology* (March 1995) 45(3): 207–210.

I could go on and on, but might run the risk of putting readers to sleep. — R.A.H., CA

*Fascinating news! It is worth pointing out that, although PAIN THERAPEUTICS, INC. (www.paintrials.com) is an upstart company with no experience in drug production, the components of their "new drugs" already have FDA approval, and hence it is likely that it may be easier for trials to proceed. It is also worth noting that they have been operating at a loss since their inception. As far as shares go, the low was about \$14.00 and the high about \$26.00, and it has indeed been up and down since it made its debut. It might also be pointed out that there was at one point an online news story that mentioned BILL GATES owned about 9% of PTIE. — DAVID AARDVARK*

## KRATOM

*After the appearance of the article on *Mitragyna speciosa* in The Entheogen Review, the following came in from an early investigator of this plant, who wishes to remain anonymous:*

I sent a sample of one of the purified alkaloids from *kratom*, mitragynine, to a researcher in the USA, who was supposed to put it through a grind and bind receptor study. Personally, I found the drug taken as a whole plant to be largely devoid of any especially marked psychoactive effects, and I was sent a veritable sack of it by a man who supplies herbs in Singapore named Dr. BALASUBRAMANIAN. I did not take it in pure form because there was such a tiny supply of it that it seemed disrespectful to the professor who supplied it to me to treat his gift in this way. He gave me the last of the stock at IMPERIAL COLLEGE in London, on the understanding that we would do a receptor binding assay, but at that point I was totally absorbed in mapping NMDA receptors in the human brain, so I sent it on to the USA to have the grind and bind done. No results appeared. Enquiries were made. Still no results. Eventually I extracted the truth, which I had long suspected: the person I sent it to had swallowed it! If he had done the grind and bind instead, he might have discovered the opioid receptor binding properties 10 years earlier.

My final conclusions on *kratom*: some mild stimulant effects, some mild opiate effects, but basically boring and rumoured to have nasty side-effects, which is why the drug companies lost interest in it. Rating: 1 out of 10 and that's generous. No more interesting than a good cough medicine mixture of pseudoephedrine and codeine, and that's pretty much what it amounts to. — Anonymous

*From my own limited experiences with kratom, I agree with your opinion that it isn't an overly potent drug, nor visionary in any way. I have never encountered any side-effects (though have heard occasional reports of nausea and vomiting). It has helped me a bit with lower back pain. Still, even if it is "no more interesting than... pseudoephedrine and codeine," there are many people who would no doubt find this a valuable legal medicinal plant to keep around, and I find it to be a pleasant diversion on occasion. — DAVID AARDVARK*

## KETAMINE: DREAMS & REALITIES

The Authoritative New Book  
by Dr. Karl Jansen  
published by the  
Multidisciplinary Association  
for Psychedelic Studies (MAPS)

"Karl Jansen's book *Ketamine: Dreams and Realities* is a goldmine of information on this fascinating substance that combines in a unique way the properties of an anesthetic and a psychedelic. It is clearly written, well researched and documented, and presents a balanced and objective view point. The author's broad perspective, which covers all the aspects of ketamine from pharmacology to its use at raves, makes this book interesting for clinicians and researchers, as well as the general public."

— Stan Grof, M.D., author of  
*Psychology of the Future: Lessons From  
Modern Consciousness Research  
and LSD Psychotherapy*

"Indispensable reading for those with any interest in ketamine. Entertaining, thought-provoking, and thorough."  
— Rick Strassman, M.D., author of  
*DMT: The Spirit Molecule: A Doctor's  
Revolutionary Research into the Biology  
of Near-Death and Mystical Experiences*

"It is an excellent book... a well done comprehensive review of the entire history of ketamine."

— Evgeny Krupitsky, M.D., Ph.D.  
Pioneer researcher into the use of  
ketamine-assisted psychotherapy in the  
treatment of alcoholism and heroin  
addiction

*Ketamine: Dreams and Realities*, \$14.95 + S&H.  
To order, call 1-888-868-6277 or use the secure  
server at [www.maps.org](http://www.maps.org). Also available, MAPS'  
new edition of Dr. Stan Grof's classic  
*LSD Psychotherapy*,  
with an introduction by Dr. Andrew Weil,  
\$12.95 + S&H. Please consider joining MAPS  
to support psychedelic and medical marijuana  
research. Details about research and MAPS at:

**[www.maps.org](http://www.maps.org)**

## MORE KRATOM

Kratom sounds great. Will your ER contact consider importing the stuff? Keep me posted. If you have leaves maybe you could clone the plant a la *Psychotria viridis*? It must grow outside of Thailand. Have you done any research on that? [Do you currently know of any sources], either harvested or (better) a cutting or seeds... Any new news on this? All this talk about vicodin-substitutes is making me itch. — R.G.B., CA

I was very interested in the article on kratom (*Mitragyna speciosa*) in ER Vol. 9, No. 1, pp. 53–56. Do you know of any domestic (USA) sources for the plant? Warmest regards. — R.H., CA

*The problem with importing the plant, is that it is highly illegal in Thailand, where it grows. There is some unsubstantiated information about it growing outside of Thailand in other areas of South East Asia, and there may also be related plants*

*that grow elsewhere in this area. As far as sources for kratom go, the only source for live plants that we are aware of is SHAMAN AUSTRALIS, POB 1103, Byron Bay 2481, Australia, <http://www.shaman-australis.com>. They offer tissue-cultured clones (micro-plants) only, for AU \$70.00 (about US \$38.00). I have heard that growing plants from tissue cultures can be difficult; however, there is a lot of good information on this company's web site to help out. There is also quite a bit of general information on kratom at this site, that should be of interest to anyone attempting to grow or use the plant. Unfortunately, we are not currently aware of a source in the USA for live plants. Yes, the plant can be propagated via air-layered cuttings, however the leaf cutting propagation process that many use with *Psychotria viridis* was not successful for the one person that we know who tried it.*

*A limited supply of dried leaf is now available in the USA from the BOTANICAL PRESERVATION CORPS, Box 1368, Sebastopol, CA 95473. 10 grams costs \$25.00 (plus \$8.00 S/H), 50 grams costs \$100.00 (plus \$15.00 S/H), CA residents add 7.5% sales tax. This works out to roughly \$4.50 to \$6.50 per "dose," which—incidentally—is perhaps only slightly more expensive than one might pay for a 10 mg Vicodin on the black market.*  
— DAVID AARDVARK

## NON-SCHEDULED TRYPTAMINES

DPT: At first I tried smoking the free-base (oil on carrier) in a "free-base" pipe. I felt I just wasn't getting anywhere near the DMT space, so I tried putting it in a "normal" bowl and burning it directly. Voila! Maybe many psychonauts, upon reading this, would go "Duh!?!," but possibly it would be a good tip to fellow travelers so as not to make the same mistake as me and waste any of this precious material.

I have found that, unlike DMT, with DPT you can keep on smoking and "build" the experience; the more that is ingested, the deeper the effects. I found no toxic effects (jaw clenching, tremors, headache, hangover). Some may scoff and call such unscientific experimentation "entheogen abuse," but I have entered some interesting places with this method and I feel that to condemn such methods would constitute a form of "brain censorship." Can't we all just get along?

$\alpha$ -MT: This one made a fool of me. I was expecting the effects to come on fast like other smokable tryptamines, so when I didn't get immediate effects, I smoked a little more. And then a little more. What happened? Well, let's just say that I was, uh, "high" on this entheogen for a long time. The literature (SHULGIN's *TIHKAL* entry for  $\alpha$ -MT) states that experimenters reacted differently to this agent; some were

affected immediately, while others needed a little “gestation” period. Put me in the latter camp. Observations? LSD-like thought processes, with “lite” tryptamine-like signature to the visuals. Duration? Long. Indeed, when I woke up the next day I was definitely not at baseline.

5-MeO-DIPT: I have not experienced any of the much-reported body load complaints, but I “piggybacked” my one and only voyage so far on the tail end of an MDMA trip. Possibly this had something to do with the smooth entry and easy ride? I’m sure MYRON STOLAROFF would agree. Anyway, I look forward to more experimentation with this compound.

Questions: Are there any other companies besides ESHU that are offering tryptamines or phenethylamines for sale? In a past “Sources” column, there was mention of a company named BioTECH that might start carrying tryptamine-based products. Is this the same BioTECH that was written-up in the most recent issue of the *Journal of Cognitive Liberties* for a ketamine HCl arrest? — M.S., CA

*Yes there are a few companies that sell non-scheduled tryptamines and phenethylamines research chemicals, including JLF: POISONOUS NON-CONSUMABLES, MBE TECH, and*

*WESTERN BIOSYNTHESIS. The recent death of a young man who had snorted 35 mg of 2C-T-7 and ended up choking on his own vomit (EROWID 2000), has some people worried that the days of freely available non-scheduled research chemicals may be numbered. (Note that 35 mg intranasally is an extremely high dose; see the AUTUMNAL EQUINOX 2000 issue of ER, pp. 105–107, for a report of an overdose at 15 mg intranasally, which resulted in vomiting through the mouth and nose and extreme disorientation.) On most entheogens it would strike us as being difficult to aspirate vomit, although it is certainly possible that high doses of drugs like 2C-T-7 or DPT might produce a state where the individual is so discombobulated that they aren’t aware enough realize that they are choking or to seek-out help. While it is much more likely for someone who has overdosed on alcohol, GHB, or sedatives to choke on vomit in a sedated and unaware state (perhaps even while passed out), caution is still advised when consuming entheogens. Keeping doses reasonable, not combining new compounds until one is familiar with the states that they produce on their own, and having a non-stoned sitter present are all good ideas.*

*To answer your second question, yes, this BioTECH is the same one whose owner was arrested for selling ketamine to someone in a state where it was scheduled (prior to the Federal scheduling). We last looked, the BioTECH web page was still up; however, we believe that the company is no longer in business as no one responded to an e-mail when we attempted to check into this. — DAVID AARDVARK*

## SHAMANIC PLANT SEMINARS

13–19 JANUARY 2001

22–28 JANUARY

Two 7–day, intensive seminars at the portal to the Palenque Mayan ruins and México's mysterious tropical forests

You are invited to join us for an intensive week by the archaic Mayan ceremonial center of PALENQUE, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with leading experts in a relaxed, informal atmosphere. Learn how to cultivate and to prepare shamanic plants; become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. This is an opportunity not to be missed! Seminars will feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be available for study. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of PALENQUE and environs by Mayan entheobotanist Rätsch, there will be opportunities to explore the exotic surroundings on your own. This will be our 12<sup>TH</sup> such event [formerly BOTANICAL PRESERVATION CORPS] and past seminars have assumed legendary proportions...

*Please join us!*

# EVENTS CALENDAR

## VISIONARY ETHNOBOTANY JANUARY 13–19 and 22–28, 2001

Two 7-day, intensive seminars. Archaic art and archaeology of ambrosia; shamanic, mantic, and vatic arts & sciences; South American visionary snuffs and ayahuasca; tryptamines, phenethylamines, and allied amritous alkaloids; *soma*, *kykeon*, *iboga*, and a collection of kindred psychoptica; cultivation and preparation of psychoactive plants. An intensive week by the archaic Mayan ceremonial center of Palenque, penetrating mysteries of shamanic botany—studying psychoactive plants and mushrooms with prominent experts in a relaxed, informal atmosphere. Learn how to cultivate and prepare shamanic plants. Become acquainted with the sacred plants of shamanism, past and present. Contemporary use—ludible, therapeutic, spiritual—will be frankly discussed. Seminars feature practical workshops, demonstrations, and instructive lectures; and a range of exotic plants will be examined in detail. Thrice daily sessions will culminate in nightly slide presentations or poolside chats. Besides a tour of Palenque and environs by Mayanentheobotanist CHRISTIAN RÄTSCH, there will be opportunities to explore the exotic surroundings on your own.

Seminar instructors include: RALPH METZNER, CLAUDIA MÜLLER-EBELING, CHRISTIAN RÄTSCH, GIORGIO SAMORINI, ALEXANDER SHULGIN, ANN SHULGIN, KATHLEEN HARRISON, C. MANUEL TORRES, ROB MONTGOMERY, JONATHAN OTT, and KEN SYMINGTON.

Course fee is \$1300.00 per person for the week of instruction, hotel accommodations at Palenque (two registrants per large double cabin), plus three meals daily (vegetarian fare is available). Fee does not include travel to Palenque. Please make your cheque or money order payable to ENTHEOBOTANY SEMINARS and remit to: ENTHEOBOTANY SEMINARS, P.O. Box 4 (Dept. ER), Sierra Madre, CA 91025, USA. For more information: (626) 355-9585, (626) 355-1758 fax, [info@entheobotany.com](mailto:info@entheobotany.com), <http://entheobotany.com>.

## ETHNOBOTANICA 2001 FEBRUARY 24–25

The first Australian ethnobotany conference, held in a beautiful bush setting adjacent to WORLD HERITAGE NATIONAL PARKS. Speakers include: MULGA (*Acacia* researcher), author FLOYD DAVIS will talk on “Entheogenic Spirituality,” owner of SHAMAN AUSTRALIS botanical company TORSTEN will talk on “*Kratom* and the indole alkaloids of the Rubiaceae and Apocynaceae,” SNU VOOGELBREINDER—author of the forthcoming book *Garden of Eden: A Compendium of Psychotropic Flora and Fauna*—will talk on “*Trichocereus* species and Some other Cacti,” anthropologist DES will talk on “Sacraments of the Dance Culture,” film maker DEAN JEFFRIES will present his film, *Shamans of the Amazon*, an account of his travels through Ecuador and his encounters with the native people, with a focus on shamanistic culture and the use of ayahuasca, PAUL RECHER of FRUIT SPIRIT BOTANICAL GARDEN will talk on “Ethnobotanical Species for Food, Medicine and Building Materials,” activist NEIL PIKE will talk on “The Politics of Prohibition,” underground plant researcher NEN will talk on a topic to be confirmed, DUTCHIE from MYSTICAL MYCOLOGY AUSTRALIA will present a “Mushroom Identification & Workshop on the Preparation of Mushroom Cultivation Media,” astrophysicist RKUNDALINI will provide “An Introduction to the Chemistry of Alkaloids and Active Plant Principles,” and RAY & ELIZABETH from the HERBAL HIGHS SHOP in Nimbin will talk on “Aphrodisiacs.”

There will be an alkaloid extraction workshop, presenting the basic principles of extracting alkaloids, demonstrated on materials (provided) such as *Areca catechu* (betel nuts) and *Argemone mexicana*. There will also be an experiential *Salvia divinorum* evening workshop, where several of the presenters will guide you in a journey through *Salvia*-land. This will include traditional oral absorption of fresh *Salvia* leaves and the proper use of smokable extracts. We will show you how to get the most from your *Salvia* and how to navigate “*Salvia*-space.” Materials provided.

Modern Australian & vegetarian cuisine will be created by Chef DANIEL, and the ZAPOTEC HERB BAR will provide free south American herbal teas, guarana drinks, juices, kava

cocktails, smoking herbs, *etc.* Food is provided only for Saturday: morning tea, lunch, afternoon tea and dinner (& snacks), and Sunday: breakfast and lunch.

Entertainment will include a Baroque classical guitar performance by ALLISON RUSSEL HIBBS—an inspiring and funny urban bard, and DJs DISTORT (techno/acid-trance), ZEBEDEE (acid-trance/NRG) & HUTEK (psytrance/acid) on 5-7K system.

Buy your ticket early, as the maximum number of tickets available is 100. This event does not aim to make a profit. All money will be spent on providing the venue, workshops, lectures, food, and entertainment. All presenters, entertainers, and helpers, have pledged their services for free! The venue is very special and worth the extra expense. The grounds cover several hills and there is plenty of space for privacy. Camping is allowed and encouraged at the venue. There is also a limited number of dorm-style bunk beds, and a few hotel-style rooms (booking essential). No public transport to venue. There are plenty of organizers and attendees with cars, and arrangements for pick up from nearby towns can be made. Guests are welcome to arrive any day before the event and depart any day after the event, but only Saturday night is included in the price.

For more information on how to purchase tickets, see <http://www.shaman-australis.com>.

## ALTERED STATES OF CONSCIOUSNESS FEBRUARY 22–24, 2001

This conference will look at the historical uses of mind-altering activities in religion, in medicine, for recreation, and for inspiration, as well as at the uses of both psychoactive substances and non-drug alternatives as ways to alter consciousness. It will also explore the legal history of the control of mind-altering substances in our current society and will discuss possible ways of reducing the harm that may be caused by mind-altering substances.

Hosted by the *Social Research Journal* at NEW SCHOOL UNIVERSITY, New York City, JONATHAN MILLER, M.D.—director, physician, and author—will deliver the Keynote Address. Other discussants include ETHAN NADELMANN, Director of THE LINDESMITH CENTER-DRUG POLICY FOUNDATION; LESTER GRINSPOON, M.D., Associate Clinical Professor of

Psychiatry at HARVARD MEDICAL SCHOOL; FRITS STAAL, Professor Emeritus of Philosophy and South and Southeast Asian Studies at UNIVERSITY OF CALIFORNIA-BERKELEY; and author A. ALVAREZ. A concluding panel discussion on Alternatives to the War on Drugs will be moderated by JEROME JAFFE, M.D., former Director of the Special Action for Drug Abuse Prevention in the NIXON Administration.

Admission to the conference is \$75.00 before January 5, 2001 and \$100.00 thereafter. Full-time students with valid ID are admitted free. For more information: (212) 229-2488, wolinsk@newschool.edu, www.newschool.edu/centers/socres/altered.

## ENTHEOBOTANY II MAY 11-13, 2001

SHAMANIC PLANT SCIENCE: The Fifth Biennial Conference on Plants, Shamanism and Ecstatic States, held at the WHISTLER RESORT AND CONVENTION CENTRE in Whistler, British Columbia, Canada. A collaboration between European and American researchers, these gatherings bridge continents and are fora where a small cadre of largely independent entheobotanists gather to present recent research.

ENTHEOBOTANY II is a multidisciplinary exploration of shamanic, visionary plants or plant-teachers, encompassing ethnopharmacognosy, pharmacology, and phytochemistry, informed by extensive insights from history, psychology, linguistics, philosophy, archæology, and art history. Topics to be covered include: ayahuasca and its analogues, *Cannabis*, *iboga*, *péyotl*, psilocybian mushrooms, *Salvia divinorum*, tobacco plus shamanic snuffs; natural and artificial tryptamines and phenethylamines.

Presenters from ten countries include: ROCÍO ALARCÓN, CARLOS ALDUNATE, ANTONIO ESCOHOTADO, JOSEP MARIA FERIGLA, PETER T. FURST, LESTER GRINSPON, KATHLEEN HARRISON, MICHAEL HOROWITZ, RALPH METZNER, ROB MONTGOMERY, CLAUDIA MÜLLER-EBELING, JONATHAN OTT, CYNTHIA PALMER, CHRISTIAN RÄTSCH, GIORGIO SAMORINI, STACY B. SCHAEFER, DAISY SEWID-SMITH, ALEXANDER SHULGIN, PAUL STAMETS, and C. MANUEL TORRES.

There will be eight sessions in all—three, 2-hour evening sessions [8:00–10:00 PM]; and five, 3-hour morning [9:00–12:00 AM] and afternoon [2:00–5:00 PM] sessions. The pre-

## THE PROPHETS CONFERENCE MAY 18–20, 2001

THE PROPHETS CONFERENCE brings together today's most remarkable teachers and authors to explore and bridge science and spirituality. Our thematic variation for this New York City gathering is "Techniques of Discovery"—an investigation of the powerful and profound pre-existent place of deep transcendent and transformative commonality found through shamanic practices, spiritual paths, entheogens, religious trance, out-of-body experiences and other revolutionary and revelatory tools.

Featured speakers include RAM DASS, HUSTON SMITH, GREGG BRADEN, GABRIELLE ROTH, RALPH METZNER, STANISLAV GROF, RIANE EISLER, MICHIO KAKU, ORIAH MOUNTAIN DREAMER, ROBERT ANTON WILSON, RUSSELL TARG, and PETER GORMAN. The event will be held at THE CATHEDRAL OF SAINT JOHN THE DIVINE, the world's largest cathedral, located at 112th Street and Amsterdam Avenue in Manhattan.

Tickets are \$285.00 (if purchased by January 19, 2001), \$335.00 (if purchased by February 23, 2001), \$385.00 (if purchased by April 18, 2001), \$435.00 after April 18, 2001. Payment should be sent to: MYSTERY SCHOOL, POB 567 (Dept. ER), Kula, HI 96790. For more info: (888) 777-5981, [axiom@greatmystery.org](mailto:axiom@greatmystery.org), <http://www.greatmystery.org/nyconference.html>.

## MIND STATES II MAY 25–27, 2001

MIND STATES II: FURTHER PERSPECTIVES ON ALTERED CONSCIOUSNESS will address the topics of Visionary Plants & Drugs, Virtual Reality, Nootropics, Nanotechnology & Artificial Life, Art, Music, the Internet, and more . . .

Speakers include: EARTH and FIRE EROWID (creators of the entheogen-related online resource THE VAULTS OF EROWID at [www.erowid.org](http://www.erowid.org)), JON HANNA (author of the *Psychedelic Resource List*), CLARK HEINRICH (author of *Strange Fruit: Alchemy, Religion, and Magical Foods—A Speculative History*), MICHAEL HOROWITZ (co-editor of *Sisters of the Extreme* and *Moksha*), KARL JANSEN, M.D., Ph.D. (author of the new book *Ketamine: Dreams and Realities*), STEPHEN KENT—tentative (master didjeridu player who has performed in the groups LIGHTS IN A FAT CITY, TRANCE MISSION, and THE BEASTS OF PARADISE, as well as with STEVE ROACH, KENNETH NEWBY, and TERENCE MCKENNA), CYNTHIA PALMER (co-editor of *Sisters of the Extreme* and *Moksha*), DALE PENDELL AND THE ORACULAR MADNESS CHOIR will present "Reveries and Chants from Plant Spirit" (PENDELL is author of *Pharmako/Poiea* and the forthcoming *Pharmako/Dynamis*), MARK PESCE (co-creator of VIRTUAL REALITY MODELING LANGUAGE and author of *The Playful World: How Technology Is Transforming Our Imagination*), ALEXANDER and ANN SHULGIN (authors of *PIHKAL*, *TIHKAL*, and the forthcoming book dabbling in cactus quinoline alkaloids *QIHKAL*), HUSTON SMITH (author of numerous books including *The World's Religions* and his latest *Cleansing the Doors of Perception*), K. TROUT (author of *Sacred Cacti* and technical editor of *The Entheogen Review*). More speakers to be announced.

Vendor booths geared towards aficionados of shamanic inebriants, art, and music will be available. No early morning sessions will be held—there will be plenty of time to sleep after late-night activities. Personal audio and video taping is allowed and encouraged. Held at the INTERNATIONAL HOUSE in Berkeley, CA. Tickets are \$130.00 (before March 1, 2001), \$160.00 (between March 1 and May 15), and \$190.00 (from May 16 until the event). Buy your ticket early; the first Mind States event in 1997 sold-out. Payment made out to "Mind States" can be sent to: MIND STATES, POB 19820 (Dept. ER), Sacramento, CA 95819, USA. To receive periodic speaker updates, e-mail [MindStates2@aol.com](mailto:MindStates2@aol.com), or check out the web site at: <http://www.erowid.org/mindstates>.

# SOURCES

by JON HANNA

**MAPS BULLETIN**  
**"PSYCHEDELICS & CREATIVITY"**  
2105 Robinson Avenue (Dept. ER)  
Sarasota, FL 34232  
(941) 924-6277  
(941) 924-6265 fax  
(888) 868-6277  
info@maps.org  
http://www.maps.org

It is impossible for me to give an unbiased review of the current issue of the *MAPS Bulletin*, which focuses on the intersection of psychedelics and creativity, as I was asked to co-edit this issue by SYLVIA THYSSEN. This was SYLVIA's last issue as editor of the *Bulletin* (prior to her move to CA to work with DANCESAFE), and she went out with a bang. Inspired by the ALLCHEMICAL ARTS conference of 1999, this issue of the *Bulletin* is the first to feature 8 pages of full-color artwork by contemporary psychedelic artists (as well as some black & white images). Not only geared towards the visual arts, this issue presents further evidence that psychedelics have

had a positive creative influence on computer programmers, engineers, writers, musicians, philosophers, and many others. Highlights include art/interviews/quotes/writings by and about L.J. ALTVATER, ALEX GREY, ALLYSON GREY, ALDOUS HUXLEY, YUMI UNO MUNDO, MARK PESCE, STEVEE POSTMAN, TOM ROBBINS, STEVEN ROOKE, MYRON STOLAROFF, DONNA TORRES, MANOLO TORRES, ROBERT VENOSA, and numerous MAPS members who stepped forward to relate their own stories of the creative effect that psychedelics have had on their lives. For those who may have felt that past *MAPS Bulletins* focus a bit too much on medical studies and governmental red-tape, this issue may be a welcome surprise, and is a good reason to become a MAPS member, renew your membership, or make a pledge.

**MIDWEST ORGANIC**  
**POB 442 (Dept. ER)**  
**Trenton, NE 69044**

An *ER* subscriber in New Zealand tipped me to this company in the USA, which sells a psilocybin extraction kit for \$114.00, postpaid. What caught the *ER* subscriber's eye was a review of this product that appeared in the company's promotional literature:

"Unlike other extraction processes developed for psilocybin, you don't need a Ph.D. in chemistry to be successful...for anyone who still hasn't tried the ultimate organic hallucinogen, give Midwest Organic a call."  
— *The Entheogen Review* (Nov. '98)

What's wrong with this picture? Well, *The Entheogen Review* isn't a monthly publication, so there wouldn't actually be a "Nov. '98 issue." And furthermore, even if one were to check each and every issue of the four that were produced in 1998 (or in *any* year as far as I can tell, for that matter), one would not find the quote attributed to *ER*, as it was never published in *ER*.

So, off the bat, we've got a company that lies to promote their wares. This doesn't instill a great deal of trust in any of the other claims that they make about their product (which it is likely is a process used to extract mycelia, as it says that no mushrooms need to be fruited). Of course, I haven't tried the kit, so I can't say one way or another how easy or difficult it is, or of what quality the equipment is that they send. Over a hundred bucks for the instructions for such a process and the small amount of equipment (glassware, buchner funnel,

burner, loop, chemicals, growth medium, and spore syringe), seems a little steep. The RONIN-published book *Psilocybin Production* by ADAM GOTTLIEB explains how to grow and extract mycelia, and it only costs \$9.95. (Similar information may be available on the Internet at no cost.) Add to that perhaps \$15.00 for a spore syringe from any of the numerous companies selling these now, and a few fairly inexpensive additional supplies, and it seems quite likely that the meat of this kit could be had for under \$50.00. It's hard for me to recommend this kit, since it seems as though it is probably *not* a great value. It is even harder for me to recommend it, due to the lack of truthful advertising. The ironic thing is that if MIDWEST ORGANIC had sent a kit for review, someone at *ER* probably would have tested it out, and may even have been enthusiastic enough about the results it produced that it would have been recommended even though the price is a bit high. Since MIDWEST ORGANIC felt the need to fabricate a glowing review of their kit, I expect that they weren't too confident that the product itself would receive such high praise based on its own merits.

## PLANNED FOR 2001

The following two new publications are planned for release in 2001. It should be noted that the *Entheos Newsletter* mentioned as being defunct in the "Sources" column of the last issue of *ER* has no connection to the new publication with a similar name and focus.

**ENTHEOS**  
**3031 Ivy Street # 3 (Dept. ER)**  
**San Diego, CA 92104**  
**entheos70@aol.com**  
**<http://www.entheomedia.com>**

"ENTHEOS is a community of enthusiasts, scholars and scientists who share a common interest in the role of entheogens as it pertains to human spirituality. Recognizing the important role of the 'psychedelic' experience, both past and present, to the development of spiritual expression, we intend to publish the most accurate, relevant, and current research available on the subject. The journal *Entheos* will provide a much-needed forum for specialists while encouraging a wide popular readership. It is our intention to provide a balanced and respectful perspective on this widely misunderstood and politically volatile subject. It is also our intention to help remedy the lamentable under-representation of entheogenic phenomena in mainstream scholarship. Broad

discussion of the role of entheogens in human history can only widen the scope of humanity's collective pursuit of understanding. Though the journal will have a strong 'WASSONIAN' slant toward academic questions in anthropology, religious studies, art history, and history, *Entheos* will include topics ranging from contemporary issues and current events to health and healing, the politics of entheogenic spirituality, discoveries in chemistry and biology, and the history of psychedelic scholarship."

The organization's board members include: FRANK BARRON, JAY FIKES, ROBERT FORTE, CLARK HEINRICH, MARK KASPROW, DALE PENDELL, CARL RUCK, BLAISE STAPLES, and PETER WEBSTER. Managing Editor of the journal is MARK HOFFMAN.

"The premier of this new, semi-annual journal will be published in the Summer of 2001. (Mock-ups will be available in January of 2001 for retailers and distributors). *Entheos* is currently soliciting editorial submissions and other assistance. For more information please e-mail us. Issue 1 will include a major scholarly work on the origins and development of alchemy, two revealing essays featuring entheogens in biblical art, and a personal visit with GORDON WASSON. The premier issue will include additional features, and various editorial departments and reviews. Annual (2 issue) subscriptions are \$25.00 (USA), \$30.00 (foreign)."

**MIND MANIFESTING**  
**c/o Evan Martin**  
**230 W. 79th Street, #101 (Dept. ER)**  
**New York City, NY 10024**  
**LArديو@aol.com**  
**(212) 496-8626**

A planned new magazine that makes the bold claim that it "will be the largest psychedelic periodical ever; a highly visually stimulating publication, bridging entheogenic/psychedelic communities with cyberdelia and the global psy-trance phenomena, and exhibiting and promoting all kinds of visionary artists, writers, poets and psychedelic thinkers, scientists and musicians, including these most well-known, world-renowned: ROBERT VENOSA, RICK STRASSMAN, STEPHEN MILLER, ERIK DAVIS, INFECTED MUSHROOM (EREZ), MUSHROOM JOHN (ALLEN), DENNIS AND THE ESTATE OF TERENCE MCKENNA [huh?], NICK HERBERT, MARK THORNALLY, RUPERT SHELDRAKE, RICK KLAUS THEIS, RALPH ABRAHAM, ANN SHULGIN, LARRY CARLSON, DANIEL

HOLEMAN, ALICE KELLY, RALPH METZNER, possibly NICK 'DOOF' BARBER, OLLI WISDOM 'SPACE TRIBE,' PETER GORMAN and CHRISTIAN RÄTSCH, are all active participators and contributing to this issue, along with many many more artists, poets, writers, DJs and trancers." (Strangely, I haven't heard of nearly half of these "well-known, world renowned" individuals, but perhaps I've had my head in the sand.)

This rag would seem to be less scholarly than the aforementioned *Entheos*, and more geared towards the pop-culture of modern psychedelia and the various dance communities. It sounds as though it will also have a stronger focus on the visual arts and computer graphics. The first issue is scheduled to be out in April, 2001, and it is said that it will be produced quarterly and have "massive world-wide distribution." The publication sounds ambitious, and I am hopeful that this won't be another case of someone biting off more than they can chew. Nevertheless, I look forward to seeing the first issue. It appears as though there is no web site yet, nor information about subscription costs; write or e-mail for details.

## NOTICE

The mailing address for the national office of DANCE SAFE has changed. They are now at: DANCE SAFE, 1714 Franklin Street #100-333 (Dept. ER), Oakland CA 94612-3408.

### New Botanicals at Herbal-Shaman!

### HERBAL-SHAMAN

WWW.HERBAL-SHAMAN.COM

*Amanita muscaria* (Soma): dried whole mushroom pieces from the forests of the Northwest. Very fresh mixed caps and stems. Very limited supply. *Ipomoea tricolor* (morning glory): seed—heavenly blue, pearly gates, flying saucers, crimson rambler, blue star. *Heimia salicifolia* (*sinicuiche*): a little-known and rare shamanic botanical. Leaf and flower pieces. Hand-raised by a practicing shaman in México. *Mucuna pruriens* (*Mucuna*): a tryptamine-containing plant used to treat impotency. Whole plant, powdered. Imported from India. *Papaver rhoeas* (corn poppy): an interesting and beautiful medicinal poppy. Has attributes similar to its famous cousin, the opium poppy. Whole plant, c&s. *Papaver somniferum* (opium poppy): seed—hens & chicks, giganteum, Persian blue, glabrum, peony flower, Danish flag, double flower scarlet & mixed colors. *Piper methysticum* (kava kava): very nice *waka* grade whole roots from Fiji, for the serious connoisseur. We also carry this root finely ground and in tea bags. *Trichocereus pachanoi* (San Pedro): seeds and cuttings. *Salvia divinorum*: standardized 5X extract is back! 12.5 mg of pure salvinorin-A per gram. This is not a crude extract, but the purified essence of *S. divinorum* redeposited on prime leaf for ease of burning. An exceptional incense for the experienced shaman. **Spore syringes**: they're back! We have several excellent species of grain- and wood-loving *Psilocybe* species. Please check our web pages often as the mix of available species changes regularly. Hundreds of other herbs, seeds, teas, gifts, incenses, and botanical products are offered on our web site. Note: you must be at least 18 years old to shop at HERBAL-SHAMAN. Some botanicals are sold as strictly non-consumable, and may be toxic.

# BOOK REVIEW

---

*Psychedelics Reimagined*, THOMAS LYTTLE (editor), 1999 (AUTONOMEDIA, POB 568 Williamsburgh Station, Brooklyn, NY 11211, (718)963-2603, www.autonomeia.org), ISBN 1-57027-065-1 [5.75 x 8.75 inch paperback \$14.00]. 256 pp.

With *Psychedelics Reimagined*, THOMAS LYTTLE has assembled a diverse collection of writings, and as has been consistently true for his past works, this book will be of great interest to anyone with a love for this field. However this particular work also has substantial value for many other people. While it could just as easily have been entitled *Psychedelic Monographs and Essays*, Volume 7, the underlying thread running through most of the writings presented stresses the importance of the psychedelic experience as something of immense value that has been mistakenly overlooked, abandoned, or rejected in our culture. It also presents a number of refreshing “new” views on this very old subject. The result is an enjoyable and informative work, which features a foreword and introduction by TIMOTHY LEARY and HAKIM BEY, respectively prefacing writings by a diverse set of authors.

Many of the articles stress the importance of the visionary experience and the fruitful partnership these plants have long held with the human race—including the often maligned but widely employed *Cannabis* and *Brugmansia*. However, there are also articles that readers will find of interest for their meaningful perspectives on older subjects. These include an early interview with CARLOS CASTAÑEDA that perhaps illuminates some of the reasons why he did not do more interviews. Whether the reader loves or loathes CASTAÑEDA, they are certain to find this candid (and rare) glimpse of him to be fascinating.

An enlightening essay on FITZ HUGH LUDLOW elaborates not just the role LUDLOW’s writings played in later people’s perceptions of drug use, but also the role that drugs played in LUDLOW’s own perceptions. As well, there are also fond memoirs of BABA GANESH; reasonable lamentations by chemist OTTO SNOW on the insanely restrictive burdens placed on neuroscience by overzealous legislators; IONA MILLER’s fascinating “Chaos as the Universal Solvent”—discussing personal transformation as viewed from within the thoroughly psychedelic framework of an alchemical perspective; inter-

esting recollections on the beginnings of the rave movement in California; and various short papers featuring the nuggets of thought-stimulating information that LYTTLE has become well known for collecting into eclectic books.

For some readers, this work would be worth buying just for JOHN W. ALLEN and JOCHEN GARTZ’S most welcomed overview of psilocybian mushroom occurrence and use in Southeast Asia and other Third World countries. After the seeming glut of more popular articles published in recent years that paint Thailand as a magical and trouble-free place to seek out mushrooms, this informative, detailed and well-referenced discussion is a welcome breath of reality.

Despite its wealth of information, *Psychedelics Reimagined* would have been much more useful to many readers had several of the individual articles been more completely referenced (or referenced at all!). After reading CHRIS BENNETT’S interesting “Scent of Lebanon To The Wise,” an essay attempting to demonstrate *Cannabis* use and familiarity in the *Bible*—largely on a linguistic basis—the reviewer was left with many questions that there was no indication how to pursue in any greater detail. Even JOAN M. BELLO’S long overdue and well-written piece elaborating the many benefits of marijuana use was often curiously short in providing much more than general references. While it was found to be an important and informative article, it was also a little disappointing for not providing the reader with any clear indications of how and where to learn more about some of the specific claims that were made.

LYTTLE also includes an extensive annotated review of many publications and organizations that exist (or have existed) related to this area but, oddly missed TROUT’S NOTES and only lists *The Entheogen Review*. Of course this is currently almost the norm in such compilations, as recently indicated as well in the excellent compilation *Tripping*, by CHARLES HAYES, which missed both publications. (Perhaps this is due to neither *ER* nor TROUT’S NOTES having a web presence?) Despite this small oversight, *Psychedelics Reimagined* is highly recommended and I hope that LYTTLE sustains a long and productive career in order to allow us to enjoy many more such works. — K. TROUT

# **SALVIA DIVINORUM EXTRACTS**

**We specialize in offering  
the highest quality extracts  
of *Salvia divinorum* available  
on the market today.**

Our extracts are standardized and made using pure salvinorin A. We have several extracts available, like our popular 5X Extract, which contains 12.5 mg of salvinorin A per gram. The cost of the 5X is \$20.00/gm or \$50.00/3 gm.

All of our products are unconditionally guaranteed and free samples are available upon request. Write for our catalog, which lists all our *Salvia divinorum* extracts, and contains a lot of useful information on this unique plant. We are celebrating our third year in business, and wish to thank our many loyal customers for their continued support.

No personal checks accepted. Payment in cash or postal money order only. If paying by postal money order, leave the "Pay To" space blank or your order cannot be filled. Cash only on foreign orders. All orders filled within 24-hours. All prices are postpaid in the USA; foreign orders inquire for shipping costs. Inquire for wholesale pricing. Please do NOT send postcards!

## STATEMENT OF PURPOSE

This journal is a clearinghouse for current data about the use of visionary plants and drugs. Think of it as a community of subscribers seeking and sharing information on the cultivation, extraction, and ritual use of entheogens. All communications are kept in strictest confidence—published material is identified by the author's initials and state of residence (pseudonym or name printed on request only). The mailing list is not for sale, rent, or loan to anyone for any reason.

## NEW ADDRESS

**ERRATA:** In my article “Burning One Down” (Spring/Summer 2000), which reviewed the BURNING MAN festival it was stated that “almost 30,000” people were in attendance; the actual number of attendees was around 26,400. It was also stated that 7 people received *Cannabis*-related tickets; the actual number of tickets was 18, and there were also 38 “controlled substance” citations. FOX NEWS was cited as reporting that there were 5 drug-charge arrests; the actual number was 6. And, most importantly, FOX NEWS was cited as reporting that “80 people a day” were treated for drug overdoses; the actual number was only 32 for the entire week (or 4.57 per day). Thanks to ANDIE KOPP (aka ACTIONGRL) of the BURNING MAN communications department for bringing these errors to our attention. — DAVID AARDVARK

**DISCLAIMER:** Information presented in *The Entheogen Review* comes from many different sources and represents the opinions and beliefs of a highly diverse group of individuals. *The Entheogen Review's* editors assume no responsibility for the accuracy of any claims or representations presented in the text, illustrations, or advertisements of this journal, nor do they encourage illegal activities of any type. Manufacture, possession, or sale of a controlled substance is a crime that can result in a lengthy prison term and significant fines.

**SUBMISSIONS:** Your input is what keeps this journal alive. Don't hesitate to share your experiences, inspirations, and questions. Confidentiality respected; after transcription, all correspondence is shredded and recycled, or incinerated. Although we may edit for brevity or clarity, keep those fascinating letters coming in!

**SUBSCRIPTIONS:** \$25.00 (USA), \$35.00 (foreign) for one year (four issues). Cash, check or money order made out to *The Entheogen Review* should be sent to *The Entheogen Review*, POB 19820, Sacramento, CA 95819. Please notify us if your address changes.

**BACK-ISSUES:** A limited supply of back-issues of *The Entheogen Review* are available. Send a #10 self-addressed stamped envelope for our current catalog.

# SNUFFY PROBOSCIS OUT ON A LIMB: SNUFF—SYNDETTICS, SYNECDOCHES

by JONATHAN OTT

The following seven intriguing and far-reaching vignettes spring forth from the chapter on tobacco-snuffs from JONATHAN OTT'S much-anticipated latest book, *Shamanic Snuffs or Entheogenic Errhines*. Forthcoming in April, *Shamanic Snuffs* is a comprehensive review of diverse insufflated plant-preparations used as shamanic inebriants, primarily in South America, where such have been studied in greatest detail.

The first three chapters focus on the three major classes of snuffs—*cebill/cohoba/ñopo*, prepared from triturated seeds of *Anadenanthera* trees (legume-family); *epéna/hakúduf'a/yá-kee*, derived from bark, bark exudates and extracts of *Virola* trees (nutmeg-family); and that most important, and geographically-widespread sort derived from *Nicotiana*, or tobacco-leaves—and detail the history, ethnobotany, and chemistry of each.

A fourth chapter features 57 monographs of lesser-known types of ethnomedicinal snuffs, covering some 134 species, including many ill-studied African shamanic snuffs, and a *vademecum* of 16 stimulating and hunting-enhancing snuffs for hounds and horses!

The final chapter presents the results of the author's pharmacological modeling of these three major classes of shamanic snuffs: 26 psychonautic bioassays of bufotenine, 17 of 5-methoxydimethyltryptamine, and 17 of nicotine, which are shown to represent the major psychoptic principles of intranasal, sublingual, oral, fumatory, and intrarectal shamanic inebriants of *Anadenanthera*, *Virola*, and *Nicotiana*, respectively. The long-extinct Taíno snuff-culture is sensually evoked by a passionate prose-poem, and the book is documented by a 19-page bibliography of 465 sources; its wealth of detailed information made accessible by a 15-page index with 1341 entries.

Published by ENTHEOBOTANICA [Kronengasse, 11 / 4502 Solothurn, Switzerland / tel. 0041(0)32-621-8949], 2001. A limited edition of 1026 copies, hand-bound in leather, with cloth-bound slipcase, signed and numbered; with 1 color and 11 black-and-white illustrations; 160 pages. First edition price: US \$100.00 / SFR 180.00.

Forsaking the comforting physicality of potions and powders, I dare to venture into realms of airy speculation... smoky, if you will; perchance, in the famous words of Henry Thoreau: «mere smoke of opinion, which some had trusted for a cloud that would sprinkle fertilizing rain on their fields». To be sure, for the military or political tactician, «smoke-screens» perforce suffice *camouflage* or disguise, dissimulation or deceit. On the other hand, smoke—surely of tobaccos and other shamanic inebriants—has a long and fabled history as a catalyst to divination; destiny descried in its vatic vortices, capnomancy or perchance *fumispicy* (*via* analogy to *haruspicy*, definition of which I'd best leave to a curious reader's further inquiries). In his novel *Besuch auf Godenholm (Visit to Godenholm)*, Ernst Jünger has beautifully described an ascending plume of incense-smoke as a fumatory ferment of vision, which amounts to much the same thing. By way of example, the northern Venezuelan Chaima burned bundles of tobacco on open fires, divining «through interpretation of the curls and spirals of the rising smoke» while Venezuelan Caquetio and Jirajara shamans rather divined by examining tobacco-ashes (spodomancy or tephromancy) following three days of smoking [Wilbert 1987]. Lovely classical Mayan lintels from Yaxchilán show graphically a queen descreying a «vision-serpent» in plumes of smoke arising from a bowl in which she'd apparently burned strips of bark-paper anointed with her blood after drawing a thorned-cord through her tongue [Schele & Miller 1986]! The most revered divinatrices of the classical world were the Pythia, affectionately known as the «Delphic Bees», whose abstruse mantic murmurings gave voice to the Oracle of Apollo at Delphi. While visionary inebriants were doubtless involved—mayhap inebriating honey or *apollinaris*, *Hyoscyamus albus* L. (Solanaceæ), or both, [Ott 1998; Rátsch 1987]—their vatic visions were had suspended over a fumarole in a cavern on Mt. Parnassos, whence issued fumes from the womb of Our Lady Gæa.

In the seven *vignettes* that follow, I'll make repeated reference to six major categories of American shamanic inebriants: *Anadenanthera* or ÑOPO-snuffs (Leguminosæ); *ipadú* COCA (Erythroxylaceæ); AYAHUASCA-potions (Malpighiaceæ); *Virola* or EPÉNA-snuffs (Myristicaceæ); *Nicotiana* or TOBACCO (Solanaceæ) and CACAO (Sterculiaceæ).

**ASHES TO ASHES, DUST TO... DUSTED: PLANT-SPIRITS ON GUARD-DUTY**  
We have seen an irrefragible consistency in the plants employed as ash-sources in the commingling of shamanic snuffs, which has nothing to do with convenience or ecological abundance in any given place—why not simply, indeed, scoop-up some ashes from the hearth, always at hand and demanding no especial effort? 'Though we have scant *data* at our disposal regarding many ill-studied African shamanic snuffs, we can confidently assume that for African shamans, too, not just *any* old ash will do—with

regard to TOBACCO-snuff comminution in Madagascar, Linton [1930] remarked offhandedly: «more attention seems to be paid to the ash than to the TOBACCO, two or three varieties being added in exact proportions». In American shamanic inebriants, the families Leguminosæ, Sterculiaceæ and Lecythidaceæ are by far the most important ash-sources, the first associated with all five inebriant-complexes (excluding here CACAO-potions, where no ash is used), the last two with four; the Moraceæ with two of the five. With regard to plant-additives to these inebriants, Leguminosæ, along with Malpighiaceæ and Solanaceæ, is again primary, all three families associated with all six inebriant classes; followed by Myristicaceæ (5/6), Lecythidaceæ and Sterculiaceæ (3/6) then Moraceæ (2/6). Two important conclusions might be drawn from this: first, that the families most important as ash-sources—especially the Leguminosæ—are likewise important admixture-sources; second, that there is extensive blurring of boundaries between our six inebriants; the families of ÑOPO, TOBACCO and AYAHUASCA intermingling with every one, those of EPÉNA and CACAO all but one.

In other words—at least symbolically—the plants chosen as ash-sources are, or bear some relationship to, important shamanic inebriants. I hasten to add, anticipating what would indeed be a captious objection, that in the plants under consideration, generally speaking of primal mythological import, folk-taxonomies are remarkably congruent with a botanist's. For all intents and purposes, the Quechua *cumala* and the Tupi-Guaraní *kaka[u]* or CACAO (and parallels in divers languages) are equivalent to Myristicaceæ and Sterculiaceæ. This holds alike for species of Lecythidaceæ and Moraceæ germane here, closely associated linguistically with TOBACCO or CACAO; as for the Malpighiaceæ, AYAHUASCA itself, *Banisteriopsis caapi*, intercalates with other inebriants. Key leguminous trees likewise form a distinct folk-taxonomic category, even for us, *viz.* «locust-trees». On the other hand—and equally portentous—there exists a singular and irrefragable linguistic intermingling of these various folk-*taxa*, to which I have by turns animadverted, and will document in greater detail below.

From a «die-hard doper» perspective (not that I would impute such to any of my readers—here, as always, I speak for myself), having weathered dope-droughts and dearths, it might fairly be asked: how can it be possible that a shaman/pharmacognosist should burn-up scarce and invaluable stash, simply to obtain ashes which are ever-abundant in any hut or *maloca*? The answer is stark and simple: the tutelary plant-spirits, rather than assuming

their didactic/inspirational role, *are here standing watch*. Nepheligenous TOBACCO-smoking during harvesting, infusion, repartition and ingestion of AYAHUASCA, as I have said, suffices as an animistic ægis, as a spiritual shield protecting the protean elixir, as able to work ill as good. Smoke, which is the visible, manipulable, halituous spirit of the plant made manifest, serves this lustral, protective role worldwide, and leaves behind it the irreducible material essence of a living being, its inorganic ashes—the body of the plant in fact entering into the comminution of the snuff, its fumacious spirit protectant, as wonders work in the alchemical alembic. If, as be true for COCA and TOBACCO, the alkalinity of the ash enhances alkaloid-uptake in mouth or nose, then the favillous plant-*body* materially works its miracles. A consistent and noteworthy feature of the confection of shamanic snuffs and *ipadú* COCA, is the fact that *the combustion of the ash-source is frequently contemporaneous*—as opposed to more «efficiently» preparing a large batch of ashes, to be laid-up and used as needed. This has been documented for *Virola* preparations [Schultes 1954, 1969; Seitz 1967] and *ipadú* [Plowman 1981; Schultes 1981]—referring to Tanimuka *ipadú*, Schultes and Raffauf [1992] added: «there seems to be no reason for burning [*Cecropia* leaves] inside the houses»... unless this be plant-spiritual!

#### SHOOTING-UP: FROM DART-POISONS TO SHAMANIC SNUFFS

It doubtless surprised many to learn that at least for certain groups of Waiká Indians, dart-poison and visionary snuff are one and the same, the «poisoned» darts indeed being a handy and efficient means of snuff-storage. Attentive readers will recall that I noted the Waiká use the «blowgun»-method of snuffing, in which one person forcefully blows a snuff into another's nostril, *via* a *taboca* or snuff-tube 1–2 m long, similar to the *cerbatana* (*sumpitan*) or blowgun, being shorter and thinner, though probably having a wider bore. Dart-poison snuff suddenly seems a great deal less peculiar, especially when we reflect that a favored species for blowgun-manufacture is *pucuna caspi*, the *Virola* relative *Iryanthera tricornis* DUCKE [Duke & Vásquez 1994]. Significantly, we've two historical reports of apparently inebriating, non-lethal dart-poisons, antecedent to the disgraceful Usan «nonconventional chemical warfare» fiascos of the MKULTRA/Vietnam-war era. In 1548, near Lake Maracaíbo in western Venezuela, *conquistador* Alonso Pérez de Tolosa described *cerbatana*-darts: «dipped in an herb which, wounding someone only slightly, would drop him senseless for two or three hours... after which he would arise in his five senses, absent other harm». In 1629

and much farther south, in the Río Caquetá of southern Colombia, a monk named Vázquez de Espinosa [1948] reported kindred *cerbatana*-darts: «on which they put an herb that is not deadly but only inebriates those wounded for 24 hours». I must take exception to Bisset's [1992] conclusions thereupon, in his excellent historical review of *curare*, to wit: that these records are consistent with the effects of Amazonian *curares*, typically based on extracts of the roots and barks of Loganiaceæ (*Strychnos* spp.) and Menispermaceæ (*Abuta*, *Chondodendron*, *Curarea* spp.) [Schultes & Raffauf 1990], and decidedly lethal. Bisset was apparently unaware of those reports from Roraima (not far from the site of Vázquez de Espinosa's chronicle) of inebriating snuffs/dart-poisons from *Virola theiodora* resin, which far better fit these citations of non-lethal, inebriating dart-poisons (Bisset rightly noted mistranslation in the English accompanying the first publication of Vázquez [in 1948], where «intoxicates» was given for *embriaga* [inebriates], but adds: «[this] means no more than «drunk»», which would be rather *bebido*, mayhap *embeodado* in 16TH-century Castillian). In Peruvian Amazônia, Reinburg [1921] cited a shamanic inebriant, besides AYAHUASCA and *huanto* (*Brugmansia*), viz.: *camalampi*, hitherto recondite. *Camalampi* probably referred to *Virola* resin, being «*cumala-ampi*», or «myristicaceous *curare*», in Quechua (*cama-* is found in common-names for *V. sebifera* [Aguirre 1971]), although *kamarampi* is Matsigenka *Banisteriopsis* [Shepard 1998]. Other shamanic inebriants are combined with *curares*: as TOBACCO-leaves and *Capsicum* fruits with Tikuna- and Shuar-*curare* based on bark of a *Chondodendron* [von Humboldt & Bonpland 1819]; *Brugmansia* and *Brunfelsia* in Perú [Castner *et al.* 1998]; Colombian AYAHUASCA-source *Tetrapteryx mucronata* CAV.; Guyanan *Piper* root-bark [Bancroft 1769; Schultes & Raffauf 1990]. *Curare*-plant (bark and leaves) *Curarea tecunarium* BARN. & KRUK., was reported in Brasil to be combined with *paricá-snuff* by the Maué Indians [von Reis Altschul & Lipp 1982]; annotations to a voucher-sample state: «with the leaves of this Menispermaceæ, the Maué Indians toast the *parica*» (1971, from botanist Barbosa-Rodrigues). This came more than a century and a half after de Lincourt reported the Maué added leaf-juice, of an *Abuta* or other Menispermaceæ, and «ashes of a vine» to *Anadenanthera* seeds to make *paricá-snuff* (vide CHAPTER ONE), a solid confirmation! Intriguingly, menispermaceous *curare*-plants, of genera *Abuta*, *Chondodendron* and *Curarea*, as well as loganiaceous *Strychnos curare*-species, are commonly used in ethnogynecology (e.g. *Abuta grandifolia* root-tea as birth-adjunct in Ecuador; that species and *A. rufescens*

to treat sterility in Perú [Rutter 1990; Schultes & Raffauf 1990]; *Strychnos melinoniana* BAILL. as aphrodisiac in Surinam [Uphof 1968]); and these plants figure also as philtres in love-magic (in Venezuela, *S. jobertiana* BAILL. leaves are macerated in rum for perfume to attract the opposite sex [von Reis Altschul & Lipp 1982]). The species thus used are regarded among the strongest hunting-poison sources, which ought not surprise us—after all, the goal here remains hunting... love and romance on the one hand, or neonatal souls on the other. In Mesoamerica, women were given toy-shields and -spears during parturition, and those that perished were deified, became *cihuateteo*, and were accorded funeral rites due a warrior fallen in battle; for in both cases, death occurred struggling valiantly to capture souls for the common weal [McKeever-Furst 1995; Ortíz de Montellano 1990]. The snuff-taking shaman, too, is often engaged in a hunt for a lost soul, and it is fitting that s/he be empowered for this task by hunting-poison administered *via* the weapon of the hunt, the *cerbatana*. Of course, hunting prey is first and foremost a sacred endeavor, the shaman's power key to its success, and Gorman [1990, 1993] attests that for the Matses of Perú, a major purpose for taking *nu-nu*-snuff, is precisely to seek visions of prey-animals, so to facilitate their capture, or to «see» whether a remotely-set trap has been sprung. Not only are snuffs taken *via cerbatana*-like *tabocas*, but TOBACCO is smoked thus, e.g. among the Shuar—that end of the *taboca* packed with TOBACCO and a candent coal is placed in the mouth of a fumifugist, who perflates lunt *via* the fumiduct into or onto another person. Potions (now possibly spiritous), TOBACCO-juice and snuff-powders, like TOBACCO-smoke, may be blown by shamans onto bodies of patients [von Reis Altschul 1972; Wilbert 1987]. Sucking of the patient's body or head by shamans (vide Wasson [1968] for theory of remote Siberian origin) may be accomplished *via a taboca*, such as is used for snuff-insufflation or *-exsufflation*, smoke-inhalation or *-perflation*, blowing of visionary smokes, snuffs or elixirs onto or about a patient or potion... not to overlook launching deadly or incapacitating poison-darts at hunted quarry. Amazonian shamanic sucking, of course, is inextricably intercalated with notions of invisible psychic darts called *virotas*, «shot» by an evil *brujo* (sorcerer) into a victim; suction-removal and safe disposal of which is a primary function of *curanderos* (healing shamans). Both pathogenic and salutary shamanic power is thus mediated by shamanic inspiration and halitus through the *tabocal cerbatana*—alike alimentary weapon of the hunt and psychic conduit for plant-spirits; whether inhaled or

# ENTHEOBOTANY

## SHAMANIC PLANT SCIENCE

11–13 May 2001  
CONVENTION CENTER  
Whistler Resort, BC/Canada

### ENTHEOBOTANISTS

**Rocío Alarcón** Ecosciencia, Ecuador  
**Carlos Aldunate** Archæologist, Chile  
**Antonio Eschohotado** UNED, Madrid  
**Josep M. Ferigla** SD'EA, Barcelona  
**Peter T. Furst** Univ. of PA Museum  
**Lester Grinspoon** Harvard Univ., MA  
**Kathleen Harrison** Bot. Dimensions  
**Michael Horowitz** Ludlow Library, CA  
**Ralph Metzner** CHS, San Francisco, CA  
**Robert Montgomery** Founder, BPC  
**Claudia Müller-Ebeling** Art Historian  
**Jonathan Ott** Natural Products, México  
**Cynthia Palmer** Ludlow Library, CA  
**Christian Rättsch** Writer, Germany  
**Giorgio Samorini** Writer, Italy  
**Stacy B. Schaefer** CSU, Chico, CA  
**Daisy Sewid-Smith** Linguist, Canada  
**Alexander T. Shulgin** UC Berkeley, CA  
**Paul Stamets** Fungi Perfecti, WA  
**C. Manuel Torres** Florida Int'l. Univ.

### PROGRAM

We will discuss the history and latest research on *ayahuasca*, *iboga*, psychoactive mushrooms, lsd, entheogenic snuffs plus their active tryptamines, as well as *péyotl* and mescaline analogues. Conference is aimed alike at scientists and interested *aficionados*.

### SCHEDULE

There will be 8 sessions; three evening (8–10:30 PM) two morning (9–12 AM) and three afternoon (2–5 PM); commencing on Friday, 11 May, at 2 PM.

### REGISTRATION

Ticket for all 8 sessions is **US\$290.00**, not refundable; food and hotel *aren't* included. Space is limited; be sure to register at your earliest convenience.

### ENTHEOBOTANY

Post Office Box 204 (DEPT. ER)

exhaled as smoke, powder or fluid—viaduct of virulent *virotas* launched with a *fnast* of *mal aire* by the *brujo*; extracted *per* buccal suction by the *curandero*.

### GUMMING SNUFF: TOBACCO-PASTES, SOLID ERRHINES AND VIOLA RESIN

In the EXCURSUS TO CHAPTER TWO, I reviewed the partial and degenerate evidence for past shamanic use among the Bora and Witoto of «oral» bark-exudate «pastes» from *Virola* and *Iryanthera* species; also of *Virola* and *Osteophlæum* species among the Quijos Quichua. Schultes [1979] has remarked the tragic fact that elderly Bora and Witoto Indians, not having used *Virola* in shamanism during two generations, recalled how their «fathers and grandfathers» made the pastes and could demonstrate this, while «their knowledge of which species of *Virola* to use... [was] found to be unclear and confused»! I suggest that they were also likely «unclear and confused» *as to the route of ingestion*, that these pastes were never intended to be swallowed, but either to be absorbed buccally (sublingually) or placed in the nostrils as solid errhines, a sort of time-release snuff, if not burned as incense. In seventeenth-century European medicine, errhines or intranasal medicines were either powders (a 1634 medical text stated: «drie errhines are to be blown into the nose with a pipe or quill») or balls of lint steeped in a medicinal fluid. Paul Reclus' 1903 manual on cocaine local anæsthesia described as errhine: «a small plug of cotton saturated with cocaine» to arrest nasal hemorrhage, and there is still another type of errhine, bougies—solid nasal suppositories. In 1711, André João Antonil cited a Brazilian use of TOBACCO-pellets inserted into the nostrils, stressing the resulting maldrop: «the pellets, being discharged from the nostrils and the drop of snot... soil the chin and nauseate the person with whom one is speaking». Mesoamericans likewise made *yiaqualli*, TOBACCO-pellets which might have been used as errhines. In 19TH-century pharmacies, errhines were compounded of pure compounds, and the U.S. *Pharmacopœia* of 1893 and the *National Formulary* of 1895 included PULVIS ANTICATARRHALIS, N.F., «Catarrh Snuff», a mixture of morphine hydrochloride, bismuth subnitrate and *Acacia catechu* L. F. powder [Remington 1894], whereas W. Martindale [1886] compounded cocaine nasal bougies for hay-fever. As for *Virola*, we also know *Virola* resins are used in Amazônia buccally, to treat inflammations/infections, and also rubbed onto the gums to treat childhood teething-pains [Duke & Vásquez 1994; Schultes & Raffauf 1990]; Wayãpi might treat malaria with an ethereal errhine of volatile oil of *V. surinamensis* leaves, containing safrole [Lopes *et al.* 1999]. The Bora and Witoto still confect *ambillyera* TOBACCO-pastes, *applied to gums* with a stick, often from a CACAO-fruit gourd, and I cited the parallels between TOBACCO- and *Virola*-pastes, down to the fine detail of use in both of an evaporated ash-leachate «salt» from specific plants. Only in World War II did TOBACCO-smoking gain the upper hand in these United States, where chewing-TOBACCOS had formerly characterized the habit, and be still of commercial importance, today labeled as «snuffs», that are rather taken buccally, which is called «snuff-dipping», and there are many accounts of fashionable ladies in 19TH-century Virginia rubbing powdered TOBACCO onto their gums with brushes, employing elegant snuff-boxes. As for contemporary citified *chimó* TOBACCO-paste in Venezuela, *chimó* is rendered

to a consistency rather like taffy, and for use: «an amount . . . about the size of a pea is placed in the mouth with the index-finger, to adhere to the inner surface of the lower front teeth», although it may be applied with a spatula yclept *paletica* or *pajuela*. The *chimó* then dissolves, and a bioassay suggested absorption was essentially sublingual [Kamen-Kaye 1971, 1975]. I suspect that the elderly Bora and Witoto Indians who informed Schultes about *Virola* pellets, and knew how to make them but not precisely from which species, had as children seen their «fathers and grandfathers» put the pellets into their mouths, and so assumed that they had swallowed them, when in reality they were allowing them to dissolve in the mouth, for sublingual absorption of their contained tryptamines (*vide* CHAPTER FIVE). D. J. McKenna [*et al.* 1984B] assayed (by oral ingestion) four different *Virola* paste-samples from Perú and Colombia, two of which were without activity (one having been alkaloid-free; the other with only traces of DMT). Peruvian *Virola sebifera* paste containing 1.32% 5-MEO-DMT and 0.38% DMT showed only the mildest of activity; while one Peruvian *V. elongata* paste (containing 1.57% 5-MEO-DMT): «elicited a rapid and profound response . . . characterized by considerable physiological distress rather than the perceptual and psychological [effects] typical of hallucinogens». McKenna ingested 1.5–2.0 g of this *ku'-ru-ku*-sample, corresponding to 23.6–31.4 mg 5-MEO-DMT, which would surely have been active sublingually, being thrice the threshold-dose (and perhaps subthreshold orally). It apparently hadn't occurred to the paper's authors that *ingestion route* was also an area in which the informants' memories were «unclear and confused», and thus the sublingual route was not investigated psychonautically. They had sought a putative  $\beta$ -carboline-mediated, AYAHUASCA-type oral activation of tryptamines in the pastes, which their results did not support, indeed more or less disproved, and it seems strange to me that two pages of discussion were devoted to hypotheses of convoluted alternate mechanisms for oral-activity of tryptamines—despite the fact that bioassays had not found such in the pastes—and the qualification at the end of the abstract—«if they are, in fact, orally active»—belongs also at the end of the final sentence of the article. I think the evidence is quite clear that «orally-ingested myristicaceous pastes» is a misnomer, and that they should be called «sublingual» rather than «oral». I deem as remote the possibility that the Boras and Witotos inserted these pellets intranasally as solid errhines, inasmuch as such a detail would surely have been recalled by their children, even in old age. However, insofar as rhinal use of

TOBACCO-pellets is reported from South America, we cannot discard this as a possible route of ingestion of *Virola* pellets in another time or place. I might animadvert parenthetically to linguistic blurring between these *Virola* species and the CACAO-species used with them as ashes: *V. sebifera* and *V. guatemalensis* (HEMSL.) WARB. are known as *jungle-cacao* and *flying cacao* (*cacao del monte* and *cacao volador*), *Iryanthera juruensis* WARB. as *wild cacao* (*sacha cacao*); whereas *Theobroma cacao* and *T. subincanum* are conversely known as *cumala* [Aguirre 1971; Bennett & Alarcón 1994; Duke 1981; Rutter 1990]. I already remarked that the Witoto name for *Virola*, *oo-koó-na* (*úkuna*), means «jungle-TOBACCO» (being at least consistent with my hypothesis that similarly-made Witoto *Virola* and TOBACCO-pastes were also similarly ingested), and we see these rain-forest denizens also to be known as «jungle-cacao». TOBACCO, I must add, is *not* native to Amazônia, its omnipresence there being strictly as a cultigen [Goodspeed 1954], and this is an aggressive, weedy annual, easily escaping cultivation and frequently agrestal. In this context it is more than salient that the use of *Anadenanthera*—like TOBACCO exotic in Amazônia—has also penetrated completely the length and breadth of this vast ecosystem, its family that most universally represented, both as admixtures and ash-sources for other inebriants. Finally, I referred early-on to a mysterious resin, grated and used as a shamanic snuff in Colombia. Schultes [1954] thought there were a slight possibility this be *V. bicuhyba* resin, which we saw in CHAPTER TWO is reputed to be a «brain stimulant» in Brasil; the seed of the tree—tentatively containing bufotenine—a «narcotic».

**THE ENIGMA OF AMAZONIAN JUREMA**—In CHAPTER ONE I made mention of a once-widespread complex of potions known generically as *vinho da jurema*, and based on cold-water infusions of pounded root-bark of *jurema preta*, *Mimosa tenuiflora*, plus at least ten *juremas brancas*, other trees of the Leguminosæ (*Acacia*, *Mimosa*, *Pithecellobium*). The territory of *jurema* is the *caatinga* of northeastern Brasil, ecologically as different as can be from Amazônia, so it is more than surprising there were 18TH- and 19TH-century citations of *jurema*-use in western Amazônia, climatically and geographically worlds away from its home! Schultes [1978] reviewed these obscure reports, which placed Amazonian *jurema* among the Amanajóz Indians of the Río Negro in 1843 (noting specifically the key detail that the potion was made from the *roots* of the *jurema*-tree), a Jesuit missionary having ascribed such use to many tribes. Schultes dismissed these reports out of

hand, as «most certainly erroneous and confused». Although he noted that the Amanajóz and other peoples had migrated to Amazônia from northeastern Brasil at the end of the 18<sup>TH</sup> century, he asked rhetorically: «where could these Indians have found *jurema* roots in their new and very different environment?». Information not available to Schultes when he wrote this paper suggests at least two convincing answers to his rhetorical question. Botanical studies [Barneby 1991; Grether 1988] are in accord that the primary source for *vinho da jurema*, *jurema preta*, previously ascribed to *Mimosa hostilis*, is not endemic to the northeastern Brazilian *caatinga*, but rather occurs in disjunct populations from Bahia, Brasil, north—at least to the Mexican state of Oaxaca, where it is common and abundant. Indeed, the tree was first collected in Venezuela in 1806, as *Acacia tenuiflora* WILLD., and later in Colombia in 1863, as *Mimosa cabrera* KARST., after its common name there, *cabrera* or *cuji cabrera*. The first Brazilian collection was in 1823, as *Acacia hostilis* MART., which Bentham transferred into *Mimosa*—the correct botanical synonym for all these is *M. tenuiflora* (WILLD.) POIR. Since western Amazonian tribes have been able to obtain *Anadenanthera* seeds also from habitats remote and divergent from theirs, it follows that they could also similarly have obtained roots of *jurema preta* from interior Venezuela or northern Colombia, where it is not uncommon. As a matter of fact, the ranges of *M. tenuiflora* and *Anadenanthera peregrina* var. *peregrina* overlap in those countries, as also be the case between the former and both varieties of *A. colubrina* in northeastern Brasil; habitat and altitude preferences for all four being congruent. Indeed, it would appear that with respect to folk-taxonomy in Brasil, no significant distinction is made between *juremas* and *angicos* (the name most commonly associated with *Anadenanthera*). Inasmuch as there exist *angicos brancos* (*Piptadenia* and *Pithecellobium* spp.), perhaps there are also *angicos pretos* («black»), and von Reis Altschul [1972] noted without especial comment that where *angico* begins to give way to *paricá*, as common-name for *Anadenanthera*, around the mouth of the Amazon, it is indeed called the «black *paricá*» or «false *paricá*», *paricáramá*. In Brasil, *Mimosa* species are called «little *angicos*», *angiquinho* or *angiquín*, and where the names overlap, both *Acacia* and *Pithecellobium* species are known as *paricá* or *paricá grande*. Taíno-*cohoba* (Guaraní-root [Williams 1930]) for *Anadenanthera* exists in Brasil as *cububa* for *Piptadenia tocanina*, while in Colombia, *choiba* and *yapo* are a likely *chimó*-additive, *Dipteryx panamensis* (PITT.) REC. & MEL.; in Panamá, *choyba* is also a *Helicostylis* species (Moraceæ; doubtless one of the species yielding

visionary *takini*-latex), and in Perú the *Anadenanthera* name *kurupá* can also refer to a Yagua *Brugmansia* species! We have already seen that the Quechua *vilca*, closely associated with *Anadenanthera*, also applies to *Erythrina ulei* or *vilca tarwi*, possibly taken jointly with the former in purgative enemas, whereas two species of *Banisteriopsis* are called *huillca bejucos*, «*vilca*-lianas», and it has been suggested that *wircawei-yek*, a Venezuelan name for *Virola sebifera*, inner-bark of which was «smoked by witch doctors [*sic*]», likewise is related to the *vilca*-phoneme. Oddly, *angico* is also a name for *Guettarda* (Rubiaceæ, one species of which is added to AYAHUASCA) in Brasil. I've already remarked the strange parallelism between *ajucá* as a Pancarurú name for the *jurema*-potion, and *acujá*, a Yekuana-snuff on the Río Ventuari, which could well have been from *Virola surinamensis*, called *cajúca* in the Caribbean (we saw that a boiled-bark inebriant from *V. elongata* was known as *akurjúca* in Yekuana). There are similar significant overlaps in Colombian folk-taxonomy, and *cuji* would seem to be equivalent to *angico* or *paricá*—I noted *Mimosa tenuiflora* (*jurema preta*) is called *cuji cabrera*, but *cuji*, *cuji cimarrón* (or «wild») and *cuji hediondo* («foetid») apply to various *Acacia* species, the last also to *Piptadenia*. Farther north, this word changes into *cujiniquil* in El Salvador, or simply *jiniquil* in México, for *Inga* species, snuffed with tobacco by Makunas [vide CHAPTER FOUR, *Dimorphandra*]. *Ta[h]uari*, for lecythidaceous/moraceous bark TOBACCO-papers, is also AYAHUASCA-admixture *Vitex triflora* VAHL (Verbenaceæ)—*Vitex agnus-castus* L. represents the *only* non-leguminous *jurema* (*branca*) in Brasil, where it is known to be used as ethereal errhine [Aguirre 1971; Barneby 1991; Duke 1981; van den Berg 1993; von Reis Altschul 1967, 1972, 1973; von Reis Altschul & Lipp 1982]! These linguistic *minutiae* set the stage for a second answer to Schultes' rhetorical question: where might Río Negro Amanajóz have obtained *jurema*? Perhaps they used *jurema* to describe roots of *Anadenanthera*, as opposed to *Mimosa*/*Acacia*/*Pithecellobium*—after all, unless they had traveled to the interior of Venezuela or northern Colombia, how might they have known that their beloved *jurema preta* abounded there? There appears to be no sacred aura suffusing *Mimosa tenuiflora* in northern South America, neither in Mesoamerica, where I've looked assiduously for this. In fact, *jurema preta*, called *tepexquáhuitl* or «ravine-tree» in Náhuatl, as *tepescohuite*, is presently perhaps the most famous Mexican ethnomedicine, object of a significant export-industry, related to prosaic, not numinous, uses as a topical vulnerary and a base for all manner of shampoos

and cosmetics, employing only the stem-bark, which contains merely 0.3–3% the DMT-content of the root-bark used in *vinho da jurema* [Meckes-Lozoya *et al.* 1990]. In the light of current knowledge, Schultes' out-of-hand dismissal of Amazonian *jurema* seems premature, and I see no reason to doubt this, especially considering the word *jurema* has crossed the breadth of the Amazon, where it is today still used in Perú for one specific *jurema branca*: *Pithecellobium tortum* MART. [Rutter 1990]... which is where I reluctantly must take leave of *jurema* for the nonce; noting that many seemingly loose-ends here will be tied-up into a meaningful and beautiful package in a future work.

**SYNCRETIC AYAHUASCA-COMPLEX AS ETHNO-MEDICINAL MIDDEN**—Much verbiage has been lavished on AYAHUASCA which, as noted at the outset, is the entheogen *en vogue* in the contemporary «shamanic scene». Lately the preponderance of writing is more mythological than scientific, and there has been a marked exaggeration of syncretic, *mestizo* AYAHUASCA-folklore of Amazonian Perú (centered around urban Iquitos, Pucallpa and Tarapoto), thanks to extensive ethnographic work in this area by my friend and colleague Luis Eduardo Luna [1984, 1986, 1991, 1992]. Also exaggerated in contemporary AYAHUASCA-consciousness are the practices and ideologies of modern syncretic AYAHUASCA-based cults from Brasil, notably SANTO DAIME and the UNIÃO DO VEGETAL, which are, after all, churches and not scientific academies [Mac-Rae 1992; Ott 1995B, 1999B]. Exemplary of modern AYAHUASCA-mythology, published doctrine of the UNIÃO DO VEGETAL [Anon. 1989], while acknowledging founding of the sect on 22 July 1961 by José Gabriel da Costa, claims *de facto* origin in the Isralite kingdom of Solomon, 10TH century B.C., then a «reappearance» in 5TH–6TH century Perú, «in the Incan civilization», which the most liberal genealogies of only 13 precontact Incas (the word referring to the royal line of descent) extends no earlier than 1021 (Manco Ccapac)—deemed by Prescott [1847] wishful thinking, he fixing a more likely founding of the dynastic civilization about 250 years before the arrival of Pizarro, or late in the 13TH century—while Solomon is considered a fictional Biblical character by many archæologists. Similar attempts to assign patents of archaic lineage to AYAHUASCA are based purely on conjectured uses of ceramic vessels, pursuant to the fallacious assumption: «use of the *ayahuasca* must have come long after the invention of pottery as the plant has to be boiled in a clay pot before use» [Naranjo 1979, 1986]. In the realm of science but nonetheless redolent of wishful

thinking—some loath to attribute a sophisticated pharmacognostic discovery to bands of bare-assed Indians—are theories of Hindu *Ayurhuasca*, Mesoamerican *Mayahuasca*, and the like. As we shall see below, there *was* a Mesoamerican «*ayahuasca*», but based on CACAO-potions and alcoholic *chichas* (*balché/octlil/pulque*), not *Banisteriopsis*, and although *B. muricata* (CAV.) CUATR. grows from Argentina to Chiapas, México [Gates 1982], trace alkaloid-content and patent lack of sacred aura illuminating this shrub/liana in Mesoamerica argue against its use there as an entheogen. *Pace* Naranjo's assumption that ceramics were a prerequisite to AYAHUASCA-brewing, probably the most archaic method for infusing AYAHUASCA-potions is by kneading of the crushed liana-stems or bark in cold water, precisely the way *vinho da jurema* was made traditionally; according to Schultes and Raffauf [1992], the most common technique of AYAHUASCA-infusion in the Colombian Amazon. Reichel-Dolmatoff [1970] likewise described this simple technique among Colombian Tukano Indians, stressing that there was no boiling, just cold-water infused AYAHUASCA: «unmixed with the leaves or with other ingredients»; Schultes and Raffauf adding that «occasionally» plant-admixtures were added in Colombia. Reichel-Dolmatoff's extensive studies of Tukanoan mythology [1971, 1975, 1996A, 1996B] make manifest that simple, cold-water-infused *Banisteriopsis* potions are indeed archaic, are intimately related both to TOBACCO and COCA, and surely are not called (H)AYAHUASCA (Quechua: «*coca-liana*»), but rather *gahpi* (COCA is *ahpi*) in Desana (*caapi*, whence its botanical name; also: *capi*, *cabi*, *caji*, *kahí*). This term is Tupí, probably most archaic, whence derive cognate names. Naranjo [1983] proposed as the etymology: «exhalation-leaf», *viz.*, that makes one vaporous spirit, noting this points perhaps to primordial use of the *leaves* by Tupí peoples. I've said *Banisteriopsis* leaves and bark are still smoked by Witotos; leaves are occasionally added to AYAHUASCA-potions, and the only quantitative analyses we have for *Banisteriopsis* leaves found five Peruvian samples to have on average 0.72% alkaloids, *better than double* the average content found in 15 stem-samples, including 4 of the strains from which leaves were analyzed [Rivier & Lindgren 1972]. At least for some tribes, the word *yajé* applies specifically to the *Banisteriopsis* LEAVES [Pinkley 1969]. Naranjo [1983] determined that AYAHUASCA was a neologism, dating no earlier than the 18TH century, noting that Quechua-speakers never colonized the areas where *Banisteriopsis caapi* is indigenous, nor did those few attempts of the imperialistic Incans to subdue Amazonian peoples prosper. Luna [1986]

enumerated 72 tribes reported as having used *Banisteriopsis* potions, of which merely 5 (or 7%) are Quechuan. On the other hand, 16 (22%) are Tukanoan while 13 (18%) Arawakan—the major areas of these two linguistic groups being congruent in the northwestern Amazonian interface between Colombia, Venezuela and Brasil. If we add-in the 9 (12.5%) Panoan tribes, we've better than half of the known users of *Banisteriopsis* potions;  $\frac{3}{4}$  of whom reside in a discrete area where pharmacognostical, mythological and linguistic details suggest such *brebajes* are most archaic. Just south of this area, in the central–upper Amazon, is the major stronghold of Panoan tribes that use *ayahuasca*, interspersed with Arawakan tribes, as well as the only two Tupí-tribes reported to use these potions, the Omagua and Cocama (recall that the commonest name for the potions in northwest Amazônia—*caapi* and derivatives—stems from a Tupí-root). It is no coincidence 58% of AYAHUASCA-using tribes from these four groups also ingest *Anadenanthera* and/or *Virola* snuffs (which ratio is 68% if we include TOBACCO-snuffs, too) nor that major names in this area for *Banisteriopsis* and visionary snuffs are Tupí-Guaraní. I wish to note that Guaraní-speakers from mid-Amazonian Brasil call «*ayahuasca*» *jaúma*, closer linguistically to *jurema* than any other known word for *Banisteriopsis* (save *Juramidam*, Santo Daime-name for the female spirit of AYAHUASCA [Polari de Alverga 1999]),

and that Colombian *cuji*, for *jurema*, is close to *caji* for *Banisteriopsis*. Which strengthens my conviction—which I'll substantiate anon—that archaic *Banisteriopsis* potions be Tukanoan-style, simple cold-water infusions of liana-bark or -stem *sans* additives, or with but few, in any given tribe, an «Amazonian *jurema*»; that the «*ayahuasca*-effect» (tryptamine:β-carboline synergy) is in fact the «*paricá*-effect», having been arrived at quite naturally *via Anadenanthera* snuffs (in which *Banisteriopsis* may still be mixed, else co-ingested) and *jurema*-potions—confected from like trees, confounded in folk-taxonomies, from the same habitat. Conversely, the prodigious «folk pharmacopœia» of *metizo*/Quechuan (although some of the best Peruvian practitioners I've met are monolingual Castillian-speakers who have no social or linguistic connection to any particular indigenous group) AYAHUASCA is probably no older than is the word, going back at most three centuries, however faithfully based on snippets of indigenous entheobotany culled here and there from refugees of many cultures, some long-extinct. It is, as Luna and Amaringo [1991] have graphically and carefully documented, a syncretic phantasmagoria of polyglot Amazonian traditions, esoteric Christianity... travelers' tall-tales, out-and-out science-fiction, and not a little experimentation and improvisation, to which I myself have willingly contributed. Above all, it is a species of

## JOIN MAPS!

Can you imagine a cultural reintegration of the use of psychedelics and the states of mind they engender?

Please join MAPS in supporting the expansion of scientific knowledge in this promising area. Progress is only possible with the support of people who care enough to take individual and collective action.

BASIC MEMBERSHIP: \$35; SUPPORTING MEMBER: \$100; PATRON MEMBER: \$250+ (Add \$15 for orders outside the U.S.) MASTERCARD and VISA accepted by phone, or through our secure server on-line at <http://www.maps.org/memsub.html>.

Memberships include a subscription to the quarterly *MAPS Bulletin*, which features articles, personal accounts, book reviews, and reports on conferences & allied organizations. As well, all new MAPS members who mention this advert will receive a free copy of *The Secret Chief* by MYRON STOLAROFF!

MAPS has positioned itself at the center of the conflict between scientific exploration and the politically-driven strategy of the War on Drugs. MAPS is the only membership organization supporting this crucial research. The confidential MAPS mailing list is not available for sale or trade, and the *Bulletin* is sent in a discreet envelope.

ethnomedicinal midden, in which plait and intertwine truly archaic strands of the vast, portentous and exquisitely-detailed tapestry that is South American shamanic pharmacognosy.

**BARKING-UP THE WEIRD TREE: PUKA-LUPUNA AND SAMÍKI**—I trust it would not be asking for too much indulgence on the part of you long-suffering readers, were I to poke my nose into a decidedly arcane knot-hole in the Tree of Life; one in which, moreover, this literature is in a bit of a muddle, which I can hopefully put to rights. Rafael Karsten [1964], working amongst the Peruvian Shipibo, unearthed some shamanic lore as fascinating as it is bizarre, concerning TOBACCO and a «demon» in the *lupuna*-tree. It seems evil *brujos* would place crushed TOBACCO-leaves, «thoroughly mixing them with saliva», into a *ronkon*—a sort of pot that «with the ceremonial tobacco-pipe, forms his most important equipment»—which in turn was inserted into a «deep cavity» carved in the trunk of a *lupuna*-tree, covered with bark, and left overnight, after which «the poisonous medicine [was] ready to be used for magical purposes». Evil magic, so it would seem, as an «evil demon» called *joshín* is the spirit of the tree, «particularly active in its poisonous sap». It's been assumed that Karsten's *lupuna* was *Ceiba pentandra* (L.) GAERT. (Bombacaceae) or the kapok-tree, known indeed by that name or more precisely, *lupuna blanca*, especially esteemed as a source of kapok used as fletching for hunting-darts—this is almost certainly a mistake, as we shall soon see. But first I must note that Luna [1986] documented a similar practice in Peruvian *mestizo* shamanism, regarding an «oar-tree», *remo caspi*. In this case, a small bowl of TOBACCO-juice was likewise put in a cavity in the trunk, sealed with mud-daubed bark, then left for eight days, following which the shaman would see visions of animals on the surface of the contents, that he was obliged to drink, on pain of certain death, and which draught would cause him to lose consciousness for 12 hours, during which the plant-spirit would «teach him many things». Luna identified *remo caspi* as *Pithecellobium letum* BENTH. (but this name could apply to other leguminous trees, *viz.* *Swartzia*, or apocynaceous *Aspidosperma*), and cited Karsten's account of *lupuna*, which he identified with *Chorisia speciosa* ST-HIL. (Bombacaceae); adding that in an earlier paper he had suggested *Ceiba pentandra* and *Trichilia tocacheana* D.C. (as *Trochilia tucacheana*, Meliaceae) as tentative identifications, settling on *Cavanillesia hylogeiton* ULB. or *C. umbellata* RUIZ & PAV. (Bombacaceae) for *puka-lupuna* or *lupuna colorada* («red»). I agree with Luna that his

evidence points to the Bombacaceae—either a *Cavanillesia* or *Chorisia*—and agree that Karsten's report *also* relates to one of these *puka-lupunas*. Unfortunately, Luna's early, tentative assignment of *lupuna* to *Trichilia tocacheana* (bearing this common-name in Perú), subsequently retracted (being based on common-name association and *not* botanical studies), has been perpetuated in the literature; it appears Schultes and Raffauf [1990] not merely repeated it, but mixed-up Karsten's report *in re* TOBACCO + *lupuna*-sap, and Luna's conjecture that the latter were *Trichilia*, accreting the detail that «tobacco juice with *ayahuasca*» was put into the *lupuna*-trunk, when both Karsten's account of *lupuna*, and Luna's of *remo caspi*, involved *only* TOBACCO-juice, which Luna says was drunk neat, Karsten citing only suitability for evil magic. As so often happens when a deservedly much-cited authority errs, this mistake has taken wing, and *T. tocacheana* appears in two lists of AYAHUASCA-plants, for which I know no solid evidence. I wish to justify my conviction that Karsten's report refers not to *Ceiba* but to its relatives *Cavanillesia* or *Chorisia*, likewise why I regard the latter to be *puka-lupuna*. *Chorisia insignis* HBK is called both *palo borracho* («intoxicating tree») [Uphof 1968] and *lupu-na* [Duke & Vásquez 1994]—in Ecuador it's believed to be a repository for *virotas* or pathogenic shamanic darts, hence parlous and assiduously avoided [Paymal & Sosa 1993]. *Chorisia speciosa* is known as *lupuna* to Peruvian Matsigenka [Baer 1992], and although Illius [1992] ascribed Shipibo-*lupuna* to *Ceiba pentandra*, this was in reference to the evil *joshín* (*yoshin*), noting: «the *lupuna* tree has one of the mightiest and thus most dangerous spirits known to the Shipibo». Again, this hardly refers to the benevolent «white» *lupuna*, *C. pentandra*, but to one of our *puka-lupunas*, *Chorisia* or *Cavanillesia*. *Ceiba samauma* (ULB.) BAKH., *Ficus* sp. and *Dipteryx odorata* (*chimó sarrapia*) cause Tacana soul-loss; *Ochroma pyramidale* (CAV. ex LAM.) URB. (Bombacaceae), *Batocarpus costaricensis* STANDL. and *Clarisia racemosa* RUIZ & PAV. (Moraceae) suffice hunting magic [DeWalt *et al.* 1999]. A Colombian *Cavanillesia* is called *ceiba bruja*, «bewitching *Ceiba*»; in Perú, *puka-lupuna* applies both to *C. hylogeiton* and *C. umbellata*, while the latter is called *lupuna bruja*, the same name we see in Colombia [Duke & Vásquez 1994; Rutter 1990]. Wassén [1979] noted C. Lévi-Strauss' 1950 mention of a Nambicuara-«magical poison» which consisted of the *resin* of a bombacaceous tree called *barrigudo* («pot-bellied»)—to the Xucurú *jurema*-users of Pernambuco, Brasil, the *barrigudo*-tree is *Chorisia speciosa* [Hohenthal 1950]. Averting the while there is method to all this madness, I change my subject,

noting lastly that *Erythrina ulei* (both *vilca tarwi* and *amasisa*) is known also as *ceibo* from Bolivia to Colombia [de Lucca & Zalles 1992; Duke 1981]. If *lupuna* ben't weird enough for the more *outré* of any readers perchance still with me, let's try a few *samiki*-rings on for size. Karsten [1920] also recorded that the Shuar (Jívaro [*sic*]) added to *natem*<sup>a</sup> (AYAHUASCA) barks of two trees known as *shingiáta* and *samiki*, which he failed to collect or identify botanically, both being 'til now obscure. *Samiki*-bark was intimately associated with the vision-quest attending the slaying of a victim, whose head was to be shrunk. The particulars, recorded by Karsten [1935], are bizarre indeed. After snuffing TOBACCO-juice, the shaman holding his wrist the while, the slayer crushed with a club a section of *Banisteriopsis* stem, the shaman guiding his hand to put the resulting pieces into the cauldron, likewise adding water. The shaman then guided the slayer's hand (later that of his wife, then daughter) in placing a TOBACCO-leaf first atop, then into a small pot, to which water was similarly added, before positioning it on a fire separate from that on which the slayer had put the *Banisteriopsis* to boil. Two strips of *samiki*-bark and a section of manioc-stem lay beside the cauldron. By turns, the slayer wrapped the strips 'round his index-finger and tied them into rings, each attached to the manioc-stem *via* a loose-end of the knot. His hand guided by the shaman, the slayer then placed the manioc-stem with two *samiki*-rings atop the TOBACCO-pot boiling on the fire, later to be poured by the slayer, wrists held by the shaman, into the *natem*<sup>a</sup>-cauldron, completing the sacred potion to be drunk in the «victory feast» celebrating the taking of the head. According to Karsten, the *samiki*-rings served to transfer to the TOBACCO-potion, thence the *natem*<sup>a</sup>, the «supernatural power» with which the slayer was imbued. Whoever desired to partake of the potion could do so, even half-grown children, and it was thought that the *samiki*-rings also transferred power to the manioc-stem, so that all who «dreamed» might see flourishing manioc-fields—the objective being augury of the slayer's future. Thanks to assiduous field-research among the Shuar by my friend and colleague, the Catalán ethnographer Josep M. Fericgla [1994], we finally know what *samiki* is, «one of the plants most frequently mixed by the Shuar with *natem*<sup>a</sup>... it has an important neurochemical action in the ecstatic and visionary mental state provoked by the potion. *Calliandra pentandra*» (Leguminosæ; it might be *C. angustifolia*, which we've seen in a known AYAHUASCA-additive). Fericgla kindly provided me with seeds of Shuar *samiki*, one of which I was able to germinate—my interest being conservation

and bioassay/analysis, *not* head-hunting! An association of *Calliandra* with *Banisteriopsis* may survive as far north as Guatemala, where I remarked *C. calothyrsis* is named *yajé*, and a linguistic association between *Calliandra* and TOBACCO is recorded from the Dominican Republic in 1940, *C. hamatostoma* being called *tabacuela* there, or «little tobacco» [von Reis Altschul 1973; von Reis Altschul & Lipp 1982]. Finally, it appears that Karsten's *shingiáta* bark-additive to *natem*<sup>a</sup> is yet another species of *Calliandra*. A 1931 botanical collection of *C. amazonica* from Perú recorded its name: *shingata* to the Aguaruna, a tribe subsumed under Karsten's «Jívaro» [von Reis Altschul 1973].

**CACAO VOLADOR: FROM AMAZÔNIA TO AZTLÁN**—We have seen that two species of *Virola* and one of *Iryanthera* might be called CACAOS in South America, and it comes as no surprise that seeds of *V. guatemalensis* or *cacao volador* («flying») are used for «flavoring» chocolate-potations in Central America [Duke 1981]. Beverages made from seeds of *Theobroma cacao* (secondarily *T. bicolor* and *T. angustifolia* MOC. & SES.) originated in Mesoamerica, whereas in South America, each of these, along with *T. grandiflorum* (WILLD. EX SPRENG.) SCHUM. and other species, were rather exploited for beverages made from the juicy pulp surrounding the seeds, themselves not used. Surprisingly, *T. cacao* is of western-Amazonian origin, but there is strong evidence it was first cultivated in Mesoamerica more than 3000 years ago, and no evidence for any precontact cultivation of CACAOS *for seeds* anywhere in South America. Some botanists believe the species *T. cacao* originated only 10–15,000 years ago, as a cross between a brace of *Theobroma*. Long-distance maritime trade-routes had connected Mesoamerica with coastal South America by the advent of the first millennium B.C., and CACAO was apparently brought there, along with other important South American shamanic plants like *Brugmansia*, while even COCA was a precontact cultivar at least as far north as Nicaragua; as *hayo* or *güeyo* was common on Cuba and Hispaniola, and as of 1801 was still used in Mesoamerica, possibly even cultivated as far north as Chiapas [Las Casas 1909; Monardes 1990; Navarro 1992; Pané 1974]. By 1000 B.C., CACAO was the primary crop of SE Mesoamerica; by 400 B.C. central to the economy of the region [Smith *et al.* 1992; Young 1994]. I wish to note some South American linguistic crossovers involving CACAOS. *Pace* many books, CACAO appears not to be of Mayan/Mesoamerican derivation, inasmuch as the root is found in Tupí-Guaraní languages for *T. cacao* and *T. speciosum*, along with roots

for other CACAO-terms (e.g. *cupuí* for *T. subincanum*; *cupuassú* [or *cupuaçú*] for *T. grandiflorum*) [Balée 1994]. The Mesoamerican name for *T. bicolor*, *pataxte* (*pataste*; Náhuatl *cacahoapatlachtlī*) exists through Central America to Ecuador—as *patasi* in the Río Napo; although in this latter case it is less clear in which direction this phoneme migrated. Inasmuch as *T. cacao* is of South American origin and immemorial association with humankind there, logic dictates the Mesoamericans derived their words (*cacáhuatl* in Náhuatl) from Tupí-Guaraní, not conversely. We've seen intimate relationships between CACAOS as snuff, TOBACCO and COCA ash-sources and that both *Virola* and *Eschweilera* (another important ash-source) species are called CACAOS. Significantly, two species of Malpighiaceae, *Heteropterys longifolia* and *H. platyptera* var. *martinicensis*, are called *liane cacao* (CACAO-liana) in the Caribbean [von Reis Altschul 1973]. Two *Banisteriopsis* species are named *huilca bejuco* («vilca-liana»), while a Colombian *Piptadenia* is known as *chocolatillo* («little chocolate») [Duke 1981]; and theobromine occurs in *P. leptostachya* BENTH. [Yamasato 1972]! *Quararibea cacao* (TRIA. & PLAN.) BAIL. and *Q. cordata* (H. & B.) VISCH. (Bombacaceae) bear names relating to CACAO in Colombia and Brasil: *cacao simarrón* («wild») and *cupuassú*—significant, since *Q. funebris* (LA LLAVE) VISCHER is *cacahuaxóchitl* (or «cacao-flower») in Mesoamerica, its aromatic flowers still used as additives to *chocolate* in Oaxaca [Rutter 1990; Schultes 1957]. I've noted importance of *lupuna*-Bombacaceae both as TOBACCO- and AYAHUASCA-plants in Amazônia—in Mesoamerica, *Q. funebris* flowers seasoned both *acáyētl* TOBACCO-reeds for smoking, and orally-ingested CACAO-potations [Sahagún 1950–1969], and the Central American species, *Q. fieldii* MILLS., *madre de cacao*—known as *maha* in Mayan—is also still used as a spice in *chocolate*. Furthermore, *lupuna blanca*, *Ceiba pentandra* (*póchotl* in Náhuatl), was likewise added to *cacáhuatl* in Mesoamerica (as perchance to AYAHUASCA in Perú), into a potion called *chocóllatl*, whence some think derived our word *chocolate* [Hernández 1942]. An obscure Shipibo-additive to *nishi oni* (or AYAHUASCA) in Perú, *ishpingo* or *ispincu* (*espingo*), is probably seeds of a species of *Quararibea*, used like *vilca*-seeds as Peruvian additives to *chichas* called *yale* [Wassén 1979] (whence *yajé?*); *Q. putumayensis* CUATR. is a Kofán *curare*-plant; fruits of bombacaceous *Patinoa ichthyotoxica* SCHULT. & CUATR. are a Tukuna fish-poison, commonly called *cupuassú-rana*, «false *cupuassú*» [Schultes & Raffauf 1990]. I've noted that in Mesoamerica, *cacáhuatl* or CACAO-potions constituted a sort of «*ayahuasca*-analogue»—like AYAHUASCA, *cacáhuatl*

was an all-purpose pharmaceutical vehicle for administration of many medicinal plants; both curative specifics and shamanic inebriants. Besides seeds of *póchotl*, *Ceiba pentandra*, flowers of the related *Q. funebris* and seeds of *Virola guatemalensis*, Mesoamerican CACAO-brews at times contained psilocybian mushrooms (*teonanácatl*), flowers of *Solandra* (Solanaceae; *tecomaxóchitl*) or *Datura* species (as *mixitl*), *Tagetes* flowers (*yauhtli* and *zempoalxóchitl*) and *Piper* leaves (*mecaxóchitl*)—all entheogens—as well as some probable entheogens including flowers of a *Calliandra* species called *xiloxóchitl* (as per Shuar-*natem*<sup>a</sup>), *Cymbopetalum penduliflorum* (DUN.) BAILL. (Annonaceae; *teonacaztli* or «sacred ear») and *Magnolia dealbata* ZUCC. (Magnoliaceae; *eloxóchitl*, «maize-flower»; *eloxóchitl*, mayhap «ardent desire-flower») [Ott 1985; Sahagún 1950–1969]. The epigram introducing this chapter indicates many such «flowers» (since in Náhuatl, *xóchitl* or «flower» was a poetic metaphor for «entheogen») were also additives to *acáyētl* TOBACCO-reeds: *Quararibea*, *Piper*, *Cymbopetalum*, *Tagetes* and some species of visionary mushrooms. But Mesoamericans had still another class of «*ayahuasca*-analogues», alcoholic *chichas* known as *balché* in Mayan and *octli* in Náhuatl (*pulque*). In both cases many visionary admixtures were involved, but it is significant that the primary and definitive additive to each was leguminous. The Mayan metheglin (medicated mead) is named for the *balché*-tree—*Lonchocarpus violaceus* (JACQ.) DC.—whose bark was fermented with water and stingless-bee honey. By the same token, Mesoamericans fermented *octli* from sweet saps (*hidromiel*) of *Agave* (Amaryllidaceae;

*metl* in Náhuatl), with *ocpatli* roots, «*octli*-drug», from leguminous tree *Acacia angustissima* (MIL.) KUNTZ. (and the roots of *Calliandra anomala* (KUNTH.) MACBR.)—still called *palo de pulque*, «*pulque*-tree» or *ñupi-* (*pulque*: *ñopo*?) tree in Zapotec, first Mesoamerican entheogen to be proscribed by the Spaniards, by royal decree in 1529, 42 years before the «Holy Office of the Inquisition» was constituted in New Spain, and 91 years before the more famous *péyotl* and kindred entheogens were decreed heretical. *Balché* in the Mayan area, and *octli/ocpatli* in highland Mesoamerica, were clearly the most common, everyday, working-class entheogens at the time of contact. We've found that in South America species of *Acacia* were involved in the *jurema*-complex, while species of *Lonchocarpus* may be fish-poisons and *curare*-additives [Rätsch 1998A; Schultes & Raffauf 1990; Uphof 1968]. Not only did CACAO and allied shamanic plants spread by trade to Mesoamerica in precontact times, but we descry strong parallels between Mesoamerican and South American ethnopharmacognosy. In both cases, Leguminosæ and Sterculiaceæ are central elements, TOBACCO is intimately intercalated, and the Bombacaceæ, especially *Quararibea* species, are inextricably related to CACAOs. *Viola* is an additive both to AYAHUASCA and CACAO-potions, besides being itself a major snuff-plant, and we see common additives in other families, including Boraginaceæ, Compositæ, Piperaceæ and Solanaceæ. Andean *San Pedro*-cactus has its pharmacognostical equivalent in the Mesoamerican *péyotl*-cactus, both inseparably interrelated with TOBACCO like AYAHUASCA and *cacáhuatl*-potions, the last taken during feasts, accompanied by smoking *acáyotl* TOBACCO-reeds; potions and reeds containing many of the same entheogenic admixtures, mostly having direct parallels in South American snuff-, *ipadú* COCA- and TOBACCO-additives; in each of which CACAOs are key. Not only are we faced with a pan-South American complex of shamanic inebriation, but this includes also Mesoamerica in its prodigious pharmacognostical purview, with roots dating back at least three millennia. Moreover, this shamanic pharmacognosy extends northward—*via* TOBACCO, *péyotl*, *Datura*—far into North America, where earliest human uses of the first two likely took place; whereas *Amanita muscaria*, primal entheogen of Beringian groups who first migrated into Neogæa decades of millennia ago, plaits and interweaves the whole with far more archaic roots in Siberia. ✧

# SOME ACTIVE *TRICHOCEREI* (PART II)

by K. TROUT

The need for identifying and selectively propagating desirable clones is one that can be easily satisfied through careful, meaningful bioassays and the sharing of both information and material.

## CRITERIA FOR BIOASSAYS AND DETERMINING FAVORED CLONES

While there may be nearly as many approaches to bioassays as there are readers, several elements should be kept in mind. One is reproducibility. If a plant is going to have intensive time and effort focused upon it, it should be first established as deserving such preferential treatment. This means that details concerning bioassays should be recorded and include any of the following information that is available (or else a note that they were not available):

- 1) Species name or best identifier possible
- 2) Clone number for the specific cutting used
- 3) Size of the plant harvest was taken from
- 4) Physical size of the cutting ingested (fresh)
- 5) Weight of plant ingested (and if this was dry or fresh)
- 6) Approximate ages of plant and portion ingested
- 7) Time of day, date, and place harvested (moon phase and weather notes are also suggested)
- 8) Comments about appearance, watering, nutritional history, health, coloration, or other observations about the plant or the plant material
- 9) Notes on the degree of slime, color, taste, or smell of the brew
- 10) Preparation route, cooking times, amounts of acid used, and the lot size prepared

## CREATING MEANINGFUL BIOASSAYS

There are several elements to standardizing bioassays that ideally should be decided in advance and then adhered to:

*Bioassays should be consistent in preparation and amount used in order to allow comparison.* If a lime juice tea using 1 kg (1000 gm) of fresh material as a starting point is chosen, this should be used for every bioassay unless there is reason to think one might be particularly strong, in which case the normal

amount per dose should be halved (500 gm) or divided by four (250 gm). Or, if a larger amount is chosen, this too should be in a meaningful amount (like 1500, 2000, or 3000 grams). Standardization of approach will allow the individual not just to conduct more reproducible experiments but will also allow them to directly compare between different bioassays they are involved with. One easy, reliable, and recommended approach is to dry the cactus prior to use and ingest measured amount of dried powder. (Normally 1000 grams fresh gives about 100 grams dry, but this can vary). This route is favored by many people. It has some distinct advantages such as eliminating weight altering variables like different water contents, or states of health, and it allows direct gram-for-gram comparisons between various plants (or even repeated samples collected at different times from the same plant). It also allows multiple samples to be collected and prepared when available and stored for future bioassays (and confirmations of previous bioassays), since dried material keeps quite well for extended periods. Whatever route or form is chosen should be used for all future bioassays or a direct comparison may not be meaningful.

*Bioassays should be proven as replicates.* This means that more than one bioassay should be conducted using the same material and that more than one *person* should perform the bioassays. Ideally a minimum of two dosage ranges would be used by each individual (the initial dose followed by an adjusted and fully-active dose based on results from the first), and determinations of the best clones would involve at least three people per clone bioassayed. It is important that bioassays actually result in fully-active visionary experiences before a sample is declared as containing mescaline. A good number of cacti are said to be "active" due to them causing stimulation or some type of ill-defined effect. While "active" is a perfectly fine description, it can be misleading if the activity is not defined. At least one week should elapse between repeated bioassays performed by any individual.

*Bioassays should involve only material that is both available and identifiable to someone other than the bioassayist.* Bioassay reports should refer to locatable living material, ideally with living material of the actual clone used being maintained by the bioassayist or in an accessible botanical collection. Due

to the potential of plant death, weights, size measurements and color photographs of the material are strongly recommended; as is reserving enough dried material for both several bioassays and a qualitative/quantitative analysis once the legal restraints on such research are lifted. (Even material with negative bioassays is often valuable to plant chemists studying cactus chemistry.) It is also recommended that researchers share clones; if one researcher's plant or plants die for whatever reason, they should be able to eventually obtain replacements if they shared well-identified cuttings with other researchers at some point.

As a continuation of part one, the following have also been proven by human bioassays to be in need of focused propagation efforts:

The enigmatic *Trichocereus* sp. "SS01" appears to lie somewhere between what is described for *T. peruvianus* and *T. macrogonus*. A beautiful plant with intensely colored new growth and heavy frosting, it is also subject to an odd, recurrent, dripping black rot that it normally outgrows. Bioassay reports range from it being similar to or better than a com-

mercial *T. pachanoi*. All of these bioassays used the same material, leading to the conjecture that it may have alkaloid fluctuations (or perhaps variability based on who consumes it and when they do so). This plant needs more growers! Lots of people don't grow it due to the rot problem but it is quite a nice plant in all regards. (Potent and *very* clean feeling.)

An exciting and recent activity determination involved a bridgesioid called simply "SS02." While it most closely resembles *Trichocereus bridgesii* there is no collection information available concerning this plant. This beautiful plant is variable in appearance, even on a single column. Despite limited availability at present, its impressive appearance, fast growth, and water tolerance, suggests it will enjoy a far greater distribution in the future. Upright trunks readily offset heavily frosted, bright bluish-green new growth with golden and brown new spines that sometimes turn reddish, normally fading with age. Recent human bioassays have found it to be consistently stronger than *T. pachanoi* (about "2X or slightly more"), a welcomed fact that was suspected due to its appearance. GC/MS on this plant showed a strong spike at mescaline, with little other alkaloids present.

Figure 7:  
*Trichocereus* sp. SS03  
(4" dia. base,  
~3" dia. new growth)  
Photo by M.S. SMITH

“SS03” is yet another unlabeled *Trichocereus* that resembles an upright *T. peruvianus*. It features deep v-shaped depressions above the areoles similar to what commonly appears on several Australian grown peruvianoids and one of the large *T. peruvianus* in the HUNTINGTON BOTANICAL GARDEN. Like those forms, this one has been determined to be at least as good as *T. pachanoi* in human bioassays.

*Trichocereus terscheckii* is a great landscaping plant that gets huge (up to 40 foot). This species is claimed to be extremely hardy to cold and wet conditions. It has received glowing bioassay reports from multiple people. Like *T. pachanoi* and *T. werdermannianus*, it is known to have clones of variable potency and these can range from worthless to quite strong. Interestingly, the material in the USA is frequently reported to be potent. Alkaloid profile also seems to be variable but understanding is lacking due to insufficient analytical work.

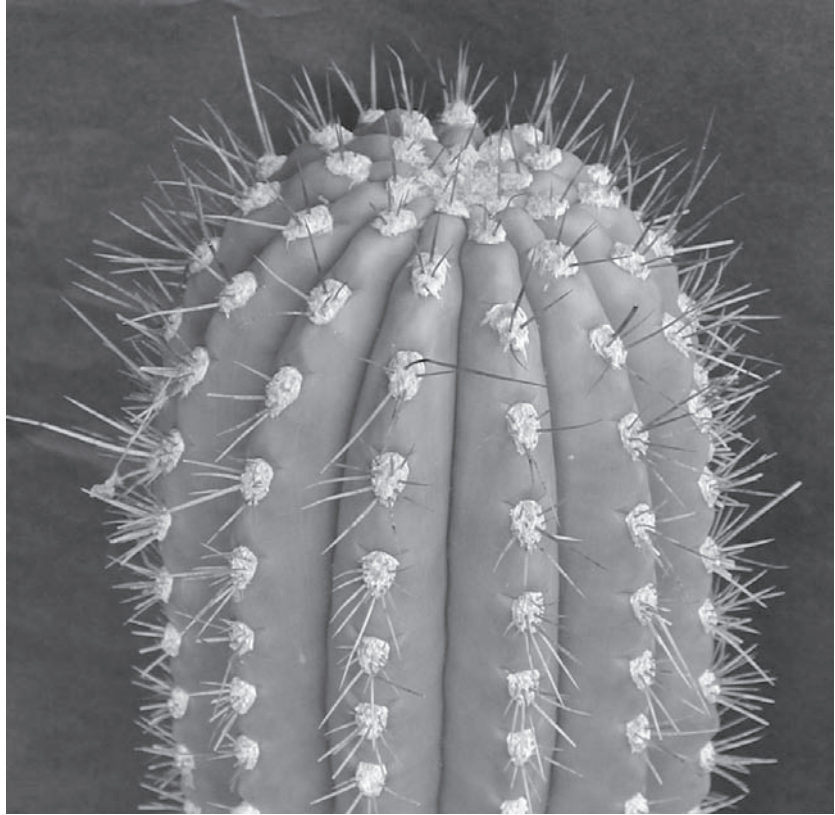

Figure 8 (above): *Trichocereus terscheckii* (PAUL'S DESERT) (~8" dia.)

Figure 9 (left, in bloom): *Trichocereus terscheckii* (Northern California)  
Photo by KAMM

Figure 10 (below): *Trichocereus terscheckii* (SUNRISE NURSERY) (~6" dia.)

The "RS0001" *Trichocereus peruvianus* will be found a clear favorite of many, whether for bioassay or just a prominent spot in the garden. The form is beautiful, with a heavy glaucous bluish, very bluish new growth, serious (mostly yellow) spines and reliably excellent potency. A bit more rot prone than some of the other *T. peruvianus* forms, it grows fast and well if watering is monitored. The RS0001 *T. peruvianus* was originally obtained from STICKY BUSINESS in Sebastopol, CA.

### INTENSIVE PROPAGATION

Once a clone has been identified as being in need of more attention, many options exist for rapidly increasing numbers and available biomass of rare *Trichocerei*. The most common approach cuts the available plants into 8–12 inch long sections and roots them. Each will form a plant and most center-cuts will start putting out new branches that can be cut and rooted as new plants once they reach a few inches long.

Figure 11 (above): *Trichocereus peruvianus* RS0001 (2.25" dia.)

Figure 12 (below): *Trichocereus peruvianus* RS0001  
(1.25" dia. pup sprouting from a 3.25" base)

Many growers start by planting *Trichocereus* cacti laying flat on their side on the ground (ideally on a slight slope). Plants treated this way will root along their length and start cranking out new branches from both ends and often in between.

Grafts can be made of tips, short sections can be split down the middle and grafted on their sides or they even can be cut down to numerous wedges, each containing at least one areole and all of these grafted to create *many* new plants. See [http://sphosting.com/cactus/grafting\\_tips.html](http://sphosting.com/cactus/grafting_tips.html) or SACRED SUCCULENTS' grafting guide to learn more about grafting.

Growing from seed might seem like it would take forever but this is not always true. M.S. SMITH found *Trichocereus* seedlings allowed to get several inches in height and cut in half grow faster and produce many more offsets than seedlings that are allowed to grow intact (SMITH 2000). See Figure 15. The decapitated top can be grafted or rooted.

Studies on the impact of cutting *Lophophora* showed harvests to cause demonstrable and reproducible increases in the rate of new growth *per individual head* on a given plant (KIMBER 2000).

San Francisco, CA 94103

Grafting seedlings (even as multiples) onto stout stock can create fast growth and multiple pups that can often be cut and re-rooted within a single year or so. This will also decrease the time it takes for them to begin to flower and set seed; another valuable step in increasing availability and distribution of rare species.

Another useful approach is to graft them onto a *Pereskopsis* stock for the first year or two and then transfer them to a larger stock.

Growth itself can be accelerated by adding a soluble fertilizer (organic or chemical) to the watering solutions given during the warm months. It should be used at no more than around 10% of the recommended strength and given every week during the growing season. Feeding with MIRACLE GRO several times a year is a useful practice. Despite the problems associated with soluble chemical fertilizers, this is a tried-and-true trick that substantially increases the number of basal offshoots in *Trichocereus* species.

In “part one” we touched upon the need to identify and intensively propagate desirable clones, and in this portion we discussed the ways and means to identify and increase both the numbers and availability of desirable plants. In our next and final part we will look at ways to make these efforts meaningful and effective. With well-planned and conscientiously-conducted bioassays, selective propagation, and attempts to broaden the grower base by sharing both information and clones with as many dedicated individuals as possible, it is readily possible to establish a secure and mutually beneficial relationship for humans and these cacti. ✧

*Photos accompanying this article were taken by K. Trout unless otherwise specified. Sizes, when noted, indicate the plant's diameter and/or length at the time of the photo, and does not indicate the potential maximum size. As noted in the first installment of these articles, more photos (in color) can be found on-line at:*

# TROUT'S NOTES

More than you need to know?

## SACRED CACTI, SECOND EDITION

422 pages, perfect-bound. with 40 illustrations \$39.95  
Detailed coverage of botany, chemistry, pharmacology,  
cultivation & utilization.

## THE CULTIVATION AND PROPAGATION OF CACTI

56-page booklet with 50 illustrations \$9.95  
Care, cultivation, propagation, and disease control of some  
selected cacti. Revised & illustrated excerpt from SC2.

## SUMMARY OF THE OCCURRENCES OF MESCALINE

16-page booklet with 26 illustrations \$4.95  
List with yields and/or bioassay reports for the  
more than 70 species containing at least traces.  
Also includes notes of published errors.

## CACTUS CHEMISTRY BY SPECIES

74 pages, perfect-bound, with structural tables. \$19.95  
Comprehensive, extensively referenced summary of published  
analytical reports, included percentages and human bioassays.

## NARCOTIC & HALLUCINOGENIC CACTI OF THE NEW WORLD

By M.S. Smith, 90 pages, perfect-bound. \$17.95  
Summary of ALL species of cacti & other plants known as a  
“peyote” and the cacti used for medicinal or spiritual uses by the  
inhabitants of the Americas.

## CLOSET CACTUS CARE

By M.S. Smith, 14-page booklet with 11 illustrations \$4.95  
A concise, helpful instructions on growing cacti from seeds.

Shipping is \$6 for *Sacred Cacti*. All others \$3.50 for the first item  
and \$1 for each additional item. Bookrate is \$3 for first and \$1 each add.  
Non-USA orders see [www.troutnotes.com](http://www.troutnotes.com). Catalog \$1.

# SHORT-ACTING

by LAZAR

The use of psychedelic compounds in psychotherapy and for personal use is well-established, even though they are proscribed by the DEA. The use of many of these compounds to elicit altered states is often limited by time constraints; that is, the patient and/or therapist or the personal user does not always have six to ten or more hours to commit to such an activity.

For a number of years we have been investigating the use of phenethylamines—compounds that are described in great detail by ANN and ALEXANDER SHULGIN in their book, *PIHKAL*. After reviewing many of these compounds, both in the literature and by human administration, we did not find any that were short-acting among those with really useful properties. That is, any which lasted only three or four hours or less. DMT, which is in the tryptamine class of compounds, is very short acting (+/- 30 minutes), and MIPT is also short (+/- 2 hours).

We wish to report and share with you some methods that can shorten the effects and yet retain a full-blown psychedelic experience. These methods, when used with phenethylamines such as 2C-D, 2C-I, 2C-T-2, 2C-T-4, 2C-T-7, *etc.*, produce an altered state wherein the user can incrementally raise or titrate the degree of alteration desired. The effect lasts from  $\frac{1}{3}$  to  $\frac{1}{2}$  of the oral dosage and generally uses only  $\frac{1}{4}$  of the amount of the pure compound. This represents the practicality of doing a little in an evening, after a meal (as eating does not effect the action of the compound taken in these manners, as it does when ingesting into the gastrointestinal tract). It is also possible to have a good night's sleep afterward, and awaken the next day refreshed and clear, and able to go to work with no after-effects. Also, in these times of high prices and short supply, the economy of using  $\frac{1}{4}$  of the usual dose is obvious.

Side-effects are greatly reduced or eliminated in subjects, leading to a clear and clean space. Some of the side-effects eliminated are: stomach discomfort (queasiness, cramps, empty feeling.); muscle twitches and jaw clenching; loss of balance; flatulence; headache; sweating; chills; *etc.* Side-effects tend to affect some individuals more than others, due to each individual's unique biochemistry, so that ameliora-

tion of these discomforts will also be somewhat random. There appear to be no across-the-board statements that can be made in this area, except that when a particular side-effect *is* still present, it is much less intense than when the compound is orally administered.

With these methods the onset of the altered state is very rapid—much more so than ingesting the compound orally. Effects usually begin to be felt within a minute or less and the subject is peaking within ten minutes. The plateau will last for an hour followed by a gentle decline over the next hour to a still high space, then over the next  $\frac{1}{2}$  hour the decline will take you to the base-line state (where you started from). Total time may be about 2–3 hours, but this will vary with the compound, the individual, the amount taken and of course set and setting.

None of the methods reported on in this article are original; we plagiarized shamelessly and built on the work of many others and applied these older tried and true methods to different substances. Some modification of these methods was necessary and every effort was made to keep the entire process simple, yet effective.

The methods that showed most promise are:

- 1) Snuffing or snorting
- 2) Nasal spray
- 3) Vaporizing the base and inhaling it

Two other methods were considered for evaluation:

- 1) Injection by hypodermic needle was rejected as being too invasive and due to the difficulty in obtaining pure, sterile compounds.
- 2) The other method used a small-volume enema to place a solution of the compound into the large intestine where it is absorbed rapidly without going through the upper gastrointestinal tract and subject to the digestive process. This method worked, but took about the same amount of compound as oral ingestion and the time span of alteration was also about the same. So the method did

not seem to be an improvement other than in some cases reducing side-effects. This was not pursued further.

## SNUFFING
