Latin was not only the first major written language of western Europe but also an enduring influence on the vernacular languages and literatures that eventually supplanted its own. To exert this sway on the spoken languages and literatures of Germany required more substantial accommodations than were needed in some Romance-speaking parts of Europe, where Latin and its literature had been established for much longer. Not only was German more remote linguistically from school Latin than were Romance dialects, but its oral culture and verse forms were also more different. In contrast to most Romance-speaking areas, German-speaking ones, because their languages had not yet acquired scripts suitable for more than brief inscriptions, had not had poetry except in oral performance before the Middle Ages.

Both Latin and German were changed by the prolonged encounter. Latin was an international language, but, as is the case with English today, it acquired distinctive characteristics in its phonology, orthography, vocabulary, and even syntax in response to the effects of the native languages in the regions where it was used: A German monk or cleric spoke Latin differently from his French or Irish counterpart. In the other direction, many Latin words entered into German in direct lexical borrowing that began already in late antiquity, as well as indirect borrowings that were transmitted through the native languages (such as Anglo-Saxon and Irish) of missionaries who brought Christianity into Germany. Furthermore, there was calquing through the combination of German elements to coin words or constructions that were modeled on ones in Latin.

The time of the most intense interchange was probably the Carolingian period. The Christian culture with which the Frankish-Roman church pervaded the public life and worship of Germany brought new objects and types of buildings, institutions and hierarchies, and concepts. This Christian culture was based largely on Latin manuscripts, access to which was attained by acquiring knowledge of the Latin language, especially as transmitted in classics of Roman and Christian Latin literature. Charlemagne (768–814) established the blueprint for the attainment of this Christian Latin culture, as in his capitulary *De litteris colendis* (ca. 780–800) when he expressed concern over the poor power of expression among the clergy and the consequent possibility of misinterpretation of the scriptures, and called for the foundation of schools to spread a standard orthography and grammar.

Throughout western Europe, the world of learning and literacy was a Latin world. To learn to read was to learn Latin, to be literate was to be a Latin user. Latin was a father tongue, a language that was spoken by no one from the cradle but that was employed routinely in both writing and speech by an elite of clerics in many of the most important institutions. The coexistence of the German mother tongue with Latin can be called cultural diglossia, as opposed to the bilingualism that exists when two fully spoken languages cohabit.

From the twelfth century on, Latin seems to have made fewer contributions to the lexicon of German than did French, although often it is difficult to ascertain from which of the two languages a given loanword derived. Nevertheless, because the world of learning remained Latin for many centuries to come, many elements of the learned language continued to enter into German throughout the Middle Ages. By the same token, living Latin never ceased borrowing from German, in place-names, words for political and social structures (e.g., *markgravius*), legal terms, and words for objects found only in local culture.

Lauber, Diebolt (fl. 1427–1467)

A writer, teacher, and employer, Lauber was active in Hagenau, Alsace. From 1440 to 1470, his handwriting is contained in several manuscripts of the Lauber workshop. He very likely had already organized the production of illustrated manuscripts in the early 1420s with the assistance of a large number of (at least sixteen) copyists and artists. Evidently, he had drawn on the experience of a preceding organization, the so-called *Werkstatt* (Workshop) of 1418. He remained active until 1470. In the late period he attempted to ensure the sale of the books by way of advertising. Prior to that he had secured his clientele through his contacts to the Hagenau *Landvogtei* (provincial government). Because of his editorial work, he was probably also involved in publishing. The genuine achievement of his business was the clear arrangement of texts, which were by and large written in the vernacular of the day, and included indexing, headings, and pictures. More than seventy codices are known today to have come from his workshop; the spectrum ranges from Bible picture books (*Historienbibeln*), which dominated until 1440, to epic poems, devotional books, scientific and legal literature. Production was subject to frequent changes in organizational form and turnover in staff. Standardized layout and text arrangement created a form of trademark, which was shaped above all by the illustrators of a group known as "A," employed in the production of twenty-nine manuscripts in the period from 1425 to 1450. At this time the illustrations acted as a form of catchword pre-interpreting the text. In contrast, during the late period, when Hans Schilling collaborated, detailed descriptions and exact presentation were emphasized.

[Manuscripts, Painting and Production](#)

Laufenberg, a cleric active in Freiburg im Breisgau and Zofingen, composed the bulk of his verses between 1413 and 1445. In the latter year he entered a cloister in Strasbourg that had been founded by Rulman Merswin (d. 1382), the lay mystic and guiding spirit for the so-called Friends of God. Laufenberg is best known as the author of some 120 sacred songs written in the German vernacular, among them Christmas and New Year's verses. His Christmas song *In einem krippfly lag ein kind* (In a little crib lay a child) is representative in its straightforward narration, plain diction, and heartfelt religious devotion. Especially pronounced is Laufenberg's veneration of the Virgin Mary; few medieval poets command his breadth of Mariological symbols and tropes. The culmination of his Mariology is the *Buch der Figuren* (1441), a massive versified catalogue and interpretative commentary on more than 100 prefigurations of the Virgin in the Old Testament. Another lengthy work from his pen is the *Regimen sanitatis* (1429), a combination cosmology and medical reference tool of more than 6,000 German verses based on many source texts, Avicenna among them. The *Regimen*, besides treating health concerns, pregnancy, and child-care, examines the solar system, the elements, and natural phenomena—including pestilence. Very popular, Laufenberg's *Regimen* was an early printed book. Rounding out his longer works is a 1437 translation, in 15,000 verses, of a fourteenth-century discourse on salvation, *Speculum humanae salvationis*.

The prolific author, who had regular ecclesiastical duties as pastor, curate, and dean, evinces broad learning, theological sophistication, and mastery of a wide range of vernacular and Latin literary forms. At home in verse and prose, Laufenberg translated Latin church hymns and sequences and composed "mixed" poetry, that is, songs in alternating Latin and German verses. Musical composer and self-aware author in one person (Laufenberg liked to sign and date his compositions), he influenced hymn writing in the Reformation and beyond. As Martin Luther was to do, Heinrich Laufenberg penned many pointed *contrafactura*, appropriating secular texts and melodies for the Christian sphere. His most famous example—and his most famous song—is *Ich wölt, daz ich doheime wer* (I wished I were at home). The "home" of which the singer speaks is heaven; he longs for a home far from earth where he can gaze eternally upon God. In like vein, Laufenberg wrote Christian dawn songs and adapted secular love songs for worship of the Virgin Mary. She appears typically in his verse as the *mülnerin* (the miller's wife/female operator of a mill), a figure who threshes, grinds, and bakes the biblical "corn of wheat" (John 12:24) that is Jesus Christ. Evident everywhere in Laufenberg's work is the desire to increase piety in his broad audience, be these nuns, religious societies, or laymen. That his texts were read silently by individual readers for meditation and private devotion is very probable.

Scholarly research on Heinrich Laufenberg has labored under the loss of unique versions of most of his creations, the result of destruction of manuscripts in Strasbourg during the Franco-Prussian War in 1870. A critical edition of his works has not yet appeared and would necessarily contain presumed transcriptions.

Medieval Germany knew no law code or act of legislation in the modern sense. Instead, most of the legal rules governing the lives of people existed as social custom, habit, and morally proper conduct in which all members of society participated. Law in this sense accorded both duties and privileges to individuals according to social status. This customary law, then, relied on the public knowledge of individuals and their participation in the legal adjudication process. Their oral memory was supported by formal procedure enhanced with symbolic gestures and formulaic speech such as oaths. This means that law was orally and locally transmitted so that even after the Carolingian kings established a centralized state, and even after lawbooks were written, knowledge of law remained local for a long time as far as practice and consistency of judgments are concerned.

From the earliest records of German law to the reception of Roman law in Germany in the sixteenth century, we find the following types of legal rules or accords: Latin laws of the Germanic kingdoms (*leges*, fifth to ninth century); vernacular customary laws applied as the general law of a territory, thirteenth to sixteenth century; vernacular city codes created and agreed to by the city councils, beginning in the thirteenth century; feudal laws governing land and fealty relations of the nobility; Peace ordinances and other promulgations by rulers, twelfth to thirteenth century.

The Leges

After the tribal migrations, when the Germanic kingdoms were created on the foundation of Roman rule, law codes were compiled in Latin. Collectively, these *leges* developed uniquely out of the Germanic tribes' encounter with the Romans. At that time the Germans were an archaic society lacking the concept of a central governing institution and found themselves confronted with a very well developed Roman legal system and culture and, in addition, with the Christian religion as an institution. Their gradual acculturation determined the specific content of the *leges*. They typically recorded Roman law as practices in their own particular region. Their long-term interaction produced the principle of personal law, which means that each person is accountable to the law of his own tribe or confederation. Thus a Roman was tried under Roman law and a Frank was tried under Frankish law. Separate rules were established for regulating disputes between litigants belonging to different ethnic groups. And finally, the Germans recognized the need to establish and maintain an organized government.

The writing of *leges* began with the Goths who confederated earliest with the Romans and continued when the Franks emancipated themselves and conquered several other tribes. Our earliest records are the fifth-century West Gothic *Edictus Theoderici*, *Lex Visigothorum*, and *Lex Romana Visigothorum*. The first two laws were for the Goths and the last for handling the interaction between Goths and Romans. The other extant *leges* are the sixth century Burgundian *Lex Gundobada*, *Lex Romana Burgundionum*, and the Franconian *Lex Salica*. In the seventh century we have the *Lex Ribuarie* (revised Salic laws), and the Lombard *Edictus Rothari* followed in the eighth century by the *Lex Alamannorum* and *Lex Baiuvariorum*. These last two were written once they were conquered by the Franks and brought into the Frankish empire. Shortly thereafter and probably prompted by Charlemagne, the *Lex Frisionum*, *Lex Saxonum*, and *Lex Thuringorum* were compiled.

Composed of Germanic, Roman, and Christian elements, it is impossible to isolate a uniquely German foundation in these texts. Moreover, the values within Roman society were already Christian and had also been assimilated. We do know, however, that orality was basic to Germanic law and cannot be recovered because the *leges* are already informed by literacy. We also know that Germanic law lacked both a concept of rulership and a concept of state. In contrast, law in these texts is already understood as a means to establish and maintain organized government. Hence, the purpose of the *leges* was to create the essential elements of rulership and to institute lasting structures that support central authority. The king appears as the giver of law and has control of governing institutions such as the law courts. The *leges* also replaced the legal blood feud with composition of payment (material restitution) to the injured family. Thus the *leges* document what the Germanic tribes learned and assimilated.

Land Peace

Land peaces (*Landfrieden*) were promulgations made repeatedly by the emperors and also by territorial princes in Latin. They continued the papacy's *Pax dei* (Peace of God) movement, which had first declared short periods of nonviolence. Beginning in 1103, the emperors provided rules for establishing and maintaining such periods of peace by suggesting means to resolve conflict and listing punishments for grave crimes against public peace such as kidnapping, imprisonment, mutilation, or patricide. Their purpose was to end blood feuds, a practice that the *leges* evidently had halted, to establish a royal judge who strove to produce consistency in the legal process throughout the territories, and to stabilize the ruler's rights vis à vis the princes. Of the several such land peace agreements, Heinrich's Truce (*Treuga Heinrici*) of 1224 and the imperial "Land peace" of Mainz (*Mainzer Reichslandfriede*, 1235), distributed in German, are best known for two significant concepts: first, a public peace that may not be violated, and second, the concept that criminal acts were to be punished by specified physical penalties regardless of the perpetrator's social status. These innovations were further developed in the vernacular lawbooks.

The Vernacular Lawbooks

The beginning of the thirteenth century marks the transformation of oral custom to a written legal tradition after 300 years of silence. This very same period marks the rise of German for official use in all types of legal texts, including the imperial land peace agreements. First the imperial city code, the *Mühlhäuser Reichsrechtsbuch*, 1223–1231, appeared for the use of imperial ministerials. It was immediately followed by Eike von Repgow's much larger compilation, *Sachsenspiegel* (*Saxon Mirror*, 1225–1235), which contains a compilation of the legal practices in Saxony, an ethnically mixed territory where the traditions of Eastfalians (*Ostfalen*, east of Saxony), Westfalians, Thuringians, Swabians, Dutch, and the indigenous Slavs merged.

The *Saxon Mirror* contains two parts. The first, the territorial law, encompasses the legal customs and procedures that regulated the daily life and concerns of all inhabitants including serfs, free peasants, women, children, and ethnic minorities. These customary laws include grazing rights, property rights in marriage, ownership and transfer of land, inheritance, criminal penalties, and legal procedures. The second part, the feudal law, records the rights and obligations that bind male and female vassals and liege lords.

From the time of the *leges* to the vernacular customary law, legal thinking changed strikingly. The *Saxon Mirror* records a critical shift in German law from a purely oral authority and transmission to written documentation that allowed greater consistency in the adjudication process. In addition, there are four specific, fundamental, and far-reaching developments in content as well. Perhaps the most obvious development is the explicit integration of Christianity by accommodating German legal custom to the canonists. The second innovation is territorial law. Unlike personal law, the *Saxon Mirror* presents a primarily territorial law for Saxony, meaning that the customs apply to all Germans living in that territory. Nevertheless, custom still acknowledged personal law for the ethnic Slavs. Procedure also allows for multilingualism, guaranteeing that a defendant can hear the charges against him in his own language. The third and most radical change, however, is the grounding of law and justice in God and the secular state (and with it, the expansion of the judiciary). No longer are the forebears the primary source of law. Rather, the concept of legal custom is firmly rooted in the state. From the outset, the *Saxon Mirror* points to God as the source of law and justice and ascribes the specific, secular application of law to imperial governance that began with Constantine and Charlemagne, who gave certain privileges to the Saxons. The king is presented as judge above all people and promulgator of laws. This emphasizes that the administration of justice was delegated from a central, royal point (section III, part 26), meaning that the king delegated his royal judicial authority to the judges and thereby gave them the right to preside over a superior court. The fourth change is the formation of a rudimentary criminal code with corporal punishments that elaborated on the land peace.

The impact of the myriad *Saxon Mirror* versions cannot be overestimated in or outside Germany. Within thirty-five years, several copies, adaptations, and

translations of Eike's text were produced. The most important of these are the Upper German translations, *Deutschenspiegel* (*German Mirror*, 1275–1275), *Schwabenspiegel* (*Swabian Mirror*, 1276), and the later, illuminated manuscripts: an Oldenburg manuscript from 1336 in Low German, one in Heidelberg from 1294ff., another in Dresden from 1295–1363, and a fourth in Wolfenbüttel from 1358–1362.

The title of *German Mirror* testifies that the translator extended the jurisdiction of Eike's book to all German-speaking areas. It also became a paradigm for codified law books in Prussia, Silesia, Ukraine, Hungary, Bohemia, and Poland. Used, therefore, throughout Germany, the book achieved the authority of a code for 300 years in more than 450 manuscript copies until reception of Roman law in the sixteenth century, and in some areas its influence lasted until the nineteenth century.

City Codes

The process of compiling city codes—also written in German—began at about the same time as the *Saxon Mirror* and was completed by the end of the fourteenth century. For the most part, these law books contained rules for merchants and markets. In addition, they included sections from the *Saxon Mirror* in order to regulate disputes between citizens of municipal and rural jurisdictions. The Magdeburg city codes begun in 1188 and then greatly expanded were probably the most influential because the new cities in the colonial areas looked to Magdeburg for legal guidance. The best known, the *Magdeburger Weichbild*, ca. 1250, describes the different courts along with their competencies and procedures. Other early cities with codes include Halle, Augsburg, Cologne, Hamburg, and Vienna.

Lechfeld, Battle of

One of the great battles of the tenth century and one that ended the threat of Magyar (Hungarian) invasion to central and western Europe and confirmed the reputation of Otto I. The battle, fought near the Lech River (Bavaria) on August 10, 955, witnessed the decisive victory of Otto and his armies against a much larger invading force. The invasion was the culmination of a long series of Magyar raids that stretched back into the ninth century. These raids had plagued not only Germany but also Aquitaine, Burgundy, East Francia, and Italy. The Magyars, lightly-armored and highly skilled horsemen and archers, raided throughout the first half of the tenth century primarily to spread terror and acquire booty. Exploiting the political instabilities of the late Carolingian world, the Magyars were quite successful in their raids of plunder and pillage and even threatened the existence of Bavaria and Swabia. The invasion of 955 was similar to the earlier assaults in that it was inspired by political difficulties in Otto's realm. Indeed, the events of 955 should be associated with the revolt against Otto of Liudolf and Conrad of Franconia in 954. A Magyar raiding party invaded during this revolt and Liudolf was accused of inviting in the enemy army, an accusation that turned the tide against the rebels. The Magyars, aware of lingering tensions in Otto's realm and confident from successes in 954, waged a more serious assault in the next year. In the summer of 955, a rather large army of uncertain size invaded Bavaria and laid siege to Augsburg on August 8. Otto, armed with the Holy Lance, led a force of Saxons south to oppose the invaders and was joined by contingents of Bohemians, Swabians, and Franks under the former rebel Conrad. Otto's army of 3,000 to 8,000 was significantly smaller than that of his enemy but was a heavily armed and armored force. Once the battle was engaged on August 10, Otto's better armed force triumphed but only after a near disastrous moment at the beginning of the engagement. The Magyar army attacked Otto's rear guard, nearly routing it, before Conrad turned and scattered the enemy. The battle turned quickly in Otto's favor as he forced the Magyars into close, hand-to-hand combat. As Widukind of Corvey notes, "The more daring of the enemy host resisted, then, when they saw their comrades behind them turn and run, were stupefied and surrounded by our army and killed." The victorious army pursued and destroyed much of the defeated foe. The Magyar leaders were captured and executed by Otto in a successful attempt to prevent further invasions by leaving the enemy leaderless. Although not without losses himself, including Conrad, Otto was hailed *imperator* (emperor) by his troops after the victory and regarded as the great defender of Christendom. His victory was seen as divinely inspired and the great prestige he earned strengthened his position in Germany and strengthened his claim to the imperial title he revived in 962.

Legenda Aurea, Alsatian

The Alsatian *Legenda Aurea*, (Golden Legendary, the oldest manuscript from 1362), is one of the first three prose legendaries (collections of legends) in German, together with Hermann von Fritzlar's *Heiligenleben* (1343–1349), and the South Middle Netherlandic *Legenda Aurea* (oldest manuscript 1358), which served as sermons and communal reading material for laymen and religious alike within the German mystics' movement of the fourteenth century, and for its later followers. The 190 legends were written in a pastoral style, and regularly include the liturgy of the day, according to the church calendar. The anonymous author might have lived in Strasbourg.

Manuscripts were produced in workshops and sold to the nobility and clergy alike. The professional productions were more accurate and usually had illustrations (mostly by Diebold Lauber). Three manuscripts were on parchment, seven had all the legends of the church year in one volume, nine had only the winter-part, eight the summer-part, four had selected only the legends of apostles (all in Switzerland), several had contamination with the *South German Heiligenleben* (ca. 1385–1400).

Manuscripts spread to all of Alsace, Switzerland, Swabia, the Palatinate, and even to Austria, as the dialects of the texts demonstrate. The legendary received an appendix of twelve legends (mostly of Strasbourg dignitaries), which was later used in the *Strasbourg Chronik* of Jakob Twinger von Königshofen (1382). Other legends were added, after the reform of Dominican women cloisters of the southwest set in (1419), up to fifty-one. By 1460, the legendary influenced the work of Sister Regula, *Das Buch von den heiligen Mägden und Frauen*, comprising fifty-seven legends of female saints.

Legends

In medieval Europe, edifying narratives of exemplary holy figures were gathered into collections called *legenda* or *legendaries*. Often very lengthy manuscripts, the collections were comprised of a variety of stories that might include the life of Christ, the life of Mary, a variety of saints' stories, both local and pan-European; tales of the church fathers; the desert fathers; passion stories or the narrations of famous martyrdoms; and a host of miracle stories. Because the fundamental material of a legend was typically the *vita* (or life) of a saint or paradigmatic holy figure, the literary form of a legend was similar to and often indistinct from that of hagiography. Much of the material was drawn from popular oral tradition and was normally organized according to the liturgical year. Selections were read aloud in monastic settings during the lessons of the second nocturn (early morning prayer period) of matins on each saint's feast day. For the laity, the hagiographic material was integrated into sermons and was often iconographically depicted in church imagery, in frescoes, chapel paintings, and sculpted figures. Throughout medieval Europe, *legendaries*—the stories of notable holy figures—were second only to the Bible in oral and written circulation.

Without doubt the most famous and widely used collection was the *Legenda aurea* or "Golden Legend" written by Jacobus de Voragine (ca. 1230–1298). Containing more than 200 stories, *The Golden Legend* quickly became the benchmark collection for all other compilers to follow. It had a remarkable impact on the composition of German vernacular *legendaries*. The *Vers-Passional*, completed between 1290–1300, was the first medieval German *legendary* to use the *Legenda aurea*. This 110,000-verse *legendary* is divided into three books, the first treating the birth of Mary, the Annunciation, the Nativity, and the life and Passion of Christ all organized according to the liturgical calendar. The second book includes stories of the apostles and Mary Magdalene, and the third book tells the stories of seventy-five saints from St. Nicholas (December 6) to St. Catherine (November 25). Although nothing is known of the poet, scholars speculate that he may also have authored the 41,540-verse *Das Väterbuch* (Lives of the Fathers) patterned on the Latin compilation, *Vita Fratrum*, and includes stories of the early Christian Church fathers and saintly monks and hermits. Together, the *Vers-Passional* and *Das Väterbuch* had enormous impact on the widespread transmission of vernacular *legendaries* in medieval German-speaking areas.

From approximately 1300 to 1350, German vernacular *legendaries* were composed metrically, as were *Das Väterbuch* and the *Vers-Passional*. After 1350, however, verse *legendaries* virtually disappeared, as prose *legendaries* became the fashion and the metrical collections were used primarily as source material. The first prose *legendary*, extant in only one manuscript, was compiled by a wealthy patrician layman, Hermann von Fritzlar, between 1343–1349. Intended for contemplation and devotion among the laity, Hermann combined the narrative elements of the *vita* with a homiletic style of sermons. The first complete German vernacular prose translation of the *Legenda aurea* was the *Elsässische Legenda aurea* completed in 1362 by an anonymous clergyman from Strasbourg. Shortly afterward, a Low German translation, the *Mittelniederdeutsche Legenda aurea*, appeared.

Regarded as the most popular of German prose *legendaries*, *Der Heiligenleben* (Lives of the Saints) was composed by a Dominican friar from Nürnberg between 1396 and 1410. Substantially larger than the *Legenda aurea*, *Der Heiligen Leben* contains 251 legends from multiple sources including the *Vers-Passional*, the *Märtyrerbuch*, the *Legenda aurea* and the *Speculum Historiale* of Vincent Beauvais, as well as the Latin *Vitae Patrum*. Only thirty-one of the lives recorded are drawn from the *Legenda aurea* and more than any other prior collection, *Der Heiligen Leben* includes selections more focused on European and especially German lives. The collection is arranged according to the liturgical year and each *vita* is accompanied by a short prayer intended for communal recitation. This especially influential collection is extant in nearly 200 manuscripts in both High and Low German vernaculars.

The literary classification of *legenda* is by its nature complex and also includes compilations such as *Der Seelentrost* (Consolation of the Soul). Written in the latter half of the fourteenth century, this vernacular collection of *exempla* or stories is largely devoted to the Ten Commandments. It is framed by a series of dialogues between a spiritual master and a young man and like other *legendaries*, it drew on popular folk material and religious doctrine to arouse interest and offer moral edification. While written in Latin for a distinctly monastic audience and composed some 200 years earlier, the *Dialogus miraculorum* of Caesarius of Heisterbach is similar in its intent to teach through engagingly presented stories. In the mid-fourteenth century, a number of Dominican convents in southern Germany composed chronicles referred to as *Nonnenbücher* (Sister-Books). Because these chronicles are largely comprised of collected *vitae* of nuns whose exemplary lives were collected as models for others, the *Nonnenbücher* have been likened to that of the *legendary*. However, while the religious intent may bear similarities with the compilation the saints' lives in the *legendaries*, the style is more accurately described as that of chronicling the history of the particular monastery.

Throughout the late fourteenth and fifteenth centuries, the production of *legendaries* escalated. And, as literacy increased among the laity and cloistered women, smaller volumes with more limited scope, narrating the life of a single saint, became fashionable, and countless editions were printed. Especially popular among these were the legends of John the Baptist, John the Evangelist, Augustine, Anne, Barbara, Dorothy, and Margaret.

During the Middle Ages the word "legend" did not carry the connotation of myth or fiction. The Latin verb *lego* meant "to gather" or "collect" and "to read out" or "recite." The word *legenda* itself came to mean a "saint's life" and the stories of the saints—the legends—were accepted by many medieval Christians as representative of historical reality. Although the material was often derived from folk and fairy tale, there were few challenges to the historical accuracy of the legends until the sixteenth century when Martin Luther condemned them as incredulous papist propaganda. Taking one of the legends from *Der Heiligen Leben*, that of St. John Chrysostom, he wrote and published a parody of the story, *Die Lügend von St. Johanne Chrosostommo*, as evidence of what he regarded as the fictional absurdity of the tales. As an aggregate of folktale, fairy tale, romance, and sacred history, medieval German *legendaries* provide historians with a great deal of evidence about the popular culture of the day.

Only a few dates between 1511 and 1527 are recorded from the life of this sculptor in wood and stone; he was probably born in Lower Bavaria about 1480, but he lived and worked in Landshut. Only in 1978 was Hubel able to associate definitively the monogram HL, discovered by Sighart in 1862, with Leinberger. The question of his early training is still undecided, with Upper Austria and Nuremberg both entertained as possibilities in the scholarly literature.

Leinberger's virtuoso forms can be seen in monumental Madonnas and figures of saints as well as in small multi-figured reliefs carved with stupendous vitality and subtle precision. In his low reliefs he masterfully conveys exceptional depth in both landscapes and interiors, and he embeds "his dense scenic representations" (Schädler 1977:68) in these convincing spaces. In a new technique, Leinberger replaces the usual polychromy (use of different colors) with the marks of up to twenty-three different tooling punches, creating a variety of effects on the unpainted wood surface. Together with the new interpretation of landscape, these features indicate Leinberger's leanings toward the expressionism of the Danube school.

The signed works include the Rorer epitaph, a limestone relief dated 1524 (Landshut, St. Martin), and wood

Hans Leinberger, Neumarkt Madonna (Munich, Bayerisches Nationalmuseum). Photograph: Bayerisches Nationalmuseum

reliefs representing the baptism of Christ from 1515 and the Lamentation from the following year, both in the Bodemuseum in Berlin, and a Calvary, also from 1516 (Munich, Bayerisches Nationalmuseum). The high altar at the church of St. Castulus in Moosburg from 1514 is documented as a work of Leinberger's, as are four reliefs from the Castulus altar and two reliefs from the Saint John altar, all made in the same year. An enthroned Virgin and a *Schmerzensmann*, from the lost high altar at Polling near Weilheim, are also documented in 1526–1527.

The works attributed to Leinberger are numerous. Among the most important figures in the round are a Madonna in the Rosary from 1516–1518 (Landshut, St. Martin) and an enthroned Virgin from Neumarkt, probably from about 1510–1515, now in the Bavarian National Museum in Munich. Also in the same location are an *Anna Selbdritt* from before 1513, and a large figure of Saint James from about 1525. Two crucifixes, dated about 1515 and a decade later, are located with Leinberger's numerous other works at St. Castulus in Moosburg; a third, from about 1530, is in the church of St. Johannes in Erding. In addition to the signed Rorer memorial, Leinberger also completed limestone epitaphs for the Mornauer family about 1513–1515, also at St. Castulus, and after 1520 and 1521, respectively, for the Walkheiners (St. Peter near Straubing), and the Notthaffts (Landshut, St. Martin).

Leo IX (1002–1054)

Pope Leo IX was born as Bruno of Egisheim in 1002 into a noble Alsatian family. His early studies were at the regional center in Lorraine of Toul, where, in 1017, he became a canon at the cathedral. Related to the German ruler Conrad II, he served prominently in the royal army in Lombardy in 1026. Conrad appointed him the bishop of Toul in 1027. Inspired by the monastic reform efforts of the tenth and eleventh centuries, Bruno sought to bring the fruits of these movements to such monasteries in his diocese as St. Aper, St. Dié, Moyenmoutier, and Remiremont. Reform of the diocesan clergy also was the order of a number of the synods he held. His efforts to reinvigorate his diocese as the bishop of Toul would prepare him for extending these activities to the whole Western Church when he became pope.

The emperor Henry III, his cousin, selected him to be pope in 1048, after the brief reigns of Henry's previous two appointees, and he was crowned at St. Peter's with the acclamation of the Roman people. From Lorraine he would summon such like-minded reformers as Humbert, abbot of Moyanmoutiers; Frederick of Liège, the future Pope Stephen IX, and Hugh of Remiremont. Joining the men of the north would be such Italian churchmen as Peter Damian and Hildebrand, the future Pope Gregory VII, to become the nucleus of what became the college of cardinals. Aided by the efforts of these and other reforming churchmen, the new pope sought through the holding of numerous regional synods in Italy, Germany, and the kingdom of the French to curb the problems of simony, nicolaitism (opposition to celibacy), and violence against churchmen and the poor and to deal with numerous other problems facing the church in this period. Pope Leo presided over these gatherings and exhibited the presence of the papacy to a substantial portion of Western Christendom, quite unlike that of his predecessors. He extended papal protection to monasteries in a series of charters and in 1050 issued a canonical collection that drew on earlier rulings to support his papal activities. His aggressive attempt to deal with the problems faced by the church is also apparent in his personally leading an army into southern Italy in 1053, with the approval of Henry III, to oppose the Normans, a major preoccupation in the latter part of his papacy, because they were such a threat to the ecclesiastical and papal political holdings in the region. The Normans defeated the army of the pope in June of that year and held Leo captive. Incensed by this invasion into a region where the Byzantines had claims, Patriarch Michael Cerularius of Constantinople closed the Latin churches in his city. Humbert was dispatched from Rome to lead a papal embassy to try to solve the problem. The result was not the desired rapprochement but a mutual excommunication by Humbert and the patriarch and the beginning, in July of 1054, of the great schism between Rome and Constantinople, between the Western Church and the Eastern Church that continues to the present. Pope Leo, however, was not alive to witness the separation. He died in April of that year in Rome shortly after his release from Norman captivity.

John of Fécamp called Pope Leo "the marvelous pope" (*papa mirabilis*), a title that in many ways he well deserved. His papacy marks an important moment in the history of the church. His achievements provided the foundation for the Gregorian reform and the future papal monarchy. He brought the presence of the bishop of Rome to many parts of Western Christendom, in a manner comparable to the papal global travels in the late twentieth century. At the Council of Rheims, he used the title of universal to emphasize the scope of the power of the vicar of Peter. His very name demonstrates his awareness of the singular importance of his position, so clearly delineated in the Petrine doctrine of Leo the Great. But he also utilized the Donation of Constantine to justify his actions in southern Italy where he aggressively displayed his leadership in a new papal militarism that looked forward to the summons of the First Crusade by Urban II in 1095. This aggressive leadership, however, also led to the great schism of 1054, a separation that has had a profound importance in the history of the church and of Europe as a whole. Few papacies, if any, have marked such a major change in the direction of the church.

Libraries

The great Roman tradition of large, state-sponsored public libraries did not exist in the Middle Ages. Charlemagne and his successors were able to revive book production and classical learning in Germany, but this effort was centered in the Benedictine monasteries and court schools. Although Charlemagne himself most likely had a modest personal library, this was the exception among Carolingian nobles. The libraries of the ninth century were small, the greatest holding only several hundred manuscripts, and were dependent on the monastic scriptorium (writing center) for growth and vitality. Serving monastic needs, worship, and education, they concentrated their holdings in the areas of biblical exegesis and certain Latin classics for the learning of grammar and style. The libraries of this period were seldom located in a separate room but were distributed among the sacristy and common areas. Manuscripts were stored in a locked closet or trunk, the *armarium*, but most reading was done in the monks' cells. Only the most rudimentary catalogs, or book lists, were prepared to inventory the holdings. Among the most significant centers of learning, with commensurate libraries, were St. Gall, Reichenau, Lorsch, Fulda, Freising, Regensburg, Trier, Salzburg, and Konstanz. Most of these centers were also responsible for the beginnings of writing in the German language.

The bridge from the ninth to the twelfth century and the advent of the university library was provided by several monastic reform movements. After a period of stagnation and the destruction of many libraries by Norman, Saracen, or Hungarian raids in the late ninth and tenth centuries, the reformed monastery of Hirsau revitalized an interest in renewing outdated or insubstantial holdings. The Carthusians saw book production and proper librarianship as keys to their ascetic vision. The new mendicant orders of the early thirteenth century, the Franciscans and Dominicans, guided by the great universities of Paris, emphasized scholastic literature and established a new kind of study library with chained books, usually in a separate room. The greatest German libraries of the thirteenth and fourteenth centuries were at Erfurt, Heilsbronn, Mainz, Regensburg, and Bamberg. Only a few possessed texts in German. There was a period of considerable decline in monastic production and collection after the great plague years in the mid-fourteenth century. It was during this time, however, that universities became established in Prague (1348), Vienna (1364), Heidelberg (1386), Cologne (1388), and Erfurt (1392). The faculties of these universities chartered substantial libraries fairly early on, and the growth of these libraries was rapid because of the support given them by individual princes or towns and the considerable donations of faculty and students. With the introduction of paper toward the end of the fourteenth century, certain monasteries were able to increase considerably the size and scope of their libraries, most notably Tegernsee, with more than 900 fifteenth-century manuscripts still extant. It was also at this time that the first useful catalogs appear, sometimes organized alphabetically by author or title, providing a means to locate texts rather than just an inventory of them. As libraries became status symbols, wealthy merchants and noblemen and women began to actively pursue private collections, with an interest in secular texts in German as well. The availability of commercial scribes and later the availability of printed books made this pursuit feasible. Although private and city libraries were to grow in importance at the end of the medieval period, the large state-sponsored library would not emerge in Germany until the seventeenth century.

The German term *Liederhandschrift* (manuscript of songs) encompasses in its widest sense all manuscripts (and other media) that contain written records of the art of the Middle High German songwriters, an art form originally conceived as oral, i.e., not to be written down. In a narrower sense, manuscripts containing only such songs are designated *Liederhand-schriften*. The earliest example of an independent German language song manuscript, known as "A," is in the University Library at Heidelberg (no. cpg. 357), written in Alsace around 1270–1280. However, since "A" is obviously based on earlier, if lost, written versions, this kind of manuscript must be older. One of the main characteristics of medieval German language song manuscripts is the attempt to attribute the songs, lays, and *Sangsprüche* (political verse) to an author (authorial principle), and to collect all the texts of a given author into one corpus (*corpus principle*). In this way they vary recognizably from the medieval compilations of Latin, French, Provençal, and Italian poetry, all of which employ a spectrum of basic ordering practices ranging from the author and corpus principle through thematic and genre related viewpoints all the way to alphabetical listing. As a rule, German language song manuscripts gather a rather large number of authors' texts together, whereby the four main manuscripts ("A," "B," "C," and "J"—discussed below), when compared with each other, reveal characteristic differences with respect to their selection and ordering of the authors' collections and the texts and genres contained therein. These differences result in part from the interests of the respective patrons, in part from the source materials then available.

Manuscript "A," one of the major collections, contains in its main corpus 791 songs and two lays, listed under thirty-four authors' names. The manuscript opens with a series of well-known authors with a large number of songs, (Reinmar, Walther von der Vogelweide, Heinrich von Morungen, Ulrich von Singenberg, Rubin), followed by a second section of collections of erstwhile anonymous groups that probably were assigned to an author (Niune, Gedrut, Spervogel, Der Junge Spervogel, Leuthold von Seven) at a later date, in addition to small collections of authors known by name. Alongside the dominant reflective courtly love songs (*Minnelieder*), "A" also contains dawn songs, Neidhart songs, shephard poems (*pastourelles*), lays, and *Sangsprüche*. "A" clearly focuses on the classical and postclassical songs. At the beginning of the fourteenth century, a number of anonymous additions were made to the anthology.

Manuscript "B" (Stuttgart, Württembergische Landesbibliothek, no. HB XIII 1), written in Constance at the beginning of the fourteenth century, contains in its main body 602 songs under twenty-five authors introduced with a full- or half-page portrait of the author and in the order that supposedly reflects the standing of the poets. The texts are reflective courting songs with related genres (messenger's song, crusade song); *Sangsprüche* are marginal throughout; no lays were included. The texts are all so-called Middle High German classic and early romanticizing *Minnesang* (courtly love poetry). This conservative core collection was later expanded and updated by Neidhart songs, *Sangsprüche*, the so-called Winsbecke complex, and two *Minnereden* (poetic excursions on love). These additions, other than the core texts, provide no pictures nor author attributions.

The major manuscript of Middle High German poetry is the Codex Manesse ("C," Heidelberg, Universitätsbibliothek, no. cgm. 848), commissioned around 1300 by the Zurich patrons Rüdiger and Johannes Manesse. After their deaths, the project was continued until about 1340. The manuscript contains the amazing total of more than 5,200 songs and thirty-six lays listed under 137 authors' names. In its main stock of 110 authors' corpora, "C" is related to two sources common to "A" and "B" (referred to as "*BC" and "*AC"—the asterisk signals the fact that these collections are postulated, but not extant). It is clear that not only texts were transmitted by "*BC," but also two definitive ordering practices: the hierarchical listing of the collections and the intention of introducing each collection with an author portrait. "*AC" shares the openness of the anthologizing concept with "C," including all known sub-genres of Middle High German poetry. "C" may also have borrowed from other collections, which can be posited using comparisons with other textual evidence. Especially close relationships exist with other illustrated poetic collections (Budapest fragment, Fragment of Nagler and Troß).

The Jena song manuscript ("J") from the Low German (northern Germany) language area around 1330–1350 contains 919 songs, the majority of which are *Sangspruch* songs, two lays and one lay fragment. Unlike the southern German manuscripts, "J" also provides—in ninety-one instances—the melodies. Three characteristics of "J" are shared by other Low German fragments (Walther von der Vogelweide, no. Z; "KLD Mb," Frauenlob, no. Z): the preference for *Sangspruch* and lays, the transmission of the melodies, and an extensive colometric (counting cola, or metric units) system of combining distinctive song portions. These manuscripts and fragments form one of two major centers of song transmission—the other being the southwest German—which vary in time and place. The illustrated southwest German manuscripts of the thirteenth and early fourteenth century present the classical genres of *Minnesang*, but without the melodies. At the other end, within the Low German area, a number of decades later, a center of *Sangspruch* and lay manuscripts emerges with melodies but without illustrations, and with only weak representation of the classical *Minnelied*.

Two special cases within the German language realm are 1) manuscript "D" (Heidelberg, Universitätsbibliothek, no. cpg. 350, South Rhenish dialect, before 1300), concentrating only on one author's works (Reinmar von Zweter, *Sangspruch*), and 2) Ulrich von Liechtenstein's novel "In Service of Women" (*Frauentienst*, Munich, Bayerische Staatsbibliothek, manuscript no. cgm. 44, before 1300, written in the Bavarian dialect), a stylized biography in which Ulrich's songs and lays are integrated into the fictional plot of the novel. Perhaps French novels with songs included served as an inspiration for Ulrich.

Independent song anthologies do not have to be written into books, but can also be arranged on a *Pergament Rotulus* (parchment roll), which are written parallel to the cross page and can be rolled together for transport (see Los Angeles, University of California Research Library, manuscript no. 170/575, and Basle, Universitätsbibliothek, no. N.I.6.50).

In addition to the dominating manuscript form of the independent song codex, there are also other forms of written Middle High German poetry. Among those are: 1. Sporadic later entries of individual songs on originally blank pages or parts of pages in the manuscript (first or last pages, pages left blank, margins), usually with no connection to the other texts in the manuscript; 2. Individual Middle High German strophes integrated into the context of Latin texts to the extent that they were no longer intended to be read as independent texts (e.g., in *Carmina Burana* manuscript); 3. Systematically arranged collections of poems in turn entered as legitimate sections of larger manuscripts containing various genres. This last kind of transmission is more commonly organized by author or corpus, much like the Neidhart corpus (Riedegger Manuscript, Berlin, Staatsbibliothek, no. mfg 1062) or the Walther and Reinmar collection of the Würzburg *Hausbuch* (Munich, Universitätsbibliothek, no. 2° Cod. Ms. 731). Occasionally, the collection principle reveals the attempt to organize by theme or by genre, for example in usually smaller *Minnesang* anthologies or in anonymous *Sangspruch* collections.

The great lyric compilations of the late thirteenth and early fourteenth centuries represent the literarization of a previously oral form of verbal art, which had resisted writing longer than other vernacular genres. Their illustration must be considered in this context.

Two of the major German *Liederhandschriften* (literally "manuscripts of songs") are lavishly illustrated, and a number of fragments suggest that similar works, although not necessarily all of the same size and scope, were not uncommon. The structure in every case involves the arrangement of the poems into author oeuvres, as already in the unillustrated "Small Heidelberg Manuscript" (*Kleine Heidelberger Liederhandschrift*, Universitätsbibliothek no. cpg 357), from the late thirteenth century, and the illustration of each oeuvre with a picture of the author.

The Codex Manesse or *Große Heidelberger Liederhandschrift* ("C," Heidelberg, Universitätsbibliothek, no. cpg 848) was made in Zurich in the first third of the fourteenth century, probably under the patronage of the Manesse family. The earliest sections were probably written before 1304. The nearly contemporary manuscript of songs from Weingarten (*Weingartner Liederhandschrift*, or "B," Stuttgart, Württembergische Landesbibliothek, no. HB XIII 1) produced in Constance circa 1310–1320, with its twenty-five miniatures, is based on the same concept and shares several of the same image types. Textually, the two are derived from a (no longer extant) common source *BC (the asterix signifies a text assumed to have been extant but now lost); the relationship between the miniatures in the two is not entirely clear, but probably the most widely accepted theory is that they share a common source.

Roughly contemporary with the Codex Manesse and the *Weingartner Handschrift*, and quite possibly earlier than these are the Budapest (Széchényi-Nationalbibliothek, no. Cod. Germ. 92) and Nagler (Krakau, Biblioteka Jagiello ska, no. mgo 125 [formerly Berlin]) fragments, both with poems grouped by author and accompanied by author pictures. The former was made in Bavaria or Austria circa 1300 or somewhat earlier, the latter is Allemanic, circa 1300. The much later Troß fragment (Krakau, Biblioteka Jagiello ska, mgq 519 [formerly Berlin]), made in Württemberg in the first half of the fifteenth century, is apparently a direct copy of C.

The illustration of named oeuvres with author pictures was not the only option for the illustration of lyric manuscripts. The earlier *Carmina Burana* (Munich, Bayerische Staatsbibliothek, no. clm 4660) from South Tyrol [Neustift?], circa 1230, contains miniatures generally related to the contents of poems, a type of illustration also found in the mid fifteenth-century *Hohenfurter Liederbuch* (Ceské Budejovice Krajská; Knihovna, Ms. 1 VB 8b), a collection of religious songs with three drawings illustrating specific verses.

The organization and illumination of the Manesstype manuscript represents a significant step in the literarization of secular song—the association of worldly lyrics with the names and personae of authors who are endowed by the iconography with something of the authority and stature of classical and Christian authors. No consensus exists on the immediate sources and inspiration of the Manesse-type illumination program. However, the general art historical antecedents of the visual topos "author portrait" lie in classical antiquity and in the illumination of the Psalms, Gospels, and other Christian texts; indeed, the depiction of Kaiser Heinrich at the beginning of the Manessische and Weingartner manuscripts employs the iconography of "David, king and prophet."

Most of the poets, however, do not appear in traditional author poses. Instead, the "portraits" reflect a number of iconographic traditions and represent a great variety of frequently punning or metaphorical responses to aspects of the poets' personae, names, and works. As such, they can generally not be taken as independent evidence of biographical facts. Overall, these authors appear not as churchly or classical authors in the strict sense, but as courtly singers, whose activity is nevertheless endowed with something of the social, representative function of literate authors.

Life of Mary, Master of (fl. ca. 1460–1490)

An anonymous Cologne painter, active from circa 1460–1490, whose work combined Netherlandish influence, especially from the works of Rogier van der Weyden and Dirk Bouts, with the style of the followers of Stefan Lochner. He received his name from the altar of the Life of Mary, formerly in the church of St. Ursula in Cologne and now divided between the Alte Pinakothek in Munich and the National Gallery in London. One of the most influential artists in Cologne after 1450, his style was characterized by emphasis on elegant single figures with little connection to one another placed in clearly defined compositions. His work is closely related in style to paintings that today have been assigned to the Master of the Lyversberg Passion with whom he was earlier sometimes identified and the Master of the Legend of St. George. Like the former master, his work displays such strong Netherlandish influence that a period of travel in that region has traditionally been assumed. It is also possible that the employment of journeymen in the Cologne workshops who brought model drawings from the Netherlands played a role, since both artists combine Netherlandish motifs with those from local styles. An approximate dating for his works has been established on the basis of stylistic criticism and the biographies of donors where they are known. Additional altar paintings attributed to him include the Passion Triptych in the St. Nikolaus Hospital in Kues and the center panel of the Triptych of Canon Gerhard de Monte in the Wallraf-Richartz-Museum in Cologne.

Limburg an der Lahn

The history of the earlier structures on the rocky outcrop overlooking the Lahn is not clear. A castle mentioned in

Limburg on the Lahn, cathedral, west façade. *Photograph: Joan A.Holladay*

the ninth century had probably been here long before that. A notice in the necrology of St. Kastor at Koblenz credits Archbishop Hetti of Trier (814–817) with dedicating a church in an unspecified location to Saint George, who is the patron of the church at Limburg, but a series of excavations undertaken on the site of the current church since 1935 have found no evidence to support the theory that there was a building at Limburg at this time. In 910, Count Konrad Kurzbold founded a monastery for noblemen; the first building that can be documented dates to this period. Gifts of the emperors Otto I and Conrad II are documented in 940 and circa 1030, respectively; those of Heinrich IV and his wife, Agnes, in 1059 and 1062 are often associated with the documented consecration of an oratorium (oratory) in 1058. It is not possible to determine whether it was a new structure or a remodeling of an existing one.

The present church of St. George (a cathedral since 1827) is important both as one of the last late Romanesque churches in Germany and for the preservation of its interior painting scheme. The consecration of the high altar in 1235 is generally taken to mark the end of the major building work. Although the church was built relatively quickly, this late date means that the church mixes features of the Rhenish Romanesque with those of the French Gothic from the second half of the twelfth century. Typical of the former are the pilaster strips and corbel tables that give the west facade its characteristic look. The multiple towers—those on the west pulled out flush with the facade wall, the use of flying buttresses around the choir, and the four-story interior elevation—the first in Germany—are marks of the influence of French early Gothic buildings such as the cathedrals at Noyon, Laon, and Tournai.

Several layers of eighteenth- and nineteenth-century paint covering the interior wall surfaces were removed in 1934–1935, revealing the medieval painted decoration intact underneath. Geometric patterns highlight the moldings on the arcades of the nave walls, and foliate motifs decorate the wall and vault surfaces. Images of apostles, prophets, kings, and virtues and vices appear above and between the arcades, and archangels and personifications of elements decorate the vaults. Between 1968 and 1972, the paint on the exterior was restored on the basis of remaining fragments; here, solid colors and geometric patterns pick out architectural elements.

The cathedral treasury still preserves some extraordinarily important works, indicating, with the royal and imperial gifts mentioned above, the status of this church in the Middle Ages and later. The Byzantine reliquary for fragments of the True Cross known as the Limburger Staurothek frames an imperial commission from the midtenth century in an outer case that is only slightly later. The silver gilt, enamel work, and inset gems mark the quality of this work, which came into the possession of the count of Flanders soon after the sack of Constantinople in 1204, but arrived in Limburg only in the nineteenth century. Equally important is the reliquary of gold foil, enamels, and gems, made to encase the staff of St. Peter, a commission of Archbishop Egbert of Trier dated 988.

Linz

Founded as the Roman *castellum* (fort) Lentia, Linz's favorable site along the Danube positioned it as a trading center for the wood, salt, and iron of Styria. The medieval fortified settlement was documented in 799 and recognized as a legitimate market town (*legittiums mercatus*) as early as 903–906. The city was held by the archbishops of Passau from 823 to 1190, with its advocates from the family of Haunsberg. Around 1200, direct control of the city and surrounding area was acquired by the dukes of Babenberg, who held it in fief from the archbishop of Passau.

The city bears traces of its medieval layout: a castle on a low hill surrounded by a moat and a triangular market-place reflecting the Roman plan. Some early houses remain, including the town residences of the nearby monastery of St. Florian. The church of St. Martin is documented in 799, although its foundations are earlier. Its Carolingian portion is a spacious hall decorated with blind arcades and featuring three apsed niches. To the late fifteenth century date the building's Gothic choir, facade, and some frescoes. The royal *Residenz* was expanded under Leopold VI circa 1210 and extended again by Emperor Frederick III, who died there in 1493. Frederick's coat of arms from 1481 appears on the rectangular, two-storied building with towers. An illustration in the *Stadtbuch* (City Book) of Grein circa 1490 depicts the castle connected to the Friedrichstor (Frederick's Gate) by a bridge. In 1497 a bridge was built from Linz across the Danube.

Today the third-largest city in Austria, Linz had its heyday in the baroque period, when much of the city, including earlier churches of the Teutonic Order and the Minorites, was rebuilt. During the medieval period, Linz was subject to the bishops of Lorch, in the archdiocese of Passau, not becoming itself the set of a diocese until 1785.

Literature and Historiography

Literature and historiography in medieval Germany do not reflect the Aristotelian opposition that history speaks of what has happened while literature addresses what can or ought to happen. They are rather two sides of the same coin: the desire to preserve actions or events in memory. Initially, truth and reliability played no role in the status of the one over the other; this distinction became a value judgment in the twelfth century.

Tacitus's reference in his Latin discussion of the Germanic peoples, *Germania* (chapter 2), to old songs in which the Germanic tribes preserved memories of heroic deeds, is an early indication that Germanic people combined creative expression and a sense of history. The Old English epic *Beowulf* (v. 867–874) also provides an account of the process to which Tacitus refers; a singer praises the deeds of the victorious hero, creating on the spot an oral record of a current event. The desire to record actions and events, orally and later in writing, highlights personality, time, place, and the importance of chronology. The prevailing sense of order in medieval Germany was the Augustinian linear chronology of a world with a beginning and an end. Recording events and actions in chronological order fell into two main categories: annals and chronicles. Annals, usually anonymous, practical records with limited use and distribution, are nonliterary; chronicles, literary works whose authors were open about their historical objectives, achieved wider distribution and recognition among literate audiences.

The overlap of history as literature and literature as history reflected, at one stage, an interest in human actions within a limited space and in a given time. The functional approach exemplified by annals, or yearly books, marked this earliest stage of historical writing in Germany. The producers were clerics and educated laymen writing in Latin. A second approach, the chronicle, used the Christian perspective of time as a finite entity surrounding a central event, the birth of Jesus Christ, extending into the past as well as into the future. This approach, world history as universal history, reflected a broader historical interest in the world from its point of origin, the Creation, up to the writer's lifetime. Annals relied primarily on memory or observation; chronicles, as universal histories, took their structure and their authority from Holy Scripture, especially Genesis and the Book of Daniel.

The twelfth-century transition from Latin to German in historical writing includes Otto von Freising's (ca. 1111–1158) Latin account of the deeds of Frederic Barbarossa alongside the *Kaiserchronik* (1135), the first German work to treat world history as a history of the deeds of the Roman emperors and their German successors. Historical writing subsequently reflected a variety of subjects: interest in Germanic tribal ancestries; accounts of the deeds of illustrious persons; histories of cities or cloisters; and, for moral and didactic reasons, the lives of saints.

The scope of literature and historiography as related concepts also includes German works based on historical events or personalities but are not reliable as historical sources. These works include, among others, heroic Germanic materials, the foreword to the *Evangelienbuch* of Otfrid von Weissenburg (ca. 800–ca. 871), and the thirteenth-century universal history of Rudolf von Ems (d. ca. 1254).

Literature, Dutch

Old Dutch (also called Middle Dutch) is a collection of dialects antedating circa 1170. The corpus of Old Dutch literature is very small, consisting of six texts, ranging in size from a brief writing sample to a more extensive religious text.

1. The *Wachtendonck Psalms* are an Old Dutch rendering of an Old High German translation of the Psalms, these texts are named after their last known owner, Arnold Wachtendonck of Liège. The translation was made ca. 950 by a monk from the Venlo-Krefeld area working for the nuns of the Münsterbilzen convent. The OHG original as well as the Old Dutch version are now lost. Based on the evidence from the remnants of a transcription (and the accompanying glosses) made by the humanist Justus Lipsius (1547–1606), the text must have contained all the Psalms as well as several hymns.
2. The *Orosius glosses of St. Omer*, both interlinear and marginal glosses in Old Dutch, were added to a manuscript of Orosius's *Historiae Adversum Paganos*. The glosses in this early eleventh-century manuscript, written in the Abbey of St. Bertin in St. Omer, are of a geographical nature, containing translations of the Latin names for the four cardinal points of the compass and some place-names. A copy of this manuscript was made in the second half of the eleventh century, including the same glosses (with two minor variations).
3. The *Holland-Utrecht names of the months and the four cardinal points of the compass* appear in a manuscript of Einhard's life of Charlemagne *Vita Karoli Magni* written ca. 1050 at Utrecht. The names were adapted from Old High German into Old Dutch. The morphology of these words indicates that the scribe may have come from the county of Holland.
4. *The Leyden, or Egmond Willeram*. This paraphrase of the Song of Songs by Williram, abbot of Ebersberg (Bavaria), was written around 1059–1065 in an Old Frankish dialect. In a copy of ca. 1100, made in the Abbey of Egmond (county of Holland), the language of the text was adapted to that of Holland. *Willeram* is a very important document for the study of Old Dutch, as it contains the oldest source for some words as well as for some inflected forms. A few words in *Willeram* would later disappear from the Dutch language. Furthermore, the text proves that the linguistic ties among Holland, West Flanders, and Frisia were still very strong around 1100.
5. *A short West Flemish love poem*, perhaps the best known specimen of Old Dutch, is a writing sample (ca. 1100) from a Dutch monk living and working at Rochester Abbey (Kent) who originated from the southwestern-most corner of the Dutch language area. On the last page of a manuscript of Aelfric's *Catholic Homilies* this monk and his colleagues tried out their quills and ink. The lines *hebban olla vogala nestas hagunnan hinase hic/enda thu wat unbidan we nu* (all the birds have started their nests, except me/and you: what are we waiting for) are accompanied by a Latin translation.
6. The *Münsterbilzen List of names and eulogy* was written in 1130 by a monk from the eastern Betuwe region (Arhem-Nijmegen-Elten) on a blank half-page in a ninth-century evangelarium (at the end of the Gospel of Matthew). It contains a list of participants at a meeting at the Münsterbilzen convent. The monk, probably Arnoldus Battaviensis, ends the list with a remark partly in Old Dutch, partly in Latin: *tesi samanunga vvas edele unde sconae.& omnivm virtutum pleniter plena* (this gathering was noble and fair and full of all virtues.)

Liturgical Vestments, Manuscripts, and Objects

Medieval liturgical vestments were an important part of the Catholic tradition and were worn during traditional ceremonies. Specific colors dominated the wardrobe including green, red, white, gold, purple, and black. The color chosen to be worn for the day symbolized the church season or celebration. Green was used during ordinary time; red was used for the feast of martyrs and Pentecost as it symbolized blood and fire; white and gold were interchangeable and used for solemnities and joyous occasions including Christmas and Easter; purple represented reflection and was worn during Advent, Lent, and at penitential feasts; black symbolized somber times and was worn at mourning and funeral ceremonies and/or processions.

Vestments represented the positions of priest, deacon, subdeacon, and laity. Priests and deacons wore the amice, alb, cingulum, stole, and the dalmatic, but the priest's attire was more formal. A white linen shawl, the amice was worn under the alb. The alb was the white tunic that had three square inserts sewn on each sleeve at the wrist and one at the base of the dress to symbolize the location of nails in Christ's body at the crucifixion. A linen belt called the cincture was twisted around the waist to shorten the length of the alb. Priests wore a stole with the ends crossed over the breast and the back and tucked into the cincture, and the deacons wore a stole that was not crossed but worn over one shoulder (lower right to the upper left on the back and upper left to lower right on the front). A linen insert called the maniple was worn along the sleeve at the forearm. The rochet (surplice) was a choir shirt. Artists embroidered and painted scenes of the life of Christ and Mary on the priest's tortoise-shell shaped cloak called the chasuble, and a similarly embroidered dalmatic was worn by the deacon. A priest wore an outer hanging stole over the rochet or chasuble to indicate his position. Priests and deacons also wore a formal raincoat called the pluviale, which was usually embellished with New Testament scenes. For ceremonial purposes, a velum was used to cover the hands of the celebrant before lifting the sacred chalice.

Additional marks of rank included the tiara or beehive-shaped headpiece worn by the pope; the bishop's hat, called the mitre, was distinguished by its long pointed shape and the two ribbons hanging at the back on each side. A staff called the crozier was carried by bishops and abbots as a symbol of their rank and referred to Christ's role as the good shepherd. The pallium, a wool cloth strip worn as a yoke around the neck, was given by the pope to archbishops. An adaptation of the pallium was the square-shaped cloth breastplate worn by the bishops and called the rationale.

Following the early Christian tradition, medieval altars contained the tomb or a relic of a dead saint covered with a slab of unbroken stone. A cross was incised in the center to mark the sacred spot for placement of the chalice. Objects used during the mass were situated around this spot: candles, a cross, and one or more manuscripts. During periods of vigilance or formal celebrations the monstrance was the receptacle that displayed the Eucharist.

The priest and concelebrants needed specific liturgical objects for the mass. The chalice held the wine, and the paten was the plate used for distributing the Eucharist. Two gold or silver servers held the water and wine prior to the consecration. During the consecration the Eucharist was placed on the white linen cloth called the corporale. The chalice was covered by a thin square linen-lined board called the pall and a veil with the color of the day. Incensers used in the church had a utilitarian and ecclesiastical function: incense removed miscellaneous odors and the rising smoke symbolized prayers ascending to heaven. New Testament scenes were incised into the metal and decorated with the *niello*, *repoussé*, *cloisonné* and/or *champlevé* enamel techniques. Cabochons and Roman cameos contained symbolic meanings and were used to decorate the bases, stems, and rims of chalices. Situated strategically around the stems of a chalice, amethysts were believed to ward off evil spirits and to contain protective forces.

Five liturgical books were essential for the mass. The *Kyriale* contained the hymns of the mass including the *Gloria*, *Credo*, *Sanctus*, *Agnus Dei*, and the Gregorian chants. The *Lectionary* was organized according to the church calendar and included the specific daily readings from the Old and New Testaments and the Epistles. The *Missal* contained the complete rite of the mass for all occasions and daily worship, and the text was read or sung by the celebrant, deacons, and the congregation. An *Evangelary* contained the selections from the Gospels to be read by the deacon who assisted the priest during Mass. The *Gradual* was the choir book containing antiphons and psalms.

Liturgy, Furniture

The altar, where the Eucharist was celebrated, was the most important piece of liturgical furniture in the church. Early German altars were usually composed of three stone slabs, but later examples incorporate columns, such as the altar at Braunschweig cathedral, donated by Henry the Lion, with a marble slab on five bronze columns (1188). Gothic altars sometimes had carved reliefs, which had stylistic and programmatic connections with other interior sculpture, as at Cologne cathedral (ca. 1300). Further elaboration of the altar areas included antependia, or altar frontals, sometimes deluxe works in gold like the Basle antependium, (ca. 1022–1024), presently in the Cluny Museum in Paris. During the Gothic period, altarpieces were frequently placed on or above altars, as in the case of Oberwesel. The consecrated bread, or Host, was stored in a suspended metal dove, symbolizing the Holy Spirit, in the early Middle Ages. In later medieval periods, the Host was kept in a tower-shaped ciborium on the altar, as at Great St. Martin, Cologne, or in an independent cabinet usually decorated with Gothic tracery, called a Sacrament house, such as the example by Adam Kraft in the church of St. Lorenz in Nuremberg (1496–1500).

During the Gothic period, the choir (the part of the church associated with the clergy), was separated from the rest of the church by a choir screen, or *lettner*, a divider frequently decorated with narrative reliefs. A large crucifix with St. John and the Virgin Mary was also frequently placed in the choir or on or above the choir screen. These crucifixes become popular in the Romanesque period and continued in popularity until the Reformation. Carved seats for the choir had misericords, or seat rests for the choir to lean against while singing, which were decorated with secular, sometimes ribald, imagery, as at Cologne cathedral (1308–1311).

The nave of the church, frequently associated with the laity, often contained a reading stand and pulpit so that the lessons and sermons might be delivered. Pulpits, such as that at Wechselburg, were usually attached to one of the nave or crossing columns. Baptismal fonts, in bronze, as the example from Hildesheim Cathedral (ca. 1220–1225), or carved stone, were usually located near the entrances of the church. Because of the symbolic importance of water in the church, sometimes entire wells, as at Regensburg, were enclosed in elaborate gothic structures within the church.

Since light was another element that had symbolic as well as practical importance, candlesticks were placed on the altar and elaborate chandeliers were hung in the nave and choir. In the early Middle Ages the chandeliers were usually wheel-shaped and frequently evoked the heavenly Jerusalem such as that in the cathedral at Hildesheim (mid-eleventh-century), which features twelve small towers and statues of the apostles. Later Gothic chandeliers were sometimes multileveled and decorated with tracery, gables, and figures of angels, as can be seen at Dortmund.

The annual cycle of acts of Christian public worship and their constituent elements, in particular the items sung in plainchant (monophonic chant). In medieval Germany, like other countries of western Europe, the Roman liturgy was celebrated. This involved observance of the yearly cycle of days of greater or lesser importance, and the daily round of services, each consisting of a certain number of prayers, readings and chants. On the one hand were the office hours: vespers and compline in the evening, the night office (also known as nocturns or matins), lauds before daybreak, prime, terce, sext, and none. Each followed a weekly cycle of sung and spoken elements, which would be interrupted by days of special solemnity, such as Christmas, Easter, or saint's days, these having had their own "proper" items. Mass was also celebrated daily, again following a yearly cycle of prayers, readings, and chants. The sung items of mass and office together constitute the body of plainchant known loosely as "Gregorian chant," for a solo singer, or group of singers in unison. The chants are of particular interest because of their great stylistic range, displaying a variety far greater than that of liturgical prayers and readings. The chief matter of the office hours was the singing of Psalms to a simple recitation formula, all 150 Psalms being sung during the course of the week. Each Psalm or set of Psalms was framed by an antiphon, usually of modest musical scope (antiphons framing the *Magnificat* canticle of vespers and the *Benedictus* canticle of lauds are more demanding). More extended were the responsories sung after each lesson during the night office. Strophic hymns with simple melodies were also sung at each of the hours. The chants of mass are usually divided into two groups: (1) the "ordinary" chants, whose texts do not vary from one day to the next, Kyrie, Gloria, Credo (from the eleventh century), Sanctus, and Agnus Dei; and (2) the "proper" chants, with texts special to each day in turn, the Introit, Gradual, Alleluia or Tract (in Lent), Sequence (following the Alleluia on principal feast days), Offertory, and Communion. Of these the Gradual, Alleluia, Tract, and Offertory are ornate in style, surpassing any item of the office in musical complexity. The establishment of the Roman liturgy and its extensive repertory of Gregorian chant in Germany proceeded during the eighth and ninth centuries. Anglo-Saxon missionaries of the seventh and eighth centuries—Willibrord in Frisia, Wynfrith/Boniface in central Germany and Bavaria, and several others—would have brought Roman liturgical observances from England (whose tradition went back to Augustine of Canterbury, in the time of Gregory the Great). But it is unlikely that uniform practice encompassing the whole Gregorian chant repertory could have been set in place at once. The more settled conditions in the Frankish kingdom of Pippin III (751–768), and especially Charlemagne (768–814), were a prerequisite for the cultivation of chant. It may be supposed that the great ecclesiastical centers such as Mainz and Salzburg, together with important Benedictine monasteries such as Fulda, played a leading role, but unfortunately we have no actual chant books from these places to document the process in detail. Books with musical notation (the signs commonly known as "neumes") are in any case very rare in the ninth century, but even books with chant texts alone are lacking for the German area. It is typical that the liturgical practice of Metz, whose song school enjoyed great prestige in Carolingian times, can only be reconstructed from the writings of Amalarius (ca. 830) and the lists of chants in the tonary (chants listed by mode rather than by liturgical order) in Metz (Bibliothèque Municipale, no. 351; ca. 850, without musical notation).

During most of the ninth century, oral transmission of the chant melodies seems to have been the rule. At least for Regensburg during the time of Bishop Baturich (817–848), a handful of notated chants have survived, and they may be indicative of similar accomplishments elsewhere in Germany. We learn most about the cultivation of liturgical chant in Germany in the late ninth and tenth centuries from the impressive number of notated chant books from the Benedictine monastery of St. Gall, witness to a highly sophisticated chant practice. St. Gall, Stiftsbibliothek, no. 359 is one of the earliest of all manuscripts notating a year's cycle of liturgical chants (in this case those proper chant chants of mass performed by the most expert solo singers). Equally significant are the St. Gall manuscripts no. 484 and 381 (second quarter of the tenth century), containing, among other things, the sequences and tropes that enhanced the solemnity of mass on the greater feast days. Sequences seem originally to have been sung as wordless vocalizations extending the Alleluia at mass, but in the St. Gall manuscripts (and all subsequent German sources), they are texted according to the principle of one syllable per note. Most of the melodies contain frequent repetitions, which when texted result in pairs of verses to the same music. The great majority of the sequence texts sung at St. Gall were composed by the monk Notker Balbulus ("the Stammerer," d. 912). A dedicatory letter (addressed to Liutward, bishop of Vercelli, chancellor of the emperor Charles the Fat) explains how he came to compose the texts and what principles guided his work, which was completed in 884.

In surviving tenth-century manuscripts from Einsiedeln and Reichenau, and from further afield as well, St. Alban's at Mainz, Eichstätt, and Regensburg, Notker's sequence texts form the basis of the repertory. If similarly early sources had survived from other places they might well tell the same tale; later manuscripts certainly do. It is difficult to know if this is the only area where St. Gall was so influential, or whether its cultivation of the basic repertory of Gregorian chant was also taken as a model in other centers.

Fellow monks of Notker also contributed new chants. Ratpert (d. ca. 900) composed a new set of office chants for the feast day of the patron Saint Gallus himself. Tuotilo (d. ca. 913) composed tropes, and both Hartmann and Waltram new versus (strophic hymn-like pieces with intercessory texts). Tropes of two kinds were sung at St. Gall: supplementary verses intercalated into the singing of the Introit at mass (occasionally the offertory and communion as well), and melodic extensions of phrases of the Introit, many of these subsequently being texted on the principle of one syllable per note. The latter type of trope was specially favored at St. Gall but not much cultivated elsewhere. Other important authors at St. Gall were Notker II (d. 975), composer of the office for St. Otmar, and Notker III ("Labeo," d. 1022) author of a treatise on music theory written in Old High German.

In the preservation of chant books other centers were less fortunate. Only one early manuscript (Bamberg, Staatsbibliothek, lit. 5, compiled ca. 1000) has survived from Reichenau, for example, a collection of tropes and sequences with a tonary. But Berno, abbot of Reichenau (d. 1048), and the Reichenau monk Hermannus Contractus (d. 1052) were both authors of important writings on music theory, an area in which St. Gall seems to have been less active. The heyday of another important center, the Benedictine monastery of St. Emmeram at Regensburg, came in the second quarter of the eleventh century. The musical life of the monastery was enriched by contacts with not only Reichenau but also the cathedral school of Chartres. Apart from the establishment of trope and sequence repertories, this period saw the creation of new offices for Saint Emmeram (by the monk Arnold, ca. 1030) and Saint Dionysius (ca. 1040—part of a notorious "discovery" of the relics of this saint and his establishment as a second patron, in which the prime mover was the monk Otloh). Hermannus Contractus then composed a new office for the canonization in 1052 of the former Bishop Wolfgang. Pope Leo IX, the former Bishop Bruno of Toul, himself a composer of offices for St. Gregory the Great and other saints, was in Regensburg for this purpose. Among those present would have been the monk Wilhelm, author of a treatise on music theory and later to become abbot of Hirsau in the Black Forest.

Music theory at this time was chiefly concerned on the one hand with parts of the late classical theory transmitted to the Middle Ages by the Latin writers Boethius, Martianus Capella, and Cassiodorus, and on the other hand with providing a conceptual framework for understanding Gregorian chant, not easily reconcilable with the former. Regino, for some years abbot of Prüm, who died in Trier in 915, is one of the most important of tenth-century music theorists. Apart from Berno and Hermannus Contractus of Reichenau, and Wilhelm of St. Emmeram (later Hirsau, d. 1091), already mentioned, the following made valuable contributions: Aribo of Freising, Theoger of Metz (ca. 1050–1120), and Engelbert of Admont (ca. 1250–1331).

The pattern of events observed at St. Gall and Regensburg was no doubt followed at many other centers. The first priority would have been the establishment of the basic Gregorian chant repertory, with a cantor and song school to ensure its preservation, perhaps aided by books with musical notation. If musical resources were sufficient, festal tropes and sequences could be taken into the repertory, perhaps even a new cycle of chants for the feast day of the patron might be composed or commissioned. Hermannus Contractus composed a special office for St. Afra of Augsburg, which, like his Wolfgang office, is remarkably advanced in musical style. (Others by Hermannus are lost.) In the next century, Udalscalc of Maisach (d. 1149 or 1151), abbot of the monastery of St. Ulrich and St. Afra in Augsburg, composed offices for St. Ulrich and for St. Conrad. At least some of the (musically most unorthodox) compositions of Hildegard of Bingen (1098–1179) are intended for liturgical use. After Notker of St. Gall, the most important German composer of sequences was Gottschalk of Limburg (d. 1098). A great deal of the new plainchant composed from the eleventh century onward (often in a nonclassical or "neo-Gregorian" style) is, however, anonymous.

The number and order of office chants differs slightly between monastic and nonmonastic customs. Some monasteries followed a nonmonastic order of

service, for example, the numerous houses of Augustinian canons in Austria, which followed a liturgy patterned on that of the canons of Salzburg Cathedral.

Many German plainchant sources display what is sometimes called the "German chant dialect," where the notes E and B are avoided in favor of F and C, respectively. This is, however, no more than a slight (and inconsistent) coloring of the melodies, a sort of regional accent; neither the number of notes nor the shape of the melodies is affected.

The earliest description of how the performance of chant could be enriched by adding an extra voice or voices (polyphony) was probably written in Germany: the treatise *Musica Enchiriadis*, and its companion, the *Scolica Enchiriadis*, late ninth century, possibly written at Werden. Here the polyphony is to be improvised according to simple rules of thumb. But there is no evidence for more sophisticated types of liturgical polyphony in Germany before the fourteenth century, when French compositions began to have some impact. In this respect, Germany appears to have been more conservative than its western and southern neighbors.

St. Gall manuscript 484 (second quarter of the tenth century) is one of the earliest sources for the special ceremony performed on Easter morning, the dialogue between the angel(s) and the Marys (Virgin Mary and Mary Magdalene) at the tomb of Christ beginning *Quem queritis in sepulchro*. Since the earliest French source is of the same date, it is unlikely that the dialogue was composed in St. Gall. (Its actual origin is still debated.) Some time in the eleventh century, a new version of the scene was made, possibly in Augsburg, beginning *Quis revolvat nobis ab hostio lapidum*; a scene including the disciples Peter and John was also added. Verses from the Easter sequence *Victime paschali laudes* are worked in, and many versions end with the hymn *Christ ist erstanden* (Christ is risen). This ceremony, found in countless sources, remained typical of medieval Germany. The material was rarely extended further. One of the earliest sources of the dramatization of the Magi story and the slaughter of the innocents at Herod's command is from Freising (11th c.) and it is possible that this matter was originally composed for nonecclesiastical edification before being adapted for liturgical use, both in Germany and elsewhere. One of the principal sources for the dramatic ceremonies of Christmas, Epiphany, and Easter, as well as many types of medieval lyric, both liturgical and secular, is the so-called *Carmina Burana* manuscript (Munich, Bayerische Staatsbibliothek, no. Clm 4660), originating probably in South Tyrol in the mid-thirteenth century.

Characteristically, the intermittent musical notation in the *Carmina Burana* manuscript is still staffless neumes. The use of the staff to notate precise musical pitches was somewhat slow to gain ground in Germany, except in monasteries connected by the Hirsau reform, and Cistercian houses, from the twelfth century onward. (The liturgy of Hirsau has to be reconstructed from books of its daughter houses, since none from Hirsau itself have survived.) Aachen and Trier are among the churches with a chant record in staff notation from the thirteenth century onward. On the other hand, it seems that in many places, staff notation was not introduced until the campaigns to codify the chant repertory in large choirbooks in the fifteenth and sixteenth centuries. In contrast to the priceless collection of early medieval manuscripts from St. Gall, almost no St. Gall sources with staff notation survive to provide a key to transcribing the earlier manuscripts and to help chart the development of chant in later centuries. One of the few exceptions is St. Gall 546, made by Joachim Cuontz for the 600th anniversary of Notker in 1512, an attempt to preserve for posterity the sequences and ordinary of mass chants and tropes of monastery's venerable tradition.

Liudolfinger

Saxon noble house named, according to modern conventions, after its earliest known representative, Duke Liudolf (d. 866). Later representatives of the family ascended the throne of the east Frankish/German realm and are commonly referred to as the Ottonian dynasty. Only the pre-royal line (i.e., up to 919) will be considered here.

The early history of the Liudolfinger remains highly speculative. That their origins lay in Thuringia is suggested by their substantial land holdings in this area. A foothold in Saxony, in the region of the river Leine, may have been their reward for supporting the Franks during Charlemagne's wars of conquest. By the middle of the ninth century, they were firmly rooted in the aristocracy of eastern Saxony (*Ostfalia*) and had established a close and mutually beneficial relationship with the Carolingian ruling house to the west. Although the precise significance of Liudolf's title (i.e., duke) is subject to debate, one can probably assume that he exercised some combination of political and military leadership, at least in Ostfalia. Duke Liudolf's wife, Oda (d. 913), was of Frankish origin and reportedly lived to the age of 107.

An important moment in the history of Liudolfinger occurred with the foundation of the house of canonesses at Gandersheim (ca. 850). This was very much a family affair. Liudolf assembled an endowment for the community and, with his wife, traveled to Rome to obtain relics for its church. In 852, Bishop Altfried of Hildesheim (851–874), a distant relative, consecrated and installed the couple's twelve-year-old daughter, Hathumoda, as abbess. He also contributed to the community's endowment. In 877, King Louis the Younger, husband of yet another of Liudolf's daughters (Liutgard), granted the community the basic privileges of royal status: immunity, protection, and (with qualifications) the right to elect their own abbess. Gandersheim provided the Liudolfinger with a focal point for their piety, a place to bury their dead and, given contemporary legal practice, there was no reason to doubt that the community's landed wealth would continue under Liudolfing control. Hathumoda's sisters, Gerberga (874–896/897) and Christina (896/897–919), succeeded her in the office of abbess. Oda, Liudolf's wife, entered Gandersheim as a canoness after her husband's death (866) and appears to have exercised considerable influence over the community. In fact, in the period 877–1043, the convent was ruled by only two abbesses who did not descend from Liudolf's lineage. It is not surprising, then, that the historical tradition at Gandersheim emphasized the close bonds between the community and Liudolf's lineage (i.e., Agius of Corvey, Hrotsvitha of Gandersheim).

Liudolf and Oda's offspring also included two sons, Brun and Otto. On Liudolf's death, Brun (d. 880) assumed his father's position as duke. When Brun himself died, during a military campaign against the Danes, this position passed to his younger brother, Otto (d. 912). Although Brun's descendants no longer possessed the title of duke, it has been argued that they continued to play a role in the politics of the realm and that one of them, Count Bruno of Braunschweig, may have made a bid for the throne in 1002. Under the leadership of Duke Otto, known as "the Illustrious," the Liudolfinger strengthened their position within the Saxon aristocracy, expanded their landholdings within their traditional stronghold of Thuringia, and extended their influence to the western regions of the duchy (i.e., Westphalia). Indeed, Otto's stature was such that he may have been considered a viable candidate for the throne in 911. Otto's wife, Hadwig (or Hathui, d. 903), belonged to the Babenberger, a powerful clan with substantial landholdings in the regions of Franconia and Thuringia. As the Liudolfinger were already a powerful presence in the latter region, an alliance with that clan can only have worked to their benefit. Of Otto's two eldest sons, Thankmar and Liudolf, we know almost nothing beyond their names, but for Henry, the third son and future king, a particularly beneficial marriage was arranged with Hatheburg, daughter of Erwin of Merseburg (d. before 909). Erwin may have been a count, though this is disputed, but certainly possessed substantial landholdings in and around Merseburg. Moreover, as he had no sons, Hatheburg stood to inherit a substantial portion of this wealth, a prospect scarcely diminished by the fact that she was a widow and had taken veil. The marriage produced a son, Thankmar (d. 938), who would later figure among the bitterest enemies of King Otto I (936–973).

In tandem with the Babenberger, the Liudolfinger took a leading role in the defense of the eastern frontier, enhancing their own stature in the process and, by the 890s and 900s, were reducing Slavic tribes, such as the Daleminzi, to tributary status. Ties to the royal house were strengthened when, in 897, Duke Otto's daughter, Oda, married Zwentibold, son of Emperor Arnulf of Carinthia. In the early years of the tenth century, a threat to the security of the Liudolfinger emerged with the outbreak of feud between the Babenberg and Conradian clans. Although Duke Otto seems to have remained aloof from the fighting, his surrender of the lay abbacy of Hersfeld to Archbishop Hatto of Mainz (891–913), in 908, may have been the price he paid for associating with the losing side. Further conflict would ensue, somewhat later, when a member of the Conradian house was elected king (i.e., Conrad I, r. 911–919). In 909, Henry repudiated his first wife, Hatheburg, and married Mathilda (d. 968), a member of the Immeding clan and descendant of Widukind, the ninth-century Saxon duke who had led indigenous opposition to Charlemagne's conquest. That he managed to do this without surrendering Hatheburg's inheritance or initiating a feud with her clan is testimony to his political acumen and suggests that some sort of compensation was negotiated. As with Henry's earlier marriage, the alliance with Mathilda brought certain advantages. In particular, it represented an expansion of the family's sphere of influence in the area of Westphalia where his new bride possessed an ample inheritance near Herford and Enger.

Duke Otto the Illustrious died in 912. Since Henry's two older brothers had predeceased their father, he now assumed both the title of duke and a position of leadership within the Liudolfing house. Almost immediately, hostilities broke out between Duke Henry and King Conrad I, who had tried to hinder his succession. Henry seized the Saxon and Thuringian possessions of the archbishopric of Mainz whose prelate (i.e., Hatto I) strongly supported both the king and the Conradian clan. He also expanded his influence in the region of the river Weser, threatening Conradian strongholds. In 915, a deteriorating political situation forced King Conrad to recognize the new status quo in Saxony and accord Henry virtual independence within his duchy. With Henry's election as king in 919, the history of the Liudolfinger entered a new phase. Up to this point, they had been one among many powerful aristocratic houses, albeit a remarkably successful one. Henceforth, they would rank among the preeminent royal lineages of western Europe.

Lochner, Stefan (1400/1410–1451)

The most important painter of the early Cologne school of painting, Lochner is the only artist whose name can be associated with individual works. However, the entire attribution of his body of works is based on Albrecht Dürer's 1530 diary entry, in which he mentions the altarpiece in Cologne he saw painted by a "Master Stefan." The work in question is presumed to be the altarpiece representing the patron saints of the city in attendance at the Adoration of the Magi (now in Cologne cathedral), the most significant altarpiece produced in Cologne. All other works associated with Lochner are attributed through stylistic affinity to this piece. As a result of the meager documentation, some scholarship has cast doubt on the identity of the creator of these works. The historical Stefan Lochner, the only Stefan in the Cologne guilds, was active ca. 1435–1451, and is presumed to have been born between 1400 and 1410 in Meersburg, on Lake Constance. Little is known of his life, but he was first documented as a master in Cologne in June, 1442, and died, probably of the plague, in September, 1451. His life was probably short, as he died within a year of his parents. Two works are dated: the 1445 Presentation in the Temple (Lisbon, Gulbenkian Collection), and the 1447 work of the same subject (Darmstadt, Hessisches Landesmuseum). Lochner's work often shows traces of Flemish realism, causing some to question the nature of his training. His paintings show little stylistic relationship to works from Lochner's homeland near Constance. Also, Lochner introduced numerous innovations to the essentially conservative Cologne school of painting. Lochner's figures inhabited landscapes and architectural settings full of specific details that clearly reflect a familiarity with Flemish works. His work shows figures that have somewhat

Stefan Lochner, Madonna in the Rose Arbor (Cologne, Wallraf-Richartz Museum). Photograph: Rheinisches Bildarchiv der Stadt Köln

more volume than previously seen, and these figures exist in space far more effectively than those of his Cologne predecessors. Several of his works, such as the Nativity (Munich, Alte Pinakothek), the Gulbenkian Presentation in the Temple, and the St. Jerome in his Cell (Raleigh, North Carolina Museum of Art), all bear numerous similarities to the works of Robert Campin and his followers, particularly in the representation of interior spaces. Lochner's largest extant work, and the best known, is the previously noted City Patrons' Altarpiece or *Dombild*. This work seems to reflect both the knowledge of the Ghent Altarpiece, particularly on the exterior Annunciation, and Lochner's characteristic sweetness, grace, and delicacy. The figures in this altarpiece are the first life-size figures painted in Cologne. Nevertheless, Lochner's paintings maintained links to the past and are noted for a tension between their fully modeled forms and linear patterns. He also often used gold backgrounds and, like earlier Cologne painters, outlined figures in red. Lochner's paintings are also characterized by a distinctly personal quality of calm and sweetness, creating a sense of quiet mysticism. These qualities are created through idealization of features, particularly those of women, and rich, glowing colors, often created with oil glazes. All these qualities are perhaps best seen in his Madonna of the Rosebower (Cologne, Wallraf-Richartz-Museum).

Lorch

In the Rems valley, west of Schwäbisch Gmünd (Baden-Württemberg), the nucleus of the city of Lorch is located on the site of a Roman garrison. Established as a defensive position on the defensive frontier of the Roman Empire, the post was abandoned in the late third century. In the early eleventh century, Lorch came under the control of the Hohenstaufen, who built an early castle there.

Before 1102, Frederick of Swabia founded the Benedictine monastery of St. Peter. Northeast over the old city, on the *Liebfrauenberg* (Mountain of the Virgin), the abbey was originally intended for private worship by Frederick and his family. The original monastery complex was completed by 1108. As of 1140, the abbey church became the royal burial site of the Hohenstaufen.

Seriously damaged in the *Bauernkriege* (Peasants' War) of 1525, surviving medieval structures include a gate house, the prelatore, a steward's house (*Vogtei*), the tithe barn (for storing an agricultural reserve to be paid to the papacy), a dormitory, the cloister, and the abbey church. The three-aisled Romanesque basilica, recognized as an example of the school of Hirsau, was given a Gothic choir in 1469. The nave, with its timbered ceiling, is separated from the transept by a triumphal arch. The founder's tomb at the center of the nave is sculpted with figural and heraldic ornaments. Although it is not known for certain precisely how many members of the house of Hohenstaufen are interred here, it is clear that no crowned male ruler's remains are among them. Queen Irene, daughter of the Byzantine emperor and widow of King Philip, was laid to rest at Lorch, as was her young daughter, Beatrice. In the north transept (the chapel of St. Mauritius) are the tombs of the lords of Woellwarth, dating to the fifteenth and sixteenth centuries. On the eight piers of the nave, paintings depicting Hohenstaufen kings and emperors have been uncovered. These are shown wearing dress of approximately 1500. Of interest in the cloister are the fifteenth-century net vaults in the north wing.

The monastery accumulated a large collection of religious relics in the Middle Ages, as a result of the patrons' participation in the crusades. After the death of Conradin in 1268, ending the Hohenstaufen line, Lorch passed into the possession of the duchy of Württemberg.

In 843, by the terms of the Treaty of Verdun, the region between the Scheldt, Meuse, and Rhine rivers fell to Lothar I as part of the middle of the three Frankish kingdoms. Lothar divided his kingdom among his three sons shortly before his death: Italy went to Louis II, already crowned king of Italy in 844 and (co-)emperor in 850; Provence, the central section of the middle kingdom, went to the youngest son, Charles; and the rich fiscal lands in the northern third went to Lothar II, after whom Lorraine (*Lotharii regnum* "Lothar's Reign," German *Lothringen*, English Lotharingia) is named. The instability of the region made it a particularly appealing target of aggression by its neighbors to the east and west, and the final chapters of this struggle did not play themselves out until the early twentieth century.

Lorraine passed under German rule from about 888 until 911 when it went over to France for a few years. Henry I reconquered it in 925, but remained concerned about it since the duke, Gisibert, was attempting to create an independent principality. Henry I confirmed Gisibert, who was elected duke by the Lotharingians; he also gave Gisibert his daughter, Gerberga, as wife. In league with the duke of Franconia, Eberhard, Gisibert rebelled against his brother-in-law, Otto I, and was killed in 939 near Andernach in the current of the Rhine. When Gisibert's minor son Henry died in 944, Otto elevated the count of the Wormsgau (district of Worms), Conrad the Red, to be duke of Lorraine. But Conrad also rebelled, and following his deposition in 954, the lordship in Lorraine was conferred upon Otto's brother, Archbishop Bruno of Cologne.

After five years of such administration, the region of Lorraine was divided into two independent duchies: Upper and Lower Lorraine. Upper Lorraine originally comprised the bishoprics of Metz, Toul, Verdun, and Trier, that is, the land from the sources of the Meuse and Moselle as far as the borders of the Eifel and the Ardennes, and over to the Rhine to include the Vosges and the Hunsrück. From 959 until 1027, Frederick I of Bar, his son, Dietrich, and his grandson, Frederick II, held the ducal office. On the extinction of their line, King Conrad II granted Upper Lorraine to Gozelo I, duke of Lower Lorraine, temporarily reuniting the two Lorraines. Gozelo's son, Gottfried the Bearded (d. 1070), married Beatrice, daughter of Duke Frederick II of Upper Lorraine and widow of Margrave Boniface of Tuscany (d. 1052). She thus united the patrimony of her father with that of her first husband in Tuscany, creating a powerful dynastic base in Germany and Italy. Her daughter by the first marriage was the famous Mathilda of Tuscany, countess of Canossa, who in turn married the son of Beatrice's second husband by his first wife, Gottfried the Hunchback, duke of Lower Lorraine. Yet Gottfried neither enjoyed the peaceful possession of both duchies, nor did he produce heirs with Mathilda. The Ardennes house in Lorraine died out with him in 1076.

Alongside the older dukes of Lorraine there was from the beginning of the eleventh century another family that grew powerful in Upper Lorraine—that of the Etichoner, or the dukes of Lorraine from the house of Alsace. Adalbert, the son of Eberhard of Egisheim, count in Alsace, appears in 1037 as *dux et marchio Lothoringiae* (duke and margrave of Lothringia, d. 1038). His son Gerhard appears only as margrave (d. 1050), but the latter's two sons were styled duke: Adalbert (d. 1048) was named duke of Lorraine in 1046 by Emperor Henry III; and Gerhard (d. 1070), originally the count of Bitsch, became his brothers successor in 1048. The Alsatian house engaged in a major struggle against the Ardennes house for control of Upper Lorraine.

Gerhard's son Thierry (d. 1116), who appears, like Adalbert, as *Lothringie dux et marchio* and in 1078 as *dux Metensis* (duke of Metz), was the direct ancestor of all the later dukes of Lorraine and of the imperial house of Austria. He was followed by his son, Simon I, who was married to King Lothar's sister, Adelheid, and who engaged in a protracted conflict with Archbishop Adelbero of Trier. Matthew, who succeeded as duke of Lorraine in 1138, was the husband of Bertha or Judith, daughter of Duke Frederick of Swabia. Simon II, duke until 1205, died as a monk in 1207. His brother, Frederick I, count of Bitsch in 1196, became duke in 1205, but died the following year. His son Frederick died in 1213, and his grandson Theobald died in 1220.

Lower Lorraine (or *Lotrick* in Flemish) comprised in earliest times the bishoprics of Cambrai, Cologne, Liège, Tournai, and Utrecht, so that in addition to the northern end of the Middle Rhine region, Ripuaria (around Cologne) also belonged to it. The short existence of the duchy and the bitter contest for it resulted in the name being applied only to the Belgian lands beyond the Maas. Already in 977 we see two competing dukes: Gottfried (Godfrey) I, count of Verdun and Eenham, reputedly a brother's son of the contemporary duke of Upper Lorraine, Frederick, from the house of Ardennes, who died after 984, and a French Carolingian, Charles (d. 991), son of Louis IV *d'outremer* (from across the sea), successor of his father since 987 and enthroned by Hugh Capet in 990.

Gottfried I's son, Gottfried II (d. ca. 1023), continued the struggle with success (he was reputedly enfeoffed with Lower Lorraine in 1012 by King Henry II). His opponent was Charles of France's son, Otto, who died in 1005 as the last Carolingian, and his brothers-in-law, Count Lambert of Louvain and Count Reginher of Hainault. Gottfried's brother and successor, Gozelo (d. April 19, 1044), acquired Upper Lorraine in 1033 as well through enfeoffment by King Conrad II. Henry III revived Ottonian policy of dividing Lotharingia, however: on the death of Duke Gozelo in 1044, the duchy was divided between his two sons. The geographical position of Lorraine between France and Germany made it difficult for any German king to secure lasting success with any policy: within a few months of the division, the eldest brother, Gottfried III, entered into league with the French king and rose in rebellion.

Even during his father's lifetime, Gottfried the Bearded had played a role in the governance of the two duchies and had received Upper Lorraine; he expected to receive both. Gozelo's death in 1044 provided Henry III with the opportunity to grant Lower Lorraine to the second son of Gozelo II, who had the reputation as a coward or an incompetent. For Gottfried this meant a reduction of his power, an arbitrary act of the king, a lack of appreciation for the unique position of Lorraine in the structure of the empire. Due to the early development of powerful comital (ducal) families in this region, a ducal authority could only exist if it had an extraordinary power base. Gottfried saw his rights and responsibilities unappreciated; he therefore went on the offensive. The king, on the other hand, saw the dukedom as an office that he could give to any member of a wide circle of relatives. The rebellion was suppressed in 1044–1045, and again in 1047–1049; Gottfried was excommunicated in 1049, and although he was reconciled with the king the same year, he lost the duchy.

The long-term effects of the reduction in the power of the dukes in Lorraine were negative: the nobles of the area had less control in their own drive for territorial lordship, and this led to a fragmentation of the western region of the empire. One of the major benefactors was Count Baldwin V of Flanders, who occupied lands on the eastern border of his county; he had them confirmed by Henry IV in early December, 1056, at Cologne; he also got the county of Hainault (Hennegau) through marriage. The king of France also had designs on Lorraine. The ducal title of Lower Lorraine evolved into the title of duke of Brabant after 1169; the descendants of the former dukes styled themselves dukes of Limburg.

Lorraine was a major source of the reforming impulse that transformed Latin Christendom from the second third of the eleventh century: Pope Leo IX was the former Bishop Bruno of Toul, and Humbert, cardinal bishop of Candida, was a Lorrainer who had come to Rome with him. Humbert looked to dukes Gottfried and Frederick of Lorraine to anchor the reform efforts when Emperor Henry III died unexpectedly in 1056: Frederick had been created abbot of Monte Cassino in 1056/1057 by Humbert, and he was also raised to the status of cardinal; he became pope as Stephen IX in 1057. The massive military support provided by Duke Gottfried in 1059 ensured the accession of Nicholas II, who issued the papal election decree at the Lateran Council.

Lorsch

From its beginning, the foundation at Lorsch (Hesse) had strong ties with the Carolingian house; when Count Chancor founded the monastery in 764, he immediately placed it under the authority of his relative, Bishop Chrodegang of Metz, powerful ecclesiastical advisor to Pippin III. Its identity quickly shifted from a family monastery to a designated imperial institution, receiving royal immunities in 772. Throughout the ninth century, its abbots maintained close ties with Charlemagne, Louis the Pious, and successive East Frankish Carolingian rulers.

Building at the monastery began early and progressed with speed. At its center was a basilica dedicated to Saint Nazarius, begun in 767 and completed within a short seven years. The church comprised three naves, a transept, a rectangular choir, and a *Westwerk* (western entrance structure) that housed a chapel dedicated to St. Michael. The church served as the culminating monument at the eastern end of a 200-meter-long approach—an imposing sequence of courtyards, punctuated by triumphal arches and fortress-like walls. Visitors first entered into a large atrium, where they encountered the freestanding *Torhalle* (Gate Hall). Beyond that arched gateway, at the eastern end of the atrium, stood a two-storied block of masonry, the *castellum*. A smaller atrium followed. Referred to as "Paradise" on account of its opulent decoration, this small courtyard gave access to St. Nazarius's impressive facade. The walled monastic complex also included a cloister to the south of the church, the abbot's quarters, a cemetery, and a small chapel dedicated to Saint Udalrich. In 876, a crypt was added to the east end of the basilica that served as a mausoleum for Louis the German and other members of the Carolingian royal family of Germany.

A rare and spectacular example of Carolingian architecture, the still-standing *Torhalle* likely served as a reception room for visiting royalty. The date of construction is disputed, but it was probably built between 784 and 791. Its lower level, with its three arches, engaged columns, and composite capitals, looks to the Roman triumphal arch for inspiration. The second level is articulated with zigzag molding and pilasters. The exterior of the whole is decorated with an inlay of cream and terra-cotta stone in a variegated pattern of squares, lozenges, and hexagons, an imitation of and variation on the Roman technique of *opus reticulatum* (a netlike creation).

As a royal monastery, Lorsch remained the recipient of great wealth well throughout the ninth century. There exist no fewer than four catalogues of the Lorsch library from this period, attesting to the monastery's place as a center of learning, book collecting, and book production. One of the catalogues lists an *evangelium scriptum cum auro pictum habens tabulas eburneas* (an illuminated evangeliary written with gold having ivory covers), presumably a reference to the still extant Lorsch gospels from circa 810. The manuscript, now divided between Bucharest and the Vatican, is considered one of the central members of the so-called Ada group of manuscripts associated with Charlemagne's court. The ivory covers, divided between the Victoria and Albert Museum and the Vatican, are the largest and among the most splendid book covers from the period to have survived. The form of the front and back covers, each composed of five separate panels, emulates late antique imperial diptychs.

All that remains on the grounds of the once resplendent abbey today is the *Torhalle* and a modest Romanesque church, built after a fire in 1090, standing at the east end of what had been the large atrium.

Lothar I (795–855)

The eldest son of Louis the Pious (r. 814–840), Lothar was born in 795. In 817, when he had three sons, Louis issued the *Ordinatio imperii*, a document intended to maintain the unity of the Carolingian empire and peace among his sons after his death. According to this plan, Lothar became co-emperor with his father in 817, while his junior brothers, Pippin and Louis the German, were appointed kings of Aquitaine and Bavaria, respectively, and made subject to Lothar. The *Ordinatio* anticipated almost every possibility except one—the death in 818 of Louis's wife, Ermengard, his remarriage to Judith in 819, and the birth of a fourth son, Charles, in 823.

Lothar, twenty-eight years old when Charles was born, spent the rest of his life trying to preserve the future promised him in the *Ordinatio* against a new reality created by the birth of his half-brother. Louis attempted to forestall tension between them by assigning Lothar the spiritually and politically significant role of godfather to Charles and by sending Lothar to rule Italy. Lothar must have felt marginalized in Italy and threatened by the knowledge that the politically astute Judith was busily securing a place in the crowded dynasty for her son. In 830, when Pippin and Louis the German rebelled against their father and Judith, Lothar raced from Italy to join in. But Louis I played Pippin and Louis the German off against Lothar and the rebellion collapsed with Lothar in disgrace and once more confined to Italy. The next year, Louis I replaced the *Ordinatio* with a new dispensation, the *Divisio regni*, which allotted four kingdoms to the four brothers without mentioning the empire or emperor. The new settlement provoked a more serious rebellion against Louis I and Judith, this time masterminded by Lothar, who had the support of Pippin and Louis the German, and even of Pope Gregory IV. In 833, Louis I, Judith, and the young Charles were captured. The rebellion fell apart when Pippin and Louis feared the ascendancy of Lothar, and others regretted the outrage the sons visited on their father and his wife.

When Louis I died in 840, his three surviving sons, Pippin having died in 838, negotiated warily and unsuccessfully among each other, Louis and Charles allying against Lothar. In June, 841, Frank fought Frank for the first time since 717 in a horrendous battle between Lothar's forces and those of Louis, Charles, and Judith that saw Lothar soundly defeated. Lothar next tried to separate these brother-opponents through diplomacy, but Louis and Charles only cemented their concord when they took the oaths at Strasbourg in February, 842, in each other's vernacular languages. In August, 843, at Verdun, after long and complex negotiations that included a survey of the Carolingian kingdoms, the brothers agreed to a three-way partition of the empire with Lothar retaining the imperial title. His portion, flanked on the west by that of Charles and on the east by that of Louis, extended from the North Sea to Mediterranean Italy. It included the political capital of Aachen and the spiritual capital of Rome.

In the years after Verdun, Lothar and Charles supported each other, Lothar even commissioning a magnificent illustrated gospel book (the Lothar Gospels, in Paris, Bibliothèque Nationale, manuscript no. lat. 266, contains a very impressive portrait of Lothar) from the monks of St. Martin in his brother's territory. When Lothar died on September 29, 855, his kingdom was divided among his three sons.

Lothar III (1075–1137)

Lothar III of Supplinburg was born shortly after his father, Count Gebhard of Supplinburg, died in battle against King Henry IV. Historians know little about his youth, his rise to prominence, or exactly why King Henry V named Lothar as successor to the late Magnus Billung, duke of Saxony, on August 25, 1106. Soon after, having grown still more powerful through other inheritances and his own political and military ability, Lothar became the leader of the opposition to Henry V.

With the death of Emperor Henry V in 1125 without a son, German princes reasserted their traditional right to elect a new king. Representative magnates of the four ethnic divisions of Swabia, Bavaria, Saxony, and Franconia were delegated to the election at Mainz under the leadership of the archbishop. Although Duke Frederick II of Swabia, Henry V's nephew and heir, and Margrave Leopold III of Austria found a great deal of support, the archbishop promoted the case of the duke of Saxony, Lothar von Supplinburg. Lothar's party probably gained the support of the main holdout, the Welf duke of Bavaria, Henry the Black, with a promised marriage alliance between Henry's son, Henry the Proud, and Lothar's only child and heir, Gertrude. Elected on August 30 as king of the Romans, Lothar was crowned in Aachen about two weeks later.

The succession did not go smoothly, however. Between the Staufens Frederick II of Swabia and Lothar a new rivalry developed. The new king needed to assert his control over royal and imperial rights and properties. But royal prerogatives were mixed together with the personal inheritance of Henry V and the Salian dynasty inherited by the Staufens. Because Frederick was reluctant to turn over certain possessions, Lothar outlawed him at Christmas, 1125. Distracted by the defiance of Sobeslav of Bohemia, Lothar could not begin a military campaign against the Staufens until summer 1127, when he began to besiege Nuremberg. There the Staufens party elected Frederick's younger brother Conrad as anti-king in December, 1127. This conflict disturbed the peace of the empire until Conrad's capitulation in 1135. Nineteenth-century historians inflated these disagreements into a grand vendetta between two dynasties, the Welf (or in Italian, Guelph) versus the Staufens (or in Italian, Ghibelline after the castle Waiblingen). While such a view oversimplified the issues involved, the competing interests of these powerful families would recurrently affect imperial affairs for decades.

Meanwhile, Lothar was capably handling the affairs of his kingdom. His exploitation of extinct noble dynasties changed the political landscape. Lothar helped establish the Zähringens in Burgundy as rivals to the Staufens. Lothar's intervention of the succession of the duchy of Lower Lotharingia led to its breakup into the duchies of Brabant and Limburg. In Saxony, his home territory, he enfeoffed the Askaniens with the Nordmark and the Wettins with the Marches of Meissen and Lausitz, dynasties that would, however, later become rivals of the Welfs. Lothar made his will felt beyond his kingdom's borders. He carried out several campaigns against the Slavs, collecting tribute from Poland and granting Pomerania as a fief. And a quick military demonstration against the Danish, where rivalry for the throne had caused disorder, encouraged the various candidates to acknowledge his overlordship almost without bloodshed.

Most importantly, Lothar became entangled in the papal schism between Innocent II and Anacletus II. Since both sides had respectable claims to the papacy, Lothar faced a real dilemma about whom to recognize as legitimate pope. Under the influence of the important Cistercian Abbot Bernard of Clairvaux and Norbert of Xanten (the founder of the Premonstratensian order, whom Lothar had made archbishop of Magdeburg), Lothar decided at a synod at Würzburg in 1130 to give allegiance to Innocent. Greeting the pope in Liège in March, 1131, Lothar acted as a groom and horse-marshal (*Strator- und Marschaldienst*), leading the pope's horse by the bridle and holding his stirrup during dismounting. The memorialization of this act with a fresco in the Vatican, implying that Lothar served as a vassal of the pope, later caused tension between imperial and papal ideologues.

In return for offering to conquer Rome for Innocent, Lothar tried to get back the old rights of investiture of bishops that had been lost for the monarchy in the Concordat of Worms. But Innocent only gave a promise of the imperial election. In late summer 1132, Lothar began an expedition to Italy with a small army. His attack on Rome brought one success: Innocent crowned Lothar and his wife, Richenza, emperor and empress on June 4, 1133, although in the Lateran Palace, since Anacletus's forces still held the Vatican. Again Lothar tried to reclaim investiture, but only received confirmation that his rights would be the same as his predecessor's. In negotiations about the Mathildine lands, he gained more success. Lothar recognized the claims of overlordship by the church, but he gained use of the lands in exchange for an annual payment of 100 pounds silver. Although the emperor immediately enfeoffed his son-in-law Henry the Proud with the lands, the papacy tried to portray him as a vassal of the church.

Within months Lothar returned to Germany, unable to defeat Anacletus's main ally, King Roger II of Sicily. Soon, Innocent was forced to flee Rome. Once the Staufens had reconciled with Lothar, however, the worsening plight of Innocent prompted Lothar to lead a second, much larger, Italian expedition in 1136. In northern Italy Lothar was triumphant; by the beginning of 1137 he invaded the kingdom of Roger of Sicily. But the quarrels between pope and emperor over the disposition of conquests and leadership, as well as the heat of summer, led to the breakup of the campaign before lasting success could be won. On the return northward Lothar sickened, finally dying in Breitenwang near Reutte in Tyrol on December 4, 1137.

Both his contemporaries and later historians have tended to judge Lothar harshly, especially those who resented his rather friendly relations with leaders of the church. Other modern historians reject his image as *Pfaffenkönig* (parson's king): his quarrels with the pope and his wars with local territorial bishops belie that charge. The conflicts after his death that ruined his legacy were largely caused by the change in dynasty, which Lothar had tried to forestall by giving the imperial insignia to Henry the Proud. In many ways Lothar successfully expanded political authority in Saxony, Germany, and the empire.

Louis the Child (899–911)

The last member of the Carolingian dynasty to reign in the east Frankish kingdom, Louis the Child was the sole legitimate son of Arnulf of Carinthia (r. 887–899), who succeeded his father at the age of six years old. He received important support from the church, including the monastery of St. Gall, and the regents, archbishops Hatto of Mainz and Adalbero of Augsburg. Throughout his reign, Louis was plagued by invasions of Magyar horsemen and over-mighty subjects. It was Liutpold, margrave of Bavaria, who provided the greatest defense against the Magyars and, thereby, demonstrated the weakness of Louis. Liutpold, however, died in battle against the Magyars in 907 and the invaders ravaged Bavaria and other parts of the kingdom with impunity for the next several years. Louis's ineffectiveness continued from his minority into his majority, 906–911, and his personal rule had little positive effect on the kingdom. At his death in 911, the nobles of the kingdom elected Conrad I (911–918) as king and ended the rule of the Carolingian dynasty in Germany.

Louis the Pious (April 16, 778–June 20, 840)

Louis (*Hludowicus*) and Lothar, a twin who soon died, were born on April 16, 778, in the palace of Chasseneuil near Poitiers to Hildegard, the wife of Charles the Great (Charlemagne). "Pious," not a contemporary epithet, was applied to Louis only at the end of the ninth century. In 781, Charles appointed Louis king of Aquitaine, an office he would grow into and hold for the next thirty-three years. In 794, sixteen-year-old Louis, already the father of two children by concubines, married Irmingard (d. 818), the daughter of Count Ingram. The royal couple produced five children within the decade.

Louis, as Charles's only surviving legitimate son, was crowned co-emperor at Aachen on September 11, 813. The implications of the imperial title Charles received in 800 remained ambiguous during his last years. The increasing involvement of churchmen in the administration of his realm suggests that Charles's concept of empire embraced religious as well as political leadership. A capitulary from this period wonders, "Are we indeed Christians?" One of Louis's great tasks after his father's death in January, 814, was to continue to define a Christian empire. Under Louis, Aachen became a beehive of activity. Charles had issued twenty diplomas during his last thirteen years; Louis nearly doubled that in his first year as emperor. Louis regarded his empire as a divine gift for whose welfare and improvement he was chiefly responsible. Much of his early legislation focused on monastic and ecclesiastical reform. With the help of Benedict of Aniane, a monk who had joined his inner circle back in Aquitaine and whom he installed at Iden nearby Aachen, Louis crafted a vision of empire in which religion, society, and politics coalesced. Concern for the unity of the Christian people animated the *Ordinatio imperii* of 817, his attempt to establish the imperial succession in a manner that would preserve the integrity of the empire. Lothar (b. 795) became co-emperor with Louis while his other sons, Pippin (b. 797) and Louis the Younger (b. 806), were assigned subordinate roles. In placing the unity of the empire before division among his heirs, Louis proposed a transpersonal vision of empire that emulated the unity of the church. Louis saw himself as emperor of the Christian people, not of various ethnic groups. His reforms and concept of empire owed nothing to papal guidance or initiative. The historic *Pactum Hludowicianum* agreement of 817 for the first time outlined specifically the nature of the papal-imperial relationship, a relationship that Louis dominated. Elsewhere he referred to the pope as his helper (*adiutor*) in caring for God's people.

Louis was equally forceful in the political realm. When his nephew, King Bernard of Italy, challenged his authority in 817 he acted swiftly to quash the rebellion, blinding Bernard and exiling the conspirators. (When Bernard died of his injuries, Louis demonstrated the depth of his commitment to Christian kingship by performing public penance.) To preempt further dynastic challenges, he had his half-brothers Drogo, Hugo, and Theodoric tonsured and placed in monasteries. After the death of Irmingard (October 3, 818), Louis married Judith, daughter of Count Welf and his wife, Eigilwi, who bore him two children, Gisela (821) and Charles (June 13, 823). The birth of Louis's fourth son later triggered searing conflicts within the family and Carolingian society at large. Other problems also challenged his reign during its second decade. Churchmen such as Bishop Agobard of Lyon began to complain about rampant corruption in Carolingian society, including exploitation of church lands and oppression of the poor by the warrior class. With the expansion of Carolingian hegemony at an end, powerful nobles who little understood the ideals of Louis's empire ransacked the Christian people and churches for material gain. The many groups ranged along the empire's extensive borders required continual attention. In the southeast, the Slovenians proved troublesome, while in the northeast Louis was able to effectively manage the Danish threat, which was defused when the Danish king Harald was baptized and adopted by Louis in 826. In the west, Louis campaigned personally in Brittany where he established nominal authority. In Gascony and the Pyrenees borderlands chronic instability reigned, partly because counts Hugo and Matfrid failed to support Louis's military efforts, a dereliction for which the emperor stripped them of their positions. Count Bernard of Barcelona was much more effective and for his efforts was appointed in 829 as the emperor's chamberlain, an office that brought him into intimate contact with the imperial family. Judith saw Bernard as a protector while Louis regarded him as the second man in the empire. Louis's forceful handling of counts Hugo and Matfrid and the empowerment of Bernard and Judith combined with the fear that any provision made for the young Charles would come at the expense of his half-brothers provoked a palace revolt in 830. Pippin and the younger Louis, aided by Hugo and Matfrid, sought to "free" the emperor from the tyrant Bernard and the Jezebel Judith, but Louis's supporters, sowing discord among his older sons, restored him to authority in October, 830. Although abortive, the coup claimed a victim when the vision of empire outlined in the 817 *Ordinatio imperii* was annulled. The new *Divisio regnum* of 831 restored traditional Frankish practice when it partitioned the empire into four approximately equal kingdoms on Louis's death. The new status quo, however, was only temporary. Adherents of a unified empire agitated against the *Divisio*, while conflict among the brothers continued and was exacerbated when enterprising nobles took sides. On June 30, 833, Louis met with Lothar near Colmar in Alsace to compose their differences, but instead the emperor found himself on the "Field of Lies" facing a coalition of his older sons, their supporters, Pope Gregory IV, and several leading clergy, who took him and Judith into custody. Judith was sent to a monastery in Italy while Louis was confined to the monastery of Saint-Medard in Soissons. Leading clerics, including Agobard of Lyon and Ebbo of Reims, argued that Louis failed as a king and must abdicate the throne. In a humiliating ceremony, he acknowledged his crimes, removed his imperial regalia, and was condemned to perpetual penance. This mistreatment of a father by his sons, another round of conflict among the older brothers and their supporters, and increasing violence soon swung sympathy and support back to Louis who, from his confinement, was orchestrating his return. Freed from captivity, his weapons, his wife, and his youngest son were restored to him.

Emperor once again, Louis continued to rule energetically, bestowing key appointments on his supporters and punishing those such as Agobard and Ebbo who had betrayed him. He continued successfully to provide for Charles against the resistance of the younger Louis. When Pippin died in 838, Louis ignored the complaints of Pippin's son and granted the kingdom of Aquitaine to Charles. Lothar dedicated himself to his Italian lands and never challenged his father again. Louis rebuilt his own political network by holding frequent assemblies after 835 and by presiding at ceremonial and ritual activities, especially hunting, his favorite pastime. He continued to see to the collection of public revenue and directed successful military campaigns. In 839, an embassy from the Byzantine Empire arrived to congratulate him for his stout defense of Christendom.

On June 20, 840, Louis died on Petersaue, an island in the Rhine near his palace at Ingelehim. His last words reportedly were *Hutz, hutz* (German for "Away, away"), shouted as his mourners imagined circling evil spirits. He was laid to rest in the monastery of Saint-Arnulf of Metz beside his mother and his sisters, Rotrud and Hildegard. Bishop Drogo, his half-brother, chose a late antique sarcophagus for him that depicted the flight of the Israelites across the Red Sea before the pursuing Egyptians. The motif symbolized baptism and triumph. Bitter civil war broke out among his sons, resulting in 843 in the formal division of the empire recorded in the Treaty of Verdun.

Louis II (November 1, 846–April 10, 879)

The eldest son of Charles II, the Bald (r. 840–877), Louis II, the Stutterer (*der Stammerer*) was born on November 1, 846. He reigned as king of West Francia for sixteen months (December 8, 877–April 10, 879) before dying of illness at Compiègne. The first thirty-one years of his life were spent at the center of his father's struggle to balance Carolingian dynastic concerns and the competing loyalty of the kingdom's ambitious nobles. Although afflicted with a speech disorder, Louis played an active role in the fractious politics of the 860s and 870s, often allying himself with his father's opponents. Charles installed Louis as king of Aquitaine in 867 and made him lay abbot of several monasteries, but strictly limited his power. After Charles's death, Louis moved energetically to preserve royal power. His descendants include King Charles III (the Simple; r. 893–929), and King Louis V (r. 986–987), the last Carolingian monarch.

Lübeck

The city of Lübeck was founded as a harbor town at its present location in 1143 by Count Adolph II of Schaumburg and Holstein. Some earthworks and the foundations of a church testify to the destruction of a previously existing Slavic castle and adjoining market Liubice. In 1158 Duke Henry the Lion of Saxon forced Adolph to surrender the site, which was strategically important to Henry's military aims toward the east and as a trading place for the Baltic. After his political downfall in 1180, however, the city came under imperial control; it remained an independent political unit until 1937.

Lübeck is located on a peninsula created by the Trave and Wakenitz Rivers and surrounded by swamps. The former castle, later replaced by Dominican priory (Burgkloster), and the adjacent castle gate (Burgtor) protect its northern access via a land bridge, now pierced by a canal. Its southernmost point is marked by the cathedral of a bishopric that, in 1160, was transferred from nearby Oldenburg. A first wooden structure was replaced between 1173 or 1174 and 1247 by the Romanesque nave and transepts that still form the core of the present monument. With its square groin vaults, it transposes the cathedral of Henry the Lion's residence at Braunschweig into the regionally dominant medium of brick. The building type was copied, although on a smaller scale, by the first parish church of St. Maria (Marienkirche, or St. Mary's), next to the market area halfway between castle and cathedral, and by the church of the Benedictine monastery of St. Johannes. Founded in 1177, the monastery was transferred to Cistercian nuns in 1246; it was demolished between 1806 and 1819.

By the mid-thirteenth century, Lübeck had changed from a feudal to a bourgeois city. The main expression of this change is the (forged) document of Emperor Frederick II that, in 1226, changed its status to that of imperial city. The previous year the city had evicted the Danish occupation garrison from its castle and established a Dominican monastery in it; although the church was demolished in 1818, the medieval convent buildings have survived. To commemorate the city's victory over the Danes at Bornhöved (July 22, 1227), a Franciscan monastery was founded in 1229; its church, St. Katherinen, was erected as a major basilica with extended crypt under the choir and transepts that do not appear as such in the interior. At the same time St. Maria was replaced by a large Gothic hall church, completed by 1270, of which the lower part of a single western tower has survived in the two-towered western facade. The civic and mercantile center of St. Maria was surrounded by other semi-independent neighborhoods and parishes within the city's enclosure. Parallel to St. Maria, the church of St. Jacobus (St. James) of the neighboring trading settlement on the Koberg plaza was begun as a hall church but was soon changed, under the influence of the subsequent rebuilding of St. Marien, to a pseudobasilica with triple apse. St. Peter, in a settlement of artisans next to the main bridge crossing the Trave, and St. Aegidius in the south, both with single towers, adopted this model.

The first century of the city's independence witnessed a major effort in architectural development. Between 1266 and 1335, the cathedral received a new hall choir; its plan with radiating hexagonal chapels that unite with the bays of the ambulatory established a prototype for churches along the Baltic coast. Possibly not before 1286, when the city council acquired the patronage of St. Marien, a further rebuilding was undertaken of the church as a major basilica with ambulatory choir and two-towered western facade, but without transepts. This monument introduced the complete system of a Gothic cathedral with high nave and flying buttresses from the cathedrals at Cologne and Utrecht to the Baltic and generated the model for the churches at Schwerin, Rostock, Wismar, Stralsund, and elsewhere.

Lübeck's economic and political importance is reflected by its prominent place in the Hanseatic League, a confederation of towns under the leadership of Cologne to protect their trading interests and to insure social stability within the communes. The city's main secular building was the town hall overlooking the main market square. Originally a long hall with a Romanesque gable, it was later expanded by a Gothic cloth hall built parallel to it. The courtyard was later built over while the ensemble received a major screen facade with wind holes to its north and south.

In 1285, the construction of the Heilig-Geist-Spital (Hospital of the Holy Spirit) was completed, a social institution that housed the city's elderly and poor. The semimonastic ensemble—nearly unchanged today—consists of a chapel, the adjoining dormitory, and the cloisters. Its chapel, which appears to the outside as three houses separated by slender towers, represents a vaulted hall church of two bays penetrated by the hall of the dormitory with its wooden barrel vault.

Despite an attempt to improve the conditions of Lübeck's trade by the building of the Stegnitz canal in 1390–1398 to connect Lübeck to the places of salt production at Lüneburg, the fifteenth century was a period of constant decline, generated by political and military ventures. In 1426–1435, the city waged war against Denmark and in 1475 against England, after uprisings and a constitutional crisis in 1408–1416 had already undermined the city's inner stability. Nevertheless, a series of major secular building projects was undertaken to demonstrate the city's apparently undisturbed position. In 1440–1442, the city's builder Nikolaus Peck erected the Kriegsstubenbau, an assembly room of the council's war department, over an open market hall, connected by a gallery to the main building. Peck was also responsible for the remodeling of the Burgtor in 1444. The famous Holstentor was built in 1466–1478 by the council's builder Helmstede; although designed for artillery, it follows the example of the two-towered city gates of Cologne from the early thirteenth century.

The end of the medieval period in Lübeck is marked by the introduction of the Reformation by Johannes Bugenhagen in 1530–1531 and the unsuccessful attempt of Mayor Jürgen Wullenweber to restore the Hanseatic predominance, which failed in the *Grafenfehde* (Counts' Feud) in 1535. Just before, in 1509, an Augustinian nunnery had been founded; although its church was demolished in 1819, the convent buildings remain intact and house the city's important medieval art collection.

Lucerne

Located on the Reuss River in Switzerland, Lucerne's history extends back to the late eighth century, when the monastery of St. Leodegar was established. The monastery became a dependency of Murbach abbey in Alsace in 840. In the second half of the twelfth century, the church of St. Leodegar was built in Romanesque style reflecting Alsatian influence; a Gothic choir, consecrated in 1345, replaced the original Romanesque east choir. The entire church, except the Gothic facade towers, fell victim to fire in 1633.

Beginning in the mid-twelfth century, Lucerne began to develop on both sides of the bridge over the Reuss, and in 1178 the Murbach abbot Konrad von Eschenbach founded the city. With the opening of the St. Gotthard Pass around 1230, Lucerne grew in size and importance as a market town. In 1291, Emperor Rudolf of Hapsburg bought the city, which ignited a quest for independence lasting more than a century, Lucerne joined the Swiss Federation in 1332 and gained its independence within the Holy Roman Empire in 1417.

Lucerne is surrounded by the Musegg wall, built in the later half of the fourteenth century; at 870 meters, it is one of the longest fortifications in Switzerland. The *Kapellbruecke*, the main river bridge, was built around 1300 and rebuilt after a fire in 1993. Owing to the city's economic and religious ties with Italy, Italian influence is evident in monuments beginning in the late Middle Ages.

Ludolf of Saxony (1295/1300–1378)

Also referred to as Ludolf the Carthusian, Ludolf of Saxony is principally known as the author of a lengthy, devotional life of Christ. Little is known of his personal history. By tradition, he is thought to have started his religious life as a Dominican; in 1340, however, he entered the Carthusian Charterhouse of Strasbourg. In 1343, he was appointed prior of the Charterhouse at Koblenz, a position he gave up in 1348. He spent the last thirty years of his life as a monk, first in Mainz and later in Strasbourg.

At different times, scholars have attributed various texts to Ludolf; current consensus definitively assigns two texts to him, a *Commentary Upon the Psalms* and the better-known *Vita Christi*. The latter became particularly popular, as evidenced by numerous manuscript copies as well as approximately sixty printed editions; the earliest was published in Cologne in 1472, followed by a second edition printed in Strasbourg in 1474. Although especially popular in Germany, by the sixteenth century the text had also been translated into Dutch, Catalanian, Portuguese, Italian, and French.

Bearing traces of both Dominican and Carthusian influence, the *Vita Christi* is a characteristically late medieval treatment of Christ's life, both in its abundant detail, and in its concern with instructing the reader on the practice of imaginative, affective veneration of Christ's life. The text contains not only biography, but also orations and meditations, and exegeses on the practice of contemplative devotion. Ludolf drew on approximately sixty different sources for this text, which was meant as a guide to individual worship, as well as a source for readings and prayers.

Ludwigslied

An Old High German poem ("Song of Louis") celebrating the victory of Louis III (r. 862–882) over Viking invaders at Saucourt in 881, written before Louis's sudden death. Though probably composed at the monastery of St. Amand, its language seems to be Rhenish Franconian rather than the native but moribund West Franconian dialect. It uses the new rhyming meter first seen in Otfrid's gospel poem.

After the death of the West Frankish king Louis the Stammerer, his two eldest sons, Louis and Karlmann, were jointly crowned in 879. Louis received Francia and Neustria when the kingdom was divided in 880. Though his victory at Saucourt seemed decisive, he faced renewed Viking invasion and died at Tours while negotiating with the invaders in 882. According to the anonymous poet, Louis is at once God's servant and His representative to the West Franks. After the Stammerer's death, Louis and Karlmann were in the care of the powerful abbot Hugo; the poet says rather that God was his guardian, having selected him to receive the throne. The Vikings are sent by God to test Louis's mettle, as well as to urge the Franks to repentance. Louis moves against them only when God commands "Help my people." Louis then proclaims:

"God has sent me here/and has Himself
commanded,
If you think it advisable,/that I should fight here,
Not sparing myself/until I have saved you."

The king goes into battle singing a hymn. After a conventional description of bravery and gore ("Some he sliced through, others he stabbed through"), the poet announces: "Praised be the power of God!/Louis was victorious."

Lüneburg

The city of Lüneburg (Lower Saxony), founded in 1247 by Duke Otto (the Child), developed in the later Middle Ages into a leading trading center and capital of the duchy of Braunschweig-Lüneburg (later Hanover). Its primary economic importance rested on the exploitation of the large salt deposits that were extracted from wells. Due to its post-medieval decline, the city has preserved much of its historic appearance with all of its major buildings erected in brick.

The town plan, forming a rough rectangle of 800 by 500 meters, reveals several historical units that grew into the present urban structure and which correspond to the different social groups that constituted the medieval town. In the southeast, the older market—the *Sand*, which is situated at the crossing of two major roads, reaches back into the pre-urban era. It is dominated by the main parish church, St. Johannis, a five-aisle hall church with a monumental western tower. The opposite urban pole lay to the northwest at the *Kalkberg*, a chalk hill just outside the town's fortifications on which stood the castle of the town's feudal lords, the Guelphs (Welfs). Both the castle and the abbey church of St. Michaelis, the dukes' burial church, were destroyed in 1371, as a consequence of the struggle for power between feudal lord and commune, and the abbey was subsequently moved within the town walls; by 1434, it had been rebuilt as a hall church in the decidedly conservative architectural forms of the late thirteenth century. The third unit to the north is the second market with the town hall to the west, a building complex whose different parts, dating from the thirteenth to the eighteenth century, serve simultaneously for civic and ducal representation. The former princely residence was situated to the north side of the market, and in its vicinity the church of St. Nikolai was constructed in the years 1407–1460. As a basilica with ambulatory choir and rich star vaults, this building follows the prototype established for the churches of late medieval princely residences in the Baltic (e.g., Schwerin, Wismar). In the neighborhood of the port in the northeastern corner of the town, the church was later adopted by the merchants and sailors. To the southwest, the parish church St. Lamberti, a hall church with rich star vaults in its nave, formed the center of the quarter of the *Salzsieder* (salt boilers); damage resulting from uneven subsidence of the ground, caused by the exploitation of the salt stock underneath, necessitated its demolition in 1860.

Lutwin (fl. ca. 1300)

Author of *Eva und Adam*, a retelling in 3,939 rhymed couplets of the biblical Creation story and the apocryphal *Vita Adae et Evae*, little is known of Lutwin apart from his written work, dated around 1300. In retelling the biblical story, Lutwin underscores Eve's sensual nature as opposed to Adam's rational one. To tempt her, Satan lures her with insight and intelligence. Ultimately, however, it is her sensual appetite that betrays her, for she is overcome by the sight and feel of the apple. Following the narration of the biblical events, Lutwin then narrates the events subsequent to the expulsion from Eden, which are found in the Latin *Vita Adae et Evae*. Briefly, it involves their search for food, the penance they undertake, the birth of their sons, and the death of Adam. Lutwin's version follows fairly closely the Latin versions (there are more than ninety extant manuscripts of the *Vita*, and no one version has been found to be the specific source for Lutwin). One episode, however, is unique to Lutwin. Following the penance where the two stand up to their necks in water, Adam for forty days in the Jordan and Eve for thirty-four days in the Tigris, the two separate. In the *Vita* the motivation for the separation is that Eve was duped for a second time by the devil, so that she came out of the water before the penance was completed. In Lutwin's version, Eve leaves Adam because of a lover's quarrel. She wanted to make love as they had done in Eden but Adam, being the more spiritual and sensible, declines. Thus, again, the baser appetites of Eve are underscored. In spite of Lutwin's stereotypical view of Eve, he nevertheless depicts her with a great deal of sympathy.

Luxemburger

In 963, Count Siegfried, the son of the Ardennes Count Wigerich, exchanged the fortress *Lucilinburhuc*, which belonged to the abbey of St. Maximin in Trier, for his own villa at Feulen. Siegfried was the Gaugraf in the Moselgau and in the Ardennesgau in 993, and he was also the advocate of the monastery at Echternach and of St. Maximin. Indicative of the family's power and importance is the fact that Emperor Henry II married Kunigunde of Luxemburg, daughter of Siegfried and his wife, Hedwig, sister of Adelbert of Alsace, margrave of Lorraine. Kunigunde's eldest brother, Henry I, was count in the Ardennesgau and in the Bedagau in 993, and in 1004, he was elevated to the office of duke of Bavaria by his brother-in-law, the king. The second son of Siegfried, Frederick I (d. 1019), appears to have acquired significant lands in Hesse through his wife, who came from the dynasty of the counts of the Lahngau. Thierry of Luxembourg (German *Luxemburg*), another sibling, sat as bishop of Metz 1004–1046; his brother Adelbert was provost of St. Paulin near Trier, and in 1008, he was elected archbishop of Trier. Their nephew, Adelbert (son of Frederick I), followed as bishop of Metz 1046–1072. The rising power of the Luxemburger dynasty can be seen in the appointment of Henry II as duke of Bavaria in 1042, of Frederick II as duke of Lower Lorraine and margrave of Antwerp by Emperor Henry III in 1046, and the election of Hermann of Luxemburg-Salm as anti-king to Emperor Henry IV in 1081. The Luxemburger were also the ancestors of the counts of Saarbrücken and Glitzberg. Conrad II, who died in 1136, was the last count of Luxembourg from the older or Ardennes line. He was succeeded by Henry, count of Namur, the son of the Luxemburger heiress Ermesindis. Her thirteenth-century namesake, also heiress to the Luxemburger lands and titles, married three times: first, with Henry, count of Champagne, then with Count Theobald of Bar, who died in 1213, and finally with Walram IV, duke of Limburg and margrave of Arlon, a union whereby the countship of Luxembourg passed to the house of Limburg.

The possessions of the counts of Luxembourg at the beginning of the thirteenth century were very significant, and they were next to the dukes of Lorraine the largest landlords on the left bank of the Rhine. The countship of Luxembourg with the enclosed county of Arlon comprised the entire modern grand duchy of Luxembourg, together with regions of western Germany around Saarburg, Trier, Bidburg, and Prüm, and the northern portion of the French department of Moselle until near Metz; it contained approximately 150 square miles. The larger western half spoke a Romance dialect (Walloon), while the smaller eastern region spoke German. In the midtwelfth century, there were approximately thirty fortresses in the county; toward the end of the thirteenth, the number had risen to about 100. The vassals who owed service to the counts of Luxembourg at the beginning of the thirteenth century numbered more than thirty-five, and there were also many ministerial families in their service. It was thus not an exaggeration when one reads that Count Henry of Namur and Luxembourg went against Archbishop Adelbero of Trier with some 1,500 men.

In 1308, Count Henry of Luxembourg was elected king of the Romans and asserted his claim to the imperial crown as well. He found support among such as Dante Alighieri, the Florentine poet whose piece "On the Monarchy," *De monarchia*, was dedicated to Henry. Although the electors rejected Henry's son as emperor, John did succeed to the throne of Bohemia; his grandson became the German king, Charles IV, in 1349. At the end of the fourteenth century, Sigismund and Wenceslas, sons of Charles IV, each sat as king for periods of time. Sigismund was emperor in 1415 at the time of the Council of Konstanz.

Magdeburg

The Frankish border fort *Magadaburg*, first mentioned in 805, stood on the location of the present cathedral complex in a strategic military and commercial site above the river Elbe. Sometime during the following century, the fort was replaced by a *Hof* (court), including the requisite chapel. With the advent of a Saxon royal dynasty, the Ottonians, Magdeburg increased in importance. Otto I (936–973) granted the city to his first wife, Edith, as her *dos* (dowry) ca. 929. In 936, Otto founded a monastery there, dedicating it to St. Mauritius and his companions in the Theban legion. Throughout Otto's reign, Magdeburg was a frequent recipient of royal visits, in particular because it provided a convenient staging point for military expeditions into the Slavic lands beyond the Elbe. The ruler's presence and continued interest brought substantial benefits to the monastic community, which soon figured among the wealthiest in the realm. It is generally accepted that, by 955, Otto had formulated a plan to elevate the monastery at Magdeburg to the status of an archbishopric. He started building a new, unusually large church, which he endowed with more extensive rights of jurisdiction and new territories. In 965, he gave it rights to hold markets, mint coins, and collect customs duties. In spite of his efforts, clerical opposition prevented the monarch's plans from being realized until 968. In that year, an archbishop and chapter were installed in the former monastery of St. Mauritius, and most of the monks moved to a new foundation, St. John the Baptist at Berge.

The forms of the Ottonian church are known from excavations carried out in 1926. A transept and round choir flanked by two towers marked the east end; it was balanced at the west by a westwork. The long nave flanked by two aisles stretched in between. Separating the nave from the aisles were antique columns of marble, porphyry, and granite topped with late Roman capitals; Otto's transport of these *spolia* from Rome in 962 emulated Charlemagne's transfer of similar fragments to Aachen and suggests again the important role Otto intended this site to play in his imperial politics. He also intended it as a dynastic necropolis. In 946, his first wife Edith had been buried in the first church of St. Mauritius; Otto himself was buried in the crypt of the still unfinished cathedral in 973. After his death the eastern parts were enlarged: the five-aisled crypt was rebuilt for a consecration in 1008, and the new sanctuary above was erected under Archbishop Hunfried (1023–1051).

Excavations have also revealed the foundations of an impressively large palace, probably built between 962 and 973. The structure may have been modeled on Charlemagne's palace at Aachen, which also incorporated a religious foundation. A rounded western entry may suggest Byzantine influence. Magdeburg remained important for the subsequent Ottonian emperors. They celebrated the great Christian feasts there and actively intervened in archiepiscopal elections. Henry II is said to have personally translated (moved) relics of the community's patron saint, Mauritius, processing with them to the cathedral in the dead of winter. The Salians, however, preferred the palace at Goslar and other sites. As Otto's palace fell into disuse, the archbishops, who replaced the emperor as the ruler of the city, built their palace over the ruins of the emperor's.

In the second half of the twelfth century Archbishop Wichmann (1152–1192) was responsible for building a city wall that enclosed both the cathedral complex and the merchant settlement. He also reorganized the streets of the town, laying out the *Breiter Weg* (the Wide Way), which still serves as a major north-south axis. During his administration, or slightly later, the cathedral cloister was also erected in a late Romanesque style. Only the south wing still stands; on Good Friday in 1207 a fire that broke out on the *Breiter Weg* moved south, severely damaging the Ottonian cathedral and the other three wings of the cloister.

Against opposition from the cathedral chapter and the townspeople, who wanted to repair the old building, Archbishop Albrecht II von Käfernburg (1205–1232) began building a new cathedral in the Gothic style. His ambitious project makes a political statement about the importance of the archbishopric even as concessions he was increasingly forced to grant to the town's citizens diminished his own power.

The scholar Ernst Schubert (*Der Magdeburger Dom*, 1984) has divided the construction of the cathedral into six phases, marked by changes in workmen and plans. It was finally finished in 1520, just four years before Martin Luther preached the Reformation at Magdeburg in the church of St. John. Already in the first phase, beginning with the laying of the cornerstone at the east end of the building in 1209, the influence of the French Gothic is apparent. Pointed arches are used throughout; the wall surface is membered with columns, including Otto's ancient imports taken over from the previous building; and the ground plan takes the typical French form in which shallow chapels open off the ambulatory ringing the polygonal choir. The transept and first bays of the nave, laid out in the second building phase between about 1220 and 1232, show the influence of the cathedrals then underway at Bamberg and Naumberg. The upper parts of the choir, including the deep gallery at the second level known as the *Bischofsgang* (Bishop's Passage), erected in the third building phase, between 1232 and 1235, reveal the influence of Cistercian Maulbronn via Ebrach and Walkenried. In the fourth campaign (1235–1254), the choir was raised, the transept finished, the nave extended, and aisles widened. The nave was finished in the fifth phase, between 1274 and 1363.

During this last phase, the west portal was also erected, most likely according to its third design. Three large stone figures of apostles, executed in the 1220s for either the west portal or that of the north transept, were mounted. Three additional figures of saints, perhaps made specifically for this site, remained against the piers of the second level of the choir interior without ever being installed in their originally planned position. The Bamberg-influenced figures of the Wise and Foolish Virgins of ca. 1250, now installed on the portal of the so-called *Paradies* (a single bay entry hall on the north end of the north transept) may have been intended for a Last Judgment portal later planned for the west facade; Schubert and the scholar Fritz Bellmann, however, posit their original placement on the predecessor to the present, mid-fifteenth-century choir screen. In its final form of ca. 1310, the west portal shows the mark of the Rayonnant facade at Strasbourg with its thin screen of attenuated, brittle verticals. The single figure on the trumeau (doorpost) represents the Emperor Otto I. The upper parts of the west facade, with sculptures of Christ and the apostles, the Madonna, and Saints Mauritius and Catherine, were finished in the sixth building campaign between 1477 and 1520.

The cathedral's rich sculptural decoration also includes tombs of several of its archbishops, including the monuments for Friedrich von Wettin (d. 1152) and Wichmann von Seeburg (d. 1192), products of the influential twelfth-century bronze-casting workshop at Magdeburg. The elaborate wooden choir stalls with relief scenes from the life of Christ were presumably finished for the consecration of the Gothic building in 1363.

The city government seems to have commissioned Magdeburg's best-known sculptural achievement, the so-called Magdeburg Rider, an equestrian figure that stands between two maidens carrying banners under a baldachin in the main Market Square. Exactly whom the Rider represents is a matter of debate, with Constantine and Otto I as the preferred identifications. Erected probably in the first half of the 1230s, the figure may well symbolize the city's pride in its imperial beginnings and the city government's claim to have received its rights from the emperor. In the second half of the decade, Archbishop Wilbrand (1235–1254) was forced to grant the burghers important concessions toward self-rule in the form of the first city constitution. This did not completely settle long-standing disputes between the archbishop and the town over rights and freedoms, however, and in 1325, Wilbrand's successor was murdered by the townspeople.

The title of this verse legend, "The Crown of the Virgin" (or "The Crown of the Virgins"), refers to the Virgin Mary receiving a martyr crown from God in the form of a *Marienpreis* (laudatory poem to Mary), a *Marienleben* (life of Mary), followed by twelve *Legends of the Virgin Martyrs*. The poems of the virgin martyrs are *Katharina*, *Barbara*, *Dorothea*, *Margareta*, *Ursula*, *Agathe*, *Agnes*, *Lucia*, *Caecilia*, *Cristina*, *Anastasia*, and *Juliana*. Intended as a monograph for the daily *Tischlesung* (reading at mealtime), these approximately 8,400 verses were composed by a Cistercian nun soon after the first printing of the *South German Heiligenleben* (1471 or 1472) in Augsburg. The legends borrow partially from Latin sources (such as the *Ave Maria* and the *Legenda aurea*) and from legends already in verse, for example, *Barbara*—which by 1425 had been preserved as a single legend in Konstanz—from a manuscript of the *Alsatian Legenda aurea* (ca. 1450), as well as from another version of the same *Alsatian Legenda aurea* (manuscript ca. 1450 from Lichtental). But the major sources for all the legends were the *Alsatian Legenda aurea* (originally ca. 1360), the *Heiligenleben* (ca. 1420), and the Latin *Legenda aurea*. Although *Katharina* is lost now, *Barbara* has some 650 verses, *Dorothea* circa 450, and *Margareta* about 280 . The author, who found verses more pleasant for extensive reading aloud, may well have been the successor to a *Lesemeisterin* and *Schreibmeisterin* (reading and writing mistress) Sister Margarethe, called Regula (d. 1478), in the Cistercian cloister Lichtental near Baden-Baden, to whose monograph in prose, the *Buch von den heiligen Mägden und Frauen* (comprising fifty-seven female saints, ca. 1460), *Der Maget kron* is closely related. While she obviously worked diligently at her poetry, there have been objections raised to her "false rhymes."

Magic

Between 800 and 1500 C.E., many different kinds of practices may be called magic. Some were ancient customs that still survive here and there as folklore and superstitions. Others involved more complicated rituals and secret knowledge of hidden powers in nature and the invisible world of the intellect and spirits. Astrology (which overlapped with astronomy in the Middle Ages) offered possibilities for magic, as did alchemy. Although commonly used magic is found in manuscripts written in Old High and Middle High German, Low German, and Anglo-Saxon, more learned forms appear in manuscripts written in Latin.

Among the earliest known magical practices are charms (*Zaubersprüche*) and amulets used for protection against sicknesses, to stop bleeding, and to help with other troubles like a lame horse or theft. Distinctive to Germanic regions were threats to health and peace of mind from disease-causing worms and elves, which could be staved off by such domestic magic.

Beginning in the eleventh century and intensifying significantly in the twelfth and thirteenth, magic reputed to derive from secret books was strongly denounced by Christian church authorities. After the translation of new knowledge from Arabic sources, widely educated medieval writers like Albert the Great at Cologne (1193–1280) sometimes succeeded in distinguishing which uses were safe and which were dangerous. But authorities had long agreed that the materials of nature—metals and precious stones, plants, animals—as well as words, contained hidden powers (virtues) of a surprising variety. A sapphire might be used to relieve an eye problem, stop a feverish sweat, free a prisoner, or induce a peaceful reconciliation. Rituals intended to focus the inherent powers in nature on specific problems might or might not involve demonic powers in the process. Lynn Thorndike and others have argued that science itself developed out of medieval *experimenta* with the powers in nature.

The planets too possessed hidden powers that influenced human events and natural phenomena. Accurate astrological calculations of the exact location of the stars and planets in relation to the signs of the zodiac and constellations made it possible to predict favorable and unfavorable times for marriages, battles, or meetings with powerful people. German Emperor Frederick II (d. 1246), like many of his noble peers, retained astrologers, including Michael Scot, in his court. Alchemy, the art of transmutations, also lent itself to magical purposes, since success at producing the elixir or philosopher's stone promised unlimited wealth and youth. Thus, alchemists often wrote down their secrets in highly encrypted forms.

In imaginative literature such as the Middle High German *Nibelungenlied*, magic attaches to objects like a sword, a cloak of invisibility, and dragon's blood. In Gottfried von Straßburg's retelling of the courtly romance of *Tristan und Isolde*, magical healing and a love potion determine the fate of the noble couple. The work of evil magicians is overcome by famous knights in Wolfram von Eschenbach's *Parzival* and the Middle High German verse novel *Wigalois*.

The figure of the magician as a person of exceptional abilities in manipulating secret powers for specific purposes emerges in the fifteenth century. A recently edited Munich manuscript (Bayerische Staatsbibliothek, no. clm 849) displays typical purposes for which a magician might conjure spirits or demons: to know the future or other hidden things (divination), create illusions as of a banquet or a fast horse, and manipulate people's emotions or behavior. The magician claims to be able to make a woman passionately desire him, cause a person to hate another, secure the favor of some powerful person, or make someone appear physically ridiculous or ill. A different kind of learned, ritual magic was intended to bring intellectual gifts, knowledge, and visions to the scholar-magician who underwent a rigorous discipline and elaborate ceremonies to acquire powers and specific knowledge in the liberal arts. Whereas conjuring demons for low purposes was labeled black magic or necromancy, conjuring with images to obtain intellectual powers constituted the *ars notoria*, or "angelic" magic, which some argued was entirely beneficent and positive. Nevertheless, at the end of the fourteenth century, people began to be condemned to torture and death for what were believed to be magical and demonic practices, activities that associated them in the minds of their accusers like the authors of the *Malleus Maleficarum* with demons (making contracts with the devil, flying, summoning devils, etc.).

How medieval Germans understood or practiced magic differs from one era and cultural environment to another. Old practices like reciting charms or divining a person's future in some object or natural phenomenon do not disappear in the later centuries of this period but continue to appear in books of medical recipes or survive alongside utilitarian information and prayers in manor books, such as the Wolfsturn Castle manuscript described by Kieckhefer.

Magic and Charms, Dutch

The study of Middle Dutch magical writings has benefited greatly from the publication of the *Repertorium van de Middelnederlandse Artes-literatuur* (Jansen-Sieben, 1989), an inventory of Middle Dutch *Fachliteratur* (technical writing) up to 1600. The corpus of extant manuscripts reveals a variety of magical writings, ranging from "white" (constructive) to "black" (destructive) magic. A substantial number of magical texts (charms, love potions, medical magic, herbal magic) has survived in a fifteenth-century manuscript preserved at Ghent (University Library, manuscript no. 697). In another fifteenth-century manuscript (London, Wellcome Institute, manuscript no. 517), a large collection of Latin alchemical, medical, and technical treatises is interspersed with some twenty-four Middle Dutch magical recipes (love magic, adjurations, incantations, herbal magic, magical experiments). A third collection of Middle Dutch magical recipes has survived in a fifteenth-century manuscript at Hattem (Streekmuseum Hattem Voermanhuis, manuscript no. C 5). The impact of magic on medieval society can best be measured by the numerous denunciations and condemnations of magical practice voiced by the authors of Middle Dutch penitentials and catechetical treatises. According to these writers, the believers and practitioners of the *artes magicae* (magic arts) will burn in hell because they sinned against the first commandment or because they have chosen the devil above God in exchange for magical knowledge. These admonitions indicate that magic occupied an important place in the Middle Ages. Recent research has propagated the study of Middle Dutch magical writings as an important contribution to the understanding of medieval literature and culture.

Mainz

Medieval Mainz grew up within the walls of the Roman military base and provincial capital Mogontiacum, located at the point where the Main River flows into the Rhine. In the Carolingian period, the city became the ecclesiastical center of Germany under Archbishop Saint Boniface (746/747–754). Boniface's successor, Lul, succeeded in getting the office of archbishop, which had originally been granted to Boniface personally, permanently associated with Mainz. Under Charlemagne, the archbishop of Mainz supervised a large number of suffragan bishops, governed the largest ecclesiastical province in the Western world, and was primate of the church in Germania. As chancellor, the archbishop represented the emperor, and as the highest-ranking elector, he cast the first vote for king. The accumulation of appointments and honors associated with the position of archbishop of Mainz made this one of the most desirable episcopal sees, but it also presented problems for the city in its progress toward self-government.

With the erection of the cathedral, Archbishop Willigis (975–1011) created a new spiritual center in the city. In the Ottonian and Salian eras, the establishment of cloisters, parish churches, and other foundations also depended largely on the bishop.

By the early Gothic, which should be considered Mainz's golden age, the artistic initiative of the archbishop had given way to that of the citizens and the monastic orders. The union of Rhenish cities in 1254, the privileges extracted by the city government from the archbishop, and the increasing wealth of the city's patriciate created the necessary conditions for extensive building activity. Archbishop Siegfried III (d. 1249) granted the citizens the right to elect their government and handle its finances, which made the city virtually independent of the archbishop's rule. In the next century this would lead to constant discord between the city's secular and religious leaders. The conflict peaked in 1462 in a catastrophe that brought the city's economy as well as its artistic production to a standstill. Archbishop Adolf II of Nassau conquered the burning city after a bloody ten-hour battle in its streets. Eight hundred men, including Johannes Gutenberg, were banished, and all rights gained by the city since the thirteenth century were revoked.

Although destroyed five times by fire, the cathedral of St. Martin still reflects the same plan as the first building erected by Archbishop Willigis. Its basilical form is modeled on that of Old St. Peter's in Rome, with the main choir in the west preceded by a transept. Like the earlier church at Fulda (791–819), also a foundation of Boniface, and the later churches at Bamberg, Augsburg, and Regensburg, the cathedral at Mainz combines this "reverse orientation" with a secondary choir in the east. The erection of a church dedicated to the Virgin of the Steps (St. Maria ad gradus) on axis outside the east choir also depends on the Roman model; with the cathedral it provided an appropriate space for the royal coronation ceremony, which took place seven times in Mainz. In 975 Willigis had the pope confirm the right of the archbishop of Mainz to crown the German kings.

On the day before the consecration in 1009, the cathedral burned; it was quickly rebuilt by Willigis's successor, Bardo, and consecrated in 1036. The eastern parts and the nave were rebuilt after a second fire in 1081. About 1200 the dilapidated vaults of the nave were replaced and a new west choir built on a triconch (with three apses) plan. The addition of side chapels with tracery windows along the aisles between 1279 and 1320 introduced the Gothic architectural vocabulary. At this point the cathedral had attained the state in which it remains today.

The unusual cycle of medieval archbishops' tombs documents the continuity of episcopal power. The two oldest preserved tomb reliefs show Siegfried III von Eppstein (d. 1249) and Peter von Aspelt (d. 1320) crowning two and three smaller kings, respectively, in a unique tomb iconography. The later tombs follow an almost formulaic type that continues into the seventeenth century: a Gothic arch in low relief frames the fully vested archbishop holding a crosier and a book. The episcopal power displayed by the tombs reveals the self-consciousness of the powerful archbishops. Rather than serving a primarily memorial or liturgical function, the tombs represent the continuity of the political institution of the office of archbishop.

Looting and destruction have been responsible for the loss of much of the cathedral's medieval decoration including Willigis's massive gold cross weighing six hundred pounds, all the stained glass windows, and the western rood screen, of which only fragments remain. The preserved bronze doors from about 1100 attest to the splendor of the church's furnishings. The inscription on the doors emphasizes that these were the first metal doors since Charlemagne's time, made by Master Berenger for Archbishop Willigis.

One of the churches in the cathedral complex, St. Johannis, the supposed predecessor of the cathedral, stands outside the cathedral's west choir. The earliest source mentioning this church dates from about 600; it tells of the king's daughter Berthoara, who supported the bishop Sidonius in the building of the church. In 754 the body of the martyred St. Boniface was prepared here for burial in Fulda. The building as reerected after World War II dates in large part to the building campaign of Archbishop Hatto (891–913), who simultaneously erected the church at Reichenau Oberzell. In both churches the individual spaces are separated by strongly projecting piers. As at the cathedral, the primary choir and transept at St. Johannis are in the west.

The archbishop's palace chapel dedicated to St. Gotthard (1137) is attached to the cathedral. The four supports divide each of the two stories of the chapel into nine bays, with the middle bay left open to allow contact between the two stories. The structure thus belongs in the tradition of palace chapels with an identical ground plan attached to cathedrals, as at Speyer and formerly at Trier and Cologne.

Apart from three eighteenth-century examples, all the churches of Mainz were erected in the few decades around 1300, when sixteen large-scale projects were realized. Among the buildings still standing today, St. Stephan's was built as a collegiate church in the first half of the fourteenth century. The wealthy citizens, eager to embellish their city with larger, more modern houses of worship, rebuilt the parish churches of St. Emmeran, for which an indulgence dated 1296 exists, St. Quintin (1300–1330), and St. Christoph (1292–1352). The cloister churches of the Poor Clares (about 1334), the Rich Clares (begun 1272), and the Carmelites (second half of the fourteenth century) still stand; destroyed are those of the Dominicans (mid-thirteenth century), the Franciscans (begun 1253), the Augustinians (founded before 1260), the Teutonic Order (1302), the Carthusians (1330), Our Lady (begun 1285), the Magdalens, as well as Dalheim (third quarter of the thirteenth century) and St. Agnes, for which indulgences in favor of the building project were issued between 1274 and 1295. The side chapels along the aisles in the cathedral and the west choir of St. Johannis also date in this period of rich building activity.

Among these Gothic churches St. Quintin, which is already mentioned in 774 as a parish church, is the oldest foundation. The plan shows the optimal use of the small space available. As at St. Stephan's and the church of the Virgin, the new building, begun about 1300 and finished in 1330, uses the hall church form favored in Mainz. The type was transferred to Mainz from St. Elizabeth's in Marburg via other sites in Hesse. The relatively short nave flanked by the tall aisles creates the unusual effect of a light-flooded, airy cube; the destroyed church of the Virgin outside the cathedral must have produced a similar impression.

St. Stephan's is the largest church after the cathedral. Founded by Willigis on an exposed hill inside the city walls, the church had become structurally unsound by the middle of the thirteenth century. The new building was financed by numerous indulgences, whose dates between 1257 and 1338 establish the period of construction. This building too takes the form of a hall church, but in the more typical oblong shape than the shortened churches of St. Quintin and the Virgin. In addition, St. Stephan's has a transept as in the Hessian hall churches at Marburg, Haina, and Friedberg. Like the cathedral and St. Johannis, it exhibits a second choir in the west, which is accentuated by a tower. A late Gothic cloister with fine net vaults was erected between 1462 and 1499.

The cloister of the Antonite monks is first mentioned in 1334; it was taken over in 1620 by the Poor Clares and today is referred to by their name. Because the Antonites dedicated themselves to care of the sick and raising pigs, they chose a site outside the city center, although still within the walls. The small aisleless church in the Gothic style is unusual for its completely intact vault painting, executed before 1350. Framed by painted tracery, saints, apostles, and the fathers of the church surround the figure of Christ, who presides over the assembly from the choir vault.

Early-fifteenth-century paintings grace the choir vaults of the Carmelite church. These represent in grisaille the suffering Christ surrounded by angels and prophets. The church, erected between 1326 and 1404, has the long choir typical of churches of the Mendicant orders, which needed more room for the choir stalls; the basilical nave is relatively short.

When St. Maria ad gradus, the church within the cathedral complex dedicated to the Virgin, burned in 1285, the decision was made to rebuild in a high Gothic style; the citizens supported the new building with unusually generous donations. Finished in 1311, the new church, erected over a nearly square plan, provided, with the neighboring cathedral, a defining element in the city's silhouette until its destruction by French bombardment in 1793. In contrast to

the other, undecorated churches of Mainz, the church of the Virgin possessed richly decorated portals; the sculpture is close in style to that of the Naumburg Master.

The Roman walls within which the medieval city developed traced a square of about one kilometer's distance on each side. This area sufficed for the city's growth into the nineteenth century, with the exception of a single extension along the Rhine in the thirteenth century. By 1300 some 20,000–25,000 people lived in the city, whose western slopes provided space for orchards and even vineyards. Most of the city's gates pierced the east wall, in order to accommodate trade from the ship traffic along the Rhine. With the exception of the Iron Tower (about 1200), the Wood Tower (fourteenth century), and short passages of the east wall between them, the city wall was entirely demolished in the eighteenth century.

After 1300 a sort of citizens' center developed to the northeast of the cathedral quarter. Here the market hall, the hospital, the city hall, and the surrounding market and business district clearly expressed the aspirations of the citizenry. The market hall, dated about 1320, was also used for large public festivals. Unlike the more typical wooden market halls with open sides, that at Mainz was a defensible building in stone, reflecting both the value of the goods stored there and the importance of trade in the city's economy. Only the sculptural decoration—reliefs representing the seven electors and the king from the crenellations of the building's upper defenses—is preserved.

The hospital dedicated to the Holy Spirit from the second quarter of the thirteenth century is one of the few preserved medieval hospitals in Germany. Its two-story elevation is comparable to that of St. John's Hospital in Niederweisel in Hesse. The lower story, originally a seven-aisled hall, probably served as the infirmary.

Despite conditions that were sometimes conducive, no particular style of painting, sculpture, goldsmith work, or manuscript illumination developed in Mainz, and the idea of a Middle Rhenish school, cultivated in art historical scholarship for decades, must be discarded. The patrons of Mainz repeatedly looked to other centers for artists, for example, the renowned Naumburg Master, who sculpted the cathedral's now fragmentary west choir screen before 1250. Characteristic for the art of the city is the constant reprocessing of new influences from Burgundy, France, Bohemia, Germany, and the Netherlands; works from Mainz are always up-to-date without having a typical local character.

Mande, Henrik (d. 1431)

Exponent of the Modern Devotion and author of Middle Dutch religious prose treatises, Mande was born in Dordrecht and worked as a copyist in the service of the counts of Holland. Before 1382 he went to Deventer and Zwolle when the Brethren of the Common Life began to spread in those cities. In 1395 he became a redditus (canon regular without ordination) in the newly founded monastery of Windesheim. There he worked as a copyist and illuminator of manuscripts. In 1431 he died while on a journey in Beverwijk (Holland).

Mande wrote fourteen relatively short treatises, of which twelve (or eleven?) survive. As an author, Mande relies heavily on writings of spiritual masters like Hugo of St. Victor, Hadewijch, and Jan van Ruusbroec. Therefore many of his treatises are read like reports. Important themes of his spirituality are the inward revelation and spiritual sincerity of living. Man has to turn into himself to find the inner truth, and he has to live without hypocrisy according to the truth that gradually is revealed to him.

Mande's numerous visions of the state of the dead made him a widely known but also disputed attraction. Most famous was his *Apocalypsis*. In this apocalyptic vision, Mande sees saints clothed by their virtues in heaven. Among them he sees a procession of the deceased leaders and former brethren and sisters of the Modern Devotion. In its imagery, vivacity, and colorfulness this vision reminds the modern reader of Van Eyck's famous painting *Lamb of God* (*Lamb of God*) in the cathedral of Ghent.

Manfred of Sicily (1232–1266)

The illegitimate son of Frederick II Hohenstaufen, Manfred attempted to reconstitute the family's fortunes in Italy and Sicily after his father's death. Inheriting many of his father's talents, including a passion for falconry, Manfred also inherited papal hostility to the Hohenstaufen, and his attempts to establish himself in Italy faced the formidable opposition of the papacy. It was this papal antagonism that would bring about the demise of Manfred and his family and introduce a new power, and new complications, to southern Italy and Sicily.

At his death in 1250, Frederick was succeeded by his son Conrad IV, and Manfred was established as the prince of Taranto and regent in Italy. It was Manfred's energy, and ambition, that secured Hohenstaufen control in the south during Conrad's absence in Germany. So great was Manfred's success that Conrad felt able to negotiate with Pope Innocent IV from a position of strength but also felt obligated to limit Manfred's grab for power in Sicily. Conrad's death in 1254 and the youth of his heir, the two-year-old Conradin, offered Manfred the opportunity to establish himself as the king of Sicily and the opportunity to create a Mediterranean empire.

At first supportive of Conradin, Manfred soon removed this support and was crowned king of Sicily in 1258. He was emboldened to take these steps because of the support he found among the Sicilian nobility, a result of his own efforts in that regard, and his victories in the field. Indeed, Innocent IV was at first willing to come to terms with Manfred and an agreement was reached between the two that saw Manfred's titles and lands restored and the assertion of papal rights over Sicily. But neither side was willing to honor the terms, and the old papal-Hohenstaufen feud was revived. Manfred rose against the pope, an offensive that led to the capture of the royal treasury and a great victory in Foggia in late 1254. Shortly after his victory, Manfred's cause received a further boost with the death of Innocent. Although the new pope, Alexander IV, was no more favorable to Manfred, momentum was on the latter's side. Throughout the later 1250s, Manfred improved his position in Sicily—securing his patrimony, founding new cities, and reviving the University of Naples—and expanded his power throughout Italy.

Manfred's success in Italy inspired him to look beyond the peninsula. He involved himself in the fractious politics of the eastern empire and supported one of the Latin pretenders to imperial power in Constantinople. The restoration of Greek control of Constantinople in the person of the emperor Michael Palaeologus provided military defeat for Manfred and his allies but also provided Manfred with a means to escape papal censure. Manfred vowed to launch a crusade to restore Baldwin II, the deposed Latin emperor, to the throne in Constantinople, a promise that did not ease tensions with the pope but did find Manfred a great ally in Baldwin. Manfred was further strengthened by successful marriage alliances with eastern powers and with King James of Aragon, so that by the early 1260s he was at the height of his power.

Manfred's successes in the broader Mediterranean and, especially, in central and northern Italy increased papal animosity toward the king. Negotiations with various princes in northern Europe had been going on for several years when Pope Urban IV came to terms with Charles of Anjou, brother of King Louis IX of France. Although the pope had found a champion in Charles and preached crusade against Manfred, it was the Hohenstaufen king who took the initiative against his rival. But Manfred called off his campaign with Urban's death in the hope that the new pope, Clement IV, would be more accommodating. Unfortunately for Manfred this was not the case. During the cessation of hostilities Charles secured his place in Italy and received support from the people of Rome and a number of Manfred's allies. In early 1266, Charles moved south and was met by Manfred at Benevento on February 26. In that battle, Manfred's army was routed but in the face of defeat Manfred fought valiantly and died in battle. Charles granted Manfred a burial with honor even though as an excommunicate he was denied church burial. Charles's victory at Benevento was a serious blow to Hohenstaufen fortunes and witnessed the death or capture of many Hohenstaufen supporters. And although Charles would eventually defeat Conradin, Charles too would fall victim to the tumultuous politics of Sicily in the so-called Sicilian Vespers.

Manuals, Artists', and Modelbooks

During the Middle Ages, the traditions of craftsmanship and apprentice training dominated the production of art objects. Accordingly, few medieval sources on the practice of the arts survive. The extant materials fall into two categories: technical manuals and modelbooks. The technical writings provide recipes for paints and explain the technological procedures for arts such as metalworking. The most famous example of such a manual is the treatise *On Divers Arts (De diversis artibus)*. It is thought to have been composed between 1110 and 1140 by the German Benedictine monk and metal craftsman Roger of Helmarshausen. It contains three sections on painting, stained glass, and metalworking. The second category consists of modelbooks that record patterns for decorative designs and figural subjects. Medieval examples survive from the tenth century into the Renaissance throughout Europe. Sometimes they are groups of leaves bound into a manuscript with diverse textual contents; at other times they form discrete books. Usually, the subjects are rendered as outline drawings. Several interesting examples come from German regions such as three leaves in a twelfth-century manuscript from Einsiedeln (Stiftsbibliothek, manuscript no. 112) and six leaves in a thirteenth-century miscellany from Saxony (Wolfenbüttel, Herzog August Bibliothek, manuscript no. Aug. oct. 61/62). While both of these modelbooks primarily depict figural motifs, the fifteenth-century Göttingen Model Book and a similar manuscript in Berlin represent a combination of artists' manual and modelbook. They contain written instruction complemented by painted illustration of the sequential steps in depicting acanthus foliage and diapered backgrounds. These varied types of manuals and modelbooks of German provenance demonstrate some of the working methods of German artists in the Middle Ages.

Manuscripts, Painting and Production

During the Middle Ages, books were constructed, copied, and illuminated by hand. Throughout this period, the basic materials and techniques remained fairly constant. Until the late Middle Ages with the advent of paper, the support for the manuscript was parchment. This material is the skin of an animal, often sheep or calf, that was soaked in a lime solution, scraped, and stretched to form a smooth, sturdy writing surface. The parchment leaves were trimmed to the size desired for a particular book. An open leaf, or bifolio, was folded in half to form two folios. The front side of the folio is called the *recto*, while the back side is the *verso*. Each *recto* and *verso* are the equivalent of modern pages, but most medieval manuscripts are numbered by the folio.

Groups of bifolios were assembled to make gatherings. The parchment bifolios were placed so that hair side faced hair side and flesh side faced flesh side. Gatherings usually consisted of four bifolios (eight folios, or sixteen pages) or five bifolios (ten folios, or twenty pages), although other size gatherings were possible. Sometimes one or more folios were added or excised, creating an irregular gathering.

The next stage was the layout of the manuscript's contents. Placement of the text and provision of spaces for decorative initials and illustrations were blocked out on the folios. The text could be in one, two, or more columns. In the later Middle Ages, the text layout often included columns for textual commentary or glosses. Illuminations could fall within a column or could span more than one column. They could be full-page or could occupy a portion of the page height. Usually the size and placement of textual and decorative elements was based on geometrical proportions in relation to the folio or bifolio. Rulings established the layout. Small prickings in the margins provided points of alignment for the straightedge. The marking instrument varied. In the early medieval period the rulings were in hard point, leaving only a ridge or furrow on the parchment. Beginning

Stages of manuscript production in the roundels framing St. Michael with monks of the Michelsberg cloister. St. Ambrose, *De officiis ministrorum* (Bamberg, Staatsbibliothek, Ms. Patr. 5, fol. 1v). Photograph: Staatsbibliothek Bamberg

around the twelfth century, ruling was usually done in lead point. By the fourteenth century, ink ruling became common.

The scribes then copied the text using quill pens and brown iron gall ink. Decorative initials, illumination, and marginal ornamentation was painted after the text was copied. Often specialized artists, the illuminators, did this work although scribes often added decorative initials or line endings. In its most simple form, the embellishment consisted of larger initials, often in alternating colors of red or blue. More lavish illumination utilized gold leaf for backgrounds and a wide range of pigments. The paints were water-based and the pigments derived from natural substances such as earth-colored ochres and browns and plant dyes. A number of medieval artists' manuals preserve recipes for the paints.

The completed manuscript was ready for binding. The gatherings were stacked in order on a sewing frame with thongs secured tightly along the manuscript's spine. The sewing went through the gatherings and around the thongs, which were then inserted into wooden covers. Leather usually covered the wood; it was often tooled with figural or decorative designs. Metal bosses, clasps, and ornaments could be attached. Some liturgical manuscripts had covers with metalwork, ivory, and jewels. The upper cover of the Gospel Book of Otto III (Munich, Bayerische Staatsbibliothek, no. Clm. 4453), for example, has an ivory panel surrounded by jewels to make a rich "treasure" binding. Many German Romanesque and Gothic manuscripts retain their tooled and stamped leather bindings that can often be attributed to individual craftsmen or workshops.

Two manuscripts of German origin contain the most complete medieval illustrations of the manuscript production process. In an early twelfth-century copy of Ambrose, *De officiis ministrorum* (Bamberg, Staatsbibliothek, manuscript no. Patr. 5) from the Benedictine monastery of Michelsburg near Bamberg, roundels depicting stages of book production surround a prefatory miniature. The bust-length figures of monks, drawn in brown and red ink, are shown stretching and trimming the parchment sheets, cutting a quill pen, scraping out a copying error, using a sewing frame to join the gatherings along the spine, preparing the boards, and attaching metal clasps to the wooden cover of the binding.

A thirteenth-century Bible (Copenhagen, Kongelige Bibliotek, manuscript no. 4, 2^o) copied for a deacon of Hamburg Cathedral in the mid-thirteenth century contains historiated (containing figures) initials beginning some of the books of the Bible that show other aspects of manuscript production. The parchmenter provides parchment sheets to a monk, and the sheets are trimmed to the desired size. A quill is cut while the parchment is smoothed with pumice. A scribe rules the layout using a straight edge to guide the pen. Several initials depict scribes copying with their pens, scrapers, and inkwells. Finally, an illuminator paints the head of a man on a parchment folio.

While the materials and techniques of making medieval manuscripts changed little throughout the Middle Ages, the organization of manuscript production reflected the social and economic shifts that occurred between the early and later Middle Ages. During the early medieval period, monastic scriptoria were almost exclusively responsible for the production of manuscript books. During the Carolingian and Ottonian periods, German monasteries were very active in making manuscripts and preserving them in their libraries. Much of the study of German medieval manuscripts dating through the twelfth century has focused on attribution of manuscripts on paleographical and artistic grounds to particular monasteries and examining how these monastic scriptoria

functioned. The emperor Charlemagne's interest in learning, literacy, and the Christian religion gave strong support to monastic manuscript production throughout his empire and established a tradition of imperial patronage for these endeavors that continued for centuries in the German empire. The exact nature of a palace school or scriptorium at Aachen and its manuscript production and illumination during Charlemagne's reign remain controversial, but many luxurious manuscripts such as a series of Gospel books were made under Charlemagne's patronage at monastic foundations in the Carolingian empire. Among the outstanding contributions of the Carolingian Renaissance to the development of the medieval manuscript are the creation of a clear, legible script termed Caroline minuscule and a style of illumination that drew inspiration from classical art for its monumental figure style. Even after Charlemagne's empire disintegrated, German monasteries continued to produce manuscript books. Under the patronage of Ottonian rulers, manuscript production and illumination flourished at centers such as Fulda, Trier, and Reichenau, among others. While Ottonian manuscripts continued to be copied in the Caroline minuscule script, the illumination tended to become somewhat more stylized, with firmly outlined figures, sharper and more linear drapery, and the use of intense colors against flat gold backgrounds. German Romanesque manuscript production reflected the changing political situation. The strengthening of the local nobility created diverse sources of patronage and correspondingly more regional variations in styles of script and illumination. Monasteries such as Weingarten continued to maintain scriptoria. At the same time, cities such as Salzburg, Hildesheim, Regensburg, and Cologne became major artistic centers on whose scriptoria the German nobility drew in commissioning manuscripts. By the thirteenth century, manuscript production altered in response to changing economic and social conditions in Europe. The strengthening of the money economy, the growth of a middle class, the increase in literacy, and the burgeoning of vernacular literature contributed to the development of commercial manuscript production by secular artisans and an active book trade. The processes involved in making manuscripts became more specialized. Parchmenters made the parchment, scribes copied the text, illuminators painted the miniatures and marginal decoration, and binders bound the manuscripts. These artisans worked individually, perhaps in a small workshop with one or more assistants or apprentices. A stationer, often working on behalf of a patron, usually coordinated the collaborative efforts needed to produce a single manuscript. Most German cities such as Cologne and Regensburg had a thriving book trade. Studies of German Gothic manuscripts from various perspectives provide more detailed nuances of how late medieval manuscript production in Germany functioned in particular locales and situations. The range of people commissioning manuscripts broadened. The greater and lesser nobility continued to acquire manuscripts, both religious and secular, usually made with costly materials and illuminations. In addition, a wider group of middle-class patrons, including merchants, tradespeople, and students, purchased books. Religious institutions now obtained books through the commercial book trade, although monastic manuscript production continued in orders such as the Carthusians. The Charterhouse of St. Barbara in Cologne presents one example of a monastic foundation that actively engaged in manuscript production including copying, decorating, and possibly binding their books in the fifteenth century. In the middle of the fifteenth century the invention of printing by Johann Gutenberg in Mainz brought major changes to the production of books. The rapid spread of printing technology in German cities and towns did not immediately displace artisans engaged in manuscript production. Rather, a transitional period ensued when an interchange occurred between manuscript and printed books. Early printed books often relied on scribes to add rubrics in red. Illuminators painted decorative initials, borders, and sometimes miniatures into the books. Binders continued to practice their trade for both manuscript and printed volumes. By the early sixteenth century, however, the printing process perfected the techniques of reproducing decorative features and illustrations, and the production of manuscripts effectively ceased.

Marburg

With respect to both urban structure and art and architectural monuments, Marburg on the Lahn River in Hesse is one of the best-preserved medieval towns in Germany. It originated before the mid-twelfth century as a market settlement at the foot of a castle belonging to the landgraves of Thuringia. A fortress on the present hilltop site is first mentioned in 1138–1139; a reference to Marburg as a city (*civitas*) and to its citizens (*burgenses*) in a chronicle of 1222 first documents its legal status as a municipality.

Medieval Marburg reached its high point in the thirteenth and fourteenth centuries, both architecturally and politically. In 1228, Marburg became the home of the widowed landgravine St. Elisabeth of Thuringia (1207–1231, canonized 1235), whose many charitable deeds included the founding of a hospital dedicated to St. Francis of Assisi outside and to the north of the city. In 1234, patronage of the hospital as well as the parish church of Marburg was ceded to the Order of Teutonic Knights, and in 1235 the Order began construction of a new church over the grave of St. Elisabeth, along with a new hospital to the south. In 1255 Marburg was established as the seat of the Teutonic Order for the entire Bailiwick of Hesse. From the late thirteenth century on, the city gained increasing political autonomy from the Hessian landgraves; its growth in population and importance throughout the thirteenth and fourteenth centuries is reflected in the construction of a Franciscan abbey in 1234 (destroyed 1731–1732) and a Dominican one in 1291 (now the university church, *Universitätskirche*,) as well as expansions of the city wall circa 1234 and 1300. The cornerstone of the present town hall (*Rathaus*) on the market square, however, was not laid until 1512; before that, the town council met in the charnel house (*Kerner*) east of the parish church.

Marburg, castle of the Landgraves of Hessen, interior, knights' hall. Photograph: Joan A.Holladay

From the mid-thirteenth to the end of the sixteenth century, a separate Hessian line of landgraves, beginning with Heinrich I (1247–1308), grandson of St. Elisabeth, adopted Marburg as one of their primary residences, a situation that gave rise to repeated architectural additions to and elaborations of the castle. In 1526, under Landgrave Philip the Magnanimous, Hesse became Protestant, and in 1527 the Philipps-Universität was established in Marburg as the first Protestant university. In 1529 the famous *Religiongespräch* on the doctrine of the Eucharist took place among Luther, Zwingli, and other reformers in the Marburg castle.

The most notable medieval monument in Marburg is the church of St. Elisabeth (Elisabethkirche). Begun in 1235, it represents one of the first churches built in Germany in the French Gothic style. A three-aisle hall church with a triconch (three-apse) choir and a two-towered facade, it evinces architectural forms related to the church of Our Lady (Liebfrauenkirche) in Trier and the cathedral of Reims. By 1250 the triconch and the three easternmost bays of the nave were standing; the nave and west portal were completed in time for the dedication of the entire church in 1283, while construction on the two west towers continued until the mid-fourteenth century.

The Elisabethkirche was erected with its north conch over the burial site of St. Elisabeth in the former chapel of the Hospital of St. Francis. From the beginning the Elisabethkirche was intended as the church for the Marburg house of the Order of Teutonic Knights and as a pilgrimage church for visitors to the grave of St. Elisabeth; after 1298, it was also used as a necropolis for the Hessian landgraves. The present distribution of functions in the triconch choir reflects the development of this threefold purpose: the north conch accommodates the mausoleum of St. Elisabeth; the east conch the high altar dedicated to Mary, patron saint of the Teutonic Order; while the south conch houses the grave monuments of the Thuringian and Hessian landgraves from Konrad of Thuringia (d. 1240) to Wilhelm II of Hesse (d. 1509).

The Elisabethkirche also contains numerous works of sculpture, painting, and sacred art (*ars sacra*). One of the most important of these is the golden shrine of St. Elisabeth (ca. 1248), located since the late thirteenth or early fourteenth century in the sacristy on the north side of the east conch; it shows the figures of Mary, Elisabeth, Christ in Majesty, and the twelve Apostles as well as scenes from the life of St. Elisabeth. Portions of the original stained glass are preserved in the six central windows of the east conch, including a cycle of scenes from the life of St. Elisabeth and other panels dating to the first half of the thirteenth century. Other painted and sculptural decoration includes the retablo of the high altar (ca. 1290), the baldachin and tomb of the mausoleum of St. Elisabeth (ca. 1280; ca. 1350), the stone choir screen (before 1343), and the *Pietà* (ca. 1390) in the predella (lowest horizontal panel) of the *Marienaltar* (altar of Mary) in the north conch. The latter, a carved and painted wooden altarpiece, and four others like it in the Elisabethkirche date to around 1510 and are the work of Marburg sculptor Ludwig Juppe (or his workshop) and the painter Johann von der Leyten.

While the Elisabethkirche, located outside and to the north of the medieval city, was associated above all with the Order of Teutonic Knights, the parish church of St. Mary within the city walls (now the Lutheran parish church) constituted an important urban focal point and served the ecclesiastical needs of the citizenry. The choir of the present Gothic structure, which succeeded a Romanesque predecessor on the same site, was dedicated in 1297, while work on the nave continued until 1390–1395; the west tower was not built until 1447–1473. Stylistically, the choir shows similarity to the palace chapel of the castle (dedicated 1288), while the three-aisled nave continues the hall church tradition of the Elisabethkirche.

In the Middle Ages as now, the townscape of Marburg was dominated by the hilltop castle of the Thuringian and Hessian landgraves. Archaeological excavations since 1989 have uncovered the remains of a fortification on the site dating to the ninth century, with further construction in the eleventh century; in its present form, the castle complex consists of structures dating from the twelfth to the fifteenth centuries. Of particular note is the great audience hall (*Fürsten- or Rittersaal*) in the north wing of the castle, a double-aisle space articulated with a central row of four piers and massive Gothic cross vaults. Built circa 1300, it is one of the largest of its kind in Germany.

Marchfeld, Battle of (August 26, 1278)

King Otakar II of Bohemia, who had managed to accumulate a large bloc of territories in the heart of Central Europe, suffered a major reversal in 1276 when King Rudolf of Habsburg forced him to surrender Austria, Styria, Carinthia, and Carniola. Many of the Austrians, and especially the Viennese, resented their new Habsburg rule and joined in Otakar's attempt to reclaim those possessions two years later. Otakar's slow advance gave Rudolf time to gather his forces, supported by allies like Hungary and Salzburg. The two forces met on a field by the river March, near the village of Dürnkrut, north of Vienna. The Hungarian mounted archers conducted a devastating attack on Otakar's right flank, causing it to break and retreat. Otakar and his left flank charged for Rudolf himself, who was briefly unhorsed. An attack by Rudolf's reserve broke Otakar's lines, and a retreat became a rout. During the confusion personal enemies murdered Otakar.

The Battle of Marchfeld, August 26, 1278, or Dürnkrut, was one of the largest cavalry battles of the Middle Ages. It was also decisive for Central European history, since it marked the beginning of the rise of the Austrian Habsburgs, while Bohemia's influence was greatly reduced.

Maria Laach

The Benedictine abbey of Maria Laach, located on the Laacher See and subject to the archbishop of Trier, was founded in 1093 by the palatine count Heinrich and his wife, Adelheid. Maria Laach was one of the later Benedictine foundations in the Middle Rhine region and was founded to provide a necropolis for Count Heinrich and his family. Initially the abbey had associations with St. Nicholas, the patron of an earlier chapel on the site, but by the mid-twelfth century, documentation refers to the Virgin Mary as the chief patroness of the abbey.

The abbey church was built predominantly during the twelfth century and consecrated in 1156. The crypt, dating from the late eleventh century immediately following Count Heinrich's death in 1095, represents the first building phase, and the main vessel of the church was constructed subsequently between 1130 and 1156. Construction on the upper stories of the western facade and the western atrium is believed to postdate the consecration, and work on this section seems to have continued into the early thirteenth century. Maria Laach represents a late example of several features common in earlier German architecture. The plan includes both eastern and

Maria Laach, west choir with *Paradies*. Photograph: Joan A. Holladay

western apses, and there is a developed west facade with three towers, which may ultimately derive from the early medieval church at St. Riquier and certainly has parallels in the architecture of St. Michael's at Hildesheim (1001–1033). The transept also has three towers resulting in a rich and complex exterior silhouette for the church. The building interior has a two-story elevation, and the nave is divided into rectangular bays separated by half columns on piers and transverse arches above. The nave is vaulted in unribbed groin vaults. Because of the semicircular section of the vaults and the rectangular shape of the bays, there appears to be considerable stilting in the vaults. This fact and the lack of continuation between the wall membering and the vaults has led to speculation that the building was originally planned with a flat wooden roof and that the vaulting was added as part of a late twelfth-century modification of the original scheme.

Stained glass windows donated by Abbot Dietrich von Lehmen (1256–1295) remain in the eastern apse, and documents mention a rich array of original furnishings including tapestries and metalwork now lost. Maria Laach also had an active scriptorium, and a number of extant manuscripts, dating from the mid-twelfth until the early sixteenth century, may be assigned to it.

Maria Saal

The Austrian collegiate church was founded in the eighth century by the archbishop of Salzburg and developed later into a center of a regional pilgrimage; it served traditionally as the coronation church for the dukes of Carinthia, and their ceremonial stone throne, the *Herzogenstuhl*, has stood since the early Middle Ages in the valley below the church, in an area known as the Zöllfeld, from which the church took its name (*ain Zol, apud solium, in solio* [a throne, near the throne, on the throne]). In 1480 when, together with the adjoining residential buildings of the convent and the chapter the church was enclosed by fortifications, it became the largest of the fortified churches in Carinthia.

The present late Gothic church was erected in different stages: the choir and transepts were completed in 1435, and the nave followed between 1450 and 1459 under the patronage of Emperor Frederick III. Unusual for the late Gothic period in Austria, the church terminates in a two-towered facade with an extensive western gallery. To stress the legitimistic aspect of rulership, the nave's vault is decorated with a painted Tree of Jesse, dated 1490. The western crossing arch, lower than the nave, displays within an open oculus (literally, eye) a sculptural representation of the Last Judgment, recalling the emperor's judicial role.

As a reflection of the humanistic tendencies at the court of Frederick III, the church exhibits on its exterior a number of reliefs and inscriptions derived from Roman funeral monuments, mainly from Virunum, the provincial capital of Roman Noricum. These reliefs depict, among others, a pair of panthers in clear allusion to the heraldic symbols of the duchies of Carinthia and Styria, while a second relief with a traveling coach drawn by horses might have referred to the medieval system of traveling kingship (*Reisekönigtum*). Other reliefs represent a scene from the Trojan War, and the famous she-wolf with the twins Romulus and Remus, both relating clearly to the founding myth of the Roman Empire, which played an important ideological role in the self-esteem of the house of Habsburg in the late Middle Ages as its members sought to reconstruct a genealogy that reached back to ancient Rome and its emperors.

Maria Wörth

The earliest church in the area of Maria Worth was established in 894 at the highest point of a rocky peninsula on the southern shore of the Wörthersee. Bishop Waldo of Freising probably directed that the church be built to provide for parish and missionary needs in Carinthia. When the relics of Saints Primus and Felician were later brought from Rome, the church was named after them. East of the parish church stands a two-story Romanesque charnel house from about 1279. The most significant medieval art at Maria Worth is to be found just west of the parish church in a much smaller church, the Winterkirche (Winter Church) or Rosenkranzkirche (Rosary Church), where an important cycle of Romanesque frescoes (ca. 1155) were discovered in 1895. The choir of the Winterkirche holds a precious stained glass panel that depicts Mary holding the Christ child (ca. 1425).

Mariazell

The earliest mention of the area of northern Styria in which Mariazell is located dates from 1025 and refers to the region's salt and iron deposits. Duke Heinrich III von Eppenstein bequeathed the land to the Benedictine cloister of St. Lambrecht, which in turn founded a *Zelle*, or small cloister, there in 1157. Mariazell has been a popular pilgrimage goal since 1330 and is still one of the most frequently visited pilgrimage sites in Austria. In 1342, Duke Albrecht II helped secure the town economically when he gave it market privileges. Although the thirteenth-century Romanesque church was replaced by a Gothic building in the late fourteenth century, an important Romanesque wooden sculpture of a seated Virgin and Child has survived from the twelfth century. This piece, referred to as the *Gnadenbild* (Picture of Grace) in acknowledgment of its miracle-working powers, is perhaps the oldest of its kind in Austria. The portal beneath the central tower of the Gothic church, flanked by baroque towers since the seventeenth century, boasts stone reliefs commissioned by Abbot Heinrich II Moyker of St. Lambrecht (1438–1439); they depict the spiritual, historical, and political significance of the church.

The cult and celebration of Mary in medieval Germany, specifically in literary works (*Mariendichtungen*), are closely connected to the presence of the Teutonic Order (*Deutschorde*). Owing their existence to the missionary purpose of the Crusades, the Order of the Knights Hospitallers of St. John, and that of the Knight Templars that preceded the Teutonic Order, tried to respond in an organized manner to the increasing need of representing Christianity as a commanding faith.

The third expedition against the Muslim people that echoed among the many Germans living in Jerusalem led to the necessity of creating a German military organization approved by the pope to defend the ecumenical Christian values within the Germanic community. Finally, Pope Innocent III confirmed in 1215 the already existent Order of the German Knights, while during the reign of the next pontiff, Innocent IV, the Teutonic Order received the constitutional acts regarding its existence.

The Rule of the Teutonic Order dates in its ultimate form from 1244, and it was strongly based on the Cistercian movement in what concerns its military organization. During the undefined period of probation before taking the vows as a new member, the novice had to declare, "I promise and swear chastity in body and to be without greed and to be obedient to God and St. Mary" (*ich entheize und gelobe kuseheit mines libes unde ane eigenschaft ze sine unde gehorsam Gote und sente Marien*). Regardless of this requirement of the chapter, the members of the Teutonic Order became to be popularly known as Marians (*Mariani*) and Knights of Mary (*Marienritter*). However, among the many annual festivals the Order observed, four were dedicated to the Virgin. Along with the distinctive black cross worn as an emblem, the Teutonic Order could also be identified by its focused dedication to the image of Mary. Moreover, the presence of the Virgin was to take material shape through the statue placed by the eastern gate into the city of Marienburg (now in Poland).

Since the Order embodied a blend of monastic and chivalric attitude, the literature it sponsored had to pertain to the basic Christian commandments. Thus, whatever could be extracted from the Old and New Testament and then transformed for obvious educational purposes into didactic literature constituted the primordial goal of the Order. Even if the presence of Mary was not central in certain texts, as the patroness of the Order she was always a central figure in their literature.

In "Das Gedicht von Siben Ingesigeln" (Poem of the Seven Seals) by Tilo von Kulm, the Marian allegory appears in the way she is portrayed as the chosen and no less pure vessel through which God sent his Son in this world. Mary is the "golden gate" (*portas aurea*), who, as in Heinrich von Hesler's *Die Apokalypse*, conceives the immaculate Son, "thus God emerged from the depth of Mary's flesh" (*Also schiet Got uz die clien des vleisches an Marien*).

An anonymous work, *Der Sunden Widerstreit* (The Contest of the Sins), is another allegorical poem with strong didactic elements. If the Christian knights should have any doubts about the outcome of their chivalric enterprises, they ought to be dispelled at once, since the Order is under the protection of the Virgin. It is just enough for the doubtful knight to recite an Ave Maria for the demonic spirits to be defeated.

In this sense, the well-known legend "Maria und der Ritter" (Mary and the Knight) stresses the magical side of the Virgin and perpetuates the rich medieval thematic of the Miracles of Our Lady. In the legend, the knight, over-whelmed by the miracles the Virgin had performed for him, decides to exchange arms for a life dedicated to Mary, "he wanted to be a Knight of Mary, that the Queen be praised" (*Marien ritter wolde sin des si gelobet die kuningin*).

In "Die Witwe und ihr Sohn" (The Widow and her Son), the widow prays to the Virgin to free her only son from the prison where he is being kept. She has almost no hope, yet one night Mary enters the dungeon and sets the young man free. Bewildered, he returns to his mother, who, having learned of the miracle, commits herself in return to renounce the chains of motherhood that had kept her son tied to her and offers, in an act of supreme sacrifice, the son to the Absolute Mother.

Within the realm of the Eastern patristic thought, the presence of Mary can be noted in Sermon 17 (Homilia XVII) of Origen (185–254 C.E.), where we find the first mention of the Virgin's compassion for the Passion of the Son. Later, Ephraim the Syriac composed a lament of the Virgin followed, among other contributions, by the collection of six hundred sacred hymns to the Virgin entitled *Mariale*, left to us by the Greek Joseph the Hymnographer (ca. 816–886).

Known as Planctus Mariae, the liturgical tradition of depicting the deep suffering through sympathy of the Virgin for the crucified Son will continue throughout the medieval period of which the German nonliturgical aspect has been discussed earlier.

If the early patristic output has almost entirely been born within the Eastern Church, beginning with the eleventh century the center of essential Marian literature will move to the West. Anselm of Canterbury's "Dialogues of Mary" (*Dialogus Mariae*) and Bernard of Clairvaux's "Book of the Passion of Christ and the Sufferings and Tears of His Mother" (*Liber de Passione Christi et doloribus et planctibus Matris eius*) will introduce even more forcefully the theme of the Mother and Son seen as identical in their suffering. While the nature of their suffering is different (Christ transcends his human condition through universal suffering), the sorrow of his Mother renders their relationship deeply human.

Ubertino da Casale explains the profound roots of the Virgin's *compassio* (compassion) as lying in her Son's decision to grant her "the primate of compassion" *primatum compassionis*. In Ubertino's "Arbor vitae crucifixae Jesu" (Tree of Life of the Crucifixion of Jesus) one finds an unusual emotional expression of the relationship between Mother and Son that reveals the poetical values of the Marian mysticism.

As we advance beyond the twelfth century, we gradually approach the peak of the lyrical mysticism in the Marian literature, a sign of modernity at the level of the poetic expression. From now on, the poets are those responsible for this switch to a less dogmatic representation of the theme of compassion; thus, from the subject of theological discourse, it becomes an exemplary story of utmost humanity. Gradually, the Marian compassion passes from the pages of the theological disputes onto the stage of theatrical representation. The dramatic account that meets the criteria and the taste for a "popular" reception given by Jacopone da Todi—author of the burlesque *Lodi*—in his "Stabat Mater dolorosa" (The Suffering Mother Stood [next to the cross]) is far from singular in the medieval and late medieval West.

Because of the extreme dramatic tones and their accessibility to a large audience, the theme of Passion is added another climactic moment by intertwining it with Mary's compassion. Theatrical representations of the painful watch of the Virgin of her Son's agony on the Mount of Calvary abound in the West. In England, the Northern and Southern Passion, in Germany Der Frankfurter Passionsspiel, the Sacre Rappresentazioni in Italy, or the Planto o duelo que fizo la Virgen de la Pasion de su Fijo Jesu Christo in Spain are few examples among many others of the kind.

In France La Passion de jongleurs, the Passion d'Arras, in Italy the Pianto from Montecassino, the Lamentatio from the Abruzzi, or the Pianto delle Marie from the Marche are all expressions of the increasingly popular desire to associate the drama of passion (*passio*) and compassion (*compassio*) with individual human fate and make it more accessible to the popular sensibility. It was the story of Mary's compassion for her Son and the latter's humility in accepting his sacrifice that set the paradigm for a human understanding of the individual suffering.

Marner, Der (fl. ca. 1225–1250)

A Swabian didactic singer from the second quarter of the thirteenth century assumed, as was common among the didactic singers, a performer's pseudonym, the Marner (mariner, or possibly pawn, as a chess figure). His didactic program and piety seem Franciscan; at any rate, he clearly had clerical training. He is the only German singer of his age to whom both German and Latin songs are ascribed, but the authenticity of the Latin songs has been questioned. His songs, though they contain puzzling passages, lack for the most part the excessive ornateness and desire to impress with arcane knowledge we find in those of many (mostly later) didactic singers, which may be less a reflection of a less educated or a modest person and more the result of his desire to teach clear lessons. In addition to his didactic songs he created minnesongs and prayers. Most of his songs, however, preach moral behavior and, more commonly, chastise sinfulness. Marner also attacks fellow singers (and audiences with fickle tastes), and these songs have attracted the most scholarly attention. Despite his relatively open style and, possibly, modesty in choice of name, he clearly is proud of and defends his artistry and the importance of his undertaking as a poet and performer; his large corpus of songs bears witness to his fecundity. He was influential; his songs appear in considerable number in several manuscripts and inspired new songs by later singers for over a century.

Marriage and Divorce

The Early Middle High German term *ê* (modern German *Ehe*, "marriage") meant "law" and referred to the Old Testament. Only after 1000 did the term acquire other meanings, and only since the thirteenth century have those meanings included the political, social, and sexual bond between man and woman. Nevertheless, scholarship on early Germanic law identifies three forms of marriage practiced during the rise and fall of the Frankish empire (ca. 485–ca. 900): *Muntehe*, *Kebsehe*, and *Friedelehe*. Because women were thought to be unable to live independently in the world and thus to require guardianship, a marital union required the transfer of guardianship rights (Latin *mundium*, hence *Muntehe*) between a suitor and the woman's father or other male guardian. This exchange took place in two public transactions: the betrothal, in which the suitor negotiated over the gift, or dowry, he would make to the bride's family (by the twelfth century, the dowry is settled on the bride); and the wedding banquet, during which the bride's kin ceremoniously handed her over to her new husband and then led her in a procession to her new home. After the marriage was consummated, the groom gave his new wife the *Morgengabe* (morning gift), an acknowledgment of her legitimacy. Options beyond the *Muntehe* included the *Kebsehe*, in which free men could take a concubine from among their servants or slaves, and the *Friedelehe*, a relationship established on mutual agreement but that involved no exchange of guardianship rights. Historians suggest that couples favored the *Friedelehe* when a woman's different social position presented obstacles to her joining the man's family, and they debate about whether this arrangement offered women a degree of (financial) independence. These three customs were not universal throughout the empire, however, which at its height covered what is now France, Germany, and northern Italy. Indeed, rather than reflecting uniformity, the legal sources reveal the conflicts arising from practices that varied considerably among different social strata and by region. In the twelfth century, Christian theologians turned their attention to this diversity as part of their efforts after the Gregorian reforms to involve themselves in the lives of the laity. This attention produced the doctrine of *Konsensehe*, a marriage made valid only if and after both parties consent to it. Hoping this requirement would combat both marriages by abduction and those made purely for political purposes, the church rejected *Friedelehe* and *Kebsehe* as forms of concubinage, brought the *Muntehe* ceremony to the steps of the church, and made marriage into a Christian sacrament. In defining this new sacrament, theologians debated the relative importance of consent versus sexual consummation. While biblical authorities like Paul claimed that the marriage union both protected individuals from carnal sin and mirrored the mystery of God's union with humanity, twelfth-century scholars cited Mary and Joseph's chaste marriage as a model, concluding that consent was the defining essence. With the rise of mendicant piety among men and women in the thirteenth century, this doctrine engendered alternative forms of spiritual marriage: husbands and wives living together in chastity, and women religious becoming the brides of Christ. Avowing not only the exclusivity of the marriage bond, but also its longevity, the church sought also to discourage polygamy, multiple marriages, and divorce. However, while divorce was forbidden, a marriage could be declared invalid in cases of incest, if one person were already married, if either partner had not consented, if the marriage remained unconsummated because of impotence, or if a Christian had married a Jew or heathen (Jewish marriage laws also forbade such intermarriages). In cases of adultery or other scurrilous crimes, partners could request separations, though men were more successful in such cases than women. Generally, canon law prohibited remarriage as long as the former spouse lived. Given high death rates, however, multiple marriages, especially among the nobility, were common. In the world of literature, an ideal marriage involved not only consent but also love, particularly in Hartmann von Aue's *Iwein* and *Erec*, and in Wolfram von Eschenbach's *Parzival*. In Gottfried's *Tristan*, however, the deep love felt by Tristan and Isolde occurs outside the arranged and very political marriage between Isolde and King Mark. Marriages "arranged" through deception lead to massive death and ruin in the *Nibelungenlied*. Divorce or separation is less common in Middle High German literature, although one thinks of Gahmuret, in *Parzival*, who leaves his first wife, the exotic Belecâne, because she is a heathen.

A scholastic philosopher and theologian, Marsilius made an important contribution to the development of late medieval logic and philosophy of nature and advocated the use of logicosemantic techniques in philosophy and theology.

Marsilius was born around 1340, in Nijmegen and died on August 20, 1396 in Heidelberg. He began his career as master of arts at the University of Paris in 1362, where he was also rector in 1367 and 1371 and student of theology from 1366 onward. He turned away from Paris because of the schism in 1378. From 1386 onward, he was master at the University of Heidelberg, which he helped to found. In Heidelberg he was rector no fewer than nine times, from 1386 to 1392 and in 1396. In 1395 or 1396 he concluded his study of theology and so became the first theologian to obtain a doctorate in Heidelberg.

His works include treatises on logic, commentaries on Aristotle, and a voluminous *Sentences* commentary. His writings on logic in particular had great influence. They were part of the syllabus of many late medieval universities, such as Prague, Heidelberg, Vienna, Erfurt, and Basle. According to Marsilius, there exists no universality outside the human mind. Universal concepts such as "man" or "animal" are formed by human thinking. The object of scientific knowledge is the proposition and the thing signified by the terms of the proposition. Science in all its different branches deals not so much with reality itself as with one's speech and thought about reality. Largely because of these convictions, Marsilius has been characterized as a nominalist (*nominalista*) and a terminist (*terminista*) since the early fifteenth century.

Märtyrerbuch

The *Märtyrerbuch*, or *Buch der Märtyrer* (Book of Martyrs), is a rhymed German legendary comprising 28,450 verses. Commissioned by a duchess, *Gräfin von Rosenberg*, and written by an anonymous poet and cleric, it celebrates in 103 legends, following the church calendar from January to December 31 (St. Sylvester, whence the German term for New Year's Eve, *Sylvester*), the feast days of Mary, of the cross, and of the saints, varying between 36 verses and 902 (*Katharina*).

The text is extant in twenty manuscripts as collections, single legends, and fragments, to which a Göttingen fragment of *Katharina* was recently added. The oldest manuscript (in Eisenstadt), possibly the original, was written in the East Franconian dialect circa 1275–1285. The poet did not yet know the Latin collection *Legenda aurea* or the German *Passional*. The two Latin collections used as sources for the *Märtyrerbuch* were the *Kurzlegendar* (an abbreviated anthology) and a collection known as the Great Austrian legendary (*Magnum Legendarium Austriacum*). Both Latin texts were derived from the *Windberg Legendar* (Windberg Legendary, ca. 1200), all three located in or near Regensburg.

The surviving *Märtyrerbuch* manuscripts suggest three levels of production: first, complete copies of the original in Swabian, Alemannic, and Bavarian dialects; second, manuscripts with contamination of the *Passional*, which reached even the East Middle German and Bohemian areas as well as Austria and Tyrol; third, single legends and later, altered copies of older collections.

Sixty-four of the legends became a source for the *South German Heiligenleben* in prose (Saints' Lives, 1385–1400). But the *Margareten-Marter* (ca. 1300) was influenced by the *Märtyrerbuch*, as well as the *Katharinen-Marter* (ca. 1300), the *Katharinenspiel* (1350–1370), two legends of *Katharina* in Donaueschingen, and also the *Heiligenleben* of Hermann von Fritzar (1343–1349).

Martyrology

Commonly used within monasteries, the lists of saints—including confessors and virgins as well as martyrs—were arranged by calendar order on the dates of their commemorations. The basis of the medieval tradition was the so-called Jerome's List of Martyrs (Martyrologium Hieronymianum).

Accepted in the Middle Ages as an authentic work of St. Jerome, this text dates from the mid-fifth century. It includes saints from much of the Roman world, but its entries normally consist only of the names of saints and the places of their death or burial. From the Carolingian period onward, "historical" or narrative martyrologies, which include capsule accounts of the saints' lives or passions, became the most common form of the genre. The earliest known historical martyrology was the work of the English historian Bede (d. ca. 735), which probably came to the Continent with the Anglo-Saxon missionaries to Germany. Ninth-century reform legislation that required the reading of a martyrology in the daily monastic chapter contributed to a surge of composition in the Frankish kingdom.

In western Francia, a series of authors established an influential martyrological tradition. An anonymous writer in Lyon added to Bede's martyrology, nearly doubling its length, and Florus of Lyon (d. ca. 860) similarly expanded the work of his anonymous predecessor. Then Ado of Vienne revised and greatly augmented Florus's text. Finally, in the third quarter of the ninth century, Usuard of Saint-Germain-des-Prés drew upon both Florus and Ado, often reducing their lengthy commemorations, to produce a martyrology that became the standard text of the High Middle Ages.

In the East Frankish region Hrabanus Maurus compiled an independent expansion of Bede's work, Wandalbert of Prüm composed a poetic martyrology based on Florus, and Woffhard of Herrieden borrowed heavily from Ado's martyrology. Usuard employed Wandalbert as one of his sources, but otherwise the eastern compositions had little influence in the west. Western works did become popular in Germany, however. In the tenth and eleventh centuries, a number of authors—including Notker the Stammerer, Hermann the Lame, and the so-called Pseudo-Bede of Cologne—produced compilations that combined materials from Ado and Hrabanus. During the High Middle Ages, Usuard's martyrology gradually supplanted most other texts in Germany as well as elsewhere, and Herman Greven's fifteenth-century compendium was a much expanded version of that work.

Beginning with the Cistercians in the twelfth century, religious orders adopted official martyrologies along with other liturgical books. German examples of such texts include those used by the congregations of Bursfeld (Benedictine) and Windesheim (Augustinian). The German region also produced a number of vernacular martyrologies, all of them anonymous. Most of these are essentially translations of Usuard, but some, such as the *Jenaer Martyrologium* (in Jena), represent more complex compilations.

Throughout most of the Middle Ages, German martyrologies remained less influential than those of the French cultural region, and Usuard's work formed the basis of the modern Roman Martyrology. However, the sixteenth-century authors of that compilation accepted the "Pseudo-Bede of Cologne" as an authentic Bede text, assuring medieval German influence on the cult of saints in modern Catholicism.

Matfridings

One of the powerful comital (ducal) families that arose in the Carolingian period has been identified as the Matfridings, because of the prominence of the name Matfrid over several generations. The first documented ancestor is Count Matfrid of Orléans, who from the beginning of Louis the Pious's reign was one of the most influential counselors for over a decade. In February 828 he and Count Hugo of Tours (who was married to Matfrid's sister Ava) were deprived of their fiefs and offices at an imperial assembly at Aachen, because both the previous year as leaders of an army called out against the Saracens had not met an attack by them in the Spanish March soon enough. Both counts were from that time onward bitter enemies of Louis the Pious, and in the rebellions of his sons in 830, 832, and 833, they stood on the side of the rebels. In each instance they were forgiven and restored to their lands, titles, and offices. Matfrid and Hugo were among those who followed Lothar I to Italy shortly thereafter, where they received grants of new lands. Most of them, including Matfrid, died in Italy in 836–837 from a contagious disease, however.

The Lotharingian Count Matfrid who flourished 843–860 in the Bietgau (or Biet District), and 844–855 in the Eifelgau just to the north, and in the Verduner Gau, was the son of the previous Count Matfrid I. Matfrid II appears often in the charters of Lothar I and of Lothar II, and he was probably among the magnates who gathered June 5, 860, at Coblenz to give counsel to the agreement among Louis the German, Charles the Bald, and Lothar II on June 7. He was also the lay abbot of St.-Vaast.

Matfrid III, the son of Matfrid II, flourished 867–878 as a count in Lotharingia and also in the Eifelgau. He appears to have property in that part of Lothar II's realm that went to Charles the Bald in 870, probably in the Wabergau and in the Verduner Gau. In 877, with other magnates he was appointed at Quierzy as counselor to Charles's son, as often as he should be in the Meuse region. Matfrid III followed his father as lay abbot of St.Vaast, and died about 883. Members of the Matfriding kinship grouping occupied the episcopal chair at Verdun 870–920/933, while the Matfriding Richard was abbot of Prüm in 897 and bishop of Liège 920–945 as well.

At the end of the ninth century, the Matfridings were rivals for power in Lotharingia with Zwentibold, the illegitimate son of King Arnulf. In 939 the Matfridings acquired the lands of another Lotharingian count, Reginar III, who was sent into exile. Although female members of the family married into the prominent dynasties of Lorraine, and as such became the ancestresses of King Henry III (1024–1039) and Pope Leo IX (1049–1054), it was the male line of the *pfalzgrave* (duke) Gottfrid (fl. before 950) from which the later dukes of Upper Lorraine descended. The name Gerhard, which appears with the Matfriding count of Metz (fl. 1021), became a dominant appellation for the Lotharingian dukes of the eleventh century, and the preference given the name by the later counts of Jülich and Hochstaden suggests some direct or agnate relationship. The name Matfrid, on the other hand, gradually disappears among the known descendants of Matfrid III, but its preferment by the eleventh-century counts in the Engersgau and their direct descendants, the counts of Wied, suggests a tie along some female line as well.

Matilda, Empress (1102–1167)

The daughter of King Henry I of England and his wife, Matilda of Scotland, Matilda became the empress by virtue of her marriage to the Salian emperor, Henry V. Her father accepted the marriage proposal during Whitsuntide of 1109, at which time she was only eight years old. In the spring of 1110 she was sent to Germany under the care of Bishop Burchard of Cambrai, betrothed to Henry V at Utrecht, and crowned at Mainz by Archbishop Frederick of Cologne. Henry V then dismissed all her English attendants, and the child was taken under the guardianship of Archbishop Bruno of Trier to learn the German language and customs. The marriage finally took place in January 1114 at Worms, the new consort now being twelve years old and her husband some thirty years her elder. Henry V had used the years between the betrothal and marriage to spend Matilda's enormous dowry of ten thousand silver marks on a major Roman expedition, during which he extracted the short-lived treaty of Ponte Mammolo from Pope Paschal II in hopes of decisively ending the Investiture Conflict.

Matilda soon played the crucial roles of patron and intercessor at court; she appeared on charters in subsequent years as the sponsor of many royal grants, and acted as petitioner several times on behalf of nobles or prelates who sought reconciliation with the emperor. Her imperial role expanded when she joined her husband on a military campaign in Rome in 1117. The imperial army occupied the city, and Matilda was crowned with her husband on Pentecost in St. Peter's Basilica by the archbishop of Braga. Matilda would choose to retain the imperial dignity even after leaving Germany, at least as a courtesy title. When her husband's presence was required north of the Alps after the coronation, Matilda remained in Italy as imperial regent. She assisted in the administration of imperial territories and presided over courts such as the session at Rocca Capineta near Reggio. She appears to have continued in this capacity during the year 1118, and then rejoined the emperor in Lotharingia in 1119. This royal apprenticeship at such a tender age prepared her well for the tumultuous years ahead. She was with Henry V in Utrecht at his untimely death in 1125, which left her a childless widow in possession of the imperial insignia at the age of twenty-three.

Her husband's hopes that she would produce an heir for the Salian line were quickly replaced by her father's need for an heir to the Norman dynasty, since Henry I's only son died in 1120. He therefore recalled her to England, and Matilda handed over the imperial insignia to Archbishop Adalbert of Mainz before returning to her Anglo-Norman homeland in 1125. After a sixteen-year absence she began yet another new life, with the only tokens of her imperial childhood in Germany being a treasure of jewels and personal regalia (most of which she would give to religious houses) and the precious relic of the hand of St. James (which she gave to the family abbey at Reading). She was recognized as the legitimate heir of Henry I in England and Normandy, and in 1128 Henry I married her to the unpopular Angevin suitor, Geoffrey Plantagenet. Matilda was the child in her first marriage, but in this second union Geoffrey was the child, being ten years her junior and only fifteen years old. Her second marriage of political expediency was a rocky one, but it did produce the needed heir in 1133 (Henry II Plantagenet). After her father's death in 1135 Matilda spent some twenty years asserting her son's claim to the Anglo-Norman throne against her cousin, Stephen of Blois.

Once Henry II succeeded Stephen in 1154, Matilda lived the remainder of her life in Normandy, and was buried at the abbey of Bec upon her death in 1167. She proved to be a valuable and trusted adviser to her royal son. Although she recommended against the appointment of Thomas a Becket as the archbishop of Canterbury, Matilda was turned to repeatedly by all sides as a mediator (*mediatrix*) in the subsequent dispute between the king and cleric. This remarkable woman's Anglo-Norman-German life was summed up in the epitaph on her tomb: "Great by birth, greater by marriage, greatest by offspring. Here lies the daughter, wife, and mother of Henry." Yet surely the legacy of this indomitable woman reaches beyond the men whose political needs set the boundaries of her life.

Maulbronn

The Cistercian monastery of Maulbronn (Baden-Württemberg), founded in 1147, remains almost unchanged since the Middle Ages. Legend reports that a group of traveling monks stopped to water their horses at this site and stayed, establishing their own religious house. A fresco in the vault of the monastery's fourteenth-century Fountain Chapel depicts this story.

At the heart of the walled complex is the monastery church, consecrated in 1178. The three-aisle Romanesque pillar basilica received Gothic net vaulting in the fifteenth century. Its richness and painted details contradict the strict Cistercian ban on church ornament. Among the most notable works at Maulbronn is a relief group created in the Parler workshop circa 1370; it depicts the Raising of the Cross, the Crucifixion, and the Entombment. Further interior ornaments and furnishings, such as the finely carved oak choir stalls (1470) and a monumental stone Crucifix over the lay altar (1473), date primarily to the fifteenth century.

The early Gothic narthex (entrance hall) of the church, known as the *Paradies*, is among the earliest interpretations of the Gothic style east of the Rhine. The unknown Master of the Maulbronn *Paradies* is believed to have been trained in northern France, probably at Laon in Picardy.

Both monks and lay brothers lived within the monastery walls, although somewhat separated. Ordained priests, many of noble birth, ate in the Lord's Refectory, while lay brothers had their own lay refectory and dormitory. In addition to these buildings, the nearly self-sufficient community contained a mill, bakery, barns, forge, fishpond, vineyards, and gardens. The monastic ideal of *ora et labora* (prayer and work), stated in the Rule

Maulbronn, west façade with *Paradies*. Photograph: Joan A.Holladay

of St. Benedict, was adhered to in the involvement of monks in the monastery's farming efforts. Despite the Cistercian rule's forbidding heated rooms, there is a calefactorium at Maulbronn. This room was heated from a lower level, with holes in the floor providing warm air.

Additional monastery structures include the abbot's house, a chapter house, cloister, oratorium (prayer room), and the parlatorium where monks would break the rule of silence. It is from the Gothic cloister that one approaches the fourteenth-century Fountain Chapel (Brunnenkapelle). At the center of the small room is a tiered fountain, at which the monks would have participated in ceremonial washings before meals.

Few changes were made to Maulbronn's Romanesque and Gothic monuments during the Protestant Reformation, largely owing to the dukes of Württemberg, who took over the complex in 1504. Secularized in 1530, a ducal residence was added in 1588. The monastery survived into the twentieth century as a school. Maulbronn serves today as a mirror of medieval monastic life and practice.

Maximilian (1459–1519)

Emperor, patron of the arts, "the last knight," Maximilian I Habsburg enjoys a popular modern reputation. As the son of Emperor Frederick III, Maximilian experienced a youth tarnished by the wars and defeats his father suffered. His first important step into politics came in 1473, when his father negotiated with Duke Charles the Rash of Burgundy for the hand of his daughter, Mary. Although Charles's original demand of a royal crown was too high, the negotiations continued over the next few years. Then when Charles died unexpectedly at the Battle of Nancy in 1477, the king of France moved to seize Mary, who was holding out in Ghent. Maximilian sealed their marriage first through procurators in April, and finally concluded it in person when he arrived at the head of a rescuing army in August. Their marriage became a true love match. The emperor enfeoffed his son with the lands of the late duke of Burgundy. Yet Maximilian only truly secured most of the lands in a series of wars with France. His victory at the battle of Guinegate in 1479 guaranteed his possession of the Lowlands and most of Burgundy, some of the richest lands in Europe.

These new lands were not so easy to hold onto, however, since the citizens of the prosperous towns disputed the power of the new dynasty. After Mary died from a riding accident in 1482, many in the Lowlands openly rebelled against Maximilian's authority. Allied with France, town forces managed to wring from Maximilian the supervision of his children, Philip and Margaret. Even worse, the city of Bruges took him prisoner for fourteen weeks in 1488. His father, in a rare but certainly necessary act of support, actually gathered an army that marched on the city, frightening the town into freeing Maximilian. Returning at the head of his own army, Maximilian conquered Bruges and many other towns, completing their defeat by 1493 in the Treaty of Senlis.

In the midst of these conflicts Frederick had managed to get Maximilian elected king of the Romans in Frankfurt on February 16, 1486, and crowned in Aachen on April 9. For the first time in a century a son had followed as king an imperial father during the father's lifetime. In 1490 Maximilian replaced his incompetent cousin, Sigismund "the Rich in Coins," as duke of Tyrol. He made that province, located between Burgundy and Austria on the way to Italy, and its capital, Innsbruck, the center of his imperial organization. From there to Mecheln in the Netherlands he established the first regular postal route in Europe. The silver of Tyrol helped to finance the reconquest of Austria from Matthias Corvinus, while the growing business with the Fugger banking family helped to underwrite many more imperial schemes. But with interest rates of over 35 percent on loans, Maximilian rarely had enough cash to fund all his plans.

After Mary's death, Maximilian fathered several illegitimate children, but he knew the importance of political marriages. To gain both cash and leverage against France, in 1490 Maximilian arranged his marriage by proxy with the twelve-year-old Anne of Brittany, who had just inherited that important province on her father's death. The next year Charles VIII invaded Brittany, dissolved his (unconsummated) marriage to Maximilian's daughter Margaret, and, without returning Margaret or her dowry of Burgundy, married Anne. Maximilian tried to gather an army to oppose these actions but was hopelessly out-numbered by French forces and hampered by his daughter's hostage status. The Brittany affair gained France a strategic province, earned Maximilian frustration and humiliation, and helped engender a centuries-long rivalry between the Habsburg and Valois dynasties. In 1497 Maximilian found another marriage partner in Bianca Maria Sforza, sister of Ludovico il Moro Sforza, who had usurped control of Milan. She brought a dowry of four hundred thousand gulden (guilders), or about three times what Maximilian could draw annually from the Habsburg Austrian lands. That money quickly disappeared also.

Soon after his father's death in 1493, Maximilian responded to a call for an imperial reform proposed for the Reichstag (imperial council) of Worms in 1495. There the archbishop of Mainz, Berthold von Henneberg, tried to gain a reform suitable to the princes. At the Reichstag, Maximilian agreed to the "eternal territorial peace" (*Ewige Landfriede*), once and for all, legally forbidding the many private wars and feuds among nobles that had disturbed the empire. To keep the peace, the Reichstag also created the Imperial Chamber Court (Reichskammergericht) and established a general tax, the "common penny" (*gemeine Pfennig*). Afterward many princes wanted further reform and withheld the general tax to put pressure on Maximilian. After his defeat in a brief war against the Swiss, the princes temporarily were able to further restrict Maximilian's authority, imposing an imperial regime (*Reichsregiment*) at Augsburg in 1500. By 1504, however, he had largely defeated the fractious princes. The possibility of a unified, effective imperial government vanished in these quarrels.

Maximilian's involvement in wars on the empire's fringes brought mixed results. He encouraged new developments in military tactics, like cannon. Or he increasingly abandoned the cavalry charge of armored knights in favor of infantry on foot with sword and pike, his *Landsknechte*. Maximilian regularly participated in the shifting diplomatic alliances, and he managed to maintain a reputation as an able commander. But he lost many wars, often through lack of funds. He fought frequently in Italy, which had become an open battleground since the invasion in 1494 by Charles VII of France. In 1508 Pope Julius II, needing Maximilian's military support in the League of Cambrai against Venice, offered to crown him emperor. Yet Maximilian was unable to fight his way to Rome. So he proclaimed himself "elected emperor of the Romans" on February 4, 1508, in Trient. Thus, with Julius's belated acceptance, he became emperor without a papal coronation.

Maximilian gained lasting importance for both his dynasty and European history because of two important double marriages he arranged. First in 1496 he married his son Philip "the Handsome," and daughter Margaret from his marriage with Mary, to the heirs of Spain, Juana "the Mad" and Juan, the children of Ferdinand of Aragon and Isabella of Castille. Philip and Juana had several children. The elder son, Charles V, eventually inherited both the Spanish and Austrian possessions and had an empire "on which the sun never set." The second double marriage was arranged in 1515, when Maximilian married his grandson Ferdinand and granddaughter Mary to the children of King Ladislaus of Bohemia and Hungary. This arrangement provided the legal claims to reunite Hungary and Bohemia with the Habsburg lands in 1526.

But Maximilian's attempts at building stronger institutions of rule in his own inherited lands led to increasing opposition, including open rebellion in some territories. Even the citizens of Innsbruck resented the burden of debts run up by the often cash-poor Maximilian. At the beginning of 1519 they finally refused to accept his credit, or to find stalls for his horses. In disdain he left the city for Vienna but sickened along the way and died on January 12. As a result, his magnificent tomb in Innsbruck lies empty; his body is buried in Wiener Neustadt, while his heart lies in Bruges, next to the body of his first wife, Mary.

Maximilian enjoys lasting fame as a well-rounded Renaissance prince. He was a patron of the arts and new sciences at the summit of the German Renaissance. His portrait by Albrecht Dürer is the most famous image of the monarch. Skilled and literate in several languages, he himself helped to produce two autobiographical epic poems (*Theuerdank* and *Weisskunig*), a hunting manual, and other works, including the *Ambraser Heldenbuch* (*Ambray Book of Heroes*, a compilation manuscript of courtly literature named after Castle Ambras). Sometimes called "the last knight," he was a great promoter of tournaments, drawing on the chivalric traditions of the court of Burgundy and continuing the Order of the Golden Fleece. Maximilian's idea of the Holy Roman Empire of the German nation ended the Middle Ages and looked forward to the attempt at universal empire by his successor, his grandson Charles V.

Mechthild von Hackeborn (1241–1298/1299)

A Cistercian sister of the Helfta community, Mechthild von Hackeborn's mystical visions were recorded in the *Liber specialis gratiae* (*Book of Special Grace*). At age seven, Mechthild entered the Rodersdorf cloister, where her sister Gertrud already resided. After the community had relocated to Helfta, Mechthild served in the capacities of magistra and cantrix. In 1261 the five-year-old Gertrud von Helfta (*die Große*) was given into her charge. Bedridden the last eight years of her life, Mechthild revealed her visions at this time to Gertrud and at least one other sister at Helfta, who recorded them without her knowledge; however, Mechthild did approve portions of the account before her death.

The original German version of Mechthild's visions has not survived. There are more than 250 contemporaneous and subsequent Latin and vernacular manuscript versions of the *Liber specialis gratiae*, but only one manuscript contains all seven books. Rich in allegory, the seven parts chronicle Mechthild's life and death, her visions, the special graces she experienced, her teachings concerning the true devotion to God and the virtuous life, and fragments of a correspondence with a female friend. In contrast to the *Fließendes Licht der Gottheit* (*Flowing Light of the Godhead*) of Mechthild's somewhat older namesake at Helfta, Mechthild von Magdeburg, the descriptions and observations found in the *Liber specialis gratiae* are based on liturgy, scripture, and the writings of the church fathers; however, like the *Fließendes Licht*, the *Liber* exhibits originality in imagery, language, and style. Of special note is Mechthild's description of the devotion to the Sacred Heart of Christ (*Herz-Jesu-Verehrung*), which she and Gertrud die Große promoted at Helfta.

Beguine, visionary, and mystic, known to us through her sole book, *Das fließende Licht der Gottheit* (*The Flowing Light of the Godhead*). Biographical information gleaned or inferred from her book and its introductory material written in Latin by others indicates that she was born to a family of lower nobility near Magdeburg. She experienced her first vision at age twelve and left home about 1230 to take up the life of a Beguine in Magdeburg, returning home occasionally perhaps because of sickness or troubles caused by her book. Just as she criticized the deportment of some Beguines, male and female religious, clergy, the pope, and others, she, too, was subjected to criticism and even threats. Equally evident, however, is the support she received, especially from the Dominicans, whose order she praised. Baldwin, her brother, was received into this order, became subprior of the Dominican house in Halle, and was esteemed for virtue and learning. Another Dominican, Heinrich von Halle, was her spiritual adviser for many years and helped her edit (and, no doubt, circulate) incomplete versions of her book. About 1270 she entered the Cistercian convent at Helfta, renowned, under the leadership of Gertrud von Hackeborn, for its thriving spiritual life and devotion to learning, as witnessed by the writings of Mechthild von Hackeborn and Gertrud (the Great) von Helfta. Here Mechthild was sheltered from the trials of the unprotected life of a Beguine but, if we can believe her, was more revered from a distance than accepted into the community. With her health weakening and her sight failing, she completed the seventh and final section of her book. Her death is described in Gertrud of Helfta's *Legatus divinae pietatis*.

The original text of her book, written in Middle Low German with some Middle German characteristics, has been lost. A Middle High German version of the complete work translated about 1345 under the direction of Heinrich von Nördlingen in Basel survives in a manuscript at Einsiedeln ("E") and provides the principal textual basis for the study of Mechthild. Parts and short fragments have been discovered in other manuscripts. A Latin translation of the first six books of the Middle Low German original, probably the work of Dominicans in Halle, has come down to us preceded by a lengthy prologue justifying the book and its author.

Das fließende Licht can be described as confessional, visionary-revelatory, mystical, poetic, and devotional. It was written, we are told, by divine command to bear witness to the unusual divine favors bestowed on its author. Mechthild describes her visions, some global and some personal in scope, as well as her ecstatic mystical experiences of union. She prophesies, exhorts, criticizes, and teaches, using a rich variety of literary and nonliterary forms of expression, from highly lyrical courtly modes with their concomitant conventions to didactic expositions of moral and ascetical truths. She avails herself of prose, verse, and, most distinctively, colon rhyme—a short, verselike unit ending in rhyme or, more frequently, assonance. Much of this colon rhyme has been lost in the Middle High German version.

Because she knew little or no Latin, Mechthild acquired her knowledge of theology and spiritual traditions secondhand through instruction and the liturgy. The theological content of her book gives striking evidence of the care given religious education by her spiritual teachers and advisers, but more especially to Mechthild's own intellectual gifts and intuitive spiritual receptivity. Among the influences perceptible in her book are the Song of Songs, Augustine, Bernard of Clairvaux, Hugh and Richard of St. Victor, and Joachim of Fiore. More important, however, Mechthild's book must be seen as unique in its conception, without discernible predecessors or successors.

Medicine

To the extent that Western European medicine drew on ancient Greek and Islamic medical ideas, medical literature was oriented toward the preservation, organization, and transmission of authoritative texts.

Early medieval medicine has been characterized as monastic medicine, because, beginning around 800, monasteries became centers for copying texts and for their practical application. The earliest medical texts written in German arose in this context. Apart from individual recipes in Latin recipe collections and vernacular glosses on Latin texts, the second half of the twelfth century marks the beginning of German vernacular medical literature with two pharmacological texts, the *Prüller Steinbuch* (Prüll Stone Book) and *Prüller Kräuterbuch* (Prüll Herb Book), the *Arzenibuch Ippocratis* (Hippocratic Healing Book), a prognostic text known as the Pseudo-Hippocratic *Capsula eburnea* (The Little Ivory Chest), the *Innsbrucker Arzneibuch* (a recipe collection), and a gynecological fragment in the same manuscript.

Major German medical works are the Thuringian *Bartholomäus* and an herbal known as *Macer* (both ca. 1200), as well as the *Arzneibuch* (handbook of general medicine) of Ortolf of Baierland (ca. 1300). As early as the mid-tenth century a center for medical learning and practice arose in Salerno in southern Italy. Increasingly in the twelfth century, the locus of learned medicine shifted away from the monastery to the university and court. By around 1300 Montpellier, Paris, Bologna, and Padua had medical faculties with set curricula that attracted students from all Europe. Also in the course of the twelfth and thirteenth centuries translations were made, particularly in southern Italy and Spain of medical works (those of Hippocrates and Galen and their Arabic followers) from Arabic and Greek into Latin. In addition, the reception of Aristotelian natural philosophy and logic as well as Arabic astrology transformed the study of medicine.

Throughout the Middle Ages the variety of medical practitioners described a spectrum with considerable overlap between the learned and popular (or practical) traditions. Ranging from lay healers and family members to university-trained physicians, it included men and women, Christians and Jews, herbalists or apothecaries, surgeons, barber-surgeons, empirics, and midwives. Many of these groups came to be regulated either by professional licensing or by guilds.

Gradually, in the fourteenth and fifteenth centuries, academic medicine began to reach other groups through translations into the vernacular and printing. The year 1348 saw the establishment by Emperor Charles IV of the University of Prague and thereafter of universities with medical faculties in German-speaking lands. Yet the majority of German medical students took their degrees at northern Italian universities. The arrival of plague in 1348 and its recurrences in subsequent centuries focused attention on public health and public health institutions.

By and large, during the Middle Ages, diseases were classified according to humoral theory, diagnosed through uroscopy, and treated with diet, medication, or surgery (including cautery and phlebotomy), although magic, astrology, and religious healing also played a role.

Meißen

Located twenty-five kilometers northwest of Dresden at the confluence of the Triebisch and Elbe Rivers, Meißen (Saxony) is dominated by the Burgberg, a strategically located cliff plateau on which Henry I, duke of Saxony, founded the Castle Misni in 928, as part of his eastward expansion into Slavic territory. The development of Meißen reflects both religious and secular powers: Emperor Otto I established the bishopric of Meißen in 968, the same year the first margrave of Meißen is mentioned. The cathedral of Meißen, which sits atop the Burgberg, is dedicated to Saints John the Baptist and Donatus and replaces a tenth-century chapel and an Ottonian basilica built between 1006 and 1073. Construction of the Gothic cathedral began in 1260 under Bishop Albert II (1259–1266) and continued by Bishop Withego I (1266–1293); its High Gothic polygonal choir was consecrated in 1268. The first phase of construction continued with interruptions until 1410. The *Fürstenkapelle*, the margraves' burial chapel, built after 1423, forms the west choir. Within the cathedral are seven standing figures from about 1255–1270 attributed to the Naumburg Master. The figures, among the best examples of thirteenth-century German sculpture, include representations of Emperor Otto I and Empress Adelheid. The original position of the figures is still debated; ranging in size from 185 to 211 centimeters, excluding bases, they may have been carved originally for a portal of the Virgin on the west facade, although current theories suggest that the figures were created before the completion of the choir and were consequently placed on the walls of the choir and the chapel of Mary Magdalene, located directly behind the choir. The second main part of the city, Agraberg, a tax-free settlement, developed in the tenth century to protect the Misni castle. After first settling here in 1064, the August

Meissen cathedral, interior, view to east. Photograph: Joan A. Holladay

tinians dedicated their monastery of St. Afra in 1205, the oldest preserved structure of the area. An annual market was established at the foot of the Burgberg in the tenth century and first documented in 1002. In 1205 Margrave Dietrich began the systematic planning of the city, which was first documented in 1295, between the Burgberg and the St. Afra settlement. The fires of 1447 and 1455 destroyed the Church of Our Lady (Frauenkirche), first mentioned in 1205, and rebuilt as a Late Gothic hall church in 1457, and the Franciscan church, which was part of the monastery founded in 1258. The margraves retained possession of Meißen until 1423, when it became a free city after Frederick I, the Elector of Saxony, received the Duchy of Saxony-Wittenberg.

The city was not destroyed during World War II, and its medieval character is evident in its architectural harmony.

Dominican theologian, preacher, administrator, and mystic. The title *meister*, a corruption of the Latin *magister* (teacher) refers both to his having received the highest academic degree then attainable and to his professional duties at the University of Paris. He was born in Thuringia, possibly in a village called Hochheim, of which there are two, one near Erfurt and one near Gotha. One document refers to him as *de* (from, of) Hochheim, but some scholars consider this a familial rather than a geographical designation and use it to bolster the claim that Eckhart was of noble origin. He most likely entered the Order of Preachers (Dominicans) at the priory in Erfurt at about the age of fifteen. Possibly he received his early training in the arts at Paris and was witness to Bishop Stephen Tempier's condemnation of 219 articles of theology including several taught by Thomas Aquinas (d. 1274), the Dominican order's most distinguished theologian. At any rate, Eckhart is documented in Paris lecturing on Peter Lombard's *Sentences* in 1293–1294. Prior to this he had absolved the various stages of Dominican formation: one year novitiate, two years studying the order's constitutions and the divine office, about five years studying philosophy, with three additional years devoted to theology. Eckhart was no doubt also among those chosen for further study, very likely at the order's *studium generale* (early form of university) in Cologne, where he might have had direct contact with Albert the Great. After lecturing in Paris Eckhart advances rapidly within the order. He is prior in Erfurt 1294–1298, professor in Paris 1302–1303, provincial of the newly formed German Dominican province of Saxony 1303–1311, and again professor in Paris 1312–1313. There followed several years of preaching in the vernacular, to Beguines and nuns among others, in Strasbourg and then later in Cologne, where he might also have had professorial duties at the *studium generale*.

In 1325 the first clouds appear when some of Eckhart's teachings are investigated as to their orthodoxy. Eckhart is cleared, but the following year Henry of Virneburg, archbishop of Cologne, begins inquisitorial proceedings against him. Eckhart responds to lists of suspect theses taken from a broad selection of his Latin and German works and, on January 24, 1327, citing delays and the public scandal the proceedings are causing, appeals to the pope. On February 13 he protests his innocence from the pulpit of the Dominican church in Cologne and soon thereafter travels to Avignon, where a papal commission begins an investigation. On March 27, 1329, some time after Eckhart's death, a papal bull, *In agro dominico*, definitively ends the investigation. In it seventeen articles are condemned as heretical, two of which Eckhart claimed never to have taught. Eleven others are judged to be evil sounding but capable of an orthodox interpretation. The bull states that Eckhart, before his death, recanted the articles and anything else that might have caused error in the minds of his audience *quoad illum sensum*. In other words, he recanted a heretical interpretation of his words, not the words themselves.

Eckhart's writings can be divided into Latin works (professional theological treatises, learned commentaries on scripture, and some sermons or sermon outlines) and German works (spiritual tracts and, especially, sermons). Because of Eckhart's sad fate, his Latin works were generally forgotten and only rediscovered in the late nineteenth century. His German works became mixed with those of other spiritual authors or were often passed on with false or no attribution. As a result, the task of creating a reliable critical edition of the German works begun by Josef Quint in 1936 is just now nearing completion. Disagreement still remains concerning the authenticity of many German sermons not yet included in the critical edition, and discussion of their chronology has just begun. Eckhart is admired both for the brilliance of his mystical thought and for his virtuosity in expressing it. The first admirers of Eckhart after his rediscovery in the nineteenth century, because of their unfamiliarity with medieval philosophy and theology, made uninformed judgments about his originality in thought and language. Although scholars still view him as an original thinker, he is now recognized as being original within the context of the already well-developed system of scholastic thought. His mysticism has been termed speculative to indicate both its imbeddedness in scholastic philosophy and theology as well as the fact that he does not talk about mystical union in terms of personal experience. Rather, he describes the metaphysical constitution of both the human soul and God's nature that makes union possible. For Eckhart mystical union between God and the soul rests on their metaphysical oneness. Eckhart sees creatures as differing from God, but they differ only through the nothingness limiting the being that they possess; and being is God. Eckhart distinguishes between two kinds of being in creatures: formal or limited being, which constitutes them in existence separate from God, and virtual being—the being of creatures in the mind of God existing from eternity. The virtual being of creatures at one with God's being is their more real and vital being. Their formal being is a mere shadow by comparison. This distinction between formal and virtual being in creatures provides the context for understanding most of Eckhart's characteristic doctrines. Thus, for example, he urges us to become as poor in spirit as we were (in the mind of God) before we were (formally existing). In other words, we are to "reduce" our existence to existence in God. So, too, in becoming the just man, we do so by uniting completely with justice, which is identical with God's being. Through our oneness with God's being the birth of the Son takes place in us, as it does in Bethlehem, and united with this divine action we become both the begotten (Son) and the "begetter" (Father). The human intellect, that faculty most essential in establishing our likeness with God, is in its purely spiritual activity the spark of the soul in which we most throw off the confines of our creatureliness and imitate divine activity. And through detachment, a key term in Eckhart's mystical asceticism, the creature frees himself from his own specific self or formal being, which is in essence the limiting factor separating us from God, to become whole or one with him. The startling vigor of Eckhart's thought is matched by the power and artfulness with which he expresses it. Though the Latin works show skillful manipulation of language, it is his German works, especially the sermons, that display a rich variety of linguistic artistry, some of it best termed rhetorical and some clearly poetic. Often he overcomes the limitations of the young vernacular's ability to express his rarefied mysticism by placing a key term in a variety of juxtaposed contexts in the manner of a leitmotif and thus gradually reveals to his audience the treasures it contains. He employs such figures as accumulation, antithesis, parallelism, hyperbole, chiasmus, and paradox to great advantage. Word games and original verbal strategies of other kinds abound.

Eckhart influenced most immediately John Tauler and Henry Suso, Dominican mystics of the next generation, and less clearly their Flemish contemporary John (Jan van) Ruusbroec. From the library of the Swiss cardinal Nicholas of Cusa (Cusanus), Latin works by Eckhart have come down to us with comments by the cardinal scribbled in the margins. Cusanus shows much affinity in thought with Eckhart and defended him against the attacks of the Heidelberg theologian Johannes Wenck. The baroque poet Johann Scheffler (Angelus Silesius) was certainly touched by Eckhartian ideas, but, as in the case of many other authors and works of the reformation period and beyond, whether the influence was direct or indirect is impossible to tell. In more modern times the philosophers Hegel, Schelling, and Baader all admired his thought, though until the mid-twentieth century much of this admiration was based on misunderstandings arising from ignorance about Eckhart's own intellectual context. The last forty years have seen great progress in understanding this exhilarating mystic, though much of his uncharted profundity remains to be explored.

Meistersinger

The term "master singers" (German *Meistersänger*) denotes German poets and writers of song lyrics, originally vagrant minstrels of the late fourteenth and early fifteenth centuries. Some scholars consider them to be the bourgeois equivalent and successors of the courtly *Minnesinger*, a group of poets singing of courtly love (*Minne*), which declined simultaneously with the Hohenstaufen dynasty. Others maintain that laymen gathered in "schools" of singing to create religious and festive songs, and that these schools arose out of the craft guilds. The claims are not mutually exclusive, each having some basis in fact. To legitimate their art without any appearance of being rebellious, the Meistersingers claimed to be the inheritors of twelve skilled medieval masters of the arts. They were not professional musicians but practiced songwriting as a formalized hobby or pastime, the opportunity occasioned by sufficient wealth to enjoy free time. Some of them were Latin educated; others possessed only very rudimentary learning. A famous Colmar manuscript, completed about 1470 and containing nine hundred songs, is the most comprehensive surviving evidence of their craft.

The creations of the Meistersingers were pedantic songs, governed by stiff rules of form called *Tablatur*, while elaborating moral and political themes. When composed for church, the lyrics adhered faithfully to the Bible, but during the fifteenth century the singers included secular topics in their repertoire. The poets supplied new lyrics for the invariable melodies of the Old Masters, though the general quality failed to match the forerunners. In the fifteenth and sixteenth centuries in Nuremberg, for example, there were six thousand poems set to only two hundred tunes. Normally, a stanza of a song called a *Gesatz* consisted of two melodically identical *Stollen* that formed the *Aufgesang* (ascending song, or "a") and the melodically distinct *Abgesang* (descending song, or "b"). As a rule, three stanzas, though there could be five or seven, comprised the bar, a musical unit (a song) following the pattern of "aab." The rhyme scheme (*Gebänd*) was frequently complicated and the rhythm sometimes irregular. The *Meistergesang* was performed by the singer without the benefit of either instrumental or vocal accompaniment. Because the static form hindered creativity, the genre seemed destined for oblivion. At the turn of the fifteenth to sixteenth century, when the Meistersingers were firmly ensconced in guilds, Hans Folz, barber and surgeon from Worms, convinced the school at Nuremberg to allow a greater variety in both lyrics and melody, a victory that infused the genre with renewed life. Some critics consider singers such as Walter von der Vogelweide, Konrad von Würzburg, Der Marner, and Regenbogen to have been Meistersingers, recalling a poem about the battle of poets at the Wartburg. It is more generally accepted, however, that Heinrich von Meissen (ca. 1260–1318) initiated the tradition. Heinrich is more popularly known as *Frauenlob* (literally praise of women), a cognomen that he earned in competition. He represents the middle-class poets who succeeded the knightly minnesingers, adapting *Minnesang* to theology and learning. His most famous work is his *Marienleich* (*Hymn to Mary*), in which he unites traditional religious iconography with philosophy. A well-educated minstrel who wandered between Prague and Mainz, Frauenlob founded schools of singers. There were no actual unions of poets in the earlier Middle Ages, though singers met at competitions such as the legendary "singers' war" at the Wartburg. The earlier minstrels depended entirely for their livelihood on their individual patrons, so a federation would have benefited them little. But in the late fourteenth and early fifteenth centuries, when a financially independent class arose in the cities, groups of poets also emerged. The early Meistersinger formed guilds, spreading throughout southern Germany, Silesia, and Bohemia. Although singers performed in northern Germany as well, there were apparently no singing schools. Members of the small trades met on Sunday afternoons to practice their homemade songs. A good song was analogous to a fine product such as shoes or clothing produced by a guild artisan. The schools of singing ordered members in ranks after the fashion of the craft associations. One began as a *Schüler* (pupil) and progressed through the ranks of *Schulfreund* (friend of the school), *Singer*, and *Dichter* (poet), only becoming a *Meister* (master) by the adjudication of the *Merker* (judge). Like their predecessors and like courtly knights, singers loved competition, in this case not a war of poets nor a tournament but a *Wettsingen*, or singing contest. Though notions of individual honor were banned in favor of the common good, the winner customarily received a medal with a picture of King David or a floral wreath. In general the works of the singers were not very popular, largely ignored, and unpublished, and few produced songs of excellence. The most famous Meistersinger, an apprentice shoemaker from 1509 to 1519, was Hans Sachs of Nuremberg (November 5, 1494–January 19, 1576). He founded a Latin school and surpassed all others in popularity, and productivity, and in artistic and theological influence. He became the master at Nuremberg in 1517, moving on to conduct the school in Munich until 1554. He wrote thousands of songs (sources vary between 4,000 and 6,000), some of which were biblical comedies and stories from both Old and New Testaments. He composed an additional 200 dramas, many for Fastnacht (Shrovetide). In his songs, Sachs espoused, in accordance with the conservative-minded nature of the Meistersingers, the cooperative efforts of all citizens and the common good as the highest goal of each individual. We remember the Meistersingers today because Richard Wagner memorialized them, especially Sachs, in his opera *Die Meistersänger* and because he renewed the form of the meistersong in his opera *Tannhäuser*. The significance of the Meistersingers lies in their devotion to their art and their attempt to inculcate moral principles through the text of their songs. According to one source, the decline of the genre began as early as 1504, with Johan von Soest. Attempts to renew the movement after 1600 failed, though the last school of singers was not actually disbanded until 1875 at Memmingen, a school that continued to exist only because of its adaptation of literary principles elucidated by the sixteenth-century German writer and literary critic Martin Opitz.

Melk

The steep rocky cliff, rising between the Danube and the Danube road at Melk (Lower Austria), appears to have been inhabited long before the Romans built a fort at Namare in the vicinity. During the migration of the German's tribes, the region was overrun by the Avars. With the Carolingian expansion eastward, the region was colonized by German nobles and monasteries. In 831 Louis the German gave the location Medelicha to the Bavarian monastery of Hereiden. Around 900 the Magyar incursion brought an end to this colonization. In the post-Lechfeld expansion a castle at Melk (Medelicha) was occupied by margraves of the Bavarian dukes. Following the revolt of the duke of Bavaria in 975, Emperor Otto II gave the castle and the surrounding region to the Babenberg Leopold I as a guardian post of the eastern frontier. The castle became the residence and burial site of the house of Babenberger. The Middle High German epic *Nibelungenlied* (ca. 1200) mentions a castle at Mederlikke, notable for its hospitality. A monastery, dedicated to Saints Peter and Paul, was established on the site by 985.

The translation of the relics of the recently martyred pilgrim Coloman from Stockerau to Melk on October 13, 1014, initiated a new era in the history of the abbey. Following numerous miracles, the cult of St. Coloman spread rapidly, with Melk as the center of veneration. In 1170 a new altar was dedicated to St. Coloman. Around this time the abbey's other most precious relics, which had been brought to Melk in the eleventh century, were "rediscovered": the Melk Cross, a piece of the True Cross, and the lance of St. Mauritius. With the possession of these important relics, and the dynastic associations of the Babenberg tombs, Melk attained important status as a pilgrimage site and one of the oldest holy sites in Austria. Coloman's status as patron saint of Austria in the thirteenth century increased the importance of Melk as a site of pilgrimage.

On March 21, 1089, Margrave Leopold II handed the site over to the Benedictines of Lambach. Leopold III (1095–1136) bestowed great gifts on the monastery, including a privilege of exemption in 1110, by which the monastery was placed directly under control of the Holy See. Leopold III also gave the Babenberg castle to the Benedictines and rebuilt the abbey church. During the twelfth and thirteenth centuries Kloster Melk was known as a great center of learning and artistic production, boasting a thriving monastery school and scriptorium. During the twelfth and thirteenth centuries a women's convent also existed on the site. A fire of 1297 destroyed the Romanesque church, library, and archive.

A new three-aisle Gothic basilica with a west tower was begun around 1324 and consecrated in 1429. The women's convent appears not to have been rebuilt. An artistic revival occurred under Duke Rudolf IV (1358–1365), who gave new Gothic settings for the Melk Cross and the Mauritius Lance, as well as a splendid monumental Gothic canopy-shrine for St. Coloman. These relics held significance for the Austrian dukes as legitimizing insignias of office.

With the reform plan of Duke Albrecht V following the Council of Constance, Melk became the center for the renewal of Benedictine monasteries in Austria and south Germany known as the Melk Reform. Monks from Subiaco arrived in 1418 to help implement the reform, which included a simplification of the liturgy, correction and production of liturgical books, and rigorous ordering of monastic life. The resulting revival of religious, scientific, humanist, and literary energy can be seen in the vast production of manuscripts from the fifteenth century at Melk. As a center of learning and reform, Melk saw many visiting monks and scholars who came to learn the new observance and study at its school. This heyday of Kloster Melk lasted for a century until a slow decline set in during the sixteenth century, when the Reformation left the monastery virtually depopulated until the seventeenth century.

The town of Melk grew up at the foot of the cliff, in the shadow of the castle and monastery above. Already in the eleventh century it was mentioned as a *civitas* in the account of the translation of St. Coloman. During the twelfth century the poet Heinrich von Melk and the poetess Frau Ava lived in the vicinity. By the thirteenth century the modest town had acquired market rights. However, the town was dominated by the fortified monastery on the escarpment above.

Merseburg

King Henry I (919–936) built a palace at Merseburg, but a settlement on the strategic site above the Saale River is already mentioned in Carolingian times. Henry's son, the emperor Otto I (936–973), promised that he would establish a bishopric there if he won the battle against the Hungarians at Lechfeld in 955, and he finally fulfilled his vow in 968. The newly founded bishopric was abolished in 981 and then reestablished by Henry II in 1004. Bishop Thietmar von Merseburg (d. 1018) laid the cornerstone for the new cathedral in 1015, and the building was consecrated in the presence of Henry II in 1021. As elsewhere, the Ottonian church was built on a modular plan. The dimensions of the square crossing bay repeat in each transept arm and in the single bay of the choir. A semicircular apse closes the choir, which collapsed twice and was subsequently rebuilt with flanking eastern towers for a consecration in 1042. The three nave bays and their flanking aisles were rebuilt in a late Gothic style in the second half of the fifteenth century, using the Ottonian foundations for both the exterior walls and the columns. The addition of a crossing tower and upper stories to the west towers in the twelfth century preceded more extensive work in the thirteenth: the rebuilding of the choir and transepts retaining the lower walls of the Ottonian building, the insertion of sanctuaries between the east towers and transepts and the addition of upper stories to the east towers, the vaulting of the nave, and the erection of a *Vorhalle* (entrance hall) at the west end of the building.

Judging by Henry's donations to his foundation at Bamberg, to Charlemagne's palace chapel at Aachen, and to the cathedral at Basel, we may safely assume that he outfitted the new church at Merseburg in a similarly lavish fashion. Nothing remains of these early liturgical objects and furnishings. But Merseburg Cathedral houses the tomb of the first antiking Rudolf of Swabia. The castbronze tomb, originally gilt and inset with semiprecious stones, was installed in the crossing soon after Rudolf's death in 1080. It is important not only as an early example of large-scale casting in bronze but as an early example of a figural tomb. At a time when the Salian kings were still buried under simple stone slabs with inscriptions, Rudolf is portrayed in low relief, wearing a crown and carrying an orb and scepter as marks of office. Probably a commission of the Merseburg bishop Werner von Wolkenburg (1059–1093), Rudolf's tomb marks the bishop's papal position in the Investiture Controversy, the battle between the pope and the German king Henry IV over the right to name bishops. It also records the direct connection to the highest levels of secular authority that the bishopric had enjoyed earlier in the century.

Metalworking

Grave finds indicate that the Germanic and Alemannic peoples who occupied pre-Carolingian Germany already knew and used most of the metalwork techniques that would characterize the works produced in the great Ottonian and Romanesque centers. Crosses of thin gold foil were pressed over or into molds of clay or wood and sewn onto veils or laid over the corpse. Silver and bronze were cast in molds to create *fibulae* (brooches) and belt buckles, as well as stirrups and decorative bosses for harnesses. Linear designs, geometric patterns, and stylized foliate and animal motifs in low relief often decorated the surface, which might be fire-gilt. Likewise visible at this early date is niello, a technique in which a mixture of lead, sulfur, silver, and copper was melted into cast or engraved grooves to create a color contrast with the lighter silver or gilt background. Filigree vine patterns in twisted wire or granulation, made of tiny balls of molten gold or silver dropped adjacent to one another, decorated hairpins and brooches. Knowledge of Byzantine objects is supposed to account for the use of cloisonné, a technique in which narrow bands of metal soldered on edge to the ground provide chambers into which enamel or semiprecious stones, often garnet, were inserted for a multicolored effect. Peoples recently converted to Christianity produced reliquaries using the same techniques as these small, portable, personal objects.

Charlemagne's building of a permanent capital at Aachen and his standardization of Christian texts and liturgical practices necessitated both larger-scale objects and those for use in the mass. The cast bronze doors of the palace chapel at Aachen and the grilles of the second-story openings are the first large-scale cast bronzes in the West since Antiquity and suggest the employment or influence of technicians from the East. The technique would be revived again circa 1000 for objects like the bronze doors of Bishop Bernward of Hildesheim and Archbishop Willigis of Mainz. After this it was used regularly for both large-scale church objects like crucifixes, such as the meter-high example of the late eleventh century moved from Helmstedt to Werden in 1547, and candelabra, for example, that commissioned by Henry the Lion near the end of the twelfth century for St. Blasius, his foundation at Braunschweig. Book covers enshrined the word of God contained in the Gospel texts within as if it were a relic. The covers of the *Codex aureus* of St. Emmeran at Regensburg, made at the Court School of Charles the Bald in 870, includes embossed panels with Christ in Majesty, the Evangelists, and scenes from Christ's life, and gems and pearls mounted in settings reminiscent of architecture against a filigree ground. The reuse of antique gems and cameos often served a political purpose. On the Ottonian Lothar cross, given by Theophanu or her son Otto III to Charlemagne's foundation at Aachen (Cathedral Treasury), for example, a Roman cameo representing Caesar Augustus that appears at the intersection of the cross arms links the image of the emperor to that of Christ. This idea is strengthened by the engraved image on the back of the crucifix, where the head of the crucified Christ also occurs at the same place as the cameo on the front. The hand of God holds a laurel wreath, a symbol of triumph similar to that worn by Augustus, over the head of Christ. Other works of the Ottonian period incorporated ivories, both contemporaneous and earlier, and Byzantine enamels.

Important single works of both the Ottonian and Romanesque periods often use the full repertory of techniques. On the front of the older cross given by Abbess Mathilda to the women's foundation at Essen between 973 and 982 (Essen, Cathedral Treasury), the body of the Christ is embossed against a flat ground of gold foil. The halo, edges of the cross, and ends of all four arms are defined with filigreed vines and insert with gems and pearls, while a cloisonné panel carries the inscription above Christ's head and another represents Duke Otto of Bavaria and his sister, the abbess Mathilda, beneath Christ's feet. The images on the back are engraved into gilt copper foil.

The appearance of three-dimensional architectural sculpture in the twelfth century coincides with the inclusion of three-dimensional figures in small scale on shrines. On the Three Kings Shrine of circa 1200 in Cologne Cathedral, for example, the figures of the apostles and prophets are presented fully in the round; their gold foil exterior covers an interior of wax. The figures appear against engraved gold grounds; the arches over their heads and the spandrels between the arches are inset with gems, many of them antique, against grounds decorated with filigree; inscriptions are in *émail brun* (*Braunfirmis*), a technique from the beginning of the eleventh century in which heated linseed oil gave a rich brown tone to the surfaces it covered. Some of the decorative borders are cast, and the haloes, columns supporting the arches, and decorative borders are in the enamel technique of *champlevé*, which was circa 1100 a cheaper alternative to cloisonné. Related to cloisonné in its materials and effects, *champlevé* inserted colored glass paste into fields cut out of the solid ground of a usually copper plate.

Little is known about the organization of metalsmiths' shops, although the treatise of circa 1100 by Theophilus instructs us on the technical details of medieval metal-working and other arts.

While art historians traditionally devote their attention to large-scale cast bronze objects and to those in precious materials associated with church services and private devotion, metalworkers also produced door knockers, handles, and locks; tableware; and military objects—swords, armor, and helmets—in baser metals.

Metz

Metz exists as both an historical site (France) and as an art historical notion. Primarily through the efforts of Bishop Chrodegang (742–766), adviser to Pippin III, Metz became the leading episcopal see in the Frankish kingdom. The city was widely admired in the Carolingian period for its distinctive liturgical practices that included an adaptation of the Roman stationary liturgy and the Roman chant. It seems fitting that the manuscript most readily associated with the city, the Drogo Sacramentary, should be a highly decorated Mass book. Commissioned by Bishop Drogo (826–855) for his personal use in circa 850–855, it is unique among Carolingian manuscripts for its delicate historiated (including figural scenes) initials, its elaborate classical acanthus decorations, and its extensive New Testament cycle.

Metz was renowned for its many churches—some forty in the Carolingian period. Paul the Deacon, in his *History of the Bishops of Metz* (783), made much of the architecturally rich cathedral complex. At its center was the episcopal church of Saint Stephen, a small octagonal church just to the west, Notre-Dame-la-Ronde, and St.Pierre-le-Majeur, a three-nave basilica to the south, all three of which Archbishop Chrodegang (d. 766) mentions in his *Rules for Canons (Regula canonicorum)*. The still-standing St.-Pierre-aux-Nonnains, a fourth-century Roman basilica that became a monastery in the seventh century; the sixth-century church of St.-Pierre-le-Vieux; the church of Saint Paul built by Chrodegang, and the late-eighth-century church dedicated to Saint Gorgon were among the cluster of ecclesiastical buildings surrounding the canons' cloister.

In 1248, the citizens of Metz wrested power from the bishop to create an independent and prosperous city-state. It was during this time of municipal reorganization that work began to replace the old cathedral with a new Gothic structure that would also incorporate the church of Notre-Dame-la-Ronde. Begun in 1220, work continued in fits and starts for some three centuries. The result is a cathedral impressive for its soaring nave (42 meters) and its array of stained glass, much of which was made in the fourteenth and fifteenth centuries. Other noteworthy buildings from the Gothic period include the octagonal chapel of the Templars and the abbey church of St. Vincent.

Metz is also a category assigned to a group of Carolingian manuscripts associated with Drogo and to important groups of ninth- and tenth-century ivories. The Metz manuscripts are characterized by their rich, vegetal ornamentation, classical motifs, and sketchy, impressionistic figural style. Goldschmidt, who derived his classificatory system for ivories from manuscript studies, devised both a Metz and a Later Metz group. The Metz group proper is a relatively cohesive group that includes the ivory book covers on the Drogo Sacramentary. These ivories are characterized by sharp and linear carving, cutout backgrounds, and flat relief. The Later Metz group is a less coherent group that Goldschmidt saw as a continuation of the earlier group. Christological narratives and elaborate crucifixions are the favored themes. An often shared figural style, repetitions of certain motifs, and the frequent appearance of a dense acanthus leaf frame provide some links among the members of this large group. Still, the term "Metz school" must be considered primarily a scholar's organizational tool rather than a documented location for the production of ivories.

Meuse River

The Meuse (Latin *Mosa*, Dutch *Meuse*) River was one of the more important waterways in medieval Europe. Rising at Pouilly on the Langres Plateau in Lorraine, it flows 590 miles (950 km) past Verdun, Sedan, and Carleville-Meieres. At Namur, it is joined by the Sambre River and then courses east to Liège, Huy, Maastricht, Venlo, and Bergen. Here it divides into two branches: the northern branch flows northwest to join the Waal River; the southern branch empties into the North Sea.

From Merovingian times there were numerous ports (*portus*) along the river, which served as an important trade artery connecting the Mediterranean and the lands bordering the North Sea. Under Dagobert (about 629–639), for example, a moneyer (authorized coiner) from Maastricht set himself up at the Frisian port of Durstede on the Meuse delta. Evidence shows that even in the eighth century there was considerable freight traffic on the Meuse, and at the end of the eighth century tolls were collected at Durstede and at Maastricht.

The region between the Meuse (with the *palatii*, or fortifications, of Jupille and Herstal), the Moselle, and the Rhine was the axis of Carolingian Austrasia. As a result of the Treaty of Verdun (843), the Meuse formed in its upper reaches the boundary between the west and middle kingdoms. From the ninth to the thirteenth centuries, it was the venue of numerous meetings between the West Frankish (French) and East Frankish (German) rulers. Durstede served as the hub of a large-scale trade with Scandinavia, but that characteristic also determined that it was pillaged every year from 834 to 837. In 841 Lothar I ceded some Frisian territory, including Durstede, to the "Normans," and a Norman duchy was established in the region of the Rhine delta. The main outlet of the empire was thus in the hands of the northerners.

Under the Ottonians, however, the entire length of the river was in German hands, and the most economically active part of the empire was the area between the Rhine and the Meuse (Meuse River Valley, Maasland), including Verdun, Mainz, and Cologne. Contacts between Frisia, the Low Countries, and England became fairly extensive, causing Durstede to expand. Tin from Cornwall was the essential material for the Maasland bronze and brass work, and merchants from the Maasland were selling their goods in London as early as 1130.

In addition to its own specialization in metalwares, the Meuse formed the northern end of the longer trade route that linked the Mediterranean and Flanders by way of the valleys of the Rhône and the Saône. Along it moved such varied goods as stone, salt, grain, fish, wood, and wine. River trade stimulated the growth of towns, as well as reviving the economic activity of the countryside. Among the towns and cities that thrived from the eleventh to the fifteenth century were Verdun, Mézières, Dinant, Namur, Huy, Liège, Maastricht, Roermond, Venlo, and Durstede.

While the Meuse united the areas through which it passed, it also served in part as a boundary, between the archbishoprics of Rheims and Cologne, for example, and (along with the Scheldt and Rhône Rivers) between France and the Empire during the High Middle Ages. The weakness of imperial authority in the region eventually led to French annexation, however, which was completed by Philip IV the Fair in 1298.

Millstatt

This Benedictine abbey was located beside a lake of the same name seventy-five miles south of Salzburg in the Carinthia region of Austria. Although the abbey, founded before 1088, was dissolved in 1469, its High Romanesque church still stands. The monastery is remembered today for its manuscript production; beginning immediately upon its foundation, the scriptorium was active well into the thirteenth century. At least one eleventh-century, around twenty twelfth-century, and about fifteen of its thirteenth-century manuscripts survive.

Its most famous manuscript is known as the Millstatt Genesis and is now kept in the Museum Rudolfinum in Klagenfurt (Kärntner Geschichtsverein, no. Cod. VI19). This twelfth-century manuscript begins with a rhymed version of Genesis in early Middle High German. In addition, it contains seven other metrical texts, of which the Physiologus section is also illustrated with line drawings. The manuscript contains eighty-seven pen drawings of Genesis scenes done in brown, red, and blue inks, distributed throughout the poem. These drawings seem to derive from an early Christian illustrated manuscript of the book of Genesis for two reasons. One, the drawings illustrate only biblical events, not interpretive passages added by the German poet; two, the drawings are close iconographically to many in a group of artistic monuments, ranging from manuscripts to mosaics, known as the Cotton Genesis recension. The Millstatt Genesis is thus highly regarded as a northern reflection of an early Christian manuscript of the Cotton Genesis recension.

Minden

The bishopric of Minden (North Rhine-Westphalia) was founded around 800 by Charlemagne at the margins of his empire on the west bank of the river Weser. The first Carolingian church was destroyed by fire in 947; its successor was consecrated in 952. Of this building, the westwork (massive entrance structure), an imitation of nearby Corvey, has partially survived. In the mid-twelfth century, this westwork was transformed into the present two-towered façade by suppressing the central tower and opening the central space as a western gallery with triple arcades leading directly into the church. The nave of the adjoining Romanesque basilica, one of the first vaulted churches in northern Germany, was replaced in the later thirteenth century by the present Gothic hall church (destroyed in 1945 and since rebuilt); the latter combines architectural and sculptural features from Reims Cathedral with those from Cologne.

The parochial administration of Minden was centered in the four monastic units of St. Johannis, St. Marien, St. Martini, and St. Simeon, all of which reflect different stages of the architectural development of the cathedral. West of the cathedral precinct (the Domburg) developed the medieval market with its Gothic town hall, erected in the late thirteenth century.

Under Bishop Sigward (r. 1120–1140), a political adviser of Emperor Lothar III, the small chapel of Idensen west of Minden was built as the bishop's mausoleum. It represents the first completely vaulted structure in northern Germany, based on the church of Elten, which Sigward had consecrated in 1129. The iconography of its completely preserved fresco cycle, a typological program with strong political overtones relating to the investiture controversy, is based on the writings of Rupert of Deutz (d. 1129).

Ministerials

Comprising a class unique to medieval Germany, the ministerials (Latin *ministeriales*; German *Dienstmänner*, or men in service) arose out of the uncertainties of the post-Carolingian period, as various German magnates sought to find a remedy for their labor needs in a number of areas, including administration, personal bodyguard, and military operations. Opting against the free nobility, whom they considered too independent and thus less reliable, great churches of the tenth century turned to the unfree peasantry for such individuals. Since the *ministeriales* were unfree, they remained obligated to serve their lord, but they could also be granted to other lords; yet they were more than mere serfs. They were trained as warriors and endowed with both allods (ceded land) and fiefs from which they supported themselves in a manner similar to feudal vassals. References to such individuals are found at the beginning of the eleventh century in narrative sources, while texts from the 1020s regulate their rights and duties.

Under the Salian kings and continuing into the Hohenstaufen epoch, secular rulers turned to extensive use of *ministeriales* as well. Conrad II (1024–1039), in his efforts to establish a strong royal authority independent of the lay nobility, relied heavily on the *ministeriales*, while the growing power and influence of the *ministeriales* at the courts of Henry III (1039–1056) and Henry IV (1056–1106) caused great antagonism toward the kings by the nobles which lasted into the reign of Henry V (1106–1125). Yet, despite princely opposition to the use of *ministeriales* to exclude them from participation in the governance of the empire, the status of the ministerial class improved during the era of the Investiture Controversy and the accompanying civil war. In time, many lay princes and lesser nobles acquired *ministeriales* as well.

Although the vast majority of the ministerial families remained modestly successful, the career of the imperial ministerial Werner II of Bolanden demonstrates the heights to which some of them rose. This man not only served Emperor Frederick Barbarossa, but he also owed service to forty-five other lords from whom he held property; he possessed seventeen castles, and he was the lord of eleven hundred knights. A descendant of his became archbishop of Mainz in the mid-thirteenth century. Equally successful was Markward of Anweiler, whom Henry VI had earlier manumitted and created duke of Ravenna and the Romagna, and to whom Henry in 1197, just prior to his death, entrusted the regency of Sicily; in short, the future of Henry's young son Frederick was placed in the hands of this loyal retainer.

After the collapse of the Hohenstaufen empire, the imperial ministerials formed the unruly estate of the imperial knights (*Reichsritterschaft*). In many thirteenth-century German dioceses, cathedral canons of ministerial origin openly challenged older families of the higher nobility for the highest ecclesiastical offices. Thus, in Trier we find the family of de Ponte (von der Brücke) competing with the counts of Wied; at Speyer, Conrad of Daun (de Tanne) became bishop in 1233; while at Worms, Conrad of Dürkheim succeeded to the bishop's chair in 1247. Other members of various ministerial families married into the high nobility; in numerous cases we find them merging into the urban patriciate (ruling class) as well.

Minneallegorie, Minnerede

Two genres of courtly love writing, the first allegory and the other commentary, combine ecclesiastical traditions of allegory and spiritual love (Otfried's *Evangelienbuch*, *Das Sankt Trudperter Hohelied*) with secular traditions of treatises on the nature of carnal love (Ovid's *Ars Amatoria* and *Remedia Amoris*, Andreas Capallanus's *Tractatus de Amore*). The love allegory (*Minneallegorie*) became extremely popular in the fourteenth and fifteenth centuries. The Minnegrotto in Gottfried von Straßburg's *Tristan* (ca. 1210) is one of the earliest, and undoubtedly the most famous, *Minne* allegories in German literature. The *joie de la curt*, "joy of the court," in Hartmann von Aue's *Erec* (ca. 1185) also functions as an allegory of love. The French *Roman de la Rose* (ca. 1230–1275) represents one of the most spectacular expressions of the form. In this French poem, we find many of the qualities that would come to define the form in Germany. The typical *Minneallegorie* embeds didactic intent within epic structure. Personifications of love and of the virtues and vices associated with it are stock figures in the love allegory. A knight in search of love encounters *Vrou Minne* or *Vrou Liebe* and her handmaidens—personifications of the virtues of love: fidelity (*triuwe*), self-control (*zucht*), charity (*milde*), and so on. This encounter takes place in a setting loaded with allegorical significance: a grotto, a garden, a forest, or a castle. *Vrou Minne* and her court instruct in the ways of love (*Minnehof*). *Der Minne Regel (Rule of Love, 1404)* by Eberhard von Cersne offers one model of the love allegory. A knight chances upon the various personified virtues guarding the ramparts of the castle of the queen of Love. Once inside, the Queen gives the knight twenty-three commandments of love and provides him with the questions and answers to thirty-eight mysteries of love. She then commands the knight to go out and capture a hawk. (The hawk is the most common symbol for knightly sexual desire.) After several adventures, the knight succeeds and brings the hawk back to the queen, who then gives further instruction, using material taken directly from Capallanus's *De Amore*. Other variations of the love allegory include hunting allegories (*Jagdallegerien*) and the allegory of the Castle of Love (*Minneburg*). In Hadamar von Laber's *Jagd* (ca. 1335–1340), a hunter captures the prey with the aid of his dogs named resolve (*wille*), desire (*wunne*), consolation (*tröst*), constancy (*state*), and fidelity (*triuwe*). In the *Königsberger Jagdallegerie* (ca. 1350), a hunter who fails to catch a doe with the various virtues in canine form succeeds when he employs the dogs of vice: inconstancy (*zweif*), infidelity (*wenken*), and deception (*falsche*). The most popular love allegory of all is that of the Castle of Love. The storming of the castle has obvious sexual connotations and is a standard erotic allusion. In 1214, revelers actually enacted the siege of the Castle of Love at a courtly celebration in Treviso. (Friedrich Schiller alludes to a similar celebration in his play *Maria Stuart*.) In the poem *Minneburg* (ca. 1340, erroneously ascribed to Egen von Bamberg), the castle represents a woman and her many virtues. Versions and variations of the poem in Middle English, *Castel off Loue*, and in French, *Chastel d' amours*, attest to its popularity. Hermann von Sachsenheim's *Moerin* (1453), the works of Meister Altswert (*Das alte Schwert*, *Der Kittel*, and *Der Tugenden Schatz, etc.*, ca. 1385), and Heinzelin von Kontanz's *Ritter oder Pfaffe (Knight or Minister, ca. 1290)* are other important *Minneallegorien*. The love commentary or *Minnerede* is a form closely related to the *Minneallegorie* in its didactic intent but differs in that none of the virtues, emotions, or vices in the poems are personified. We find commentaries on love in the works of Heinrich der Teichner, Peter Suchenwirt, Zilies von Sayn, Johann von Konstanz, and Eberhard von Cersne.

Medieval. German love poetry, or *Minnesang*, represents one of the German-speaking world's lasting contributions to world literature. Some medieval Latin love songs date from the eleventh century; William IX of Aquitaine, the "First troubadour," created his Occitan love songs around the beginning of the twelfth. The first Middle High German songs by named singers about love (*minne, liebe*) and relationships between the lovers and their society that survive stem from roughly 1150, though they first appear, as do most later songs, in manuscripts dating from the late thirteenth and early fourteenth centuries. Minnesongs interested some members of the nobility, the secular clergy, and the ruling patrician class in the cities and continued to be created into the fifteenth century. In common parlance, *Minnesang* refers not only to love songs but also to religious, political, or topical songs, and wisdom poetry that is directed to the same audience, the courts, and performed (predominately) in secular settings. The term excludes hymns and other songs written for a religious community or occasion (such as the songs within the mystical writings of Mechthild von Magdeburg or the vernacular songs within religious dramas), though such songs both influence and are influenced by *Minnesang*. It also excludes the rule-driven songs composed by and for artisans from the fourteenth into the seventeenth century (*Meistergesang*), although the mastersingers knew and explicitly drew on the minnesang tradition in shaping their forms and melodies. For the most part, *Minnesang* also excludes various popular songs with both religious and secular themes that were collected in song books, predominately in the fifteenth and sixteenth centuries, or cited in city chronicles, even though some of these recast minnesong motifs.

The "first minnesinger" is Der von Kürenberg, and other older singers include Meinloh von Sevelingen, the burgraves of Regensburg and Rietenburg, and Dietmar von Eist. Scholars date these singers on formal and, to a lesser extent, thematic grounds: long-line or rhymed couplet strophes, occasional impure or slant rhymes (*liep: niet*), relatively simple syntax, no overt borrowings from the troubadours and trouvères (northern French singers who started imitating the troubadours shortly before the minnesingers did). The archaic German singers seem to have flourished along the Danube (with Regensburg as a western limit). Despite their eschewing a direct imitation of Romance models, they probably were aware of them. One generally archaic singer can be dated more precisely, since many documents inform us about Kaiser Heinrich (Emperor Henry VI, 1165–1197), who was knighted in 1184 and reigned as emperor only six years, though none refers to him as a singer. He is a transitional figure (as is Dietmar), since part of his oeuvre directly reflects Romance influences.

Early songs tend to be one strophe, or less commonly two or three strophes, long; later ones are often longer. Laments about fickle or unresponsive lovers, promises to serve the lover (with feudal overtones), complaints about the intrusions of spies and slanderers (*merkaere, lügenaere*) in the lovers' (hoped-for) relationship recur in early (and later) minnesongs (and are common in Occitan and northern French songs as well). The lover relationship is implicitly illicit (almost never expressly adulterous); appeals to secrecy are common. Public disclosure of the relationship would bring shame or even death. Loving and singing of love, despite the pain and suffering it so often causes the lover(s), contribute to courtly joy (*höher muot*). Fairly rare, apparently archaic, are narrative accounts of the plight of lovers other than the person speaking; when they occur, they often introduce the quotation of a woman speaker. Strophes in the woman's voice constitute a major portion of early *Minnesang*. Direct dialogues are rare; more commonly, the lady and her lover utter monologues on a related topic, talking past each other. This exchange (German, *Wechsel*), a key feature of archaic song, is imitated and modified by later singers such as Reinmar der Alte, Heinrich von Morungen, and Walther von der Vogelweide. Songs (strophes) in which the lover is addressed directly are rarely answered. Occasionally, a messenger serves as a go-between (*Botenlied*) or the sole partner in a (direct) dialogue.

Dawn songs—laments by lovers forced to part by the coming of the dawn (German, *Tagelied*; in Occitan *alba*; in northern French, *aubade*)—combine elements of narrative (setting the scene, commenting on actions taken), monologue, and dialogue. Though the first dawn song, ascribed to Dietmar (in the anthology *Minnesangs Frühling*, no. 38, 18), is early, and songs by Morungen and Reinmar allude to the dawn song, only at the height of sophisticated minnesongs around 1200, with the dawn songs of Wolfram von Eschenbach, does the genre become clearly established among the songs transmitted. Throughout the subsequent centuries to the mid-fifteenth century, such songs remain popular. Far more of them (over a hundred) exist in German than in the otherwise more extensive troubadour and trouvère traditions.

Deriving early German (Portuguese, Spanish, even some Medieval Latin) songs (in part) from noncourtly folk traditions is disputed, but plausible. Note the heavy use of the woman's voice; the simple syntax; the absence of overt references to Ovid, the Song of Songs, or hymns in praise of Mary (major influences on Medieval Latin, Occitan, French, and later German songs); and the relatively unsophisticated strophic forms and slant rhymes. The songs themselves, however, clearly, even self-consciously, situate the joys and sorrows of love at court. The lovers fear the opprobrium and desire the approbation of the courtiers. A central paradox of medieval love songs in general—that one strives to keep secret what one very publicly proclaims—permeates early minnesongs as much as it does later ones, though only later, in the selfreflexivity of Walther's "Unter der linden" (Beneath the Linden Tree) is the paradox thematized.

Some medieval German songs (*Spruch, Spruchlied, and Sangspruch*) deal not with love per se but rather with general questions of wisdom, often morality or propriety. The earliest examples are ascribed to Spervogel (and, by modern editors, to Herger), but they represent a type of song that was surely more common than the manuscripts indicate. Occitan poems known as *serventes* and many of the *coblas* (stanzas) as well as Latin wisdom poetry parallel, but do not clearly influence, Spervogel, but did probably serve as models for subsequent singers. Walther became the master of the sophisticated *Sangspruch* and *Spruchlied*, which in his hands often contained a political overtone, and his songs are a major influence on the didactic and political songs that constitute a major genre throughout the thirteenth, fourteenth, and fifteenth centuries.

Internal references and reports about the performance of songs in the Middle Ages make it clear that medieval vernacular songs were composed to be performed, to be sung, as were many Medieval Latin songs. A tradition of Latin poems written for a reading audience extends back to Antiquity, but such poems, though they provided motifs copied by the troubadours, trouvères, and minnesingers, cannot serve as a model for our understanding of medieval vernacular songs. This having been said, one must admit that our knowledge of minnesongs of the twelfth and thirteenth centuries is based almost entirely on manuscripts that do not contain musical notation. None of the songs, in the classic edition of twelfth-century minnesongs, *Des Minnesangs Frühling*, are transmitted with (readable) music. By the mid- to late thirteenth century our songs may well have become, in effect, poems, i.e., have been read (silently or aloud) and understood as written texts. However, although internal references to an implicit audience are doubtless inherently fictional, recurrent direct addresses to a courtly audience ("you nobles" or simply "you") and exhortations like "listen" or "behold" (an implied performance gesture) permeate Occitan and Middle High German lyrics up to and including Walther von der Vogelweide. Though one may, perhaps must, assume that devotees of even the earliest extant songs collected them in written form (and read them), what they had were the texts of songs originally sung. Apparent performance cues are singularly lacking in Medieval Latin and rare in northern French and most Middle High German songs from the mid-thirteenth century on. Later authors such as Konrad von Würzburg (last half of the thirteenth century) may have written consciously, in part at least, for readers.

Our information on the intended audience for the songs derives from the songs themselves and from depictions of performance situations in epics and romances of the time, as well as in miniatures. For instance, a lady opens a song by Der von Kürenberg (*Minnesangs Frühling*, no. 8, 1):

*Ich stuont mir nehtint späte
an einer zinne,
do hört ich einen rîter
vil wol singen
in Kürenberges wise
al üz der menigîn*

"I was standing late last night at a rampart when I heard a knight sing excellently in Kürenberg's melody from amidst the throng."

In this clearly fictional account of a listener, we have a singer at court overheard by a lady who is so struck by his singing that she continues: *er muoz mir diu lant rûmen, / alder ich geniete mich sîn* (He must leave my lands/or I'll claim him for myself). Two possible continuations of the song are transmitted; in one the knight echoes the lady's opening words and says he was standing by her bed but dared not wake her, to which she responds with a curse that she was not a wild boar (*Minnesangs Frühling*, no. 8, 9). If genuine, this would represent an almost unique instance of true dialogue and the only

exchange within a strophe of archaic minnesong; many editors consider the strophe a spurious addition by a later author. Later, the generally accepted strophe responding, in the form of a *Wechsel*, to her has the knight calling for horse and armor so that he can leave her lands to evade her clutches (*Minnesangs Frühling*, no. 9,29). Both sets of strophes are burlesque in tone; neither strikes us as a very reliable guide to the way songs were presented and received; nevertheless, from what information we have some conclusions can be drawn.

As best we can determine, those interested in songs and singing in the courtly fashion made up a small number of the members of the most advanced and powerful courts. Singing of love entertained a select coterie of connoisseurs. It competed during courtly festivities with other amusements. Dancing, music making by instrumentalists, the recitation of both short and long tales, slanging matches (witty repartee), juggling and acrobatics, feats of martial skill, ostentatious promenading to display one's expensive clothes were direct competition. Eating and especially drinking were even more important. Just as there were no concerts for passive audiences in the Middle Ages (music accompanied other activities), there were no song recitals in the modern style. A singer had to divert a few people's attention from all the other available pastimes. But for this very reason, a singer could assume that those few who deigned to listen were intensely interested and involved in what was being sung. Increasingly, the songs presuppose an intimate awareness of poetic conventions. From the very earliest extant songs we can discern both the existence of code words for unspoken norms and the singers' willingness to arouse and thwart their audience's expectations in turn.

Almost all the twelfth-century songs are transmitted solely in three anthologies, codices written down between roughly 1275 and the early part of the fourteenth century: the *Small Heidelberg Song Codex* (A), the *Stuttgart Song Codex* (B), and the *Large Heidelberg ("Manesse") Song Codex* (C). There are several fragmentary manuscripts with texts also found in C, most significantly the Budapest fragment (Bu), which includes, among other texts, the first nine of the fifteen strophes ascribed to Der von Kurenberg, following the same exemplar (thus leading to a lost source text referred to as *BuC). We can assume that at least one of the exemplars of B, C, and Bu was itself an anthology with miniature portraits representing the authors, similar to these collections. Another codex, the Würzburg one (E), contains songs ascribed to Reinmar and Walther. The earliest anthology to contain minnesong strophes is the codex of the *Carmina Burana* from the second fourth of the thirteenth century. Most of its songs are in Latin, but a few are in both Latin and German, and a number of the Latin songs conclude with a strophe in German. This codex includes neumes, an early form of musical notation. The form of neumes used cannot be read with any degree of precision; those reading them must have already known the melody and merely needed a reminder. A major fourteenth-century collection of songs with clearer musical notation, the *Jena Song Codex* (J), anthologizes almost exclusively didactic singers of the last half of the thirteenth and first part of the fourteenth century; it does have songs (with music) by Spervogel.

Almost always, the sorts of mistakes we find in these manuscripts were copying errors, not memory lapses; in addition, the song collections were clearly compiled primarily from previously extant (shorter) song collections. Often, when two codices have the same song, they transmit other songs in the same order. This is true, for instance, for extensive stretches of B and C (deriving from a lost source text *BC), of A and C (*AC), and of E and C (*EC). Though there are cases of divergent ascription (the same song or, more commonly, a related version of a song, ascribed to more than one singer), for the most part the manuscripts agree. Even if they were not fixed in writing on composition, as many may have been, it is unlikely that a large number of the songs spent a considerable time in oral transmission before they were collected and eventually, entered in A, B, C, E, and so on (or in the exemplars *AC, *BC, *EC); otherwise they would have lost the ascription to their authors. Though on occasion scribes may have arbitrarily assigned a song transmitted anonymously, whether orally or in writing, to a known author, the evidence speaks against this being a common practice. Many instances of multiple ascription arguably resulted from one singer appropriating (or, as we would say now, covering) another's song.

Friedrich von Hausen, Heinrich von Veldeke, and Rudolf von Fein, whose works can be dated with some precision to the 1180s and early 1190s, were singers from western German-speaking areas (or, in the case of Veldeke, a Dutch-speaking one) who closely modeled their songs on Occitan models. Motifs such as love from afar, a suitor's being spurned by a haughty lady, and hyperbolic praise of the lady's excellence abound. The singers concentrate on discussions of their own feelings and situations. Not infrequently, songs examine the nature of love, which is depicted as a mysterious and somehow novel force. As Hausen (MF 53, 15–17) asks (in Middle High German 'dactyls'): "Waz mac daz sîn, daz diu werlt heizet minne,/und ez mir tuot sô wê ze aller stunde/und ez, mir nimet so vil miner sinne?" (What can that be that the world calls love and that hurts me so at all times and deprives me of so much of my reason?) Typically, though not universally, the suitor's love is unrequited. Lovesickness, described in language echoing classical Antiquity, especially Ovid's love lyrics (but also reflecting symptoms dealt with in medical treatises), is foregrounded. While most minnesingers situate themselves, their actions, and their aspirations at court, Veldeke delights in introducing a song with images of nature. He employs a *Natureingang*, a device common in Medieval Latin songs that also occurs, more sparingly, in Occitan and northern French ones. A few of the earlier minnesongs (anonymous ones and some ascribed to Dietmar von Eist) show traces of the device, but Veldeke is the first minnesinger to employ it schematically. Scholars differ as to whether such nature introductions reflect folk songs or are literary borrowings from Roman Antiquity. Veldeke, in any case, clearly was emulating, in form and content, Medieval Latin songs (which may themselves mingle a sprinkling of folk-song motifs among their overt classical allusions). The predominant strophic form from Hausen on (for several centuries), often termed *Kanzone*, is tripartite, with a bifurcated *Aufgesang* followed by an *Abgesang*. Impure (slant) rhymes are rare.

Perhaps beginning slightly later than Hausen, Veldeke, and Fein, though probably roughly contemporary with them, Ulrich von Gutenberg and Heinrich von Rugge share, for the most part, their motifs and forms. They are less obviously directly dependent on romance models. For each of the two, however, an example of a new form is transmitted: the *Leich*, which suggests courtly listeners appreciated a singer's mastery of complicated forms and training in the sophisticated musical techniques of ecclesiastic circles. Rugge, especially, delighted in intricate internal rhyme schemes and wordplay of a sort that became typical of such thirteenth-century minnesingers as Gottfried von Neifen and especially Konrad von Würzburg. In one strophe, for example, he characterizes love with such a profusion of *minne* that nothing else is left: the first two lines of the *Abgesang* (*Minnesangs Frühling*, no. 102, 2–3) recount that *Der minne erzeige ich mit der minne,/daz ich ûf minne minne minne*. (I demonstrate to love through love that I love love for the sake of love.) He was apparently much admired by his younger contemporaries. Hartmann von Aue borrowed heavily from Rugge's crusading *Leich* in creating his own crusading songs. Reinmar der Alte not only emulated his love songs but may have sung some of them himself. Many songs attributed by the editors to Rugge are ascribed in the manuscripts to both. The thirteenth-century minnesinger Rubin, in turn, draws on both Rugge and Reinmar.

Two other minnesingers of the last decades of the twelfth century, Heinrich von Morungen and Albrecht von Johansdorf, utilize many of the same motifs and similar forms, but treat them with greater freshness and originality (traits that were not necessarily prized in their own times but have made their songs especially attractive to modern readers). Morungen has been thought to echo and heighten Romance and Medieval Latin traditions; interestingly enough, however, none of his songs seems to have a discrete model. Johansdorf, on the other hand, clearly shows familiarity with specific Occitan and northern French songs and singers.

Both couple fervor with wit, letting their suitors pant or even die for love while the poet/performer ironizes their plight. Johansdorf even carries this ironic stance into his crusading songs, all of which thematize the tension between service to the lady and service to God (since going on a crusade means leaving the lady behind). He concludes one such song with the statement and plea (*Minnesangs Frühling*, no. 90, 13–15): *alle sünde liez ich wol wan die;/ich minne ein wîp vor al der werlte in minem muote./got herre, daz vervach zu guote!* (I would eschew all sins but one: I love a woman in my heart more than all the world. Lord God, solve this dilemma to my benefit!) On the face of it, this is a bold rejection of total subservience to God. However, when we consider that earlier in the song we learn that the only real reason to undertake a crusade is to avenge the Muslim assertion that Mary was not a virgin, things get less clear. On the one hand, Johansdorf has consistently identified the lady as a somewhat fickle and demanding but, nevertheless, desirable woman of the court; on the other, he leaves himself the out that if his somewhat reluctant crusader were to be accused of impiety, he could easily maintain that his "sin" was merely loving the Holy Virgin too much.

Extolling the virtues of the lady with attributes normally associated with Mary, Morungen invites us to wonder at times whether he celebrates secular or divine love. He probably uses intimations of the sacred merely to intensify the profane. Within the lively, light-filled, and varied imagery of his songs, he combines the fire of passion with hyperbole that suggests playfulness. In his *In sô hôber swêbender wunne* (Such highly floating joy, *Minnesangs Frühling*, no. 125, 19), for example, the speaker heaps up ever more synonyms for joy about his requited love, ending with the assertion that his *liebe* (joy

or love) is so great that he cannot express it—after, of course, he has devoted four strophes to doing so. Whether the revelation in the *Aufgesang* of the fourth strophe, that the favor he has received was merely a word should lead us to find his joyful reaction risibly disproportionate or sublimely tactful depends on what we imagine the word to be. If the lady said yes, as Morungen has his suitor wish she would in another (overtly playful) song (*Minnesangs Frühling*, no. 137, 17), rapture is reasonable.

Better known for his narrative works, Hartmann von Aue is often underappreciated as a minnesinger, though his skill and range are indisputable. His themes range from stereotypical love laments to idiosyncratic rejections of love service. As he does in his narratives, especially in *Erec*, he actively addresses and draws in his listeners. In addition to developing a sense of the singer as performer, he introduces seemingly autobiographical elements into his songs. It is generally agreed that the poetic "I" of medieval courtly song is a convention; the would-be lover speaks not as a flesh-and-blood suitor but rather as a literary type. Hartmann, though he uses (and refers to) the conventions, also flouts them. His songs in the woman's voice and his crusading songs are remarkable for their diversity.

The most prolific minnesinger of the twelfth century, to judge from what has been transmitted, Reinmar der Alte, did not lack in wit, though scholars have tended to ignore it. Reinmar eschews imagery for the most part; the relatively infrequent images generally occur in only one of several versions of a song or in songs ascribed to him by the manuscripts that scholars attribute to other singers. His persona, the hapless suitor whose every attempt to win his lady's favors is rejected haughtily, weaves convoluted arguments and engages in intricate meditations on his pitiful plight, often losing sight almost completely of the putative object of his affections, so intent is he on bemoaning his fate. What scholars, put off by this stance, have tended to ignore is that Reinmar has more than one voice. Of all the minnesingers from the decades before and after 1200, he utilizes the woman's voice most frequently. Though Reinmar's ladies assume various stances (sometimes even different ones in different versions of the same song), in none of the songs and strophes in the woman's voice can we discern a haughty lady spurning a suitor's love. On the contrary, Reinmar's ladies typically yearn for the lover kept from them (and from their bed) by society or even by their suitor's diffidence. Clearly Reinmar plays literary motifs off against each other. It does seem, to be sure, that he is more than anything concerned about his status as a poet. He and other singers seem to have transformed stock figures, the spies and chaperones who are typically cursed for keeping lovers apart into critics whose concern is not with the lovers but with artistic skill and rivals—not (only) for the lady's favors but (even more) for the broader audience's approbation.

The minnesinger who vied most directly for Reinmar's audience and learned most from him (and others) and created an oeuvre of minnesongs more varied than any before (or since), as well as many other sorts of songs, was Walther von der Vogelweide, who flourished as a singer in the decade before and the three decades after 1200. No other singer has attracted, or deserved, so much attention. Walther created minnesongs in the conventional style but also borrowed and transformed love-song motifs from Medieval Latin and often reshaped tired motifs by introducing aspects of the pugnacious persona he developed so skillfully in his didactic and political songs: *Sangsprüche* and *Spruchlieder*—the former being single strophes devoted to a theme; the latter, multistrophic songs. The prominence of such nonamatory songs in his oeuvre make him unique among medieval German singers, most of whom either specialized in minnesong with at most an occasional *Sangspruch* or devoted themselves to didactic poetry virtually exclusively. Walther's *Leich* and a number of his other songs are notable for their religious fervor and their relative theological sophistication. He sang not only for secular courts but also for ecclesiastic ones, and it has been suggested that he was by training and possibly by station more closely aligned to the religious community than seems to have been the case for most minnesingers. Whatever his rank in society (probably a lower one than early scholars assumed, but perhaps higher than many more recent scholars have posited), he was intensely aware of privilege and propriety. He vigorously defends himself as a singer against rivals and other detractors, but his touchiness may in part stem from a sense of social inferiority.

Wolfram von Eschenbach, whose tilts with Walther occur in his narratives, devoted most of his creative powers as a minnesinger, as best we can determine from what is transmitted, to the dawn song. Five of the nine songs ascribed to him treat the joys and sorrows of loving and parting at daybreak, though one of them (*Minnesangs Frühling*, no. M/T IV), "Der helden minne ir klage," (The Complaint of the Love of Heroes), with its pithy observation that the heartbreak of parting could be ameliorated if one were married to the woman embraced, is more nearly an anti-dawn song. Wolfram's imitators in this genre were legion. The four conventional minnesongs, though they lack the weight, complexity, and power of Wolfram's dawn songs and were not similarly influential, do add a lyric grace note to the oeuvre of this titanic epic poet. The observation (*Minnesangs Frühling*, no. M/T IX 3, 7) [*manlich dienst, wiplich lôn gelîch ie wac* (manly service and womanly reward have always had equal weight) echoes the emphasis on knightly deeds as service of the lady so prominent in courtly romance.

Ulrich von Singenberg, a prolific minnesinger of the early thirteenth century who extols Walther as his master, borrowed from him some of the variety of song types, sharing a dual interest in minnesongs and the *Sangspruch*. He carried an enthusiasm for wordplay several of his models possessed to an extreme. His most striking departure from the conventional, preserved only in codex A (from *AC—the C scribe arguably deleted it as undecorous), is a two-strophe altercation between Ulrich's son and Ulrich about which of them should serve the lady that is appended to a five-strophe, conventional praise of her. Ulrich, whose aspirations do not seem to have included originality, may have gotten the notion of inserting himself and his son into courtly song from Neidhart, whose innovations reshaped the landscape of minnesong.

Neidhart drew on the traditions of courtly love songs and of the *postourelle* (a dialogue between a shepherdess or other peasant girl with a knight or cleric) to develop a wide range of satiric songs. Most of his songs set in the summer have dialogues between peasant girls or between a peasant girl and her mother or monologues by an older woman about an anticipated dalliance (often at a dance) with a knight of Riuwental (hence the appellation von Reuentel often given Neidhart). The older woman becomes a comic figure through her fervent desire for pleasure (sometimes expressed with the tropes of conventional minnesongs). Some summer songs present a wry, disillusioned view of the crusade as far less heroic and desirable than it is depicted to be in songs by Hartmann and Walther, for example. Many of Neidhart's winter songs culminate in a barn-dance battle between village louts who preen themselves as knights. Neidhart laments the loss of his dance partner or her loss of her mirror (a token of love? of poetry? of virginity?) to such as these. Or he praises her ring of hair into which he can thrust his "finger." Other winter songs begin more like typical courtly love laments, only to have the "courtly" world transform itself into one of parvenu peasants or to conclude with the introduction of the persona of the singer as an impoverished knight von Riuwental (vale of sorrows). The rare songs without such a clash between the ideal world of courtly song and a harsh rural reality make us wonder if a strophe or two might not have gotten lost. Yet other winter songs are laments that one has been too long involved in and with the world, such as we find among the songs of Hartmann, Walther, or Singenberg, with the often abrupt intrusion of country bumpkins. Does Neidhart parody an uncouth (provincial?) court or mock a rich peasantry with airs above its station? Perhaps both. Some early songs ascribed in manuscript C to Neidhart already present him as the protagonist in a ribald tale. Neidhart then becomes a literary figure in the role of an enemy of the peasants. A relative profusion of melodies is transmitted for Neidhart's songs.

A large number of more conventional minnesingers flourished in the thirteenth century, though Neidhart's influence and popularity peek through when one least expects them. Otto von Botenlouben creates noteworthy dawn songs. Burkhard von Hohenfels draws his elaborate nature imagery as much from scholasticism as from the world around him. Ulrich von Winterstetten introduces refrains as a standard feature of German songs. Walther von Metz tracks the history of minnesong with his borrowings. Gottfried von Neifen glories in formal artificiality but also creates a "peasant" song. Ulrich von Liechtenstein not only tries himself in many genres and invents some of his own but also creates a narrative framework for himself as minnesinger in his *Frauendienst* and offers commentaries on his own songs. Tannhäuser's dance *Leichs* blend Neidhart's world with that of a court enamored with French fashions and vocabulary (traces of which can already be seen in some of Neidhart's songs). Steinmar complements his traditional minnesongs with a rollicking harvest song, in which wine is preferred to women, and a bucolic dawn song, in which the lovers are peasants and the bed for their tryst is a pile of hay. Konrad von Würzburg, whose minnesongs make up only a small part of his extensive oeuvre, excels in the ornamental use of rhyme.

Most of the minnesingers are from the south. Though some of the most prolific didactic singers, such as Reinmar von Zweter and Marnar, lived and sang in the south, didactic singers such as Meister Rumelant, Suchensinn, Regenbogen, and Frauenlob tend to be from or have flourished in the north. The minnesong codices A, B, and C, from the southwest, do contain didactic songs, but love songs dominate; the major anthology of didactic songs, J, from the northeast, has few love songs, among them the Low German songs of Wizlav von Rügen. Probably the provenance of the codices has skewed the

evidence, but it may well be that the courts to the south of Thuringia were more receptive to love songs and those to the north to didactic ones. Those in the middle appreciated both. Many of the didactic singers were probably not noble; their names often appear to be literary ones, as von der Vogelweide or von Reuental may have been. Frauenlob, Heinrich von Meissen, gained his (nick) name for his songs in praise of Mary, especially his magnificent "Marienleich." Often the didactic songs reflect scholastic lore and some, though not all, of these singers will have had a clerical background. Increasingly, their language became obscure. Frauenlob and others at the end of the thirteenth and beginning of the fourteenth century prided themselves on their flowers of rhetoric (*geblümter Stil*), most of the minnesingers were nobles or ministeriales, or at least identified themselves with noble courts. Clearly, however, there was no hard-and-fast rule dividing the two types of singers, and many songs could be considered either a minnesong or a didactic one. Though the mastersingers held up members of both groups as exemplary (*alte Meister*), they tended to model their own songs on the didactic ones. The Colmar Song Codex from around 1470, the most extensive fifteenth-century mastersong codex, has some songs (erroneously) ascribed to Walther, Wolfram, Neidhart, and Tannhäuser (the ascription may have simply signaled that the form and melody were borrowed), as well as a generous number of songs by didactic singers.

Mithras

The Roman army first introduced the cult of Mithras to the Germanic tribes living along the banks of the Rhine and Danube Rivers in the second century, and it remained the religion of choice for the military and merchant classes in the outer Roman provinces until the collapse of the western empire in the fifth century. Throughout this period the Romanized Germans embraced the cult to an extent unseen elsewhere in the Roman colonies, and Mithraism's influence among the Germans spread well beyond the imperial frontiers, reaching all the way to Scandinavia and the Baltic region. The depth of Mithraism's influence on the Germanic consciousness is as familiar as the names of the days of the week in the modern Germanic languages. The Roman day-names reflect Mithraic cosmology and—in a neat reversal of the familiar *interpretatio romani* (world view based on Roman perspectives)—were adopted by the Romanized Germans in the second century and translated to fit their native pantheon. About this same time, Scandinavian artisans began to produce amulets modeled on Roman coins featuring motifs borrowed from the coins themselves as well as from Mithraic monuments.

Evidence suggests that Mithraism was an exclusively male cult and that most of its adherents were soldiers. It was a mystery religion without a sacred literature, and its mysteries were preserved and transmitted via a body of elaborately symbolic art, an apparently no-less-elaborate liturgy, and a seven-tiered process of initiation. The central figure in Mithraism is the god Mithras, who was celebrated as savior, world renewer, invincible god, and ally both of the great god of the sun, or shining sky, and of mortal rulers. He always is depicted as a powerfully built youth clad (sometimes only) in a Phrygian cap and blue cloak and armed with a dagger or short sword. The central mystery of the cult was the regeneration of the universe through Mithras's slaying of the cosmic bull, a feat that was reenacted in its liturgy and also provided the favorite subject for its sacred art. It was especially popular in the heavily garrisoned Rhineland and around the seaports of the Low Countries.

Mithraism's influence on Germanic literature cannot be demonstrated directly because neither the cult nor the Germans of late antiquity recorded their myths or religious practices in writing. Nevertheless, Mithraic art and architecture offer many striking parallels to the preChristian mythology and heroic legends of the Germans, in particular to the figures of Sifrit (Siegfried), Sigmund, and Sigurd and the dragon-slaying tradition associated with them. The names of all three heroes share the protheme *sîge-* (victory), a name element associated with the worship of the Germanic god Wotan, the decider of battles and patron of the noble class whose cult arose in the Migration Age under the influence of Mithraism. Sifrit and the Nibelung legends express especially powerful affinities with Mithraism: Sifrit is associated in the *Nibelungenlied* with the city of Xanten "down by the Rhine," his mysterious magic cloak (*tamkappe*) recalls the distinctive cap and mantle of Mithras, and his most famous feat, the slaying of the dragon, has much in common with Mithras's sacrifice of the cosmic bull.

The ideal *mithreum*, or Mithraic temple, was a natural cave proximate to a spring or other source of fresh, running water. All *mithraea* were subterranean and built to imitate caves where natural caves were lacking. The cave is of central importance in Mithraism because the cult held the universe to be a cavelike pocket of ordered matter amid immaterial chaos, and Mithras performed the sacrifice of the cosmic bull in a cave after capturing it in open country. Representations of the bull sacrifice emphasize Mithras's reluctance at the very moment he plunges his blade into the bull's nape. Similarly, Sifrit ambushes the dragon outside the beast's lair beside a stream while the hero himself lay in a trench that further recalls the Mithraic cave. This formula in which a hero engages a monstrous adversary in or just outside a cave or barrow proximate to water also is echoed in the dragon fights in *Beowulf*, in the Icelandic lays of Sigurd and Fafnir, and again in the Norse epic *Volsunga saga*. Moreover, the Germanic dragon slayer typically engages his prey without rancor and at the behest of some third party, and his defeat of the beast brings immense wealth to his folk, just as Mithras's reluctant sacrifice of the bull liberates its life force and reinvestigates the universe.

Monasteries

Although monasteries and religious houses came to dot the landscape of medieval Germany no less than in the rest of Europe, their initial position was different. Most of "Germany" lay beyond the Roman Empire, which had adopted Christianity as its sole official religion in the fourth century. In the province of Gaul there were already about two hundred monasteries by the year 500, and about four hundred by the year 700. Across the Rhine, by comparison, monasteries were an integral part of the expansion, creation, and conversion of medieval Germany.

Thus Fulda was founded in 744 by the Anglo-Saxon monk Boniface, the "Apostle of the Germans," as a base for missionary work. Chrodegang, bishop of Metz (d. 766), wrote a rule for secular canons who lived in community and sang the Divine Office, but who, unlike monks, were not obliged to forgo private property. Charlemagne promoted the adoption of this rule by cathedrals and collegiate churches and of the Rule of St. Benedict by monasteries, and he ordained that all these institutions establish schools and copying-rooms (*scriptoria*) for the preservation of texts. Abbeys like St. Gall and Reichenau were great centers of Carolingian cultural activity.

With the advance of the Franks, the Bavarians, and their successors, monasteries came to be planted in the lands of the Saxons and the Slavs. Although the reform "order" of Cluny scarcely penetrated into Germany, in the tenth and eleventh centuries Gorze, Stavelot-Malmedy, and Hirsau and other houses played a definitive role in the monastic reform movement. Interestingly, the great religious orders founded during the flowering of the twelfth and thirteenth centuries—the Cistercians, Carthusians, Premonstratensians, and the mendicant Franciscans, Dominicans, Augustinians, and Carmelites—all had their origins elsewhere (especially in France and Italy). Two of these orders, however, were founded by Germans: Bruno of Cologne, who established the Carthusians, and Norbert of Xanten, who founded the Premonstratensians. Both orders were a bit eccentric: the Carthusians were austere eremitical, living mostly in their individual cells and coming together at best weekly, and in the late Middle Ages celebrated as the only religious order not requiring reformation, while the Premonstratensians were regular canons, living communally as monks, but also actively engaged in pastoral work rather than withdrawal from the world. Significantly, Bruno and Norbert created their orders in France, not on German soil. Just as no major heretical movement came out of medieval Germany, so too no major religious *order*.

Yet in the late Middle Ages the Rhineland did produce some significant religious *movements* that modified monastic ideals and practices for lay people living in the world and thus tended to break down the barriers between clergy and laity, thus paving the way for Luther's assault on monasticism and insistence on the priesthood of all believers. Chief among these movements were the Beguines, the Beghards, and the Brethren of the Common Life.

As in much of the rest of Europe, monasteries and religious orders in Germany were in trouble in the late Middle Ages. By the mid-fourteenth century, all save the Carthusians were thought in desperate need of reform, including the mendicants, which had arisen just a century earlier. The popes launched reform initiatives beginning in the 1330s, and during the next two centuries members of the orders, often aided by princes and governments, achieved varying levels of success. Among the more conspicuous were the Benedictines, for which the monasteries of Melk, Kastel, and Bursfeld created reform "congregations." No fewer than eighty houses belonged to the Bursfeld Congregation by circa 1520. Similarly, Augustinian canons could look to the congregation of Windesheim, which numbered eighty-seven houses by 1500. Yet many monasteries, including the famous abbey of Weißenburg in Alsace, refused to reform and found an escape by formal conversion to collegiate churches. The strongly aristocratic character of the German church proved to be a major impediment to reform.

Monasteries for women in Germany deserve a special note. As in England and a few other places in Europe, there were here a number of double monasteries, with branches for women and men, but ruled by abbesses. As in the rest of Europe, monasteries in Germany provided refuges and protection for women and their property, but they seem also to have been peculiarly nourishing of women. It is probably no accident that out of German monasteries came Hroswitha of Gandersheim, the first dramatist of the Middle Ages; Hildegard of Bingen (1098–1179), one of the most formidable figures of the twelfth century; and a significant number of mystics like Mechtild of Magdeburg. One possible factor was that in the political world of Germany it was possible for a woman like the imperial princess-abbess of Essen to cut a large swath. (Women also held their place in the guild system and the world of work longer in Germany than they did elsewhere.) Whatever the reasons may be, women in monasteries tended to resist the introduction of the Reformation in the sixteenth century more stoutly and successfully than men did.

On the eve of the Reformation, there were in Germany no fewer than 160 Benedictine, 120 Premonstratensian, 80 Cistercian, 125 Franciscan, 70 Dominican, 60 Augustinian, and 50 Carmelite houses, as well as around 300 collegiate churches of all sorts.

Monasticism, Dutch

Since the slow process of Christianization in the Low Countries took place from the south to the north, the oldest monasteries are situated in the southern Netherlands. Particularly the Irish missionaries, mostly monks themselves, were active here in the founding of monasteries, using them as outposts in a mainly pagan area. By the beginning of the eighth century, thus about forty monasteries were founded in the south, among which important abbeys as Lobbes (at the Sambre River), Sint-Truiden, Echternach (in present-day Luxemburg), and Sint-Baafs (in Ghent). The regions north of the river Rhine, only partly christianized in the ninth century, had no monasteries in the early Middle Ages. Even though there existed a chapter of canons at the cathedral church in Utrecht, it was not until circa 1000 that the first monastery in the northern Netherlands was founded, the abbey of Hohorst near Utrecht.

In most parts of the Low Countries, especially in the north, the number of monasteries therefore was only small at that time. This changed drastically, however, in the period around 1100. From the reform movement in the church then arose two new monastic orders, the Cistercian and the Premonstratensian, which really flourished in the Low Countries. The reasons for their success were many. In the first place, some of these regions thus far virtually had no monasteries, so the new orders found fertile soil here. In the second place, the bishops here supported these new orders vigorously and the laymen were eager to donate properties to them. As a result, in less than a century several dozens of Cistercian and Premonstratensian abbeys were founded in the Netherlands. Apart from monastic services, these institutions also devoted themselves to public tasks. Though not to the extent suggested in earlier literature, in some cases they played an active part in land reclamation, diking of rivers, and cultivation of wasteland. In addition, they played an important role in spiritual care in countryside parishes and also created huge farms operated in a comparatively rational fashion. Famous in this last respect are the Cistercian abbeys of Ten Duinen en Ter Doest, which owned ten thousands of acres in the coastal areas of Flanders and Zeeland.

As in other parts of Europe, these abbeys grew richer and richer as a result of their religious and economic success. The wealth they acquired, however, evoked serious criticism from new monastic movements that placed special emphasis on the vow of poverty, such as the Franciscans and the Dominicans. These mendicant orders, whose members lived in extreme sobriety, became very popular in the economically and demographically fastgrowing cities of Holland and Flanders, where dozens of new convents were founded during the thirteenth and fourteenth centuries. Yet as in the course of years these orders, too, lost some of their religious splendor, a new movement developed in the northeastern regions of the Netherlands at the beginning of the fifteenth century, called the Modern Devotion. Inspired by their religious leader, Geert Grote, groups of men and women (the brothers and sisters of the Common Life) started living together in poverty and devotion, but without adopting a monastic rule. This movement exercised a strong influence on the religious orders, which also tried to reform themselves, and on the spiritual life in general, in the Netherlands as well as elsewhere.

As a result of this strong reform movement on the eve of the Reformation, monastic life in the Netherlands was fairly sound. Notwithstanding this, in the late sixteenth century an abrupt end came to the monasteries in the northern parts, because the Calvinist rebels against the Catholic Habsburg regime gained military and political control over these regions. They prohibited the practice of Catholicism and abolished all monasteries. In the south, on the other hand, the Catholic government stood its ground. Here the monasteries were damaged by the Iconoclasm of 1567 and the frequent military clashes but anyhow continued their existence into the modern era.

Mönch von Salzburg, Der (fl. 2d half of the 14th c.)

Known variously as Hermann, Johans, or Hans in the over one hundred manuscripts in which his songs are transmitted, the Monk of Salzburg was the most prolific and popular German singer of the fourteenth century. His six polyphonic pieces are the earliest surviving partsongs in German. His forty-nine secular and fifty-seven religious songs represent nearly every genre current in fourteenth-century German singing, including the hymn, the sequence, the new year's song, the alba, the drinking song, and the *Leich* (lay). Virtually nothing is known about his life except that he moved in the courtly circles of the archbishop of Salzburg, Pilgrim II von Puchheim (r. 1365–1396).

His melodies fall between those of two dominant medieval German genres, *Spruchdichtung* and *Meistergesang*. Some reflect the traditional German e-based modalities (phrygian), though many tend toward the modern major, beginning on E or B-natural and ending on C. The songs are frequently adorned with richly textured preludes, interludes, and postludes. He sometimes favors *melissmas* at the beginning and end of lines and makes frequent use of refrains. "Josef, liber neve min" (Joseph, My Dear Nephew), a German Christmas song still sung today, is attributed to him in one of the manuscripts.

The monk's secular poetry combines themes of the courtly lyric and folk songs, earthy but sometimes simple and affecting, with strong reminiscences of the rhetoric of *Minnesang* and of the Neidhart tradition. His religious songs, some translations of Latin hymns, are closely akin to and probably influenced the songs of the Meistersinger in the fifteenth century. The most gifted German-language lyric singer of the next generation, Oswald von Wolkenstein, was indebted to the monk in both text and melody.

Morgarten, Battle of (November 15, 1315)

In 1291 the three Alpine communities of Uri, Unterwalden, and Schwytz swore an "Eternal Alliance," there-with seeking their independence from local dynasts, most particularly the Habsburgs. In the disputed royal election of 1314, they showed their support for Ludwig von Wittelsbach against his rival, Frederick "the Handsome" von Habsburg, by sacking the Abbey of Einsiedeln. To punish these upstarts, Duke Leopold I von Habsburg of Austria (1293–1326) collected a large army of several thousand and marched along the narrow path of Morgarten to reach and attack Schwytz. When the vanguard was halted by a hastily built rampart, the knights jammed up along the narrow mountain road. Then the Swiss tumbled boulders and logs down on the army. In the resulting panic, the knights trampled their own infantry or fell down the mountainside. Finally, the Swiss moved in and butchered the Austrian forces, probably using their famous weapon, the halberd.

Throughout Christendom many nobles were shocked by the defeat of knights by mere peasants. The battle helped to secure the growing strength of the Swiss Confederation and the reputation of its fighting men.

The story of Moriz von Craûn exists today in only one early sixteenth-century manuscript, the *Ambraser Heldenbuch* (Seria nova, No. 2663, Austrian National Library, Vienna). *Moriz von Craûn*, 1,784 lines, appears on folios 2va–5vc, in the manuscript of 238 oversized folios (460 mm×360 mm). The name of the original poet, the precise date of composition (somewhere between 1173 and 1250), and the source (probably French) are unknown. From the rhymes and the choice of vocabulary, we can deduce that the poem was composed in the language region between Low or Rhenish Alemannic and Rhenish Franconian, i.e., between Strasbourg and Worms.

The story begins with a lengthy prologue of 288 lines in which the poet summarizes the course of chivalry (*translatio imperii*) since its inception in Greece—from Troy to Rome to France. Moriz von Craûn is a perfect knight who serves the countess of Beaumont, demonstrating his claim to chivalry in a number of somewhat distorted ways: he builds a ship that sails across the land on wheels pulled by hidden horses; he performs in a tournament, defeating countless knights. He is generous to a fault, giving away all his possessions. Moriz comes to the countess after the tournament, dirty and bloody and thus showing his complete devotion, to claim his reward. The countess makes him wait for her and thus he is asleep when she arrives for the rendezvous. She stalks away. Moriz awakes and decides to claim his reward without her consent. He finds the count and countess in bed. The count wakes up, sees Moriz approaching, and believes him to be the ghost of the knight he accidentally killed in the tournament; he jumps up in fright and strikes his shinbone, rendering himself unconscious on the floor beside the bed. Moriz slides into bed exclaiming: "This bed is half empty." The countess, not knowing the fate of her husband, now decides to give Moriz his reward. When they are finished, Moriz stands up, gives her back her ring, and reproaches her for not immediately giving him his reward. He rides away from the castle, and the countess repents her deeds.

For years scholars have questioned the genre of *Moriz von Craûn*: novella, *Schwank* or farce, exemplum (didactic tale), parody, fabliau, *mære*, short story, or *Erzählung*, whether it is courtly or anticourtly, a serious didactic work, an outrageous parody, or all the above. The text contains many elements characteristic of medieval culture and medieval literature: a strict—even classical—form and structure; descriptions of nature, armor, a castle, a tent, a tournament, a ship on wheels, a fantastic bed, a lady's chamber, and exotic birds and animals; courtly love according to Andreas Capellanus and his modern interpreters, pushed to its ridiculous logical conclusion (the concept of *dienstlôn*); lessons on chivalry; possible parody, and certainly satire as well as evidence of medieval knowledge of history (*translatio imperii*) and the classics.

Moselle River

The source of the Moselle (German Mosel; French Moselle) River lies at Col de Bussang in the southern part of the Vosges mountain range of Lorraine; it flows in a generally northern direction past Metz and Trier, before beginning its twisting and turning course between the Eifel and the Hunsrück Massifs, and emptying into the Rhine River at Coblenz. The length of the river is some 335 miles (about 545 kilometers), and its course, together with that of the tributary rivers Saar, Sauer, Kyll, Ruwer, and Lieser, has provided the setting for settlements since pre-Roman times. Metz, lying at the confluence of the Moselle and the Seille Rivers, became the capital of Merovingian Austrasia in the sixth century; Trier, founded in 15 B.C.E. as Augusta Treverorum at a point where the river valley widens out, took its name from the nearby settlement and tribal sanctuary of the Treveri; it became an imperial residence toward the end of the third century, and it was here that Constantine the Great resided 306–312.

Tradition has it that Caesar Augustus introduced the grape, the walnut, and various fruits and flowers into the Moselle valley in 15 B.C.E. Certainly the mild climate of the region made it attractive, as did the numerous hot springs. During the tenth century, viticulture experienced remarkable development in the Moselle region, typical of what was happening along the Lot, the Seine, the Oise, and the Yonne. Long before the eleventh century the Moselle region became densely settled, with both the Hunsrück and the Eifel exhibiting high levels of demographic growth in the eleventh and twelfth centuries. Towns such as Wasserbillig became market centers as early as 1140. The region was also home to religious communities, such as the monastery Springiersbach, founded about 1150.

The Moselle formed an important and ancient trade route, in connection with the Rhône and the Saône. During the Middle Ages it was navigable as far as Remiremont and Épinal, but large boats could travel only as far up as Toul. Its significance as a major transport route therefore began at Toul, and in the mid—eleventh century boats from Toul were paying tolls at Koblenz. Venantius Fortunatus reports of a boat trip taken in 588 from Metz to Andernach; Bishop Gregory of Tours mentions the salt trade between Metz and Trier on the Moselle. In addition to salt, Moselle commerce was in wine, grain, wood, honey, wool, and also cloth.

The Moselle valley lay at the center of the Moselgau, that administrative district that arose in the aftermath of the collapse of the Carolingian Empire; the counts of the Moselgau appear in documents well into the twelfth century. The role of the Moselle in the context of territorial lordships (among others, the archbishopric of Trier; the bishoprics of Metz, Toul, and Verdun; the duke of Lotharingia; and the counts of Bar, Luxemburg, and Sponheim) can be seen in the numerous fortresses that overlook the river. Cochem, sometime known as the Reichsburg (imperial castle) and a frequent residence of the Lotharingian pfalzgraves, dates from 1027; the Burg Eltz dates from about 1160; the Gravenburg was also built in the twelfth century near Traben-Trarbach; while the Burg Thurandt (at Alken, fifteen miles from Koblenz) belonged to the future Pfalzgrave Henry of Welf, the son of Duke Henry the Lion, in 1192. From Metz downward there were also numerous toll stations on the river.

In the later Middle Ages, the Moselle lost out to the Maas/Meuse as a major trade artery, and economic decline set in.

The reputation of the painter Lucas Moser rests on a single work, the altarpiece with scenes from the life of Mary Magdalene in the former chapel of the Virgin (now the parish church) in Tiefenbronn, near Pforzheim in south-western Germany. An inscription dates the work 1431 or 1432—the last digit is hard to read with clarity—and names "Lucas Moser, painter from Weil," a nearby town, as its author. Apart from this brief mention, nothing is known of the artist's life or career, and attempts to link him with documentary mentions of painters named Lucas in this area and with other works have not been widely accepted. Even the attribution of the Magdalene altar to Moser was disputed in a highly controversial book on the altarpiece published by Gerhard Piccard in 1969. Considering the inscription as a nineteenth-century forgery, Piccard assigned the work to a follower of the Sienese painter Simone Martini and argued that it had been made for the church of the Magdalene at Vézelay in Burgundy. Piccard's book, which received much publicity in advance of its publication, occasioned numerous rebuttals afterward, many of them based on new art historical or technical work. Current consensus holds that the inscription is not modern; that the altarpiece was made for its present position, where its unusual shape reflects that of the wall painting underneath, which it replaced; and that the coats-of-arms, which may have been added very slightly later, represent the patrons of the work, Bernhard von Stein and his wife, Agnes (Engelin) Maiser von Berg.

The central part of the altarpiece is occupied by episodes from the life of Mary Magdalene as told in the *Legenda aurea*. At the left, the saint and her companions, set adrift by pagans in a rudderless boat, approach the coast of Marseille, portrayed here in a recognizable view. In the center, the saint's companions are asleep below, while in the attic room above, the Magdalene appears to the ruler's wife in her sleep to ask her to intervene with her husband on behalf of the Christians. In the final scene, angels deliver the saint, clothed only in her hair after long years in the desert, to a church where the Bishop Maximinus administers her the last rites. In the unusual arched upper panel, the Magdalene washes the feet of Christ, while bust-length figures representing Christ as the Man of Sorrows in the midst of the Wise and Foolish Virgins fill the long, horizontal predella below. On feast days the unusually narrow wings would have been opened to reveal the siblings of the Magdalene, Saints Martha and Lazarus, painted on their insides, flanking a sculpted figure of the Magdalene (now replaced) at the center of the shrine.

Moser's style provides some clues to his early training. His individualized head types, exceptional interest in detail, and use of disguised symbolism indicate knowledge of Flemish painting. Charles Sterling sees Moser as "a close follower of Robert Campin" and notes particularly the use of a continuous background across the four scenes of the center of the altarpiece, a device the Fleming had used as early as about 1420 (1972:19–22). Sterling also suggests the influence of Flemish and Franco-Flemish manuscript illumination and the possibility of a trip to Provence. What is clear is that Moser's only known work is a masterpiece in both its style and its virtuoso handling of material and technique.

Mühlhausen

Archaeological finds indicate a fifth-century fortification and church at the strategic site where north/south and east/west trading routes intersect with the Unstrut River. Gregory of Tours reports that the Franks defeated the local Thuringians in 531; Christianizing missions and the establishment of an administrative center for both economic and military purposes followed. The first mention of Mühlhausen by name dates to 967, when Otto II, still during his father's lifetime, issued a document here; this is the first of a number of recorded visits by the Ottonian emperors and indicates that the site had a certain importance. It also suggests that a palace must have stood here by this date. A notice in an eighteenth-century chronicle credits Otto I with building a church here in 970. While this late mention has sometimes been discounted and the earliest incarnation of the Marienkirche (Church of the Virgin) dated to the reign of Henry III (1039–1056), Ulrike Gentz has argued for the earlier date on the basis of similarities to the cathedral Otto founded at Magdeburg in 955. In 974 Otto II gave his wife Theophanu *civitas* and *curtis* (city and court) at Mühlhausen.

From about 1000, the city was organized around several centers; the two most important of these were the Altstadt, or Unterstadt (Old Town, or Lower Town), around the parish church of St. Blasius and the Neustadt, or Oberstadt (New Town, or Upper Town), organized around the Marienkirche along a ridge. The association of the latter with the imperial interest in Mühlhausen can be seen in the long triumphal axis that stretched from the church of St. Johannes (St. John's) to the facade of the Marienkirche; similar processional routes existed at the imperial cities of Speyer, Würzburg, and Augsburg. As a result of its strategic location Mühlhausen continued to be of interest to the Salian and Staufer emperors; Henry IV held an assembly of princes here in 1069, and about 1180 Frederick I Barbarossa extended the palace and allowed the city to build a defensive wall.

Mühlhausen experienced a second flowering in the late Middle Ages. The city's financial well-being, largely a result of the cloth trade, expressed itself in a building boom. The extent of a fire in 1244 remains unclear; much of the area around St. Blasius was destroyed, and the historian Gentz sees the fire as grounds for rebuilding the south tower of the Marienkirche. Steps toward governmental independence culminated in the citizens' destruction of the royal palace in 1256; the choir of the Marienkirche was extended using stones from the razed buildings. A polygonal apse was added to the choir of St. Blasius about 1270 and a Gothic nave finished circa 1300–1310. Its hall church form is based on that of St. Elizabeth's at Marburg, which, like both St. Blasius and the Marienkirche, was under the control of the Teutonic Order. A fire in 1315 seems to have necessitated rebuilding the latter as well, and in 1317 the archbishop of Mainz issued an indulgence to support the building effort. Work proceeded haltingly, however, slowed by the political disturbances in the city in midcentury. The long choir with two shorter, parallel side chapels reflected the modern choir type recently erected at St. Stephen's in Vienna. Concentrated work on the transept and nave dates to the second half of the century. Twelve of Mühlhausen's sixteen medieval churches still stand; with the Marienkirche and St. Blasius, many of them date to the building boom of the late thirteenth and fourteenth centuries: the church of the Franciscan friars, also known as the Kornmarktkirche (church at the grain market); St. Petrus (St. Peter's); and the Jakobikirche (church of St. James), among others.

The mention of the Rathaus (town hall) in 1310 and 1320 reflects the city's steps toward self-government, and in 1348, when Charles IV exempted the city from its tax obligations, it achieved the status of *freie Reichsstadt* (imperial free city). In 1362 Charles made a further decision to the city's advantage, when he settled a long-standing dispute between the Teutonic Order and the city council in the latter's favor. The unusual sculptural group installed on the Marienkirche after 1362, perhaps about 1380, mirrors the emperor's interest in and protection of the city. On the south transept exterior, facing toward the city center, four over-life-size figures lean out from a balustrade to address the passers-by below. The pair at center—a crowned male figure and veiled woman—must represent Charles IV and his wife, the two outer figures well-placed courtiers. As at the Frauenkirche (church of the Virgin) at Nuremberg, where a second-story balcony allowed the ceremonial presentation of the king to the crowds below, Charles addresses his subjects, in this case the members of the city council, who were required to pay homage to the king on this site once a year. There is no evidence that Charles ever visited Mühlhausen, but in these sculptures, the city council gave visual expression to the city's long and prosperous history of imperial connections.

Working in stone, wood, and metal, Multscher was Ulm's foremost sculptor during the mid-fifteenth century. Originally from the countryside near Leutkirch in the Allgäu, he moved to Ulm by 1427, when he was accepted as a freeman, married Adelheid Kitzin, daughter of a local sculptor, and became a citizen. Since he already owned a house in Ulm, Multscher may have arrived a few years earlier. Where and with whom he trained are unknown. Artistic influences in his work suggest he traveled to the Rhineland, Burgundy, and the Low Countries during his *Wanderjahr* (year as a journeyman).

Multscher's large workshop produced both single figures and complex retables with painted panels. His name is inscribed on the Karg Altar of 1433 in the cathedral of Ulm, whose statues were destroyed during the Protestant iconoclasm of 1531. Multscher signed the painted wings of the large Wurzbach Altar from 1437, portions of which are in Berlin (Gemäldegalerie). This altarpiece may have been executed for the Church of the Assumption of the Virgin (St. Maria Himmelfahrt) in Landsberg am Lech, where the large stone Madonna and Child remains. Between 1456 and 1459 Multscher and his workshop prepared the high altar of the parish church at Sterzing (Vipiteno) in South Tyrol; the remnants of this altar, which was dismantled in 1779, are divided among the church and the Museo Multscher in Sterzing, the Ferdinandeum in Innsbruck, the Bayerisches Nationalmuseum in Munich, and a private collection in Basel. These works form the basis for other attributions. Although Multscher is often cited as a painter, there is little evidence that his personal involvement extended beyond his roles as workshop head, master designer, and sculptor of some of the statues.

The artist introduced a greater sense of realism into southern German art. At a time when the lyrical Soft

Hans Multscher, Man of Sorrows, Ulm, cathedral, porch. Photograph: Joan A. Holladay

Style with its Beautiful Virgins, gracefully curved poses, and elongated proportions was popular, Multscher developed solid, more naturalistic figures that display the general influence of Netherlandish post-Sluterian sculpture. The Landsberg Madonna and Child from 1437 still includes hints of the Soft Style with its swaying stance, yet her inherent stability, the clear treatment of the deeply cut drapery folds, and the marvelously animated Christ Child who squirms in Mary's grasp reveal Multscher's new aesthetic sensibilities. Using this and related works, scholars have attributed to Multscher several slightly earlier projects. The most significant of these are the images of Charlemagne and other figures made circa 1427–1430 to adorn the eastern window of Ulm's city hall (the originals are now in the Ulmer Museum), the life-size Man of Sorrows from 1429 above the western entry to the cathedral of Ulm, and the alabaster Trinity group from circa 1430 in the Liebieghaus in Frankfurt. The half-nude Christ evocatively displays his wounds to all who enter the cathedral. Its spirit recalls similar Christ figures by both Claus Sluter and the Master of Flémalle. Related to the Man of Sorrows is the slightly later model for the tomb of Duke Ludwig the Bearded of Bavaria (1435, now in the Bayerisches Nationalmuseum, Munich). Employing fine Solnhofen limestone rather than the coarser sandstone that he typically used, Multscher devised a highly detailed scene of Ludwig kneeling before the Holy Trinity. The tomb, intended for Ingolstadt, was never executed.

In the ensuing decades Multscher and his shop supplied numerous Madonnas, crucifixions, and other religious figures for churches near Ulm. His most notable creations include the tomb effigy of Countess Mechthild von Württemberg-Urach (1450–1455), now in the Stiftskirche in Tübingen; the bronze reliquary bust (ca. 1460) in the Frick Collection in New York; the life-size wooden *Palmesel* (palm donkey, 1456, Ulm Museum), which was made initially for the church of St. Ulrich and Afra in Augsburg, and the now divided Sterzing High Altar. The latter was made in Ulm and then transported to Sterzing, where Multscher and several assistants spent about seven months erecting the altarpiece in 1458 and early 1459.

Munich

Although the first written mention of a village at the site of Munich (Bavaria) dates from the eighth century, archaeological evidence attests to the presence of a settlement during the sixth and seventh centuries. Legendary etymology linking the earlier name *Munichen* to the phrase *zu den Monchen* (at the monks' place) is questionable. Excavations in 1945 revealed that a parish church built during the mid-eleventh century existed at the present site of St. Peter's, the oldest parish church in Munich (1181). As a city, however, Munich's development began in 1158 with an act of aggression on the part of Duke Henry the Lion. Endeavoring to secure toll revenues for himself from an important salt transport route and to increase his political power as well, Henry destroyed a bridge over the Isar River in Oberföhring that was controlled by Bishop Otto of Freising and built a new bridge a few miles further upstream in his own territory. He fortified the new bridge, instituted a court of law, and established a mint and a market in the existing town. In 1180, following an altercation between Duke Henry and Emperor Frederick Barbarossa, nephew of Bishop Otto and cousin to Henry, the emperor gave control of the city to the bishops of Freising. Munich remained under church rule until, in 1240, the emperor awarded the duchy of Bavaria to Otto of Wittelsbach in return for the latter's loyal service. Munich became the residence of the Wittelsbachs when Ludwig the Stern (der Strenge), grandson of Otto, built a palace (Alter Hof) there in 1253–1255. The city continued to be the dukes' residence throughout the medieval period, increasing in importance when it became the capital of all Bavaria in 1505 consequent to the death of the last duke of Landshut, George the Rich (der Reiche), and the unification of Upper and Lower Bavaria under the Munich branch of the Wittelsbach family.

In 1327, fire destroyed one-third of all the buildings in Munich. After the fire, Duke Ludwig of Bavaria enlarged the Alter Hof and, since the city had outgrown its first wall, promoted construction of a second wall. This second wall contained Munich until it was taken down at the end of the eighteenth century. Three gates from the fourteenth century wall have survived: the Sendlinger Tor, the Karlstor, and the Isartor. Although the Holy Ghost Hospital (Heiliggeistspital) is thought to have been founded as early as 1208, construction of the present Holy Ghost Church (Heiliggeistkirche) did not begin until 1327 and was not complete until 1392. When Ludwig of Bavaria was elected king (Ludwig IV) in 1328, Munich's importance as a political center increased along with his status. The city thrived under Ludwig's reign as a result of his concern for civic peace and his promotion of commerce and communication. His Bavarian code of law was an important contribution to law and order during this period. Learned Franciscans like Marsilius of Padua and William of Ockham were centered in Munich and lent theoretical support to Ludwig's claim that the empire had a right to elect kings and emperors without ecclesiastical participation. Ludwig's death in 1347 was followed by half a century of civil unrest culminating with civil war in the city in 1397–1398. By 1412, the population of Munich had reached ten thousand, and in the years that followed, the city experienced both economic growth and an increase in artistic activity. Two central buildings constructed during the second half of the fifteenth century bear witness to the self-determination of Munich's citizens and to the autonomy they enjoyed with regard to both secular and ecclesiastical authority: the city hall and the church that still distinguishes the skyline, the Frauenkirche. Both these projects were carried out under the direction of Jörg Ganghofer, master builder of Munich. The medieval city hall (Altes Rathaus), destroyed several times by fire, was rebuilt for the last time in 1470. Important late Gothic (1480) wood carvings of dancing figures, the *Mauriskentänzer* (*Morris Dancers*) by Erasmus Grasser, which once adorned the interior of the old city hall, are now in the Stadtmuseum. Munich's Frauenkirche, one of the largest Gothic churches in Europe, was completed in just twenty years (1468–1488). This massive brick church with twin towers 120 meters high was planned and financed by the townspeople. In medieval times, the exterior would have been plastered and painted. Ludwig IV was the first of the Wittelsbachs to be buried in Munich; although his body is not in this church, Albrecht IV placed a splendid red marble memorial sculpture there around 1500. With almost fourteen thousand inhabitants in 1500, Munich housed the largest urban population in Bavaria, approximately equal to that of Basle, Trier, or Frankfurt.

Münster

The name Münster, derived from the Latin *monasterium* (monastery), reflects the monastic origins of the church, bishopric, and subsequent town. The monastery stood on the site later occupied by the cathedral precinct, on the east bank of the river Aa at the intersection of old roads connecting the Rhineland to the east and the north. The oldest names of the site, Mimigernafor and Mimigardeford, may reflect the importance of a crossing over the river. A Germanic sacred site apparently was superseded by a Frankish royal residence. Sent by Charlemagne to Christianize the western Saxons, St. Liudger founded a monastery on the site under the rule of St. Benedict around 793. Shortly thereafter, the bishopric of Münster was established, with Liudger consecrated as the first bishop on March 30, 805. In 819 the apostle Paul is mentioned as patron of the church, and one of his teeth was acquired by 1022. This relic, encased in a golden head reliquary, may have prompted the construction of a larger cathedral. This second cathedral was dedicated in 1090 by Bishop Erpho. It was rebuilt following a fire in 1121. A grand westwork (entrance structure) was added under

Münster, cathedral, Vorhalle, apostles. Photograph: Joan A.Holladay

Bishop Hermann II (1174–1203). Following a disastrous fire of 1197, all but the westwork was rebuilt. The cornerstone of this third (present) cathedral was laid on July 22, 1225, and Bishop Gerhard von der Mark dedicated the new building on September 30, 1264. The new church, with its three-aisle basilica nave, polygonal choir, double transepts, and massive twin-towered westwork, while essentially Romanesque in form and detail, anticipates the *Sondergotik* (unusual Gothic style) hall church in its open flow of space. The statues of the apostles (ca. 1235) from the west portal are among the earliest works of Gothic sculpture in Germany. The question of the influence of French models or sculptors on these figures is important in the understanding of the spread of the Gothic style into Germany. The fourteenth through sixteenth centuries saw a series of mostly ornamental additions to the cathedral fabric in the late Gothic style, best seen in the *Salvator*-(Savior)-gable on the southeast transept. The Domburg (cathedral precinct) also contains a second church, dedicated to the Virgin.

During the ninth century the Domburg stood in the middle of a large agrarian surrounding. A new town (*civitas*) developed around the cathedral enclosure. By the beginning of the eleventh century a market was established to the east of the cathedral immunity. Around 1100 the Domburg was expanded and the enclosure fortified by a stone wall. The principal roadways were relocated to the Domburg, initiating an expansion of trade in the area of the Prinzipalmarkt (Principal Market).

On May 7, 1121, during the Investiture Controversy, the town and cathedral stronghold were stormed by the forces of Lothar of Saxony. The rebuilding of the city and cathedral from the ensuing fire initiated a new chapter in the city's history. The market area was reconstructed in an orderly manner. Though the bishop remained the principal authority up to the thirteenth century, the rise of a burgher upper class can be traced to the twelfth century. The town grew dramatically during the twelfth and thirteenth centuries, with the establishment of numerous parishes and the granting of a civic charter on January 18, 1278. The earliest parish was centered around the city and market church of St. Lambert, first constructed in the late eleventh century at the intersection of the trade routes and the principal markets in town. Around the time of the granting of the civic charter, the church was reconstructed in the Gothic style to symbolize the ascendancy of the urban merchant class and its growing autonomy from the episcopal center. The present three-aisled hall church dates from the fourteenth and fifteenth centuries, the period of greatest economic growth in medieval Münster. These centuries are marked by tensions between the religious/political center and the mercantile/ economic periphery. This is best seen in the mid—fourteenth century Rathaus (City Hall), constructed on the Prinzipalmarkt just across from the main entrance to the cathedral immunity.

The growth of Münster was largely predicated by its location on important trade routes. Market and minting rights, possibly granted as early as the 960s, were well established by the mid-eleventh century. The impetus for community stemmed from the market area of St. Lambert and not from the central cathedral immunity. Merchant guilds were established by the eleventh century. The economy of Münster was based largely on textile trade, particularly local linens and imported furs and wool. As a mercantile center, Münster joined the Westphalian city league in 1246. During the fourteenth and fifteenth centuries, Münster played an important role in the Hanseatic League.

Despite the polarities of cathedral and market, the seven hundred years of the medieval period in Münster (ca. 800–ca. 1500) are marked by religious unity and economic expansion. This came to an end during the turmoil of the sixteenth century. Perhaps the watershed year, marking the end of the medieval period in Münster, is 1534, at which time the Anabaptist leader Jan van Leiden (Leyden) proclaimed himself king of the New Zion and established Münster as his capital. In 1535 the Anabaptist stronghold was stormed by the troops of Prince Bishop Count Franz of Waldeck. Jan van Leiden and his followers were massacred and the bodies of the leaders suspended from cages on the tower of the market church of St. Lambert. This symbolic act illustrates the tensions and forces that shaped the form of the city throughout the medieval period, as the bishop thus expressed his resumed sovereignty over the town. To assert the reinstated episcopal authority, a great bastion was constructed on the west side of town. The medieval period in Münster comes to a close with this restructuring of the face of the city. In contrast to the development of Münster from the cathedral core outward, this new era is introduced by an alteration in the urban fabric—a great bastion now dominating the city from the outside.

See [Liturgy Music](#).

In all probability, the name Muskatblüt is the family name of a Franconian didactic and lyric poet, rather than a nom de plume. Between 1424 and 1458 a Konrad Muskatblüt is frequently mentioned—although not as a poet—as the recipient of remunerations and gifts from several lords and the free imperial cities of Regensburg and Nuremberg, as well as an annuity granted by the archbishop of Mainz. Thus we may assume that in addition to his attendance at several imperial diets he was employed as a diplomatic courier, undertook extended journeys, e.g. to the Teutonic Order in Prussia, and served as an escort of various nobles. However, we cannot determine with certainty whether this individual who appears in the archives is identical with the poet whose songs, with few exceptions, are collected in one manuscript from 1434, and whose final strophes contain the auctorial identification "thus speaks Muskatblüt." The poet Muskatblüt, however, has obvious political interests reflected in some of his works where he refers to important contemporary events like the Council of Constance (1415) and the Imperial Diets in Nuremberg (1422 and 1431) and Frankfurt (1427). Assuming they are the same person, his biography would be as follows: He made a name for himself as a poet in his youth, and then after a period of itinerant minstrelsy coupled with political tasks, he settled in Mainz in the service of the court. His life span would then be from roughly 1390 to 1458. The majority of his songs, which, as a result of his identification in the final strophes, can be confidently ascribed to him, are found in the 1434 Cologne manuscript (a), which is itself a copy of a lost original collection. A few more are found in scattered transmission. Thematically as well as formally, his songs are close to those of the Meistersinger, dealing with salvation history, praise of the Virgin, and the Seven Liberal Arts, and using the well-known *Töne* (literally, melodies, i.e. songs). But as far as can be determined, he never belonged to a school. In more than forty songs he presents his main concerns in the role of an admonishing teacher probably to a noble as well as a bourgeois audience. He denounces the injustices of his time: arrogance, greed, and especially the corrupt morals of the nobility, the standard bearers of the empire. Comparing his time to the courtly period, he affirms traditional values: honor, decency, dignity, and conjugal fidelity as opposed to the existing decadent state of affairs abounding with murder, arson, usury, robbery, and lewdness, although his admonitions often fell on deaf ears, as he himself asserts. In his spiritual songs (among them eighteen or twenty hymns to the Virgin), most of which were composed on the occasion of religious feasts (Christmas, the Ascension, and the Epiphany) he employs an allegorical technique, e.g., the empire is presented as a maiden with torn clothes, vices are depicted as animals, and so on. Also his thirteen love songs must have been well received by the public, and the popularity and wide dissemination of his works is attested to by numerous laudatory comments of his younger contemporary, Michel Beheim (1416–ca. 1475), among others. Indeed, his poetry was so well known that the adapted form of his name, a *Muskatblüt*, was not only used as the title of several of his poems in the subsequent manuscript tradition but was also employed by later poets for audience appeal. Whole parts of his poems were taken over by other writers and were even integrated into everyday didactic texts (*Gebrauchsliteratur*).

Muspilli

This Old High German poem describes the fate of the soul after death and the Final Judgment, while admonishing its audience to do penance. The *Muspilli* has often been called "the most desperate piece of OHG literature", as its study is fraught with difficulties. None of the philological basics can be established with any certainty. The anonymous piece has been transmitted in the margins of four pages in only one manuscript (Munich, no. clm 14098), a codex dated between 821 to 827, by an unskilled scribe in the later part of the ninth century. The *Muspilli* is a fragment of 103 lines with the beginning and the end missing. The time of composition is quite uncertain (dates between 790 and 871 have been proposed), and so is the place (linguistic evidence suggests Bavarian origin). The title itself reflects much of the aura of mystery that surrounds the poem, it being derived by the first modern editor from an enigmatic word in verse 57 ("Then no kinsman can help a kinsman before the *muspille*") whose etymology and meaning has been a main topic of research. The suggestions have ranged from "the name of a fire demon" to "world destruction" to "Final Judgment," and to "verdict." The content itself poses no general problems. The first thirty lines describe the fight of the angels and devils for the soul right after death, the bliss of heaven, and the torments of hell. The rest of the text deals with the end of the world and the Last Judgment: the summons (ll. 31–36), the battle between Elijah and the Antichrist (ll.37–49), the destruction of the earth (ll. 50–62), and the beginning of the Judgment (ll. 73–103). At various points the narrative becomes a penitential sermon, especially in lines 63–72, which warn against judicial abuse through bribery.

Although no one specific source has been established, the *Muspilli* belongs in the tradition of eschatological narratives particularly popular toward the end of the millennium. The details, however, are quite peculiar. The destruction of the world and God's court of justice are described in images and terms that seem to come from a Germanic origin. Inconsistency and disunity in form and structure have rendered the poem troublesome for interpreters. The meter is that of Germanic alliterative verse, but it is often flawed and is mixed with end rhyme features. The style fluctuates between poetic and prosaic. The narrative seems to juxtapose two incompatible themes (two judgments of the soul), it tends to digress into homiletic admonition, and its parts are joined rather abruptly. Until fairly recently such incongruence caused great dissatisfaction among scholars approaching the poem with modern concepts such as "harmony." The resulting common view was that the piece was a patchwork compilation of two different texts or that the original had been corrupted by interpolations. In the last two decades, however, a new attitude has emerged, relinquishing ideas of unity and of philological determinacy in favor of reading the poem on its own terms: as a reflection of the discontinuity of the times, for example, or as a member of a literary genre of pastiche and compilation.

The ongoing fascination of the *Muspilli* probably stems from three sources: first, the challenge of a text about which so much is unknown; second, the echoes in rhythm and imagery of other, lost Germanic poetry; and third, the allure of its powerful language and images seen, for example, in lines 51–54: *so intprinnant die perga, poum ni kistentit/enihc in erdu, aha artruknent/muor uarsuilhit sih, suilizot lougiu der himil/mano uallit, prinnit mittilagart* (Then the mountains burst into flames, no tree remains standing on earth, the waters dry up, the marsh swallows up itself, in fire smoulders the sky, the moon falls, the world burns).

Müstair

A Benedictine cloister in the diocese of Chur, Müstair is located in a mountain valley among the Engadine, the Vintschgau, and the Veltlin in the Swiss canton of Graubünden. The extensive preserved and excavated remains

Müstair, cloister church, detail of Carolingian wall painting from east wall (now Zurich, Schweizerisches Landesmuseum, LM-11990.1): Ascension of Christ. Photograph: Schweizerisches Landesmuseum, Neg. 100176

of the early medieval cloister make this site one of the most important examples of Carolingian architecture and wall painting. The foundation, which tradition credits to Charlemagne, dates before 806, probably at the end of the eighth century. Originally a men's abbey, it was given over to nuns in 1163. The Carolingian establishment, erected over the remains of Bronze Age and late Roman settlements, is a rectangular complex with extensive conventual and farm buildings to the north and west of the cloister. At least the west and south wings of the cloister were two stories in height. At the northeast of the complex, the three-aisle church dedicated to St. John the Baptist is marked by a triapsidal sanctuary; the exterior features flattened blind arcades and a profiled roof cornice. The north annex, which runs the full length of the church, was originally matched by a similar structure along the south, which contained the original entrance to the church. At the southeast corner of the complex stands the chapel of the Holy Cross, which apparently also dates to the ninth century.

The cloister church houses the most extensive known cycle of Carolingian wall paintings, which were discovered under a layer of whitewash in 1896. Five registers on the nave walls described, from top to bottom, the story of David and the Infancy, Public Life, and Passion of Christ. The paintings of the lowest zone are almost completely lost; they apparently represented saints' (perhaps apostles') martyrdoms. The heavily restored paintings in the apse vaults portray, in the center choir, Christ in Majesty, with Christ giving the law to Peter and Paul (*traditio legis*) in the left apse and the jeweled cross (*crux gemmata*) in the right. On the walls of the apses are represented scenes from the lives of the saints to whom the altars are dedicated: Peter and Paul on the left, John the Baptist in the center, and Stephen at the right, some of these covered over with Romanesque paintings of the same subjects. A monumental Last Judgment occupies the upper registers of the west wall. Originally nearly one hundred scenes were separated from one another by a decorative system consisting of staffs wound with garlands; the images combine decorative richness—for example, in the background architecture painted with precious stones and pearl strands—with richly contrasting effects of light and shade.

Not all the wall paintings have been preserved in situ (on site). The installation of a late Gothic vault at the end of the fifteenth century obscured significant parts of the upper register of paintings. In 1894, David scenes from the upper nave walls and the remains of an Ascension of Christ from the triumphal arch were discovered above the vaults. These were subsequently removed and transported to the Swiss National Museum in Zurich.

The scholarly literature on the painting cites relationships to contemporary northern Italian and Roman monuments, although the insecure dates of the comparative objects make the chronological results uncertain. A date of about 800 supported by the archaeological evidence has been superseded by a more convincing one in the second quarter of the ninth century; an attempt to narrow down the date still further to the years between 829 and 840 on historical and iconographic grounds remains hypothetical. Marble relief panels remain from the Carolingian choir enclosure; they are housed in the cloister museum, as are fragments of Romanesque wall painting from 1157–1170. A stucco figure of Charlemagne now installed to the south of the central apse probably also dates from the Romanesque period.

The cloister and the roof and wood ceiling of the church were restored after a fire in 1079. The interior of the church was transformed into a hall church between 1487 and 1492 with the addition of a late Gothic ribbed vault and a nuns' choir on the west side.

Mysticism

Mystical texts treat the process of attaining knowledge of the Divine through personal spiritual experience ranging from contemplation and prayer to near absorption of the human soul into the Divine. The mystical literature of medieval Germany includes writings that describe mystical experience, as well as those that probe the meaning of the mystical way. These distinctions can occur along gender lines. Writings of some male mystics, for example, tend not to emphasize their own mystical experiences, but instead analyze the road to union with God. Writings of many women mystics, in contrast, are often distinctive in the detail they offer of visions, Christ-like suffering, and other physical phenomena. Nevertheless, and unfortunately, some studies particularly on the German tradition have limited male mystics and their writings to *speculative* and female mystics (or the label *Frauenmystik*) to *experiential* mysticism. Scholars now generally acknowledge, however, that such generalizations can obscure the variety of mystical events and texts that both men and women experienced or produced. Rather, the medieval German mystical tradition is best understood by viewing male and female mystics and their writings in historical context, often as interacting and, at times, as distinct phenomena.

Besides the Bible and patristic writings, three major influences shaped the German medieval mystical tradition: the writings of Dionysius the Pseudo-Areopagite, a late-fifth- or early-sixth-century likely Syrian theologian; interpretations of the Song of Songs; and Franciscan spirituality. The teachings of Dionysius the Pseudo-Areopagite attempted a harmony between neo-Platonism and Christian doctrine. His core teachings on the possibility of the soul's union with God as a result of its passage through the three stages of purgation, illumination, and union reverberate through much of medieval Christian mysticism, especially in Germany. Among various patristic and medieval interpretations of the Song of Songs, Bernard of Clairvaux's series of eighty-six sermons on the topic is the most profoundly influential for German mysticism. Bernard describes the soul as the bride and Christ as the Bridegroom, and mystical union thus as nuptials. Such nuptial influence is evident, for example, in one of the earliest examples of German mystical literature, the *St. Trudpeter Hoheslied*, written in early Middle High German around 1150 or 1160. Finally, many medieval German mystical writings are also deeply indebted to Franciscan spirituality, especially the asceticism and very physical *imitatio Christi* symbolized by Francis's reception of the stigmata (wounds of Christ at Crucifixion).

Catalogs of German medieval mystics often begin with the Benedictine Hildegard of Bingen (1098–1179), who journeyed throughout Germany preaching against the abuses of the church and also corresponded with Bernard of Clairvaux and other ecclesiastical leaders, as well as Emperor Frederick Barbarossa. She wrote numerous visionary and theological treatises, songs for use by nuns, and even medical and scientific tracts. Such remarkable accomplishments notwithstanding, some scholars argue that Hildegard should be considered apart from the German mystical tradition. The scholar Kurt Ruh, in particular, points out that, though visionary, Hildegard was not ecstatic. Indeed, she claims to have experienced her visions while fully within her senses, not while taken up outside (or within) herself in a rapture. Furthermore, her visions were not scenes of her own interaction with the Divine but were rather showings of things to come, for which she served as prophetic reporter.

The Latin writings of the Benedictine Elisabeth of Schönau (ca. 1129–1164), are, like those of Hildegard, sometimes prophetic. Written in collaboration with her brother Ekbert, Elisabeth's descriptions of her visions and ascetic and ecstatic experiences, however, identify her as more clearly mystical than Hildegard, with whom she corresponded. Although not as diverse as those of Hildegard, Elisabeth's writings were more widely available in the Middle Ages and were also translated into several vernaculars.

The thirteenth century was a period of a new spirituality, typified by a desire to return to the *vita apostolica*, or simple life of poverty and prayer exemplified by Christ and his apostles. The development of the mendicant orders (Dominicans and Franciscans) corresponded with this new spirituality. David of Augsburg (ca. 1200–1271), a Franciscan, wrote numerous mystical, pastoral treatises encouraging prayer and asceticism for those who would reach union with God. This same period also marked the beginning of increased prominence of women in the European mystical tradition, associated in part with the formation of independent communities of laywomen not associated with any established religious order, now generally referred to as Beguines. Beguine communities flourished especially in the Low Countries, with such mystically and literarily gifted representatives as Marie of Oignies, Beatrice of Nazareth, and Hadewijch of Antwerp among them. This period also saw an increased cooperation, or "mutual enrichment," as Bernard McGinn (1998:18) describes it, between men and women, due partly to the growth of pastoral duties for monks from the mendicant orders toward the rapidly developing women's communities. From these male-female interactions, some of the most important mystical literature of the Middle Ages arose, as the men wrote or urged the women to write of their remarkable spiritual lives. Men's participation in the texts is not at all unproblematic, however, and poses an interesting challenge for readers and scholars, since the men were often not simply scribes but also editors.

Mechthild of Magdeburg (ca. 1208–1284 or 1297), Germany's most famous Beguine, composed a masterwork of German vernacular mysticism, *The Flowing Light of the Godhead* (*Das fließende Licht der Gottheit*). It comprises seven books, the first six of which were written between 1250 and 1270, while she lived as a Beguine in Magdeburg. The seventh book was written sometime after 1270, after she had left the Beguine life to join the prominent Cistercian/Benedictine convent at Helfta. Mechthild's use of language from courtly literature indicates that she was of noble birth and that she enjoyed a basic education. Her writings span an impressive breadth of genres. Mechthild's mysticism describes the soul's striving to find eternal refuge in God's love. Like her predecessor Hildegard, Mechthild is sometimes prophetic and critical of the church. Mechthild's mysticism was influenced most profoundly by the divine "greeting" she received at the age of twelve, a sign of God's presence in her life that both motivated and authorized her writing. She did not begin the record of her spiritual journey, however, until her confessor, likely Heinrich of Halle, encouraged her to do so in 1250.

Mechthild's Middle Low German original is lost. Her text survives in a Latin translation of the first six books and, in testimony to her significance for later German mystics, also in a Middle High German (Allemanic) version from around 1345, produced in Basel by the secular preacher Heinrich of Nördlingen, or by others in his circle. Nördlingen is also known to have sent portions of this translation to the Dominican nun Margaretha Ebner in Bavaria.

Two nuns of the Helfta convent, Mechthild of Hackeborn and Gertrud (known as the Great), highly esteemed Mechthild of Magdeburg, and their writings reflect the influence of her mysticism. The fact that their writings were in Latin, however, assured that they were read more widely and for much longer in the Middle Ages than was the idiosyncratic vernacular of the *Flowing Light*. The revelations of Mechthild of Hackeborn (d. 1298/1299) were recorded by two of her sister nuns, one of which was certainly Gertrud, in *The Book of Special Grace* (*Liber specialis gratiae*). Mechthild's book teaches worship of Christ, the Virgin Mary, and the Saints, and expands on the relationship of the soul to God. It was translated and disseminated widely in Europe and England throughout the Middle Ages.

Gertrud of Helfta (d. 1301/1302) wrote an account of her spiritual journey in *The Herald of Divine Love* (*Legatus divinae pietatis*), which consists of five books. Book Two, written in 1289, contains Gertrud's account of the visions and other mystical experiences that shaped her spiritual life. Sometime after 1289, Gertrud also wrote the *Spiritual Exercises* (*Exercitia spiritualia*). Gertrud's works emphasize the liturgy, especially the Eucharist. They also promote devotion to the Sacred Heart of Jesus and were influential in the spread of that cult in the later Middle Ages.

The fourteenth century is generally considered the most vibrant period for German mysticism, and the Dominican Eckhart (ca. 1260–ca. 1328), known as Meister Eckhart, is its most acclaimed figure. Eckhart left a diverse and sizable corpus of teachings, both theological/philosophical and spiritual or mystical, written in Latin and in his German vernacular. Among Eckhart's German oeuvre, *The Book of Divine Comfort* (*Daz buoch der goetlichen troestunge*, 1314 or 1318), is considered his most important work. His eighty-six German sermons, which his listeners wrote down, offer the greatest insight into Eckhart's particular brand of mysticism, which is generally classified as speculative mysticism in its purest form. Indeed, Eckhart's writings reveal nothing of his own interior life, and he even ridicules mystical experiences such as visions. His mystical thought is indebted to neo-Platonism, including especially a negative theology, which comprises both God's unknowability and the necessity for the soul to become nothing in order to unite with God. Eckhart also emphasizes the importance of turning away from the things of the world to facilitate the birth of God in the soul. Eckhart does not teach of a mystical way per se in the sense of steps or a path to mystical union. His followers Johannes Tauler (ca. 1300–1361) and Henry Suso (ca. 1295–1366) are more traditional in this aspect. Tauler and Suso are also in large part responsible for the dissemination of Eckhart's ideas, which was otherwise hampered by papal condemnation, in 1329, of twenty-eight of Eckhart's sentences. In fact, Eckhart remained in obscurity for several centuries

after his death until his rediscovery in the nineteenth century.

The Dominican Tauler may have come under the direct influence of Meister Eckhart while a student in Cologne, where he was also likely a compatriot of Suso. Tauler's mysticism was in any case deeply informed by Eckhart's teachings. Like Eckhart, Tauler left no writings that describe his interior life. In fact, Tauler's teachings survive at all only because of the recording efforts of a group of Dominican nuns to whom he preached. Tauler teaches a practical mysticism, outlining the pseudoDionysian three-step path to mystical union. Tauler was associated with a group of spiritually minded laymen and clergy known as the Friends of God (*Gottesfreunde*). One of them, a layman named Rulman Merswin, appears to have fabricated the existence of the so-called Great Friend of God (*Großer Gottesfreund*), the alleged author of a series of mystical writings that he circulated in an apparent attempt to increase piety among his contemporaries. The writings were most likely the work of Merswin himself.

Henry Suso (Heinrich Seuse) is something of a transitional figure between his contemporaries Eckhart and Tauler. Like them, Suso preached widely, and his mystical teachings survive in large part because of his sermons. Unlike the writings of Eckhart and Tauler, however, Suso's writings include his *Vita*, a detailed, at times graphic account of his spiritual life, which was marked in its early stages by extreme asceticism. The *Vita*, which is also rife with courtly imagery, was recorded secretly by Elsbeth Stigel, a Dominican nun who served as Suso's confidante. Although Suso destroyed a portion of the text on learning of its existence, a divine message later assured him of God's approval of the record, which Suso then edited and expanded after Stigel's death. Suso's writings also include numerous letters, as well as an apology for and expansion of the teachings of Eckhart (*The Book of Eternal Truth—Büchlein der Wahrheit*, ca. 1326–1328), with whom Suso studied in Cologne. Suso's *Book of Eternal Wisdom (Büchlein der ewigen Weisheit*, ca. 1330) emphasizes the imitation of Christ's example as a means to mystical union. Suso himself translated and expanded the *Book of Eternal Wisdom* into Latin between 1331 and 1334 (*Horologium sapientiae*). The vernacular version was among the most widely read devotional texts of the late Middle Ages. The *Horologium* also enjoyed a vast manuscript (over three hundred) and print history (nine early prints) and circulation in clerical circles.

Heinrich Nördlingen, a secular preacher who was likely in contact with Johannes Tauler and other Friends of God, is best known through his nineteen-year correspondence with the Dominican nun Margaretha Ebner (ca. 1291–1351). In fact, the years of their letter exchange provide the only known information on Nördlingen's life. Scholars debate whether or not Nördlingen himself was a mystic, but, in any case, he supported Ebner and was an eager disciple of her mystical gifts. Their correspondence is generally considered the earliest surviving letter exchange in the German vernacular.

Besides her correspondence with Nördlingen (only one of her letters is extant, compared with fifty-six from Nördlingen), Ebner also wrote an account of her remarkable spiritual life in her *Revelations*. This work is one of several records of the flowering of spiritual and literary activity, from the thirteenth to the fifteenth centuries, but especially in the mid-fourteenth century, in southern German Dominican convents. Ebner's contemporaries penned the so-called *Sisterbooks*, or convent chronicles, which depict the ecstatically infused spiritual life of the convents. These chronicles, which recent studies have shown to be similar, in many ways, to saints' lives, were written to document for later generations of nuns the presence of God's grace in their convents. Typical of these vitae are details of the subjects' extreme physical suffering, as well as of their visions, auditions, visitations, and ecstasies, which often surrounded some aspect of the life, especially the childhood and passion, of Christ. Christine Ebner (1277–1356) and Elsbeth of Oye (ca. 1290-ca. 1340) are two of the more well-known mystics whose lives these chronicles record.

Mystics and spiritual thinkers from the Low Countries also influenced German mysticism. Of particular significance is the so-called *Devotio moderna*, a movement found in both lay (Brothers and Sisters of the Common Life) and religious (e.g., Windesheim Congregation) circles that began in the northern Low Countries but also spread to the Rhineland and beyond. The movement encouraged contemplation and the strengthening of the inner life of the individual. Originated by Geert Groote and influenced by Bernard of Clairvaux, Franciscan spirituality, and Jan van Ruusbroec among others, the best-known literature from the *Devotio moderna* movement is unquestionably the popular *Imitatio Christi* (first circulated 1418), attributed to Thomas à Kempis.

The later Middle Ages and early modern period brought important reception of earlier medieval mysticism. Nicholas of Cusa (1401–1464), for example, is perhaps better known as a philosopher or theologian than a mystic. Nevertheless, his vast writings, which examine God's absolute unity and endlessness, are indebted to Christian/neo-Platonic thought, such as that of Dionysius the Pseudo-Areopagite, as well as to Meister Eckhart. The so-called *Theologia Deutsch (Theologia Germanica)* is a fourteenth-century treatise transmitted in three manuscripts from the fifteenth century and later edited and published by Martin Luther (1516 and 1518). The *Theologia Deutsch* describes the deification of the human soul through the complete relinquishment of the will and a total following of the life of Christ. Luther's enthusiastic promotion of this mystical treatise (which other reformers did not second) contributed to its popularity for many decades.

From the late fifteenth century well into the seventeenth century, the Cologne Carthusian monastery of St. Barbara was a major center for the reception and publication of medieval mystical literature. The Cologne Carthusians, whose order had, since its eleventh-century beginnings, been active manuscript copyists, printed editions and translations—most for the first time—of the works of many important medieval mystics, including Jan van Ruusbroec, Johannes Tauler, Henry Suso, Catherine of Siena, Gertrud the Great of Helfta, Dionysius of Rijkel (or Dionysius the Carthusian, the most prolific European medieval mystic), and others. The Carthusians directed their publishing efforts to religious and lay circles alike in an attempt to rejuvenate the devotional spirit in the church and, later, to address the Lutheran challenge.

Mythology

Mythology is the study of myth, and there is a great deal of discussion as to how to define myth. Mythology overlaps in part with comparative religion and with the history of religion (*Religionsgeschichte*), even magic, and superstition. Myths are stories about gods and supernatural happenings. Germanic mythology concerns the beliefs of the Germanic peoples. In the study of Germanic mythology there is a tendency to speak of North Germanic and South Germanic (what philologists call West and East Germanic) myth. This article is devoted to South Germanic myth. We must avoid equating Old Norse mythology with Germanic mythology, though there are numerous similarities and much comparative material.

For sources we have few direct witnesses as to Germanic mythology and religion. Most of what we know has been reported by people who were either not Germanic (e.g., the Greek and Roman reports) or not heathen, so that we often are looking at Germanic religion and mythology through foreign eyes. The sources for South Germanic mythology are extremely sparse. We have scattered information in reports by Caesar, Tacitus, and other Roman writers and later writers. Direct information is available in such monumental works as rune stones (the Nordendorf *fibula*, or clasp), rock carvings, and, for Germany in particular, such things as "Jupiter columns" (*Thor/Donar*) and *matrona* (matron) statues. Archaeology, linguistics, names, and literary history also contribute to our knowledge of South Germanic mythology, and the Old Norse sources offer comparative material. One must also not forget the reports of the churchmen, as well as such official documents as the *Indiculus superstitionum et paganiarum*, from the middle of the eighth century, and the various *Capitularia* of Charlemagne, which can be precious sources as to customs they wish to combat and names of heathen practices. The same can be said of such things as the Old Saxon Baptismal Oath (*Sächsisches Taufgelöbnis*), which lists things one wishes to renounce.

The next complex of problems is caused by such sources. There is the *interpretatio romana*, in which Roman authors such as Tacitus use Latin names for Germanic deities, e.g., *Mercurius* for *Wotan*. The obverse of this is the attempt by the reporter to equate Germanic gods with Roman gods: *Tiu=Mars*, and so forth, which can even go to such extents as to equate *Gefjon* with *Diana*. We can also speak of *interpretatio christiana*, in which medieval Christian myths, such as the Leviathan myth, are equated with heathen myths, such as that of the Midgard serpent.

Using *interpretatio germanica* may help us, however, to understand the Germanic pantheon through the use of the names of the days of the week. *Lunae dies=Monday* (day of the moon), *Martis dies=Tuesday* (Alemannic *Ziestag* "day of *Tiu*, god of war"), *Mercurii dies=Wednesday* (day of *Wōdan*), *Jovis dies=Thursday* (day of *Thor/Donar*, god of thunder), *Veneris dies=Friday* (day of *Frija*, goddess of beauty). The importance of the various members of the pantheon varies in space and in time. As one can see from the etymology of his name, *Wōdan* (Latin *vātes* "poet, seer"; Old Irish *fáith* "poet, seer") was originally the poet of the gods; in Old Icelandic literature, he is, as *Óðhin*, the chief god, but in South Germanic myth, the chief god may be Donar or *Ziu* (*Saxnót*).

We learn of other gods from various sources. The Nordendorf *Fibula* (clasp) mentions *Wōdan*, *Loga<thorn> ore*, and *Wigi<thorn>onar*, the latter two the source of much speculation. From the second *Merseburg Charm*, we learn of a number of names: *Phol*, *Wotan*, *Balder*, *Uuodan*, along with the goddesses *Sinthgunt*, *Sunna*, *Friia*, and *Volla*, all the source of much discussion. One might add to these the many names of goddesses such as *Hariasa* and *Hludana*, found on inscriptions, a rich list indeed.

An interesting source of myth is the *origo gentis* theme, the myths held by a people as to their origins (ethnogenesis). Tacitus (*Germania*, Ch. 2.9), for example, tells us of Tuisto, the tribal father of the Germanic tribes, whose son, Mannus, bore the progenitors of the tribal groups of the Ingvaeones, Hermiones, and Istvaeones. The common myth of the royal twins (*dioscuri*; compare Romulus and Remus), called *Alcis*, is related by Tacitus (*Germania*, Ch. 43.12 ff.) of the Naharvali, and Paulus Diaconus tells us of the twin progenitors of the Langobards, *Ibur* and *Aio*, for example.

Nature myths were obviously quite common, but we know very little about them. The Germanic tribes worshiped nature and particular phenomena of nature. We know of sun worship, worship of trees, sacred groves, even worship of poles, erected for the purpose. The famous *Immensûl*, chopped down by Charlemagne in 772, is a prime example. Tacitus tells us about the earth goddess, *Nerthus*, whose image was carried around in a cart and returned to an island sanctuary. Tacitus tells us of predicting the future from various natural phenomena, such as the flight of birds, and the *Indiculus* tells us about the use of birds, horses, cow dung, and even sneezing for such purposes, though this borders more on magic than mythology.

The belief in ghosts, revenants, wights, and the like was common. The famous relation of Ibn Fadlan of a Viking ship burial (reconstructed by Michael Crichton in his 1976 novel *Eaters of the Dead*) points to a form of suttee (burial of the widow with the dead husband), known also from archeological evidence. This indicates a belief in life after death. An Old High German charm, *Ad signandum domum* (For a spirit in a house), indicates a belief in wights (spirits), as was to be expected, and the comparison with Old English and more modern German phenomena shows a belief in witches. There was also a widespread belief in the Wild Hunt, called in Middle High German *Wuotanes her*, a course of spirits and demons through the night air, especially during the Twelve Days of Christmas. The *Idisi* women mentioned in the first of the *Merseburg Charms* seem to have been a kind of Valkyrie, perhaps connected with the Old Scandinavian *disir*. There was also a belief in dwarves and giants.

The casting of spells, predicting the future, and apotropaic devices were also common. Tacitus already tells us of "wise women" (seers, sibyls) who could foretell the future, and he leaves us the names of two: *Veleda* and *Albruna*. That there were heathen beliefs in an end of the world seems quite likely, based on the word *muspilli*, used in the Old High German poem *Muspilli*, for final conflagration. The Germanic people also believed in a sort of paradise, a heavenly "meadow," as revealed in the Old English *neorxnawang* (paradise).

Nabuchodonosor

Derived from biblical origin, *Nabuchodonosor* is the name frequently used for two Early Middle High German religious poems linked together in a famous Vorau (Austria) manuscript of Middle High German poetry, *Drei Jünglinge im Feuerofen* and *Die ältere Judith*. Their common element is the biblical figure of Nebuchadnezzar, active in the first poem, but passive in the second. *Drei Jünglinge im Feuerofen* (*Three Young Men in the Fiery Furnace*), the first poem, contains a rhymed version of the familiar story of the three Israelite youths—Shadrak, Mishak, and Abednego—from the Old Testament Book of Daniel (Chapter 3). King Nebuchadnezzar rejects the true God of the Israelites and has a golden idol built, ordering all his people to bow down before it. The three youths are depicted as faithful servants of God who refuse to bow down to Nebuchadnezzar's golden idol; they are thrown into the fiery furnace but are saved from harm by an angel. It is a short poem (eighty-four verses in seven strophes of varying length), concise, and dramatic—not unlike a ballad—ending in the recognition of God's power by the heathens and the disgrace of Nebuchadnezzar and his idols.

Immediately following the *Drei Jünglinge* in the Vorau manuscript, almost without interruption, comes *Die ältere Judith* (the "earlier Judith" as opposed to a "later" version). This is an abbreviated story from the Apocryphal Book of Judith, which describes Judith's slaying of Nebuchadnezzar's general Holofernes, in his own tent. The ensuing relief of the siege of the Israelites in Bethulia is not narrated, leading to the assumption that this version is fragmentary. The determination of Judith to save her people, who had almost given up hope of salvation from God, and her courage to go into the enemy camp and decapitate Holofernes are evidence of God's working through a woman to save His chosen people. The poem ends before the actual decapitation and comprises only 136 rhymed verses in 13 stanzas of varying length. Like *Die drei Jünglinge*, it resembles a ballad, with the action carried largely by the dialogue. However, *Die jüngere Judith* ("younger [poem about] Judith") that follows in the Vorau manuscript is considerably longer (1,821 verses) and is almost a rhymed translation of the biblical Book of Judith, which starts with the events leading up to the siege of Bethulia and ends with the release of the Israelites after Judith's heroic deed. A hint of incipient courtly behavior may be seen in the scenes at Holofernes's camp. There is little overt exegesis (learned biblical commentary) in any of these three poems. They are direct examples of divine power working through people of steadfast faith, and the moral interpretation is therefore obvious. All three poems are by different authors, probably from the first half of the twelfth century.

Nancy, Battle of

The duke of Burgundy, Charles the Bold (or, more properly, the Rash), had been trying to dominate the border regions of France and the Holy Roman Empire. In 1476 he swiftly conquered the Duchy of Lorraine, but its ally, the Swiss cantons, came to its aide. The Swiss inflicted two major defeats on Charles in 1476, at the battles of Grandson and Morat, or Murten. With Burgundy's forces weakened, Lorraine rose in rebellion. When Charles was forced to besiege Lorraine's capital of Nancy, the duke of Lorraine with Swiss allies and mercenaries arrived to relieve the city. On January 5, 1477, through clever strategy and under cover of a snowstorm, the Swiss attacked on Charles's front and the flanks at the same time. Burgundy's armies, outnumbered and outfought, broke and retreated. The duke was found two days later, his head smashed in, his body half-frozen and partially devoured by wolves. Without a male successor, the Burgundian inheritance fell largely to Maximilian I Habsburg, who quickly married Charles's only daughter, Mary. The successful establishment of the Habsburgs in the Lowlands and part of Burgundy altered the balance of European politics and created an enduring rivalry between the French Valois and Austrian Habsburg dynasties.

Naumburg

A bishopric was founded in Naumburg in the early eleventh century. This site on the Saale River in Saxony was selected when the local bishopric, originally founded in nearby Zeitz, came under Bohemian attacks. The newly founded town also became the major seat of Count Ekkehard and his descendants. Strategically located between the firmly settled German provinces and the Slavic hinterlands, the new town exploited its location to become a major center of trade between the two groups, a process that continued and grew throughout the Middle Ages. A major annual event was the fair held on the Feast of Saints Peter and Paul (June 29), which provided substantial revenue for the town. An increase in trade in the later Middle Ages allowed Naumburg to be admitted into the Hanseatic League in 1432, solidifying its position as an economic center.

The thirteenth-century bishops, including Bishop Engelhard (1207–1242), held considerable power in medieval Naumburg and were able to marshal the resources necessary to begin construction of a new cathedral. During the thirteenth century, however, controversy broke out between the bishop, who was supported by the chapter, and the town council, supported by the local count. The chapter was in considerable debt because of the construction of the cathedral, and the actual power of the bishop waned as the economic and political power of the town council grew. By the end of the century the bishop withdrew to Zeitz, leaving the chapter, headed by a provost, in Naumburg. While the bishop retained nominal rights, after the thirteenth century the town council, with some input from the cathedral chapter, actually governed the city.

Probably the best-known building from medieval Naumburg is the cathedral, dedicated to Saints Peter and Paul, originally constructed about 1050 and rebuilt in the thirteenth century to incorporate the burial church of Count Ekkehard, which originally stood to the cathedral's west. The building represents a combination of late Romanesque and early Gothic features typical in thirteenth-century German architecture. It retains the traditional exterior massing of Saxon Romanesque basilicas but has a greatly elaborated four-towered facade and a more imposing scale than earlier buildings. The cathedral has single side aisles and a two-story elevation in the ribbed groin-vaulted nave, common in German early Gothic architecture. The building has two choirs—an east choir for traditional liturgical uses and a west choir that incorporated the former burial church of Count Ekkehard within the cathedral's space. The east choir was rebuilt in the High Gothic style during the fourteenth century and represents one of the few substantial structures built under the bishop's patronage at this date. In addition to the cathedral itself there is also a cloister containing a Three Kings' chapel and a church dedicated to the Virgin.

The cathedral's sculptural ensemble is one of the most celebrated examples of German Gothic sculpture. It is found in two locations—the west choir, with large figures representing the family of the founding count, Ekkehard, and on the choir screen, which provides an entrance into the west choir. The primary sculptor, known as the Naumburg Master, has been the subject of scholarship that is so fundamental that it may be used to trace the development of German medieval art history. The Naumburg sculpture incorporates French style, largely stemming from Reims Cathedral. However, it does not represent direct influence but rather a creative departure from a wave of French influence that had appeared earlier in the thirteenth century at Bamberg and Magdeburg. Although charting the history of the Naumburg sculptor or workshop is a complex task, it is generally accepted that the choir screen at Mainz represents an earlier project of sculptors who continued their work at Naumburg and were subsequently active at Meissen.

Twelve members of the founding Ekkardinger family are represented adorsed (set back to back) on columns in the west choir, which is composed of one square with a polygonal apse. A date of circa 1250 is likely for the work, since a document of 1249 promises indulgences for contributing to the work in the west choir, and the founders' positions are similar to those of the standing apostles of the Sainte Chapelle in Paris, completed 1248. The ensemble shows two couples facing each other across the square bay, Count Hermann (d. 1032) standing next to his wife, Reglindis, and his younger brother Count Ekkehard II (d. 1046) standing next to his wife, Uta. Two other countesses and six additional counts appear as single figures, including Counts Dietmar, Syzzo, Wilhelm, and Thimo, who are attached to the colonettes between the windows in the polygon. The figures are notable for the lifelike depictions of features and behavior. Uta, for example, shields her face with her cloak collar, while grasping the mantle with the long expressive fingers of her other hand. The west choir also contains a stained glass program of saints and bishops that complements the sculpture.

The choir screen, usually dated slightly after the founder figures (ca. 1250–1255), has a central crucifixion with a highly expressive mourning Virgin and St. John and a band of Passion reliefs. The placement of the crucified Christ with outstretched arms in the center of the screen's doorway means that each person entering the west choir would have to pass under the arms involving him or her immediately with the sculpture. The Passion reliefs are distinguished by an everyday realism. Apostles tip back their cups and put bread into their mouths in the Last Supper relief, and the Jews depicted in the Paying of Judas and the Arrest of Christ scenes wear the small, pointed hats associated with members of that religion in medieval Germany. The realistic detail combined with heightened expressiveness seen at Naumburg is absent in contemporary French work, and these unusual qualities are an important reason for the continued interest in the character and career of the people who sculpted the figures of the west choir.

Additional medieval architecture in Naumburg includes the original parts of churches dedicated to St. Moritz and St. Wenzel and a hospital dedicated to Mary Magdalen, which was erected by 1144. As the communal movement was established in Naumburg, buildings suitable for civic uses were constructed. The fourteenth century saw the erection of walls around the city including five towers containing city gates (although the original construction was in wood rather than stone). The original City Hall (Rathaus) on the town square dated from the fourteenth century, although it was destroyed and rebuilt after fires in 1384, 1408, and 1457; the present building was constructed after a fire in 1517.

A Middle High German poet of some renown, there is no documentary evidence of Neidhart's name or of his origins. Under the title "Lord" (*her*) *nithart*, the so-called large ("C") and the small ("A") *Minnesang*-manuscripts at Heidelberg University Library record the stanzas attributed to him. The singer is apostrophized as *der von Riuwental* (the one from the Riuw Valley) in the *Summer Songs* (*Sommerlieder*) and the defiantly stated "responseverses" (*Trutzstrophen*) of the *Winter Songs* (*Winterlieder*). This explains the name Neidhart von Reuenthal, a term especially used by earlier scholars. Both names can also be interpreted allegorically (*nithart* is a medieval name for the devil); *riuwental* taken literally reads as "valley of grief"). The only indication for dating Neidhart's poems is through an allusion in Wolfram von Eschenbach's courtly novel *Willehalm* (l. 312, 12; written ca. 1215), as well as references to contemporary political events or personalities in his songs (Archbishop Eberhard II of Salzburg, Duke Friedrich II of Austria). These clues lead to the conclusion that Neidhart may possibly have lived from circa 1190 to 1240. The author's occupation and social rank are just as unknown, although, like Walter von der Vogelweide, he was probably a professional poet. It is almost certain that Neidhart spent part of his early literary career in the area of Bavaria/Salzburg, which he was forced to leave for some unknown reason—possibly due to losing his patron and/or audience, as can perhaps be discerned in changes in his literary style. There are no definite clues that Neidhart might have belonged to the Wittelsbach court of Ludwig the Kelheimer. On the other hand, Winter Song No. 37 directly addresses Archbishop Eberhard II of Salzburg. Later on Neidhart sang in the vicinity of the Babenberg court of Friedrich II the Valiant (*der Streitbare*) in Vienna. This may also have been the setting for a literary argument with Walter von der Vogelweide and his concept of *Minnesang* (see Song L 64,31). The writers of subsequent generations (Rubin, Der Marner, Hermann Damen) regarded Neidhart as a good example and "master". The special form of his poetry developed into a separate lyrical genre in the late Middle Ages, while the content partly underwent strong changes. These later poems were passed on under the name *ain nithart* (a Neidhart) in the manuscripts (these songs, regarded largely as imitations following the nineteenth-century scholar Moritz Haupt, have come to be put under the term "pseudo-Neidhart" by researchers). During the last stage of this reception Neidhart became the hero of the *Schwankroman Neidhart Fuchs Schwankerzählungen und -Lieder* (*Neidhart Fox's Comical Tales and Songs*, published 1491/1497, 1537, und 1566), and many Neidhart plays, which belong to the oldest existing secular plays written in German. Altogether the numerous manuscripts (from the end of the thirteenth to the fifteenth century) record about 140 songs under the name of Neidhart, of which, however, only 66 are considered to be authentic. In the field of *Minnesang*, well-preserved songs form the major exception, even though they were recorded mostly only at a later period (about 68 tunes in all).

As far as form and content are concerned, Neidhart's songs, often described as "rustic/rural poetry" (*dörperlich*), can be divided into Summer Songs and Winter Songs (according to the varying introductory natural settings) and *Schwanklieder* (comic songs). The Summer Songs, divided into scenes, render simple verse forms that have been worked out in detail (*raien*), while their content forms a clear contrast to traditional *Minnesang*. The plot is shifted from the courtly to the rural realm, the "Knight," or Ritter von Riuwental, is exposed to the unconcealed sexual desires of the farmer's daughters and wives. Whereas the mother, who is the representative of socially accepted moral conventions, warns her daughter of the consequences of having an affair with the impoverished knight—in the so-called *Songs of the Aged* (*Altenlieder*) the positions of mother and daughter are reverse—the girl struggles to participate in the summer dance and thus also to gain the opportunity of a rendezvous. In the Sommer Songs, thought by some to be later, there are frequently statements on the unsatisfactory position of the singer and the loss of *vreude* (happiness) in courtly society (demonstrated via the theme of Engelmar's mirror theft). The Winter Songs, structured by stollen, require an intimate acquaintance with form and content of "classical" *Minnesang* to be understood, since the patterns of content and representation in *Minnesang* are constantly referred to in quotations and opposed to the so-called *dörper*, or farmer-stanzas. They portray the threat posed to the singer by rural upstarts, who arrogate aristocratic clothing and lifestyles to themselves, and, even though they adopt only the superficial forms of courtly culture, but not its actual contents, alienate the singer from his *vrouwe* "lady" (who turns out to be a "farmers daughter" or, in the so-called *wert-süeze*, or "wordly delight" songs, "Hure Welt"/Whore World). In the *Schwanklieder* the knight Neidhart is promoted to the role of ever-victorious enemy of the physically and intellectually inferior peasants. According to massive tradition as well as extraliterary evidence, the Neidhart-*Lieder* (songs) with their transformations of content enjoyed sustained popularity from the thirteenth to the sixteenth century. Only in recent times has research begun to refrain from continuing the debate about authenticity and to accept instead the genre of the "Neidharts" in the fullness of its tradition and history.

Neubrandenburg

Founded in 1248 by Margrave Johann of Brandenburg as a border fortress against Pomerania, Neubrandenburg, as part of the Stargard dominion, was integrated into Mecklenburg in 1317. As a model example of a colonial town of the thirteenth century, Neubrandenburg possesses a circular ground plan with regular street pattern; its four gates are deliberately not aligned in order to avoid creating continuous thoroughfares.

In this pattern, the central block is replaced by the market square on which the town hall, and later the castle, were built; the main ecclesiastical building, the Marienkirche (church of the Virgin), is positioned farther to the south, replacing another block of houses. Consecrated in 1298, the church represents an unusual type: its rectangular ground plan lacks all indication of a choir, and articulated arcades over heavy compound pillars subdivide the central nave from the narrower aisles. The nine-bay length expresses a clear sense of longitudinality. The straight east end of the church enabled the erection of a monumental gable with finials and traceries transforming, by the use of molded bricks, a High Gothic cathedral facade—like that of Cologne Cathedral—into brick. The Franciscan monastery was founded circa 1260 at the northern termination of the town's main axis, where it was incorporated into the defensive works. In the first half of the fourteenth century, its first building was replaced by the present hall church, which, although an asymmetrical hall with only a northern aisle and the monks' choir, imitated St. Marien.

The nearly complete destruction of Neubrandenburg at the end of World War II, including its town hall, castle, and historic houses, left the shell of St. Marien standing as a ruin, while the Franciscan church remained intact. The town's defense works, however, are among the best preserved of their kind. Their main elements are the four gates (Friedländer, Stargarder, Treptower, and Neues Tor) dating from the fourteenth and fifteenth centuries. Of these, the Neues Tor (New Gate) shows in the fields of its traceried (ornamented with interlacing lines) gable on the town side eight female statues assembled out of pieces of terra-cotta. In the fifteenth century, as in many other towns, barbicans and outer, lower gates were added; only at Neubrandenburg have these survived to give the impression of a fully fortified medieval town.

Nibelungenlied

Germany's preeminent heroic epic, the *Nibelungenlied* (*Song of the Nibelungs*), recounts Kriemhild's love and loss of her husband, the mighty hero Siegfried, and her revenge on his slayers, culminating in the destruction of the entire Burgundian empire. The story was written at the outset of the thirteenth century, during the first golden age of German literature. Its origins lie in the Danube region of what is now Austria. Almost nothing is known of the poet, whom most scholars regard as an educated clerk employed in some official capacity at court. The *Nibelungenlied* is preserved in three principal thirteenth-century manuscripts: "A", the shortest, in the Staatsbibliothek in Munich (Cod. germ. 34); "B", the most authoritative, dated as early as the first half of the thirteenth century, in the Stiftsbibliothek in St. Gall, Switzerland (Ms. 857); and "C", the most "courtly" version, in the Fürstlich Fürstenbergische Hofbibliothek in Donaueschingen (Ms. 63). The wealth of manuscripts (ten complete, 24 fragments) attests to its popularity during the Middle Ages. All extant manuscripts include *Die Klage*, an epic poem in rhymed couplets that recounts how the fallen heroes are mourned. This courtly and sentimental continuation to the abrupt and catastrophic conclusion of the *Nibelungenlied* is inferior to the epic itself. The name "Nibelung" occurs in the first part of the poem to denote Siegfried's treasure and the heroes who guard it; throughout the second half, the attribute is used as an alternate designation for the Burgundians.

Nibelungenlied is divided into 29 cantos (*âventiuren*) and comprises well over 2,300 four-line strophes. Its distinctive metrical form, known as the *Nibelungenstrophe*, was also used by the early Minnesinger known as Der von Kurenberg. Each of the long lines is divided into two by a caesura (audible break), and each half line contains three full beats, except for the second half of the fourth line, which contains four. The story itself falls into two parts.

Cantos 1–19 recount the love and marriage of Kriemhild and Siegfried and the slaying of Siegfried at the hand of Gunther and Hagen. In cantos 20–39, the poet tells of Kriemhild's marriage to Etzel and of her plan for revenge, culminating in the death of all the Burgundians. Part I introduces the virtuous and beautiful Kriemhild, the sister of the Burgundian kings Gunther, Gernot, and Giselher, whose duty is to protect her. In a dream Kriemhild sees two eagles tear to pieces a falcon she has raised. Her mother, Uote, interprets the falcon to be a husband who will bring her joy and sorrow. News of Kriemhild's great beauty reaches Xanten, and the young Siegfried, King Siegmund's son, sets out to woo her. When Siegfried arrives in Worms, the grim Hagen, Gunther's chief vassal, identifies the newcomer for Gunther and recounts his earlier, heroic deeds: Siegfried had single-handedly won a vast treasure, the Nibelungen hoard, and, after having bathed in the blood of a dragon that he had slain, became invulnerable save for one spot between his shoulder blades. When the Danes and Saxons subsequently declare war, Siegfried helps Gunther by leading the Burgundians and distinguishing himself in battle. Upon his return he meets Kriemhild for the first time and they fall in love. Hearing of Brünhild, a queen of remarkable strength and beauty who may be won only by a man capable of besting her in three athletic contests, Gunther determines to woo her. He enlists the aid of Siegfried, to whom he promises the hand of Kriemhild if successful. In Ienstein, Siegfried pretends to be Gunther's vassal and, with the aid of his Tarnkappe (cloak of invisibility) is able to help him defeat Brünhild. Gunther thus wins her under false pretenses, and a double wedding takes place in Worms. But Brünhild, who has grown suspicious, resists Gunther's advances during their wedding night. Siegfried, who agrees to help Gunther, again dons the Tarnkappe and subdues Brünhild; she is once again deceived into believing in Gunther's mastery. Ten years later, Brünhild, brooding over her unhappy marriage, prevails upon Gunther to invite Siegfried and Kriemhild to Worms. During a knightly contest, the queens quarrel over the prowess of their respective husbands, with Brünhild insisting that Gunther is the superior man. The quarrel escalates, until Kriemhild reveals to Brünhild the ring and girdle that Siegfried had stolen from her the night he helped Gunther take her maidenhood. Devastated by the import of such visible evidence, Brünhild leaves the court in tears. She recounts the incident to Hagen, who plans and carries out Siegfried's murder. Hagen tricks Kriemhild into revealing the location of Siegfried's vulnerable spot and later uses this information to kill him by stabbing him in the back. Kriemhild is inconsolable and lives only for revenge. The grief-stricken widow remains in Worms distributing the Nibelungen treasure among her supporters and hoping that they will help her avenge Siegfried's death. When Hagen learns of this, he steals the treasure and sinks it in the Rhine.

At the start of Part II, thirteen years have elapsed since Siegfried's death. Etzel, king of the Huns, hears of Kriemhild's great beauty and determines to wed her. He sends his Christian vassal, Margrave Rüdiger of Bechlarren, to Worms as his proxy wooer. Kriemhild agrees to marry the wealthy and powerful Etzel only after she exacts an oath from Rüdiger that he will avenge all wrongs done her. Her departure from Worms marks a turning point in her personality: she no longer passively grieves for her dead husband; she now actively plans her revenge. After ten years of marriage, Kriemhild persuades Etzel to invite her brothers and Hagen to Gran for a festival. Despite Hagen's warnings, the Burgundians, or Nibelungs as they are now called, accept the invitation and Hagen leads the expedition. Before they cross the Danube, Hagen learns from two water sprites that none of them will return alive except the chaplain. To test the truth of their prophesy, Hagen tosses the chaplain, a nonswimmer, overboard during the river crossing and uses an oar to try to keep his head submerged. Despite Hagen's best efforts, the chaplain reaches the opposite shore. On their arrival at Bechlarren, Rüdiger receives them with great hospitality, and Giselher is betrothed to Rüdiger's daughter. As host, Rüdiger accompanies his guests to Etzel's court, and shortly thereafter hostilities break out. The Huns attack the Burgundians in the sleeping quarters and thousands die. Soon afterward in the great banquet hall, Etzel's generous hospitality turns to hatred as he witnesses Hagen behead the former's young son, Ortlieb, in battle, an act that incites a new wave of fighting. The death toll rises to devastating heights on both sides. The Burgundians are finally besieged in the great hall, which Kriemhild has set on fire. The warriors quench their thirst with the blood of the slain. The loyal vassal Rüdiger, after a desperate struggle with his conscience, is compelled to enter the fray and battles against his friends, the Burgundians. After horrific carnage, Dietrich von Bern defeats the two remaining Burgundians, Gunther and Hagen, and brings them shackled before Kriemhild. Kriemhild has Gunther killed and then, with Siegfried's sword, she beheads the bound and defenseless Hagen. She herself is struck down by Hildebrand, Dietrich's vassal. At the conclusion of the work, only Etzel, Dietrich, and Hildebrand remain alive.

Part I of the *Nibelungenlied* differs from Part II in its attempt to incorporate courtly conventions into the narrative. The poet took great pains to portray Siegfried and Kriemhild's love in the refined terms of his day, a concession to the cultured tastes of his audience. Despite its courtly overlay, the *Nibelungenlied* differs markedly from the fashionable, idealistic courtly epics of the early thirteenth century. Not compassion, repentance, and forgiveness but rather jealousy, betrayal, and vengeance carry the narrative of the *Nibelungenlied*.

The tragedy that the poet recounts offers the medieval audience a depiction of what befalls when loyalties are betrayed, when noble status (*ordo mundi*) is ignored, when greed rather than goodness, when self-interest rather than human compassion become the order of the day. Moderation, the cornerstone of all courtly virtues, is absent; deception is the watchword of this tragic tale. God's will does not determine the action but rather the repercussions of deception revealed. Duplicity forms the thematic core of many of the highly dramatic and memorable scenes that punctuate the narrative.

Nibelungenlied, the subject of prolific scholarly inquiry, continues to intrigue its readers and elicit new and original research. Numerous investigations, past and present, have focused on the identity of the author; the date and origins of the poem; its narrative structure and oral-formulaic content; the characters, motivation, and message of the poem; and its reception. Much of the early research addressed the source or sources of the poem. Karl Lachmann, who published his source study in 1816, viewed the poem as a compilation of individual lays by autonomous poets. In 1920 Andreas Heusler refuted Lachmann's celebrated *Liedertheorie* (theory of songs) by postulating that the poet fashioned his tale from two distinct sources. He submitted that the first half derived from the "Younger Lay of Brünhild" (*Jüngerer Brünhildlied*), a short lay that recounted the love of Siegfried and Brünhild, the artifice used during Gunther's wooing, the quarrel between the two queens, and Brünhild's terrible revenge. Heusler posited a longer epic, the so-called *Ältere Not* (older tale), an account of the destruction of the Burgundians, as the basis for the second half of the *Nibelungenlied*. Many recent critics have given credence to Heusler's theory and have adopted and revised it.

More recent source studies have investigated *Nibelungenlied's* literary connections with the verse and the prose *Völsungasaga* in Old Norse and the Scandinavian *Thidrekssaga*, while the second part of the *Nibelungenlied*, based on the destruction of the Burgundians by the Huns in 436, also forms the

content of an older Eddic poem, the *Atlakviða* (Lay of Atli). However, the Eddic version, told from a completely different point of view, depicts Guthrun (Kriemhild) taking vengeance on her husband, the cruel and treacherous Atli (Etzel), not on Högni (Hagen) and her brothers. Modern scholarly research has moved from source studies to a consideration of the artistic merit of the work itself. Scholars who view the anonymous poet as a masterful artist with the ability to create his great two-part heroic epic of Kriemhild's love, loss, and revenge from two originally unrelated poems have studied the poet's use of parallelism, foreshadowing, symbolic imagery, and dramatic confrontations to inform and structure his tragic tale and to depict his all-too-human characters. For example, Kriemhild's invitation to her brothers and Hagen in Part II shares a similar framework and motivation with Brünhild's invitation to Kriemhild and Siegfried in Part I. Such interconnected scenes lend richness, coherence, and new meaning to the narrative. Of the numerous studies investigating the major characters of the work, several have dealt with Hagen, Gunther's mighty vassal. One of the problems with the *Nibelungenlied* is that Siegfried, the hero, dies at the conclusion of Part I. Some critics have argued that Hagen, who leads the Burgundians to Gran, changes from villain to hero, from treacherous murderer to compassionate friend in the second half of the poem. While he is praised by many as the quintessential vassal entrusted with the safekeeping of his king and his people, others view Hagen as demonic, self-interested, and villainous to the end. Kriemhild's role in Siegfried's death and her demand for the treasure at the conclusion of the poem have also formed the subject of scholarly inquiry, as has Brünhild's conspicuous absence from the story line after Siegfried's death. Numerous investigations focus on the Christian knight Rüdiger, a highly moral and much respected hero caught up in the web of conflicting loyalties. The *Nibelungenlied*, which has intrigued both the medieval listener and the modern scholar with its complex origins, purposeful structure, psychologically credible yet sometimes contradictory characters, and dramatic denouement, continues to inspire diverse and original scholarly interpretation.

The *Nibelungenlied* (*Song of the Nibelungs*) is the earliest and greatest of medieval German treatments of what we call the Nibelung legend (*Nibelungensage*), but it is not the only one. Several lesser works (*Nibelungia Minora*) treat the legend directly or indirectly.

The most popular of these is the *Rosengarten zu Worms* (*The Rosegarden at Worms*), a poem also included in the general area of Dietrich poems, since it involves Dietrich and his men and is told generally from their point of view. Kriemhild, desirous of demonstrating the superiority of her fiancé Siffrid (Siegfried), challenges Etzel, Dietrich, and their men to serial single combat with the men of Worms, including Gunther, Giselher, Gernot, and Hagen, along with Siegfried. Etzel, Dietrich, and the others accept the challenge after adding several heroes to their usual number, most notable of whom is the warrior-monk Ilsa. Twelve battles are fought with a kiss from the princess as the reward in each case. The men of Worms are beaten in all the battles, which culminate in the battle between Dietrich and Siegfried. Dietrich is loath to join battle and does so only when goaded by Hildebrand, who accuses him of cowardice. The *Rosengarten* survives in almost twenty manuscripts and fragments in some four clearly recognizable versions.

The Nibelung legend proper reappears only in a late strophic narration called *Das Lied vom hürnen Seyfrid* (*The Song of Horned Siegfried*), which derives its name from the notion that Siegfried's skin was invulnerable after his bath in dragon's blood because it turned to horn. The young Siegfried is here portrayed as being obstreperous at home and is given to a smith to be raised. The smith finds him equally difficult and sends him out to fight a large number of dragons who are killed and melted down in a great fire. One dragon's horny skin adheres to the youth's and gives him his protective coating. Princess Krimhild, the daughter of king Gybich, has been carried away by a flying dragon who has imprisoned her on a mountain. Seyfrid hears of this from a dwarf, Eugel, who shows him the way to the mountain. The dragon's lair is guarded by a giant named Kuperan, and much of the poem is devoted to the long battle between Seyfrid and the giant. After defeating the giant he rescues the maiden from the dragon. In a brief epilogue we are told that Seyfrid's in-laws will kill him and that his wife will avenge him.

The poem is poorly constructed and shows evidence of having been assembled from a number of differing versions. It survives only in printed versions from the early sixteenth century onward. The poem shares a number of details with Norse versions that are missing in the *Nibelungenlied*, suggesting that there was "recontamination" of German tradition from the north or that there were varying versions of the story of young Siegfried in oral tradition in Germany.

Most important German thinker of the fifteenth century (Latin, Nicolaus Cusanus), ecclesiastical reformer, administrator, and cardinal. His lifelong effort, as canon law expert at church councils, as legate to Constantinople and later to German dioceses and houses of religion, in his own diocese, and even in the papal curia was to reform and unite the universal and Roman Church. This active life finds written expression in several hundred Latin sermons and more theoretical background in his writings on ecclesiology, ecumenism, mathematics, philosophy, and theology. Curious and open-minded, learned and steeped in the Neoplatonic tradition, well aware of both humanist and scholastic learning, yet self-taught in philosophy and theology, Nicholas anticipated many later ideas in mathematics, cosmology, astronomy, and experimental science while constructing his own original version of systematic Neoplatonism. A whole range of earlier medieval writers influenced Nicholas, but his important intellectual roots are in Proclus and Pseudo-Dionysius. In spite of his significance few later thinkers, apart from Giordano Bruno, understood or were influenced by him until the late nineteenth century.

Born in Kues (between Koblenz and Trier), Nicholas studied liberal arts (and perhaps some theology) at Heidelberg (1416–1417) and canon law at Padua, where he earned his *doctor decretorum* (1423) and made initial contacts with Italian humanists and mathematicians. He studied and taught canon law at Cologne (1425), where Heimericus de Campo introduced him to the ideas of Albertus Magnus, Ramon Llull, and Pseudo-Dionysius. He soon ended his formal schooling and became secretary, then chancellor, to the archbishop of Trier. He refused chairs of canon law at Louvain in 1428 and 1435, preferring administrative work in the church. As an expert at the Council of Basel (1432–1438), he wrote on the Hussites, papal authority, and reform of the calendar. His important conciliarist treatise, *De concordia catholica* (*On Catholic Harmony*, 1433), stressed the principles of representation and of consent of the governed and embodied his lifelong commitment to bring harmony and unity out of conflict and diversity.

In 1437 Nicholas changed his support from the conciliarists to the pope to better work for unity. He traveled in the delegation to Constantinople seeking to reunite Greek and Roman churches. Ordained a priest by 1440, he traveled as legate to Germany for the next ten years on behalf of the papal cause, and was named (1448) and made (1450) cardinal. He was appointed bishop of Brixen in Tyrol the same year, but traveled to Germany and the Low Countries to preach the jubilee year and issue edicts of reform. His efforts to reform his own diocese led to enmity with the local archduke; twice Nicholas had to flee to Rome. After 1458 he remained in the papal curia of Pius II at Rome. Nicholas died in 1464 en route to Ancona from Rome.

His important masterpiece of 1440, *On Learned Ignorance* (*De docta ignorantia*), was the foundation for his writings over the next quarter century. While fully engaged in practical ecclesiastical affairs, Nicholas also wrote some twenty philosophical/theological treatises and dialogues, plus ten works on mathematics, focusing on the problem of squaring the circle and on using mathematics in philosophical theology. The three books of *On Learned Ignorance* expound his central ideas about God, the universe, and Christ. Nicholas was to extend, expand, and modify these speculations in later writings.

"Learned ignorance" is so called because it involves acknowledging the limits of human knowledge when we seek to know what God is (or, indeed, what the exact essence of anything amounts to). Our rational knowledge is a kind of conceptual measuring designed for the finite realm of more and less, but unable to reach the absolute maximum and thus inadequate for measuring the infinite God. There is no humanly conceivable proportion between God and creatures. Yet for Nicholas, we are supposed to move in ignorance beyond reason's inadequacies in hopes of touching God (*incomprehensibiliter comprehendere*) through a kind of intellectual-mystical vision wherein all things are one. Since God's fullness comprises everything, Nicholas invokes the idea of the coincidence of opposites (*coincidentia oppositorum*) as the ontological correlative of learned ignorance. By limiting the principle of contradiction to the realm of finite creatures and their differences, we recognize that in divinity all opposites coincide in the transcendent infinite oneness. The lack of resemblance between God and creatures means that all our knowledge of God must be metaphorical.

Nicholas's later writings propose conjectural metaphors for exploring the limits of our knowledge and at the same time seeking the God beyond. Of particular import are *De coniecturis: On conjectures* (ca. 1442), where Nicholas proposes a hierarchical Neoplatonic ontology as a speculative conjecture (while pointing out that all our conceptual knowledge is provisional or conjectural) and *Idiota de mente: The Layman—About Mind* (1450), which parallels our minds' creation of a conceptual universe and the divine mind's creation of the actual world. In *De visione Dei: The Vision of God* (1453), Nicholas proposes an all-seeing icon to hold together for imagination and thought how our striving to see God is one with God's seeing us.

De possess: On Actualized Possibility (1460) and *De li non aliud: On the Not-other* (1461–1462) work out two descriptions, or "names," of God. The first stresses how in God all possibilities are real or actually exist; thus in God possibility and actuality coincide. The second is concerned to express how God is and is not present to created things—intimately connected ("not other than") yet never identical with (*not* "nothing else but") creatures in space and time. Each of these metaphors and, indeed, all of Nicholas's later writings are calculated to initiate dialectical thinking so that one may move from thinking of God and creatures as exclusive and exhaustive alternatives to seeing them as identified, yet not identical. God is to be seen as both all and nothing of created things; creatures are limited images of the divine infinite oneness that they cannot resemble yet for which they ceaselessly strive.

Clyde Lee Miller

A goldsmith and enamelist active in the late twelfth and early thirteenth centuries, Nicholas is known for the stylistic originality of his work. Two dated works inscribed with his name exist: the ambo, or pulpit, dated 1181 (and remodeled into an altarpiece in 1330), from the Augustinian Abbey of Klosterneuburg near Vienna, and the shrine of the Virgin in Tournai Cathedral, dated to 1205. The shrine of the Three Kings in Cologne Cathedral, usually dated to the 1190s, is also partially attributed to Nicholas. This large reliquary was built to house the relics of the Three Magi, which Archbishop Rainald von Dassel had received from Emperor Frederick Barbarossa in 1164. After Nicholas's creation of the shrine, the Magi, as examples of both the first Christian pilgrims and the first Christian kings, became closely associated with theories of German kingship and also with the city of Cologne, their crowns appearing on its coat of arms by the end of the thirteenth century.

In technical details and certain stylistic features, Nicholas's work is related to the general tradition of metalwork in the Rhine and Meuse valleys, a region known in the twelfth century for its sophistication. His work is particularly closely related to the Heribert Shrine, considered the major achievement in metalwork from this area in the second half of the century. As with other Mosan artists, Nicholas was accomplished in creating both *champlevé* (decorative enamel filling) plaques, such as those found on the Klosterneuburg ambo, and three-dimensional figures, which are found on the Three Kings Shrine and that of the Virgin. In addition to reflecting Mosan traditions, Nicholas's work, both two- and three-dimensional, shows a new interest in the natural proportioning of the human body, the fall of cloth garments over it, and a type of soft drapery fold called *Muldenfaltentstil* (trough fold style), which is smoothly curved and unlike the angular, inorganic drapery found in Romanesque art. This drapery style, perhaps first appearing in Nicholas's work, becomes extremely popular in the years around 1200 in a variety of other works, including cathedral sculpture, such as that at Bamberg Cathedral, stained glass, and manuscripts. The sources for these components of Nicholas's art are a matter of controversy with contemporary Byzantine art, Ottonian art, early Christian art, and even Roman minor arts cited as possible works Nicholas may have studied to acquire classicizing elements.

In spite of great stylistic innovation, there is evidence that Nicholas had the help of theologians in designing the complex iconographies of his shrines. A plaque of the Mouth of Hell from the Klosterneuburg ambo features a sketch of the Three Marys at the Tomb on the back. This is believed to represent a trial composition whose subject was later modified by the theological advisers to better accommodate the typological meaning of the whole ambo. The complex relationships between the Three Magi and contemporary kings implied by the images of the Three Kings' Shrine are also thought to reflect the ideas of theologians, in this case persons associated with Cologne Cathedral.

A sculptor whose few surviving documented works are dispersed from Trier and Strasbourg to Vienna, Nicolaus Gerhaert von Leyden remains relatively unknown today even though his style influenced late Gothic sculpture throughout Germany. Of the surviving stone carvings attributed to him or to his school, only five are authenticated by documents or signatures. The earliest to display his new inner dynamism and portrait realism is the signed tomb effigy of Archbishop Jacob von Sierck, dated 1462, now in the Diocesan Museum in Trier. Originally the upper half of a two-tiered tomb with his decaying corpse below, the deeply cut effigy was undoubtedly made by a mature artist. His stay in Strasbourg, where Nicolaus was mentioned frequently in documents from 1463 to 1467 and where he became a citizen in 1464, is the best-documented and most productive period of his life. Here he was commissioned in 1464 to create the portal of the Neue Kanzlei (New Chancellery), on which busts appeared as if looking down from a window; only two heads survive: the so-called Bärbel von Ottenheim in the Liebieghaus Museum in Frankfurt and Count Jacob von Hanau-Lichtenberg in the Musée de l'Oeuvre Notre-Dame in Strasbourg. The Epitaph of Conrad von Busnang in the Chapel of St. John in the cathedral at Strasbourg, signed and dated 1464, provides the only comparison for Madonna statues attributed to his circle. In 1465–1467 he worked on the carved wood high altar for the Constance Minster that was later destroyed. His best-known work, the signed Crucifix for the Old Cemetery in Baden-Baden, now in the Stiftskirche there, was

Nicolaus Gerhaert von Leyden, so-called Bärbel von Ottenheim (Frankfurt am Main, Liebieghaus-Museum alter Plastik). Photograph: Liebieghaus-Museum/Werner Neumeister

dated 1467. In the same year, in response to the second invitation of Emperor Frederick III, Nicolaus went to Vienna and Wiener Neustadt, where he was responsible for the tomb lid of the Emperor in the Apostle's Choir of St. Stephen in Vienna. Nicolaus died in 1473 and was buried in Wiener Neustadt. There are fewer documents from these last years, and they provide less certitude in regard to the extent of his work.

In spite of the widespread destruction of Netherlandish sculpture of the fifteenth century and a lack of study of French work of the same time, the stylistic origins of Nicolaus are generally agreed to lie in the Flemish-Burgundian region. The individualism of his portrait heads derives from those of Claus Sluter at Dijon, and his knowledge of the late work of Jan van Eyck is also generally accepted. His busts from the Chancellery at Strasbourg are often compared to the earlier figures above the entrance to the house of Jacques Coeur in Bourges. The new dynamism he infused into his figures together with their physical expressiveness and the drapery expanding into the surrounding space characterize his contribution to the new style. These characteristics also appear in the works of the Masters E.S. and Martin Schongauer, both working in the Rhineland at approximately the same time as Nicolaus; the engravings of these artists are partly responsible for the rapid spread of his style in the late fifteenth century.

The most convincing unsigned and undocumented work attributed to Nicolaus is the bust of a Meditating Man in the Strasbourg museum, assumed to be a self-portrait, also from the New Chancellery. The Crucifixion Altar in Nördlingen and the Virgin of Dangolsheim in Berlin are frequently considered his early work or that of a sculptor close to him.

Nobility and Farmers

Although there were aristocratic families in the Merovingian period descended from the Gallo-Roman population, there were clearly others who traced their roots to the Frankish past. By the Carolingian age, certain kindreds had asserted themselves to the forefront, claiming special privileges among the rest of the population. One such kindred was that of the Udalrichings, of which Charlemagne's wife, Hildegard, was a member. Her brothers, Ulrich and Gerold, took a prominent place, especially in Alemannia. During the reign of Louis the Pious, however, they were replaced by the "Welfs" from the area near Lake Constance.

It was from kinship groups such as the Udalrichings, Alahofings, Etichons, Hunfridings, and Matfridings that the Carolingian rulers chose those men whom they installed as dukes and counts throughout their realms. Some scholars argue that the real end of the Carolingian empire came at the end of the ninth century, as these royal appointees began to establish territorial lordships—or to regionalize, a process that continued into the thirteenth century and beyond. By about 1000 C.E., noble families and kinships began to style themselves after their residence and to push down roots where they held power and influence. At the same time, the old kindreds fragmented into various branches; for example, the comital families of Bregenz, Buchhorn, Winterthur, Pfullendorf, and Heiligenberg, who flourished in the High Middle Ages, all claimed descent from the Udalrichings. In the sense of the period after about 1000, noble families did not exist in the Carolingian and Ottonian ages.

The society of ninth- and tenth-century Germany was predominantly agrarian; at the same time it was decidedly unequal. Nobles shared space with nonnoble freemen and with the unfree. If one accepts the image of the nobility found in the fragmentary late-eleventh-century Latin poem *Ruodlieb*, the nobility spent great amounts of time feasting, hunting, honing their skills with weapons of war, and engaging in various family- and church-oriented activities such as the establishment of religious foundations. Documents of the eleventh and twelfth centuries reveal that many members of the nobility were becoming vassals to both spiritual and temporal princes, often creating conflicts of interest as the same noble found it challenging to serve two lords.

Like the nobility, free peasants could have rights in land called allodial, and in Ottonian times at least they probably owed some sort of military service. Servile peasants did not enjoy these same privileges or obligations, although Germany seems to have had areas throughout the Middle Ages where serfdom barely reached, particularly in the Alpine regions of the south. In time, manumitted serfs, called *censuales*, appear who rendered an annual sum to their landlord. Peasants might occasionally rise above their status through intermarriage or preferment within the church, though in Cologne and several other bishoprics, membership in the cathedral chapter was restricted to members of the nobility. If literature accurately reflects reality, this upward striving turned to tragedy. The poem *Meier Helmbrecht*, composed about the middle of the thirteenth century by Werner "der Gärtner" (the Gardener), presents a vivid and realistic picture of the age of decaying chivalry, relating the story of a young peasant who, dissatisfied with his lowly social position, becomes a highwayman and is finally hanged by angry peasants.

The economic recovery of the Rhineland in the tenth century and the expansion of the arable land beyond the limits of the Merovingian and Carolingian periods contributed to the vitality of Ottonian Germany. This internal expansion was matched on the eastern frontier by agricultural expansion in the marks of Meissen and Lausitz, on Germany's eastern frontier, which saw peasant pioneers flow in from all over the realm. The effects of this migration, and the subsequent demographic changes, left its impact from the coasts of the Baltic to Bohemia and Carinthia. German peasants thus became major players in the economic development of Central and Eastern Europe during the High and later Middle Ages.

Notke, Bernt (ca. 1440–1509)

Although born in Lassen in Pomerania, Notke centered his artistic career in northern Germany, in the Hansa city of Lübeck. He is best known for large sculpted altarpieces, which were installed in Hansa cities throughout the Baltic region including Tallinn, Estonia; Stockholm, Sweden; as well as Lübeck. Although known primarily for his sculpture, Notke was also a painter, printmaker, and goldsmith. Notke's most notable projects include his triumphal cross in the Marenkirche in Lübeck and his St. George and the Dragon from the Storkyrka in Stockholm. The triumphal cross (1477) was a life-size wooden ensemble with Christ on the Cross, here in the form of a Tree of Jesse, accompanied by St. John, the Virgin, Mary Magdalene, the patron Bishop Krummedyk, and Adam and Eve. The St. George and the Dragon (1489) was made as a votive offering from Sten Sture, who defeated the Danes after praying to St. George in the Storkyrka; the sculpture also contained a burial place for Sture in the base. Although St. George's face is not individualized, his elaborate armor and horse are modeled on those of Sture. The fantastic dragon is decorated with real elk horns, and the princess looks on from a separate console, adding to the dramatic verve of the piece. Notke's paintings include a Mass of St. Gregory in the Marienkirche in Lübeck and the wings of several altarpieces, including that at Aarhus. Notke created woodcuts of the Dance of Death (1480), perhaps related to his painted versions of the subject, and was also a talented metalworker, who was head of the Swedish mint (1490) and made the silver figure of St. George, now in the Museum für Kunst und Gerwerbe in Hamburg.

Also known as Notker III and Notker Teutonicus (Notker the German), Notker Labeo (the *lîp*) was a St. Gall monk and teacher best known for his Old High German translation-commentaries of Latin classroom texts. In a letter to Bishop Hugo of Sitten (ca. 1019–1020), Notker refers to the vernacular translation project on which he has embarked as something uncommon and revolutionary and notes that it may even shock his reader. He argues, however, that students can understand texts in their mother tongue much more easily than in Latin. Notker's translation method adopts contemporary glossing practices (syntactical, morphological, and lexical) and develops and integrates them into a continuous Latin/German text. First Notker often rearranges the word order of the original Latin into a variant of the so-called natural order, the *ordo naturalis*, a current pedagogic word order that roughly corresponds to a subject-verb-object typology. He then expands on the text with additional classroom commentary—either his own or culled from other sources—by providing synonyms, supplying any implied subjects or objects, expounding rhetorical figures and etymologies, and interpreting mythological figures. Finally Notker appends his Old High German translation, which is sprinkled with further explanation in the vernacular and occasional Latin terms, a kind of mixed prose (*Mischsprosa*).

In his letter to the bishop, Notker also includes a list of works he had finished, thereby providing us with a fairly accurate account of his corpus: Boethius' *De consolatione Philosophiae* (*On the Consolation of Philosophy*); Martianus Capella, *De nuptiis Philologiae et Mercurii* (*On the Marriage of Philology and Mercury*); Boethius's Latin versions of Aristotle's, *De categoriis* (*Categories*) and *De interpretatione* (*On Interpretation*), and, his most popular work, the Psalter (together with the *Cantica* and three catechistic texts). He also refers to several of his own classroom compositions, which contain translations of technical terms and/or examples in Old High German; among these are thought to be *De arte rhetorica* (*On the Art of Rhetoric*), *Computus* (*Calculating the Calendar*), *De definitione* (*On Definition*), *De musica* (*On Music*), *Partibus logicae* (*On the Parts of Logic*), and *De syllogismis* (*On Syllogisms*). A few Latin treatises produced in the St. Gall school may also have been compiled by him: *De dialectica* (*On Dialectics*), *Distributio* (*Logic*), and *The St. Gall Tractate*. Other translations listed by Notker have not survived: *Principia arithmetica* (*Arithmetic Principles*, by Boethius?), *De trinitate* (*On the Trinity*, by Boethius or Remigius of Auxerre?), Gregory the Great's *Moralia in Iob* (*Moral Deliberations on the Book of Job*), and Cato's *Distichs*, Vergil's *Bucolica*, and Terence's *Andria*. Notker's work did not find great resonance, and only the Psalter and several of the minor treatises are preserved outside of St. Gall.

Notker's late-tenth-century Alemannic marks an important transition period in the history of the German language. The extant eleventh-century St. Gall copies of his texts are recorded with a fairly consistent spelling, which modern scholars have interpreted to reflect guidelines that Notker imposed on the St. Gall scribes. They include the *Anlautgesetz* (devoicing initial voiced stops *b* *d* *g* following a voiceless consonant and/or a pause and in compounds) and the use of the acute and circumflex accents to mark word and/or sentence stress and vowel length. Notker's lexicon has also received considerable scholarly attention, owing to the many new words he coined to render into Old High German the highly complex Latin terminology he was translating.

[Bible](#); [Boethius](#); [Latin Language](#)

Postulated author of the *Memento mori* (remember death), a penitential rhymed sermon (nineteen strophes, seventy-six long lines with a lacuna, or gap, of indeterminate length between lines 61 and 62) composed between 1080 and 1090 by a monk named Notker, quite probably Notker the abbot of the reform monastery of Zwiefalten who died on March 6, 1095. The work exists only on the final pages of an eleventh-century parchment manuscript from the Monastery of Ochsenhausen in the Allgäu (Bibliothèque Nationale et Universitaire Strasbourg, manuscript no. cod. germ. 278, fol. 154v–155r), which also contains the seven strophes that comprise the Strasbourg version of the *Ezzolied*. The misleading title, *Memento mori*, was given to the work by its first editor, K.A. Barack, misleading because the work deals with life and not death, although it is likely that it was delivered during the season of penitence, Lent. The sermon was intended for members of the lay nobility

The work, whose basic theme is the journey of the soul through the world toward ultimate union with God, comprises three parts: I, strophes 1–6, which describe the need for the journey and the dangers that beset the soul; II, strophes 7–11, in which a special danger is high-lighted, namely, that the rich and powerful do not grant the poor and powerless the rights to which they have every just expectation. It is this one sin that can condemn the soul to hell (this section contains the lacuna); III, strophes 12–17, in which Notker returns to the theme of the journey through life with a concrete example of the type of correct behavior demanded, namely, the proper disposition of wealth. The final two strophes (18 and 19) are probably not original to the poem. Essentially, Notker is presenting the basic tenet of Christianity—love of neighbor—to demonstrate that while times may have indeed changed toward the end of the 11th century, the enduring admonitions of Christ have not.

Numbers and Calculation

Ancient number systems were used for counting objects, and therefore the number concept was concrete and finite, consisting of unit fractions, submultiples (a new unit that is a fraction of a larger unit, e.g., foot/inch), and integers; "zero" represented the absence of objects. For higher bases, the linguistic and metrological number systems combined different multipliers chosen for their numerical qualities, such as those having many divisors (6, 10, 12, 20), often in combination with the numbers of sequence of doubling progression of base 2 (2, 4, 6, 16, 32, etc.). In these systems, early societies were able to perform the four basic operations of arithmetic.

The linguistic number words reveal that Germanic peoples mastered a decimal system of calculation based on the Indo-European system with terms for one, ten, and one hundred; the word *thousand* was common only to the Germanic language group. In all Germanic languages the numerals show vestiges of a peculiar duodecimal element, resulting in a change in the linguistic expression between twelve and thirteen, sixty and seventy, and an extension of the decades to 120, meaning "one hundred" (*Großhundert*—12×10, or six score *Stiege*) rather than "100"; "thousand" meant a *Großtausend* (120 ×10) rather than "1,000". Even though the Germanic languages had a decimal concept, it did not represent the concept of exponentiation of base ten because the numerals had several meanings. "Hundred" was a "long hundred" of "120" when counting objects, whereas in counting money, years, and in ecclesiastical contexts it was "100"; for weights "hundred" was 112 pounds (the "hundredweight"). The Roman numerals "C," "D," and "M" further complicate the issue, as their numerical values depended on what was being counted. A 20 count ("score") formed an alternative method of counting, and each multiple of the score had a specific name.

The earliest examples of "long hundreds" are indirect sources in Gothic (Ulfi's Gothic Bible translation, fourth century), whereas Salfronconian *chunntualepti* (in the *Salian Law*) meant "120". "Long hundred" numerals are found in Old Norse, Old English, and Middle Scottish grammars, and in coinage (1 pound=20 shillings= 240 *denarii*). Counting "six score to the hundred" continued far into the modern period as a method of accounting in the Royal Scottish administration, in Icelandic land taxation (until 1915), and was used for counting the leaves of the renowned Irish manuscript *The Book of Kells* in 1588. Long after the "long hundred" had disappeared from the language, it was used for counting by the piece in Baltic and North Sea trade and fishing, for counting commodities such as turf, planks, fish, cloth, fruit, vegetables, and eggs.

Calculation was performed by casting counters on a counting table (*Rechenbrett*). The result was recorded by incisions on tally sticks (*Kerbholz*) or by writing the number word, which sometimes was abbreviated into peculiar Roman numerals.

Medieval arithmetic was a theoretical discipline (Boethius, Isidore of Seville) that did not relate to practical calculation. Walther von Speier studied the abacus in St. Gall and wrote on practical arithmetic in *Ritmimachia* (Number Fight, 983). Gerbert (later Pope Sylvester II) brought Arabic science from Spain after 967. Arabic numerals began to occur around 1300 and became widely used around 1500 and thereafter. The ten numerals, the positional system, and decimal fractions revolutionized calculation after the Middle Ages.

Nuremberg

From the mid fourteenth to the sixteenth centuries, the city (German, *Nürnberg*) was among Europe's foremost artistic and mercantile centers. Located in sandy forests of middle Franconia within the diocese of Bamberg, Nuremberg was selected by Emperor Henry III (r. 1039–1056) as the site for a small castle and, in 1050, a chartered town. Nuremberg's fate was long linked with both the Holy Roman emperors and the Hohenzollern kings and burgraves. Rudolf I (r. 1273–1291) made it an imperial free city. Ludwig the Bavarian (r. 1314–1347) granted Nuremberg freedom from external legal jurisdiction and gave it custodial control of the imperial castle. In the Golden Bull of 1356, which formalized the imperial election process, Charles IV (r. 1355–1378), a frequent visitor, designated Nuremberg as the site of the inaugural diet of each new emperor. Under Charles's son, King Sigismund, the imperial relics and regalia were permanently transferred to Nuremberg in 1424, where they were stored in the Heilig-Geist-Kirche (Church of the Holy Spirit) and displayed annually until 1523 in the main market. The city ordered the Schöner Brunnen (Beautiful Fountain; planned 1370, erected 1385–1396), with its statues of the electors, for the market to commemorate its special position as one of the important imperial cities. As the community grew on both sides of the Pegnitz River, it was ringed by a common wall in about 1320. The walls had to be expanded again between 1377 and 1430 to accommodate the burgeoning population,

Nuremberg, St. Sebaldus, north door: Death, Funeral, and Coronation of the Virgin. *Photograph: Joan A. Holladay*

Nuremberg, castle, entrance. *Photograph: Joan A. Holladay*

which by 1500 had doubled to about 45,000–50,000 inhabitants. These fortifications, much of which are still extant, included 128 observation towers and walls averaging almost eight meters high.

Early views of Nuremberg, such as in Hartmann Schedel's *Liber chronicarum* (*Nuremberg Chronicle*, 1493), stress the city's majestic skyline dominated by the castle (Kaiserburg), its many church spires, its rich stock of stone houses, and its mighty defensive walls. Nuremberg boasted two great parish churches (St. Sebaldus and St. Lorenz), two dependent churches (Frauenkirche and St. Jakob), nine major monasteries, and a host of cemetery churches, hospitals, chapels, and other religious establishments. St. Sebaldus, which served the northern half of the city, is mentioned as early as 1070, when the faithful came to worship the saint's relics. The present, double-choir church was begun in 1230 with its western choir and nave. These sections contrast vividly with the much wider, airier hall-style choir erected between 1361 and 1372. St. Lorenz, situated south of the river and on the site of an earlier chapel, is slightly newer in date. Shortly after the nave and crossing (1270–1350) were finished, Charles IV helped to fund the elaborately sculptured west facade (1355–1360). Between 1439 and 1477 Konrad Heinzelmann, Konrad Roritzer, and Jakob Grimm built the substantial hall choir. Both St. Sebaldus and St. Lorenz still retain much of their original decoration. Unlike churches in many other important Protestant towns, only some of their art was removed when Nuremberg embraced Lutheranism in 1525. The local patrician families vied with each other in endowing altars, erecting epitaphs, and commissioning sculptures and stained glass windows. Both churches offer rich surveys of Nuremberg's artistic talent between about 1350 and the Reformation. Like the two parish churches, the small Frauenkirche (Church of Our Lady, 1352–1358) and the Augustinian monastery (1479–1485), demolished in 1816, were hall-style churches. The former stands between the main and fruit markets on the site of a Jewish synagogue that was razed in 1349. Just north of the main market is the Rathaus (city hall). Extensive portions of the medieval building survive, including the vast great hall (1332–1340) where imperial diets, patrician dances, a legal court, and other events were held. Situated on major trade routes, Nuremberg thrived from its commercial ties with Italy, Bohemia, and the rest of Europe. In the fifteenth and early sixteenth

centuries it supported a remarkably large community of artists and artisans. These were divided into two groups—the sworn and the free. The sworn artists, notably the metalworkers, were those whose productions were deemed essential to Nuremberg's economic well-being. Annually they pledged allegiance and promised not to leave Nuremberg without the city council's permission. By contrast, the council sought to encourage the other arts by removing most barriers other than basic rules about training. Painters, printmakers, sculptors, and glaziers, among others, could settle in Nuremberg far more easily than in most other towns. It was the city council rather than guilds, which had been dissolved in 1349, that regulated all the trades.

Nuremberg's metalworkers were especially renowned. Importing ores and other metals from Bohemia, Saxony, Thuringia, and Swabia, artisans produced everything from humble sewing needles to sumptuous goldsmith cups to ornamented armor, much of which was exported. In the 1490s Hans Frey devised intricate table fountains, while another anonymous goldsmith fashioned the renowned Schlüsselfelder Ship in 1503 (Nuremberg, Germanisches Nationalmuseum). At a height of 79 cm, this is a wine pitcher in the form of a three-masted sailing ship perched on a twin-tailed mermaid. Gilt silver sailors man the guns and climb the riggings. Such works were destined for a highly sophisticated clientele. Ludwig Krug, Melchior Baier, and their peers also supplied costly reliquaries and liturgical objects. In 1514 Nuremberg registered 129 goldsmiths. The city's redsmiths, who worked in brass and bronze, were also quite prominent. Between 1462 and 1496 Nuremberg was home to 165 master redsmiths. Foremost among these was the Vischer family, who supplied tombs, epitaphs, memorials, and, later, small-scale sculptures to clients across Central Europe. Their skill is evident in the huge Tomb of St. Sebaldus that Peter Vischer the Elder and his sons completed in 1519 for the parish church. Other metalworkers made Nuremberg a leader in the production of portrait medals beginning in the late 1510s.

The city reached its greatest fame during the lifetime of Albrecht Dürer (1471–1528). Talented sculptors such as Veit Stoss and Adam Krafft enriched both parish churches. For the St. Lorenzkirche Stoss carved the polychromed (multicolored) limewood Angelic Salutation (1517–1518), an over life-size Annunciation within a rosary, that hangs before the high altar. Nearby stands Krafft's sacrament house (1493) with its realistic self-portrait statue seemingly supporting the 18.7 meter tall stone tabernacle. Pioneers like Dürer's godfather, the publisher Anton Koberger, and his teacher, Michael Wolgemut, recognized the emerging potentials of the print and the illustrated book to reach audiences across the continent when they collaborated on the Schatzbehalter (Treasury, 1491) and the *Liber chronicarum* (*Book of Time*, 1493). Two decades later there were dozens of printmakers and publishers creating books, religious prints, and, with the advent of the Reformation, often polemical broadsheets.

The Reformation, with its attendant religious and political upheavals plus broader shifts in European trade toward the Atlantic, affected Nuremberg's artists. Goldsmiths suffered far less than painters and sculptors from the waning of religious commissions. The city rediscovered and celebrated its medieval and Renaissance heritage in the early nineteenth century. Nuremberg still retained most of its older architectural heritage until the devastating bombings of 1945. Only a fraction of these structures were reconstructed after the war.

Oliver of Paderborn (d. 1224)

Oliver of Paderborn (North Rhine-Westphalia) appears as the scholastic at Paderborn in the waning years of the twelfth century. His reputation was such, however, that by 1202 he had been appointed scholastic at Cologne Cathedral. In 1207 we find him in Paris, where he acted as the mediator between a canon from Reims and the monastery of St. Remy. Presumably, he had been attending the schools of Paris at the time. The following year, he appears in southern France, apparently as a preacher against the Albigensians. At this time, he established his lifelong friendship with Jacques de Vitry and Robert de Courçon, both of whom became well-known preachers of the Fifth Crusade in France.

In the papal encyclical *Quia maior nunc* of May 1213, Oliver was named as one of several crusade-preachers for Germany, with specific duties in the ecclesiastical province of Cologne. Assisting him was *magister* (master) Hermann, dean of St. Cassius's Church in Bonn. Over the next four years, he and his colleagues crisscrossed Germany, convening assemblies of people and exploiting every opportunity to present their message and enlist support for the crusade. They were armed with letters of indulgence with which to entice and reward participants. Following the Fourth Lateran Council in Rome (at which Oliver was also present), he and the other preachers were also charged with collecting the half-tithe that Innocent III had imposed on the clergy as a means of providing financial support for the crusade.

In the summer of 1217 the first company of warriors departed by ship from the Lower Rhine. Among them was Oliver himself, who played a vital role in the campaign against Damietta in the Nile delta. His *Historia* of this event and his other writings and letters make him the best known of the German preachers. Only after the fall of Damietta to the Muslims on September 8, 1221, did Oliver return to Cologne, where he appears again in the spring of 1222.

In 1223 Oliver was elected bishop of Paderborn. He never really occupied the office, however, having first resumed his role as crusade-preacher in 1224, and shortly thereafter being elevated to the cardinal-bishopric of St. Sabina. One sees the influence of his fellow German, Conrad of Urach, and perhaps also of Cardinal Robert de Courçon, in this appointment. Like Conrad, however, Oliver lived but a short time after donning the cardinal's hat; he died the same year.

Onomastics

[This entry includes four subentries:

Introduction
Personal Names
Toponyms
Chrematonyms]

Introduction

Onomastics is the study of names and how names are given. A name is one or more words designating an individual person, place, or thing as an entity. Names are important in that they allow the bearer to be located in space and time. *Sine nomine persona non est* (No name, no person) goes a Roman legal proverb. Since names (proper nouns) are of persons, places, or things, we usually divide the subject up into personal names (anthroponyms), place names (toponyms), and names of things (chrematonyms, a less commonly used term); these may then be broken into any number of subcategories: tribal names (ethnonyms), names of bodies of water (hydronyms), and so on.

Personal Names

Although one could have just a single-stem name, such as *Karl*, *Hengist*, *Wulfila*, or *Hraban*, the Germanic tribes inherited from their Indo-European ancestors the habit of dithematic (bipartite) personal names: *Hilti-brant*, *Wolf-ram*, *Diet-rich*, and the like. Common second components of men's names are *-hari*, *-wolf*, *-balt*, and *-helm*; of women's names, *-gund*, *-hilt*, *-rûn*, and *-lint*. There was a tendency to give a "first name" plus an attribute, *Karl der Große* (Charles the Great), *Ludwig der Fromme* (Louis the Pious), *Ludwig der Dicke* (Louis the Fat). Again, as in Indo-European, these bipartite names might be shortened, usually into *n*-stems, and names from baby talk were not unusual: *Pappo*, *Mammo*, *Pippo*, *Poppo*, *Dhuoda*. Hypocoristics such as *Ebbo* (Eberhard), *Ezzo*, and *Anno* are also common. There were in general no family names, though the family or place of origin might be indicated. One cannot say that the Germanic tribes used patronymics, but there was a tendency to refer to the parent: *Hiltibrant*, *Heribrantes sunu*, and Modern German *Mommsen*. Finally, there was a tendency to give (three) alliterating names within a family: *Heribrant*, *Hiltibrant*, *Hadubrant*; *Gunther*, *Gîselher*, *Gêmôt*. Because of the Latinate nature of Carolingian culture and its transmission, many of our names are known primarily in Latin form: *Hrabanus Maurus*, *Walahfrid Strabo*, *Notker Labeo*.

As we move toward Middle High German, the old dithematic names become less common or lose their meaning, and foreign names become more common, such as saints' names and biblical names: *Johannes*, *Peter*, *Andreas*. There was a remarkable increase in shortening of names, and *Dietrich* might yield many variants: *Dieto*, *Dietel*, *Dietze*, *Dirk*, *Thilo*, *Tymme*. Even biblical and saints' names might yield hypocoristics: *Beppo* (*Josef*), *Tönnies* (*Antonius*). Cognomina naturally increased as a means of differentiation, and we see the beginning of surnames, often from place names: *von Eschenbach*, *von der Vogelweide*, *von Aue*, *von Straßburg*, then from occupations, and so on. Ecclesiastical (*Bischof*, *Probst*), and literary names (*Artus*, *Biterolf*) were often used.

There was a tradition of name play in literary onomastics, as in St. Jerome's *Nominum interpretatio*. We find such things as Otfrid's acrostic and teleostic, Wolfram's "etymology" of *Parzival* (140,16f.), such place names as *Munsalvæesche*, even the *argumentum a nomine* (*nomen est omen*). In the religious sphere, name play was already found in the Bible, and it was extended during our period. The use of cognomina led to such things as "the 72 names of God" and to the hundreds of epithets applied to Mary, collected by Salzer, such as *mersterne* (*Stella maris*), *Aarons gerte* (*virga Aaron*), *beslozzener garte* (*hortus conclusus*), used so effectively by Walther.

Toponyms

As in the case of personal names, place names may also be simple, as *Köln* (Cologne), *Rîn* (Rhine), or compound. In the case of the compounds, it is useful to divide them into a first component, an adjective or a noun (determinant), and a second component (nucleus). The nucleus normally refers to some natural feature of the landscape: 1. names connected with streams, bodies of water: *-bach*, *-ach*, *-furt*, *-bronn*, *-weiher*; 2. islands: *-werder*, *-werd*, *-worth*; 3. mountains and hills: *-höhe*, *-berg*, *-halde*; 4. woods: *-hart*, *-lohe*, *-forst*; 5. fields: *-au*, *-ried*, *-lar*, *-heide*; and so on.

As we move toward Middle High German, we note that the clearing of land gives us new names reflecting this activity: *-reut*, *-rode*, *riute*, *-schwand*, *-brand*, *-hagen*, *-hain*, and so forth. Expansion to the east led to the use of Slavic names, for example, *Leipzig*, *Dresden*, and *Berlin*. The expansion of cities and knighthood led to an increase in such nuclei as *-stadt* and *-burg*. The wider contact with the outside world occasioned by the Crusades led to many new or renewed geographical names: *Pülle* (also called *Apulia*), and *Bern* (as in *Dietrich von Bern*; also called *Verona*).

Chrematonyms

Names for things reflect the native taxonomy of medieval Germany, and they do not always overlap with modern nomenclature. Favorite dogs, horses, swords get names, often foreign ones: *Hiudan*, *Buzival* (Alexander's horse), *Durendart* (Roland's sword). Along with pet names, the beast epic and the fable brought in such names as *Reinhart* and *Ysengrin*. In Latin, it was common to use such terms as *Brunellus* (ass), and kennings such as *sonipes* "horse" and *comiger* "cow." The rise of the chancery languages, with their circumlocutions and alliterating formulas (*Land und Leute*, *Hand und Habe*), created many new words, and the increase in words in *-heit* in the language of the mystics has been noted.

Onomastics reflects the culture and history of the nation and forms a valuable resource for their study.

Ordinatio Imperii

In 817, Louis the Pious, perhaps motivated by a recent accident, met with the leaders of the realm to determine the Frankish empire's fate. Louis decided to establish a succession plan, the *Ordinatio Imperii*, based on the idea of the empire's unity. Louis, after seeking divine inspiration, bestowed the succession on his eldest son, Lothar, and granted his other sons, Louis and Pippin, royal authority over subkingdoms in the eastern and western parts of the empire. Sovereign in their own territory, the younger sons would be subject to the authority of Lothar once Louis died. This attempt at establishing the empire's unity was not met with uniform support. The settlement was met by passive resistance from the Franks, whose tradition favored divided succession, and by active opposition in the failed revolt of Louis's nephew, Bernard, king in Italy. The *Ordinatio's* later history was troubling for Louis, who revised the plan of succession to include a fourth son, Charles the Bald, and was accused of violating the document, and thus violating God's will, by Louis's enemies in the revolts of the 830s.

Osnabrück

The medieval city of Osnabrück was established as a bishopric ca. 780 by Charlemagne, who donated relics of Saints Crispin and Crispinian of Soissons to the cathedral of St. Peter. (They are now preserved in two gable shrines of the 1220s in the Diocesan Museum.) The first city wall was erected in the twelfth century around the Altstadt (old town). Excavations under the Church of St. Katharine in 1990 unearthed a twelfth-century centrally planned cruciform church, its western arm polygonal and reminiscent of the Ottonian church of the women's abbey in Essen. An inner circle of eight columns, possibly forming a Holy Sepulchre, is located in the center of this western arm.

In the Middle Ages, the thirteenth century was the period of the greatest prosperity for Osnabrück, which joined the Hanseatic League in 1246 and gained increasing civic autonomy from the bishop. The Neustadt (new town) surrounding the Altstadt was incorporated into the town around 1300. The Kaiserpokal, a silver-gilt cup of the late thirteenth century preserved in the town hall, is the most important medieval secular artwork in Osnabrück, although its origin and early history are unknown. The present Rathaus (town hall), erected and decorated with statuary circa 1500, replaced earlier thirteenth-century buildings.

The present Gothic cathedral with three aisles and domical ribbed vaults was begun in 1218 and dedicated in 1277. Its furnishings include a bronze baptismal font of 1217 and a monumental wooden crucifix of the 1230s. A number of churches were built in the city during the second half of the thirteenth and early fourteenth centuries: the Johanniskirche, Marienkirche, and Katharinenkirche, dedicated respectively to Saint John, the Virgin, and Saint Katherine—all three-aisle hall churches—and the single-nave church of the Dominicans. From the portal of the Marienkirche, the Coronation of the Virgin from the tympanum and figures of the Church (*Ecclesia*) and Synagogue (*Synagoga*) and the Wise and Foolish Virgins from the jambs are all now preserved in the Kulturgeschichtliches Museum. Two thirteenth-century polychrome wooden (multicolored) crucifixes are preserved in the church. A richly illuminated gradual of circa 1300, known as the Codex Gisle, from the Cistercian convent in the neighboring village of Rulle (now in the Bischöfliches Generalvikariat), a chalice from Rulle in the Diözesanmuseum, and a silver-gilt abbess's staff of circa 1380 from the Benedictine convent of St. Gertrud (now in the Kestner Museum in Hanover) reflect the wealth of the local nunneries. The goldsmith Johannes Dalhoff was active in the city in the mid-fifteenth century. His extant works include the shrine of St. Cordula and a *Gnadenstuhl* (Throne of Grace) reliquary, both in the Diözesanmuseum today.

By the late fifteenth century Osnabrück had a population of ten thousand, and its continued prosperity is reflected in the new square ambulatory added to the cathedral, the east end of the Marienkirche, the tower, east end, and vaulting of the Katharinenkirche, as well as the erection of the present Rathaus.

No other medieval German poet is better known to us today than the South Tyrolean Oswald von Wolkenstein. Apart from amazingly concrete autobiographical references contained in his large oeuvre of 133 songs, the poet also left a vast number of historical traces in more than one thousand still extant documents. Even though the poetic statements about his own life have often to be taken as tongue-in-cheek and as topical in nature, recent research by Anton Schwob and others who have studied the archival material has confirmed most of Oswald's claims in his songs regarding his personal experiences. Born as the second son of an aristocratic South Tyrolean family, Oswald had to struggle for many years to establish his own existence both on the local and the international level. In 1401 he participated in a military campaign in Italy of the German King Ruprecht of the Palatinate; in 1410 he went on a pilgrimage to the Holy Land; between 1413 and 1415 he served Bishop Ulrich of Brixen and subsequently joined the diplomatic service of King Sigismund, with whom he traveled through western Europe. In 1417 Oswald married Margaretha von Schwangau and thus gained the rank of an imperial knight. In 1420–1421 he participated in one of the several wars against the always victorious Hussites, but in one of his songs ("Kl[ein]. [no.] 27") Oswald ridiculed the opponents. In the following years the poet was involved in many struggles and military conflicts with his neighbors, both peasants and aristocrats, and so also with the duke of Tyrol, Frederick IV of Habsburg. A major bone of contention was the castle Hauenstein in Seis am Schlern, to which Oswald had only a partial claim but which he took in his total possession after his marriage. At one point he even ended up in the ducal prison (1421–1422) and had to pay a huge ransom to be released. Although Oswald's power position improved over the next years to some degree, he was imprisoned again in 1427 and then had finally to submit under the centralized government of Duke Frederick. In 1429 Oswald joined the secret but highly influential court of justice, Feme, which was active all over Germany, and he also managed to consolidate his power base back home through manifold political connections and public services. In recognition of his accomplishments as diplomat and imperial servant, Oswald was inducted into the Order of the Dragon in 1431. In 1432 King Sigismund, while he stayed in northern Italy, called him into his service again and soon after sent him as one of his representatives to the Council of Basel. In 1433 Oswald probably witnessed the coronation of Sigismund as emperor at the hand of Pope Eugene IV in Rome. In 1434 Oswald participated in the imperial diet of Ulm, where Sigismund commissioned him to collect fines and taxes in South Tyrol and also confirmed his rank as imperial knight. After the death of Duke Frederick, Oswald and his allies successfully organized opposition against the Habsburgians in South Tyrol, as they could influence and dominate the young successor, Duke Sigmund, at that time still under age, for several years. Ultimately, however, the landed gentry, and so the Wolkenstein family, increasingly lost ground and had to submit to the centralized government, the growing weight of the urban class, and even the economic power of the peasants.

Whereas Oswald's political career sheds significant light on the political and economic history of the early fifteenth century, his poetic production has earned him greatest respect among modern philologists and musicologists since the full rediscovery of this amazing literary personality as of the early 1960s. In contrast to most other medieval poets Oswald created his songs for personal reasons and commissioned his first personal collection of his works in 1425, manuscript A, to which he added songs until 1436, perhaps even 1441. In 1432 the second collection was completed, manuscript "B," in which Oswald also incorporated a stunning portrait of himself created by the Italian Renaissance painter Antonio Pisanello or one of his disciples while the poet was staying in Piacenza, Italy, in the entourage of King Sigismund. Both manuscripts were most likely produced in Neustift, near Brixen, and contain melodies for many of the songs. In 1450 Oswald's family had another copy of his songs made in a paper manuscript ("c"—by convention, paper manuscripts are listed by lowercase, parchment by uppercase letters), which is almost identical with manuscript "B" but lacks the notations.

Although twenty of Oswald's more traditional songs were also copied in a number of other song collections all over Germany throughout the fifteenth and sixteenth centuries (the last one in 1572), the poet was soon forgotten after his death, probably because his most important songs were too autobiographical and idiosyncratic, and also too innovative for his time. Some of the texts contain surprisingly erotic elements and seem to reflect Oswald's private experiences with his wife. His prison songs and his dawn songs are unique for his time, and so the various polyglot songs in which he combined a string of languages to present his own linguistic mastery. On the one hand Oswald demonstrated a thorough familiarity with conventional German courtly love song, or *Minnesang*; on the other he introduced melodies and poetic images from French, Flemish, and Italian contemporaries. Many of Oswald's songs are polyphonic and reflect an amazing variety of musical forms, such as the *caccia* (hunt, Kl. 52), or the *lauda* (praise, Kl. 109). Hardly any other poet before him had such an excellent command of the broadest range of lyrical genres, as his oeuvre contains marriage songs, spring songs, prison songs, war songs, autobiographical songs, travel songs, dawn songs, Marian hymns, calendar songs, Shrovetide songs, songs about city life, songs in which he criticized both the rich merchants and the arrogant courtiers, various religious songs, and repentance songs.

Oswald was also a master of onomatopoeic expressions, such as in his Kl. 50, where the arrival of spring is vividly conveyed through the imitation of birdsongs. He seems to have learned much both from the Middle High German Neidhart tradition and from the Middle Latin tradition of boisterous and vivacious love songs as in the *Carmina Burana*. In addition, the Italian trecento (thirteenth-century) poets Cecco Angiolieri, Giannozzo, and Franco Sacchetti might have provided Oswald with important poetic models, but in his many old-age songs we also discover possible influences from the French poet Charles d'Orléans. Moreover, some scholars have suggested François Villon as a possible source for Oswald's autobiographical songs. Considering Oswald's extensive travels throughout western and southern Europe, Spanish and Flemish poetry also might have had a considerable impact on his work, as he adapted his models by way of *contrafacture* (use of secular melody in religious song). Recently we have also learned that contemporary folk poetry, proverbs, and perhaps specific legal formulas can be discerned in Oswald's language. Even narrative epics such as the Old Spanish *El Cid* and the Italian *Decamerone* by Boccaccio might have influenced him in his compositions. Finally, the poet also translated several Latin sequences that were usually performed during the liturgy.

Oswald's poetic genius transformed all these sources and models into highly individual poetic expressions. We will probably never reach a full understanding of which elements the poet borrowed from his predecessors and contemporaries, but we know for sure that Oswald had an extremely open mind for novel ideas and thoroughly enjoyed experimenting with a wide variety of poetic genres, styles, and images. He was one of the first medieval German poets to correlate closely text and melody and also created astoundingly polyphonic effects typical of *Ars nova* and the Italian trecento culture. Curiously, though, Oswald does not seem to have been in contact with humanists and Renaissance writers, even though he once refers to Petrarch (Kl. 10, 28), whose concept of man's sinfulness seems to have influenced Oswald's religious thinking. In this regard the poet is quite representative of his own time, as he still lived in the medieval tradition and yet also opened his mind to many new approaches to music (*Ars nova*) and poetry.

Oswald's oeuvre can be located at the crossroads between the late Middle Ages and the Renaissance, as the poet belonged to neither cultural period yet shared elements with both. His songs already reflect a strong sense of the modern individual with the emphasis on personal experiences, ideas, needs, and desires, but they are, at the same time, deeply drenched in the medieval concept of human sinfulness and of life as nothing but a transitional period here on earth.

A monk of the abbey of Weißenburg (now Wissembourg in Alsace), Otfrid is the author of a remarkable poem based on the four gospels, completed by about 870 and preserved in four manuscripts, three of them complete or nearly so. The famous Vienna manuscript was carefully corrected, and perhaps written in part, by Otfrid himself.

Otfrid composed the poem in a new, stress-based strophic verse form with two long lines per strophe. Each long line contains two half lines joined by rhyme or at least assonance at the caesura (audible break at the middle of a line). Thus the Lord's Prayer begins:

Fāter unser gūato, bist drūhtin thu gimꝥato

in himilon io hōher, uuīh si nāmo thiner.

Biquēme uns thinaz richi, thaz hoha himilrichi,
thāra uuir zua io gingen ioh émmizigen thingen.

Our Father good, thou art a kindly king

so high in the heavens, holy be thy name.

Thy kingdom come to us, the high kingdom of heaven,

toward which may we always strive and firmly

believe. (2, 22, 27–30)

All four manuscripts show the caesura and use initials, indentation, and rhythmic accents to explicate and show off the new verse form. Otfrid describes the meter and his spelling innovations in a letter to archbishop Liutbert of Mainz (included in two manuscripts), where his pride of invention is everywhere apparent. Suggestions that Otfrid merely modified an existing German verse form are therefore unlikely. Neither did Otfrid slavishly imitate Latin hymnody of the period: though some contemporary Latin hymns also show assonance, rhyme, and/or alternating stress, the overall effect of his poem is quite different. Otfrid's verse form was quickly used in several other Old High German and early Middle High German poems and seems the likely basis for the couplets of the Middle High German courtly epics.

Otfrid portrays the life of Christ as described in the four gospels, but his work is not merely a verse translation. After many narrative sections, he includes passages for reflection, labeling them *mystice*, or in a mystical sense. As in Germanic alliterative verse, Otfrid constantly repeats and restates ideas and phrases, often for the sake of the rhyme or the rhythm. His writing seems prolix; in the passage above, he uses thirty words where the alliterating Old Saxon Heliand has twenty-one and the prose Weißenburg Catechism only thirteen.

Otfrid's attention to meter and orthography suggests that the poem was meant to be read aloud or even chanted (one manuscript has some neums, an early form of musical notation), but it could have had no place in the Latin liturgy of the time.

The dialect of the poem is Southern Rhenish Franconian, though in part because of Otfrid's orthographic innovations, it differs slightly from that of other Weißenburg documents.

Known as the author of *Eraclius*, the poet identifies himself in his prologue: *ein gelerter man hiez Otte* (a learned man was called Otte, v. 40). The poem, based on the *Eracle* (1180) of Gautier d' Arras, may have been composed at the court of Landgrave Hermann I of Thuringia or at the court of Duke Ludwig I in Landshut. However, both the date and the place of composition are disputed. *Eraclius* (5,392 lines) borrows from secular and ecclesiastical legends, historical chronicles, and courtly romance. The story is loosely based on the life of Byzantine Emperor Heraclius (ca. 575–641) and radically deviates from the known historical facts. There are three main sections of *Eraclius*. In the first part of the story, a pious couple bears a son blessed by God with the ability to identify the worth of any stone, horse, or woman. Eraclius wins the favor of the Emperor Focas with his fantastic abilities and chooses a wife for the emperor. The second part of the story, believed to be based on legends of the marriage of Theodoius II (408–450), incorporates themes of courtly literature and implies a familiarity with Heinrich von Veldeke's *Eneit* and perhaps even Gottfried von Straßburg's *Tristan*. Against the advice of Eraclius, Focas has his wife, Anthânais, locked up in a tower while he is away at war. From the tower, Anthânais falls in love with Parides. Otte's depiction of the lover's passion reveals a playful side of the poet: *swaz diu frouwe und der jüngelinc ein ander dâ tâten, daz möhte ein nunne errâten* (Whatever the woman and the young man did there, it may be guessed by a nun, vv. 4010–4012). The lovers are discovered, but Focas acts upon Eraclius's advice and spares them. The third part of the story relates the capture of Jerusalem and the confiscation of the relics of the True Cross by Cosdrôas (Chrosoes II). Eraclius defeats the Persian king in battle and returns the True Cross to Jerusalem. Gautier's poem ends here, but Otte continues the story with the cautionary tale of Eraclius's hubris. Otte also draws on information found in Otto von Freising's *Historia de duabus civitatibus* (*History of Two Cities*) and the *Kaiserchronik* (*Chronicle of the Emperors*) to include historical accounts of Saint Anastasius, the Monotheletism heresy, and the birth of Muhammad.

Otto I (912–973)

King of Germany 936–973 and emperor 962–973, Otto (the Great) was a member of the Liudolfing, or Saxon, dynasty, born in 912 to the future Henry I and his wife, Mathilda. Little is known of his early years. In 930 Otto married Edith, the half sister of King Aethelstan of Wessex, beginning a policy of marriage to foreign princesses that became the norm in Germany. He was almost certainly designated at that time as the next king. After his father's death, Otto was acclaimed by the nobles and crowned in Aachen on August 7, 936, reviving the coronation ritual that Henry I had foregone. This is the first sign of Otto's new view of kingship, marked by a policy of systematically increasing the gap between king and dukes and rejecting the rule by personal pacts that had characterized his father's reign. Perhaps this attitude helped provoke the civil wars of 937–941, as nobles took advantage of an unestablished king to settle old feuds and reduce royal rights. The two most important rebels were Otto's elder half brother Thankmar (who deeply resented that Henry I had declared his first marriage to Thankmar's mother invalid) and his younger brother Henry, who was supported by their mother, Mathilda. This has been hailed as resistance against a new Ottonian principle that the realm could not be divided as it had been by Merovingians and Carolingians; the truth was that Henry I had not had enough control of the kingdom to make a division possible, although he did divide his personal lands and treasure among his sons. The period of rebellion concluded with Thankmar's death and the submission of the other important rebels. Henry was forgiven and, in 947, given the duchy of Bavaria.

Otto continued his father's vigorous eastern and northern policy. Margraves Hermann Billung and Gero, acting with Otto's support, won a series of victories against the Slavs, gaining territory that Otto strove to pacify with an active policy that included both the establishment of fortified garrison outposts and active royal activity in missionary enterprises. The latter included the erection of several bishoprics—Brandenburg and Havelberg in 948; Oldenburg, Merseburg, Meissen, and Zeitz later in 968—at which time Otto's beloved monastic foundation of Magdeburg was also elevated to an archbishopric with authority over much of the eastern frontier. The success of the Ottonian eastern policy culminated in a series of victories in 955. On August 10 of that year, Otto decisively defeated a Magyar coalition at the battle of Lechfeld near Augsburg, an event that marked the end of Magyar raiding in Germany. This was followed by a victory over the Slavs at Recknitz on October 16th. Further campaigns led to the subjection of the Slavs between the middle Elbe and the middle Oder by 960, as well as making Bohemia and Poland tributary to the German king.

From an early period Otto had imperial ambitions. He took advantage of the disorders caused by Bangor's seizure of power in Lombardy to establish a foothold in Italy in 951. Otto accepted Bangor's submission and reinstated him as subking. To strengthen his personal control of Lombardy, though, the widower Otto married Adelheid, the widowed queen of the Lombards. At that time, Otto requested that the pope crown him as emperor, but the pope refused, probably from fear of a strong German presence in Italy. Otto had to cut short his time in Italy, returning to Germany to deal with the revolt of his eldest son, Liudulf, who apparently felt threatened by Otto's new marriage alliance. In 961, though, Pope John XII appealed for Otto's help against his enemies. Otto responded swiftly with a second expedition to Italy. He prepared for a long campaign, taking the precaution of having the six-year-old Otto II, his eldest son by Adelheid, elected and crowned as king, and establishing a regency in Germany. The pope's enemies fled before Otto's army, and John XII crowned Otto I as emperor on February 2, 962, reviving the imperial title that had fallen in abeyance early in the century, and creating a link to the prestige of Charlemagne.

The imperial coronation led to a major shift in Otto's interests, leading him to spend ten of the last twelve years of his life in Italy. John XII soon realized that Otto was exerting much more direct domination over Italian affairs than he had bargained for. The pope therefore took part in a conspiracy aimed at ending Ottonian involvement in Italy, which led Otto to drive John from Rome and arrange his deposition. Otto then set up a new pope of his own choice, initiating almost a century of German control of the papacy. Imperial interests also led to campaigns in southern Italy from 966 on, especially with the goal of gaining Byzantine recognition of Otto's imperial title.

Otto I was an even more peripatetic ruler than most of his contemporaries, ruling largely through verbal orders during constant travels throughout his realm. He received little formal education, learning to read only in 946, while mourning for his first wife, Edith. Despite this, Otto established a particularly strong and secure kingdom, thanks especially to his military successes, the wealth acquired through exploitation of the newly found silver mines at Goslar, and his alliance with the church, particularly with German monasteries. Beginning in the 940s, Otto gradually replaced the dukes of Germany with members of the Ottonian family, who on the whole proved to be loyal supporters of the throne. His personal prestige and close kinship to the top families in western Europe allowed Otto to act as mediator in Burgundy and in France between the last Carolingians and the rising Capetian (French kings, tenth to fourteenth century) family. By the time of Otto's death at Memleben on May 7, 973, his German-based empire was the strongest state in Europe, a position it held for the next century. He is buried in the church he founded at Magdeburg, beside his wife, Edith.

Otto I, Art

The single extant artistic representation of Otto is found on one of the sixteen remaining ivories that once formed a larger series narrating the life of Jesus. The plaque (New York, Metropolitan Museum of Art) shows the ruler in diminutive scale presenting a church to Christ in Majesty, a depiction presumably related to Otto's elevation of the church of Magdeburg to metropolitan status in 967. The original group of forty to fifty ivories already shows the interest in extensive New Testament cycles that would become a hallmark of later Ottonian book illumination.

Though probably made in Milan, the ivories were used in Otto's favored foundation of Magdeburg, perhaps to decorate an ambo (pulpit) or cathedra (throne) but most probably within an altar antependium. They constitute one of the few remaining indications of the glory of Otto's Magdeburg, developed as an eastern Saxon counterpart to Aachen, the western Lotharingian center inherited from Charlemagne's empire. As in Aachen, Magdeburg contained an integrated church and palace complex, though the cathedral was likely unfinished at the time of Otto's death in 973; the palace may have fallen into disrepair already by the twelfth century. A suggestion of the richness of Otto's original cathedral can be seen in the marble, porphyry, and granite columns originally used in the nave but incorporated into the rebuilt thirteenth-century choir. These columns were late antique *spolia* (war booty) brought to Magdeburg from Italy, probably from Ravenna in imitation of Charlemagne's activities in Aachen. As was his first wife, Edith, the emperor was buried in the cathedral, where his marble sarcophagus, also perhaps from Ravenna, is still preserved.

Accompanied in the Magdeburg ivory by St. Mauritius, patron of the cathedral, the bearded Otto wears the high-arched crown that was made for his imperial coronation in 962 and became an integral part of the German regalia (Vienna Schatzkammer). Otto's imperial coronation also produced an innovative change in his seals, from the depiction of a traditional military figure in profile with lance and shield to a more imposing frontal figure holding a scepter and orb; the possible influence of Byzantine sources is difficult to gauge. Equally unclear is the relative impact of Byzantine, Italian, and western prototypes on the so-called *Ottonianum* diploma issued by Otto in 962 as a compact with the papacy. This unusually large presentation copy measures 100×40 cm and was executed on purple vellum with gold calligraphic script (Vatican, Archivio Segreto).

As part of his Carolingian emulation, Otto drew together at his court intellectuals, like Stephen of Novara and Liutprand of Cremona, though certainly not to the same degree as Charlemagne or Charles the Bald. Rather, because of the itinerant nature of Ottonian kingship and the political structure of the realm, cultural and artistic production was not centrally located or controlled, but was distributed among various important ecclesiastic and monastic sites. These included Cologne, where Otto's brother Archbishop Brun led a cathedral school of unparalleled learning; Corvey; and Gandersheim, where Widukind and Hrotsvitha, respectively, composed their historical works extolling Otto the Great.

Otto II (955–983)

King 961–983, emperor 967–983, sole ruler of the German Empire from 973, Otto II was born in 955 to Otto I and his second wife, Adelheid. His father arranged for the six-year-old Otto's election and coronation as king of the Germans in May 961, before setting out on his second Italian expedition. To secure the imperial title to his dynasty, the elder Otto further arranged to have his son crowned co-emperor on Christmas Day 967; Otto II was the last western emperor to receive imperial coronation in his father's lifetime. Despite these honors, the future Otto II was not given an independent position even after he came of age, and has left only twenty-seven extant documents from the twelve years of his official shared rule with Otto I. At his father's death in 973, the eighteen-year-old Otto was accepted as ruler without opposition.

The early years of Otto II's reign were occupied by a series of rebellions in Bavaria and Lotharingia. These rebellions were provoked by an attempt Otto made in 974 to reduce the power of his overly mighty cousin, Henry II "the Quarrelsome" (the nickname is not contemporary), duke of the semiautonomous duchy of Bavaria. Henry's defeat in 976 gave Otto the opportunity to reorganize the southern duchies, weakening Bavaria by turning its province of Carinthia into a separate duchy. Henry, unsatisfied with his position, led a second uprising in 976–977, and Bavaria was pacified only with Henry's imprisonment in 978.

Otto II's early military campaigns were successful, as Otto continued the strong eastern and northern policies of his father and grandfather. A victory over the Danes in 974 led to an expansion of German efforts to evangelize in the north. He also invaded Bohemia several times, returning it to its earlier tributary status after its ruler had seceded by joining with Henry the Quarrelsome in the rebellions of 974–977. On the western front, though, Otto was unable to play as strong a role as his father had. An effort of the French King Lothar to gain control of Lotharingia in 978 caught Otto by surprise, forcing him to flee Aachen before the French army. Otto quickly retaliated with a raid that penetrated France to the gates of Paris, but that accomplished little besides salving Otto's pride.

In 972, Otto II had married the Byzantine princess Theophanu, a marriage arranged by his father to enhance the prestige of the Ottonian dynasty. Contemporary sources suggest that Theophanu exerted a very strong influence on Otto, including the belief that the empress's "childish advice" led to Otto's disastrous campaign in southern Italy in 982. In reality, the southern campaign needs little explanation. Otto decided in 981 on the conquest of southern Italy, split at that time among Saracens, Greeks, and Lombards. He probably planned the campaign as an extension of imperial policies begun by Otto I, who had conducted several inconclusive campaigns in the region. Otto II's army was, however, decisively defeated by a Saracen force at the battle of Cotrone (Cap Colonne) on July 13, 982. Almost the entire German army was destroyed; Otto himself escaped only by swimming his horse out to a Greek ship in the bay, then disguising his identity until he reached safety. The Saracen army was too badly weakened to press its advantage, so the battle had little effect on the balance of power in Italy. This defeat, though, dealt a severe blow to Otto's prestige. The Slavs responded to news of the German defeat with an uprising in the summer of 983. A Slavic confederation devastated the German border, destroyed the bishoprics of Havelberg and Brandenburg, and burned Hamburg, reversing most of Otto I's successes in Slavic territory. Perhaps the seriousness of the political situation can be seen in the fact that Otto II summoned an imperial diet at Verona on May 27, 983, where he had his three-year-old son Otto III elected to the German kingship, then sent the child on to Aachen to be crowned. Otto II remained in Italy, trying to subject Venice to imperial control. He died of malaria in Rome on December 7, 983, at the age of twenty-eight, and is the only emperor to be buried in St. Peter's Basilica.

Otto II appears to have been dominated and overshadowed throughout his life by people of stronger character, first his father, then his wife Theophanu, and also by his counselors, especially the loyal and talented Archbishop Willigis of Mainz. Physically Otto was not as impressive as his father; the exhumation of his body in 1609 revealed that he was a small man, and eleventh-century sources describe him as a redhead. Certainly his reputation has suffered by comparison to his great father and exotic son. In general, his reign is best seen as one of consolidation and growing sophistication. Unlike his predecessors, Otto II was well educated. His love of luxury and ostentation was notorious, although this perhaps should be taken more as a sign of the enormous wealth the Ottonians were able to command than of character weakness. His reign saw advances in the imperial chancery and greater cooperation between the German and Italian parts of the empire. It also saw a closer identification with the ancient Roman Empire and the city of Rome, setting aside the Byzantine emperor's claim to be the only true successor of the caesars. Otto's chancery in 982 adopted for the first time the title Roman empire (*imperator Romanorum augustus*) as the designation of a German emperor, a title that became standard to Otto's successors. Despite his reverses in Italy and on the Slavic frontier, Otto left a firmly established realm, increasingly self-assured and international, to his son.

That the royal and imperial seals of Otto II are almost identical to those of his father suggests the relative political stability and continuity that resulted from Otto's cocrowning as king and emperor during Otto I's lifetime. Perhaps in memory of his father, Otto II presented Magdeburg Cathedral with a now-lost manuscript whose gold and gem-encrusted cover depicted Otto II and his wife, Theophanu. Otto II's personal interest in manuscripts is evident from the fact that he took a quadripartite Psalter dated 909 from the monastery of St. Gall during a visit in 972 (now Bamberg, Staatsbibliothek, manuscript no. Bibl. 44), perhaps for the purpose of learning Greek.

His union with Theophanu figures prominently in the artistic objects associated with Otto II. The luxurious presentation copy of the marriage diploma from 972 is one of the greatest monuments of Ottonian art (Wolfenbüttel, Staatsarchiv). Measuring 144.5×39.5 cm, the unusually large and sumptuous diploma is written in calligraphic script in gold ink on purple parchment and decorated with pairs of medallions patterned after Byzantine textile designs. The conception and ornamental details of the contract have been called a "Byzantine paraphrase," a description that applies as well to the ivory plaque depicting Otto II and Theophanu (Paris, Musée de Cluny). The rulers, wearing Byzantine attire, flank Christ, who crowns them; the inscriptions in mixed Greek and Latin call Otto *imperator Romanorum* and Theophanu *imperatrix Augustus*, indicating a date of 982–983. The plaque was likely made in Italy at the instigation of John Philagathos, Otto's chancellor in Italy, who kneels in submission under the emperor's feet. Though not a direct copy, the Ottonian ivory is essentially modeled on an almost contemporary Byzantine plaque representing the imperial couple Romanos II and Eudokia, datable to around the middle of the tenth century (opinions ascribing the Byzantine ivory to Romanos IV, 1068–1071, are less convincing).

While the coming of Theophanu to the west can no longer be regarded as a unique catalyst for the influx of Byzantine art into the Ottonian realm, it is nonetheless true that the blossoming of Ottonian art occurred during the reign of Otto II. As in the period of Otto I, cultural and artistic production continued to be scattered among diverse ecclesiastic and monastic centers. Especially noteworthy is the patronage of Archbishop Egbert of Trier, who promoted the so-called Master of the *Registrum Gregorii*, an artist whose oeuvre can be reconstructed with some confidence, and who was fundamentally responsible for the reintroduction of the classical style into Ottonian art. The Registrum Master has also been credited with a hand in the creation of Theophanu's marriage diploma (Hoffmann 1986:108–116). The now fragmentary manuscript from which the artist takes his name contains the first in a series of Ottonian images in which the enthroned ruler receives homage from personified provinces. Egbert's poetic verses in the manuscript bemoan the passing of his patron Otto II, so that the ruler image should be seen as Otto II. The only Ottonian ruler buried in St. Peter's in Rome, Otto II should be credited with a greater role in the development of the Ottonian idea of the *renovatio imperii Romanorum* usually ascribed primarily to his son Otto III.

[Egbert](#); [Gregory VII](#); [Otto I](#); [Otto III](#); [Registrum Gregorii](#); [Master of](#); [Sankt Gall](#); [Theophanu](#)

King of the Germans, 983–1002, emperor 996–1002, Otto III was the most flamboyant and controversial of the German emperors. He was born in 980, the only son of Emperor Otto II and the Byzantine princess Theophanu. Otto II continued his own father's policy of assuring Ottonian rule by having the young Otto elected king at Verona, May 27, 983. He then dispatched the three-year-old Otto to Aachen for coronation on Christmas 983. This was several weeks after Otto II's death in Italy but before the news had reached the north.

A series of informal regents governed the empire for most of Otto's short life. By German custom, the young king's proper guardian was his closest adult male relative, Duke Henry II the Quarrelsome of Bavaria. Henry, though, soon tried to supplant his charge, claiming the kingship in his own name. Archbishop Willigis of Mainz, though, threw his support behind Otto III, summoning the young king's mother, Theophanu, and grandmother Adelheid from Italy to help him preserve Otto's rights. After a period of intense political maneuvering, Henry surrendered Otto to the two empresses on June 29, 984. Theophanu assumed the regency for her son. After her death in 991, Adelheid directed affairs until Otto III formally came of age in September 994.

Otto's role during his childhood was strictly symbolic. In 986 he was sent on a campaign against the Slavs—not to fight but so Mieszko of Poland could join the host and do homage. For the most part, though, Otto was not very visible in German affairs until he came of age. He was very well educated. His main tutor was Bernward, the future bishop of Hildesheim, but he also received instruction in Greek from his mother's friend John Philagathos, a southern Italian. After coming of age, Otto continued his education with the most learned man of the age, Gerbert of Aurillac.

Rome during Otto's minority had fallen into the hands of the local noble Crescentius II. Pope John XV asked for Otto's help in 995, leading to Otto's first Italian expedition. John died before his arrival, so Otto forced the Roman Church to accept his own cousin Bruno of Carinthia as pope, who took the name Gregory V. Gregory then crowned Otto as emperor on May 21, 996. The imposition of a German pope shows Otto's early determination to control Rome. This marked a new departure, since Gregory was the first non-Roman pope since the Byzantine emperors had appointed Greeks to the office in the seventh century. Gregory was soon driven from the city, forcing Otto to return and reinstate him in 998. This time Otto secured Rome by having Crescentius executed, and had Crescentius's antipope (none other than Otto's former tutor, John Philagathos) blinded and imprisoned. Afterward, Otto stayed in Rome, having decided to make the city the capital of his empire. He had a palace built for himself on the Aventine. This has been taken as evidence of Otto III's grandiose plan to create a new Roman empire. Certainly Otto greatly developed the idea of a western empire, but it was not inextricably linked to Rome. At first he wanted to set up Aachen as a "new Rome," placing the focus of the empire in the north. It is probable that political instability in Italy made Otto decide to stay closer, where he could intervene effectively in affairs. Naturally enough, this made him very unpopular with the Romans, who revolted in early 1001, besieging Otto for a time in his own palace. Otto sent for more troops and was preparing an attack on Rome at the time of his death.

The earlier Ottonians had ruled almost entirely by means of continual travel throughout their realm. The decision to reside in a permanent capital thus marked another new departure. It forced Otto to develop a larger bureaucracy and enabled him to acquire a larger and more glittering court. For a time Otto's aunt, Abbess Mathilda of Quedlinburg, acted as regent in Germany, but after her death the emperor relied ever more on bishops to perform the work of government, laying the groundwork for the "imperial Church system" of the late Ottonians and Salians. In Rome itself, Otto created a hierarchy of court officials, elaborate by German standards, most of whom had Greek titles in emulation of the Byzantine court. Otto also insisted on a higher degree of ceremony than had been known to earlier German rulers, modeled on Byzantine practice.

Otto clearly saw his role as emperor in terms of leadership over the Christian world, assuming the titles "servant of Jesus Christ," and "servant of the apostles." This strong development of the imperial idea was already visible in 996 with Otto's appointment of the first German pope; after Gregory V's death in 999, the emperor continued his effort to control the papacy by appointing his former tutor Gerbert of Aurillac, who took the name Sylvester II. The two cooperated closely, even declaring the Donation of Constantine to be invalid. Otto appears to have been personally pious; he was close to both St. Nilus and St. Romuald of Ravenna; Bruno of Querfurt claims that the emperor even swore an oath to abdicate and retire to the wilds of Poland as a hermit. While this is unlikely, Otto did take very seriously his duty toward the church. In 1000 he made a pilgrimage to the tomb of the martyred Bishop Adalbert of Prague in Gniezno, arranging at that time for Gniezno to become the archbishopric of Poland. He went on from there to Aachen, where he had Charlemagne's grave opened, taking the pectoral cross from the body. Certainly this was in part the effort of an upstart Ottonian to associate himself with the prestige of the Carolingian dynasty. It is very likely that the tomb opening was also the first step in a project to canonize Charlemagne, perhaps the best example of Otto III's belief in the divine nature of the empire (*imperium*). He also planned to continue the family alliance with the Byzantine emperors, arranging to marry the porphyrogenita (female successor) Theodora, but she arrived in Italy only at about the time of Otto's death.

Otto III's history, though, is one of largely unrealized potential. He died unexpectedly on January 24, 1002, at the age of twenty-one.

In contrast to the relative paucity of images connected to both his father and his grandfather, there are numerous representations of Otto III from throughout his short life. He appears as a child in the arms of his mother, Theophanu, on an ivory from circa 983 (Milan, Castello Sforzesco), and is paired with her again on the remarkable book cover made in Trier under Archbishop Egbert between 985 and 991 (*Codex Aureus*, or Golden Manuscript from Echternach; Nuremberg, Germanisches National-museum, manuscript no. 156142). From the same period of Otto's minority is the small prayer book written for the king by the female scribe Duriswint under the direction of Archbishop Willigis of Mainz and probably Theophanu. With its combination of late Antique, Carolingian, and Byzantine stylistic and iconographic elements, the book is characteristic of Ottonian art in general.

While Otto's library does not seem to reflect an interest in contemporary works, it was an extensive and scholarly collection that included, for example, a fifth-century Livy and numerous books given to him by his tutor, Gerbert of Aurillac, including a luxury Boethius originally owned by Charles the Bald. A late Antique illustrated Itala manuscript, like many other luxury items, may well have been passed by Otto to the foundation of Quedlinburg, ruled by his sister, Adelheid.

The sumptuous manuscripts produced for Otto III at Reichenau clearly express the imperial ideals and notion of Christocentric kingship promulgated by the ruler and his advisers. In the Gospel Books now in Aachen and Munich (Staatsbibliothek, manuscript no. clm. 4453), the portrait of Otto replaces the expected composition of Christ in Majesty; in the Aachen Gospels, Otto is depicted in a mandorla (body halo), surrounded by symbols of the evangelists and elevated into heaven in a direct and unparalleled imitation of Christ. Similarly, in the Lothar Cross also in Aachen, the obverse has an antique cameo of Augustus Caesar substituted for Otto's portrait, a taut exposition of Otto as the Holy Roman emperor.

Otto's seals and bulls show a variety of innovations, but none is so meaningful as the imperial bull with the inscription *Renovatio Imperii Romanorum*, which copies a bull of Charlemagne and so epitomizes both the imperial aspirations and Carolingian emulation of Otto III. Otto's gift of copies of the Holy Lance, the most important relic in the Ottonian realm, to the recently converted Boleslav Chrobry of Poland and perhaps Stephen of Hungary, is a concrete manifestation of the eastern conversion policy adopted by the Saxon king in imitation of Charlemagne. A second bull, with a personification of *Aurea Roma*, is strong evidence of Otto's continued preoccupation with Rome, as is his renovation of the Roman imperial palace. Nevertheless, the writings of Gerbert of Aurillac (later Pope Silvester II), Leo of Vercelli, and the extensive artistic patronage of Bishop Bernward of Hildesheim make clear that the desire for a Roman imperium (empire) did not reside with Otto alone. Indeed, Bernward's bronze column, copied after the Column of Trajan but now expressing the victory of Christ, is a cautious reminder that the fascination with Rome usually ascribed to Otto is really seen only through the refracted lens of his teachers and advisers.

Emperor and sometime ally of Pope Innocent III (1198–1216), Otto's reign was a time of chaos after the premature death of Henry VI. Leader of the Welf house and son of Henry the Lion, Otto was involved in a civil war for control of the empire with candidates of the rival Hohenstaufen house, Philip of Swabia and Frederick II. The struggle for control of the imperial crown had international implications and involved the princes of Germany, the kings of England and France, and the pope. Otto would ultimately lose the struggle to maintain control of the empire to Frederick.

The unexpected death of Henry in 1197 left the empire in a difficult situation because his heir, Frederick, was only three years old. It also offered the papacy the opportunity to break free from encirclement by the Hohenstaufen, an opportunity Innocent would exploit by playing one side against the other in the civil strife in Germany or by acting as referee between them. The situation was complicated by shifting alliances both inside and outside the empire. Frederick was first supported by the Staufen, including his uncle, Philip of Swabia. But Philip, motivated by the activities of forces opposed to his family, presented himself as king and was crowned at Mainz in September 1198. He also revived the alliance between his family and the Capetian dynasty, headed by Philip Augustus, to improve his position in Germany and Europe. The anti-Staufen forces inside Germany, supported by King Richard I of England, did not stand idly by but promoted a Welf candidate. The eldest son of Henry the Lion was still on crusade, and therefore the younger son, Otto became the anti-Staufen candidate.

Otto, who had been raised at the court of his uncle, Richard I, and had been made count of Poitou and duke of Aquitaine in 1190 and 1196, respectively, made the most of his opportunity. He was crowned before Philip by the proper ecclesiastic, the archbishop of Cologne, and in the right place, Aachen. His election also carried great weight because he was elected by those traditionally empowered to choose the king. Indeed, the nature of his election was of great importance to Innocent, who would involve himself in the succession crisis because of the close ties of empire and papacy and because of papal claims to superior jurisdiction. Innocent, suspicious of the Hohenstaufen family and fearful of their territorial gains in northern and southern Italy, came to support Otto. This was critical to the king's success because his situation in Germany was weak despite having been elected by the right people and crowned in the right place, and because his greatest international ally, Richard, died in early 1199. To maintain papal support, Otto made important territorial concessions to the pope in Italy.

Otto's difficulties did not end, however, even though he had papal support, which was reinforced by Otto's concessions. Despite his excommunication, Philip managed to increase his power in Germany in the opening decade of the thirteenth century. He managed to increase support among the bishops of the empire, including the very important archbishop of Cologne, Adolf. Perhaps motivated by hostility to Rome, many princes also came to support Philip. By 1207 the papal curia had come to support Philip's claim to the imperial dignity and kingship in Germany, and in the following year the pope himself recognized Philip as king. Negotiations over territory in Italy and the imperial coronation were held between Philip and the pope, but they made little headway before Philip was murdered by Otto of Wittelsbach over Philip's broken engagement to Otto's daughter.

In 1208, fortunes once again turned for Otto, and he now received widespread support in Germany. He was elected king by the German princes a second time in November in Frankfurt and was victorious over French attempts to establish a rival king. To further strengthen his position in Germany, Otto was betrothed to Philip's daughter Beatrix. He was then crowned emperor by Innocent in Rome in October 1209, after renewing his promises to respect papal territory in Italy and also to refrain from intervening in Sicilian affairs.

Otto's success, however, seems to have gotten the better of him and, following the advice of his ministerials, he decided to extend his authority in Italy. He sought to expand his rights into papal lands, and thus alienated an important ally and created a dangerous opponent, Innocent. He further raised the ire of the pope by occupying Tuscany and invading the Hohenstaufen kingdom of Sicily. His invasion and conquest of Sicily in November 1210 led to the very encirclement by a German ruler that Innocent had struggled to prevent. Otto's actions also led Innocent to excommunicate the emperor in the autumn of 1210, and in the spring of 1211 Innocent released Otto's vassals from their oaths to the emperor.

Otto's difficulties were not limited to the opposition from the pope. To secure his position in Germany, Otto married Beatrix in 1212, but she died shortly after their marriage. He faced revolts in northern Italy, where opposition to German domination had existed for more than a generation, and in Germany, where the nobility had been released from their obligation of loyalty by the pope. He faced a rival king because Frederick followed him to Germany, where the princely opposition to Otto, with papal support, crowned Frederick king at Mainz. Frederick was able to gain a solid foothold in southern Germany, thus undermining Otto's authority and blocking his access to Italy. And both Frederick and Otto benefited from their alliances with the kings of France and England.

Otto's alliance with King John, however, would prove his undoing. Fearing that Philip Augustus would take English territory in France, John invaded with his nephew and ally Otto, who hoped to weaken French support for his Hohenstaufen rival. First John was defeated on the Loire and then, on July 27, 1214, Otto was disastrously defeated at the Battle of Bouvines. His supporters melted away after the defeat, and Frederick went on the offensive in the empire, imposing himself on Otto's remaining allies. Otto was formally deposed the following July and was confined to his personal lands in Brunswick until his death on May 19, 1218.

Otto of Freising (ca. 1112–1158)

The most important historian of the twelfth century, Otto of Freising was well placed to write his works of history. He was born into the most prominent families in the empire and was related to the imperial Salian and Staufen lines. His father was Leopold III of Austria and his mother was Agnes, daughter of Henry IV and whose first husband was Frederick I, duke of Swabia. Otto was thus half brother of Conrad III and uncle of Frederick I Barbarossa. His ecclesiastical career began while he was still a child, when he became provost of the house of canons at Klosterneuburg (near Vienna). In 1127 or 1128, Otto journeyed to France to study with the great masters at Paris, including Hugo of St. Victor, Gilbert de la Porrée, and, probably, Peter Abelard. He left Paris in 1133 and on his way home joined the Cistercian abbey at Morimond. He was later elected bishop of Freising, before the canonical age and as the result of family influence. He participated in the Second Crusade (1147–1148) and, while en route to a Cistercian general chapter, died in Morimond in 1158.

Otto is best known for two historical works, *The Two Cities* and *The Deeds of Frederick Barbarossa*. The first of the two, is the more pessimistic but also the more philosophical work. Written between 1143 and 1146, *The Two Cities* is a world chronicle that tells the tale of salvation history that was heavily influenced by the work of St. Augustine. The first seven books outline the history of the world from creation to 1146. Otto's history describes the struggles of good and evil and praises the monks, the true representatives of the City of God on earth. *The Two Cities* also is a history of the *translatio imperii*, describing the transfer of universal power from the Greeks to the Romans to the Franks and ultimately to the Germans. It was in the Christian empire of the Germans that Otto saw the possibility of the existence of the City of God on earth, but the troubled times facing the empire from the time of Henry IV to Conrad III left him with little hope. The eighth, and final, book of *The Two Cities* is thoroughly eschatological and describes the coming of Antichrist, the Final Judgment, and establishment of the heavenly Jerusalem. Otto's somber perspective is not continued, however, in his other great work, *The Deeds of Frederick Barbarossa*. Completing the first two books before his death in 1158, Otto followed the plan outlined in a letter requested by Otto from his sponsor, Barbarossa himself. The first book details the events of the tumultuous reigns of Barbarossa's predecessors, and the second describes the first four years of the reign of Barbarossa, a time of peace and glory for the empire. Although *Deeds* overlooks matters unfavorable to the Staufen line, misrepresents the state of the realm at Barbarossa's ascension, and overstates his successes in Italy, it remains the most important source for events in the early years of Barbarossa's reign.

Ottonian Art and Architecture

[This entry includes eight subentries:

Introduction
Architecture
Ivories
Manuscript Illumination
Metalwork
Sculpture
Textiles
Wall Painting]

Introduction

Ottonian art is best represented by the surviving illuminations, frescoes, ivories, and metalwork dating from the reigns of the Emperors Otto II (973–983), Otto III (983–1002), and Henry II (1002–1024). The major patrons were the emperor and his kin and close associates, many of whom were leading churchmen and -women. The hieratic quality that characterizes Ottonian art reflects this synthesis of secular and sacred authority and results from style, iconography, and the use of costly materials, including precious metals, ivory, enamels, and gemstones. Most surviving works were intended for ecclesiastical use, but many include both sacred and imperial imagery: on the ivory *situla* (vessel) from circa 1000 in Aachen, for example, the emperor, Saint Peter, and a number of bishops are represented together.

A variety of monastic workshops flourished under Ottonian patronage. Most of the important centers were located along the Rhine and Meuse Rivers, and many of them achieved prominence because of their links to the imperial family. Cologne, for instance, was associated with the court from the time of Archbishop Bruno (953–965), brother of Otto I, and was patronized by the royal abbesses of Essen. Trier became prominent under Archbishop Egbert (977–993), a member of Otto II's chancellery. The manuscript painter known as the Gregory Master—the leading artistic personality of the Ottonian age and Egbert's contemporary—was apparently active at Trier. Hildesheim flourished in the eleventh century under Abbot Bernward (993–1022), tutor of Otto III. The hollow-cast bronze doors and column he commissioned (now at Hildesheim Cathedral) are among the most sophisticated and ambitious works of early medieval art. Other leading centers, distinguished by their scriptorium activity, include Reichenau, Regensburg, and Echternach.

Architecture

Under Saxon rule (919–1024), Ottonian architecture in the Holy Roman Empire moved beyond the shadows of Carolingian interpretations of Christian Antiquity to coalesce with pan-European Romanesque building trends during the eleventh century. Many Ottonian buildings survive, but seldom unrestored. Many more are known only from archaeological remains postdating the mid-tenth century. From beginnings under Henry I the Fowler (king 929–936), and remarkable accomplishments under Otto the Great (king 936–962, emperor 962–973), Otto II (972–982), Otto III (983–1002), and Henry II (1002–1024), Ottonian architecture continued until approximately 1065 in Germany, especially along the Rhine, Moselle, and Danube Rivers.

Henry I shifted construction largely northeastward into Saxony. He resumed late Carolingian policies of erecting fortifications to defend palaces, castles, churches, and monasteries against fierce pagan invaders, for instance, at Quedlinburg, Merseburg, and Werla. Otto I's selection of Charlemagne's grand, central-type, palace church at Aachen for his own coronation in 936 signaled the continuing Ottonian esteem for the Carolingian Holy Roman past. The same is reflected in central buildings newly constructed at Bruges (before 950), Mettlach (983–984), Liège (972–1008), and Cologne-Deutz (999–1021), among others, while Aachen's interior elevation was quoted unmistakably in three vertical sections of

Cologne, St. Pantaleon, westwork. Photograph: Joan A. Holladay

the massive mid-eleventh-century west tower of Essen's Münster.

Although frequently grouped with Carolingian building as early Medieval, Ottonian architecture was itself often innovative. Typically, Ottonian architects simplified the Carolingian full westwork at Reims (ca. 976), made it more monumental in the mighty "turris sanctae Mariae" at Werden on the Ruhr (ca. 920–943), and both simplified and monumentalized it in the reduced westwork at Cologne's St. Pantaleon (984–1002). While Werden retained the dominant central tower and substantial high transept of Carolingian full westworks, it relinquished the low, vaulted, entry-level hall "crypta," leaving two remaining levels opening east into the church proper. Such spatial changes were so consistently followed in tenth and early-eleventh-century German westworks that they suggest a diminution of the liturgy of the Saviour in the reduced Ottonian westwork. By 1015 the west choir of Saint Michael's at Hildesheim was still consecrated traditionally to the Saviour but also to the Virgin, the Holy Cross, and especially to the Archangel Michael.

Ottonian architects were more engaged with the Byzantines than their predecessors had been. In the very small church of St. Cyriacus at Gernrode (959/961–965; ~970s), the influences of the Byzantines, looked upon then as the contemporary living Romans, are seen in the short nave, the full gallery over either side aisle, and the articulation of nave and gallery elevations in complicated rhythmic combinations of columns and piers. Recalled were late-fifth-century galleries at Saint Demetrius in Thessaloniki that had become common in Byzantium's western provinces by the tenth century. Recalled too in the gallery's external blind arcading was an articulation seen more than thirty years before at Constantinople's Myrelaion church (930). Delays in construction at Gernrode suggest these Byzantine elements belonged to its last construction phase, probably under Otto II's wife, the former Byzantine "princess" Theophanu (972–991). In 1017–1018 Bishop Meinwerk of Paderborn called in *operarios graecos*, (Greek or Byzantine workmen) to erect his chapel of St. Bartholomew. Its walls, articulated in shallow niches, enclosed a rectangular, hall-like, three-aisled space, in which elegantly slim columns defined a bay structure that was buoyantly and delicately vaulted.

At the very large, galleried, wooden-roofed monastic basilica of St. Maximin at Trier (934–952), nave and side aisles were separated by alternating piers and columns supporting spanning and lesser arcades, respectively, while at either end were three parallel semicircular apses. There seems to have been only a north transept arm. One apsidal group belonged to a massive westwork (949) entered from a tall, semicircular exedra that mirrored the nave's west apse. Far to the east, the second group (942), that of the main choir, led into a two-storied, five-aisled outer crypt (952) behind the church. From 934 into the eleventh century, St. Maximin was the center of a Benedictine reform movement that swept through the Germanic lands, often bringing with it the large outer crypt and the diminished Ottonian westwork. Later, this reform was overtaken and finally assimilated by that of Cluny.

Inculcated with the reform at Trier, Archbishop Bruno of Cologne (954–966), the younger brother of Otto the Great and a leading sponsor of religious architecture, enlarged Cologne's cathedral after 954 and founded or reformed many monasteries. Benedictine St. Pantaleon at Cologne, with its plump tower on a cruciform westwork, was begun in 964, continued for a short time after Bruno's death (d. 965), and completed under Empress Theophanu (d. 991). Its monumental, wooden-roofed nave without side aisles extended east beyond screened spacious transept arms with apsidioles (smaller apses) to a shallow semicircular apse. Externally, continuous gigantic blind arcades must have evoked thoughts of Charlemagne's audience hall at Aachen (799–800) and the *aula* (great hall) of Emperor Constantine I at Trier (310). Bruno's architects went beyond Charlemagne's buildings at Aachen, however, when at St. Pantaleon for the first time they transformed the pagan Roman audience hall type into a sacred Christian space. When more delicately proportioned blind arcading was carried into the nave, the major Romanesque architectural motif that took form was destined to appear half a century later in the nave of Speyer's great Romanesque basilican cathedral (1030–1060). Clearly, St. Pantaleon at Cologne was a seminal Ottonian and early Romanesque building.

Ordinarily, Ottonian architects constructed churches similar to Carolingian masonry basilicas with nave and side aisles ending in one or three semicircular apses, and with the nave's long, timber roof posed on a clerestory over arcades on piers, rather than columns. Frequently, their eastern appendages were low transept arms, though some coursed continuously north to south (Gernrode 970s, Hildesheim Cathedral 852–872 and ca. 1035, and Magdeburg Cathedral 978). Many but not all had a west tower, westwork, or west building, and an external eastern crypt.

Outside Hildesheim, Abbot Bishop Bernward's monastic church of St. Michael (ca. 1013–1015) echoed Carolingian St. Riquier at Centula (799) in its east and west transepts and tower groupings. Yet St. Michael's also diverged considerably from its likeliest Carolingian models. Its proportional dimensions reflected the writings of the Roman architect Vitruvius, but its abstract geometrical capitals rejected the classical orders. An unusual, twostoried ambulatory, which coursed around the substantial, projecting apsidal west choir with low, vaulted crypt beneath, may be traced to the late-tenth-century ambulatory built into fifth-century Santo Stefano at Verona. Unlike Hildesheim's cathedral, where a traditional building was preserved, St. Michael's was subtly original in plan and elevation, and openly so in its capitals. Without direct followers, Bernward's St. Michael's was a uniquely personal building.

Three mid-eleventh-century churches illustrate the rich diversity of later Ottonian or Germanic Romanesque architecture. Two were mainly unvaulted: the moderately sized Santa Maria im Kapitol at Cologne, with its continuous trefoil choir-with-ambulatory concluding the nave and side aisles; and the huge, magnificently monumental St. Gertrude at Nivelles, with its stately long nave and side aisles broken by diaphragm arches into elongated spatial bays, with its multileveled, towering west building, and an external eastern corridor crypt. One, the north basilica of the double cathedral at Trier, rebuilt in the tenth century, received at its west front a most impressive apse surmounted by twin low set-back blocklike towers. Probably first wooden-roofed, it was completely vaulted in the twelfth century.

The Ottonians' search for a functioning monumental architecture to express their new alignments with early Christian Rome and the contemporaneous Byzantine Romans was followed throughout the eleventh century by an increasing preoccupation with the structural technologies of vaulted bay systems. As the conflict between secular and churchly authority heightened circa 1070, a more limited post-Ottonian world continued to build as before, and endured as one of the principal regions of Europe's "Romanesque."

Ivories

In the tenth and eleventh centuries, elephant ivory was used primarily in prestigious ecclesiastical commissions. The largest group of surviving objects is plaques with relief carvings, most of which originally decorated the covers of liturgical books. Three-dimensional ivory carvings are less common, but the situlae, or buckets for liturgical use, from late-tenth-century Milan (Milan, Cathedral, Treasury, and London, Victoria and Albert Museum) and the early-eleventh-century Mainz Virgin and Child (Altertumsmuseum) represent this type.

The attribution of Ottonian ivories to identifiable individuals, such as the Master of the Registrum Gregorii, and specific ateliers has proven problematic. Some artists may have traveled with the peripatetic Ottonian court. Others moved among the monastic workshops of the empire, so formal and iconographical influences were constantly exchanged. Furthermore, the imperial patrons favored numerous centers with their commissions. Ottonian ivories also exhibit a variety of influences ranging from late Carolingian to late Antique Roman and contemporary Byzantine. Thus, no single workshop and no homogeneous style dominated in the Ottonian period. However, the formal development indicated by ivories carved between the middle of the tenth and the middle of the eleventh century is characterized generally by an increasing monumentality and clarity of individual forms and entire designs, despite frequently complex and spatially ambitious compositions.

The largest surviving group of ivories dating to the beginning of this development is the series of plaques, now dispersed, from the so-called Magdeburg Antependium. The majority of these reliefs, which may originally have decorated a pulpit or bishop's throne rather than an altar frontal, depict the events of Christ's life and emphasize his ministry. In comparison to plaques carved in the first half of the century under the influence of late Carolingian models from Metz, the Magdeburg figures, displayed against a decorative geometric ground or contained within geometrized architectural enclosures, have gained in monumentality and dignity. The narrative emphasis of these clearly legible compositions suggests contact with Middle Byzantine lectionary illustration. Contemporary Byzantine as well as late Antique western sources exerted increased influence on ivory carvers during the reigns of Otto II (973–983), who married the Byzantine princess Theophanu, and of their son, Otto III (983–1002). The adaptation of Constantinopolitan models on the one hand and of Roman sources on the other both resulted in a stronger concept of the three-dimensional human figure and of perspectival architecture and space. An ivory situla made at Milan around 980 in preparation for a visit by Otto II is decorated with seated figures of the evangelists and the Virgin and Child in high relief under arcades (Milan, Cathedral, Treasury). The figures have gained in volume and the drapery in complexity in comparison with the Magdeburg reliefs, and compositional clarity is retained. The situla reliefs and an approximately contemporary plaque from Milan with a standing figure of the evangelist John (Paris, Louvre) are consistent with Byzantine ivory carving of the mid-tenth century, such as the Harbaville Triptych (Paris, Louvre), and indicate the authority of eastern models and their transmission to imperial art via northern Italy. The high figural relief and interest in perspectival space evident in several contemporary ivories of northern origin, such as the Halberstadt plaque of circa 985–990 with the evangelist John (Cathedral Treasury), are influenced by the Registrum Master's adaptation of late Antique western models.

Manuscript Illumination

Unlike the Carolingians, whose attempt to centralize government resulted in the establishment of a fixed court with an attendant school from which deluxe illuminated manuscripts emanated, the Ottonian rulers were essentially itinerant, and a central court school never developed. Rather, the production of illuminated manuscripts was the domain of various episcopal sees and monasteries throughout the realm. Scholarship on Ottonian manuscript production has thus focused on outlining the individual schools of manuscript painting; major schools not otherwise mentioned below include Corvey, St. Gall, Einsiedeln, Fulda, Essen, Seeon, Salzburg, Freising, Minden, Stavelot, and Liège.

While the court itself did not produce manuscripts, the close interdependence among court, church, and cloister (customarily termed the *ottonisch-salische Reichskirche*) meant that those foundations favored by the imperial house were at the forefront of manuscript production. The monasteries at Reichenau were particularly active in the manufacture of books on behalf of the royal house. Notable examples include three manuscripts for Otto III—the Aachen Gospels (Aachen, Münsterschatz), the Gospels of Otto III (Munich, Bayerische Staatsbibliothek, no. Clm. 4453), and the Bamberg Apocalypse (Bamberg, Staatsbibliothek, no. Ms. 140)—and the Pericopes (liturgical readings) of Henry II (Munich, Bayerische Staatsbibliothek, no. Clm. 4454). The

numerous ruler portraits in these and other liturgical manuscripts both develop and depart from Carolingian practice and emphatically underscore the sacral nature of the ruler himself. The greatest exposition of this idea is the image of Otto III in the Aachen Gospels, where the enthroned ruler, surrounded by evangelist symbols and a mandorla (body halo), is lifted up into the heavenly sphere. The picture essentially substitutes Otto III for Christ in a *Maiestas* (in His Majesty) composition; in fact, the page appears just after the book's canon tables, where the representation of Christ in Majesty would normally be expected. The image also includes two pairs of soldiers and ecclesiastics, signifying the unified support of the realm for and under Otto. It was the distribution of such deluxe manuscripts by the ruler that not only forged ties with individual foundations throughout the realm but also reminded the recipients of the sacral nature of the ruler.

A change in king usually brought a change in the fortunes of specific sees or houses. Just as Reichenau flourished under Otto III around 1000, Regensburg saw increased manuscript production as a result of Henry II's patronage throughout the first quarter of the eleventh century (e.g., a Sacramentary and Gospel Book [Munich, Bayerische Staatsbibliothek, no. Clm. 4456; Vatican, Biblioteca Apostolica, no. Ms. Ottob. 74]), while the rise of the Salian rulers Conrad II and Henry III meant new commissions for Echternach in the middle of the century (e.g., the *Codex Aureus* [Nuremberg, Germanisches Nationalmuseum, no. Ms. 156142], and the Gospels of Henry III for Speyer Cathedral [Escorial, no. Cod. Vitr. 17]).

Because of the devolution of power to individual sees and monasteries, ecclesiastics became important as patrons of art to a greater degree than they had been in the Carolingian world. Such individuals as Bishops Egbert of Trier and Bernward of Hildesheim were dynamic patrons whose commissions in manuscripts and in other media enriched the wealth and status of their foundations. Noble women, often from the royal family, who served as abbesses were particularly vigorous book patrons, and such deluxe works as the *Hilda Codex* from Cologne (Darmstadt, Hessisches Landes- und Hochschulbibliothek, no. Ms. 1640) and the *Uta Codex* from Regensburg (Munich, Bayerische Staatsbibliothek, no. Clm. 13601) indicate not only the remarkable fortunes these women controlled but also the great intellectual level embedded in the pictures made for them.

The *Codex Egberti* (Trier, Stadtbibliothek, no. Ms. 24), executed for Egbert around 974, manifests several trends in Ottonian manuscript illumination besides the importance of episcopal patronage. It is a lectionary, a collection of Gospel excerpts read in the mass, perhaps the most popular kind of book illuminated in the period. Like the Gospels of Otto III, its pictures of the Life of Christ are chronologically ordered throughout the book. Other books introduced different programmatic schemes. The *Codex Aureus* of Echternach, for example, grouped the cyclical narratives together at the beginning of each gospel; cycles of the life of Christ were also incorporated into the sacramentaries that were a speciality of Fulda. The increased attention to the representation of Christ is the result of a renewed eleventh-century interest in Christ as a model for the ruler in particular and for individuals in general.

With its red frames, illusionistic backgrounds, and naturalistically modeled figures, the pictures of the *Codex Egberti* reveal the influence of late Antique manuscript painting (as found, for example, in the Vatican Vergil); the foremost proponent of this classical style in the tenth century was the so-called Master of the Registrum Gregorii, who worked primarily for Egbert. Other examples of his work include a Gospel Book now in Manchester (Rylands Library, no. Ms. 98), which had a dramatic influence on the development of painting in Cologne, and the Sainte-Chapelle Gospels (Paris, Bibliothèque Nationale, no. Ms. lat. 8851), which was imitated in the *Codex Aureus* of Echternach. The copies of this master's work disclose the general stylistic trends in Ottonian manuscript painting. Three-dimensional illusionism, as found in late Antique manuscripts and revived in Carolingian works, is the exception. Backgrounds are normally rendered as broad fields of gold, purple, or other saturated colors; rich colors are rarely blended but are juxtaposed to produce dramatic contrasts. This contributes to the overall reduction in spatial depth, so that figures often hover in two-dimensional space. A predilection for expressive hands and facial features is a hallmark of Ottonian book painting. The reduction in modeling and plasticity and a tendency toward linearization in both individual figures and compositional structures would be further developed in the Romanesque period.

Identifying the sources of Ottonian book painting has long been a scholarly concern. Despite differences of opinion about specific motifs, it is agreed that three basic sources were used by Ottonian illuminators: late Antique/early Christian, Carolingian, and Byzantine. This is neatly exemplified by a prayer book made in Mainz for Otto III by his mother, Theophanu, and Archbishop Willigis around 984 (Munich, Bayerische Staatsbibliothek, no. Clm. 30111). The dedication picture with the king is derived from late Antique imagery, as seen, for example, in the Calendar of 354; the image of the orant Otto beneath a Deesis (i.e., Christ depicted between the Virgin Mary and John the Baptist) relies on roughly contemporary Byzantine iconography, like that of a triptych in the Palazzo Venezia, Rome; while the representation of Otto prostrate before Christ is a development of Carolingian ideology, as expressed, for example, in the Prayer Book of Charles the Bald (Munich, Residenz, Schatzkammer [treasury]).

In general, Ottonian book illumination relied foremost on Carolingian models, which often provided the original artistic impetus as the Ottonian schools emerged in the middle of the tenth century. The clearest example is the *Gero Codex* (Darmstadt, Hessische Landes- und Hochschulbibliothek, no. Ms. 1948), made in Reichenau shortly before 969; its pictures were modeled directly on the Lorsch Gospels (Alba Julia, Batthayneum Library and Vatican, Biblioteca Apostolica, no. Ms. Pal. lat. 50), made in Charlemagne's court school at the beginning of the ninth century. Likewise, the images in the Sacramentary of Henry II of 1002–1014 depend to a great degree on the *Codex Aureus* of Charles the Bald from circa 870, which was housed in St. Emmeram, Regensburg's main monastery. For all their theopolitical contention with the Byzantine Empire, with a concomitant importation and emulation of eastern ideas and objects, as seen, for example, in the Byzantine ivory on the cover of the Gospels of Otto III, the Ottonians looked above all to the western, Carolingian Empire as their primary conceptual model. This was evident in their quest for papal coronations as emperor, in their conversion policies toward the Slavs, and in the manner they adopted and transformed Carolingian manuscript painting—through a distinctive style and new iconographic motifs—to express an ever increasing spiritual and political abstraction.

Metalwork

The centralized patronage and clear development of style in the Carolingian period were replaced during the tenth and eleventh centuries by a far more complex situation under the rule of the Saxon emperors Otto I, Otto II, Otto III, and Henry II, and the Salian Conrad II. Metal-work reflected the ideals and

roles of imperial and episcopal rule as well as monastic culture in Ottonian society. Receptiveness to Byzantine cultural influence was signaled by the marriage of Otto II to Theophanu, niece of the Byzantine emperor John Tsimiskes, and later by Henry the Lion's pilgrimage to the Holy Lands in 1172–1173. Throughout the period, relics and luxury and liturgical objects were imported in large numbers from the east. The patronage of the emperors, artistic activity of bishops and of notably active abbesses, and production at the great artistic centers of the empire, such as Reichenau, Regensburg, Cologne, Fulda, and Corvey, resulted in a variety of styles executed in traditional metalworking techniques. Among the imperial commissions number the crown probably made for Otto I (961–962, Vienna, Schatzkammer) and most notably the commissions of Henry II: the pulpit and the altar frontal known as the Pala d'Oro made for the palace chapel at Aachen circa 1002–1014 and circa 1020, respectively, and the golden altar frontal of circa 1022–1024 from Basel Cathedral (Paris, Musée de Cluny). Bernward, Bishop of

Hildesheim, commissioned a pair of silver candlesticks (ca. 996–1000) a cast bronze column (1000–1010) and a pair of cast bronze doors (ca. 1015). Mathilde and Theophanu, abbesses at Essen, granddaughters of Otto I and Otto II, respectively, commissioned a total of four processional or altar crosses to the abbey; Theophanu also donated an elaborate book cover circa 1050. These and other splendid crosses, such as the Lothar Cross (ca. 985–991, Aachen, Cathedral Treasury), crowns like that of the Golden Virgin at Essen (Minster, ca. 983), and book covers such as that from 983–991, that decorate the *Codex Aureus* from Echternach (Nuremberg, Germanisches Nationalmuseum), together with reliquaries, like that made for a fragment of the sandal of St. Andrew (977–993 Trier, Cathedral Treasury), were executed in cloisonné and champlevé enameling, filigree, niello, and repoussé, and were embellished with gems. With the death of Henry II in 1024, Conrad II, first emperor of the Salian dynasty, continued to support the arts, commissioning the imperial altar cross, (ca. 1023–1130, Vienna, Schatzkammer), and the cast bronze "Krodo Altar" of the late eleventh century (Goslar, Museum).

Sculpture

Ottonian sculpture is an elusive entity. The chronological limits are hard to discern, because its beginning occurred somewhere in the continuum of the Carolingian tradition of sumptuary art, around the middle of the tenth century, and its end fell somewhere in the genesis of the Romanesque revival of monumental stone sculpture, about a century later. It is difficult to decide what artistic work ought to count as sculpture as distinct from sumptuary art, because Ottonian objects that were embellished with carved, modeled, or cast relief images—mostly figures—run the gamut in scale from miniature to monumental. It is also difficult to define an Ottonian formal character because two stylistic strains coexisted side by side: a pictorial mode, miniature in conception, that stemmed from Carolingian illuminations, and a new volumetric mode, relatively monumental in conception, in which forms occupy either real space or an abstractly defined space but not a pictorial one. Emerging in the late tenth century, the volumetric mode became dominant only at the point that Ottonian sculpture was about to become Romanesque. There is yet one more difficulty, namely, validating Ottonian sculpture as an artistic tradi

Gero Crucifix, Cologne, cathedral. Photograph: Rheinisches Bildarchiv der Stadt Köln

tion, because there was no continuum; its production was sporadic and scattered and was virtually limited to patronage from the most privileged level of society. Until the middle of the eleventh century, when production of large stone figures began, the crafting of images with a third dimension, either in relief or in the round, was more a function of employing precious metals such as ivory, gold, or bronze than it was a conscious urge to make sculpture as a medium distinct from painting.

Virtually all Ottonian objects with sculptural embellishment are related to Christian worship, serving either as liturgical implements, church furniture, or reliquaries. Although undoubtedly commissioned and executed in a spirit of piety, the most lavish among them imply the additional motivation of celebrating the magnificence of an imperial regime or ecclesiastical reign. The most outstanding objects in the first period, the decades flanking 970, are a large wooden crucifix in Cologne Cathedral, made for Archbishop Gero; a large freestanding Virgin and Child in Essen Münster, carved of wood and covered with gold, made to hold a relic; and fragments of monumental stone figures from the facade of St. Pantaleon in Cologne. In the second period, the decades flanking 1010, there are three: at Hildesheim a great doublevalved bronze door with scenes of the Life of Christ and a tall bronze column with a spiral narrative of the mission of Christ, both made for Bishop Bernward; and for Basel Cathedral a gold altar frontal, given by Emperor Henry II, with Christ, three archangels, and St. Benedict framed in an arcade (now Paris, Musée de Cluny). In the third period, the decades flanking 1060, there are more: a freestanding wooden Madonna and Child, originally covered with gold and holding a relic, made for Bishop Imad of Paderborn; a wooden door with scenes of the Life of Christ, at Maria-im-Kapitol (Mary in the Capitol), Cologne; a nearly life-size funerary slab figure of the Anglo-Saxon missionary Widukind, a long-dead military-political hero, at Enger; and three stone reliefs of Christ Enthroned and two saints, now set above a portal at St. Emmeram, Regensburg. Among these monuments there is no connective thread and no pattern of development, leaving Ottonian sculpture with the exceptional characteristic of manifesting no historical trajectory.

Textiles

Many of the luxury textiles favored in the West during the Ottonian period, a number of which still survive in Rhenish treasuries, were imports and gifts from the Byzantine Empire. Acknowledging the Ottonian taste for Byzantine silks is not, however, to dismiss local production of fine textiles, particularly in the form of tabletwoven silk bands of which several from the late tenth century still exist. In addition to examples found at Augsburg and Speyer, Trier claims an extremely well-preserved stole that depicts along its length frontal portraits of each of the twelve apostles. In Bamberg resides a fragment of a particularly luxurious band once attached to a cope of St. Kunigunde. Brocaded with green and blue silk and gold, it is decorated with a series of confronting lions on either side of stylized trees.

The earliest example of Ottonian embroidery can be found on a reliquary cover at St. Kunibert in Cologne. Made of blue linen, embroidered with silk and strips of gilded leather, this piece showing Christ in the heavens was created in the second half of the tenth century. The many fine embroideries associated with Kunigunde and her husband, Henry II, in the Bamberg treasury attest to imperial interest in this highly developed art. The "Star Mande," so called because of the zodiacal signs and constellations that adorn it, was a gift to the cathedral from the imperial couple. Another cloak there said to have belonged to Kunigunde is decorated with a row of embroidered roundels showing New Testament scenes, while another depicts rows of enthroned rulers. All three are made of silk and embroidered with silk and metal threads.

Wall Painting

In the period when monumental sculpture was just beginning to experience a resurgence, wall painting constituted the dominant medium for the decoration of Ottonian churches. Contemporary chronicles mention these paintings in praiseworthy, albeit somewhat general terms. Thangmar, the contemporary biographer of Bernward of Hildesheim (r. 993–1022), described the bishop as having decorated the "walls and ceilings [of his cathedral]... with marvellous bright paintings, so that one had the feeling of being in a completely new church" (Thangmar 1841:761). The paintings in the chapel of St. Gertrude at Eichstätt were described as "wonderful and almost living pictures" (Dodwell 1993:126).

Despite the chronicles' mention of paintings in centers such as St. Gall, Peterhausen, Deutz, Cologne, Aachen, and Echternach, few examples remain today. From the extant works it appears that Ottonian wall painting followed the Carolingian goal of illustrating scenes from or prefiguring the New Testament. The two primary sites where examples of Ottonian wall painting are preserved today are at Fulda in Hesse and in the area of Lake Constance. The Fulda murals are found in the crypts of two churches: Petersburg and St. Andrew at Neuenberg. The Petersburg paintings are fragments of a larger mural, and include scenes of Christ's Baptism in the Jordan, the Lamb of God, angels, and saints. The images at St. Andrew's date to circa 1023 and display a limited palette. C. R. Dodwell describes these works as "tinted drawings" and suggests an Anglo-Saxon model for the images, which include Abraham, Melchizedek, Abel, and a Christ in Majesty (Dodwell 1993:128).

The Reichenau murals in the church of St. George at Oberzell convey a sense of the scale and sophistication of wall painting during this period. Paintings in the nave are set off by a frieze and illustrate Christ's miracles, including the storm at sea, the healing of the leper, and the raising of Lazarus. The figures are shown against a backdrop

Reichenau-Oberzell, St. George, interior with Ottonian wall paintings. Photograph: Joan A. Holladay

of architecture and horizontal bands of color. Deterioration, compounded by an extensive restoration in 1880, has resulted in the loss of much of the modeling. In the first publication to deal with these works, F.X. Kraus assigned a date of 985–987, locating them within the tenure of Abbot Witigowo. Later scholarship broadened the sphere of prospective dates to 950 or later but generally agree on an Ottonian origin for these works. These arguments rest primarily on stylistic and iconographic similarities to contemporary Reichenau book painting. In the most recent study on these works, Koichi Koshi has suggested that the paintings actually date to the Carolingian period and were contemporary with the construction of the church under the Abbot Hatto (888–913). Koshi's argument examines these works from a stylistic point of view, placing them in the context of Carolingian mural painting rather than manuscript illumination. The paintings at St. Sylvester at Goldbach are more modest in scale and execution than those at Oberzell, but are significant in that they have never been restored. In addition to a cycle of the miracles of Christ, the Goldbach paintings include the figures of the twelve apostles and that of Winidhere, the founder of Goldbach and monk of Reichenau.

The discourse surrounding Reichenau's status as a major center of book production has also questioned whether the monastery had its own wall painters. Wall paintings went for the most part unsigned, making it difficult to trace the artists. It is known that Reichenau possessed monastic wall painters in the ninth century, when they are recorded as having worked for a time at St. Gall. Dodwell suggests that a century later, the Oberzell paintings could have been executed by itinerant artists. Others have argued for Reichenau as a center of a school of wall painting, however, on the basis of the amount of work found in the region and its stylistic links to the Reichenau manuscripts. Deschamps even suggests that the miniaturists were also wall painters, asserting that these two arts penetrated each other. This question of context appears to be the crux of the problem for future research. Only when scholars have reconsidered the relationship of Ottonian wall painting to both contemporary manuscript illumination and earlier Carolingian mural cycles will a more complete history emerge.

Born in the Puster valley in south Tyrol, the painter and wood carver Michael Pacher was one of those rare double talents of the late Middle Ages whose reputation reached well beyond his native region. Contemporary documents reveal, however, that he was primarily a painter, like Friedrich Pacher, who is presumed to be a relative. Thus, in spite of his astounding professional activity as a sculptor, most of his religious works comprise panel paintings and frescoes, including the vault paintings in the old sacristy at the cloister Neustift from about 1470. By 1467 at the latest he directed a workshop in Bruneck. Pacher's importance lies in his adaptation of new artistic forms from Italy, the Netherlands, and southern Germany, which, in combination with his Alpine piety, he transforms into a new pictorial language. A clear understanding of Mantegna's frescoes in Padua and Mantua with their bold foreshortening and deep spaces constructed in virtuoso perspective is already apparent in four early panel paintings preserved from an otherwise lost altar dedicated to Thomas Becket (about 1460; Graz, Joanneum). In the altarpiece of the church fathers from Neustift near Brixen (1482–1483; Munich, Alte Pinakothek), he developed these pictorial techniques fully, setting the monumental figures under diagonally arranged trompe l'oeil baldachins (realistic figures) that seem to spring out of the paintings. Realistic, portraitlike facial features characterize the four small panels with the apostles and the helpers in need that were located at Wilten after 1820 (about 1465; now divided among the Österreichische Galerie in Vienna, the Museum Ferdinandeum in Innsbruck, and a private collection in the United States). No trace remains of a documented altarpiece, probably dedicated to the Archangel Michael, made for the parish church in Bozen between 1481 and 1484.

Of four Virgin altarpieces, all with richly sculptured shrines, three are fragmentarily preserved. An enthroned Madonna from 1462–1465 in the parish church of St. Lorenz near Bruneck, probably accompanied by the figures of St. Michael (Munich, Bayerisches Landesmuseum) and St. Lawrence (Innsbruck, Museum Ferdinandeum), has lasted through the centuries, although without the original shrine structure. Single panels from the wings, which were painted on both sides, are now housed in Munich (Alte Pinakothek) and Vienna (Österreichische Galerie). Pacher set a Coronation of the Virgin, composed as a scene rather than a stiff row of saints, into the center of the polyptych at Gries near Bozen (1471–1475); polychromed and gilded reliefs occupy the wings of the chapel-like shrine. Pacher's representation of the coronation before a gold brocade curtain supported by angels is based on Hans Multscher's altar in Sterzing. The contract mentions guard figures, which would have flanked the shrine; these, along with the painted wing panels, have disappeared. The masterpiece among Pacher's altars is the double triptych in the choir of the pilgrimage church at St. Wolfgang in the Salzkammergut; the contract is dated 1471, the execution between 1475 and 1481. With this work Pacher set the artistic standards against which other paintings and sculptures of the last phase of the late Gothic are measured. Here this "genius among altar sculptors of south Tyrol" (Paatz 1963:44, my trans.) developed his own artistic language in the shimmering gold coronation set onto a stage under a filigreed tracery superstructure that reaches up to the vaults, in the imposing figures of the church's patron and St. Benedict, in the militant knight-saints at the sides of the shrine, and in the accompanying painted cycles with scenes from the lives of Christ, the Virgin, and St. Wolfgang. Probably the largest of Pacher's Virgin altars was that commissioned for the Franciscan church in Salzburg in 1484 and finished in 1498. This structure, greater than seventeen meters, was dismantled in the baroque period; its enthroned Madonna, later inserted into an altar by Fischer von Erlach, and several panels are preserved (Vienna, Österreichische Galerie). The extraordinary sum of 3,300 Rhenish gold florins was likely the highest paid for an altarpiece of this period. Pacher died in 1498, shortly before its completion.

Paderborn

In 777 Charlemagne held an imperial synod at Paderborn, and in 799, the royal palace witnessed the historic meeting between Charlemagne and Pope Leo III, during which the terms for the imperial coronation were determined. In 805, Paderborn became a bishopric and missionary center for Saxony. Both the Carolingian cathedral and the palace complex to its north are known through excavations.

Under the patronage of Bishop Meinwerk (1009–1036), a relative and adviser of Henry II, Paderborn experienced, following the conflagration of 1000, a major urban reconstruction. The center of this scheme was the cathedral, a basilica with eastern transepts and a westwork (massive entry structure) in the Carolingian tradition, flanked to its north by the imperial and to its southwest by the episcopal palace. This central complex was to become the nucleus of a cruciform arrangement of monuments, intended to present a sacred topography, or *mappa mundi*, but was left uncompleted by the death of the patron. To the east, the centrally planned abbey church of Busdorf—the burial church of Meinwerk consecrated shortly before his death in 1036—represented the Holy Sepulchre at Jerusalem; to ensure a likeness with the prototype, Meinwerk had actually sent Wino, Abbot of Helmarshausen, to Jerusalem to procure the measurements of this church. The western arm of the cross was formed by the abbey of Abdinghof, founded by introducing thirteen monks from Cluny. After the collapse of the original church, a simplified version of the second abbey church at Cluny, the very day before its consecration in 1015, it was rebuilt instead "in the Roman manner" (*more Romano*) with a western set of transepts, which might have been originally intended for the planned monastery of St. Alexis south of the cathedral. The chapel of St. Bartholomew, attached to the imperial palace and known to have been built in 1017 by Byzantine craftsmen (*per Grecos operarios*), corresponds in all its measurements and major architectural features—even though transformed from a centrally planned church of the "cross-in-square" -type into a small hall church—with the church of the Myrelaion in Constantinople, planned as the burial church of Emperor Romanos I Lekapenos (922–944). An even closer copy of this model existed in the episcopal chapel attached to the southern transept of the cathedral, one of the earliest examples of a double-storied chapel with four columns and a central dome. The place of the planned monastery south of the cathedral was finally taken by the parish church, or *Gaukirche*, dedicated to St. Ulrich, a vaulted basilica of the twelfth century to which a Cistercian nunnery was attached in 1228.

The two most important works of art dating from this period are the so-called Imad Madonna from the mid-eleventh century and the small portable altar created by the artist Roger of Helmarshausen, or Theophilus Presbyter, as the author of the *Schedula de diversis artibus* calls himself.

In the second third of the thirteenth century, a rebuilding of the cathedral took place. It started with the western tower and the adjoining basilica bay and western transept, and continued as a hall church of the "Westphalian" type, integrating late Romanesque elements from the Rhineland and Gothic forms from the Île-de-France. A porch, the *Paradies*, was added to the south end of the western transept; its monumental sculptures show the distinct influence of works from Reims Cathedral. Following work on the cathedral, a Gothic hall nave was attached in the late thirteenth century to the church of Busdorf, and its octagonal part was subsequently demolished, leaving only its two round facade towers as flanking towers to the new choir. The Gothic parish church of the market district, St. Mary's, was demolished around 1800. An interesting reception of medieval style exists in the church of the Jesuits, built between 1682 and 1692 as a post-Gothic basilica with galleries.

Paleography

Etymologically the word *paleography* means "old writing" (from Greek *palais*, "old," and *graphia*, "writing" or "script"). However, the term has come more generally to refer to the study and history of writing. The most common objects of study for paleographers concerned with the Middle Ages are manuscripts and manuscript fragments. Paleographers examine the appearance of letters, abbreviations, the slant of writing, the size of the letters, the movement of the pen, the direction and quality of the pen strokes, and the nature of the writing material. They attempt to classify scripts and plot the development, persistence, and dissemination of types of scripts. The study of paleography can help to establish the number and the skill of the hands that wrote a given manuscript, to determine the origin of a given manuscript, and, more specifically, to localize a manuscript to a region, a scriptorium, and sometimes even a particular scribe. Paleography is an important auxiliary science to history, philology, anthropology, and literature.

Most written texts from the early Middle Ages are in Latin, but Old High German glosses appear in religious texts from the middle of the eighth century. These glosses are generally interlinear or marginal German translations or explanations of Latin words and passages. The glosses comprise the largest corpus of the Old High German language. The earliest extant text of significance written in the vernacular is a bilingual German and Latin dictionary of synonyms from around the year 770, called the *Abrogans* after the first entry. The first narratives in Old High German appear around the turn of the ninth century. The genres of these narratives include sermons and religious legends. Several charms have also come down to us. Charlemagne first initiated the translation of important religious texts into German for missionary purposes. His efforts resulted in an increase in the use of the vernacular for writing. In this early period writing took place exclusively at monasteries. Through the dialectal variation in written Old High German, philologists can often trace a given text to a particular scriptorium.

The first manuscripts containing narratives of a secular nature appear toward the end of the twelfth century. In the twelfth and thirteenth centuries—the High Middle Ages—the number of manuscripts written in the vernacular increases significantly. The most common genres of texts written in Middle High German are literary texts, legal codifications and documents, and chronicles.

The script used in medieval German manuscripts changed in style in the course of the Middle Ages. From the end of the ninth to the late eleventh century, documents were written primarily in Caroline minuscule. This script evolved in the late eighth century, during the period of Charlemagne (r. 771–814). The Caroline minuscule is thought to have originated in northern France or western Germany, but its precise origin is subject to debate. By the mid-ninth century, this script was used for copying books throughout the Carolingian Empire, except in the far southeastern regions. In the second half of the tenth century, it was introduced into northern Germany, Poland, Bohemia, Hungary, and Scandinavia as these areas were Christianized. Caroline minuscule is an economic script and is highly legible. Each letter is written as an individual character, and there is only limited use of abbreviations and ligatures. This script remained widespread for four centuries.

Starting around the end of the eleventh century, the Caroline minuscule was replaced by Gothic script. Gothic minuscule is popularly regarded as the typical medieval script. Far more books and documentary texts are preserved in the Gothic script than in any other. The name *Gothic* actually refers to a family of scripts that became increasingly differentiated in the course of the Middle Ages. Certain features are common to most Gothic scripts: preference for angularity over curves, angular finishes at the top and bottom of short vertical strokes used to form the letters *m*, *n*, *i*, and *u* (called minims), lateral compression that emphasizes height in letters, and thick perpendicular strokes. The Gothic script became the model for Fraktur (literally "fractured," i.e., the "broken," or forked, form of the shafts), the script used for printing texts in the German language by printing presses in Germany into the beginning of the twentieth century (By contrast, Latin was generally printed in Roman script). Standard German handwriting is a continuation of cursive Gothic script.

Scribes, rubricators (colorers), and illustrators each took part in creating a manuscript. Initials were painted in red by rubricators after the manuscript had been completed. Initials were also frequently adorned, sometimes with a simple design and sometimes with elaborate, figurative images. Both religious and secular manuscripts often contain illustrations. The quality of the illustrations varies considerably. In general, liturgical manuscripts are more ornately and expensively decorated than manuscripts of a secular nature. The choice of subject matter for the images, and the relationship between word and image, varies considerably in the High Middle Ages.

In the Middle Ages, the most common writing material was parchment made out of the skin of calves (vellum), goats, or sheep; quill pens usually made from goose feathers; and ink that was often made from a mixture of oak gall and copper vitriol. The sheets of parchment were folded into gatherings that were then sewn and bound into books called *codices*. A codex can be made up of one or more folded sheets. Book formats are classified as folio, quarto (4to), octavo (8vo), duodecimo (12mo), sextodecimo (16mo), and so forth, depending on whether the sheet was folded to make two, four, eight, or sixteen leaves. The codex was usually bound between two wooden boards fastened together with clasps.

Parler Family

Centered in Germany in the mid- to late fourteenth century, the three generations of Parlers were both architects and sculptors. They worked throughout Germany and its eastern neighbors, and whether called Parler, von Gmünd (from Gmünd) or von Freiburg (from Freiburg), they shared the mason's and master's mark of a twice broken staff, in the shape of a hook. Diverse in their style, the members of the Parler family were nevertheless enormously influential and involved in many of the grandest building projects of the fourteenth century.

Cologne, cathedral, west façade, Peter's Portal, left jamb. *Photograph: Joan A.Holladay*

The patriarch of the family, Heinrich Parler (fl. ca. 1330s–1371/1377), an architect, was master of the works at the Heiligkreuzkirche (Church of the Holy Cross) in Schwäbisch Gmünd by the 1330s. He is credited with redesigning the eastern section of the nave to coordinate with his plans for a hall choir instead of the original basilican plan. In addition to altering the layout of the church, Heinrich combined architecture and sculpture here in a way not before experienced in Europe. Mentioned in an inscription above a portrait of his son, Peter Parler, in the triforium (short middle story) of St. Vitus Cathedral in Prague, he continued to work on the Swabian cathedral until his death in 1377.

Scholars also credit Heinrich with leading building campaigns at the Frauenkirche (Church of the Virgin) in Nuremberg, the Münster at Ulm, and the choir of Augsburg Cathedral, work on which was taken up by his youngest son, Michael, after Heinrich's death. At the Frauenkirche, Heinrich once again utilized a hall church plan, basing his design on the local palatine chapel. With its profusion of sculpture, cubic form, round columns, and innovative segmented arches, this structure is typically Parleresque. Heinrich's direct contribution at Ulm is questionable because of his advanced age at the time its foundation was laid in 1377. Nevertheless, he and his son Michael (fl. ca. 1359–1383) were commissioned by the town council to design an expansive hall church that was later changed to a basilica in 1392.

The elder son of Heinrich, referred to as Johann von Gmünd (also Hans Parler, fl. Basel ca. 1356–1359), followed his father's conception of open space and unarticulated bays in both his work at Basel Minster and the cathedral of Freiburg im Breisgau, where he was named director for life in 1359. He was most likely responsible for the design of the choir, and stylistic details point to his involvement in the sacristy and the superstructures of the two "Cock Towers" flanking the choir.

Before being called to Prague in 1356 by the Holy Roman Emperor Charles IV, Heinrich's second son, Peter Parler ("von Gmünd", 1333–July 13, 1399), assisted his father on both the Heiligkreuzkirche in Schwäbisch Gmünd, where he was born, and the imperially funded Frauenkirche in Nuremberg. Peter Parler's reputation grew enormously with his imperial commissions, and he became one of the most celebrated architects and sculptors of the Middle Ages. Peter's innovative style suited Charles IV's desire for a new aesthetic to accompany his dynastic program.

Along with the cathedral of St. Vitus, Peter Parler also designed the Charles Bridge and Tower in Prague, begun in 1373. The ceilings of both these monuments are covered in a profusion of rib vaulting; in particular, the free-standing vaulting of the south porch at St. Vitus helps dissolve the walls from which it springs. He also included more subtly striking elements, such as pinnacles that pierce through their offsets in the exterior lower story of the cathedral's chevet (apsidal termination of the eastern choir), and shafts that unify the clerestory (tall upper windows) and triforium (short middle story) by piercing the undulating cornice that runs between these two levels. When Peter retired as master of the works of the cathedral in 1397, he was succeeded by his son Wenceslas.

Peter Parler, as sculptor, was responsible for a set of carved choir stalls for St. Vitus (destroyed), and the tomb program of Charles IV's ancestors, begun in 1377, of which only the effigies of Ottokar I and Ottokar II can be linked to his hand. Peter Parler's high status at the imperial court is as much attested to by the numerous burgher commissions he undertook, seen in the churches of St. Bartholomew in Kolin, with its polygonal choir vaults, St. Apollinaris at Tyn, Saint Barbara in Kuttenberg, and of the Knights of Malta in Prague, as by his inclusion as one of the elite few whose busts, sculpted after his design, look down from the triforium of his cathedral in Prague.

The two sons of Johann von Gmünd—Michael (III, fl. 1380–ca. 1387/1388) and Heinrich (IV, ca. 1354– after 1387)—referred to themselves as "von Freiburg" as well as "von Gmünd." Michael worked with his father in Basel, probably raising the Münster towers by 1380. He then became master of the works at Strasbourg Cathedral in 1383, where he completed the middle story of the west facade after the great fire in 1384.

Heinrich is known for his skills as a sculptor, which he seems to have acquired under the direction of his grandfather Heinrich I in Schwäbisch Gmünd. His Christ Carrying the Cross and Man of Sorrows survive in the Heiligkreuzkirche. He traveled to Vienna and by the 1370s was working under the direction

of his uncle, Peter Parler, in Prague. His figure of Saint Wenceslas remains in the saint's chapel in the cathedral, his tomb effigies of Bretislav I and Spytihnev II in the axial chapel, and his bust of Duke Wenceslas I of Luxembourg in the triforium. Heinrich was probably in Cologne by 1378, where he took up work on the Petersportal, the only medieval portal at the cathedral. Aided by a second Parler master, perhaps Michael II of Savoy, he executed the baldachins over the apostles in the jambs (sides of doors), the tympanum (triangle above doors), and the seated archivolt (tympanum molding) figures. Additional evidence for Heinrich's presence in Cologne during the 1380s is seen in the female corbel bust (Eve?, now in the Schnütgen-Museum in Cologne) bearing the Parler mark. Because of the tender, soft, less realistic style of his sculptures, he and his workshop are credited with helping to develop the *Schöne Madonna* (Lovely Virgin Mary) type. Other members of the Parler family—Hans Parler, Heinrich Parler III, and Johann von Freiburg—were called to advise on plans for the enormous cathedral in Milan, where Hans was named master engineer in May 1392.

Passau

Located at the confluence of the Danube, Ilz, and Inn Rivers, Passau is one of the oldest important, continuously occupied settlements north of the Alps. In the fifth century, it was already a bishop's see with a basilical church and cloister located on the east bank of the Inn. The center aisle of the Ottonian Severinikirche, the church dedicated to Saint Severin, who presided there during the fifth century, is built over the foundations of these early Christian buildings.

In 739, Saint Stephan's cloister was founded as the bishop's cloister on the peninsula between the Danube and the Inn. During the ninth and tenth centuries, bishops of Passau exerted missionary influence over Austria, Hungary, and Bulgaria, even into the realm of the Orthodox Church. Indeed, Bishop Ermanrich (866–874) vied with Saints Cyril and Methodius over territory. Under Bishop Pilgrim (971–991), the cathedral school directed by Liudfrith came to be well respected. The two cloisters St. Nicola (ca. 1070) and St. Stephan were centers of manuscript illumination. The oldest extant part of St. Stephan is the Romanesque crypt; the cathedral was rebuilt beginning in 1264, and the late Gothic choir with its unusual dome was completed during the fifteenth century.

The Niedernburg cloister was also founded during the eighth century and designated as distinctly royal property. The dedication to the Virgin, documented in 976, is characteristic of the royal churches of the Carolingian period. The bases of its towers, decorated with Romanesque frescoes, have survived as has the portal, which dates from 1200. The minnesinger Albrecht von Johannsdorf, who is believed to have accompanied Hartmann von Aue on a crusade in 1197, was the son of a prominent Passau family.

Beginning in Carolingian times, a merchant district developed between the imperial quarter around Kloster Niedernburg in the west and the bishop's quarter around St. Stephan's in the east. Citizens of this middle section struggled for some independence from the king and the bishop. The city hall with its high tower was begun in 1298, but citizens' demands were not fully met until 1443, when Passau was granted the status of imperial city (*Reichstadt*). The church of Sankt Bartholomäus with its Romanesque tower and late Gothic aisle and choir was completed in 1328.

Between 1410 and 1420, the walls of Passau were extended to include Innstadt as well as Ilzstadt. Ilzstadt developed beginning in the tenth century and increased in importance to become the starting point of the Bohemian trade route known as the Goldene Steige (Golden Staircase). During the fifteenth century, Ilzstadt was home to a large Jewish community.

Passienbüchlein

The *Passienbüchlein von den vier Hauptjungfrauen* (*Little Book of the Passion of the Four Major Virgins*) is a rhymed collection of legends (or legendary) of circa 2,200 verses on the passions of Katharina, Barbara, and Margareta, plus Dorothea, all four the major virgin martyrs from late Antiquity who were involved in the conversion of numerous heathens.

Conversion and catechism were topics within the Teutonic Order (Deutschorden), where Prussians, Lithuanians, and others were the objects of missionary activity, and from where the *Passienbüchlein* might have originated (ca. 1330/1340), under the Master (Hochmeister) Luder von Braunschweig (Brunswick, 1331–1335) and his chaplain Nikolaus von Jeroschin. The sources for *Katharina* (595 verses) were another collection of saints' trials and tribulations, the *Passional* (1300/1320), and a Latin Bible translation (known today as *Vulgata 1*); for *Margareta* the *Passional* and the *Margareten-Marter* (*The Martyrer of Margaret*, 760 verses); for *Barbara* (440 verses) and *Dorothea* (400 verses) only the Latin versions from the appendix of the *Legenda aurea* (*Golden Book of Legends*). *Dorothea* served as the source for a religious play, the *Kremsmünsterer Dorotheenspiel* (ca. 1350).

The eighteen *Passienbüchlein* manuscripts (four on parchment before 1400)—most in East Middle German, three in Low German, one in Bavarian, and one in Rhine-Franconian—were spread as a complete set first, then as parts in collections, and finally as single legends up to the end of the fifteenth century. Three printed editions followed in Marienburg (ca. 1492) and Leipzig (1508 and 1517).

In Cologne, some six printings were produced (ca. 1492–1520), which were partly reprinted in Lübeck (ca. 1515 and 1521), whereby for *Margareta* the *MargartenMarter* became an additional source. In a Magdeburg printing (1500, without *Katharina*), the *South German Heiligenleben* (in Low German) and the *Legenda aurea* were used as sources, while for *Margareta* the *Low German Margareta-Legend* (ca. 1450) was also employed. The legends of these saints were, at least in part, perceived as being interchangeable and enjoyed relatively widespread distribution.

Passional

The *Passional* (or *Verspassional*, ca. 1290–1320) was the most widely spread rhymed German legendary, originating from an anonymous poet and priest within the Teutonic Order (*Deutschorden*) who had also produced the *Väterbuch* (*Book of the Fathers*). In three parts (I Mary and Jesus; II Apostles; III seventy-five Saints' Legends), the work was quickly distributed to all its centers in Germany, Austria, and Bohemia for the purpose of preaching and communal reading. Besides the elegant Latin *Legenda aurea* (*Golden Legend*) of Jacobus of Voragine, as the major source, in his late classical style, one notices the influence of the German writers Rudolf von Ems, the Stricker, and Konrad von Würzburg.

In 1978, 95 manuscripts of the *Passional* were discerned, 9 of them paper, the others parchment, 10 with pure text of the *Passional*, 15 collections, 70 made up of 106 fragments. Book I had 19,000 verses, Book II 23,600, and Book III 66,400. The saints' legends in the order of the church year, from Nikolaus to Katharina, varied in length between 64 verses and 3,564 (*Katharina*). Before 1350, Heinrich von München included a quarter of the text of Books I and II in his *Weltchronik* (*World Chronicle*, in eight manuscripts). The *Marienleben/ Marienmirakel* (*Life of Mary, Miracles of Mary*) and *Apostelbuch* (*Book of the Apostles*) were widely received in similar works (like the *Münchner Apostelbuch*).

In 1982, it was demonstrated that the *Passional* formed the major source not only for the *South German Heiligenleben* (*Lives of the Saints*), 1385–1400, but also for the *Heiligenleben* of Hermann von Fritzlar, 1343–1349; the *Darmstädter Legendar* of 1420; the *Passienbüchlein von den vier Hauptjungfrauen*, ca. 1330–1340; the *Katharinenspiel* of 1350–1370; and several legends of the life of Catherine *Katharinenlegenden* (*Passio-Katerine*, Heinrichau, Wolfenbüttel, and Bielefeld).

The promotion of oral and written works by sponsors using property or protection as a procuring medium is a medieval German phenomenon. German has several words for "patron": *Gönner*, *Auftraggeber*, and *Mäzen*, the latter a loan-translation from the Latin, commemorating Gaius C. Maecenas, friend and sponsor of the Latin poets Horace and Virgil (thus the German term for "patronage," *Mäzenatentum*). Patrons advanced literature in two main ways: the issuance of concrete contracts with poets, and the creation of an environing influence—an intellectual climate in which the arts could flourish. A third sphere of influence was the poem of supplication, which arose in expectation that a would-be sponsor would confer favor. In Germany, secular patronage of literature flowered in the High Middle Ages, when social and political conditions enabled the so-called *weltliche Fürstenhöfe* (worldly courts) of the aristocracy residing in city and castle to displace the church as the chief impetus for, and donor of, the arts. A notable exception is Wolfger of Erla, bishop of Passau from 1191, who may have been the patron of the *Nibelungenlied* poet. A highly aristocratic form of society permits the most complete development of literary patronage, it is agreed, because inequalities of wealth and position bring forth individual protection or largess. The model for the sponsorship of literature in medieval Germany was the feudal contract itself. Poets, often drawn from the ranks of the *ministeriales* (administrators) received sanctuary within the noble *familia* (extended family) in barter for the *servitium* (service) of literary production, which, as an act of fealty, furthered the interests of the donor and recipient. Author and sponsor thus participated in a reciprocal, communal act, a covenant of "give-and-take," according to which the patron gave protection and sustenance to the poet-vassal and took literature as a means of exchange. Literary patronage was thus not only an institution but a ritual with well-defined rules: for support of the poet, the patron expected reflected glory and personal memorialization as a promoter of art. Visible evidence of sponsorship are verses of homage to the patron, traditionally appearing in prologues or epilogues, sometimes as acrostics.

German medieval literary patronage was marked by the intersection and mingling of value systems—the ethical, the economic, the sociological, and the religious. In the amalgam, virtue itself puts on a new face. Writers self-servingly celebrate generosity as the chief aristocratic virtue, even as they equate prudence and uprightness with enlightened literary sponsorship. Diplomacy and pecuniary considerations were vital to patronage, the former in the acquisition of foreign manuscripts, and the latter in the subsidization of the often circuitous route from source material to public performance. The sponsors of lengthy narrative poems, as for example the Arthurian romances, needed financial resources for parchment, manuscripts, scribes, and probably translators. Of the motives for literary patronage, the dominant one was memorialization (*Gedächtnis*) and the status that it brought. The desire for recognition by one's peers accounted for much literary patronage; sponsorship communicated the benefactor's sense of self as aristocrat and sense of predestination to occupy a position of power. In one person the patron was therefore feudal lord, financier, connoisseur, collector, founder of libraries, arbiter of taste, and prime mover behind the patron's own commemoration as a gesture of aristocratic *Repräsentation*. In sociological terms, the patron embodied society itself; the act of patronage was hence an act of social accommodation. Although the relation between patronage and literary style is well defined, the degree to which literary sponsorship influenced political ethics is still contested. Witness the case of Walther von der Vogelweide, who in the interest of his current protector composed songs in support of opposing dynasties (Welf and Staufens). Scholarship on Walther traditionally excuses his opportunism, slighting the influence of literary patronage on his tendentious verse in general and on his choice of song types in particular.

The systematic study of German medieval literary patronage began in the 1970s, when critical attention turned to conditions giving rise to the flowering of the arts. Sponsorship of literature, first believed to be a mere appendage to the sociology of literature and a subject of marginal interest only, has since emerged as a bona fide academic discipline, and it is the rare book that fails to mention the circumstances of composition. However, since primary evidence for sponsorship (direct commissions and the like) is sparse, researchers turn to speculation and deductive reasoning. In most cases it is very difficult to puzzle out which poems had a connection with a particular court or court circle, or which writers were part of a patron's entourage. Nevertheless, it is possible to draw general conclusions. First, there is a marked difference between the patronage associated with the royal courts and the courts of the lesser nobles, especially the landed aristocracy. Whereas the former encouraged encomiastic literature and history, often in the Latin tongue, the latter promoted courtly romances, lyric and epic poems—in the vernacular. Second, there is more proof for sponsorship of *Sachliteratur* (nonliterary writing) in all its forms, than for belles lettres. Finally, literary patronage is able to shed light on heraldic poetry, the origins of libraries, practices of enfeoffment, and literary reception. Of German patrons, Landgrave Herman of Thuringia (d. 1217) and Henry the Lion (d. 1195) are the best known. The latter, the Welf duke who ruled over Saxony and Bavaria, promoted the arts and sciences, including architecture, mural paintings, statuary, illuminated manuscripts, goldsmithery, and literature. The *Lucidarius* arose at his behest; the *Rolandslied*, and even Eilhart von Oberg's *Tristan*, are associated with his court. The desire for political power certainly inspired Henry to further the arts, but the pursuit and legitimation of power cannot alone account for his munificence. His generous, large-scale patronage was an avenue for grand self-definition. Other princes and clans fostering literature were the Zähringer, Wettiner, Manesse, Wittelsbachs, and Habsburgs. Bohemia and Tyrol among geographical regions, called forth scholarship, while Heidelberg, Innsbruck, Munich, Augsburg, Vienna, and Zurich were the cities attracting the most interest. Urban patronage held special fascination because municipalities, as home to patrician and plebeian alike, were early testing places for the cooperation of social strata in literary and manuscript production.

Peter von Staufenberg

A verse novella (1,192 verses) written in the first decade of the fourteenth century (ca. 1310) by Egenolf von Staufenberg, member of an Alsatian noble family. Egenolf was a proponent of the social values associated with courtly literature of the twelfth and thirteenth centuries and part of a German literary tradition linked to Gottfried von Strassburg and Konrad von Würzburg. The emphasis on physical love and its tragic consequences places *Peter von Staufenberg* in a thematic context well known in the High and late Middle Ages. This work from the courtly epigonic (imitatory) period contains a number of motifs, including the rash promise of a pleasure-seeking male and subsequent punishment by a vindictive female, linking it with much older Celtic folk materials and later French adaptations, a line of development generally cited with respect only to the major French and German courtly epics. As regards the incorporation of folk material into courtly literature, *Peter von Staufenberg* shares themes and motifs with Konrad von Würzburg's *Partonopier und Meliur*, the anonymous lay *Guingamor*, the lay *Guigemer* of Marie de France, and the thirteenth-century work *Li Roman de Dolopathos*.

While Egenolf's specific family background remains vague, his noble status underlines the practical, personal, and social objective of his literary effort: to provide a behavioral model for young noblemen. In the tradition of the mirrors for princes—didactic texts stressing the duties and responsibilities of rulers—*Peter von Staufenberg* reveals the author's interest in problems of social obligation and individual responsibility. The story illustrates this conflict in the context of the attitudes and actions of the lower nobility in relationship to societal and imperial demands and desires. Egenolf uses social elements alongside traditional courtly literary themes and motifs to define the conventional world of the knight and his lady while introducing into that world asocial, supernatural elements bearing a forceful didactic message.

Thematically, *Peter von Staufenberg* belongs to the tradition of tales of the Swan Knight type (Konrad's *Schwanritter*) or, in the view of some, Melusine, tales of love, lust, and death as the ultimate form of retribution. Egenolf's hero accepts the sexual and material favors of a beautiful woman who appears and disappears at will, he agrees to reject marriage proposals so long as the favors continue, and he faces the crucial conflict when his family and advisers insist that he marry the emperor's niece. Acquiescing to social pressure and forsaking his mysterious paramour, who the clergy conclude to be an emissary of Satan, Peter's tragic end comes by means of a vengeful lightning bolt from a female leg thrust through the ceiling of the church during the wedding ceremony.

The moral-didactic nature of *Peter von Staufenberg* attracted writers beyond the medieval period. A late medieval version (1588), attributed to Johann Fischart, is the work of Bernhard Schmidt, with Fischart contributing only the introduction. Friedrich de la Motte Fouqué's *Undine* (1811), the opera adaptation by Gustav Lortzing (1845), and Jean Giradoux's play *Ondine* (1939) are variations on the same theme.

The most important mystical writer of the *Devotio moderna* (Modern Devotion) movement, Peters received his spiritual education from the Brethren of the Common Life in Deventer, especially from Florens Radewijns. On Radewijns's instigation, Gerlach went, at an uncertain date, to the monastery of Windesheim and entered the order of canons regular in 1403.

As far as we know Gerlach did not become a writer before entering the monastery. Of his works, sixty-five manuscripts have been traced so far. He wrote two Middle Dutch *Letters* to his sister Lubbe, a Sister of the Common Life in Deventer, and two Latin works, *Breuilloquium* and *Soliloquium*. In the first of the two *Letters* he advises Lubbe how to combine her development in the spiritual life with the daily routine of being a *procuratrix*. In the other one he gives her a short treatise on the mystical life, strongly influenced by John Ruusbroec. In his *Breuilloquium* Gerlach tries to make clear how to live a truly spiritual life within a community. The influence of other devotionalists in this text is evident. Gerlach is most famous for his *Soliloquium*, a mystical text written as a *raparium*, or abduction story, put together by his friend Johannes Schutken after his death. His mysticism is Christocentric and influenced by the mystical teaching of Jan van Ruusbroec. However, we find personal elements such as his spirituality of the Cross and his very remarkable discernment of spirits. This text was printed as early as 1580 and afterward printed many times in Latin and translated into six languages, also in this century. Yet the text has been contaminated by an editor with a conservative, Counter-Reformation background.

Physiologus

The *Physiologus* is an anonymous early Christian text-book on the theological meaning of nature, written in Greek, apparently in Alexandria, Egypt, in the second to fourth centuries C.E. Throughout the Middle Ages and on at least into the fifteenth century it was seen as a major authority. It circulated widely, particularly in Latin but with translations also in most vernaculars, and survives in over four hundred manuscripts. The text itself refers to the author simply as the *physiologos* (natural philosopher), but medieval sources attribute it to various of the Greek fathers.

The forty-eight chapters draw together natural history and salvation history, following the principle of divine economy that holds that everything in creation reflects spiritual truth. Typically, each chapter begins with a Bible verse, followed by one or more *proprietates*, images from nature describing elements of contemporary knowledge of the lives of animals. These are then interpreted allegorically with respect to Christ, the Devil, the Christian, the sinner, and so on. Some of the motifs are extended and contain fantastic material. Elephants, for example, cannot bend their knees and have to sleep leaning against a tree. Hunters catch them by cutting down the tree. If an elephant is thus brought to a fall, he calls for help, but the other large elephants can do nothing; only the smallest elephant can help him back to his feet. Likewise, when the Devil caused Adam to fall, all the great prophets and patriarchs could not save him; only the frailty of Christ could achieve this.

The Latin *Physiologus* exists in a number of variant forms, mainly resulting from attempts to shorten it. One of the most influential is the version "b," a prose text known from manuscripts from the tenth century on. Two important versions apparently of the eleventh century are the *Physiologus Theobaldi*, containing twelve to thirteen chapters in various metrical forms, and the *Dicta Johannis Chrysotomi de naturis bestiarum* (the *Dicta* version), with twenty-seven chapters. In addition to the *Physiologus* proper, many bestiaries and medieval encyclopedias contain related texts.

The German versions of the *Physiologus* fall chronologically into two groups—those of the eleventh and twelfth centuries, which are translations of the *Dicta* version, and those of the fifteenth century, which mainly follow the *Theobaldi* text. The Old High German fragment—the "older," or *Älterer Physiologus*, survives in a late-eleventh-century manuscript held in Vienna and contains the first twelve chapters. Two closely related twelfth-century texts in early Middle High German are the *Vienna Physiologus* and the *Millstätt Physiologus*. These are found in the same large manuscripts as the Vienna and Millstätt *Genesis*. A twelfth-century Schäftlarn (Bavaria) fragment, scribbled in the gaps in an otherwise Latin manuscript, is apparently completely separate. The late medieval versions include three translations of the *Physiologus Theobaldi*, one prose, one verse, and one interlinear gloss. There is also a set of inscriptions from Celje, Slovenia, and the important *Melk Physiologus*, both of which stand out because of their relative independence of the known Latin traditions.

Pilgram, Anton (ca. 1450/1460–1515)

This Moravian architect and sculptor is best known today as master of works of St. Stephan's Cathedral in Vienna between about 1511 and 1515. His architectural designs are representative of the Flamboyant Gothic style and his sculptures of the late Gothic naturalism then prevalent in southern Germany and Austria.

Pilgram was born in Brno circa 1450–1460. He trained in Brno and Vienna. His earliest documented activity is in Swabia, at the parish church of Wimpfen, where his mason's mark appears twice, with the dates 1493 and 1497. He is credited with the choir's loopedring vaulting. A corbel (projected bracket) angel in the nearby parish church of Schwieberdingen also bears his mason's mark.

Next documented in Brno, his mason's mark appears in the north aisle of the church of St. James, begun 1502. Of his now destroyed Judentor (Jews' Gate), completed in 1508, seven console masks, an inscription, and his mason's mark survive (Brno, Moravian Museum). He completed the portal of the Rathaus (Town Hall) at Brno circa 1511.

In 1511 the Vienna City Council selected Pilgram's design for the cathedral's organ pedestal, then already under construction by Jörg Öchsel, which resulted in a legal feud. Pilgram became master of works for the cathedral in 1511. The pedestal, dated 1513, features a bustlength self-portrait. Although a similar self-portrait is located beneath the pulpit, circa 1513–1514, which also features Pilgram's mason's mark, recent scholarship has questioned this attribution. The busts of the church fathers on the pulpit are inspired by late-fifteenth-century Swabian and Upper Rhenish sculpture.

Also attributed to Pilgram is a tabernacle from circa 1482–1487 in the church of St. Kilian at Heilbronn. Its two caryatid (supporting column) figures of stonemasons are similar to those from Heutingsheim (parish church), Öhringen (Berlin, Deutsches Museum), and Rottweil (Lorenzkapelle). An Entombment group (Munich, Bayerisches Nationalmuseum), circa 1496, and a figure of a falconer (Vienna, Kunsthistorisches Museum), circa 1500, both in wood, and the Keckmann-Epitaph from circa 1511–1512 (Vienna, Stephansdom) are also ascribed to Pilgram.

Pilgrim's Badges

From the twelfth through the fifteenth centuries, flat, often perforated *Pilgerzeichen*, or badges with one-sided relief representations of a saint or of venerated holy relics, were a visible sign of the visit to a particular pilgrimage shrine. Made and sold at the site and commissioned by the spiritual leaders, they were often produced in thousands and sold inexpensively. Usually made from easily melted metals, often a tin-and-lead alloy, they had rings on the side so that they could be sewn on hats or garments or hung from the pilgrim's staff or rosary. Badges secured a certain protection for those who wore them because the powers of the relics or honored saints were considered alive and active in them. Because of this vicarious power, they have been found in graves and in reliquaries and altars in churches, and they also played a part in superstitious or popular medical practices. Very few of the original number have come down to us because of their fragile nature and small value. Some examples have been found cast on church bells or in bodies of water that preserved them. As the showing of relics was removed from the churches into the open air, small mirrors were added to the badges that were thought to capture the radiating power of the relic, bringing its benefits into the daily life of the pilgrim. In the late fifteenth century badges were made in the form of coins or medals without rings but with holes through which they could be sewed on hats and garments or into Books of Hours. In this period, they were often painted in the borders of miniatures or shown as part of the pilgrim's costume in paintings.

Pippin (d. 768)

Pippin (the Short)'s father, Charles Martel, died on October 22, 741, leaving control of the family and of Francia to two of his sons. The elder, Carloman, assumed the position of mayor of the palace in Austrasia, thereby controlling it along with Alemannia and Thuringia, while the younger, Pippin, became mayor in Neustria, controlling it along with Burgundy and Provence. The Aquitanians, Alemans, Saxons, Gascons, and Bavarians immediately revolted. The brothers also faced trouble within the family from Gripho, Martel's son by another wife. He became a focus for discontent and a leader of revolts against his half brothers until his death in 753. In 743, to bolster their position against these threats, Carloman and Pippin placed a legitimate Merovingian, King Childeric III (743–751), on a throne that had been vacant for six years. Childeric was the last Merovingian to reign.

In 746, in the midst of dealing with all this, Carloman retired to the monastic life at Rome, leaving governance of the whole Frankish realm and its problems to Pippin. By 749, Pippin had managed to calm the political waters north of the Alps somewhat, but in Italy, the pope's troubles with the Lombards were increasing, and these would open the door for Pippin's usurpation of the Frankish throne.

In 750 Pippin sent envoys to Rome asking Pope Zacharias (741–752) the famous question whether it was right for a king to rule without having any royal power. Zacharias responded that he who had the royal power should be king. This reply was a clear papal signal that Pippin would have apostolic approval to take the throne for himself. In 751 he deposed Childeric III, tonsured him, and imprisoned him in the monastery of St. Bertin. Then, in the ancient Merovingian seat of Soissons, he had himself proclaimed king by the assembled Frankish great. In 753 and 754 the new king caused Pope Stephen II (III) (752–757), who had crossed the Alps to personally ask for Pippin's help against the Lombards, to anoint him king in obvious and holy imitation of the Old Testament.

In 755, now as King Pippin I (751–768), he invaded Italy, making good on his pledge to the pope to deliver Rome from the Lombards' military threat. In the wake of this campaign, Pippin established the Papal States, a kingdom comprising most of central Italy, protected by Frankish arms and with the pope as its secular head.

Both as mayor and then as king, Pippin was a strong ruler. He built on the work of his father, keeping the basic policies that his son, Charlemagne (768–814), would also continue. He conducted successful wars of conquest against the Germans to the East and took every opportunity to increase the control of his own central government, especially over Aquitaine and the other areas south of the Loire. In these endeavors, he relied heavily on the Austrasian nobility, placing them in the important positions of the realm. He established close cooperation with the papacy and fostered much ecclesiastical reform and expansion (St. Boniface) and also supported the revival of learning. When he died in 768, he indeed passed on many problems to his sons, Carloman and Charlemagne, but in general the position of the new Carolingian dynasty was secure.

Playing Cards, Master of (fl. ca. 1435–1450)

This anonymous Swiss or south German engraver, active circa 1435–1450, is known chiefly from a set of designs for a pack of sixty playing cards first described by the Nazarene artist and collector Johann David Passavant. Geisberg (1905), the first to examine the engravings thoroughly, noted that the court cards were printed from single plates, with the suit added by overprinting, while many of the remaining cards had been created by means of small multiple images arranged to form page layouts. Lehmann-Haupt, who discovered nearly identical playing-card motifs in the marginalia of the Giant Bible of Mainz and the Hours of Catherine of Cleves, theorized that a model book by the Cleves illuminator had been taken to Mainz and used by Johann Gutenberg in 1453–1454, and that Gutenberg restruck the small plates to print playing cards after his bankruptcy in 1455. More recently and definitively, Van Buren and Edmunds (1974:12–29) have disproved the Gutenberg theory, which fails to account for the use of obsolete fashions for the queens and knaves of the pack—clothing no longer worn in the 1450s. They found further use of the playing-card motifs in a group of twenty-four Tyrolean, Franco-Flemish, Savoyard, and English manuscripts, all dated earlier than 1455. As Van Buren and Edmunds pointed out, none of the surviving cards had been mounted for play.

Virtually nothing is known of the game or games originally played with the cards, which are divided into suits of men, birds, deer, and beasts of prey. The Bibliothèque Nationale in Paris owns the largest and most important collection (forty cards), while smaller groups are found in the print rooms of Dresden (fourteen), Vienna (six), Berlin, London, and Nuremberg (one each).

Pleier, Der (fl. 1240–1280)

An Austrian or Bavarian author, Der Pleier wrote three Arthurian verse-romances between 1240 and 1280, all of which survived only in later manuscripts. Well-acquainted with courtly works in German, Pleier carefully fitted his heroes and their adventures into the Arthurian framework left to him by earlier poets. His *Garel von dem blühenden Tal* (*Garel of the Flowering Valley*) employs the basic structure of Stricker's *Daniel vom blühenden Tal* (*Daniel of the Flowering Valley*) but keeps only two of its episodes and drastically changes its spirit. Through a series of adventures, Pleier's hero wins a queen, gathers a great army, and defeats a monarch who intended to attack King Arthur's realm. For *Tandareis und Flordibel*, Pleier varies the plot of a story that he probably knew from Konrad Fleck's *Flore und Blanscheflur*. It tells of the forced separation of two teenaged lovers and the many dangers the hero must survive before they are reunited. The bare framework of *Meleranz* came ultimately from the anonymous Breton lay (short verse narrative) *Graellent*, but in Pleier's version the fairy of the lay is a human girl-queen whom the boy Meleranz meets on his way to become a page at Arthur's court. He falls in love and, years later, rides out as a knight to search for her. After many adventures and the winning of a kingdom, he finds her and they are married. The most distinctive features of Pleier's romances are their detailed descriptions and their emphasis on manners.

Pleydenwurff, Hans (ca. 1425–1472)

This panel and glass painter was active in Franconia from circa 1450 until about 1472. He established the first significant painting workshop in Nuremberg, which produced works inspired by Netherlandish art. Michel Wolgemut was his pupil and assistant.

Pleydenwurff was born circa 1425 in Bamberg. Nothing is known of his initial training, but he probably went to the Netherlands in the early 1450s. He worked in Bamberg then in Nuremberg, where he became a citizen in 1457. At his death there in 1472, Pleydenwurff was listed as a glass painter. That year, Michel Wolgemut married his widow, Barbara, and inherited the workshop.

Pleydenwurff's only documented work is the Breslau Altarpiece, of which only fragments survive. Installed in the church of St. Elizabeth in Breslau on June 30, 1462, this large double-winged retable with a carved shrine fea

Hans Pleydenwurff, Descent from the Cross from the Breslau Altar (Nuremberg, Germanisches Nationalmuseum). Photograph: Germanisches Nationalmuseum

tured scenes from Christ's Infancy and Passion, and Saints Jerome and Vincent of Teate. The upper part of the Presentation survives (Warsaw, Nationalmuseum). An undamaged wing with the Descent from the Cross (Nuremberg, Germanisches Nationalmuseum) is based on Roger van der Weyden's Deposition Altarpiece of circa 1444 (Madrid, Prado).

Other works have been attributed to Pleydenwurff on the basis of style. Earliest is the half-length Löwenstein Diptych of about 1456. Based on a type popularized by Roger van der Weyden in the Netherlands, it consists of a Man of Sorrows (Basel, Kunstmuseum) and a portrait of the Bamberg canon and subdeacon, Count Georg von Löwenstein (Nuremberg, Germanisches Nationalmuseum). Also ascribed to Pleydenwurff are a large Crucifixion (Munich, Alte Pinakothek), circa 1470, an altarpiece wing with St. Lawrence (Raleigh, North Carolina Museum of Art), after 1462, and wings with Infancy and Passion scenes from the Hof Altarpiece (Munich, Alte Pinakothek), dated 1465. This last was a workshop production, executed by assistants, including Michel Wolgemut.

Poeta Saxo (fl. late 9th c.)

Sometime between 888 and 891 an otherwise unidentified Saxon poet (hence the Latin name by which he is customarily known), perhaps a monk at the monastery of Corvey (now North Rhine-Westphalia), composed a five-book verse epic. The first four books, aptly entitled *Annals Concerning the Deeds of Emperor Charlemagne*, amount to 1,999 hexameters (a few have been lost) and follow Charlemagne from the beginning of his reign as sole ruler in 771. The fifth book of 347 distichs (two-line strophic units) presents a general view, in panegyric terms, of Charlemagne's achievements and character. The poet offered Charlemagne as an example to encourage King Arnulf of Carinthia, during whose reign the Poeta Saxo wrote, to restore the Saxon realm to its rightful glory.

For Charlemagne's career from 771 to 801 (up to Book 4, line 70) the Poeta Saxo relied on the so-called *Einhart Annals*; for the portrait in the fifth book he drew mostly on Einhard's *Life of Charlemagne*; and for 802–813 he presumably tapped lost annals. Because of his indebtedness to earlier texts, the Poeta Saxo has not been highly regarded as a source for historians. Among literary critics he has been viewed as a versifier rather than as a creative poet, because his displays of familiarity with classical poetry and formal rhetoric lead to a recasting of his sources only occasionally in style and very seldom in content. Despite his low standing, the Poeta Saxo deserves recognition for having been the first to put annals into verse and for having produced a history that makes the Saxons a central focus.

Dutch poet and diplomat. After he finished high school (the "Latin School,") Potter entered the service of the count of Holland. Having started as a treasury clerk, he was, after 1400, promoted to clerk of the court of justice, bailiff of The Hague, and secretary of the count. As a diplomat he went on a number of journeys to Rome (1411–1412). In his spare time he wrote works of literature: two discourses in prose (after March 1415), *Blome der doechden* (*Flowers of Virtue*), which goes back to the Italian *Fiore di virtù*, and *Mellibeus*, translated from a French translation of Albertanus of Brescia's *Liber consolationis*; but his principal work is *Der minnen loep* (*The Course of Love*, 1411–1412), a treatise in verse about love, larded with stories largely taken from the Bible and from Ovid, in particular from the *Heroides*. The work consists of four books (over eleven thousand lines). Potter distinguishes "foolish," "good," "illicit," and "licit" love; one book is devoted to each of them. Potter derived the classification in Books I, III, and IV from medieval commentaries on *Heroides*, which discern in the *Heroides amor stultus, illicitus, and licitus*. The "good" love of Book II does not originate from the *Heroides* commentaries, but (at least from Potter's point of view) it forms a whole with "licit" love, which is the highest degree of "good" love. It turns out that Potter knew the complete "medieval Ovid": Ovid's works, the commentaries on these works, and the *accessus*, i.e., the medieval introductions to them. Within the tradition of the "pagan" *artes amandi* (treatises on the art of love), Potter created a Christianized *ars amatoria*. As such he is highly original: *Der minnen loep* is unique in the European context.

Prague

Late in the ninth century, members of the Premyslid dynasty chose this site on a bend in the river Vltava as their capital. There they erected the first castle in Hradcany, where a much modified version still stands today. During the course of the next century, Prague grew into a busy city linking the lands to its east and west. It expanded its limits across the river, where a second castle, Vyšehrad, was built and where the Old Town sprang up as the central market district. By 973, Prague was already a vital enough city to warrant the establishment of a bishopric, at which point Saint Vitus's Rotunda, formerly the church of Prague Castle, became the city's cathedral.

Nothing remains of this tenth-century town. Prague's oldest traces come from the Romanesque city built around the Old Town Square and Little Square, such as the houses that still stand on Husova, Jilská, Celetná, and Karlova Streets. Prague Castle (Pražský Hrad) also has several authentic Romanesque interiors, such as the hall from the palace of the Premyslid princes Sobeslav I (1125–1140) and Vladislav II (1140–1172). The hall, some fifty yards long and supported by columns carved with their original interlace design, is now under the Gothic palace built by the rulers of the Jagiello and the Luxembourg dynasties.

During the Romanesque period the cathedral of Saints Vitus, Wenceslas, and Adalbert was erected on the site of Saint Vitus's Rotunda on the orders of Svatopluk II. The project for replacing the centrally planned rotunda with a basilican church began in 1060 and finished with the consecration by Bishop Cosmas in 1096. The final building, with single, vaulted aisles, eastern and western choirs, a transept, and towers in the west, preserved the location of the tomb of the dynasty's family saint, Wenceslas, in the southern aisle. As with the largest part of the Romanesque castle, nothing survives of this church. Prague continued to expand and reorganize during the course of the twelfth and thirteenth centuries. Both castles were modified, and the two sides of the river were linked by a new stone bridge, the Judith Bridge (later to become the Charles Bridge). A number of churches were constructed; the Dominican, Franciscan, and Clarissan mendicant orders became established; and the Old-New Synagogue (Altneuschul) was erected in the Jewish Quarter, an area located just north of the Old Town. This building, the oldest synagogue in Europe, retains both its early-thirteenth-century single cell with transverse ribs and pointed barrel vaults, and the double-aisle, ribvaulted hall added in 1280.

Another effect on the direction and growth of Prague was the independence granted by Václav I (1230–1253) to the Old Town in the 1230s and the founding of the Little Quarter (Mala Strana) by King Premysl Ottakar II in 1257. Separated by the river, these two governmentally distinct sections defined the boundaries of Prague, until Emperor Charles IV established the New Town in the middle of the next century.

In 1310 Emperor Henry VII expanded his territorial base by marrying his son, John of Luxembourg, to the orphaned Elizabeth Premyslid, Queen of Bohemia. The son of this match, who, in addition to his Bohemian kingship, would eventually be elected Charles IV, king of the Romans and Holy Roman emperor, initiated a program of rebuilding in Prague that was to transform it from a town into the most politically and culturally important city in Central Europe. Even before Charles transferred the seat of the empire to Prague, he had begun his renovations and foundations throughout the city. One of his first acts on returning to Prague in 1333 as coruler of Bohemia was to authorize reconstruction of the Hradcany Palace. His campaign for the promotion of Prague to an archbishopric proved successful. He inundated Prague with scholars and founded Central Europe's first university in 1348. Of great use to the citizens of Prague was Charles's rebuilding of the Judith Bridge, destroyed by floods in 1342. Essential for convenient travel from the Old Town to the Little Quarter and Hradcany, it was finished soon after 1373 and renamed the Charles Bridge; sculpted portraits of Charles IV, his heir (Wenceslas IV), and Saints Adalbert, Sigismund, and Vitus look down from the portal.

From his early years in France and Italy, Charles IV was open to the influences of foreign artistic currents. But he also employed architects, sculptors, and painters from closer to home with the combination of these multinational styles resulting in the magnificent medieval city still evident today, one of the few cities remaining in Europe where one can still experience the layout and architecture much as they existed in the Middle Ages. The best-known and most elaborate example of this style is the cathedral of St. Vitus. Built on the site of its Romanesque predecessor, this project was part of the larger renovations to the Hradcany, linked physically to the royal palace by its location, and ideologically as the site of royal coronations and the resting place of the imperial family. The cathedral's foundation stone had been placed on the order of Charles IV on November 21, 1344, in celebration of Prague's new status as an archbishopric. The first architect, Matthew of Arras, began building the new choir and chapels in the rayonnant style popular in contemporary France.

Peter Parler, an architect from Swabia, was summoned by Charles IV in 1356, a few years after the death of Matthew of Arras. Well-founded in established German architectural traditions, he transformed these to create his own innovative style, which was well suited to Charles IV's dynastic design. He distinctly altered the layout of Matthew's cathedral, introducing a less integrated design that stressed horizontal architectural units with the rayonnant verticals. He utilized star vaults punctuated by bosses and innovative linear molding profiles (seen clearly in the clerestory level of the choir) to break down the building into a series of discrete units. To the most sacred part of the church, above the original tomb of Saint Wenceslas and facing south to the palace, was added a much larger, symbolically charged chapel to the imperial saint encrusted with precious stones and a canopy of vaulting. Directly adjacent to the chapel of St. Wenceslas is the south porch, also known as the Golden Portal from its exterior decoration of mosaic depicting the Last Judgment with the six patron saints of Bohemia, Charles IV, and Empress Elizabeth of Pomerania in attendance. This is one of many references to the imperial dynasty contained in the cathedral. The new tombs that Charles commissioned for six of his Premyslid ancestors were placed in the choir chapels by 1377, and the emperor, with his four wives, was included in a cycle of busts depicting the imperial family, the archbishops of Prague, and some of the artists responsible for the cathedrals construction, including Parler, in the triforium level.

Prayer Books

The tradition of German prayer books extends as far back as the ninth century and represents an evolution in sophistication of the early Christian Psalter (Book of Psalms). Prayer books are collections of prayers, Psalms, and meditations intended for a specific individual's private devotions. They are small enough to be comfortably portable and, because of the high cost of production, were usually commissioned by the aristocracy.

The earliest surviving examples of Psalters and prayer books that can claim Germanic origin are Carolingian. The Reims school of illumination is credited with the execution of a mid-ninth-century Psalter and the famous Utrecht Psalter (preserved in the University Library of Utrecht), which boasts some of the most beautiful displays of illumination in Western art. The oldest extant prayer book made for a medieval king is that of Charles the Bald, a product of Charles's court school, the last great school of the Carolingian renaissance.

Later examples of prayer books are not as frequent in Germany as they are in other countries such as France and England. Particularly underrepresented are Books of Hours. (The Book of Hours, an extremely popular form of prayer book, derived its name from its texts, which were suitable for recitation at each of the eight divisions of the medieval day. The Hours of the Virgin was its central text, but other texts such as excerpts from the gospels or calendars of feast days were also often incorporated.) A few noteworthy examples of post Carolingian prayer books include the prayer book of Otto III, and Hildegard von Bingen's personal prayer book, preserved at Munich's state library. A prayer book out of fourteenth-century Saxony, written in the vernacular, has also been recovered.

Prayer books fell under scrutiny with the coming of the Reformation. Martin Luther considered them ornamental extravagances of the wealthy and objected that they often included devotions not derived specifically from the Bible. In response, he wrote the Personal Prayer Book in 1522, in which he attempted to simplify the prayer book's essential nature. Despite such efforts, however, traditionally sumptuous prayer books flourished in Germany at this time. The prayer book of Emperor Maximilian I, illustrated in part by Albrecht Dürer, is an excellent example. Others include Nicholas Glockendon's "Missal Cum Prayer Book" for Albert of Brandenburg in 1524, and Albert Glockendon's prayer book of William of Bavaria, completed in 1534.

Preaching was a fundamental activity of the church throughout the Middle Ages. Sermons were preached to convert and to instruct the populace with an explanation of the divine word contained in the Bible, in order to strengthen its faith and implement Christian morals. Sermons formed part of the divine service on Sundays and feast days (liturgical sermons *de tempore* and *de sanctis*), but they were also held separately on other public occasions, and could be directed to various specific social groups within the community (*sermones ad status*).

As early as the late fourth century missionaries became active in the southern parts of the Low Countries, whereas serious Christianization in the north started only in the seventh and eighth centuries under Carolingian protection. These missionaries—such as Amandus, Willibrord, Boniface, Liudger, and Lebuin—and their successors probably composed Latin sermons, but they had to engage in vernacular preaching as well to reach the lay population. Thus from the outset preaching in the Low Countries implied working in a bilingual situation. In the course of the ninth century the process of Christianization and the establishment of an ecclesiastical organization was completed (the dioceses Utrecht, Münster, Liège, and Osnabrück under the archdiocese Cologne; Terwaan, Tournai, and Kamerrijk under the archdiocese of Reims). By then the times of wandering missionaries were over. As in the numerous (Benedictine) monasteries founded in the Low Countries from the Carolingian period onward, sermons were foremost composed for internal use, not for the edification of the population in the outside world; pastoral care of the laity was predominantly the responsibility of the bishops and their subordinates (auxiliary bishops, deacons, parish priests). In the smaller country parishes, which in principle had their own church with a parish priest to administer the sacraments, celebrate mass, and preach, nothing but the most elementary religious instruction would have been offered.

In the late eleventh and twelfth centuries new monastic orders, the Premonstratensian (or Norbertine) order in particular, displayed a serious interest in the struggle against heresies and the religious instructions of the laity. Norbert of Xanten (1080–1134) and other Premonstratensian monks traveled through the southern parts of the Low Countries as wandering priests, and in the neighborhood of their monasteries they often took responsibility for the ministry of parish churches. Even greater changes occurred in the thirteenth century, with the rapid ascent of the mendicant orders in these regions (Dominicans, Franciscans, Augustinian Hermits, Carmelites). Preachers from these new orders took an active part in the pastoral care of the urban laity, sometimes in rivalry with the local secular clergy. They preached in parish churches, in their own convent churches—which were designed to house many people—on the streets, and on the marketplace.

The oldest extant sermon collections in the Low Countries, such as the twelfth-century Latin sermons of Elias of Ter Duinen and Stephen of Tournai, were meant for a monastic audience. These are carefully composed literary works, foremost of a mystical and spiritual exegetical character. The extant (Latin and vernacular) sermons of the mendicant preachers, who preached for very diverse clerical and lay audiences, cover a far wider range of topics. The emphasis of these sermons was primarily on penance, straightforward religious instruction, and the stimulation of lay devotion for the Eucharist and for local saints. Very important for the history of religious literature and experience in the Low Countries and for sermon literature in particular were the pastoral and literary activities of preachers associated with the Modern Devotion, such as Geert Grote (1340–1384) and Willem Jordans (ca. 1321–1372); and of "observantist" preachers such as the Franciscan Jan Brugman (1400–1473), Jan Storm of Brussels (d. 1488), and Hendrik Herp (d. 1477). These and many other popular preachers left us an impressive corpus of sermon collections and related works in Latin and in the vernacular. These collections, e.g., the anonymous *Limburgse sermoenen* (ca. 1340), the anonymous *Zwolve sermoenen* (before 1380), and the collations of Dirc of Herxen (1381–1457) not only contain translations and adaptations of Latin originals, such as translations of Bernard of Clairvaux's liturgical sermons and *sermones ad status* of Guilbert of Tournai—works that were very popular in the Low Countries in the later fourteenth and fifteenth centuries—but also reflect an impressive production of original sermons in the vernacular tongue. Many of these sermons were meant for private reading and meditation as well as for public hearing. Together with an array of other devotional texts and treatises (which, like many sermon collections, have yet to be critically edited), these sermons played an important role in later medieval religious life and the formation of lay and religious affective spirituality in the Low Countries.

Preaching and Sermons, German

As an integral part of the medieval liturgy on Sundays, Saints' Days, and Feast Days, the sermon followed the reading of the Gospel, providing biblical exegesis as well as theological and moral instruction. From the fifth century through the Middle Ages, Augustine's treatise on homiletics, Book 4 of *De doctrina Christiana* (*On Christian Doctrine*), was the exegetical model for preaching. With wide-ranging diversity in rhetorical styles, the primary goals of all sermons were to teach, to please, and to persuade. Typically, sermons began with a scriptural text and followed a particular theme that related the text to the lives of the listeners or readers. Throughout medieval Germany, whether preached in monastic settings, cathedrals, university chapels, or small parish churches, sermons both reflected and shaped society. While the intent was similar, sermons preached to the clergy (*ad clericos*) and those to the laity (*ad populum*) were considerably different. Popular sermons focused less on issues of doctrine and more on vices and virtues and included a greater number of exempla and legends.

Prior to the rise of Scholasticism in the twelfth century and the emergence of the Dominican and Franciscan orders in the thirteenth century, there was little variation in the form and style of sermons. As popular preaching increased, so also did the available sources for preachers. Manuals for preaching, *artes praedicandi*, and collections of model sermons (*Musterpredigten*), as well as a vast number of collections of legends and exempla were in wide circulation by the fourteenth century to assist the preacher in the construction of a sermon and the manner of delivery. Not all sermons were preached, however. It was not uncommon for sermons to be written, sometimes in the form of a letter, for private or communal study. Universities such as Prague, Vienna, and Heidelberg placed homiletics—training in the writing and delivery of sermons—in the curriculum. Jordan of Saxony (1190–1237) actively recruited in the universities for the Dominican Order, a mendicant order of friars known for preaching. Albertus Magnus (1207–1280), a renowned Dominican theologian, was one of his recruits.

Collections of sermons were copied and circulated throughout the Middle Ages. Extant collections of notable German preachers provide historians a great deal of evidence about medieval German religious customs and daily life. The Franciscan preacher Berthold of Regensburg (ca. 1211–1272) and Dominican preachers Meister Eckhart (ca. 1260–1327) and John Tauler (1300–1361) are among those whose sermon collections have been edited and received scholarly attention. With a growing number of Dominican convents and the blossoming of women's mysticism in fourteenth-century Germany, Dominican preachers such as Eckhart, Tauler, Henrich Seuse, and Heinrich Nördlingen were responsible for the spiritual guidance (*cura monialium*) of nuns. In addition to preaching in universities and monasteries, Dominican friars such as John Herolt (1390–1468) also preached to the laity—to peasants and burghers—on topics such as marriage and child rearing, exhorting them to lead virtuous lives. Even as the preliterate society of the early Middle Ages gave way to the biblically literate populace of the fifteenth and sixteenth centuries, preaching continued to occupy a significant role in German religious life.

Pregnancy and Childbirth

With few exceptions, medieval written sources on pregnancy and childbirth were composed by learned men. Comprising a variety of discourses (legal, theological, medical, physiological, and social or domestic) that at times intersect, these sources do not, therefore, reflect women's experience either as healers or as patients. Within medical discourse on gynecology and obstetrics, theoretical and practical, learned and folk traditions overlap. Women's reproductive health care lay in the hands of a range of practitioners, male and female, trained and untrained, Christian and Jewish, which included physicians, apothecaries, barber-surgeons, midwives, lay healers, friends, and family members. In the course of the Middle Ages in cities, women's health care increasingly came to be supervised by city physicians and officially approved "honorable women" through the examination and licensing of midwives and, from the fourteenth century on, through midwives' oaths. To counteract the negative effects of plague on the European population, increased emphasis was placed on female reproductive health in the late Middle Ages.

Medieval explanatory models regarding conception, time of gestation, embryology, and the like derived from ancient (Hippocratic, Galenic, Aristotelian, and Methodist) sources, transmitted to the Latin West largely through Arabic translations and compilations. Competing theories regarding the nature and role of menstruation and sperm in conception and heredity (the Galenic two-seed theory versus Aristotelian hylomorphism with the rennet-milk analogy) all were products of a male-centered biological tradition that served to warn men of the dangers of women. These included the right-left theory of sex determination, the phases of embryological and fetal development including astrological influences and ensoulment, the mortality of the eighth-month child, the seven-celled uterus (of Salernitan origin), pica (the pregnant woman's craving for "unnatural" foods), *imaginatio* (the influence of the mother's mental state on the offspring), and the milk-menstruum continuum. Patriarchal interests also motivated the intense concern with sterility. Information on contraception and abortion was transmitted, by contrast, in haphazard fashion. The major source of information on obstetrics was Soranus of Ephesus (second century, C.E.) whose *Gynaikea* was translated and adapted by Muscio in the sixth century. This literature, addressed to midwives and pregnant women by physicians, treats such topics as birthing stools, the choice of suitable birth attendants, treatment of difficult labor, fetal positions and manual version, retention of the afterbirth, extraction of a dead fetus, tears in the perineum, uterine prolapse, and pre- and postnatal care. Two printed obstetrical handbooks in German from around 1500—Pseudo-Ortolf of Baierland's *Frauenbüchlein* (*Little Book for Women*, ca. 1495) and Eucharius Roesslin's *Der Swangern Frauen und hebammen Rosegarten* (*Pregnant Women's and Midwives' Rose Garden*, 1513—addressed to women, are based on this tradition.

Prenzlau

Now part of Berlin, Prenzlau, consisting of earlier settlements around the parish churches of St. Nikolai and St. Jakobi, is mentioned for the first time in 1188 as a market. In 1235, Prenzlau was given the status of a town by Duke Barnim of Pomerania, which started its subsequent urban development. The inclusion of the two rural settlements led to a shift of axis in the otherwise regular ground plan characteristic of a colonial town. In 1374, Emperor Charles IV held a diet with north German princes at Prenzlau. In 1415, the town came under the rule of the margraves of Brandenburg.

The road leading into town through the suburb known as the Neustadt (New Town) continued as the middle cross axis of the town, marked by the Marienkirche (church of the Virgin) and Rathaus (town hall). The latter is destroyed, but the Marienkirche has survived as a ruin without its roofs and vaults. It represents a hall church of the triple-apse type from the mid-fourteenth century, which received—after its completion—an elaborate eastern gable with tracery in brick. The church of the Franciscan monastery, dating from the mid-thirteenth century and still erected in fieldstone, represents an unusual single-aisled and square-ended hall of five square bays, crossrib vaulted, with triple groups of narrow windows. The Dominican monastery, begun in 1275 and consecrated in 1343, consists of a hall church with narrow aisles and short choir, and the monastic complex with cloister, chapter house, refectory, and other double-aisle halls. Prenzlau has also preserved portions of its defensive walls with several gates (Schwedter Tor, Blindower Tor, and Mittelort).

Printing Press

The mechanism of the wooden screw press was developed in Germany in the fifteenth century. The basic construction of the printing press consists of two major components: the vertical uprights (the cheeks) and the horizontal platform (the carriage). The screw is fitted into the head, a transverse board between the cheeks. A hose covers the screw, and a heavy flat board, the platen, is hung from the hose. A long pole or spindle attached to the screw allows the printer to raise and lower the platen to apply the pressure.

The composed form of type is placed on a horizontal bed or coffin that moves along the carriage. The paper is attached to a frame called the tympan, which is hinged to the coffin. A frisket (light parchment frame) that covers the margins of the paper can be folded over the tympan. Printing is accomplished by securing the paper to the tympan, inking the type, folding the tympan and frisket over the inked type, rolling the carriage under the platen, and applying pressure by turning the screw with the spindle to lower the platen.

The technology of the printing press probably developed gradually. Documents about Johann Gutenberg's early printing efforts circa 1440 in Strasbourg that mention a press and his association with a wood turner, Konrad Saspach, suggest that he was working out the mechanism of a press. The clear impressions and clean margins in the Gutenberg Bible printed in Mainz circa 1450–1455 indicate that he had solved many technical challenges of the printing press. The earliest illustrations of printing presses from around 1500 show the basic components in place. The perfection of the printing press in mid-fifteenth-century Germany was essential to the success of printing books and illustrations.

Printmaking

During the late fourteenth century, when paper became available in plentiful supply, the first printed works on paper were made in Europe in southeastern Germany and Austria. These first prints—woodcuts—had great significance because they were the first works of art that could be reproduced easily in large numbers. Earlier, panel painting was the least expensive artistic medium. The low cost of woodcuts thus expanded the audience for visual art beyond the well-off merchant families commissioning panels to those of lesser means. Woodcuts were printed from wood blocks and follow in the late medieval tradition of printing textiles from inked blocks of wood.

Early woodcuts employ simple designs emphasizing outlines corresponding to the areas left in relief in the wood block, thus not carved away with knives. Lines were then inked and printed. During the second quarter of the fifteenth century, woodcuts became technically and pictorially more sophisticated, yet still rather simple but elegant, adding texture and dark-light to their designs. Woodcut incunables (pages printed using woodcuts, dating before 1450 and the invention of movable type) were stamped face down onto paper in the method of printed textiles, rubbed face up with a wooden implement like a spoon, perhaps even printed face up on a press.

The simple style of early woodcuts was often complemented by the addition of color by hand, enlivening their increasing naturalism and continuing the late medieval taste for color. Subjects were mostly Christian, including saints and scenes from the life of Christ and Mary, although after mid-century secular subjects such as playing cards increased in number. By the early sixteenth century, subject matter shifted toward the secular and included popular festivals and contemporary historic events.

Engravings were added in the second quarter of the fifteenth century to these less costly printed works of art. Originating in the Rhineland, engravings were an extension of what was then considered to be the more noble craft of the goldsmith tradition, which worked precious materials including gold. From the beginning, engravings differed from woodcuts in appearance and subject. The earliest engravings were printed from copper plates into which designs were carved in fine lines using a burin (steel tool). Engraving plates were run through a cylinder press, face up with wet paper on top, with the press exerting considerable pressure pushing the paper into the incised, inked lines. In such prints, called intaglios, carving fine lines into metal was faster and easier than removing wood from a block for woodcuts, especially in areas with complex designs involving cross-hatching. Early on engravings achieved not only line but light, shade, and color. These were indicated by flicks and parallel lines, with cross-hatching first used soon after mid century by Master E. S. Consequently, color was needed less, and added less frequently to engravings than to early woodcuts.

From the beginning, therefore, engravings were more detailed pictorially than woodcuts and made use of a wider range of subjects, including secular ones like bathhouses and playing cards. Based on this greater sophistication and the higher prices paid for engravings, their audience has been estimated to include wealthier and more educated individuals than for the audience of woodcuts. Further research, especially specific case studies, is needed to bear this out.

Early prints are generally unsigned, but their makers have often been assigned names based on the type of work or marks on the prints, thus the Master of the Playing Cards and Master E.S. The work of the first known named engraver, Martin Schongauer, dates from 1470 to his death in 1491. Schongauer was first and foremost a painter. Fifteenth-century engravers like Schongauer, trained in the engraving tradition, fashioned their own designs and cut their own plates. The designers of woodcuts, by contrast, made detailed drawings but left cutting the blocks to woodcutters. The division between designer and woodcutter was standard for woodcuts from the outset. Designs for both woodcuts and engravings were transferred onto block or plate in reverse, compensating for the design reversal during printing. Designs were either drawn directly onto the block or flopped and pounced for transfer or greased, increasing the paper's transparency and lucidity of design.

The introduction of printing from movable type on a flatbed press in the years around 1450 resulted in the production of woodcuts on a more sophisticated level by the end of the century. Wood blocks were placed face up on the press, paper on top, and a flat wooden bed pressed down on paper and block, exerting pressure created by a large wooden screw turned tight. These presses were used for both books and their texts, and the numbers of illustrations in books increased substantially by the turn of the century. Woodcut illustrations became part of a larger web of connections within the book industry with its marketing throughout Europe. The connection between woodcut and book industry had two major repercussions for woodcuts. First, woodcuts appeared in books more frequently and increased in size, from several inches to as large as a foot (thus, half or full-page format of large books) by the time of Albrecht Dürer at the end of the century. Second, by that last decade of the century, woodcuts were marketed by international publishers like Anton Koberger, who sent books in barrels throughout Europe. With the publication of Koberger's *Nuremberg Chronicle* in 1493, woodcuts became successful from a modern perspective—they were large-scale productions, sophisticated pictorially with cross-hatching, and were no longer anonymous (Michael Wolgemut and Dürer were designers). Dürer's woodcuts began with book illustrations and can be considered the finest produced in the history of Western art. By the end of Dürer's life (d. 1528), woodcuts and some engravings took on new meaning and importance in support of the Lutheran Reformation.

Whether early prints are viewed today as communicators of ideas (Ivins 1969), mechanical reproductions of one pictorial image (Benjamin 1955), or as part of a new culture of print after Gutenberg (Chartier 1987:1–10), the appeal of late-fifteenth-century prints to the modern viewer is undeniable. The first print catalogue published by Adam von Bartsch between 1803 and 1821 (known today as "Bartsch") gives short shrift to the earliest anonymous prints in favor of prints by painter-print designers like Schongauer. Bartsch's catalogues, neatly titled *Le peintre-graveur* (*The Painter-Engraver*), helped shape our modern taste for the named artist and placed prints on the art historical map.

Privilegium Ottonianum

A solemn privilege (Privilege of the Ottonen) granted to the papacy by Emperor Otto I on February 13, 962, eleven days after his own imperial coronation. This document confirmed the Carolingian "donations," grants of land and rights, to the popes. The *Ottonianum* did not grant any significant new concessions to the pope's temporal authority; indeed a provision, perhaps added the next year, gave the emperor the right to ratify papal elections. This provided a juridical basis for future imperial domination of Roman politics.

The intent of the *Ottonianum* was clearly to signal a new relationship between the papacy and the German Empire. A copy of the privilege was drawn up on empurpled parchment in letters of gold, emphasizing the significance of the act. This should best be seen as a statement that Otto I, in whom the moribund empire had been revived, understood protectorship of the papacy and the Roman Church to be an essential part of his imperium. The *Ottonianum* also marked what proved to be a very temporary alliance between Otto I and Pope John XII. John, finding that the new emperor was intent on dominating Italian politics, formed a coalition intended to end the German presence on the peninsula. Otto, returning in 963, first forced the pope to flee Rome, then arranged his deposition by a church council, using the imperial power agreed on in the *Ottonianum* to arrange the election of a more amenable pope.

Püterich von Reichertshausen, Jacob (ca. 1400–1467)

Püterich belonged to the urban patrician class of Munich and served at the court of the Bavarian dukes. In 1462 he composed a dedicatory poem, the so-called "Letter of Honor" (*Ehrenbrief*), for the countess of the Palatinate, Mechthild, Duchess of Austria, who held her own retirement court in Rottenburg on the Neckar. In his poem Püterich lists all the books kept in Mechthild's and in his own library and compares both their collections. Mechthild had sent him a list of ninety-four titles in her library; of these twenty-three are unknown to him, obviously because they were part of contemporary vernacular literature, especially representatives of the *Volksbücher* (chapbooks). Püterich's own library comprises 164 titles that he had collected over forty years on travels between Brabant and Hungary, some of which he acquired by means of force, as he openly admits, others he purchased, and others again he had copied with his own hand. Püterich did not like contemporary literature very much; instead, he praised the books from the old days, i.e., courtly romances from the thirteenth and fourteenth centuries, such as Albrecht (von Scharfenberg's) *Jüngere Titulel*. Püterich still attributes it to Wolfram von Eschenbach and falsely claims it as the masterpiece of German literature. He also included a praise of the duchess, discussed the miserable conditions of this world, cast a stylized image of himself, and listed all Bavarian families socially entitled to participate in tournaments. The *Ehrenbrief* plays a major role in literary research as it informs us about the prevalent taste at that time on the part of the intellectual elite. It has survived in only one manuscript, today housed in the Getty Museum in Malibu, California. Although the portion of secular books in Püterich's library was quite extensive for his time, it made up only about a sixth of his entire library, which was filled with theological texts.

Quedlinburg

The first documentary evidence of a settlement at the Saxon city of Quedlinburg dates to 922, but it seems likely that a Carolingian fortress had already stood for a century in this location on the Bode River at the northern edge of the Harz Mountains. The erection of this first, undated fortification and the early-tenth-century history of this site are linked to the protection of the Holy Roman Empire against barbarian incursions from the east and to the related attempts to expand the empire's borders and Christianize the populace in these areas. Begun under Charlemagne at the end of the eighth century, these attempts were revived in the tenth century by the local duke and later king, Heinrich of Saxony. In 926 he enlarged the castle there; a palace chapel may have been erected at this time. In 929 he gave the settlement and its inhabitants to his wife, Mathilda, as part of her widow's pension in the event that he should predecease her. On his death in 936, he was buried before the altar of the palace chapel.

Soon thereafter—and clearly with the intent of establishing the church as a fitting family necropolis—Mathilda replaced the twelve canons with canonesses and granted the foundation privileges intended to confer it with a special status. The abbey was placed under royal protection and exempted from local secular laws and those of the neighboring bishop of Halberstadt, and the canonesses were allowed to elect their own abbess rather than accept one imposed on them by outside authorities. Queen Mathilda herself took up residence in the newly founded cloister and assumed its direction until her death in 968, when she was buried at her husband's side.

The queen was succeeded by her granddaughter, also named Mathilda, who initiated a series of abbesses from the royal family. During this period the abbey was also home to other royal women: after the death of Otto II in 983, his mother, Empress Adelheid, and his widow, Theophanu, retired to Quedlinburg, where, with the Abbess Mathilda, they ruled for the child Otto III until he assumed the rule for himself in 994. Under Mathilda's leadership the church was enlarged in and after 997: the small palace chapel became the choir of the new building, chapels were added at its sides, and it was extended to the west with a transept and long nave.

On Mathilda's death in 999 she was buried at her grandparents' heads, and Otto III appointed his sister Adelheid to succeed her. Adelheid undertook a complete rebuilding of the tenth-century church on a larger scale; the new building was consecrated in the presence of Heinrich II, the Empress Kunigunde, numerous bishops, and members of the nobility in 1021. This building burned in 1070 and it was quickly rebuilt in a Romanesque style; its consecration, delayed until 1129, took place in the presence of the Emperor Lothar. The documentation of sixty-nine royal visits to Quedlinburg between 922 and 1207 suggests the continued political importance of the site even after its high point under the Ottonian rulers.

Quedlinburg has enjoyed unusual attention at two points in recent history. Since Heinrich I was considered the founder of the first German Christian Empire, the First Reich, he elicited considerable interest among the founders of the Third Reich. When the one-thousandth anniversary of Heinrich I's death fell conveniently in 1936, Heinrich Himmler, leader of Hitler's SS (secret police), who may have considered himself a reincarnation of Heinrich, conducted excavations at Quedlinburg to search for the king's bones.

In 1990, the return to Quedlinburg of the luxury manuscript known as the Samuhel Gospels, which had been missing since the end of World War II, was negotiated after it appeared mysteriously on the art market. The recovery of this early-ninth-century illuminated codex with certain connections to Charlemagne's Court School led to the discovery of a dozen objects from Quedlinburg in Whitewright, Texas, where they had been shipped by an American GI at the end of World War II. Among these were an ivory casket, or reliquary box, and a liturgical comb, long thought to be gifts of Heinrich I to the abbey, and numerous small crystal vessels, some containing relics, that may have come with Theophanu from Byzantium and were then given by her or her children to the royal foundation. Other objects in the impressive treasury are traditionally identified as donations from the early Ottonian emperors to their family foundation: a second casket with ivories of early-tenth-century date is held to be a gift to the abbey from Otto I, and on his trips to Italy in 951–952 and 961–965, he is known to have purchased relics for his mother's foundation at Quedlinburg. These included a hair of the Virgin, a drop of her milk, and one of the alabaster vases in which Christ changed water into wine at the wedding feast at Cana as well as the bodies of the early Christian Saints Laurentia and Stephana. Thietmar of Merseburg relates how Otto III gave a golden staff, which is still preserved at Quedlinburg, in honor of his sister's installation as abbess. Many of the abbey's rich collection of manuscripts have also been identified. The covers of two of them were remodeled and an important tapestry acquired for the abbey about 1200, in a new period of well-being under two successive abbesses from the house of the margraves of Meißen.

Rabenschlacht

See [Buch von Bern and Rabenschlacht](#).

Exponent of the Modern Devotion, founder of the Brethren of the Common Life, founder of the monastery of Windesheim. Radewijns was born circa 1350 at Leerdam or Gorinchem and died at Deventer in 1400. He studied at Prague (master of arts) and became a canon in Utrecht. After a sermon of Geert Grote, he converted and accepted the lower position of vicar at Deventer, where Grote lived. For this vicariat he had to be ordained priest. He became the first leader of a congregation of Brethren of the Common Life. These Brethren gave guidance to a convict of schoolboys.

Radewijns compiled two little treatises, which are important because they influenced the treatises of his housemate Gerard Zerbolt of Zutphen. These widely spread treatises gave the Modern Devotion its spiritual fundament. We also have some fragments of Radewijns's letters. He also wrote a (lost?) *propositum*, a set of personal intentions.

In Radewijns's spirituality, humility is a central theme. The idea of externals pulling along the inner man leads to a severe asceticism, as did the idea that a humble inner self has to reflect itself in humble and austere exteriors. By fasting and waking Radewijns had broken his weak nature and almost lost his sense of taste and his appetite. This severe asceticism is colored by the spirituality of the Desert Fathers, which also seems to have influenced his fear of the demon. In his young days Thomas à Kempis lived together with Radewijns. In his biography of Radewijns, Thomas portrays him as a man who incites both love and fear with his straightforwardness.

Rahewin (d. before 1177)

Notary, canon, devoted servant and chaplain of Otto of Freising, provost of St. Vitus of Freising, Rahewin (died before 1177) is best known as the continuator of Otto of Freising's *The Deeds of Frederick Barbarossa*. Although frequently judged the lesser of the two authors of the *Deeds*, Rahewin made a contribution not without merit, and his work as a historian stands well above that of his successors. At the very least we are indebted to Rahewin for information on the life of Otto, including a description of Otto's deathbed scene in which Otto requested that his views concerning Gilbert de la Porrée be corrected.

Rahewin's other contributions to the *Deeds* are not insignificant. Continuing the work after Otto's death in 1158, Rahewin wrote books three and four of the *Deeds*, which covered the years 1157–1160. These books detail Barbarossa's relations with the Poles and Danes as well as his involvement in Italy. Rahewin describes Barbarossa's physical appearance and struggles with and success against Milan. These books tell of Barbarossa's often difficult relations with the papacy and includes an account of the incident at Besançon where, in 1511, a confrontation between papal representatives and Barbarossa occurred. Rahewin's literary style is also noteworthy. His continuation contains the same laudatory, almost propagandist tone found in Otto's section, but this should not surprise because Barbarossa himself commissioned the work. Rahewin's work is very florid and often incorporates whole passages "borrowed" from Einhard, Jordanes, Sidonius Apollinarus, and Sallust. He also incorporated in his continuation the complete texts of letters and other official documents issued by the emperor or the pope in their disputes. Despite the often critical assessment of his work, Rahewin's continuation provides valuable information on an important period in the empire's history.

Rainald of Dassel (ca. 1120–1167)

From 1156 until his death in 1167, Rainald of Dassel was Frederick Barbarossa's most loyal and powerful adviser. Born to a family of Lower Saxon lesser nobility circa 1120, Rainald was educated first at the Hildesheim cathedral school, then in France in the 1140s. He returned to Hildesheim by 1146. Rainald cultivated an interest in arts and letters and would become the chief patron of the "Archpoet" circa 1060. In 1156, Barbarossa chose Rainald as imperial chancellor. Rainald straightway committed himself to the Hohenstaufen agenda of rejecting papal claims to primacy and establishing German imperial hegemony over northern Italy. Rainald's leadership led to innovations in the chancery almost immediately, including the use of the phrase *sacrum imperium* (Holy Empire) and its variants. Rainald played a consistently dramatic role in international relations after his elevation to the chancellorship. In 1157, papal legatees met Barbarossa's court in Besançon to protest the imprisonment of Archbishop Eskil of Lund. The Latin text of Pope Adrian IV's letter suggested that the imperial crown numbered among many possible *beneficia* that could be given by the pope. Rainald's translation of the document deliberately rendered *beneficium* as "fief" (*lehen*) rather than "good work" or "favor," Adrian's intended meaning. The subsequent uproar led to a propaganda victory for Rainald and a clear formulation of the imperial position: empire derived from election by the princes and the grace of God, not papal coronation, which was simply a ceremonial act incumbent upon the pope. Elected archbishop of Cologne at Barbarossa's instigation in 1159, Rainald did not actually take major orders until 1165. Rainald's uncompromising attitude toward the Roman curia led Barbarossa to reject conciliatory papal offers; the result was formal schism with the election of the antipope Victor IV in 1159. In 1162, Rainald oversaw the brutal destruction of Milan, upon whose unconditional surrender he had insisted. Within a few months, however, he had to preside over the failed synod of Saint Jean de Losne, convoked to resolve the papal crisis, but ending in a diplomatic victory for Pope Alexander III, who stubbornly refused to appear and be judged. In April 1164, in Lucca, Rainald orchestrated the election of another antipope, Paschal III. In July 1164, Rainald brought the relics of the Three Kings from Milan to Cologne, where they became the object of a major cult. Late in 1165, Rainald presided over the canonization of Charlemagne in Aachen, the most dramatic step taken in the programmatic sacralization of Barbarossa's imperial rule. Rainald's uncompromising policy toward the papacy meant that only open conflict could decide the schism. In July 1167, the imperial army won a major victory at Tusculum. Rome was taken, and Alexander III fled in disguise. Triumph was short-lived, however: an epidemic, probably malaria, decimated the German host, killing Rainald and several other princes. Barbarossa returned to Germany with what was left of his army. The political approach of the rest of his reign was markedly more flexible than it had been during the era of Rainald of Dassel.

Regensburg

Founded on the Danube as the Roman camp *Castra Regina* in 179 C.E., Regensburg (Latin, *Ratisbon*) was widely acknowledged in the Middle Ages to be the main city of the *terra bavarica* (Bavaria) and often claimed to be the largest city in Germany. Seat of the Bavarian dukes from the time of Charlemagne onward, it was also a favorite city of German kings and emperors. Regensburg was the capital of the East Frankish Empire; Louis the German met embassies from Constantinopolitan Emperor Basil I in the city in 871 and 873, and in 875 built the *Alte Kapelle* (Old Chapel) as his palace chapel.

On the site of the *Alte Kornmarkt* (Old Grain Market), rulers took up residence, first the Roman *quaestor* (magistrate), then Bavarian dukes, and Carolingian kings. Around 1200, the Wittelsbach dukes established themselves there, living in what is now the *Herzogshof* (duke's court).

The Old Stone Bridge (*Steinerne Brücke*) was built over the Danube between 1135 and 1146 and, in 1182, was granted toll-free status. Around 1184, the position of *Hansgraf* (hannisgrave) was instituted, elected by the citizens of the city to oversee civic matters. After 1205, struggles between bishops and Bavarian dukes for control of the city resulted in the granting of numerous privileges, particularly in favor of the Jewish and foreign trading communities. Evidence of the newfound sovereignty of the city was its entrance in 1256 into an alliance with Rhenish cities. By 1285, Regensburg was recognized as a *freie Reichstadt* (imperial free city), expanding to absorb the nearby towns of Donaustauf (1385) and Stadtamhof (1408). The city's trading network was far-flung, and the *Regensburger Pfennig* (penny) was a recognized currency from Paris to Warsaw. However, the city suffered during the political trials of the late fifteenth century, and a bankruptcy of 1485–1486. In 1475, Regensburg put itself freely under the protection of the dukes of Bavaria-Landshut and in 1479 passed to Duke Albrecht IV of Upper Bavaria (Oberbayern). Finally in 1492, Regensburg was returned to Frederick III as a free imperial city, although civic unrest remained. By this time, it was clear that the ducal seat would be established in Munich, and Regensburg increasingly took a back seat to competitor trade towns of Augsburg and Nuremberg. However, the town continued a favorite place for imperial meetings, and the Reichstag (Imperial Diet) met in Regensburg no fewer than sixty-two times between 788 and 1653–1654.

The bishopric of Regensburg was founded in 739, and until 975 the office of bishop was held simultaneously by the Benedictine abbots of St. Emmeram. The cathedral is first mentioned in documents in 778, but the present building, begun circa 1250 in imitation of French Gothic style, was not completed until the sixteenth century. The Roriczer/Roritzer family served as cathedral *Baumeisters* (builders), notably Wentzel (1350–1419) and Konrad (1454–1466). Matthew Roriczer went on to work at St. Lorenz in Nuremberg and published his architectural handbook, *Das Puechlein der Fialen Gerechtigkeit* (The Little Book on Building Correctly), in Regensburg and Nuremberg in 1486. The Regensburg Ordinances of 1459 and 1514 have provided evidence about the organization of Gothic architectural guilds. The last Roritzer, Wolfgang, was beheaded as a heretic in 1514. The cathedral sculpture from circa 1375–1410 is immediately connected with the Parler family of Prague. The present structures of the cathedral cloister date from the eleventh and twelfth centuries. Most notable is the All Saints Chapel (*Allerheiligenkapelle*), whose dome rests on squinches modeled on those in the *Capella Palatina* in Palermo. The chapel was intended for the burial of Bishop Hartwig II (1155–1164) and decorated with frescoes illustrating the feast of All Saints, as described in Chapters 4 and 5 of the Book of Revelation.

The powerful Benedictine abbey of St. Emmeram, an eighth-century foundation, was richly endowed by Carolingians, particularly Arnulf of Kärnten, who donated the precious *Codex Aureus* (*Golden Codex*) of circa 870 (Munich, Bayerische Staatsbibliothek, no. Clm 14000). The monastery was renewed by Wolfgang (972–994), who separated the offices of abbot and bishop. Abbot Ramwold (974–1001) spearheaded the Gorze reform of the monastery and was responsible for the exterior crypt dedicated in 980 and built on the model of St. Maximin of Trier. St. Emmeram boasted a significant scriptorium, an important school of music, and a school in the liberal arts tradition of Fulbert of Chartres. Manuscript production flourished particularly at the beginning of the eleventh century, when the convent produced the *Sacramentary of Henry II* (Munich, Bayerische Staatsbibliothek, Clm 4456). In the early eleventh century, the monastery became interested in the works of the pseudo-Dionysius, and even claimed to have the body of St. Dionysius himself, supported by a vision and documents forged by the scribe Otloh. Under Abbot Reginward (1048–ca. 1060) the monastery reconstructed its western church to include a transept and a choir dedicated to St. Dionysius raised over the crypt of St. Wolfgang. While St. Emmeram's monks were never able to prove its ownership of Dionysius over the more convincing claims of St. Denis outside of Paris, their study of pseudo-Dionysian writings fueled the creation of typological poetry and artworks, including the magnificent ceiling of St. Emmeram, no longer extant.

Regensburg boasts numerous significant ecclesiastical foundations. Niedermünster was an imperial abbey of Benedictine nuns, founded circa 955 by Henry the Wrangler, whose wife, Judith, became abbess in 973 and was buried there. The Gospels illustrated for Abbess Uta between 1002 and 1025 (Munich, Bayerische Staatsbibliothek, no. Clm 13601) are another notable example of the Regensburg taste for deluxe manuscripts and typological iconography. The seventh-century itinerant bishop Erhard, who was buried in the church, was canonized in 1052. The Obermünster was a church of canonesses, a Carolingian foundation given in 833 to Hemma, wife of Louis the German, who served as abbess until her death in 876. A new church was consecrated in 1010 and reconsecrated in 1024 after a fire, but today stands in ruins. It was probably one of the women's convents that produced the magnificent mantles worn by the sainted imperial couple Henry II and Kunigunde, now preserved at Bamberg. The church of St. James (*Jakobskirche*), or the so-called *Schottenkirche*, was settled by Irish Benedictine monks circa 1067, and was probably the home of Honorius Augustodunensis in the mid-twelfth century. Honorius's works have been suggested as sources for the enigmatic north portal of the church, a three-leveled arched facade peopled with puzzling and archaizing figures that have been variously interpreted to represent the Easter mysteries, the Last Judgment of the Book of Revelations, or a cosmological vision.

Regensburg's output of medieval mural painting must have been enormous, though little survives. The most important extant material is found in Prüfening, ascribed to circa 1125 and 1150–1160, executed in a severe style related to the Hirsau reform movement that had inspired the church's foundation in 1109 by Bishop Otto of Bamberg. It is generally difficult to separate Regensburg from Prüfening artistic production in the third quarter of the twelfth century, and scholars attribute to the school both frescoes and the illustration of such manuscripts as the *Glossarium Salomonis* (Munich, Bayerische Staatsbibliothek, Clm 13002) or the *Laudes sanctae Crucis* (Munich, Bayerische Staatsbibliothek, Clm 14159). The mendicant orders appeared early in Regensburg. The Franciscans were established by 1221 and nourished the noted vernacular preacher Berthold of Regensburg (ca. 1210–1272). The Dominican church of St. Blasius dates to 1230, and distinguished theologian Albertus Magnus served briefly as bishop of Regensburg (1260–1262) before returning to the Dominican order. By the midthirteenth century, mendicant influence had reoriented Regensburg scholarship and book production toward Paris. By the early fourteenth century, the city was also a center for illustrated manuscripts in the German vernacular, particularly Ottheinrich's Bible (Munich, Bayerische Staatsbibliothek, no. Cgm 8010/1 and 2) and the works of Martinus Opifex. Most of Regensburg's medieval manuscripts are now kept in the Bayerische Staatsbibliothek in Munich. Although the city was not a major center for printing, a few blockbooks and religious tracts, primarily Marian in subject matter, seem to have been printed there by Lienhart Wolff and Johannes Eysenhut. Although many of Regensburg's structures were rebuilt in the seventeenth and eighteenth centuries, numerous medieval houses remain, and it has been remarked that the scale of the dense medieval town keyed to packanimal traffic remains little changed today.

Registrum Gregorii, Master of (fl. late 10th c.)

Also known as the Registrum Master or Gregory Master, the Master of the *Registrum Gregorii* was the leading artistic personality in the Ottonian empire during the last quarter of the tenth century. Documentary evidence for him is lacking. He seems to have been active in Trier during the episcopate of Archbishop Egbert (977–993) and is known primarily from the miniatures he painted for Gospel and liturgical books. He may also have been an ivory carver. The Master's name derives from his miniatures depicting Pope Gregory the Great (Trier, Stadtbibliothek) and an Ottonian emperor, probably Otto II (Chantilly, Musée Condé, manuscript no. 14 bis), originally included in a compilation of Gregory's writings—a *Registrum Gregorii*—commissioned by Egbert. Both miniatures exhibit the Master's characteristic rounded, weighty figures and perspectival approach to space and architecture, representing his adaptation of classicizing Roman models of the fifth and sixth centuries to the medieval idiom.

The Registrum Master's style influenced illumination at many centers in the late tenth and eleventh centuries, but nowhere was his impact so evident as at Reichenau in the wake of the illumination of the *Codex Egberti* (Trier, Stadtbibliothek, manuscript no. 24). This Gospel lectionary was commissioned by Egbert and illustrated by the Registrum Master, to whom the first seven miniatures have been attributed, and two Reichenau monks. The circumstances surrounding the execution of the *Codex Egberti* continue to be debated, but the influence of the Master's style is fundamental for the evolution of Liuthar Group illustration at Reichenau, beginning in the mid-990s with such manuscripts as the Gospel lectionary in the Vatican (Biblioteca Apostolica, manuscript no. Barberini lat. 711) and the Gospel book in Aachen (Cathedral Treasury).

"Empire" (*Reich*) is a term used throughout the German Middle Ages to refer to various political constellations. To the inner circle at Charlemagne's court in 800, his adoption of the title "emperor" gave expression to the fact that he was more than just the king of the Franks, or king of the Lombards; with the exception of Anglo-Saxon England and Christian Spain, every Christian area of the Latin West was subject to him, and many non-Christian areas to the east recognized his suzerainty. There was to some large degree a correspondence between his realm and Latin Christendom.

Very quickly, however, the relationship between theory and practice changed. With the Treaty of Verdun (843), the idea of an ecumenical empire gave way to a more limited one. Lothar I received the title of emperor along with the Middle Kingdom, but when his lands were subdivided in 855, the imperial title went to his son Louis II as ruler of Italy. In short, the significance of the imperial title contracted almost to the point of meaninglessness.

In theory, however, the imperial title implied a claim to the disputed lands of the Middle Kingdom, and by the early tenth century it was a hotly contested prize. The winner in this go-around was the German king Otto I, who, in 962, assumed the imperial title, signifying the union of Germany, Italy, and Lorraine. His concept of empire, and the realities as well, looked back to Lothar I far more than to Charlemagne for its model. For the next three centuries the term *Reich* had reference to this area, in which Germany exercised hegemony over the other two regions. Maintaining some substance for the theory required considerable effort, however, and from time to time German rulers ignored the imperial dimensions of their office, focusing on matters north of the Alps.

Otto I and Otto II both appeared as plain *imperator augustus* (noble emperor), but Otto III's chancery used the more pretentious *imperator Romanorum* (emperor of the Roman Empire). Though the Capetian kings of France were anxious to live on good terms with the empire, they were never prepared to admit to being imperial vassals. When Emperor Henry II and King Robert the Pious met on the banks of the Meuse in August 1023, they did so as equals; similarly, when Henry III and the French King Henry I met at Ivois in 1056, they did so on terms of equality. Henry III saw his imperial role not so much in territorial terms as in his obligation to purify and reinvigorate the papacy, the other universal head of the *respublica Christiana* (Christian republic). He did, however, object to the use of the title *Hispaniae imperator* (Hispanic emperor), which the Spanish king, Ferdinand the Great of Castile, had adopted after a great victory over the Moors.

German emperors often sought legitimization of their title and claims by marrying into the Byzantine imperial family. Otto II was the only one to do so, though appropriate spouses had been sought for both Otto III and Henry III. The securing of the hand of Isabella/Yolande of Brienne, heiress to the Latin kingdom of Jerusalem, by Frederick II of Staufen in 1223, gave a similar boost to the pretensions of the leader of the Christian world.

The accession of Frederick Barbarossa in 1152 brought a change in his attitude toward Italy, over what had prevailed for some time. In correspondence with the Byzantine emperor of Constantinople, he declared that the kings of Europe were constantly sending ambassadors to his court, to show their respect and obedience, and to offer oaths of loyalty and hostages. His chancery spoke disdainfully of the kinglets, or *reguli* (little kings), in at least one instance meaning thereby the kings of France, England, and Denmark who were *reges provinciales* (provincial kings). John of Salisbury waxed indignant over the implications of such claims for the king of France, but in the historian Rahewin's continuation of the *Gesta Friderici* (*The Deeds of Frederick*), we find a letter of Henry II of England that (although disputed) is made to say to Barbarossa: "We offer you our kingdom and all the lands under our dominion, we hand them over to your power, so that you may dispose of them as seems good to you, and so that your imperial will may be accomplished in all things." According to the English chronicler Hovedon, England's independence was compromised beyond that expressed in Henry's letter when Richard I, "by the advice of his mother Eleanor stripped himself of the kingdom of England and delivered it over to the emperor as lord of the world," a reference to the enforced homage of Richard to Barbarossa's son Henry VI in 1193.

Frederick Barbarossa found his plans for a reinvigorated empire challenged not only by the rising power of the Italian cities but by the theocratic pretensions of Pope Hadrian IV. To counter papal claims that the emperor held the empire as a "benefice conferred by the pope," Frederick declared that he held his kingdom and his empire from God alone. To buttress this argument, his chancery began to use the adjective *sacrum* (holy) or *sanctissimum* (most holy) in connection with the empire in 1157, contrasting it with *sacra ecclesia* (Holy Church). Several years later, Frederick secured the canonization of Charlemagne, who, in effect, became the patron saint of the empire; the beatification of Charles the Great symbolized the rebirth of the empire yet again under Frederick's rule.

Henry VI of Hohenstaufen's accession in 1190, and his abortive attempt to effect a union of the kingdom of Sicily with the empire, marked a decided departure from earlier imperial policy. Henry's son, Frederick II, in turn abandoned Germany in large measure, though there were still those who promoted the twelfth-century Staufen notion of the universal empire. At the Fourth Lateran (Papal) Council in 1215, Archbishop Siegfried II of Mainz, as arch-chancellor of the empire, objected to the announcement by Pope Innocent III that King John of England had surrendered his realm to the papacy and received it back as a fief during his efforts at reconciliation with Rome; the archbishop's protest that the empire exercised suzerainty over the *regnum Angliae* (rule of Anglia) was rejected.

Meanwhile, in 1202 Innocent III in the decretal *Per Venerabilem* had declared that the king of France was emperor within his own realm, "*cum rex superiorem in temporalibus minime recognoscat*"—he recognized no temporal superior. The epithet *Augustus* given to Philip II by his biographer and retained by history is a sharp reflection of his attitude to the imperial daydreams, and the collapse of the Hohenstaufen after 1250 placed the question of empire in the forefront of European politics. Pierre Dubois and John of Jandun maintained that the French king was the natural successor to the imperial dignity of the Hohenstaufen, and in fact the integrity of the western boundary of the empire began to erode toward the end of the century. Rudolf of Hapsburg was less interested in perpetuating the imperial ideas than in establishing an hereditary monarchy. It was during his reign that the lands of the bishopric of Toul west of the Meuse fell into French hands (1291), while in 1297 the French established control over the entire bishopric of Metz. But even in the fourteenth century there were still political theorists in France who recognized a certain validity to the emperor's claims of universal overlordship.

From 962 onward the rulers of Germany were, either actually or potentially, emperors. Only Otto II was consecrated emperor in his father's lifetime, and even then he had been king for some years before his imperial coronation. Otto III and Henry II did not become emperor until 996 and 1014, respectively, in each case more than a decade after they had succeeded to the throne. Conrad II was crowned in Rome in 1027 after a gap of only three years; his son Henry III waited seven years before crossing the Alps and receiving imperial coronation in 1046. Elected in 1212 and crowned at Aachen in 1215, Frederick II did not receive imperial consecration until November 1220. In short, the imperial crown could not simply be assumed; it had to be received from the pope at Rome.

This factor helps explain the frequent bitter struggles that went on between certain German monarchs and the papacy. Many German rulers made do with the title *rex Romanorum*, indicating that although they had been duly elected king, they had not yet received imperial coronation. Only in the fourteenth century did the German electors challenge this practice, and by then the imperial dignity was much less preoccupied with Italy than with Central Europe. Meeting at Rhens on the Rhine in July 1338, the German estates declared that the imperial dignity was held directly of God, and that a king elected by the majority was the legitimate ruler, entitled from the day of his election to exercise his functions without papal consent or confirmation. This was reaffirmed in the Golden Bull that Charles IV published in 1356.

The concept of the Holy Roman Empire—the full term appears first in 1254—lasted in one form or another until 1806, but a second empire was created in 1870–1871, to be followed by a third *Reich* in the early twentieth century. As a symbol of overlordship, the term emperor was also taken over by Napoléon in 1804, whose imperial coronation at the cathedral of Notre Dame in Paris was clearly influenced by that of Charlemagne on Christmas Day, 800, at Rome.

Reichenau

Located on Lake Constance (German, Bodensee) in what is today the state of Baden-Württemberg, the island monastery of Reichenau was founded by St. Pirmin in 724. Pirmin was a Visigothic monk who had come to the Frankish court from southern Gaul and was sent to Alemannia by Charles Martel. Although this region had succumbed to Frankish rule during the early sixth century, efforts to Christianize the Alemanni achieved widespread success only in the following century. The establishment of a monastery at Reichenau, like that of the nearby St. Gall (Switzerland) in 720, was meant to provide the region with a strong center of Christian and Frankish influence.

During the Ottonian period (919–1024), Reichenau continued to function as an outpost of royal influence. Eleventh-century documents attest to the monastery's policy of accepting only nobles into its community. As a royal abbey, it provided crucial support for the itinerant ruler, with its loyalty to the king providing a necessary check to the ambitions of the local nobility. Reichenau received land grants for its support of Otto I in the uprising of 953, and hosted the emperor in 965 and 972. Despite the ruler's infrequent appearance at the monastery, by the early eleventh century his presence was felt through the maintenance at Reichenau of a palace for his reception. One of the few East Frankish monasteries to have papal privileges confirming its authority, its abbot was subject to the authority of the king alone.

Reichenau, like St. Gall, was a major educational and artistic center during the Carolingian and Ottonian periods. In the ninth century the monastery's library contained four hundred codices. By the tenth and early eleventh centuries the collection had expanded to five hundred volumes. The Abbot Witigowo, who served from 985 to 997, is known for his patronage of the arts. He was eulogized by the monk Purchart in a lengthy poem describing his architectural projects, gifts of metalwork, and commission of wall paintings. While these paintings no longer remain, the church of St. Georg at Reichenau-Oberzell is one of the few sites to preserve examples of Ottonian wall painting.

Although recent scholarship has questioned whether Reichenau was indeed the site of a centralized scriptorium, the monastery continues to be widely recognized as

Reichenau-Oberzell, St. George, view from south. Photograph: Joan A.Holladay

a major center of Ottonian book production and transmission. The unfortunate disappearance of Reichenau's treasury explains why no significant illuminated manuscripts survive from the monastery itself. Instead, the manuscripts that remain are those that can be linked to the monastery through paleography and stylistic analysis.

The Gero Codex of circa 965–969 (Darmstadt, Landesbibliothek, manuscript no. 1948) is the earliest of the great Ottonian manuscripts attributed to Reichenau. The manuscript is a collection of pericopes, excerpts of Gospel texts to be read at the Mass, and derives its name from the dedication pages showing the patron Gero presenting the book to Saint Peter, and the scribe Anno extending the manuscript to Gero, the future archbishop of Cologne. It is the first extant book of the Ottonian period to utilize figurative art. Its evangelist portraits in particular have led scholars to name the Carolingian Lorsch Gospels (ca. 810) as a direct model. The materials and careful execution of its manufacture speak to the quality of the scriptorium that produced the manuscript, but it departs from its Carolingian model in several important ways. Whereas Carolingian painting utilized modeling and architectural elements to convey the illusion of figures existing in space, the first move toward a specifically Ottonian aesthetic can be seen in the *Gero codex*. An emphasis on geometric patterning and the use of gold replaces the painterly style favored by the Carolingians. The figures in the *Gero codex* are sharply drawn and colored. Their large size and frontal poses further separate them from an illusionistic background.

Evidence for Reichenau's artistic ties to the imperial court can be found in the Gospel Book of Otto III of circa 998–1001 (Munich, Bayerische Staatsbibliothek, manuscript no. cgm. 4453) and the Pericopes of Henry II of circa 1007–1012 (Munich, Bayerische Staatsbibliothek, no. cgm. 4452). These two luxurious books fully realize the new aesthetic goals expressed in the earlier *Gero codex*. In the Pericopes of Henry II, large-scale figures float on gold grounds. Both manuscripts feature ruler portraits in the Christ Maiestas tradition, reinforcing through a visual synthesis of Christ and ruler the belief that the emperor was Christ's representative on Earth.

Reichskirche

Most strictly, the term *Reichskirche* (imperial church) applies to the church properties, rights, and offices under the immunity protection of the king/emperor. This royal connection set nascent national churches, such as in England or France, somewhat apart from the developing Roman ecclesiastical hierarchy. In Germany, however, the kings of the Ottonian-Salian dynasty thoroughly expanded the secular authority of bishops and abbots as a counterweight to the competing dukes and locally entrenched magnates. Consequently, the kings often endowed churches with royal prerogatives, such as the right to hold markets, mint coins, carry out justice, and command warriors, in the process creating the powerful spiritual princes or princebishops. While historians once discussed the "Imperial Church System" (*Reichskirchensystem*), this term misleadingly implies a methodical organization. In practice, the king's influence on clerics, just as the popes, varied widely depending on personalities and local circumstances.

Brian A. Pavlac

Reinmar der Alte (the old) or, as he is often called by scholars, Reinmar von Hagenau, is the most prolific minnesinger of the twelfth century. He flourished (in the last fifteen or so years of the twelfth and the first years of the thirteenth) at the Babenberg court in Vienna, and probably also traveled widely, as did most courtiers and court retainers. He left no documentary record; we know him only as he presents himself and as other poets refer to him. He lacks the range of Walther von der Vogelweide; the only didactic lyrics he wrote were a few reflections on love, there is no *Leich* transmitted for him, and the only political songs ascribed to him are a widow's lament and two crusading songs. Yet the view of him as a singer of only one style of minnesong (courtly love song)—the lament of the hapless suitor—though influenced by his own stylization of his persona, is largely an artifact of scholarship during the past two centuries. Especially toward the end of the nineteenth and the first half of the twentieth century, scholars created an ever narrower image of Reinmar by claiming that songs and strophes ascribed to him were spurious, until the number of "pseudo-Reinmar" strophes exceeded those accepted as genuine. If we accept that he sang (and, in large part, created) most of the songs and strophes ascribed to him, it becomes clear that his oeuvre was rich and varied in addition to being extensive.

Even the narrow Reinmar canon is more nuanced than scholars were initially willing to perceive. For one thing, Reinmar utilizes the woman's voice more often and in more different ways than any minnesinger save Neidhart, whose peasant women and girls reflect the pastourelle (bucolic) rather than the *Wechsel* (exchange) that was Reinmar's inspiration. One thing becomes clear in the multifaceted roles the woman's voices depict: Reinmar's women cannot be equated with his personae lady. The lady as the suitor describes her is recalcitrant, haughty, distant; the noble woman's voices show someone who, if she spurns her suitor, does so unwillingly, constrained by fear of social sanctions. Often, she demonstrates a desire for her lover far more impassioned (and physical) than that expressed by "Reinmar" in his stereotypical role. Indeed, she exposes his maunderings as misguided at best, ludicrous at worst. Of course, the woman's voice is Reinmar's projection just as much as the man's voice, but he surely intends the incongruity between the stances portrayed to be noted and relished. Just as Don Quixote is Cervantes's knight of the woeful countenance, Reinmar's suitor is doleful. Both are (tragi-) comic fictions. In many of the songs in the man's voice, the lady is marginalized, referred to sparingly and obliquely, and the primary subjects of the song are an examination of the suitor's feelings, the singer's singing, and the audience's reaction to songs or singer. The syntax is typically complex; abstractions and legalisms (casuistries) abound. Imagery is rare; it may be that where Reinmar tried to introduce imagery (in part, perhaps, by appropriating strophes from other singers), his audience rejected it. Several songs containing a strophe with some striking image omit this strophe in most versions and others are transmitted only once. For many minnesingers songs are transmitted in multiple versions; for no singer is this transmission tendency more common than for Reinmar. Not only was he prolific, he was apparently also intent on extending and varying his repertoire by changing the order and number of strophes and even, on occasion, the basic tenor of songs. Changes in wording, form, and most strikingly voice enable him to make new songs of old ones. Some of the variants we have are due to later singers (such as Niune) appropriating songs or scribes adding strophes from other versions or deleting ones they consider inappropriate or corrupt. And some of the textual variants are due to faulty copying, flawed memory, or scribal "improvements." Nevertheless, though most scholars dispute or disregard it, the texts make it abundantly clear that an authorial intention is behind most of the variance we find in Reinmar's (and other minnesingers') songs.

Many minnesingers thematize singing about singing; but Reinmar, with his unusually introspective and reflective persona, does so more than most. While focusing on the theme and engaging that segment of the listeners most concerned with singing, other singers, directly, he reacts to and may even borrow and adapt strophes from them. Such an interchange of allusions and even strophes gave rise to the notion that he feuded with Walther von der Vogelweide, with the latter objecting to Reinmar's ideology of love. Actually, their views on love are quite similar (and similarly diverse, depending on which genre they echo); nevertheless, both singers vie over which of the two is the superior artist. The *Wartburgkrieg*, a fictional account of a contest between singers at the Wartburg in Thuringia, probably reflects their competition (at considerable remove; Reinmar der Alte may have been conflated with Reinmar von Zweter). The coupling of the two singers in the Würzburg Song Codex may be another reflex of their strife. Gottfried von Straßburg pairs both "nightingales" as masters of minnesong. Walther, in his eulogies to Reinmar, praises his art but declares an antipathy toward his person; perhaps the latter is intended to lend veracity to the former, but it is also possible the two simply did not like each other very much. Reinmar arguably caused one of the most egregious instances of multiple ascription by copying a collection of Heinrich von Rugge's songs, or acquiring such a collection, to serve as models. A series of songs by Rugge, to which he may have added songs and strophes of his own, subsequently was copied into codex C twice, once under Rugge's name and once under Reinmar's. The affinities between the two singers are not restricted, however, to one block of songs, so the parallel transmission cannot be explained away as a mere scribal blunder, as scholars have tended to assume. Allusions to or strophes shared with Hartmann von Aue and Heinrich von Morungen probably also reflect Reinmar's willingness to appropriate; he in turn serves as a major model for such singers as Walther von Metzze and Rubin.

Reinmar von Zwetter (ca. 1200–ca. 1250)

We know this prolific singer of *Sangspruchdichtung* (political and religious thought) only from his songs. They suggest he was born in the Rhineland, grew up in Austria, and was employed as a courtly singer by King Wenzel I of Bohemia in the 1230s. Other internal evidence indicates he sang at the court of the archbishop of Mainz in the 1240s. Reinmar's last datable piece stems from the years 1246 to 1248. He left some 230 single twelve-line, onestanza songs, all sung to the same tune (called *Frauenehrenton* in manuscript "D") and a *Leich* (lay) without melody. There is also a handful of songs, probably spurious, in other stanzaic forms with which his name is associated. Only a few of his one-stanza songs can be thematically linked together. Most of Reinmar's work is contained in two sources, 219 stanzas in manuscript "C," the famous Manesse Song Manuscript (Heidelberg, no. Cod. Pal. Germ. 848), and 193 stanzas in manuscript "D" (Heidelberg, no. Cod. Pal. Germ. 350). Other stanzas are scattered over some twenty additional manuscripts. The illustration in "C" depicts him as a blind singer dictating his songs, though there is no evidence in the body of his work that he was sight-impaired. The *Frauenehrenton*, Reinmar's only known melody, is a utilitarian d-based construction, a solid structure for the delivery of all his content-laden stanzas. It is possible that it is not an original composition, since one of Reinmar's confreres in courtly singing accuses him of being a tune thief (*doenediep*). Reinmar's singing encompasses many of the popular subgenres of *Spruchdichtung*, e.g., political songs, religious songs, cautionary songs, songs of praise, songs about the nature of love, and songs extolling knightly virtue. In this he is a disciple of Walther von der Vogelweide, though his poetry lacks the nuance and lyricism of Walther. Many of his songs have a elegiac quality, lamenting the passing of the heyday of love, honor, and courtly values. In these Reinmar provides a canon for knightly behavior in the first half of the thirteenth century. His rhetorical style is direct and convincing, underscoring his belief in the old-fashioned values of knighthood (especially *Minne*—courtly love—and honor) and reflecting a natural piety in which he pleads for righteousness, though never in a self-righteous way. His stanzas, especially the political ones, also afford glimpses of his life as a courtly singer. Like Walther before him, Reinmar had to generate political propaganda to suit the occasion. Illustrative are two songs composed in the 1230s, the first issuing a dire warning to those conspiring against Emperor Frederick II (Roethe: No. 137), the second (composed after a change of patrons) urging willful resistance to the same monarch (Roethe: No. 149). Pursuing the tradition of Walther's political and religious songs, Reinmar is the link to later singers of *Spruchdichtung* in the second half of the thirteenth century such as Bruder Werner, Meister Alexander, Meister Stolle, der Marner, and Frauenlob. That such a rich assortment of stanzas was collected in more than twenty manuscripts attests to his popularity. For three hundred years he was venerated by the Meistersinger, who counted him among the twelve old masters.

Relics and Reliquaries

Medieval relics functioned as symbols of saintly life, served as instruments of intercession, and possessed a certain power as defined by the church and the believer. The relic constituted a part of a venerated person's physical remains or it was an object associated with his or her life. Relics conjured up the image of those who were faithful, filled with the Holy Spirit, connected to the mystical body of Christ, and as such were used as instruments of God to perform miracles. Medieval sensibility advocated veneration of the remains of the deceased who was considered holy and could intercede for the faithful before God. The reliquary was a container for the relic and emerged out of the need to enshrine the actual relic.

Relics are classified as primary, secondary, and tertiary types. Primary relics refer to the actual body parts of the deceased. An object that was used by or came into contact with the deceased is a secondary relic, and tertiary relics are those objects that came into contact with a primary relic and thereby possess a spiritual power. Popular examples of these types include the bones or tooth of a saint as a primary relic; a part of the true cross as a secondary relic; and a piece of cloth that has come into direct contact with the remains of a saint.

During the early Christian period a *memoria*, meaning the place of martyrdom, referred to a funerary place that was covered, housed the bones of the deceased, and was venerated. This tradition continued, and the bones of saints were considered sacred, called "relics," and housed in a crypt. The tradition that relics were hidden and could be touched rather than seen emerged in the Orthodox Church during Iconoclasm in Constantinople. By the mid-ninth century the western church replaced this hidden aspect and advocated actually seeing the relic. This visual emphasis led to the building of chapels for housing the sacred remains and to the creation of reliquaries for protecting and enshrining them.

Relics were transported throughout Christendom, especially during the Crusades. They were given as gifts to various cities. The possession of holy relics secured power and authority for the ruler and his kingdom by allying him with a holy object. Leaders vied to possess important relics as symbols of divinity and believed that their presence brought holiness to their city.

During the twelfth century, theological concerns conferred a new importance on sainthood, and the relic was elevated and moved from its original placement under the altar to a more prominent position above it. Believers visited relic sites and recognized the divine status of the saint who, as a result of her or his holy earthly life, had the power to cure and perform miracles with the help of God. Kings and queens, cardinals, and wealthy citizens commissioned metalsmiths to create reliquaries. Costly materials, such as cabochons and antique cameos, were used by artisans to embellish the containers. Inscriptions and images were sculpted into the surfaces to identify saints and the holy family.

The interest in the mystery and powers of the relics grew continuously, and the presentation of reliquaries added a theatrical aspect to worship. Reliquaries of all shapes and *picturae*—altarpieces with painted narrative images that often contained relics—formed a focal point for reflection at the high altar or at smaller subsidiary altars. Various relic forms conjure up some interesting images. Bust, foot, and arm reliquaries are known as "speaking reliquaries" because their shape reflects the relics they contain. Other popular types of reliquaries include the house, church, cross, purse, necklace, and triptych-shaped forms that survive today in cathedral treasuries and museums. The celebrated Shrine of the Three Magi (about 1190) contains bones believed to be those of the Three Kings, acquired by Emperor Frederick Barbarossa for Cologne. Nicolas of Verdun and his workshop sculpted gold repoussée (embellished with patterns) figures of the three Magi, Mary, and the Christ child, and the apostles and prophets. Rare gemstones, enamels, and filigree embellish the large shrine that was created for the archbishop as a symbol of holiness.

The legend of Saint Ursula told in the *Golden Legend* reads like a medieval romance and forms the basis for an incredible reliquary room in Cologne. At some unknown date in the early Christian era Ursula, who, with eleven thousands maiden companions, died in a massacre at Cologne upon returning from a pilgrimage from Rome. Excavations in Cologne (1106) revealed a large number of skeletons discovered not far from the Rhine, and these remains were believed to be Ursula's retinue. In the seventeenth century a special room, called the Goldene Kam

Cologne, St. Ursula, Golden Chamber (Goldene Kammer), reliquary busts of the companions of St. Ursula. Photograph: Joan A. Holladay

mer (Golden Chamber), was built to enshrine the bones within the thirteenth-century church dedicated to this saint.

The cathedral at Aachen also exhibits exceptional examples of relics and reliquaries, including the head reliquary of Charlemagne containing part of the emperor's skull; the large house-shaped reliquary holding his bones located at the high altar; and the *Marienshrein* (shrine of the Virgin) containing a fragment from the dress of Mary, a piece of the loincloth of Christ worn on the cross, the cloth that wrapped the head of John the Baptist, and the swaddling clothes of the Christ child. To this day relics continue to mystify the beholder and their presence in Germany attests to the focus of medieval devotion.

Renovatio Imperii Romanorum

A reference to efforts, real or rhetorical, to "revive the Roman Empire." Variations on the phrase appear already in Antiquity (e.g., *Renovatio Romanorum*, *Renovatio urbis Romae*), and especially under Charlemagne (*Renovatio Romanorum imperii*). In the form cited here, it appears on a lead seal attached to a *diploma* (no. D O III 285) issued at Rome, in 998, by Emperor Otto III (983–1002). In general, the phrase *Renovatio imperii Romanorum* has been taken as a reference to that emperor's ill-fated plan to create a renovated Roman Empire with its capital at Rome. The contours of this plan (or program) were established in a pioneering study published by Percy E. Schramm in 1929. Schramm argued that Otto had constructed the policies of his government around an ideal vision of Rome that was unique in being specifically secular, political, and universal. As evidence of this program, never explicitly witnessed by Otto himself, he cited a variety of literary, visual, and ritual sources. Although Schramm's interpretation of Otto III's *Rompolitik* (policy toward Rome) has long represented the basis for subsequent work on the topic, recent literature has cast doubt on his evidence and brought the whole character of Otto's program into question. In particular, a study by Görich concludes not only that the standard pool of evidence is insufficient to support the kind of theoretical structure proposed by Schramm, but perhaps is incapable of supporting any kind of *Rompolitik* at all. At this point, no clear alternative to Schramm's interpretation has emerged, but there seems to be general agreement that, whatever *Renovatio* may have meant to Otto III, it is unlikely to have represented a coherent program or a policy in any modern sense.

Renovatio Regni Francorum

The concept of the "Renewal of the Frankish Empire" occurs in the Carolingian and Ottonian periods of medieval Germany. It contains notions of internal renewal, both of a political and a religious nature, and a confirmation of the Franks and their East Frankish successors as leaders of a Western Christian empire on parity with the Byzantine Empire. The terminology first appeared on a metal seal of Louis the Pious—although some scholars argue that Charlemagne may have already used it in 813—and it has been linked with a program of reform activity that began late in Charlemagne's reign and intensified early in Louis's reign. Used sporadically in the ninth century, this inscription appears most dramatically again in 1003 on a lead seal of Henry II of Germany, who used it again to indicate a programmatic reform in his realm along Carolingian lines and to express the parity of the Western empire with Byzantium.

Van den vos Reynaerde, a Middle Dutch animal epic (3,469 lines in rhyming couplets), is one of the show-pieces of Middle Dutch literature and probably the most widely studied Middle Dutch text. The author mentions his name, Willem, in the first line and adds that he previously had written a text named *Maddock* (now lost); other than this, nothing is known about him. Nonetheless, dialect features and the use of many specific Flemish placenames make it quite certain that the author was of Flemish origin. The poem dates from the thirteenth century, probably from 1230–1260. The fact that Jacob van Maerlant refers to the poem in his *Rijmbijbel* (*Rhymed Bible*, 1270) and that the prime source Willem used, *Li plaid*, branch I of the Old French *Roman de Renart* (*The Story of Renart*), was written after 1173 set firm chronological limits. Because Willem also used other, younger branches of the *Roman de Renart* as additional sources, the year 1200 seems a plausible earliest possible date of composition (*terminus post quem*).

Three complete manuscripts and fragments of four more have been preserved. One of the complete manuscripts and one of the fragments have a special place in the manuscript tradition, actually they are manuscripts containing *Reinaerts historie*, a younger, enlarged version of Reynaert's story, in which *Van den vos Reynaerde* was completely incorporated.

Even though the nobility is severely criticized in *Van den vos Reynaerde*, it is plausible that the text was actually meant for an aristocratic audience. The good quality of the manuscripts is one of the arguments for this hypothesis.

In essence, *Van den vos Reynaerde* is the story of a trial. Many animals have complained to King Nobel about Reynaert's behavior. The king sends messengers to bring Reynaert to the court. The first two of them, Bruun the bear and Tybeert the cat, are lured into a trap by Reynaert, who uses their greed to bring them into a perilous situation. The third messenger is Grimbeert the badger, a relative of the fox. Reynaert agrees to accompany him to court, because otherwise his lair will be besieged by the king. At court Reynaert presents himself as a loyal servant to the crown and tries to challenge the plaintiffs. King Nobel furiously confronts him with his crimes against Bruun and Tybeert, but Reynaert replies that they were victims of their own vices. Once again a lot of animals bring in their complaints about Reynaert and he is sentenced to death by hanging. At this moment Grimbeert and Reynaert's other relatives leave the court. While the appointed executioners—Bruun, Tybeert, and Ysengrijn the wolf—are off to prepare the gallows, Reynaert makes a public confession of his sins. In this he comes up with a concoction about a treasure, hidden in a place called Kriekepit. This treasure was meant to overthrow King Nobel's throne in favor of Bruun. The other conspirators mentioned by Reynaert include Tybeert, Ysengrijn, Grimbeert (who had left the court), and his own deceased father. The implication of his father and Grimbeert lends credibility to Reynaert's story, and King Nobel and his wife cannot control their greed for gold. The king wants Reynaert to lead him to the treasure, but the fox refuses because he is under a papal ban and has to make a pilgrimage to Jerusalem. When the executioners return to the court they are immediately taken prisoner. Bruun is sentenced to give a pilgrim's bag to Reynaert, made of his own skin. Ysengrijn and his wife have to give him their "shoes," made in the same way. The next day Reynaert wants to leave court and refuses Nobel's offer to escort him with his complete retinue. But he asks Cuwaert the hare and Belijn the ram to come along. At his "castle," Maupertuus, Reynaert entices Cuwaert to come inside and then kills the hare. He tells his wife, Hermeline, to prepare for flight, because the king will soon learn the truth. To the ram he gives the pilgrim's bag with the head of Cuwaert and tells him the bag contains a letter for King Nobel. At court Reynaert's deceit becomes apparent and the king is furious. Fyrapeel the leopard suggests that the ram be given to Bruun and Ysengrijn as a means of atonement. Thus peace is restored and Reynaert outlawed.

Many different interpretations have been suggested for *Van den vos Reynaerde*. Arendt (1965) interpreted it as a satire on the "wrong world," based on symbolic oppositions within the text (inside-outside, straight-crooked). Peeters (1973–1974) wanted to read it as an historical roman a clef, referring to the contemporary conflict between the Avesnes and the Dampierres over the county of Flanders. Most convincing are the interpretations of Lulofs (1975) and Wackers (1986, 1988). Both start from a contrast between the level of the narrative and the level of meaning. Lulofs stresses the importance of the trial as narrative framework, in which Reynaert appears to be a positive hero by outsmarting his opponents. On the level of meaning Reynaert is negative: he is a devilish seducer. Wackers opposed this interpretation by pointing out that in medieval literary theory the level of meaning always prevails over the level of the narrative. Especially the abuse of language makes it clear that Reynaert is evil incarnate on both levels. The brilliance of Willem is that he presents Reynaert as a very tempting protagonist: when the audience sympathizes with the fox in his viciously outwitting his opponents, it actually sympathizes with a way of life in which the end justifies every means.

Van den vos Reynaerde in its original form was never printed, but a prose version of *Reinaerts historie* was one of the first books to be printed in Dutch (Gouda 1479). It has been reprinted many times ever since, very often with beautiful illustrations and adapted to the needs of the period or to specific audiences (children). Very remarkable is the Latin translation, *Reynardus vulpes*, made by the Flemish poet Balduinus Iuvenis shortly after the Middle Dutch original.

Rhenish Palatinate

About the year 1000 the greatest potential for power in the Rhenish (Rhine River) portion of the archdiocese of Cologne lay in the hands of the family of the Rhenish pfalzgrave (count Palatine). The office of *Pfalzgraf*, or *comes palatinus* (duke of the Palatinate, or palsgrave), was originally exercised by the highest *ministeriales* (ministerials, or officials) of the imperial Pfalz (*palatium*, whence Palatinate) at Aachen. Gradually, they appear as the representatives of the rights of the duke of Lower Lorraine in Ripuarria, that is, the area between the Meuse, the Rhine, and the diocese of Trier. In 916 a Widricus *comes palatii* appears; he is probably the same person as the contemporary count in the Ardennesgau, Bedagau, and Triergau (*gau*=district), the ancestor of the Ardennes dynasty. He was followed by a Herinbertus *comes palatinus* in 959, and by a Hermannus *comes palatinus* in 992 and 993 (this is probably the same Count Hermann who appears in 970 in the Bonngau, and in 975 and 980 in Eifelgau). Hermann in turn was the father of Ezzo (the short form for Ehrenfried), count in the Mühlgau in 996, in the Auelgau in 1015, and in the Bonngau in 1020; in 1023 Ezzo is called *comes palatinus* and in 1027 *advocatus Franciae*. The center of the ducal office in the Pfalz at Aachen gave its occupants on the Rhine axis an important power base.

Ezzo married Mathilda, daughter of Emperor Otto II and Theophanu, and thereby rose into the most prominent group of imperial princes. He was honored and granted lands by Henry II, and when he died in 1034, he was buried in the Abbey Brauweiler, west of Cologne. The Ezzonen (i.e., those of the house of Ezzo) held countships in the Bonngau, the Auelgau, the Ruhrgau, and the Keldachgau in the greater Cologne area; they also were counts in the Eifelgau and in the Zülpichgau, and they supervised the royal *finisci* (treasuries), extensive forests, and over certain trade routes. These latter were controlled by their fortified seats at Brauweiler, the Tomburg near Zülpich, and the Siegburg. They also held the rights of advocacy over important imperial monasteries and foundations (*Stifte*) in Essen, Vilich, Kornelimünster, and Maastricht. In short, the entire south region of the diocese of Cologne lay under the direct influence of the Ezzonen.

Ezzo's son Otto succeeded him as palsgrave, and from 1045 he was also duke of Swabia; he died without heirs in 1047 at the Tomburg. In 1036 another son, Hermann, became archbishop of Cologne, while daughters headed cloisters at Essen, Gerresheim, Nivelles, Gandersheim, Altmünster (near Mainz?), Neuß, Dietkirchen near Bonn, Vilich, and St. Maria in Capitol at Cologne. This generation clearly marked the apex of the family's power.

Tensions arose in the family as Henry I, the son of Ezzo's brother Hezelin (who appears as count in the Zülpichgau in 1020) became palsgrave (1047–1061). Henry and Archbishop Hermann worked more and more in opposition, resulting in Hermann's transfer of the Hauskloster Brauweiler to St. Peter, the patron of the Cologne church, as well as other important pieces of family property. Of greatest significance was the grant of the Tomburg, which dominated the Aachen-to-Frankfurt military road (*Heerstrasse*) to Cologne. With this the archbishopric of Cologne began to encroach on the strategic points of support in the palsgrave's base of power. This was the situation when Anno became archbishop in 1056.

Anno was a stranger to the Cologne region, coming from the middling nobility of Swabia. As palsgrave, Henry used the minority of Henry IV to attempt to reestablish his power base; Anno opposed him. Henry was driven to his fortress at Cochem in 1060 (or 1061) where, in an insane rage, he murdered his own wife, Mathilda, countess of Ahr and heiress of Laach. He was eventually captured and taken to the monastery at Echternach where he died shortly thereafter.

Henry's successor was his minor son, Henry II, who came under the power of the archbishop and was forced to accept the changed realities: in the future, many of the former allodial (belonging to independent estates) possessions of the palsgravelly family were held as fiefs of Cologne. The power of the palsgraves in the region of the Lower Rhine was forever gone; thereafter, it was centered in the Moselle area and on the Middle Rhine. Henry married Adelheid of Orlamünde; they were the cofounders of the abbey at Maria Laach about the year 1093. Henry II, who died April, 12 1095, as the last of the Ezzonen, lies buried there.

The office of *Pfalzgrave* now went to Adelheid's son by her first marriage, Siegfried, count of Ballenstädt, who appears in 1110 as principle advocate of the Treverene Church (*Treverensis ecclesiae principalis advocatus*); he died in 1113. His son and successor, William, was challenged by Count Gottfried of Calw in 1129, a supporter of Emperor Henry V. William prevailed over Gottfried, however, and appears as palsgrave of the Rhenish Franks and of the Palatinate on the Rhine (*comes palatinus Francorum Rheni*, *comes palatinus de Rheno*) from 1129 to 1140; he died without heirs. King Conrad III briefly designated Henry Jasomirgott, the margrave of Austria, as Rhenish *pfalzgrave*, but the latter could not establish himself on the Rhine. There was already a bitter struggle going on between Otto, count of Rheineck (from the house of Luxemburg-Salm), who was at once an heir to the former *Pfalzgrave* Hermann and the husband of Gertrud of Nordheim, widow of *Pfalzgrave* Siegfried and mother of the previous *Pfalzgrave* William, who was a pretender to the pfalzgravelly dignity, and Count Hermann of Stahleck, himself the husband of Gertrud, Margravine of Meissen.

Otto of Rheineck died in 1150, apparently out of grief over the death of his son Otto the Younger, who had been taken captive in 1148 by his rival Hermann. But Hermann of Stahleck did not occupy the Palsgrave's office for long. King Conrad III took from him in 1151 the fortresses Cochem, Clotten, and Rheineck, and his continued conflict with his ecclesiastical neighbors led to his being forced to submit to the humiliation of *Hundetragen* (carrying a dog over a prescribed distance) at an imperial diet at Worms in 1155. Deeply humbled, Hermann died 1158, leaving his ancestral lands near Bacharach to Conrad of Staufen, who in 1155 was enfeoffed by his half brother Frederick Barbarossa with the pfalzgravelly dignity.

Conrad combined the ancient pfalzgravelly possessions in Ripuarria and on the Mosel with the Stahleck allods (estates) on the Rhine; to these he added those lands inherited from his grandmother Agnes, daughter of Emperor Henry IV, in the Nahegau, Speyergau, and Wormsgau, and otherwise on the upper Rhine. These became the basis for the later Rhenish Palatinate. He fortified this all by building fortresses and towns, and although he initially continued the territorial-political quarrels with the archbishop of Trier, he eventually agreed to resign the rights of advocacy over Koblenz to the latter.

Palsgrave Conrad died in 1195 without male heirs, having first provided for the succession to his lands by his daughter Agnes, wife of Henry of Welf, the son of Henry the Lion and the brother of Otto of Brunswick. Pfalzgraf Henry in turn transferred the center of gravity of his possessions from the Middle Rhine (Tomburg, Laach, Cochem, Stahleck) to Heidelberg. He likewise surrendered an important set of rights in 1197, namely, the advocacy of Trier, which he renounced in favor of the archbishop. As had so many of his predecessors, Henry died without male heirs in 1227. His only son, Henry, had been enfeoffed in 1212 with the administration of the pfalzgraviate on Rhine, but he died two years later without heirs. As a consequence, the office of pfalzgrave went over to another line of the house of Welf, that of Bavaria.

During the thirteenth century, the count palatine of the Rhine emerged as one of the four temporal princes to whom, along with the three archbishops of Mainz, Cologne, and Trier, the exclusive right of electing the German king belonged. In a fresco dating to 1355 in the Spanish Chapel in Santa Maria Novella at Florence, the Rhenish palsgrave is shown seated to the immediate left of the emperor, signifying some theoretical preeminence of this office in relation to other German nobles.

Riemenschneider, Tillmann (ca. 1460–1531)

Tillmann Riemenschneider is, perhaps, the best known of all German sculptors active during the years around 1500. His father, also Tillmann, was the mint master in Osterrode in Lower Saxony, but by 1483 the younger Riemenschneider was a journeyman carver in southern Germany. Documents place him in the guild of St. Luke in Würzburg, where he was a master by 1485. His workshop was large and successful, with twelve apprentices registered between 1501 and 1517.

Riemenschneider's two sons were also sculptors. From 1505 Riemenschneider served on the Würzburg Council, and he was burgomaster (mayor) in 1520–1521. In 1525 he was fined for refusing to support the bishop against a peasant revolt.

Riemenschneider's sculpture reveals familiarity with German and Netherlandish styles from a broad area. None of his travel is documented, however, and at least some of these regional styles could have been assimilated through the study of exported sculptures. In addition to his carefully worked surfaces, Riemenschneider is known for his excellence in wood, especially linden wood, as well as stone, primarily alabaster and sandstone. His training

Tillman Riemenschneider, Tomb of Rudolf von Scherenberg (d. 1485), Würzburg cathedral. *Photograph: Joan A. Holladay*

as a stone carver is usually attributed to his North German origins.

Riemenschneider was an innovative wood carver, experimenting with unpainted surfaces in such early works as the Münnerstadt altarpiece of 1490–1492, the artist's first dated work. This winged altarpiece, dedicated to Mary Magdalene, is currently divided between the Münnerstadt parish church and the museums in Munich (Bayersches Nationalmuseum) and Berlin (Staatliche Museen Preussischer Kulturbesitz). Recent conservation has removed later gilding and polychromy (painting) to reveal Riemenschneider's extraordinarily careful attention to surface detail and nuance, akin to sculptures on a smaller scale, such as ivory carving. The success of Riemenschneider's unpainted sculpture is seen in such works as the great altarpiece of the Holy Blood (ca. 1499–1505) still in situ in the Jakobskirche in Rothenburg, and the lindenwood sculpture of Saints Christopher, Eustace, and Erasmus (1494), a fragment of a relief originally representing fourteen helper saints, now in the Metropolitan Museum of Art in New York City (The Cloisters). All these works reveal Riemenschneider's ability to carve refined drapery and flesh as well to reveal the underlying bone structure. Shortly after the completion of the Rothenburg altarpiece, Riemenschneider created the Creglingen altarpiece (Herrgottskirche, ca. 1505–1510) representing the Assumption of the Virgin in a more elaborate and complex style than the earlier works.

Riemenschneider's works in stone include the sandstone figures carved for the Marienkapelle in Würzburg, including the figures of Adam and Eve (1492–1493), and the nine apostle figures of 1500–1506 (all these now in the Mainfränkisches Museum, Würzburg). Among his most extraordinary achievements, however, are the few surviving works in alabaster such as the Angel and the Virgin Annunciate in Amsterdam of about 1480–1485 (Rijksmuseum), and the St. Jerome with the Lion in Cleveland (Museum of Art), which probably dates before circa 1495. Like some of the linden wood sculptures, these works are sparingly decorated with polychrome and gilt highlights, but they rely on the fineness of the carved surface for their impact.

In addition to altarpieces and architectural sculptures in wood and stone produced for churches in and around Franconia, Riemenschneider's career can be traced through several tomb monuments that attest to his prestige. As early as about 1488 Riemenschneider carved the monument of Eberhard von Grumbach (d. 1487) now in the parish church at Rimpfing, depicting the knight in full Gothic armor in relief. The same format is repeated in the tomb monument of Konrad von Schaumburg (d. 1499) in the Marienkapelle in Würzburg. This work, however, of about 1502 is more mature in style, more portrait than effigy. Much grander in scale is the sandstone and marble monument of Archbishop Rudolf von Scherenberg (d. 1495) in the cathedral of Würzburg. Most impressive is the limestone and sandstone tomb of Emperor Heinrich II and Empress Kunigunde (1499–1513) in the cathedral of Bamberg. Below the relief of the imperial couple are a series of six relief panels illustrating scenes from their lives. Finally, around 1520 Riemenschneider carved the sandstone and marble monument of Archbishop Lorenz von Bibra in Würzburg Cathedral.

Robertians

The Capetian kings ruled the west Frankish kingdom, lands that would come to be recognized as "France," from the accession of Hugh Capet in 987 to the death of Charles IV in 1328. The ancestors of this royal dynasty, however, are identified by modern scholars not as Capetians but rather as Robertians.

The Robertians can be traced with confidence back to the first half of the ninth century, when the family's namesake, known to us as Robert the Strong, moved west across the Rhine from the east Frankish lands into the kingdom of Charles the Bald. From the king he received some benefices and then, beginning in the early 850s, a number of offices and lands in Neustria. For the next decade, Robert was one of the most powerful and prominent men in the west Frankish kingdom and, despite his participation in a rebellion against the king, he was generally a loyal supporter of Charles. When he died in 866, he left behind two young sons who did not inherit his offices, but it was not long before most of Neustria was again under Robertian control. In fact, it was not long before there was a Robertian king of the Franks. In 888, after Charles and four other kings—Carolingian kings—had died in just over a decade, the west Frankish magnates deemed the only Carolingian heir too young to rule. Beset by threats of invasions from Northmen, they elected Robert's eldest son, Odo, as their ruler. Odo had, by that time, recovered most of his father's lands and offices, and as count of Paris, he had distinguished himself as a successful military leader in the defense of the city against Northmen in 886. During his reign, Odo bestowed numerous offices on his brother Robert, who built up and consolidated the Robertian lands in Neustria. When Odo died in 898, however, Robert did not become king. Rather, Odo was succeeded by the Carolingian Charles the Straightforward, whom the Franks had passed over a decade earlier and who had claimed the throne for himself in a rebellion against Odo in 893. Robert appears to have accepted the agreement for the succession reached by Odo and Charles, and he remained a loyal supporter of the king throughout much of Charles's reign. But the relationship between Charles and Robert and, for that matter, between the king and most of the west Frankish leaders, deteriorated in the late 910s. In 922, the Franks renounced Charles and elected Robert as their king. Robert was never able to establish his rule, however. He died in a battle with Charles in 923.

Although he never ruled as king, Robert's son Hugh—later nicknamed "the Great"—was no less prominent in Frankish politics than his father and uncle had been. In the mid 910s, while Robert and Charles were still on good terms, the king conferred on Hugh the inheritance of his father's lands. Hugh later orchestrated the accession of Charles's son, King Louis IV, in 936, and received from the new king the title *dux Francorum* (duke of the Franks), which enhanced his authority in Neustria and extended it north of the Loire. But like the rest of his lineage, Hugh found himself at times in conflict with the Carolingians. Indeed, during the late 930s and much of the 940s, Hugh and Louis had competing interests as they negotiated the hazards of shifting alliances among Frankish leaders. But the two men reconciled in the early 950s. And not long after their deaths in 954 (Louis) and 956 (Hugh), the king's son and heir, Lothar, granted Hugh's son, Hugh Capet, the ducal title. Although this Hugh jostled with other magnates and, at times, with the king to consolidate and extend his own power within the kingdom, like his father and grandfather, he appears to have had no evident royal ambitions—at least not until later in life. When Lothar died in 986, and his son Louis V died without a child in the following year, a gathering of Frankish leaders then elected Hugh as their king. Unlike any of his ancestors and in the face of some opposition, Hugh took steps to secure the throne for his dynasty: six months after his own accession he associated his son Robert to the throne, a move that, if only in retrospect, transformed the Robertians into the Capetians.

Rodenegg

Murals in the castle at the village of Rodeneck/Rodengo, near Brixen (French/Bressanone) in South Tyrol, depict the story of Iwein. Eleven scenes start with the hero's departure to seek adventure, then continue with his encounter with the wild herdsman, his combat with Ascalon, the death of Ascalon, and the search for Iwein, and end with Iwein kneeling before Laudine as Lunete looks on. No evidence suggests that additional paintings have been lost. Stylistically related to religious works in Brixen, the paintings are the work of an anonymous painter and date from the 1220s to the 1230s. Early attempts to connect them with a "painter Hugo" and to place them in the first decade of the thirteenth century have proved untenable. The "incompleteness" of the narrative as compared to Hartmann von Aue's *Iwein* has posed a challenge to literature-oriented interpreters, many of whom have assumed

Rodenegg Castle, final scene: Lunete presenting Yvain to Laudine. *Photograph: courtesy of Leonhard Graf von Wolkenstein-Rodenegg.*

that viewers were intended to read the final scene as standing for the entire episode of Iwein's marriage to Laudine. However, the rather bleak closing image gives no indication of future love, happiness, or marriage. Even preinformed viewers who can mentally "complete" the story are left with a lingering image of grief and despair. Moreover, the artist has given a central position to the Lamentation-based rendering of Ascalon's death and visually juxtaposed scenes of adventure and combat with scenes of loss, despair, and grief. In general, the narrative appears to question sharply the values of knightly adventure and of the romance genre.

Roger of Helmarshausen

An early-thirteenth-century copy of a document dated August 15, 1100, records the payments made by Henry of Werl, bishop of Paderborn, to the abbey of Helmarshausen for a cross and a container (*scrinium*) dedicated to Saints Kilian and Liborius made by the monk Roger (*Rogkerus monachus*). The container has been identified with the portable altar with images of the two saints and Henry preserved in the Diocesan Museum in Paderborn. The distinctive character of Roger's drawing style with characteristic nested V-folds, here conveyed in niello on silver, has led scholars to attribute a number of other high-quality works in metal to him. A second portable altar from the Abdinghof Monastery (now also preserved in the Diocesan Museum in Paderborn) has been identified with Roger's own hand by stylistic comparison of details of its movemented, narrative scenes with the more formal, hieratic images of the Kilian and Liborius altar; its images in silver-plated copper represent the martyrdoms of Sts. Blasius and Felix. The reliquary cross from the church of Saints Dionysius at Enger (Berlin, Kunstgewerbe Museum) has been associated with the cross mentioned in the Werl document cited above (Lasko 1992:79, 103). Many other works have also been associated with the hypothetical "workshop" of Roger based on stylistic and iconographic similarities; these include, for example, the cover of a Gospel book now in Trier (Cathedral Library, Ms. 139) and the backplate of a cross with the engraved image of St. Modoaldus, whose relics were transferred from Trier to Helmarshausen in 1107 (Cologne, Schnütgen Museum).

Eckhard Freise has found entries mentioning a monk Roger (with different spellings) in records of prayer confraternities at Benedictine houses in Stavelot and Cologne, as well as at Helmarshausen, and on this basis has constructed a hypothetical itinerary for Roger's monastic career. According to Freise, Roger would have been a monk at the Benedictine abbey at Stavelot until soon after 1100, when he moved to St. Pantaleon in Cologne; from 1107 until his death soon after 1125, he lived and worked at the abbey at Helmarshausen. Freise's chronology calls into question the date of 1100 for the document that has been used to date the Kilian and Liborius portable altar and to situate Roger in Helmarshausen at that time, since it places Roger in Cologne at the Benedictine monastery of St. Pantaleon until 1107. Westermann-Angerhausen has painstakingly reviewed many of the consequences of Freise's work on the accuracy of the date of the Werl document and traditional chronology of Roger's oeuvre, both of which assume him working already at Helmarshausen at the beginning of the twelfth century. By redating the portable altars in the 1120s, they are closer in date to the stylistically comparable illuminations from the scriptorium also associated with Helmarshausen, for example, the Gospels now in the J.Paul Getty Museum in Los Angeles (Ludwig Ms. II.3). So although Roger may lose his primacy as initiator of the nested-V fold style, his works now fit more comfortably with a larger group from the third decade of the twelfth century (Westermann-Angerhausen 1992:70–71). It remains clear that Roger's nested V-fold style links him with Mosan metalwork, but questions as to where he was trained and the precise source of his metalworking traditions have not yet been satisfactorily resolved.

Interest in Roger's career is heightened by the widely accepted identification of him with the author of the *De diversis artibus* (*On Diverse Arts*). The text is now generally dated early twelfth century, when Roger is known to have worked, and the existence of a rubric in the very early Vienna copy of the text (Österreichische Nationalbibliothek, Ms. 2527) states that its author, who calls himself Theophilus, was actually Roger. The treatise has been associated with a Benedictine monastery because of the prologues, which can be identified with Benedictine theology, and thus strengthens the identification of Roger with the author of the treatise. The text includes most extensive instructions for "how to do" metalwork, including many techniques used by Roger himself, but there is not complete congruence of Roger's techniques and those described in the treatise. Thus, if Roger was involved, he was adapting the knowledge of others and possibly material from earlier texts, since practices already out of date at the beginning of the twelfth century are included in the treatise.

Roland and Charlemagne, Illustrations

From the modern point of view it is easy to distinguish the historical realities of Charlemagne and Roland from the legendary and literary traditions that developed around these figures. From the medieval point of view it is probably impossible. Charles and Roland were historical figures, popular saints, and political icons of immense importance. The visual reception of these figures reflects this status. Throughout Europe, especially in the earlier period, Charlemagne and Roland tend to appear in monumental works of art in highly public places—church sculptures, stained glass windows, mural paintings. In the German language area, such public works include the golden shrine of Charlemagne in Aachen (ca. 1200–1215), decorated with scenes from the emperor's life, and two reliquaries also in Aachen, one for Charlemagne's arm (ca. 1165) and one (portraitlike) for his skull (ca. 1350). Charlemagne also appears in numerous representations of the Nine Worthies, for example, in the Hansasaal at Cologne and in the "triads" at Runkelstein. Highly visible today are close to forty statues of Roland, mostly in northern Germany, but scattered as far as Prague, Modena, Verona, and Dubrovnik.

The French *Song of Roland*, belonging to the oral sphere, remains unillustrated throughout its textual transmission, though in the thirteenth century and later the Charlemagne/Roland material is illustrated in a large number of *chansons de geste* and chronicle manuscripts from France. In Germany, the situation is different, reflecting the perceived "literariness" of the *Roland* adaptations and the political importance of the Charlemagne/Roland material. Pfaffe Konrad's *Rolandslied* was probably illustrated from the beginning of its manuscript tradition. The only complete manuscript (Heidelberg, Universitätsbibliothek, cpg. 112), dating from the end of the eleventh century (possibly as early as 1170), with its thirty-nine pen drawings, is one of the earliest illustrated German manuscripts of a secular text.

Der Stricker's *Karl der Große* is lavishly illuminated with full-color miniatures on gold ground in two luxury manuscripts: St. Gall, Stadtbibliothek und Bibliotheca Vadiana, manuscript no. 302 Vad., made in Zürich ca. 1300, has fifty-eight miniatures; and the twenty-three folios remaining from a southwestern German manuscript of the early fourteenth century (Berlin, Staatsbibliothek Preußischer Kulturbesitz, no. mgf 623) contain three full-page miniatures. Two mid-fifteenth-century manuscripts (Bonn, Universitätsbibliothek, Ms. germ. fol. 136 and Hamburg, Staats- und Universitätsbibliothek, Cod. germ. 19) also contain Stricker's *Karl*. Beyond these, at least three German chronicle manuscripts contain visual responses to the legends of Charlemagne and Roland.

The sociopolitical, representative significance of Charlemagne and Roland persisted throughout the Middle Ages, as attested, for example, by the appearance of Charlemagne as representative ruler in a number of legal manuscripts. At the threshold of the modern era, Charles and Roland appear as saints in a work of propagandistic Habsburg genealogy, *Die Heiligen aus der Sipp-, Mag- und Schwägerschaft Maximilians I*, which exists both in illustrated manuscripts and as a woodcut series.

Roman de la Rose, Dutch

Two Middle Dutch translations of the French allegorical poem *Roman de la Rose* (Tale of the Rose) have come down to us: the anonymous Flemish *Rose* and Heinric's *Die Rose*. These two texts go back to two distinct groups of French manuscripts and must have come into being independently. We do not know which of the two Middle Dutch texts is older, nor whether the two poets knew each other's work.

The author of the Flemish *Rose* is not known, but the work reveals a poet of exceptional stature. The text is incomplete. Nine fragments have survived, originating from two codices and forming a total of nearly three thousand lines. The older manuscript is dated at about 1290, so the Flemish text must have come into being not long after the French model was completed (1269–1278). The story as we know it from the *Roman de la Rose* has been changed drastically. With the dream having been omitted, the Flemish *Rose* has a completely new framework. Here we have a first-person narrator who introduces himself as a clerk. He relates how he once met Jolijs and Florentine, a perfectly happy couple. Jolijs told him that he had received Florentine as a reward for his loyal services to Cupid. The clerk, who introduced himself as *Minre met Groter Quale* (lover with a Serious 111-ness), thereupon asked Jolijs to tell him the entire story as he hopes to learn what love is and how he himself should act to become a happy lover, too. In reply, Jolijs told him the story of the lover in the garden that in the Old French source is the account of the poet's dream. In the remainder of the Flemish text, Florentine reappears several times. Here, however, she has largely taken over the role of Bel Accueil in the original. For the most part, the discourses the allegorical figures deliver are faithful renderings of the Old French. This might mean that the poet considered these passages to be the essence of the text and therefore chose not to make major changes.

The other Middle Dutch translation, *Die Rose*, came into being at about the same time (the oldest manuscript dates back to ca. 1325), but originated in another region: Brabant rather than Flanders. The poet calls himself Heinric. He has been identified as Heinric van Aken, but there is no evidence for this. *Die Rose* is a fairly faithful translation with extensive abridgements, especially in the part by Jean de Meun. The most conspicuous change is the omission of the episode on *Natura* (nature personified) and Genius.

Introduction

The term "Romanesque" derives from the resemblance of the monuments of this period to the works of ancient Rome, both the city and the larger empire; one thinks immediately of the Roman triumphal arch that served as a model for numerous church facades. But this label is an invention of the early nineteenth century, and thus the connection to Rome should not be drawn too insistently. Romanesque is primarily a style of churches and cloisters and the decorative arts associated with these sites, and as such is tied to imperial and papal tradition. Since Kubach, German scholarship has traditionally divided the period into the pre-Romanesque (eighth until early tenth century), the early (tenth to eleventh century), high (ca. 1100–1140), and late Romanesque (mid-twelfth to mid-thirteenth century). American scholars tend to label the two earlier subdivisions "Carolingian" and "Ottonian," corresponding to the political powers at the time and the family groups that provided the major patrons of these buildings.

Architecture

While certain features characteristic of the Romanesque were already present in the tenth century, such as the ambulatory, which first appears in the cathedral of Clermont-Ferrand in France (consecrated in 946?), the full Romanesque style is marked by the use of modules, usually the square, in the plan and elevation and by the clarity of the spatial organization, especially visible from the building's exterior. Romanesque churches are further characterized by crypts, galleries, cross vaults, transepts, and nave bays that correspond to two bays of the aisle.

The facades of Romanesque churches derive from the Carolingian and Ottonian westwork, as seen in Corvey (873–885), where an almost independent structure precedes the nave, and St. Pantaleon in Cologne (late 10th c.). The three-tower group, found, for example, at the abbeys of Marmoutier in Alsace (mid-12th c.) or Maria Laach (ca. 1200), can be seen as a follower of the westwork, although it lacks the same independence. The two-tower facade, as seen in the abbey church at Königslutter, is also typical.

The double-choir arrangement, in which an apse at both the east and the west end of the church houses an altar and choir stalls, goes back to ancient Roman models. The type appears in the Carolingian period, at Fulda (ca. 800), for example, and in numerous Ottonian examples. Among them are the abbey church in Hersfeld (after 1037), and the church of St. Michael (1010–1033) in Hildesheim. The church of St. Godehard in Hildesheim (begun in 1133) and the cathedrals at Worms (after

Cologne, St. Kunibert, east end. *Photograph: Joan A. Holladay*

1171) and Mainz (1181–1239) provide examples of the double choir layout from the Romanesque period.

The double-choir church of St. Cyriacus at Gemrode in Saxony, built by Margrave Gero (d. 965) in the tenth century and supplied with a western choir in the twelfth, offers the earliest example of the use of galleries in Germany. They may be related to the building's function as a foundation for women, whose separation from other churchgoers was necessary.

The invention of the cubiform capital, which provides a perfect transition from the square abacus to the round column below, provides a clear geometric alternative to the more elaborate Corinthian capital. It appears first at the church of St. Michael at Hildesheim (1010–1033), from which it develops a variety of forms to become a standard feature of the Romanesque.

The windows of Romanesque buildings are typically round-headed, cut into the wall with tapered edges or decorated with columns at the sides. Sometimes they are grouped in twos or threes; in the late Romanesque, the

Cologne, St. Kunibert, interior. Photograph: Joan A. Holladay

middle one is sometimes taller than those framing it. Elaborate portals, stepped back into the wall as at Speyer (mid-11th c.), or decorated with columns or figures, as at the so-called Golden Portal (Goldene Pforte) at the cathedral of Freiberg in Saxony about 1230, also begin to appear. The stone is always carefully worked in contrast to the fragments and found stones of earlier periods. The high quality is accentuated in the eleventh century by the use of ashlar (hewn and dressed stone) masonry; in the north, brick is also used, especially for cathedral and cloister churches.

As the necropolis for the Salian emperors, the cathedral at Speyer (begun ca. 1030) served as an important model for Romanesque churches. The still unfinished building was consecrated in 1061; it was completed in a second campaign between about 1080 and 1106. The building's crypt is divided into separate spaces under the choir, crossing, and transept. These spaces are all vaulted, with the vaults supported on columns with cubiform capitals. The vaulting at Speyer plays an important role for the Romanesque. Here not only small spaces, such as crypt and aisle bays and chapels, were vaulted in stone, but, in a renovation to the originally wood-ceiling building, the nave too was, for the first time, given cruciform vaults about 1100. This represents a surpassing of the model, for in both ancient and medieval Rome, naves were typically left open to the wood roof.

The collegiate church at Königsutter in Lower Saxony, begun by Emperor Lothar of Süpplingenburg in 1135, marks the beginning of the late Romanesque, characterized by the more vertical multistoried structuring of the eastern apse. The figural ornament on the apse arcades indicates the participation of north Italian artisans. This building allies modest monastic architecture, now without a crypt, with late Romanesque decorative display. Cologne's numerous late Romanesque churches, for example, St. Gereon with its east choir dated between 1151 and 1156, predict the transition from Romanesque to Gothic in the thirteenth century, with their apses articulated in three or four stories (crypt, main story, upper story or gallery, and dwarves' gallery).

The monastic church of the Benedictines at Maria Laach (ca. 1220) is preceded to the west with an elaborately decorated Paradise or atrium, defined by three wings around an open courtyard. The round arcades are accented by moldings, and columns member the stepped portal at the west. Of the three towers over the west facade (12th and early 13th c.), the outer two are round with moldings while the center one is square in plan and structured with moldings, windows, and arcades.

The chapel of St. Gotthard at the cathedral of Mainz was completed about 1137 as the bishop's private chapel. It is typical of the court chapels of the period. It is built on a square plan with a small choir with rounded apse; its two stories are each supported by four columns. As at the palace chapel at Aachen, which served as a model for chapels of this type, the ruler, from his position at the western side of the upper story, would have had a direct view onto the mass performed at the altar below. Most of the Salian and Hohenstaufen palaces exist today in ruins; only parts of the fortification walls and palace buildings with their grouped window arcades still stand. Thus the remaining palace chapels are of particular importance. These take two basic forms: the extended form, as in Kaiserslautern (before 1160) and Gelnhausen (about 1180), and the two-story central structure with four interior supports, as in the chapel at Mainz. Examples of this latter type include the palace chapel of the landgraves of Thuringia at Landsberg near Halle (about 1170) and those at the imperial palaces at Hagenau in Alsace (about 1175, destroyed in the seventeenth century), Nuremberg (1170–1180), and Eger (1220–1230). The two-story chapel of St. Clement at Schwarzrheindorf, consecrated in 1151, deserves special mention for its painted interior and spatial clarity. In addition, the dwarves' gallery, which runs around the entire exterior of the building, is typical of late Romanesque.

Although the church of St. Elizabeth in Marburg, started in 1235, marks the beginning of the Gothic in Germany, buildings continued to be built in the Romanesque style for some time thereafter.

Ivories

A long-established workshop tradition made it possible for Germany to prosper in the area of ivory carving during the Romanesque period, in spite of a severe shortage of elephant tusks. While sculptors continued to work with small pieces of elephant ivory whenever possible, they more often turned to the more readily available materials of walrus ivory and bone. Eleven related plaques distributed in museums in Europe and the United States attest to the skills brought to the craft of walrus tusk carving during this period. The large square panels, perhaps created for the front of an ambo (pulpit), are each made up of several smaller pieces of walrus ivory. Characterized by small nicks that emphasize the folds of the drapery, these pieces of the so-called *gestichelte* (pricked) style are variously dated from 1110–1130 to 1170. They all depict scenes from the life of Christ, using iconographic schemes borrowed from Ottonian manuscript illumination. Their sinuous line, gently rounded volumes, and oval heads in three-quarter profile link them to monumental sculpture in Cologne.

With workshops specializing in book covers, game pieces, reliquaries, and portable altars, Cologne was a prominent ivory-producing center during the twelfth century with a thriving export business throughout Europe. Some thirty examples of octagonal or tower reliquaries all decorated with figures of the apostles still survive, a tribute to Cologne's "mass-production" of reliquaries made from bone. Rhenish carvers also collaborated with goldsmiths to create elaborate reliquaries that combined ivory or bone with gold, silver, and enamel. The Eltenberg Reliquary at the Victoria and Albert Museum in London demonstrates the proficiency with which these artists, using in this instance walrus ivory, could create large mixed-media objects dazzling for their rich effects.

Manuscript Illumination

Manuscripts painted in a Romanesque style were produced from the latter eleventh into the thirteenth centuries in the German provinces. This style, generally characterized as linear and stylized, concentrated on line and pattern in both figural treatments and backgrounds. The division of draperies into separate units and repetition of shapes within each unit contribute measurably to the stylized aspect of Romanesque painting. Figures and their settings were rendered by means of pen-and-ink drawing or full-body color in varying combinations. Major goals

Eneide (Staatsbibliothek zu Berlin—Preußischer Kulturbesitz, Ms. Germ. Fol. 282), fol. 17v: death of Dido. Photograph: Staatsbibliothek zu Berlin—Preußischer Kulturbesitz

were to contour faces and to give figures substance and weight. Backgrounds were often composed of reiterated shapes, an inner area nesting into the outer, one usually blue, the other green. Gold backgrounds were chosen for the most elaborate productions.

Framed miniature paintings and ornamented initials were the primary decorations of Romanesque manuscripts, enriching the codices visually and conceptually as they indicated textual divisions. The size and complexity of these established a hierarchy of decoration that corresponded to the importance of the text being introduced. The initials were one of the most varied aspects of Romanesque book illumination; they were decorated with vinescroll ornament, single figures, or narrative scenes. Both miniatures and initials were often subdivided into compartments. Rather than use

Ornamental frames around introductory phrases in the Romanesque illuminators did, Romanesque scribes usually placed these phrases directly into text columns. German Romanesque manuscript production was chiefly the work of those committed to religious lives; knowledge of it can be only partial because the output of some of these monasteries is entirely lost. The names of some of the scribes and artists, among them women, have been preserved in dedicatory verses or illustrations.

Many new types of manuscripts were produced in the Romanesque period; among these were world chronicles, encyclopedias, saints' lives, modern and ancient authors, in addition to the liturgical texts, bibles, gospel books, psalters, and writings of the fathers of the church that had been the staples of manuscript production. Psalters were copied for private devotions as well as for community worship. Among liturgical texts, the development of the missal to combine the pericope (liturgical readings) book and the lectionary was a Romanesque phenomenon. An explosive growth in production of giant bibles took place during the Romanesque period, perhaps owing to increased demand as the number of monasteries grew or to the stimulus of the giant bibles created in Italy. These were generally multivolume illustrated bibles, approximately three feet by two feet in size.

A major characteristic of the Romanesque period was its compulsion to organize; thus every effort was made to arrange clearly both the contents and the decoration of manuscripts. Miniatures were devised to illustrate the moral allegories thus constructed in the encyclopedias and various teaching and devotional manuals. In the bestiary, some animals were associated with biblical figures, for example, the unicorn with the Virgin. The typological approach juxtaposed Old and New Testament events based on their prefiguring or fulfillment relationship.

The roots of German Romanesque painting lie in Ottonian art, and it was influenced by Mosan, northern French, Italian, and Byzantine art. Similar artistic objectives and styles prevailed throughout the five main manuscript-producing areas of Germany: the duchy of Swabia (which also included Alsace), the Rhineland, Saxony plus Westphalia and Thuringia, the Salzburg region, and Bavaria.

The German Romanesque style was inaugurated in Swabia, where the monasteries of Hirsau, Zwiefalten, and Weingarten were the most active manuscript producers. Hirsau's manuscript production was linked to its role as a pioneer in the reform movement of the early Romanesque period. Henry IV's gift to Hirsau of an Italian giant bible may have launched the period of greatest activity in its scriptorium. Hirsau provided its daughter houses their basic manuscripts; those became models for subsequent copies. Although much of the output of Hirsau is lost, many illuminated manuscripts produced at Zwiefalten, its daughter house, are extant and remain the single largest group of Swabian Romanesque manuscripts. In the eleventh century Judith of Flanders gave Weingarten—the Guelph (Welf) family monastery—a group of Anglo-Saxon and Flemish manuscripts that provided a wealth of models and ideas for those it made in the following century. The magnificently illuminated Berthold Sacramentary (New York, Pierpont Morgan Library, no. M. 710) was the culmination of this activity. The finest manuscript produced in Alsace was the *Hortus Deliciarum* (*Garden of Delights*). Using texts and images drawn from a number of sources, Herrad, abbess of Hohenbourg, constructed in it a universal history of salvation centered on the life of Christ. Although the sole manuscript of this text was destroyed in 1870, much of its text and imagery had been recorded and has been reconstructed.

In the Rhineland, much manuscript production echoed Ottonian stylistic traits and drew on Ottonian models. Rhenish Romanesque depictions of single figures such as prophets mirrored its contemporary revival of stone sculpture. The close interplay between Mosan metalwork and manuscript painting here is revealed in the production of several scriptoria, among them Arnstein, St. Martin, and St. Pantaleon. Hildegard, abbess of Bingen, was a prolific writer best known for two books describing her visions, *Scivias* (Heidelberg, Universitätsbibliothek, Cod. Sal. X 16) and *Liber divinorum operum simplicis hominis* (Lucca, Bibliotheca Statale, no. Cod. lat. 1942). Important giant bibles copied in the Rhine region that have survived include the Arnstein (London, British Library, Harley Ms. 2799), Pommersfelden (Pommersfelden, Gräflich Schönborn'sche Schlossbibliothek, Mss. 333–4), and Worms (London, British Library, Harley Ms. 2804) Bibles.

Saxony's Romanesque manuscripts also reveal clear stylistic and iconographic relationships with Mosan painting and metalwork. Corvey, Goslar, Hildesheim, Halberstadt, and Helmarshausen were the most important monasteries in this region. Theophilus, the author of an early-twelfth-century artist's handbook, *De diversis artibus*, was probably a monk of Helmarshausen. This scriptorium was active by mid-century, and in the late twelfth century it came under the direct patronage of Henry the Lion (Wolfenbüttel, Herzog-August Bibliothek, no. MS Guelph 105. Noviss. 20). Giant bibles produced in Saxony include the Hamersleben (Halberstadt, Dombibliothek, Cod. 1–2), Merseburg (Domstiftsbibliothek, Cod. 1–3), and Mildenfurth (Jena, Universitätsbibliothek, Ms. Elect. theol., fols. 12 and 14) Bibles.

Salzburg was the center of Romanesque artistic developments in the area now known as Austria. Italian art was a great influence here; additionally, Byzantine stylistic and iconographic influences penetrated this region by way of Italy. The styles espoused in Salzburg were adopted throughout the whole region, with specific influences weakening as the distance from Salzburg increased. In Salzburg itself the monasteries of St. Peter and St. Erentrud produced many significant manuscripts, including the Antiphony of St. Peter (Vienna, Österreichische Nationalbibliothek, Cod. Ser. Nova 2700) and the Admont Bible (Vienna, Österreichische Nationalbibliothek, Cod. Ser. Nova 2701–27102) at the former and a Pericope Book (Munich, Bayerische Staatsbibliothek, no. Clm 15903) and an Orational (Munich, Bayerische Staatsbibliothek, Clm 15902) at the latter. A giant Bible (Stiftsbibliothek, Cod. perg. 1) and a breviary (Munich, Bayerische Staatsbibliothek, Clm 8271) were produced for the nearby monastery of Michaelsbeuren. Other monasteries with active scriptoria at this time include Admont, St. Florian, and Mondsee, all significantly influenced by Salzburg's manuscript painting. Cistercian manuscripts produced by such houses as Zwettl and Heiligenkreuz were decorated more simply than those by the other Benedictine houses.

Bavarian manuscript illumination was impacted greatly by Salzburg, both stylistically and iconographically. Bavarian decoration was often pen-drawn rather than fully painted and characterized by conceptual lucidity and economy of detail. The major centers of Regensburg and Prüfening produced works so closely related in script and illumination that they are practically impossible to distinguish. Notable productions include copies of the works of Ambrose, Isidore, Rabanus Maurus, as well as saints' lives and miscellanies. The lavishly illustrated Erlangen Bible (Universitätsbibliothek, Cod. 1 perg.) was owned by a house of canons in Ansbach and may have been made in Regensburg.

Illuminated manuscripts are the best-preserved store-house of German Romanesque painting styles. It is mainly through this body of evidence that we are able to trace stylistic developments from Ottonian through Romanesque into Gothic painting. By the 1230s the *Zackenstil* (zigzag style), a late Romanesque style transitional to Gothic, came into use in most of the German regions. The *Zackenstil* was introduced in Thuringia in the early thirteenth century.

Metalwork

We are fortunate to be informed about the craft of the Romanesque metalworker in Germany by one of its practitioners, identified as Theophilus Presbyter. Evidence suggests that Theophilus might be one and the same as the great Lower Saxon metalworker Roger of Helmarshausen. The treatise *De diversis artibus*, written in the early twelfth century, describes the tools of the workshop and a wide variety of techniques including casting and repoussé (relief on reverse side) decoration as well as niello (black incised designs) and enamel. The techniques and materials described by Theophilus correspond closely with extant examples of Romanesque metalwork.

The surviving monuments convey the range of the Romanesque craftsman in metal. In addition to precious liturgical objects for the altar, large-scale objects were among the major ornaments in Romanesque churches. Bronze doors decorated major buildings, and wooden doors were fitted with elaborate wrought iron hinges and cast bronze door pulls (or sanctuary rings) in the form of lions' heads. The font by Rainer of Huy in Liège demonstrates the mastery of bronze casting already available to metalworkers at the beginning of the twelfth century. Churches were decorated with monumental sevenbranched candlesticks such as the example in the cathedral of Braunschweig, as well as great wheel-shaped chandeliers such as those at Aachen and Gross-Komburg. Large-scale bells also figure in the production of the Romanesque metalworker, although they are usually not elaborately decorated. Smaller-scale objects include censers (incense-burning vessels), aquamaniles (ewers used in Mass), altar candlesticks, chalices and patens, crucifixes and cross bases, portable altars, retables (religious paintings on panels), and altar frontals. Reliquaries became increasingly large,

Shrine of St. Heribert (Cologne-Deutz, Church of St. Heribert). Photograph: Rheinisches Bildarchiv der Stadt Köln

particularly in the Meuse valley and Cologne, where the architectural form of the house-shrine became dominant.

German metalwork was concentrated in the Romanesque period primarily in two geographic regions—Lower Saxony, and the Meuse valley and Cologne—both of which had been metalworking centers in earlier times. The early Romanesque metalwork of Lower Saxony is best seen in the work of Roger of Helmarshausen from about 1100. Roger's surviving monuments include the portable altar in Paderborn (cathedral treasury), made for Bishop Henry of Werl (1084–1127), a portable altar from Abdinghof Abbey (Paderborn, Franciscan church), and the cover of a Gospel book from Helmarshausen in Trier (cathedral treasury). Roger's work is characterized generally by a strong graphic quality and a fondness for nested Gothic V-folds in particular. His work had a lasting influence throughout Germany during the twelfth century.

In the Meuse River valley just after 1100 the cast bronzes of Rainer of Huy had a seminal influence comparable to that of Roger of Helmarshausen in Lower Saxony. Best seen in the great baptismal font now in the church of St. Bartholomew in Liège (1107–1118), Rainer's work is the most significant manifestation of classicism in early Romanesque metalwork. The classicizing tradition continued in the Meuse and Cologne areas throughout the twelfth century, as seen in such works as the great enameled objects made for Stavelot Abbey in the 1140s, the St. Bertin cross base of about 1150–1160, the great house shrines such as the St. Servatius shrine, and continuing to the work of Nicholas of Verdun in the late twelfth and early thirteenth centuries. Nicholas of Verdun's work, such as the Klosterneuberg Altarpiece (Klosterneuberg Abbey Church), the Shrine of the Three Kings (Cologne Cathedral), and the Shrine of the Virgin (Tournai Cathedral), is recognized as one of the strongest classicizing statements of the western Middle Ages.

Mural Painting

Despite subsequent additions to the literature, Otto Demus's 1968 survey (published in English translation in 1970) provides other scholars with what remains the essential basis for the study of Romanesque wall painting. From Lower Saxony through Westphalia, Bavaria, and Austria and from the Ottonian antecedents of Romanesque painting to the last Gothic phases of the *Zackenstil* (zigzag or jagged style) in the thirteenth century, he outlines issues that scholars continue to address. Undoubtedly the most controversial has been his emphasis on the Byzantine sources of Central European painting, although especially with regard to thirteenth-century painting his observations have held up under the detailed scrutiny of other scholars. He also noted the importance of iconographic innovation in the formulation of the programs of wall paintings, for while the basis of many programs remained Old and New Testament cycles and saints' lives, changes were introduced, including program concepts based on Byzantine or Sicilian dome and apse decoration, as, for example, in the All Saints' Chapel at Regensburg dated around 1165. Other new programs were based on the writings of Rupert of

Deutz and Honorius Augustodunensis and other political issues that those addressed in the apse frescoes at Prüfening near Regensburg. Fresco painting was found throughout Europe before the Romanesque period, and thus Demus begins his discussion of Romanesque wall painting by looking at remaining Ottonian cycles, especially in churches at Reichenau dated around the year 1000. In their subject matter and their linear painting and facial types can be found the origins of twelfth-century paintings such as those in the parish church of Idensen, which was founded as the private chapel of the Bishop of Minden, and was painted between about 1120 and 1140. As with other wall paintings, the best comparisons for these frescoes are in illuminated manuscripts, in this case from the major center at Helmarshausen. Mid-twelfth-century and slightly later frescoes found at the Nonnberg Convent at Salzburg, at Purgg, in the Rhineland at Schwarzhemdorf, and eventually at Prüll near Regensburg, among other sites, show familiarity with Byzantine or Byzantinizing church decoration or even manuscripts.

Among the most spectacular of the fresco programs are those remaining from the thirteenth century executed in the *Zackenstil*. The earlier examples, in the 1240s, appear to be in Lower Saxony at Braunschweig and Goslar, as well as at Soest and Cologne. Related images including the painted wooden ceiling at St. Michael's at Hildesheim, stained glass windows, and illuminated manuscripts help to establish approximate dating, as well as a relationship to Byzantine art, especially at Venice. Furthermore, the art of the *Zackenstil* has qualities of three-dimensionality and movement that resemble those of early Gothic painting in England and France. Nevertheless, the formality of the compositions and the linearity of the intense, angular, zig-zag drapery led Otto Demus to describe this style as Romanesque "mannerism" (Demus 1970a: 200–203; Demus 1970b: 615). In addition, he has argued that the zigzag style is, in fact, an emotionally charged exaggeration of the sort of drapery folds found in Byzantine art and Byzantinizing art, particularly that found in the mosaics of San Marco at Venice. Dates from the 1240s through the 1260s make comparisons with the volumetric figures of the early Palaeologan period of Byzantine wall painting convincing. Even more important is the motif book at Wolfenbüttel, which includes figures found on the Hildesheim ceiling and in the Goslar Gospel, dated around 1240. Buchthal (1979) among others has connected all these images with Byzantine manuscripts and the mosaics at San Marco. That the drawings are the work of a Venetian artist or a Saxon artist who had visited Venice or had seen a Byzantine Gospel provides insight into the manner in which Byzantine images became available to Central European painters. Moreover, frescoes at Matrei in Osttirol attributed to Paduan painters recruited to work at Salzburg demonstrate another manner in which Byzantine characteristics reached the north. By the third quarter of the thirteenth century the *Zackenstil* had reached Austria, and superb examples can be found in frescoes at Gurk, Göss, Seckau, and Krems, where the elegance of Gothic paintings begins to be more evident.

Sculpture

Germany was one of the earliest regions in medieval Europe to develop large-scale sculpture. In the German empire there was continuity between Carolingian minor arts and larger works in a variety of sculptural media that began to appear during the late tenth century, such as monumental sculpted doorways and figures for devotional settings. Tomb sculptures were also an important early type of German Romanesque sculpture and include the cast bronze tomb of Rudolf of Swabia (ca. 1080) in the cathedral at Merseburg. Early projects of relief sculpture also characterize German Romanesque work and include stone reliefs now above the doorway at St. Emmeran, Regensburg (ca. 1050), and reliefs associated with the tomb and crypt of St. Liudger in Werden (now in the Rheinisches Landesmuseum, Bonn, ca. 1050).

Although there is considerable continuity with Ottonian sculpture, after about 1100 German sculptors began to produce the historiated (containing figural scenes) capitals and monumental stone entrances commonly associated with the Romanesque style in other European regions. However, many of these works were less elaborate than contemporary church facades in other countries and seem dependent on foreign models, especially sculpture from France and Italy. Cologne was an important sculptural center throughout the period, but continuous traditions and interrelationships between workshops are uncommon in other regions. Historiated capitals, one of the most common types of Romanesque sculpture, are comparatively rare in Germany, and the examples that do exist tend to be derivative of northern Italian models, such as the capitals with figurative ornament found at Speyer Cathedral (before 1106), Mainz Cathedral (after 1106, with a second campaign around 1180), and the Chapel of the Holy Cross in Delecke/Soest (mid-12th c.). Portal decoration is more common than elaborate capital programs in Germany. However, exterior sculptural ensembles in Germany tend to have fewer subordinate parts than those in France, Spain, or Italy. While there are some elaborate multipart portals, such as Petershausen (1173–1180), Bamberg (1220–1235), Freiberg (ca. 1230), and the Galluspforte in Basel, Switzerland (end of the 12th c.), most portals consist of a tympanum (curved triangle above the door) alone. The most common iconography of these tympana is a central Christ surrounded by either the Virgin and St. John or by Peter and Paul. This group is sometimes accompanied by donor figures and/or local saints. Numerous examples of such portals exist in many parts of Germany and include the tympanum at the church in Gandersheim showing bust-length images of Christ, Peter, and Paul (ca. 1150), and a tympanum showing an enthroned Christ with the Virgin and St. Peter, a bishop, and a donor from Worms Cathedral (end of the twelfth century). German Romanesque tympana are located on various parts of the building. In addition to the traditional west entrance, other locations, especially the south side of the nave, were also common. Diverse materials also characterize German portal sculpture including limestone—the material almost universally used in France—and sandstone; even granite, a very hard stone, was employed in the Baltic re

gions. Moreover there is continuous production of sculpture in wood and stucco, which is closely related to the works produced in stone. The style of German Romanesque sculpture varies considerably, from flat, minimally articulated shapes, seen in the west portal from Grossen-Linden (after 1230) and the granite tympanum from Norderbrarup (end of the 12th c.), to ornately draped, three-dimensional forms, some of which exhibit similarity to contemporary French sculpture. After 1150 the early Gothic style, consisting of simpler, more architectonic forms, was increasingly popular in northern France, and by 1200 a second wave of the Gothic style, characterized by greater three-dimensionality and smooth, sweeping folds, known as the *Muldenfaltstil* (trough fold style), had become widespread in French sculpture. After 1160 these styles began to appear in Germany, especially in Cologne. For example, the tympanum from the church of St. Cecilia in Cologne (ca. 1160, now in the Schnütgen Museum) represents influence from the French early Gothic. Although occasionally a pure French style appears, as is the case in the Princesí Portal at Bamberg (ca. 1235), where a workshop trained at Reims Cathedral seems to have been active, it is more common for visual elements from French cathedral sculpture to appear in combination with local Romanesque art. Elements from the minor arts in the Mosan style, itself an important source for French sculptural style, sometimes appear to have been directly adapted by German sculptors. Other stylistic components in German sculpture, such as the *Zackenstil* (jagged style), seem to derive from contemporary book illumination. Such combinations produce dynamic visual hybrids common in Germany during the first half of the thirteenth century. By the second half of the thirteenth century most German sculpture is unmistakably Gothic in style.

Throughout the Romanesque period German sculptors continued to produce crucifixes, grave monuments, and sculptures of the Virgin and Child. In addition to examples in stone, many of these sculptures continue to be made in the traditionally employed materials of wood, metal, and stucco. Such works represent a continuous tradition from the eleventh century and suggest the important role of unbroken tradition in German Romanesque sculpture.

Stained Glass

Although a few fragments of earlier glass are known, in the Romanesque period the medium comes into its own. Two basic types prevail: the narrow oblong windows typical of Romanesque architecture could each be filled with a single standing figure or with several multifigured scenes combined into a vertical narrative sequence. The latter would have been more appropriate for areas close to the spectator, while the large-scale, single figures would have been easily visible even in the clerestory windows far above the viewer. Biblical subjects predominate: the narrative programs typically juxtaposed typologically related scenes from the Old and New Testaments. The single figures lend themselves to programs that are linear rather than narrative or hierarchical: at the cathedral at Augsburg the prophets in the south nave clerestory probably faced figures of the apostles; the figures of German kings, apostles, female saints, and knights preserved at Strasbourg Cathedral were part of a larger All Saints program.

The windows at Augsburg, the earliest known programmatic cycle, are variously dated in the first half of the twelfth century; an association with the rebuilding begun in 1132 seems likely. Although the five preserved windows reveal an effort to differentiate the figures from one another in the color and details of costume and in the attributes and placement of the hands, they all share the strictly frontal pose, large staring eyes, and unfurled scrolls that drape down their bodies. The partitioning of body parts and drapery passages into abstract compartments with a logic of their own—a typical stylistic feature of the Romanesque—is furthered here by the nature of the stained glass medium, in which leads separate the colored glass fragments.

Although a similar program at Speyer is now known only through textual sources, the six kings preserved in Romanesque style at Strasbourg Cathedral represent the remains of an elaborate multilevel cycle from the late twelfth century. According to Zschokke's reconstruction (1942), the present position of the kings in the north aisle of the Gothic church corresponds to their placement in the earlier building. They would have faced apostles in the south aisle while figures of female saints occupied the south clerestory, and popes, deacons, and bishops of Strasbourg stood in the north clerestory. Execution of the cycle must have spread over a period of time, for twelve additional kings are in a Gothic style.

Five panels dated circa 1150–1160 remain from the Premonstratensian church of Arnstein on the Lahn (now Münster, Westfälisches Landesmuseum on loan from Schloá Cappenberg). Here five windows, each three panels high, developed an early narrative program in the choir. An abbreviated Tree of Jesse window at the center illustrated the genealogy of Christ; a narrative window on either side showed scenes from his life and after his death; the Old Testament scenes in the outermost windows represented types or prefigurations of the Christological scenes. Scenes preserved from the churches at Alpirsbach (ca. 1160–1170), St. Patrokli at Soest (ca. 1160–1166), and the cathedral at Strasbourg (last third of the twelfth century) indicate that these buildings also had narrative window programs with typological structures.

Romanesque stained glass, despite regional stylistic differences, presents a relatively unified picture, which will dissolve into technical, programmatic, and stylistic variety in the great glass programs of the Gothic.

Textiles

German luxury garments, such as ecclesiastical and princely vestments, were most often made from silk woven in the eastern or southern Mediterranean, principally the Byzantine and Islamic east. Relatively few significant German textiles survive from the Romanesque period, but from them we learn that production consisted largely of wool and linen embroideries and woven tapestry wall hangings. Examples of both techniques were undoubtedly created for secular as well as ecclesiastical interiors, but few secular textiles are extant.

The earliest surviving European tapestries are at the cathedral of Halberstadt. The first of these, dating from the mid-twelfth century, is more than ten meters wide in its current, somewhat fragmentary state. It represents scenes of Abraham and Isaac, and it is generally consistent with Romanesque art of Lower Saxony. The second Halberstadt tapestry, of about 1170, is similar in style, depicting Christ in Majesty flanked by the Apostles. An early thirteenth-century tapestry at Halberstadt depicts the enthroned Charlemagne surrounded by four ancient philosophers. Roughly contemporary tapestry fragments depicting scenes from the Marriage of Philologia and Mercury, after a text of Martianus Capella, survive at Quedlinburg.

German embroidered altar decorations are best represented by late-twelfth-century linen fragment from the Rhineland, formerly preserved in Berlin but destroyed during World War II. It depicted scenes from the life of Christ in a fine linear style using linen chain stitch and silk thread for details. Still essentially Romanesque in style and also Rhenish is the silk antependium (decorative hanging) depicting Christ in Majesty flanked by saints and donors from Rupertsberg (Brussels, Musées Royaux d'Art et d'Histoire), embroidered in metallic threads about 1230.

A German master builder and printer, Roriczer was a member of a family of master builders associated with Regensburg Cathedral for three generations. Although Roriczer followed his father, Konrad, at Regensburg Cathedral, Roriczer is best known for his publications on architecture. After an early career in which he served as undermaster for his father at the church of St. Lorenz in Nuremberg and worked on the sacristy in Eichstätt, Matthew Roriczer succeeded his father as master builder of the cathedral of Regensburg circa 1476 and spent the remainder of his career in that position. In 1486 Roriczer published "The Booklet on the Correct Design of Pinnacles" (Büchlein von der Fialen Gerechtigkeit) on his own press. This booklet, consisting of only ten folios, explains how to create the ground plan and, from that, to derive the elevation of a pinnacle using geometry. The language of the booklet is explanatory, spare, and clearly oriented to the practical process of creating the structure. There is great interest in this small piece of writing because it represents one of the first printed accounts by a medieval mason of his methods. In it Roriczer was revealing information, which was previously taught orally and that was the private province of the masons. The Regensburg Ordinance of 1459, a set of professional rules for the masons from many German centers, says that masons should not reveal technical information to nonmasons. An additional value of Roriczer's booklet is that it may describe a construction tradition used by much earlier Gothic builders, active in the thirteenth and fourteenth centuries, who left few written records.

Rosary

From its remote beginnings in the seventh century, the Ave Maria (Hail Mary) prayer went on to become the most popular extraliturgical devotion of the Catholic Church. In its earliest form the prayer combined the Angel Gabriel's salutation in Luke 1:28 with Elizabeth's words to Mary in Luke 1:42. By the twelfth century the Ave salutation had become a popular way of greeting images of the Virgin. In the widely circulated thirteenth-century Marian miracle story, "Aves Seen as Roses" (*Marien Rosenkranz*, or "Mary's Rosary" in the Middle High German *Passional* "Passion Book"), 50 Ave-salutations are miraculously transformed into a rose chaplet. Three chaplets of 50 Aves—a substitute for the 150 Psalms—constituted a "psalter of Our Lady." In other forms, repetitions of the phrase "Ave Maria" were paired with 150 verse epithets for the Virgin. At least six Middle High German rosaries and Marian Psalters of this type can be found in manuscripts of the thirteenth and fourteenth centuries. Later, narrative meditations on the life of Christ came to be paired with repetitions of the Aves. A version with 50 such tags composed by Dominic of Prussia (1384–1460) is found in numerous fifteenth-century manuscripts and incunabula.

Around 1470 the Dominican Alanus de Rupe (1428–1475) tried to revive the older Marian Psalter form by founding a Brotherhood of Our Lady's Psalter at Douai. A more successful confraternity enrolling over 100,000 members within seven years was established in 1475 by Jacob Sprenger in Cologne and went on to become the largest such sodality. Although local chapters featured divergent methods of saying the devotion, the shorter form with fifteen meditations became the most popular and was made official by papal proclamation in 1569.

Rostock

A city in northern Germany on the Warnow River and Baltic Sea, Rostock was founded as part of the German expansion into Baltic trade, which took place in the late twelfth and thirteenth centuries. Around 1200 a community of German merchants settled in Rostock, an area with a previous Slav town that had a market popular with Scandinavians. Rostock was recognized by the princes of Mecklenburg in 1218, and was granted a town council of ten and the law code of Lübeck. By 1262 two nearby small towns had been amalgamated with Rostock into a single city, and by circa 1300 a city wall enclosing all three settlements had been built. Rostock's prosperity and architectural character were determined by its role in the Hanseatic League, a trade consortium that flourished from the thirteenth through the fifteenth centuries, although in the late fourteenth century Rostock's wealth was augmented through the city's becoming a base for Baltic pirates.

As befits an important Hansa city, fine buildings in *Backsteingotik* (Gothic brick) characterize the medieval architecture of Rostock. This style, characteristic of northern Germany, uses locally manufactured brick instead of the stone more common in southern Germany and elsewhere. The Marienkirche (church of the Virgin), begun in 1230, is one of the most impressive medieval buildings in Rostock. It is a merchants' church, indicating the importance of this group as architectural patrons in Rostock, and is located next to the market square and Rathaus (town hall). The Marienkirche in Rostock is modeled on the Marienkirche in Lübeck, and both churches have multipart rib vaulting influenced by French Gothic architecture, perhaps through such intermediaries as the cathedral of Tournai, and east ends characterized by French-style radiating chapels. But unlike its counterpart in Lübeck, the Marienkirche in Rostock is a hall church, with a transept and aisles the same height as the nave. The Marienkirche in Rostock retains an original bronze font from 1290, which attests to continued north German expertise in that medium. The covered font is supported by figures representing the rivers of paradise and decorated with biblical scenes, which continue on the ornate cover with depictions of New Testament episodes. The church also contains an altar dating from around 1500 dedicated to St. Roch, protector from the plague; it is decorated by attenuated figures and detailed architectural elements.

Other churches in Rostock are less innovative than the Marienkirche. St. Nicholas, begun in the mid-thirteenth century, was built in brick in a Romanesque style. The church of St. Peter, constructed circa 1300, abandoned the French-influenced plan of the Marienkirche for a simple apse, rectangular aisled nave, and hall church form in *Backsteingotik*. Additional religious architecture in Rostock was created by the Cistercians and the mendicants, religious movements important in late medieval cities. The Cistercian women's convent of the Holy Cross founded in 1270 by the Danish Queen Margaret had a brick church, a large cloister, and additional monastic buildings, including a refectory decorated with painted floral motifs. The Franciscans and the Dominicans also had religious establishments in Rostock from the thirteenth century. Fragments remain from the Franciscan cloister St. Catherine's, founded in 1243, and the Dominican St. John's monastery, founded in 1256.

Medieval Rostock also had a considerable number of secular buildings, as was common in important Hansa towns. The city wall was erected around 1300. A section of the wall still remains, with two original medieval towers. Although the medieval Rathaus (town hall) was encased in an eighteenth-century facade, it preserves a mid—thirteenth-century core. Turrets and the tops of the tracery of lancet windows may be seen projecting above the later facade. Rostock also contained a large number of merchant's houses in the *Backsteingotik* style. A particularly fine example is the Kerkhofhaus from the first half of the sixteenth century, with its elaborate brick arcading, ornamented with terra-cotta plaques of male heads, female figures, mermen, and foliate motifs.

The university of Rostock, the oldest on the Baltic, was founded in 1419. Rostock was also important as an early center of printing in the Baltic region. In 1476 the Brethren of the Common Life set up a printing press in their monastery, which specialized in humanist works in German and Latin, as befitted a printing press in a university town.

Rothenburg ob der Tauber

This small Franconian market town retains much of its medieval and Renaissance character because of its own historical misfortunes. During the Thirty Years' War (1618–1648), Protestant and Catholic armies repeatedly passed through its lands. Rothenburg was plundered by the count of Tilly's troops in 1631; three years later the town council paid the Swedish army not to attack. Since the town's economy never fully recovered, there were no funds for new construction. Rothenburg began in the ninth century as a fortification on a ridge about 305 feet (100 meters) above the Tauber River. With the death of the last count of Comburg-Rothenburg in 1116, control of Rothenburg gradually passed in 1142 to the Hohenstaufens, who immediately built a castle here. Emperor Rudolf of Habsburg elevated Rothenburg to an imperial free city in 1274. Emperor Charles IV sold the castle site to the city following the earthquake of 1356. Other than the Rödertor (Röder Gate) and the Weißertorturm (White Gate Tower), which date to the twelfth century, most of the city's extensive walls are from the fifteenth century. During Heinrich Toppler's tenure as mayor (1373–1408), Rothenburg reached its peak. In 1525 the city backed the peasants of the Tauber valley in their revolt against the bishop of Würzburg and other lords and was subsequently punished. The council embraced Lutheranism in 1544. It lost its free status in 1802–1803 when it was incorporated into the kingdom of Bavaria.

St. Jakob's, Rothenburg's parish church, stands on the site of a late-twelfth-century structure. The bishop of Würzburg transferred control of the church to the Knights of the Teutonic Order in 1258. They were the custodians of the Holy Blood Chapel, which houses a reliquary cross containing drops of Christ's blood. Within a decade this chapel was the focus of an active pilgrimage. In 1258 St. Jakob, formerly a dependent of nearby Detwang, became a parish church. The new structure reflects its three distinctive audiences. The Teutonic Knights erected the deep eastern choir and the two flanking towers around 1340 for their own services. The parishioners built the nave and aisles, which were largely finished in 1436 but not consecrated until 1471. Niclas Eseler and his son, Niclas the Younger, constructed the airy western choir (1452–1471) above an existing street for the Brotherhood of the Holy Blood when the old chapel proved too small for the number of pilgrims. The net vaults were completed in 1528. Between 1499 and 1506 the local joiner Erhard Harschner and the famed Würzburg sculptor Tillmann Riemenschneider created the monumental Holy Blood Altarpiece. Two angels holding the relic are incorporated into the elaborate superstructure of the altar. The artists structured the frame for the Last Supper in the corpus as a fictive room with bull's-eye windows. This innovation permits light to surround and accent Riemenschneider's expressive limewood statues. The wings of the church's high altar, located in the eastern choir, are signed and dated (1466) by Friedrich Herlin, a former Rothenburg citizen who had become the town painter of Nördlingen. His scenes depicting the lives of the Virgin on the interior and of St. Jakob (James Major) on the exterior reveal strongly the influence of Rogier van der Weyden. The sculptors are unknown, though Simon Lainberger of Nuremberg possibly carved the Crucifixion group while the style of the other standing saints suggests an Ulm master. The joiner was Hans Waidenbach of Nördlingen. The east choir retains its three stained glass windows including its central light with typological scenes (ca. 1340). The other pair date around 1400 and to the later fifteenth century. Much of St. Jakob's decoration was removed during the Reformation and especially after 1556, when this became a Lutheran church. Herlin's wings were painted over only to be rediscovered in 1922. New side galleries were built in 1614 but removed in the nineteenth century. Nevertheless, the church still contains its sacrament house (ca. 1400) and several notable sculptures.

Rothenburg's other religious establishments included a Franciscan monastery and a Dominican convent. The early Gothic-style Franciscan church, begun in 1285 and completed in the middle of the fourteenth century, still contains its screen separating the nave from the monks' choir, which was consecrated in 1309. The Dominican nunnery was founded in 1265 for local noble women and suppressed in 1524–1525. Today housing the Reichsstadtmuseum (Municipal Museum), the church still retains its noted Passion Altarpiece from 1494, whose painted panels Hartmut Krohm attributes to Martin Schwarz, a local Franciscan monk. This is one of the few projects that one can link with a local artist. Rothenburg seems to have been too small to sustain a notable painter, sculptor, or architect, so that, repeatedly, the town had to import its art. Riemenschneider, working in the episcopal seat of Würzburg, supplied no fewer than seven altarpieces, including two for St. Jakob's, one for the Dominicans, and two for the Franciscans.

The city hall consists of two parallel buildings. The western wing dates to the years just after the fire of 1240. Leonhard Weidmann's imposing eastern wing from 1572 faces Rothenburg's main square and replaces an earlier structure that burned in 1501. Notable among Rothenburg's rich stock of houses, most of which are medieval or Renaissance, is Heinrich Toppler's small castle from 1388, a stone and half-timber structure perched in the middle of the Tauber River.

Rottweil

Located some 60 miles (100 kilometers) south-southwest of Stuttgart, Rottweil has an unusually complicated early history. Archaeological excavations carried out since 1967 have located the oldest settlement, from the second half of the sixth century B.C.E., on the left bank of the Neckar on a bluff surrounded on three sides by a bend in the river. After 72 C.E., the Romans erected a number of forts in this area; the largest, situated on a flatter plain on the opposite side of the river and several hundred meters to the south, developed into a significant town known as the Arae Flaviae. Coins from the late third and fourth centuries indicate a continued Roman presence, although the town's high point had certainly passed. The name Rotuvilla, which first appears in 771, and numerous tombs and building remains, including those of a stone structure, from the eighth century indicate Frankish resettlement of the area. The scholars Gildhoff and Hecht suggest that still intact Roman roads may have made the advantageous position on the river even more attractive. The Carolingians administered their local territories from a palace erected on the left side of the Neckar along the Roman road, and both Carolingian and Salian rulers are documented visiting Rottweil, sometimes for longer periods.

The settlement flourished in the twelfth century. A large area around the palace known as the Mittelstadt (middle town) was walled, and a mint was established, perhaps as early as 1160 or 1170. This thriving town was abandoned about 1200, however; evidence points to a devastating fire as the cause. Instead of rebuilding on the same site or the Roman site across the river, where a small settlement, the so-called Altstadt (old town), was located, it was decided to move a kilometer to the north to a dramatic site on a high bluff almost entirely surrounded by the river and therefore easily defensible. The city center sat to the west of the entry into this horseshoe-shaped area, and in 1241 Frederick II remitted the city's taxes for use in building the defensive wall. At the center of town, streets were laid out in a grid pattern that is still visible, and buildings, including an unusual number of structures in stone, were built on oblong lots. From the thirteenth century, the city seems to have enjoyed increasingly independent forms of self-government; in the fourteenth century, the city was granted the status of an imperial free city (*freie Reichsstadt*). From 1299, it was the site of an important imperial court with jurisdiction over a large part of southwestern Germany.

At the end of the thirteenth and in the first half of the fourteenth century, galleries were built near the main intersection to serve as commercial centers. The two main religious foundations—the Heilig Kreuz Münster (the church of the Holy Cross) and the Kapellenkirche (chapel church), stand to the northwest and southeast of this intersection, respectively. The former, first erected with a Romanesque nave and a Gothic choir in the first half of the thirteenth century, was rebuilt in the fifteenth century, starting with the choir. The present, late Gothic nave with net vaults, dated 1497–1534, was erected according to the plans of Aberlin Jörg, who had built the similar Stiftskirche in Stuttgart. The Kapellenkirche stands on the site of—and probably gets its name from—an earlier pilgrimage church dedicated to the Virgin. A single tower, taken as a symbol of increased civic self-consciousness, was added beginning about 1325; Winfried Hecht has cautiously associated it with a Master Heinrich of Basel, probably a member of the Parler family, who is documented in Rottweil in 1342. By 1364, the nave and choir had been replaced. Aberlin Jörg added the two upper stories to the tower about 1473 and rebuilt the choir between 1478 and 1483. The three portals of the tower and the surrounding walls are decorated with an elaborate program of sculptures from the 1330s. The scenes from the life of Christ, apostles, and prophets can be attributed to several masters; the work of the most important, together with that of some of the same assistants who had aided him at Rottweil, also appears on the north portal of the cathedral at Augsburg.

The Dominicans were given an especially important site at the north edge of town, closing off the main axis out of town in this direction. Their new church was built beginning about 1266 and dedicated probably in 1282. As typical of Mendicant architecture of this region and elsewhere, the flat-roofed nave was separated from the narrow, vaulted choir by a choir screen. In the second half of the eighteenth century, the nave was completely rebuilt in the baroque style and the choir remodeled. The chapel dedicated to Saint Lawrence Lorenzkapelle, a late Gothic funerary chapel at the northwest edge of town, now houses the sculpture from the tower of the Kapellenkirche and other local works.

The presumably Swiss author from Hohenems wrote five surviving quasi-historical epics in verse for important men close to the Stauffer court (at first, during the reign of King Heinrich VII) and eventually for King Konrad IV himself, whom he might have accompanied on a campaign to Italy, where the king (and maybe the poet) died in 1254.

The works (based on French and Latin sources) in approximate chronological order are *Der gute Gerhard* (*Good Gerard*), commissioned by Rudolf von Steinach (ministerial of the bishop of Constance) circa 1220; *Barlaam und Josaphat*, after a literary model of abbot Wido von Cappel (near Zürich); *Alexander*, without a known commissioner; *Willehalm von Orlens*, commissioned by Konrad von Winterstetten at the Stauffer court in Swabia, before 1243; the French source was provided by Johannes von Ravensburg's *Weltchronik*, dedicated to King Konrad IV. Another theory is that Rudolf did not go to Italy and continued the *Weltchronik* beyond "Salomo," after which he added still two later excursus to *Alexander*. If Rudolf had also produced earlier courtly works, which he claimed in *Barlaam und Josaphat*, that is unproven. But an *Eustachius*-Legend, mentioned in *Alexander*, is lost.

Der gute Gerhard, after an unknown source, demonstrates courtly humanity toward a heathen (two manuscripts are extant). *Barlaam und Josaphat* describes the Indian Legend of Buddha after a Latin source of 1220–1223. (Extant in 47 manuscripts; the only illustrated manuscript, of 1469, was done by Diebold Lauber, with 138 drawings.) Alongside the *Laubacher Barlaam* of the Freisinger Bishop Otto II, Rudolf's is the second German version. In *Eustachius*, a high Roman general under Trajan converted to Christianity. *Willehalm von Orlens* is neither an *aventure*, or courtly chivalric romance (Wolfram), nor a *chanson de geste* (heroic ballad, like Guillaume), but rather basically a courtly *Fürstespiegel*, or guide for nobility. An ideal government, Stauffer knighthood, exists also in France and England. (Of the twenty-nine extant manuscripts, seven are illustrated, mostly by Diebold Lauber.) A shorter narrative in rhymed couplets, *Wilhelm von Orlens*, was created in the fifteenth century, extant in four manuscripts and one print of Anton Sorg (Augsburg, 1491). Hans Sachs based his drama of 1559 on this print. In 1522, an anonymous Swabian writer reworked Rudolf's epic as strophic form in the HerzogErnst-Tone, a thirteen-line pattern. The story is also recounted in pictures, on a tapestry in Frankfurt of the first quarter of the fifteenth century, in fifteen scenes. The couple Wilhelm and Amelie is also found as a fresco at Runkelstein castle near Bozen. In *Alexander*, Rudolf wanted to portray history, not a heroic or courtly romance. Ten volumes were planned, which were stopped in the middle of the sixth book, however (death of Darius and victory over his followers). The two main sources were the *Historia de preliis* and Curtius Rufus. Fairy-tale portions were left out. (Of the three extant manuscripts, the Munich State Library manuscript was illustrated by Diebold Lauber.) The *Weltchronik* ends, after thirty-six thousand verses, in the middle of the Jewish history of the kings. (Over one hundred manuscripts are extant, as well as reworkings and rhymed bibles.)

Runes

Runes form a writing system, an alphabet, used by some of the early Germanic peoples, mostly for epigraphic, but also occasionally for apotropaic (protective) purposes. They are derived from a Greco-Roman base, but specific details are argued, as are also dates. It is usually assumed that the runes arose somewhere during the first century C.E., and most runologists today seem to lean toward derivation in the West, from North Italic alphabets. The runes were in use until early modern times in Scandinavia, so that they naturally developed geographical and temporal variants, ligatures, and the like. The word *rune* itself derives from a Germanic stem meaning something like "secret, secret meeting."

We usually divide runes into "older runes," three rows of eight each: *fuparkgw—hrijepRs—tbeml*¹*do*, and "younger runes," a sixteen-rune alphabet: *fupark—hrias—tbmly*, then divided into various national and subnational forms: Old English, Swedish, Danish, bind runes, dotted runes, staveless runes, and the like. Runes might be written in either direction, and even *boustrophedon* (one line one direction, next line opposite) inscriptions are known.

The runes found in German territory are all older runes (from the series of twenty-four), dating from circa 500 C.E. to circa 700 C.E. It is quite difficult to decide which runes are "German," and the term "South Germanic Runes" is used by many. There are fewer than fifty such runic inscriptions, mostly on movable objects, so that the place of the find cannot be used as a criterion in assigning them, and most of them consist of what seem to be names—of owners, rune masters, recipients, deities—one cannot say with certainty. A number of alphabet series are attested.

Though the use of runes thus ceased quite early in Germany, antiquarian interest in runes begins quite early also, even in Merovingian times (Venantius Fortunatus), but particularly under the Carolingians, with authorities such as Hrabanus Maurus, Alcuin, and Walafrid Strabo. The so-called *Abecedarium Nordmannicum* offers in a mixed language (mostly Old Saxon) a short treatment of the younger runes and their names. The *Abrogans* (an eight-century Latin-German glossary) offers us the word *runstaba* as a gloss for Latin *litterae* (letters). The earlier use of runes is probably attested by such words as *rizan* (to write, scratch, Otfrid). Occasionally, runes were used within the Latin alphabet, for example, the w-rune in the *Hildebrandslied* manuscript, or the g-rune for *ga* in an Old High German prayer (*Wessobrunner Gebet*), and we have a letter from Swedish King Ansgar to Louis the Pious in 832 that mentions runes (doubtless Swedish).

Runes continued to be mentioned as an object of anti-quarian interest and to be used in magical and medical texts throughout the Middle Ages. The so-called *Alcuin Treatise* of Manuscript 270 at St. Gall (Stiftsbibliothek) tells about the use of runes in a kind of rudimentary cryptography.

Runkelstein

Built in the 1230s, castle Runkelstein (Italian, Castel Roncolo) near Bozen (Italian, Bolzano) in South Tyrol was acquired in 1385 by the brothers Nicolaus and Franz Vintler, wealthy financiers who renovated and expanded the castle, added the Sommerhaus (summer house), and commissioned the extensive program of wall paintings for which the castle is known today. The restoration ordered by Maximilian I *von wegen der guten alten istori* (because of the good, old stories [i.e., the pictorial narratives]) was carried out in 1508 by Marx Reichlich. The north wall of the summer house collapsed in 1868, destroying significant portions of all three narrative cycles; Ignaz Seelos's 1857 drawings preserve several of the lost scenes.

The paintings appear to have been executed by local artists, those of the west palace between 1388 and 1395; those of the Sommerhaus and chapel between 1400 and 1407. Most of the chapel paintings can be attributed to the Bozen painter Hans Stocinger. The summer house paintings are stylistically similar, but precise evaluation is impossible, given Reichlich's extensive overpainting and the poor condition of the murals today.

Taken as a whole, the paintings add up to a representation of "courtliness" in terms of around 1400. The murals of the west palace are a direct representation of court culture, with courtly people standing in relaxed poses or engaged in conversation, sports, games, or dance. In one painting, the landscape background includes a realistic depiction of Runkelstein circa 1390; in another, two participants in a tournament are heraldically identified as the Vintler brothers. The paintings of the Sommerhaus are devoted to historical, legendary, and literary motives. A series of portraits of the Holy Roman emperors stretches along the ground floor wall facing the courtyard; on the gallery wall above, the nine Triads begin with the traditional Nine Worthies and continue with figures from romance (three knights, three pairs of lovers) and heroic literature/popular legend (Germanic heroes, giants, giantesses, and dwarfs).

Inside on the ground floor, green grisaille murals depict scenes from the story of Wigalois, the hero of Wirnt von Gravenburg's early thirteenth-century romance. Twenty-one scenes in two registers, probably about half the original total, survived into modern times; about ten remain today, in poor condition. On the second floor, another set of green grisaille paintings depicts thirteen scenes (originally fifteen) from the story of Tristan and Isolde. In another room on the second floor, a series of colorful murals depicts scenes from the story of Garel from Der Pleier's late-thirteenth-century romance. Of the twenty-two scenes described in the nineteenth century, only about ten are extant today.

The paintings of the chapel include scenes from the legends of Sts. Christopher, Anthony, and Catherine, and a Crucifixion. The walls of the east palace were apparently painted as well, but only unidentifiable traces have survived into modern times.

Ruodlieb

The *Ruodlieb* is a Latin poem, probably mid-eleventh century, in internally rhymed dactylic hexameters ("leonine hexameters"). It is extant only in fragments of two manuscripts, one apparently the poet's autograph, the other a clean copy produced under his direction. The surviving portion has been estimated to be only two-thirds of the original (2,320 verses of approximately 3,850), and even when intact the poem was probably unfinished.

Sometimes considered the earliest courtly romance, the *Ruodlieb* relates the adventures of a knightly hero who leaves his mother and ancestral home because his services as a courtier have brought him feuds rather than rewards. He becomes attached to the court of a foreign king ("the greater king"), is quickly promoted, and soon vanquishes an insurgent ("the lesser king"). Upon receiving a message that his mother needs him and that his opponents have died, Ruodlieb resolves to return home. Offered his choice of wealth or wisdom, Ruodlieb opts for the latter, which he receives in the form of a dozen precepts, but he also is given two loaves of bread that contain a treasure of riches and jewels. Ruodlieb's travels back to his native land begin with episodes (involving a redheaded rascal) that confirm the validity of the first three precepts, but the story then develops independently of the king's counsels. Ruodlieb encounters a nephew of his, they enter a castle, and the nephew falls in love with the daughter of the chatelaine. On arriving home Ruodlieb announces the wedding. Pressed to take a wife himself, he has a farcical misbetrial with a woman who turns out to be less than virginal. How the poem ended—if the poet ever completed it—is uncertain. The last two fragments give hints, in a dream that Ruodlieb's mother has and in a prophesy that a dwarf captured by Ruodlieb makes. Evidently Ruodlieb is destined to kill two kings, marry the surviving princess, and inherit the kingdom.

The narrative of the poem was a daring experiment. One indication that the *Ruodlieb* was a work in progress has already been mentioned: the poet starts to use the twelve counsels as a structuring device but then abandons them. Another is detectable in the poet's decision, apparently reached midstream in composition, to name his lead character: he seems to have added the name "Ruodlieb" (whence the title assigned the poem by modern editors) over an erasure in fragment no. 5 and to have employed it regularly only from fragment no. 12 on.

In its style too the poem is exceptional. Although its Latin has been faulted for its woodenness, it is living, much less bound by grammatical purism and emulation of influential classical authors than is usually the case in medieval Latin verse, especially hexameters. The poem also represents a new departure in its central themes, which anticipate those of later courtly romances in Old French and other medieval vernaculars a century or more later. It urges upon lords mercy, restraint, and generosity, and it promises good fortune to those who practice these virtues even in the face of adversity.

Rural Settlement

Rural settlements in medieval Germany were diverse, ranging from hamlets and isolated farmsteads to a variety of planned nuclear villages such as Rundlinge, which had a central common, and Hufendörfer, which were arranged in straight lines. Although the theory has now been abandoned, legal scholars used to argue that these villages evolved from the so-called *Markgenossenschaften*, early medieval communities practicing a form of primitive communism. In Swabia, Bavaria, and Franconia—the heart of Old Germany—there was a long tradition of manorialism (the *Fronhof* system). Elsewhere such as in Saxony and Frisia there were large numbers of free peasants. Everywhere mountain communities tended to remain smaller and more independent.

It is difficult to identify common patterns of change amid this diversity, but generally speaking manorialism declined in the eleventh, twelfth, and thirteenth centuries as the population rose, the three-field system was introduced, and more land was cleared. East of the Elbe and Saale Rivers, a mixed population of indigenous Slavs and German and Dutch settlers was established in planned villages that formed increasingly self-conscious communities as they developed new legal, economic, political, and religious frameworks.

In the late Middle Ages, however, Germany experienced the same loss of population, due to plague and war, and decline in grain prices that affected the rest of Europe. In the heartland this led to the desertion of settlements, a rise in real wages, and greater freedoms as landowners tried to attract laborers and maintain levels of production; but in other regions, especially in the east and southwest, the agricultural crisis led to increased obligations and greater peasant dependence.

David R.Blanks

The term *Sachliteratur* (literally, literature on a subject area), for which there is no good English equivalent, refers to texts dealing with the natural world and its inhabitants. By convention, fictional literature, history, law, and religion are excluded for various reasons, while science, medicine, and technology are included. German scholars working in the tradition established by Gerhard Eis, the pioneering scholar in studying German *Sachliteratur*, have preferred the terms *Fachprosa* (literally, prose writing in a discipline), *Artes-Literatur*, or *Fachliteratur*, because some medieval systematists categorized such literature according to the seven liberal arts, a corresponding seven mechanical arts, and even a third set of forbidden arts, or *Fächer*. In modern usage, the term *Fachliteratur* refers to specialized literature written for experts, and medieval German texts on scientific, medical, and technical subjects were neither exclusively nor even predominantly written for experts, hence the more inclusive term *Sachliteratur* is preferable.

Before the late twelfth century, German *Sachliteratur* was limited to Latin-German glossaries and a few short texts, often in the form of recipes written on the endpapers or in the margins of Latin manuscripts. Two early medical recipes from a manuscript at Basle, Switzerland, may be the oldest extant prose texts in the German language. The glossaries and other aids to understanding Latin texts continued to be produced throughout the Middle Ages, as did various other kinds of aids for learning Latin. The number and sophistication of Latin-German glossaries continued to grow, and the *Vocabularius Ex quo* (named after its first headword), produced around 1410, is extant in over two hundred manuscripts and forty printed editions from before 1500.

In the decades before and after 1200, anonymous authors first wrote lengthier prose texts in German on secular subjects, namely, the cosmological encyclopedia known as the *Lucidarius*, the medicinal herbal known as the *Older German "Macer,"* and the *Medical Handbook of Master Bartholomew*. The first two show signs of having been created for presentation to courtly audiences, while the last presupposes that there were readers interested in academic medicine in German. All three derive from Latin sources, and they all show signs of significant editorial intervention to adapt to a German-speaking audience. While the *Medical Handbook* by Ortolf of Baierland, written in the second half of the thirteenth century, soon replaced the *Bartholomew* as the most up-to-date medical treatise in German, excerpts from the latter are attested throughout the Middle Ages. The same can be said of the *Lucidarius*, which was superseded by the *Treatise on the Natural World* written by Conrad of Megenberg in the mid-fourteenth century. The variety of medicinal herbals attested after 1300 is so great that it is impossible to summarize their distribution here.

As already noted, medical literature occupied a particularly prominent role in the history of German *Sachliteratur*, with regimens of health, herbals, treatises on particular topics or individual medicinal plants, and surgery handbooks proliferating in the fourteenth and fifteenth centuries. One popular genre was the plague tract, following the appearance of the Black Death in Europe after 1347. While the most efficacious advice was usually the admonition to flee, these texts show how the medical establishment struggled to cope with a sudden, inexplicable, and deadly epidemic. The compilation of treatises into miscellanies—manuscripts containing texts on a variety of subjects—was especially characteristic of the late Middle Ages. These ranged from collections of medical treatises with additional recipes written into the margins, presumably by medical practitioners, to "house books"—collections of medical texts for private use along with treatises on subjects ranging from household management, cooking, agricultural practices, and wine making to veterinary medicine.

Magicians and conjurers were not necessarily distinguished from cheaters and swindlers by members of the late medieval elite, and texts describing their practices are often classified together as the "forbidden arts." In his *Book of All Forbidden Arts*, Johannes Hartlieb (d. 1468), a prominent Munich physician who wrote an overview of magic practices for a patron, Margrave Johann of Brandenburg, describes only methods for conjuring and prognostication. His creation of seven categories, following the seven liberal and seven mechanical arts mentioned above, is sometimes cited in support of dividing *Sachliteratur* into *Fächer*. Astrological prediction was officially one of the forbidden arts, but especially in the fifteenth century it played such a significant role in medical prognostication that astrological medicine assumed a prominent role in medical literature. The gradual expansion of literacy and the introduction of printing in the second half of the fifteenth century expanded the readership for German texts, especially after schools and pedagogical materials began to appear for teaching literacy in German to those with little or no previous knowledge of Latin. Texts describing technical skills date in some instances from the fourteenth century, but these were primarily in areas of direct interest to noblemen or clerics (e.g., veterinary medicine, hunting, hand-to-hand combat, cooking, cloth dyeing). Even these texts do not become common until the fifteenth century. Texts written by experts for fellow specialists are rare before 1400 but become more common before the end of the Middle Ages. One example is the *Book on Grafting and Wine-Making* by Gottfried of Franconia. Gottfried wrote his Latin tract before the middle of the fourteenth century, and it was already translated into German before the end of the century, but there are numerous manuscripts extant from the fifteenth century. Three tracts on using geometry to construct architectural features written and printed in the 1480s by Matthäus Roriczer, a Regensburg architect, fall into the same category.

Other texts, while usually containing technically accurate information, seem aimed at readers interested in learning about subjects of interest to them even though they are not themselves skilled in the area under discussion. There are tracts on gunnery, warfare, mining, distilling, and agriculture that seemingly fit into this category. It is indicative that the massive world chronicle produced in Nuremberg at the end of the fifteenth century by a group of prominent citizens under the leadership of Hartmann Schedel was immediately translated into German. This compendium of medieval knowledge, usually referred to as the *Nuremberg World Chronicle* and available in both Latin and German, marks the apotheosis of German as a language for serious scientific subjects. When German eventually replaced Latin as the language of academic discourse in the eighteenth and nineteenth centuries, the last vestiges of medieval *Sachliteratur* were traceable only in popular literature and beliefs as well as in specific subcultures such as astrology or so-called folk remedies. While these subcultures periodically experience bursts of renewed popularity even today, they also contribute to a skewed sense of the full range and value of medieval *Sachliteratur*.

Saints' Cult

In the fourth century C.E., the cult of the saint developed from the Hellenic cult of the dead. The adoption of this Hellenic ritual by the Christian Church achieved far-reaching effects. Initially, it assisted in the conversion of pagans to Christianity. More important, it gave laypeople real faces to identify with in their quests for holiness and a method by which the church could promote social cohesion. In addition to the miraculous nature of saints and their relics, saints were perceived to be direct links to the divine.

In early Christian development, drama was perceived as an overt act of paganism because it was idolatrous and obscene. Saint Cyprian, bishop of Carthage, introduced this argument against the creation of Christian drama in the third century, and in the fourth century Chrysostom, patriarch of Constantinople, developed it. The identification of drama with paganism held until the tenth century, when the Saxon nun Hrotsvitha von Gandersheim began writing "comedies" and the English monk Ethelwold argued in favor of representative performance to elucidate church liturgy. The reintroduction of drama into Christian practice quickly gained popularity throughout Europe. Plays dramatizing the lives of saints, the Passion, the Harrowing of Hell, and the Last Judgment were wide-spread until the sixteenth century, when theater shifted its interest to more secular themes.

Medieval German drama is not so much a national literature as a liturgical one. The themes, subjects, and conventions used in it are common to medieval dramatic practices throughout Europe. Medieval German dramatic conventions stem directly from hagiographic conventions contemporary to these miracle plays.

Three salient features of medieval hagiography are the handling of the saintly ego, the experiences of the saints, and the conception of saintly time as paradoxical. The ego of the saint cannot be understood as that of one individual, but as closely linked, through the spirit of the divine, to the egos of other saints and ultimately to that of Christ himself. In addition, such saintly characteristics as grace and virtue cannot be seen, in the classical sense, as being qualities that can be nurtured by the individual. Grace and virtue, in the medieval mind, are perceived as gifts from God. The experiences of saints must be understood as being able to contradict logic. Time cannot be understood in the traditional Christian linear sense. The time of saints exists outside of traditional time. Although saints are categorized as humans, they represent manifestations of the grace of God on Earth as exemplars of ideal human behavior.

Another rhetorical convention common to the literature that surrounds saints is the use of *communio sanctorum* (community of saints): the connecting of the lives of the saints to one another and to the life of Christ through the co-option of experiences of other holy persons and the descriptions thereof.

Thus, the effect sought by liturgical drama and miracle plays was not achieved through the act of representation but through symbolic and stylized logic designed to evince the theological ethos that suffering on Earth led to redemption in the afterlife. In particular the German *Heiligenspiele* (plays of the saints) themselves were not an *imitatio Christi* (imitation of Christ) but a legitimization of the miracle of divine grace operating through the lives of the saints being portrayed.

The most famous German *Heiligenspiel* is the Oberammergau Passionspiel (Passion Play). It was first performed in the Bavarian town of the same name in 1633 to celebrate God's sparing the town from the plague. It has been performed approximately every ten years since that date and, true to its hagiographic origins, it has been rewritten a number of times.

Other German literary texts important to the understanding of the medieval cult of the saint include works by Hildegard von Bingen (1098–1179) and Mechthild von Magdeburg (1207–1282). Hildegard von Bingen's first major literary publication, *Scivias (Know the Ways)*, includes a musical play *Ordo Virtutum (Order of Virtue)* along with descriptions of her visions. Mechthild von Magdeburg, a visionary and bridal mystic, published *Das fließende Licht der Gottheit (The Flowing Light of God)*. The fourteenth-century translation of this text into Middle High German counts among the most forceful examples of women's writing from the Middle Ages.

The literature that surrounds the cult of the saints reflects a received tradition. In this sense, the artistry of the literature is secondary to the importance of the material that is conveyed. Thus, the literature of the saints must be seen as polymorphous, as rising out of the community of believers and changing as the needs of the community change, rather than as a static reflection of the genius of the author. Hence, the lives of saints retain the quality of presence; they never become historical artifacts.

In Middle Dutch literature, stories about the lives of saints play an important role. Not only the legends of local saints but also the lives of saints worshipped by the whole Christian world were adapted for the vernacular language. It is likely that there was already an oral tradition of stories of saints even before they were written down. This article first treats longer *vitae* (Lives), which circulated as independent issues, and second shorter versions, which were collected in often quite substantial anthologies.

The oldest Middle Dutch manuscript, which has been handed down only fragmentarily and which dates from the end of the twelfth century, is also the first example of Middle Dutch hagiography. It is the legend of St. Servatius written in verse by Heinric van Veldeke. About 1170 this poet from the region near the Meuse adapted the *Leven van Sint Servaes* (*Life of St. Servaes*) from a Latin original, presumably for the use of pilgrims and by order of the countess Agnes van Loon and Hessel, the *custos* (caretaker) of the church of St. Servaas in Maastricht in which the relics of this bishop were worshipped. From the thirteenth century, a number of stories of saints written in verse have been passed down. Between 1276 and 1283 the West Flemish poet Jacob van Maerlant adapted the *Leven van Sint Franciscus* (*Life of St. Francis*) from a Latin biography written in 1261 by Bonaventure and accepted by the general chapter of the congregation of the Minorites in Pisa. Unfortunately, nothing has been preserved of the *Leven van Sinte Clara* (*Life of St. Clara*) which Maerlant claims to have written. Among mystics, some women from Limburger origin were highly worshipped. Willem van Affligem (1210–1279), abbot of the St. Truiden monastery, adapted the life of Saint Lutgard (1182–1246), abbess of the Cistercian convent of Aywières near Luik, from the Latin *Vita piaie Lutgardis* (*Life of St. Lutgard*), written by Thomas van Cantimpré, a confidant of Lutgard. From this quite substantial *Leven van Sinte Lutgard*, only the second and the third book (together some twenty thousand verses) have been preserved. The same *vita* was again translated into the vernacular for nuns from the convent of Nonnemielen near St. Truiden by a Minorite named Brother Geraert, who came either from East Brabant or from West Limburg. This author also wrote the life of Christina (Kerstine, called "the Wonderful," about 1150–1224) from St. Truiden, who has never been officially canonized. Again a Latin *vita* written by Thomas van Cantimpré was used as a source. Also in the thirteenth century, the anonymous legends of Saint Trudo and Saint Alexius were written, which have been preserved only in fragments. Strictly speaking, the story of the miraculous sea voyage of the Irish abbot Saint Brendan (from Clonfert), which was translated from a Rhenish dialect into Middle Dutch, presumably at the beginning of the thirteenth century, does not belong to the genre of saints' lives.

During the following centuries, lives of saints were mostly written in prose. An important exception to the rule is the anonymous story of St. Kunera from Rheen en and the *Leven van Sint Amand* (*Life of St. Amand*), written by Gillis de Wevel in 1367, which is more than twelve thousand verses long. Among the rather long prose legends from a more recent date, the lives of Saint Katharina, Saint Hieronymus, and Saint Elisabeth deserve attention. All were written by unknown authors. The legend of the local Saint Godelieve from Gistel (about 1045–1070), which dates back to the fourteenth century, drew attention even outside West- and French-speaking Flanders. Above all, the period of religious reorientation known as *Devotio moderna* (new piety) highly stimulated the spread of lives of saints. That a work like the *vita* of Saint Lidwina from Schiedam (1380–1433), written by Jan Gerlachs, was very popular is shown by the fact that this work was printed almost immediately after having been written and that it was still being reprinted in the fifteenth century in Gouda and Delft. Anonymous prose legends of Saint Francis, Saint Clara, and Saint Anna were also reprinted repeatedly.

Collecting the lives of saints for compilation started very early. Fragments of the so-called Enaamse Codex, in which, next to other texts, the lives of Saint Katharina, Saint Eustachius, Saint Agatha, Saint Werner, Saint Maria Egyptiaca, and Saint Zosimas, all written in verse, have been handed down, can be dated back as early as to the end of the thirteenth century. Some of these texts were written by a monk from the monastery Enaamse near Oudenaarde, but who composed the others is unknown. Also the *Spiegel Historiae* (*Mirror of History*, 1283–1288) includes numerous lives of saints. A part can be traced back to Jacob van Maerlant. The *Tweede partie* (second part) of this voluminous world chronicle, which almost exclusively contains stories of saints, is attributed to Philip Utenbroecke, it is unknown whether the anonymous author of *Der Ystorien Bloeme* ever succeeded in realizing his ambitious plan to relate the lives of the apostles, the martyrs, the confessors, and the virgins and widows. Fact is that only the first book containing the rhymed lives of the Twelve Apostles (4,280 verses) has been preserved. It is almost certain that the fourteenth-century author was inspired by the work of one of the most important Latin hagiographic collections of his time, i.e., by the *Legenda aurea* (*Golden Legend*) of Jacobus de Voragine (d. 1298).

This *Legenda aurea*, in the vernacular also called *Gulden Legende* (*Golden Legend*), or more often *Passionael*, was extremely popular. Apart from *Der Ystorien Bloeme*, this collection of saints' lives, which originally contained about 180 stories of saints, was presumably translated twice (or perhaps even three times) into Middle Dutch prose. The first adaptation dates back to about 1357 and was carried out by an anonymous monk, perhaps from the Carthusian monastery of Herne, some thirty miles (fifty kilometers) southwest of Brussels. As this monk also translated a number of books from the Old Testament in 1360, he is often called the "Bible translator of 1360." Unfortunately only a part of the oldest copy of his translation of the *Legenda aurea* (1358) has been preserved. The quite numerous copies, mostly dating from the fifteenth century, vary substantially in composition. From the standard collection of Jacobus de Voragine, stories are regularly left out or are substituted by the lives of other saints, not infrequently local ones. Yet often stories are also divorced from their context and included either alone or in groups in other collections.

Probably about 1400, the so-called northern Dutch translation of the *Legenda aurea* came into being in Holland. It might be that it was a new translation. Another possibility is that someone from north Holland adapted one of the versions of the southern Dutch translation that circulated in Holland, using the Latin text as reference. It is also unclear whether the whole corpus of legends has been adapted or only a part of it. The fact is that no manuscript is preserved that contains a complete northern Dutch translation, whereas a mixture of legends from both the southern Dutch and northern Dutch version are found in a number of manuscripts. The distribution of the northern Dutch translation was restricted mainly to the north of the Netherlands and to the Dutch-German border region, whereas the southern Dutch translation spread all over the Dutch-speaking area, with the exception of Flanders in the southwest. It is not unlikely that this is closely connected with the movement of the *Devotio moderna* (Modern Devotion). The Dutch version was also read and copied in wide areas of Germany. A recent inventory registers about 110 manuscripts, fragments, and printed editions. For the sake of completeness let it be mentioned that in one of the manuscripts the legends of Saint Eustachius, Saint Basilus, and Saint Johannes de Aalmoezenier can be found in still another, perhaps even a third translation.

Parts of the *Vitae Patrum* (Books 1, 2, 5, and 6) with, among others, the life of Saint Anthonius written by Athanasius, the lives of the Desert Fathers written by Timotheus of Alexandria, and other legends have been adapted more than once in Dutch. The oldest translation is again one made by the Bible translator of 1360 and is known by the name of *The Book of Fathers* (*Der vader boec*). In this case too a number of texts were translated for a second time in the north, presumably in Utrecht at the beginning of the fifteenth century. A third translation of the *Verba Seniorum* (*Words of the Elderly*) is supposed to have come to Limburg via a Ripuarian (Rhine Valley) link. The legends of *Der vader boec* were dealt with in exactly the same manner as those taken out of the *Passionael*: some copies contain the complete text of the *Vitae Patrum*, other copies chose only the lives of saints, and again others made another selection within this subgroup. Therefore it is sometimes difficult to distinguish exactly between the traditions of the *Passionael* and *Der vader boec*, respectively.

Gregory the Great's *Dialogi* were also translated twice in Middle Dutch. The first translation was made in 1388 by the Bible translator of 1360, the second probably in the early fifteenth century by an anonymous translator within the sphere of the *Devotio moderna*. The dissemination of excerpts from Gregory's *Dialogi* and other hagiographic sources in Latin sources through a wide variety of texts and collections defies any attempt at surveying, mainly because relevant research is still in progress.

It is strange that among this rich harvest of saints' lives, no story of the Blessed Virgin can be found. Therefore seven dramatized episodes out of the life of Mary, the so-called *Seven Bliscappen* (*Seven Joys*), out of which every year one episode has been performed in Brussels since 1448, are worth mentioning. Only the first and the last part of this cycle has been preserved. From the sixteenth century, dramatized stories of St. Trudo and St. George (St. Joris) have been handed down.

Saliens

The Salian (German, *Salier*) dynasty, which produced four kings or emperors in the eleventh and early twelfth centuries, traced its roots back to at least the seventh century to a kinship group (*Adelssippe*) known as the Widonen that held high administrative positions and occasionally occupied the episcopal chair in Trier. At an early date they established a proprietary monastery (*Hauskloster*) at Mettlach on the Saar River, and by 742 or shortly before, they had founded a second such institution at Hornbach in the Bliesgau (Blies District, now in Rheinland-Pfalz). In about 760 a small monastery, that of St. Philip at Zell, west of Worms on the Pfrimm, belonged to the Widonen as well. The main center of Widonen power lay more or less in the area between Metz, Trier, Idar-Oberstein, and Pirmasens.

The Widonen appear as important helpers of the Carolingians. They and other noble families played a major role in building up the Frankish government as the Carolingians once again began to renew lordship rights east of the Rhine. At the end of the eighth century, the Widonen kinship split into various branches that established bases of power in Brittany, in the area of the lower Loire, and above all in the duchy of Spoleto. Duke Wido of Spoleto was ambitious and powerful enough that in 888 he laid claim to the throne of Burgundy. Though this lofty plan failed, he did manage to acquire the imperial crown in 891.

One branch of the family remained in the original homeland, and in the course of the ninth century their lordship spread outward from the Bliesgau (centered at Hornbach, since Mettlach was lost early on to the archbishop of Trier) into the Wormsgau and Speyergau. At the end of the ninth and the beginning of the tenth centuries, we encounter a Count Werner in the Wormsgau (891), Nahegau (891), and Speyergau (906), who was most probably a member of the Widonen kinship and from whom the line of Salian ancestors continues without interruption. Werner appears in the narrative sources as a violent man who gave his support to the Conradian monarchy; he even married one, probably a sister of Conrad I (911–919), which placed his family in the direct vicinity of the king.

Although the German crown passed to Henry I, duke of Saxony, in 919 and, upon his death, to his son Otto I, the Conradians struggled to create a Rhine-Frankish duchy for themselves; their defeat in the rebellion of 939 made way for the rise of the Saliens as the dominant family on the Middle Rhine. Count Werner's son Conrad, surnamed "the Red," appears as count in the Nahegau, Wormsgau, and Speyergau, but also in the Niddagau, north of Frankfurt. As early as 941 he appears in the closest proximity of Otto I, and his ties to the Ottonian house were solidified by marriage in 947 to the daughter of Otto I, Liudgard. In 944 (or 945) he obtained the duchy of Lorraine from the king, i.e., the region from Alsace to the mouth of the Rhine, between the Meuse and the Rhine, with the tasks of defending the realm on the west and of subduing the Lotharingian nobility.

But Conrad the Red was perhaps too ambitious, and in 953 he joined a rebellion of Otto the Great's oldest son, Liudolf, against the king. Otto retaliated by stripping Conrad of his duchy in 953/4 and transferring important comital, or ducal, rights in the city of Mainz and in the area of Bingen to the archbishop. Conrad shortly thereafter made peace with the king, and in 955 he led the Frankish forces at the battle of Lechfeld; he died during the conflict and was buried at Worms Cathedral, in a fashion normally reserved for kings and bishops.

By now, Worms had become an important family center. It was the site of a Salian *Grafenburg*, an old Carolingian royal *pfalz*, or fortification, and it was also the center of family property and of important lands held by them. In 956, Conrad's son, Otto II, appears as count in the Nahegau, which he inherited from his father, and in the following years he united the Wormsgau, Speyergau, Niddagau, and other countships between the Neckar and the Rhine (Elsenzgau, Kraichgau, Enzgau, Pfingzgau, perhaps Uffgau)—an almost solid countships-complex in the Middle and Upper Rhine. This accumulation of power caused concern for Emperor Otto II, who, in an effort to remove him from his power base, appointed him duke of Carinthia and margrave of Verona in 978.

Deprived of his dukedom in 985, Otto II returned to his power base on the Rhine. Contemporary sources of the late tenth/early eleventh century refer to him as *der Wormser* (he of Worms) as a means of distinguishing him from a similarly named duke of Swabia and Bavaria who, like him, was a grandson of Otto the Great. Otto Wormatiensis also appears with the appellation *Wormatiensis dux Francorum*, a somewhat idiosyncratic term since he in fact had no duchy; he was simply put a "Frankish duke of Worms," and the royal court seems to have accepted this earliest instance of a "titular dukedom" in German history, a dukedom that rested on the ever increasing nobility and comital lordship with its center at Worms.

The prestige of Duke Otto of Worms helps account for the nomination of his son Bruno, now imperial chaplain (*Hofkaplan*), to be the successor of Pope John XV. He took the name Gregory V, and it was from him that Otto III, his kinsman, received the imperial crown on May 21, 996. His pontificate was painful, however; there was great resistance from Rome and he was driven out. An antipope (John XVI) was installed briefly, and although Gregory V was restored in February 998, he died in February 999. Sylvester II (Gerbert of Aurillac) succeeded him.

The family position also came under attack closer to home. The concentration of power in the area of Worms inevitably brought about a struggle with the bishop for temporal control. Following the election of Henry II in 1002, the new king heaped favors on the church at Worms that had supported him. With the full backing of Bishop Burchard, King Henry II forced Otto to renounce claims over Worms in October 1002. The decreasing importance of the Saliens can also be seen in the fact that, although Otto's son Conrad briefly held the duchy of Carinthia, when Conrad died in 1011, King Henry passed over Conrad Jr. in favor of Adalbero of Eppstein.

The fortunes of the Saliens were dramatically altered by the death of Henry II in July 1024, which left the empire in shambles. Seeking a quick solution, the German princes selected Conrad the Elder, cousin to Conrad Jr., as king. He was consecrated at Mainz on September 24, 1024. He had previously married Gisela, daughter of Duke Hermann II of Swabia, to whom he was closely related. Their son, Henry III, succeeded virtually unopposed to the German throne in 1039, but his early death in 1056 left a small boy as heir. Born in 1050, Henry IV had received consecration as future king on July 17, 1054, and assumed personal rule on March 29, 1065, at Worms. His reign was characterized by the rising opposition of the German nobles to Salian policies and by the prolonged struggle with the papacy (particularly with Gregory VII) over the issue of lay investiture of high church offices. The conflict called forth the most bitter exchange of letters, bulls of excommunication, and depositions. For its sheer dramatic value, nothing exceeded the picture of the emperor standing outside the walls of Countess Mathilda of Tuscany's fortress at Canossa in early 1077, seeking forgiveness from the pontiff, who was determined to travel to Germany, where he planned to preside over Henry's formal deposition. Canossa prevented that from occurring, and it clearly led to Henry's gaining the upper hand over Gregory. Henry died in August 1106, just weeks after he himself had escaped from confinement.

His son and the last Salian, Henry V, inherited a very different world than the one his grandfather had known. By 1100 the self-awareness of the nobles as representatives of the interests of the empire was on the rise. This required a new set of relationships between the king and the princes. For the ecclesiastical princes this was the Concordat of Worms of 1122; for the lay princes, it meant incorporating them into a new system during the twelfth century, the *Heerschildordnung* (order of the coat of arms). Henry V's death on May 23, 1125, without male heirs gave the German princes the opportunity for a free election: ignoring the blood-right claims of Duke Frederick I of Swabia, who had married Agnes, the daughter of Henry IV, they selected instead Conrad II of Franconia.

The Salian age was one of great building activity in Germany; hardly any Carolingian buildings survived past the mid-eleventh century. Recent scholarship has shown that Conrad II intended from the very beginning that Speyer and not the abbey of Limburg-on-the-Haardt become the family burial place. Speyer appears circa 1000 as a dilapidated bishopric and city, and he breathed new life into it. Construction began in 1025, and by the time Conrad II died in 1039, the crypt was sufficiently completed for his remains to be buried there; his wife, Gisela (d. 1043), and Henry III were buried alongside him. The cathedral was completed and consecrated Oct 4, 1061, by Bishop Gundekar II of Eichstätt. During the reign of his son Henry IV (1080s), however, it was expanded once again, under the direction of the *Bauleiter* Bishop Benno II of Osnabrück (1068–1088), who also built his own cathedral.

Salzburg

For much of its history, Salzburg was the residence of the archbishop of Salzburg, one of the most powerful figures in the Holy Roman Empire and ruler of the leading archbishopric in Germany. Often referred to as the "German Rome," the city was a political and cultural center, and especially in the eleventh, twelfth, and thirteenth centuries, its art had a major impact on the painting of Central Europe. The earliest settlement of the city appears to have been a Celtic one around 500 B.C.E. The Romans arrived around 40 C.E. Under the Romans, Christianity was introduced, and catacombs were built around 400 C.E. in the city, which was then known as Iuvavum. Among the

Orationale from Salzburg (Munich, Bayerische Staatsbibliothek, Cim. 15902), fol. 72v: initial with Madonna and Child. Photograph: Bayerische Staatsbibliothek.

medieval churches, the most important are the monastery of St. Peter, founded around 696 by Saint Rupert, the Nonnberg Convent founded by Saint Erentrud at about the same time, the cathedral, the Franciscan church, and the church dedicated to Saint Michael. It is in connection with the first two that manuscripts and paintings are found today, in part because St. Peter's, the site of a major scriptorium, was the seat of the archbishop, who was also its abbot, for much of the early Middle Ages. Among other projects, the fortress on the Hohensalzburg was begun by Bishop Gebhard in the eleventh century. Few frescoes remain. At St. Peter's, today a Romanesque church with a Gothic cloister, can be found a personification of the third hour of the monastic offices. This is the sole figure remaining from the twelfth-century redecoration of the church, which took place after a fire in 1127; it is painted in a Byzantinizing style similar to that found in manuscripts produced there at the same time. A mid-thirteenth-century image of St. Mary Magdalen with a donor has been connected with Salzburg manuscripts of that same period. The subject of much greater discussion has been a series of mid-twelfth-century frescoes at the Nonnberg Convent, said to be the oldest convent for women north of the Alps. Although portions of the structure's basis reach back to the Roman period, the present Romanesque building probably dates from the patronage of Henry II and Kunigunde around 1009. The remnants of its extensive fresco program, including the feet of an enthroned figure, can be seen on the west wall, below which is a series of niches with half-length figures of male saints, of which six survive intact. A number of scholars, including Paul Buberl and Otto Demus, have argued that the painters of these frescoes demonstrate a sensitive understanding of Byzantine art, probably transmitted through Italian examples at Venice.

Major activity in manuscript illumination at Salzburg dates from the eleventh century, after monastic life at St. Peter's was reformed from Regensburg in the tenth century following a period of violent upheaval. In several manuscripts dated to this era can be found evidence of both Carolingian and Byzantine models. In the twelfth century a period of spectacular production began, with a noticeable stylistic relationship to both Byzantine art and Italian art.

Manuscripts such as the Walther and Admont Bibles, from the second quarter of the twelfth century, share significant iconographic elements with both English and Byzantine works, and have been at the center of discussion of the history of Bible illustration. They also share a distinctive style that combines aspects taken from Byzantine models with a strong, linear treatment of figures with works such as the Pericope (Gospel Readings for the Mass) of St. Erentrud. Unquestionably the most impressive manuscript from this period is the St. Peter's Antiphony, painted at mid-century. In this work the illuminators' familiarity with Byzantine facial and drapery types is even more striking. Some of the images are actually tinted drawings, a technique found in other Salzburg manuscripts from the second half of the twelfth century. By 1200 Salzburg illumination reached a superb level in the *Orationale* of Saint Erentrud, a luxurious manuscript that includes images of the Virgin demonstrating a profound familiarity with Byzantine models. The continued production of manuscripts at Salzburg into the middle of the thirteenth century is demonstrated in works such as the "Salzburg Lectionary" and the "Seitenstetten Missal," which has a calendar that directly copies the decoration of the calendar in the *Orationale*. These works mark the continued acquisition of Byzantine and Italian characteristics by Salzburg painters, in this case through the arrival of northern Italian illuminators in Salzburg, along with characteristics of the *Zackenstil* (zigzag style). The association of Salzburg artists with the Wimpassing Crucifixion panel and the stained glass in the upper church at Assisi argues for extensive production of art at Salzburg in the thirteenth century.

Sammelhandschrift

The term *Sammelhandschrift* refers, most simply, to a manuscript that has more than one text. The term itself can be translated into literal English as "collected manuscript." It contrasts with *Einzelhandschrift* (individual manuscript), referring to a manuscript with one text only. The number of texts in a *Sammelhandschrift* varies greatly; some preserve just two or three texts, while others have hundreds. The maximum number of texts in a manuscript is limited only by physical constraints such as the availability of writing material, the strength and width of the binding, or the size of the script; or by cultural constraints, such as the availability of texts in a given scribal milieu. Perhaps the main factor determining the number of texts in a *Sammelhandschrift* was the goal or intention of the scribe or compiler. Manuscripts whose text collection has some degree of coherence or focus have particular literary or cultural significance. Yet the contents of many *Sammelhandschriften* (plural) were collected randomly or haphazardly, for example, through the uncoordinated actions of several individuals over an extended period. Since many, perhaps most, manuscripts are *Sammelhandschriften*, the term designates a norm of medieval bookmaking. Collected manuscripts arose not only in German, but also in Latin and in the other European vernaculars. Examples of *Sammelhandschriften* are therefore numerous.

Although the word *Sammelhandschrift* is widely used in scholarly writing, its definition offers some surprising complications. For example, the variability of the medieval text, which includes adaptation, merger, fragmentation, and the like, makes the notion of the text itself unstable. For descriptive purposes, variability can make it difficult to count the number of texts present in a collected manuscript. From a more theoretical standpoint, the openness of the text to others in its folio environment may be a far more salient feature of the medieval book than the accumulation of textual units implied by the basic definition of the *Sammelhandschrift*. Glosses, marginalia, and occasional notations are not usually considered texts for the purpose of identifying a *Sammelhandschrift*, although this distinction is arbitrary. It is further doubtful whether a manuscript with a highly intentional composition should be classified as a *Sammelhandschrift*, simply because it has multiple texts. Examples of likely non-*Sammelhandschriften* include manuscripts whose contents are uniform and typically found together, such as the stories of the saints comprising the *Golden Legend*; or collections of Arthurian romances in which each romance has a chapterlike character; or manuscripts whose contents are arranged to follow the liturgical year. Still another complication arises with respect to language. Some scholars use the word *Mischhandschrift* (mixed manuscript) to designate a manuscript with both German and Latin texts, reserving *Sammelhandschrift* for manuscripts in either language exclusively. A distortion arises from this seemingly simple distinction, though, when a single Latin text or text cluster turns up in an otherwise German collection, or vice versa. Such occurrences are common. These complications indicate the poverty of our vocabulary for talking about the contents of medieval books and the rudimentary stage of our understanding of the manuscript's cultural dynamics—the factors that influenced their production and their use.

The concept of the *Sammelhandschrift* belongs fundamentally to the realm of bibliography. Decades of philological effort have solved most of the descriptive problems arising from collected manuscripts. A description of a manuscript indicates whether it is a *Sammelhandschrift* along with notes about the binding, materials, script, layout, marks of ownership, and so on. Each text is then enumerated, often with folio location, opening lines, manuscript and modern research titles, and a listing of other manuscripts in which each text is found. Particularly thorough descriptions also include references to important scholarship on individual texts. Such *Sammelhandschrift* descriptions are found in catalogues of manuscript collections, as well as in the apparatus of scholarly editions. Even when only one text from a *Sammelhandschrift* is edited, it has become standard practice to describe the entire manuscript in this manner. Bibliographic descriptions are essential because they provide a sense of the scope and diversity of the medieval book to readers who may rarely come into contact with the actual manuscript. They also make known the single text's most immediate historical context, the one offered by the collected manuscript.

This high bibliographic standard has developed hand in hand with an increasing awareness of the importance of *Sammelhandschriften* for rethinking aspects of medieval culture and history. Scholars in several text-based fields of medieval studies, working in a variety of medieval time periods, have become interested in the way texts are bundled in manuscripts as a key to how knowledge was organized. This research energy is especially productive for the field of vernacular cultural studies, with a focus on the later Middle Ages. In the fourteenth and fifteenth centuries, the use of German and other vernaculars as the written medium of all kinds of knowledge and information—religious, legal, medical, political, literary, etc.—simply exploded. This expanded use of German came in the wake of the disintegration of the cultural synthesis of the thirteenth century, in which an elite public produced, through patronage and direct authorship, and consumed, a stable set of literary genres. As more and more was written in German, and as the use of paper and the spread of literacy made manuscript production and ownership more common, manuscripts became ever more diverse in their contents. Text diversity is not necessarily randomness, though. Many *Sammelhandschriften* are a synchronic cross section of their historical moment of production and use. What has been called the typology of the *Sammelhandschrift*, or the stable "symbiosis" of text types in many manuscript collections, is the starting place for a cultural history of the text grounded in actual reading and bookmaking practices.

We are only beginning to know how to "read" *Sammelhandschriften* as cultural indices, aided by the publication of key *Sammelhandschriften* in their entirety. The rewards for this effort are significant. For example, *Sammelhandschriften* reveal aspects of performance when the sequence of texts reflects a performer's repertoire. The Middle Dutch Van Hulthem manuscript, dated about 1400, preserves the oldest known secular dramas from the German territories. These are paired so that a serious drama, usually on a courtly theme, is followed by a farce with a *märe*-like (comic) plot. These pairings represent the way the dramas were presented to medieval audiences. The entire group of drama pairs in van Hulthem was almost certainly copied from the repertoire of a theater company.

It is significant that whoever compiled the Van Hulthem manuscript kept these pairings so they became part of the reading experience for the manuscript's owners and users. The concept of reading experience is one of the most important ideas arising from the study of one important group of late medieval *Sammelhandschriften*—those with short texts in couplets. The notion of reading experience implies that texts in juxtaposition interpret each other, or resonate together, so that the process of sequential reading adds up to more than the mere sum of random parts. Some of the juxtapositions, such as the combination of eulogies with discourse on courtly love, are standard. They reveal not only the expectations of medieval readers but also tell modern readers far more about the reception of these genres (i.e., that a lover's absence was commensurate with a lover's loss through death) than could the study of either genre in isolation. Other juxtapositions one finds in *Sammelhandschriften* were clearly ad hoc but striking in their pointedness. By far the most common way of combining texts in *Sammelhandschriften* was through thematic pairing to form dyads. Dyads represent a textual equivalent of the couplet rhyme, and show how variance could occur among texts as well as among versions of the "same" text.

Along with readership experience, the concept readership practice has emerged from the study of *Sammelhandschriften*. Important insights have been achieved through the study of Middle English collected manuscripts, and these insights can be extended in the future to German manuscripts as well. Readership practice refers to all the ways readers could alter texts and text collections to suit their own tastes or needs. It begins with fairly simple incursions such as marginal notes or ownership marks, but extends to the addition of texts to a *Sammelhandschrift*. Additions could accrue over time and represent the participation of several readers who thereby altered the overall character of the manuscript. The Middle English song collection known as the Findern manuscript is a good example; women especially can be documented among the manuscript's active readers. Readership practice also refers to the insight that scribes and compilers were themselves readers and editors; or that in the literate, vernacular culture of the later Middle Ages, the roles of scribe, collector, and manuscript user were no longer separated. Thus a literate person from any walk of life could adapt texts and tailor a *Sammelhandschrift* specifically to his or her own purposes, perhaps as a household book or a book of personal piety. A London green grocer named Richard Hill made a manuscript courtesy book (now British Museum, Balliol collection, manuscript no. 354) emphasizing ideal masculinity, including carefully selected extracts from Gower's *Confesio amantis*. This way of studying *Sammelhandschriften* brings in historical and sociological factors that greatly enrich the more formal approaches sketched above.

The study of *Sammelhandschriften* has had an impact on the way we think about literary history. It has been argued that the compilation of collected manuscripts is a powerful and autonomous witness to how medieval people organized and used their own textual heritage. Manuscript typology, or the

prevailing ways of combining texts to produce *Sammelhandschriften*, is as important to historical reconstruction as more traditional categories such as genre or the author's oeuvre. In fact, a manuscript-centered approach to literary history can greatly improve our understanding of what an oeuvre or genre is by giving it a firm historical basis. Some late medieval manuscripts preserve the works of an author, but the authorization pertains less to the work itself than to the use to which it was to be put. Oswald von Wolkenstein's and Hugo von Montfort's oeuvres were preserved in manuscripts for family use and family inheritance (the Montfort and Wolkenstein family books, so to speak); Hans Rosenplüt's works, both authentic and spurious, were preserved in manuscripts with strong historical connections to Nuremberg by collections as concerned with the city's cultural identity as with the person of the author. Genre study has a similar, revisionary relationship to manuscript study. Thus manuscripts confirm the historical identity and autonomy of various genres, above all the song collections of the later Middle Ages. More often, though, they reveal the symbiosis of genres in patterns whose cultural significance we have only begun to suspect.

Finally, the new understanding of *Sammelhandschriften* has provided powerful tools for the study of single medieval texts diachronically, during their period of active transmission. Variance is no longer regarded as a corruption of an author's original creation but, rather, as the trace of the text's historical reception. While certain kinds of variance can be interpreted without reference to manuscript context, variance tends to be much more meaningful in situ (on site), or with reference to the other texts around the one under scrutiny. Even texts that change little from manuscript copy to manuscript copy read very differently, depending on their immediate and overall manuscript context. Thus the same medieval tale can be read as a warning against the wiles of women in a *märe* (comic) context or as a high-minded reflection on the discipline demanded of the lover in a *minnerede* context, or as an allegory of salvation in a religious context.

Sangspruch

A lyric subgenre of courtly song, *Sangspruch* (also *Spruchdichtung*) encompassed a style of gnomic, monostanzaic song treating matters other than love. It coexisted with *Minnesang* (courtly love singing) at the German-speaking courts as a popular entertainment between the twelfth century and the fifteenth. The songs were often propaganda pieces commissioned by a patron, personal pleas to a lord for a reward (such as a house), or complaints about the indignities and discomforts inflicted on the singer (too little respect, too much travel, bad clothes, among others). Other themes included knightly virtues, courtly ethics, the condition of the world, laments about the chaotic present as opposed to the ordered past, the art of courtly singing (including polemics against rival singers), and Christian doctrine. A strong underlying theme was the preservation or restoration of traditional, conservative values. The songs were composed and performed by professional singers not of the nobility, though their audiences were noble as were their pretensions. The livelihood of these paid courtly entertainers depended on the production and performance of songs to amuse, edify, and flatter their patrons. For most, the tenure at any one court was brief, so that they have been called *Fahrende* or *Wandersänger* (traveling or wandering singers).

Unlike the polystanzaic songs of *Minnesang*, *Sangspruch* was customarily confined to a single stanza. The stanzaic form echoed that of *Minnesang* (bar form), except that the lines and the stanzas of *Sangspruch* tended to be longer. The singers normally composed a number of one-stanza songs with the same metrical form, rhyme scheme, and melody, a melodic-poetic unit called the *Ton* (tune, plural *Töne*), and though the single stanza could stand by itself, thematic connections existed between some (though seldom all) of the stanzas within a *Ton*. A singer probably performed groups of stanzas together, though in a later performance he may have rearranged them or composed new ones in the same *Ton*. Early redactors sometimes gave these *Töne* descriptive names, e.g., the "Long Tune," "Golden Tune," "Court Tune." *Sangspruch* is sometimes equated with the moral and didactic *serventes* or the epigrammatic *cobla* of Old Provençal, though the *serventes*, with its three to five stanzas, was typically longer.

Little is known about the singers and their circumstances, although the performance venue can frequently be identified. Only in rare cases (e.g., Walther von der Vogelweide and Konrad von Würzburg) did a singer compose both *Sangspruch* and *Minnesang*.

The term *Spruchdichtung* (*Spruch-poetry*) was coined in the nineteenth century by Karl Simrock as a designation for the vast body of lyric verse that did not treat love as its principal theme. Simrock and others erroneously concluded that this verse was recited and adopted the word *Spruch*, a "saying reflecting proverbial wisdom," a meaning often applicable to the content of *Sangspruch* but that ignores its musical aspect. The hundreds of melodies transmitted in the manuscripts make it clear, however, that the songs were sung in performance. More common today is the term *Sangspruch* (song-*Spruch*) or *Sangspruchdichtung* (song-*Spruch-poetry*).

There were a few early, sporadic singers of *Sangspruch* in the twelfth century (Spervogel, Herger, Friedrich von Hausen, among others), but Walther von der Vogelweide, the most notable lyric singer of the German Middle Ages, defined the art around the year 1200, shaping it into a powerful vehicle of serious public entertainment. His more than eighty stanzas of *Sangspruch* reflect the turbulence of imperial and papal politics, the travails of the singer's peripatetic professional life, and his reliance on and need for a dependable patron.

Walther's stanzas achieved a singular popularity in the decades after his death, influencing *Sangspruch* for two centuries. Some singers, such as Reinmar von Zweter (second quarter of the thirteenth century), were limited in their ability to produce a variety of *Töne*. Reinmar confined himself to a single *Ton*, though he lavished his inventiveness on a rich diversity of thematic material (God, the Trinity, instruction for patrons, and songs of praise and propaganda, both for and against the Hohenstaufen emperor Friedrich II). Other echoes of Walther's *Sangspruch* can be heard in the stanzas of Marner and Bruder Werner (mid-thirteenth century), both of whom were skilled political propagandists. Konrad von Würzburg (d. 1287) is the first attested singer to have led a largely urban existence, perhaps pointing ahead to the middle-class art of the Meistersinger several centuries later. His large literary and musical output, produced primarily in Basle, reflect his bourgeois patronage. His *Sangspruch*, however, embraced many of the same themes and values of Walther and his followers.

Well before the end of the thirteenth century some singers had adopted (or had been given) fanciful names, perhaps following the example of Spervogel (Sparrow Bird), one of the few twelfth-century singers of *Sangspruch*: Singauf (Sing Out), Regenbogen (Rainbow), der Unversagte (the Undaunted One), der Wilde Alexander (Alexander the Wild), Rumeland (Leave-the-Land), der Kanzler (the chancellor), and Höllenfeuer (Hellfire).

The courtly popularity of *Sangspruch* continued through the thirteenth century. A devastating interregnum between 1256 and 1273 ended when Rudolf, the first royal Habsburg, was elected German king. Two singers, Friedrich von Sonnenberg and der Unverzagte (the Undaunted One) attached themselves to his court and performed before 1292. Der Unverzagte is remembered for an especially caustic complaint about the parsimonious proclivities of his patron, King Rudolf, toward his courtly singers and musicians.

All the singers of *Sangspruch* till about 1250 had learned their trade and sang in the central and south German areas. But later in the century north Germans such as Rumeland von Sachsen (Leave-the-Land from Saxony) and Hermann Damen began to appear. Most seem to have performed at central or south German courts, and their songs, copied into the manuscripts in a High German (i.e., south German) dialect, betray traces of their Low German (north German) origins.

The most important voice of *Sangspruch* around the year 1300 was that of Heinrich von Meißen, also called Frauenlob (Praise of Ladies). He, too, may have been in the service of King Rudolf as well as other south German patrons. The illustration in the Manesse Manuscript (ca. 1300) depicts him as an orchestra conductor leading an ensemble of nine singers and instrumentalists, possibly performing a *Leich*. According to legend he earned his nom de plume in a poetic debate with a singer named Regenbogen, defending the name *froue* (lady) against his opponent's predilection for *wîp* (woman).

Sangspruch after Frauenlob was practiced at the courts with dwindling enthusiasm. As the tradition aged, there was a growing dearth of inventiveness and a tendency to look back and imitate the old masters. Though a few singers such as Heinrich von Mügeln (second half of the fourteenth century), Muskatblüt, and Michel Beheim (both fifteenth century) produced *Sangspruch* in a courtly context, the art was clearly in decline. But it was to serve as the basis of a new tradition of singing, *Meistergesang* (master singing), which took root in the cities of central and south Germany in the fifteenth century. It was now urban tradesmen and artisans who practiced the gnomic art. They organized themselves into guilds and based the composition of their songs on a set of strict rules. Though thoroughly middle class in social status, mentality, and audience, the Meistersinger took up the ethical and moral themes as well as the forms and melodies of the courtly singers. They paid homage to many of their predecessors by designating the "twelve old masters," among them Walther, Reinmar von Zweter, Frauenlob, and Marner, using the old *Töne* as templates for new texts.

Sankt Bartholomew Altarpiece, Master of (ca. 1445–ca. 1515)

This master's name piece (Munich, Alte Pinakothek) was originally located in the church of St. Colomba in Cologne. He was known as both a painter and an illuminator of manuscripts. Most scholars believe that he was trained in the Netherlands, working in the area of Utrecht, and later settled in Cologne. He was probably born circa 1445 and died in Cologne around 1515, after moving there sometime about 1480. His only dated work is a manuscript, the 1475 Hours of Sophia van Bylant (Cologne, Wallraf-Richartz Museum), which was created in the area of either Utrecht or Arnheim. It has also been suggested that the Master was a Carthusian monk, and two of his works, the St. Thomas and Crucifixion altarpieces, were commissioned by Dr. Peter Rink for the Carthusian monastery in Cologne (now Wallraf-Richartz Museum).

His style was extremely distinctive, and he seems to have had no direct followers. He has been described as a "Late Gothic Mannerist," and his work is characterized by an intense mystical piety, with extremely volumetric treatment of form juxtaposed with rich, exaggerated, linear patterning. His figures also have distinctive characteristics, including long, bony, awkwardly articulated fingers and tiny mouths. Further, he has been called last of the Gothic painters in Cologne, owing in part to his adherence to standard iconographic patterns such as brocaded hangings in front of which stand rows of saints. However, behind these hangings one may often see deep, naturalistic landscapes, and his figures have a great deal of volume, although their poses are often rather contorted. His works are meticulously crafted, with a tremendous attention to detail. The overall effect is one of contrasts between naturalism and abstraction. The Master of the Saint Bartholomew Altarpiece also used extensive underdrawing, which is visible through some of the lighter pigments and has been verified throughout his works by technical means.

The abbey of St. Gall, located in northern Switzerland near lake Constance (German, Bodensee), was an important cultural center in the early Middle Ages. Its history is related in the *Casus Sancti Galli*, an ongoing chronicle written between the ninth and fourteenth centuries. The monastery was founded in the first half of the eighth century and experienced its greatest prestige around the year 900, but declined in the tenth century in the aftermath of Hungarian and Saracen raids and a disastrous fire. Thereafter, St. Gall again achieved prominence in the fifteenth, seventeenth, and eighteenth centuries. The monastery was dissolved by the Council of the Canton of St. Gall in 1805. The extant buildings date to the seventeenth and eighteenth centuries, but the appearance of the abbey and town of medieval St. Gall can be ascertained from drawings and plans predating the Baroque rebuilding. St. Gall's origins lie in the withdrawal to a hut along the Steinach tributary of the Rhine of the monk Gallus (d. ca. 650), a follower of the seventh-century Irish missionary St. Columba. Gallus built an oratory and monks' cells for a few companions, but the monastery proper was founded near Gallus's grave sometime before 744 by Otmar, an Alemannic monk. Otmar built the first church dedicated to Saint Gall, and it was during his abbacy that the Benedictine rule and thus the Latin rite were adopted. The appearance of the medieval abbey was primarily determined by the building programs of the ninth century. Sometime before 830, Abbot Gozbert received from his counterpart at the neighboring abbey of Reichenau the famous plan of St. Gall, now in the St. Gall library. The plan, which measured about 43½ inches in length by 30 inches in width, was drawn and inscribed in red and black ink on parchment. It indicates the disposition of all the religious and secular spaces of a Benedictine monastery, from the great church at the center of the complex to utilitarian buildings, such as the houses for livestock and their keepers, at the perimeter. The contention that the plan reflects the priorities of the Carolingian court, including the emulation of early Christian, Roman models and reforms of the Benedictine order, has evoked considerable controversy, as has the suggestion that the plan builds on the system of square schematism. In any event, the plan was never carried out. Although Gozbert built a new abbey church in the 830s, archaeological investigation has revealed numerous deviations from the church of the plan, and subsequent building programs at St. Gall were likewise unrelated to it. The medieval buildings were replaced between about 1660 and 1800. The present monastery is dominated by the late Baroque church begun in 1755 by the architect Peter Thumb.

The monks of St. Gall made important contributions in many areas of medieval culture. Throughout the early Middle Ages, for example, they were active in the transmission of the liturgy, a scholarly interest indicated by such manuscripts as the *Rex Palimpsestorum* (St. Gall, Stiftsbibliothek, no. Ms. 908), which includes numerous liturgical texts dating from the sixth to the eighth century, and the *Sacramentarium Triplex* (St. Gall, Stiftsbibliothek, Ms. 43; ca. 1020–1030), with Gregorian, Gelasian, and Ambrosian sacramentary texts. In addition, three St. Gall monks contributed significantly to the development of church music. Four Latin hymns by Ratpert (d. ca. 890) have survived, Notker I the Stammerer (d. ca. 912) wrote sequences to be sung between the Epistle and Gospel readings, and the sculptor Tuotilo (d. 912) also wrote tropes, including those preserved in the *Evangelium Longum*, which bears the ivory covers he carved. The St. Gall library possesses some twenty books dating from the ninth to the twelfth century that include the neumes for liturgical singing, as well as theoretical texts.

The monastery of St. Gall is best known, however, for the illuminated manuscripts produced by its scriptorium. Surviving St. Gall manuscripts suggest that eighth and ninth-century efforts were restricted to initial illumination and depended on both Irish and continental models, as the initials in the Wolfcoz Psalter of circa 835 indicate (St. Gall, Stiftsbibliothek, Ms. 20). The earliest figural miniature known to have been painted at St. Gall appears in a mid-ninth-century Psalter now in Zurich (Zentralbibliothek, Ms. C 12, fol. 53r). In the second half of the ninth century, St. Gall illuminators exploited contemporary Carolingian models from Tours, Metz, and the Court School of Charles the Bald. Three manuscripts of this period—the Folchart Psalter of 872–873 (St. Gall, Stiftsbibliothek, Ms. 23), the *Evangelium Longum* (Stiftsbibliothek, Ms. 53), and the Golden Psalter (Stiftsbibliothek, Ms. 22), the latter two circa 900—together represent the apogee of initial and figural composition at St. Gall. Tuotilo's ivory covers on the *Evangelium Longum*, representing Christ in Majesty, the Assumption of the Virgin, and a miracle performed by Saint Gall, are characterized by a figural and spatial illusionism and coherent, disciplined composition that represent a continuation of the style of Carolingian Reims, in such works as the Utrecht Psalter, and of Metz. Tuotilo's understanding and appropriation of classical values is unequalled at St. Gall. He appears to have had no successors.

Cultural activity at St. Gall was curtailed in the tenth century by the invasions and fire. When the scriptorium resumed production around the year 1000, it was over-shadowed by the imperial commissions of its neighbor and friendly rival, Reichenau. The early eleventh-century miniatures from St. Gall on the whole share neither the classicizing sophistication of the Carolingian painting nor the expressive stylisation of Ottonian Reichenau, although the illuminated antiphony in St. Gall (Stiftsbibliothek, Manuscripts 390–391), written during the abbacy of Herker the Recluse (986–1017), has formal affinities with the Reichenau Ruodprecht group of the 980s.

Sankt Katharinenthal

The Dominican women's cloister, suppressed in 1869, lies on the left bank of the Rhine, downstream from the village of Diessenhofen in Canton Thurgau (Switzerland). It developed out of a house of Beguines founded near Winterthur at the beginning of the thirteenth century; in the middle of the century the convent was accepted into the Dominican order. The cloister was erected on territory of the counts of Kyburg. For topographical reasons, the conventual buildings stand on the north side of the church, which was dedicated to the Virgin, Katherine, Nicholas, John the Baptist, and John the Evangelist. The baroque rebuilding of the church, dating from 1732–1735, retains the spatial sequence of its

Gradual from St. Katharinenthal (Zurich, Schweizerisches Landesmuseum, LM-26117), fol. 183v: initial M with the beheading of John the Baptist, and John the Evangelist with text roll; sister Katharina de Radege in the margin. Photograph: Schweizerisches Landesmuseum, Neg. 49255

dieval predecessor: a single-aisle nave, with two successive, flat-ended choirs at the east, an outer one (outside the cloistered area) and an inner one, the nuns' choir.

From the end of the thirteenth century, the cloister was a center of the south German mystical movement; visits are documented by Meister Eckhart, Albertus Magnus, and especially Heinrich Seuse (Suso), a member of the Dominican convent in Constance from 1327 to 1348. The nuns' lives recorded in the middle of the fourteenth century report the mystical experiences and visions of the sisters. Sculptures mentioned in the texts are now spread throughout the world. One of the best known is the life-size group of Christ and St. John the Evangelist in painted walnut from about 1305 (Antwerp, Museum Mayer van den Bergh). The work is considered a typical *Andachtsbild* (devotional image); it attempts to represent the theological concept of the *unio mystica* (mystical union) in pictorial terms. The sculpture was created by Master Heinrich of Constance, who, with other members of his workshop, made other sculptures for the convent: an over-life-size wood crucifix circa 1300 (St. Katharinenthal), a Madonna from the beginning of the fourteenth century, reworked in the baroque period (St. Katharinenthal), and a life-size, polychromed statue of John the Baptist about 1300 (now Paris, Musée des Arts Décoratifs, on long-term loan to the Badisches Landesmuseum, Karlsruhe). A small wooden Visitation group from about 1310–1320, now at the Metropolitan Museum of Art in New York, is attributed to the so-called Visitation Master. Two candlestick-bearing angels from about 1330 preserved in the Liebieghaus Museum in Frankfurt are supposed to come from a sculptured Entombment group that apparently stood in the nuns' choir. The so-called *croce dipinta* from circa 1250–1270 (Basel, Historisches Museum), a painted altar- and processional-cross, relies on a cross type especially favored in Italy.

Several liturgical codices, some lavishly illuminated, are preserved, including a group of seven manuscripts from the late thirteenth century in Rome (Biblioteca Apostolica Vaticana, Cod. vat. lat. 10769–10775) and the so-called Nuremberg Gradual, also from the late thirteenth century (Nuremberg, Germanisches Nationalmuseum, Hs. 21897), with twenty-six framed miniatures on gold ground. This latter served as a model for the manuscript known as the St. Katharinenthal Gradual (Zurich, Schweizerisches Landesmuseum). Dated to 1312, this manuscript, decorated with over seventy colored initials on gold ground, belongs to the most outstanding works of art from the Upper Rhine. The nuns must have copied the texts in the cloister's scriptorium themselves. The high-quality miniatures were painted in a workshop with far-reaching contacts, probably in Constance. The complex image program was designed by Dominican theologians, probably from the cloister in Constance, which was responsible for the care of the nuns' souls. It remains unclear whether the miniatures were executed in secular painting shops and/or in a monastic scriptorium.

Sankt Paul in Lavanttal

The importance of St. Paul in Lavanttal is twofold: in its own right as the oldest Cluniac cloister in Kärnten (Carinthia) in southeastern Austria, and as the successor to the royal monastery of St. Blasien in the Black Forest, whose monks were transferred to St. Paul after secularization in 1806–1807.

The castle at Lavant to the east of St. Veit and Klagenfurt had come into the possession of the counts of Spanheim with the marriage of Richardis of Aribon to Count Siegfried. Siegfried died on Crusade in 1065, and five years before his own death in 1096, their son Engelbert turned the castle into a cloister in his father's memory, calling twelve monks from Hirsau in Swabia. Remodeling of an existing church was finished for a consecration in 1093. The new church built during the tenures of Abbots Pilgram (1159–1192) and Ulrich I (1192–1222) shows the influence of the important church at Hirsau. The status of the abbey is marked by two papal favors: in 1099 Urban II took the abbey under his protection, and in 1177 Alexander III granted Abbot Pilgram the miter. Family burials continued here until 1256.

After a fire in 1367, the choir, transept, and part of the *chorus minor*, which extended three bays into the nave, were vaulted. The elaborate vaults added in the nave in 1468 were painted soon thereafter by the Pacherners. The fifteenth century was a difficult period for the cloister, however; it suffered under ineffective leadership, the plague, unrest in the region, and the incursions of the Turks.

The monastic community was dissolved in 1787, but in 1809 monks from the tenth-century royal foundation with them not only liturgical objects and manuscripts from their earlier home but the bones of fourteen Habsburg family members from the thirteenth and fourteenth centuries that had been moved to St. Blasien from Basel and Königsfelden in 1770. The library now at St. Paul, consisting largely of manuscripts brought from St. Blasien, is one of the most important in Austria. The manuscripts located at the cloister before its dissolution have been transferred to Vienna and Klagenfurt.

Sankt Veit an der Glan

First mentioned as a village in 1131, St. Veit is located in Carinthia on the Glan River along the primary traffic artery between Vienna and Klagenfurt. By 1199, the village was known as a marketplace, and by 1224 it was considered a city. Originally, St. Veit belonged to the bishop of Bamberg, but during the second half of the twelfth century, it became a possession of the dukes of Carinthia. Under the sovereignty of Bernhard of Spanheim (1202–1256), the city, with a ducal residence within its walls and castles in the surrounding area, developed rapidly. Until 1518, St. Veit was the headquarters of the Carinthian dukes.

The parish church of St. Veit, or the Holy Trinity, dates from 1162; it is essentially a three-aisle, late Romanesque basilica that, in its restored state, has the appearance of a late Gothic structure. Just outside the west wall of St. Veit stands a Gothic church from 1323, which was originally a cloister church for the Poor Clares. Although the towered city gates were destroyed during the nineteenth century, the city wall still exists in its fifteenth-century form. St. Veit's city hall dates from 1468. The facades of buildings surrounding the central square were changed after a fire in 1829, but the old town retains its medieval character, and the structure of these buildings is otherwise undisturbed.

Sankt Veronica, Master of (fl. ca. 1395– ca. 1415)

This anonymous master's name piece is the panel of Saint Veronica with the *Sudarium* (cloth), in Munich (Alte Pinakothek), a variation of which may be found in London (National Gallery). He was active in Cologne from circa 1395 until about 1415. There have been numerous attempts to associate the master with a name from Cologne's extensive guild lists, and Master Wilhelm from Cologne, Herman Wynrich von Wesel, and Hermann von Köln (Cologne) have been suggested. However, none of these names can be positively associated with the Master.

Scholars have seen the influence of French and Burgundian artists in his work. There has been some speculation as to the Master's association with the Carthusians and, in particular, the Chartreuse de Champmol in Dijon. In fact, authors have suggested the influence of Jean Malouel in the Master's work. His Crucifixion (Washington, D.C., National Gallery of Art) depicts a Carthusian monk kneeling at the foot of the cross recalling works executed by Malouel's teacher, Jean de Beaumetz, for the Chartreuse de Champmol. The Master's Small Calvary (Cologne, Wallraf-Richartz Museum) has been described as an enlarged version of a French illuminated manuscript.

The Master of St. Veronica's works are characterized by very fluid lines and expressive faces and gestures. The fluidity and gentle nature of his works is in keeping with the *weicher Stil* (soft style) of the International Gothic period. Through delicate modeling, the Master produced figures with a greater degree of plasticity than earlier Cologne painters, whose works tended to be flatter. His color sensibility, too, was very delicate and very original. He also created early examples of the typical painted *Andachtsbild* (devotional image). These small works depict half-length figures before a gold ground. Both versions of St. Veronica with the *Sudarium* fall into this category and were probably used for private devotion.

The Master of Saint Veronica was the most influential painter in Cologne before Stefan Lochner, and it has been suggested that other painters, such as the Master of St. Lawrence, were trained in his workshop.

Sankt Wolfgang

About 994, Wolfgang, bishop of Regensburg, founded a hermitage for his retirement on a rocky spur above the Abersee (Lake Aber, also Lake St. Wolfgang, Upper Austria). The site attained cult status with Wolfgang's canonization in 1052, and by the twelfth century it had developed into a pilgrimage site. By 1380 a small market town had grown around the church, an estate of the Abbey of Mondsee (also in the region known as the Salzkammergut). After the destruction of the church by fire in 1429, a new, larger, three-aisle basilica was constructed, in response to the increased veneration of St. Wolfgang. Begun by Abbot Simon Reichlin of Mondsee Abbey, the new pilgrimage church was consecrated in 1477 by Abbot Benedikt Eck. The construction and decoration of the pilgrimage and parish church of St. Wolfgang am Abersee was also part of a general policy of the renewal of the estates of Kloster Mondsee during the second half of the fifteenth century.

The most significant monument associated with the church is the altarpiece created by Michael Pacher. Commissioned by Abbot Benedikt Eck in 1471, the altarpiece was completed and installed on the high altar in 1481. The contract of December 13, 1471, carefully stipulates the price—1,200 Hungarian guilders—and the iconographic program. The polychrome and gilded wooden corpus depicts the Coronation of the Virgin, flanked by Saints Wolfgang and Benedict. The predella (lowermost altar panel, *Sarg*) below portrays the Adoration of the Magi. In the florid pinnacles (*Aufzug*) are the Crucifixion, the Annunciation, and various saints. Two pairs of painted wings allow the altarpiece to variously display different scenes during distinct times of the liturgical calendar. For high feast days both wings would be opened, revealing the carved corpus flanked by four scenes of the life of the Virgin. For lesser feast days, only the outer wings would be opened, revealing a cycle of eight scenes of the Life of Christ. On the outer wings, seen in the closed position, are four episodes from the life of Saint Wolfgang.

The altarpiece, among the most significant works of Michael Pacher, reveals a variety of techniques and stylistic influences. The carved wooden corpus, predella, and pinnacles are in the tradition of late-fifteenth-century German carved altarpieces. The painted scenes on the wings, however, reveal a strong influence of north Italian painting of the fifteenth century, particularly the works of Andrea Mantegna. The combination of influences may be explained by Pacher's origins in the Tyrolian Alps.

Scholarly opinion varies over the attribution of different figures on the altarpiece. Despite the contractual stipulation that all work be by Michael Pacher himself, certain stylistic discrepancies are apparent. These slight variations may be attributable to the work of assistants, most likely Pacher's brother Friedrich and son Hans, and possibly to local artists working under Pacher's direction.

Saxon War

The "Saxon War" (1073–1088) is the name given by both contemporaries and modern scholars to the period of intense political and military conflict between nobles of East Saxony and other regions and King Henry IV (1056–1106) that persisted from 1073 until 1088. According to contemporary sources, the Saxon princes and people, led by Otto of Norheim and Bishops Werner of Magdeburg, Werner of Merseburg, and Burchard of Halberstadt, conspired against the king in 1073 for several reasons: he had undertaken an aggressive campaign of castle building in Saxony intended to subjugate the Saxon people; he was attempting to usurp rights and privileges traditionally enjoyed by the Saxon princes; he had violated the norms of elite political behavior in his prosecution of injuries; and, finally, there were rumors of flamboyant immorality. Modern scholars have further suggested that the Saxon princes were also rebelling against a long-standing Salian policy of reacquiring, but not redistributing, royal lands in Saxony that had intensified during Henry's reign.

After initial success in 1073–1074, noble support for the Saxon cause in other regions waned as a result of political miscalculations and the sacrilegious destruction of the Hartzburg castle by Saxon peasants. At the battle of Unstrut in 1075, Henry IV wreaked a terrible defeat on Saxon forces and took their leaders into captivity, thus putting a temporary end to the rebellion. With Pope Gregory VII's excommunication of Henry IV during Lent of 1076, however, the rebellion regained momentum. The princes from Saxony and southern Germany allied themselves with the papal cause and called for an assembly in early 1077 at which the matter of the kingship would be decided by the German princes and the pope. When Gregory VII's journey to Germany was cut short by Henry IV's sudden appearance and penance at Canossa in Tuscany in January 1077, the princes assembled at Forchheim in February 1077 and elected Rudolf of Rheinfelden, duke of Swabia, as their king. The election at Forchheim is particularly noteworthy for the theory of purely elective monarchy articulated there. Although papal recognition of the legitimacy of Rudolf's kingship came only after Gregory VII's second excommunication of Henry IV in the Lenten synod of 1080, the election itself consolidated politically the alliance of Saxon and Swabian forces, and they enjoyed several military victories under Rudolf's leadership. He died in October 1080 as the result of battle wounds.

After electing Hermann of Salm as their king in December 1081, the rebellious princes continued to resist Henry IV for the next six years, although with diminishing success as key leaders like Otto of Norheim died (maybe in 1083) and others became reconciled to Henry IV, especially after Pope Gregory VII's death in 1085. With the deaths of Hermann of Salm and Bishop Burchard of Halberstadt in 1088 and the reconciliation of the remaining leaders to Henry IV, the Saxon War effectively ended, although the Salian monarchs continued to face occasional resistance in the region into the twelfth century.

In its effective challenge to the Salian style of kingship, in its vigorous assertion of noble rights, including the right to judge and elect the king, and in its recognition of and complex interaction with the legitimating power of the papacy, the Saxon War marked a crisis in the development of the medieval German polity and was a harbinger of the key diplomatic role the papacy would come to play in later medieval politics.

Schaffhausen

The city of Schaffhausen, Switzerland, owes its foundation to its strategic position on the right bank of the Rhine. The nearby rapids and the *Rheinfall*, or drop in the Rhine River bed, necessitated an interruption in shipping traffic between Basle and Constance, an important trading route since the tenth century. A settlement grew up around the storage depot set up for the transfer and warehousing of goods. Emperor Henry III granted the community the right to strike coins in 1045; in 1080 it received market rights from Count Eberhard III of Nellenburg. Until the thirteenth century, the abbot of the Benedictine cloister ruled the city. As of 1218, Schaffhausen was an imperial city with the exception of the period from 1330 to 1415, when it was under Austrian rule. In 1411 a government of the city's guilds was instituted. The first treaty of alliance with the Swiss confederation was drawn up in 1454; in 1501 Schaffhausen joined the confederation as the twelfth member canton. The city decided in favor of the Reformation in 1529 and dissolved the local cloisters, including the Benedictine monastery of All Saints and the Franciscan cloister.

About 1049–1050 Count Eberhard of Nellenburg, a wealthy noble related through his mother to the Salian dynasty of emperors, founded the monastery of All Saints. He held all the rights of the monastery himself as its lay owner; the monks are presumed to have numbered twelve and may have come from Einsiedeln. The founder's son, Burkhard of Nellenburg, augmented the gifts of his father to the house and renounced his rights as the cloister's head in favor of William of Hirsau, who became abbot. With the help of the monks of Hirsau, William succeeded in reforming the cloister according to stricter Cluniac principles. Pope Gregory VII confirmed the new order, and contemporary sources praised the discipline of the Schaffhausen cloister, a reputation it shared with Hirsau and St. Blasien. For this reason monks from

Schaffhausen, Church of All Saints, interior, view to east. Photograph: Joan A.Holladay

Schaffhausen were called to Benediktbeuren about 1106, to Lipporn in 1114, and to Rommersdorf, near Andernach, in 1117. Between the institution of the Hirsau reform and the middle of the twelfth century, a number of manuscripts were written in the cloister scriptorium. In the beginning these were illuminated on the model of manuscripts from the area of Lake Constance, which themselves reflected Reichenau illumination; under the influence of the Hirsau reform, illuminators renounced figural representation and limited themselves to foliate (full page) initials. Because the greatest part of the manuscripts have remained in Schaffhausen and an inventory from about 1100 allows us to know what is lost, the exact contents of the library of the reform cloister are known.

After the middle of the twelfth century, the influence of Hirsau in Schaffhausen waned, and as a result so did the importance of the cloister. The early history of the cloister church is not entirely clear. An altar dedication by Pope Leo IX is dated to 1049, but as work on a large church continued in the years after 1050, the dedication does not seem to mark the building's completion. In 1064 the bishop of Constance consecrated the church, which was never completed. Excavations have revealed that the structure had at least one and perhaps two aisles on each side of the nave, a transept, and a large semicircular apse flanked by two chapels. To the east of the church was a courtyard in which several chapels were arranged in a cross formation. With the introduction of the *Consuetudines*, or common law statutes, of Hirsau, the present church was erected, probably on the model of the mother church at Hirsau; it was finished in 1103–1104. The three-aisled, flat-roofed nave was preceded by a narthex and tower in the west; at the east, a salient transept separated the nave from the flat-ended choir. Nothing remains of the rich medieval furnishing of the church, which is known only from documents. Some fragments of architectural sculpture and the tombs of the founders, which date from about 1100, are preserved in the Allerheiligen Museum located in the former cloister.

Schleswig

The location of Schleswig on the Jutland peninsula near the Danish border, where it sits on the north shore of the Baltic estuary of the river Schlei, gave it an important early role in Baltic trade, especially before the founding of Lübeck (1143) and the growth of the Hanseatic League. In the tenth century there was a Viking city, Haithabu, on the south shore of the Schlei, which was recognized by the German emperor Otto II and had a missionary bishop subject to the archbishop of Hamburg. After the destruction of Haithabu in 1066, the foundation on the north of the estuary, Schleswig, remained, and the bishop was transferred there. In the twelfth century, although its importance as a trade center decreased, Schleswig retained its episcopal stature and became the seat of the duchy of Schleswig. The first duke was Knud Laward (1115–1131). In 1139 the bishopric of Schleswig was transferred to the jurisdiction of the archbishop of Lund, Denmark. During the twelfth through fourteenth centuries the descendants of Knud Laward were frequently kings of Denmark as well as dukes of Schleswig, increasing the city's Danish ties. However, Schleswig retained its intermediary status between Germany and Denmark throughout the Middle Ages. Bishop Berthold (1287–1307), for example, was born in Copenhagen, while his successor, Johannes von Bokholt (1308–1331), was born in Lübeck.

The cathedral of St. Peter was first mentioned in a chronicle of 1134, which describes the burial of the Danish King Niels in the cathedral some years earlier (1120). Presumably the cathedral was begun circa 1100. The original building was in granite, and remains of the granite nave piers were discovered within the later brick piers. Sculpture from the twelfth-century campaigns includes a sculpted doorway (ca. 1180) on the south side of the cathedral with a granite tympanum (triangle above door) showing Christ in Majesty surrounded by St. Peter, St. Paul, and a donor. Its flat, minimally modulated Jutland style is also found in the tympana of the nearby churches of Munkbarup and Norderbarup. Granite reliefs with vibrant embracing lions biting each others' tails in a style reminiscent of earlier abstract animal interlace also date from this campaign. The church was largely destroyed in a fire circa 1200 and reconstructed in the brick common in the Hansa cities in the thirteenth century (*Backsteingotik*). The nave was further reconstructed in brick in the fifteenth century, giving it a hall-church form and taller profile. The cathedral of St. Peter was originally decorated with an elaborate set of narrative wall paintings from the thirteenth and fourteenth centuries. The church retains a sculpted Three Kings altar from 1418 and a sculpted altar with passion scenes by Hans Brüggemann from 1521.

Schleswig was located on a peninsula whose shoreline changed considerably during the Middle Ages. In the eleventh and twelfth centuries the city was centered on a palace, the cathedral, and the harbor trading centers. The church of St. Nicholas also dates from this early period. By the thirteenth century the shoreline extended into the estuary, and a market square and cloisters for the new mendicant orders the Franciscans and the Dominicans were erected in the city. The earlier palace was covered over by the Franciscan cloister, suggesting a change in focus in the later medieval city.

Schmalkalden

The early-thirteenth-century Hessenhof in this Thuringian city contains murals depicting scenes from the story of Iwein. Proposed dates for the paintings range from the 1220s to around 1250, with the 1240s perhaps most likely.

Twenty-three scenes in six rows on one wall and a vaulted ceiling narrate the Iwein story from Arthur's nap to Iwein's killing of the dragon, with significant omissions. Limited and inconclusive evidence suggests that a seventh register may originally have been present. A large painting of a courtly feast at one end of the room has often been read as part of the Iwein narrative, but the connection may be more thematic than narrative.

The pictorial narrative at Schmalkalden shows a high degree of independence from canonical versions of the Iwein story. The painter devotes fully half the scenes to images of courtly behavior—conversation, ceremony, and the bedroom—and an entire register to the wedding of Iwein and Laudine. On the other hand, the entire sequence of Iwein's missed deadline and his subsequent madness and recovery is omitted, and the murals thus offer no hint that Iwein's later adventures are undertaken for redemption, or that any of his adventures are problematic in any way. But adventure is also not endowed with any superior value, appearing, rather, as a kind of game played out in a context of courtly leisure reinforced by the room's apparent use for dining and drinking, as well as by the festive meal depicted on the end wall.

The Alemannic poet (also Schöndoch), who wrote the *Litauer* (*The Lithuanian*), a legendary short epic of 324 verses, and the *Königin von Frankreich und der ungetreue Marschall* (*The Queen of France and the Unfaithful Officer*), a courtly novella (*maere*) of about 720 verses (all twenty five manuscript copies considered), is known only by his pen name, since he was an itinerant poet (*Fahrender*). The *Litauer* focuses on the baptism of the historic Lithuanian king (*Großfürst*) Butawt in 1365, after he attended a mass at a church of the Teutonic Order (*Deutschorden*), in which he observed a miracle. A connection to the Teutonic Order is assumed because of the content of this quasi-historic epic and its transmission in just one manuscript, together with the legend *Martina* of Hugo von Langenstein, a very fervent work on behalf of the Teutonic Order.

The *Königin von Frankreich* had as its main hero Herzog Leopold III of Austria, who later died in the battle of Sempach in Switzerland in 1386 and became legendary. This novella, or *maere*, was the most copied in all southern and west Middle German dialects and can be seen as a work of propaganda for the Habsburgs. It is because Leopold creates justice for all classes and all good and bad persons in the plot of the novella, where the innocent exiled queen of France had to live in poverty for over four years, before she was brought back to the court of France. The story is based on the French chanson de geste *Reine Sébile*, but Schondoch changed the plot halfway through (without a fighting army and power, but simply by letting justice take its course). For its time, it must have been quite modern, enlightened, and even democratic, although as a metaphor for old, dependable justice, a fight between the murderer and the dog of the victim stood at the center, which was followed up by trustworthy councillors and knights of the king, as well as workers, merchants, the clergy, and justices in opposition to bad councillors. This story had universal appeal, as an exemplum with typecasts, and suited generations of German-speaking European courts. The story is also depicted in four picture cycles, known today as the *Königin von Frankreich*.

A prose version of this novella, *Cronica*, was composed by an anonymous author around 1460, extant in one Silesian manuscript of 1465. Only few changes occurred, for instance, that the queen was Leopold's sister. The novella was also used as the model for a *Meisterlied* in fifteen strophes, first printed by Hans Sporer 1498 in Erfurt and later six times between 1510 and 1570 in Nuremberg. The contents was mostly just shortened, but new emphasis and consideration was given to the king of France instead of Leopold. Finally, Hans Sachs wrote a drama of the *Meisterlied* in 1549.

Elisabeth von Nassau-Saarbrücken translated and transformed the French *Reine Sébile* into an Early German novel, after 1437; and the *Cronica* of the *Königin von Frankreich* might have been written with the knowledge of the *Sibille* (*Sébile*) novel, but not necessarily so. It was clearly derived from the novella.

Known today primarily as an engraver, this artist, active in Colmar and the Upper Rhine area from circa 1470 until about 1491, was nicknamed Hübisch Martin (Fair Martin) by his contemporaries in praise of his abilities as a painter. He is important as an assimilator of Netherlandish art. His work was influential in Germany, and he attracted many followers, including Albrecht Dürer.

Martin Schongauer was probably born circa 1450 in Colmar, a town south of Strasbourg. Although some have proposed a birth date of about 1430, this view has not found widespread acceptance. His father, Caspar, was a goldsmith, and Martin probably first trained in his shop. His father apparently wanted his son to become a cleric, for Schongauer's name appears in the 1465 matriculation records of the University of Leipzig. After only one semester, however, he returned to Colmar and began training as a painter. Caspar Isenmann, active in Colmar circa 1435–1472, is often cited as his teacher, but no evidence, documentary or stylistic, supports this assumption. As a journeyman, Schongauer likely traveled to Cologne, then to the Netherlands. His experience of works by the major Netherlandish masters—Roger van der Weyden, Robert Campin, Dieric Bouts, and Hugo van der Goes—is evident in his overall style and in his appropriation of Netherlandish compositions, motifs, and figure types. After his travels, Schongauer settled in Colmar, where he purchased a house in 1469 and again in 1477. He remained there until 1489, when he became a citizen of nearby Breisach. He died there in 1491.

None of Martin Schongauer's paintings are signed. The only dated work attributed to him is the *Madonna of the Rose Arbor* (Colmar, church of St. Martin), dated 1473 on the reverse. The figure types and detailed, naturalistic rendering of plants and birds are inspired by Netherlandish art. This work's date has been used to establish Schongauer's chronology.

Scholars agree that the earliest preserved works by Schongauer are two wings from the altarpiece commissioned by Jean d'Orlier, preceptor of the Antonite monastery of Isenheim, about 1470 (Colmar, Musée d'Unterlinden). They feature an Annunciation on the exterior, and on the interior, an Adoration and Jean d'Orlier presented by St. Anthony. Schongauer painted several small devotional paintings in the 1480s: two Holy Families (Munich, Alte Pinakothek; Vienna, Kunsthistorisches Museum), an Adoration of the Shepherds (Berlin, Gemäldegalerie), and two versions of the Virgin and Child at a Window (private collections). His last painting, a Last Judgment fresco in Breisach Minster, is based on Roger van der Weyden's Last Judgment Altarpiece of about 1445 (Beaune, Musée de l'Hôtel Dieu).

One-hundred sixteen monogrammed engravings survive, which include both religious and secular subjects. Schongauer's great contributions to the medium were his innovative use of stipling (dots), hatching (fine lines), and crosshatching to create tonal effects like those in paintings, and his adoption of complex compositions derived from paintings. The works are divided into two periods.

Martin Schongauer, *Christ Carrying the Cross*, engraving (Bartsch-21; Colmar, Musée d'Unterlinden). Photograph: © Musée d'Unterlinden Colmar, photo O.Zimmermann

The early engravings date to the early 1470s. Compositions, as in *Christ Carrying the Cross*, tend to be intricate and crowded with figures, and the system of modeling inconsistent. Mature works, from the late 1470s until his death, contain smaller groups, or single figures, and the modeling is more controlled and logical, as in the *Wise and Foolish Virgins*.

A number of drawings attributed to Schongauer also survive. The recent attribution of a watercolor *Study of Peonies* (private collection) provides insight into Schongauer's working methods (Koreny 1991:591–596). It was probably executed as a preparatory study from nature for the 1473 *Madonna of the Rose Arbor*.

Schwäbisch Gmünd

Situated on an upper stretch of the river Rems (Baden-Württemberg), the settlement of Schwäbisch Gmünd was first documented under the name of Gamundias in 782. Two Roman military roads crossed at this location (Rems and Fils), making the site attractive to craftsmen, horse traders, and small merchants serving the needs of travelers. King Konrad III of the house of Hohenstaufen (1138–1152) granted Schwäbisch Gmünd its city charter in 1155. Building campaigns commenced thereafter under the patronage of the house of Hohenstaufen and subsequently the dukes of Württemberg. The nucleus of the settlement, roughly the area of today's market square, was fortified with walls and towers before gaining its city charter. A second ring of gates and towers encircled a broader area in the thirteenth century, only a small section of which remains today. The third

Schwäbisch Gmünd, Church of the Holy Cross, interior, nave and choir, view to east. Photograph: Virginia Jansen

city wall, with twenty four towers or half-towers, was enlarged again in the fourteenth and fifteenth centuries. Six towers from this period survive, among them the fourteenth-century Königsturm (King's Tower), which served as the medieval city's dungeon.

The late Romanesque church of St. Johannis, built between 1220 and 1250, stands on the site of an earlier Romanesque structure commissioned by Duchess Agnes of Swabia (d. 1105). The small basilica, with a simple rectangular form, uniform pillars, two-story elevation, and timber roof, relies heavily on early Christian models. Exterior ornament consists of corbel tables and rare sculptural works, depicting hunting-related imagery and fantastic beasts. An important enthroned Virgin and Child of sandstone, originally created for the church's southwestern exterior corner, is today displayed inside. Gothic alterations from the fifteenth century have since been removed.

Work on the church of the Holy Cross (Heiligkreuzmünster) began about 1310, to replace a smaller twelfth-century parish church. Heinrich Parler, the second architect hired for the project, radically changed the plans of the first unknown builder, designing the first hall church in southern Germany. The nave was completed in 1350, and the foundation stone of the choir was laid in July 1351. Heinrich's son Peter Parler, born in Schwäbisch Gmünd in 1330, is believed to have been responsible for the design of the church's choir. Before its completion, however, the twenty-three-year-old Peter was called to Prague, where he was named master builder of the cathedral of St. Vitus. The work at Schwäbisch Gmünd was finalized by one "Master Johannes," who installed a flat wooden ceiling over the whole of the interior. Consecration took place on September 21, 1410. The Parler builders undoubtedly intended for the church to be fully vaulted, and by the late fifteenth century, this was realized with the decorative star vaulting of Burkhard Engelberg of Augsburg. The net vaulting of the choir dates to after 1500 and bears the mason's marks of Aberlin Jörg of Stuttgart and Hans von Urach.

The church's exterior and interior are richly ornamented with sculptural works, executed during the period of the Parlers' activity here. Among the finest of these is the southern portal, with its complex Last Judgment tympanum, dating to 1353. Fresco fragments from the fifteenth century, in a chapel behind the high altar, depict the Crucifixion and the Descent from the Cross.

As early as the fourteenth century, Schwäbisch Gmünd became known as a center of goldsmiths who enjoyed a widespread reputation for their superior work. Guilds were established here from the fourteenth century onward and exerted an increasing influence on the city administration and its building projects throughout the later part of the Middle Ages.

Schwäbisch-Hall

Originally a Celtic settlement on the hillside above the Kocher River, Schwäbisch-Hall prospered on its salt works. It received a charter from Frederick Barbarossa in 1156 and became an imperial free city in 1266. It was famous in medieval Europe for the imperial silver coins minted there: the Häller, or Heller, *pfennige* (pennies). Characteristically bearing an open hand and cross, these coins originated in the 1180s and were struck into the late fourteenth century.

Schwäbisch-Hall retains many reminders of its medieval past. Among these are a 1509 Gothic square fountain flanked by statues of Samson, St. Michael, and St. George. The town still has several medieval half-timbered houses. Its historical museum is in a ten-story Romanesque tower. On the opposite side of the river is the church of St. Katherine from the fourteenth and fifteenth centuries. An imposing flight of stairs leads up to St. Michael's; it still retains its Romanesque west tower, of which only the tower's top is a later replacement. Its Gothic hall-church interior dates to the fifteenth century; one of its chapels, added a century later, is in the flamboyant style. It contains altarpieces dating to the fifteenth and sixteenth centuries.

Two miles outside of Schwäbisch-Hall is Gross Comburg, a Benedictine abbey founded by Graf Burkhard II in 1078. In 1488 the abbey became a house of Augustinian canons. Known as Kloster Komburg in the Middle Ages, it was built as a fortified abbey on a hilltop. One of its entrances retains its twelfth-century Romanesque twin towers with a blind arcaded gallery and a hexagonal chapel dedicated to St. Erhard higher up on the left side.

Komburg's abbey church retains three Romanesque towers and two major monuments of Romanesque metalwork, a chandelier and an antependium or altar frontal. An inscription on the candelabrum names Abbot Hertwig, who ruled circa 1104–1139, as its donor. Made circa 1130 of copperplated and gilded iron, it is in the form of a crown nearly five feet in diameter. Its pierced scrollwork bands are decorated with towers and circular medallions, themselves decorated with three-dimensional standing figures and relief busts. The ensemble symbolizes the Heavenly Jerusalem, and the figures represent the just who inhabit the Holy City. The question of whether the candelabrum was actually made at Komburg has not been definitively settled.

The antependium of Komburg's high altar was also made circa 1120–1130. Of gilded copper and enamelwork, it depicts in relief with flattened folds Christ standing in a mandorla (body halo) flanked by evangelist symbols and apostles. Each stands in his own compartment with his name embossed, framed by bands of cloisonné (sectioned multicolor) enamel. Inscriptions appear on the rectangular frame and Christ's mandorla. Valentien argued convincingly that the Byzantine influence on its figural treatment, decorative patterns, and enamel technique came by way of Salzburg.

Schwerin

The chronicler Thietmar of Merseberg mentions Schwerin in 1018 as an outpost of a western Slavic tribe known as Obotrites (also Abotrites), who had built the castle Wallburg on the site of the current castle. After Henry the Lion, duke of Saxony, defeated the Slavs in 1160, he founded the margraviate of Schwerin and established the bishopric the same year. The early years of the bishopric were dominated by the Cistercians and Bishop Bernos, who built the Cistercian monasteries Doberan (1171) and Dargun (1172) in the immediate area. A Romanesque cathedral, of which only remnants of the west tower remain, was constructed in the latter half of the twelfth century; its choir was consecrated in 1248. Construction of the present brick Gothic basilica on the same site began in 1250; its choir was consecrated in 1327. Although construction lasted for almost two hundred years, the entire structure of the basilica is harmonious despite stylistic variances. The heyday of the bishopric was the thirteenth century after Margrave Henry I brought from Palestine a relic of the blood of Christ in 1222 and erected the Heilig-Bluts-Kapelle (Chapel of the Holy Blood) as a pilgrimage site. Emperor Charles IV made Schwerin a duchy in 1348; the ascension of Duke Albert II in 1358 brought an end to religious influence of the bishopric.

Seals and Sigillography

Seals have a long history. Having originated alongside if not actually preceding the invention of writing, sealing was, in medieval Germany as in most other civilizations, a significant mechanism for marking and protecting ownership, signing commitment, designating identity, representing authority, and authenticating documentation. In parallel to their role in the sphere of practice, seals have also served as a metaphoric focus. Mesopotamian and biblical texts, Platonic and Aristotelian treatises, patristic and theological commentaries, literary texts—all incorporate sealing imagery as a conceptual tool. Such historical continuity need not imply congruence of the cultural and modal significance of the seals themselves. While partaking of the general Western cultural phenomenon, which between the twelfth and the fifteenth century privileged the seal as an authoritative mode for the representation of

Seal of Reinald von Dassel, Archbishop of Cologne, 1166 (Historisches Archiv der Stadt Köln Dom U3/11). Photograph: Historisches Archiv

individuals, officials, and corporations, German seals and sealing practices present distinctive features, in particular with respect to their sociology, their legal capacity, their aesthetics, and the circumstances of their diffusion.

The study of seals, or sigillography (German, *Siegelkunde* or *Sphragistik*), achieved its disciplinary status and received its epistemological framework from Jean Mabillon's *De re diplomatica* (*On Diplomatics*, 1681), complemented for Germany by Johannes Michael Hennecius's *De veteribus Germanorum aliarumque nationum sigillis* (*On the Old Seals of the German and of Other Nations*, 1719). Sigillographic studies have, since their inception in the seventeenth century, been consistently pursued within the constraints of an auxiliary science required to serve the greater discipline of history. Seals have thus been defined as sources requiring specific heuristics, and a technique of conservation—the cast—has selectively privileged the most significant seals and the best extant impression of a given seal type. Such an epistemology, which fostered a scholarship based on cast collections, ultimately denatured seals, changing their locus (on documents) and their status (as signs), and erasing their fundamental signifying and operative principle: iteration, by which medieval seals (re)produced themselves as identity and as identical devices. Thus abstracted as object of knowledge and removed from the sphere of medieval discourse and practice, the medieval seal has literally been recast as a fixed type, all too often the prisoner of antiquarian agendas. In the last half of the twentieth century, however, electronic databases of medieval sealed charters, such as the LichtBildArchiv (photo archives) in Marburg, have permitted the consultation of seals in their original forms and loci. Computerized techniques of information retrieval, by enhancing the possibility of accumulating data along various thematic axes, have stimulated the formulation of newer approaches that have attempted to restore the historicity of seals as agents within the culture that produced and used them. A recent argument has been made, for instance, that seals, poised as they were at the nexus of the gestural, the visual, and the legible, fostered trust in writing and hence acculturation to literate modes. Seal iconography has lent itself to pioneering studies in ideology and iconology. A semiotic approach has redirected the analysis toward seals' modes and areas of signification (authority, identity), and contributed a methodology for retrieving the assumptions seals encode about the nature of their operation. A medieval seal (Latin, *sigillum*; German, *Siegel*) is a mark pressed in relief on a plastic material (wax, lead, or

Seal of Elisabeth von Vrenburg, Abbess at the Convent of the Holy Virgins (St. Ursula's), Cologne, 1310 (Historisches Archiv der Stadt Köln HUA 3/745A); *Schutzmantelursula*. Photograph: Historisches Archiv

gold) by the impact of a matrix, or die (Latin, *typarium*; German, *Siegelstempel*, *Petschaft*, *Typar*), intaglio-engraved with a text (the legend) and an iconographic device that, together, defined and personified the seal owner. In medieval as in modern terminology the term *seal* may designate both the matrix and the impressions issued from it. But for the sake of clarity, current usage tends to reserve the term *seal* for the impression (German, *Siegel* or *Siegelabdrücke*).

In western Europe following the disintegration of the Roman Empire, seal rings were widely used to communicate verbal orders and, imprinted in wax, to close personal letters. They belonged to private individuals, to bishops, and to rulers. Among the earliest royal extant rings are those of Childeric, king of the Franks (d. 481), Alaric II, king of the Visigoths (d. 507), and Theodoric the Great, king of the Ostrogoths (d. 507). By the seventh century, the royal sealing practice took on a specific, distinguishing feature as wax seal impressions bearing the king's image and title came to be attached to the diplomas given in his name. The western sealed diploma remained an exclusive royal and imperial prerogative until the tenth century. This documentary model was derived from the Byzantine imperial chancery, which, since the sixth century, had issued letters and documents sealed in lead and gold, inspiring further the use of metallic impressions (Latin, *bullae*; German, *Bulle*) by Western writing bureaus. Thus the pope, as both bishop of Rome and a Byzantine magistrate, sealed from the sixth century onward exclusively with lead *bullae*, introducing wax only in the thirteenth century and then exclusively for the papal secret seal known as the Fisherman's ring (Latin, *anulus piscatoris*; German, *Fischerring*). From the very year of his imperial coronation in 800, Charlemagne (d. 814) emulated the Byzantine *basileus* by resorting to gold and silver bulls for the sealing of his solemn diplomas, as did his successors. After his own assumption of the imperial crown in 962, Otto I (d. 973) resumed sealing with metallic bulls, a practice that Otto III (d. 1002), son of the Byzantine princess Theophanu, adopted systematically for a while. The leaden bull remained in use until the reign of Henry III (d. 1056). The much rarer golden *bullae*, exceptionally used by Louis the Pious, the Ottonians, and the Salians, became the exclusive prerogative of the Hohenstaufen chancery.

Whether wax or metal, medieval German seals were, at first, attached exclusively to royal or imperial deeds. The late Antique habit of closing letters with signet ring impressions became confined to the only part of society that still engaged in official epistolary exchanges, the bishops. The signet rings of Archbishop Ratbod of Trier (883–915) and of Liuthard, bishop of Paderborn (862–887) are still extant. The earliest western European instances of nonroyal documentary sealing occurred in tenth-century Germany, this usage deriving its momentum from the seal's role in both the definition and validation of kingship, and in ecclesiastical literate practice. The very use of sealed charters having already spread in parallel to the Carolingian multiplication of kingships, the Bavarian duke Arnulf (d. 937) undertook to seal documents issued in his own name, thus asserting his political independence from and opposition to the newly elected non-Carolingian king of Germany, Conrad of Franconia (d. 918). This example was followed by the Salian Otto, as duke of Carinthia in 978, and in 1004 by the Saxon Duke Benno, thereafter extending to other potentates and to lesser lords. Episcopal documentary sealing also began in the tenth century, at Cologne (ca. 950), Trier (955), Mainz (976), Salzburg (ca. 958–991), Halberstadt (ca. 968–996), Liège (980), Tournai (994), Hildesheim (996), and Toul (971), paralleling the growing integration of the episcopacy into the royal/imperial administrative apparatus. By the eleventh century, cathedral chapters (Münster) and abbey (St. Gall, Fulda, Corvey) had started to seal as well. Whereas the imperial chancery issued imperial documents exclusively, the schoolmen staffing episcopal and monastic writing bureaus undertook to write charters on behalf of laymen and women, thus further extending to these latter a practice of sealing informed by newly developed prescholastic theories of symbolic representation. Between the thirteenth and the fifteenth century, men and women from the lesser nobility, the church, the cities, and the crafts, as well as the peasantry, Jews, officials, towns, corporations, courts, and jurisdictions—all could, and many did, commit themselves by sealing the deeds recording their obligations. During the fifteenth century, such alternative modes for authorizing contracts as personal signatures and the notariate progressively replaced the seal for such purposes.

As seals spread socially, the originally empirical nature of their operations became an object of theory on the part of authorities, who introduced degrees within the seal's efficacy and fostered its function as a legal device for the authentication of written documents. Papal decretals, beginning with Pope Alexander III (r. 1159–1181), stipulated a distinction between seals that committed only their owners and users (private seals), and the *sigillum authenticum* (German, *authentisches Siegel*), which, emanating from those individuals, institutions, or corporate bodies invested with public authority, alone carried credibility and guaranteed systematically the contractants' transactions recorded in writing. The thirteenth-century Saxon law code, the *Sachsenspiegel*, written first in Latin and then in Low German between 1220 and 1235, displaying but little familiarity with canon law and no knowledge of

Roman law, and based exclusively on the practical experience of the author, Eike von Repgow, in East Saxon law courts, distinguishing clearly between the personal seal validating only an act given in the seal owner's name, and the seal (that is, the *sigillum authenticum*) that validated documents given in the names of people other than the seal's owner. The Swabian legal code *Schwabenspiegel* (ca. 1275–1276), borrowing heavily from Roman and canon law, declared that only popes, emperors, kings, potentates, bishops, chapters, and convents had the right to validate documents by their seals; that minor landholding nobility might validate acts of their vassals; that the official or the town could validate those of their dependants.

Although such sociolegal regulations remained primarily prescriptive, as the large number of extant seals of knights, peasants, burghers, and Jews testify, seals belonging to public/official authorities nevertheless underwent a distinct fate. All seals had diversified, indeed multiplied into distinct categories, whereby a sealer would own several seals, each assigned a specific function. The great seal (Latin, *sigillum magnum*; German, *grosses Siegel*, *Hauptsiegel*) was the main seal used for solemn/formal documents. The small seal (Latin, *sigillum parvum* or *minus*; German, *kleines Siegel*) was affixed to writings dealing with internal administration, while the signet (Latin, *sigillum secretum*; German, *Sekretsiegel*) appeared on papers of personal matters. The counterseal (Latin, *contrasigillum*; German, *Rücksiegel*), which could also serve as small seal and signet, was a smaller impression made at the back of the wax to corroborate the principal seal and to discourage its forgery. Yet only public and official seals further diversified as seals of jurisdiction (German, *Gerichtssiegel*, *Geschäftssiegel*; Latin, *sigillum ad contractus*, *ad obligationes*, *ad recognitiones*), which authorities used to supervise and certify contracts as part of their judicial and fiscal responsibilities. Seals of jurisdiction thus served as tools of the burgeoning administrative organization that reshaped both lay and ecclesiastical governance from the twelfth century onward.

Seal performance in the legal and administrative spheres has somewhat obscured other roles played by seals, roles deriving from and dependent on their iconic and symbolic language. For instance, in the cortege formed at the inauguration of the Imperial Diet (*Reichstag*), the chancellor of the kingdom in which the diet was meeting preceded the emperor, carrying all imperial seals attached to a silver rod. At the end of the ceremony, the seals were returned to the imperial chancellor. During state rituals and travel throughout the empire, the emperor and his archchancellor wore the seal matrices around their necks.

Manufacture of imperial seal matrices, wherever documented, appears to have been entrusted to major artists and court advisers. Abbot Wibald of Stavelot (d. 1158), whose patronage of the greatest goldsmiths of his time (such as Godfrey of Huy) led to his supervision of the execution of imperial seals, inspired the iconographic program on those of Frederic I Barbarossa (d. 1190) and his empress, Beatrix of Burgundy (d. 1184). However, little is known of seal engraving in general, and the more than hundred German seal makers (Latin, *taillatores*, *sculptores*, *incisores sigillorum*; German, *Stempelschneider*) who have been identified appear only in the fourteenth- and fifteenth-century accounts of those elite nobles or corporations and cities intent on possessing finely engraved items. Some places were then particularly famous for their seal-cutting workshops, such as Trier, Cologne, Nuremberg, and Augsburg, but fine engraving played little part in the manufacture of most medieval seals, which were simply cast. Relatively few medieval matrices are extant, for they were typically either destroyed or buried at the death of their owners, or used until they wore out.

Extant seal impressions, on the other hand, number over one million in western Germany and about three million in the whole of Europe; they are mostly round, pointed oval, or scutiform (shield shaped). Impressed on wax, which was the general method in the empire but for the use of (always round) metallic bulls by the imperial and a few episcopal chanceries (Cologne, Hamburg, Halberstadt), the seals' colors vary. At first, the wax was uncolored; by the thirteenth century it might be green (verdigris), red (vermilion), or brown. Occasionally the impression, in one color of wax, would be enclosed within wax of another color. From the early fifteenth century onward, red wax became a prerogative of the imperial chancery. Otherwise, the use and distribution of various colors in seals seem to have variously obeyed either taste, fashion, or local administrative practice. There were three standard ways of attaching the seal to the document, all used throughout the Middle Ages in imperial Germany. In one, the wax was laid on the surface of the parchment and stamped to produce an applied seal. A second method was to suspend the seal from a tag (parchment) or cord (silk, linen, woolen thread) that passed through slits made in the bottom edge of the document, usually folded back for added strength. The third technique involved attaching the seal to a strip of parchment (the tongue) partially cut away from the bottom edge of the document.

The system of figural representation on seals is the product of a dialectical tension between letters and images. The text (the legend) named the owner. It was normally displayed clockwise in an outer band, beginning at the top with a cross. This cross has been recently interpreted as a religious invocation by the German sigillographer Toni Diederich (1996), who notes that on certain seals, for example, the second city seal of Siegburg in Westphalia, the initial cross had been replaced by the verbal invocation *in nomine domini amen* (In the Name of God, Amen). In contradistinction to the individualizing legend, the image was emblematic of the seal's owner, pointing to status and to membership within specific categories: kingship, equestrian nobility, knighthood, office, occupation, religion, institution, kin (heraldry), holiness, or womanhood. Iconographic patterns, such as majesty, architecture, or sanctity, were meant to signify a concept rather than realistically to represent a person. Seals generated personal identity through a grammar that articulated the organizing principles of society. Personal identity was produced as an instance of social order, and thus served as the verifier of the system it substantiated. While seal images carry factual information about costume, architectural detail, and material culture in general, they also testify to concepts crucial to medieval thinking and praxis. Above all, they embody the medieval ability to invest the invisible with visibility.

Seghelijn van Jherusalem

This Middle Dutch (Flemish) romance is named after its main character, Seghelijn of Jerusalem. This extensive poem, almost twelve thousand lines in coupled rhyme, was written in the early fourteenth century by an anonymous poet (the attribution of it to Loy Latewaert is dubious). The poem is an original Middle Dutch work, though the poet used many different sources (e.g., the legends of St. Julian Hospitaller, St. Andrew and Judas, the *Bonne Florence de Rome*, *Fierabras*, and *Elie de St. Gilles*). He created an "anti-courtly romance" with a strong religious and hagiographic tone in which he also incorporated elements of (late) medieval crusade ideology and criticism. The text survives in one manuscript (ca. 1415), one incunabulum, five prints of the sixteenth century, and one excerpt in a fifteenth-century manuscript. The poem is an outstanding example of the late medieval narrative tradition in the Low Countries.

Seghelijn (meaning "the victorious and/or the blessed") is the son of Prides, the Muslim king of Jerusalem, and Queen Braffeleur. His mother, secretly converted to Christianity, fears for her son's life and abandons him. He grows up in a poor fisher family, but he returns to the court of his unsuspecting father to find out about his true identity and to become a knight. Refusing to swear an oath of fidelity to Muhammad, Seghelijn has to flee from court. He starts an adventurous life fighting the enemies of Christianity and collecting the relics of Christ's Passion. For fathering seven sons with seven unbaptized damsels—later to be known as the Seven Wise Men of Rome—he spends fifteen years in heathen prison, doing penance. After his release he continues his adventures as God's chosen knight, completing his collection of relics with the Holy Cross. Eventually he becomes emperor of Rome and ends his life as pope Benedict I.

Flemish-Brabantine poet, known for his *Trojeroman* (*Trojan Novel*), a courtly romance in circa 2,300 lines of coupled rhyme, not a comprehensive history of the Trojan War. Using a limited episode from this history as a narrative setting, Segher describes and debates some aspects of (courtly) love and virtues, with Trojan heroes as main characters. Segher's romance consists of three parts—*Tprieel van Trojen*, *Tpaerlement van Trojen*, and *Den groten strijt*. Formerly considered to be three separate romances, they are now viewed by modern scholarship as parts of one coherent text, in which the division in three parts is an important structural principle ("love debate"—"battle with words"—"battle in arms"). This structural principle also functions within the constituent parts (especially *Tprieel*), strongly drawing attention to love as the main theme (three dialogues and the general complaint on love). For the last two parts Segher used Benoît of St. Maure's *Roman de Troie*. *Tprieel*, however, is completely his own work (though he refers to Dares Phrygius as his source), in which he tries to emulate Benoît's concept of love. Benoît presented love and passion as destructive forces, Segher as a positive aspect of courtly culture, a force ennobling men and women. This concept forces Segher to leave the story of the Trojan War "unfinished," for it is passion that lays at the root of Troy's ultimate destruction.

Most likely Segher wrote his *Trojeroman* around 1240–1245 for the ducal court of Brabant (perhaps commissioned by Duke Henry II, d. 1261). The *Trojeroman* is preserved as an interpolation in Jacob van Maerlant's *Historie van Troyen* and as three separate texts in the famous Hulthem Manuscript (Brussels, Koninklijke Bibliotheek, manuscript no. 15, 589–623); no independent manuscript survives of this very fine and early specimen of Middle Dutch courtly literature.

Seckau

Isolated in the Lower Tauern range of the high Alps, Seckau is the site of the oldest Augustinian foundation in Styria and was the seat of the diocese from 1218 until 1782. Established in 1140 in St. Marein on land given by Adalram von Wolfegg (Wolfeck) in penance for a murder, the community was organized under the first provost Wernher (1141–1196) and moved to its present location in 1142. A house for both male and female religious, Seckau was populated by Augustinian canons from Salzburg, making it part of the Augustinian reform circle of Salzburg Archbishop Konrad I (1106–1147). Konrad's earlier position as a canon in Hildesheim explains the Saxon stylistic features of the church at Seckau, a threeaisle, transeptless basilica, consecrated in 1164 by Bishop Hartmann of Brixen. Liturgically, Seckau was dependent on the Salzburg cathedral rite, but it also became a center for the development of the Augustinian sequence form. The vibrant community provided canons for the new foundation of Vorau in 1163. In 1218, Eberhard II, archbishop of Salzburg, with the permission of Pope Honorius III, established Seckau as the seat of a small bishopric, and Frederick II consented, conferring on the bishop the dignity of prince of the Roman Empire. The first prince-bishop was Provost Karl von Friesach (1218–1230). Substantial rebuilding of the church precinct was necessitated after a fire of 1259. To the renewals of that period belong the no longer extant Liechtensteiner Chapel (consecrated in 1279), which extended the eastern end of the church. Probably executed circa 1290 is a Zackenstil fresco depicting in five tiers an extensive life of St. John the Baptist, now displayed in the south transept of the church. During the reigns of Provosts Andreas Ennstaler and Johannes Durnberger in the fifteenth century, the basilica was elaborately vaulted. The convent of Seckau was rebuilt in the baroque period, vacated in 1782, and resettled in 1883 by Benedictines. The bishopric was moved to Graz by 1786, and the bulk of the medieval manuscript holdings of the monastery are today found in the Graz University Library.

Seligenstadt

Although the most recent publication on the town is devoted to the restoration of the Romanesque House (Ludwig, 1987), Seligenstadt, on the Main River east of Frankfurt, is best known for the Benedictine monastery founded by Einhard, Charlemagne's biographer and one of the most prominent members of the emperor's court. Einhard constructed the monastery to house the relics of Saints Marcellinus and Petrus, reputedly removed by his agent from the funerary basilica of that name on the edge of Rome. Although Einhard first constructed a church at Steinbach for these relics, and presumably for his own burial, by 830 he had begun building the larger monastery at Seligenstadt, then called Obermühlheim am Main, most likely the town or area in which he had been born to a noble family. The dedication of the monastery took place in 836 with Louis the Pious present.

On the basis of excavations and early descriptions, scholars have proposed reconstructions for Einhard's church building within the monastery complex. Seligenstadt is an important example of the Carolingian desire to build in the *more romano* (Roman style), also articulated at Lorsch and Fulda—an architectural extension of the interest in the ancient world that characterized the court of Charlemagne. Significant architectural motifs included a single raised apse with an annular crypt for the relics of the saints and a transept, elements that Krautheimer traced to St. Peter's at Rome, although he identified exact parallels for some of the characteristics of Seligenstadt in other Roman churches. At the west end of the nave with single side aisles was a narthex (entrance structure) that included the burials of Einhard and his wife Imma.

Sempach, Battle of (July 9, 1386)

Provoked by the Swiss conquest of Luzern and the sacking of several castles, the Austrian Habsburgs once more decided to teach the Swiss a lesson and reclaim their lordship in the western Alps. With a force of several thousand, Duke Leopold III was marching through the town of Sempach toward Luzern on July 9, 1386, when he and the Swiss came upon each other. Because their cavalry had been defeated by infantry at the battles of Morgarten and Laupen, this time the Habsburgs tried to adapt to their enemy's tactics. Leopold dismounted his cavalry and had them march on foot with their lances toward the Swiss, who were lodged on high ground. But the Austrians lost their initial advantage, perhaps because Swiss reinforcements arrived or the Austrians grew weary in their hot plate armor. The story of the Swiss hero Arnold of Winkelried, who threw himself on the Austrian lances to open a gap for his comrades to rush in, is purely legendary.

The victorious Swiss slew over six hundred knights, including Duke Leopold himself. Thereafter the Habsburgs could do little to prevent Swiss independence.

Servatius

Composed around 1185 by an unknown author (whose name most likely appeared at the work's end, now lost), the *Oberdeutscher Servatius*, a version of the life of St. Servatius in an Upper German dialect, tells of the life, death, and posthumous acts and miracles of Servatius, the fourth-century bishop of Tongres in modern-day Belgium. The legend focuses on events in the history of Maastricht, the city with which Servatius is the most closely identified, and describes the actions of a number of rulers (Attila, Charlemagne, Otto I and II, Henry I, II, and III). It also deals with topics such as purgatory, absolution, the power to forgive sins, and heresy. While the Upper German *Servatius* conforms to the expectations of its genre—the saint's life—its author digressed significantly in several passages from the source(s) and thus created what has been called by several commentators a "courtly legend."

In 1172 Agnes of Loon, the patroness (or her daughter) of Heinric von Veldeke, who composed a life of Servatius in his native Limburg dialect, married Otto of Wittelsbach. In her new home, she apparently commissioned a local poet to compose a work honoring her patron saint in the Upper German dialect. Though related to the perhaps more famous version of the saint's life composed by Veldeke, the Upper German version is not a translation of that earlier work. There is textual evidence that the writer consulted Veldeke's work, but the primary source used by the Bavarian author had to have been the late-eleventh-century Latin *Gesta Sancti Servatii*.

The *Oberdeutscher Servatius* is found (missing several final pages) in the Austrian Nationalbibliothek in Vienna (manuscript no. 2696); fragments of four other manuscripts also attest to the work.

Servitium

See [Fodrum, Gistum, Servitium.](#)

This Dominican priest served as a confessor, preacher, and teacher to religious men and women in the German south. His poetic works in the mystical tradition served to inspire those in his care.

Born into a patrician family in or near Constance, Seuse did not seek out ministerial service but followed in the footsteps of his religiously oriented mother, whose name he chose to use. At thirteen he entered the monastery at Constance. Following a general course of study there, he may have studied briefly in Strasbourg before attending the *studium generale* (early form of university education) in Cologne around 1324 or 1325, where he studied with Meister Eckhart. Seuse probably remained in Cologne until the master's death in 1327, when he returned to Constance and was appointed lector at the monastery. At the age of forty, around 1335, Seuse was told by God to abandon the ascetic practices he had followed for twenty-two years. This turning point in his personal life also marked a change in his professional career: Seuse became an itinerant preacher and spiritual adviser, concentrating his activities in Switzerland, the Alsace, and along the Upper Rhine. Because he supported the pope in a power struggle with Ludwig of Bavaria, Seuse was forced to leave Constance in 1338 or 1339; some eight years later he probably returned. Around 1348 he was transferred to the Dominican monastery in Ulm, where he remained until his death more than fifteen years later. He was canonized in 1831.

In his last years, Seuse undertook the editing of his works for publication, his *Ausgabe letzter Hand*; the works he chose make up the *Exemplar*. Included are his life (*Vita*), which chronicles in third-person narrative the life of the *Diener der ewigen Weisheit* (Servant of Eternal Wisdom), Seuse himself. The authorship of the *Vita* is disputed; the Töß sister Elsbeth Stigel, one of Seuse's spiritual charges, probably played a role in the editing, if not the writing of the work. Following are Seuse's earliest works, the *Büchlein der ewigen Weisheit* (*Little Book of Eternal Wisdom*) and the *Büchlein der Wahrheit* (*Little Book of Truth*), two of the most popular devotional tracts in the late medieval mystical tradition. Both are written as dialogues between the Servant and the personification of eternal wisdom and truth, respectively. The *Exemplar* concludes with the *Briefbüchlein* (*Little Book of Letters*), an edited version of Seuse's correspondence with the Dominican sisters in his charge, primarily those at the convent of Töß. The *Little Book of Love* (*Minnebüchlein*), whose authenticity is doubtful, and a larger collection of letters, the *Großes Briefbuch* (Great Book of Letters), also survive. Both sets of letters by Seuse are more characteristic of the homiletic rather than the epistolary genre. Indeed, few of his homiletic works are extant, although he was charged with the responsibility of preaching; only two German sermons are accepted as authentic works of the Dominican friar, but neither is included in the *Exemplar*. The *Horologium sapientiae* (*Clock of Wisdom*) is the only extant work of the Dominican in Latin; it is an expanded version of the *Büchlein der ewigen Weisheit*.

The religious content of Seuse's work, which draws on the Bernhardian tradition, stands in marked contrast to the speculative mystical theology of his teacher Eckhart. Because of his poetic style and the preeminence of love imagery in his writings, Seuse often is characterized as the *Minnesänger* among the medieval German mystics.

Siegburg, Abbey

A Benedictine abbey founded in 1064 by Archbishop Anno II of Cologne (r. 1056–1075) as part of an ambitious building program for abbeys, parish churches, and chapels within his archdiocese. Of the three cloisters he founded outside Cologne, Siegburg Abbey was his favorite (the other two were in Grafschaft and Saalfeld). The richly decorated abbey, whose patrons were St. Michael and St. Maurice, was located on the Michaelsberg in the town of Siegburg, just northeast of Bonn at the confluence of the Sieg and Agger Rivers.

Initially populating the cloister with monks from St. Maximin in Trier, Anno sent them back around 1070 and installed a dozen Italian monks from Fruttuaria in hopes of spreading the Cluniac reform movement throughout his archdiocese. He also forcibly replaced the Benedictine communities of St. Pantaleon and Grafschaft with Fruttuarians. This imposed reform proved so unpopular that the Cluniac monks were said to have barely escaped with their lives from an uprising against the archbishop in 1074. After dealing harshly with the rebels, Anno retired to his favorite monastery, where he died and was buried in 1075. The reformed monks at Siegburg perpetuated the memory of the archbishop with a *vita* (saint's life) and accounts of his miracles at the abbey. Their archiepiscopal patron soon became their patron saint when the abbot of Siegburg obtained Anno's canonization from Rome in 1183, after which a golden shrine was established in the cloister for the archiepiscopal relics. Siegburg Abbey served (along with the monastery of St. Blasien) as a center of Cluniac reform in Germany and produced several reform-minded churchmen, like Bishop Kuno of Regensburg (1126–1132). The cloister continued to enjoy special archiepiscopal benefaction until its suppression by Napoleonic authority in 1802.

Siegburg, Art

The Siegburg settlement arose near the Sieg River, at the foot of the Michaelsberg (Mount Saint Michael), where Archbishop Anno II of Cologne established a monastery in 1064. The first abbey church (now destroyed) was a late Ottonian/early Saxon flat-roofed, three-aisle, crossplan basilica with a square choir, four round crossing towers, and wide apse. A western tower, Gothic rib vaulting, and expansion to seven aisles were later modifications. Anno (d. 1075) chose to be buried here, in his favorite foundation, dedicated to the Archangels Michael and Mauritius and companions. Anno's cult soon flourished, with graveside miracles beginning 1076–1078. His memorial, commissioned by Abbot Reginhard (1076–1105), perhaps included the famous Siegburger Madonna, a Cologne work of circa 1150. The thriving Siegburg pilgrimage center amassed a rich treasury, commissioning numerous liturgical objects, although few were locally produced.

Local Siegburg creations existed, however. Evidence of a monastic scriptorium from circa 1100 includes script and painting, similar to Cologne and Echternach work—until a distinctive Siegburg style emerged in the thirteenth century. Original literary production includes the *Vita Annonis* (*Life of Anno*), the epic poem *Annolied* (*Song of Anno*), local chronicles, theological treatises, liturgical music, and office and prayer books.

Vita Annonis (Darmstadt, Hessische Landes- und Hochschulbibliothek, Hs. 945), fol. 1v. Archbishop Anno and his foundations Siegburg, St. Georg and St. Maria ad gradus in Cologne, Grafschaft, and Saalfeld. Photograph: Rheinisches Bildarchiv der Stadt Köln

Perhaps most noteworthy was Siegburg pottery, from the Aulgasse kiln from the mid-twelfth through the early nineteenth century. Early types were derivative of Pingsdorf and Paffrath wares, but by the thirteenth century, local shapes and decoration emerged. Indigenous clay withstood kiln temperatures well, resulting in a thin, grayish ware, decorated with various color slips and paints, notably brown, violet brown, red, sand, and gray. Both handbuilt and wheelthrown Siegburg wares supplied local and export markets.

Sigenot

Two versions of the tale of the giant Sigenot survive. An *aventiurehafte* (episodic) Dietrich epic composed in the complicated verse form known as Bernerton (melody of Verona), *Der ältere Sigenot* (*The Earlier Sigenot*) is an abbreviated version functioning as an introduction to the *Eckenlied* in manuscript "L." Variants of *Der jüngere Sigenot* (*The Later Sigenot*) are preserved in seven manuscripts (including the Dresden Book of Heroes, or *Heldenbuch*) and at least twenty printed versions dating from the fifteenth through the late seventeenth century.

In the earlier *Sigenot*, Dietrich finds Sigenot, a giant, sleeping in the woods. They duel. Sigenot wins, avenging Grine's death. Throwing Dietrich into a dungeon, he goes to find Hildebrand. He defeats him temporarily, but Hildebrand rallies and kills him. Hildebrand and Eggerich, a dwarf, free Dietrich. Hildebrand and Dietrich return home to Bern.

The later *Sigenot* begins in Bern, from which Dietrich, rejecting Hildebrand's efforts to dissuade him, departs to fight Sigenot. On the way he rescues Baldung, a dwarf, who gives him a magic stone. The duel takes place as in the earlier *Sigenot*. Dietrich is thrown into a cave of serpents, but the stone protects him. Hildebrand and Sigenot meet and duel. Sigenot wins and drags Hildebrand to his cave, but Hildebrand rallies and kills him. As in the earlier *Sigenot*, Hildebrand and Eggerich free Dietrich, then Hildebrand and Dietrich return home,

Sigenot helps document a lost Dietrich epic involving a duel with the giants Grine and Hilde on which a similar episode in the Norse version (*Thidrekssaga*) might have been based. It also features a traditional motif in the Dietrich story—the rescue of the hero by a companion—that occurs in the Old English *Waldere* as well as in *Virginal*, another Dietrich epic in Bernerton. Sigenot thus employs the highly literary *Bernerton* strophe to narrate a traditional tale of rescue. The combination had lasting appeal: *Sigenot* was popular longer than any other Dietrich epic.

Siger of Brabant (ca. 1240–November 10, 1284)

This scholastic philosopher, an important representative of thirteenth-century heterodox Aristotelianism, played a prominent role in the debate on the proper place of philosophy with respect to theology and Christian faith.

The details of Siger's biography are largely unknown. He was born around 1240 or shortly thereafter in Brabant and started his academic career circa 1255–1260 in Paris, where he received an M.A. in 1260–1265. On November 10, 1284, he died in Orvieto, killed by his secretary.

His oeuvre includes commentaries on Aristotle's *Physics*, *Metaphysics*, and *On the Soul*, and a number of separate questions dealing with logic, philosophy of nature, metaphysics, and ethics. Most of his writings resulted from his teaching as a master of arts at Paris. His published work probably dates from around 1270 and thereafter.

In his early writings, Siger professes the ideal of the pure philosopher searching for truth unaided by Christian revelation and trying to reveal the exact teachings of Aristotle, the philosopher par excellence. This attitude was seen as a serious threat to theology by a number of theologians, whose reaction was reflected in the famous Parisian Articles of 1270 and 1277, issued by Bishop Stephen Tempier. In his later work, however, Siger is less radical and steers a middle course between philosophy and Christian faith.

Of central importance was Siger's theory of the human intellect. In line with the teachings of Averroës, Siger holds that humans receive intellectual knowledge from a single, pure intellectual substance, which is the last of the hierarchy of intellectual substances and which consists of an active and a potential part. Only this pure intellectual substance is immortal; final personal responsibility therefore has no place. The theory evoked a sharp and detailed criticism of Thomas Aquinas. Toward the end of his career, Siger no longer defended it, mainly because of the attack of Thomas Aquinas, which seems to have convinced him that he was wrong.

Sion

Located in the Swiss canton of Valais, the city of Sion (German, Sitten) is situated at the base of two small hills in the Rhône valley. The Romans called the settlement Sedunum—*sedo* meaning "seat" and *dunum* meaning "hill" or "stronghold"—and the Celtic tribe that occupied the region the Seduni. Sion's many important medieval monuments and objects testify to the power of the church there and its dedication to the arts throughout the Middle Ages. Lombard raids in 565 and 585 forced the episcopal see to move from Martigny to Sion further north. It was also for reasons of safety that the earliest cathedral of Sion was built on top of one of the two hills called Valeria. This structure was then dismantled and a new one built on the valley floor in the first half of the twelfth century, the new center of the city, now protected by defensive walls. However, the new cathedral was destroyed in 1418 in battles between the Zenden in the upper Valais and the barons of Raron. With only the tower and the foundations remaining, rebuilding began again under Bishop Walter Supersaxo (1457–1482) and continued under Cardinal Schiners (1499–1522). Although Notre-Dame-du-Glarier qualifies as a late Gothic structure, its adherence to the Romanesque foundation produced an archaic appearance. It was the last cathedral built in Switzerland in the Middle Ages. In the interior, south of the choir in the chapel dedicated to St. Barbara, is a carved and polychromed (multicolored) altar given by Bishop Supersaxo in 1474. In the cathedral treasury are many outstanding objects dating from the late Antique to the late Gothic. Of note are the rich collection of Roman, Byzantine, and Oriental silks used for the wrapping of relics and two early medieval reliquaries: the Adalricus reliquary made out of bone from the eighth century, and the Altheus reliquary, named after a bishop of Sion, made out of silver and goldplated silver with enamels from the late eighth century. Next to the cathedral is the late Gothic church dedicated to St. Theodore, a bishop of Sion in the fourth century. Excavations from 1960 to 1964 revealed that the sixteenth-century church rests on foundations from the Carolingian and Roman periods and that the crypt beneath the altar was built to house the relics of the saint.

Atop the hill Valeria, a new and imposing church, Notre-Dame-de-Valère, was rebuilt at the end of the eleventh and beginning of the twelfth century. The rounded apse, the southern choir chapels, the transept, and the first nave bay to the west, as well as all the remaining foundations, were all completed between 1100 and 1130. The acanthus leaf and figural capitals in the choir are loosely executed, signaling a new direction in the third quarter of the twelfth century. Construction then proceeded sporadically; the tower was added at the end of the twelfth century and the nave in the thirteenth. Many medieval objects from the Notre-Dame-de-Valère are now preserved in the Musée Cantonal in Sion.

Sister-Books

Also referred to as Convent Chronicles, this body of literature comprises nine texts from different Dominican women's monasteries in the southwest of the Germanspeaking area from circa 1318 to 1350. The two oldest books were originally composed in Latin, the others in Middle High German. While the nine texts differ slightly as to their literary significance and as to their cultural and sociohistorical relevance, the texts are more or less identical in structure, contents, and style. The language is deliberately simple; characteristic for the style is the lively contact the authors establish with their intended monastic women audience. Most texts have an initial chronicle dealing with the circa 100-year-old history of the particular monastic community; all Sister-Books contain a series of entries on selected saintly women of the community past and present. Only five authors are known by name.

The Sister-Books are modeled after the Dominican friar Gerard de Frachete's late-thirteenth-century *Vitae fratrum* (*Lives of the Brothers*) and are presumably intended as a feminine counterpart.

To recognize the fact that the Sister-Books' authors meticulously observed the rules of rhetoric is the point of divergence between condemning and appreciating these texts. For the repetitive description of visions, auditions, and various other charisms make sense only when interpreted as hagiographic topoi (recurring themes).

Most of the Sister-Books have never been critically edited, and only minor excerpts have ever been translated into English. In a roughly chronological order, the nine Sister-Books and their known authors are as follows:

The Adelhausen Sister-Book, circa 1318, author: Anna von Munzingen of Adelhausen in Freiburg, Black Forest; Middle High German translation circa 1345–1350.

The Unterlinden Sister-Book, circa 1320, author: Katharina von Unterlinden (von Gueberschwyr) in Colmar, Alsace; Middle High German translation by Elisabeth Kempfin, Unterlinden, late fifteenth century.

The Gotteszell Sister-Book, circa 1320/1330, community of Gotteszell (Cella Dei) outside of Schwäbisch-Gmünd, Württemberg; author unknown.

The Engeltal Sister-Book, circa 1340, entitled: *von der genaden uberlast*; author: Christine Ebner of Engeltal near Nuremberg. Christine Ebner was also the author of *Revelations*, a work that markedly differs in style from her Sister-Book.

The Kirchberg Sister-Book, before 1340; author: Elisabeth von Kirchberg in Sulz, Neckar (Baden-Württemberg).

The Töss Sister-Book, circa 1340; one of several authors is Elsbet Stagel of the monastery of Töss near Winterthur, Switzerland.

The Oetenbach Sister-Book, after 1340; the Oetenbach monastery was in Zurich; author(s) unknown.

The Diessenhofen Sister-Book (also referred to as the *Katharinental Sister-Book*), before 1343 in the monastery of St. Katharinental near Diessenhofen, Switzerland; author(s) unknown.

The Weiler Sister-Book, 1350 in Weil(er) near Esslingen (Baden-Württemberg); author(s) unknown.

Slavery

Slavery was practiced throughout Germany in late Antiquity and the early Middle Ages. In those territories, west of the Rhine and south of the Danube, that were accustomed to the Roman system, there were large numbers of slaves who worked the fields of big plantations. Slavery was also common to the north and east, among the Saxons, Bavarians, and Franks, and among the Lombards after they moved into Noricum and northern Italy. Significant portions of the Lombard law codes of the seventh and eighth centuries concern either unfree Germans or household slaves of Roman descent.

Although it is often presumed that slavery disappeared outside the former territories of the Roman Empire, in fact it continued in German lands throughout the ninth and tenth centuries. Most slaves came from the eastern borders—Slavs captured in raids and sold at markets in Prague and throughout Bohemia. There was an important slave trade in southern Germany as well, especially among Jewish merchants. Trade routes ran through Alpine passes to the Mediterranean, from the Elbe toward the valley of the Rhine, and along the Meuse and Moselle Rivers toward Verdun, where captives were castrated and sold as eunuchs.

But by the late twelfth century slavery had for all intents and purposes come to an end in Germany. As the wars against the Slavs slowed and the number of Christian converts rose, slavery ceased to fulfill the function it did in the ancient world. The word *servus* took on a new meaning and a new legal definition as slaves were gradually transformed into serfs, an arrangement much better suited to the seigniorial system.

[Meuse River](#); [Moselle River](#)

The oldest church in the Westphalian city of Soest was founded in 780 and dedicated to St. Peter. In 954 the archbishop of Cologne founded the church of St. Patrokus, which later became the cathedral. Relics of this saint were brought from Troyes in 964. Located on the trade route across Westphalia known as the Hellweg, Soest achieved great prosperity in the twelfth and thirteenth centuries as a member of the Hanseatic League. In 1179 the town was walled.

The present church of St. Peter and St. Patrokus both date to the mid-twelfth century. St. Peter is a three-aisle basilica with a single western tower. An imperial gallery inside the tower once connected directly to the neighboring archiepiscopal palace established in the tenth century; remains of the palace are still visible. A sculpted capital gives one of the oldest artist's inscriptions in Germany: *Herenfridus me fecit* (Herenfrid constructed me). The main portal of circa 1150, on the south side, depicts the martyrdom of St. John the Evangelist.

The church of St. Patrokus, dedicated in 1166, was embellished with frescoes and stained glass windows. Paintings in the main apse, which was destroyed in World War II, depicted Christ in Majesty; the north side apse of circa 1230 shows the Adoration of the Magi with the Virgin and Child enthroned in a mandorla (body halo). Fragments of a Tree of Jesse window are preserved in the north transept; and scenes of the Resurrection, Ascension, Crucifixion, and Israelite spies carrying grapes are set into modern windows in the apse. The glass dates to the time of the church's dedication. The theme of the main apse is echoed in the north portal tympanum, which shows a half-length blessing Christ surrounded by the symbols of the four evangelists.

During the thirteenth century, a number of new churches were built, and the east end of St. Peter was completed. Two of more than twenty small chapels once located in the town are still extant. One of them, St. Nicholas, is a two-aisle church built in 1202 by the Hansa merchants next to St. Patrokus. Its mid-thirteenth-century apse fresco in the Zackenstil (zigzag style) depicts Christ in a mandorla surrounded by the symbols of the evangelists, with the Virgin and saints to the sides, echoing the composition of the main apse of St. Patrokus.

The church of St. Maria zur Höhe (or Hohnekirche) was built circa 1220. Its western tower is slightly earlier. It is entered through a portal on the south side; the tympanum (triangle above door) depicts the Crucifixion in a quadrilobe (with rounded corners) frame, flanked by the Nativity and the Three Marias at the empty tomb. Inside a wooden *Scheibenkreuz* (wheel cross) dating to circa 1220, the earliest example known, was originally placed on a triumphal arch. The cross has lost its central Crucifixion group. It was surrounded by four circles and four outer squares containing scenes of the Passion and Resurrection: Entry into Jerusalem, Christ teaching, Gethsemane, Betrayal, Entombment, Christ in Limbo, Three Marias at the Tomb, and Ascension. The wheel cross is now supported by two fifteenth-century wings. It had great influence on later wheel crosses in Scandinavia. The frescoes decorating the east end of St. Maria zur Höhe are the most elaborate in the city. The domical vault before the main apse (ca. 1240) depicts the Virgin and a circle of angels. The paintings from the 1250s in the north side apse represent the Coronation of the Virgin in the conch and the legend of St. Katherine on the side walls. In the north side aisle there is a Holy Sepulchre niche also decorated with frescoes.

Other churches built in the thirteenth and fourteenth centuries include Alt St. Thomas (Old St. Thomas), begun in 1181 and enlarged 1250–1270, which was the first church in Soest built in the Gothic style. Neu St. Thomas (New St. Thomas) was built for the Franciscans after their arrival in 1237. The church itself is fourteenth century in date. The church of St. Paul is a mid-fourteenth-century hall church with somewhat later statues of the Virgin and apostles on the piers of the choir, in the tradition of Cologne Cathedral. The most famous of the Gothic churches is the hall church St. Maria zur Wiese, begun in 1313 and finished only in 1530. Stained glass windows in the east end include some of mid-fourteenth-century date depicting the Virgin and saints under baldachins. The main portal on the south side dates to circa 1400 and has the Virgin on the trumeau (inner door frame on double door) and two saints on either jamb (outside door frame). Statues are also arranged on piers around the choir.

Panel painters and manuscript illuminators were also active in Soest. The oldest panel painting is an antependium (front altar panel) of the 1170s from the cloister of St. Walburgis depicting Christ in Majesty, the Virgin with the gifts of the Holy Spirit, John the Baptist, and Saints Walburgis and Augustine (now in the Landesmuseum in Münster). Two later thirteenth-century altarpieces—the first depicting the Crucifixion, Christ before Caiaphas, and the three Marias at the Tomb; the second depicting the Throne of Grace—are both in Berlin, as is a mid-fourteenth-century antependium from the Wieskirche depicting Christ in a quadrilobe frame flanked by eight saints. Illuminated manuscripts from the nearby Cistercian convent of Welver and the Dominican nunnery of Paradies, and the well-known *Nequambuch* (*Book of Misdeeds*) of 1315 are further evidence of flourishing artistic activity. Fragments of thirteenth-century stained glass have migrated to museums in Burg Altena and Cologne. A splendid series of seven windows of the 1240s from Lohne near Soest is now preserved in the Landesmuseum in Münster. Goldsmiths were also active. A shrine of St. Patrokus by the artist Siegfried was commissioned in 1313. Once in the Deutsches Museum in Berlin, it was destroyed, with the exception of some of its figures, in World War II. An embroidered altar hanging of circa 1375 in whitework depicting the Coronation of the Virgin, the *Noli me tangere*, and the Annunciation in quadrilobes is still preserved in the Wieskirche. In the early fifteenth century, the city's most famous artist, Conrad von Soest, and his atelier painted altarpieces for many churches in the city.

Song of Songs

There are two early Middle High German versions of *Das Hohelied* (*The Song of Songs*): a paraphrase by Williram, abbot of Ebersberg (Bavaria), written about 1060, and the *St. Trudperter Hohes Lied* (so named after the source of the oldest complete manuscript) about one hundred years after Williram by an unknown author. Both are written in prose but have different accents, even though the younger version uses Williram's translation of the biblical text. Williram begins his work with a Latin preface, after which the main text follows in three columns: the Vulgate Latin text in the middle, a Latin interpretation in leonine hexameters on the left, and a German translation with a prose version of the Latin interpretation on the right. The German text is liberally larded with Latin words, phrases, even sentences, reminiscent of Notker Labeo's translations. Williram follows the interpretation of the Song of Songs as a dialogue between Christ (the bridegroom) and the Church (the bride), whereas in the St. Trudpert version the dialogue is between the Holy Spirit and the Virgin Mary, who prefigures the individual soul. Williram's institutional emphasis can be seen against the background of his day, the period of church and monastic reform, and the developing Investiture Controversy. The St. Trudpert version represents the more personal, mystical approach of a later period. Both works must have attained considerable popularity. There are over twenty two extant manuscripts of Williram's text and about six of the St. Trudperter.

Speyer

A fortified town under the Roman Empire, Speyer (Rheinland-Pfalz) was destroyed around 450. Rebuilt and later made a bishopric in the seventh century, the town became important in the early eleventh century when the Emperor Conrad II (r. 1024–1039) designated it as the burial place for the Salian emperors and began the construction of a new cathedral for that purpose. Work on the cathedral began by 1029 and was completed circa 1061. A second phase of building saw the construction of vaults and their supports between circa 1080 and 1125. The town was strongly fortified in the twelfth and thirteenth centuries.

The cathedral has a semicircular east apse behind a trapezoidal choir with barrel vaults, a three-bay transept,

Speyer, cathedral, view of choir from south. Photograph: Joan A. Holladay

a crossing with octagonal lantern tower, a long nave with side aisles, and a massive western entry structure, or west-front. The hall crypt is among the largest of the Middle Ages and extends under the crossing, transepts, choir, and apse. There is no evidence of earlier buildings beneath the Romanesque cathedral, and a study of the early liturgy at Speyer indicates that there was not a strong cult of a local saint or an elaborate processional liturgy at the time of the initial construction. In the following years the emperors donated a number of relics to the cathedral that added to the liturgical and religious life of the building, including the head of St. Anastasius and the body of St. Guido, given by Henry III in 1047, and relics of Saints Martin and Emmeram and a number of other saints, gifts of Henry IV in the 1050s. *The Golden Evangelary* (book of gospel readings) of Henry III is the most important liturgical manuscript from Speyer.

The cathedral, erected in two distinct building campaigns, is one of the most significant examples of Romanesque architecture. The first phase of the building was a simpler version of the extant plan. The earliest work saw construction of the crypt under the apse and choir, followed by the construction of the present eastern towers. The crypt was then extended laterally to fill the bays of the transept. Work then proceeded on the transept and the nave, which was extended from an original eight bays to twelve. The cathedral was consecrated in 1061. The original building had vaults only in the apse and the choir, with wooden ceilings in the nave.

The reasons for vaulting the church are not certain; the decision may be due to a combination of damage from flooding as well as to a desire to create a more magnificent and up-to-date cathedral under Henry IV. This monarch was concerned to show his power during the Investiture Controversy, and the imperial burial church provided an opportunity to demonstrate his patronage.

During the second phase of building, the apse was reconstructed, with niches set into the interior walls and elaborate blind arcades and a dwarf gallery placed on the exterior. The walls of the choir were thickened and additional chapels were inserted into the building, as well as a two-story chapel in the exterior corner between the south aisle and the transept. The walls of the transepts and nave were rebuilt and alternate piers were considerably strengthened in preparation for the construction of groin vaults. These are among the largest Romanesque vaults, with a height of about thirty three meters and width of about fourteen meters. During the final phase of construction the chapel of St. Afra was also built on the south side of the nave. Dwarf galleries and elaborate architectural ornament were added throughout the building. The wealth of ornamental detail owes much to Roman models.

Grouped together in the early nineteenth century, the *Spielmannsepen* (minstrel epics)—*König Rothar*, *Herzog Ernst*, *Münchener Oswald*, *Orendel*, and *Salman und Morolf*—have been known by this designation ever since. Originally this grouping situated the texts between the heroic poetry of the early medieval period and the sophisticated and stylistically harmonious courtly romances. The earliest scholarship was shaped by the romantic concept of minstrels (*Spielleute*), as itinerant, uneducated performers. Scholars thought that in their striving to astonish audiences by embellishing their narratives with magic, fantastic plots, and mythic characters, they diminished the aesthetic quality of their texts. The style of these poems was condemned as inept and repetitive, the language as coarse, the scenes as burlesque, and the narrative as superficial. Whether the minstrel was considered a transmitter of poetry or a genuine poet, he was blamed for narratives that merely offered entertainment.

Defining this group according to the heterogeneous category of minstrels fails to characterize the texts and justify the genre. The customary quotation marks signify the inadequacy of our definitions. Since the early 1970s, scholars have realized that these texts are more complex than previously thought. The scholar Rolf Bräuer suggested that they were produced for townspeople, not a court, whereas Hans Simon-Pelanda emphasized their political dimension, calling them state epics. Unfortunately, these suggestions lose sight of the vitality of the individual texts and their interest in foreign adventure. Alternatively one might recategorize the poems, but this, too, fails because they do not share enough essential characteristics with other narratives to be placed into any single, related category such as heroic epic, romance, or hagiography. Attempts at recategorizing have led to the recognition, however, that they are hybrid forms, exhibiting similarities with all three narrative types. These poems can be understood as attempts to adapt the heroic epic to a Christian ethic. The medieval reception of these texts certainly supports this thesis because the texts were included in heroic as well as religious collections. The *Orendel* with a strong hagiographic thread appears in the *Straßburg Heldenbuch* in the company of the heroes Alexander, Siegfried, and Dietrich. At the same time, the similarly hagiographic *Oswald* is found together with annals of popes, martyr legends, and conversion stories.

These hybrid forms may, nevertheless, be examined together as well as separately because they share plot structure and many significant elements. First of all, these poems draw heavily on oral tradition. Second, each poem has a historical event or person at the center. Third, the bridal quest combined with the crusade ideology dictates both plot structure and motivation (except in *Herzog Ernst*). Fourth, the texts explore popular themes: the political and religious ramifications of the crusade mission, the lives of hero-saints, and the centralization of power in the hands of a king. Finally, in contrast to earlier vernacular poetry, they are secular in that they all convey an ardent curiosity about the physical world, and the political ambition to control foreign lands. Even the most hagiographically drawn heroes—*Orendel* and *Oswald*—are theocratic kings who progress to sainthood by serving God in battle.

We know nothing of oral precursors to these poems, but they certainly draw heavily on oral tradition both in their inclusion of heroic characters and in their formulaic style. From Germanic tradition they inherited characters (*Orendel*, *Asprian*, *Witold*, *Dietrich*), mythic figures (giants, mermaids, dwarfs), and magic. Formulaic phrases in the manuscripts replicate for the reader a performer's typical interjections. These formulas indicate a desire even in written literature to imitate an oral performance. Therefore, minstrels' performances and, consequently, their interpretations had a formative influence on the audience and its reception of literature. What this implies, then, is that however clumsy scholars find these epics, the vitality of transmission and performance must also be considered.

Second, one might call these texts historical legend because they contain a historical kernel and a claim to historical truth. *Orendel* is connected with the seamless cloak of Christ deposited in Trier Cathedral in 1196. *Oswald* is associated with Regensburg, the seat of the Welfs, because St. Oswald was their patron saint. *König Rothar* is connected with the Langobard king Rothari (636–652) and the Norman ruler Roger II (1105–1154), who was unsuccessful in establishing a marriage between his son and a Byzantine princess. The *Salman und Morolf* documents the existence of the Christian Kingdom of Jerusalem (1100–1187). Finally, *Herzog Ernst* may have been inspired by the actual revolt of Ernst II, duke of Swabia, against his stepfather, Conrad II, in 1026. All five "minstrel epics" are likely to have originated in the twelfth-century because of these historical elements. However, we have twelfth-century manuscripts of *Herzog Ernst* and *König Rothar*. But the fact that these two texts are contemporary with courtly romances means they are not necessarily precursors. The other three "minstrel epics" are extant only in fifteenth-century manuscripts and printed books, so we have no knowledge of their earlier form. Since the stories tell of faraway places, they give the appearance of satisfying people's curiosity about the foreign lands, but basically these poems use the foreign and the exotic as a negative contrast by which to define and extend the borders of the familiar.

Most likely, *Herzog Ernst* and *König Rothar* were composed in a form similar to what we find in the earliest manuscripts from the second half of the twelfth century. This was a period of especially rapid social and economic growth and an explosion in literary activity. And within this explosion, the "minstrel epics" are obvious examples of literary experiments that cross boundaries. These narratives were popular but, lacking the concepts of *Minne* (courtly love) and *aventure* (knight errantry), never became a generic model.

Third, the bridal quest narrative found in the "minstrel epics," but not limited to them, follows a simple pattern: The royal councillors advise the king to marry and produce a successor. Only one princess, usually pagan, has the qualifications of rank, wealth, beauty, and virtue, but her father takes the life of all suitors. In each poem the protagonist accomplishes the courtship and abduction of the chosen princess in a different manner. Although he asks her approval, she is nevertheless vulnerable because the threat of force can compel her to consent. The courtship and abduction process causes a battle that often becomes an invasion of foreign (heathen) territory. The suitor fights in genuinely deadly battles and abducts the bride in an act of violence that isolates her and leaves her completely powerless—so much so that the narrative frequently leaves her nameless.

This plot is often doubled. On the couple's return home, the husband loses his new wife. In *König Rothar* the princess's father sends someone to abduct her, and Rothar must then return at great risk to retrieve her. The pattern can vary, and the wife may be lost to him in other ways, but in all cases, the husband must retrieve her. In *Orendel*, the heathens imprison queen Bride during the crusade. The *Salman und Morolf* inverts the bridal theft but also contains two cycles.

Fourth, composed against the background of a crusade ideology that encourages conversion efforts, courtship naturally looks to the heathen lands. The crusade thus provides the religious grounds for political expansion. To save the young woman from paganism, it is justifiable to wrench her from the protection of her kin. As a reward for this violence, the suitor achieves not only purification and salvation by means of his crusading vow but also stands to acquire her property because she is the single heir. Thus the crusade ideology fosters two themes: It supports the hero's attainment of grace, thus bringing these narratives in proximity to the saint's legend, and at the same time it advances the cause of territorial expansion and consolidation. In *Oswald* the typical abduction is transformed into a miracle story in which Christ arrives at the wedding disguised as a beggar to test Oswald by asking him for his possessions, including his new wife in the name of Christ. Oswald passes the test by turning everything, including the wife, over to the beggar. And the *König Rothar* attempts to validate the foundation of the universal empire when the eventual fruit of the union between Rothar of Italy and the princess of Constantinople is Charlemagne.

Finally, as the bridal quest plot forces the king to confront strange and foreign lands in pursuit of his bride, his search becomes the vehicle for exploring the compatibility of the crusade with the political questions these works are concerned with. As a group, these epics explore the increasing institutionalization of the monarchy and the way the king strives to augment political advantage by ensuring succession and expanding territorial sovereignty. The progressive institutionalization of kingship unfolds in the later texts only (*Oswald*, *Orendel*, *Salman und Morolf*). As they portray the king's decreasing capacity to make decisions and increasing reliance on advisers, they demonstrate that the office of king loses no credibility or power as a result. The narratives thus experiment with ways to incorporate a new kingship into the inherited literary forms of heroic epic and saint's life. In addition, they describe crusade expeditions in which an entire society may take part. Although nonbelievers are occasionally converted, the purpose of the crusade battles is primarily to extend and consolidate the Christian (and German!) territories. Thus we find here a sense of state planning that extends far beyond courtship and royal succession and emphasizes the consolidation of the monarchy as an institution. It is significant that in most of these epics (*Orendel*, *Oswald*, *Herzog Ernst*, *König Rothar*), the leader (king or exiled warrior) loses his entourage and must collect a new set of supporters. If he proves his ability to gather loyal warriors and to sustain cooperation within the body politic, he wins the bride. This implies that if the king and realm are to

achieve stability, they must forge a structured social organization of a magnitude in which the energies of individuals join to support the king's established common goals.

Happily, scholarship has been moving these texts out of the rubric of "minstrel epics" and opening them up to broader comparison. Fruitful research would focus on storytelling strategies, ways of establishing the credibility of the narrator, and the strategies of violence and subjugation that pervade these texts. Also, a more subtle political agenda still needs attention, namely, the way in which courtship texts define an implied German identity by means of the protagonist's encounter with the foreign.

Stained Glass

See [Gothic Art and Architecture](#); [Romanesque Art and Architecture](#).

An Austrian by birth, the cleric Leopold Stainreuter studied at the Universities of Paris and Vienna, becoming court chaplain to Duke Albrecht III of Austria (d. 1395). Stainreuter was a prominent translator of Latin theological tracts, having rendered the *Rationale divinarum officiorum* of Guilelmus Durandus (d. 1296) for the ducal court. Apparently at the behest of the duke's steward, Hans von Liechtenstein, Stainreuter translated Latin books on pilgrimage (called *Pilgerbüchlein*). Stainreuter, as translator and popular theologian, joins the so-called *Wiener Schule* (Viennese School), formed from authors with close ties both to the Habsburg court and the University of Vienna: Heinrich von Langenstein, Nikolaus von Dinkelsbühl, Thomas Peuntner, Nikolaus Kempf, and Nikolaus von Astau. (Johannes von Gelnhausen, Rudolf Wintuawer, Friedrich der Karmeliter, and Ulrich von Pottenstein are also associated, however tangentially, with the Viennese School.)

Central concerns of the authors named were religious instruction and edification, to which ends they translated Latin writings into the vernacular. Believing that literature should offer practical instruction for daily living and should promote the conversion of souls, they aimed their catechetical literature at a broad audience, embracing clerics, the laity, common people, and the nobility. Augustinianism was the theological direction of the school, Stainreuter having been active in the monastery of the Augustinian Hermits in Vienna.

Stainreuter also found his voice as historian, translating and composing dynastic history. For his 1385 translation of the *Historia tripartita*, the three-part church history by Cassiodorus, he wrote, as a type of introduction, a panegyric poem to Duke Albrecht III, labeled an "Epistel in daz lob des furstleihen herren herzog Albrechten czw Österreich" (Epistle of praise of his princely duke Albrecht of Austria). In the work Stainreuter identifies himself both as *chapplan*, *prueder Lewpoltz* (Brother Leopold, chaplain) and *lesmaister* (lector). Noteworthy is his employment of genealogy, a topic carried to fullness in his *Österreichische Chronik von den 95 Herrschaften* (begun in the late 1380s), an influential compendium of Austrian history borrowing the frame of world history, and commissioned by Duke Albrecht III. The *Chronik*, sometimes called the *Chronica patrie*, is a detailed, annalist prose history—based in part on the religious chronicle *Flores temporum* focusing on Austria from its earliest times through the rule of Duke Albrecht. (The concluding events are the death of the duke in 1395 and the pilgrimage of Duke Albrecht IV in 1398.) Stainreuter's *Chronik* is nourished by its vivid historical awareness, as indicated by its opening references to Seneca as helmsman, of the value of memory (*gedechtnüs*), and of history writing itself. There follows a fabulous pseudo-history, insistent in its efforts to legitimate Habsburg rule, placing Austria in a historical context that is both inventive and tendentious. As valuable as any of the Austrian historical events reported by Stainreuter is his allusion to a very early German Bible. He reports (in paragraph 388) that Queen Agnes of Hungary (d. 1364), *het ain bibel, die waz ze deütsche gemachet* (possessed a Bible written in the German tongue).

By the 1980s scholarship on Leopold Stainreuter seemed stable and serene. For all the vague remarks in the critical literature of the type that works were "ascribed" to him, a consensus had emerged that he was a translator and historian of note. Now that consensus has been shattered. Paul Uiblein recently shook Stainreuter research to its foundations, claiming Stainreuter was in fact the beneficiary of a kind of mistaken identity. Uiblein identifies our author, instead, as a certain Leopold of Vienna (Leupoldus de Wienna), a cleric of similar background who studied theology in Paris and taught the same in the theological faculty of the University of Vienna, established in 1384. At some point before this, Leopold had become court chaplain of Duke Albrecht III of Austria. Among his ducal duties was the preparation of translations; for these, as well as for his teaching at the university, he was recognized in 1385. In that year Duke Albrecht interceded on Leopold's behalf with Pope Urban VI, so that the chaplain might receive a benefice. That Leopold of Vienna already enjoyed the favor of the pope is shown by the bestowal of the title "papal honorary chaplain" in 1385.

Suffice it here to say that scholarship on Leopold Stainreuter is in flux; it is not yet certain when, or how, researchers might sort through the claims and counterclaims, and make a cogent case for the achievements of either "Leopold." Until that time, the literary patronage of the Habsburg dukes, primarily Albrecht III, will be more opaque than once believed. What is clear is that in late-fourteenth-century Austria a court historiography arose animated by nobles and confected of genealogy, historical fact, and fable.

Statutum in Favorem Principum

During the latter years of the 1220s, King Henry VII of Staufen followed a policy that favored the towns over the princes. A case in point was a privilege (Statute in the Favor of Princes) that he granted to the burghers of Verdun in March 1227, giving them the rights to elect their own town council and to fortify their town by means of a self-imposed tax; these rights were to be valid even without the consent of their prelate. Opposition from the princes, headed by Archbishop Dietrich II of Trier, forced the king to revoke the privilege the following month.

By early 1231, however, tension between Henry and the princes, particularly the bishops of Würzburg and Strasbourg, reached the point where, on January 23 at Worms, they compelled him to give legal recognition to their lordly rights over the towns in their territories. This was confirmed in April 1231 in the *Statutum in favorem principum*. Frederick II, whose policy regarding Germany at this time was one of identifying the interests of crown and princes by implicitly accepting their point of view vis-à-vis the towns, confirmed the *Statutum in favorem principum* May 1232 at Cividale. Frederick thereby extended to all princes, lay and spiritual, concessions made in 1213 (the Golden Bull of Eger) and in 1220 (*Confoederatio cum principibus ecclesiasticis*) to the ecclesiastical princes alone.

Whereas in England and in France, the monarchy allied itself with the rising interests of the towns against the princes, the *Statutum* and its predecessors effectively eliminated the possibilities of a strong monarchy in Germany by rejecting the economic and political potential of the towns in favor of continued harmony with the princes. Thirteen of the twenty-three clauses in the *Statutum* make direct reference to towns and markets, control of which was demanded by the princes. They furthermore received guarantees of full control of all courts and jurisdictions within their territories. It was thus the princely territories that emerged from the Middle Ages with strong and effective administrative machinery, rather than the monarchy, as in England and France.

[Frederick II](#); [Staufen](#); [Verdun](#)

The Staufen (also Hohenstaufen, literally "high Staufen") were a great imperial ruling family of the twelfth and thirteenth centuries whose struggles with and eventual defeat by the papacy signaled the decline of the medieval empire. The greatest members of the line were the two Frederick's: Frederick I Barbarossa and his grandson Frederick II Hohenstaufen. Both these rulers embodied the values and desires of their age and also represented the greatness of imperial authority. After the death of Frederick II and that of his heirs, the empire fell into a period of interregnum and then a prolonged period of decentralization and fragmentation.

The Staufen rise to royal and imperial power occurred in the early twelfth century. Possessors of extensive estates in Swabia, the line felt ready to assume the throne on the death of Henry V in 1125, in the person of Duke Frederick of Swabia, but the last of the Salians chose the Welf (Guelf) Lothar III (r. 1125–1137). Opposition among the Staufen to Lothar's succession was strong, and in 1127 the line engineered the election of Conrad as antiking. But the time was not ripe for the Staufen claim to the throne, and only papal schism kept Lothar from a total victory over his rivals. The victory, however, would be short-lived because Conrad (III) would succeed to the throne in 1138. His reign witnessed triumph over his Welf opponents in Germany—although the Welfs would remain among the most important adversaries of the Staufen. Conrad, like many contemporaries and descendants, was attracted to the idea of crusade and joined the ill-fated Second Crusade. His return from the Holy Lands saw him accept another religious obligation—defense of the pope against his Norman enemies. Indeed, Conrad would receive imperial coronation for his efforts, but he died before he could mount a campaign in Italy. His death left the line in a precarious position, particularly with Conrad's heir still a minor. Although the Staufen hold on power was tenuous, Conrad's eventual successor would secure the dynasty's hold on power and raise the line to great heights.

Arguably the greatest of the line, and one of the greatest rulers in all the Middle Ages, Frederick Barbarossa assumed the throne in 1152—favored by Conrad over his own son, who was still a minor. Frederick was also favored because of important family connections with both his own Staufen line and the rival Welfs. It was his great talents that enabled him to exploit his advantages. His reign was marked by three major concerns: Germany, Italy, and crusade. In the homeland of the realm, Frederick skillfully managed the territorial nobles and family relations to strengthen his authority. He maintained the support of his family by making his displaced cousin duke of Swabia. He also manipulated relations with the rival Welfs effectively, granting them important titles and positions but exploiting the violation of feudal relations of their most powerful figure, Henry the Lion. Frederick also married well, acquiring Burgundy in the process, and intervened in disputed episcopal elections and made greater use of *ministeriales* (ministerials, or officials) during his reign to make his authority more effective. Moreover, it was Frederick and his advisers who recognized the value of Roman law in imperial governance and who first used the term *sacrum imperium* to describe the empire and thereby made it a rival with the holy power of Rome.

Frederick's second great concern was with Rome and Italy. His relations with the papacy were stormy and marked by schism. Although crowned emperor by the pope in 1155 and supportive of the pope at the outset of his reign when he helped suppress the Roman republic associated with Arnold of Brescia, he would find himself in conflict with popes in the 1150s and 1160s. There was the unfortunate incident at Besançon concerning the nature of his relationship with Rome and the exact nature of the "gifts" bestowed by the pope on the emperor. He also found himself on the side of the antipopes during the Alexandrine schism of the 1160s and 1170s. Frederick would see success in this struggle and would have Charlemagne declared a saint, but he would also suffer a major defeat by the Lombard League, which weakened his hand in Italy and ultimately recognize the authority of Alexander III.

Barbarossa's last act was his participation in the Third Crusade. A participant in the Second Crusade, Barbarossa led a large force toward the Holy Lands and enjoyed early success along the way. Unfortunately, while crossing the river Saleph on June 10, 1190, Barbarossa drowned. Demoralized, much of his army returned home; with a much weaker crusader army in the field, chances for success were greatly diminished. Despite his unfortunate end, Barbarossa made a lasting impact on the empire and left it at peace and in the relatively capable hands of his son, Henry VI.

Although not the warrior his father was, Henry was nonetheless a skilled and ruthless ruler whose abilities and ambitions offered great promise to the empire. In his short reign, he managed to strengthen the central authority and reinforce the prestige of the imperial title. He struggled successfully in both Italy and Germany to assert his territorial and political rights and sought to create a hereditary monarchy encompassing Germany and Sicily. His untimely death, however, was disastrous for the empire and led to a period of instability and civil strife in the competition for power among Otto IV, Philip of Swabia, and Henry's own heir, the three-year old Frederick.

Frederick II, one of the most interesting and controversial figures of the Middle Ages—the *stupor mundi* (stuporous to the world)—was the least likely to succeed at the death of Henry. He would triumph over the Welf, Otto IV, whose support from Rome dissipated once he sought to expand his authority into Italy. Frederick resurrected the fortunes of the dynasty after the death of his uncle Philip of Swabia, whose death prevented his triumph over Otto, only to fall ultimately in his prolonged struggle with an increasingly power hungry papacy. Like his illustrious grandfather, Frederick II was concerned with matters in Italy—king of his native Sicily, his attentions naturally focused on the peninsula—Germany, and the Holy Lands. His relations with a series of popes, however, beginning with Innocent III and ending with Innocent IV, shaped his reign. It was support from Innocent III that ensured Frederick's rise and successful claim to succession to the throne in Germany. It was the excommunication passed by Gregory IX that strengthened the opposition to Frederick. Indeed, the popes themselves were often in the forefront of opposition to Frederick, in part because of his failure to honor pledges to keep the crowns of Germany and Sicily separate. His failure to launch a crusade in timely fashion—despite his successful negotiation with the sultan of Egypt and his coronation as king of Jerusalem—brought about the first papal excommunication.

Despite his great ability as a ruler and his ruthlessness, Frederick's sudden death while under the ban of excommunication seriously damaged the line's fortunes. Frederick's descendants, especially Manfred of Sicily and Conradin, were unable to secure the power and position of their father and grandfather, and suffered the continued implacable hatred of the papacy. Frederick's sons were killed in battle or died in prison, and the glorious line that had dominated imperial affairs and raised Germany to great heights was finally defeated by its papal rival. But the legend of the return of Frederick persisted, testifying to both the awe in which he was held and the importance of his family to the medieval empire.

Steinbach

The so-called basilica of Einhard, the only remains of the former Benedictine cloister at Steinbach near Michelstadt in the Odenwald (Bavaria), is one of the most important examples of Carolingian architecture to survive in Germany. It was founded by Einhard, the biographer of Charlemagne, to whom Charlemagne's son Louis the Pious had given the border settlement Michlinstadt in 815. By 827, when the relics of the martyrs Marcellinus and Petrus were transferred from Rome *in basilicam noviter a me constructam sed nondum dedicatam* (to the church recently built in my honor but not yet dedicated, *Translatio* 1887:243), the church was apparently finished but not yet consecrated. A three-part westwork (entrance structure) preceded the three-aisle nave supported on piers; together with the low chapel-like transept wings and the cruciform shafts of the crypt, these features characterize a building of the "compressed, compartmentalized basilica" type (*gestauchte Zellenbasilika*) in the circle of Abbot Gozbert's abbey church at St. Gall and associated with the reform movements of Benedict of Aniane. The rough stone work of the nave was plastered outside; in the eastern parts of the building, by contrast, the ashlar

Steinbach, Einhard-Basilica, plan of church (above) and crypt (below) in present state. Photograph: after Georg Schaefer, *Kunstdenkmäler im Grossherzogthum Hessen, A. Provinz Starkenburg, Kreis Erbach*, p. 250 (Darmstadt: Arnold Bergsträsser, 1891)

masonry of sandstone with light-colored joints was left visible (*pietra rasa* surface). A painted console frieze on the interior below the ceiling remains from the wall painting contemporary with the building's construction; the rest of the walls were whitewashed. Remains of the Carolingian plaster paving are preserved in the apse, but fragments of figural wall painting in the middle apse probably date only from the eleventh century.

Einhard left the site already in 828, taking the bones of the two Roman martyrs with him to the newly erected abbey church at Seligenstadt. Repair work and new building is documented for the years about 1073, when a Benedictine priory was established by Abbot Udalrich of Lorsch, and again about 1160, when two western towers were erected. The towers were pulled down in 1588. In 1232, after the Abbey Lorsch was transferred to the diocese of Mainz, Benedictine nuns were settled at the site. In 1539, the convent was dissolved and the church secularized.

Of the original building only the nave, its arcades walled in since the fourteenth century, the main apse, and the north side choir with its attached two-story "winter choir," added about 1168, still stand. The complex was fully restored between 1968 and 1974.

Stendal

The original rural settlement grouped around the Petrikerche (church of St. Peter) in the north, still recognizable in today's town plan, received market privileges in 1160 from Margrave Albrecht "the Bear" of Brandenburg. To enhance the importance of the place, the Augustinian chapter at nearby Tangermünde was transferred to Stendal in 1188, and its church, St. Nikolai (the Dom), was established to the south. Between these two poles developed the market town with the Marienkerche (church of the Virgin) and the town hall; finally, the three units became enclosed by a defensive system that gave the town, like Lübeck, an oval shape with its main axis stretching north-south.

The main parish church of St. Marien—begun before 1400 and vaulted in 1447—belongs to a group of similar churches, characteristic of the margraviate of Brandenburg and modeled on St. Sebald's in Nuremberg. Like the churches of St. Nikolai in Berlin and Spandau and those dedicated to St. Katharinen and St. Gotthardt in Brandenburg, St. Marien displays a hall ambulatory choir and shallow chapels filling the space between the inverted buttresses. What distinguishes Stendal from this group, however, is that only here do the seven sides of the exterior correspond to an equal number of the inner apse with six narrowly spaced pillars instead of a single pair that created a portal-like vista.

In contrast, the Dom is a conservative, rather archaic looking monument of the fifteenth century, which in all its aspects re-creates the image of a thirteenth-century building; it is covered throughout by cross-rib vaults and consists of an elongated choir ending in a half bay and five sides of a decagon, with expanding transepts and a hall nave with heavy round pillars and five-partite vaults in the aisles (just as in Magdeburg Cathedral); the latter correspond to the duplication of windows in the outer walls. The result is a spatial clarity and a brightness enhanced by the largely surviving late Gothic stained glass windows.

Both Dom and Marienkerche, like the two smaller parish churches of St. Peter and St. Jakob, have, although Protestant, preserved most of their medieval fittings. Carved in wood, their choir stalls, rood screens, and altar retables contrast in their late Gothic detailing with the sober architecture executed in brick.

The town hall, which creates a screen between the market square and the two-towered facade of St. Marien, represents an ensemble of different parts. In the earlier fifteenth century, the open loggia that served for public court sessions was erected. The long brick building behind, consisting of the northern cloth hall and the southern council hall, was built around 1450, and a wing projecting into the market square was added in the later fifteenth century; this was changed in the subsequent century to a stuccoed Renaissance building with scrolled gable. Of the originally three town gates, two (i.e., the Tangermünder Tor to the northwest and the Uenglinger Tor to the south) have survived. In both, the simple square tower gate built in fieldstone was heightened in the mid—fifteenth century by an impressive superstructure in brick with round corner towers and richly decorated wall surfaces, as well as an ornamental battlement surmounted by a round central tower.

Stoke, Melis (fl. early 13th c.)

The author of an important Dutch chronicle, Melis Stoke is known to have been employed as a town clerk in Dordrecht starting in July 1296. In December 1299 he entered the service of Count Jan II (d. September 11?, 1304) and worked as a chancellery clerk at the court of Holland until November 1305. His *Rijmkroniek van Holland* (*Rhymed Chronicle of Holland*) is a regional chronicle in the vernacular (more than 13,000 lines long) and is an invaluable source of information about the history of Holland and Zeeland around 1300. Three manuscripts and three fragments of the chronicle have survived. The earliest version (of which no manuscripts have been preserved but which can still be recognized in the part preceding Book 4,1. 242 in later versions) dates from 1278–1282 and was dedicated in the prologue to Count Floris V of Holland. The most important source of this version of the chronicle was the *Chronicon Egmundanum*, written in the monastery of Egmond in Holland. The author aimed to emphasize Floris V's noble ancestry and to show why the subjection of the rebellious Frisians was legitimate. In or around 1305, the early version was rewritten and a continuation was added that devotes a great deal of attention to the murder of Floris V (d. June 27, 1296) and to Holland's conflict with the count of Flanders and the Zeeland nobility. The last remark in the continuation concerns the marriage of Count Willem III of Holland, of the House of Avesnes, to Jeanne of Valois (May 23, 1305). Two versions of the continuation have survived, the later of which was dedicated to Count Willem III.

The famed sculptor was born in Horb am Neckar and died in Nuremberg on September 20, 1533. Virtually no documentation exists about Stoss's training and earlier years. His earliest secure sculptures show his familiarity with the heightened realism of the art of Nikolaus Gerhaert and Martin Schongauer, suggesting a stay on the Upper Rhine, perhaps in Strasbourg. Rogier van der Weyden's paintings, likely through other artistic intermediaries, also influenced the young sculptor. Although scholars have suggested the Stoss collaborated on altarpieces in Rothenburg (1466) and Nördlingen, nothing is known about his very earliest production. He certainly was an established sculptor when, in 1477, he moved to Kraków from Nuremberg, where he had married before 1476. Between 1477 and 1489 he created the Mary Altarpiece for St. Mary's in Kraków. Measuring 13.95× 10.68 meters, this is probably the period's largest winged retable. Several of the apostles in the Death and Coronation of the Virgin in the corpus are about 2.8 meters tall. Here and in the relief scenes of the inner and outer wings, Stoss provides his figures with little space. Most are located within a shallow stage with a sharply tilted ground plane. Stoss's virtuosity in cutting highly animated draperies with deep, crisp folds is best observed in the richly polychromed (multicolored) and gilt corpus statues. For a project of this magnitude, the artist employed several assistants likely including a few of his seven sons. The Mary Altarpiece the red marble Tomb of King Casimir IV Jagiello (1492) in Wawel Cathedral in Kraków, and his cast bronze Tomb Plate of Callimachus (Filippo Buonaccorsi, d. 1496) in the city's Dominican Church, among other works, exerted a tremendous influence on other artists active in Poland and eastern Prussia.

In 1496 Stoss moved back to Nuremberg. Three years later he completed stone statues of the Man of Sorrows and Mater Dolorosa plus three reliefs of the Last Supper, Christ on the Mount of Olives, and the Arrest of Christ that patrician Paulus Volckamer set in the eastern choir wall of St. Sebaldus church. The emotional appeal of the figures, notably Christ and Mary, who look beseechingly at the viewers passing in the ambulatory, coupled with a growing clarity of form define Stoss's more developed style. His career, however, was temporarily sidetracked. Having lost 1,265 guilders speculating on copper, Stoss forged a promissory note in 1503. After being convicted, he was branded on both cheeks and banned from leaving the city. In 1504 Stoss fled and worked briefly in Münnerstadt, where he polychromed Tillmann Riemenschneider's Mary Magdalene Altarpiece (1490–1492) and painted four scenes of the Martyrdom of St. Kilian on the wings. These are Stoss's only documented paintings; he also created ten engravings during this decade. Stoss returned to Nuremberg and through the intercession of Emperor Maximilian resumed his career. For the choir of St. Sebaldus, he made the limewood St. Andrew (1505–1507), in which the clear and stable pose of the apostle contrasts with the marvelous billowing drapery. Stoss carved both small-scale and large statues throughout the 1510s and 1520s for local patrons and churches. His greatest feat was the Angelic Salutation (1517–1518), an over-life-size Annunciation suspended from the choir vault in St. Lorenz church. Supported by an angel holding *sanctus* bells, Gabriel and Mary float before the high altar. They are enframed by a giant rosary complete with roses, beads, small figured roundels, a group of joyous angels, and, at the apex, God. The ensemble included a great crown above, now lost, and Jakob Pülmann's candelabrum. Commissioned by Anton II Tucher, Nuremberg's highest official, the Angelic Salutation was covered for much of the liturgical year. With the advent of the Reformation in Nuremberg, the whole group was sheathed permanently from 1529 until circa 1806. The Reformation also affected Stoss's final great commission, the Mary Altar (1520–1523) ordered by the artist's son, Andreas Stoss, who was the prior of the local Carmelite convent. Stoss's preparatory drawing is today in the University Museum in Krakow. The sculptor had yet to be paid when the convent was dissolved in 1525. After a long legal battle, the altarpiece was transferred by Stoss's heirs to Bamberg in 1543 and is now in the cathedral. Like several of Stoss's later carvings, the Mary Altar was stained but never polychromed. Stoss continued working at least until 1532. His impact on regional sculpture, at least before 1525, was considerable.

Stralsund

The city of Stralsund is located in a strategically prominent position on an elevation dominating the Strelasund, which separates the island of Rügen from the Pomeranian coast, and secured on the landward side by a series of lakes created from swamps. The economically important medieval city grew out of a preexisting Slavic settlement and received trading privileges from Prince Wizlaw of Rügen in 1234. As a result of its speedy economic development, which provoked the envy of Lübeck, Stralsund was conquered and sacked in 1249 by the latter; it soon regained and surpassed its former prosperity, however, and by 1256 there is mention of the Heilig-Geist-Spital (Hospital of the Holy Spirit) in the new town, indicating that the first major urban expansion was well on its way. A fire in 1271 did not halt the urban development either but led to a rebuilding of the city, now surrounded by defensive works in brick. In 1316, Stralsund sided openly with the Baltic cities and was consequently besieged by its territorial lord, the prince of Rügen. In 1325, after the prince's death, Stralsund fell to Pomerania. The treaty of Stralsund, signed in 1370 to end the war between the Hanseatic League and Denmark, marked the first peak of the town's economic and political importance, and in 1429, a Danish fleet was destroyed near Stralsund. The second half of the fifteenth century witnessed the lasting conflict between the city's growing struggle for independence and the territorial interests of the Pomeranian princes which, in 1512, reached a compromise. Through the subsequent centuries, which saw the Swedish occupation of Stralsund, the city underwent a continuous decline. As a result, the city was able to preserve its late medieval architectural appearance.

The town plan of Stralsund reflects the fusion of two halves, i.e., the old town with town hall and Nikolaikirche (church of St. Nicholas) to the north, and the new town with the Marienkirche (church of the Virgin) to the south. The present Nikolaikirche, which replaced an earlier hall church, was begun after 1276 when the council asked for donations, and—to be more precise—most probably in 1288, when Dietrich von Barth was appointed architect for the building. An inscription near the western portal gives the year 1311, and by the mid-fourteenth century the church itself must have been completed, while its monumental two-towered facade was still under construction. As a basilica with flying buttresses, St. Nikolai can be considered a faithful copy of the exactly contemporaneous Marienkirche in Lübeck, which had applied the scheme of a Gothic cathedral to a parish church erected in brick. Like its prototype, St. Nikolai has no transepts but an ambulatory choir with integrated hexagonal chapels and a two-storied wall elevation with high niches in the clerestory.

The first Marienkirche of the new town—likewise a hall church—was destroyed by the collapse of the tower in 1382 or 1384 and was subsequently rebuilt as a late Gothic variation on the theme of St. Nikolai. Already in 1394, the northern transept received its stained glass window, while the massive western tower was begun in 1416 and completed in 1478. In contrast to its model, St. Marien has a set of transepts with aisles, and the radiating chapels become unified externally to form a large polygon. Despite its late date, the Marienkirche shows a rather austere treatment of all architectural forms in accordance with the brick technique. It still exhibits simple cross-rib vaults, and only the crossing possesses a star vault not unlike that of Amiens Cathedral, but also found in contemporaneous north German brick architecture. The western tower, however, its accompanying transeptlike wings, and even its arcades that pierce the massive walls, show an abundance of late Gothic star vaults. Like a donjon, the square tower, flanked by turrets at all its four corners, rises above the ridgeline of the church in an octagonal superstructure. In the third parish church, the Jakobikirche (church of St. James), the original hall church with straight eastern termination was not, as in the two others, completely rebuilt, but only heightened during the fifteenth century to correspond to the system of the two existing basilicas. Its tower repeats the scheme of St. Marien, but with corner towers flanking the octagon.

The completely preserved Dominican monastery of St. Katharinen (St. Catherine's) with its church—a hall church of eight bays plus choir, consecrated in 1287—serves today as the city's museum, while the Franciscan monastery, founded 1254 and destroyed 1944, survives as a ruin. The Heilig-Geist-Spital, rebuilt in the fifteenth century, consists of a chapel—a hall of four bays, cross-rib vaulted with the exception of a central bay that shows a complicated star pattern—and the hospital as its eastern continuation. The latter consists basically of two wings that prolong the chapel's aisles, while an open courtyard acts as the continuation of the central nave.

Stralsund's town hall is one of the most impressive monuments of this building type. Placed as a barrier between the western facade of the Nikolaikirche and the market square, it consists, like its prototype in Lübeck, of two parallel wings separated by an elongated courtyard, and a northern wing that unites the two buildings; with its six high gables between turrets and opened in tracery, the northern wing presents to anyone who approaches the city from the north a majestic silhouette.

Strasbourg

This important medieval city began as a fortified Roman settlement named Argentoratum or Argentina. Because of its location on the Rhine River at the border between German and French lands, Strasbourg has always been a crossroad as its Merovingian name, Strateburg—"the city on the roads"—indicates. It was a prosperous city throughout the Middle Ages. The bishops of Strasbourg controlled the city until the thirteenth century, when, with support of the Staufers rulers, the citizens of Strasbourg assumed control. While its geographic location and economic prosperity made Strasbourg a vital medieval intellectual and artistic center, the ravages of numerous wars, most notably the bombardment by the Germans in 1870 (Franco-Prussian War) and the bombing in 1944 by the Allies, destroyed or damaged many of Strasbourg's medieval monuments.

The best-preserved and restored medieval edifice is the cathedral of Notre-Dame, which represents a mixture of German and French artistic influences. The plan and proportions follow the eleventh-century Ottonian Romanesque church, including the elongated crypt and an octagonal crossing tower. Some of the Romanesque stained glass windows are preserved in the transept. During the thirteenth century, French Gothic styles predominated, first in the sculpture of the south transept, which reflects influences from Chartres, and most important in the nave, which was rebuilt around 1240–1275 in the rayonnant style of Parisian Gothic architecture. The most famous aspect of the cathedral is its "harp string" facade, which was begun around 1277 and completed in the fifteenth century. It is a prime example of Rhenish Gothic architecture.

As a flourishing city, numerous religious foundations were established in medieval Strasbourg. Many of these have been destroyed completely, or the medieval remains have been considerably modified or restored. The Dominican convent, one of the earliest Dominican establishments in southern Germany, was begun in 1254 but was destroyed in 1870. The churches of St. Aurelia, St. Thomas, and St. Stephen were founded during the Car

olingian period. Parts of these structures dating from the Romanesque and Gothic periods survive. Two churches were dedicated to St. Peter. The most fully preserved, known as St. Pierre-le-Jeune, is a Gothic structure primarily of the fourteenth century. Little of the medieval walls, gates, streets of commerce, and houses of wealthy burghers remain in their original state.

Strasbourg Oaths

Recorded in Nithard's Latin history of the Carolingian civil war (Book 3, Chapter 5), the Strasbourg Oaths were the oaths sworn at the city of Strasbourg in Alsace on February 14, 842, among Louis the German of east Francia (r. 840–876), his (half-)brother Charles the Bald of west Francia (r. 840–877), and their followers. Louis and Charles swore these oaths to reaffirm their fraternal alliance against their elder brother Lothar I (r. 840–855), who had claimed the entire Carolingian Empire for himself on the death of their father, Louis the Pious (r. 814–840). Recorded by Nithard in proto-Romance (*lingua Romana*) and the Rhine-Franconian Germanic dialect (*lingua Teudisca*), the Strasbourg Oaths provide the earliest surviving example of Old French and one of the earliest examples of Old High German. This alliance enabled Louis and Charles to force an equal division of the empire at the Treaty of Verdun in the following year. Because that division gave Louis an east Frankish kingdom and Charles a west Frankish kingdom, scholars in retrospect have interpreted the Strasbourg Oaths as a linguistic and political milestone in the origins of France and Germany.

The Strasbourg Oaths reveal the complexities of aristocratic loyalties and spoken and written communication in Frankish politics. By February 842 the nobility had become weary of civil war. Louis and Charles therefore swore oaths at Strasbourg to reassure their supporters of their fraternal alliance through which they hoped to force permanent concessions out of Lothar. Because Louis and Charles wanted the rank and file of their eastern and western armies to understand their negotiations, they swore not in educated Latin but rather in the vernacular. Before the oaths, Louis and Charles briefly recounted their just grievances against Lothar, with Louis addressing his forces in the German tongue (*lingua Teudisca*) and Charles his forces in a Romance language (*lingua Romana*, i.e., French). Thereupon Louis and Charles swore oaths of mutual help to each other and promised never to enter an alliance with Lothar. This time each swore in the language of his brother's followers—Louis in Romance and Charles in Old High German—thus revealing the kings' facility in both vernacular tongues. Finally Louis's and Charles's supporters swore in their respective vernaculars that they would support their king only as long as he kept his promise to his brother. In this way the eastern and western nobles sought to hold Louis and Charles to their alliance by threatening to withdraw their loyalty if they did not.

Nithard's record of the Strasbourg Oaths functioned as a rhetorical and literary device that reflected his political agenda. Nithard was an illegitimate grandson of Charlemagne who played an active role in the civil war as a politician, counselor, envoy, and warrior. He supported Charles the Bald in the conflict with Lothar, and indeed Charles commissioned him to write his history. By inserting the Germanic and Romance oaths into his Latin history, Nithard sought to convey the political solidarity among the eastern and western nobles that Louis and Charles so desperately hoped to forge at Strasbourg. In reality the linguistic situation was much more complex: as Nithard himself reports, Louis's followers included east Franks, Bavarians, Alemans, and Saxons, and Charles led Bretons and Gascons as well as west Franks. Thus their supporters spoke different dialects and languages, and one therefore cannot take Nithard's record of the oaths as an accurate rendering of the actual words and dialects spoken. Janet Nelson argues that Nithard intended his history to be read aloud at Charles the Bald's court, in which case his vernacular record of the Strasbourg Oaths would have served as a linguistic metaphor for the eastern and western kingdoms that Louis and Charles were striving to create.

[Carolingians](#); [Charlemagne](#); [Lothar I](#); [Louis the Pious](#)

This itinerant poet, known only by his pseudonym, was probably born toward the end of the twelfth century in the Middle German region. A major portion of his life was spent in Austria, where he died about 1250, if the last poems for which reliable dates exist are taken as *terminus post quem*. Clearly not a member of the nobility, he seems to have worked for various audiences and patrons, although none is known to us by name. His oeuvre, consisting of nearly 170 works and spanning a wide variety of genres, attests not only to his versatility and originality but also to his considerable knowledge of theological and legal issues. He is familiar with the works of Hartmann von Aue and Wolfram von Eschenbach. The paucity of information regarding the poet extends to the chronology of his works. While it is generally assumed that his two longer works, *Daniel von dem Blühenden Tal* and *Karl der Große*, are products of his youth, it remains impossible to establish a sequence for *Pfaffe Amis*, various stories of medium length, and his vast output of short narratives consisting of fables, prayers, didactic poems, and a corpus of *Mären* (stories or tales) that constitute his actual claim to fame. *Daniel von dem Blühenden Tal*, consisting of 8,478 verses and transmitted in four extant manuscripts, is a highly original treatment of the Arthurian romance genre. Denounced by earlier scholarship, which viewed Stricker's *novum* of an unproblematic hero and an active, functioning society as a serious misunderstanding of the genre, it is recognized today as the coherent and skillful text that introduced the notion of *ratio* as a means to avoid the pitfalls of human life. The popularity of Stricker's *Karl* is attested to by twenty-four manuscripts and twenty-three fragments. Whether it was written in the wake of the Charlemagne revival or occasioned by the moving of his remains to Aachen in 1215 or by the transport of Charlemagne reliquaries to Zurich in 1233 still must be determined. Although Stricker's primary source was the *Chanson de Roland*, modern scholarship has been reluctant to label the 12,206 verse narrative simply a reworking of his source. Yet, attempts to explain it in its historical context as a political piece aimed at renewing interest in crusading efforts or as confirmation of the Hohenstaufen emperors as legitimate heirs to Charlemagne are inconclusive as well. A comprehensive interpretation remains a desideratum.

Stricker's shorter narratives are transmitted in fifty-three manuscripts and range from 10 to circa 2,500 verses. Counted among the latter are *Die Frauenehre*, Stricker's praise of women, and *Pfaffe Amis*, a cyclical narrative arranged in twelve episodes that castigates the folly of man. The thematic emphasis on *prudencia* and self-knowledge, either as underlying message or overtly stated, extends to many of the shorter works, which range from purely religious to profane, from entertaining to moralizing. Viewed as a whole, the shorter narratives present a canon of values appropriate to men and women and to all social classes.

Stuttgart

The Stuttgart valley had been settled by Celts and Romans, long before the Duke Liudolf first established his mares' meadow (*Stutengarten*) on this site in approximately 950. First mentioned in official documents in 1229, the city became the seat of the counts and dukes of Württemberg in the fourteenth century.

Among the earliest monuments built here is the thirteenth-century Altes Schloss (Old Castle), first designed as a fortress surrounded by water and later renovated in the German Renaissance style. The nearby medieval grain storage house (Fruchtkasten) has fourteenth-century origins.

At the center of the old town is the abbey church of the Holy Cross. The oldest sections of this monument are the lower stories of the south tower, which date to about 1175. In the thirteenth century, the church became the burial place of the counts of Württemberg. By 1347, the High Gothic choir was completed. Hänslin and Aberlin Jörg finally finished the nave of the hall church by 1495.

The exterior of the monument retains fragments of its original fourteenth-century sculpture. Of highest importance in the interior is the tomb of the patron couple Count Ulrich (called *Ulrich mit dem Daumen*, "Ulrich with the thumb") and Agnes von Liegnitz. Their elegant and finely worked effigies date to 1300. The north wall of the nave is ornamented with a number of interesting late medieval reliefs, among them the Annunciation, the Adoration of the Magi, and a very unusual Christ of Mercy (*Schutzmantelchristus*) protecting the pious beneath his cloak.

Aberlin Jörg was also responsible for the construction of the church of St. Leonhard, after 1463. The older choir of the hall church suggests the existence of an earlier church, probably a chapel dedicated to Leonhard. The city's Hospitalkirche (Hospital Church), also built under Jörg, was completed between 1471 and 1493. This threeaisle hall-form structure served as a monastery church from 1473; it was given over to the Dominicans in 1475.

North of the city center, in Stuttgart-Mühlhausen, is the small but important Chapel of St. Vitus, built between 1380 and 1385 under the patronage of the Prague citizen Reinhard von Mühlhausen. Most noteworthy is the chapel's cycle of wall paintings dating to 1428. The legend of St. Vitus is shown in twelve episodes between small interior chapels; the life of the Virgin is depicted over the windows, and a Madonna of Mercy appears on the north wall. Over the choir arch is the Last Judgment.

Succession

The tradition of political succession in medieval Germany was characterized by two seemingly contradictory practices: election and inheritance. The tradition of election was a legacy of ancient Germanic custom from before the period of migrations in the late Roman period. This practice found expression among early Germanic peoples and, especially, among the Franks. The usurpation by Pippin III, the Short, was confirmed by the church but also by election of the Frankish people in 751. The practice of election would emerge throughout the Carolingian period, particularly in the later ninth century and would involve the succession of Arnulf of Carinthia. The act of election was important in the end of the Carolingian line and the rise of the Saxon dynasty. Elections would play a role in the succession of the first of the Saxon kings, Conrad I (911), Henry I (918), and Otto I (936), and would confirm the efforts of Henry to ensure the hereditary succession of his son Otto. The electoral process would, perhaps, be most important when the reigning king died childless, as was the case with Otto III (983–1002), Henry II (1002–1024), Henry V (1056–1106), and Lothar of Supplingburg (1125–1137), or when the reigning family faced great opposition and disgrace, as was the case with the election of Rudolf of Habsburg in 1273. Indeed, election was a powerful tool in the hands of the ruler's opponents, as Henry IV discovered when he faced the election of the duke of Swabia, Rudolf of Rheinfelden as king of Germany in 1077. But just as election could undermine royal and imperial authority, it was used to buttress this authority and secure the nomination of the king's appointed successor, often his son or close family member. Otto the Great, Henry IV, Conrad III, and Frederick I Barbarossa all designated successors whose succession was confirmed by election. The practice of hereditary succession was attempted by many of the same rulers who had been elected and witnessed the election of their sons as successors. Although somewhat of a paradox, the use of elections was a means by which proponents of hereditary succession could confirm the legacy for their sons as successor to the throne. And in the Golden Bull of 1356, the principle and practice of election were confirmed by the emperor, Charles IV, and the great powers, the electors, of the realm. But the terms of this document too would be used to secure the hereditary succession of the Habsburgs. Finally, the succession to the throne was confirmed by the act of coronation and unction by the pope. A practice begun by Pippin at the creation of the Carolingian monarchy and confirmed as the essential act of the ascension to the imperial dignity, coronation would provide divine sanction to the succession to the imperial throne and would be sought after by most rulers of medieval Germany.

Suchenwirt, Peter (fl. 14th c.)

Neither the birth date nor death date is known for this most famous German herald of the fourteenth century. The name Suchenwirt is apparently a professional one derived from *such den wirt* (get the innkeeper); he calls himself *chnappe von den wappen* (page of the weapons, poem 30, ll. 169–189). His name appears in twelve documents from 1377 to 1407, all dealing with his house in Vienna. His name also appears in a eulogy by Hugo von Montfort (1357–1423), who was with him on Duke Albrecht III's Prussian crusade of 1377. Suchenwirt's language, perspective, and sympathies suggest that he was an Austrian. The best source of information about his life is found in his poetry.

There are fifty two poems by Peter Suchenwirt extant in at least thirty three manuscripts. The main manuscript containing Suchenwirt's works, called "A," is in the National Library in Vienna (no. a3045, 503 pages from beginning of fifteenth century). The poems range in length from 57 lines to 1,540 lines. They include a number of different genres: four death laments; eighteen elegies (*Ehrenreden*); eleven historical and political occasional poems; fifteen moral allegories and spiritual didactic poems; four comic poems. The general term *Ehrenrede* was coined by Alois Primisser, Suchenwirt's first editor, and was applied to Suchenwirt's poems honoring famous Austrian nobles. These were poems that followed a strict formula: a formal expression of humility; general praise of the hero; description of hero's specific deeds; repetition of general praise; prayer for intercession of his soul (if the hero was already deceased); description of his coat of arms, both shield and helmet; name of the hero; a short closing prayer.

The subject matter of his political comments is especially enlightening. He discusses the ramifications of a division of property, the political consequences of a tax on wine, and the interrelationships among the classes; these are not generally the subject matter for chronicles or historical songs. Suchenwirt (and a certain Gelre in the Low Lands) are unique in writing *Ehrenreden*. Their poetry places them within a long and illustrious tradition whose origins are in the death lament, the political-historical song, and in the so-called "tournament and siege poetry."

The heroes of the *Ehrenreden* follow similar life patterns with crusades against the heathens in Prussia, pilgrimages to the Holy Land, expeditions into Italy, and in the so-called numerous local campaigns in their homelands.

Sylvester II (ca. 945–1003)

Pope, archbishop of Ravenna, educator. Born circa 945 into a peasant family in the Auvergne, the young Gerbert was befriended by the monks of the monastery St. Gerald of Aurillac and there received his early education. In 967 he journeyed to Catalonia, where he continued his studies, with special attention to the *quadrivium* (four of the seven liberal arts: geometry, astronomy, arithmetic, music). In the early 970s he began teaching at the cathedral school at Reims and became a close associate of Archbishop Adalbero. Emperor Otto II named him abbot of Bobbio in 982, but he returned to Reims in 984 after Otto's death. As a teacher he was a master of the seven liberal arts: both the lower level, or *trivium* (grammar, logic, rhetoric), and the higher level, or *quadrivium*, although he was probably best known for his ability in mathematics, particularly for his great skill with the abacus. His students included Fulbert of Chartres, Richer of Saint-Remi and King Robert II. In 991 Gerbert was selected by Hugh Capet (ca. 940– October 24, 966, Duke of Francia) to be archbishop of Reims but failed to gain papal support because the pope would not accept the deposition of Gerbert's predecessor, Arnulf. In 997 having traveled to the court of Otto III, he became the young emperor's teacher. In 998 Otto named him archbishop of Ravenna, and in 999 he was appointed pope as Sylvester II. He worked closely with the emperor until the latter's death in 1002 in seeking the conversion of eastern Europe. In several ways his papacy prepared the way for ecclesiastical developments later in the century. He was a strong supporter of reform in the church, especially in curbing simony (selling of indulgences) and nicolaitism (opposition to celibacy). He also took much interest in the protection of Jerusalem. After his death in 1003 later historians would recall him as one of the most gifted thinkers of the tenth century, even as a magician who received his inspiration from the diabolical forces he found in Islamic Spain. Thus was remembered the pope of the year 1000.

Sylvester, Trierer

The so-called *Trier Sylvester*, a tale of events from the life of the fourth-century Pope Sylvester, was composed some time after 1150 by an unknown author from the Middle German dialect region. The date of composition is based on the fact that the *Trierer Sylvester* is a reworking of lines 7, 806–10, 400 from the *Kaiserchronik*, which was completed after 1147. At the center of the legend is the relationship between Pope Sylvester and the Emperor Constantine, which results after Sylvester brings Constantine to the Christian faith, baptizes him, and heals him of a disease that has plagued him. Constantine's own worth, too, is clear; he is favored by God because he has abandoned a plan to gain healing by bathing in the blood of sacrificed infants. Through the depiction of a strong partnership between pope and emperor, a number of key institutions of the Middle Ages are given "historical" justification: a Christian Roman Empire, a Rome-based papacy, and the ideal of the Christian warrior and ruler. Also stressed is the superiority of Sylvester's arguments in disproving the validity of other religious systems; the legend has a strong apologetic tone. The Trier version exists only in fragmentary form (manuscript no. 364 in the Trierer Stadtbibliothek) and breaks off before Sylvester is able to confound the arguments of learned unbelievers and thus bring the Empress Helena to the Christian faith.

Synod of Frankfurt (794)

In June 794 Charlemagne presided over an assembly of the great men of the realm and a concurrent synod that included bishops from Francia, Italy, Aquitaine, and Provence, along with Alcuin and two papal legates. Although the assembly's *acta*, or official records, have not survived, a summarizing protocol of fifty-six chapters from the synod shows that the impulse to reform church and society articulated in the *Admonitio generalis* (edict of 789) remained strong. Those general reform measures frame three unusual items.

The synod rejected the adoptionist christology of Felix of Urgel and Elipand of Toledo, according to which Jesus, in his divinity the truly begotten Son of God, was the adoptive Son of God in his humanity. A Frankish council had condemned the teaching in 792 and sent Felix to Rome to recant before the pope. When the error continued to spread in the Spanish March, the prelates gathered at Frankfurt renewed the condemnation and wrote three antiadoptionist tracts. Alcuin probably drafted two of these, a letter of the bishops of Francia, and Charlemagne's letter to Elipand and the Spanish clergy. The third is a treatise written on behalf of the bishops of Italy by Paulinus, patriarch of Aquileia.

Image worship was the other major doctrinal issue the synod considered. The arrival at the Frankish court of the iconodule (supporting icon) *acta* of the Second Council of Nicaea (787) had elicited an exhaustive polemic against image worship known as the *Libri Carolini* (793). By contrast, the bishops at Frankfurt denounced only one statement from the Second Nicaean Council, namely, that images are entitled to the same adoration and service that are given the Trinity. While the condemned statement was a translator's corruption of an unobjectionable original, the synod's aversion to image worship remains. The comparatively subdued response in 794 likely reflects a desire to avoid open disagreement with Pope Hadrian I, who had lately informed Charlemagne of his approval of the doctrine of the Second Nicaean Council, and whose legates at Frankfurt may have been instructed to monitor the discussion of images.

The synod also witnessed the final public act of Duke Tassilo of Bavaria. Despite his oaths of loyalty to the Carolingians, Tassilo's taste for autonomy made him a troublesome vassal. In 787 his flagrant recalcitrance gave Charlemagne cause to depose Tassilo and confine him to a monastery. Tassilo appeared before the synod to renounce his duchy in a definitive way, thereby conferring a certain legitimacy on the Frankish annexation of Bavaria.

Syrlin, Jörg the Elder (1420/1430–1491) and Jörg the Younger (1455–1523)

Father and son were highly successful joiners and masons. Based in Ulm (Baden-Württemberg), they supplied furniture, altars, fountains, and other carvings for towns throughout Swabia and southern Germany. Yet were they also sculptors? The answer to this question ultimately determines the level of their fame. Recent scholarship suggests that most carvings attributed to the pair are by other Ulm sculptors with whom they collaborated. The careers of the Syrlins are relatively well documented. Jörg the Elder signed and dated (1458) an oak lectern with sculpted evangelist symbols now in the Ulmer Museum. More important, his signatures appear on the sedilia (chancel seats, 1468) and elaborate choir stalls (1469–1474) in the Münster cathedral in Ulm. This is the finest extant late Gothic cycle in Germany. It includes ninety nine exquisite oak busts and reliefs of philosophers and sibyls, each distinguished by fine facial characterizations and varied natural poses. Traditionally, scholars ascribed the sculpture and the carpentry to Jörg the Elder, though already in 1910 Georg Dehio challenged this view by arguing that Jörg's signatures and monograms pertain only to his production as a joiner. The sculpture of these and other carvings ascribed to Jörg are quite varied in their styles rather than the work of a single hand. In later fifteenth-century Ulm, it was common for a single master to receive a commission for a complex altarpiece. This artist then engaged a collaborative team of sculptors, joiners and painters. Between 1474 and 1481, Jörg and his colleagues created the Münster's monumental high altar. Although the altar was destroyed on July 20, 1531, during the Protestants' iconoclastic cleansing of the church, Jörg the Elder's intricate presentation drawing (81×231 cm; Stuttgart, Württembergisches Landesmuseum) displays his talents as a designer, notably his adept mastery of architectural ornament. The sculptor of the altar is unknown, though Michel Erhart of Ulm has been suggested.

Jörg the Younger trained with and assisted his father before assuming control of the workshop in early 1482. Under his direction the atelier's production seems to have expanded, though again his role as sculptor is doubtful. Inscriptions and other documentation link him with projects at the Benedictine abbeys of Ochsenhausen, Zweifelten, and Blaubeuren. For Zwiefalten Jörg prepared choir stalls, a sacrament house, and seven altars between 1509 and the dedication of the choir in 1517. He was aided by Christoph Langeisen, an Ulm sculptor. Langeisen was likely just one of several participating sculptors. Little survived the rebuilding of the church in the mid-eighteenth century. Passion reliefs from one of these altars, today in the Württembergisches Landesmuseum in Stuttgart, are attributed to Nikolaus Weckmann (active 1481–1526), another Ulm sculptor to whom the majority of carvings once ascribed to Jörg the Younger are now credited. It appears that the son too was primarily a joiner and contractor. In 1493 his workshop created the elaborate choir stalls at Blaubeuren, which while loosely patterned on those in the Ulm Münster include far fewer sculpted busts.

Jörg the Younger, like his father, excelled as a designer. In 1482 one of the Syrlins completed and signed the Fish Trough fountain opposite the city hall in Ulm. The pair probably collaborated on the project; some scholars believe the showy twisting of the spire relates to other architectural drawings, such as the plan for a new western tower for the Münster, ascribed to the son. The three sandstone sculptures of knights, now in the Ulmer Museum, are by yet another hand.

Tannhäuser, Der (fl. mid–13th c.)

The lyrical works of Tannhäuser, a thirteenth-century traveling singer and composer, are preserved in the famous Zurich Manesse family and Jena manuscripts of courtly love poetry known as *Minnesang*. The name is toponymic, but as several villages are called Tannhausen, the poet's place of origin cannot be determined. We know only that he was for a time at court in Vienna under the patronage of Duke Frederick II. The first song (*Leich*) can be dated to 1245, the sixth to 1264–1266. The language is South German.

The range and quality of the surviving poetry reveal Tannhäuser as a fine poet of great versatility. All three major categories of Middle High German verse are represented: *Minnesang*, *Leich*, and *Sangspruch*. The six *Minnelieder*, preserved in the Manesse manuscript, can be grouped as two summer songs, two winter songs—all relatively conventional—and two *Minne* (courtly love) parodies in which the poet's optimism is obviously misplaced in the face of the impossibility of his lady's absurdly exaggerated demands.

The *Leiche*, likewise in the Manesse manuscript, are probably Tannhäuser's best-known pieces. There are seven, five of them *Tanzleiche*, the earliest such dance songs in German literature. The first is a panegyric on Duke Frederick, and princes and patronage return later in *Leich* 6. *Minne* is a theme in several, and 2 and 3 both contain love stories. The shortest, 7, is a riddle. Recurring motifs are nature, May, and dancing, lending the *Leiche* a consistently jovial tone. The poet delights in references to contemporary narrative literature. A passion for geographical locations is no doubt intended to underscore the vast experience of the traveling singer, though some feel that in *Leich* no. 5 this reaches the level of parody.

There are sixteen *Sangsprüche* in three cycles in the Manesse manuscript and—though authenticity is open to question—a further cycle of four in the Jena manuscript. The principle theme of the Manesse *Sangsprüche* is the experience (and the poverty) of the traveling singer, patronage, and the death of the patron. The Jena cycle is more pious, including prayers of atonement. Other lyrical works attributed to Tannhäuser in Jena, Kolmar, and Wiltener manuscripts are at best of dubious authorship.

Tannhäuser was held in particular esteem in ensuing centuries, his love poetry being celebrated by the *Meistersänger*, who named a melody (*Tannhäuser-ton*) after him and cast him as the thirteenth member at the gathering of the "12 old masters." By contrast, a pious rejection of sexuality underlies the late medieval Tannhäuser legend, in which the poet endangers his soul by his service to Venus but turns to Mary in the end. In the poems *Tannhäuser und Venus* and *Tannhäuser und Frau Welt*, the Minnesinger takes his leave of the goddess despite her allure. The fifteenth-century *Tannhäuser-Ballads* develops this, with Tannhäuser then traveling to Rome to seek absolution. The pope (Urban IV) tells him he can no more be saved than the papal staff can produce life. When the dry stick begins to bud, the pope sends for Tannhäuser, but too late; the poet has returned to Venus and the pope is damned. The most familiar modern version of the legend is Wagner's opera, in which it is merged with the story of the *Wartburgkrieg*.

Tatian

Latin and Old High German "harmony" (or compilation) of the first four books (gospels) of the New Testament, preserved in the monastery library at St. Gall. This text, called "G," is probably a copy made around 840, embracing a translation made about 830, almost surely at Fulda. The Old High German text, arranged side by side with the Latin, is generally a conservative East Franconian of a Fuldian cast. There is some variation among the six scribes, or translators, one of whom also functions as corrector.

Eduard Sievers thought the Old High German text was a translation of the Latin with which it appears, a theory generally subscribed to into the 1960s. But the German text, although closely tied to the Latin, still deviates significantly. Recent research has made Sievers's theory untenable and elevated the importance of the medieval German version.

Tatian himself was a Syriac monk who fashioned a gospel harmony (synopsis) in Greek or Syriac around 170 C.E., which soon found Latin form as well. In the sixth century Bishop Victor of Capua found a Tatian gospel harmony, in either Greek or Latin, that he caused to be translated or copied into Latin. Sievers believed this manuscript ("F"), brought to Fulda, to be the basis of all later Latin gospel harmonies, including "G." But it now seems clear that Latin "G" is independent of "F" and that the German of "G" derives from neither.

Tegernsee

The Benedictine abbey of Tegernsee, strategically situated on Lake Tegern on the road to the Tyrol, is particularly important in the early history of the Middle Ages. By tradition, the first church was founded by Adalbert and Otker in the mid-eighth century. In 805, the church received the relics of St. Quirinus and took the fifth-century Roman martyr as its major patron. The wealthy monastery was prominent in Carolingian affairs but declined after the disastrous Bavarian defeat by the Magyars in 907, and burned in 975. Tegernsee celebrated its second founding in 979 through Abbot Hartwig (978–982) from St. Maximin in Trier. The Gorze Reform continued with Abbot Gozbert (982–1001), student of Ramwold of St. Emmeram in Regensburg. Tegernsee itself sent monks to found the abbey of Sts. Ulrich and Afra in Augsburg in 1015. The reign of Abbot Ellinger (1017–1026, 1032–1041, d. 1056) was marked both by struggle with local vassals and the flourishing of the convent. In 1041 the exterior crypt was consecrated, an architectural form significant in the reformed spiritual practice of Trier. In Tegernsee, the poet Froumond (d. 1012) was active, and *Ruodlieb*, the earliest poetic romance, was written circa 1050. The monk Edemeram is credited as builder of the new church building, consecrated in 1087.

Under Abbot Rupert I, Count of Neuburg (1155–1186), Tegernsee was involved in conflicts between pope and emperor. It was probably Rupert's brother Otto of Rottenbuch who brought to the library a copy of the pro-imperial *Play of Antichrist* (*Tegernseer Antichristsspiel*). To the late twelfth century belong the poetic *Quirinalia* of Metellus and the scholastic works of Werenher. While Tegernsee's privileges were repeatedly confirmed, battles between local vassals laid waste to the monastery in 1208 and 1214, and Tegernsee suffered thirteenth-century declines typical of the Benedictines. The monastery burned in 1410, and the church choir collapsed in 1424.

Under the leadership of Kaspar Aindorffer (1426–1461), protégé of Nicholas of Cusa, Tegernsee emerged as a center of the Melk reform in Bavaria. Ulrich Stöckl, also known as Trunculus, was legate to the Council of Basel from 1432 to 1437 and wrote a valuable account of it, among other poetic works. In 1426 a generous new Gothic choir and sacristy was built, in 1445 a substantial portion of the church was vaulted, and in 1476 the nave was consecrated. Wood-carvers Johannes of Reichenbach and Hans Haldner, and the Master of the Tegernsee *Tabula Magna* created works for the church interior. The church received its baroque appearance in a seventeenth-century remodeling; it was secularized in 1803. Today, Tegernsee's two thousand medieval manuscripts are housed in the State Library in Munich.

Theodoric, Master (fl. ca. 1359–ca. 1381)

During the reign of Holy Roman Emperor Charles IV of Bohemia, this master (also known as Theodoricus of Prague and Zelo) was a principal member of the so-called Bohemian school of painting. Tax records naming Theodoric as the emperor's "master painter" show that he lived in the Hradcany quarter of Prague by 1359 and was deceased by 1381. In a letter dated April 28, 1367, Charles IV thanked Theodoric personally for his "great ingenuity and artistic sense" in the design of the Chapel of the Holy Cross in Karlstein. It is in that chapel that the best example of Theodoric's organization and style of painting is preserved. His panel paintings of bust-length saints cover the walls of the chapel, framed by frescoes in the window recesses of the Annunciation, the Visitation, the Adoration of the Magi, scenes from the life of Mary Magdalene, the Crucifixion, the Entombment, and the Last Judgment; golden vaults embedded with stars span the room. Certainly affected by his predecessor at the Bohemian court, Tommaso da Modena, and his visits to Italy, Theodoric fills out his subjects with solid modeling and naturalistic forms. But his grounding in the art of Bohemia balances these traits with a dark, psychological intensity that gives his holy subjects a massive feel, mirroring their function as protectors of the imperial insignia and crown jewelry housed in the chapel.

Theodulf of Orléans (d. 820/821)

Theodulf, a Visigoth from Spain, came to the court of Charlemagne (r. 768–814) sometime in the 780s, where he became a familiar and central figure in the moral and intellectual reform of Frankish society. He also served Charles's government as a *missus dominicus* (emissary). Appointed bishop of Orléans before 798, he also governed several monasteries. Implicated in the plot against Louis the Pious (814–840), Theodulf was stripped of his offices in 817 and sent into exile in Angers, where he died in 820 or 821. Theodulf was a dedicated pastor and keen-witted intellectual. His poetry provides a lively and detailed window into court life. Principal writer of the *Libri Carolini* (*Book of the Carolingians*), the Carolingian response to Byzantine iconoclasm, Theodulf also revised the text of the Vulgate Bible and composed several theological tracts. His works are important sources for Carolingian religion, art, and intellectual and political life.

Theophanu (ca. 959–991)

Married to Otto II on Easter 972, Theophanu (also Theophano) was crowned empress on the same occasion. The marriage was the result of an alliance between Otto I and the Byzantine Empire. Otto desired a princess of imperial descent (*porphyrogenita*) for his son to help legitimize Ottonian rule. Instead of a *porphyrogenita*, though, he received Theophanu, a noble kinswoman of the Byzantine usurper John Tzimiskes. Contemporary sources agree that she was not the "longed-for princess," but her Greek sophistication and enormous treasure overcame most dissent to the marriage.

Theophanu, almost certainly born in 959, soon exerted a strong influence over Otto II, as can be seen in her sixtysix interventions among Otto II's 317 extant documents. She traveled with him almost continually, even giving birth to her children at monasteries along the royal itinerary, so she could rejoin her husband quickly. She was blamed for Otto II's ill-fated campaign to southern Italy, although it is unlikely she would have favored the Byzantine government after the Macedonian dynasty was restored in 976.

After Otto II's death on December 7, 983, Theophanu at first made no effort to claim the regency for her infant son Otto III. After Duke Henry the Quarrelsome proved his unsuitability for the post by trying to make himself king, though, the twenty-three-year-old Theophanu stepped into the vacuum that had been created. She gained power especially thanks to the efforts of Archbishop Willigis of Mainz, who summoned her from Italy to help protect her son's rights. She then acted as effective sole regent until her death. Although she did not lead troops herself, Theophanu supported the Saxon margraves's campaigns against the Slavs. Even the frequently hostile Quedlinburg annalist gives her credit for restoring political stability after Otto II's defeat at Cotrone, the Slav revolt of 983, and Otto's untimely death. She reestablished alliances with the Danes, Boleslav II of Bohemia, and Mieszko I of Poland through diplomacy, and was also able to maintain loose German control over Italy. In the fall of 989 she was able to visit Rome for business with only a few followers, acting there as "emperor Theophanius," using the masculine form to give her authority since she could not issue documents in the name of the absent Otto III. Much of her authority as regent came from her close alliance with churchmen who often acted as her agents, especially Gerbert of Aurillac and Bishop Notker of Liège.

Contemporaries accused Theophanu of excessive love of luxury and of talkativeness, perhaps a comment on the unusual role she played as a female ruler. Kinder commentators have called her "eloquent." She appears to have been pious, acting as a typical royal widow of the time in her alms and prayers for her husband's soul. She was about thirty years old when she died on June 15, 991, in Nijmegen, leaving a stable realm for her son. She is buried in the monastery of St. Pantaleon, Cologne.

Theophanu, Art

The empress's political power is reflected in two images that depict her as the equal of her husband, Otto II (d. 983): the byzantinizing ivory coronation image in the Musée de Cluny, Paris, and on an ivory plaque preserved in the treasury of the cathedral of Milan.

It is harder to define her cultural impact than her political power. With the exception of her patronage of St. Pantaleon, Cologne, where she was buried, there is little evidence for artistic commissions. However, Theophanu's arrival in the west coincided with the flowering Ottonian art and with an increase in Byzantine stylistic and iconographic influence. Furthermore, the number of tenth-century objects from Byzantium preserved in German collections is markedly greater than those from earlier and later periods. Scholars have thus assumed that Theophanu brought with her to the west a substantial dowry of Constantinopolitan sacred and secular objects, books, and textiles, and that these provided models for and gave impetus to the fledgling Ottonian scriptoria and workshops. Although not a single object has been linked securely to the empress, a series of liturgical furnishings known to have been in the possession of her children may be assumed to have belonged to Theophanu, such as the ivory plaque depicting the Dormition of the Virgin set into the cover of the Munich Gospels of her son, Otto III, for whom she served as regent, (Bayerische Staatsbibliothek, no. Clm. 4453) assembled at Reichenau circa 1000. In addition, Henry II is said to have taken into his possession the personal treasure of Otto III in addition to the imperial insignia which may account for the Byzantine objects he presented to a variety of churches and monasteries during his reign. Thus, while careful analysis indicates that Ottonian visual culture resulted from the synthesis of various traditions and cannot be accurately attributed solely to an influx of Byzantine models in the possession of Theophanu, her indirect influence in the evolution of Ottonian art cannot be doubted.

The best-studied medieval book of instructions on how to do various crafts is the *De diversis artibus*, whose authorship is given on the title pages of the earliest texts to Theophilus Presbyter, possibly a pseudonym for the renowned metalworker Roger of Helmarshausen. Both the earliest manuscripts of the text and the artist have been associated with the early twelfth century. The use of certain terms has identified the text with northern Europe and specifically with the Rhineland.

The text, divided into three books devoted to painting, stained glass, and metalwork, contains recipes for preparing materials and using them to make certain things. Instructions stemming more from myth and folklore than from actual practice of any period and instructions with only the most tenuous relation to medieval practice are combined with very precise instructions that relate to contemporary practice of the twelfth century. So it is likely that the compiler brought together different sources, including the knowledge of twelfth-century artists.

The "prologues" attached to each book in some manuscript versions of the text have been studied to try to determine the purpose of the book. They reveal an understanding of theology related to Benedictine thinking and have suggested a relation to the Benedictine dispute with the Cistercians about the use of art in the liturgy. The importance to the Benedictines of creating and using precious objects in the liturgy may have been defended and enhanced by the setting down of the text. The prologues also contain a passionate defense of the value of the *artes mechanicae* (mechanical arts), reflecting a trend in thinking of the early twelfth century.

The association of the text with Roger of Helmarshausen and with the Benedictine monasteries of Stavelot, St. Pantaleon in Cologne, and Helmarshausen, and the importance of the arts in all three of these monasteries, has suggested these three sites as possible places where the text may have been assembled.

Born into the comital house of Walbeck in eastern Saxony, Thietmar received his primary education at the royal convent of Quedlinburg. In 987, his father transferred him from Quedlinburg to the monastery of Berge, outside of Magdeburg. Thietmar remained at Berge for three years, continuing his education, apparently with the expectation that he would eventually join the community. When a place could not be obtained for him there, he was moved to the cathedral at Magdeburg (November 1, 990). Thietmar studied at the cathedral's school, then among the empire's preeminent centers of learning, and was formally admitted to the chapter circa 1000, during the reign of Archbishop Giselher. Professional advancement came to him during the reign of Giselher's successor, Archbishop Tagino. The archbishop elevated him to the priesthood in 1004 at a ceremony attended by Emperor Henry II, and thereafter he seems to have joined the archbishop's entourage. It was due to Tagino's favor, moreover, that Thietmar was chosen by Henry II to succeed the recently deceased bishop of the see of Merseburg (1008). As Bishop of Merseburg, Thietmar inherited a host of problems deriving from that diocese's troubled history. Emperor Otto I had founded the bishopric in 968, in conjunction with his elevation of Magdeburg to the status of archbishopric. For a variety of reasons, it was suppressed in 981, its property being divided among neighboring dioceses and its cathedral transformed into a proprietary monastery of the archbishops of Magdeburg. Although the diocese was restored by Henry II in 1004, its boundaries and property rights remained a matter of dispute. Thietmar seems to have occupied most of his career in attempts to regain diocesan lands ceded to neighboring dioceses during the period of Merseburg's suppression (i.e., 981–1004). Similar issues led to a long running property dispute with the Saxon ducal house of the Billunger.

Thietmar's chief gift to posterity is his history, the *Chronicon*, which he composed between 1012 and his death in 1018. The work is divided into eight books and survives in two manuscripts at Brussels and Dresden, the latter now available only in the form of a facsimile. The Dresden manuscript is particularly valuable as it was produced under Thietmar's direction and includes corrections and additions made in his own hand. In compiling the *Chronicon*, Thietmar drew heavily at times on the work of other historians, but much of his material is based on his own observations and experiences, especially in the later books. Indeed, for events in the reign of Emperor Henry II, he is often our unique informant. It is generally assumed that Thietmar's original intention was to focus on the history of his diocese. If so, his theme must have rapidly expanded to include the history and deeds of the Ottonian kings, their lineage, and other topics as well. Thietmar was nothing if not opinionated and expressed views on subjects ranging from politics to the (in his opinion) shocking character of contemporary women's fashions. He subjected monastic reform and its advocates to a withering critique and offered negative characterizations of Lotharingians, Bavarians, Italians, and others lacking the good fortune to have been born Saxon. With his detailed commentary on the career of Duke Boleslav Chrobry, Thietmar is one of the most important witnesses for the emergence of the medieval Polish state, and his detailed descriptions of Slavic social customs and religion are some of the earliest on record. Thietmar's testimony is especially valuable for the history of Ottonian policy in the east, German relations with the western Slavs, and the family histories of the east Saxon aristocracy.

An author of spiritual writings, Thomas (Hemerken) à Kempis (also Hamerkein, Malleolus) was born some time between September 29, 1379, and July 24, 1380, at Kempen near Cologne. At the age of thirteen he left for Deventer to attend classes at the chapter's school of the Lebuinus Church. In 1399 he applied for admission to a monastery of the Canons Regular at Zwolle called St. Agnietenberg. This monastery, a daughter-house of Windesheim, was pervaded by the spirit of the *Devotio moderna* (Modern Devotion) movement. After taking the habit in 1406 and after his solemn profession in 1407, Thomas was ordained a priest in 1413 or 1414. He evolved into a prolific transcriber and author of several spiritual writings. From 1425 till 1430 (and in a second term starting in 1433), he performed the task of subprior and combined it with the assignment of a novice master. In this last quality he developed as a musician, preacher, and history teacher. For the job of procurator Thomas turned out to be less suited; he held that office for only one year in 1443. He died on either May 1 or July 24, 1471.

Thomas à Kempis is credited with thirty-one treatises, as well as three cycles of *sermones* (sermons), some *cantica* (catechetical songs), and *epistolae* (letters). Depending on the goal he had in mind or the audience he wanted to reach, he used different genres. He proved to be a pious historian in, e.g. his *Chronicon Montis sanctae Agnetis*. One can discover his qualities as a musician and writer of letters in his *Cantica* and *Epistolae*. His output consists in large part of practical-ascetic works, such as his *Libellus de disciplina claustralium*, *Vita boni monachi*, *Manuale parvulorum*, and *Doctrina iuvenum*.

His famous *De Imitatione Christi* is included in this category as well. This work deserves a wider treatment here, as it is one of the most influential spiritual texts of the late Middle Ages and can be considered the most widely read book in Christianity, with the exception of the Bible. In the centuries-old fight about the authorship of this fifteenth-century treatise, forty serious candidates have been taken into account. Among them Augustin, Bernard, Jan van Ruusbroec, Geert Grote, Joannes Gersen, abbot of Vercelli, Jean Gerson, and, finally, Thomas à Kempis, were the most prominent. On the basis of the excellent linguistic and codicological (manuscript) investigations of L.J.M. Delaissé, it is now generally accepted among scholars that Thomas à Kempis has to be regarded as the author of the four *libelli* (books) that form *De Imitatione Christi*. The first four treatises of Thomas à Kempis's autograph of 1441 (Brussels, Koninklijke Bibliotheek, manuscript no. 5855–5861) form, in this order, books I, II, IV, and III of *De Imitatione Christi*. They have the following incipits (first lines):

1. *Qui sequitur me, non ambulat in tenebris*
2. *Regnum Dei intra vos est dicit Dominus*
3. *De sacramento. Venite ad me omnes qui laboratis*
4. *Audiam quid loquatur in me Dominus Deus*

In other manuscripts and incunabula, treatises I, II, and IV often appear as a unity. If one considers the contents of these works and the titles given by Thomas in his autograph of 1441, this unity is not purely a coincidence. A codex belonging to a monastery of Canons Regular at Nijmegen, now in the Royal Library in Brussels (manuscript no. 22084), makes clear that the four *libelli* of *De Imitatione Christi* already circulated in 1427, fifteen years before Thomas completed his final redaction in the autograph mentioned above.

In treatise I, *Admonitiones ad spiritualem vitam utiles*, Thomas formulates, for beginners in spiritual life, some points of advice concerning a life in silence, prayer, and study. In treatise II, *Admonitiones ad interna trahentes*, Thomas merely describes the mental state that the young religious has to develop to consider prayer as a privileged place where one is able to meet Christ personally instead of a mechanical duty. Treatise III, *De interna consolatione*, is Thomas's personal testimony of his intimate relationship with Christ in daily life of the monastic community. Thomas points out that the life of a person who is looking for God is not without obstacles. He wrote this book, furthermore, to provide consolation. Finally, treatise IV of the *De Imitatio Christi* contains reflections on the Holy Eucharist that are characteristic of the time in which the *Imitatio* was composed but not strictly coordinated with the contents of the first three books. It is especially in these books that Thomas develops the concept of a "journey" for the faithful. Here he first describes the inner disposition from which one can be open to Christ and follow Him in the most appropriate and fruitful way. From studies made after those of Delaissé mentioned above, the conclusion can be drawn that Thomas made the stylistic improvements in the *Imitatio* not because of his love for the beauty of the (Latin) language, the *latinitas*, but for catechetical reasons.

Other treatises, like the *Orationes et meditationes de vita Christi*, have a more theological character. In his *Hortulus rosarum* and *Soliloquium animae*, Thomas shows his gifts as a spiritual writer. All but one of his works were composed in Latin; he wrote a small treatise in Middle Dutch: *Van goeden woerden to horen ende die to spreken*. Finally, he compiled his *sermones* in three coherent cycles.

One can easily conclude that the quantity of scholarly contributions on the sources, style, and theology in Thomas à Kempis's *opera omnia* (complete works) stands in no proportion to the enormous amount of literature devoted to his authorship of the *Imitatio*. The study of his theology is in an early stage; up until now, no attempt has been made at a synthesis. Recent investigation has shown that Thomas's originality lies in his view that the ascetic structuring of life is explained by the mystical longing that Thomas wants to develop in each person. In his theological anthropology, mystical aspirations are exclusively nourished and purified by a realization of the self in an ascetic way of life. Furthermore, his spirituality is strongly Christ-centered.

Thomasîn von Zerclaere (fl. early 12th c.)

Born into an ancient noble family in Cividale in Friulia, northern Italy, around 1185, Thomasîn was a member of the monastic cathedral of Aquileia and so later came into close contact with Wolfer von Erla, the German patriarch of Aquileia known for his patronage of such famous German poets as Walther von der Vogelweide. We might assume that Wolfer commissioned Thomasîn to compose his famous book of courtly etiquette, *Der Welsche Gast* (*The Italian Visitor*), consisting of about 14,800 verses. Thomasîn dated his Middle High German poem by telling us that he wrote it twenty-eight years after the loss of Jerusalem to the Arabs in 1187, that is, in 1215. The intention with his treatise was to improve the desolate state of the German nobility. It is the first German *Hofzucht* (courtly primer) ever written, and this by a nonnative speaker; it addresses young noblemen and -women, teaching them the norms of courtly behavior. Thomasîn also added a general lesson about courtly love that he based on his *Buch von der Höfischeit* (*Book of Courtliness*), which he had previously composed in the Provençal language. In his book the poet emphasizes the value of constancy (*staete*), moderation (*mâze*), law (*reht*), and generosity (*milte*). Thomasîn drew from many different sources but mentions only the *Moralia* by Pope Gregory the Great (d. 604), a highly popular Latin moral treatise. Nevertheless, the text demonstrates Thomasîn's extensive knowledge of theological and secular literature of his time. The poet was clearly opposed to Walther von der Vogelweide's polemics against the pope, warned of the threatening spread of hereticism, and appealed to the German knighthood to embark on a new crusade. For him, knighthood must be subservient to the church and must pursue primarily religious and moral ideals. However, Thomasîn did not hesitate to recommend courtly literature as reading material for young noble people because some of the best-known protagonists in Middle High German literature would provide them with models of ideal behavior. The *Welsche Gast* proved to be an enormously popular didactic treatise and has come down to us in some two dozen manuscripts (thirteen complete, eleven as fragments), of which almost all are illustrated.

Tnugdalus

Around the year 1190, at the urging of three women (Otegebe, Heilke, and Gisel), a priest named Alber composed a Middle High German version of the Latin *Visio Tnugdali* (*Vision of Tnugdalus*, or *Tundalus*), written by a monk Marcus circa 1150. The story is of a certain Tnugdall/Tundalus, an Irish knight who, in the year 1149, lay dead for three days, during which time he traveled to Hell, learned of the various torments to which the damned are subjected, and experienced these in part. In the end he was released from his travails through intercession from Heaven, and returned to his earthly existence. After his experiences he took up the spiritual life and went about calling others to repentance from their sins lest they, too, meet a similar fate. The *Visio* and its vernacular reworkings are important examples of the literary journey to Hell or beyond, a genre that originated in Antiquity and culminated in Dante.

Alber himself cannot be identified with any certainty. He has frequently been placed in the monastery at Windberg (on the Danube east of Regensburg), because two deacons with his name are attested to have died there around 1200. There is also a Windberg (Bavaria) manuscript of the *Visio Tnugdali*, which could well have served as Alber's exemplar. The author says that he rhymed his tale at the behest of a "brother Kuonrat" of Windberg; evidence has been found for the existence of several Conrads in that monastery between 1190 and 1200.

Alber's rendering of the Latin text is reasonably close, though he has added a prologue, an epilogue, and, most interestingly, the story of how St. Patrick converted an Irish king. This tale is also found, in the form used by Alber, in the *Legenda aurea* (Golden Legend) of Jacob of Voragine; a common source for the two has never been identified. Having made these additions, Alber abridged the Latin *Tnugdalus* in a number of places, for the most part by simplifying or omitting passages of theological import. He also omitted an explanation of how pre-Christian Irish heroes received eternal reward by being true to their own pagan religion. Whether this omission was due to Alber's (and his audience's) lack of interest in things Irish or because he chose to sidestep a matter of religious controversy cannot be said.

Alber's style is best described as "didactic"; he frequently addresses his readers in the second person and has added some short passages of a homiletic nature. Though Alber obviously wished to warn his audience of the perils of entering the afterlife unprepared, he did not refrain from a sort of "sensationalism" in his description of Hell's torments and of how the damned suffer, and surely managed in the best medieval sense both to edify and to entertain his readers.

The question of the development of the idea of Purgatory has often occupied scholars of the *Tnugdalus* stories; of the *Visio* (and of Alber), it can probably best be said that the concept of a separate Purgatory is not actually developed, appearing instead as a sort of "higher Hell," though with similar functions.

Alber's *Tnugdalus* is preserved in the Austrian National Library in Vienna (manuscript no. 2696, the *Wiener*, or Viennese, manuscript). An edited text of fragments in the German Middle Franconian dialect is included in Wagner's edition.

Toul

Located at the intersection of important Roman roads, ancient Tullum (Tullum Leucorum) was the main center of the Gallic tribe of Leuci. By the mid-fourth century it had become the seat of a bishopric that eventually became a suffragan (subordinate administrative unit) of Trier. During Merovingian times, Toul was the first major port along the Mosel River from which goods were transported as far as Koblenz and Andernach.

In 925 Toul, together with the rest of Lorraine, became part of the east Frankish realm, and during the early eleventh century its bishops played an important role in the empire. Bishop Bruno of Toul was one of Henry III's favorite churchmen, eventually rising to the office of pope in 1049 as Leo IX.

From late Antiquity a wall surrounded the city within which lay the cathedral St. Stephan (St.-Étienne) and, over time, the monasteries, cloisters, and foundations of St. Vaast, Ste. Geneviève, St. John, and St. Gangolf (St.-Gengoult). To the north of the city lay the great abbey of St. Mansuy, while the monastery of St. Evre lay along the main road to the south. About 1240, the bishop and burghers collaborated in building a new wall that extended protection to the area (particularly west of the old wall) that had grown up during the previous centuries of economic expansion.

Until modern times, viticulture was the most important economic activity for the religious houses and foundations of Toul, the patrician families, and the general population as well. The wealth derived from the wine trade is reflected in the cathedral of St. Stephan, the present interior of which was begun in 1204:321 feet long and 105 feet high, it was a monument to both the piety and the prosperity of the townspeople. The church of St. Gangolf was also expanded; its choir boasts some of the finest thirteenth-century stained glass in eastern France. The west facade of the cathedral was done in the fifteenth century, in the then current flamboyant style.

The same roads that carried trade to and from Toul also facilitated the spread of heretical notions, however, and in 1192 a synod held in Toul condemned the Waldensians. Toul was also infected by the spirit of civic independence that spread across Germany in the thirteenth century. Having been an episcopal city for centuries, it sought liberation from that relationship and, shortly after 1250, we begin to read of conflicts between the bishop and the city, more particularly the leading families.

Toul's proximity to the boundary between the empire and France made it a convenient venue for meetings between monarchs. In 1224, Louis VII of France met with Henry VII for deliberations; and in 1299, Adolf met Philip the Fair near Toul (at Quatrevaux). By the latter year, however, Toul was under French domination. It had ceased to be of much significance as an imperial city since the mid-thirteenth century, and in 1281 the French king took it under his protection; ten years later, the lands of the bishopric of Toul west of the Meuse became French. In 1297, the neighboring bishopric of Metz also came under French control.

Tournaments

Although equestrian military games stretch much further back in time, the three main types of mounted military exercise or sport in medieval Germany are all first recorded in the twelfth century: *buhurt*, joust (*tjost*, *stechen*), and tourney (*turnei*).

The *buhurt* was a group exercise involving the clashing of shields or lance charges. Full armor was not necessary and there was no pursuit of material gain; rather the *buhurt* was a matter of military training, sport, or display. It was often connected with dancing and other pastimes as an expression of aristocratic joy and was a standard accompaniment of marriages, knightings, and other festivities. The *buhurt* faded out after the end of the thirteenth century as more peaceful forms of the *turnei* emerged.

Jousts were mounted combats of two knights attacking with couched lances, a technique that arose in the eleventh century. They are documented in German literature in the twelfth century and in historical sources from the thirteenth century onward. Jousts enjoyed great popularity throughout the Middle Ages as events that were simpler to organize than the mass tournaments. Jousts figure in two basic types—with blunt lances and with sharp lances—these described, respectively, as *stechen* and *rennen* from the fourteenth century onward. Many variations on these types emerged in the late fifteenth century, when the German areas were foremost in Europe in this field. The books commissioned by Emperor Maximilian I, and other sources, document this variety pictorially. Jousting had strong fictional connections, and knights jousted at times in imitation of characters from Arthurian literature.

The tourney arose in the late eleventh century in France, whence it spread through the rest of Europe, the term first appearing in Germany in the mid-twelfth century. The early tourneys were still close to feud warfare in style. They were prearranged mass encounters in which the participants fought in groups, wearing full battle armor and using lance and sword to take captives who had to buy themselves free. The combatants were usually accompanied by auxiliary squires, who helped particularly in seizing the horses of unseated knights as booty. The events were held on large tracts of open ground, often between two places, or outside a town. Injuries, even fatalities were frequent, and material gain was an important motive. This early tourney was far more bellicose than the *buhurt* and was condemned by the church throughout Christendom. Stronger regulatory tendencies then appeared during the thirteenth century (equal numbers on both sides, the exclusion of or tighter control over auxiliaries, the use of blunt weapons), and new, less bellicose forms of the tournament emerged, notably the "Round Table," which involved jousts with blunt lances. These developments led to the revocation of the papal ban on tourneying in 1316, and they allowed tournaments to become an adornment of aristocratic festivities. They were now commonly held in enclosed spaces in towns, with specially constructed seating for spectators.

After a transitional period in the fourteenth century, the fifteenth century brought a resurgence of interest in the tournament, which had by that time undergone important changes of form and function. The tournaments of the fifteenth century were demonstrations of aristocratic solidarity in a time of social change, and they employed equipment quite different from that of real warfare: maces (*Kolben*) as weapons, and special light armor. Entry to the tournament was now dependent on proof of noble ancestry, and participants who had offended against the honor of the nobility were to be punished by receiving a thrashing. These new measures were codified in detailed ordinances that were agreed by committees representing the nobility of the "Four Lands"—Bavaria, Swabia, Franconia and the Rhinelands (texts of the ordinances in the *Turnierbuch*, "Tournament Book," of Ludwig von Eyb). The tournaments of the Four Lands were large operations involving hundreds of participants and their families. They mark a late and critical phase in the independence of the German nobility. The last such event was held at Worms in 1487. Tournaments continued to be held, and to change in form, during the sixteenth century and beyond, but they were now tied to the courts of rulers, and they were carefully stage-managed affairs, as demonstrations of the power of the ruler in the early modern state.

Town Planning and Urbanism

The early Middle Ages in Germany (ca. 500–1050) are marked by both the disintegration of the urban fabric inherited from Roman antiquity and the emergence of new forms of settlement that would develop into the cities of the High Middle Ages. While fortified settlements are known to have existed in Germanic territories during the Roman period, the major urban centers on German soil were those founded by the Romans west of the Rhine and south of the Danube (Xanten, Cologne, Bonn, Mainz, Worms, Trier, Augsburg, Regensburg, Salzburg, etc.). With the collapse of the administrative infrastructure of the Roman Empire and the depopulation of these provincial Roman centers, de facto municipal leadership was assumed in large measure by the church, both politically and architecturally. In the Merovingian period, settlements grew up around cathedrals or saints' burial churches, sometimes within the area of the old Roman *civitates* (cities) and *castella* (forts), as at Cologne, Mainz,

Rolthenburg ob der Tauber, Markusturm. Photograph: Joan A. Holladay

and Trier, and sometimes outside them, as at Xanten and Bonn; in some cases parts of the original Roman walls and street system were preserved (e.g., Cologne). In addition to the old Roman cities, the bishoprics, abbeys, and palaces established under the Carolingian and Ottonian emperors (Aachen, Ingelheim, Paderborn, Münster, Hamburg, Hildesheim, Bamberg, Magdeburg, Quedlinburg, Goslar, and others), often endowed with special market privileges, served as the germ for new settlements. Structurally, these protocities consisted of one or more smaller fortified complexes (cathedral, palace, monasteries, and convents) with craft and trade settlements (*suburbia*) developing outside and along the roads leading to the main centers; the *suburbia* themselves might or might not be fortified. In the eighth and ninth centuries a number of semi-independent trade settlements (*wiks*) also flourished along the North and Baltic seacoasts (Dorestad, Haithabu).

The twelfth and thirteenth centuries represent the great age of urban expansion in medieval Germany. From the late eleventh century on, inhabitants of existing settlements, above all merchants and craftsmen, won increasing political and economic independence from bishops and feudal overlords. At the same time, kings and other nobles founded and built numerous new towns with charters granting rights and freedoms to the inhabitants; examples of the latter include towns founded by the dukes of Zähringen in southwestern Germany and Switzerland (Freiburg im Breisgau, Bern, Villingen, and others) and by Henry the Lion in the north (Braunschweig, Lübeck, Schwerin), as well as the Hanseatic merchant cities and foundations of the Teutonic Order in the east (Rostock, Stralsund, Prenzlau, Stettin, Danzig, etc.). In this way the city acquired a status as a separate legal entity with political and economic privileges for its citizens, including freedom from servitude; at the same time, such privileges were bound to the clearly demarcated space within the city walls (hence the proverb *Stadtluft macht frei*, "city air sets free"). Thus the significance of the walls built everywhere in the eleventh and twelfth centuries lies not only in their practical function as a means of defense but also in their role as symbol and marker of a political and economic sphere qualitatively distinct from that of the surrounding countryside.

The city wall often served to unite two or more settlements into a single urban area (Braunschweig, Hildesheim) or, reflecting an increase in population and prosperity, to enlarge the total area of the city and incorporate new districts (Nördlingen). In new or extended towns, the urban area was articulated by street systems ranging from a single central artery with alleys branching off (Neuenburg am Rhein, Friedberg), to two or more parallel avenues crossed by a ladderlike series of shorter streets (Bern, Lübeck), to a more or less regular grid plan (Hann, Münden, Neubrandenburg, Breslau). The transition from barter to money economy, central to the growth and proliferation of towns, is reflected in the emergence of the market street or square—an open space furnished with temporary booths or a permanent hall for the sale of produce and wares from town and countryside as well as commodities brought in from greater distances. Such markets, subject to special municipal tolls, were usually located along the main artery or at the intersection of principal streets.

The fully developed city of the High and late Middle Ages was characterized by a high degree of topographic differentiation, with districts and architectural forms manifesting the variety of social networks in which the lives of individual citizens were embedded. Ecclesiastical and secular overlords maintained an architectural presence in cathedrals and fortresses, although the growing economic and political power of the townspeople sometimes resulted in greater citizen participation in the building and decoration of cathedrals or in the acquisition and demolition of the local castle. Family life and occupation centered around the private house, typically a wooden structure on a narrow rectangular parcel; in the later Middle Ages, houses of the patrician class were increasingly built of stone or brick. Houses and workshops of certain professions were often grouped together in the same district according to the topographical requirements of the trade; tanneries, mills, and dyeworks, for example, were often found on the urban periphery, as were hospitals and the cloisters of the mendicant orders. Ethnic groups of varying origins likewise concentrated in distinct quarters (Jews, but also Frisians and other foreign tradesmen). The civic consciousness of the citizenry found architectural expression in the town hall (*Rathaus*), most often located on the market square and equipped with spaces for council meetings, law courts, archives, state receptions, and dancing, as well as in the often elaborate parish churches and houses of the guilds and religious confraternities.

Trier

The Romans founded the city of Trier during Caesar Augustus's reign. They gave it the unusual name of Augusta Treverorum, after a local Celtic tribe, the Treveri. The Romans at first took advantage of its useful location on the Mosel River, across which they soon built a stone bridge to provision the Roman military outposts along the Rhine. The city soon grew into a major center of trade and imperial administration, becoming a provincial capital. At its height, its population probably exceeded sixty thousand, surpassing most of the cities of northern Gaul. A brief decline followed the Roman Empire's troubles of the third century, probably including a sacking by the Alamans in 276. Some of the city walls and the famous Porta Nigra (Black Gate) commemorate this period. Shortly thereafter the city experienced a new revival under Constantius Chlorus and his son, Constantine. Emperor Constantine especially promoted the city as one of his residences, for which he had built his famous basilica and baths.

By the end of the fourth century, with the destabilization of the Roman Empire, Trier had lost its important status. At the beginning of the fifth century invading Germans began to sack the city repeatedly. The Ripuarian Franks finally absorbed the city into their realm by the end of the century. While much of Trier lay in ruins and its population had been reduced to a few thousand, some importance was preserved because the city was the seat of a bishop. Indeed, the bishops of Trier would lead the slow revival of the city's fortunes, and not just as religious prelates. They soon became political rulers, namely prince-bishops. They would turn the desolate city into the capital of a middle-sized political territory spreading from the lower Moselle across the Rhine and along the lower Lahn Rivers.

The bishops necessarily took on civic leadership because of the chaos created by the Germanic invasions. Soon they began to cooperate with the Frankish kings, who often used the episcopacy as part of their methods of government. By the eighth century, the bishops exercised broad authority in the city and its surroundings. Yet the election of Frankish nobles as bishops also meant the prelates became more secularized, sometimes scandalously leading a noble lifestyle of hunting and warfare. In reaction, the Carolingians trimmed back some of the

Trier, Church of Our Lady, west portal: Adoration of the Magi and Presentation in the Temple. *Photograph: Joan A.Holladay*

bishops' political power to reemphasize the spiritual office. Charlemagne transferred the royal ban and rights to mint money to a local count. At the same time, Charlemagne likewise preserved the bishops' preeminent position in the region, especially in a reorganization of the church hierarchy. Shortly before 800 the prelates were elevated to be metropolitan archbishops with suffragans (representatives) in Metz, Toul, and Verdun.

In the wake of late Carolingian civil wars and invasions by Vikings (who sacked Trier in 882), effective royal authority waned. Again the archbishops slowly rebuilt the city and reasserted their governance over the surrounding area. By the tenth century the patronage of the kings of the Ottonian and Salian dynasties became especially helpful. Emperor Otto I, for example, confirmed or added to their immunity protection, their freedom from tolls, and their possession of a large forest and monasteries. Other kings gave them more forests, minting rights, market privileges for the city of Trier, and even the surrounding counties. The grant of Coblenz in 1018 was very important for the future. Forming a bridgehead on the Rhine, it provided a motive for the archbishops to connect that city with Trier along the Moselle and through the Eifel and Himsrück hills to the north and south. By the mid-eleventh century, the archbishops of Trier had become a major political force in the Rhineland.

The Investiture Controversy opened up a period of disturbances as pope and emperor tried to assert control over the bishops throughout the empire. Gradually the archbishops of Trier increased their independence from the king as they tried to preserve and defend order in their diocese. At the same time they faced increasing competition from local dynasts, like the counts Palatine by the Rhine or the counts of Luxembourg, to name the most powerful, who were trying to consolidate their own territorial rule. Meanwhile, the bishops had been increasingly using ministerials, or servile knights for their local administration. Many of these, however, soon began to act like free nobles and sought their own interests before those of their master, the archbishop. At the beginning of Archbishop Alber of Montreuil's reign (1131–1152), the burggrave of Trier had taken political and economic leadership from the previous weak prelates: he commanded the soldiery and controlled the revenues. Alber reclaimed the archbishop's paramount position, reducing Ludwig to the status of servant. Additionally, in a seven-year war over the substantial properties of the abbey of St. Maximin by Trier, Alber also excluded the abbey's advocates, the counts of Luxembourg, from the area around the city.

Tension also began to increase between the archbishop and the citizens of Trier, who increasingly sought to form their own government. In 1157, residents of Trier formed a sworn conspiracy to organize communal government, independent of the prelate. Archbishop Hillin briefly suppressed the movement with the aid of a judgment by Emperor Frederick Barbarossa. Then, while Hillin was on a military campaign in Italy during 1161, the movement revived, this time with the cooperation of Conrad von Staufen, the count Palatine by the Rhine and half brother of Emperor Frederick. Fortunately for the archbishop, once again the emperor reinforced the archbishop's regime.

By the mid-thirteenth century not only the citizens of the towns but also the cathedral chapter began to demand a greater share in political rule. The cathedral chapter's membership was largely drawn from the nobility of the countryside. By the end of the century the chapter was demanding capitulations from candidates before election to archiepiscopal office. These capitulations tended to guarantee more and more power to the canons, limiting the political choices of the archbishops. By the late Middle Ages regional nobles would often join forces with their relatives in the chapter and the city leaders of Trier. Eventually they were able to establish a corporate system where the archbishop shared some power with the estates.

In the late Middle Ages, the most effective of Trier's rulers was Baldwin von Luxembourg (1307–1354), ironically, a member of an old rival noble family. He opposed his own relatives, the counts of Luxembourg, while constructing a more effective archiepiscopal government. First, he checked the local nobility through force (sieges and battles) and the enforcement of laws. He reformed the chancery, both reviewing old and producing new documents. Second, he expanded the territory through purchase, trade, and feudal contracts. Third, Baldwin augmented archiepiscopal power through royal privileges. The most famous, the Golden Bull of 1356, granted by his nephew Charles IV, assured the archbishop's preeminence in the empire as one of

the electoral princes and tightened his control over cities like Trier and Coblenz. From this foundation regional dynasts would never again be able to threaten the core of archiepiscopal rule.

Schisms inflicted by divided cathedral canons did, however, damage the territory's political development. One of the worst occurred in 1430 as one faction elected Jacob von Sierck and another voted for Ulrich von Manderscheid; subsequently the pope rejected both and provided Hraban von Helmstätt, who was already prince-bishop of Speyer. Ulrich and his supporters not only took up arms, they appealed to the Council of Basel. The soon-to-be-famous humanist Nicholas of Cusa went to argue Ulrich's case, even though the prelate was less than the best role model (by the time of his death, he had four natural children). Although the council supported the papal candidate, Hraban of Speyer, Ulrich fought on, financing his efforts by mortgaging the precious rights, privileges, and key places of the territory and diocese. The schism ended with Ulrich's death in Italy in 1437. The territory took decades to recover from this civil war.

And at the end of the Middle Ages, the city of Trier made one last attempt at achieving the status of a free imperial city independent of the archbishop's authority. But the Imperial Chamber Court decided once and for all in favor of the archbishop in 1580. Surviving the famous rebellion of Franz von Sickingen (1522–1523) and the Reformation intact, the Electoral Principality of Trier remained a not insignificant player in German politics. Only the wars of the French Revolution, as they demolished the Holy Roman Empire, likewise destroyed the temporal rule of the archbishops of Trier.

The city of Trier lies nestled between the hills of the Moselle River valley. After the Romans under Augustus conquered the Treveri, the Gallic tribe that inhabited the region, the town was founded as an administrative center and became prosperous through active viticulture and craft industries. With its position on the Moselle and the construction of a bridge over the river, Trier also became an important trading center. The city was laid out in a grid pattern, with the streets *cardo* and *decumanus*, named after thoroughfares in Rome, set along the north-south and east-west axes and a large complex of public buildings in the center of the city. Numerous Roman monuments, many reused throughout the Middle Ages, testify to Trier's prosperity and importance. Following the reorganization of the Roman Empire under Diocletian in the late third century, Trier became the capital of Constantius Chlorus. An important mint was established and numerous new buildings were constructed, including the basilica of Constantine, the imperial baths, and the Porta Nigra (Black Gate).

With the Christianization of the empire, Trier became one of the early centers of the church. Ambrose was educated in Trier, and Augustine and Martin visited the city. Trier's topography was transformed by the construction of churches, mainly outside the city walls in the cemeteries that the Christians had used in the third and fourth centuries. These include the churches of St. Eucharius (later St. Matthias), St. John the Evangelist (later St. Maximin), and St. Paul. A huge double cathedral was founded in the northern quarter of the city.

Trier continued to be an important center throughout the Middle Ages. Its archbishop, along with those of Cologne and Mainz, was influential in the affairs of the church and the Holy Roman Empire and served as elector. Trier was a major center of artistic production, especially during the Ottonian dynasty under Archbishop Egbert (r. 977–993). During this time the archbishops of Trier were particularly active in establishing their position that Trier was the primary church of Germany as a result of its foundation by St. Eucharius, a disciple of St. Peter who had personally sent the bishop north along with his staff. A number of important relics are attested in Trier during the Middle Ages, including the robe of Christ and a nail from the crucifixion, the body of St. Matthew, and the staff that St. Peter gave Eucharius.

Later medieval sources state that the first cathedral of Trier was built on the grounds of the imperial palace at the instigation of Helena, mother of Constantine. Excavations following World War II revealed the remains of a luxurious residence under the cathedral and suggested that the first building was indeed constructed during the reign of Constantine. This cathedral, whose plan is imperfectly understood, had a long nave preceded by a second basilica hall and possibly atrium, with a total length of about 210 meters. A second, narrower building lay parallel to the south under the present-day Liebfrauenkirche (Church of the Virgin), and a baptistery lay between the two buildings. The dedications of the churches are unknown. The east end of the cathedral was reworked during the middle of the fourth century with a twelve-sided structure. During the last third of the fourth century the entire east end of the cathedral was rebuilt as a large, square building with corner towers and a lantern; the walls of this building still serve as the lower stories of the side walls of the present building.

The cathedral was destroyed in 451 in the attack of the Huns and reconstructed under Bishop Nicetius (r. 525-ca. 566). During the Carolingian period the sanctuary of the cathedral was remodeled, but the building was again destroyed in 882, this time by the Normans. Reconstruction of the east end, still seen in the cruciform piers flanking the lower choir, did not begin until the tenth century under Archbishop Egbert (r. 977–993), but the complete restoration of the cathedral did not take place until the eleventh century. Under Archbishop Poppo (r. 1016–1047) the present western end of the church was constructed, giving the cathedral a doubleapse plan and creating an early example of Rhenish Romanesque architecture. A new eastern choir similar in form to the earlier choirs of St. Simeon in Trier and the cathedral of Verdun was added to the cathedral under Hillin (r. 1152–1169) and dedicated in 1196. By the early thirteenth century the entire church was vaulted.

The Liebfrauenkirche stands over the foundations of a fourth-century basilica church that lay parallel to the cathedral and was attached to it by a baptistery and connecting structure. It is possible that this was a church for catechumens, who would then be initiated and taken to the cathedral. The close liturgical and functional relationship of this church to the main cathedral can be seen in its reconstruction under Nicetius following destruction in 451. Its sanctuary was also reorganized during the Carolingian period in a plan similar to the cathedral. Following the destruction in 882, the church was rebuilt before the cathedral in the early tenth century, and had a cloister built at its east end. This Ottonian building remained relatively unchanged during the many phases of the cathedral's reconstruction, but the building was razed and a new Gothic structure was begun in the 1230s. This building is related in style and form to the church of St. Elizabeth in Marburg, but is unusual among Gothic buildings in having a centralized plan. The location of doors on the four axes of the church show that it continued to function with the cathedral in processional liturgy, but the building takes on a more independent character from this point.

The Benedictine abbey of St. Maximin was important in the Gorze reform movement of the tenth century. Excavations have produced the remains of a painted crypt that is a valuable example of late Carolingian and Ottonian mural painting. The crypt was dedicated in 952 and is an example of an outer crypt, a structure projecting beyond the walls of the apse of the church. This was not an uncommon type in Lotharingia.

Between 1147 and 1160 Provost Albero added a choir to the east end of one of the Roman city gates, the Porta Nigra. The church commemorated St. Simeon, the Greek monk from Sicily who came to Trier following the pilgrimage of Archbishop Poppo to the Holy Land and took up residence in the ruins of the Porta Nigra until his death in 1035. In 1042 Poppo had established a chapter of canons and dedicated the building to Christ, Mary, and Simeon. The new Romanesque choir had two floors, one for the laity and one for the canons above. A crypt below held the bodies of Poppo and Simeon. In form it develops the type found in the choir of Verdun that was consecrated in 1147 and precedes the building of the east choir of the cathedral.

Trier was an important center for art production during the Middle Ages, particularly in the tenth and eleventh centuries. The Codex Egberti was probably produced in Trier utilizing monks from Reichenau as scribes, although this is disputed. This work and others have been attributed to the Master of the Registrum Gregorii, who was active in Trier during the last quarter of the tenth century. A variety of reliquaries produced by Trier workshops included those for the nail of the cross, the sandal of St. Andrew, and the staff of St. Peter.

Ulenspiegel

The hero of a large number of facetious, scatological, and social-critical narratives collected in a jest book perhaps composed by the Brunswick toll collector Hermen Bote (ca. 1463–ca. 1520), *Ulenspiegel* (literally, owl's mirror) was one of the most popular and entertaining texts all over Europe from the late Middle Ages until today and has been one of the most influential German contributions to world literature. The earliest printed version dates from 1510/1511 (Strasbourg); later versions were printed in 1515, 1519, and 1531. In the sixteenth century alone at least twenty-eight printed versions appeared in Germany, not counting the considerable number of translations in all major European languages. According to the 1510/1511 edition, the original text was written in 1500; later versions date the text as early as 1483. Apparently a Low German copy was used by the Strasbourg printer that seems to be lost today. The general appeal of these narratives did not decline until the late seventeenth century, but they regained in literary status again since the middle of the nineteenth century (reprint of the 1519 version in 1854 by J.M.Lappenberg).

The collection comprises a prologue and ninety-six *histori* (tales); later versions added up to nine more *histori*. The text is written in early New High German, reflecting some influences of Low German dialects.

Ulenspiegel is known as a historical personality from the first half of the fourteenth century who became famous for his jests and skill in fooling others in a rather outrageous manner. Since 1350, when he was supposed to have died, a rich oral tradition kept his memory alive, until Hermen Bote (or somebody else) copied them down in 1500. The tales, each of them a relatively independent narrative, all taken together describe the life of the protagonist who plays tricks with members of all social classes and with men and women alike. Many of his jokes are based on scatology; many rely on linguistic puns and reveal the ambivalence of everyday-life metaphorical speech. In some tales Ulenspiegel ridicules the urban intelligentsia, in others the clergy, innkeepers, merchants, and craftsmen. Nobody is spared, not even the protagonist himself. Whereas his most drastic form of criticism relies on the body's anal functions, no references to sexuality or erotic elements can be found throughout the book. The allegedly "bawdy" character of these tales did not diminish their popularity, which explains in part the generic label *Volksbuch* (chapbook), coined in 1807 by Joseph Görres.

Throughout the sixteenth and seventeenth centuries *Ulenspiegel* was heavily criticized by theologians, philosophers, and public administrators of all colors, but the general demand for these entertaining tales could not be suppressed. We know of more than 250 poems and other texts written between the sixteenth and the late twentieth century in which Ulenspiegel comes to life again, not counting the vast number of *Eulenspiegel* children's books enjoying a vast popularity even in the late 1990s. Richard Strauss composed a symphony with the title *Till Eulenspiegel* in 1895.

Ulm

Situated in Swabia along the Danube River, Ulm slowly developed into one of Germany's foremost mercantile centers. Its name is first recorded in 854 when a Carolingian palace was located on the Weinhofberg. Few vestiges remain from either this period or from the late eleventh century, when Ulm served as a Hohenstaufen residence. The town obtained its civic rights in 1164 and in 1274 was elevated to an imperial free city. Buoyed by its prosperous economy, notably its textile industry, and its growing regional importance, Ulm quadrupled its circumference when it expanded its city walls between 1316 and 1335. Supplemental fortifications were added around 1527 and again in 1616. At its apex during the later fourteenth and fifteenth centuries, Ulm boasted a splendid city hall, the largest parish church in southern Germany, ten other churches, thirty-one chapels, eleven independent cloisters, and ten town residences for other regional monasteries. Ulm controlled more territory than any other imperial free city except Nuremberg. Between 1397 and 1548 representatives of the seventeen guilds shared political power with a slightly smaller group of patricians, thus guaranteeing guilds a leading role in running the city. Ulm supported a sizable community of artists who in many cases exerted considerable regional influence. The painters and sculptors belonged to the Large Shopkeepers' Guild yet since 1402 had their own brotherhood of St. Luke with a chapel in the former Wengen cloister church.

The Münster, dedicated to the Virgin Mary, dominates Ulm's skyline. In the aftermath of an imperial siege

Ulm, cathedral, interior, nave, view to east. Photograph: Virginia Jansen

in 1376, when access to their parish church proved difficult, the council decided to erect a new church on a more secure site. The new building, constructed between 1377 and 1531, matched Ulm's own ambitiousness. In his civic encomium, written in 1488, the Dominican Felix Faber stressed that this remarkable church was funded solely by the citizens, and that its remarkable scale surpassed any other German parish church. Indeed the Münster, with exterior dimensions of 139×59 meters, rivals in size the cathedrals of Cologne and Vienna. In a stone relief commemorating the laying of the foundation stone in 1377, Bürgermeister (mayor) Lutz Krafft and his wife set a model of the church on the architect's back. The original plans were formulated by Heinrich (fl. 1377–1387), Michael (fl. 1387), and Heinrich the Younger (1387–1392) Parler, a branch of the famed family of architects and sculptors who hailed from Schwäbisch Gmünd. Either Heinrich the Younger or, more likely, his successor, Ulrich von Ensingen (fl. 1392–1419), transformed the initial hall church design into a basilica plan with the addition of a second pair of aisles, a different configuration for the choir, and the introduction of a single massive western tower. Although the church was dedicated in 1405, work continued until 1531. Then measuring 70 meters, the tower would attain its full height of 161 meters and appearance, carefully following von Ensingen's original plan (Ulm, Stadtarchiv), only when construction resumed in 1856–1890. The two smaller towers by the choir were built in 1875–1880.

From the late fourteenth to the early sixteenth centuries, local families and civic groups lavishly decorated the Münster. The church had fifty-two altars, each ornamented with a statue or an altarpiece. Unfortunately, virtually nothing survives of this patrimony since on June 19, 1531, the church was "purified" by order of the Protestant-dominated city council. As followers of Huldrych Zwingli, who held most religious art to be idolatrous, they purged all the altars, the large statues lining the nave, and selected other objects. Only the Hutz Altar from 1521 with its painted wings by Martin Schaffner and its corpus statues attributed to Niklaus Weckmann survived. It had been removed just before the iconoclasm and now serves as the high altar. Because the council so tightly controlled the occasion and specified precisely which works were not to be touched, the Münster still retains much of its original embellishments. Each of the five western portals are ornamented with sculpture, much of it produced in the 1350s for the old parish church and transferred by the end of the century. Most of the Genesis cycle in the tympanum above the main doorway dates before 1391 and reflects the Prague Parler school style. None of the surrounding statues of Mary and saints matches the evocative power and heightened realism of Hans Multscher's life-size Man of Sorrows (1429), who displays his wounds to all who enter through the central portal.

Faber praised the Münster's interior light that provided both illumination and spiritual mood. He doubtlessly responded to the beauty of the church's cycle of stained glass windows. Best preserved are the windows of the choir, which include four (1385–1404) by the noted Ulm glazer Jakob Acker plus another pair (ca. 1480) by Peter Hemmel von Andlau of Strasbourg. The adjacent Besserer chapel contains the five exquisite windows (ca. 1430) by Hans Acker. The iconoclasts spared Jörg Syrlin the Elder's set of choir stalls (1468–1474), Germany's most famous and most extensive cycle from this period. Complementing Syrlin's skilled carpentry are ninety-nine freestanding and relief busts of philosophers (north side) and sibyls (south side) by several local sculptors. Particularly impressive are the lifelike busts and varied poses of figures such as Ptolemy, Seneca, and Virgil. The eastern wall of the crossing is covered by the monumental Last Judgment fresco from 1471 (145 m²). Below, at the northern entrance to the choir, stands the 26-meter-tall sacrament house (1467–1471) with its sculpted statues of prophets. These have been unconvincingly attributed to Jörg Syrlin the Elder and Michel Erhart but are likely by a different Ulm workshop. When the iconoclasts removed the statues lining the nave and inner aisles, they left twenty-nine of the original figural consoles fashioned by artists in the Parler workshop between 1383 and 1391; these included several naturalistically painted female busts whose hair metamorphosizes into foliate supports.

None of Ulm's medieval churches, other than the Münster, survives intact. The city's embrace of Protestantism obviated the need for monasteries; the Trinity church and former Wengen cloister were altered later, in keeping with changes in tastes; and the 1944 bombings of Ulm obliterated most of the medieval city. The marketplace before the Münster originally contained a large *Ólberg* (Mount of Olives group) designed by Matthäus Böblinger in 1474 and erected in 1514. The architectural canopy covered life-size statues of Christ in prayer on the Mount of Olives with twelve apostles; the figures were removed in 1534 to discourage their use by Catholics. South of the Münster stands Ulm's city hall. Much of the structure dates to the 1360s, with major alterations of the east wing around 1420. Hans Multscher and others carved the figures of Charlemagne, the imperial electors, and their standard bearers

that adorned the eastern show window. Facing the south side of the city hall stands the Fish Trough Fountain from 1482, designed by the Syrlin workshop, perhaps by Jörg the Younger. The fountain's three sandstone knights together with the city hall statues and remnants of the *Ölberg* are today in the Ulmer Museum.

For over a century Ulm was Swabia's major economic and artistic center. By the end of the fifteenth century it was surpassed by Augsburg and never regained its prominence.

Ulrich von Etzenbach (fl. 2d half of the 13th c.)

A German author who contributed to the emerging German culture at the Bohemian court in Prague of the House of the Premysl. He began writing his *Alexander* romance around 1270 under the patronage of King Ottokar, and completed it in 1286 under King Wenzel II, Ottokar's son. The legendary romance *Wilhelm von Wenden* was written around 1290, whereas the date of Ulrich's *Herzog Ernst* version D (attribution uncertain) cannot be confirmed.

We do not know much about Ulrich apart from what he mentions about himself in his works. He was born in Northern Bohemia (*Alexander*, vv. 27627f.) and acquired a solid education, though he probably did not become a cleric. His knowledge of Latin was very good, and so his familiarity with "classical" Middle High German literature, to which he refers often.

The *Alexander*, which has been preserved in six manuscripts and several fragments, deals with the famous history of the Macedonian ruler Alexander the Great and follows his conquest of the Persian Empire and all the lands extending to the river Indus. The text is based primarily on the Latin epic poem *Alexandreis* (thirteenth century), composed in hexametric verse by Walther of Châtillon, but then also on the *Nativitas et victoriae Alexandri Magni regis* (*Birth and Victories of Alexander the Great King*, ca. 950–970) by the Archpriest Leo (which again was based on the tenth-century *Historia preliis*).

For both Walther and Ulrich, Alexander's victories laid the foundation for the third of four secular empires that would, according to biblical traditions, come and go before Christ's return and the Day of Judgment. For religious reasons Alexander's activities are cleansed from any negative elements as in the older tradition; even murderous slaughter and killing of enemy troops are exculpated. Moreover, the important aspects of Alexander's curiosity leading to his exploration of the world (dive into the sea in a glass bubble; flight in the air with the help of griffins) are eliminated as well, because he is seen as God's instrument and made to an ideal ruler in the tradition of the *Fürstenspiegel* (didactic texts for princes). In many respects, Alexander is modeled after Ottokar II, whom Ulrich wanted to idealize through his work.

In *Wilhelm von Wenden*, preserved only in one manuscript, now in Dessau, King Wenzel II and his wife, Guta of Habsburg, are immortalized in the figure of Prince Wilhelm of Parrit and his wife, Bene (the Good One). Wilhelm secretly departs from his dukedom to make a pilgrimage to Jerusalem and to convert to a Christian. Bene accompanies him but is left behind in a foreign country after she delivers twins, whom Wilhelm sells to Christian merchants to be free of this burden on his pilgrimage. Because of Bene's virtuous lifestyle she is later elected (!) the ruler of that country, and when by chance the family eventually reunites again after many years, they all convert to Christianity and thus missionize the entire country. Both the role of the strong woman and the tolerant attitude toward non-Christian religions are remarkable. Ulrich used as his model either *Guillaume d'Angleterre* by Chrétien de Troyes, or the *Eustachius* legend in the *Legenda aurea* (*Golden Legendary*).

Herzog Ernst D finally, extant in one manuscript (Gotha, called "d"), follows the tradition of goliardic narratives (*Spielmannsepen*) in which the young Bavarian duke has to leave Germany because of political and military conflicts with his father-in-law, the irrational and impetuous emperor, and explores the world of the Orient. Both this text and the *Alexander* were later translated into Czech.

Ulrich von Liechtenstein (ca. 1200–1275)

Ulrich von Liechtenstein's action-filled life as a political *ministeriale* in Austria in the middle two fourths of the twelfth century is well documented in contemporary records. As a literary parallel to his life, Ulrich created with his *Frauendienst* (*Service of Ladies*), compiled around 1255, though doubtless utilizing songs composed earlier, a fictional verse romance in which his persona, the minnesinger Ulrich, woos a recalcitrant lady with songs, adventures, including a cross-country tournament for which he dresses himself as Venus, and misadventures. In one of these he disables a finger while fighting to gain his lady's approval. When he learns that she doubts he was really injured, he chops the finger off and sends it to her in a jeweled casket, accompanied by a verse booklet proclaiming his love. His misadventures, which often echo literary motifs, are recounted with rollicking humor. His attempted tryst with the lady in her chambers, in the course of which he is hoisted up to and let down (literally: let fall) from her window in a basket and is so distraught at being rejected that he tries to drown himself, forms a high point of his hapless service. Angered by her consistent rejection of him, he turns to the service of a new lady, undertaking yet another marathon tournament, this time as King Arthur. In the midst of all his feverish service of a lady, he explicitly takes some time off to enjoy the company of his wife. Whereas songs more or less punctuate the narrative in the first half of the work (though their motifs often seem to have inspired its plot), they dominate the second half. Here, the framework often becomes little more than a poetological commentary on the songs though as in many *razos*, or reasons (i.e., prose commentaries), of the troubadours—a possible inspiration for this part of the work—the commentary consists largely of paraphrase, and praise of the songs' excellence. Ulrich's fifty-seven songs and one *Leich* (poem), though accomplished, pale somewhat against the originality of their frame. His models were Walther von der Vogelweide (whom he quotes without attribution), Wolfram von Eschenbach (whose dawn songs he parodies), and Gottfried von Straßburg. He also doubtless learned from singers such as Gottfried von Neifen (whose use of the motif of the lady's rose-red mouth he exaggerates to comic effect) and probably influenced others in turn, such as Steinmar. A set of strophes he shares with Heinrich von Veldeke and Niune (Kraus, no. 58 XII) probably bears the former's name through scribal misascription and was adapted into two shorter songs by the latter.

In addition to the *Frauendienst*, he wrote the *Frauenbuch*, a didactic treatise in debate form in which a lady and a knight discuss who is responsible for the sad state of the world. In the end the lady is declared free of blame. Though it lacks the innovative sparkle (and the occasional narrative tedium) of the former work, its earnestness and apparent sincerity remind us that despite the ubiquity of humor and playfulness in Ulrich's larger work, he seems to have taken the exhortations to be constant, loyal, pure, and kind (good) that permeate both works to heart. Despite all the weaknesses and absurdities that he clearly recognizes in contemporary life and (especially) letters, he valorizes courtly ideals and seeks to promote *hôher muot* (courtly good cheer).

After Gottfried von Straßburg had left his *Tristan* as a torso around 1210, two authors picked up the fragment and provided their own conclusions—Heinrich von Freiberg (ca. 1280–1290) and Ulrich von TÜRHEIM. The latter composed his *continuatio* (continuation) roughly between 1230 and 1235, adding a total of 3,730 verses. Ulrich's conclusion of the *Tristan* was commissioned by the imperial cup-bearer (*Reichsschenk*), the Augsburg nobleman Konrad von Winterstetten (d. 1243). Sometime after that Ulrich wrote the continuation of Wolfram von Eschenbach's *Willehalm*, the so-called *Rennewart*, comprising more than 36,000 verses, completed before 1250. Among his earliest literary enterprises, however, we find Ulrich's short narrative *Clîges*, which is extant only in a fragment from circa 1230 and based on Chrétien de Troyes's *Cligès*.

An Ulrich von TÜRHEIM appears in the documents of the bishop and the cathedral chapter of Augsburg between 1236 and 1244. We assume that he was identical with our poet.

For his *Tristan* continuation, Ulrich relied heavily on the *Tristan* version by Eilhart von Oberg, *Tristrant*. Here, Tristan marries Isolde Whitehand, without sleeping with his newlywed. Her brother Kaedin learns about this scandalous situation and challenges Tristan, who then tells him of Isolde the Fair. Together they travel to England and meet Isolde secretly. Tristan spends one night with her alone, whereas Kaedin is duped by a chambermaid. Later Tristan is falsely accused of having failed in his service for the queen, and the latter orders him to be beaten and chased away when he shows up at court in the guise of a leper. The lovers overcome the conflict and misunderstanding, however, and Tristan can spend some time at court hidden behind his mask, until he is discovered and then returns to Arundel with Kaedin. Now Tristan fully accepts his wife and sleeps with her. When he later helps Kaedin in a secret love affair, Kaedin is killed and Tristan badly wounded. He requests help from Isolde the Fair, and asks that in case of her arrival the ship should set a white sail. When Isolde the Fair approaches the coast, jealous Isolde Whitehand deceives her husband and tells him that the sail is black. Despairing, Tristan dies, and when his true love has finally arrived at the bed, she drops dead next to him. King Marke has both buried together; a rosebush and a grapevine planted on their grave later intertwine, symbolizing the everlasting love of Tristan and Isolde the Fair.

Ulrich's *Rennewart* focuses on the history of the eponymous hero, who is, after the victory over the Saracens (described by Wolfram von Eschenbach in his *Willehalm*), baptized and married to King Loys' daughter Alise. *Rennewart* assumes the kingdom of Portebaliart and continues with his battles against the heathens. Alise dies at the birth of her child Malefer, who is soon after kidnapped by merchants and brought to Terramer, who wants to raise him as an opponent to Christianity, though to no avail. *Rennewart*, deeply grieved, joins a monastery where he lives for twenty more years. Two times he enters the battlefield again, however, and there he meets his son and entrusts him with the rulership of Portebaliart. Malefer later conquers the Oriental empire of his grandfather Terramer and marries the queen of the Amazons, Pentieselie, who delivers a child with the name Johann who will continue with the religious struggle against the heathens. When Terramer's son Matribuleiz attacks France anew, *Willehalm* returns from his hermitage, a move that immediately convinces the Saracens, reminded of their previous defeat, to return home. *Willehalm* erects a monastery near Muntbasiliere where he will eventually meet his death.

This *continuatio* was, along with Wolfram's epic, highly popular and is extant in thirteen manuscripts and twenty-nine fragments. Ulrich relied in part on the French tradition of the *chansons de gestes* (heroic songs), which are focused on Guillaume d'Orange. The Augsburg citizen Otto der Bogner supplied Ulrich, as he indicates in his *Rennewart*, with the manuscripts of the French texts (vv. 10270–10282). Ulrich probably composed his works for the royal court of the Hohenstaufen family.

Flourishing in the late twelfth/early thirteenth century, Ulrich von Zatzikhoven was author of the earliest German version of the Lancelot story, *Lanzelet*, a poem of over 9,444 lines in rhymed couplets. This version differs significantly from that of Chrétien and subsequent versions in that it does not contain the affair between Lancelot and Guinevere. Ulrich translated an AngloNorman manuscript received from "Hûc von Morville," who was a hostage in 1194 to Duke Leopold of Austria in exchange for King Richard the Lion-Hearted of England. The only historical record of Ulrich's existence is found in a document of 1214, where Ulrich is mentioned as a parish priest of Lommis in the Swiss canton of Thurgau.

Lanzelet's story is one of lost and regained identity and patrimony. Lanzelet, kidnapped as an infant and raised by a sea fairy, leaves at age fifteen to become a knight, without knowing his identity or lineage. The sea fairy promises to reveal it to him if he avenges her by killing a certain Iweret. This search carries Lanzelet through the first half of the romance, where he encounters and wins three ladies and defeats all comers at a tournament. The central episode is the winning of Iblis, which he does by killing Iweret and thereby learning his identity and his place in the Arthurian family (Arthur is his uncle). The second part of the romance deals with the Arthurian community and the rehabilitation of Lanzelet's patrimony. Lanzelet's activities generally are in collaboration with other Arthurian knights, including the rescue of Ginover from Valerîn and Lanzelet's own rescue from the Queen of Plüris. In the end, Lanzelet recovers his lands, and with his wife, Iblis, becomes the ruler of their combined holdings.

Universities

The university in German-speaking areas of the Middle Ages was a phenomenon that appeared relatively late. The first universities, that is, those centers of learning distinct from the cathedral and monastic schools and developed into viable, independent secular institutions, were exclusively established in the Gallo-Mediterranean area, with the notable exceptions of Oxford and Cambridge, in the early thirteenth century. This development continued throughout the first half of the fourteenth century, and it was not until 1347 that Charles IV established a university in Prague.

The late fourteenth century saw a rapid succession of such university foundings, with Kraków (1364), Vienna (1365), Fünfkirchen (1367), Erfurt (1379), Heidelberg (1385), and Cologne (1388). By the end of the Middle Ages, some fifteen universities existed within the Holy Roman Empire, plus those in Basle and Kraków. This late but determined expansion was based largely on imperial politics and the desire to increase the intellectual and cultural significance of central Europe. It was also driven by the Great Schism of 1378 and the resulting split in church authority, with faculty having to choose sides and often electing to found new centers of study elsewhere.

All medieval universities were small by modern standards, with perhaps a few hundred students enrolled. By the end of the fifteenth century only some three thousand students were matriculated annually in all of Germany. The university was built on the concept of the *studium generale*, that is, a place where a number of disciplines could be studied, and the desire to promulgate the study of the seven liberal arts along with theology and the secular subjects of civil (Roman) law and medicine. German universities developed faculties that sought to develop local reputations and student bodies, in competition with the older international universities such as Paris and Bologna. These faculties soon became independently endowed entities, or colleges, with their own libraries, housing, staff, and curriculum. The German college system tended to be organized around the masters, or professors, and formed the locus for almost all lectures and readings. Students were usually organized along the Paris model of nations based on their place of origin. The university at Prague established four nations: Czech, Bohemian, Bavarian, and Saxon. These student organizations had varying degrees of influence on the administration.

The history and organization of universities must also be seen in conjunction with the rise of the medieval city. Universities were city institutions and served the needs of the ever-increasingly secular and mercantile population. Those who studied there went on to serve the community in any number of capacities, especially administrative, clerical, and pedagogic. The universality of Latin as the language of instruction allowed the exchange of new ideas to spread rapidly, and Germans who had studied in Italy in the fifteenth century succeeded in bringing humanism north of the Alps.

A convenient start for the history of this ecclesiastical principality (also known as Het Sticht) is the arrival of the Anglo-Saxon missionary Willibrord in 690. Shortly before, the Frankish Mayor of the Palace Pippin II had captured the part of Friesland (Frisia) in which lay the small Roman *castellum* of Utrecht. The most important settlement in these lands was the *emporium* of Dorestat. Nevertheless, Willibrord chose Utrecht as the place for his *cathedra*. He refounded there a church that had temporarily existed in the reign of Dagobert (d. 638) and maybe also founded a second church, although this is debated. Willibrord, whose interests included the region around Antwerp and the monastery of Echternach, closely cooperated with the Franks, who tried to get a hold in Friesland. After Frisian defeats in 719 and 733–734 the political situation stabilized. The gift of the *castella* in Utrecht and nearby Vechten with their dependent properties to the Utrecht clergy by Charles Martel in 723 marked the beginning of the growth of the temporal domain of the Utrecht church, further stimulated by the grant of immunity circa 753.

Missionary activities to the north and the east dominated the rest of the eighth century. But problems arose over the status of the Utrecht church. Willibrord's rank of archbishop was personal to him; after his death in 739 the bishop of Cologne claimed control on the grounds that the church of Dagobert had been given to Cologne. Boniface, who had been assistant to Willibrord in 719–722, defended the Utrecht case. In old age he had retired to Utrecht to help the mission again. By his violent death by sword at the hands of the Frisians in 754 he became Utrecht's most famous martyr. Between circa 775–811 the relations with Cologne were sorted out: the authority of the bishop of Cologne was recognized; before 811 he became the metropolitan for Utrecht. From circa 775 onward, Utrecht was definitively the see of a bishop. After some bishops, who were related to the Carolingian family, the majority of the bishops between 806 and 975 probably belonged to the same noble family, which had its roots in the *riverengebied*, roughly the area in the delta of rivers between Amsterdam, Nijmegen and 's-Hertogenbosch. We have here another example of the well-known practice of episcopal dynasties.

Serious trouble arose in the ninth century with the attacks of the Vikings, who plundered Utrecht and Dorestat several times. As a result the Utrecht bishops were exiled (857-ca. 920/929). They took refuge on royal or episcopal domains, first in Odiliënberg, later in Deventer, which together with Tiel had taken over the commercial role of Dorestat. It was bishop Balderik (917–975) who was finally able to return to Utrecht (between 920–929). During his long episcopate he reorganized the Utrecht bishopric. He did compile a list of goods of the Utrecht church in that region, which was formerly occupied by the Vikings, and he probably rebuilt or founded churches in places that were associated with other missionaries such as Elst, Oldenzaal, and Deventer. These places became the focal point of episcopal power, although some of them were later lost or traded off.

In 925 Balderik with the nobility of Lotharingia transferred his allegiance to the kingdom of the East Franks. Although the scholar Rolf Grosse (1987) has suggested that the bishops up until 1010 probably did not approve of the Ottonian system because they disagreed with the idea of a cleric using military force, nevertheless Utrecht was a key point for the German emperors in their attempt to control the unruly nobility of Lotharingia. Brune of Cologne, the brother of Otto the Great, and Henry V were educated at Utrecht; the duke of Bavaria was kept in custody there for the German ruler (978–983); a *vita* (life) of Henry II was written by Bishop Adelbold (r. 1010–1026). The Bishops Willem, Koenraad, and Burchard (1054–1112) were staunch supporters of Henry IV and Henry V in the Investiture Controversy; the hearts of the Emperors Conrad II and Henry V were buried in Utrecht Cathedral. Gifts from German kings and emperors, who had their own palace in Utrecht, started early and greatly enriched the bishops; they laid the foundations for their temporal lordship. In the tenth century the bishops received mainly gifts of lands (sometimes confiscated) and regalia like the mint in Utrecht (936), the toll in Muiden (975), toll and mint in Zaltbommel (999), forestry rights in Drenthe (944), and domains in the *riverengebied* (944, 949) and Salland (960). In the eleventh century gift continued like toll, mint, and other rights in Deventer and Hamaland (1046) and comital rights in Drenthe (1024) or in (parts of) Teisterbant (1026), Groningen (1040), Holland (1064), and Frisia and Salland (1077, 1086, 1089). Some of these gifts had to be confirmed or were in the end ineffective because the former owners who had forfeited their rights could not be expelled. A natural opponent of the Utrecht bishops was a Westfrisian comital family (later counts of Holland), which had lost (944 and 1064) part of their rights to the bishop owing to rebelling against imperial authority. Westfrisian victories in 1018 and 1076 marked nevertheless the growing power of these counts. Yet the bishop of Utrecht was at that time still the strongest and richest ruler in these northern regions.

Bishop Bernold (1026–1054) enhanced this status by a grandiose building scheme. He rebuilt the churches in Deventer and Emmerich. Stimulated and funded by Emperor Henry III, he transferred an abbey to Utrecht and founded there two more collegiate churches that were symbolically laid out as a cross centered on the cathedral, although some authors are skeptical about this. This scheme was crowned by the foundation of a fifth church circa 1085. Bernold also restructured his bishopric, e.g., by separating the properties of the Utrecht church and giving old and new chapters more control over it. Archdeacons received a part of the episcopal jurisdiction in their districts. Bernold and his successors in the eleventh century ruled lands that would form the nucleus for the later principality, based on their right of immunity and the comital rights they had derived from the emperors and also based on their position of being the sole bishop in these regions. The core was of course Utrecht, which had developed into a busy commercial center. To the far north lay the *vill* of Groningen and rural Drenthe; in between lay Salland, Twente, and Vollenhove (nowadays the province of Overijssel), with Deventer as preeminent center. Important for the future was the fact that the region around Utrecht (the later Nedersticht) was being separated by lands held by the count of Gelre from the other episcopal regions (the Oversticht). Other properties and rights in the west (Holland), south (Odiliënberg), and east (e.g., Emmerich) were lost or traded off in this or the following centuries.

Momentous for the future was the *Grote Ontginning* (great drainage) operation that continued for centuries. Till then Holland and Utrecht were very sparsely populated, because most of the country consisted of vast boggy marshes. From the end of the tenth century, Holland out of the west and the bishop from the east started to clear these wastelands by draining them. Planning and articulation seems to have been greatest on the part of the bishop. The curiously indented frontier with Holland was partly defined by this development. Part of the planning existed in granting the right to organize these clearances to *ministeriales* and clerics. At first this system enlarged the resources of the bishops, but in the twelfth and later centuries successful *ministeriales* would sharply remind them of their growing power. This situation was aggravated by the fact that the Utrecht bishops in the eleventh and twelfth centuries liberally distributed wealth, lands, and rights to their chapters, which became rich institutions. An important reason for the later weakness of the bishops lies in the fact that they were relatively poor, mainly because they had given away too much.

The Concordat of Worms (1122) brought important changes. From that date the bishop lost his backing by the emperor, especially since the attention of the emperor was directed more and more to the south; so the bishop had to stand on his own. After 1122 the counts of Holland and Gelre were driving forces behind the election of every new bishop. Protégés or (financially) weak bishops would the more easily succumb to the pressure of the counts who tried to extend their hold over fiefs, rights of jurisdiction, and *ministeriales* of the bishop. These last ones tried to get more independent by claiming that their lands and offices were allods (lands without obligations), or by becoming the vassals of the neighboring counts. In 1159–1160 they openly rebelled against the bishop. In the thirteenth century this led to the existence of very powerful lords at the borders of the Nedersticht like the Amstels, Woerdens, Abcoudes, and the *burggraven* of Montfoort. The bishops, in their struggle with the *ministeriales*, had to ask assistance and borrow money from the neighboring counts. At the end of the thirteenth century this resulted in the loss of the lands of Amstel and Woerden to Holland.

Similar problems existed in the Oversticht and Drenthe. Bishop Harthert (r. 1139–1150) made his brothers hereditary prefect in Groningen, and castellan and sheriff in Coevorden and Drenthe. In the beginning of the thirteenth century the prefect of Groningen quarreled with its inhabitants, who were being backed by the castellan of Coevorden in his attempt to get a dominant position in the north. Bishop Otto came with an army to the assistance of his prefect but was slain in 1227. From then on the bishop had to use considerable effort to be recognized in Drenthe. Not until 1395 did he succeed in getting control over Coevorden. From the thirteenth century Groningen was more or less an independent city that succeeded in controlling large tracts of the surrounding countryside. Groningen recognized the bishop merely nominally as overlord of the city and region, and then mostly only in times of crisis, such as in 1469, when the Burgundians tried to annex Groningen.

Utrecht's municipal rights were confirmed as early as 1122. In the eleventh and twelfth centuries it was an important commercial center. Because of the

increased silt deposits in its riverways and the growing role of the towns of Holland and Utrecht lost its position in international trade. Nevertheless, it retained a crucial function in regional trade and commerce, its wealth being augmented by the many churches and monasteries within its walls. Till the sixteenth century Utrecht remained the biggest city in the northern Netherlands, with a corresponding influence in politics. In the Oversticht the three towns of Deventer, Kampen, and Zwolle knew rapid growth during the fourteenth and fifteenth centuries. River trade and the transferring of goods from Holland and the Rhineland to northern Germany made them prosperous. What was missing in all these towns was an important industry. Because of their richness, these three towns in the Oversticht became the most influential factors in the politics of this region.

At the end of the thirteenth century and between circa 1320 and 1345, the authority of the Utrecht bishop was at its lowest ebb. He was more or less broke; his lands had become a protectorate of the counts of Holland and Gelre, who in fact twice concluded a secret treaty (1331 and 1420) to divide the temporal goods of the bishopric. But after circa 1345 the bishop recovered his position. The neighboring counties of Holland and Gelre were weakened by internal strife. Furthermore the bishop got more and more support from the important five Utrecht chapters and from his towns. They had become sufficiently independent to realize the disadvantages of a weak bishop. Central concern for towns and clergy was the damage done by unruly (robber) knights. Nedersticht and Oversticht were lands apart, but in each the towns donated money to the bishop or supported him with troops. In return they got control over castles or functionaries (e.g., 1352 and 1375). In the fourteenth century cooperation among the chapters, Utrecht, and the gentry institutionalized into the Estates of the Nedersticht. In 1375 the bishop was compelled to give them the *Landbrief* in which the rights of the Nedersticht were written down. From circa 1350 bishop and Estates ruled the Nedersticht together. The Oversticht knew a growing tendency to combine the different regions. More and more the three towns consulted with the gentry of those regions, thus forming the Estates of the Oversticht. The rural-oriented and isolated Drenthe, however, kept aloof.

Internal strife and factions in Utrecht caused many problems, the more so because the bishop was obliged to take sides to control his most powerful city, and because both sides combined with factions in Holland and Gelre. Foreign troubles therefore also undermined the stability of the Nedersticht. Wars with Holland (e.g., 1345–1346, 1355–1356, 1373–1375, 1419–1421) and Gelre (1419–1421) were closely connected with these factions and the attempts of the bishops to control their lands. The same can be said of the episcopal elections of 1423 and 1455; these resulted in the "Utrecht schism" (1423–1449) and in a campaign by the count of Holland, Philip of Burgundy, to establish his son as a bishop (1456). From 1455 till 1524 all Utrecht bishops were virtually nominees of the Burgundians/Habsburgs. Consequently rivalry between factions coincided more and more with a general attempt in the Netherlands to ward off the growing Burgundian/Habsburg power. This was especially the case from 1492, when Burgundy and Gelre often warred openly, with the Sticht in between. The results were several campaigns and continuous pressure from Gelre in the Oversticht and Groningen, and civil wars in the Nedersticht (1481–1483 and 1525–1527). In 1527 the bishop asked the assistance of Emperor Charles V to help him win back the Oversticht and Utrecht, which were more or less occupied by Gelre. For his help the bishop translated his authority over the Sticht to the emperor in 1528.

Van Meckenem, Israhel (ca. 1445–1503)

A highly productive engraver and a goldsmith, van Meckenem worked primarily in Bocholt near the Dutch border. He was taught by his father, who shared the same name but is known also as the Master of the Berlin Passion. Both father and son used the same housemark for their engravings, and the son's early style is similar to that of his father.

Although van Meckenem was a highly creative artist in his own right, he has been maligned for being a prolific copyist of other printmaker's works. Among the artists whose works he copied are Schongauer, the Housebook Master, and Albrecht Dürer. Van Meckenem produced a large body of works, but relatively few—less than one-fourth—are his own design. It is clear from his choice of subject matter as well as his artistic manipulation of certain designs that van Meckenem was a savvy businessman as well as an artist.

Around 1466, van Meckenem visited Constance to study under the Master E.S. When his master died sometime in 1468, van Meckenem assumed many of his plates and reprinted them. By the 1470s, van Meckenem had moved back to Bocholt, where he continued as a printmaker and received several commissions to create silver objects for the city council. Later in his career, van Meckenem's engravings seem to have been influenced by paintings because of their sense of volume, texture, and richness of detail. His style appears to have been affected by Netherlandish art as well as his professional relationship with Hans Holbein the Elder.

Väterbuch

This rhymed legendary *Väterbuch* (*Book of the Fathers*, ca. 1285–1300) was the first German translation and adaptation of the Latin *Vitas patrum* (*Book of the Fathers*). However, at the end of this collection, five legends from the *Legenda aurea* (*Golden Legendary*) were added by the same poet who wrote the *Passional* (*Passion Stories*) within the Teutonic Order (*Deutschorden*). None of the legends in the *Väterbuch*, comprising 41,542 verses, are repeated in the *Passional*.

In the *Väterbuch*, the anonymous poet and priest addresses the community of lay brothers to live with humility and devote their lives to conquering heathens and converting them. Against the worldly courtly life, the model of the fathers of late Antiquity was widely accepted within German mysticism. Numerous prose renditions followed in the fourteenth and fifteenth centuries in all German, Swiss, Austrian, and Dutch regions, which are based on the *Vitas patrum*. The role that the *Väterbuch* might have played for the prose translations has not quite been established yet.

To date, thirty manuscripts of the *Väterbuch* are reported that were quickly distributed through the Teutonic Order from the fourteenth century, and only two from the fifteenth, including complete texts, selections, and fragments. For *Maria Aegyptiaca* (*Mary of Egypt*), the poet used the poetic Latin version of Hildebert von Lavardin as a source. For *Alexius*, it has been possible to discern the influence of Konrad von Würzburg's *Alexius* in addition to the *Legenda aurea* and so-called Latin Version B, and to establish that *Alexius* of the *Väterbuch* was a partial source for the version in other collections of legends, specifically the *Heiligenleben* (*Saints' Lives*) of Herbort von Fritzlar, and in versions known as *Alexius* "B," and *Alexius* "F."

Verdun

The site of an earlier Gallic fortress on the left bank of the Meuse River, Verodumum (strongly fortified place) grew into a Roman *oppidum* (rural town) and by the fourth century C.E. was a Christian bishop's seat. Located on the Metz-Reims corridor, it enjoyed a favorable location for trade. During the reign of Theodebert I (534–548), Verdun played an important role in the Frankish trade in Slav and Avar slaves captured on the eastern frontier. Gregory of Tours tells of the *domus negociatorum* (great bazaar) found in the city in his day and of the rich businessmen who profited from the slave trade. In the days of Charlemagne and as late as the tenth century, merchants of Verdun organized slave caravans bound for both Spain and Italy.

In 843 the three sons of Louis the Pious (d. 840)—Lothar, Louis the German, and Charles the Bald—divided Charlemagne's empire at Verdun. The central portion, including Verdun, fell to Lothar, who also styled himself emperor. In 880, however, the region (now known as Lotharingia, or Lorraine) went to the east Frankish realm; thus, it later belonged to the empire. During the ninth and tenth centuries, the location of Verdun far from the coastal regions provided some security against the depredations of the Vikings.

The economic recovery of western Europe that began in the mid-tenth century affected the region around Verdun as well, and the growing wealth of the city can be seen in the Romanesque cathedral built between 1048 and 1083. The German civil war after 1198 caused the burghers of Verdun to build city walls.

The burghers tried early in the thirteenth century to gain some independence from their bishop, but an imperial diet at Aachen in July 1215 had forbidden them to form a *coniuratio*, to fortify their town, or to tax themselves. A new opportunity arose with the contested election of Rudolf of Thourotte as bishop in 1224. At an audience with King Henry VII early in 1225, representatives of the newly formed commune secured privileges that usurped the rights of their prelate; Archbishop Dietrich II of Trier represented the bishop before the king, demanding that the charter of privileges be retracted. Meanwhile the burghers successfully withstood a siege by their bishop.

The German princes supported the bishop, however, and in April 1227 King Henry was forced to write the burghers, revoking the privileges. At great risk to himself, Archbishop Dietrich went to Verdun to retrieve the document, an act that required two attempts. The tension between the king and the German princes regarding the towns and cities of Germany ultimately resulted in the *Statutum in favorem principum*, which both Henry and his father, Frederick II, recognized.

Being a French-speaking diocese, Verdun became the target of Phillip II Augustus, who sought to secure the election of French bishops to the see. Phillip III continued this aggressive policy, directing French expansion toward the rivers Meuse and Rhone. After 1273, the French were near Verdun, encroaching on German land. By 1297 the French controlled Metz. The bishoprics of Liège, Verdun, and Lyon were the key to the frontier. Owing to his conflict with Phillip IV, Pope Boniface VIII placed anti-French bishops at Verdun, but eventually the French policy prevailed: Louis X was the first French monarch to accord royal protection to the city of Verdun.

Versification

Old High German (OHG) verse is structured basically according to one of two principles: *Stabreimvers* (strongstress alliterative verse) and *Endreimvers* (verse in which the concluding syllable or syllables rhyme, or at least assonate). The oldest form, which is shared in general with Old Saxon (OS), Anglo-Saxon (AS), and Old Norse (ON), is strong-stress alliterative verse, all of which has a long line with a pronounced break in the middle (a caesura). Various systems have been posited to describe this verse, none of which are totally adequate. The commonly accepted definition of OHG and OS alliterative verse, for instance, is so general that it fails to predict which configurations do not occur. More stringent descriptions appropriate for selected texts of AS and ON verse, however, cannot be applied meaningfully to other AS and ON and especially to OHG and OS texts.

Stabreimvers has two strong stresses in each half line. A strong stress can be on either a linguistically long syllable (one containing a long vowel (fohem) or a diphthong (muotin) or a short vowel followed by two or more consonants (rihtun) or on a short one plus a single consonant followed by an unstressed one (garutun). Strong stresses may fall on (most commonly) nouns, full verbs (on the stem syllable), adverbs, or adjectives. One or two of the strong-stressed syllables in the first half line or a-verse (*Anvers*) alliterates with the first of the two strong-stressed syllables in the second half line or b-verse (*Abvers*). The rhyme patterns a/x a and a/a x are the most common, but x/a x also is possible (a=strong-stressed syllable with alliteration; x=strong-stressed syllable without—unstressed syllables are not considered here). Since all strong-stressed vowels in the Germanic languages begin with a glottal stop, that is apparently what actually alliterates. At any rate, all vowels count as one alliterative sound, and it is rare for the same vowel to be repeated. However st-, sp-, so, and su- (sw-) do not alliterate interchangeably or with s-.

Here is an example from the *Hildebrandslied*, verses 53–57 (alliteration underlined; strong stresses accented):

nu scal mih suásat chind suérto háuwen,
bréton mit sinu billiū, eddo ih imo ti bánin wérdan.
doht maht du nu áodlíthho, ibu dir din éllen táoc,
in sus héremo mán hrústi giwinnan,
ráuba biráhanen, ibu du dar enic réht hábes.

In the *Hildebrandslied*, most long lines correspond to syntactic units, creating what one terms *Zeilenstil*, Occasionally the syntactic unit begins with the b-verse (and ends with a later a-verse), *Hakenstil* (hook style), which is more common in the Heliand.

her was héroro mán,
férahes frótoro; her frágen gistúont
fóhem uuórtum, hwer sin fáter wári
fireo in fólche—

Otfrid's OHG *Evangelienbuch* is the first extant longer work of European literature to use end rhyme as a consistent structural principle. Otfrid apparently used the Latin Ambrosian (fourth-century) hymn as his model, which has a long line with eight plus eight syllables often, though not always, ornamented with end rhyme. Many of these lines can be read as alternating unstressed and stressed syllables, one of three possibilities for Medieval Latin verse (some ML verse replicates, more or less precisely, the meters of Antiquity; some is accentual; much controls primarily the number of syllables in a line, as does Romance verse). Otfrid may have borrowed this feature as he made the use of rhyme structural. But it is also possible that accentual ML verse reflects a tendency of indigenous vernacular poetry. Otfrid may have thought he was replicating classical meter—he speaks of "feet"—but another feature of his verse is arguably more significant. He praises its "times." Perhaps he realized he had created isochronic verse, verse in which the "feet" might not be perfectly equal but in which the stresses follow at regular intervals. (Book I, Chapter 1, lines 19–26. The accents are in the original and apparently indicate primary stresses.)

Ist iz prósun slihti thaz drénkit thiñ in rihti
odo metres klíni: theist góuma filu réini.
Sie dúent iz filu súazi, joh mézent sie thie fúazi,
thie léngi joh thie kúrti, theiz gilústlichaz wúrti.
Éigun sie iz, biþhénkit, thaz sillaba in ni wénkit,
sies álleswio ni rúachent, ni so thie fúazi suachent;
Joch állo thio zñi so záltun sie bi nóti;
iz mizit ana bága al io súlih waga.

If it is simple prose, that quenches your thirst immediately; if, however, there are exquisite meters, that lies cleanly on the palate. They do this with much sweetness; they measure the feet, the longs and the shorts, so that it provides pleasure. They have paid attention that no syllable is missing; they are intent on how they seek the feet. In addition they counted the times carefully; such a scale weighs without deviation.

Some scholars read *Stabreimvers* isochronically, often including weaker stresses as well to reach four beats per half line. That reading is problematic, but if it were accepted it might explain why not just German versifiers but also English and Scandinavian ones, after they had abandoned strong-stress alliterative verse, tended to adopt similar substitutes, for the most part independently. Clearly, in any case, the presence of a regular beat is the primary organizing principle of German verse from Otfrid to the Renaissance literary scholar Opitz. When Opitz in 1624 recommended structuring German verse by iambs (x x) and trochees (x x), substituting (under the influence of Dutch models) stress and its lack for the long and short syllables of classical verse—soon afterward, dactyls (x x x) were declared acceptable as well—he shaped the way German poets conceived of their verse and readers understood it from then on. Enough remained of the isochronic tradition, however, sustained perhaps by folk songs, that it shaped much of the irregular verse that became fashionable from the late eighteenth century on.

The sample above of Otfrid's verse may be read as twice three beats, with each rhyme having one stress. But when we look at other passages, twice four beats seems more likely, with two stresses on each disyllabic rhyme word. A fair number of verses (both a and b ones) end with a single stressed syllable; these appear to have four beats, though some are ambiguous (l, 1, 65–66 and 69–70).

Sie búent mit gizugon—ioh uuarun 10 thes
giuuón—
in guátemo lánte: bi thiu sint sie únscante....
Zi núzze grébit man ouh thár ér inti kúphar,
ioh bi thia meina ísina steina,

The first and the third line rhyme only the final syllable. The second, third, and fourth are irregular—the "feet" are defective—but the lines work perfectly well as isochronic verse. (In the following schema, x denotes a syllable of indeterminate length, long or short, and a linguistically long one. The vertical lines divide the beats [lifts, *Hebungen*] and unaccented syllables [dips, *Senkungen*] into measures, which need not have metronomic precision.)

```

x|x x|x x|' |x x|x x|x x|x x|x
x|' |x x|' |x x|x xx|' |' |x
x|x x|x x|x x|x |' |x x|' |x
|x x|x x|' |x |' |x x|' |x

```

This general pattern of verse prevails in the Middle High German (MHG) and Early New High German periods, though with time internally rhymed (*binnengereimte*) half lines became regarded as couplets.

A passage from the *Rolandslied* (*Song of Roland*) can provide an example of MHG couplets as they existed in the period between Otfrid and the *Blütezeit* (or high period, 1185–1230). (l. 6681–88. In the schema, u stands for a linguistically short syllable where length may be metrically significant.)

Rolant was do aine. |x x|x x|' |x
do wanten di haiden x|x x|x x|' |x
si scoltten in erslahen: x|x x|x x|úu

an dem lîbe nemach in do niemen geschaden. xx|x̣ uu|j̣ xx|x̣ xx|ú

Rolant sach in allenthalben sin, |x̣ x|x̣ x|x̣ x|x̣|x̣

wi Olivir unt Turpin x|x̣ x|x̣ x|x̣ |x̣

unt ander sine gesellen x|x̣ x|x̣ uu|x̣

in plûte lagen bewollen. x|x̣ x|x̣ xx|x̣

The basic verse line has four beats, but three-beat and five-beat (called, respectively, hypometric and hypermetric) lines do occur, and the reading given above of the fifth line as having six beats is not absurd. Given the freedom with which a measure can be filled (Füllungsfreiheit), it may make no sense to distinguish between threesyllable measures in which the first two or last two are short (|x̣ u u | or | ú u x |) and others where at least the second of the syllables is long (|x̣ x x |). However, in the verse (both of narrative couplets and of song) of the Blütezeit, the former patterns are common and the latter is fairly rare. (Modern editors have often rewritten the verse to make it even rarer.) The line may begin with the first beat or there may be one or two (rarely more) syllables before the beat (the Auftakt, or anacrusis). Note that many of the "rhymes" are really assonances, i.e., the vowels correspond but the consonants do not. This is a typical feature of archaic MHG verse. Inexact correspondences in vowel quality, which sporadically occur even in works of the Blütezeit, probably reflect dialect variation. In the example "gesellen : bewollen," however, it may be that only the last syllable was intended to rhyme (an identical rhyme of "-len").

In general, the verse of the Blütezeit is more regular; the model of Romance octosyllabic couplets and songs with syllabic verses with pure rhymes seems to have led to a modification of German verse. Three-beat lines are rare in narrative verse, and five-beat ones are virtually nonexistent. Three-syllable measures are fairly rare except for the special cases where the first or last two of the syllables are short. Narrative verse has three cadences (cadence is the rhythmic treatment of the end of a line or half line): masculine (|x̣), split masculine (|ú u), and doublestressed (|x̣|x̣). Some modern readers find the last cadence implausible, and they read it as a feminine one (|x̣ x). If one chooses to do so, one must then explain why (with few exceptions) all verses in narrative couplets with "feminine" cadence have three beats, while those with the two varieties of masculine cadence have four. (Some Germanists eschew the terms masculine and feminine, but the substitutes they use create more problems than they solve; the traditional terms derive from French, where the masculine adjective, e.g., grand, typically has one syllable, while the feminine adjective, e.g., grande, has two.) It is best to speak of cadence rather than rhyme, since not all verse endings are rhymed. Regularity does not necessarily mean rigidity. MHG narrative verse often has a richness of rhythmic variation absent from modern verse in rhyme couplets. (That is one reason why modern verse translations of MHG works can seem so stiff.) In the ten lines of the following passage from Der arme Heinrich by Hartmann von Aue (11. 16–25), we find eight different expressions of the basic pattern.

nu beginnet er iu diuten xx|x̣ x|x̣ x|x̣|x̣

ein rede, die er geschriben vant x|ú ux|x̣ x|x̣ x|x̣

dar umbe hât er sich genant, x|x̣ x|x̣ x|x̣ x|x̣

daz er sîner arbeit, |x̣ x|x̣ x|x̣|x̣

die er dar an hât geleit, |x̣ x|x̣ x|x̣ x|x̣

iht âne lôn belîbe, x|x̣ x|x̣ x|x̣|x̣

und swer nâch sînem lîbe x|x̣ x|x̣ x|x̣|x̣

sî hoere sagen oder lese, x|x̣ x|x̣ x|x̣ x|x̣|ú

daz er im bittende wese, x|x̣ x|x̣|x̣|x̣|ú u

der sêle heiles hin ze gote. x|x̣ x|x̣ x|x̣ x|x̣|ú u

The verse of the Nibelungenlied (as of most other heroic epics and many archaic songs) utilizes a long line. In general, the caesura does not rhyme; the long lines typically rhyme in pairs and are collected in strophes. One major difference between Otfrid's verse and the long-line strophes is that the a-verse and b-verse in MHG usually differ in form. In the following pattern for the Nibelungen strophe, m=male cadence; k=double-stressed cadence ([schwer]klingend); a and b indicate the rhymes; x designates the unrhymed caesura (also indicated with a colon); and the numbers give the number of realized beats. (Since the split masculine and the regular masculine cadence may be used interchangeably, a generalized schema need not differentiate; a description of a given set of verses should, in which case gm [gespalten männlich] may be used for the former.)

4kx:3ma 4kx:3ma 4kx:3mb 4kx:4mb

Some read the double-stressed cadence as feminine=w (weiblich), but if we accept that such cadences in rhyme couplets are double-stressed, it would make sense to read them the same way here, especially since we can assume that the performance of heroic strophes more closely resembled chant than that of courtly couplets (in chant and song, double-stressed cadences still occur today, as in the children's verse "Backe, backe, Kuchen" |x̣ x|x̣ x|x̣|x̣). In addition, the same linguistic patten (long, normally stressed syllable followed by two of indeterminate length), when it occurs within a

verse line, generally leads to an augmented lift (beschwerte Hebung), e.g., 13,4b "nimmer ge-"|x̣|x̣ x. Roughly half of the 4b verses of the Nibelungenlied achieve their fourth beat in this way. Others consider the first three b-verses to have an additional beat in the pause (as one sometimes finds today in marching songs), but the prevalence of enjambment (a syntactic period extending over a verse boundary) and Hakenstil would seem to speak against this, as do the fairly rare examples of cadence switching (Kadenztausch), where a masculine cadence creates the fourth beat in the a-verse or a double-stressed one fills the second and third beats of one of the first three b-verses. In the following example 13,1b is most easily read as 4ka; only the pattern of the other strophes would lead us to posit a disyllabic anacrusis. The demotion (from a stress or lift to an unstressed syllable or dip) of the 13,2b anacrusis "starc" is a normal treatment of the initial element of an extended series (one that occurs even in modern verse).

13 In disen hohen êren troumte Kriemhilde,
wie si züge einen valken, starc schoen' und wilde,
den ir zwêne arm erkrummen. daz si daz muoste sehen:
ir enkunde in dirre werlde leider nimmer geschehen.
14 Den troum si do sagete ir muoter Uoten.
sine kundes niht bescheiden baz der guoten:
"der valke den du ziuhest, daz ist ein edel man.
in welle got behüeten, du muost in schiere vloren hân."

There are a fair number of trisyllabic double-stressed cadences like 14a "sagete" in the Nibelungenlied, most of them with the first two or (as here) all three of the syllables short. Many would consider a measure anomalous if it contained only u u, since the symbols -, x, and u for isochronic verse are often explained as equivalent to half, quarter, and eighth notes, and the verse is thought of as performed in two four time. But since it is highly unlikely, even if we assume that the verse had a fairly regular beat, that the "metrical" length of each syllable was precisely measured in performance, it makes better sense to retain—and u to indicate a necessity for linguistically long and short syllables and use x where the syllable may be either short or long. A word is in order here about the presence or absence of hiatus in MHG verse. The manuscripts often omit (elide) a final unstressed vowel before a following vowel;

modern editors have regularized this practice, sometimes indicating the elision with an apostrophe (as in "schoen") or a dot under the vowel to be elided (medieval correctors often used subscribed dots to indicate desired deletions). One point, however, not all editors (and other scholars) have considered is that hiatus is permissible, even likely, if the following vowel is stressed, since the glottal stop that introduces stressed vowels would have inhibited elision.

Variations of the Nibelungen strophe are used in most heroic epics and for much archaic song. The Kürenberg strophe is virtually identical, though the first two strophes ascribed to Kürenberg have an additional a-verse between the first and second long-line couplets, and there are more irregularities throughout than can be easily explained by a faulty transmission. For the most part, the strophes used by other early singers are somewhat more complicated, often with more lines. Other early song forms are simple strings of rhyme couplets, often concluded by a tercet in which a couplet encloses an orphan (*Waisenterzet*). The Burggraf von Rietenburg may be an early adapter of Occitan strophic forms, or his cross rhyme quatrains may be a further development of couplet strings. His "Ich hörte wîlent sagen ein maere" (MF 16,25), for example, probably has the following form (A=anacrusis):

A5ka A4mb A5ka A4mb A4mb A5ka A5ka 3mc A4mc A4mc

The masculine rhymes are, in part, assonances (and thus archaic) and the prosody (the way the words fit the meter) is rough; otherwise, the strophic form shows considerable sophistication and an economy of rhyme sounds reminiscent of Romance songs. The choice of double-stressed cadences over feminine ones is based on deference to the archaic traits (feminine rhymes seem to be one of the innovations borrowed from Romance and Latin verse). In addition, the anacrusis in lines 2, 4, and 6 (it is lacking in 7) provides an ideal precondition for them. If the following line begins with a beat, the clash of a secondary accent followed by a primary one would be awkward (though not impossible). Sometimes such clashes, which also can occur if a masculine cadence is followed by a line without anacrusis, mark a structural break in the strophe, a pause, as they may here (against the syntax) between lines 7 and 8. In a large number of songs the anacrusis is facultative (sometimes present, sometimes absent, with no discernible pattern). Many scholars would read this strophe (ignoring the presence or absence of anacrusis) as follows:

4wa 4mb 4wa 4mb 4mb 4wa 4wa 3mc 4mc 4mc

If one posits that the arguably consistent use of anacrusis deceives and that anacrusis is actually facultative (i.e., has no relevance for the underlying structure), this simpler schema is preferable to the previous, cumbersome one. (Since only one strophe in precisely this form is transmitted, we cannot tell whether, for example, the seventh line lacks anacrusis in some significant way or purely by accident. The differences between the MF text of the strophe, following codex C, and the parallel transmission—from a common exemplar—in the Budapest fragment do not go beyond word choice; the strophic form is identical.) Scarcely anything with respect to medieval German meter is uncontested. Most of the conclusions are based on matching the evidence (which all too often consists of texts reworked by editors to match some posited ideal) to one's preconceptions. Even the conventions about what to call what one is describing and the symbols used to denote them vary from scholar to scholar. Fortunately, if one spends some time examining examples, it is fairly simple to translate from one ad hoc system to another. To uncover preconceptions, one must sometimes read between the lines; not all scholars admit (or realize) that they have them.

Combinations of long lines and couplets also occur, for example, in some of the songs of Dietmar von Eist (for whom we have such a wide range of forms and styles that some scholars suggest several generations of singers created the songs ascribed to him). Dietmar also mixes lengthy lines and short ones. A lengthy line (*Lange Zeile*) is one with five or more beats that does not resemble the archaic long line (*Langzeile*) of the heroic epic, with its relatively rigid pattern of a-verses and b-verses. Spervogel utilizes all three—short lines, long lines, and lengthy lines—in one strophic pattern, which he uses for a number of didactic songs (*Sangsprüche*), e.g., "Swer in vremen landen vil der tugenden hât" (MF 20,1). (Note that anacrusis, which is facultative for Spervogel, is not indicated.)

6ma 6ma 4mb 4mb 4mx4kc 4mx4kc

When minnesingers began to emulate Occitan models, they made a common form almost a universal one. The tripartite *Kanzone* (from an Italianate variant of Occitan *canço*, "song") consists of a unit (two or more lines) followed by a metrically and (presumably) musically identical one, followed by a different unit. The two initial units, termed *Stollen* by the later Meistersinger, form the *Aufgesang*. The third unit concluding the strophe, the *Abgesang*, usually differs in meter and rhyme scheme from and is typically longer than a *Stollen*. Lines may vary in length from two to eight beats, though four beats are the most common. A strophe might have the form 3 3 4/3 3 4//3 3 3 4, for example. Rhymes, which tend to be pure, usually link the two *Stollen* (e.g., a b c/a b c). Though the rhymes are occasionally echoed in the *Abgesang*, it more often has new ones (e.g., d d x d—with x signaling a line that does not rhyme, a *Waise*, "orphan"). An orphan that rhymes with the corresponding line in a subsequent strophe is termed a *Korn* (K). In general, German songs, even those directly imitating Romance ones, have more different rhymes. Many strophes have a bridge (*Steg*) between the *Aufgesang* and the *Abgesang* proper, though this bridge is generally regarded by scholars to be part of the *Abgesang* that does not constitute a separate unit. Refrains, which are common in Romance songs, occur exceedingly rarely; when they do, they are signaled in a schema by a capital R or by capitalizing the letter used to designate the rhyme.

Interestingly enough, though the elements that make up a strophe are fairly restricted, few of the thousands of extant love songs share precisely the same form, and many of those that do seem to replicate the form of a given song as a parody or response to it. Scholars who eschew noting the presence or absence of anacrusis or do not attempt to differentiate between double-stressed and feminine cadences find more shared patterns. Since variation in the use of anacrusis and possibly even the type of cadence can occur from one version of the same song to another, marking them may indeed create false distinctions.

Two types of meter occur in the *Kanzone*. One, which is similar to the meter of narrative couplets, is basically alternating (lift plus dip), perhaps with less freedom to add or drop a dip than in narrative verse (in most editions, many irregularities that show up in the manuscripts have been excised). The other, so-called dactylic, is less common and seems to have fallen into disfavor by 1250. Heinrich von Morungen delighted in combining dactyls with alternating lines, so one of his strophes can demonstrate both forms. Its overall schema would need to be accompanied by a note that the fifth (long) line is alternating, while the others are dactylic. (The anacrusis of the sixth line is anomalous; none is present in the other two strophes.)

```

| ˘ ˘ x | ˘ ˘ x | ˘ ˘ x | ˘ ˘
| ˘ ˘ x | ˘ ˘ x | ˘ ˘ x | ˘ ˘
| ˘ ˘ x | ˘ ˘ | ˘ ˘ x | ˘ ˘
| ˘ ˘ x | ˘ ˘ x | ˘ ˘ x | ˘ ˘
| ˘ u u | ˘ x | ˘ x | ˘ x | ˘ x | ˘ x
x | ˘ ˘ x | ˘ ˘ | ˘ ˘ x | ˘ ˘
| ˘ ˘ x | ˘ x | ˘ x | ˘ ˘ x | ˘

```

Many scholars ignore the secondary stresses in MHG dactyls. However, only through them can one explain the common substitution of | ˘ ˘ x | for | ˘ ˘ x |. If one reads the verse as strings of | ˘ ˘ x |, one cannot explain why the first syllable must be long; if as | ˘ ˘ x |, why there is no secondary stress on the second syllable. In addition, one must, when reading the texts as they occur in the manuscripts, either assume very imperfect verses or

attempt to rewrite the lines. Even positing the patterns $[\acute{˘} \acute{x} x]$, $[\acute{x} x \acute{x} x]$, and $[\acute{˘} \acute{˘}]$ does not enable us to scan every dactylic verse transmitted; scribes copying songs long after dactyls had fallen out of fashion may well have corrupted them. But, anomalies are rare. Dactyls represent a musical rhythm, probably one used in dance, that caused the singers to shape their verse in an unusual and artificial manner. All metrical accentuation bends and stylizes the normal patterns of speech, but the dactyls do so most strikingly.

Though scholars of MHG meter commonly treat the lifts and dips of alternating verses as having equal length, the music may have made distinctions not reflected in the language. Most of the music sparsely transmitted with medieval German songs is not mensural, i.e., we cannot discern what values were intended. An exceptional mensural notation, for a song by Neidhart, does suggest triple meters rather than duple ones (of the sort one would assume following the metrical conventions proposed in this sketch). Tripduple meters are often suggested for Romance songs. They are also described in Medieval Latin treatises, where dactyls appear as the third rhythmic mode: 312.

Not all songs of the *Blütezeit* and beyond have the form of the *Kanzone*, but it is by far the most common (its hegemony continues through the fifteenth and into the sixteenth century). Another type of song, the *Leich* (lay), differs radically. This through-composed, nonstrophic form parallels the Latin sequence. It also has affinities to Romance dance songs such as the *estampie*. As a rule, a *Leich* is longer and more complex than minnesongs or didactic songs. The *Leich* does have units, versicles, comparable to the *Stollen*, which are often doubled, and some *Leichs* seem to double the overall assemblage of versicles.

Neidhart uses the *Kanzone* for his winter songs; for his summer ones, however, he utilizes through-composed strophes that may echo dance songs. Other singers occasionally seem to use a series (three or, more commonly, four) versicles from a *Leich*. For the most part, the strophes of didactic songs tend to be longer and more complex than those of minnesongs, though the brooding contemplations of Reinmar der Alte, for example, often exhibit both the form and the tone of the former. Lengthy lines, which lack, almost by definition, a consistent caesura can be broken by internal rhymes either sporadically or at fixed spots within the line. These internal rhymes, which may (initially, in what is termed a *Pausenreim*) fall on the offbeat, do not seem to signal that the line is to be broken into small units. In those cases where we have music (such as for songs by the fourteenth-century Mönch von Salzburg or the fifteenth-century Oswald von Wolkenstein), the melodic line disregards internal rhymes. The complexity of metrical forms for strophic songs may not correlate well to the simplicity or complexity of the music, though so little music is preserved for most twelfth-century and even thirteenth-century songs that there can be no certainty in the matter. The archaic long-line strophe seems to have been sung more simply than the *Kanzone*, and the *Leichs*, especially those with religious themes, were the most complex.

Vienna

The medieval (and modern) capital of Austria is situated south of the Danube in the naturally well-protected area of the "Bay of Vienna" formed by the foothills of the Viennese forest and opening eastward to the Pannonian plains. A Roman military camp, Vindobona, intended as part of the protection of the important city of Carnuntum on the Danube, represents the urban nucleus of medieval Vienna; it dated from the first century C.E. and was subsequently enlarged in the third century. With its square form it is still recognizable in the modern plan of the city, while a civic settlement grew up to the east. Not much is known about the intermediate time period after the withdrawal of the Roman forces in 433, although a continuity of settlement can be assumed. The early parish churches St. Peter and St. Ruprecht, which were constructed at the south and north boundaries, respectively, point through their patron saints to the archbishopric of Salzburg as the missionary center for early medieval Vienna. In 881 the place, known under the name *Wenia*, is mentioned in connection with the Hungarian expansion, which dominated Vienna through the tenth century, until, in 976, Emperor Otto I granted Austria as a margravia to the new dynasty of the Babenberger. After having suffered a major defeat against the Hungarians in 1030 at Vienna, Emperor Henry III held an imperial diet here in 1042. In 1137 Vienna is already called a *civitas*, and its parish system became firmly established with a new parish church built outside the southeast corner within a developing suburb. The first Austrian duke, Henry II Jasomirgott, erected his residence in the southwest corner of the former Roman camp (Am Hofe), which, with its wall system, still enclosed the city, and in 1155 he founded a monastery of Irish monks, the Schottenkloster, in its vicinity; its Romanesque basilica still survives under baroque disguise. During the next half century, Vienna experienced major economic growth and urban extension, especially to the east around the new church of St. Stephan. By 1200, when a new city wall enclosed all the settlements outside the Roman walls, Vienna had already reached its medieval extension within the Ring.

In 1208 and again in 1221, Duke Frederick I (1196–1230) gave civic rights to the city, to which he moved the ducal residence. At the same time, a rebuilding of the parish church of St. Stephan, situated just outside the Roman town walls, was undertaken in the form of a major basilica whose Romanesque exterior enclosed a space that, with its cross rib vaults over compound pillars, made full use of the new Gothic system. Furthermore, a number of monastic churches were founded under ducal patronage, such as the nearby monasteries of the Augustinian Hermits and the Minorites, or the Teutonic Knights and the Knights of Malta. The new parish church of the ducal residence became St. Michael's, which like St. Stephan's was built in an early Gothic style. The pretensions of Duke Frederick II and his struggle with his namesake, Emperor Frederick II, caused the seizure of the city in 1237 by the emperor, who granted it—although only for one year—an imperial status. Duke Frederick's death, and with it the end of the dynasty, in 1246 brought Vienna finally under the rule of King Ottokar Premysl of Bohemia, which was ended only by Rudolph of Habsburg's victory in 1278; Rudolph assigned Austria to his son, Albrecht I. Under Albrecht, in 1287–1288, and following his death in 1308, the city revolted against Habsburg rule but was subjected again. Under Albrecht II and his brother Frederick the Fair, who unsuccessfully claimed the crown of the Holy Roman Empire against Louis of Bavaria, the city experienced a new period of urban growth. The ducal castle (Hofburg) was built at a strategically important position controlling the Weidmer Tor, one of the city's gates. The medieval courtyard with its fifteenth-century chapel has survived within the extended complex of buildings from the seventeenth through nineteenth centuries.

By 1300 the civic constitution was firmly established, and the new town hall was erected at its present location; it was expanded again in 1316 by the adjacent building, which, after the insurrection of 1308, had been confiscated by the duke and given to the city. A projected rebuilding as a highly ornate monument of three stories with tower and chapel for which Laurenz Spenyng had prepared the drawings in 1456, however, remained on paper.

After the Black Death in 1348, the brief but important rule of Rudolph IV (1358–1365) is marked by the foundation of a collegiate chapter at St. Stephan's, to which the new university, the Rudolphinum, was linked. To house this chapter, Rudolph apparently expanded—in 1359—the choir of St. Stephan's to the existing hall choir and laid the foundation stone to the south tower. Completed only in 1433, this tower is closely linked to the building project of Rudolph's father-in-law, Emperor Charles IV, at Prague Cathedral. The western chapels added by Rudolph IV were, in 1396, topped by the ducal chapel, which originally housed the cycle of stained glass windows with the genealogy of the Habsburg dukes (Herzogenfenster), now mainly in the municipal museum. The church's nave, integrating the two princely portals (Fürstenportale) of Rudolph's time, however, is basically the work of the first half of the fifteenth century, erected under Duke Albrecht V, who, in 1438, secured the crown of the Holy Roman Empire for the Habsburg dynasty.

In the fifteenth century, however, the city experienced political disturbances and an economic decline, even though a bridge over the Danube was constructed in 1439. In 1407–1408, a revolt against the ruling circle caused an interruption of work at St. Stephan's, and in 1420 the Jewish community was expelled from the city in response to religious pressure. In 1461, Emperor Frederick III granted the city a new (imperial) coat of arms, but the subsequent year the city revolted openly against him and besieged him in the Hofburg, although it finally surrendered to imperial rule. After this event the emperor made Vienna his main residence for the next two decades and, in 1469, achieved the promotion of the collegiate church of St. Stephan's to the rank of a cathedral. By this time the church was basically completed with the exception of its northern tower, mainly the work of Laurenz Spenyng from Dresden; the construction of the tower had begun in 1467, but it was finally abandoned in its present unfinished state in 1513. The tomb monument of Frederick III with the highly realistic figure of the deceased, begun in 1469 by Nicolaus Gerhaert van Leyden and completed only in 1517, is the largest of its type.

Another important ecclesiastical monument is the church St. Maria am Gstade. Originally one of the early parish churches of the city, it became, next to St. Stephan's, the most important late Gothic monument. The choir, with its important cycle of stained glass windows, dates back to the early fourteenth century, while its nave was begun in 1398 under the influential Hans of Liechtenstein, but completed in 1414 after his downfall under Duke Albrecht IV. Its design is by the dukes architect, erroneously named "Chnab," who is supposed to have been involved briefly in the construction of St. Stephan's.

In 1485 the city was besieged and finally conquered by Matthias Corvinus, King of Hungary, and held until his death in 1490. Civic self-administration came to its end in the unsuccessful uprising of 1522, after which Ferdinand I terminated the constitution and integrated the city into the early absolutistic system in which it was to become, until 1918, the political center of the large complex of territories under Habsburg rule.

Viktring

Founded in 1142 by Duke Bernhard of Spanheim, Viktring Abbey became one of the most important Cistercian cloisters in Carinthia (southern Austria). The abbey, just south of Klagenfurt, had extensive land holdings that were a frequent source of strife with secular rulers until the jurisdiction of the abbey (*Burgfried*) was officially recognized, although in a significantly reduced state, in 1418.

The abbey became famous under the direction of Abbot Johann of Viktring (1312–1345), whose work, *Liber certarum historiarum*, established his reputation as one of the most important historians of the late middle ages. The comprehensive nature of Johann's writing attests to the presence of a large library at Viktring during the fourteenth century.

In 1202, the abbey church, a late Romanesque threeaisle pillared basilica with barrel vaults, was consecrated. In its interior space, the church is reminiscent of that at Fontenay abbey in Burgundy; it is perhaps the most important extant example of Burgundian Cistercian architecture in the German-speaking realm. The rib-vaulted apse, added during the early fourteenth century, houses three of the most famous Gothic stained glass windows (1380–1390) in Austria. An altar from the abbey church (1447) is now in St. Stephan's Cathedral in Vienna.

During the late Middle Ages, a moat was constructed on three sides of Viktring, and although the abbey itself never fell, it suffered during various military encounters with Hungarian and Turkish forces. Inner turmoil under Abbot Matthäus (1467–1481) hastened the decline of Viktring Abbey.

Virginal

This *aventiurehafte* (episodic) Dietrich epic composed in the complicated verse form known as Bernerton (Melody of Verona), also known as *Dietrichs erste Ausfahrt* (*Dietrich's First Sojourn*) or *Dietrich und seine Gesellen* (*Dietrich and his Companions*), is preserved in twelve fifteenth-century manuscripts, three of which are complete. There are two main versions, that of a manuscript from Hagenau ("h") and that of the *Dresdener Heldenbuch* (*Dresden Book of Heroic Tales*, "d"). A third version, that of *Lienhard Scheubels Heldenbuch* (the Viennese *Piaristenhandschrift*, "w"), is a combination of the other two. The narrative probably originated in Alemannic territory in the second half of the thirteenth century.

In version "h," Hildebrand takes a reluctant Dietrich to the Alps to instruct him in adventure: Dietrich is supposed to help Queen Virginal, whose country has been invaded by the heathen Orkise. Leaving Dietrich, Hildebrand rescues a maiden sent by Virginal as annual tribute to Orkise, killing Orkise in the process. He then helps Dietrich defeat a band of heathens. The maiden invites them to Jeraspunt, Virginal's residence. On learning from her of the visit, Virginal sends Bibung, a dwarf, to bring the heroes to court. Hildebrand rescues Rentwin, his grandnephew, from the maw of a dragon. They find Dietrich fighting a dragon, which he kills with Rentwin's sword. They visit Arona, where Rentwin lives with his parents. Bibung brings Virginal's invitation and is sent back and forth to transmit plans for the visit. On the way Dietrich gets lost and is captured by Wicram, one of a dozen giants who serve Nitger, master of Muter. At Muter Ibelin, Nitger's daughter helps Dietrich contact the group at Jeraspunt. They decide to send for Dietrich's men. Messengers crisscross the territory arranging for Dietrich's rescue. In a series of duels Dietrich and his men defeat the giants. Fighting giants and dragons along the way, the heroes finally reach Jeraspunt, where a feast awaits them. A messenger announces that Bern is in danger. Dietrich and his men arrive there and are welcomed. His men depart for their home territories.

In the *Dresdener Heldenbuch* there is no Muter episode. In Arona Dietrich fights a duel with Prince Libertin of Palermo and they become friends. They depart for Jeraspunt. Orkise's son Janapas invites them to Castle Orteneck, where they are attacked by his men and also by lions. Victorious, they rescue three more maidens sent to Orkise as tribute. Dietrich then defeats a boar and a giant, then all go to Jeraspunt. Dietrich and Virginal marry at the feast, then go to live in Bern. The *Piaristenhandschrift* includes not only the Libertin and Janapas episodes but also an abbreviated version of the Muter episode, which takes place just before the arrival and wedding feast at Jeraspunt.

Virginal consists of stock situations of the Dietrich story coupled with clichés of courtly literature. Because of its uncritical absorption of heterogeneous narrative material, its plot is very confused. Literary scholars try to excavate and date an original narrative underneath the layers of accretion or attempt to find consistency in the narrative goals of each version.

Visionary Literature

Otherworldly journeys, apocalyptic eschatologies (interpretations), miraculous visits, and mystical unions abounded in medieval German vernacular and Latin literature. This literature recounted contact with the supernatural realm, either through human transport out of the world or miraculous visits into the world by figures such as angels, saints, Mary, Christ, or the devil. Some vision narratives comprised segments within larger works, but many constituted entire works themselves. Their authors chronicled a variety of dreams, journeys, apparitions, ecstasies, passion accounts, apocalyptic furies, and mystical unions.

Medieval visionary authors drew on several models. Classical examples included Virgil's *Aeneid* and Cicero's *Dream of Scipio*. Scriptural models came from the Old Testament (Isaiah, Ezekiel, and Daniel), the New Testament (Revelation of John), and the apocrypha (*Vision of Paul*). Early church figures such as Augustine, who distinguished three types of visions (corporeal, spiritual, intellectual), Gregory the Great, and Boniface continued the visionary tradition. The twelfth century witnessed the greatest development of visionary literature and a major shift in types of visions. Prior to the mid-twelfth century, vision literature outlined unique, lengthy tours through the otherworld for the purpose of conversion. Thereafter it described short, repeatable encounters with heavenly figures for specific theological instruction or the vision-ary's own sanctity. By the later Middle Ages visions formed the basis for popular literature, most famously the *Roman de la Rose* and *The Divine Comedy*.

One of the best-known accounts from Germany was the *Vision of Tundal* (ca. 1149). This clearly structured, popular tale told of an Irish monk in Regensburg traveling through a fantastic otherworld. Hundreds of manuscripts in Latin and many vernaculars attest to its popularity. In the *Vision of Gottschalk* (ca. 1189–1190) a peasant farmer from Holstein returned from a near-death experience to retell highlights from his angel-guided tour of the otherworld.

Much of the most popular German visionary literature hails from the context of monasticism and developing religious movements in the form of saints' lives, spiritual guidebooks, and mystical texts. The Benedictine Rupert of Deutz (d. 1129), for example, tied his visionary experiences to his exegetical teaching. Women were highly represented in this literature. Hildegard of Bingen (d. 1179), the "Sibyl of the Rhein," gained notoriety as prophet and apocalyptic reformer through her visionary activity. She considered her visions a capacity of her soul and was adamant that they occurred neither in dream states nor rapture. Elizabeth of Schönau (d. 1165), even more widely read in the Middle Ages, mediated messages from angels and sought reform in church teaching and politics. The Beguine Mechthild of Magdeburg (d. ca. 1282) wrote otherworldly journeys and mystical unions to teach people the path to God. The visions of the Helfta nuns helped fortify the monastery's reputation as a thriving center of devotion. Visionary literature predominated among fourteenth-century German Dominicans as Margaret Ebner (d. 1351), Christina Ebner (d. 1356), Adelheid Langmann (d. 1375), and the Engelthal Sister-Books illustrate. German authors thus used visionary literature throughout the Middle Ages in a variety of contexts both to warn and to inspire their readers.

Vom Rechte

An early Middle High German poem, *Vom Rechte* (*On the Right Way*) deals specifically with social matters in relation to salvation. It is difficult to find a good, short expression in English for *Recht*. It certainly means "justice," the "right," or the "law," but here it seems to stand for the broader concept of the divinely ordained, established order of things in the world. Naturally, that order would be "just" or "right," but the poet spares no words in explaining that such order is not always observed by man and that no one is indeed so noble, high, or mighty as *Das Recht*. Putting oneself above the "law" will surely have dire consequences for the salvation of one's soul. The proper Christian life is characterized by loyalty, truthfulness, and reliability. Wealth and power lead to pride and exploitation of the poor. Masters and mistresses should be fair in their treatment of their servants and share the profits of their common work. Lies and slander are to be avoided. Greed is a shameful trait. The relation between man and woman should also be subject to God's laws, and by all means one should consult one's priest on how to lead a proper life. The descriptions of human behavior are taken very vividly from everyday country life and show a keen appreciation of human foibles. All in all, it is a fascinating, lively sermon-in-verse (*Reimpredigt*), and impresses with its style and seriousness of purpose.

Vom Rechte is found in the Millstadt *Sammelhandschrift* (manuscript containing a number of texts). The text is in poor condition and presents editorial problems. There are 549 lines in rhymed couplets in thirty stanzas of varying length, or half that many long lines. The dating of the text is also difficult (1150–1160); its language is Austrian (Carinthian).

Walahfrid Strabo (ca. 809–August 18, 849)

Despite a tragically brief life (ca. 809–849), Walahfrid Strabo (alternatively, Strabus—the nickname refers to the cast in his eye) played a major role in ninth-century intellectual activity. Of Swabian origin, he studied first at Reichenau and then, under Hrabanus Maurus, at Fulda. In forty years Walahfrid left a lasting mark in Reichenau as monk, teacher, and abbot (838–849) and elsewhere, thanks to his achievements as poet, theologian, liturgist, naturalist, and royal tutor (829–838) of the future Charles the Bald.

His most substantial poem is also very precocious: he composed "Wetti's Vision" when he was eighteen years old. It relates the deathbed visions of heaven and hell that the monk Wetti (one of his teachers, d. 824) experienced when Walahfrid was fifteen years old. A highly literary recasting of an earlier prose account, it is seen as anticipating Dante's *Divine Comedy* in its emphasis on purgation and purgatory. Among Walahfrid's other poems (which employ a considerable number of different meters), particular importance has been attached by modern scholars to a polemic against the erection of a statue to the Ostrogothic king Theodoric in Aachen and to a didactic work on horticulture that describes the medicinal plants found in the monastic garden of Reichenau and their properties.

Among his other works are found commentaries on various books of the Bible (both Old and New Testaments), a history of various ecclesiastic institutions and practices, redactions of saints' lives and Einhard's *Life of Charlemagne*, and homilies.

Waltharius

The *Waltharius*, which could be translated into English as *The Poem of Walter*, is a Latin epic of 1,456 dactylic hexameters written by a speaker of a Germanic language dealing with peoples and individual characters of interest to a Germanic audience. Its narrative action divides into three main sections. After a brief preface (1–10), the first (11–418) describes the subjugation of assorted Germanic peoples by the Huns; the exploits of Walter of Aquitaine in Hunland with his fellow hostage, the Frank Hagen; and Walter's escape from there with another captive, his betrothed Hildegund of Burgundy. The second (419–1061) enumerates a sequence of nine combats, most of them duels between Walter and individual Franks who seek to vanquish him to gain from him possession of the treasure he has taken from the Huns. The third (1062–1452) is devoted to the final combat that Gunther and his retainer Hagen wage against Walter. Gunther loses a leg, Hagen an eye and some teeth, and Walter his right hand. After the battle ends the warriors drink wine and taunt each other. The poem concludes with a short epilogue (1453–1456).

The dating and authorship of the *Waltharius* are as notoriously controverted as are those of another famous early Germanic heroic epic, *Beowulf*. The three main possibilities for the author are an otherwise unidentified Gerald, Ekkehard I of St. Gall (900–973), and an anonymous. Gerald, who wrote a prologue of twenty-two hexameters that is included in four manuscripts, need not have been the author of the entire poem. Alternatively, he could have been a copyist who composed a poem to his patron, Erckambald (perhaps the man by this name who served as Bishop of Strasbourg from 965 to 991), to accompany a manuscript of the poem that he had produced. As for dating, the earliest manuscript evidence is a fragment of 975; scholars place the composition of the poem variously in the early ninth century (Charlemagne), late ninth century (Charlemagne's successors), and mid-tenth century (Ottonian emperors).

The story or stories that the poet had at his disposal cannot be easily reconstructed, although evidence in other medieval languages supplements what is found in the Latin. In Old Norse we have a lay about Attila and the *Attila rekssaga*, in Old English the short and fragmentary *Waldere*, in Middle High German a mention of the tale in the *Nibelungenlied*, and even several accounts in Polish; but none of these is nearly as elaborate as the *Waltharius* itself, and nothing appears to be even closely related to a possible source of it. Furthermore, in none of these is evident the same fusion of Germanic, classical, and Christian features that characterizes the *Waltharius*. Alongside a close knowledge of such poets as Vergil and Prudentius, the poet shows an insider's appreciation for the basic workings of oral German epic and considerably more than a passing interest in the Germanic past.

Walter und Hildegund

The legend of Walther of Aquitaine (or of Spain, in most medieval German sources) found its way into writing quite early. We find a Latin epic, *Waltharius*, probably from St. Gall, and an Old English epic, *Waldere*, which unfortunately exists only in fragments, both of which are probably products of the tenth century. The Middle High German version was almost certainly of epic breadth as well, if the surviving fragments are any indication. It was composed in a strophic form much like that of the *Nibelungenlied*. Parchment fragments of two different manuscripts of the epic were later used in the bindings of books and thus survive, albeit as tiny scraps of a large poem. There is also a version of the story in the Norwegian *Thidrekssaga af Bern*. The story of Walther remains essentially the same in all versions. Walther is a noble hostage at the court of Attila/Etzel. He is in love with his fellow hostage Hildigund. He steals a considerable amount of treasure and his beloved and, taking advantage of the Huns' drunkenness, escapes from Attila's court. Underway he is attacked by Gunther and Hagen as he crosses the Rhine. He holds off an attack in the Vosges Mountains by placing himself in such a position that only one of his attackers can reach him at a time. After defeating all his attackers but Gunther and Hagen, he finally fights to a draw with his old friend Hagen, and Hildigund binds the wounded men. The Middle High German versions included a festival in Walther's homeland after his return.

[Nibelungenlied](#); [Waltharius](#)

In service largely at the Hohenstaufen courts, Walther is considered the greatest of the German courtly singers of the High Middle Ages. Some would argue for his poetic primacy among European singers in any language. Internal evidence in his songs suggests he was active between the early 1190s and the late 1220s. His *Minnesang* (love singing), in which he sang the painful joy of unrequited love for a woman of high station (*hōhe minne*), shows influences of fashionable German courtly singers such as Heinrich von Morungen and Reinmar der Alte. Walther also sang of the so-called *nidere minne* (down-to-earth love), an amorous relationship both physical and mutual that has close parallels in Latin secular love songs. His political, personal, didactic, and religious songs (*Sangspruch*) reflect the vicissitudes of his career as well as the turbulent political events of the *sacrum imperium*, known later as the Holy Roman Empire.

Extant today are over six hundred stanzas in some three dozen manuscripts. Walther's music has been entirely lost save for five melodies, two of them fragmentary and another two from manuscripts written three centuries later. Accordingly, readers must use their imaginations to re-create the conditions of performance and the effect of the melodies and their accompaniments.

Walther's name appears only once in nonliterary documents of his lifetime, a 1203 entry in the travel accounts of Bishop of Passau directing that five shillings be given the singer (*cantor*) for a *für coat*. But other thirteenth-century singers and romancers provide ample encomia, or formal praise, for this towering figure of German lyric singing. Gottfried of Straßburg in his *Tristan* (11. 4751–4820) calls him the nightingale carrying the banner of *Minnesang*, praising Walther's high (tenor?) voice and his dexterity in the polyphonic style of the day (organum). His artistry is also celebrated by, among others, Reinmar von Zweter, Bruder Werner, and Rudolf von Ems. In the waning Middle Ages he is enthroned by the Meistersinger as one of the Twelve Old Masters. Only one contemporary provides negative criticism: Thomasin von Zerklare castigates him as a slanderer of Pope Innocent III and a deceiver of men (*Der welsche Gast*, 11. 11091–11268).

The songs classified as *Minnesang*—the sequence can only be surmised—are normally categorized in the following major groups: early songs of elevated love (*hōhe minne*) linked to Reinmar at the Viennese court; later *Minnesang*; songs of down-to-earth love (*nidere minne*); and late songs. Augmenting the difficulties of dating these songs is the strong possibility of revision in the course of the singer's career or changes developing from the orality of the pieces.

Walther's assumed apprenticeship at the Viennese court, in the 1190s under the tutelage of Reinmar der Alte (Reinmar von Hagenau), produced a number of early songs. Some of these have been linked to a "Reinmar feud" (*Reinmar-Fehde*), a quasi debate revealing the outlines of a serious polemic with his former mentor on the nature of *minne*. Reinmar is the representative of the traditional (since the 1160s) ideas inherent in the troubadour lyric: his love, unrequited and unconsummated, is for an unapproachable lady of a higher station. Walther, on the other hand, hints at a more mutual love; his lady is valued not for her cold, Turandot-like majesty but for a more immediate and shared joy. The Reinmar debate began in the 1190s and seemed to continue until after Walther's departure from Vienna in 1198. Emblematic of this exchange is Walther's *Ein man verbiutet âne pfliht* (no. L. 11 1,22ff), a response to Reinmar's *Ich wirbe umb allez daz ein man* (*Minnesangs Frühling*, no. 159,1ff), in which, using the same melody and stanzaic form, he weaves Reinmar's key motifs into his song to produce an ironically critical response to his mentor.

It is difficult to separate what seem to be the more mature songs of the Reinmar debate from Walther's non-Reinmar-related songs of the period circa 1205–1215, a time in which he achieved mastery of language. Here the singer composed his most effective and inventive songs, sharply breaking with the traditional German *Minnesang* (as performed by Heinrich von Morungen, Reinmar, and others), with its prickling tensions and the incessant conjectures about an impossible love. Walther's style now becomes pointed, ironic, playful, and original. Though still dancing around the theme of *hōhe minne*, many of his songs now suggest an equal relationship with a young woman whose station is not of importance and whose designation increasingly becomes the generically female *wîp* (woman) rather than the socially hierarchical *frouwe* (lady). In *Si wunderwol gemachet wîp*, (L. 53, 25ff), he sings of the physical attributes of a woman not of the nobility, completing his catalog of adulation with an unprecedented image of the woman, unclothed, stepping cleanly from her bath.

Among the songs of this period are some that appear outside the scope of the *Minne* theme. The so-called *Preislied* (panegyric) *Ir sult sprechen willekomen* (L. 56, 14ff) is possibly a response to the troubadour Peire Vidal (fl. ca. 1187–1205), whose unkind characterizations of German deportment probably rankled at German-speaking courts. Walther's praise of German (*tütschiu*) woman and, by extension, German culture is unique in medieval song.

During these years Walther also composed songs with bucolic settings about the real and physical love of a young woman who seems tangential to courtly circles (songs of *nidere Minne*, sometimes called *Mädchenlieder*). In "Herzeliebe bez frouwelîn" (L. 49, 25ff) he is charmed by a woman or girl whose glass ring he values more than the gold ring of a queen. "Nement, frowe, disen cranz" (L. 74, 20ff) projects a dream vision of his beloved, a pretty girl (*wol getânen maget*) portrayed in the scenery of the *Carmina Burana*, that is, under a blossoming tree on a meadow graced by flowers and the singing of the birds.

"Under der linden" (Beneath the Linden Tree, no. L. 39, 11ff) is Walther's most celebrated love song. In the tradition of the Latin *pastourelle*, it contains the same predictable imagery as in "Nement, frowe, disen cranz." But Walther brings to this tradition a deceptively simple language expressing the essence of the lovers' joy, deftly combined with a playful and delicate web of motifs to form a song with complex levels of meaning.

Walther's position at court required him also to excel at the art of *Sangspruch*. The term pertains to songs in which love is not the primary matter: political pieces, songs of personal invective, requests for favors from a patron, crusade songs, and songs with a didactic or religious content. Each piece is normally restricted to one stanza, though in some cases several stanzas composed in the same tune (*Ton*, plural *Töne*) can be bound together to form a performance piece. Walther's *Sangspruch* provides a glimpse of the events of his life as well as the fortunes of the empire under the Hohenstaufen rulers and its ongoing struggle with the papacy. These songs were composed largely for patrons at the electoral courts—kings, dukes, counts, and bishops—who expected from the singer both workmanlike compositions and persuasive performances. Occasional songs in the best sense, they were composed about specific events or personalities. In editions of Walther they are usually grouped into cycles of stanzas of identical metrical and musical form (*Ton*). Some, though not all, of the stanzas of a *Ton* have the same general thematic content. Modern scholarship has given them associative names that apply to some though not all of the stanzas in the *Ton*. In the "König-Friedrichston" (King Friedrich Tune, no. 26, 3ff), for example, King Friedrich (later the emperor Friedrich II) plays a major role only in a few of the stanzas. Each of these *Töne* contains between three and eighteen stanzas.

Walther's best-known *Ton*, the "Reichston" (Imperial Tune, L. 8,4ff), may well be the earliest. A triad of long stanzas (twenty-four lines each), it begins pensively with the trademark image of Walther sitting on a stone in the pose of the philosopher (*Ich saz ûf eime steine*, I sat upon a stone). In the second song (L. 8, 28), Walther moves out of the meditative mode and into the political, calling for the crowning of the true emperor, the Hohenstaufen candidate Philipp of Swabia rather than the papally sanctioned Otto of Brunswick, dynastic leader of the Welf party. With pointed imagery he declares the clergy of Rome corrupt and the times out of joint. In the third song (L. 9, 16), assuming the persona of a pious hermit, he indicts the pope as being too young (Innocent III was only thirty-nine), an anomaly symptomatic of the ills besetting the curia at Rome and its imperial policy.

In 1198 Walther left Vienna and attached himself to various Hohenstaufen courts in the middle German regions, continuing both positive and negative associations with Philipp of Swabia (in the five stanzas of the first "Philippston," Philipp Tune, L. 18, 29ff). Despite Walther's ardent propaganda for the imperial candidate, he complains of Philipp's parsimony. This theme of a patron's miserly qualities would become a favorite of the later generation of *Sangspruch* singers in the thirteenth century.

The "Wiener Hofton" (Viennese Court Tune, L. 20, 16ff), largely composed after Walther's departure from Vienna in 1198, reveals an ambivalence about the Viennese court, combining a longing to return to this desirable venue with an uneasiness about his relations with the reigning Duke Leopold VI. Walther continues to sing in the causes of Philipp until the would-be emperor's death in 1208, but gradually in the course of the first decade of the thirteenth century, he forms new courtly associations, most prominently with Hermann, Landgrave of Thuringia, and his son-in-law, Dietrich, Margrave of

Meißen. These princes are forced to change allegiance after Philipp's death, leaving the imperial candidacy open to his archrival, Otto of Brunswick. Walther reflects the new loyalties in the "Ottenton" (Otto Tune, L. 1 1,6ff), in which he welcomes the new kaiser to the Reichstag (imperial diet) in Frankfurt, declaring that his patron, the Margrave of Meißen, is as loyal to the emperor as an angel is to God. Less than a year later the margrave and other princes (like the fallen angels) are in open rebellion, preparing the way for a new Hohenstaufen pretender, the young Friedrich II, grandson of Barbarossa. As was the lot of singers employed by the courts, Walther continued the propaganda commissioned by his various patrons. In one of his sharpest and most amusing pieces, "Unmutston" (Disgraced Tune, L. 34, 4), Walther rants against that most ardent enemy of the Hohenstaufen interests, Pope Innocent III, for his collecting of German monies to finance the Albigensian Crusade in 1213, accusing the Roman clergy of feasting on capons and wine while the German laity grows lean from fasting. There is evidence that Walther was able to gain a modicum of independence as overseer of a fief. In 1220 he composed a song of request to King Friedrich for his own house, playing on his lord's sympathy for a homeless singer whose wearisome life was a procession of one-night stands. ("König-Friedrichston," L. 28, 1). Apparently Walther was successful, for in the same *Ton* (L. 28, 31) he proclaims triumphantly his thanks to the king, grateful that he need no longer go begging at the courts of base lords for shelter.

Since these songs of praise and political propaganda were produced on demand to suit the shifting political alliances of a turbulent period of imperial history, one might properly ask to what extent Walther's songs reflect his own values. Many are outright propaganda, although of a kind wrought with the highest poetic skills and a deft sense of language. And yet many pieces reveal a personality sharply troubled by the woeful state of the mutable world and impelled by a desire to return to the established, predictable, and more ethical patterns of time past. The "Wiener Hofton" bewails the uncouth behavior of courtly youth (L. 24, 3), marking its disparity with the days when one did not spare the rod with ill-mannered children. More personal and sadder echoes of this nostalgia permeate the "Elegie" (Elegy, L. 124, 1 ff), generally held to have been composed in Walther's old age. It too complains of the uncourtly behavior of young people, but combines it with what must have been an old man's deeply personal sense of an irretrievable past. And yet, in the last stanza, it is clear that it is a song of outright propaganda, urging knights to undertake a crusade, possibly that of Frederick II in 1227. Walther was still the paid entertainer whose patron called the tune.

The manuscripts also contain a scattering of personal and religious songs of one or more stanzas that cannot properly be called *Sangspruch*. One is the "Palästina-Lied" (Palestine Song, L. 14, 38ff), also a recruiting song for a crusade, containing the only complete and proven melody among Walther's songs. Another is the *Leich* (L. 3,1ff)—This most virtuosic of all medieval lyric forms—derived from the liturgical sequence—is a large-format song built on a series of versicles and responses that undergo repetition and variation. It may have been specifically composed for groups of singers and instrumentalists, who would have sung and played it antiphonally in unison or possibly with rudimentary polyphony (*organum*). With its many repetitions and variations, it often approached the complexity of a fugue. This is Walther's longest single performance piece, a prayer to the Mother of God (hence called a *Marienleich*), marked by lush praise of the Virgin commingled with references to the Trinity, biblical prefigurations, and elements of Christian theology. Yet even in this, Walther's most pious work, the singer cannot refrain from references to the Roman curia and its "unchristian things" (*unchristliche dinge*).

The legacy of Walther's *Sangspruch* was a set of models and patterns for a century of professional singers who followed. His love songs, on the other hand, marked in a sense the end of *Minnesang*. The art had soared in the songs of Morungen and Reinmar. Walther moved through the exhausted concept of *hōhe minne* and brought the love song back to earth. But after him no other Minnesinger approached his or his predecessors' mastery of the art.

Warbeck, Veit (ca. 1490–1534)

The fifteenth century saw the rise of a new literary genre, the chapbook. Although precise definitions are still missing, the large number of prose novels, often based on medieval themes and motifs, if they are not direct translations, which were soon printed and made available for an increasingly expanding readership, are generally called *Volksbücher* (literally, books of the folk). Veit Warbeck was born shortly before 1490 as the second son of a wealthy patrician in Schwäbisch Gmünd. In 1527, he translated, on the occasion of the wedding of his student, Prince Johann Friedrich of Saxony, the chapbook *Magelone* into German on the basis of a French version, composed between 1453 and 1457, which again can be traced back to many Oriental sources. This text was to become one of the very successful early modern chapbooks when it was posthumously printed in 1535 by Georg Spalatin.

In 1505 Veit began with his university studies at the Sorbonne in Paris and passed his master exam in 1508. In 1514 he continued with the study of law at Wittenberg but soon switched to theology under Martin Luther and became a minister. In 1519 he celebrated his first church service. Subsequently, the Saxon court librarian Georg Spalatin befriended him and arranged his employment at court in many different functions since 1523, especially as tutor and teacher for the young princes. When Johann Friedrich assumed the throne in 1532, Veit was appointed councillor and vice chancellor. He died on June 4, 1534. His daughter Anna married one of Luther's sons.

In *Magelone*, young Peter, son of the count of Provence (France), wins the love of the princess Magelone, but the parents oppose their marriage. The couple escapes from home, but they lose each other in the woods because Peter, erotically aroused, had opened Magelone's dress while she was asleep, which in turn had made it possible for a bird to steal a cloth of hers, suggesting romance. While Peter tries to catch the bird and recover the cloth, he is captured by pirates and sold to the Egyptian sultan. Whereas Peter develops into a loyal servant of the sultan, Magelone builds a hospital in Peter's home country. Here the two lovers eventually meet again and can finally join hands in marriage. The novel specifically emphasizes morality, virtues, and highly affectionate relationships. The narrator strongly admonishes parents to keep better watch over their children, but still idealizes the young people's love and loyalty.

Warfare

Warfare was a dominant feature of medieval German history. After the late fourth century, Germanic tribes penetrated the western Roman Empire in force, bringing important changes to the military system. Roman discipline and organization gave way to badly organized forces with poor training, few arms, and almost no discipline. Military recruitment and payment for services were based on the amount of booty a leader could provide his soldiers, and loyalty to this leader was dependent on the continued success of his conquest. Soldiers generally were equipped with only a rudimentary shield and helmet, and their arms consisted of a sword, ax, or spear. These militaristic barbarians had an almost Homeric sense of heroism and revered martial skills. Their names, both male and female, reflected the constant presence of war, and warriors were the elite of the *wergeld* (literally, man money) system of compensation and given elaborate burials with their equipment and booty.

By the sixth and seventh centuries, the Merovingian Franks, who required military service of all free men, had an effective army based on infantry. Their special weapon was the *francisca*, a throwing ax. They adopted body armor only gradually. With this army, they conquered most of the land of what would become Germany. They protected their lands with fortifications, which, other than those inherited from the Roman Empire, were simple earth and wood ramparts.

When the Carolingians came to power in the eighth century, the requirements of a large empire led to new military institutions that presaged the military obligation patterns of a later time. Rulers granted income-producing estates to followers who promised to render full-time military service at their own expense. The expanding role of the stirrup gradually encouraged the development of heavy cavalry and eventually the archetypical medieval knight.

The system of land grants and oaths of loyalty enabled Charlemagne to muster an effective cavalry force almost annually. His armies were not large, but they were powerful and dominated their opponents. He generally led them himself, and although there were few "formal" military tactics, they were successful in most engagements and in adding much new land to his empire. Among these lands were Saxony and Lombard Italy.

As the ruins of the Carolingian Empire gave way to Ottonian, Salian, and eventually Hohenstaufen Germany, rulers stayed in power largely by dint of their military capabilities, and some suffered serious political reversals when defeated in war. Recruitment of soldiers increasingly depended on administrative institutions of obligation in the eleventh and twelfth centuries, and emperors and other nobles sometimes could not muster sufficient troops to fight their wars. As they began to acquire more resources, they began to supplement traditionally recruited troops with paid professionals.

Mounted soldiers were still the core of the army. With improved weapons and armor and mounted on expensive warhorses, they usually decided the course of each battle, fighting with couched lance in a tournament-like fashion. Most cavalry soldiers of the twelfth and thirteenth centuries were knights supported by fiefs. Large battles were infrequent, and those that were fought often included only rudimentary tactical combinations.

While the cavalry was the core of the army, the most numerous forces were still the infantry. Levied from among the freemen of the kingdom, these troops were armed much less well than their mounted counterparts. While some were protected by a helmet, a small shield, and a leather hauberk, infantry soldiers frequently served without armor. Offensive infantry weapons included the spear, sword, lance, and pike, with little standardization among these weapons. Archers also served in infantry contingents, initially being equipped with traditional wood bows. In the course of the twelfth century, these began to be replaced with the more powerful crossbow.

Following the Carolingian period, the siege replaced the battle as the primary form of military engagement. Though Charlemagne had effectively altered the standard of battlefield fighting, he and his successors tended to neglect fortifications, leaving the empire vulnerable to the raids of Vikings and, especially in Germany, Hungarians. In the eleventh century, local rulers led in the construction of fortifications, at first small earth and wood castles, but soon larger and stronger structures of masonry. These more intricate and costly fortifications provided valuable defenses. Although mining, sapping, and stone-throwing engines were used against them, a castle or town with strong stone walls could generally be reduced only by starvation.

In the late Middle Ages, five significant developments altered warfare. First, armies fighting on foot began again to predominate. The stunning defeats of German cavalry armies at Mortgarten in 1316 and Vottem in 1346 were followed by several others in the Holy Roman Empire over the next two centuries. The second development was the continual fighting that beset Germany between the early thirteenth and sixteenth centuries. This long military struggle exhausted the German military and eventually required a stricter and often less noble military bureaucracy, which would not be fully achieved until the reign of Emperor Charles V. As well, the emergence of *condottieri*, paid mercenaries without traditional military obligation, weakened medieval military institutions. The third factor was the Black Death of 1348–1349, which significantly reduced the numbers available to fight on the battlefield and defend German towns and castles. The fourth was the advent of frequent and often violent popular rebellions by German peasants, townspeople, and nobles, the suppression of which required changes in military tactics.

Finally, warfare was changed by the advent and proliferation of missile weapons employing gunpowder. Appearing initially in the early fourteenth century, they began influencing warfare by the 1380s, when they were used effectively against fortifications and on the battlefield. By 1400, no siege was free of their use, as they reduced substantially the time needed to destroy walls. No longer was it necessary to rely on starvation to force the capitulation of castles or towns. By the 1430s, hand-held gunpowder weapons began to take their place among infantry contingents, changing the face of battlefield engagements. By the Swiss and Burgundian Wars of 1475–1477, one third of the infantry on each side was outfitted with handguns. These late medieval changes brought an end to medieval forms of warfare and encouraged the development of states capable of financing modern armies.

Wartburg

The palace of the langraves, or counts, of Thuringia on the Wartburg occupies a dramatic and easily defensible site in the hills outside Eisenach at the edge of the Thuringian forest. As part of his successful attempt to consolidate Thuringia as a separate territory, Count Ludwig der Springer built a castlelike fortress on this site about 1067. Sometime after King Lothar conferred the title of landgrave on Ludwig's son in 1130, the decision was made to erect a building more representative of the family's power and aspirations to the south of the modest living structure. The once controversial dating of the present palace building now seems to have been settled by dendrochronological investigation. The oak trees that provided ceiling beams for the ground floor were felled about 1162 and those for the second story within five years of 1168. The lack of original wood beams in the third story makes it impossible to date this area accurately. While it is generally accepted that the third story was not part of the original plan for the building, the previously accepted delay between the erection of the two lower stories and the third, upper story is now discounted, as is the legendary association of the building with Landgrave Hermann (r. 1190–1217). The building was erected at the latest under his predecessor, his brother Ludwig III (1172–1190), and if Hermann was involved

Wartburg, palace, courtyard façade. Photograph: after G. Voss, *Die Wartburg* (Jena: Verlag Gustav Fischer, 1917)

at all, his role must have been limited to completing a nearly finished structure. A number of devices make clear the importance of this structure in the landgraves' self-definition. The Singers' Hall on the second floor, the supposed site of the famous *Sängerkrieg* (poets' competition) sponsored by Landgrave Hermann in 1207, competes in scale with the ceremonial halls of the imperial palaces erected about this time. Likewise the arcaded open gallery facing onto the courtyard was a standard feature of these imperial palaces. Stylistic relationships between capitals in the palace and those at the church of Schwarzhendorf near Bonn indicate the importation of sculptors from important Rhenish sites in an effort to insure the quality of the building. The use of a number of columns of *Kalksinter* (literally *limestone*) serves a similar purpose. These columns, made from the mineral deposits found in the Roman aqueducts that had supplied Cologne with water from the Eifel, were as highly prized in the Rhineland as marble, which was not available locally. Their discovery this far to the east is unusual and, together with the references to imperial palaces, makes it clear that the landgraves spared no expense in the building of the Wartburg, which they intended as an expression of their political position in the empire. The incorporation of the Wartburg into the early legends of the *Sängerkrieg* and the story of St. Elizabeth and Luther's translation of the New Testament here in 1521–1522 helped to secure the status of the complex as a national monument.

Wartburgkrieg

The *Wartburgkrieg* (Wartburg Contest) is a collection of anonymous poems from the thirteenth to the fifteenth centuries written in two different melodies—the *Türinger Fürstenton* (Thuringian Emperor's Melody) and *Klingsors schwarzer Ton* (Klingsor's Black Melody). The best manuscript versions are in the Heidelberg, Jena, and Colmar manuscripts ("C," "J," and "k," respectively). There is as yet no complete edition. The complex tells the story of a singers' contest at the Wartburg, material that Richard Wagner later incorporated in his opera *Tannhäuser* (1845). Manuscript "C" has a famous miniature depicting the contest. The *dramatis personae* consists of the landgraf of Thuringia and his wife, who speak little but host the contest, six singer-poets (Walther von der Vogelweide, Wolfram von Eschenbach, Reinmar von Zweter, Biterolf, Der Tugendhafte Schreiber—"the virtuous scribe"—and Heinrich von Ofterdingen), Wolfram's mysterious adversary, Klingsor of Hungary, and various spirits. All the singers apart from Heinrich von Ofterdingen are known from other sources as composers of *Minnesang* (courtly love poetry) and *Sangspruch* (political poetry), and it is assumed that Heinrich was likewise a contemporary poet of note. The character of Klingsor, on the other hand, the "master-priest" and authority on astronomy and necromancy, is derived from Wolfram's grail epic *Parzival*, where Clinschor is the magician and foe of the Grail Knights.

The most important pieces in the complex are the long poems *Fürstenlob* (*Praise of Lords*) and *Rätselspiel* (*Guessing Game*). The latter appears to be the oldest part of the *Wartburgkrieg*, with the former designed as a prequel. The *Fürstenlob* tells how six singers compete to see who can best sing the praises of a generous patron, one of the set-piece motifs of *Sangspruchdichtung*. The poets compete in turn; Walther finally defeats Heinrich by a ruse, whereupon Heinrich insists that Klingsor be called to arbitrate. The *Rätselspiel* then takes up the story with Klingsor and Wolfram facing each other in a riddle competition, Klingsor setting abstruse puzzles with spiritual meanings and Wolfram as the pious layman proving his equal by solving each riddle. In one riddle a father tries to waken a child sleeping by a dam, but the child sleeps on until the dam breaks. The solution: the sinner who ignores God's warnings until surprised by death. A version of the *Rätselspiel*, incidentally, forms the prologue to the courtly novel *Lohengrin*.

Other poems in the *Wartburgkrieg* cycle are less well integrated into the narrative setting. The *Totenfeier* begins with a contest between the "Tugendhafte Schreiber" and another voice (possibly Biterolf) in the art of lamenting the dead. The Tugendhafte Schreiber describes a vision of the personified Justice and Compassion, who stand by the grave of a Thuringian lord and dispute whether the occupant has deserved a song of praise. *Zabulons Buch* tells how after the contest recounted in the *Rätselspiel*, Wolfram calls on St. Brandan for support, and Klingsor on the magic Book of Zabulon; the bulk of the poem describes the history of the book. *Aurons Pfennig* (*Auron's Penny*) is an account of a conflict between monks and secular priests in which the latter are accused of corruption. A letter written in Aramaic, passed to Klingsor by a neutral angel, contains the charges against them.

Weapons

The Roman soldiers who faced the barbarian invasions of the fourth and fifth centuries were outfitted with offensive armaments that varied little from those carried by the first-century legionnaires. The barbarian soldiers whom they faced in the fourth and fifth centuries had different weapons and different attitudes to them than did the Romans. Although there was little standardization among, or even within, the various tribal armies that invaded the Roman Empire, their infantries tended to use spears as their chief weapon. They also were outfitted with axes, bows with iron-tipped arrows, and swords. The chief weapon of the cavalry was a long, two-edged sword. Although the weapons of the barbarians were in most instances not as effective as those of the Romans, the invaders seemed to recognize these limitations and modified their tactics until they could more effectively use their "inferior" weapons.

By the time of the Carolingians, the standardization and effectiveness of offensive weapons had greatly improved. The principal weapon remained the spear, and it was to be carried by both infantry and cavalry troops. As early as 792–793 Carolingian laws required the lance as a weapon for all horsemen, with the infantry outfitted likewise with a lance, as decreed in 802–803. From this time throughout the end of the Middle Ages, the spear, both as an infantry weapon and as a cavalry weapon, took on a new importance in warfare. It continued to be used sometimes as a javelin but mostly as a thrusting weapon, the soldier either thrusting downward with his spear, in a stabbing motion, or thrusting upward, in an attempt to strike an opponent under his armor or to lift him from his horse. Yet using the lance only as a thrusting weapon when mounted made the warhorse merely a fighting platform and did not incorporate either its power or speed into the attack. This was accomplished only when the lance was held fixed under the horseman's arm in a couched position. Then, in what is now called mounted shock combat, as the horse charged an opponent, the lance blow was delivered by a combination of the lance, the rider, and the horse, producing a far greater impact to the attack than a manual thrust ever could. In the fourteenth and fifteenth centuries the infantry spear lengthened to become a pike. In this form it continued to dominate infantry warfare until well into the eighteenth century.

The sword was also prominent in Charlemagne's army. When a warhorse was owned, so too should a sword be owned. Carolingian swords also set the technological standard for sword making for several centuries. The swords on both sides of the Norman conquest of England were Carolingian-influenced. They were also the swords of the Spanish Reconquista and the First Crusade. This was mostly because of the chain mail armor they faced, armor that was most easily destroyed by using the sword as a slashing weapon. Thus, sword blades remained flat and light, with sharp edges emphasized rather than a point. With the fourteenth-century change in armor, from chain to plate, a change in sword fabrication was also needed. Plate armor easily resisted the slashing attacks of the Carolingian-style sword but was more easily penetrated than chain mail had been. Thus the sword needed to be modified to take advantage of that handicap. It became a thrusting weapon, its point used more than its edge to attack an opponent. Swords of the late Middle Ages became shorter and stiffer, often with reinforced, sharp points. Daggers, too, were used throughout the Middle Ages, both for military and for nonmilitary functions.

The ax as a weapon continued to be used until the end of the eleventh century. By that time it began to be replaced by the mace. Derived from the cudgel or club, the mace consisted of a flanged or knobbed iron head mounted on a wooden haft, although by the fourteenth century, some maces were being constructed completely in metal. The mace proved to be a popular weapon, with soldiers using it in a tournament or battle causing great damage to their opponents' shields and armor. But with its variation, the war hammer, the mace tended to be used most frequently by cavalry soldiers.

A late medieval infantry variation of the mace was the staff weapon. The staff weapon describes an entire category of offensive weapons. In their simplest form, staff weapons united the spear or lance with an ax, hammer, or mace to produce a long-hafted infantry weapon that combined the capabilities of a lance against the charge with those of the axe or mace in close-combat melee. In the early years of the fourteenth century, infantry-based armies began to witness their first substantial and constant victories over cavalry-based armies. Although these victories were not determined by weapons alone, the long-hafted weapons that the infantry used at these battles was recognized, as well as that more and more improved, long-hafted weapons would continue to be needed. This led ultimately to the development of many different staff weapons in the next few centuries. These included instruments with names such as halberd, pole axes, goededages, military forks, glaives, guisarnes, ahlspiesses, bardiches, vouges, bills (or billhooks), chauvesourises, couseques, partisans, and rawcons.

Finally, missile weapons, bows, and crossbows were also frequently used on the battlefield, with slings used less frequently.

Nicolaus Weckmann became a citizen of Ulm in 1481, and documents reveal that he subsequently became a highly successful wood sculptor. His large oeuvre was not recognized, however, until Wolfgang Deutsch's research was published in 1968 following the discovery four years earlier of a signature on the base of an over-life-size linden wood statue of the *Ritter* (Knight) Stefan von Gundelfingen at the parish church in Neufra. The inscription "niclaus weckman bildhauer...1528" (Nicolaus Weckman Sculptor... 1528) revealed during a cleaning of the Neufra sculpture is likely that of the younger Weckmann, but its discovery has resulted in a reevaluation of sculpture in Ulm during the years around 1500 and of the recognition of Weckmann the Elder as a major artistic personality.

Prior to 1964 Michel Erhart and Jörg Syrlin the Younger were considered the major wood sculptors in Ulm active around 1500. Deutsch has recognized, however, that the younger Syrlin was primarily a contractor who acted as an agent in securing wood carvers and decorators for the production of altarpieces. Much of the work previously attributed to the younger Syrlin has now been given to Weckmann. Some of the key monuments are a figure of Saint Sebastian in the Neidhart chapel of Ulm Münster, the Virgin with Saints Peter and Paul from Ochsenhausen now at Ballamont, a Holy Kindred in the parish church of Haldenwang, the center of the altarpiece from Talheim now in the Württembergisches Landesmuseum in Stuttgart, and the Virgin Enthroned on the Crescent Moon in the Kunsthistorisches Museum in Vienna.

Weckmann maintained a large workshop, and there is consequently some inconsistency in the generally high quality of its output, as well as a formulaic approach to such features as drapery carving and hair. Nicolaus Weckmann the Elder is last mentioned in documents in 1526 when he was characterized as "old."

Welfs

The Welfs (also Guelfs) came originally from Alsace. A Frankish noble called Ruthard, count of Argengau in the reign of Pippin III, the Short, is now recognized as one of the founders of the family.

When Louis the Pious married Judith, the eldest daughter of Count Welf, possibly Ruthard's son or grandson, in 819, her brothers Conrad the Elder and Rudolph advanced rapidly at court, and her younger sister Hemma married Louis the German, Judith's stepson. Conrad the Elder in particular acquired much land in Swabia. Conrad's sons Conrad the Younger and Hugo, and Rudolph and Welf were deeply involved in the problems of the Carolingian Empire after 841. Their Swabian power base committed them initially to Louis the German of east Francia, but in 859 Conrad the Younger chose to ally himself with the west Frankish Charles the Bald, and he married the Carolingian Waltrada. In 865, Conrad acquired the former Burgundian "kingdom." Burgundy was a Germanic settlement in the northern Rhône valley, the eastern Alps and the Upper Rhine. In the fifth century their leader Sigismund had become a Christian, but Attila's Huns seriously damaged the fragile kingdom, and the expanding Merovingian Franks destroyed it soon after. Little remained but legends later turned into the *Waltharilied* (ninth century) and the *Nibelungenlied* (thirteenth century).

Conrad's son Rudolph, cognizant of his Carolingian heritage, called himself "King of Burgundy" in 888. His ambitions suffered a serious setback however, at the hands of Arnulf of Carinthia, the new ruler of East Francia, who blocked Rudolph's expansion into Lotharingia. Rudolph bequeathed his dreams and his kingdom to his son in 912. Rudolph II also tried to move westward into Vienne, south into Provence and Italy, and eastward into the areas around Basel. Italy was beyond his grasp, but he managed to move into Provence. In 922 he married Bertha of Swabia and in 926 he became an ally of the German king Henry I. Rudolph II died in 937; his son Conrad "the Peaceable" eventually succeeded him in circa 941; his daughter Adelheid first married Lothar of Italy in 947 (d. 950) and then the German king Otto I. Conrad died in 993; his son Rudolph III ruled Burgundy until 1032, when he died without heirs. The senior branch of the Welfs ended and Burgundy became part of Conrad II's empire.

The younger branch of the Welf family descended from Welf I (d. 876), left behind as Count of Argengau when his elder brothers defected to Charles the Bald. His grandson Henry (*Heinrich mit dem goldenen Pflug*) recovered some of their lost lands in Swabia, and in 935 he founded the convent of Altdorf. His marriage to Atha von Hohenwarth brought him lands in Bavaria; one of his sons, Conrad, became bishop of Constance (934–975). His great grandson Welf II (ca. 970–1030) married Imiza (Irmentrud) (ca. 985–after ca. 1057), daughter of Frederick of Luxemburg. Welf II and Imiza had two children: a daughter, Kunigunde (Cuniza) (ca. 1010–ca. 1040), married to Azzo II marquis of Este about 1030, and a son, Welf III (born ca. 1005), duke of Carinthia. He relocated the family monastery of Altdorf on the Martinsberg, now called Weingarten. Unmarried, Welf III willed the Welf lands to Weingarten. On his death in 1055, however, his mother, Imiza, challenged his will on the grounds that she had not consented to his bequests; her Italian grandson Welf IV (d'Este) inherited instead. Welf, then about twenty, began his long career in Swabia and Bavaria under the Salian emperors Henry III and Henry IV, becoming duke of Bavaria in 1070. He died in 1101. He married three times but had children only by his third wife, Judith of Flanders (d. 1094), the widow of Tostig Godwinson (d. 1066). His eldest son, Welf V, born circa 1073, married the middle-aged Mathilda of Tuscany in 1089, but the marriage was dissolved in 1095. In 1101 Welf V became duke of Bavaria, dying on September 24, 1120; his successor was his younger brother Henry the Black (Heinrich der Schwarze), born 1074 and died December 13, 1126. In 1095/1100 Henry married Wulhild of Saxony, heiress of Magnus Billung duke of Saxony (she died on December 29, 1126). Henry the Black thus established a foothold in Saxony for the Welf family; he and his wife had seven children, among them Judith (1100–1130), the wife of Frederick of Staufen, duke of Swabia, and the mother of Frederick Barbarossa; Welf VI, who inherited all the Italian lands (Spoleto and Tuscany) and died in 1191, his only son, Welf VII, having predeceased him in 1167. The eldest son, Henry the Proud (Heinrich der Stolze), born circa 1100, became duke of Bavaria in 1126, married Gertrude, daughter of Lothar III, in 1127, and became duke of Saxony in 1137. Henry the Proud had fully expected to follow his father-in-law as ruler of the Holy Roman Empire in 1137, but he was passed over for Conrad of Staufen. A civil war ensued, but Henry died suddenly on September 24, 1139, and the Welfs' power seemed at an end. Henry and Gertrude had one son, Henry the Lion (Heinrich der Löwe), (ca. 1129/ 1131–August 6, 1195), whose guardians managed to save his Saxon lands. Henry the Lion rose to great heights as duke of Saxony and Bavaria in the reign of his cousin, Frederick I, only to lose everything through arrogance and political miscalculation. Henry the Lion's marriage to Mathilda of England (1156 to June 28, 1189) produced at least eight children, among them Henry of Braunschweig (1173–1227), Otto IV (1177–1218), and William of Winchester (1184–1213). William and his wife, Helena of Denmark, had one son, Otto the Child (Otto das Kind, 1204–1252), who became duke of Braunschweig-Lüneburg. His descendants were the electors of Hanover (1699) and kings of England (1714).

The Welfs are one of the oldest noble families of Europe, beginning in the eighth century. In the twelfth century a Swabian cleric in the employ of Welf VI wrote a family history, *Historia Welforum*. Embellished with legendary details, this chronicle bears witness to the Welfs' pride as a noble clan. Though dimly aware of their Frankish past, the Welfs saw themselves as proud Swabians connected to the most powerful families of Germany and Italy; their name "Welf," so they believed, derived from *welp* (cub), particularly the lion's cub. A lion was their heraldic symbol.

Wenceslas IV (Václav, Wenzel, king of the Romans 1378–1400, king of Bohemia until 1419) was the eldest son of Charles IV by his third wife, Anna of Schweidnitz. Wenceslas was born on November 26, 1361, in Nuremberg. He was elected king of the Romans on June 10, 1376, and assumed control of imperial affairs as Staathalter in February of the following year. After Charles's death, he inherited the Bohemian crown. Wenceslas has not enjoyed the good reputation of his father. In particular, he has been generally condemned for his sloth, vacillation, and drunkenness.

Wenceslas was faced immediately with several serious problems. First was the Swabian City League, established July 4, 1376. The growth of the league, aimed directly against the mortgage policies of his father, led to a major war, lasting until 1389. The second problem was the Great Schism, which broke out in the fall of 1378. Wenceslas supported the pope in Rome, Urban VI. In 1380 he traveled to Paris in an attempt to convince French King Charles V to withdraw support from the Avignon pope, Clement II. When this effort failed, on the advice of Urban VI, Wenceslas allied himself with Richard II of England. The alliance and resulting marriage between the English king and Wenceslas's sister Anna marked a total break with the traditional pro-French Luxembourg policy. Within the empire, a group of southern principalities, led by Leopold III of Austria and Archbishop Pilgrim II of Salzburg, supported Clement VII.

During the first years of his reign, Wenceslas sought to resolve the problems of the cities. The *Landfriede* (peace) of Nuremberg (1383) marks the first attempt to divide the empire into districts or counties (*Kreise*), anticipating the later reforms of Albrecht II and Maximilian I. After the league's defeat at Döfingen (1388), the *Landfriede* of Eger (1389) provided a modicum of stability for the next several decades. The political autonomy of the cities was recognized, while they were banned from making further leagues.

After 1390, problems in Bohemia consumed most of Wenceslas's energy. He tended to support the towns and lower nobility; this provoked resistance from the great nobles and higher clergy. The archbishop of Prague, Jan z Jenštejna (1379–1396) in particular proved a serious opponent of the crown. The torture and murder of the vicar general of Prague, John of Pomuk (March 20, 1393) by royal officials provoked a noble Fronde in 1394. Wenceslas's cousin, Margrave Jost of Moravia, joined with the nobles and took the king prisoner (May 8, 1394) with the collusion of Duke Albrecht III of Austria. Jost was named regent, but the intervention of Wenceslas's half-brother John of Görlitz and Ruprecht II of the Palatinate led to the king's release. As Wenceslas now turned on his opponents, a civil war broke out. The deaths of Albrecht III (August 29, 1395) and John of Görlitz (March 1, 1396) brought an end to the fighting. Wenceslas's other halfbrother, king Sigismund of Hungary, was able to negotiate a peace settlement among Jost, Wenceslas, and the nobles. In return, Sigismund was recognized as Wenceslas's heir and named imperial vicar.

After the battle of Nikopolis (September 28, 1396), Sigismund turned to securing his Hungarian lands. This left Wenceslas, after a ten-year absence from Germany, faced with an angry crowd of princes at the imperial diets of Nuremberg (1397) and Frankfurt (1398). The four Rhenish electors issued a series of demands. The *Landfriede* and Schism were perennial sticking points. Wenceslas's elevation of Giangalleazzo Visconti to the duchy of Milan (April 11, 1395) also provoked the electors' ire. In June 1400 the Rhenish electors demanded that Wenceslas appear before them to answer to their complaints. Their request coincided with a renewal of hostilities among Wenceslas, Jost, and the nobles. Wenceslas's Bohemian problems did not, in the eyes of the electors, excuse his refusal to appear. On August 20, 1400, the four Rhenish electors declared Wenceslas deposed and elected the count palatine, Ruprecht III, king of the Romans.

Wenceslas refused to recognize his deposition, but he was too occupied with Bohemian affairs to do much about it. The death of Ruprecht of the Palatine in 1401 presented Wenceslas with an opportunity to regain the German throne. Unfortunately he could not count on support from his family. Indeed, both Sigismund and Jost were able to secure election to the imperial throne. Jost's death—perhaps from poison—in January 1411 cleared the way for an agreement between Sigismund and Wenceslas. The latter agreed to relinquish his German crown in return for half the imperial revenues and recognition of his position in Bohemia.

The last years of Wenceslas's reign in Bohemia saw the beginnings of a religious and political crisis that would later erupt in the Hussite revolution. Since the time of Charles IV, a series of radical preachers, among them Conrad Waldhouse, Jan Milic, and Matthew of Janov, had been attacking the higher clergy. The marriage between Anne of Bohemia and Richard II of England led to the growth of a Wycliffite faction among Czech scholars at the University of Prague. Jerome of Prague, along with his student Jan Hus, appeared as leaders of the Wycliffite Czechs. The ideological struggles were connected with political struggles in the university between the Czech minority and the three German-dominated "nations."

After the Roman pope Boniface IX (1389–1404) supported the Rhenish electors in 1400, Wenceslas turned to support the Czech reformers. He agreed to recognize the Council of Pisa (1408) and at the council of Kutná Hora ordered the German masters of the university to do so as well. The Kutná Hora decrees (January 18, 1409) broke the Germans' control over the university, giving the Czech nation three votes to one for all three of the German nations. A number of German masters left, later forming the core of the University of Leipzig.

The principal architects of the Czech victory were Jerome of Prague, Jan Hus, and Jakoubek of Stribro. In the wake of the Kutná Hora decrees, Archbishop Zdynek of Prague (1399–1411) excommunicated a number of royal officials and placed Prague under the interdict. Wenceslas ordered the city's clergy to ignore the decree. Zdynek agreed to submit to the king, but then fled the kingdom, seeking the aid of Emperor Sigismund. The archbishop died in Bratislava in September 1411, and after his departure, the Hussite movement became more radical. A group of reformers began calling for the administration of the cup to the laity (*utraquism*). In 1412 Hus and Jakoubek publicly declared the Roman pontiff to be antichrist, leading to their excommunication. Along with the new archbishop, Conrad of Vechta, Wenceslas made a furtive attempt to restore Catholicism. Hus turned to the nobility for support, and at a synod in February 1413, Wenceslas again changed his mind, ordering the archbishop's commission to declare that there was no heresy in Bohemia.

In 1414 Emperor Sigismund requested that Hus appear before the Council of Constance to explain his program. Under a guarantee of safe-conduct, Hus went to Constance but soon found himself imprisoned. Over 250 Czech nobles protested this action, but to no avail. On July 6, 1415, Hus was burnt as a heretic in Constance. Reprisals against other Hussites had already begun. The German burghers of Olomouc had burned two lay preachers a week earlier; Jerome of Prague was burnt in May of the following year. Hus's death led fifty-eight Hussite nobles to form a Hussite league in September 1415. A Catholic alliance followed a month later. In 1416 Wenceslas again tried to restore Catholicism in Prague, but resistance from the university faculty and nobility forced a compromise on the question of *utraquism*.

The election of Pope Martin V in 1417 increased pressure on Wenceslas to take a hard line against the heretics. In the spring of 1419, Wenceslas arrested priests in Prague who granted the cup to the laity, and appointed Czech and German Catholics as *Bürgermeister* (mayors) in the Nové Mesto. On July 30, 1419, the radical preacher Jan Zelivsky led a procession through the city to the New Town Hall demanding the release of imprisoned Utraquist priests. A scuffle broke out, and thirteen of the council members were thrown out the window. The first defenestration of Prague led to the outbreak of a great revolt. Not long after, on August 6, 1419, Wenceslas died. While most works ascribe his death to a stroke, research by a Czech neurologist suggests that the actual cause of death was acute alcohol poisoning.

Wenceslas was married twice, to Johanna of Bavaria (d. 1386) and Sophia of Bavaria (d. 1425). He had no children and all his lands fell to Emperor Sigismund.

Werden

Located near Essen on the Ruhr River, Werden was founded as a private monastery about 800 by Liudger (or Ludger), the missionary to Friesland (Frisia) and the first bishop of Münster in Westphalia; after his death in 809 he was buried here. Richly endowed and stamped by Anglo-Saxon influence, the abbey possessed an important scriptorium, a large library, and several early medieval church buildings. Of Liudger's original three-aisle church, only the foundations of the nave and the west wall have been excavated. Building II, a basilica structure with a triapsidal sanctuary and a hall crypt where Liudger's grave was located, was consecrated in 875. Its basic forms are visible in the Romanesque ring crypt from the eleventh and thirteenth centuries and in the outer walls of the choir integrated into the new, late Romanesque church. A "westwork," or side of the structure facing west, known as the tower of the Virgin (*turris Sanctae Mariae*) and later as the church of St. Peter, was added onto the late Carolingian building in the second quarter of the tenth century and consecrated in 943; its middle tower with flanking two-story side spaces is also largely preserved, although changed as a result of its incorporation into the thirteenth-century building. In 1892 and 1953–1954, wall paintings were uncovered in the westwork. Architectural features, such as the undersides of the arches of the gallery, were decorated with color and, in places, ornamental detail, and remains of unidentified scenes occupied two niches in the side walls of the aisles. These may well be the oldest known Ottonian wall paintings. After a fire in 1256, Abbot Albero rebuilt the church (now the parish church of St. Ludger) almost completely in the mature forms of the Rhenish late Romanesque; it was consecrated in 1275.

The treasury of the secularized cloister was partially auctioned off; a Frankish reliquary casket made of bone in the eighth century, the so-called chalice of St. Liudger of the ninth-tenth century, and a Romanesque bronze crucifix from the daughter cloister of Helmstedt (about 1060) attest to its former richness. Still preserved in the church are seven limestone reliefs representing two standing deacons and fourteen seated figures, mostly women, under individual arcades; these panels, which probably came from a rearrangement of Liudger's tomb about 1058, represent an important early step in the development of stone sculpture in the Rhineland.

The eastern parts of the three-apsed choir of the affiliated church St. Clemens, which stood on the hill above the abbey church, have been excavated; this church was consecrated in 957 and razed in 1817. The remains of the eleventh-century parish church St. Lucius, a three-aisle basilica with alternating supports dedicated in 1063, have been severely altered as a result of partial demolition in the eighteenth and nineteenth centuries, secularization in 1803, and rebuilding in 1958. Some figural painting remains in the niches of the square choir bay.

Matthias Exner

The creator of one of the most realistic narratives of the Middle Ages, Werner der Gärtner (the gardener) composed *Helmbrecht*, a short epic of 1,934 lines written in rhyming couplets, between 1250 and 1280, although some dispute this dating. Detailing a drastic picture of contemporary life, Werner depicts the decline of chivalry as well as the moral decay of the peasantry. The work has been variously described as a *Dorfgeschichte* (village tale), *Verspredigt* (rhymed sermon), and exemplum (moral tale). *Helmbrecht* survives in two manuscripts: "A" refers to the famous *Ambras Book of Heroes* (Heldenbuch) from 1504 to 1515, a costly parchment manuscript in Vienna (Nationalbibliothek) copied by Hans Ried; and "B," the "Leombach Manuscript" (1413), a paper manuscript. A third, illustrated manuscript, now lost, was still extant at the start of the nineteenth century. Manuscript "A," regarded as the original version, points to the Austrian-Bavarian region as its place of composition. Little is known of Werner, who is generally thought to have been a cleric, a wandering minstrel, or an occasional poet. He was an educated man whose work was intended for a sophisticated, noble audience. This moral-didactic tale centers on the generation gap between father and son, between older conservative values and newer progressive aspirations. Werner begins with a description of the elaborate and highly inappropriate cap with which Helmbrecht, the farmer's son, hopes to find acceptance among the knights. The younger Helmbrecht rejects the farmer's life and instead aspires to become a knight, a calling for which he is clearly unsuited. His mother and sister provide him with expensive clothing (a contravention of the sumptuary laws); father Helmbrecht provides him with a costly steed, but only after trying to dissuade his son from leaving the farm (vv. 233–258; 279–298; 329–360). Helmbrecht easily finds acceptance with a band of robber knights and soon becomes the worst in his gang. After a year of plundering, he returns home and tells his father about the depravity and immorality of the knights. The elder Helmbrecht again tries to convince his son to remain on the farm and offers to share all that he has with him (vv. 1098–1114). Helmbrecht scoffs at this offer and returns to his band of robber knights, taking with him his sister Gotelint, who secretly has agreed to marry his friend Lemberslint. The marriage proves ill-fated, for after the wedding breakfast the judge and his hangmen appear and try them on the spot. Helmbrecht's nine companions are summarily hanged. Helmbrecht's life is spared but only after he has been maimed and blinded as punishment for his behavior toward his parents. It is in this pitiful condition that Helmbrecht returns home for the last time. Unlike before, he does not find a compassionate father ready to help him, but rather a disdainful father who turns him out (vv. 1713–1760; 1775–1813). Helmbrecht suffers a miserable existence in the forest until he is finally captured by peasants whom he had wronged and is hung.

The three conversations between father and son mark the tale's progress. The lesson is clear: parents should be strict in educating their children; children should obey their parents (the Fourth Commandment); one should be content with one's station in life (*ordo mundi*). Whether or not Werner actually witnessed the events he describes, these events accurately reflect the social unrest occasioned by the end of the Hohenstaufen reign in the late thirteenth century. Werner addresses the major social issues of his time by depicting the collapse of the feudal system, the decline of chivalry, and the new self-assertiveness of the peasants; his social criticism is directed at peasants and knights alike.

Westphalia

This region of northwest Germany (German, Westfalen) was originally the territorial home of one of the three ancient Saxon groups: Westphalians, Eastphalians, and Angarians (or Engern). The Westphalian Saxons had settled in the plains around the Hunte and Ems Rivers around the late seventh century and migrated southward thereafter almost as far as Cologne. They became the target of missionary activity but resisted Charlemagne's attempts to extend Frankish power in the region. Westphalia retained a separate identity for the next three centuries, during which the traditional distinction between the Westphalians and Angarians fell into disuse. In spite of the formation of a Saxon tribal stem duchy under the Liudolfinger (Ottonian) dynasty, the Weser River remained the dividing line between Westphalia and the duchy of Saxony as it emerged east of the Weser in the tenth century.

After rising to royal status, the Saxon princes of the Liudolfinger line retained Westphalia as crown land after establishing a new Saxon duchy under the Billung dynasty by the mid-tenth century. After the extinction of the Saxon royal dynasty, however, the many local secular and ecclesiastical lords increased their power and independence in Westphalia as a result of the Investiture Controversy wars and other rebellions against the Salian royal dynasty. When the Billung ducal house also died out (in 1124), the Saxon duchy (east of the Weser) and the territory of Westphalia were reunited in 1142 and placed in the hands of the Welf, Henry the Lion (thus the duke of Saxony and Bavaria). This reunification of Saxony under ducal leadership was short-lived, however. An anti-Welf alliance of Bishop Ulrich of Halberstadt (recently deposed by Henry the Lion) and the Cologne archbishop, Philip of Heinsberg (who was seeking to recover his nephew's confiscated Saxon inheritance as well as to extend his lordship into western Westphalia) led to increasing feuds with the Welf in Westphalia. The result was Henry the Lion's famous deposition in 1180 at the hands of the emperor (Frederick I Barbarossa), at which Barbarossa gave Westphalia to the archbishop of Cologne as the new duchy of Westphalia. This duchy would be ruled by the archbishops of Cologne until 1803, with its own political and administrative institutions and capital (first at Arnsberg, then from 1434 at Werl). In actuality, effective archiepiscopal lordship was confined mainly to the Sauerland, an area just north and east of Cologne. The other regions of Westphalia were ruled by the bishops of Münster, Paderborn, Osnabrück, and Minden, with the counts of Waldeck, Schaumburg, Lippe, Ravensberg, and Mark (with the Limburg), the imperial city of Dortmund, and the abbey of Essen.

With regard to trade and commerce, the cities of Westphalia tended to follow the city of Cologne throughout the eleventh and twelfth centuries. This is best seen in their coinage, which they minted as replicas of the Cologne penny (*pfennig*). But by the mid-thirteenth century they had become vital centers of trans-European trade in their own right, and were among the first in Germany to form an urban league for the advancement of their economic interests. The Westphalian city league was created in 1246, lead by such cities as Münster, Osnabrück, and Minden.

Widukind of Corvey (fl. 760s–770s)

Little is known of Widukind's personal life. It has been suggested that the future historian may have entered Corvey at the age of fifteen, during the reign of Abbot Folkmar (d. 942), and that, given the community's social profile, he would have stemmed from the high Saxon aristocracy. Indeed, he may well have been related in some way to "Duke" Widukind, the ninth-century leader of Saxon resistance to Charlemagne's conquest. If so, he would also have been distantly related to the wife of King Henry I, Mathilda, and to her nephew, Count Wichmann. Widukind is known to have composed two works of hagiography: a passion of Thecla the Virgin, and a life of Paul the Hermit. Neither of these has survived. His only extant work, then, is his Saxon history. The work survives in three versions. The first and earliest ("A") is dedicated to Abbess Mathilda of Quedlinburg (d. 999) and includes appropriate prefaces for each book and additional material, most of it intended to edify or flatter her. Widukind apparently hoped that Mathilda, a royal princess, would use her influence at court to help the monks of Corvey. This version of the text extends as far as Book 3, Chapter 69, and is thought to have been completed by 968. Version "B," the so-called *Hand-* or *Klosterexemplar* (monastery copy), remained at Corvey. It preserves most though not all the additions included in "A." Widukind subsequently added material to this text that now extended through the death of Emperor Otto I in 973. Version "C" also continues Widukind's text up to the death of Otto I but shows evidence of revisions that differ from both version "A" and "B." It is generally thought to have arisen after 973 and to have been based on "B." The text itself is organized into three books. The first book considers the origins of the Saxon folk, especially their early relations with the Franks, the early history of the Liudolfing lineage (i.e., the future royal dynasty), and the rise to power of King Henry I. Here, too, one encounters Widukind's observation that Henry had refused the right of royal anointing, a passage whose significance has intrigued historians for generations, and his equally problematic reference to the *agrarii milites* (armed farmers) who manned the king's fortresses. The second book covers the history of Otto the Great through the death of Queen Edith (946). It includes a unique and particularly detailed description of the king's coronation at Aachen and deals extensively with the uprisings and feuds that plagued much of his reign. The third book continues the story of Otto's reign up to the death of Count Wichmann the Younger (967), who ended his life as a rebel against King Otto I. As already noted, versions "B" and "C" continue the story to Otto's own death and the election of his successor, Otto II. Widukind appears to have known the more familiar historical works of the era, especially Bede and Einhard, and had access to works, such as the anonymous *Translation of St. Vitus*, produced by members of his own community. Among classical authors, he is thought to have been influenced in particular by the Latin poet Sallust, although recent study has raised strong arguments to the contrary.

Wiener Neustadt

Not commonly referred to as Wiener Neustadt (literally, Vienna New City) until the seventeenth century, Neustadt was founded by Leopold V, duke of Austria and Styria, in 1194. He intended that Neustadt fortify the eastern boundary of his realm against Hungarian invasion and protect the roads through that frontier area. According to tradition, Leopold's share of the ransom paid by Richard the Lionhearted (50,000 pounds sterling) financed the city walls. The task of building the town, however, fell to Leopold VI, as his father died within a few months of its founding.

The military colony was laid out as a parallelogram with four main streets leading from a rectangular plaza in the center of the city out through four city gates, each dominated by a massive, four-cornered tower. A canal was constructed to divert water from the Schwarza River to the city, then into a moat between a high inner wall and a lower outer wall around the town; the moat provided additional protection for Neustadt as well as its water supply.

To draw inhabitants to the new military colony, the duke transferred market rights from Neunkirchen to Neustadt. Throughout the Middle Ages, moreover, the ruling lords encouraged the Neustadt economy by granting its citizens special trading privileges as well as exemption from tolls and taxes. The special privileges and protection afforded the town sparked jealousy in the surrounding area. Indeed, Neustadt's history during the second half of the fourteenth century is marked by repeated, sometimes violent quarrels with Vienna over the smaller town's preferential treatment. Impressive works of art like the intricate Gothic cross base, the so-called *Spinnerin Kreuz* (weaver's cross), commissioned about 1380 by wealthy citizens and trade guilds, are a testament to Neustadt's prosperity during this period.

The presence of cloisters and churches contributed significantly to the character of Neustadt. Construction of the parish church dedicated to the Virgin (Liebfrauenpfarrkirche), a spacious three-aisle basilica, was completed in 1279. The two imposing towers on either side of the west portal are a prominent feature of the city skyline. Although the church has a Romanesque exterior, the interior displays predominately Gothic elements. A Gothic choir and transept were added to the church in the early fourteenth century. In 1469, Pope Paul II established the bishopric of Neustadt and elevated this parish church to a cathedral. The church's new status required that appropriate embellishments be undertaken. During the later fifteenth century, late Gothic auxiliary chapels were added, four new altars were consecrated, and splendid sculptures and paintings were produced to adorn the interior of the cathedral. Among these were grand, twometer-high figures of the apostles with companion paintings of twelve prophets.

Before 1250, Cistercians, Dominican friars, Dominican nuns, and Franciscans had established houses within the city walls. The exterior walls of the Dominican cloisters were incorporated into the city walls so that these buildings, too, contributed to Neustadt's fortification. The choir of the Franciscan church (Minoritenkirche), built around 1300, provides the most impressive example of Gothic architecture in Neustadt. Later, Augustinians as well as Teutonic Knights and Knights of St. George all had houses within the town's walls.

Additional fortification was added to the frontier town in the early fourteenth century when Duke Frederick II (Babenberg) built a new castle against the southeast corner of the city walls. This castle was then the largest four-towered Gothic castle in Babenberg territory. During the fifteenth century, under Habsburg rule, the castle was improved and transformed into a Renaissance palace. An already famous walled garden, the Tiergarten, on the east side of the castle was enhanced. A new church, St. George's, was constructed on top of the western gate of the palace and furnished with rich carvings and stained glass windows. The famous Wappenwand, on the exterior of the church, which boasts 107 coats of arms around three Gothic windows, was completed in 1453.

By around 1250, one of the most important Jewish congregations in the empire had developed in Neustadt, where its members experienced greater tolerance than did their counterparts in other cities. Neustadt's Talmud school attracted students from all over the empire, as well as from Hungary and Bulgaria. The school reached the height of its fame under Rabbi Israel Isserlein. After his death in 1460, its importance waned. In 1496, Maximilian I ordered the Jewish community to leave Neustadt. By 1500 this exodus was complete.

Neustadt became the primary residence of the Habsburgs in 1412. Their continued presence increased the city's stability and fostered a period of tremendous economic and cultural growth, particularly during the period of Frederick III (1433–1493). When Duke Frederick was elected king in 1440 and crowned emperor in 1452, the political importance, prosperity, and outward splendor of Neustadt increased accordingly. A richly gilded altar that Frederick commissioned for the Neuklosterkirche was completed in 1447. It is one of Austria's most important late Gothic works of art. During this period of Habsburg residency, Neustadt was second only to Vienna as an important center of Gothic architecture in the eastern realm.

When Frederick III left Neustadt to reside primarily in Graz and Linz, the city's population and glory began to decline. In 1483, Neustadt was captured by the Hungarian king Matthias Corvinus after a siege of seventeen months. Maximilian I recaptured the city and, although he moved his court to the more centrally located Innsbruck, he returned frequently to a hermitage built onto the Neustadt castle for him. His tomb is there in St. George's. A fire in 1497 destroyed much of the city and accelerated a decline in population.

Wienhausen

A nuns' cloister of Cistercian observance dedicated to the Virgin and St. Alexander was first documented on the Aller River northwest of the village of Wienhausen (Lower Saxony) in 1229. Founded by Agnes of Meißen, a daughter-in-law of Henry the Lion, it received rich donations from the dukes of Brunswick-Lüneberg as well as from the early nuns who were from noble families. Its building and decoration reached a high point in the fourteenth and early fifteenth centuries, and it is remarkable today for the number and quality of original artworks, interiors, and furniture still existing in the original setting. An economic decline that began with a Windesheim reform in 1469 and continued in the sixteenth century with the successful efforts to force a Lutheran reform ensured that no extensive baroque changes replaced the early arrangement.

Today, the interior of the All Saints' Chapel (ca. 1300), the west wing of the cloister (ca. 1310), and the nuns' church (ca. 1330) remain from the original buildings. The latter two, both with stepped gables, ogival (diagonal) blind niches, and high ridge roofs, as well as stairway towers at the corners, are early examples of brick Gothic building in the Lüneberg Heath. In the west wing at the former entrance to the winter refectory, fragments of wall painting (ca. 1320) show the donor Agnes with the church, its patron saints, and the abbess and provost with the west wing, which was built in their time. The oldest stained glass windows of the cloister (1290–1300) are found in the All Saints' Chapel and on the upper level of the south cloister (ca. 1330), where six Passion scenes and a Crucifixion by the Virtues are found. In an adjoining new chapel are the half-life-size figures of the Throned Madonna and Child and the Resurrected Christ from the late thirteenth century.

The nuns' choir is a rare example of completely preserved, although often restored, wall and ceiling painting showing the lives of saints, Old and New Testament scenes, and the Heavenly Jerusalem (ca. 1335). In the middle is a house-shaped Holy Tomb consecrated in 1448; it is painted inside with the Life and Passion of Christ and contains a wooden Christ figure of the late thirteenth century. High wooden candlesticks with scenes of the Life of the Virgin and Passion of Christ from about 1400 now stand at its four corners. The late Gothic altar retable from 1519 has in the center an almost life-size Virgin on a Half-Moon and, flanking her, wings containing relief scenes from her life.

The cloister museum displays a large number of small medieval devotional objects and items for daily use found in 1953 under the floorboards of the choir. Each year, in the second week after Pentecost, the nine famous woolembroidered tapestries on linen dating from the fourteenth and fifteenth centuries are shown to the public. Their subjects vary from the important and early Tristan tapestry and one with Hunting Scenes, to Old Testament Prophets, a typological *Speculum* (mirror, or primer) tapestry, and Legends of St. Thomas, St. Anne, and St. Elisabeth. Most of the available literature on the cloister is descriptive and historical; only since 1990 have studies relating its furnishing to the practices of north German women's cloisters been published.

Wigamur

This Arthurian romance was written by an anonymous poet of unknown social status, presumably around 1250. Subsequent references to this 6, 106-verse work by Der Tannhäuser and Ulrich Fūeterer and in *Jūngerer Titrel* and *Friedrich von Schwaben* provide no help in more precise dating. East Franconia has been named as a possible place of origin. The text is transmitted in one paper manuscript (Wolfenbüttele) from the end of the fifteenth century and two fragments written on parchment (now in Salzburg and Munich) dating from the mid-fourteenth century and from around 1300, respectively. The fragments have played a crucial role in emending the text of the head manuscript, which is, in part, seriously flawed by lacunae and interpolations. While earlier scholarship viewed the romance as a primitive compilation of traditional episodes and motifs derived from the vast body of Arthurian literature, most notably *Lanzelet* and *Wigalois*, contemporary critics have pointed to a sequence of narrative elements that is structured as follows: Prelude: Wigamur's abduction and childhood; Probationary Period: From precourtly state to knight errant; Affirmation: Wigamur in the Arthurian world; Reintegration: Wigamur's homecoming and wedding; Postlude: Abduction and rescue of Wigamur's bride. The achievement of the *Wigamur*-poet is seen in his unique emphasis on the hero's reintegration into family and society, which begins with Wigamur's personal quest of identity and ends with the assumption of royal duties and the administration of justice. These themes are supported and elaborated in the Wolfenbüttele manuscript by an impressive picture cycle consisting of sixtyseven framed drawings. Not only do they exhibit a distinct narrative structure of their own, but they also bear testimony to the positive reception of the work in fifteenth-century Germany.

See [Wolfram von Eschenbach](#).

The most important author and performer of *sproken* (short verse narratives) in Middle Dutch literature, Willem was born around 1350 in Hillegersberg, near Rotterdam (county of Holland). He died between June 1408 and April 1409. He was not of noble heritage and seems to have received a rather restricted education. We can probably take seriously the verses in which he states that he is ashamed of his lack of knowledge of Latin. Willem was an itinerant poet, performing at aristocratic courts, in abbeys, and in towns. He maintained a close relationship with the court in The Hague, judging by his frequent appearances in the writings about the counts of Holland. Between 1383 and 1403, Willem is mentioned no fewer than thirty-two times.

Much of Willem's oeuvre survives; 120 *sproken* can be attributed to him. His name is mentioned in forty of them. Two manuscripts contain almost all known *sproken* written by him: The Hague, Koninklijke Bibliotheek (manuscript no. 128 E 6) and Brussels, Koninklijke Bibliotheek (manuscript no. 15.659–661), preserving 117 and 119 *sproken*, respectively. Fragments and *sproken* in other miscellanies prove that Willem of Hildegarsberch was very esteemed in his days.

The *sproke*, a short poetic genre, was performed from the fourteenth century onward by itinerant artists in the Middle Dutch area. It has an average length of 180 to 200 verses, but shorter as well as longer *sproken* are found. The *sproke* can be mainly narrative as well as demonstrative, mostly with no lyrical tenor. It generally implicitly or explicitly moralizes or serves a didactic purpose. Moral truth and Christian or worldly ethics are often stressed. The genre of the *sproke* is very close to the exemplum, the parable, and the sermon. Willem mostly writes rhyming couplets, but he sometimes switches to a strophic form.

Willem's poems treat a large diversity of themes. He speaks about religious subjects, such as Christian virtues or the Easter gospel. On the other hand, he does not hesitate to criticize the clergy. An important part of Willem's oeuvre was meant to be recited at court, and these texts are consequently directly addressed to the lords. Here he is concerned with worldly virtues like honor and justice, especially complaining about their decline. He considers it to be his duty to advise the lords in matters of government and to confront them with the truth. His criticism concerns especially the rogues who surround the lords and deceive them. Willem of Hildegarsberch was conscious that he depended to a very large extent on the favor of the lords. This is why he sometimes felt obliged to soften the truth. In those cases he formulated his criticism in an indirect way. Thus, no one had to feel offended, and the person in question always had the possibility to say the criticism did not apply to him or her. The way to make his criticism indirect is fiction. Willem uses dissociating elements: he wraps his criticism in exempla, allegories, or (animal) fables, for example.

Wimpfen

The lower town of medieval Wimpfen—known as Wimpfen im Tal (Wimpfen in the Valley)—was constructed on the ruins of a Roman garrison built to protect the imperial frontier. From the ninth century, Wimpfen belonged to the bishopric of Worms. Little is known about the first church built here, the foundations of which were uncovered in 1901, during the restoration of the abbey church of Saints Peter and Paul. The floor plan shows a central-plan structure, which according to a report of Burkhard von Hall was destroyed in 905 by the Huns. The church was subsequently rebuilt and enlarged; its Romanesque western end still survives. This two-story

Wimpfen am Berg, remains of the imperial palace, from left: gallery, stone house, Blue Tower. *Photograph: Joan A. Holladay*

narthex (entrance hall), with its eight-sided towers, dates to before 1000. It probably stands today only because the building campaign for a new three-aisle Gothic church, after 1269, ran out of money before the demolition and rebuilding of the western end.

Burkhard von Hall, in his chronicle of the Gothic campaign, reported that a builder was called on to construct a new church in the French manner (*opus francigenum*). The south side of the Gothic nave and choir has a more fully developed ornamental program than the north side, which is attached to the monastery's Gothic cloister. Within a gabled porch is a Crucifixion relief in the tympanum, a Virgin and Child sculpture on the trumeau, jamb figures of martyrs bearing palms, and figures of Peter and Paul within niches on either side of the portal. The gable is crowned with a figure of the resurrected Christ. The slender, elegantly proportioned choir, lined with figures of saints on consoles between its windows, is one of a number of German monuments inspired by Ste.-Chapelle in Paris. The oak choir stalls here, commissioned in 1298, are among the earliest examples of wood carving of this kind in Germany. Fresco fragments in the west transept depict Christ Carrying the Cross.

The upper town, Wimpfen am Berg (Wimpfen on the Mountain), was the site of the Hohenstaufen's largest and favorite palace on German soil. Between the so-called Red Tower in the east and the Blue Tower in the west, stretches a 25 meter wide and 89 meter long fortified settlement that was probably established by Emperor Frederick I Barbarossa at the end of the twelfth century. He was here in 1182, at which time he may have commissioned the construction of the imperial palace. The most frequent resident here was King Heinrich (Henry) VII, who held court nine times at Wimpfen in the period between 1224 and 1235. In addition to the two towers, which are accessible to the public, a long section of the north wall of the palace survives. Here, overlooking the Neckar River, one finds remnants of a delicately sculpted arcade dating to about 1200. Twin columns, each with its own abstract capital design, and in some cases shaft ornaments, support a series of round window arches. The Romanesque palace chapel, greatly altered in the nineteenth century, has since been restored.

The well-preserved Steinhaus (stone house) largely dates to the twelfth century. Long thought to be the storehouse for the fortification's provisions, it is now believed to have been the original residence of the queen. The second story is occupied by a large hall with a semi-circular Romanesque hearth and decorative wall paintings believed to have been done in the thirteenth century. The ground floor probably originally served as a kitchen; it was converted in the later Middle Ages for use as a prison. At the same time, the upper hall served as the town's courtroom. Although most of the town's half-timbered (*Fachwerk*) houses were destroyed in the Thirty Years' War, several fine examples survive. Among the oldest is the Bürgerspital (Citizens' Hospital) from circa 1233, with each of its upper stories overhanging the one beneath it.

The Stadtkirche (Municipal Church) in the upper town is a Gothic hall church, the construction of which began in 1234. A Romanesque church on this site, predating the imperial palace, was demolished to make way for the larger Gothic building. The lower sections of the square-based eastern towers are all that remain of the Romanesque monument. The decorative programs on and within the church, including its sculptural works and decorative vaults, largely date to the later part of the Middle Ages. Fine examples of stained glass from this monument (ca. 1300) are preserved in the Württembergisches Landesmuseum in Stuttgart.

Winterthur

The city of Winterthur/Oberwinterthur in Switzerland was founded around 1170 by Count Hartmann III of Kyburg to serve as a marketplace and stockyard. Hartmann was a member of the powerful Kyburg family, which owned lands in the present-day cantons of Zurich and Aargau in the twelfth and thirteenth centuries. After the extinction of the Kyburgs in the mid-thirteenth century, the Habsburgs under the leadership of Count Rudolph acquired Winterthur and used it as a point of defense against the Swiss confederation in 1264.

After its founding in 1170, a small church dedicated to St. Lawrence was erected in Winterthur but was destroyed by fire in 1313. In the section of the city known as Oberwinterthur, a Romanesque parish church is still preserved. There, unique early Gothic frescoes can be found. Oberwinterthur was the site of excavations in the nineteenth century and then again in 1949–1951 and 1958–1959. These revealed first a Roman fort, known as *vitudurum*. Also found were the foundations of an early medieval church erected under the patronage of the Frankish Bishop Arbogast. This church, first mentioned in the sources as Winteraduro in 856, included a rounded apse. Arbogast's church was enlarged in the twelfth century to a basilica with a nave and flanking aisles, and later a choir and tower. The churchyard walls of this church still follow the defensive walls of the Roman fort. The frescoes in the twelfth-century nave were executed around 1340, probably by a workshop from Zurich or Constance. The style of the images can be compared to the Manesse Codex (Heidelberg, Ms. Pal. germ. 848) and the gradual from St. Katharinenthal (Zurich, Schweizerisches Landesmuseum), as well as to the stained glass produced in eastern Switzerland. On the south wall of the nave is a Passion cycle, and on the north, the life of St. Arbogast; both are framed by decorative bands. Portraits of apostles and saints appear between the windows above, in the tradition of basilican wall painting in Rome. During the Reformation in the sixteenth century, the frescoes were whitewashed; they were rediscovered only in 1835.

Wirnt von Grafenberg (fl. 1204–1210)

Author of the Middle High German Arthurian romance *Wigalois*, written between 1204 and 1210, Wirnt is thought to be a *ministerial* (clerical administrator) from the town of Gräfenberg north of Erlangen.

No documents associate him with any particular court at which *Wigalois* might have been written, but Berthold IV, count of Andechs and duke of Meran, is his most likely patron. References to characters from *Erec* and *Iwein* as well as the first part of *Parzival* attest to the author's familiarity with the works of his famous contemporaries Hartmann von Aue and Wolfram von Eschenbach. Although earlier treatments of the *Wigalois* story, such as Renaud de Beaujeu's *Le Bel Inconnu*, existed outside of Germany, Wirnt insists that his source was a story told by a squire. It has been suggested that the citing of an oral source served as a pretext to set his own emphasis rather than following slavishly the demands of the genre.

The *Wigalois* romance consists of 11,708 verses and is written in rhymed couplets. The story of Gawein's son, it is divided into five distinct parts: the hero's upbringing in his mother's fairy kingdom; his arrival at Arthur's court and his adventures in the Arthurian realm; his adventures in the otherworldly realm of Korntin and ultimate triumph over the prince of darkness, the heathen King Roaz of Glois; the hero's wedding and coronation; and the avenging of the murder of a wedding guest. While earlier scholarship insisted on viewing Wirnt's hero as the unproblematic knight of fortune's wheel, more recent work detects a flawed character in need of God's mercy who submits to the will of God. It is God who provides the supreme guidance through the supernatural obstacles of Korntin and grants victory. Wirnt's novelty is the Arthurian knight as God's champion in the eschatological conflict between heaven and hell. He uses the genre to send a message of apocalyptic urgency to his contemporary society, drawing obvious parallels between that society and *Wigalois*'s antagonist. Both have lost sight of the ultimate good, and thus the story of *Wigalois* serves as a vehicle to reaffirm God's grace as our only hope for salvation. Wirnt's romance has enjoyed surprising popularity, judging not only by the relatively large number of extant manuscripts but also by its influence on contemporary as well as subsequent German authors writing in the latter thirteenth and fourteenth centuries. Noteworthy later adaptations of the story include a fifteenth-century chapbook, a Yiddish rendition transmitted in manuscripts from the sixteenth century, and a nursery tale dated 1786. Wirnt himself became the hero of Konrad von Würzburg's verse narrative *Der Welt Lohn*, in which he is depicted as a knight who learns to forsake the things of the world and to serve God. The story of *Wigalois* has also contributed valuable material to the body of Arthurian iconography, ranging from the *Wigalois* frescoes in Runkelstein castle near Bolzano in South Tyrol and woodcuts illustrating the chapbook version to picture cycles in two of the manuscripts. One of these, the parchment codex no. *Ltk 537* of Leyden, is considered the only significant illuminated Arthurian manuscript of the fourteenth century.

Wismar

The historic importance of Wismar results from its fortunate geographical position at the southern end of a bay naturally suited to the placement of a harbor, which was mentioned for the first time in 1211; its importance was enhanced by the land connection to Lübeck along the coastline. The nucleus of urban development is the northern quarter around the Nikolaikirche (church of St. Nicholas) in the immediate vicinity of the old harbor. The town itself developed during the first half of the thirteenth century along the axis of the road to Lübeck. In 1256, the dukes of Mecklenburg moved their residence from the nearby castle of Mecklenburg—destroyed in 1358 and today a mere village—to a castle just outside Wismar and in 1300, after conflicts between prince and citizens, to an unfortified court palace within the town itself. Even though Schwerin became the new capital of the duchy after its acquisition in 1358, the dual function of Wismar both as a prosperous trading center, centered around the market square, town hall, and Marienkirche (church of the Virgin), and as a princely residence with Fürstenhof (the Princes' Court) and Georgenkirche (church of St. George), determined its development and architectural appearance. The first half of the fifteenth century was characterized by civic unrest between patriciate and artisans, between the city and the duke, who demonstrated his continued interest in the civic administration, and by tensions between Wismar and Lübeck.

Despite the severe damage it suffered in 1945 during World War II, Wismar largely still preserves the character of a medieval Hanseatic town. Among the three Gothic parish churches, only the Nikolaikirche is well preserved. Begun in 1381 by Heinrich von Bremen and largely completed in 1459, its tower was finished only in 1508; it is, although a century later, a faithful copy of Lübeck's Marienkirche as a transeptless basilica with ambulatory choir and hexagonal chapels. Of the fourteenth-century Marienkirche, which followed the same model, only the western tower escaped destruction in 1945 and subsequent demolition in 1960. The present Georgenkirche, while integrating a straight-ended choir of circa 1300, was erected in 1404–1497 as a cruciform basilica with expanded transepts and a short nave of three bays covered by star vaults. Partly destroyed in 1945, its ruined state was only recently restored to its original appearance.

Of the town's fortifications as built in the mid-thirteenth century, only the late Gothic Wassertor (Water Gate) from the later fifteenth century has survived intact, and among the many medieval houses with their brick facades, although mostly remodeled, the house Zum Alten Schweden (The Old Swede) on the market square with its splendid Gothic gable represents the best example of its type. The Gothic town hall, a brick building of the mid-fourteenth century stretching along the entire north side of the market square, was rebuilt 1817–1819 in classical forms, but incorporating the original vaulted basement. Of the two mendicant monasteries in the town, only the choir of the Dominican church, consecrated in 1397, exists today; its nave was demolished in 1876 for a rebuilding of the school into which the Reformation had turned the monastic institution. The chapel of the HeiligGeist-Spital (Hospital of the Holy Spirit), founded around 1250, an unvaulted single-aisled structure, dates from the same period. The Fürstenhof was rebuilt in 1512–1513 and 1553–1554 in Renaissance forms with terra-cotta decoration.

[Hanseatic League](#); [Lübeck](#)

Author of the *Ring*, a comic-didactic verse satire of the early fifteenth century, Heinrich Wittenwiler employs chiefly High Alemannic language in the poem, with occasional Bavarianisms. As shown by his knowledge of the local dialect, which he places in the mouths of the peasants in the *Ring*, Wittenwiler probably stemmed from the Toggenburg area of Switzerland. The poem exists in only one manuscript, located in the Meiningen (Thuringia) archives.

Wittenwiler served as *advocatus curiae* at the episcopal court in Constance, where, as a high official of the bishop, he would have moved in circles favorable to the Austrian nobility and inimical to disruptive forces such as the city guilds and the Bund ob dem See (Dutch marine commerce alliance). His use of *Sachliteratur* (technical writing) shows him to have been a man of great learning and wide-ranging interests. He is mentioned in documents from the last two decades of the fourteenth century, although the composition of the *Ring* falls in the first decade of the fifteenth, probably during the episcopate of Albrecht Blarer.

Wittenwiler derived the basic structure of the *Ring* from the short farce *Metzen hochzît* (*Metz's Wedding*), but expanded it to almost ten thousand lines with extensive allegorical, didactic, and satirical passages. Set in the village of Lappenhäusen, the first of three sections deals with Bertschi Triefnas's devotion to Mätzli Rüterenzumph, the antipode of all ideals of courtly beauty. During his wooing, Bertschi accidentally inflicts a head wound on Mätzli, who, while receiving treatment, is impregnated by the doctor Chrippenchra. To cover up his misdeed, the doctor persuades Mätzli to marry Bertschi.

In the second section, a lengthy debate on the pros and cons of marriage, as well as instruction for Bertschi in religion, manners, virtue, hygiene, and home economics, precede the wedding. At the wedding feast, the villagers display every possible form of bad manners and finally abandon themselves to wild dancing. A minor incident at the dance leads, in the third section, to an all-out war between Lappenhäusen and neighboring Nissingen. The conflict escalates until it involves most of southwestern Germany and figures from the Germanic epics. Fro Laichdenman, the local astrologer, betrays Lappenhäusen to its enemies, and the village burns to the ground. Bertschi, the only survivor, laments his failure to follow the wise teachings of his mentors and moves to the Black Forest to lead the life of a hermit.

To underscore Wittenwiler's method of alternating didacticism with bucolic bawling (*gpauern gschrai*), the manuscript differentiates by means of red or green marginal stripes those passages that can serve as stylistic models (red) from those that satirize peasant mores (green). Read as an allegorical work, the *Ring* strongly associates peasants with images of a carnal and sinful humanity; read politically, it expresses the disgust of an urban nobility faced with a series of peasant revolts.

In 1896, Daniel Burckhardt of the Öffentlichen Kunstsammlung in Basle published his observations on the stylistic similarity between the panels of an incomplete Heilsspiegel Altar (Altar of Human Salvation) in Basle and the panels from the St. Peter Altar in Geneva, which are signed by Konrad Witz and dated 1444. This artist, whose distinctive style had little influence on later German art, had been forgotten since his death. Konrad Witz was probably born in Rottweil in Württemberg circa 1400–1410; he is first documented by his entrance into the Basel painters' guild on June 21, 1434.

The Council of Basle (1431–1437), which brought high church officials to the city, thus increasing the possibilities for important artistic commissions, was probably the motivation for his move. On January 10, 1435, he became a citizen of Basle, and he married shortly thereafter. In 1441 and 1442 he was paid for unknown paintings in the Kornhaus (granary). One of the wings of his altarpiece for the high altar of St. Peter in Geneva is signed and dated 1444. In 1446 he is recorded as dead, leaving his widow and five young children.

The Heilsspiegel Altar, dated circa 1435 and partially destroyed and dismembered in the iconoclasm of 1529, was painted for the choir of the church of St. Leonhard in Basle. Based on the *Speculum humanae salvationis* (*Mirror of Human Salvation*), which places Old Testament and other prefigurations next to their fulfillment in the New Testament and Last Judgment, it is the earliest and largest altar in this tradition in the fifteenth century. The center and predella (lower altar panel) are lost, but seven of the eight scenes from the inner wings survive. Five are in the Kunstmuseum in Basle and the other two in the Gemäldegalerie in Berlin and the Musée des Beaux Arts in Dijon. Since they show Old Testament or historical scenes with two figures standing before a gold background, the missing center must have shown their fulfillment: an Adoration of the Magi or a *Christus Salvator* (Christ as Savior) are most often suggested. The outside panels seen on the closed altar showed single figures standing in narrow rooms. Five of the original eight survive: four in Basle and one in Dijon.

The St. Peter Altarpiece (Geneva, Musée d'Art et d'Histoire) also lacks its center and predella, probably destroyed by iconoclasts in 1535, when the remaining panels were separated. Today the inner wings show the Adoration of the Magi on the left and the donor presented to the Virgin by St. Peter on the right. The left outside wing represents the Miracle of Fishes and Calling of St. Peter, and the right outside wing the Freeing of St. Peter from Prison. The landscape of the Miracle of Fishes gives an accurate view of the shores of Lake Geneva with the Savoy Alps and Mont Blanc and is considered to be the first topographical landscape portrayed in northern European art. New research considers the connection of this panel to the politics of Savoy. Other undated paintings attributed to Witz are the Annunciation (Nuremberg, Germanisches Nationalmuseum), the Meeting at the Golden Gate (Basel, Kunstmuseum), and Saints Catherine and Mary Magdalene in a Church (Strasbourg, Musée de l'Oeuvre Notre-Dame).

The physical presence of figures and materials is more important in Witz's paintings than depiction of rich costumes or detailed settings. His tempera technique and strong, simple colors increase the immobility that characterizes his figures, and strong shadows help to define his space. The forms on the outside wings in their narrow rooms resemble those in some miniatures of the Utrecht school circa 1430.

Two of the most important strophic heroic narratives written down in numerous versions throughout the later Middle Ages. The differing versions of the *Wolfdietrich* poem vary so widely that they can properly be called different works. There are two major branches of the story, identifiable by the incompatible stories of the hero's birth. The version that appears in the most manuscripts and in the printed *Heldenbuch* (Book of Heroes) is the longest version, referred to in the literature as *Wolfdietrich D* (editions Holtzman, 1865; Amelung-Jänicke, 1870). The "B" version is apparently a condensation of "D" and appears only in three late manuscripts. Most scholars consider all versions to be products of the thirteenth century, probably from around the middle, but the dating will probably remain uncertain because almost all surviving manuscripts derive from the fifteenth and sixteenth centuries.

Version "D" begins with the bride-winning romance of the hero's father, Hugdietrich, who wins his bride by posing as an exiled princess. The son of this union is Wolfdietrich, who is exiled by his younger brothers upon Hugdietrich's death. The hero passes through many adventures involving giants, heathen rulers, dragons, and morally ambiguous females before returning to regain his rightful throne and free his imprisoned faithful vassals. After reigning for many years he retires to a monastery, where he helps defend the monks against Saracen raiders. In an unusual episode, Wolfdietrich does penance for his heroic life by once again battling all the men he had killed in a single night's dream.

Version "A" (edition Schneider, 1919) is transmitted only in the *Ambras Heldenbuch*, where it is a fragment. Here Wolfdietrich is the youngest son, born during his father's absence, and he is forced out of his rightful position when his brothers claim he is illegitimate. The conclusion of the fragment is derived from the "D" version. There is a much shortened version of "A" in the *Dresden Heldenbuch*. Version "C" survives only in fragments rescued from the binding of later books. The fragments are insufficient to provide a coherent view of a version that is apparently as different from the other two as they are from each other. Wolfdietrich appears in all versions except "B" together with Ortnit, which forms something of a prelude to Wolfdietrich's encounter with Ortnit and his later marriage to Ortnit's widow.

Ortnit is presented as emperor in Lombardy. His story is a bride-winning romance in which the young emperor receives help from his father, a dwarf with supernatural powers named Alberich. He goes to the Near East to win his bride. After his abduction of the bride, his father-in-law seeks revenge by sending dragon eggs to Ortnit's land. When the dragon hatches and begins to ravage the countryside, Ortnit sets out to slay the beast. Along the way he rests under a tree and magically falls into a deep sleep. The dragon takes him to her cave to feed him to her young.

The story is repeated in *Wolfdietrich D* (although the full text of Ortnit appears in all manuscripts of *Wolfdietrich D*), after which Wolfdietrich sets out to avenge his friend. He kills the dragon and returns to Ortnit's court, where he marries the emperor's widow.

Wolfdietrich is identified in various versions as being from Constantinople, Saloniki, or simply from Greece. In "D" he is identified as the grandfather of Dietrich von Bern. The attempts to find historical sources for the story are unconvincing, and the poems are best understood as heroic romances based on traditional narrative materials that may or may not have historical roots.

All versions are composed in the four-line stanza known as the *Hildebrandston*, a version of the *Nibelungen* stanza in which all four lines are metrically identical. The rhyme scheme is *aabb*, with frequent rhyme at the caesura (gap between first and second half of each line). The formulaic language and strophic form suggest roots in the same, presumably oral tradition of heroic poetry that lay behind the *Nibelungenlied*, *Kudrun*, *Alpharts Tod*, *Ortnit*, and *Der Rosengarten zu Worms*.

The greatest German epic poet of the High Middle Ages, Wolfram wrote *Parzival*, *Willehalm*, *Titarel*, and nine lyric poems. Internal evidence in his works makes it likely that he composed *Parzival* between 1200 and 1210, worked on *Willehalm* after 1212, and left it unfinished sometime after 1217, possibly as late as the 1220s. Wolfram's few lyric poems, most of them amorous exchanges between two lovers ("dawn songs"), were probably completed early in his career, and the two fragments that make up *Titarel* were composed either during or after his work on *Willehalm*. Wolfram must have lived from about 1170 to the 1220s. He names himself in both *Parzival* and *Willehalm* and characteristically interjects remarks about his personal life and circumstances, so that we seem to have ample biographical information about Wolfram. Yet it is difficult to know how much of it is true or how much is only a pose.

If we take Wolfram at his word, he was a poor man, probably not a ranked administrator (*ministerialis*, ministerial), dependent on wealthy patrons for support. He must have been at the court of Landgrave Hermann of Thuringia, who, he says, provided the French source for *Willehalm*, and he claims to have been a military man with a wife and young daughter. Wolfram was probably born in the Middle Franconian town of Ober-Eschenbach, today renamed Wolframs-Eschenbach. His grave was seen there in the fifteenth century and again in the early seventeenth century, but there is no sign of it today. He was well acquainted with the works of the leading poets of his day: Heinrich von Veldeke, Hartmann von Aue, Gottfried von Straßburg, Walther von der Vogelweide, and Neidhart von Reuental. He surely knew Eilhart von Oberg's *Tristan*, the German *Alexanderlied*, *Rolandslied*, *Kaiserchronik*, *Nibelungenlied*, and other heroic sagas. Yet Wolfram claims not to be able to read or write (see *Parzival* strophe 115, ll. 27–30; *Willehalm* 2,16–22). Such remarks may well have been made in reaction to poets like Hartmann and Gottfried, who boasted of their learning and their literary abilities.

Wolfram's *Parzival*, an Arthurian romance of over 25,000 lines in rhymed couplets, is based on Chrétien de Troyes's *Perceval* (also called *Le Conte del Graal*). It is not a translation in the modern sense, rather an adaptation, expansion, and completion of Chrétien's work. There are several important differences. Chrétien's romance is unfinished. Although there are several continuations, his work stops after 9,234 lines. Wolfram provides his *Parzival* with a detailed prehistory and brings his story to a logical conclusion, while maintaining the general sequence of events found in his source. The prehistory (the first two books) deals with Parzival's father, Gahmuret, and how he eventually marries Herzeloide, but is killed in battle. Stricken by the news of Gahmuret's tragic death, Herzeloide gives birth to Parzival and resolves to raise him in the wilderness, far from the knightly world of the court.

Wolfram takes Chrétien to task in an epilogue for not having told the story properly then goes on to say that a certain "Kyot," who told the true tale, might well be angry about that (*Parzival* 827, ll. 1–4). Earlier Wolfram had claimed Kyot as his source on several occasions and had gone into great detail about how Kyot had found the true story of the Grail in a discarded Arabic manuscript in Toledo. In the manuscript there was a report about the Grail and the Grail family by a part-Jewish astronomer named Flegetanis, who had read about the Grail in the stars. Kyot, a Provençal Christian, had to learn Arabic to read the manuscript. Then he read in Latin chronicles and finally found the story of the Grail Family, which he eventually located in Anjou. All in all, an elaborate invention, especially since we have no real evidence of such a Kyot.

Another striking difference between Wolfram and his source is the nature of the Grail. In Chrétien it is a dish or bowl, in Wolfram a fantastic stone with the pseudo-Latin name of *lapsit exillis*. The angels, who had remained neutral during Lucifer's rebellion, were banished to the stone. Later, a human family became the guardians of the Grail and lived from the food and drink that the Grail miraculously provided. Anyone who has been in the presence of the Grail will not die for a week thereafter, only a virgin can carry the Grail, and inscriptions appear on the stone to name children who are called to the Grail. They grow up to become knights and ladies and are sent out to occupy thrones that lack rulers. The knights defend the Grail Castle and are forbidden to marry or to have a love relationship with a woman (Wolfram calls them "templars"). Only the Grail King may have a wife, but King Anfortas had been wounded by a poisoned spear while performing chivalric deeds in the service of a lady, and been kept alive by the power of the Grail, yet suffering excruciating pain. Nevertheless, although the Grail cannot be found by any seeker, an inscription on the Grail announced that a stranger would come and Anfortas would be healed if he asked the question without prompting during the first night. The stranger would then become Grail King.

Of course, Parzival is destined to be that stranger. He grows up ignorant of knighthood until he encounters some knights, riding through the forest. Impressed by their armor, Parzival is intent on becoming a knight himself. His desire for knighthood stems from the paternal side of his genetic makeup, and his mother reluctantly allows him to leave. Still, she dresses him in fool's clothing in the hope that the ridicule he will surely receive will force his return. However, Parzival's handsome appearance impresses people, and he eventually reaches King Artus's court, only to be told that he should get his own armor by attacking Ither, a knight outside the court who is feuding with Artus, if he wants to become a knight.

Parzival kills Ither with his crude javelin, unaware that Ither is a blood relative, strips him of his armor, puts it on, and rides off on Ither's horse. He arrives at the castle of Gurnemanz, who gives him a short course in knighthood and admonitions about how to behave as a knight. Traveling on to Pelrapeire, Parzival wins the beautiful Condwiramurs by defeating her besiegers. After some time, Parzival leaves Condwiramurs to visit his mother, but he arrives instead unwittingly at Munsalvæsche, the Grail Castle. There he is received with great honor, sees the Grail procession and the bloody lance, hears the lamenting of the people, and receives a sword from King Anfortas, who is obviously in great pain. But Parzival, mindful of Gurnemanz's advice not to ask too many questions, remains silent. The next morning the Grail company has disappeared, and Parzival leaves to try to find them. Two days later, he comes to King Artus's court, which has been eager to meet the Red Knight, as he was called by the knights he had defeated, and sent to Artus. His arrival occasions a feast at the Round Table, and Parzival is duly admitted to that select company. At this crowning moment of Parzival's knightly career, the ugly Grail messenger, Cundrie, appears and castigates him verbally for having failed to ask about Anfortas's suffering. Publically humiliated, Parzival leaves, angrily blaming God for his shame and determined to find the Grail and rectify things.

After Parzival's humiliation by Cundrie in front of Artus and his knights, that other paragon of chivalry, Gawan, is challenged to defend his honor. He then takes over center stage of the narrative with his quest for four queens and four hundred maidens held captive at Schastel Marveille. His adventures predominate from Book VII through XIV, except for Book IX, where the story returns to Parzival. Book IX is crucial for Parzival, angry as he is at God but with his thoughts on the Grail and his wife, Condwiramurs. Four and one-half years have passed since Parzival was at the Munsalvæsche and had failed to ask the question. Now, on Good Friday, he is directed to his uncle, the hermit Trevrizent, who tells him about his family and his relationship to the Grail King Anfortas. In addition, Parzival learns all about the Grail, about his mother's death, and the fact that he had killed a relative, Ither, in his effort to become a knight. Hesitatingly, Parzival admits that he was the one who had visited the Grail Castle but had not asked the question. After this confession, Trevrizent gives Parzival a new understanding of the relationship of God and humans, so that he makes his peace with God through penance. Nevertheless, he will still wander in search of the Grail Castle.

Gawan, in the meanwhile, has cleared his family name, rescued the queens from Schastel Marveille, and won the hand of Orgeluse. He has one last task to complete: single combat with Gramoflanz in the presence of his uncle, King Artus, who arrives with all his court. Before that can happen, Gawan fights with Parzival but is spared when they recognize each other. Parzival fights in place of the wounded Gawan against Gramoflanz and defeats him. King Artus then arranges a reconciliation among all the parties involved, and a joyous nuptial celebration ensues. Parzival leaves the festivities alone and encounters his heathen half-brother, Feirefiz, in combat. Just when it appears that Parzival will be defeated, Feirefiz throws aside his sword and magnanimously discloses his identity first. Now Parzival, with his new awareness of God and having been tested to the point of death, is ready to be summoned to the Grail. Cundrie appears, announces that Parzival has been called, and they leave for Munsalvæsche accompanied by Feirefiz. There Parzival asks the question, Anfortas is healed, and a short time thereafter Parzival is reunited with Condwiramurs, who arrives at the castle with their twin sons.

In Wolfram's *Parzival* we see two ideal realms, that of King Artus and that of the Grail. The knights of Artus's Round Table represent the highest secular ideal of chivalry, epitomized in the person of Gawan. The Grail knights on the other hand have a special relationship to God. They are chosen for divine purposes. Parzival belongs to both realms by virtue of his inheritance: from his father, the skill and desire to excel in knightly combat; from his mother, his genealogical relationship to the Grail family and his destiny to succeed Anfortas as King of the Grail Castle. We see in his story first his misguided striving to become an exemplary knight, then his angry confusion when he is humiliated at what should have been his moment of highest honor. Finally, he

earns to adjust his own sights from the goals of his own ambition and accept the purposes that God has for him. The twofold structure of the work embodied in the figures of Gawain and Parzival shows both knights succeeding in their particular tasks of freeing two groups of people. For one it is a worldly success, for the other, a transcendent, spiritual achievement.

Wolfram's other major work, *Willehalm*, is quite different from *Parzival*. Not only is it unfinished, but it is also not an Arthurian romance. Its source is the Old French *chanson de geste*, *La Bataille d'Aliscans*, one of the twenty-four poems in the cycle about Guillaume d'Orange and his family. This is heroic poetry that revels in combat and death, Christians against heathens, good against evil. Wolfram himself takes notice of the difference when he states: "Whatever I recounted earlier about fighting [...] ended in some way other than in death. *This* fighting will settle for nothing less than death and loss of joy" (*Willehalm* 10, 22–26). Yet for Wolfram, love and courtly attitudes are not lacking. *Willehalm* deals with the conflict between religions and the love that makes the religious conflict tragic. It involves immense slaughter and suffering on both the Christian *and* the heathen sides, and the religious differences and the human experience of the struggle give the work a much greater depth. Although he has transformed the material of his source perhaps to an even greater extent than in *Parzival*, Wolfram still preserves the essential sequence of events of his source as far as his story goes. One final difference: the *chanson* is written in tirades—stanzas of a varying number of ten-syllable lines, with each tirade, or *laisse*, having the same assonance. Wolfram uses the rhymed couplets of the courtly romance.

Willehalm begins in the midst of the first great battle of Aliscans. The heathen emperor Terramer had summoned huge armies and landed not far from Willehalm's fortified city of Oransche. Terramer's purpose is to force the return of his daughter Arabel to her husband, Tybalt, and to the religion of her people. Arabel, now called Gyburg after her baptism, had fallen in love with Willehalm when he was a prisoner in heathendom. She had helped him escape, left Tybalt to flee with Willehalm, and converted to Christianity. Her former husband and her son have come with the Saracen forces.

In the course of the first battle, Willehalm loses all his knights, including young Vivianz, who is the outstanding fighter for the Christians. Willehalm himself is barely able to escape the slaughter by donning the armor of King Arofel, whom he had slain, and riding away through the heathen ranks, almost unnoticed. He spends the night at Oransche with Gyburg, then leaves early the next morning to seek help from King Louis. Gyburg is left to defend the fortress with her ladies and a handful of survivors.

Having arrived in Laon, Willehalm receives an extremely cold welcome. King Louis and the queen, Willehalm's sister, are most reluctant to do anything for him. Willehalm, in great rage at the insulting treatment and deeply concerned about Gyburg's fate, grabs the queen by her braids and threatens to cut her head off. When Willehalm's father, mother, and brothers, who are present at court, hear what has happened at Aliscans and Oransche, they immediately pledge help. Eventually, Willehalm's anger is appeased by the intervention of his niece, Alyze; Louis, whose life had also been threatened by Willehalm, is mollified so that he, too, offers to send imperial forces under Willehalm's command to raise the siege at Oransche.

Before setting out for Oransche with the French troops, Willehalm obtains from Louis the services of Rennewart, a huge young heathen who had been working as a kitchen boy, having rejected baptism. Rennewart is eager to fight, believing that his relatives had refused to ransom him after he was abducted by merchants. He asks for a gigantic club, bound with iron bands, as his weapon, but he forgets it repeatedly on the way to Oransche. (In *Aliscans*, Rainouras is a burlesque figure who eventually dominates the fighting in the second battle. Wolfram's Rennewart, however, despite some boorish acts, is portrayed as a young nobleman in undeserved circumstances. He is actually Gyburg's long-lost brother!)

Willehalm hastens back to Oransche with the French troops, only to discover that Terramer's forces had withdrawn to the coast where the air was better without having stormed the fortress successfully. Gyburg and her meager forces had been able to hold them off. One by one, Willehalm's father and his brothers arrive with their armies, and the stage is set for the second battle. However, before it begins, a meeting of all the leaders takes place, at which all voice their resolve and support for the battle. Gyburg alone adds a temporizing voice. Tearfully she expresses her sorrow that she is the cause for the huge loss of life on both sides and makes a moving plea for the Christians to spare the heathens, if possible.

In the ensuing battle the Christians are victorious, but the loss of life on both sides is immense. Rennewart, who had forcibly "persuaded" the wavering French not to desert, plays a leading role in the victory. Terramer manages to escape to his ships, and the expected confrontation between Rennewart and his father does not take place. Indeed, when the battle is over Rennewart is missing. Willehalm grieves at the apparent loss of Rennewart and about the terrible slaughter that has occurred. In a gesture of respect for the noble heathens, he gives orders to have their fallen kings embalmed and buried according to their own rites. At this point the narrative breaks off.

Most scholars believe that *Willehalm* is a fragment, basing their argument on the fact that too many narrative strands are left untied. Others feel that, for whatever reasons, Wolfram may have been unable to finish it and devised an emergency conclusion (the *Notdach* theory). Still others maintain that *Willehalm* is complete as it stands, that with the tragic quality of the poem Wolfram has put an entirely new meaning into the substance of his source and that for him any continuation of the Rennewart story had become irrelevant. One further, more recent position is that Wolfram intended it to be a fragment. No matter how one looks at the ending, or lack thereof, *Willehalm* is still a powerfully moving work, dealing with problems that have been with us, as Wolfram says: "since Jesus was plunged into the Jordan to be baptized" (*Willehalm* 4, 28f). Wolfram seems to have been deeply affected himself by the tragedy of it all, if one can judge by his numerous self-reflective remarks throughout the poem.

The two fragments usually called *Titurel* from the name of the old Grail King in the first line of the first fragment deal with the two young lovers, Schionatulander and Sigune, from Wolfram's *Parzival*. It is as if Wolfram attempted to flesh out the briefly mentioned story of their tragic love. Written in four long-line strophes that resemble the *Nibelungenlied* strophes to a limited degree, the first fragment deals with the discovery of the mutual love of the two young people, and the second fragment describes an idyll in the woods that is interrupted by the catching of a hunting dog who had been running through the woods trailing a fantastically elaborate leash with a story depicted on it. Sigune wishes to read the story to its end, but the dog escapes as she loosens the leash to read more and carries the leash away. She promises Schionatulander her love as a reward for retrieving the leash. We know from *Parzival* that Schionatulander gets killed in the attempt, and Sigune is left mourning over his dead body when Parzival meets her. A later poet named Albrecht (von Scharfenberg?) took on the task of completing *Titurel*, and he did so with a vengeance. There are over 6,000 strophes in his so-called *Jüngerer Titurel*, compared with Wolfram's 170! Although it is poetically inferior, Albrecht's work was thought for a long time to be Wolfram's because he identifies himself as Wolfram early on in the work, disclosing his own name only at almost the very end.

There are many problems in *Titurel*. These include the manuscript tradition, the precise text of the poem, and the relationship of the two fragments to each other. Even the theme of love is treated strangely, portraying the exuberance and joy of the naive young lovers trying to act so properly as courtly lovers, yet with a background of impending tragedy on the basis of family history. It is a work of changing moods with somberness predominating.

Wolfram's lyric poems generally describe the parting of lovers at dawn and follow a tradition found in Provençal and Old French poetry. For the most part the lady is the dominant figure. She is the one who is awake as dawn is breaking and must wake her lover so that he can leave without being seen. But Wolfram also includes a sympathetic watchman in several instances, and in one poem he is the dominant speaker. The poems generally end with one last embrace and then the tearful parting as the sun rises higher. Wolfram's dawn songs, among the first in German of that genre, are marked by their striking imagery and their sensitive portrayal of the lovers. His few other poems are similar to more traditional *Minnelieder* (courtly love songs) but show his complete mastery of that type.

The thirteen visual manifestations of the Parzival material that can be cataloged for the German language area—eight books, one embroidery, two mural cycles, and two other wall paintings—reflect a broad range of responses to the story of Parzival.

At one extreme we may locate the well-known illuminations in the mid-thirteenth-century Munich manuscript (Bayerische Staatsbibliothek, no. cgm 19). In twelve scenes on the two sides of a single bifolio, presumably part of a larger lost or incomplete program of illumination, the layout of the illuminations in three registers, the choice of scenes culminating in Feirefiz's baptism and his destruction of heathen idols, and the iconography, with its resonances of the Last Supper and the baptism of Constantine, suggest an equation of knighthood with salvation and a profound religious meaning for the work as a whole.

At the other extreme are perhaps the illumination programs of the Parzival manuscripts produced in the Alsatian workshop of Diebolt Lauber in the middle of the fifteenth century, in which the story is radically deproblematized and largely stripped of any transcendence, becoming a story of a knightly career with almost exclusively social significance. The mid-fourteenth-century Braunschweig embroidery, with twenty scenes from the story of Gawain and Orgeluse, probably fits into this category as well.

The two mural cycles are difficult to analyze, given their fragmentary state of preservation. The early- to midfourteenth-century Lübeck cycle appears to have taken Parzival from youth to the Grail kingship. Its ten scenes—of originally twenty or more—were discovered

Parzival in the Red Knights armor before Arthur, Ginover, and their guests, Haus zur Kunkel, Constance. *Photograph: Joan A. Holladay*

in 1929 and destroyed soon after. Also from the early fourteenth century, the approximately twenty-two scenes of poorly preserved wall painting in the Haus zur Kunkel in Constance appear to concentrate on Parzival's youth as well, although the extent of the narrative is difficult to determine.

Two wall paintings remove Parzival entirely from his narrative context, presenting him as an exemplary figure. He appears among the Slaves of Love in the Haus zur Kunkel (mid-fourteenth century) and as one of the three best Arthurian knights—with Iwein and Gawein—in the "Triads" at Runkelstein circa 1400–1405.

The illustration of the Willehalm trilogy—Wolfram's *Willehalm*, Ulrich von dem Türlin's *Arabel*, and Ulrich von Türlheim's *Rennewart*—is characterized by an opulence rare in the illustration of German vernacular literature, reflecting the status of the Willehalm material as something closer to historical and salvific truth than "mere" romance.

Among the most lavishly decorated Willehalm manuscripts are royal and princely codices such as Vienna, Österreichische Nationalbibliothek (no. Cod. ser. nov. 2643), made in 1387 for King Wenzel I of Bohemia, with 247 miniatures; and Kassel, Murhardsche Bibliothek und Landesbibliothek (no. 2° Ms. poet. et roman. 1), made for Landgrave Heinrich II of Hesse in 1334, with spaces

Willehalm (Kassel, Hessische Landesbibliothek, 2° Ms. poet. et roman. 1), fol. 1v: Frontispiece with Christ in Majesty and Heinrich II, Landgrave of Hesse. Photograph: Hessische Landesbibliothek

for 479 miniatures, of which 62 were brought to varying stages of completion. That the Willehalm material was regarded as history in the later Middle Ages is also indicated by the adoption of excerpts from all three parts of the trilogy, sometimes with illustrations, into the *Weltchronik* of Heinrich von München.

Unique among illuminated vernacular literary manuscripts, the fragmentarily preserved *Große Bilderhandschrift* (Munich, Bayerische Staatsbibliothek, no. Cgm 193/III; no. Cgm 197/III, A; no. Cgm 197/III, 3b; and Nuremberg, Germanisches Nationalmuseum, Graphische Sammlung, no. Hz 1104–1105 Kapsel 1607), which might have contained up to 1,380 miniatures, attempts to illustrate practically every moment in the narrative in a format derived from *Sachsenspiegel* illustration, with the inner column of each page devoted to text and the outer one to pictures.

A provisional catalog of German Willehalm illustrations would include approximately sixteen manuscripts and fragments of all or part of the trilogy, with miniatures, space left for miniatures, or rubrics suggesting a lost illustrated source, as well as at least three manuscripts of the *Weltchronik* that include Willehalm illustrations.

Wolgemut, Michael (1434/1437–1519)

Born in Nuremberg between 1434 and 1437, Michael Wolgemut was the city's foremost painter and printmaker in the late fifteenth century. Wolgemut trained with his father, Valentin, a painter, and worked as a journeyman with Gabriel Mälesskircher in Munich before returning to Nuremberg in 1471. A year later he married Barbara, the widow of the noted painter Hans Pleydenwurff. Whether he had collaborated earlier with Hans is uncertain. Wolgemut developed a large workshop that specialized in the production of large retables, woodcuts, and designs for stained glass windows. The artist's pupils included his stepson, Wilhelm Pleydenwurff, and Albrecht Dürer, who was in the shop from 1486 until 1489.

Wolgemut's first documented painting is the high altar completed in 1479 for the St. Marienkirche in Zwickau. This complex polyptych includes painted wings depicting the Passion of Christ (exterior) and Infancy (middle) that cover the nine life-size standing statues of saints on the inner wings and in the corpus, a painted and carved winged predella (lower altar panel), and a Last Judgment covering the back of the altar. Wolgemut employed a team of now anonymous joiners, painters, and sculptors on this and similar elaborate projects, notably the Peringsdorfer Altar made circa 1486 for the Augustinian Cloister in Nuremberg (today in the Friedenskirche) and the high altar (1506–1508) in the church of St. Johannes and St. Martinus in Schwabach. In his paintings, including his independent portraits, such as that of Levinus Memminger circa 1485 (Madrid, Museo Thyssen-Bornemisza), Wolgemut displayed his familiarity with Netherlandish art, notably the works of Rogier van der Weyden and Dirk Bouts. His clearly defined figures are located in the extreme foreground before deep landscapes.

Today the artist is best known for his prints. In addition to independent woodcuts, Wolgemut recognized the potential of illustrating books. The artist, his stepson, and his shop supplied 96 woodcuts for Stephan Fridolin's *Schatzbehalter* (1491) and 1,809 woodcuts using 645 different blocks for Hartmann Schedel's *Liber Chronicarum* (*Nuremberg Chronicle*, 1493), both published by Anton Koberger in Nuremberg. The latter with its maps, city views, portraits, and elaborate illustrations was the century's most ambitious publishing project and was marketed across Europe.

Wolgemut's career spanned four decades. His last major picture, the *Epitaph of Anna Gross* (Nuremberg, Germanisches Nationalmuseum), dates around 1509. In 1516 Albrecht Dürer affectionately recorded his mentor's likeness in a portrait (Nuremberg, Germanisches Nationalmuseum). Wolgemut died on November 30, 1519, in Nuremberg.

Women

Most medieval source documents about German women reveal more about reigning cultural ideologies of gender and concepts of the feminine than they do about actual females who lived. Indeed, the terms "woman" and "women," vigorously debated by feminist theorists, remain as slippery when viewed in the past. For theologians, the figure or concept of woman embodied both original sin (being descended from Eve) and the path to redemption (through the mercy of the Virgin Mary); for hagiographers, woman's greater susceptibility to sin made her sanctity that much closer to the divine; for natural philosophers, women's bodies represented imperfection in juxtaposition to the perfection of men; for the courtly poet, the lofty lady's ideal beauty and behavior lifted him to new heights of virtue; and for the male heroes of romance, women made men complete. Nevertheless, women were neither silent nor absent from medieval German history and literature. Chronicles report of influential and charismatic queens. Female-authored texts offer readers both alternative views of women and responses to prevalent ideas about gender. Finally, recent and ongoing research into primary source documents such as wills and tax and church records reveals women active on every level of society.

The negative images of women circulating in medieval German culture had their roots in the complex tradition of Judeo-Christian misogyny. Condemned in the Bible as the origin of sin and more bitter than death (Ecclesiastes 25:33; 7:27), women were declared inferior and subservient to men. In the letters of Paul recorded in the New Testament, women's subordination to men justified a ban on both public speaking and teaching (Timothy 2:11–12). With the Bible as their authority, later commentators could claim that women were the gateway of the devil (Tertullian, ca. 160–225), the source of all evil (Jerome, d. 420), or the servants of men, according to natural order (Augustine, 354–430). Made at different times, for differing purposes and often met with debate, such statements became fodder for medieval theologians like Gratian (d. ca. 1160), who codified women's subservience into canon law (*Decretum*) or scholastic theologians like Thomas Aquinas (1225–1274), who reinforced these laws with the rediscovered natural philosophy of Aristotle, thereby linking the perceived inferiority of women to matters of "science."

In stark contrast to these negative conceptualizations of women and female nature stands the poetry of courtly love (a term, it should be noted, invented by modern scholars) known in German scholarship as *Minnesang*. Poems singing the praises of an inaccessible lofty lady, or *domna*, became popular in the courts of northern France and the southeastern region of Provence in the twelfth century.

Poets decried the strength of their love inspired by the unsurpassable beauty and virtue of the lofty lady (often the wife of the poet's patron). The lady's inaccessibility on the other hand meant that the ideal remained forever beyond the poet's grasp. In its German incarnation, courtly poetry grew out of and coexisted with a "native" tradition of "woman's song" in which female voices offer laments about love as in the poetry of Der von Kurenberg. Later poets portrayed a lofty lady (Middle High German *vrouwe*) who came to represent not only ideal female beauty but also ideal virtue and perfection. The poets' desire for the lady's love inspired them to serve her, a service through which they became better men. Among the classic composers of *Minnesang* are Reinmar der Alte, Heinrich von Morungen, and Friedrich von Hausen. Not all poets adhered to these conventions, however. Walther von der Vogelweide wrote in his later poetry of consummating his passion with a less than ideal but real woman, and Neidhart von Reuenthal's poetry turns the conventions of courtly love into burlesque comedy.

The women figures in the courtly epic and romance tend to be more realistic, which is to say, they reflect not only the ideal but also the dangerous characteristics of womanhood. Particularly in the romances of Hartmann von Aue (*Erec* and *Iwein*), women inspire a love that is consummated in marriage, indirectly cause dishonor, and become the means through which honor is regained. Hartmann depicts his women characters as beautiful, virtuous, and sensible (though to varying degrees: one thinks here of Lunete, who is far more politically savvy than Queen Laudine, whom she serves), but also as struggling to negotiate the rules for gendered behavior by which they live (Enite). In Gottfried's *Tristan*, the elder Queen Isolde not only practices medicine but also deftly maneuvers for the authority to speak for the King, primarily to secure a position like her own for her daughter through marriage. Portrayals of powerful women are consistently ambiguous, however, as evident in the *Nibelungenlied*, where Brünhild's physical strength vanishes once she is vanquished in the marriage bed, and Kriemhild's excessive desire for revenge leads to the fall of a dynasty. In late medieval short narratives, strong women are most often caricatured as shrewish wives or mothers (see Der Stricker), though with some interesting exceptions like the anonymous tale of the ladies tournament (*der vrouwenturnei*).

While in France a small group of women contributed to the tradition of courtly love lyric (*Trobairitz*, or women troubadours) and one to the tradition of romance (Marie de France), in Germany women wrote within the context of the church. In the tenth century, Hrosvit of Gandersheim wrote a series of plays on the virtues and saints for the edification of her community. In the twelfth century, Herrad of Landsberg wrote an encyclopedia of natural history interlaced with biblical passages. The twelfth through fourteenth centuries produced religious women both in and outside of the cloister who wrote compelling and original treatises on their visionary experiences (Hildegard of Bingen, Elisabeth of Schönau, Mechthild von Magdeburg, Gertrude the Great, Mechthild of Hackeborn, Adelheid Langmann, and Margaretha Ebner, among others). These texts offer insights into how women negotiated the images of women and femininity circulating in their differing cultural milieus, as well as the hierarchical power structures in which they lived. Of those listed, Hildegard, an abbess of a Benedictine convent, received sanction both to write and to teach from the pope, and Mechthild of Magdeburg, a Beguine, was the first woman to write in German. Mechthild's text evokes special literary interest (as does a contemporary Middle Dutch text attributed to Hadewijch of Antwerp), for it engages not only with ecclesiastical discourse but also with the courtly poetry of her day.

These women writers and the women portrayed in literature come from the upper tiers of the medieval social hierarchy—namely, the nobility. The women writers are exceptional, the noble women of literature, ideals. The majority of the female population, however, was busy doing other things such as cooking, washing, and mending. Recent research, focusing for example on women peasants in the countryside (Bennett), women in cities (Wunder), and widows (Mirror) proves that women's contributions to society extended beyond servicing men and having children to entering professions like medicine, textiles, and trade.

Women and Art

In medieval Germany, women were included as the subjects of visual representation certainly just as often as men. Depictions of women abounded: images of the Virgin, other biblical women and female saints, female personifications of virtues and vices, female figures depicting the labors of the months, images of women donors, and self-portraits by women artists. Recent scholarship has explored the ways in which these images helped to shape gender roles within specific historical and social contexts. Women likewise played important roles in the making and using of what later generations have called "art." They initiated, commissioned, financed, and donated art and architecture. Among the best-known female sponsors of art in German-speaking lands during the early and High Middle Ages were empresses Theophanu, Kunigunde, and Agnes, Queen Gisela, Duchess Hedwig, and Abbess Hildegard von Bingen. With the expanding base of patronage during the late Middle Ages, many bourgeois women commissioned epitaphs and altarpieces in urban centers. Women also participated directly in the production of art, especially as embroiderers and manuscript illuminators (e.g., Guda, Clarissa, Barbara Gwichtmacherin). During the late Middle Ages they served important roles as workshop wives who managed business affairs and sometimes took part in hands-on activities in what were family enterprises (e.g., wife of Adam Kraft). When widowed, these women occasionally led workshops themselves (e.g., Barbara Wolgemut, widow of Valentin), and through remarriage they frequently determined the new master of the shop (e.g., Barbara Pleydenwurff, the widow of Hans, who married Michael Wolge

Madonna, Magdeburg cathedral. Photograph: Joan A. Holladay

mut). Women were also significant as users, owners, consumers, and audiences—not only of works made exclusively for them but also as individuals and members of groups that viewed works differently than their male counterparts.

Art history has traditionally excluded women from the discourses on art in the Middle Ages in several ways. For one, scholarship has focused on the maker—an area in which women were underrepresented. Moreover, even though much medieval production resulted from the collaborative efforts of anonymous craftspersons, some of whom were women, male artists shaped in the mold of the nineteenth-century solitary romantic genius have been invented for the Middle Ages. Moreover, valorizing architecture and sculpture as the premier art forms of the Middle Ages has effectively marginalized not only the so-called minor arts but also their makers, many of whom were women. Second, when attention is focused on the sponsors—an area in which women were well represented—men are given credit for the projects. Indeed, numerous sources show that decisions were made jointly by a couple or that surviving women utilized their own or inherited capital to initiate memorials for themselves and their families. Third, when audiences are considered, the position of the dominant is usually taken for the whole, and women's alternative readings of works are thus not taken into account. Feminist medievalists are now beginning to use the art and history of the Middle Ages to challenge art history's paradigms and change its time-honored habits.

World Maps

By far the dominant genre of medieval cartography, world maps (German, *Weltkarten*; Latin, *mappaemundi*) range from the mere schematic diagrams to elaborately descriptive images in which pictorial and textual elements are densely interwoven. Regardless of their simplicity or complexity, they fall into two broad categories in terms of content: either they are focused exclusively on the inhabited portion of the world (the *oikumene*) surrounded by ocean; or they portrayed in plan a longitudinal section of the entire globe showing half the Northern Hemisphere (which contained the *oikumene*) separated by an equatorial ocean from half the Southern Hemisphere, the two quadrants encircled by an ocean running through the poles. Typologies based on purely formal criteria have been proposed, but such arbitrary systems of classification obscure the essential fluidity of cartographic representation throughout the Middle Ages. Modes of figuration remained highly contingent on the specific contexts in which maps were embedded and on the particular purposes they served. Seemingly (i.e., to us) contradictory models of geographical space coexisted, even commingled, because they facilitated visualization, hence understanding, of different aspects of reality.

World maps circulated within manuscripts as illustrations, glosses, résumés of or programmatic introductions to texts, scientific and spiritual. Display outside the codex entailed the use of a variety of supports: *mappaemundi* could be made of precious metals as treasury objects or incorporated into the monumental decoration of diverse architectural spaces as mosaic pavements, mural paintings, and large wall hangings on vellum or cloth. In schools, palaces, and churches, world maps performed multiple cognitive and symbolic functions.

A key monument from the high medieval period is the giant Ebstorf map (destroyed in World War II), named after the Benedictine nunnery in lower Saxony where it was discovered. Art historians have now convincingly linked the map, painted on thirty goatskin panels stitched together, to works produced circa 1280–1300 by and for women in convents of the region. As places featured on the map reveal a Guelph political agenda current during the reigns of Otto IV or Otto the Child, an earlier work displayed at the palace at Braunschweig or Lüneberg may have served as a model. Gervasius of Tilbury is known to have made a world map to accompany his *Otia imperialia* (ca. 1214), dedicated to Otto IV. Whether the exemplar from Ebstorf ultimately reflects Gervasius's ideas is open to debate.

Worms

Located in the Rhineland-Palatinate, the city of Worms was first settled by the Celts in the fifth century C.E. as Borbetomagus and later served as a Roman garrison town (Civitas Vangionum) and capital of the Vangiones region through the fourth century C.E. Parts of the original Roman city wall still stand. In 413 C.E. the city became the capital of the Burgundian Empire, and later was completely destroyed by the Huns in 436. It was rebuilt by the Merovingians, especially Brunhilda and Dagobert, in the first half of the seventh century. Worms may have been a bishopric as early as the fourth century, although the earliest recorded date is 614.

Beginning in the eleventh century, Worms became one

Worms, cathedral, west choir. Photograph: Joan A.Holladay

of the most important medieval cities and played an integral role in the antagonism among the Holy Roman Empire, the pope, and local dukes and bishops. The ascension of Worms can be traced to Bishop Burchard I (1000–1025), who was instrumental in creating the religious landscape of the area, and the local dynasty, the Salian family, from which Emperor Konrad II (1024–1035) stemmed. The city's political and religious freedom was defined by the Investiture Controversy, a struggle between Emperor Heinrich IV (1056–1106) and Pope Gregory VII (1073–1085) concerning the nomination of bishops. The dispute arose when the citizenry of Worms supported Heinrich in a conflict with other princes and clergy, including Bishop Adelbert of Worms. For the next half century, tension between citizenry and clergy was high; the dispute finally ended in 1122 with the Concordat of Worms. Edicts in 1156 and 1184 by Emperor Frederick I guaranteed the freedoms of the city, which in 1184 became an imperial free city. Throughout the thirteenth century the bishops of Worms attempted unsuccessfully to reassert their control over the city. In 1254 Worms founded the Rhine League with Speyer and Mainz. As an imperial city, Worms was the site of more than one hundred imperial diets from the eighth to the sixteenth centuries, most notably that of 1521, at which Martin Luther and his associates were condemned. A Jewish community existed in Worms from around the tenth century; its synagogue, dating from the tenth century, was completed in 1174, destroyed during the Nazi Kristallnacht (Night of the Broken Crystal) pogrom in 1938, and completely rebuilt after World War II. Adjacent to the synagogue is one of the largest Jewish cemeteries in Europe, with more than two thousand graves dating from as early as the eleventh century.

The architecture of Worms is dominated by the imposing cathedral dedicated to St. Peter, built over remains dating from late Antiquity. The current cathedral stands on the foundations of a church constructed under Bishop Burchard I and consecrated in 1018. It was a crossshaped basilica; little survives from this structure other than the bases of the west towers and the tenth-century tombs of members of the Salian dynasty. Along with the cathedrals at Mainz and Speyer, the current cathedral in Worms is one of the greatest examples of High Romanesque architectural style in Germany. The fully vaulted basilica, built primarily from red sandstone, has a double choir, two slightly different, octagonal towers over the east and west choirs, and two round towers flanking each choir. Construction of the cathedral began in the first half of the twelfth century under Bishops Burchard II and his successor Konrad II; it was consecrated in 1181. External architectural ornamentation is limited; notable are the sculptures of animals on the eastern facade. A few examples of twelfth-century wall painting survive in the north transept.

Although the city was completely destroyed in 1689 by the French and again during World War II, several other examples of medieval, specifically Romanesque, architecture still stand. Most notable is perhaps the church of St. Paul, which stands on the site of a former Salian castle. After Bishop Burchard I procured the castle, it was modified in the first quarter of the eleventh century to accommodate the church. The originally three-story basilica incorporated two former castle towers. Of specific interest are the stone cupolas on the west towers, which give the impression of a small, squat Byzantine church. These changes, along with those of the east choir and west facade, may have been inspired by the Crusades of the early thirteenth century. Two other churches can be directed to Bishop Burchard's involvement: the church of St. Andreas, a three-story basilica, was built in the eleventh century and renovated in the early thirteenth century, and the church of St. Martin, a vaulted basilica with two towers, begun in the eleventh century, renovated in the thirteenth century, and consecrated in 1265.

Worms and its history are closely linked to the anonymous German heroic epic, *Das Nibelungenlied*, from around 1200. The Burgundian empire and Queen Brunhild form the historical basis of the work, which conveys the historical, political, and cultural importance of the city. The north portal of the cathedral, the portal of the emperors, is the site of the legendary fight between rival queens Brunhild and Kriemhild. With the recovery of and new-found emphasis placed on *Das Nibelungenlied* in the nineteenth century, Worms began to commemorate its role in the epic.

Worringen, Battle of (June 5, 1288)

During a long fight between the Archbishop Siegfried von Westerburg of Cologne (1275–1297) and the city of Cologne, which was trying to become independent of the archiepiscopal government, a dispute over the inheritance of Limburg sparked a broader regional war. Allied with powerful lords like the counts of Luxemburg and Nassau, the archbishop faced an alliance of Cologne and the counts of Berg, Jülich, and Cleves, as well as the duke of Brabant. The Brabantine and Cologne forces met the archbishop's army near his castle of Worringen. In the course of the massive battle on June 5, 1288, over two thousand were killed, including the commander of the Cologne city troops. But Brabant and the city prevailed, managing to surround and capture the archbishop.

This defeat left Cologne as an independent, self-governing city, forcing the archbishops to move their main residence to Bonn. The territorial rule of the archbishops on the lower Rhine also continued to decline in competition against the secular dynasts.

Würzburg

The city developed on the Main River near where the Irish missionary Saint Kilian was martyred in about 688. A *castellum Virteburh* on a hill west of the Main, first mentioned as the center of an expansive agrarian settlement in 704, seems to have been an important residence of the Frankish dukes. The castle walls enclosed the Marienkapelle (Chapel of the Virgin), the oldest round church east of the Rhine. St. Boniface established a bishop's see at Würzburg in 741, and the Andreas Cloister (*Andreaskloster*), housing a school, a library, and a scriptorium, was founded soon after by the first bishop, Burchard. The original cathedral, dedicated to the Savior, was built during the second half of the eighth century but burned to the ground after being struck by lightning in 855. Bishop Arno began a new cathedral dedicated to Saint Kilian, the Kiliandom, and a bishop's residence, thereby drawing craftsmen to Würzburg. The Kiliandom was rebuilt in 1045.

Through the eighth and ninth centuries, Würzburg developed under Carolingian patronage. Indeed, since the time of Charles Martel, members of the royal court, including Charlemagne, had resided there in the Wirtschaftshof, a center of local commerce. Located at a ford across the Main, Würzburg lay at the crossing of an important east-west travel route and a north-south pilgrimage route from Denmark to Rome. The bishop's see and the Carolingian palace encouraged development of urban settlement so that by the end of ninth century, Würzburg was an important trade center. A market thrived near the cathedral, and a community of fishermen and shippers flourished along the riverbank. The presence of a mint in Würzburg further attests to the city's commercial importance during this period.

Centrally located and the see of one of the empire's most powerful bishoprics, Würzburg continued to be a popular place for emperors to reside and hold court. In 1127, the first known German tournament took place in Würzburg. The Staufer rulers, Konrad III and Frederick Barbarossa, the latter in particular, visited the city numerous times. Frederick celebrated his marriage to Beatrix of Burgundy here in 1156.

Over the course of the eleventh and twelfth centuries, the bishop became the absolute authority in Würzburg; the *Goldene Freiheit* (Golden Freedom) of 1168 extended the bishop's power over the whole city. The five-cornered city wall, known as the Bischofshut (bishop's hat), dates from the eleventh century, and a number of important churches and cloisters were established in and around Würzburg during this period. In 1042, St. Burkard, a three-aisle Romanesque basilica of which the original western portion is still standing, was dedicated. A late Gothic transept and choir was added to this church in 1490. The Neumünster (new cathedral) was built between 1045 and 1090. In the thirteenth century Albertus Magnus laid the cornerstone for the church of the Dominican cloister. The Würzburg cathedral school and library, with its rare manuscripts dating from the fifth to the tenth centuries, were particularly well respected. Many of these manuscripts are still preserved in the University Library.

In 1230, the minnesinger Walther von der Vogelweide died in Würzburg, where Friedrich II had granted him permanent residence. His gravestone is in the Neumünster.

As long as bishops controlled the city, the citizens had little opportunity to regulate and govern their own business, and in the late thirteenth century, the townspeople began to assert themselves against bishops and clerics by plundering and burning their residences. The bishops retaliated with high taxes and punishments so that citizens who could manage it moved elsewhere. Nuremberg began to replace Würzburg as an important center of commerce, at least in part because of the social unrest that marked the history of the older center during the fourteenth and fifteenth centuries. Beginning in 1372, bitter battle raged for over twenty years between the bishop in the Marienburg castle on the hill and the citizens of Würzburg below. Between 1376 and 1475, the townspeople built their own church, the Marienkapelle—a three-aisle, late Gothic hall church with portal decorations that rank among the masterpieces of the period.

The bishops of Würzburg amassed tremendous debt, and the secular rulers repeatedly allowed them to raise taxes to repay their debts. Würzburg became a depopulated, impoverished city and remained so well into the second half of the fifteenth century. The city was also involved in the turmoil of religious reform; Hans Bohm, who preached reform in the church, was burned at the stake in Würzburg in 1476.

Xanten

About 105 C.E. the Roman emperor Trajan established the city Colonia Ulpia Traiana on the left bank of the Rhine near the sites of a smaller settlement and two earlier Roman forts. It would become, after Cologne some eighty kilometers (fifty miles) to the southeast, the most important trading center and harbor in the Roman province of Lower Germany. About the middle of the fourth century, the Romans were forced to abandon the recently fortified city to the local Germanic tribes, who built up a new settlement outside the city wall along the main road leading to the south. Here in the Roman cemeteries, which typically lined the main traffic axes leading out of town, were buried the remains of the third-century martyr St. Victor and his companions of the Theban legion. The name "Xanten" comes from the Latin *ad sanctos*, meaning "near the saints." The development of the site is typical: an early oratory over the burial site, supposed to have been erected by Saint Helen, the mother of the emperor Constantine, was replaced by a succession of later churches dedicated to the saint. In this case, a Carolingian building from the mid-eighth century, which burned in 1109, was supplanted by a Romanesque church. During the High Middle Ages, the foundation developed into one of the wealthiest landholders on the Lower Rhine; its well-placed canons built houses inside a walled area that included the cathedral and the palace of the archbishop of Cologne.

In 1263, Prior Friedrich von Hohenstaufen, brother of the archbishop, laid the cornerstone to the new cathedral of St. Victor, which incorporated the towers and Westwerk (entry structure on the side facing west) of its predecessor. Destroyed with much of the rest of the city in 1945, it has been completely rebuilt in its medieval form, which reflects the long building period extending into the sixteenth century. The Gothic cathedral has the same dimensions as its predecessor, suggesting that the decision to rebuild in the new style had more to do with the canons' self-perception, and with fashion and prestige, than with the need for more space. In the two-story elevation, the building reveals the influence of the recently built church of the Virgin (Liebfrauenkirche) at Trier; likewise the chapels set diagonally between the choir and the east ends of the aisles are taken over from the Trier plan. The influence of the Gothic cathedral underway at Cologne since 1248 is visible in the stone statues adorsed (attached back to back) to the columns of the choir and nave. Among the oldest figures, sculpted in a style related to Cologne works, number those of Saints Helena and Victor in the choir. The short nave without transepts is flanked by a double aisle on each side, which gives the impression of great width. Much of the interior decoration of the cathedral has been preserved; in addition to the Romanesque shrine for the relics of St. Victor, now incorporated into the later high altar, the oldest carved choir stalls in the Rhineland, from the middle of the thirteenth century, and some of the stained glass windows from the earliest building period are still to be seen in the choir. Some twenty elaborate, carved altarpieces, many of them from the first half of the sixteenth century, are also preserved at St. Victor's.

In 1228 Archbishop Heinrich von Molenark granted city rights to the market settlement just to the south of the walled cathedral area. Trade with Flanders and the Hansa cities made the strategically located city wealthy; it also made its control important to the surrounding political powers, the archbishop and the counts of nearby Kleve. At the end of the fourteenth century, the archbishop decided to protect the city with a wall, some of whose towers still stand. But in 1392, before the fortification was completed, the counts' men occupied the northern half of the city. After a half-century in which the city was divided between the two powers, the pope granted it to Kleve in 1444.

Siegfried, the hero of the *Nibelungenlied*, is supposed to have been born in Xanten.

Zeitblom, Bartholomäus (ca. 1460–1518/1522)

Also known as Hausner, this painter and polychromer, who was probably born about 1460 in Nördlingen, appears for the first time in Ulm documents in 1482, where he is listed as an unmarried citizen. The first two of his three later wives were the daughters of the painters Hans Schüchlin of Ulm and Friedrich Herlin of Nördlingen. His use of Herlin's technique and the appearance of ornamental patterns from Schüchlin's workshop in the backgrounds of his paintings make it probable that he was trained by these two painters. From 1499, Zeitblom paid taxes on a house in Ulm and a pew in the city's cathedral. His death date lies between 1518 and 1522.

Zeitblom's reputation reached far beyond the city walls of Ulm. His shop exported numerous winged altarpieces, many of them made in collaboration with the wood sculptor Nicolas Weckmann and the painters Schüchlin, Bernhard Strigel, and the anonymous Master of the Pfullendorf Altar. Characteristic of his thinly painted panels are introverted saint figures whose monumentality radiates a great calm.

Two altars signed by Zeitblom are preserved. The winged altarpiece from Heerberg near Schwäbisch Hall—a collaborative project with Weckmann dated 1497–1498—is now in the Württembergisches Landesmuseum in Stuttgart, as is the slightly earlier one from Kilchberg near Tübingen. Written sources document an altar at Süßen from 1507, now destroyed, and polychromy on a Mount of Olives group by Michel Erhart at the south side of Ulm Cathedral.

Fragmentarily preserved altarpieces from Donzdorf (about 1490, now in the Fürstenbergische Gemäldegalerie in Donaueschingen), Eschach (1496; Stuttgart, Staatsgalerie), Söflingen near Ulm (ca. 1500; Kempten, Alpenländische Galerie), and the Wengenkirche in Ulm (ca. 1510; Ulm, Ulmer Museum) can be attributed to Zeitblom's workshop on the basis of technical and stylistic similarities to his documented works. Conversely, Zeitblom's participation as a member of Schüchlin's workshop on the panels of the Hausen altarpiece from 1488 (Stuttgart, Württembergisches Landesmuseum) and those for the Blaubeuren altar from 1493–1494 has been demonstrated conclusively, as has his work with Weckmann on the retable dated 1511 at Adelberg, near Schwäbisch Hall.

Zillis

The village of Zillis, Switzerland, lies above the Schams valley to the south of the ravine of the Via Mala. Already settled in the Roman era, Zillis lies on the important Alpine route leading through the Splügen Pass. The settlement of Ciranes (Zillis), mentioned circa 831, already contained the principal church of the Schams valley—the parish church (*ecclesia plebia*) of St. Martin. The seat of the criminal justice system of the entire Schams region, the village of Zillis was thus both the spiritual and the legal center of the area, owing principally to its location on the trade route. Initially under control of Pfäfers Monastery, Zillis was given over to the bishop of Chur by Otto I in 940. In the early twelfth century the Schams valley, including Zillis, became the property of the lords of Vaz. In the fourteenth century it is again named as property of the chapter of the cathedral of Chur.

The most significant monument in Zillis is the parish church of St. Martin. Four building phases can be discerned. An early Christian church (ca. 500) in rectangular form with a large parabolic apse appears to be the earliest structure on the site. Immediately to the north, a tripartite structure may have been a baptistery/sacristy. This was replaced circa 800 by a three-apse hall church, typical of Carolingian Raetia, as seen at Müstair. The present Romanesque church was constructed circa 1130 with a single rectangular nave, narrow square chancel, and flat wooden roof. At this time too was constructed the tower on the south flank. The Romanesque chancel was replaced with the present star-vaulted, Gothic polygonal chancel and sacristy, signed "1509 meister andres büchler" (1509 Master Andres Büchler).

Zillis, St. Martin's, detail of painted ceiling: central panel of Last Supper with Judas, John the Evangelist, Christ, and Peter. Photograph: Eidgenössisches Archiv für Denkmalpflege/Boissonas, Geneva

Of particular importance is the painted wooden ceiling, the earliest extant painted Romanesque wooden ceiling, and the only surviving example of its kind from the twelfth century. While dated variously from 1140 to 1200, a date of circa 1160 seems the most probable and is popularly accepted in recent scholarship. Comprising 153 panels, painted in a limited palette of green, red, gray, white, and black, the ceiling appears to have been polychromed prior to installation. Strong stylistic and iconographic affinities have been noted between the ceiling and manuscript illumination of the twelfth century, suggesting that the artists came from the scriptorium at Chur.

The ceiling, arranged in seventeen rows of nine panels running east to west, depicts scenes from the lives of Christ and St. Martin, surrounded by a border. At the four corners angels, labeled as the four winds, blow trumpets. The remaining forty-four border scenes portray lively, fantastic aquatic animal hybrids and two episodes of fishermen in boats (Peter and Andrew, Jonah). The inner scenes run from east to west, beginning with three Old Testament kings and allegorical figures of Synagogue and Church. The narrative cycle of scenes from Christ's life, including both scriptural and apocryphal episodes, begins with the Annunciation and concludes with the Crowning with Thorns. The final seven panels contain scenes from the life of St. Martin, the church's patron.

While the conclusion of the Christ cycle with the Crowning with Thorns is unusual, it appears to follow a strong regal theme in the cycle, beginning with the three Old Testament kings and continuing through a strong emphasis on the Three Magi. This emphasis may reflect the passage of the relics of the Three Magi through Zillis during their translation from Milan to Cologne in 1161. Peculiar too is the absence of the Crucifixion, although it is alluded to in the cross pattern, formed by parallel rows of bold wavy lines, extending along the central east-west and north-south axes of the entire ceiling. The lost Romanesque chancel may also have contained additional imagery.

The entire ceiling seems to present a spiritual *mappa mundi*—an image of the world as the triumphal route of Christ. The role of the church in administering this path is adumbrated in the appended scenes of the titular saint, Martin, and also in the complex number symbolism employed. The number of panels reflects the 153 fish drawn by Peter in the miraculous draught described in John 21:11. The ceiling thus functions as a vision in which Christian time and space are "mapped" out.

Zug

First mentioned as a city in 1246, Zug, Switzerland, owes its founding to the counts of Kyburg. Rudolph von Habsburg acquired the town in 1273 and used it as a strategic point of defense against the original Swiss cantons in the battle of Morgarten in 1315. A fifteen-day siege by the confederates led to Zug's entry into the union in 1352.

Zug is home to one of the most richly decorated late Gothic churches in Switzerland. St. Oswald's was built on the site of a fourteenth-century church dedicated to the other patron saint of Zug, St. Michael. St. Oswald's was begun in 1478 by Hans Felder from Oettingen in Swabia. Felder was also responsible at this time for the second city wall. Later additions to St. Oswald's included the elongation of the polygonal choir (1494–1496) and, in the sixteenth century, the aisles to flank the nave as well as the steeple. Of particular interest are the figural sculptures on the west facade executed by an unknown sculptor. These include figures of saints Oswald and Michael, a Madonna and Child, German emperors, and saints—all standing in niches and partially enclosed by baldachins.

Zurich

The strategic site where the Limmat exits the northern end of Lake Zurich (Switzerland) was inhabited as early as the Neolithic age, but the Romans were responsible for the permanent settlement of this area. A toll station was established here in Augustan times, and under Emperor Valentinian I (364–375) a fort was erected on the Lindenhof, a hill on the left bank, and a bridge nearby spanned the river. A Christian church may also have stood near here at this time, on the site of the later church of St. Peter. Burials near here attest to the continuous use of the site in the fifth through seventh centuries, even after withdrawal of the Romans in 401. More modest graves on the right bank signal an early settlement in this area as well.

Medieval Zurich enjoyed two periods of extended prosperity. In the middle of the ninth century, Charlemagne's grandson, Louis the German, and Louis's daughter Hildegard founded the women's abbey known as the Fraumünster on the left bank. Hildegard served as the convent's first abbess, establishing what would be a long tradition of the personal power of the abbess and the foundation's proximity to the highest political instances. At the same time as the building of the Fraumünster, which was consecrated in 874, a new palace was built on the Lindenhof, with material quarried from the remains of the Roman fort. The Grossmünster (big church) stood on a hill on the right bank of the Limmat directly opposite the Fraumünster, on the site of the cemetery where the town's patron saints Felix and Regula were buried; it served the religious needs of the men's abbey.

After the death of the last male heir of the house of Zähringen in 1217, the Emperor Frederick II granted Zurich its freedom from a territorial overlord (Reichsfreiheit), and the city experienced a political and economic boom. The palace on the Lindenhof, which had been rebuilt in the tenth century under the Ottonian emperors and later under the Zähringer dukes, was razed to symbolize the city's independence; a new town hall (Rathaus) was built along the river; and the city was ringed with a protective wall. The church of St. Peter and the Wasserkirche (Water Church), on the island below the Grossmünster where Felix and Regula had been martyred, were rebuilt, and building on both the Grossmünster and Fraumünster, which had been started in the previous century, was completed. The newly arrived Franciscans, Dominicans, and Augustinians constructed churches and convents near the city wall. Well-placed citizens built and enlarged stone houses in both the *mindere Stadt* (lesser town) on the left bank and the *merere Stadt* (larger town) on the right; a number of these still preserve interior wall painting—both decorative and figural—from the period about 1300 and the fourteenth century. These same patrons, like the well-known patron of *Minnesang* Rüdiger Manesse, also commissioned lavish manuscripts, like the *Große Manessische Liederhandschrift* (*Great Manessian Song Manuscript*, Heidelberg, Universitätsbibliothek, no. cpg 848) and the world chronicles in St. Gall (Vadiana, no. 302) and Berlin (no. mgf 623). Whether these and other commissions were executed in lay shops or in scriptoria at the Grossmünster, the Dominican men's cloister, or the Dominican women's convent Oetenbach at the northern tip of the *mindere Stadt*, has not been definitively settled.

The craftspeople, who had significantly contributed to the city's financial success, finally managed to better their political and legal situation in 1336. In an uprising led by the knight Rudolf Brun, they stormed the Rathaus and exiled some members of the city council. Brun was named mayor, and the new constitution, based on that of Strasbourg, gave the thirteen newly formed guilds political representation equal to that of the nobles and the wealthy who had traditionally ruled.

Huldrych Zwingli began preaching the Reformation in Zurich in 1519, and five years later the iconoclasts under his influence emptied the city's churches of crucifixes, altars, metalwork objects, and manuscripts used in the Catholic rite and dissolved the foundations. Despite the "cleansing" of Zurich's churches and the rededication of some of them to other purposes, the street plan and

Zurich, *mindere Stadt*, with (from left) towers of the *Fraumünster* and of St. Peter and trees on the *Lindenhof*. Photograph: Joan A. Holladay

many of the buildings of the medieval city are still more or less intact.

Zwettl

The Cistercian monastery of Zwettl was founded in 1137 by Hadmar of Kuenring, a member of the dynasty of dominant influence in Lower Austria. The events of the foundation and its ongoing support by subsequent generations of the family and others are described in the lavish *Founders' Book* (*Liber fundatorum*) compiled between 1310 and about 1320 from earlier sources. Its figural decoration consists of fifteen mostly full-page family trees and sixteen images of other donors.

The first, Romanesque, abbey church, the western part of which survived until 1722, was a basilica with transepts and a "Benedictine" choir. The present Gothic abbey church is, despite its stylistic uniformity, the result of different building campaigns of the fourteenth, fifteenth, and eighteenth centuries. On the initiative of Albrecht II, a new ambulatory choir was begun in 1343; its radiating chapels were consecrated in 1348. Under the patronage of Charles IV, work was resumed in 1360, and after a change of plans, the first hall-ambulatory choir in Austria was completed in 1383. A reconsecration of the church and main altar is recorded for 1437, and by this time the two easternmost bays of the nave, which contained the choir stalls of the monks, were built as a hall church in continuation of the existing choir. The westernmost bays of the church, finally, were constructed, still in Gothic forms, when the Baroque facade was added in 1722. In 1471, the monastery was thoroughly fortified, and the church, after a fire in 1511, was reroofed and equipped with defensible towers and a central spire. At the same time, a refurbishing of the church took place. The eight stained glass windows that Abbot Koloman Bauernfeind ordered for the north side of the church from master Michael at Steir in 1490 got lost in transit; of their replacements, only one panel, with the Trinitarian Coronation of the Virgin, a subject popular at the court of Frederick III, has survived. A late Gothic altarpiece, carved by Andreas Morgenstern from Budovice and stylistically related to the one at Kefermarkt, was installed in the choir in 1525.

The town of Zwettl, first documented in 1139 and founded as a town at the present site in 1200, is located about two miles west of the abbey. The first parish church of Zwettl, however, was the Romanesque church of St. John, situated on a hillside overlooking the Kamp valley within the original castle of the Kuenrings. In 1483, Emperor Frederick III founded a collegiate chapter at the church and advised its subsequent fortification.

Note on Index Page Hyperlinks

This Index retains the "Print Book Page Numbers" as links to embedded targets within the content. Navigating from a "Page Number" link will take you to within three Reader "Page Forward" clicks of the original Index reference point.

This strategy retains the full value of the academic Index, and presents the relative positions and distribution of Index references within this book. The Index Page Numbers are hyperlink pointers and have no relationship to the Reader soft-generated page numbers.

Entries with page numbers in **bold** indicate main entries.
